THE announcement on Christmas Eve of the names of the Second Front Commanders puts an end to a long weary period of waiting and preparing. The *dramatis personæ* are heralded; the curtain is about to go up. History will have to decide whether the war could have been won in 1943, or whether the delay will in the end have cost a bleeding world less than an assault imperfectly mounted and incompletely prepared. But there can be no doubt about the intentions for the New Year. From East and South and West—and perhaps from the North and certainly, relentlessly, from the air—a grand assault is going to be made. All the carefully hoarded trumps in the Allied hand are about to be played, in the hope of winning trick, game and rubber. God they do—for if they do not, the prospect is indeed. There are sound and solid reasons for hopefulness: the resources are vast, the leadership good, the determination is unshakable. But no military venture, least of all an amphibious one, can be conducted with a certainty, however massive the resources, however complete the preparation “down to the last gaiter-strap.” By January 1st, 1945, either the European war will be over, or else the prevailing view about the time and the manner of its ending will have to be radically altered. For total victory, it is now or never.

It is not only for military victory that the tide must be caught now or never. There is a good prospect that within a very few months the nations will be faced with the vital responsibilities of peace. The silence that will fall

on Europe when the guns stop firing will not be a restful pause for thought and planning. It will be a vacuum into which a chaos of actions and doctrines will rush. The shape of the world for many years to come will be decided by what is done in that brief instant. Those who have studied the history of the Armistice months of 1918 and 1919—there is an admirable short summary in Sir Frederick Maurice's recent book—realise how very quickly the moment of absolute victory and absolute opportunity passed. By February, 1919, the Germans were successfully bargaining. Before the Peace Conference met, the framework of the treaty had already been decided by the attitudes of the Governments and Parliaments. The new basis of German government—a tacit alliance between the Socialists and the *Offizierskorps*—had been set without Allied challenge. By a year after the Armistice, the treaty had been signed and elections in Britain, France and Germany had set new courses which could not later be altered. This time, the treaty may not be born so hurriedly; but there will be no pause in the stream of events, each of which is a commitment, a draft on opportunity. If the angels are not ready to rush in and fill the vacuum, the fools—or the worse than fools—will get there first.

Are we ready for the peace? We are far less ready than last time. Indeed, there is a striking contrast in the state of mind then and now. In 1918 the whole world knew what an Allied victory would mean—and, what was more important, the Allies themselves knew what they wanted.

In the international field, an Allied victory would mean a league of sovereign, self-determined, national states; it would mean a pledge to work towards arbitration, general disarmament and collective security. The dominant system of government would be that of the liberal, bourgeois, democratic state, with its two-chamber Parliament, its civil liberties and its law courts, its elections and its parties. In economics, there would be a return, as rapid as might be, to the gold standard, to relatively free trade controlled only by moderate protective tariffs, to economy and balanced budgets. Government controls would be removed and private enterprise would resume its sway. It is of little moment now to reopen the insoluble debate whether this consistent order of ideas failed because it was invalid or because it was never tried. The point is that the victors knew what they were going to do with their victory.

What are we going to do with our victory, if we win one in 1944? We do not know. Who can hazard a guess about the nature of the world order that will emerge from a victory of the United Nations? We know what it will *not* be—it will not be Nazi. But what positive ideas are agreed between Washington, London and Moscow? From all the reports of the Moscow, Cairo and Teheran Conferences, and from what can be read between the lines, it is apparent that only one thing was firmly established—the presence of good will. That is something—indeed it is a great deal—but it is not enough of a foundation for world order. What sort of nations will emerge from this war? How will the liberated countries of Europe conduct their relations among each other? How will they organise themselves internally? As free democracies, as one-party Soviets, as oligarchies, as military hierarchies? And what is the economic organisation that will follow from a victory led by America, Britain and Russia? Is it private enterprise, or state capitalism, or a struggle between the two, or a synthesis of the two? If there is any man who can answer these questions with confidence that he is right, he is gifted either with arrogance or with second sight. Yet we are within a few months—or so we must hope—of decisions on these matters, of decisions either taken by forethought and deliberation or forced by the blind madness of events. The dawn is breaking and we do not yet know what to do with the day.

Nor is it only on the international plane that the most urgent matters are still unresolved. At home, there is much talk of preparation for reconstruction, but there is very little evidence of real preparedness. The Beveridge Plan is, in essence, a comparatively simple rearrangement of familiar administrative structures. But

after more than a year the Government has not even yet produced its White Paper. The planning of the rebuilding of areas devastated by bombing—the first introduction to the beginning of the prologue to reconstruction—is still held up for simple decisions of finance and authority. If Ministers cannot say anything definite on these matters, is it really possible to believe that they have even begun to think about the really difficult and essential subjects, such as full employment, foreign trade, productivity and the rest? When last heard of, Full Employment was the subject of an argument at departmental level about the relative responsibilities of the Treasury, the Board of Trade and the Ministry of Labour.

It is difficult not to be very impatient and very angry. The whole complex of questions to which the inadequate title of Reconstruction has been given is still being treated as if it were a remote contingency, a distant set of footnotes to the eventual problem of demobilising the forces. In point of fact, it is a battle that will soon be on us, a battle that will be won or lost as quickly as the Battle of Britain, a battle whose outcome will be quite as decisive for the future of the world. We have just about as long to prepare for it, and just about as far to go, as we had in the summer of 1940. But we are tackling it with Chamberlain methods; we are bumbling when we ought to be bustling.

The New Year is going to be full of blood and glory. After more than four years of strain, the nation must nerve itself for heavy casualties and for very grievous losses. But not all the people are fighting men, or even in the direct succession from the fighting line. Unlike 1940, this is the period of fulfilment, when many people's war work is done. The planners, whether of strategy or of production, have finished their tasks; the quality of their planning is to be put to the test, but they cannot alter it now. The problems of economic mobilisation are solved—save for the last turn of the manpower screw. Many of the producers are still needed to work at full pressure—those in the coal mines and the aircraft factories, for example—but others have produced all that is wanted. For all these people it would be poor patriotism and worse psychology to stand around in attitudes of vicarious heroism while the young men fight it out. The desire to have a job to do can best be met by working overtime to have the instruments of victory ready for when they are needed. In 1944, as in 1940, it is for the Government to issue the call and direct the energies. There is just time, even yet to make certain that the moment of opportunity to be won on the battlefields of the Second Front is not let slip for ever.

## Middle Eastern Opportunity

MR CASEY has been appointed Governor of Bengal and, so far, no successor has been announced to his former post—that of Minister of State in the Middle East. Some reports suggest that no successor will be appointed. Does this mean that, now the war has receded a little from the Levant, the Government no longer feels the need for a measure of co-ordination in its dealings with the Middle Eastern States? Does it mean that the promising system of regionalism for which wartime needs laid the foundations is to be scrapped? If so, it would be a disaster, both for the states concerned and for British interests in that area.

It would be a disaster first of all because the aftermath of war will leave all the Middle Eastern states in acute economic difficulty. Unless some machinery exists, with influential backing, to help them through the crisis, the end of hostilities may leave the Middle East permanently more divided, mutually hostile and potentially aggressive than ever before. Wartime shortages, the varying degree of expenditure by occupying troops, different systems of rationing, the varying scope of the black markets, have all helped to accentuate the economic differences between the states. In one small geographical area there are five or six

different price levels and currency values. Cross-frontier trading is greatly reduced. Unless these states are given some assistance, they may be tempted to try to overcome their post-war problems by fierce economic nationalism and emerge from the war more disintegrated than before.

Such an outcome would be all the more tragic in that Middle Eastern politics show some encouraging signs of tending towards unity. With the focus provided by the Middle East Supply Centre at Cairo, a number of steps have been taken to secure co-ordinated action throughout the region. For example, at the recent conference on statistics held in Cairo it was arranged that a Statistical Bureau should be set up to serve the whole area; that the governments should arrange for the exchange of publications through specially appointed liaison officials and that common studies should be undertaken on questions which of their nature bear no relation to national frontiers. In February, an agricultural conference is to be convened at which experts from the various states will give their information and experience. In the cultural and educational fields, discussions have begun on securing some uniform educational standards—for example, there is considerable

of adopting English as second language in all the schools. Members of the Governments of the various states have held informal conferences. Recently, for instance, their Supply Ministers consulted together. These activities have been encouraged by the existence in Cairo of a focal point where expert advice and a great deal of disinterested help are available. It is likely that, without the underlying assistance of the Great Powers, the Middle Eastern Governments would hardly have gone even the modest distance towards unity that they have achieved so far.

Arab unity is still at the level of aspiration. It needs far more positive backing if it is not to go out through the Gate of Ivory. There can be no doubt that Arab unity, as opposed to the fractious divisions of half a dozen impoverished states, is profoundly in the interests of the Great Powers and quite especially of the British. They must therefore do more than go on repeating Mr Eden's warm but vague blessing on Arab union. The war has shown how much functional co-operation can be secured, provided the machinery is there. It would be folly in the needy post-war period to scrap the whole system. With the guidance and assistance of British experts, Egypt recently announced an ambitious Four-Year Plan, including a great electrification project in connection with the Assuan dam. An entirely new departure was made when the Government accompanied their decision by the launching of a large internal loan, which is having remarkable success. The experiment is a pointer to the manner in which, under the guidance, say, of the MESC, the economic difficulties of the area as a whole might be used to underpin greater unity. All the states are showing in purchasing power. This surfeit of money is one of the great difficulties in achieving a proper relation between the various price levels. The Egyptian precedent might well be followed. The other Middle Eastern states have available to them in Cairo expert financial and technical consultants to advise them on an investment policy of their own. They should be encouraged to undertake the local financing of further Four-Year Plans and further development schemes, not simply state by state, but crossing frontiers and knitting the area into greater economic unity. Many useful projects, particularly irrigation schemes, naturally fall across national boundaries. An almost infinite degree of expansion is possible in this desperately backward and under-developed area.

The effect of the working of such schemes would not be simply economic. It would bring to the fore new types of men—the technician, the administrator, the official more interested in the efficiency of his job than the advancement of his family. That such men exist has been proved by such experiments as the Syrian and Lebanese Bread Grain Office (*Office de Céréales Panifiables*), which has initiated rationing schemes in the large towns in Syria and throughout Lebanon, where, moreover, it has succeeded in using local talent in building up a really remarkable population census on which to base the

rationing scheme. The administration is British, French, Syrian and Lebanese. It is efficient and incorrupt. The young men are feeling the exhilaration of working without graft or nepotism. It would be impossible without the British and French stiffening. With it, a new type of executive officer is being created—a radical revolution in these lands traditionally riddled with lawyers and professional politicians. But here, as with all the concrete schemes for greater unity, the Middle Eastern Governments themselves have not the weight nor the drive necessary to translate their general aspiration towards Arab unity into actual fact. They need the friendly help—and pressure—of the Great Powers.

The general British interest in a peaceful and unified Middle East is obvious. Communications, oil supplies, imperial relations are all linked with the fate of the Middle East. But there is another and more urgent reason for British concern. In March, 1944, will come the day fixed by the White Paper for changing the conditions of Jewish immigration into Palestine. By that time the Government has a positive obligation to state its policy in the Palestine question. Most experts in the Middle East are agreed that the problem is not soluble in terms of Palestine alone. It can only be approached through a wider conception, that of a measure of Arab union in the Middle East. The first, most obvious and most manageable step is the creation, or rather restoration, of Greater Syria by bringing together Syria, Lebanon, Transjordan and Palestine in some form of close political and economic association. Such a solution would give elbow room to both Arabs and Jews. It would not guarantee a settlement of the Jewish problem, but at least it would put an end to conditions in which any settlement seems impossible. Now is the time to initiate this wider scheme. One of the obstacles to it, France's desire to cling to its special position in Lebanon, has now been removed. General Catroux's brilliance and skill as a negotiator have ended the deadlock of a few weeks ago. The aspirations of Syrians and Lebanese alike are being met with remarkable and encouraging speed. The French are now relinquishing most of the subjects formerly reserved for their control under the Mandate. Even the old vexed *intérêts communs*—the Customs hitherto collected by the French and divided by them between Syria and Lebanon—are to be handed over to the Syrian and Lebanese Governments. By the same token, the Syrians and Lebanese can probably be more easily persuaded to join in a wider scheme now while their constitutional life is anyway in a state of flux than later when their interests will have had time to harden.

It is an opportunity for statesmanship which will not recur. Mr Casey has left Cairo, it is true. But Mr Churchill has been there. He has the prestige and the imagination to initiate a bold policy. If he lets the moment pass, who knows what evils and insurrections and divisions and frustrations may lie ahead.

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

# The Principles of Trade

IT is a commonplace that the reconstruction of the import and export trades of the United Kingdom will be one of the most urgent and most difficult tasks confronting the country after the war. But the prospects of British overseas trade cannot be discussed except in the framework of international trade as a whole. It is therefore necessary—and this is what complicates the matter so badly—to discuss both the general and the particular at the same time, both the abstract principles of international trade and the particular problems of balancing the accounts of the pound, or, for that matter, of the dollar.

Unfortunately, of all the major problems of reconstruction, this one has received the least fundamental and the least helpful attention. There have been analyses of the British balance of payments which took little account of the shape and structure of world trade or of other countries' views on the problems arising. There have also been discussions of the principles of international trade which have taken even less account of the practical necessities. There have been very few public studies which comprehend both aspects of the matter; in general, public opinion, confronted with a problem of great difficulty and complexity, is floundering. *The Economist* has no wish to exempt itself from this criticism. For a journal that was founded as a Free Trade organ, this is a question that clearly needs the most careful analysis, the more so if the argument appears to be leading to any modification of the view taken up a hundred years ago and consistently maintained ever since. Nor is the arrogant claim made that the series of articles, of which this is the first, will provide a complete answer to all the problems. But an attempt will be made in this series to set down some of the basic considerations and the consequences that seem to follow.

The first and most fundamental question relates to the purpose of international trade in general. Is it something to be sought after? Is an increase in international trade an advantage *per se*? Or is it, in the modern world, only a marginal and unfortunate necessity, to be indulged in only when the resources of domestic economic planning fail? The classical answer is to point to the international division of labour. The nations are so constituted and so placed in the world that their productive abilities differ. In every country there are things that it is cheaper to make than to buy, and other things that it is cheaper to buy than to make—and "cheaper" in this context means cheaper in terms of the ultimate resource of human labour. In the particular case of Great Britain, there are many things that can be procured with a much smaller expenditure of British manpower by the mechanism of exchange than through domestic production. To forgo this cheapest method of procurement is to waste manpower and therefore to reduce the sum total of goods and services that can be produced by the manpower available—in short, to reduce the potential standard of living of the British people. This is true of Great Britain in a high degree; but it is true in some degree of every nation in the world. An increase in a country's international trade is a sign that it is availing itself of its opportunities to raise its standard of living through the mechanism of exchange. A decline in international trade is a sign of deliberate or imposed impoverishment.

This is the classical doctrine, and *The Economist* adheres to it. Neither the world as a whole nor any individual country in it is so well supplied with material

goods that it can afford to dispense with the addition to its standard of living that can be got from international exchange. Indeed, if the attainment of the highest possible real national income were the only object of economic policy in this age, without regard to the regularity of its flow or its distribution between rich and poor, or to national safety in time of war, then there would be no need to modify in the least the pure Free Trade position. Even as things are, it is still true that every reduction in international trade is a reduction in the potential standard of living; and if any modifications in the Free Trade position are necessary, it is because the modern community has acquired economic needs other than maximum wealth.

To admit the possibility of modifications is not, however, to admit that there is any force in many of the arguments that are frequently advanced against an increase in international trade. It may be as well to pass some of these arguments in brief review.

The first is the argument, frequently put forward by Colonel Walter Elliot, that science is removing the differences in productive efficiency between the nations. An international division of labour may have been an advantage when industries were compelled to be specialists. But now that every country is well on the way to being able to produce everything, international exchange is merely a disturbing influence. This, of course, is sheer bunkum. It is true that science is removing some of the absolute differences in productivity. Rubber, which could formerly be grown only in equatorial lands, can now be produced anywhere in the world. But these absolute differences were never very important to the basis of international trade. It is relative differences that count, and they are further from being removed than ever. To make a case for international trade, it is not necessary to prove that Britain cannot grow wheat or that Argentina cannot make textile machinery. It is only necessary to establish that Britain cannot grow wheat so cheaply as Argentina or that Argentina cannot make machinery so cheaply as Britain. So far from removing the basis for international trade, modern technology, by emphasising the need for heavy capital investment and for special operating skill, is tending to increase it.

A second very familiar objection is that the primary producers of the world are industrialising themselves and will no longer be ready to buy British manufactures. This is a specious argument and is the more attractive since it may possibly be true. If the majority of countries deliberately embark upon a policy of complete autarky, and are willing to accept the severe reduction in their living standards that would be involved, then international trade will be an impossibility. But mad though the world was in the 1930's, it was not so mad as that, and there are very few cases of attempts at complete self-sufficiency. In general, a country that industrialises itself enriches itself, and provided it does not pursue a hopelessly stringent policy towards imports, it becomes a better, not a worse, market for other countries' goods. It is true that it does not become a better market for the simple, mass production goods to which a country naturally turns first—cheap cotton textiles, for example. But if the Indian peasant can earn a larger income by making loin-cloths than he previously earned in agriculture, he can spend more, not less, on imports, if only the overseas producer will give him what he wants. This is the natural result of industrialising, and if too severe a protective policy threatens to prevent it, the political power of the primary producers in all these countries is still great enough to make their governments very responsive to hints dropped by the world's largest importer of primary products. It cannot be true that a country with Britain's widespread commercial ramifications would be injured by anything that enriched the world.

A third objection to a policy of maximising international trade has some force, but not nearly as much as is often attributed to it. This is the argument that the need

to be strong in time of war prohibits dependence on imports. It is an argument which may be quite valid for a country in Germany's position, but has very little validity for Britain. Any restriction of trade in the interests of defence is a deliberate decision to impose a lower standard of living in peacetime in order to be strong in wartime. Any country embarking on such a policy would naturally have to ask itself how much peacetime wealth it would sacrifice for how much wartime strength. In Britain's case the sacrifices that would have to be made to secure any substantial increase in the national safety would be very large. This may be demonstrated by the fact that all the efforts and all the very large sums of money that have been devoted during the war to the increase of domestic food production have succeeded in raising it only to about half of the present reduced standard of consumption, when measured by food content. (The higher proportions often quoted are arrived at by comparing weights, which is, of course, misleading in this context.) And even if self-sufficiency in food could be attained, there is the even more difficult problem of self-sufficiency in raw materials. Self-sufficiency would be an extremely expensive (that is, extremely impoverishing) way of securing British ability to sustain a war. A fraction of the resources devoted to maintaining the merchant fleet, the Royal Navy and the ports or to storage of imported commodities would attain the same result much more easily. For the second time in a generation, actual experience has revealed that the limit is put on British military strength not by imports but by manpower. If, as is probably the case, Britain has been able to put a higher proportion of her manpower into the war sector (armed forces plus munitions industries) than any other belligerent, it is because she is *not* self-sufficient, but enjoys the enormous manpower economies of getting her food and raw materials by international exchange.

There is thus no case on defence grounds for any restriction of British dependence on imports of the bulk items, such as food and the major raw materials. There

is, however, a case for ensuring some domestic production of certain special items which are particularly important in modern warfare—such things as aircraft, internal combustion engines, machine tools, motor fuel, light metals, and many of the branches of the chemical industry. Even here, however, it would be foolish to insist on complete self-sufficiency. A production large enough to form the basis for wartime expansion, and to ensure that there is a supply of people in the country with the required "know how," would be sufficient to meet the reasonable requirements of defence.

Three objections to the policy of expanding international trade have thus been considered and rejected, in whole or in part. There are, however, two further arguments of much greater substance which must now be taken up. The first of these is the belief that post-war Britain will be unable to pay for her imports. The maximum of overseas trade is, indeed, in Britain's interests—so runs the argument—but the basis of her trading has been so shattered by the war that it will not be possible to get back even to the pre-war volume of trade, let alone to increase it. Against her will and against her interest, Britain will be compelled to restrict her imports.

The second of these major objections is that the present-day community has other economic objectives as well as the maximum aggregation of material income. In particular, it desires Full Employment, and is willing to sacrifice a certain measure (though a strictly limited measure) of wealth to secure it. This requires some purposive direction of the national economy by the state and free international trade, so it is argued, is not compatible with the planned economy. Foreign trade must not be allowed to become a disruptive force in an economy which it will be difficult enough, in any event, to keep on an even keel.

These two objections cannot be waved aside. They must be taken seriously. Accordingly, the next two articles in this series will take them up in turn for further examination.

## The Indian Prospect—II

## Political Possibilities

AN earlier article two weeks ago discussed the broad economic needs of India as they have lately been underlined by famine conditions and set out in various proposals for Indian reconstruction after the war. The conclusion was reached that the solution to the economic problem must in the first place be a political one. That is, the economics of the Indian situation require a strong Central Government; will Indian politics in fact permit the establishment of such a Government?

Since then, both Sir George Schuster, speaking in Parliament, and Professor A. V. Hill, speaking in India, have given their support to a 10-year economic plan for India, and Lord Wavell himself has emphasised India's economic needs. But the Viceroy has also stated that this is no time for fresh attempts to reach a political settlement. Presumably, his view is based upon two considerations. The first is that the military position of India as the base for an early attack upon Japan is too delicate for political risks to be taken; secondly, the likelihood of an agreement among the Indian parties, if new negotiations are opened, may seem to him slight. This is not the present opinion of many Indians, who believe that the full co-operation of all the Indian people is militarily indispensable, and claim that the chances of Indian agreement are now high.

In the past, it has been the view of the most impartial British students of India—of whom the latest is Professor Coupland—that, while India, economically, required a strong Central Government, politically only a weak Central Government, with authority dispersed, communally and regionally, was in fact possible. Insofar as the Cripps plan was a plan for partition between Moslems and Hindus, it accepted this line of political logic. Now it is suggested that this is not so. The Indians who argue for

economic planning deny that they are being unrealistic in their demand for the centralisation of Indian government. They say that, on the contrary, the tide of Indian opinion is flowing rapidly towards a much greater degree of unity for free India than has hitherto been thought practicable—largely because the basic problem before free India will be the abolition of Indian poverty. If this is true, it is vastly important. It has never been the British wish to see India divided and weak, when freed; this has only been the reluctant conclusion from the observation of Indian politics. If the situation has really changed, the British as well as the Indian approach to India's future can be radically altered.

Two points are accepted by the increasing number of Indians who are more optimistic about the political possibilities than Lord Wavell or Professor Coupland: first, that it is the British intention that India should have Dominion status or independence; and secondly, that the Indians will be left free to choose their own constitution. But they are not prepared to accept the assumption that any radical change in the status or government of India must be postponed until the end of the war. What is sought by them as by the Congress is a Provisional National Government at the centre and popular Ministries in the Provinces, for the duration and prosecution of the war, which would be regarded as practical proof of a prompt and satisfactory settlement after the war—and as "a rightful recognition of the general desire of all the communities and interests of India to fight against Fascism and aggression." It was largely upon this issue that the negotiations with Sir Stafford Cripps in 1942 were permitted, on the Indian side, to break down. Now, it is said, not only are Indians ready to support the war, but they are ready to agree on a much greater degree of Indian unity

\* An exception to this generalisation must be made for a pamphlet by Mr E. F. Schumacher entitled "Export Policy and Full Employment" just published by the Fabian Society (33 pages; 1s.). Not everyone will agree with all of Mr Schumacher's arguments or with the details of his conclusion. But he has written by far the most clear-headed and logical analysis of the problem that has yet appeared. Like a true Fabian, Mr Schumacher is, in this pamphlet, neither a doctrinaire nor a dogmatist, and his very moderate conclusion is as will appear from the present series of articles) very similar to that reached, by an independent route, by *The Economist* in its own investigation.

than has yet been thought practicable. What real evidence is there of these various contentions?

There was much in the conduct of Mr Gandhi in 1942 and in the violent disturbances which followed his imprisonment to justify the assumption that some Indian opinion, at any rate in the Congress, was, potentially, pro-Axis. But many more than Mr Gandhi's followers now swear that this is quite untrue. In recent months, they claim, the desire of the Indian people, and of all the Indian parties, to co-operate fully in the war has become very evident, even insistent. The cynic might comment that this expression of confidence in the cause of the United Nations has coincided significantly with a dramatic reversal in the fortunes of war, and the assurance of an Allied victory—or even, more cynically still, that the imprisonment of Mr Gandhi and his lieutenants has apparently borne some sound fruit. Nevertheless, the war effort of India, in terms of men, munitions and materials, is sufficiently large, and has been sufficiently long sustained to give substance to the claim that, fundamentally, India is overwhelmingly on our side.

But the events of 1942, and the absence then of either agreement or co-operation, remain to be explained. Two years ago, the leading political party in India, including fervent and sincere anti-Fascists, was willing to trifle with a pro-Japanese programme in order to obtain political concessions from Britain. The attitude of the most influential of Indian nationalists towards the war was in practice mainly determined by considerations of partisan politics. The real obstacle was the inability of the various Indian political parties to agree either with Britain or among themselves about the governing of a free India. To this, the political optimists, who are also the economic planners, have now a confident reply. To the outside observer, it has always seemed that the Moslem demand for independent self-government, and the Congress Party's refusal to see that demand recognised except within the framework of a single united Indian Dominion, presented an apparently insuperable obstacle. Now it is suggested, by members of all the Indian parties, that this deadlock can be broken; that the programmes of the Moslem League and the Congress Party have in effect come much closer together—that the vision of a really united free India is now practical politics. Mr Jinnah, president of the Moslem League, it is said, is now "not altogether hostile to the incorporation of autonomous Moslem Provinces, federally, within a united India"—with new provincial boundaries drawn to incorporate Moslem majorities in new and separate areas. In any case, the argument says, whatever the views of this or that political leader may be, the bulk of opinion, both Moslem and Hindu, is in favour of such a solution; the only reason why an agreement on these lines has not been made is the fact that the Congress leaders are in prison.

This communal issue, which is fundamental, affects the immediate wartime governance as well as the more lasting post-war settlement of India. The Moslem League would clearly not enter into any provisional national wartime administration which prejudged or prejudiced Moslem claims in the later settlement. Here, again, it is said that, in fact, the Moslem League and Congress are now sufficiently in agreement for immediate progress to be possible. Mr Jinnah's conditions for participation in a Provisional National Government are "equal representation" with the Congress Party, and the recognition of Moslem post-war claims; these, it is actually suggested, are now acceptable to both the Congress Party and the Hindu Mahasabha—which would represent a remarkable and historic change in the outlook for India.

At first glance, all this seems very encouraging—but at the same time very surprising. It is hard, at this distance from the ramifications of Indian politics, to see why, if this is really the state of opinion, the Cripps Mission, much more modest in the degree of agreement sought, broke down so utterly—and still more difficult to understand why the main Indian parties, said now to be in such close accord, have not already worked out an agreement for themselves. To this there is, apparently, only one answer,

namely, the fact that the Congress leaders are in prison. But they were not in prison when Sir Stafford Cripps presented his offer. Perhaps experience has taught lessons in India as elsewhere. But the confident assertion that all can be put right in a twinkling by the release of Mr Gandhi must inevitably be still regarded sceptically, as it has been, for instance, by a number of speakers at this week's meeting of the National Liberal Federation of India. True, the new optimistic view was represented in the speeches at the conference, but two other points were strongly put: first, that the Moslems and minorities are no more likely in 1944 than in 1942 to accept the kind of central government sought by the Congress party; and, secondly, that progress towards a settlement will not be possible until Mr Gandhi clearly pledges his support to the war effort.

In the past, it has been a common experience to find Indian nationalists of differing parties agreeing in general principle about political reforms and failing entirely to reach agreement in practice when the task of definition has come up. It is easy for Moslems and Hindus to agree that free India should be "federal," with decisive powers for central federal organs, and that representation should be "fair," but vastly more difficult to state specifically the degree of federation and the qualities of fair representation. It remains an open question whether, when it comes to the point, federal safeguards and sectional claims can really be reconciled with the strong central government which all the advocates of economic planning for India rightly say is necessary?

Nevertheless, if there is a new chance of a wartime agreement, on the basis of much more integration between Moslem and Hindu than has ever seemed likely, it should be taken. It would be worse than disingenuous for us to use the past record as an excuse for doing nothing. Lord Wavell cannot, indeed must not, take undue risks in the present military situation. The onus of proof that progress by a genuine national agreement is now possible must rest upon the Indians who seemed to prove that it was quite impossible two years ago. The door is open. Mr Gandhi could come out of gaol to-morrow if he would repudiate all anti-war activities, past or future. The British and Indian Governments are already bound to consider closely any agreed proposals for a settlement. Let them be produced.

Probably the invitation to advance, the reminder that the door is still wide open, should come from the British side. Lord Wavell's great chance is to create a new atmosphere of trust and confidence. The British people will not now go back on the promise to give India independence, and there are only two reservations: India's defence in the wider strategic context of the Indian Ocean must be provided for; and the protection and autonomy of minorities by some sort of communal or geographical federalism must be secured. Now it is suggested that the Indians are actually ready to march this way, and it is essential that the possibility should be put to the test.

A programme can be sketched by which the test could be made—or the bluff called, if it is a bluff. First, the Indianisation of the Viceroy's Council, nearly complete, should be completed. Secondly, an invitation should be made to all Indian leaders, including Mr Gandhi and the other Congressmen, to take part in talks to make the Council more representative, and therefore more capable of assuming full responsibility. But the Congress prisoners cannot be released without assurances of good behaviour, already asked for, or without a plain denunciation of the outbreaks of 1942; failing such assurances, they should be brought to trial as soon as possible. If all that so many Indians are saying is true, a new vista of accord and of Indian unity, political as well as economic, might then be opened up; assurances would be given, wartime agreement reached, popular government set up at the Centre and restored in the Provinces; economic planning, the nationalists' new main aim, would become politically possible. If not, if all the old frustrations took charge again, no new harm need be done; honour would be satisfied, though the prospect for India might be poorer and sadder.

## NOTES OF THE WEEK

### New Fields

The lesson of every campaign of the war has been that fighting men are made by battle experience, however real and thorough their battle training. A trek westward of troops and commanders from Africa and Italy suggests that, wisely, the core of the grand invading forces on the Second Front will be the men and methods which set victory on the move in the Mediterranean. It would have been quite needless, and an undue risk, to look farther than General Eisenhower for a Number One with ability, in his case proved, to lace together nationalities and Services in a single, effective and fluent instrument of attack; and with him will come the key men of his many-uniformed team. Air Marshal Tedder, who has been picked to be Deputy Supreme Commander, is perhaps, in qualities of mind and grasp of modern multi-dimensional fighting, the discovery of the war on the British side. The practice of combined command and operations, worked out first under pressure in the Western Desert, developed between Mareth and Salerno into a terrible weapon and lately stated with lucidity in speech and writing by his coadjutor on land, General Montgomery, stands chiefly to Air Marshal Tedder's credit. General Montgomery, who is to command the British land forces, has, for a general, one of the highest qualifications: successful leadership. The Allied naval commander will be Admiral Ramsay, who organised the Allied descents upon North Africa and Sicily, as well as the British withdrawal from Dunkirk; and Air Marshal Leigh-Mallory, whose home-based fighters and light bombers know every inch of the enemy's western territories, will command in the air. Least fortunate of the team which swept through Africa is General Alexander. To him, within the Mediterranean Command of General Maitland Wilson—whose armies have stood in wait further east, and whose scouts and staff officers have linked the Balkan patriots with Allied plans—is left the task which rudely halted the march out of Africa: the capture of Rome and conquest of Italy.

### Ninety Days

Though the core of the Second Front forces will be veterans, the bulk will be unblooded and ready for the test. In the largest expedition that has ever left these shores, most of the faces will be new and the majority of men American—just as the majority on the Mediterranean fronts will still be British. Success will depend upon yet another process of fusion, not simply between nationalities and Services, but between the new methods of the old hands and the possibly older methods of the men who have been waiting here or have just arrived. In a sense, the chances of outright victory when the movement comes have already been set by what has been done in the Home Commands and training camps, on both sides of the Atlantic, and by the extent to which this fits the strategic and tactical plans and technique of the commanders now nominated, at the eleventh hour, by battle experience. There is neither time before the appointed day nor room in this small island to make fresh starts in the organisation and methods of deployment and fighting. The task of moving vast modern armies, on land or over the water, is itself fearsome. General Eisenhower and Air Marshal Tedder have come to their posts with a desperately short time to go before action, and they will stand or fall by what the Chiefs of Staff, General Marshall and General Brooke, have made ready for them.

### Marshal Vatutin's Victory

The new Russian offensive from Kiev marks a decisive turn in the campaign in the East. The analogy between the Battle of Kiev and the earlier Battles of Kharkov and Kursk is striking. In all these cases, the German Command set out to rob the Russians of vital springboards for planned offensives. Towards the end of last winter's campaign the plan succeeded; Kharkov, the last prize which had fallen to the Russians, was wrested from them. In the Battle of Kursk, at the beginning of this summer's offensive, the

German plan failed; and the Russians were able immediately to strike with success at Orel. For some time Manstein's bid for Kiev this winter was a very powerful threat to the Russians. Had the Russians been thrown behind the Dnieper here it would have taken much time and much costly effort to restore the bridgehead and to advance from it. Fortunately, the German advance, for all its power and fury, was much too slow to upset the Russian array. Marshal Vatutin took the shock admirably. His forces retreated only half way to Kiev. Behind their screen, men and equipment were massed for the counter-thrust. The feat is remarkable for several reasons. The Kiev bridgehead was relatively narrow. It afforded little elbow room. Weather on the Dnieper at this season is as adverse as possible. The surprise effect of Vatutin's sweep forward was therefore tremendous. It is reflected in the contrast between the respective rates of the two advances. Manstein's tempo was two miles a day at its best. Vatutin's maximum was eight miles a day in the course of the first three days. After a week's fighting he has recovered three-quarters of the ground lost during the previous six weeks. It may be that it is still premature to speak of the Russian winter offensive here. But this, at least, is certain: the threat to Kiev has been removed. The advantages of surprise have been reaped by the Russians mainly because of the highly original planning of the directions of the thrust. The centre of gravity was first switched from the west to the south-west, from Zhitomir to Berdichev, a communication centre of utmost importance to all the German armies in the Ukraine, and then to Korosten in the north of the Kiev bulge. Simultaneously with their success in the Ukraine, the Russians have gained new ground on the Baltic sector. Here the main fighting has switched from Nevel to Vitebsk and the Smolensk-Orsha road Vitebsk is now almost encircled.

### The scene changes

LITTLE more than a hundred years ago Britain was an agricultural island. Its resources were undeveloped, its roads often incredibly bad; power-operated machinery was almost unknown. Then James Watt invented the steam engine . . . and by the middle of the nineteenth century the tide of industrial development was in full flood. In almost the span of a lifetime, Britain became the centre of the world's trade and in this vast change the Westminster Bank (founded in 1836) played its part, providing—as it does today—a complete banking service for industry and the individual.

## and in Suspense

On Christmas Eve Herr Frank, the German Governor of Poland, appealed to the Poles for their co-operation in fight against Bolshevism. He recalled the Polish-Soviet pact of 1920 and tried to convince his audience that, in 1944, Poles will be confronted with the same task. Other overtures have been made in the last few months, not on the ole munificent: an increase in rations and a slight relaxation of economic and political repression is all that the Germans have so far offered. It is, however, difficult to judge how far off how such meagre sops can affect the mood of a population which is nearly exhausted by years of starvation and unparalleled terror. The complete obscurity in which the Polish-Soviet relations are still wrapped leaves much room for doubt and suspicion. Frank's appeals will certainly not meet with any wide response, perhaps none at all, possibly. But they may play their part in creating a mood of pathetic neutrality among the Poles just when their own unhappy country becomes a battlefield again. Neither the Soviet nor the Polish Government has so far done anything to forestall this danger. The Poles have been given no real assurance that they will be treated like Allies by the advancing Soviet armies, or that this time they will be spared what they experienced in Eastern Poland in 1939 and 1940. The Polish Government, on the other hand, has not clearly instructed the Polish underground to assist the Soviet armies when they enter Poland. Neutrality will prove untenable; a nonsensical suggestion made in some Polish quarters that the cadres of the Polish underground should be moved to Hungary before the entry of the Russian armies into Poland would plainly spell political suicide. All the recent diplomatic omings and goings have not even resulted in the resumption of Polish-Soviet relations. Every day of delay now may tell disastrously on the position inside Poland in the very near future.

## Conditions in Southern Italy

The outbreak of typhus in Naples and the declaring of the town out of bounds for the Allied armies have focused attention on the appalling misery of South Italy. Eye-witnesses have returned bringing terrible accounts of the complete disintegration of social life which has followed on the starvation conditions in the towns and even villages. The result has been considerable criticism of the working of Amgot and a tendency to lay the blame for desperate conditions on administrative failure. This is grossly exaggerated and very unfair. The two basic causes of Italy's present condition lie entirely outside the control of Amgot. One is the failure of the Sicilian and Italian harvests; this year, the yield is not expected to be quite as much as two-thirds of the normal harvest. Usually, the Italians barely support themselves without outside supplies. War or no war, this year's harvest would have spelt shortage and even starvation in parts of Italy. But to this basic factor has been added the Germans' work of demolition. As they have withdrawn they have systematically destroyed stocks of grain, stores of all sorts, water supplies and public utilities. Eye-witness accounts speak of the phenomenal thoroughness of the work of destruction. If to this again is added the transport difficulties inherent in war, and German bombings and sinkings of Allied ships, it becomes clear that the most perfect administration could hardly have prevented starvation. Nevertheless, some administrative errors do seem to have aggravated a desperate situation. Between military commanders, Amgot, the Italian Control Commission, the Italian local authorities, the Badoglio Government and the Allied Advisory Council spreads a web of confused authority in which many necessary decisions have doubtless been enmeshed. Yet here again there has been a good deal of unfairness in the criticism. Those who have been loudest in their condemnation of Amgot's inefficiency have also been most bitter in their criticism of its toleration of "Fascism." There is a real confusion here. Amgot never had and never could have the necessary personnel to take over the entire administration of civilian life behind the lines. It was compelled from the first to use local officials who inevitably included some fascists.

## Jugoslavia: The Old Problem

The split between Marshal Tito and the Cairo Government has been, if possible, widened by a week of mutual abuse. The Cairo reaction to the setting-up of the Tito Committee—an immediate denunciation of Tito and his men as outlaws and traitors—began the evil. Tito was

obviously constrained to deny the legality of a government which, if it returned, would be liable to condemn his followers by court-martial. Now his "exiling" of the King has aroused another storm of abuse from Cairo. It is to be hoped that behind the façade of mud-slinging, Allied diplomacy is at work to prevent an irremediable cleavage. It is easy to paint the Yugoslav crisis in terms of black and white and Right and Left. But the situation is far more complex, and the deepest issue of all is probably the question whether a Yugoslav state in its pre-war form will be possible after the war. Yugoslavia's twenty years of existence between the wars were dogged with the unsettled racial problem, between Croats, Slovenes and Serbs. The Tito-Cairo split is in essence the same problem. Tito's writ runs in Slovenia, Croatia and parts of Bosnia. In Serbia—on which the full weight of German fury fell—there is far less organised resistance, but what there is Mihailovitch controls. It is true that a large number of Serbs are fighting among Tito's partisans—some estimates put his Serbs at over 40 per cent of his troops; but presumably they are those who have tired of Mihailovitch's waiting tactics. They do not operate in Serbia. The fears aroused in Croats and Slovenes by the pan-Serb tendencies of the Cairo Government have been well publicised. Less recognised are the fears of Serbs that Tito's movement may mean the weakening or even the partition of Serbia. The only solution which gives any hope of preserving Yugoslav unity and giving the state a chance after the war to develop unhindered by racial strife would be the reconciliation of King Peter with Tito. It may be too late, but it is the simplest sense for the Allies to do all within their power to bring it about.

## The Falange Dissolved

At the recent conference of regional leaders in Spain three decisions were taken which call for comment. The first was the granting of an amnesty; the second, the permission given for freer comment in the press; the third, the dissolution of the Falange Militia. At their face value, they represent a "liberalising" of the regime, which the Spanish Government no doubt hopes will be well received in London and Washington. But they cannot be taken at their face value. The invitation to free comment has since disappeared without trace. The full text of the amnesty suggests that it is only for those who have been in prison for more than five years. It follows that it can only cover a very small fraction of prisoners. Five years ago the majority of Republicans, when captured, were shot. It is only since the end of the Civil War that the mass incarceration of political prisoners began. It is impossible for Franco to grant an amnesty to the vast numbers still in prison. It would mean the collapse of his regime—as did the release of prisoners by Gil Robles in 1936. Some 2,000,000 souls, with hatred ingrained in them and in their families, cannot possibly be passed back into ordinary political circulation. The Franco regime never succeeded in reconciling them. It cannot now release them.

The dissolution of the Falange, however, is bitterly in earnest. It is the culmination of the deep feud between the groups on the Right which from the moment of insurrection in 1936—and before—split Franco's backers into rival and deeply hostile groups. Among his supporters were the Carlists, the Army, the Church on the one hand, and the Falange on the other. The former group were Conservative as only Spaniards can be—anti-modern, anti-industrial, anti-mass civilisation, seeking to live a medieval life behind the barrier of the Pyrenees. The Falange was the party of the young disgruntled intelligentsia. It looked for its model to Fascism in Italy and Nazism in Germany. It was aggressive and modernising, and aimed at becoming a mass movement in sovereign control of the state. Between the Falange and the traditionalist Franco the gulf was always great. But the Falangists had to be tolerated because they were the means of securing German and Italian support. And when the war was won, there was just a chance that their mass appeal might win some popular support for the new regime. But they have failed to deliver the goods. Since Franco's victory, the Spanish people have suffered four sullen years of imprisonment, unemployment, starvation and disease. The chief economic problems—above all, the land question—are still unsolved. Internal failure and the eclipse of the Axis made the dissolution of the Falange inevitable. It was simply a question of time. Yet its dissolution solves no problems for Franco. His chief preoccupation must be the basic unpopularity of

January 1, 1944

THE ECONOMIST

9

his regime. The Army, the Church, the landed interests represent a tiny fraction of Spain. Now the Falange, the young-intellectuals with their gangster fringe, have been thrust into angry opposition. It is the tragic paradox of Franco's position that each time he seeks to strengthen his control over the regime, he is obliged to strike down one of its props. The outlook for its continuance is bleak, the prospects of the Spanish people even bleaker.

## The Nursing Profession

The Government's White Paper on the health services is due to appear at any time now, and the problem of how to obtain an adequate supply of nurses, on which the success of any national health service must largely depend, will again become prominent. The war period has already seen the adoption of a higher and national scale of salaries, which should make nursing an attractive profession financially. It has also seen a survey of the existing nursing manpower of the nation by means of registration; the regulation of the status of the "assistant nurse" by the Nurses Act of 1943; and, finally, an attempt to solve the problem of domestic work in hospitals—the nurses' bugbear—through the regulation of wages and conditions of work for domestic workers. Against this background a campaign for recruitment to the nursing profession has been carried out in recent months, and has achieved a certain measure of success. But so far nothing has been done to reorganise the early stages of a nurse's career, except financially, and to remove the chief obstacle to possible nursing recruits, which is generally known as "the gap"—the gap between the school-leaving age and the earliest age—18—at which most hospitals will accept student nurses. The Nursing Reconstruction Committee, under the chairmanship of Lord Horder, has now produced a report dealing with these two aspects. Its first section, on education and training, emphasises that the student nurse is a student and not a source of cheap labour for the hospital—as she is so often regarded by many hospitals which have had themselves recognised as training-schools solely for this purpose. In accordance with this principle, the Committee recommends that the state should implement the recommendation of the Athlone Committee that state grants should be made to all recognised training hospitals in respect of the national work done in the training of nurses. It also makes the more revolutionary recommendation that student nurses should be required to pay a fee for their training, though it emphasises that no good potential nurse should be debarred from payment by lack of means, which should be made good by liberal maintenance grants and scholarships. There is much to be said in favour of this proposal, especially from a long-term point of view. It would strengthen the probationer's position as pre-eminently that of a student and not as a performer of menial tasks, which would raise the status of nursing as a profession and help to attract a better type of recruit. On the other hand, so much emphasis has been laid on the fact that a nurse is paid during her training that a sudden reversal of the principle might prejudice the recruiting campaign just when nurses are badly needed. It is, therefore, a recommendation that may have to wait some years, until nursing is well established as an attractive profession in the eyes of the public, able to hold its own in competition with other careers and opportunities.

## Finding Recruits

The Nursing Reconstruction Committee nevertheless recognises that a considerable amount of a nurse's training should be practical and that she should not be "a mere peripatetic observer, with no share in the life of the hospital..." But it does not agree with the view that a nurse is primarily a skilled craftsman, who should not be concerned with theory or with the whys and wherefores of treatment. It considers that a good educational background is a first qualification for a recruit, and that her training should be a combination of theory and practice in the wards, as at present, but that the theoretical part should not be carried out, as it so often is at present, in off-duty time. It recommends, therefore, the adoption of the block system. Under this system, student nurses are relieved entirely of their hospital and nursing duties for varying periods during their training, during which they receive the greater part of their theoretical

instruction. From the point of view of hospitals, the block system is uneconomical, and again the Committee urges that the state should be prepared to make grants to meet the financial burden involved.

There can be no real reform in nursing education till each school of nursing has an income independent of the hospital to which it is attached.

But the organisation of the training of a nurse will be largely useless, unless a better type of recruit can be obtained. At present, there is a survival rate of only about 52 per cent, if the numbers successfully passing their final examinations are compared with the original numbers of recruits. Yet it will still not be possible to obtain all the recruits needed from the annual output of 40,000 girls from the secondary schools, though this output should eventually be considerably increased by the new reforms in secondary education. And, in spite of the raising of the school-leaving age to 15, "the gap" will still be there to prevent the intelligent elementary school-girl, who has to start earning money as soon as she leaves school, from taking up nursing as a career. It is here that the Board of Education's proposals for the provision of part-time education on technical and vocational lines for those aged 15 to 18 will be a step forward. But neither this nor the Committee's proposals for practical work in children's nurseries and, later, in health and rehabilitation centres, will entirely meet the problem until there are adequate maintenance grants so that a girl of 15 to 18 need not earn money while she is taking a vocational course. There is, finally, still an obstacle to be overcome in the form of the instinctive prejudice against nursing as a career. The Athlone proposals, the Rushcliffe proposals, and now the Horder proposals should go a long way towards breaking down this prejudice. But the difficulty is that, apart from the financial recommendations, they are dependent on a far larger supply of trained nurses—and ancillary staff—than at present exists. Consequently, the vicious circle—that there can be no major reforms in nursing until there are enough nurses, but that there will not be enough nurses until the major reforms are carried out—still exists. It can, however, gradually be broken

"When  
your  
tobacco  
smokes hot—

take my advice  
and cool it down with Grand Cut"

**Grand Cut**

2 oz. for 5/-

Obviously a pipe of GRAND CUT alone  
smokes even cooler and more slowly

if every opportunity for making a reform is seized, and especially if teachers and schoolgirls alike are brought to regard nursing as a useful, well-paid and interesting career, and not merely as a means of inculcating selflessness and self-sacrifice or as a step towards the higher life.

### Local Men

The Education Bill is only the first definite instalment of the heavy weight, financial and administrative, which many imminent and essential social reforms must throw on local authorities. The local authorities are not reluctant, but they are afraid. They welcome reforms in schooling, health, land planning and the rest; indeed, they clamour for them clear cut and decided. But they are deeply in the dark about how they will be able to do their work or pay their way. Very rightly, the Education Bill states an appointed day and suggests a timetable, though with some "get out" clauses. But for the local authorities it is, to begin with, a question of manpower. Have they the staffs to prepare and apply even the first educational reforms in their areas before April 1st, 1945? Some are already at wits end to find officials to list voters under the new electoral reforms, to draw up housing programmes, to make town or country plans, to revise health and nursing arrangements and to do wartime duties, including ARP and fire-watching. As more definite decisions and instructions on all these and other matters come gradually down from Parliament and Whitehall, these difficulties must multiply. The local authorities are caught at present between the devil and the blue sea. On the one hand they have little inkling of what or when the Government is likely to decide on policy, finance and administration over almost all the field of reform. On the other, they are hard put to do even the duties they know for certain. Earlier in the war there may have been a case for reducing local staffs to skeletons while the staffs of wartime Ministries swelled prodigiously. But now, in the final phase of the war, there is just as much need for competent men and women in sufficient numbers at centres of local administration as there will also be in the planning and preparing sections of Government departments. Unless local government work—never, except very narrowly, a reserved occupation—is now given a high claim on essential manpower, local government may well break down under the weight of work done and orders issued at a higher level.

### Local Money

Not even the recruitment of sufficient staffs, which need not in sum be very numerous, would relieve local authorities of their present anxieties. They have always in front of them, kept there by their councils as well as their consciences, the incalculable rate burden that will be accumulated as reconstruction proceeds. It is easy for an economist to show that, in real terms, reconstruction and social reform can be afforded by the nation. But, with the present distribution of money costs between rates and taxes, and the inequitable and inefficient character of the rating system, it is equally easy for ratepayers to prove that, whatever the nation as a whole may be able to afford, no individual local authority can stand more than a limited increase in the present level of rates. The result of this is that almost every social reform—since practically all must be administered locally, in part at least—is discussed on the basis not of its merits but of its effect on local rates. Up and down the country, local officials are faced with the vigilance of so-called Ratepayers' Associations, bodies with no policy except to keep rates down—and obviously misnamed, since the only legitimate representatives of ratepayers as a whole are the elected councils. The only solution is a radical redistribution of financial burdens between central and local funds.

### Leeway for Colonel Llewellyn

Few Ministers have ever moved into such seemingly smooth and sunny waters as Colonel Llewellyn when he took over the Ministry of Food from Lord Woolton, favourite of all who eat and most who cater. This is a remarkable tribute to rationing and to the Ministry's experts, for almost all foods have been short, and many merely legendary, for a very long time. Even so, there is

work here for a new broom. There is the large task of preparing public opinion and adapting the system of rationing and supply for continued shortage when the war is over and appetites are newly whetted—with the great added claim of starving Europe to be met from world food stocks. More immediately, wartime rationing, *pace* Lord Woolton, could still be bettered. Basic rations are probably arranged as well as may be. Special rations are still not satisfactory. A cold and sickly winter has already shown that old and ailing people need extra supplies of certain foods at least as much as mothers and children. And some outstanding production problems show that the provision of extra food for really heavy workers is still insufficient. The method of distribution is by canteens which cover very many people whose work is not heavy at all and exclude many of those who most need extra food. The prime example is, and always has been, coalmining. It is fantastic that, throughout the coal crisis, with every effort turned, in theory, to maintaining and increasing output per man, differential rations of meat, bacon and fats are still refused to pitmen.

### Miners' Wages

The miners still stand firm on their demands—for more Government control over wartime production and, most of all recently, for more wages. Draft by ballot is necessary because the labour supply of the coal industry cannot be kept up by voluntary recruitment. In the case of tin and iron ore mines, the Ministry of Supply ended the manpower crisis quickly by enforcing higher wages. It is doubtful, however, whether the flat rate increase sought by the miners would solve the problem either of recruitment or production in coalmining. The conditions and atmosphere of the industry are adverse and hostile. Even so, it is not too late for the unions, owners and Government to ask whether, for output's sake, pay should not be still more closely related to effort; at present, even the replacement of the district bonus for target production by a pit bonus is held up. There may even be something to learn from the Soviet wages system. Traditionally, the response of coalminers to increased wages is "heterodox"; above a certain level of earnings they are satisfied not to earn more by harder work. Increased wages should therefore not be granted as a flat rate. First, the ratio between day wages (for "non-productive" jobs) and hewing pay should be weighted much more in favour of the latter, which is more dangerous, less attractive and more productive. Secondly, according to the Soviet example, and contrary to the miners' own proposals, minimum wages should be left unchanged. Increases in time wages should be in the form of a combined attendance and productivity bonus, to form a substantial part of the total pay-package. Thirdly, increases in piece wages should be heavily weighted in favour of output above a certain minimum. Both time and piece wages should be made dependent on minimum attendance and minimum output. Should these fall below it, in the Soviet system, cumulative deductions are introduced. Thus the average wage of a miner would rise and fall substantially with output. These measures, while safeguarding the interests of the workers, might restore the incentives which have been destroyed by wartime policies and conditions. Whether British miners would for a moment consider taking the increase they seek in this way is another matter; but it is a tragedy that the close relation of pay and work, above a standard, has not been better studied by any of those responsible for producing Britain's coal.

### Select Committee

The Commons' Select Committee on National Expenditure, appointed to examine how the huge war outlays are spent, has devoted the first report of its 1943-44 session to the explanation of a number of changes in its own organisation and procedure. Hitherto the Committee, with Sir John Wardlaw-Milne as chairman, has worked through a number of sub-committees which carried out the actual work of investigating expenditure on the various war activities. Because the nature of the subjects calling for inquiry are continuously changing, the Committee decided to appoint a co-ordinating sub-committee to select subjects for investigations, to allocate them to the most appropriate of six investigating sub-committees, and to direct their work. Hitherto, each of the investigating sub-committees has

had one particular field of activity, but by the new and more flexible arrangement this functional delimitation of activities has been removed. The co-ordinating sub-committee consists of Sir John Wardlaw-Milne as chairman, the chairmen of the six investigating sub-committees—Sir Ralph Glyn, Sir Arnold Gridley, Sir George Schuster, Mr Silkin, Sir Herbert Williams and Mr Woodburn—and three other members, Mr Ammon, Sir Adam Maitland and Mr Graham White. Like Sir John Wardlaw-Milne, Sir Adam Maitland has been nominated a member of all sub-committees. The Select Committee, which must not be confused with the Committee of Public Accounts, has done much valuable work in drawing attention to waste and other defects, especially in munition production. Altogether, it has published some 80 reports and, as its 79th report showed, has continued to carry out a large number of special investigations during its session in 1942-43. Although the Committee of Public Accounts has long been a careful watchdog over wasteful expenditure, feared and respected by Government departments, it is concerned with the examination of the expenditure in preceding financial years.

### Shorter Notes

The influenza epidemic is apparently on the decline. The number of deaths in the 126 great towns of England and Wales was 1,109 in the week ended December 18th. This was a decrease of 39 on the previous week, which was itself seven below the peak reached in the 1937 epidemic.

During November, no detention orders were made under Regulation 18B. Fifty-six persons were released, including 20 persons of Italian origin, and on November 30th the total number of persons detained under the Regulation was 299.

## AMERICAN SURVEY

### Congress and the President

The summaries which conventionally follow the adjournment of Congress have seldom been more critical. With few exceptions, the press has censured Congress for its subservience to pressure groups and its "gross callousness to the public welfare." Most commentators are too cautious to echo Walter Lippmann's conclusion that the "past six days have shown conclusively that President Roosevelt's leadership is indispensable," but there is general anticipation of a vigorous Presidential counter-offensive. Reference by the President to the soldier's vote issue suggests that he will not acquiesce without a struggle in the disfranchisement of Servicemen, and it is predicted that he may veto a whole flock of Bills embodying the revolt of Congress against the anti-inflation programme, perhaps even including the Tax Bill. There is a pious hope that Congress may return chastened from its contact with the grass roots. Last summer's recess produced a startling Congressional change of heart on foreign policy, and it is thought that public opinion may work the same conversion on domestic issues. This appears a shade optimistic. Going back to their constituencies, Congressmen are in many cases returning to the fount of those pressure groups which they are castigated for yielding to. A farm Senator, after renewed contacts with his constituents, may well return to Washington more certain than ever of their support on farm prices and the subsidy issue. The session that is just past has undoubtedly provided the President with a magnificent opportunity of carrying his case to the country as the representative of the national, as opposed to sectional, interests. But on domestic concerns, in which they have an immediate interest, the voters themselves may prove less susceptible of persuasion than on grand issues of foreign policy, and in an election year Congress may feel that it can afford to turn a deaf ear to White House strictures.

### Ending the Strikes

Strikes in the steel and railway industries which would have done untold damage to the war effort have been narrowly averted by a combination of conciliation and force. Although President Roosevelt secured the consent of seventeen of the railroad unions to his arbitration, the recalcitrance of three operating unions made it necessary to order the Army to prepare to take over the railways. This was sufficient to persuade all the unions to call off the strike. Meanwhile President Roosevelt has announced his decision on wage increases for the two conciliatory operating unions. They are to have a 5 cents an hour increase to cover overtime pay, in addition to an earlier increase of 4 cents an hour, making a total of 9 cents an hour, and they have gained the

right to an annual week's holiday with pay. The non-operating unions have secured the agreement of the railway managements to overtime beyond 40, rather than 48, hours weekly. As for steel, the War Labour Board has been persuaded by the President to reverse its stand on making any pay increase retroactive, and the steel workers have returned to their jobs at the behest of President Murray, who can now boast that he obtained for them the same concessions that John L. Lewis secured for the coalminers. It was of the first importance that both these strikes should be averted, for either could have had a disastrous effect upon the American, and indeed the whole United Nations' war effort. Only second to this consideration is the effect which the President's solutions will have upon the stabilisation programmes. The seizure of the railways, and references to the applicability of the anti-strike law cannot conceal the fact that concessions were wrested from the Government under pressure and that Mr Roosevelt was unable to give unqualified support to earlier decisions of his own agencies, the War Labour Board and the Stabilisation Office. It is unfortunate that, if the concessions were inevitable, and the failure to pay overtime to railwaymen did indeed constitute such an obvious injustice, a more conciliatory attitude was not adopted earlier. The unions can hardly avoid feeling that their just grievances were only remedied at the pistol-point, and there has been considerable exacerbation of public feeling, which at first was less critical of the railwaymen than it had been of the miners. This renewed demonstration of Mr Roosevelt's indispensability as a negotiator, and the failure of the appropriate agencies to reach a solution under law, is the cause of some dissatisfaction, particularly in anti-Administration circles.

### End of the New Deal?

A recent visitor to the White House has reported that the President would like to see the name "The New Deal" abandoned in favour of some such phrase as "Win the War and Peace," and President Roosevelt has drawn a sharp contrast between the doctor needed to cure the nation's peacetime ills and the surgeon called in to mend the broken bones of war. There are disillusioned liberals who consider this only a belated recognition of the fact that the President has long since thrown his social programme overboard in order to win the war. In some respects this appears to be true, though not in all. But it is unlikely that after the war the nation will embark on a career of perpetual good health. The New Deal is dormant, not dead. The best testimony to the impression the New Deal has made on American political thinking is the violence of the attacks still made, not only on its author, but on those Republicans who sympathise with his social aims. Nobody bothers to kick a dead donkey or a dead Deal. Thinking Republicans, as well as Democrats, know that it will need

only a post-war slump to revive the demand of the under-dog for a return to the progressive policies of the thirties. Much, of course, will depend upon which party is in power when the threat of post-war depression materialises, as it inevitably will. There will be a natural tendency to blame those who are in power in the next bout of hard times, and if this proves to be Mr Roosevelt, or a Democrat of his choosing, then the New Deal, as such, may never be resurrected under its own name, although the Republicans would probably have to invent something like it. But if it is a Republican regime that is caught in the blizzard, there would be an overwhelming demand for a return to Roosevelt methods. Like Mr Lloyd George in the last war, the President has been forced to abandon social reform for a policy of winning the war and peace. Both leaders made many concessions to the Right. Like Mr Lloyd George, Mr Roosevelt is bewailed as the lost leader. But Mr Roosevelt, unlike Mr Lloyd George, is not the prisoner of the Conservatives and has not broken his party. So long as he lives he will exercise an unchallenged supremacy in the Democratic Party, and when the war is over he will be free, if he chooses, to forge it anew as an instrument of social reform. Nothing in his Fabian strategy during the war makes that impossible. The least that can be said is that the new view of governmental responsibilities and opportunities embodied in the early legislation of the Roosevelt Administration has become a permanent part of American political thinking. It can never be wholly erased; it may be revived sooner than the Old Guard—of both parties—likes to believe.

### Republican Futures

At a time when the Republicans are jubilantly counting the unhatched chickens of 1944, a new study of "American Political Parties" recently published in the United States by Dr Wilfred E. Binkley, urges caution on the revellers. Dr Binkley raises the question whether one more Republican victory may not be the party's last, the rally of the patient before the end. The argument, which at first sight looks preposterous, in view of the Republican cast of the political scene for eighty years past, and Republican gains in the last elections, is based on a close analysis of recent returns. Democratic victories in the wards have been notably correlated with average rents paid, and therefore with income. There are no signs as yet that the Republicans, once conspicuously a labour party, have been able—or indeed have seriously tried—to win back the lower-income groups. The facts of the birth-rate handicap the Republicans in a country where party loyalty looms large. As Dr Binkley points out, there are more Republican than Democratic families in the United States, but the latter are bigger.

The older stocks inhabiting the poorer soils of the back country and traditionally inclined to Democracy... are scarcely less prolific than the newer stocks of the great cities. The New England Irish long ago overwhelmed the native Yankees by big families rather than by continuous immigration. "Out of Ritzy Humboldt Park they get two voters to a family," said a Polish ward politician of Buffalo. "I get six out of my house. I got neighbours who gave me eight."

It is Dr Binkley's contention that the Republicans have lost their own most prolific ethnic group, the negroes, whose loyalty was too long taken for granted. The results of the recent Kentucky election make this less than certain, but a striking statement by the editor of one of the largest Negro papers in Pennsylvania in 1932 may yet hold good. Supporting Mr Roosevelt, he said:

My friends, go turn Lincoln's picture to the wall. That debt has been paid in full.

The comparative weakness of the Republicans with young voters is another straw in the wind. Dr Binkley argues, further, that the Republicans have failed to build up a combination of group interests as a substitute for the earlier geographical basis of politics, and that in recent years their leadership has been of a kind suitable to a static and prosperous society, rather than the dynamic reality. They have, consequently, become purely a party of opposition. It is the book's thesis that, if the Republicans wish to survive, they must outbid the Democrats for lower and middle-class support. This is the line Mr Willie has espoused with his call for a New Deal within the party. Under the influence of war prosperity and war irritations

the Old Guard may be able to flout his advice. The post-war period may drive the moral home.

### Planning for Jobs

A businessmen's organisation to save the system of free enterprise by good works is now in full swing: The Committee for Economic Development, with a membership including some of the greatest names in American big business, is making an ambitious effort to forestall Government action on unemployment by proving that Business, unaided, can provide the jobs. The lesson of the thirties has not been lost. The cornerstone of CED thinking is the fundamental necessity of providing work, and hence a high level of productivity, if business is to face and survive the life and death test of the post-war period. As one of its regional managers has said:

Unless business provides jobs, we are going to have some form of collectivism. We want a completely competitive business economy, with no restrictions on competition.

The Committee has now been in existence for some time, and from the elaborate and even glossy publicity it has issued, an outline of the methods by which it hopes to avoid post-war unemployment and save business from government regulation is now beginning to take shape. The Committee has established organisations, not only in regions corresponding to the twelve Federal Reserve districts, but in each state and hundreds of smaller communities. Case studies are being distributed illustrating what is being done by individual companies and business groups in cities like Peoria (Illinois) and Memphis (Tennessee) to estimate the probable demand for work after the war and outline ways in which production can be increased to provide the jobs necessary to avoid the disillusioning experience with doles and bread-lines. Businessmen are urged to set their sights high, to keep in mind war-time levels of national income rather than the relatively low pre-war income. Each community is being urged to look after its own, to absorb the total local labour force, enlarged as this well may be by the normal increase, the retention of some war workers not normally employed, and the returned Servicemen. There may be some reasonable doubt about whether this approach can solve an income-maintenance problem of the magnitude which the United States may face, and whether even if successful it will bring about the most effective use of the nation's labour force. There are hardened cynics, indeed, who suggest that some of the support of the Committee comes from Roosevelt-haters who are more impressed by its potentialities as a political instrument than by its job-creating powers. But many thousands of businessmen are sincere in their desire to expand production and employment. As the Committee's Chairman has said, "When you get a businessman into a tight enough corner he reluctantly starts to think his way out." The rapid progress of the Committee is a sign that this desirable process has begun, although it is too soon to say where it will end.

### Global Suckers

The spirit of the Five Senators goes marching on. While disclaiming any thought of being anti-British, Senator Ralph Brewster, of Maine, one of the ablest of the party, in a recent article in *Collier's Weekly*, brings out, fully orchestrated, the grand theme of the tourists that "The British are out-maneuvring and out-trading us." He goes on to say:

If, on the political and economic war fronts, British interests are better looked after than ours, don't blame the British. Blame us for being global suckers. We have practised hard-headedness at home. Our Government has practised soft-headedness abroad.

Senator Brewster insists that he is hammering this home purely in order to avoid disillusionment with the British after the war. But aside from the facts of the case—which might be interpreted very differently—the fact remains that this reiterated argument in journals of wide circulation that Britain is outwitting simple Uncle Sam is making many honest Americans exceedingly suspicious of everything British. A climate of public opinion is being created which is far from propitious to the delicate and difficult post-war settlements. It will be hard indeed for American political leaders and officials to negotiate any arrangements if the public to which they are responsible is firmly convinced that the British will get the best of every bargain.

## THE WORLD OVERSEAS

### Protection for Minorities

(By a Correspondent)

IT is a mere truism that the political dissatisfaction of the European minorities provided in the past and may again provide in the future, a powerful explosive capable, in combination with other factors, of wrecking any peace settlement. At every stage of his conquest of Europe, Hitler was able to use this explosive material to his advantage. He exploited the grievances of the German and Slovak minorities in order to wreck Czechoslovakia in 1938. In 1939, the Polish Republic succumbed, not only to the impact of Hitler's panzer divisions, but also to the hostility of its own German and Ukrainian minorities. In his campaigns in Western Europe, Hitler could not exploit antagonisms of the same order. But when his armies wheeled back to the south and south-east of Europe, they could again reap a rich harvest sown in old feuds. The Croats and the Bulgarian-Macedonians were played off against the Serbs, the Hungarians against the Rumanians. After the occupation of Eastern Poland in 1941, the Ukrainians, Byelo-Russians and Lithuanians were used against the Poles.

In the first years of this war, a partly organised and partly spasmodic vengeance was taken by minorities throughout Europe. The crumbling of the states set up at Versailles was the signal for revenge. Serbs were slaughtered by Croat Ustashe, Poles by Ukrainians and Lithuanians, Roumanians by Hungarians, Russians by Roumanians, and Jews—themselves a minority—by each and all of them, as well as by the Germans. This outbreak of vengeance might not have been possible had it not been prepared by the oppressive policies of the majorities during the inter-war period. In the twenties and in the early thirties, the minorities everywhere looked for protection to the League of Nations. In domestic politics, the leaders of the minorities coalesced with the liberal and Left parties of the majorities. But the protection which the League of Nations was able to give them was very inadequate. Indeed, not infrequently, Great Powers used their influence at Geneva to shield oppressing majorities against the protests of their victims. Croats and Macedonians found their petitions to the League shelved, because French diplomacy was anxious to avoid any steps that might hurt its Pan-Serb allies. Ukrainian protests against punitive expeditions by the Polish police were suppressed, or their consideration was delayed, with the support of Japan, seeking in return Polish support in the Manchurian dispute. When finally, in 1934, Colonel Beck unilaterally denounced the Treaty on Minorities, the League was in no position to counter the challenge.

The tide of nationalism, which after the Great Depression swept nearly all the countries in Central, Eastern and Southern Europe, powerfully affected the political outlook of the minorities. In their ranks, too, extreme and terrorist forms of nationalism for a time gained the upper hand. The blocs formed between the minorities and the liberal and Left parties of the majorities woke up. The ground was prepared for more or less open alliances between some sections of the resentful minorities and Nazism and Fascism.

### Minorities in Revolt

But now, in the course of this war, the ephemeral nature of that alliance has become obvious. Some of the minorities have turned very sharply against the Germans. The Croats and the Slovenes form the bulk of General Tito's partisans; Pavelitch's Ustashe are now an isolated fraction. The Ukrainian nationalists in Poland, who in their fight against both the Russians and the Poles looked for help to Berlin, have now entered into the struggle against the Germans. The Polish-Ukrainian auxiliary police, which was formed and armed by the Germans, has now en masse joined the pro-Soviet guerrillas in Eastern Poland. But even in the struggle against the Germans the old antagon-

isms reassert themselves. The Croats still hate the Serbs; and the Ukrainians fight against Poles as well as Germans.

The dangers with which the present position is fraught are only too clear. The victory of the Allies may again become the signal for bitter revenge. This time it may be the revenge of majorities on the disloyal minorities. The mood which prevails among many European peoples threatens to create a vicious circle of revenge and counter-revenge. The lesson which most continental politicians have apparently drawn from their experience in the inter-war period is that, in future, the screws on minorities must be tightened. On the twenty-fifth anniversary of Czechoslovakia, Dr Benes frankly stated that a rebuilt Czechoslovakia will grant the Slovaks less autonomy than before. The evolution of Yugoslav official policy from reluctant semi-federalism to undisguised pan-Serbian centralisation reflects the same trend. Similarly, many Poles still think of their future relations with the Ukrainians and the White Russians in terms of old "pacifications." It is significant that no representatives of nationalities which accounted for nearly one-third of Poland's pre-war population have been included in the Polish Government or in the Polish National Council.

The problem has, in addition, been gravely complicated by recent changes in the economic background. Forced transfers of property and downright expropriations have been carried out on a very large scale in most occupied and in many satellite countries. In very many cases, the beneficiaries have been not only—and not even mainly—Germans. Croats took possession of the property of Serbs who had been expelled from Croatia. Hungarians enriched themselves at the expense of Roumanians in Transylvania. While Germans grabbed the estates of Poles, Poles inherited the houses and shops of slaughtered or deported Jews. "Aryanisation," in particular, has radically changed the economic structure of Eastern Europe, because of the prominent rôle which the Jews used to play in East European trade. In Poland and in the Baltic states, thousands and tens of thousands of Poles and Balts have sprung into the economic gaps created by the massacre of Jews. Everywhere, new and powerful vested interests have arisen which will stubbornly oppose or obstruct every attempt at restitution.

### Restitution of Property

Restitution of stolen property will, of course, have to be enforced as an elementary recognition of justice. But it will hardly be possible to apply the principle of restitution without any exceptions. In some instances, the substance of the expropriated capital may be destroyed or consumed, when its rightful owner reappears to claim it. In other cases, restitution of large-scale productive property, such as, say, mines or plant, to impoverished owners without sufficient capital to work them may entail industrial stagnation and unemployment—a danger which induces some Allied Governments to plan along the lines of some degree of state control or state ownership. As for the former Jewish property, few of the owners are likely to survive to put in a claim. The extent of restitution itself will also depend on the social climate in each of the liberated countries. If the war is followed by a strong movement for land reform in Eastern and Southern Europe—as it probably will be—it will be very difficult to restore semi-feudal estates to their former owners no matter whether the land has in the meantime been distributed to peasants of the same nationality or of some other one.

Whatever the social and political conditions, a programme for the restitution of property must be agreed upon. Small and medium-sized property should be unconditionally and

Immediately restored to the rightful owners. In the case of larger properties, where capital is required to secure use and employment, different methods may be needed; but property rights should be fully recognised, and compensated accordingly. A special demand is that such Jews as may survive should be given back their property, subject only to the general conditions imposed on the restitution of property to non-Jews. This demand will almost certainly meet with strong opposition from those who have, in the meantime, "inherited" Jewish houses or shops. The attitude of the various exiled Governments is by no means uniform. The Czechs, for instance, leave no doubt about their intention to do justice to Jews. Polish policy remains undefined; and very influential elements in the Polish Government still persist in Colonel Beck's old search for a colonial territory to which the remnants of the Jews from Poland can be transferred.

### Collective Security

These are only some of the minority issues which emerge from the fog of war. They will lead to the conclusion that the need for some arrangements for the protection of the European minorities will be much more pressing this time than it was after the last war. The protection of minorities under the Versailles settlement was a failure. What guarantee is there that new arrangements would work better? The "failure" of the old Minority Treaties was, however, not so definite or absolute as it is often suggested. In spite of the weakness of the League of Nations, the mere existence of the Treaties and the opportunity of minorities to put their grievances before the Council of the League was a fairly substantial brake upon oppressive policies. The position might have been far worse without the formal guarantees established at Versailles. The eventual failure of those guarantees was an inevitable by-product of the general crumbling of the whole structure of the League. Any new protective arrangements for the minorities will, therefore, be effective to the same extent as the new framework of international security is effective.

An objection raised in 1919 and later was that Minority Treaties are an "intolerable infringement" on the sovereignty of national states. This objection applies, however, to the setting up of any international authority, economic or political. Finally, there is the objection that the small states cannot accept any obligations which are not at the same time accepted by the Great Powers. In the past, this meant that, whenever a minority lodged a petition with the League of Nations, the Serb, the Roumanian or the Polish press resorted, say, to "revelations" about British rule in India.

The Minority Treaties of 1919 were a British invention. Over a number of years they helped to humanise the relations between the different ethnic, national and religious groups in Europe. They also maintained and strengthened the reputation of Britain as the guardian of civil liberties. The time has, perhaps, not yet come to elaborate the specific forms which the protection of minorities ought to take. Such forms are secondary to the general principles of the peace settlement; and they can only be evolved from them. But it is certainly not too early to approach the problem, and to re-state the right of the European minorities to international protection.

## Island Outpost

[BY A CORRESPONDENT]

THE 716 square miles of Mauritius contain a relatively dense population, estimated in 1938 at 415,462 (including a small number on the surrounding islands), of whom 268,885 were Indians and the remainder Africans, Chinese, Europeans and of mixed blood. But these people comprise, according to Major Orde Browne in his report on labour conditions in the colony,

a poorly paid, undernourished, sickly population, capable only of such a limited output of work that an increase of wages offers little promise of improved performance.

This indictment of British colonial rule, coming from the Labour Adviser to the Colonial Office, shows that Mauritius is another of those colonial distressed areas of which the British public remains in ignorance until they are forced on its attention by the outbreak of labour disturbances and riots.

Nor are the basic causes of Mauritian troubles much different from those in, say, the West Indies. The island

suffers from the usual effects of a single crop economy; sugar represents about 96 per cent of the total exports, and the plains are now almost entirely a vast sugar plantation, affecting the lives of every person on the island and providing employment, directly or indirectly, for the majority. In 1940, of 182,041 cultivated acres, 150,845 were under sugar cane, and another 20,000 acres were used for aloe production, leaving only a very small acreage devoted to food production. Moreover, the dominance of sugar extends from the economic into the political life of the island. It is the sugar interests which discuss the Colony's affairs in the Legislative Council. A high property qualification restricts the electorate to about 10,000 in a population approaching half a million. There has been no general election for a number of years in spite of a popular demand for one; yet it is difficult to see that the people would benefit if an election were held, unless some constitutional reform and widening of the franchise were carried out first.

### Widespread Unemployment

The characteristics of sugar production are such that full employment can exist only during the harvest period, which lasts approximately four months; at other times, unemployment is widespread. Nor does this seasonal variation affect only the agricultural worker, for the workers in allied industries, especially the transport services, are likewise affected. Again, the droughts and cyclones which periodically visit the island, often with disastrous results to the sugar crop, add a further hazard. Secondary industries scarcely exist except in an experimental form, apart from those auxiliary to the sugar industry and consequently subject to the same fluctuations. Tea, tobacco, the manufacture of aloe fibre and of matches provide regular employment unaffected by seasonal variations, but their demand for labour is too small appreciably to diminish unemployment among the workers on the sugar estates. In the towns, before the extraordinary demands of the present time upon labour resources, there was much unemployment among the artisan and clerical classes. The evils of excessive apprenticeship had appeared, the employers frequently discharging their "apprentices" after a number of years of very low wages. Moreover, the only provision made for the unemployed is a system of poor relief. A Social Insurance Committee, reporting in 1940, made far-reaching proposals which, however, cannot be brought into operation until essential statistical information concerning the life of the colony is available.

Wage rates, as Major Orde Browne found, are low. He states in his report that in the sugar industry "able-bodied" labourers receive 66 cents for a day of eight hours' work during the inter-crop season and Rs.1.25 during the crop season. Less efficient workers receive 50 cents for a seven-hour day. The eight-hour day has only recently been introduced. Formerly, labourers had to work for long hours on the sugar estates during the crop season with no overtime payment at all, and even to-day the hourly rate is not increased for time worked over eight hours, the argument being that the present purchase price of sugar under the Government agreement makes such extra labour costs intolerable for the industry.

Malaria, hookworm, avitaminosis and anaemia are very prevalent. All these should be dealt with on a preventive rather than curative basis, but the anti-malaria campaign in particular has been seriously handicapped in the past by the opposition of owners of land adjoining mosquito-breeding areas to clearance schemes affecting their property. There is a widespread ignorance in the island of proper sanitary arrangements, and there has as yet been no proper education campaign by the Health Department. Hopes expressed in the colony that a grant will be made after the war under the Colonial Development and Welfare Act, to enable malaria and hookworm to be finally eradicated, nurses and midwives to be trained, and an improved water supply to be provided, will be disappointed unless Mauritius reforms its trade union legislation to bring it up to the minimum required by the Act.

The majority of manual workers are at present particularly susceptible to disease, because their meagre diet, based upon over-polished rice, has led to almost universal under-nourishment, particularly since 1937, when employers ceased to issue basic rations as part of wages. Sugar dominates agricultural production to such an extent that almost the whole of the food supply has to be imported. Yet a considerable proportion could be produced locally with much advantage to health and finance. At present, the cumulative effect of disease, malnutrition and bad environment generally means that, in spite of the low wage rates, the island's manual

workers are expensive. Their output is now considerably smaller than it was twenty-five or thirty years ago, and many find it physically impossible to perform more than six hours' work a day for five days a week.

### Labour Troubles

Industrial relations have been steadily worsening. Although the organisation of trade unions is legally possible, employers have victimised union members, and the Government appears to have assisted the employers in their resistance to combination. Demands for higher wages have met with refusal. At the end of September, 1943, a series of strikes culminated in riots which, suppressed by the police with military help, resulted in the death of three persons and 33 other casualties. Stimulated, perhaps, by these events, and by the recommendations of the Orde Browne Report, the Government has now appointed a Conciliation Board, a Minimum Wages Board and a Labour Advisory Board. But for the relief of post-war unemployment, a problem demanding immediate attention, there appear to be no plans. Since the war there has been something approaching a labour shortage in the colony, and wages have risen, although they have not by any means kept pace with the rising cost of living. Rice is now unobtainable, and the prices of other foods are at unprecedented levels. The Government, by means of price control and the subsidy of basic foodstuffs such as flour, has gone some way towards the prevention of distress. Nevertheless, the possibility of famine conditions in Mauritius in the not distant future is very real, particularly as the new and unfamiliar foodstuffs have not met with general approval among a population conservative in its diet, in spite of energetic efforts on the part of the Government to popularise them.

These problems could more easily have been solved had the possibilities of a local food supply been explored earlier. Climate and soil are favourable for the production of food crops in sufficient quantities to satisfy local demand. It is essential, too, to create some alternative means of employment which cannot be provided by the very limited secondary industries. Unfortunately, conditions are not suitable for rice production, but maize, soya beans, potatoes and a greater amount of fruit could be grown to take the place of imported foodstuffs. Local fishing might be encouraged, to provide fresh fish instead of the imported salt and tinned varieties. New irrigation schemes, though not yet nearing completion, are making large areas of land available in the north-west of the island, which, if the one-crop outlook can be changed, will facilitate subsistence agriculture. A determined educational campaign would be needed to break down the prejudice in favour of a monotonous rice diet. Once this is done, the effect upon health and upon the island's economy would be very beneficial. A combination of subsistence agriculture and periodical labour on the sugar estates during the crop season would provide one solution of the growing unemployment problem, while at the same time it would secure the colony's main industry against an increased burden of labour costs which it cannot easily bear.

## Sweden's Economic Problems

[BY A CORRESPONDENT]

December 21st

At the end of October, Germany withdrew, for the second time this year, permission for Swedish ships to use the Skagerrak in the limited overseas trade to which both Great Britain and Germany had consented. This year's period for overseas trade lasted only from May 25th to the end of October, and the supplies of cotton, wool, hides, oilseeds, petrol and coffee which have reached Sweden must have been small. The seasonal decline of industrial activity has been accentuated this autumn. The index of industrial production began to fall in the summer, at a time when there was a special call-up for military service. During the autumn, certain non-recurrent work of the defence programme ended which, together with the release of soldiers, caused the unemployed some difficulty in finding new work.

The unemployment figures, expressed as percentages of

## DAILY PAPER

THE growing shortage of newsprint from overseas has caused your daily paper to shrink. Compare the one you buy today with the same paper of 1940, let alone 1939. The difference in size and bulk is astonishing. The Press as well as the individual must save every scrap of paper. The fact that you are still well served with papers and magazines is a tribute to the efficiency of the newspaper industry and to the paper-makers. They have shown how with care and resource a little may be made to go a very long way. But behind their efforts stands the skill of the research chemist and the strength of the British chemical industry. The chemist has not only improved the yield of paper from such normal raw material as is still available, but has discovered highly satisfactory methods of recovering new paper from old. The greatly increased use of re-fashioned paper brings with it a host of subsidiary problems, such as the provision of suitable printing-inks, sizing material, and "loaders." These are all matters demanding skilled chemical research, often of a surprisingly intricate kind. Colour-printing sets even stiffer tasks, which the British chemical industry has solved by the production of remarkable new pigments with a wide flexibility. Shortage of tin and other metals needed for printers' type is another poser for the chemist. You can rely upon him finding a satisfactory answer to this as to the other problems inseparable from the regular appearance of your daily paper in time of War.

No. 3 in the "Services of an Industry" series  
issued by

IMPERIAL CHEMICAL INDUSTRIES LTD.

the membership of trade unions, reached their lowest point in August, with 3.9 per cent, against 4.0 per cent in August, 1942, and 7.5 per cent in August, 1941. The monthly average was 11.8 per cent in 1940, 11.3 per cent in 1941 and 7.5 per cent in 1942, which indicates that the armament and substitute production programme did not reach its full extent before 1942. During the spring and summer of 1943, however, Sweden was obviously more concerned with the period of economic transition after the war. A plan for this period of transition has been set up for discussing fully employment policy, the stabilisation of the currency, import and export trade, the building industry, and so on. The Government has decided to take part in relief measures, and a kind of lend-lease policy for the northern countries has been suggested.

After the fall of France, Sweden, whose exports amounted to roughly one-quarter of its industrial production, was cut off from overseas countries and became, for the maintenance of its industry, dependent on German supplies of coal and steel. The country's large cellulose exports dwindled and are at present probably less than 50 per cent of the pre-war amount. The decline in the export of iron ore was less marked and was as follows:—

|      | (in '000 tons) |      |       |
|------|----------------|------|-------|
| 1939 | 13,650         | 1941 | 9,540 |
| 1940 | 10,140         | 1942 | 8,630 |

Practically the whole of these exports have been shipped to Germany since 1940. The Graengesberg concern, which accounts for the greater part of them, has lost during the war period 14 ships of a total of 111,000 gross tons. One of the three large loading quays at Narvik has been fully repaired, but the greater part of the exports seem to be shipped from Lulea, the northern port in the Gulf of Bothnia.

Sweden, like other countries, has been trying to utilise and develop indigenous resources regardless of the cost of production. Hydro-electric power and the forests presented an opportunity of replacing imported commodities. The generation of hydro-electric power increased by 30 per cent from 1939 to 1942 and will be almost 150 per cent of

## Vitamins in chocolate for liberated Europe

The British Government, having examined all the ways in which sufficient vitamins could be provided to the under-nourished children of liberated Europe, have arrived at the conclusion—as Rowntrees did in 1938—that chocolate offers one of the best vehicles for carrying added vitamins. In chocolate, the vitamins retain practically all their potency.

Before the war, Rowntrees pioneered the addition of vitamins to cocoa and chocolate. Their object was to enhance the protective value of these already highly nutritious foods.

Today, when the Allied Governments are faced with the enormous problem of rehabilitating each occupied territory as it is freed, Rowntree's experience of fortifying cocoa and chocolate with vitamins on a large scale is proving of great value. When the war is won, this experience will again be used for the benefit of the British public.

**ROWNTREES**

the 1939 output at the end of 1944. Great improvements have been made in the industrial utilisation of wood, which is used for making cellulose for feed, generator fuel and cellwool, and from the wood tar produced by carbonisation a satisfactory lubricant has been developed. At present, 73,000 motor vehicles are run on generator gas, out of a total of 250,000 motor vehicles on the road before the war. In addition, 10,000 tractors have been converted to the use of generator gas. The charcoal for generators is now being produced on an industrial scale, and the period of experiment, during which small manufacturers supplied the market with very varied models of generators, has passed.

The most important expansion has, however, been achieved in the machine building industry because of the extensive rearmament programme. This made it necessary for the iron and steel industry and the base metal and light metal production to be expanded at the same time. The Boliden-Gruben concern hopes to reach in 1943 a copper output amounting to 15,000 tons, against 7,000 tons in 1939. Low grade manganese ore is mined, and lead and zinc production has also been increased. Yet copper output is still less than 50 per cent of pre-war consumption. The aluminium capacity will reach some 4,000 tons. It is produced from andalusite, which requires a more difficult working process than the imported bauxite. Great difficulties have been encountered in the production of synthetic rubber, but a small plant will soon begin operations. Supplies of civilian commodities seem to have been satisfactory during the first two years of the war. Standardisation of clothing and shoes, thought to be sufficient at first, was finally made more effective by the rationing of clothing in January, 1942, and of footwear in April, 1943.

### Prices, Wages and Rations

From the beginning of the war to the middle of 1943, the wholesale price index increased by 80 per cent and the cost of living index by 43 per cent. There was, however, no corresponding increase in wages, which were stopped when a price stop was introduced. Several methods had been tried to arrest the rise in prices. First, there was a system of price equalisation. In November, 1942, a temporary price stop was decreed, which excluded foodstuffs and a number of manufactured articles. The price stop is now, however, comprehensive, and the price indices have been practically stable since the beginning of 1943. The inevitable reduction in the standard of living is more clearly shown in the food rations, which are comparatively small for the normal consumer, although the categories of heavy workers are comparatively well supplied. The greatest hardship seems to be the shortage of coffee, which is even more important in the national diet than tea in Great Britain.

Sweden's wartime trade relations are based on trade with Germany. Before the war, Germany supplied roughly one-fifth of Sweden's imports, and one-sixth of Swedish exports went to Germany. Detailed figures for the first quarter of 1943 show that Germany supplied 53.4 per cent of imports and took 37.8 per cent of exports. The value of the foreign trade was as follows:—

|                 | (In million Kronor) | Imports | Exports |
|-----------------|---------------------|---------|---------|
| 1939            | 2,498               | 1,889   |         |
| 1940            | 1,999               | 1,337   |         |
| 1941            | 1,672               | 1,345   |         |
| 1942            | 1,770               | 1,313   |         |
| 1943 (6 months) | 883                 | 589.5   |         |

On the basis of the price indices, the figures suggest that the volume of Sweden's foreign trade is perhaps only half what it was before the war. The decline in imports continued to the end of 1942. During the first six months of 1943, there was an increase because of greater German deliveries. There seems to be no doubt that Germany made every endeavour to supply the promised quantities of coal, coke and steel. During these first six months, Sweden imported 2.1 million tons of coal and coke, against 1.2 million tons during the same period of 1942. Five million tons have been promised for the whole year. Steel, potash and sodium deliveries were also higher than in 1942, and small quantities of Buna rubber have been promised. As long as Sweden is cut off from overseas sources, German supplies are absolutely necessary for Swedish industries, the armament industries included. Germany, on the other hand, depends on Swedish iron ore and specialised industrial manufactures. Both sides have, therefore, been trying to maintain their trade with the other.

# THE BUSINESS WORLD

## Government in the City

THE growth of financial controls during the war and the probability of their extension, for a time at least, into the post-war period puts the problem of authority in the City in an altogether new light. Until 1939 the City and its financial markets were, in large degree, left to run themselves. Under the guidance and leadership of the Bank of England this self-government achieved admirable cohesion. The tradition of the City was one of discipline achieved by voluntary co-operation, and the advice of the authorities seldom went beyond the bounds of moral suasion. That was true even of the period of the 1914-18 war, and remained true of the 1932-39 period during which the first experiments in financial control were made. The ban on foreign issues imposed at various periods before 1939 and the control of new trustee loans were achieved with no legal sanctions and purely through the voluntary co-operation of the responsible markets and institutions of the City. The domination of Bank rate over the whole interest-rate structure of this country was in no way the product of legislative enactment; but it was none the less effective for that. This wholly informal method of control was admirably suited to the days of *laissez faire*. The slight wagging of a monitory finger here—a hint there—in serious crises, the discreet and dignified passing of the hat to save some great name—those were initiatives which the Bank of England took admirably and for which no better instrument or technique could have been devised.

But if the controls are to become more formal and to demand a stream of directives, if advice is for any length of time to give way to dictation, this informal representation of "authority" in the City may be found wanting. There are indications that the adaptation of the old mechanism to the situation created by wartime financial controls has already created some friction. In two instances which directly affect the Stock Exchange—the retention of minimum prices for gilt-edged securities and the withholding of permission to deal in securities whose issue has been authorised—a strong body of opinion in that market feels that its views have not received adequate hearing from the ultimate source of executive authority at the Treasury. Without going into the pros and cons of each case, it can be said that the Stock Exchange view on such issues, which is that of maintaining a real market in the securities in which it deals, may at some points conflict both with the banking view, which is primarily concerned with the valuation of assets and of the collateral securing assets, and also with the Treasury view, which is "no competition with Government loans."

It is, of course, open to any individual or organisation to approach the Chancellor of the Exchequer direct on any matter of public concern. But for any institution in the City to make such direct approach to the Government without informing the Bank of England and without prior discussion with that institution would be regarded both by the Bank and by the Treasury as indecorous, and would for that reason prejudice the case of the plaintiff. In any case, such direct approach would merely change the order of procedure. The Treasury would immediately send the whole matter back to its principal financial adviser, the Bank of England. The Bank has, from the moment it became conscious of its rôle and responsibilities as a central bank, been the recognised channel of approach and communication between the Government and the financial markets. There are many weighty arguments in favour of this state of affairs. The interests of tidiness are best served by it; it makes for cohesion in policy and execution which might otherwise be jeopardised; it has even been argued that the interests of the City will be best served when pleaded by the Bank, which speaks in the tones to which the Treasury is accustomed, and that the rougher merchants and adventurers might get short shrift if they presented their case themselves.

In matters pertaining to currency and banking there can be no serious quarrel with this rôle of the Bank of England and even with the vesting of considerable authority in its hands. It is when the Bank pretends to act as the voice of authority in matters that lie rather outside the direct sphere of currency and credit that difficulties may appear. All will be well so long as the Bank, in such matters as concern the Stock Exchange, investment trusts, issuing houses or insurance companies, acts as a real go-between and does not set itself up as tribunal. On these matters the Bank of England may be extremely well advised, but it will not have the direct knowledge that comes of day-to-day experience of the markets concerned. Even on questions of routine joint-stock banking, the Bank of England may have no more than a very well-placed outsider's view and in discussions of the relevant problems with the Treasury direct participation of the joint-stock banks might be valuable.

The technique of a new method of contact between the Government and the financial markets of the City is already being worked out. The Foreign Transactions Advisory Committee was the prototype of the new mechanism—a committee on which the Bank of England, the Stock Exchange, the joint-stock banks, the investment trusts and industry have from its inception been represented. The Committee changed its functions with the beginning of the war and became known as the Capital Issues Committee. It is now the recognised instrument for authorising capital issues otherwise banned by the Defence Regulations and by agreement with the Stock Exchange, it also gives rulings on such matters as "permission to deal." Its independent chairman, Lord Kennet, may be regarded as the spokesman for the Treasury, which, otherwise, is not represented on it. This committee has perhaps suffered from the fact that from its inception it has been necessarily a negative instrument. Its duty has been to say "No" in all cases of doubt. Before the war it was "No" to foreign issues or repatriations of shares from abroad which would strain an already taxed sterling exchange position; since the war it has been "No" to domestic issues which might conceivably compete with Government loans. This negative bias has inevitably coloured the approach of its members to all problems put before it, and the results of its deliberations should not, therefore, be regarded as a typical product of the new technique.

A rather more constructive example is the standing foreign exchange committee which devises the various

orders and notices through which the control of foreign exchange is operated. The broad lines of exchange policy are settled between the Treasury and the Bank of England, but this committee, on which the Treasury, the Bank and the joint-stock banks are represented, translates these broad directives into detailed instructions to banks. It has done excellent work, and has proved a valuable and essential link between the ultimate control authorities and the exchange bankers, whose task it is to apply the regulations, and to see to it that they interfere as little as possible with genuine trade requirements. Until now the committee has been working within the somewhat restrictive and negative framework of war-time controls. After the war, when the time for exchange control relaxations arrives, the scope for its activities should be widely extended, and its experience of co-operative working between Treasury officials and representatives of the Bank and of the exchange market should stand it in very good stead.

This device of a joint committee may well be extended after the war. One possible direction has already been hinted at, namely, the establishment of more direct contact between the Treasury and the joint-stock banks. If some control of investment is to remain after the war—and it is almost certain to be extended to the transition years—it will perforce have to apply to the advance policy of the banks. At present the banks work to an essential negative formula: no loans except those that directly help the war effort. With the coming of peace the formula will become positive and immensely complicated. The objective will no longer be simple; the priority ranking will call for constant review and interpretation, for consideration of special cases and for a host of other tasks for which the machinery does not exist to-day. A strong committee on which the Treasury, the Bank and the joint-stock banks were represented would seem to be the obvious device for tackling this task of co-

ordinating the joint-stock banks' loan policy within the broad lines of the Government's investment policy. Similar machinery should be devised—and is perhaps already designed—for dealing with the special problems of building societies after the war. In all such cases control of the institutions concerned demands fairly close and permanent contact between them and the Treasury whence the statutory orders will originate. The Treasury should have the direct expert advice of the institutions in question, and should not have to depend exclusively on second-hand, though no doubt highly expert, information and advice from the Bank of England.

It is, however, to be hoped that the new technique will not exclude the informality and the personal relationship which have always been the feature of Government in the City. Much would be lost if this flexible system, depending largely on the willing co-operation of all the parties concerned, were put into the strait-jacket of statutory codification. "In England," wrote Walter Bagehot, "we can often effect by the indirect compulsion of public opinion what other countries must effect by the direct compulsion of Government." The present Governor of the Bank of England quoted these words at the Centenary Luncheon of *The Economist* last September, and added the comment that "it is an advantage which we should be slow to sacrifice." It is also to be hoped that financial interests, great and small, will continue to take their problems and difficulties to the Bank of England, for friendly discussion of these problems solve nine-tenths of them without the formality of an approach to the Government. But, given the extension of financial controls, it is clear that contact between the Treasury, where most of the authority must be exercised, and the various institutions and markets concerned will have to be diversified and rendered rather more representative than is to-day.

## Business Notes

### Lend-Lease Changes

Reports from Washington have officially confirmed rumours previously circulating in the American press that a number of goods hitherto delivered by the United States to Great Britain on lend-lease terms will henceforth be paid for in cash. The articles in question are durable capital goods, including machine tools, and industrial equipment of all kinds. There are suggestions, as yet unofficial, that the list is likely to be extended and that it will soon cover textile exports to the Middle East sterling area. It is impossible to divorce these decisions from the highly charged political atmosphere which now surrounds the lend-lease question in the US. They may be regarded as a form of appeasement of the opposition to Mr Roosevelt which has already shown remarkable aptitude in serving its own political end by attacking the administration of Lend-Lease. There is, however, a simpler and more obvious angle to these changes: it is the considerable improvement which has, of late, occurred in the British Treasury's dollar position. That improvement is in large measure a reflection of the personal expenditure of considerable numbers of US troops now stationed in this country—the wartime variant of that important British invisible export, the tourist trade. If the principle underlying the grant of US lend-lease aid to Great Britain is, in effect, that this country must empty its pockets of dollars before it is entitled to lend-lease assistance, then the answer to the recent improvement of British dollar balances must be either to shift goods from the lend-lease to the cash list, or else to increase Britain's own deliveries on "reverse Lend-Lease." Actually it would appear that both methods are being used, since, in addition to the changes now announced, the recent British White Paper on Mutual Aid announced that raw materials from the Empire, for which the United States had hitherto been paying cash, were now to be supplied on Mutual Aid terms. The effect of these changes will be large, and it is to be hoped that the adjustment is not being overdone under political pressure. In the Canadian case, Britain pays as long as it has Canadian dollars at its disposal, but deliveries are not made in any way conditional on the availability of such balances, and anything that cannot be paid for is then given freely. The "empty pocket" principle, it should be noted, does not apply to the whole

of the US lend-lease operations. Lend-lease aid to Brazil, for example, has been given in abundance, while at the same time Brazilian dollar assets have accumulated and have been converted into gold which has subsequently been exported from the US to Brazil.

### Ordinary Shares

With the close of the year stock markets have become very quiet but quite firm. In this respect the market is passing through a repetition of the experience of 1942, but the net movement in prices in 1943 bears a closer resemblance to that of 1941. The steady but moderate improvement in equities during that year was only interrupted towards the close by the entry of Japan into the war. That caused a fall which continued into March, 1942, and from then on there was a steady rise, with only one reverse, until at the close of that year the index of Industrial ordinary shares, compiled by *The Financial News*, showed a net appreciation of 14 points. Last year and in 1941 the net improvement was a trifle over 9 points, the proportionate increase being, of course, heavier in the earlier year. The existing position is that half the relapse of mid-October to mid-November has been made good; and there is no evidence at the moment to suggest any very definite movement either way in the general body of British industrial equities. There is, however, combined with a general appearance of stability and a very faint upward trend, an extreme sensitiveness of individual prices to any development which appears to throw light on the existing position or future prospects of any company or industry. This results, probably, from the paucity of opportunities for speculation, now that all the frankly speculative shares have been run up to high levels. Thus, rubber shares have improved in the year by some 15 per cent and most other commodity shares are able to show rises ranging from 7 to 10 per cent. The net effect of the rises of the past three years has been to wipe out over two-thirds of the maximum fall during the years of war and preparation for it. Thus, the index of British industrial ordinary shares touched a peak of 124.9 (July 1, 1935=100) on November 18, 1936. On June 26, 1940, it was down to 49.4 and it is now back to 103.0.

### Rubber Control

In an announcement issued this week the Colonial Office drew attention to the fact that the present international rubber regulation agreement—it came into force at the beginning of 1939—was due to expire on Friday. The operation of the regulation scheme has been in abeyance for some time, for Japan now controls the Far-Eastern countries that contributed nine-tenths of world production before the war, and production in the areas still accessible to the United Nations had to be increased as much as possible, without reference to pre-war arrangements. The remaining countries which were parties to the old agreement—the United Kingdom, Holland and India—are desirous of maintaining international collaboration and anxious to retain machinery for consultation on future international action; but, in their opinion, the International Rubber Regulation Committee, in its present form and with its restricted membership, is not an appropriate means for planning the future regulation of the rubber-growing industry. They have been considering the possibility of forming a new and more widely representative committee for consultation and the collection of information and, as representatives of "natural" rubber-producing countries, they have wisely expressed the hope that all other countries with a substantial interest in natural and synthetic rubber, whether producers or consumers, will join the proposed committee. To gain the necessary time they have decided to extend the existing agreement for a short final period of four months. The proposed committee is to be a purely consultative one. In the view of the three Governments

it should have no powers of regulation of exports, production or planting, and membership of it would involve no obligations to restrict production or planting.

It is merely designed to pave the way for a plan which will secure the long-term interests of rubber producers and consumers alike.

in conformity with such principles for international commodity schemes as may be generally accepted after the war.

Before the war the chief rubber consuming country, the United States, was not also a producing country; after the war it will be both the largest producer—of synthetic rubber—and consumer. The solution of the "natural" rubber problem will have to be found within a context radically different from pre-war conditions.

\* \* \*

### Primary Products

There is a great deal to be said for an attempt at evening out excessive fluctuations in the prices of primary products—especially when they are produced by large numbers of small farmers, planters or miners—for they make for instability of incomes, which is as great a scourge in primary producing countries as recurring mass-unemployment is in industrial countries. But just as a successful employment policy should be a policy which not merely assures jobs to willing workers but jobs in the most productive occupations, so a successful price stabilisation policy should be a policy designed to keep prices as low as possible to the consumer and not one that is based on restriction by a combination of producers. A successful employment policy in industrial countries would itself tend to bring greater stability to the demand for, and the prices of, primary products. Obviously, plans for primary products cannot be postponed, pending the achievement of full employment in industrial countries. They should form part and parcel of the scheme of post-war international reconstruction, and, indeed, part of the ground has already been surveyed at Hot Springs and at other conferences. There are two principles which should guide the formulation of any regulation schemes for individual commodities. First, they should not be mere producers' cartels, designed to maintain prices by the restriction of production. Secondly, and this follows from the first principle, they should be controlled by Governments, not by private agencies, though this does not mean, of course, that they need be operated by Governments. Any proposals should be submitted to these two tests.

### Help for Lombard Street

Preparations for the year-end ordeal have again monopolised the activities of the money market during the week. The prospect has been eased by the decision of the Treasury

not to request any Treasury Deposit Receipt money from the banks this week. As the current week's effective TDR maturities amount to about £20,000,000 some relief has been obtained from a quarter which, by contrast, has in recent weeks persistently drained market resources. The effect has been to reduce the amount of money which the banks have had to call from the market at the turn of the year. It might be contended that the actual volume of such calling should have left the discount market unconcerned, since the gap thus made in its resources can almost automatically be made good by selling bills at the open market rate to official quarters. This, however, leaves out of account the important difference in the effect of these two alternatives on the appearance of the discount houses' end-of-year balance-sheets. The efforts made to show a reasonably orthodox ratio between the holdings of bills and investments might be seriously jeopardised if previous to the turn of the year the market had to make more than usually large sales of bills to the Bank of England agents. That contingency has been avoided by relieving the banks of TDR payments and thus enabling them to keep their normal quota of short money in the market over the turn of the year. Despite this relief, official assistance has been provided on a fair scale, and the Bank return showing the position on December 29th already reveals the inflation of bank cash over the turn of the year in a rise of £65,235,000 to £234,274,000 in bankers' deposits. The counterpart to the expansion in this item and in the note circulation and public deposits is a rise of £81,659,000 in Government securities, which reflects the assistance which the market had by then already taken from official quarters. These figures illustrate the paradox of extreme ease in credit conditions preceding the moment of greatest stress, which is always in evidence during the last week of the year. The money market has at its disposal the additional resources being created by window-dressing operations, but the bulk of that additional credit is "bad money," on the retention of which over the turn of the year the market cannot count.

## Cotton Trade Profits

The recent strength of cotton textile shares has received a slight stimulus from the increased margins granted for cotton yarn and cloth from December 22nd. So far as it is possible to calculate an average, the rise is about 4 per cent, and the bulk of this will be absorbed by the higher labour costs imposed upon both spinners and manufacturers. A slightly increased margin per unit of output is likely to remain, and there will be no lack of demand for any goods which can be produced, there having recently been a further increase in orders. Unfortunately, lack of labour and increased absenteeism threaten, for the present, to reduce turnover. Absenteeism is largely involuntary, and with the passing of the present outbreak of sickness, production may be restored. Meanwhile the results of the smaller Lancashire cotton spinning and weaving mills for 1943, so far as available, show a familiar pattern. Profits of 62 spinning mills average £7,959 for 1943, against £8,078 for a slightly larger sample for 1942, but 102 spinning mills paid an average dividend of 10.68 per cent, against 10.22 per cent, while twelve firms, combining spinning and weaving, paid 6.98 per cent compared with 6.87 per cent in 1942. So far as these figures can be considered a good guide to the total result, there has been a very moderate fall in profits and an increase in distributions. For industry as a whole, recent figures of *The Economist* show a modest rise in distributable profits and an increase in the proportion distributed in ordinary dividends at the cost of reduced allocations, absolute or relative, to reserves. Despite the heavier proportion paid in dividend by these mills, there is an improvement in credit balances shown, but it is so slight as to suggest that a more conservative policy might be beneficial.

## Future Difficulties

The story of cotton-mill results for 1943 is, thus, satisfactory, and there is promise of much better things to come. But, so far as the large cotton companies are concerned it may be doubted whether there is anything in the outlook which would justify a long term investment in cotton shares at existing prices, which give an average yield of some 3½ per cent, unless the buyer had reason to believe that the company chosen was among the lowest cost producers in the industry and was capable of maintaining that position. Everybody is agreed that the potential post-war demand for cotton goods will exceed anything yet known. But that will not last for ever. There can be little doubt that more and more countries will wish to produce for themselves the standard lines which make up the bulk of both export and home demand. It may very well be that, once the bare essentials have been met, restocking with imported goods will be damped down with the object of leaving exchange available for the import of capital goods, including textile machinery. Against this, it is possible that for a time the competitive power of Japan will be greatly reduced. But it must not be forgotten that if Japan is barred from the possession of an armaments industry there will be all the more resources available for competition in those activities which are permitted. By and large, there appears to be very little doubt that, within a short period of years and on any assumption, Lancashire will have to face a further curtailment of overseas demand for staple products. It is even possible that, given full employment and a real rise in the standard of living at home, the domestic demand for some types of cotton textiles will also fall away. Whether this will be the case or not must depend in large measure upon the cost and excellence of the new textiles. Probably, their future and that of the cotton trade proper depends upon co-operation between the old and the new and the evolution of new fabrics. A good deal has been done on these lines already, but more should be. Success on these lines may, however, demand fresh plant and a radical overhaul of methods and this may mean further scrapping of existing equipment on a considerable scale. This will call for larger appropriations from profits and it is not even certain that the Government will remove EPT at the conclusion of hostilities.

## Raw Cotton

The international raw cotton position appears to have reached a new stage. Consumption in the United States appears to have passed this season's peak, while in certain

other countries, such as the United Kingdom, it is rising. If, as is possible, the two opposite trends cancel each other, world consumption during the season ending July 31st this year may again reach the previous season's total of 24,800,000 bales. This figure compares with 28,507,000 bales consumed in 1938-39. World production this season may be slightly lower than in 1942-43, although the decline will not be a material one. The "preliminary final" United States estimate, at 11,478,000 bales, is 1,346,000 bales below last season's final harvest figure, but at least part of this decline, it appears, will be made up by an increase in the combined "outside growths," that is crops outside the United States. During the 1942-43 season, world cotton production amounted to 26,625,000 bales; this season it may again be somewhat in excess of consumption. The world's carry-over of raw cotton into this season amounted to about 23,600,000 bales. This is 10 per cent more than at the end of the last pre-war season and the highest world carry-over ever recorded. Well over half of this total, some 12,300,000 bales, consisted of "outside growths," although in the last pre-war season the carry-over of American cotton was nearly twice as large as that of cotton from other producing countries. The large surpluses of outside growths will prove an important factor in the immediate post-war markets. A considerable part of these supplies has been subsidised by the Governments of the producing countries, but they may possibly be offered at prices below the high prices for the heavily subsidised United States cotton. As the purchasing power in the majority of war-torn areas will be rather low immediately after the war, such a price differential would assure producers outside the United States a substantial demand, although some time may pass before they can fully regain their strong pre-war position. Many countries, which have found it difficult to obtain raw cotton or cotton goods during the war, have relied increasingly on other textiles. A recent study of the post-war cotton outlook, prepared by the United States Bureau of Agricultural Economics, indeed, comes to the conclusion that the upturn in world cotton consumption after the war may be fairly low. If this view proves correct, the raw cotton supply position will not cause much difficulty after the war.

## Disposal of Tramps

The stupendous output of cargo ships by American shipyards and the success of the measures taken against the U-boat have largely solved the shipping problem of the United Nations. After the war there is likely to be a surplus rather than a deficiency of big cargo ships, and most of them will be owned by Governments, that is chiefly the American Government. The *Shipping World* of December 22nd sees the position as follows:

| ESTIMATED TRAMP TONNAGE<br>(Vessels of 6,000 deadweight and over) |            |
|-------------------------------------------------------------------|------------|
|                                                                   | Gross tons |
| World Tonnage before the war.....                                 | 10,000,000 |
| World Tonnage at end of war.....                                  | 21,000,000 |
| Of which                                                          |            |
| Privately owned.....                                              | 5,000,000  |
| Government owned:                                                 |            |
| American Liberty fleet (incl. coastal ships)                      | 12,000,000 |
| Canada.....                                                       | 2,000,000  |
| United Kingdom.....                                               | 1,500,000  |
| Continental Governments.....                                      | 500,000    |
| Total Government owned....                                        | 16,000,000 |

The post-war figures are conjecture, but they serve to illustrate the change in the position since 1939 and the kind of problems that will have to be faced. Significantly, the *Shipping World* suggests that large-scale sales of tramp ships by Governments to private owners would push the bottom out of the freight market as effectively as would an attempt by the Governments to keep the vessels in operation. The surplus, it suggests, would, therefore, have to be withdrawn by the Governments. The ships owned by Governments might be let to private managers in such volume as would ensure minimum freight rates; simultaneously they would offer ships for sale on the world market at prices corresponding to the minimum rates. This scheme is a variation of one outlined in *The Economist* on July 24, 1943, though by itself it would scarcely ensure the restoration of a large and efficient British merchant fleet.

## Statisticians Enter the Factory

The striving for both quality and quantity in the manufacture of munitions, for the highest possible yield per man-machine hour, has led to many innovations and improvements in methods of production. Not the least important of these innovations has been the introduction of quality control, charts based on samples, one of the statistician's contributions to the war effort. Quality control is not only reducing waste in production by diminishing the proportion of rejects, it is also a means of raising the average quality of the products to which it is applied. Erratic behaviour in the operator and the machine can be detected by the repeated presence of points outside the control limits indicated on the chart; lack of uniformity due to the quality and age of the machine is shown by an excessive average range in the dimensions of the sample; faulty tool setting is disclosed when the average size of the sample differs too much from the dimension on the drawing. Quality control has been recognised by the Ministry of Supply as an important means of improving the efficiency of production, especially in engineering, and its use has been gradually extended during the past two years. In order to speed up the adoption of quality control, the Ministry has recently published "A First Guide to Quality Control for Engineers," describing, by way of example, how it can be applied. Quality control in the factory has become a new occupation for statisticians, for in future no reputable engineering firm will be able to dispense with it.

## Bolivian Tin

Formerly the territories occupied by Japan produced some two-thirds of the world's tin supplies; the loss of those supplies necessitated the expansion of output in other countries to the limit of their capacity. In the Belgian Congo and Nigeria efforts to increase output have been successful; but in Bolivia, the world's third largest supplier, they appear to have failed. In 1929, when Bolivia's output of tin ore reached its highest level, the metal content of shipments was 46,338 tons; the highest figure since then was 42,319 tons recorded in 1941. In 1942, shipments, instead of increasing, fell to 38,294 tons. There was little improvement last year, for shipments during the first nine months, at 29,941 tons, were only 486 tons higher than during the corresponding period in 1942. The main difficulty appears to be a shortage in the supply of labour which cannot easily be made good by the transfer of workers from other districts or countries because of unfavourable climatic conditions. Nor can a speed-up in mechanisation yield immediate results because, in contrast to other countries whose tin can be dredged, Bolivian ore has to be mined in lodes as it occurs. The attempt to encourage expansion in output by the offer of high prices has, therefore, met with little success. Since January, 1942, the price paid by the United States and the United Kingdom has been at the rate of 60 cents per lb. of metal, f.o.b. South American west coast ports, equivalent to £333 10s. per ton. Although this price was exceeded in this country for short periods after the last war, it compares with an average London price of £189 10s. in 1938, and with the current price of £275 per ton, delivered to consumers' premises. Yet, Bolivian interests are apparently anxious to secure a further increase in prices to 70 cents a lb. and are reported to have refused an offer of 63½ cents a lb., made by the United States Board of Economic Warfare. It is doubtful, however, whether a further substantial and general advance in the price of Bolivian tin will lead to an expansion in shipments. Nor is it possible, at this stage, to assess the effect of the recent *coup d'état* on the shipments. If it is technically possible to speed up output in the near future, and if a special inducement is needed to secure it, it might be preferable to offer Bolivia a premium on, say, any excess in shipments over last year's total, rather than to concede another general advance.

## Nitrate Problems

The report of the Lautaro Nitrate Company for the year to June 30, 1943, shows a substantial fall in total sales of Chile nitrate, from 1,371,284 tons to 1,243,040 tons, of which the company's share was 420,828, against 464,245 tons. The improvement in iodine sales of the company was proportionately greater from 327,435 kilos to 376,954 kilos and there was a modest improvement in profit, while the amount available is further increased by the fact that renewals reserve took only £156,326, compared with

## AND WHEN THE WAR IS WON?

Back to the old trade antagonisms or . . .

"friends in fact, in spirit and in purpose"?

Out of the Teheran Conference has come the greatest pledge of a just and durable peace the world has ever known.

The three great signatories seek the active co-operation of all nations, large and small . . . not as dependants upon a powerful but benevolent triumvirate, but as sharers in the responsibility for the future of mankind.

Part of this responsibility must be borne by industry, which will be called upon to build a new world prosperity for this new "world family of democratic nations." The choice of the Nations is between world-anarchy and world-order. The choice of industry is between blind self-sufficiency and intelligent participation . . . between the old destructive trade rivalries and the new constructive economic collaboration . . . between peace, progress and prosperity on one hand and World War 3, chaos and extinction on the other.

This Statement is issued in support of the principle of continued industrial collaboration between the United Nations after the war. Announcements by the International Nickel Company of Canada, having the same purpose, are appearing in Canada and the U.S.A.

THE MOND NICKEL COMPANY LTD  
Grosvenor House Park Lane London W1

£171,672. The result is a rather higher dividend on the ordinary capital, announced at the end of November, and a more marked acceleration of funded debt redemption. The directors were unable to give an idea of the results of the current year, since they will depend primarily upon the amount of shipping available. The company and the other Chilean nitrate producers have benefited little from the war, since increased demand from some markets has been pretty well offset by the closing of others. As a producer of iodine, however, it has been able to reap some benefit for the average sales of the four war years have been more than 30 per cent above those of the corresponding pre-war years. Unfortunately, it is probable that the demand for this product will fall off, once hostilities cease, almost as rapidly as it rose, and the future of the company is wrapped up with sales of Chile nitrate. The demand for fertilisers after the war must be very large indeed for some years, both because it will be necessary to produce larger amounts of food-stuffs and because some of the synthetic plant will be destroyed, while labour and materials will be required for the production of materials for which there is no alternative available. Once this period of three or four years is over, the outlook is obscure. Unless there is a differential rise in wage costs in the manufacturing countries, it would be reasonable to suppose that the relative costs of producing the synthetic material would tend to fall and those of extracting the natural one to rise, with a further deterioration in the profits of the oficinas.

### Co-operative Trading

The turnover in the dry goods departments of the Co-operative Wholesale Society continued to decline during the first nine months of 1943; the returns for the last thirteen weeks, however, suggest slackening in the rate of decline, which has encouraged the belief among the directors that those sections have reached a fairly stable level. They are renewing their objection to the Purchase Tax—particularly on goods subject to price controls and on those made to Board of Trade specifications of type or quality. The turnover of all branches of the CWS for the 39 weeks ended October 9, 1943, was £120,675,122, an increase of £6,281,453 compared with the corresponding period of 1942. Supplies from the society's own productive works were £36,367,235. Grocery and provisions, at £90,284,258, were responsible for three-fourths of the sales. Half the business was done through the Manchester headquarters, with the London branch steadily expanding to a turnover above £40 million. Sales to the Ministry of Food totalled £5,014,363; and the supplies of meat and milk to the retail co-operative societies during the nine months were £9,697,913 and £9,188,274 respectively. The amalgamation of retail societies has resulted in the closing of fourteen accounts with the CWS Bank, in which 859 societies have accounts, along with 10,521 trade union branches. The combined total of deposits and withdrawals of the bank from January to October, 1943, were £795,054,477, an increase of £54,940,038, reflecting, at least in part, the closer association between the co-operative and trade union movements.

### Coal Tribunal Awards

The outstanding result of the appointment of an independent tribunal under the National Conciliation Scheme has been the substitution of national for district negotiation and agreements. The first of the awards of the Porter Tribunal gave the juveniles in the coalmining industry a national minimum wage scale; the second granted the application of the Mineworkers' Federation for a national holiday-with-pay agreement; and the third conceded the miners their claim for a national agreement for the regulation of payment for overtime and week-end work. In regard to holidays-with-pay the miners asked for (1) a minimum of twelve holiday days per annum, six of them to be taken consecutively, and to be regarded as the annual holiday, (2) an allowance for the annual holiday of £6 a week to adult workmen and others with dependants, and of £3 per week to youths under eighteen, (3) an allowance in respect of each of the six additional statutory and customary holidays of £1 per day to adults and 10s. to youths, and (4) the cost of the holidays not to be treated as an admissible charge against the wages ascertained. There was no dispute over the principle of a national agreement, and the employers agreed that six days with pay was not unreasonable; as a matter of fact, holidays-with-pay agreements on a district basis were already in operation in most of the coalfields.

The Tribunal has refused to grant the specific allowances for which the men applied, and has decided also that holiday pay must be regarded as an admissible charge under the joint audits, but for the provision of funds to meet the cost of the holiday week it has recommended the following formula:

(a) The total sum earned as wages in the calendar year prior to that for which holiday payments are to be made, shall be ascertained; (b) from this total there shall be deducted the sum actually paid during that period under any holidays-with-pay agreements; (c) the resultant figures shall be divided by 50. This figure, after the deduction of (b), and after taking into account the existence of six unpaid holidays, will give an average week's wage for the whole industry. The sum so arrived at is to form a pool, and this pool is to be divided amongst the miners in such manner and in such proportions as the Mining Association and Mineworkers' Federation shall mutually agree.

The employers' and the workmen's representatives are now discussing this problem, but in the event of a failure to agree the intervention of the Tribunal will again become necessary. In regard to the overtime award, discussions by the National Negotiating Committee over the terms of the national agreement are in progress. The concession of the claim that the new overtime rates should be calculated not on standard earnings, but on the normal gross earnings, is a considerable gain to the workmen; hitherto in many districts the overtime payments have been calculated on standard wages. It should be pointed out, however, that because of the statutory limitations on working hours, overtime wages in the coalmining industry do not represent on the average more than 5 per cent or 6 per cent of total wages.

### Gold Export Licences

The procedure to be followed when exporting gold coin and bullion from this country is to be simplified on January 15th next. From that date it will no longer be necessary to obtain an export licence for such exports, except in the case of gold coin more than 75 years old which, as collectors' pieces, might command a value greater than that of their gold content. The removal of other coins and of gold bullion from the export licence list does not mean that such gold will in future leave the country without restriction. The Defence Finance Regulations still prohibit such exports except under due authorisation of the Treasury; such authorisation will still have to be obtained before gold can be sent out of the country. The export licence on gold had, in large measure, been a duplication of the Treasury control, and it is for that reason that it has been dispensed with. In the case of gold coin having special collectors' value, the licence is still required because the Defence Regulations are only concerned with the bullion value of coin and might, therefore, sanction an export of gold of greater value than that represented by the gold contents of such coins.

### COMPANY MEETINGS

#### RHOKANA CORPORATION, LIMITED

##### SATISFACTORY PRODUCTION OF COPPER AND COBALT

The twenty-first annual ordinary general meeting of Rhokana Corporation, Ltd., was held on the 22nd ultimo at 11, Old Jewry, London, E.C., the Rt. Hon. The Lord Geddes, G.C.M.G., K.C.B. (chairman of company), presiding.

The directors' report issued with the accounts was as follows:—

The directors submit their report and statement of accounts for the year ended the 30th June, 1943.

The production of copper and cobalt at the mine has proceeded satisfactorily throughout the year.

No change has taken place in the authorised or issued capital of the Corporation. The debenture debt was reduced from £184,450 to £163,450 by the drawing for redemption as at December 31, 1942, of £21,000 debentures, in accordance with the provisions of the Trust Deed. On August 26, 1943, notice was given to pay off at par on November 30, 1943, the whole of the Debentures then remaining outstanding.

##### ACCOUNTS

The balance of the profit and loss account for the year ended June 30, 1943, which has been carried to an appropriation account, was £2,187,252.

The balance brought forward from the year ended June 30, 1942, was £254,628.

Making a total of £2,441,880.

Against this the directors have made appropriations as follows:—

Taxation, £753,833.

Preference Shares Redemption Fund, £7,500.

General Reserve Account, £500,000.

Dividends on Preference Shares paid on December 31, 1942, and June 30, 1943, £82,500.

Interim Dividend of 10 per cent. (2s. per unit of Stock) on the Ordinary and "A" stock was paid on August 13, 1943, in respect of the year ended June 30, 1943, £250,000.

The Directors now recommend the payment of a final dividend of 15 per cent. (3s. per unit of Stock) on the Ordinary and "A" Stock, in respect of the year ended June 30, 1943, £375,000.

Under 84(D) of the Articles of Association, the Directors are entitled to additional remuneration of £31,250.

Making a total of £2,000,083.

Leaving a balance to be carried forward of £441,797.

The appropriation for taxation consists of the total amount of taxation accrued on the profits to June 30, 1943, estimated in accordance with the present known regulations and rates.

If the necessary resolution approving the dividend is passed, the warrants will be posted immediately after the meeting.

The rates of tax deducted from the dividends are as follows:—

Preference Shares.

December 31, 1942, and June 30, 1943: 5s. in the £ (10s. United Kingdom Income Tax, less provisional Dominion Income Tax Relief at 5s.).

Ordinary and "A" Stock.

Interim: 5s. in the £ (10s. United Kingdom Tax, less provisional Dominion Income Tax Relief at 5s.).

Final: 5s. 9d. in the £ (10s. United Kingdom Income Tax, less provisional Dominion Income Tax Relief at 4s. 3d.).

#### MUFULIRA COPPER MINES, LIMITED

Since the date of the balance sheet, the Corporation's holding in Mufulira Copper Mines, Ltd., has been reduced to 1,300,000 shares as the result of the sale of 279,270

shares, of which the members were advised in a notice dated August 16, 1943.

The directors' report and accounts of Mufulira Copper Mines, Ltd., for the year ended June 30, 1943, have not been issued.

#### NCHANGA CONSOLIDATED COPPER MINES, LIMITED

The Corporation's holding in this Company has, since the date of the balance sheet, been reduced by the sale of £260,000 of Ordinary Stock, of which the members were advised in the notice referred to above, and by the sale of a further £63,150 stock on the open market. The Corporation's holding is now, therefore, £2,000,000 Stock.

The Operating and Profit and Loss Account of that Company for the year ending March 31, 1943, was £336,691. After deducting the balance brought forward from the year ending March 31, 1942, and providing £21,666 for taxation and £137,061 for depreciation reserve account, a credit balance of £59,000 was carried to the balance sheet.

##### STAFF

The directors wish to place on record their appreciation of the services rendered to the Corporation by the general manager, his staff and employees in Northern Rhodesia, and the staff in London. They also wish to express their thanks to the Anglo-American Corporation of South Africa, Ltd., the Consulting Engineers and Geologists, and Managers in South Africa.

The report and accounts were unanimously adopted and the dividends as recommended were approved.

The retiring directors, The Lord Geddes, Mr. J. N. Buchanan and Mr. F. L. Gibbs, were re-elected; and the auditors, Messrs. Deloitte, Plender, Griffiths and Co., having been reappointed, the proceedings terminated.

#### IDEAL BUILDING AND LAND COMPANY, LIMITED

##### A SUCCESSFUL YEAR

The ninth ordinary general meeting of this company was held, on the 21st ultimo, in London, Sir Thomas Keens, D.L., the chairman, presiding.

The following is an extract from the chairman's circulated statement:—

The consolidated profit and loss account shows a trading profit of £132,599, as compared with £86,218 last year. The directors recommend the transfer to general reserve of £40,000 and a dividend of 4 per cent., less tax, on the ordinary shares.

The house purchase side of the business has not been active during the year, though small sales have taken place and activity in the current year has been somewhat greater. The rents of our considerable housing estates have enabled our subsidiary, New Ideal Homesteads, Limited, to show a profit which is considered satisfactory. Our main contracting subsidiary, Kent and Sussex Contractors, Limited, continues to be concerned almost entirely with carrying out building and civil engineering work, and the year under review has been one of great achievement. To carry out this work the directors' borrowing limit for general purposes has been exceeded, although total borrowing has been kept within the authorised limit. Resolutions will be submitted at meetings following the annual general meeting to obtain ratification of past borrowing and a variation of borrowing powers.

The results for the first six months of the present year are not unfavourable and the volume of work in hand, although lower than at this time last year, indicates that the results of the year should not be unsatisfactory.

The report and accounts were adopted and the resolutions dealing with the board's borrowing powers were passed.

The report and accounts were unanimously adopted.

#### BRAZILIAN WARRANT COMPANY, LIMITED

##### RESULTS AGAIN SATISFACTORY

The annual general meeting of the Brazilian Warrant Company, Limited, was held, on the 29th ultimo, in London.

The following is an extract from the speech of the chairman (Mr Arthur Whitworth) circulated with the accounts: A year ago this company presented a report and accounts which in their showing were an improvement on any of the results of recent years. We are in the fortunate position this year of presenting you with results no less satisfactory. The gratuity up to £17,500, which in fact amounted to £17,042, which you specially authorised last year in connexion with the Centenary of our principal subsidiary, E. Johnston and Company, Limited, was charged against the profit of the year, and accounts in the main for the reduction in the operating profits from £88,125 in 1941 to £76,312 in the year under review. Whereas last year we proposed a final dividend of 6 per cent with a bonus of 2.3 per cent in connexion with the Centenary of E. Johnston and Company, we this year feel justified in consolidating that bonus with the dividend. If you will accept this recommendation, the accounts show that there will be carried forward to 1943 a sum of £112,448, against £91,118 brought into the accounts from 1941.

##### WHOLLY OWNED SUBSIDIARIES

We are on this occasion presenting for the first time a consolidated balance sheet which gives the names of all the subsidiary companies wholly owned by this company. Of these the Atlas Coffee Company, Limited, and the Anglo-Brazilian Cotton Syndicate, Limited, both domiciled in London, are of little importance. The others should be known to all of you who are acquainted with this company's operations, with the possible exception of the Sociedade Agricola Macacu, Ltda., which is technically a subsidiary of E. Johnston and Company, Limited. This is the fazenda which was purchased in 1937. The development has cost us more than we anticipated, and we had hoped that by this time the orange plantations would have been productive, but not only have there been setbacks in their growth, but the whole of the export trade in oranges from Brazil has been terminated by war conditions.

In other directions the business of this company and its subsidiaries was active and profitable and continued to be so. Particularly would I mention the success of our branch at Sao Paulo, where we have established a definite and respected position in the cotton trade of that State. Our operations in coffee, while curtailed under war conditions, are continuous, exports being confined until recently to the U.S.A. At the end of November the Ministry of Food announced the purchase by them of 100,000 bags of Brazilian coffee.

##### POST-WAR OUTLOOK

The two principal Brazilian commodities in which this company is interested are, so far as the export trade is concerned, under Government control. As the war continues, not only will the export trade of Brazil flourish, but her local industrial position will improve as she endeavours to fill her own needs by manufacturing what was previously imported.

With the vast natural resources and the enterprise of her citizens, great progress is being made, and no doubt the lessons learned in the years following the last war will not be forgotten. So far as coffee is concerned, nature has come to her aid. With a severe frost and drought in 1942, followed by another frost this year, the production of coffee has been sufficiently curtailed to stop compulsory purchases by the Government. It remains to be seen whether equilibrium between supply and demand can be established.

The report and accounts were unanimously adopted.

## S. SMITH AND SONS (MOTOR ACCESSORIES) LIMITED

### LARGER TRADING PROFITS

The twenty-ninth ordinary general meeting of S. Smith and Sons (Motor Accessories), Limited, was held, on 30th ultimo, in London.

Mr W. Henderson-Cleland, M.C. (the chairman) said that the net profit for the year amounted to £103,081, compared with £103,439 last year. In the balance sheet fixed assets showed a decrease of £44,000, of which £10,000 was due to the amount written off patents last year and the remainder to the excess of their depreciation over additions.

There had been no variations in the investments in subsidiary companies during the year under review, and it was interesting to note that the net assets of the subsidiary companies, after excluding all intangible assets, exceeded the cost. The total floating assets exceeded the total liabilities by £398,000, or £360,000 after the proposed dividends had been paid.

The trading profit at £657,446 had increased by just over £50,000 compared with the previous year and interest by over £3,000, the greater part of that increase being due to interest received on Tax Reserve Certificates.

He would conclude his remarks by saying that as far as was possible, without affecting war production in any way, the directors were making plans for the utilisation of the company's large facilities for the production of peace-time equipment to come into effect immediately hostilities ceased.

He would not wish the occasion to pass.

without expressing to Sir Allan Gordon-Smith, their managing director, their good wishes and thanks.

The report was unanimously adopted. A final dividend of 10½ per cent., making 17½ per cent. for the year on the preferred ordinary shares and a dividend equal to 37½ per cent. on the deferred ordinary shares were approved.

## THE INDUSTRIAL CREDIT COMPANY, LIMITED

At the tenth ordinary general meeting held in Dublin, on the 14th ultimo, the chairman (Mr. J. P. Colbert) said:—

The total portfolio of investments appears in the balance sheet at £658,746. These investments comprise almost exclusively stocks and shares of companies whose issues we had underwritten, or, alternatively, shares subscribed to in cases where a public issue was not feasible initially. As regards those shares which are not quoted on the Stock Exchange, your directors are satisfied that, taken as a whole, they are worth considerably more than the figure at which they stand in our books. By far the greater part of our investment portfolio is comprised by stocks and shares which are quoted on the Dublin Stock Exchange, and the total present market value of these is very substantially in excess of the net cost to the company, before deducting reserves.

The gross profit for the year is £57,184, as compared with £40,090 in the preceding year. Administrative and general expenses show a decline of £638 to £7,592. The net profit is £49,591, being an increase of £17,732. Income Tax and Corporation Profits Tax absorb £21,310. Your directors recommend the payment of a dividend of

2½ per cent., less tax, on the paid-up capital, which will absorb £12,695, and a transfer of £15,000 to investment and other reserves, leaving £2,795 to be carried forward to the next account.

The new industries which we sponsored to the public during the ten years of our existence have proved themselves in all cases to be efficient producers. It is gratifying to be able to say also that these new companies have amply justified the confidence reposed in them by Irish investors. The total number of applications to the various issues of an industrial character which have been offered to the public since we commenced business is 33,754. The overall average amount allotted in respect of these applications is only £246, showing that the stocks and shares are, in general, in the hands of the small investor.

As regards the issues sponsored by the Industrial Credit Company, if an investor had put an equal amount into each security at the issue price his total investment in Debenture Stocks would show as at October 31st last an appreciation of 8.6 per cent. according to market values, in Preference Shares an appreciation of 11.1 per cent., and in Equity Shares an appreciation of 22.8 per cent., the overall appreciation being 16.9 per cent. On his total investment he would have received during the year to October 31st last a gross dividend of 5.65 per cent., subject in a great many cases to a 20 per cent. income tax rebate.

As regards the financial results, your company is to-day in a stronger position than it has been at any time. The total net profit earned during the 10-year period is £342,693, of which the company has paid £118,920 in taxation and £52,642 (net) in dividends, including the dividend proposed in the present report.

The report and accounts were adopted.

(Continued from page 26.)

Agriculture in Argentina indicates an estimated outturn of linseed of 1,796,000 tons which, if realised, will be 271,000 tons, or 17.1 per cent., more than actually harvested last season. The new seed is now on the market, some part of which is being absorbed on home production of linseed oil and part earmarked for fuel oil. There is also some demand for early shipment for account of the United Nations. In the United States next season's linseed goal is 5,895,000 acres, a reduction of 394,000 acres, equal to 6.2 per cent. Canada also is contemplating a reduced acreage. Arrivals of linseed and other oilseeds in Great Britain continue of fair volume and for the completed 12 months are about at the same level as in 1942, and have enabled the Government to supply and to be supplied and the paint and allied industries to receive good deliveries of linseed oil and other drying oils used in products required by the war effort. Prices have again advanced. Linseed oil, for example, the monthly average of which (controlled) is £48 16s. 7d. a ton, against £44 8s. 4d. per ton naked, ex mill, in 1942. Crude cotton oil (controlled) has advanced during the year from £39 2s. 6d.

to £52 2s. 6d. per ton ex mill; other oils also are dearer, in accordance with increased prices of oilseeds.

## Post-war Democracy

AN article on another page sets out some of the difficulties which face French representatives at Algiers arranging for the restoration of democratic government in France. The task before the French Consultative Assembly raises two issues: the resumption of normal political life in territories now occupied by the enemy; and the establishment in those countries of popular governments that will also be stable and efficient. The demand for popular government, after years of arbitrary alien rule, will be very great; and this will not be easy to establish and maintain against the background of frustration and lawlessness which resistance to invaders has inevitably brought with it. The need for stable government will be all the more acute; and, in modern economic and strategic conditions, the ability to provide efficient government will be decisive. The countries of Europe, even those formerly called democracies, cannot simply go back to their pre-war regimes. In some countries there was no kind of democracy. In others democracy did not work; it was neither stable nor efficient. Axis propagandists and others have drawn from them examples of the breakdown of democracy. Democratic governments were set up after the last war, they argue, in a conscious attempt to apply the principles of British parliamentary rule to all Europe, and the attempt has failed. This is quite untrue. While elaborate parliamentary constitutions were introduced after 18 into many European countries, including Germany,

parliamentary rule as we know it in this country was transplanted nowhere. What attempt there was to imitate the British system was mistaken; the law was sometimes copied but never the practice.

Low though the standard of political performance often fell before the war in this country, we have possessed even at the worst times governments more popular, more stable and more efficient than most other democracies. Mr Churchill is not a freak, but a representative British statesman, bred in the House of Commons and the Cabinet room. It is because post-war Europe needs popular, stable and efficient governments, and leadership that is both strong and democratic, that it is important for Europe as well as for us, to look at the realities of the British parliamentary system, to see how best its virtues can be kept and how aptly, or otherwise, they might fit European requirements. The British system of government has stood the test of fire.

What are the characteristics of the British system which other democracies missed in the inter-war years? They can be summarised as follows. British Governments are not prevented by Parliament from ruling. What they decide to do will normally be approved by both Parliament and the people. At an election, it is the Government that is chosen, with a Parliament to go with it, and although in theory Parliament is sovereign, and may become so in fact in a political crisis, the right of the Executive to make

and apply policies, once a mandate has been given by the people, is accepted. It is not possible for Parliament continually to chop and change Governments with impunity. It is possible for British Governments to pursue consistent and continuous policies for sufficiently long and sufficiently boldly to get things done. Parliament retains, as it must, the right to dismiss the Government when it seems that the popular will has altered, but until its Members are willing to go to this length, which will throw them, as well as the Government, into the electoral melting pot, its power over the Executive from day to day is confined to criticism, questioning, complaint and suggestion. Governments can be displaced, but only on overwhelmingly important issues, not on every shifting side-wind in public opinion. The first function of Parliament is now the first power won by their predecessors in the fifteenth century, the right to call for the redress of grievances. The House of Commons is a sounding board for the expression of the people's views and opinions; and only occasionally do these noises off compel the Commons to take arms against the Government, and bring it down.

In countries like, say, pre-war France, on the other hand, parliamentary government did not work in this way at all. Governments rose and fell according to the shifting alignment of many parties in the Chamber and Senate, without any reference except at set intervals to the electors. It was impossible for any Government to rely on sufficient support, sufficiently continuously, to carry out the programmes of reform or defence that France needed. Governments were not the creations of the electorate, but the creatures of Parliament, made and unmade with startling frequency, until they had little or no connection with the men and measures for which the people had voted at the previous election. Governments tended to be powerless and Parliaments to be irresponsible.

Yet, on the face of it, all the features of parliamentary government were present. The Senate as well as the Chamber was elected; the Prime Minister and Cabinet were responsible to the people's elected representatives. Laws were made by Act of Parliament, and administered under parliamentary control by Ministers. All these features—representative assemblies, responsible Ministers, Cabinets and parliamentary legislation—are parts of British constitutional law and were present in the other newer democracies of Europe. Yet with the exception of countries like Sweden, which had a sound tradition of their own, the consequence was almost always the same—there was no consistent home or foreign policy, popularly approved and technically sound; no adequate measures for defence or economic development.

In large part, the difference in the results achieved by the British and these other systems of democratic government is the difference between the substance and the shadow of the parliamentary method. British policy, too, had outstanding failures in the inter-war period, in economic policy, defence and diplomacy; but they were due not to the British system of parliamentary government, but to the failure to work it properly, and they

were not disastrous. Government was often inefficient, but it was always stable, and usually popular. In other countries, the position was very different. They preserved the constitutional theory that Parliament is sovereign, and overlooked the political practice which in Britain, in modern conditions of government, has given sovereignty to the Executive. They failed to see that, of necessity, modern governments must have the power to legislate. They did not adopt the convention by which governments must either be supported or forced to take the electorate's opinion at the polls. In short, they missed precisely the things which have enabled parliamentary government to continue to work in this country. British parliamentary government itself worked worst during the inter-war period, when it ignored the practical conventions upon which it had come to be based: when programmes and policies changed without reference to the electorate; when the formation of National Governments all the real issues of policy were left blurred and unresolved; and when the Opposition, incapable of offering itself as an alternative Government with an alternative policy, became content with a merely guerrilla rôle.

It may be that, because of different national characteristics or different social and economic situations, it is impossible to export even a modified version of British practice. It may be that, for some countries, the Soviet system of rigidly centralised power, beyond criticism or control, set in the framework of a great number of representative but powerless bodies, will be more suitable. It may be that, in other cases, the American model of an elected Executive set in constant counterpoise against an elected Legislature may be more appropriate. But the Soviet system is not popular government in the British sense, for it leaves out civil liberties as well as free election and parliamentary support. And, in modern times, the American system has hardly provided the strong and efficient government which European democracies want, and need; Congress, too, is irresponsible; the Administration does not depend upon its support; and neither can force the other to take the opinion of the people. *Prima facie*, the British system has a special contribution to offer to the solution of Europe's post-war difficulties.

After the war, the nations of Europe will be seeking an alternative to authoritarian rule. British practice offers the possibility of continuous and consistent government, based on popular support and exposed to popular criticism; freedom of speech, opinion and the press, freedom of election and of Parliamentary criticism and inquiry, and the equality of citizens before the law are indispensable conditions; the existence of only a few political parties, representing distinct but broad groupings of opinion and interest, and each capable by its personnel and policies of being chosen by a majority to constitute the Government, is no less necessary. If, in their own ways, these other countries can combine a similar practice with these essential conditions, then it will be possible to say, for the first time, that parliamentary government as we know it is being tried abroad.

extremely vague. It is difficult to say what form of association he had in mind. He certainly did not suggest that the democracies of Western Europe should "join the British Empire," and what many of his critics seem to have forgotten is that in a number of ways a "western fringe" did in fact exist before the war. Common interests and policies already drew the nations of Western Europe towards each other. They were constitutional democracies. They were trading and maritime nations with economic interests all over the world. Britain, France, Holland and Belgium between them controlled most of the world's colonial territories. Up to a point this special relationship was expressed in more formal shape. All the Scandinavian countries adhered to the sterling bloc and had

made special trade agreements with Great Britain. The Oslo Agreements drew Scandinavia and the Low Countries together in their commercial policy. During the war it has been possible to arrange for a completely unified shipping pool. Years before the war the relations between Britain and France were in all but name a full alliance. The question is thus not whether a "western fringe" should be created but whether an existing complex of interests and sympathies—some political and some commercial—should be systematised into a more formal association.

There is much to be said for such a policy. The British Commonwealth provides the pattern of co-operation without subordination, the great virtue of Britain as the most powerful element in such an association is that it has abundantly proved its total unaggressiveness. Indeed, the pacific record of British policy was singled out by M. Van Kleeff's as a reason for hesitation.

When, therefore, General Smuts advises us to collaborate with England after the war, my answer will be: I can only think of this provided the British Empire and Britain in particular shows that it has no intentions of once more going the way towards large-scale disarmament.

It might be possible after the war to associate the Western democracies first of all at the level of strategy through a joint general staff or at least formal and regular consultations. Some measure of agreement on foreign policy could also be achieved through a regular meeting of the Foreign Ministers of the various states. In economic matters, common currency agreements have been made in the past. They could be made again together with agreements on shipping, freight rates, customs and similar matters. The test in each case would be the benefit of the proposed extension of collaboration to all the state members. The approach would be resolutely practical. In the colonial sphere, in particular, the closer association of the western states could be made into a real instrument of progress.

Any proposal for closer association would clearly require the most delicate psychological adjustment. Every Western nation is more rather than less nationalist as a result of the war. Any suggestion that they were being inveigled into the British Commonwealth would be resented and rejected. It was one of the misfortunes of General Smuts's speech that the substance of his proposals was put forward in unnecessarily wounding language; and one of the reasons for the tepid reception this passage received from the Allied Governments was obviously that they cannot be expected to be attracted by the suggestion if its only purpose is to strengthen the British hand at the Great Power table.

This fact should not lead to the assumption that only jealous nationalism keeps the western states from a greater readiness to accept the Smuts proposal. Their hesitations go deeper. They do not want to take part in

exclusive arrangements unless it is clearly seen that they form part of a larger whole. None of these western nations wishes its relations with Britain to exclude the closest possible links with the United States. Holland in particular, with the bulk of its colonial territory in the Pacific, is insistent upon the importance of American policy in shaping Holland's own. Norway, too, sees its interests in an Atlantic rather than a European framework. As one Norwegian spokesman put it,

The objection . . . to the European Federation is that it might create new barriers between the United States and Europe. This objection also applies to General Smuts's plan for a British-West European federation. . . . An Atlantic Regional Agreement would probably give us the maximum degree of security.

Speaking for Holland, M. Van Kleeff's also makes the point that, to feel secure, his people and their neighbours would need to feel behind them the weight not only of Britain but of the United States. Then it would be a security system in fact as well as name.

If things move in this direction, we would see a strong formation in the west with America, Canada and the other British dominions as the arsenal and vast reservoir of power, with England as the base, especially for air power, and the west of the European mainland . . . as the bridgehead. . . . It is difficult to imagine a stronger position for our country.

Thus the first outspoken reservation is the need to associate with a "western fringe" the full collaboration of the United States. It is not the only reservation. Most of the Allied spokesmen have shown themselves equally determined not to enter a bloc which might be hostile to the Soviet Union. They regard Germany as the menace now and for generations to come. M. Van Kleeff's demands that "the formidable western bloc" should "find its eastern counterpart in Russia." The Norwegians demand that they should "expand and strengthen" their good relations with Russia. It is obvious that any acceptance they might give to local regional arrangements—possibly on the model of the recent Russo-Czech Pact—would be dependent on the degree to which such arrangements were a part of an international security system and not a substitute for it.

These are the reservations of the smaller western powers. They are even more obvious and compelling in the case of France. The French naturally cling to sovereignty more fiercely than any other European state, for they are the greatest of the nations which were stripped of it. They would never take part in any arrangement that suggested the subordination of their military power and foreign policy or colonial responsibilities to those of Great Britain. This does not of course mean that they are irrevocably set on a policy of minimising British influence in Europe. On the contrary, the restraint of the Consultative Assembly in Algiers on the morrow of the Lebanon crisis and General Smuts's wounding comment on France shows the

## The Western Fringe

SOME weeks have passed since General Smuts made his suggestion that Britain should seek to bring up the standard of its power more nearly to the level of that of Russia and the United States by entering into closer relations with the Western democracies of Europe. Since that time there have been a number of official and unofficial reactions from the countries concerned, in particular from the Belgian, Dutch and Norwegian Governments. All of them desire closer relations with this country. It is obvious that all of them have completely rejected isolationism. But there is, on the whole, a big gap between the form taken by their desire for collaboration and the form proposed by General Smuts.

It is, of course, true that the General's proposals were

### CREATE AN ESTATE

strength of sympathy for Britain, particularly in occupied France. But it does mean that all the reservations made by the smaller nations about the form of association hold good, and that French diplomacy will in all probability seek to make its own arrangements with the other great power centres, the United States and Russia.

All these reservations need to be very carefully taken into account. But none of them is fatal to the proposal. They would, indeed, be fatal to any suggestion of a tightly-knit, mechanistic federation. But that would not, in any case, be the British way of going about the matter. The architects of the British Commonwealth of Nations are familiar with individual susceptibilities. The federalists and the constitution-mongers would be no more in place in designing a closer association in Western Europe than they were at the drafting of the Statute of Westminster. Moreover, the particular reservations that have been mentioned can be directly met. The sort of special relationship that exists between the members of the British Commonwealth does not prevent each of them from seeking the most intimate association with the United States. Moreover, though American policy has departed from isolation, it is unlikely to arrive at specific alliances with individual countries. It may very well be that the closest approach that the smaller West European democracies can obtain to that complete Atlantic Agreement which is their heart's desire (and Britain's), is to enter into a close association with Britain which, without any formal alliance, would, as a whole, concert its policies with those of the United States. A West European entente, so far from being inimical to good relations with America, could be so devised as to be the best means of securing them. Similarly with Russia. No nation has done more than

Britain to bring together the two worlds of Russia and America. Politically and militarily, the Anglo-Soviet Treaty is a guarantee that all local agreements are fully compatible with the wider object. Special relationships between Britain, Scandinavia and the Low Countries would be no more anti-Russian than the Russo-Czech Treaty is anti-British. British policy stands or falls by the attempt to build a world-wide system out of the existing local elements. By giving it their support and adhesion the countries of the western fringe would be advancing, not retarding, the growth of a universal association.

The Moscow and Teheran Conferences with their agreement on the necessity of post-war collaboration will have helped to dispel these uncertainties, but in any sound foreign policy there is always a maximum and a minimum approach. The policy which will best suit the interests of Britain and the western democracies will obviously be one of close military and economic collaboration between the Great Powers together with the regional organisations of geographical and cultural units such as Europe, supplemented by special arrangements between neighbouring states. But if by ill fortune or bad management the wider solutions fail to take shape, this is not in itself a compelling reason for abandoning all attempt at creating various forms of local understanding. Such an attitude would be as illogical as the behaviour of a man who, unable to insure with the best insurance company, refused to take out any policy at all. The western democracies, and Britain itself—are perfectly right to subordinate everything to the pursuit of the best and fullest settlement in which world-wide, regional and local organisations would all have their place. But they must also be ready to maintain any part of it, even if the wider plan should fail.

### The Principles of Trade—II

## The Balance of Payments

THE first article in this series, which appeared in *The Economist* last week, re-stated the basic argument in favour of the greatest possible expansion of international trade. But it reserved for further examination two objections, *prima facie* weighty, against a return after the war to comparative freedom of international trading. The first of these two objections, with which the present article is concerned (the second will be taken up in a later article), can be briefly stated. Has the British balance of payments been knocked so badly out of equilibrium by the war that it cannot be put right by the methods hitherto considered proper and orthodox? It is right and proper that British opinion should be concerned with the British balance of payments. But there is some danger lest that concern should lead to the belief that the embarrassments of the pound sterling are the chief obstacle to world-wide equilibrium. The British problem is indeed severe; but there is no reason to suppose that it is substantially worse than the problems that will face most of the invaded or occupied countries in reconstructing their international commerce. Some of them, it is true, will have much more ample gold reserves and exchange resources than are left to Britain after the process of "scraping the bottom of the barrel" has been concluded. But this does not mean that any of them will find it easy to set up a balance of payments whose current account will be in equilibrium. Moreover, there is the problem of the dollar. Two articles in *The Economist* of November 27th and December 4th, 1943, based on an official American report, reached the conclusion that, in the absence of special steps to prevent it, the post-war American international accounts would be out of equilibrium to the amount of probably between \$1 and \$2 billion a year. This will be a disequilibrium on the credit side, it is true, but it will be none the less disturbing for that.

It would, therefore, be a mistake to fall into the habit of regarding the British balance of payments as the "world's financial problem number one." The real ques-

tion is far wider. It is whether the world's chief trading nations are going to find themselves after the war with their international accounts so widely and intractably out of balance, either on the credit or debit side, that somewhat mild mechanisms for adjustment known as orthodox commerce will not avail to produce a tolerable equilibrium. Of this wider question, the facts of the present position must be taken as only one example.

Those facts are, by now, fairly well known. The British balance of payments, as it stood in the three years before the war broke out, was as follows:—

| BALANCE OF PAYMENTS OF THE UNITED KINGDOM, 1936-38 |     | (Figures are the average of the three years, in £ millions) |     |
|----------------------------------------------------|-----|-------------------------------------------------------------|-----|
| DEBIT                                              |     | CREDIT                                                      |     |
| Imports .....                                      | 930 | Exports .....                                               |     |
| Govt. payments .....                               | 10  | Investment income .....                                     |     |
|                                                    |     | Shipping earnings .....                                     |     |
|                                                    |     | Commissions, etc. ....                                      |     |
|                                                    |     | Other receipts .....                                        |     |
|                                                    |     | Deficit .....                                               |     |
|                                                    |     |                                                             | 940 |

The immediate effect of the war will be to reduce severely the "invisible" items on the credit side. If there were no other elements in the problem, it is probable that there would be a gap (including the pre-war deficit) of at least £200 million on the credit side.

But there are other elements on the problem. If there are to be no severer restrictions on trade than there were before the war—the condition of the problem that is under discussion in this article—it is probable that British imports will be higher than they were in 1936-38. In those years there were, on the average, 1,630,000 unemployed in this country. If reasonably full employment is attained, the volume of consumption will be higher and the volume of imports, if it is allowed to do so, will rise above the pre-war level. Moreover, the terms of trade have, during the war, shifted sharply in Britain's dis-

favour; imports now cost more, relatively to exports, and as long as the world market remains a seller's market, the relationship is perhaps unlikely to alter. And lastly, British exports are necessarily made with imported materials. Every increase in exports leads automatically to some increase in imports; the net gain is smaller than the gross. When all these facts are taken into consideration, the 50 or 60 per cent. increase in British exports which is generally mentioned in current discussion as a measure of what is necessary begins to look like an under-estimate.

This is a gigantic task. For three years now British exports have been neglected—more than neglected, for they have been deliberately restricted by the demands both of British mobilisation and of American policy. Yet the task is not merely to restore them to their pre-war volume, but to increase that volume by half or two-thirds, and to do so quickly. Can it be done?

It would be a mistake to ignore the fact that Britain will start with a number of advantages. The world will be crying out for goods of all kinds, and of the world's manufacturers, Britain has a good chance to get to the market first, without taking any unfair advantages. Most of the competitors—the European countries and Japan—will, in greater or less degree, be devastated and dislocated. The United States, it is already apparent, will be suffering from a very sharp rise in costs of production, almost certainly unaccompanied by any fall in the exchange value of the dollar. Moreover, there is a surfeit of pounds in the world and a shortage of dollars. There is hardly a country in the world that will not find it easier to buy—or at least to make payment—in Britain than in America, and not all those payments need be in reduction of British debts. There is no good reason why Britain should not enjoy a head start. But it would need a gigantic start to achieve, by this means alone, an increase of the proportions that are required.

Much will depend, after the start has been gained, upon whether British exporters are helped or hindered by financial policy. Some of the mistakes of last time will surely not be repeated. It is unlikely, for example, that there will be deliberate deflation at home, or a deliberate overvaluation of the pound sterling abroad. Indeed, the danger is lest public opinion, with too simple-minded a memory of 1931, should insist on putting too low a valuation on the pound. Devaluation of the pound can be of great value to Great Britain when trade is depressed and all the world trying to sell—though even then the advantage to Britain tends to be offset by disadvantages to other countries. But for several years after the war, the conditions will be the reverse—at least in the primary product markets the advantage will be with the sellers, and a devaluation of the pound might do more harm by making British imports expensive than good by making British exports attractively cheap. There are dangers to be avoided in currency policy—those of excessive or badly-timed overvaluation—but it is doubtful whether there is much positive advantage to the expansion of British exports to be gained from tinkering with exchange rates.

### Efficiency and Salesmanship

If the necessary increase in the volume of exports is to be secured it will not be by such mechanical devices, but by more laborious and familiar methods, by the energetic salesmanship of good products, designed to suit the customer and offered at low prices. And the greatest of these is low prices. The doctrine appears to be growing up, almost unawares, that British industry cannot hope to compete on an open basis with other countries. It is a curious doctrine, and is maintained with the utmost inconsistency against both low-wage and high-wage countries. Where we are not undercut by the low wages of the Japanese—so runs the argument—we are undercut by the high productivity of the Americans. This is pure defeatism. It would be just as true to argue that, with good management, we can out-compete any country in the world—the low-wage countries by the skilled use of complex machinery, and the high-wage countries by the cheaper cost at which our policy of importing food and raw materials enables us to sustain a high standard of living.

The real trouble is that too few British business men are trying to compete. In these days, to say that a firm has so increased its efficiency that it can sell at low prices is not to give praise for initiative and enterprise, but to criticise it for breaking the rules of "fair" trading and indulging in the ultimate sin of "cut-throat" competition. Countless examples could be given of this attitude. But perhaps the most striking is the wide acceptance of the ideas known as the World Trade Alliance, which can be briefly described as a proposal that the world market for all goods should be deliberately parcelled out by agreement, with a rather vague addendum that any surplus resulting from this method of distribution should be donated to the poorer countries. This order of ideas has not the slightest chance of acceptance, if only because the mere official proposal of it would be regarded as an unfriendly act in the United States, where private and official opinion is much more concerned with dissolving the existing international cartels than with creating new ones. But what is frightening is the extent to which these ideas have been accepted by British business and British labour. Their defects are obvious. In the first place, international cartellism would merely be a buttress for restrictionism and for the high-profits-and-low-turnover mentality at home. That is its intention, and that is its appeal to the trade unions. It would effectively prevent any interference from abroad with progressive inefficiency at home. Secondly, such a plan would, if it worked at all, stereotype the present pattern of trade for all time and prevent that buoyant development of new opportunities in which is the chief hope for rising world prosperity. And finally, how can an agreed sharing of the market possibly meet the requirements of a country that is forced to expand its exports by 50 or 60 per cent? The only possible basis for an agreed allocation is by reference to the past, or, if that basis is dropped, the "commercial antagonism"—whose replacement by "co-operation" is the chief emotional appeal of the plan—is not abolished at all, but merely transferred from the market-place to the boardroom. It is a phantasy to suppose that markets can for long be allocated by an agreement which ignores the facts of competitive relationships. As has been remarked in *The Economist* on an earlier occasion, "the producer who could extend his sales in open competition will be just as insistent on a larger share as the best-armed brigand at a robbers' share-out." If Britain is in a strong competitive position the World Trade Alliance is unnecessary. If Britain is in a weak competitive position, it would work, if at all, to our disadvantage. The popularity of such proposals shows how far the leaders of British industry and labour—or at least those of the older generation—are from realising their duty to the community.

### The Limits of Orthodoxy

It is thus difficult to give a clear answer to the question posed at the beginning of this article. If the competitive advantages and disadvantages of Britain's post-war position were objectively assessed, and if there were a determination on the part of Government, management and labour to remove the disadvantages, and to exploit the advantages with all possible vigour and resolution, then it might be reasonable to conclude that the British balance of payments could be brought back to equilibrium before very many years have passed, without any further restriction of imports. It might even be possible to hope for the restoration of a small favourable balance, so essential if the country's reserves are to be rebuilt. But it is clear that there would, even in the most favourable circumstances, be an interim period while this export drive was succeeding. Additional business measured in hundreds of millions of pounds cannot be secured overnight. And if the prevailing climate of opinion in the governing circles of British business is unchanged, the interim period may be of very long duration.

For as long as this interim period lasts, there are only two "orthodox" means of balancing the British accounts. The first is by borrowing; the second is by restricting British imports. The acceptance of comparatively small, short-term credits by Britain would be legitimate, though

hardly pleasant to contemplate. But borrowing on the scale and for the duration that might be needed would obviously be improper for a developed country with creditor habits. Restriction of imports, on the other hand, would be equally bad. Some sectional interests, it is true, would be overjoyed at the prospect, and many of the tears shed so frequently over the plight of the export trades are obviously of the crocodile variety. But for the community as a whole a sharp restriction of imports means (as the war has demonstrated) a sharp reduction of the standard of living. There are very few "unessentials" that can be cut out of the import list: in 1938, food, materials and oils amounted to 80 per cent of the total. And, in any case, the restriction of British imports, whether essential or unessential, would be a blow to international trade as a whole, which might well react in its turn on the prospects of exporting.

One is therefore forced to the conclusion that there are no means—at least for a long time to come—of balancing the British accounts that are both orthodox and non-restrictionist. In this particular case, a strict adherence

to the methods deemed orthodox by, for example, Mr Cordell Hull and his school of thought, would lead directly to a restriction, not to an expansion, of international trade. On this score, then, the case is made out for an exploration of the alternatives. There are, in substance, two alternatives. One can be called "unorthodox multi-lateralism"—that is, the search for hitherto untried methods of preserving the world-wide unity of international trade. The Keynes and White plans are attempts of this character. The other is bilateralism or regionalism—that is, in its extreme form, the reduction of international trade to two-sided barter, or, in a less extreme form, the creation of *blocs* or regional groupings, the members of which conduct trade among themselves on terms different to those they accord outsiders.

The next article in this series will examine the relationship between full employment policy and international trade, in the attempt to discover whether or not there is reason on this score also to conclude that the orthodox rules are inadequate. The series will then turn to the alternatives to orthodoxy.

## The Approaching Budget

THE main interest of the December 31st Exchequer return, which is summarised in the table at the foot of the page, lies in the evidence it provides of a flattening-out of the curve. Expenditure on Supply Services (which include almost everything except the service of the debt) was actually lower by £40 million in the fourth quarter of 1943 than in the fourth quarter of 1942. The figures of expenditure on Supply Services, by quarters, from January 1, 1940, are as follows (in £ million):

|                      | 1940  | 1941  | 1942  | 1943  |
|----------------------|-------|-------|-------|-------|
| January-March.....   | 913   | 1,137 | 1,238 | 1,505 |
| April-June.....      | 613   | 985   | 1,198 | 1,304 |
| July-September.....  | 875   | 1,111 | 1,229 | 1,305 |
| October-December.... | 1,012 | 1,168 | 1,364 | 1,324 |
| Year.....            | 3,413 | 4,401 | 5,029 | 5,438 |

These figures are not strictly comparable throughout. For example, the passage of the American Lend-Lease Act in March, 1941, led to a substantial reduction in British expenditure in the United States. Similarly, the introduction of the Canadian Mutual Aid scheme early in 1943 led to lower British expenditure in Canada. But Lend-Lease from America does not explain a decline in expenditure between 1942 and 1943, both of which were Lend-Lease years, and the effect of the Canadian transfer is not enough by itself to explain the trend of the British figures. The trend can best be seen by comparing each quarter with the same quarter of the previous year:

|                   | 1941 | 1942 | 1943 |
|-------------------|------|------|------|
| January-March.... | +224 | +101 | +267 |
| April-June.....   | +372 | +213 | +106 |
| July-September..  | +236 | +118 | +76  |
| October-December  | +156 | +196 | -40  |

Too much should not be deduced from a single quarter; but it looks as if the peak—or rather the plateau—of British war spending has been reached. The total ordinary expenditure for the full year, of which three months are still to come, looks like amounting to about £5,825 million, and it may be that the Chancellor of the Exchequer will not have

to budget for much more than £6,000 million for next year, even on the assumption of continued maximum fighting. For those who like their statistics in daily form, it can be said that the rate of total ordinary expenditure in 1943 was £15.9 million per day, and that the probable "plateau" rate will be about £16½ million a day. These figures presuppose that there is no further decline in the value of money in terms of the things on which the Government spends.

The revenue figures, as is usual in wartime, toil painfully in the rear of the expenditure. Nevertheless, it is apparent that the buoyancy of the revenue has once again been underestimated, though not so badly as in recent years. Income-tax was estimated to produce £168.2 million more in the full twelve months and, with the vital three months still to go, already shows an increase of £106.7 million. NDC and EPT show a combined increase of £105.3 million, compared with an estimated rise in the full year of £122.5 million. Customs receipts have already provided within £2 million of the expected increase, and Excise duties show an increase, in nine months, not far short of double the estimate for the whole year. This under-estimation, it should be remarked, is not to be ascribed to conservative budgeting, but, on the contrary, to over-optimism in assessing the extent to which public spending and consumption can be kept down. The increase in the total revenue, which was expected to be £87.7 million in the year, is already £70.7 million. It is more difficult to estimate a "plateau" of revenue than of expenditure. Total ordinary revenue this year may be about £2,950 million. There should be a further "natural" increase next year, without any changes in rates of taxation, of perhaps £200 million. The transition to "pay-as-you-earn" will increase the yield of income-tax by an amount that is difficult for the outsider to guess, but is probably at least £50 million. In very rough and round figures, the "plateau" of total war is represented by tax revenue of £3,200 million and Government expenditure of £6,000 million, against a net national income which may be in the neighbourhood of £8,500 to £9,000 million.

|                      | REVENUE (£ millions) |                   |                                |                       |                  |                      |

## NOTES OF THE WEEK

### From the Dnieper to the Dniester

The first week of the New Year has been a black week for the Wehrmacht. In the course of it Mannstein's armies have been dislodged from the outer fringe of the Kiev salient which still held in the last days of December; and Vatutin's, once, has assumed tremendous momentum. Three main thrusts by the Russians can be discerned so far. In the north they have swept forward from Korosten through Olevsk and Novograd Volynsk towards the old Polish frontier, which has now been crossed—presumably only by advance guards—at several points. In the centre they have retaken Zhitomir and spread westwards towards the important railway junction of Shepetovka, on the Russian side of the frontier, and southwards towards the Ilichev hedgehog, which has now fallen to the Russians. To the south of Kiev the Russians have captured Byelaya Tserkov, a key position, from which they have struck towards Vinnitza and the all-important Zhmerinka junction on the Lvov-Odessa railway in the south, and from which they may be able to unhinge the German army to the south-east, inside the Dnieper bend. Of the many blows, which have now thrown some of Mannstein's divisions into confusion, those converging on Vinnitza and Zhmerinka are of the greatest consequence for the whole campaign. If the Lvov-Odessa line is cut at Zhmerinka and, even more, if the Russians succeed in reaching Mogilev on the Dniester—only fifty miles away from Zhmerinka—then the German armies will have to pay a disastrous penalty for their stubborn and prolonged clinging to the Dnieper bend. At best, they will have to fight their way out, either by cutting the Russian ring somewhere to the north of the Dniester or else by trying to escape through the corridor between Odessa and the Carpathians into Roumania. An even greater disaster may befall them if, encircled on so gigantic a scale and spread over the distances from the Dniester to the Dnieper, they lose their coherence and capacity for orderly withdrawal.

But so far no signs have appeared of any radical disintegration in the German ranks. The possibility of a German counter-thrust from the upper Bug—where large German forces are reported to have been massed—cannot yet be ruled out. The repetition of a "battle of encirclement and annihilation" on the Stalingrad pattern may not seem very likely, if one considers the size of the German forces and the distances involved. On the Volga, the Russians encircled von Paulus with three hundred thousand men, left without any supply lines by rail or road. The encirclement of about a million men inside the Dnieper bend and in the Ukraine presents a vastly more difficult task, so long as the enemy does not suffer an irretrievable breakdown in morale. But all that Mannstein can now hope for is to stave off disaster, and to make a relatively orderly retreat from the Dnieper to the Dniester.

### South and North

While the fighting in the south has carried the Russians very far towards their objectives, no such spectacular results have been achieved in the north. The Nevel-Vitebsk wedge has not yet been driven deeply into the German defences which cover Latvia and Lithuania; and Vitebsk is still in German hands. The synchronised timing of offensive thrusts all along the front, such as the Russian High Command was able to achieve in the course of last year, can possibly no longer be expected. North and south are now separated by the wide stretches of the Pripiet Marshes, which make the shifting of massive forces from sector to sector very difficult, if not impossible. Faced with this natural obstacle to co-ordinated fighting all along the front, the Russians have so far concentrated on achieving decisive results in the south. There are probably economic as well as political reasons for this. White Russia in the north is poor in industry as well as in agriculture. Politically, victories in the south promise more important and more immediate gains than those which may be expected in the north. A Russian advance to the Carpathians is sure to throw the whole of

the Balkans into a state of confusion, and to bring into play pro-Russian sentiment among the Balkan peoples. The attitude of the Baltic nations towards the advancing Russians cannot be forecast with the same degree of confidence. On the other hand, the German defence there is likely to stiffen as the Germans approach their native soil in eastern Prussia, at least until the Second Front. The fact that the northern and the southern sectors of the front are now separated by the Pripiet Marshes makes the problem of relative strength in manpower even more important than it was before, since the Russians no longer possess the freedom to shift reserves on which the achievement of local superiority may often depend. General Dittmar, in his melancholy survey of 1943, spoke of the heavy casualties of both the Germans and the Russians; but he admitted that in spite of their allegedly heavier casualties, the Russian had maintained their superiority in total numbers. How wide the margin of that superiority may be now cannot be conjectured. The opening of a front in the west would widen it enormously.

### The Last Opportunity

On January 4th, the advance guards of Vatutin's army crossed the 1939 Polish frontier. Until the Soviet Ukraine proper has been cleared of the enemy no deep Russian penetration into Polish territory is probable. As yet the crossing of the frontier has political rather than strategic significance. It has brought the Polish-Soviet dispute back into the foreground. On January 5th, the Polish Government issued a declaration in which it stated its desire to resume relations with Russia. The statement did not make it clear whether the Polish Government still considers recognition by Russia of the territorial status of 1939 to be a condition for the

## ACT OF UNION for the Common Good.

Two great building societies — The Abbey Road and the National — have united. The immense resources of the newly formed Abbey National Building Society are pledged to the service of those millions who, when peace comes again, will wish to build their new lives on the old sure foundations of home ownership.

## ABBAY NATIONAL BUILDING SOCIETY

Joint Managing Directors:  
Sir Harold Eellman, J.P., L.L.D. R. Bruce Wycherley, M.C., F.C.I.S.

Head Office:  
Abbey House, Baker Street,  
London, N.W.1

Chief City Office:  
National House, Moorgate,  
London, E.C.2

LARGE RESOURCES AVAILABLE TO ASSIST HOME OWNERSHIP

resumption of relations. If this is the case, then the statement offers no prospect of the renewal of diplomatic contact between Poland and Russia. The official Polish press has interpreted the statement in a way which leaves no room for compromise; and in the light of this interpretation, the Polish Government's instruction to the underground movement to avoid conflicts with the Soviet army, and to co-operate with it only if and when relations between the Governments are resumed, assumes the highest significance. While the sincerity of the Polish Government's desire to avoid conflict cannot be questioned, an attitude of non-co-operation is almost certain to lead to an open clash. A state of "neither war nor peace" between Russians and Poles can hardly be maintained once the war against Germany is being fought by Russians on Polish soil. True, the possibility of a clash between the Polish underground and the pro-Soviet guerillas is not likely to arise very soon, since in Eastern Poland the pro-Soviet guerillas, now helped by and helping the Russian army, seem to be sole masters of the situation. But as soon as the Russian armies reach the heart of Poland, a very grave crisis may begin. The time between the crossing of the frontier by the Russians and their advance into central and western Poland provides perhaps the last opportunity to forestall disastrous consequences.

### Industrial Generalisations

The Conservative Sub-Committee's report on "Work: the Future of British Industry," which should not be confused with the unofficial publications of the Tory Reform Committee, is none the worse for being, both in origin and gist, a frankly party document. Largely the work of Mr Henry Brooke, M.P., the Sub-Committee's chairman, it sets out to do two things: to show the measure of agreement that nowadays exists about industrial and economic policy between Conservatives and progressive thought; and to prove the prior claims, in industrial and economic practice, of private initiative and individual enterprise. Inevitably, it is for the most part in very general terms—a "statement of principles": the small business is an essential part of national life; industry exists to serve the consumer; no country has a greater interest than Britain in overseas trade; the outlook for Britain's balance of payments is critical; efficiency and technical research and education are essential; every worker in industry should have a status and feel responsible; industrial management is all-important; trade unions are a part of the industrial structure, but workers should be free to join or not. Few but the most partisan could quarrel with these aphorisms; but they add up to an attitude rather than a policy. On the specific issue of the relations between industry and the state, one of the two most important passages in the report, the Sub-Committee's views are more clear cut. Except for control over industrial location to prevent extremes of local congestion or depression, they are opposed to direct state control, interference or ownership when the transition from war to peace has been accomplished. They regard nationalisation as necessarily inefficient, and public corporations as characteristically authoritarian, irresponsible and unenterprising: "Private enterprise best serves public purpose." There is no attempt to separate activities which, for social or other reasons, might best be publicly run from the majority which will be best left entirely in private hands—within the frame of public policy. Against such evidence, the possibility of private "unenterprise" is barely admitted, though inefficiency, lack of initiative, waste and restriction, by either employers or trade unions, are condemned.

### The Case for Disagreement

The Conservative Sub-Committee's report is much more fair and open-minded than most previous pronouncements from Conservatives and industrialists, and much less pessimistic about the outlook for Britain. But very many of the main issues of policy are blurred by the immense effort made to show where Conservatives agree with other people, rather than where they disagree. The fact is that political discussion is at present weighed down by a monstrous fallacy. In the past, progress has been made, it is said, by compromise, by the highest common factor of agreement. This is not really true, and the consequences can be a deal of political cant. Constant compromise there is in the process

of legislation and Parliamentary discussion. But the main issues of policy cannot, or should not, be compromised—which means, in the last resort, left unsettled. The corn law discussions of a hundred years ago did not end in a compromise, but in the repeal of the corn laws; the controversy between free trade and protection a generation ago ended in a complete victory for free trade. Compromise in the British lexicon of politics does not mean doing nothing with which other parties would violently disagree; it means accepting the policy of the majority after the electorate, given the issues to be decided, has chosen which party is to be the majority. The most important part of the process is for all the issues, and all the disagreements about them, to be fully and frankly revealed.

### Policy for Work

Much the most important passage in the Conservative report on industry deals, as its title suggests, with post-war employment.

Industry is more than a producer of goods; it is also a means of livelihood. The people of our country are not concerned only to see the goods there in shop windows; they are vitally interested in having a job and therefore, earnings, and therefore, the means to buy the goods. The main result they ask just now of Government policy is that it should enable British industry to provide steady employment for all who depend on jobs in industry for their daily bread.

The view is stated that the solution to unemployment is primarily to be sought internationally; that unemployment and, therefore, full employment are a world problem. The first line of attack proposed in the report is by means of international agreements and agencies to stabilise currencies and prices, and to provide credits to countries with heavy adverse balances of payments, or in need of long-term development. Correspondingly, the first item in a national employment policy, in this view, should be the promotion of exports, by the stimulation of private industrial efficiency and with skilled Government assistance—not, it should be noted, subsidies. This emphasis upon exports in employment policy is open to some question. The maintenance of employment in the export trades will be of prime importance; but the first purpose of exports, in national economy, is not to provide work, but to pay for imports in the cheapest possible way, that is, among other things, with the smallest possible use of labour—which is, of course, enough in itself to give export policy a first priority. But employment, in current theory, depends not simply on overseas trade, but upon the balance between savings and investment, in which the balance of overseas payments is one important factor. The report does admit this point among its second-line measures. It does not approve large-scale public expenditure on capital projects; but it calls upon the Government for policies to encourage private investment when it shows signs of falling short of the total required for full employment, and to discourage it when inflation seems likely. Moreover, in order to keep up consumption as part of full employment policy, the report gives its backing to an interesting and valuable proposal "for financing the bulk purchase of universally desirable household goods"—boots and shoes, furniture, refrigerators and all kinds of labour-saving equipment. Among the other measures proposed is the adjustment of taxation to stimulate expenditure on plant and machinery, for the sake of efficiency as well as employment, a proposal to which the report, in more than one passage, rightly attaches great importance. On balance, however, it is doubtful whether the Conservative Sub-Committee has allowed itself, because of its somewhat indiscriminate bias against direct state action, to understand the real employment problem. In the determination to prove that, where they conflict, maximum employment is more important than maximum output, a serious confusion arises. The fact is that, in the first place, employment is a national, and not an international, problem; it can be provided, at some level of welfare, by domestic contrivance. But the standard of living, the possible level of wealth and welfare, does, admittedly, depend, especially for a small island like this country, upon overseas trade, upon the ability to import and pay for foodstuffs and raw materials, upon the share that can be taken in the international division of labour—and it is very welcome, despite the lack of balance in their whole argument, to find these Conservatives willing to depart so boldly from traditional, Little Englander and protectionist tenets.

### Bolivian Dilemma

There is still too little news from Bolivia to judge how firmly the new regime has taken root. It is clearly made up of extremely diverse elements and it is not certain that the Fascist group will win the upper hand. A report to the *New York Herald Tribune* says that, although the new regime includes such notorious pro-Nazis as Augusto Cespedes, Secretary General to the Government, Gustavo Chacon, Minister of Economy, Carlos Montenegro, Minister of Agriculture, and Antonio Ponce, Minister of Public Works, some other members, including President Villaroel and the Ministers for Defence, Education, Foreign Affairs and Labour, and the "brains of the Government," Victor Estensoro, have clean records. Indeed Estensoro's sympathies have been strongly Left. The eagerness of the new Government to secure recognition from the United States and the other United Nations may mean either that its own internal position is weak or simply that its sympathies are with the anti-Axis front. The country is, after all, at war with all the Axis countries. Another element in its eagerness is the total dependence of its economic life on the United States and Britain. The *Herald Tribune* report states that in 1942 the United States took 66 per cent of Bolivia's exports, while 32 per cent went to Britain and only 2 per cent to Argentina. Bolivia's offer to give the United Nations a monopoly of quinine supplies was proof of good will and, incidentally, since it entailed a ban on exports to Argentina, a diplomatic setback for the Argentine Government. Thus the evidence is sufficiently contradictory to present the American and British Governments with something of a problem.

The case for recognition is that the new Government has guaranteed to honour all its obligations as a United Nation, that it has made friendly economic gestures, that it includes men of good will, that it may give the Bolivian workers better treatment—a matter over which the United States Government has shown some concern—and that, in any case, non-recognition would weaken pro-Allied and strengthen pro-Axis elements. Working against recognition is the fact that the experience of the United Nations in the case of Argentina was very unfortunate. Taking its guarantees at their face value, the Allies recognised the Ramirez regime, which has since followed the same old obstinate policy of isolated neutrality and has built up a full-blown Fascist regime. Bolivia might go the same way, and the United States would find that it had recognised a government whose ideology it detested. The arguments against recognition have been slightly strengthened by Argentina's decision to afford full recognition, although it obviously increases the danger of Bolivia slipping over to the Argentine camp. The United States Government can, of course, put on the economic screws; but is loth to do so, because such a move would be exploited by Axis sympathisers as "Yankee imperialism," and be used for propaganda in other Latin American States. The position of the United States is very delicate, and Mr Cordell Hull is probably grateful for the escape clause provided by the Advisory Committee for the Political Defence of the Western Hemisphere. This body, set up as a result of the Pan-American Conferences, has suggested that until the end of the war all the State members shall agree not to recognise any regime established by force, unless they have had prior consultation with each other. This will enable the United States to concert its action with the other republics.

### The Coal Cut

In order to maintain sufficient supplies of coal for military operations on the Continent, the Minister of Fuel has decided to impose a cut of 10 per cent on industrial users. At the same time, quantities available to domestic users are restricted during January to a maximum of 4 cwts in the south and 5 cwts in the north. For some unknown reason, the Ministry is unwilling to produce any figures to show the recent increase in consumption of gas and electricity, which is officially said to be "alarming." The Ministry emphasises that the restrictions on domestic use do not represent a ration, but a maximum consumption; and renewed appeals for voluntary restriction are being made. The new cut is very different from the original scheme for rationing proposed by Sir William Beveridge. It makes no provision for rationing the domestic use of gas and electricity. The householder whose house is warmed and

lit by gas or electricity will be much better off than if he had an old-fashioned grate, unless he makes most gallant cuts of his own free will. The reduction in supplies of coal for industry, after the large voluntary cuts already made, is a very grave step, and may have effects on war production. However necessary the cut may be, in view of declining production, it is difficult to avoid the familiar comment that the present situation could have been avoided if an all-round and equitable rationing scheme had been introduced eighteen months ago. This winter may well be much colder than last, and, with new war demands added, on transport as well as coal, the optimism about stocks expressed by Government spokesmen in the coal debate last October may prove to have been premature. Industrial users are being encouraged to use coke, coke breeze and anthracite dust, which are not affected by the cut, and to exercise the utmost economy in coal utilisation. The use of alternative fuels, increased economy and the increased use of outcrop coal, whose production is to be greatly expanded this year, will help to bridge the gap. But little immediate contribution to production can be looked for from the young recruits now entering their training centres.

### Teachers in Training

The Education Bill, which will take up much time when Parliament meets again, remains a blank cheque, whose value may still be much smaller than hoped for, until definite plans have been laid for the kind of subjects to be taught in the new schools and for the recruitment and training of teachers. The report of the McNair Committee on teacher's training has been held up by a fundamental dispute on the functions of training colleges and universities. Appointed in 1942, the Committee was to have reported before the end of last year; now it is merely hoped that it will report before Easter. Teachers' training before the war was unsatisfactory. Many training colleges, mainly residential, were too narrow in outlook and atmosphere, and inappropriate for students of over undergraduate age, many of whom will be needed to fill gaps when the war is over. Many universities, depending much, in most cases, upon grants to teachers in training, regarded their education departments too much as side shows. In theory, the training colleges produced elementary school teachers and the universities secondary school teachers. In fact, secondary school teachers of no high quality were over-produced, and many went, disappointed and poorly prepared, into the elementary schools. There will be a sudden extra demand for teachers to make possible the raising of the school-leaving age in 1945 and the subsequent reforms at every stage of schooling; an extra 80,000, it is estimated, will be required, with 10,000, instead of 7,000, new candidates for training every year. The Board of Education has prepared, with the local authorities, an emergency scheme to meet the first call when the war is over, using local and even military facilities as far as possible. But, even if there were not this extra demand, there would be need for reform of both the training colleges and the university education departments. The need is to raise the skill and status, as well as the pay, of teachers; and, to make this

### INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

possible, training colleges must become much more than technical boarding schools. They must cater for students with much more experience of life than pupils straight from school, and they must provide for much greater contact during training with the practical problems of teaching. At the same time the universities must take a vastly broader view of their responsibilities in the training of teachers. At present the quality of university education and the quality of teachers' training are mutually depressed.

### Gaps among the Women

The news that volunteers, in the low age groups and outside certain reserved occupations, are to be accepted for the Women's Services is not surprising, and means no change in policy. There is no intention of expanding the Women's Services again, and the manufacture of aircraft and equipment still has first claim on female labour. The problem is rather to keep the Women's Services up to strength. In the stringent manpower situation of last year, when a very large transfer and recruitment of women for aircraft work was called for, the Women's Services were not even given a sufficient allocation to cover wastage from ill-health and other reasons. This had two unfortunate effects. First, numbers inevitably tended to dwindle. Secondly, because of this, the regulations allowing discharge for compassionate and other grounds were tightened in some instances to the point of harshness; there have been several cases of women being kept in service against the advice of doctors, commanding officers, welfare societies and other persons well qualified to know individual and family circumstances. If sufficient recruits are now found to ease this painful situation, which has arisen through no fault of the military authorities themselves, the efficiency of both the Women's Services and the men's formations they serve will be reinforced.

### The Biggest Depressed Area

Recent statistical analyses have shown how badly England and Wales compare with other countries, particularly New Zealand and Holland, in the reduction of infant mortality. Yet the comparison with Scotland is favourable. There the infant mortality rate, on the five-year average of 1934-38, was as high as 77 per 1,000 live births, compared with 57 in England and Wales and 32 in New Zealand. Scotland, in fact, had the highest rate of seventeen countries, including the Dominions, the United States and all the countries of Western Europe except Spain and Portugal. Its place has not always been so bad. In 1880 it had a better rate than England and Wales or Holland, but since then, it has only been able to achieve a reduction of 40 per cent and has consequently fallen well behind. These shocking facts are found in a report\* of a sub-committee of the Scientific Advisory Committee of the Department of Health for Scotland, which sat under the chairmanship of Sir John Boyd Orr. The report also points out that Scotland would need to reduce its neo-natal mortality by one-third, and its mortality between the ages of one and twelve months by three-quarters, to stand comparison with the best countries; that, whereas New Zealand's general rate (32) is comparable with the rate shown by Class I in the Registrar-General's classification by father's occupation for England and Wales, Scotland's general rate compares with that of Class V, and its neo-natal rate is even worse. Thus, infant mortality as a whole in Scotland has lagged behind the rate shown by the poorest working classes in England and Wales. Investigating the causes for Scotland's dismal record, the committee emphasised, first, that infant mortality is high because a large part of the population "lives under poor housing conditions and in poverty." In a housing survey of 1935, the percentage of families found overcrowded in Scotland was 22.5, compared with 3.8 in England and Wales, and the percentage living in overcrowded conditions is still higher. An investigation by Sir John Orr in 1936 showed that 10 per cent of the population of Great Britain had an income per head of less than 10s. a week, which meant that less than 4s. was spent on food. A similar investigation in Scotland showed that twice as high a proportion of the population is in this income group. The effects of poverty on the mother's diet during pregnancy and after are stated to be one of the prime causes of infant mortality. Thus, the two chief recommendations of the committee are better housing

In Scotland the housing position is so bad that it cannot wait on formal town planning,

and an improvement in diets such as was recommended at the Hot Springs Conference. It further recommends an extension in the child welfare services, in antenatal clinics and in maternity hospitals; Scotland's ratios of children and mothers attending clinics and of health visiting again compare very unfavourably with those of England and Wales, and in the latter the expenditure per birth in 1935 was £5.2, whereas in Scotland it was only £3.5. All these statistics, in fact, are further proof of the poverty of Scotland. Its infant mortality rate is a true indication of its position as Britain's biggest distressed area.

### Post-war Priorities

A common view in official circles is that plans for long-term reconstruction must give way to plans for demobilisation. In mere chronology, of course, this is true; the first task will be to release and employ serving men and war workers. Food, work and homes for the first post-war months come first. In policy, however, this distinction, used as it may be to excuse lack of thought for a longer period—is very dangerous. It may be comparatively easy, as the experience of 1918-19 showed, to find some sort of work at once for demobilised soldiers. The most important point is that this work should be lasting; and this cannot be secured unless planning for demobilisation is itself only part of planning for the most productive possible national economy in the first postwar decade at least.

### UNRRA Reports

Widespread demand for some comprehensive survey of the programme outlined by UNRRA has now been met, to some extent, by the very belated publication of the resolutions and reports adopted at Atlantic City in November. The value of the White Paper lies more in the collection and accessibility of the decisions arrived at than in any new light on the nature of the proposed system of relief and rehabilitation. The same points, extracted from a diversity of sub-committee reports and statements in *The Economist* on December 11th last year (page 778), are here sorted out and emphasised. The essential principles of limiting assistance to immediate needs for consumption; of subjecting UNRRA's activities to the consent and control of the military authority; of establishing effective systems of rationing and price-control; of distributing supplies free of political discrimination; and of making liberated countries pay as they can, without assuming the burden of an enduring foreign exchange debt—are stated plainly. Together with the kind of methods proposed to effect relief and rehabilitation, however, they serve to underline the nature of UNRRA as a purely temporary instrument, establishing merely the pre-requisites of economic order and stability, without which no comprehensive scheme of reconstruction, national or international, can be contemplated. That UNRRA itself is aware of its strictly limited scope is important, and much to be welcomed; but it is more important still that governments and peoples alike should also recognise it, and should not fall into the error of quieting their consciences with the sop of relief without deciding upon more radical economic reconstruction. Otherwise UNRRA may gradually be saddled with more responsibilities than its powers and machinery can bear, and problems will be left untackled for want of a more adequate instrument of international government.

### Boom in Betting

Previous estimates of large increases in the volume of betting on sporting events since the outbreak of war have now been supplemented by detailed data relating to greyhound racing. The Churches' Committee on Gambling has issued hitherto unpublished figures on totalisator returns on the principal dog-tracks in the country, which undoubtedly show a boom in this national amusement. Not unnaturally, the increase is greatest in industrial areas, where temporary increases in population and employment are bound to have repercussions on the volume of money spent on amusement as on other, essential, consumption.

goods. Compared with an increase in London of only 7½ per cent, Birmingham is representative of industrial districts in its increase of 124 per cent. Nevertheless, London, with its 19 tracks out of a national total of 92, still shows the largest regional turnover, and over half the tote betting in the country is staked on London tracks. Side by side with the boom in dog-track betting should be remembered the undoubted increase in off-the-course betting on horse-races, especially in factories and workshops, together with a probable rise in the actual number of people gambling on football pools. Considered in relation to the general rise in personal consumption, however, which is also concentrated in the same industrial areas, the total increase in greyhound totalisator receipts since 1938 is not astonishingly high. In fact, the proportionate rise in these receipts, spread over the whole country, is only a third, compared with the increase of over 50 per cent in personal consumption expenditure between 1938 and 1942, estimated in the 1943 Budget White Paper. Taking the volume of betting as a whole, it seems unlikely that the anxiety of the Churches' Committee for the moral welfare of the nation need be heightened, nor those concerned with the direction of a war economy unduly disturbed, by any statistics of a dog-track boom. The restrictions on football pools, and the gradual reduction of horse-racing events, will necessarily increase the volume of money

spent on other forms of betting. In the case of dog-racing, where the number of races has been cut by 50 per cent, where races are held out of normal working hours, and where the wastage of labour and food is obviously less than with either pools or horse-racing, it seems unreasonable to carp overmuch at any recorded rise in its popularity.

### Shorter Notes

The first part of the transfer of "common interests" from France to the Syrian and Lebanese Governments was concluded this week when the French handed over the Customs tobacco monopoly. Among the other "common interests" which are to be transferred are all public security except the Army; public works; economic and financial departments; inspection of posts and telegraphs; the legislative department; and the control of quarantine and of the tribes. Other transfers will be considered later.

In an article on "India's Economic Needs" in *The Economist* of December 18, 1943, on page 805, it was stated that "the currency in circulation in India has risen from Rs. 60 crores in August, 1939, to Rs. 800 crores last month." The first figure should have read, "Rs. 169 crores."

## AMERICAN SURVEY

### Misgiving on Thanksgiving

(From Our Washington Correspondent)

#### Thanksgiving Day

THIS year, a fair part of the domestic Thanksgiving turkey supply flew the coop of price control. The symbolism of the American holiday makes that fact tempting to the moraliser.

Because the means were in sight to carry out their main objective, that of living through the winter, the members of the Plymouth colony declared a day of Thanksgiving after their harvest of 1621. Subsequently, a confusion arose between means and ends: having turkey-and-all-the-fixin's became the main purpose of the day. (And in the later 1930's the turkey-and-fixin's were themselves pushed back a week by the President—to what the Republicans termed Franksgiving in response to merchandisers' desire to increase the interval for the display of Christmas goods.) This Thanksgiving time, when members of American families were scattered around the entire world, the relation between the turkey and the objectives became pertinent again.

As to those in the Armed Forces, the news has been that they are progressing toward their objectives and their turkey has been progressing toward them. Under an order of the Food Distribution Administration, sales of turkey were restricted to the supply branches of the Armed Forces until ten million pounds should have been acquired. When the limitation was terminated on October 25th, the military situation in regard to turkey was evidently well in hand—a national magazine previewed the results by a cover showing a soldier, eyes popping and mouth stuffed, waving a drumstick of non-military origin.

But in Washington on Thanksgiving eve, the District of Columbia OPA office was wailing for help from the OPA's of surrounding Maryland and Virginia. The marketmen of the adjacent counties had been up-country the preceding week-end, gathering turkeys till their yards were a-gobble by Monday and Tuesday when the killing-and-dressing process began. The plump yellow piles of finished birds had hardly begun to mount when men drove up in cars. They were not from the neighbourhood families who regularly engaged a turkey a few days ahead. They took twenty and thirty turkeys at a time. Washington market receipts were correspondingly lightened; the number of birds sold under ceilings correspondingly reduced. Apparently the country did a much better job getting turkey to the military

than handling the distribution of the civilian supply.

That is the point at which the story turns into a moral, for the war production records of the past months have been made possible by a substructure of civilian economic relationships that is now cracking under accumulated strains. In the application of the various civilian wartime controls, exceptions are disproving rules with some regularity.

The wages-and-prices spiral is being given a new permanent. The House has gone on record against the subsidy method of keeping down food prices—the Bill continuing the Commodity Credit Corporation, whose Section 3 prohibits subsidies in any form, was passed by a 278-117 vote. Section 3 would put an end to the present subsidies of dairy products, butter, meat, etc. It would forestall a possible subsidy intended to keep the price of bread at 10 cents a loaf, to maintain the price of wheat at least where it is, and still to relieve the present pinch on the people between the producer and the consumer. The result of suspending existing subsidies is estimated as a rise of about 7 per cent in food prices. A presidential veto is anticipated if the Bill should pass the Senate in anything like its present form, and it is also anticipated that the veto would be sustained. That would leave the whole question to be dealt with again in time to prevent the CCC automatically expiring with the last stroke of December 31st.\*

Statistics on what has happened to prices are these: As of October 15th the Department of Agriculture's general index of farm prices stood at 116 per cent of "parity"; as of the same date, the Department of Labour's cost of living index showed a rise of 23.4 per cent over January 15, 1942; by items, food was up 41.3 per cent, clothing 32.1 per cent, rent 2.9 per cent, fuel-electricity-ice 7 per cent, house furnishings 26.4 per cent, miscellaneous items 15.4 per cent.

Why did an addition of some 7 per cent to the first of these items not seem formidable to Congress? First, because the consumer interest rarely gets organised before the eleventh hour. The High Cost of Living, or H.C. of L., a strong issue of the political life of Wilson's day, will doubtless put in an appearance in time for next year's campaign—articles captioned "The White Collar Burden"; "Plight of Nation's Unorganised Workers in Face of Rising Living

\* Editor's Note. As the Senate adjourned without taking any action, the subsidy programme has been given a few weeks' grace.

\* "Infant Mortality in Scotland." 1s. 3d. net.

Costs"; "How Income of Group Compares with that of Factory Employees, Farmers" have already begun to make prominent space. But the subsidy fight was a conflict between the factory employees and farmers. The commercial farm bloc gathered Republicans and Conservative Democrats and made a successful push against labour and the New Deal.

The anti-labour appeal of the farm bloc took both a specific and a general form. Commercial farm constituents, operators on a scale large enough to make them employers, were specifically aware that the farm wage rate index, which averaged 118 between 1935 and 1939, stood at 272 on October 15th of this year; wages-with-board jumped from \$26.00 to \$65.22 in that interval. With this going on, they argued, why keep the lid on farm prices? A broader group of constituents opposed subsidies less because the commercial farmers didn't want price ceilings than because organised labour did. A vigorous drive by Labour to tie wages up to the rising cost of living is well advanced in the planning stage—the time for renewal of contracts in the automotive industry, for instance, is nearly at hand.

In turn, the recent rail wage increase is an incentive to the railroads to raise freight rates; over large segments of industry, increased costs will come back to the public again in the bills for war contracts made on a "cost plus" basis.

Behind the Little Steel formula, which has tried to freeze both wage rates and the cost of living, was the President's speech of April 27, 1942, which said that to prevent inflation, concurrent action was required on the following seven points: (1) Taxation, to provide revenue and control profits; (2) Ceilings on prices and rents; (3) Wage stabilisation; (4) Farm price stabilisation; (5) War bond purchases; (6) Rationing of essential scarce commodities; (7) Restriction of credit. The present situation on the first of these points illustrates the difference between current progress on the military side of the war and current ineffectiveness with regard to the civilian structure that makes such progress possible. The Treasury urges a \$10½ billion tax bill this year. The Congress is talking, still vaguely, about something in the neighbourhood of \$2 billion. The probability is thereby increased that mink coats will lose their traditional status as symbols of the wages of sin and come to signify merely the wages of war production.

In one sense only can these developments—or their absence—be called forward-looking: to November, 1944. Last November's elections showed the domestic unpopularity of the Administration. Republican committeemen, in urging the adoption by both parties of identical foreign-policy planks, are proposing a necessary basis for continuity in American foreign policy; they are also proposing to confine the election to issues on which they can almost certainly win. But if the domestic front is disintegrated by a wave of inflation there will not only be no background for future foreign policy; there will be grave problems in maintaining production for war.

## American Notes

### "Crime Against America"

The statement, now widely attributed to General Marshall, that the threat of a railway strike, and the steel stoppage, amounted to the "damnedest crime against America" and might prolong the war by bolstering up wavering morale in the Axis and satellite countries, has evoked a storm of protest. Mr William Green, president of the AF of L, has called the statement "irrational, uninformed and inflammatory," and the issue of military interference in civilian matters has been raised. Even commentators who support the argument regret the official anonymity under which it was cloaked. Although this may have been ill-advised, there are signs that the traditionally pro-labour Administration is not unsympathetic with this expression of the soldiers' discontent with strikes at home. It was intimated that President Roosevelt and the unnamed military source "were thinking along the same lines," and Elmer Davis, head of the Office of War Information, in a New Year's address, made much of the different conceptions of duty on the war fronts and in the factories. This sharper note followed the realisation that although the railroad strike would probably not take place, the underlying dispute was still unsolved. The fifteen non-operating unions have rejected the basis on which President Roosevelt offered to arbitrate their claim for overtime pay, calling the joint consideration of a wage increase and overtime pay "a gross

injustice." The unions apparently fear that the effect of the decision on the claims of two of the operating unions may mean that wages will be frozen for the duration; and according to a White House statement they are demanding, not only the sliding-scale increases recommended by an earlier wage board, but overtime payments on top of these. A statement by Mr Davis, head of the War Labour Board, also makes it clear that the main issue in the steel dispute has not yet been reached. The strike last week concerned only the question whether a wage increase, if one is granted and approved by the WLB, would be made retroactive to the date the old contracts expired. The threat of further labour disputes, therefore, still hangs over the Administration; and the President probably did not entirely regret the forceful language of the General's rebuke.

### Pearl Harbour Doctrine

The state of Minnesota, buried in the heart of a continent, is creating a record for imaginative thinking on world affairs. The state which made Harold Stassen its Governor, and sent Joseph Ball to the Senate, has now given birth to a "Pearl Harbour Doctrine" which its sponsors hope will serve as companion piece to the Monroe Doctrine. Its statement of policy reads:

When any nation, anywhere in the world, openly proclaims the theory that might makes right, and makes vast military preparations against fictitious foes; or attacks its neighbours, and embarks on a career of conquest, such action is a threat to our "life, liberty and pursuit of happiness," and to the sovereignty of the people of the United States. We, therefore, stand ready to support a rule of international law co-operatively backed by adequate force.

The Minnesota United Nations Committee, staunch backers of Governor Stassen, have worked out an elaborate advertising campaign to bring the issue of internationalism down out of its intellectual clouds, and to reach the average citizen by capitalising on his two basic wishes, for peace abroad and economic security at home. One of their main objects is to rescue the word "sovereignty" from the neo-isolationists, who have made great play with this magic word to throw mud on any form of partnership or co-operation. General Booth did not see why the Devil should have all the good tunes, and these Minnesotans do not propose to let the isolationists copyright all the good slogans. Selden Menefree, writing in the *Washington Post*, expresses some doubts about the huge amount of money necessary to popularise the doctrine throughout the nation, and fears that even if the poison were extracted from the word "sovereignty" new witch words would be found. There may also be some reservations about the name. If Pearl Harbour is a symbol for anything, it stands for the reluctance of a country to fight until its own naval bases are bombed, and although it is all to the good to exploit the emotional impact of Pearl Harbour, the committee is surely aiming at a policy which is precisely the opposite. Perhaps this is looking the gift horse too closely in the mouth. The campaign appears to be based on a sound educational approach; it is renewed evidence that the Middle West is not solidly isolationist.

### Discrimination in War Industry

The Administration's attempt to diminish racial discrimination in war industries is becoming a national issue. The President's Fair Employment Practice Committee has met with a flat refusal from some of the south-eastern railway companies which it had ordered to cease discriminating against the employment of negroes. This refusal has raised once more the question of the legal and constitutional authority of the Committee. Created by an executive order on June 25, 1941, the committee has had a series of agency homes, and, finally, after a decision of the War Manpower Commission to postpone hearings on railway discrimination, the President made it an independent agency in May, 1943. Its authority was recently challenged by the South-Western Bell Telephone Company, which refused to execute a contract containing the standard FEPC non-discrimination clause, and the company was upheld by the Comptroller-General, who ruled that the President's order was merely a directive, and not mandatory. The resulting storm in the negro and liberal press prompted President Roosevelt to declare that the clause was indeed mandatory,

not only in prime war contracts, but in all sub-contracts as well. This the railroads now dispute, arguing that compliance would handicap the war effort and that the FEPC's order violates the Railway Labour Act. According to Mr Ross, the FEPC chairman, the railroads have also tried to stir up alarm by pretending the order was designed to support "alleged pretensions of negroes to be engineers and conductors," whereas in reality it was only concerned with their hiring as firemen. The stand of the railways is expected to be supported by the Railroad Brotherhoods, and there may be a congressional investigation of the FEPC. President Roosevelt has already appointed a committee of three as his personal representatives in the matter. The task of forming a policy to make the greatest use of negro manpower in the war effort without incurring the handicap of white hostility, both on the part of management and labour, is plainly one of great difficulty and delicacy. In an election year it is further complicated by the desire of both parties to secure the negro vote and the temptation to accuse the party in power of playing politics with the war effort to this end. Within the Democratic party itself, the Southern bloc is likely to have even less sympathy for the aims of the Administration in this matter than it displayed on the soldiers' vote issue.

### The Brunt of Invasion

Public opinion has taken with calm Senator Johnson's forecast that 73 per cent of the Army of invasion would be American. Senator Wheeler, the *Chicago Tribune*, and a few other professional trouble-makers, have done their best to make mischief out of this estimate, which is, as yet, wholly unofficial and unauthorised. Senator Wheeler talked wildly of massacre, and declared that Americans "would not stand for it." The suggestion that Britain intended to fight to the last American has been revived. These insinuations seem to have fallen on barren soil. There has been, indeed, in the past week, a remarkable rally of opinion in newspapers of all shades. It has been pointed out that, as the population of the United States is about three times

that of Great Britain, it is inevitable that American forces—both in manpower and equipment—will outweigh the British in the Army of Liberation. The opportunity has been taken to pay warm testimony to the way in which limited British manpower has been stretched to provide the sinews of land, sea and air war; and the disproportionate burdens borne by Russia and Great Britain in other theatres have been stressed. This episode is encouraging for more than one reason. It was better that this particular snake should be scotched now than that it should appear later on during a time of emotional tension and bitter losses. It is also encouraging proof of the firmness and detachment with which the American public has learned to consider the more sombre realities of war. The burden of invasion costs as outlined by men of Senator Wheeler's stamp might have been reasonably expected to provide a severe trial of United Nations unity. So far the test has been passed with flying colours.

## Shorter Notes

A Gallup poll asking the question: "Would you favour adding a law to the Constitution which would prevent any President from being re-elected in the future if he had already served two terms?" showed for the first time a greater than 50 per cent favourable response. Those voting "Yes" at this time total 54 per cent against 46 per cent in April, 1943, and 41 per cent in 1940.

The campaign to "Make General McArthur Commander-in-Chief" (i.e. President) has been launched in Illinois, where his supporters have begun to collect petitions to place the General's name on ballots for the Illinois presidential preference primary elections. The fact that the General has not been consulted is no bar in Illinois, where the candidate's consent is not necessary.

# THE WORLD OVERSEAS

## The Government of Liberated France

ON Tuesday the French Consultative Assembly met for its second session at Algiers. The agenda reflects the degree to which the Assembly, despite its consultative character, has already extended its powers into the field of legislation. Three main issues figure on the agenda: the Budget; the restatement of French colonial policy; and the establishment of a Provisional Government in France when liberated.

The session is expected to last three weeks. The original regulations only provided for eight-day sessions. Thus the miniature French Parliament *d'outre mer* has, in yet another respect, won the first round; for those who called it into being did not expect it to grow so rapidly in stature. It is a reflection of the strong urge to restore parliamentary rule to France.

To solve the problem of the Provisional Government, two schemes are before the Consultative Assembly. One is associated with the name of the Commissioner of Justice, M. de Menthon, and reflects General de Gaulle's own conception. The other, put forward by M. Vincent Auriol, former Minister of Finance in M. Blum's Popular Front Government, has the support of most Socialists. The Menthon plan provides for the election of municipal and general councils immediately after the liberation of France. These councils would choose delegates who, in their turn, would elect from their members a Consultative Assembly. The Consultative Assembly would then appoint the Chief of the Provisional Government.

The most significant departures from French constitutional tradition suggested by the Menthon scheme are, first, indirect elections; and, secondly, the irresponsible status of the proposed Provisional Government. The appointed Chief introduces the members of his Government to the Assembly, which can accept or overthrow the Government *en bloc*, but cannot vote against any one Minister. Once the Assembly has passed a vote of confidence in the Government it becomes a purely consultative body, without any legislative powers, and cannot overthrow the Government in any circumstances.

### From Instability to Autocracy?

The motive behind this reform is clear. The old parliamentary practice which made French government so unstable before the war is ruled out. The familiar see-saw of coalition and counter-coalition disappears. But the scheme represents a very extreme reaction from the unhappy experience of unstable Governments. It provides for a Government which, while stable, will be irresponsible. There is a chance that the remedy may result in killing the patient—parliamentary rule itself.

It is right, and necessary, that the Provisional Government should have power to act; that it should possess the initiative in policy and legislation; and that it should be protected against the changing moods and whims of the *couloirs*. But it is equally essential that the existence of that Government should ultimately be dependent on the confidence of the Assembly. For this the Menthon project makes no provision. The Assembly, having brought the Government into being, will relapse into nothingness like the animal that is said to die when it has given birth.

The consequences of such an arrangement can only be properly seen against the likely background of French politics immediately after liberation. There seems at the moment to be no doubt that General de Gaulle will be the only candidate for Chief of the Provisional Government. He will be at the peak of his popularity. The French people will welcome him as the great patriot who raised the banner of resistance in 1940. But this enthusiasm for the liberator will not imply popular consent to the authoritarian programme ascribed to General de Gaulle by his critics. The critics are afraid that patriotic enthusiasm may be exploited for the establishment of personal rule, and so they distrust the implications of the Menthon scheme.

The first normal election—it is claimed at Algiers—could not take place until a year after liberation, when the prisoners of war and deportees will have returned to France. The intervening year will be a period of the greatest importance; the decisions taken in the course of it—and *faits accomplis*—will weigh upon the future. And during that year, in the Menthon scheme, there will be no constitutional means by which the Assembly could check or correct the policy of the Provisional Government.

Moreover, the Menthon scheme proposes to settle the new Constitution in the transition period also. The scheme provides for a Legislative Commission consisting of eighty members, of which forty would be chosen by the Assembly and forty by the Chief of the Government. From the reports available so far it looks as if this Commission would act as a Constituent Assembly. As the majority of the Commission is most likely to consist of Gaullists, the Constitution, too, would almost certainly bear the Gaullist mark. The Commission would make not only the new Constitution, but also a new electoral law; and the next election would take place within a new constitutional framework settled, "once and for all," without any appeal to the popular verdict. To the extremist critics the whole scheme looks like a plan for a quasi-Bonapartist plebiscite, in which the initial popular vote will be taken only in order to extinguish all popular control.

### The Alternative

The counter-plan of M. V. Auriol seems, unfortunately, to be very ill-adapted to meet the needs of transition. M. Auriol rejects the idea of elections altogether. According to his scheme, the Provisional Government would be set up by an Assembly of Liberation, composed partly of members of the old Parliament and partly of representatives of the movements of resistance. The Provisional Government would be responsible to and controlled by the Assembly. The argument advanced by the supporters of the scheme is that no valid elections can take place before the return home of two million electors, prisoners of war and deportees. The crucial question, therefore, is how long it will take before conditions allow for normal, full-dress elections. Should it take not more than, say, two or three months, then there really seems to be no reason why fundamental constitutional changes should be rushed through by a Provisional Government. But if—as it is very possible—the period of transition were to last longer, then a Provisional Government brought into existence and controlled by a non-elected and arbitrarily composed Assembly simply would not possess the authority needed to cope with the difficult and urgent tasks with which it is certain to be confronted. M. Auriol's scheme offers no safeguards against instability of government.

### The Process of Amendment

The Consultative Assembly at Algiers will probably not pronounce on the two schemes before the last week of its session. Some Socialists are opposed to M. Auriol's scheme, and many non-professional Gaullists view the de Menthon plan rather critically. There is a considerable feeling that, in any case, such fundamental reforms as the change of the Constitution should be left to a genuine Constituent Assembly after popular elections. Firm safeguards are needed against the uneasy see-saw which in the past gave few French Governments the chance to pursue a policy over a reasonable period. These may possibly be found in the power of the Chief of the Government to dissolve the Provisional Assembly and order new elections after his Government has been defeated in a vote on a matter of confidence. Some amendments to the de Menthon project have already been announced, and others are likely to come; these aim at taking the "Bonapartist" sting out of the suggested plan. What is now happening at Algiers is only the first act of a great constitutional drama.

## Sweden's War Finances

[BY A CORRESPONDENT]

January 3rd

VARIOUS estimates agree that roughly 40 per cent of Sweden's nominal national income is absorbed by the state and the communes. The total budget expenditure during the financial year 1942-43 amounted to Kr 4,261 million and expenditure for the current year, which ends in June 1944, is estimated at Kr 4,151 million. Last year's deficit, which was covered by loans, amounted to Kr 1,600 million, and the deficit for the current year will again exceed Kr 1,000 million. Until 1942-43 there were, roughly speaking, the ordinary budget, in which revenue and expenditure balanced, and the defence budget. For the current year, both budgets have been combined, and the defence expenditure is carried in a general account as a budget of preparedness. The ordinary revenue reflects the general tendency of the financial measures introduced since the beginning of the war, and its main items were as follows:

|                                  | (Million Kronor) | 1938/39 | 1941/42 | 1942/43 |
|----------------------------------|------------------|---------|---------|---------|
| Total revenue                    |                  | 1,442   | 2,268   | 2,701   |
| Income, property and profit tax  |                  | 436     | 851     | 993     |
| Motor-car tax                    |                  | 130     | 31      | 49      |
| Import duties and excise         |                  | 537     | 919     | 1,141   |
| Income from state-owned concerns |                  | 197     | 344     | 372     |

During the four years of the war, total revenue almost doubled. The fact that income tax and the property and profit taxes doubled during these years is common to almost all belligerent and neutral countries. Import duties and excise, on the other hand, increased by 113 per cent. This would indicate that the present volume of imports, which may be estimated, by comparing the price indices with the value of imports, at roughly 50 per cent of the last pre-war year, must actually be smaller. The revenue from the motor car tax is almost an exact indicator of the restrictions placed on motor transport, which reached its lowest level during 1941-42. The increase recorded in the following year shows that a considerable number of motor vehicles returned to the roads fitted with generators.

In 1942-43, the defence budget expenditure, which included extraordinary expenditure for maintaining essential supplies for the population, amounted to Kr 1,335 million. The estimated expenditure for 1943-44 comparable with this item will reach Kr 1,260 million. In other words, certain items of the defence expenditure, mainly, probably, the cost of the construction of factories and substitute plants, have been reduced because construction came to an end. It may, however, be assumed that at the same time state subsidies to agriculture and other price subsidies are still increasing. The most interesting point is that it has not been possible to keep defence expenditure within the limits set by the original Five-Year Plan for defence. The estimated annual expenditure amounting to Kr 775 million has been exceeded, and the deficit has consequently risen more quickly than was expected. The national debt has increased as follows:

|              | (In million kronor) | August, 1939 | End of 1941 |
|--------------|---------------------|--------------|-------------|
| August, 1939 | 2,500               | 2,500        | 6,149       |
| End of 1939  | 2,808               | 2,808        | 8,143       |
| „ 1940       | 4,518               | 4,518        | 8,730       |

The total national debt has thus almost reached the total of the nominal national income of the last year before the war. It is, however, clear from the changes in the annual increases in the debt that borrowing policy changed its character in the autumn of last year. A new loan was issued, although it was clear that immediate financial expenditure could have been covered by tax payments at the turn of the year. Yet the loan was issued, and its main purpose was to reduce excess financial liquidity.

The excess in financial liquidity is a source of great anxiety in Sweden and the fear of inflation seems to be real. During the four years of the war, the note circulation has increased by 45 per cent, which is a relatively small rise but sufficient to keep the fear alive. There is also the unpleasant prospect of a surplus in shipping tonnage when normal conditions have been restored after this war. No doubt, Swedish industrial and financial circles are thinking of the coming post-war period in terms of the post-war period of 1918 to 1925. Leading economists predict that it will be necessary to devalue the currency because of the huge national debt, whereas industrialists and banking circles cherish the hope that boom conditions after the war will make it possible for industry to continue

within the framework of the exaggerated price level. It is hoped that during the boom industrial activity will be adapted to higher prices and to the financial liquidity which is at present largely superfluous.

Sweden's commercial banks and other financial institutions, such as savings banks and insurance companies, are as completely controlled as in any belligerent country. The huge state expenditure has resulted in the banks becoming mainly collectors of deposits and in the state taking the place of private industry as their debtors. Before the war, Swedish commercial banks were already in a difficult position. There was a strong tendency to concentration in Swedish industry, and the large concerns naturally made themselves financially independent of the commercial banks. During the war, this concentration has continued, in addition to the growing influence of the state. Cheap money policy has at the same time reduced the banks' profit margin and particularly that of the savings banks, which have suggested that a limit should be placed on the acceptance of deposits from small savers.

Sweden's economy is bound up with world trade and world shipping. The large import surpluses have been paid by income from shipping and from foreign investments. Before the war, Sweden's merchant fleet amounted to 1.6 million gross tons, and in 1939 the income from freight services for foreign countries was estimated at Kr 237 million. During 1942, when shipping losses since the beginning of the war had reached almost 30 per cent of the total tonnage, the income from these services for foreign countries was estimated at from 325 to 375 million kronor. Thus, the greater part of the Swedish merchant fleet plied outside the Skaggeak. The tonnage chartered by Great Britain alone was reported to have been 450,000 since the war, of which, however, roughly 300,000 tons had been lost. During 1939 and 1940, Sweden's balance of payments was unfavourable because of the very heavy imports. But during 1941 the balance showed a net surplus amounting to Kr 390 million, which decreased during 1942 to Kr 260 million.

It is worth noting, in connection with Sweden's industrial effort, that roughly three-quarters of the total shipping losses have been replaced by new construction. The tonnage launched at Swedish shipyards was 155,000 in 1940, 161,000 in 1941, and 134,000 in 1942. In the summer of 1943, 68 ships, with a tonnage of 326,000, were under construction, and the total orders placed with Swedish concerns amounted to 652,000. A large part of the tonnage under construction was on German account, which explains why Germany was very anxious to supply the necessary plate. There were, however, indications that Germany was unable to deliver the promised quantities in full.

The industrial and financial difficulties, which increase or decrease in conjunction with the changes in the general situation and particularly with the changes in the relations between Sweden and Germany, are aggravated by the fact that the relatively large production of war materials cannot be continued. Neutral Sweden seems to have reached saturation point in war production. Since this material cannot be used in actual warfare, because of Sweden's neutrality, production has to be adjusted. Thus, a change-over is necessary which will create new difficulties at a time when, outside Sweden, the war continues.

## Eire and Denmark—A Comparison

[FROM OUR DUBLIN CORRESPONDENT]

December 28th

COMPARISONS between Eire and Denmark—two countries alike in many respects yet different in many others—are commonly made, usually to the disadvantage of Eire. Denmark is constantly held up as a model for Eire to follow, and the Danish farmer as a model for the Irish farmer. It is important that such comparisons should be based on exact statistical information. Dr J. P. Beddy, secretary of the Industrial Credit Company, has performed a useful service in compiling a paper for the Irish Statistical Society comparing the principal economic features of the two countries. Why is it, he asks, that Denmark, which is smaller than Eire, with a less equable climate, a lighter and poorer soil, no coal or water power or mineral deposits, should maintain a larger population, a greater agricultural output, a more developed industrial system, a higher national income and a better standard of living?

The population of Denmark is 25 per cent greater than that of Eire. The respective densities per square mile are 224 and 112. If Eire had the same density as Denmark, its population would be 6,000,000, or twice what it is. For the last half-century the Danish population has steadily grown, whereas the Irish has steadily declined. The reason for this difference is the great emigration from Ireland. The Danish population is much more urbanised than the Irish; the rural populations of Denmark and Eire are respectively 38 and 68 per cent. The density of the Danish agricultural population is greater than the Irish—70 and 55 respectively per thousand cultivated acres. If Eire had the same density as Denmark, its occupied agricultural population would be increased by about 175,000 and its rural population by about 350,000.

Danish agriculture is certainly much more intensive than Eire's. In Denmark, the percentage of total land tilled before the war was 61, in Eire 22; the respective figures for permanent grass were 13 and 47. Since 1870, the area under cereals in Denmark has slightly declined, but the area under root and other crops has substantially increased. In Eire, on the other hand, the areas under cereal and root crops have both declined. In 1871, the area under root crops in Denmark was about one-third of that in Eire; in 1933, it was three times as much. The changes in Danish agriculture were the result of the development of an intensive animal husbandry based upon tillage and the specialised production of high-quality dairy products. Eire, on the other hand, with a heavier soil, milder winters and abundant rainfall, adopted a system of animal husbandry based upon grass, calling for less capital and less labour. The density of livestock in Denmark increased very rapidly. Between 1871 and 1938, Danish milch cows increased by 85 per cent, other cattle by 150 per cent, and pigs by 575 per cent. In Eire during the same period, milch cows increased by 6 per

cent, other cattle by 40 per cent, while pigs decreased by 28 per cent. If Eire had the Danish density of livestock to-day, the number of milch cows would be increased by 1,100,000, and the number of pigs by 3,300,000. The volume of production, both per acre and per man, is much greater in Denmark than in Eire. Farming profits are higher and the standard of living of the rural population is superior.

Industrially, Denmark is also far ahead of Eire. In a pre-war year, the value of the gross output in Denmark was £219 million and the numbers employed 460,000, compared with £81 million and 153,000 respectively in Eire. Danish industry grew up, without any protective tariff, to meet the growing demand of the agricultural community for industrial products of all kinds. About 80 per cent of industrial commodities consumed in the country are home produced. Important export industries have also been developed, notably shipbuilding, and the manufacture of cement machinery, marine engines and dairy machinery. Shipping services constitute a substantial invisible export. The experience of Denmark supports the opinion that Eire could develop export industries concentrating on high-class specialised products, and that the growth of secondary industries is best secured by the expansion of the agricultural income. That such an expansion is compatible with a large volume of external trade also emerges from a study of Danish conditions. Denmark imports and exports considerably more per head of population than Eire, and yet succeeds in maintaining a more intensive agriculture and a more developed industry.

The contrast between the two countries is certainly striking and calls for explanation. The outstanding cause of the different agricultural developments is the difference of climate. Ireland could have done what Denmark did, but Denmark could not have done what Ireland did. The very excellence of the Irish climate is, in some ways, a curse to the country. Denmark had the advantage of a satisfactory system of land tenure at a time when Ireland was in the throes of agrarian warfare. The Danish system of adult education facilitated the adoption of improved methods and, above all, the development of the co-operative system. Danish agriculture is far more deeply capitalised than Eire's. Farms in Denmark are all heavily encumbered with debt, and the country has sold all its external investments to provide capital for its internal development. Eire is much stronger financially than Denmark, and is in a position to undertake a programme of agricultural and industrial intensification without resort to any foreign borrowing.

## Letter to the Editor

"Shall we be Poorer?"

TO THE EDITOR OF THE ECONOMIST

SIR,—Many people will be grateful for your article on this subject, which enables us to see more clearly what may be expected to be the position after the war. One falls, perhaps, into the error of assuming that because some hitherto rich classes of people will be less rich after the war, therefore the nation will be poorer. Is it not the case that a great war normally brings a redistribution of incomes, and that we may expect to see the very rich reduced to moderate wealth, while wage earners generally will have improved their earnings as against pre-war days, and will also be in possession of saving certificates, post-war credits, etc.? The outward evidences of great wealth—large country and town houses, luxury yachts, etc.—will disappear while the general standard will be raised, as happened after the last war.

There should be no cause for lamentation here: on the contrary, the "spread" of wealth should be a stabilising factor in the national economy.

Such a development, however, inevitably brings fresh problems in its train; and I would suggest that one of these is the financing of speculative ventures such as the exploitation of new materials and processes. In the past, such enterprises have been financed to a large extent by rich or moderately rich men who could afford to take risks. Will the small man be inclined to hazard his slender capital? And if not, how will British trade obtain the resources required for such very desirable but speculative purposes?—Yours, etc.,

## THE COMING TREND

The trend in business furniture after the war will be more than ever towards the precision and permanence of steel. Sankey-Sheldon, in preparing to meet this growing trend, have realised that to this efficiency of steel must be added beauty—the beauty of soft contours finished in harmonious colour schemes and warm, caressing coverings. Sankey-Sheldon's post-war programme will provide a wide range of furniture and equipment, clean and hygienic, fire resisting and practically impervious to damp, dirt and deterioration. There is something inevitable about Sankey-Sheldon steel furniture.

## WHITE HORSE

*When distillation ceased*

You can make bricks without straw, but you cannot make Scotch Whisky without barley. Since the war began the fruits of each golden harvest have been called up for National Service. No more whisky is being made: distillation has ceased.

Yet in this fifth year of war you can still, with good fortune, obtain White Horse. This is because stocks have always been laid down many years ahead of the time when they will be released for your pleasure. White Horse was growing old when this war was young. It is therefore in your own interest that supplies should be very carefully regulated so that in the years to come you may still be able to enjoy White Horse, fine as a fine liqueur.

## The Supply of Electricity

THE debate about the future of the public electricity supply industry appears to resolve itself, once again, into a fight for and against private enterprise, or, to be more precise, into an argument for universal public boards *versus* the existing mixture of municipal and private company undertakings. This is far too simple an approach to a complicated technical problem, and one that is unlikely to yield fruitful results. Any rational approach to the problem should be guided by two considerations. First, electricity is only one form of energy; its future should therefore be considered in the context of fuel policy as a whole. Secondly, systems of ownership and management are not of primary importance; proposals for reorganisation should be directed towards ensuring that electricity is supplied as cheaply and efficiently as it can be had for given purposes.

This is not the occasion for laying down the details of a national fuel policy nor, consequently, the precise rôle that electricity should play in the general scheme of things, though two general points may usefully be made by way of introduction. The first, an obvious one, is that, as a matter of general principle, a national fuel policy should have as its object the supply of fuel at the lowest possible real cost. Electricity is the most convenient, cleanest and most flexible form of power, and, for a number of purposes, has no rival. The extension of its use is therefore desirable, but not necessarily for its own sake. For many purposes electricity is more expensive than coal or gas; moreover, technical progress in the use of alternative means of applying energy—in the combustion of hard coal, for example—has by no means reached a limit, and has, in fact, been noteworthy during the last few years as a result of research and of the fuel economy campaign. Electrification for the sake of electrification would involve waste where cheaper alternative sources of power are available, and go against the principle of a national fuel policy. The second point arises from the first in that it seems highly desirable to maintain a policy of freedom of choice for the consumer, except where the duplication of facilities would be manifestly uneconomic. Freedom of choice should not merely mean a choice between alternative fuels, but also the freedom for the consumer to produce his own supply. Patches of monopoly may be unavoidable; a complete fuel monopoly would be disastrous.

The problem of the public supply of electricity itself has two aspects, that is, generation and bulk transmission, and retail distribution. The rationalisation of generation and bulk distribution took a long step forward as a result of the

Electricity (Supply) Act, 1926. While the generating stations remained in private or municipal ownership, they were linked up by a national grid, thus yielding substantial economies through the reduction in the ratio between productive capacity and demand. Although the Central Electricity Board, which owns and operates the grid, does not own the generating stations, but purchases electricity from them on a cost basis, it has a large measure of control over them. On technical grounds, it is doubtful whether the transfer of ownership of all the generating stations to the CEB would yield much in the way of additional economies. The benefits cited in support of proposals for transferring them to the CEB are mainly financial. It is argued that the formula of the Act of 1926, whereby undertakings which engage in generation as well as in retail distribution can repurchase electricity from the CEB on the basis of what their cost would have been in the absence of the grid, is purely hypothetical, and becoming more and more divorced from reality. It is argued, further, that this arrangement amounts to price discrimination among distribution undertakings, between those that do and those that do not own selected generating stations, in that the former do not have to pay their share of the cost of maintaining and operating the grid, and therefore obtain their supplies more cheaply, on the average. From a purely administrative point of view the transfer of generating stations to the CEB would simplify matters quite considerably, though there may possibly be other ways of straightening out the financial tangle. The chief source of inefficiency in the generation of electricity is the maintenance of too many selected stations. Many of the smaller ones are retained largely out of kindness to their owners, and the CEB, if it owned the whole system, might secure economies by reducing the number of stations. On the other hand, it might seem very unjust to penalise the owners of the better stations, some of which are very efficient, for the faults of their less efficient colleagues.

Retail distribution, as distinct from generation and bulk supply, is much the most important source of potential economies, to which the present organisation of distribution is a definite obstacle. In 1936 the Committee on Electricity Distribution—the McGowan Committee—pointed out that, whereas the average cost of generation had been nearly halved during the ten years to 1933-34, "the average cost of distribution per unit sold has been practically constant during the last ten years." The causes of inefficiency, where they are to be found, are not necessarily due to unenterprise, either in private or municipal undertakings, but often to past legislation which strait-jacketed this side of the industry. The original Electric Lighting Acts of 1882 and 1888 envisaged the supply of electricity as a purely parochial matter. A licence to supply electricity could be obtained from the Board of Trade by any local authority, company or person, but the first Act gave local authorities the right to purchase private undertakings after 21 years, a period which was extended to 42 years by the second Act. The technical possibilities of electricity were then not foreseen. At the turn of the century, when these possibilities were beginning to take shape, Parliament authorised the formation of the so-called power companies, with perpetual franchise but geographical and other restrictions on their markets. The result was a mixture of undertakings; municipal undertakings, which predominate, operate mainly in urban areas and generally take in little of the surrounding area; and private enterprises which operate mainly, though not exclusively, in less densely populated districts. The figures in a report presented to the London and Home Counties Joint Electricity Authority this week, showing that public authorities provide cheaper electricity for domestic consumers than private companies, are therefore misleading—the average price per unit to domestic consumers was stated to be 1.529d. per unit for public suppliers, against 2.021d. per unit for supplies from the power companies and 2.104d.

from other companies. The disparity is not a measure of the inefficiency of private enterprise, but of the higher cost of supplying the less densely populated areas. Within its limits private enterprise has built up a number of efficient systems by the grouping of undertakings, but these groups are threatened—the threat has been temporarily suspended—with fragmentation, for many of their constituents have reached, or will soon reach, the period when municipal rights of purchase operate.

There is no doubt that a measure of reorganisation is essential if the potential economies in distribution are to be realised, and if the path is to be cleared for further development and progress in electrification. Larger and better balanced systems would almost certainly bring economies in capital expenditure—this represents an exceptionally high proportion of costs in the electrical supply industry—and in management. Standardisation of voltages, equipment and, so far as possible, appliances would contribute further to reductions in cost. There is general agreement about the need for reform, but the reformers have ranged themselves on either one of two sides.

On the one side there are, of course, those who advocate some form of nationalisation merely on political grounds, irrespective of need or consequences. They have been joined by the technicians of the industry, represented by the Electrical Power Engineers' Association. In a report published last July, the EPEA suggested that the whole industry, from generation to retail distribution, should be brought under a single hat, a national electricity supply board, appointed by the appropriate Minister in consultation with the Electricity Commissioners. Under this scheme, generation and bulk transmission would be controlled nationally as at present, but retail distribution would be decentralised, the distribution areas to be determined, in the first instance, by the Electricity Commissioners, with due regard to technical and administrative considerations, but to be subject to adjustment by the national board in the light of experience. Each region would be under the control of a regional distribution engineer and manager, appointed by the national board. It is argued in support of this scheme that the real issue is "whether electricity is to be made available to all—even though it be not immediately economic to do so—or whether supplies are to be restricted to those whom it is profitable to supply." In the view of the engineers,

the economies and advantages gained by national control with the pooling of city, urban and rural areas, would make it possible to provide an adequate supply of electricity to all rural areas, at charges which would be similar throughout the country, without increasing prices to existing consumers.

The claim is a large one, though the idea is not new. The Electricity Bill of 1919 had proposed the compulsory creation of District Electricity Boards, that is of regional bodies designed to take over all electricity undertakings in their area, and constituted by the Electricity Commissioners, together with representatives of the undertakings. This proposal, however, had disappeared when the Bill emerged from the House of Lords and reached the Statute Book as the Electricity (Supply) Act, 1919.

On the other side are those who see the solution on the lines advocated by the McGowan Committee. As an alternative to complete reorganisation on a regional basis under a regime of regional boards, the Committee suggested—

the retention and utilisation, where possible, of the larger and more efficient of the existing undertakings—both public authorities and companies—and the absorption by such undertakings of the smaller and less efficient undertakings.

The Committee suggested that the Electricity Commissioners should delimit the country into a number of areas in which it appeared to them desirable that a suitable scheme or schemes of amalgamation and co-ordination should be prepared. Next, the Commissioners would appoint a district commissioner in each area to prepare and submit for their consideration plans for reorganisation. The recommendations of the McGowan Committee have not been embodied in legislation, which was postponed, presumably owing to the outbreak of war. But in 1937 the Government, elaborating the McGowan formula in a White Paper, suggested three alternative methods, that is, the acquisition by one undertaker of the existing undertakings in the area; the transfer of all existing undertakings in the area to a newly constituted distribution authority; and the transfer of two or more local authorities to a newly constituted joint board. The memorandum on the electricity supply industry issued last November by the Incorporated Association of Electric Power Companies closely follows the McGowan Report. But whereas the latter recommended that after a period "which

in no case should exceed 50 years," the consolidated undertakings should be purchased by some form of public authority, on the basis of capital expenditure less depreciation, the memorandum representing the views of a section of power companies suggests that, instead of a definite time limit, there should be securing options, the first after a period of 50 years.

There is something to be said for both methods of approach, but if the aim is efficiency and nothing else, there appears to be no need for a universal reorganisation of the distribution side on public board lines. If inefficiency merely occurs in patches, the most appropriate approach seems to be that suggested by the McGowan Report, that is, to leave alone the areas where there is a cheap and efficient supply, and to reform the unsatisfactory areas, whether the defects arise from technical or commercial inefficiency, or from excessive Balkanisation of areas. Wherever reform is undertaken—and it should not be done timidly—the reorganisation should take the form of a public board—not a cumbersome representative body like the existing joint authorities, but a compact body approved by the Electricity Commissioners or the Minister. To impose a system of untried regional boards upon the whole industry, merely for the sake of removing patches of inefficiency, seems hardly worth while, at least at this stage. Standardisation of voltages and equipment—one of the main sources of economy—could be entrusted to the Electricity Commissioners or a technical department at the Ministry of Fuel and Power. It would surely be more profitable, and speedier, to concentrate on removing the bad patches. They certainly exist, and should be scheduled, as soon as possible, by a committee of experts. It will probably be found that some grouping is necessary to realise potential economies, and that the splitting up of existing groups by the exercise of the rights of purchase of local authorities should be prevented. A Bill giving powers for *ad hoc* treatment on the basis of technical efficiency might be the most effective and speediest solution of the problem. This does not mean that reform within the present system will be possible without a measure of resistance. But an assurance that reorganisation will not be regarded as an end in itself may confine resistance to the undertakings that are inefficient—that is, to those whose objections should be overruled.

### "Why do I read the Yorkshire Post?"

"I'm not a Yorkshire man but I feel I am missing something when I don't see my Yorkshire Post. This is why I have read it for years. It gives me a clear idea of what people in the North are thinking, and that's important to me. I haven't always got time to work things out for myself, and I have

come to know that I can rely on its considered point of view.

"Many men I know also think it's a good idea to read a paper other than a London one. I chose The Yorkshire Post because of its sane, balanced outlook on politics, finance and industry; because its leading articles are excellent, and because it gives me the news without sensationalism but with reasoned comment."

### Important Notice to our Sherry Customers

FINDLATER'S FINO, well-known to Sherry drinkers all over the World, will in future be known as

FINDLATER'S DRY FLY SHERRY

The reason: Findlater's Fino cannot be registered and protected from imitations under that name. FINDLATER'S DRY FLY is registered, ensuring protection for our customers throughout the World.

FINDLATER, MACKIE TODD & CO. LTD.  
Wine Merchants to H.M. the King 92 Wigmore Street, W.1

# Business Notes

## Investors' Experience in 1943

The coming of the New Year has brought no revival in business, so far, although the general firmness of markets continues. The recovery to date is, according to the index of *The Financial News*, almost exactly half the decline from the peak. The figure of *The Actuaries' Investment Index* makes it rather less, since it carries the story only up to December 28th. The value of this index is that it allows a partial analysis of the factors which have gone to make up the further improvement on the year of some 8 per cent, against 18.6 per cent during 1942. The changes in some of the main items over the past three and a half years are given in the accompanying table. The aggregate figure has exactly doubled since the bottom of the slump caused by the collapse of France, the entry of Italy into the war and, not least, by the imposition of EPT at 100 per cent. Even on that long period there are very wide variations in the degree of recovery in individual groups, but all are well up and all showed rises in both 1942 and last year, with the single exception of shipping in the latter year, which fell by some 4 per cent. Rises in 1943 were almost all less than those of 1942, but there were exceptions in the cases of insurance and investment trust shares, home railway ordinary stocks and oil shares. The range of rises varied a great deal more in 1943 than in 1942, despite the smaller appreciation in the total. Oil shares make the best showing with an improvement of almost 30 per cent, but gas and home rails did half as well as that, and building material, electrical equipment, stores and brewery shares were all outstandingly good. Notably, the important miscellaneous sec-

tion showed a rise of 5.2 points in each of the last two years. In comparison with the large rises mentioned, aircraft, electrical distribution and iron and steel shares showed improvements of little over 1 per cent, and of these sections the first and last yield 7.81 per cent and 6.06 per cent respectively, compared with the average for the whole list of 4.43 per cent. There is little to be said of fixed-interest stocks. Those usually included in the wider definition of the gilt-edged list are a trifle lower on the year, but industrial debentures and preference shares have continued to rise, although less rapidly and in a rather more halting fashion than in 1942. Of the 18 different categories of equity, financial and industrial, covered by *The Actuaries' Index*, no less than seven yield less than the average return on industrial debentures and ten less than that on preference shares. The yields obtainable suggest that the investor is very distrustful of the outlook for aircraft shares, appreciably less so for coal and iron and steel shares, and not very confident about home rails.

## Railways Look Skywards

The appointment of Mr D. H. Handover, traffic director of British Overseas Airways Corporation, as air adviser to the four main line railway companies suggests that the

stage has been reached where their plans are to be translated into a detailed scheme of post-war services. As was shown on page 652 of *The Economist* of November 13, 1943, the railways have achieved a dominating position in inland air transport since they were given authority to "take to the air" in 1929; the concerns associated with them are operating all the authorised inland routes, with one exception. It is understood that, subject to the necessary sanction being given, the group of railway-associated air concerns are envisaging a wide expansion of services and facilities for air transport as soon as they can obtain the additional aircraft. Moreover, the railways are planning to take an active part in the development of European air services after the war. During a recent speech in Nottingham, Sir William Wood, president of the LMS, pointed out that five years ago he was of the opinion that air transport had no future except for limited journeys at high rates—before the war the railways charged roughly just over 1d. a mile, compared with 3½d. a mile by air—but that wartime developments had caused him to change his views. The plans of the railways lack neither ambition nor imagination, for, given adequate facilities at reasonable cost, the density of air traffic may be expected to grow quite rapidly after the war, though its contribution to the revenue of the railways is likely to be too small, at least for some years, to be taken into consideration in estimating dividend prospects.

## Strains of Window-Dressing

The money market had a more exciting turn of the year than it had bargained for. The earlier assurances that all would be duly taken care of and last week's absence of Treasury deposit receipt payments had perhaps caused the market to underestimate the volume of calling with which it would have to contend on the last day of the year. As matters turned out, the final stage of window-dressing caused sufficient strain to compel the market to sell bills to the tune of many million pounds to the official agents. The official buyer included a substantial proportion of February maturities in his purchases, leaving the earlier January bills to the market and the banks, since these bills will be needed to offset the effect of heavy tax payments. In the normal course, the effect of open market purchases of bills wears off rapidly because the authorities take the shortest bills available. On this occasion, the decision to take a large proportion of February bills would have led to an unduly prolonged inflation of the cash basis had the bills in question been kept by the authorities. The method chosen to meet this situation was for the official agents to resell to the market this week an appreciable part of the bills which they had bought last week. Open market policy has thus been seen functioning "in reverse" with more open candour than is customary. There is nothing new in this process of reversing the open market engine. It has often happened before, but it has been customary, when official sales of bills have been made, to direct them to the banks. Moreover, open market policy, when working in this direction, has avoided publicity because it does not serve the purpose of the authorities to advertise the fact that credit is over-abundant and requires the contraction of open market sales of securities. On the other hand, when credit is in short supply, the knowledge that special assistance is being given to the market will put borrowers on their guard and make them search for loans from unaccustomed sources which might not otherwise have been tapped. This week's procedure was the more direct method of restoring discount market bill holdings, which had been seriously depleted by end-year selling to the official agents. The inflated volume of bank cash over the turn of the year must have reached record proportions. On December 29th, the total of bankers' deposits at the Bank of England reached over £234 million. By the close of business on December 31st it must have topped £250 million. By Wednesday of this week the total had come back to £184 million, showing the rapidity with which open market operations had remedied the year-end inflation. Are window-dressing credit upheavals of this magnitude really necessary?

## How Many Houses?

The primary need in any rational discussion and elaboration of a long-term housing programme is to distinguish between the desirable and the practicable. The standard of desirability should be the long-term aim; the actual volume of construction should be flexible and defined year by year in the context of the resources that can be devoted to house-building. Such a definition will be essential during the first few years after the war, when there will be strong alternative demands on resources, for the re-equipment and modernisation of industrial and transport equipment, and for the replacement of the much-depleted stock of amenities other than dwellings. The widely-quoted official housing programme, envisaging the construction of between 3,000,000 and 4,000,000 houses during the first ten to twelve years after the war is obviously based on a standard of desirability. But such a standard needs careful definition before it can acquire any meaning. A rough-and-ready definition was given on December 1st by Mr Willink, Minister of Health, in answer to a question in the House of Commons. He pointed out that between 1,500,000 and 2,500,000 new houses would be needed to replace slum dwellings and houses in a poor condition, or grossly deficient in modern amenities, and a further 1,500,000 to provide each family with a separate dwelling. The official standard of desirability is therefore not merely one that would give every family a separate dwelling, but a dwelling with a minimum of modern amenities. The term family, presumably, is meant to express the number of separate households that would exist if the potential demand for houses could be met, not only in physical but also in financial terms. A clear and unambiguous definition of the Government's standards of desirability, in terms of numbers and amenities, with a full disclosure of its assumptions, would be of considerable assistance in removing the present confusion in discussions about housing. But the time has come to go one step further—that is, to estimate, for the immediate post-war years, the size and geographical distribution of the demand for housing in terms of urgent minimum needs, that is on a shelter-for-every-family standard rather than on a shelter *cum* amenity standard. The attainment of such a standard will be the most pressing immediate post-war task; it may be the maximum that can be accomplished during the first few years.

## A New Estimate

An attempt to estimate housing needs after the war, in terms of a desirability standard, has been made by Mr M. A. Abrams in the November issue of *Agenda*. He set himself the task of answering the question of how many dwellings would be needed after the war to provide each family with a separate house. His calculations of the number of houses required seem to be based on potentially effective demand, with an allowance for replacement demand, based on an assumed average "life" of dwellings. Mr Abrams begins by estimating supply and demand in Great Britain immediately after the war. Here are his estimates:

|                                                        |            |
|--------------------------------------------------------|------------|
| Supply and demand for dwellings at the end of the war: |            |
| Potential number of separate households ...            | 12,785,000 |
| Allowances for vacancies (about 5 per cent) ...        | 600,000    |
| Potential demand for dwellings ...                     | 13,385,000 |
| Supply of dwellings likely to be available             | 12,700,000 |
| Deficiency (allowing for vacancies) ...                | 685,000    |

On the basis of a shelter-for-every-family standard, the deficiency at the end of the war shown by these calculations is thus comparatively small, that is, it could be made good in about two years, at the pre-war rate of building. Taking the average "life" of houses at 70 to 80 years, Mr Abrams suggests that most of the 4,000,000 houses which are over 80 years old should be replaced as soon as possible, that is, on the basis of his desirability standard, the deficiency at the end of the war will be of the order of 4,685,000 units. Such a standard, obviously, can only be achieved by a long-term programme which, moreover, must take account of the need for replacing the remaining stock of houses. With an assumed normal "life" of 75 years, the call for replacement of this remaining stock would be at the rate of 125,000 a year. On the basis of a 25-year plan, an average of 285,000 dwellings would have to be replaced every year on these assumptions. Since, on his calculations, total potential demand would show little change during the next 25 years, once the initial physical shortage of 685,000 is made good, this replacement demand represents his desirability standard. In other words, the total demand for houses arrived at in

this way depends entirely on the assumption that it will be possible to replace houses when they are 75 years old. If that assumption is wrong, so is the calculation. Moreover, the actual volume of construction from year to year must be determined in the general context of competing demands for labour and materials, not merely by reference to a housing standard. Nevertheless, a yard stick is essential, and Mr Abrams' calculations are a useful contribution to the statistical aspect of the housing problem.

## Rights of Preference Shares

The opposition to the Crosses and Winkworth scheme, organised in the interest of the preference shareholders, has been so successful that the directors failed to obtain the 75 per cent majority required at the meeting of that class of shareholder. (Holders of only just over one-third of the preference capital voted, and the adverse vote was less than 10 per cent of the issued preference capital.) The scheme is, therefore, defeated and some at least of the debenture holders appear to have been in despair at the result. The board does not seem to have made any proposal, but the representatives of the preference shareholders let it be known that all they wanted was a rather larger share in the cake and that the last thing they wished was to wreck the scheme as a whole. The original scheme was dealt with on page 791 of *The Economist* of December 11th, when it was suggested that the debenture holders were entitled to full satisfaction and that the preference and ordinary holders did well out of it. If the debenture holders are prepared to forgo some part of their rights it is, presumably, only in order to secure agreement from the other classes of capital. If the preference shareholders stand on their rights as against the ordinary, it is only reasonable that the debenture holders should adopt a similar attitude towards them. The market, however, assumes that there will be an arrangement whereby there is a minor improvement of the preference holders' position at the expense of the equity.

Meanwhile, the receiver and manager appointed in the interests of the debenture holders of Achille Serre is putting forward a plan for the resuscitation of the company. His management has been so successful that, with the assistance of the special wartime demand for services to keep clothing in good condition, profits for the six months to June 30th last exceeded £35,000. The company is now in a position to pay off its debentures in full and make some payment to unsecured creditors, but the receiver suggests that all concerned may prefer to keep the business in being. To achieve that, the only sacrifice which need be asked of the debenture holders is to defer the date of repayment. In return they are offered 3 per cent premium and certain concessions as to the amount of stock which may be issued ranking prior to, or *pari passu* with, them. This seems strictly reasonable, but it is less reasonable that unsecured creditors should receive only certain small payments in full at once and have the option of accepting 15s. in the pound cash in full settlement, or 10s. in cash and an equal amount in 4 per cent second debentures with a

maximum life of 22 years. Further, the preference shareholders are asked to forgo arrears of cumulative dividend and accept conversion into ordinary without any compensation other than that the existing equity holders are to have their capital written down by 75 per cent, which means that the preference obtain six-sevenths of the equity. The reason given for this is the poor EPT standard, but surely that is a transient factor, so far as is known at present. It would warrant cancellation of the cumulative rights of preference holders for the period of the tax in exchange for suitable compensation. It is true that it is fifteen years since any preference dividend was paid, but that means that there will soon be 90 per cent of arrears due, an item of which some account should be taken. The unsecured creditors and preference shareholders would be well advised to object to the terms of the scheme.

### Chile Raids Sinking Funds

There is, unfortunately, nothing new in the fact that the Chilean Government failed in 1943 to implement to the full its undertaking with regard to sinking funds on its overseas loans. The service of this debt is provided for by a law passed in January, 1935, which pledged the profits of the Nitrate and Iodine Sales Corporation and certain profits on the sale of copper to the service of the bonds. One half of the total was to be used to pay interest and the other to buy up bonds. No specific sinking fund attached to any loan; the bonds were bought, if at all, where they were cheapest. This has meant in recent years purchases almost entirely in New York and reductions of derisory amount in the sterling debt, the latest example being £600 to reduce the debt to £27,742,471, nominal value. The British bondholder would, perhaps, accept this anomaly if the funds appropriated were in fact used for redemption, but only a small fraction of them is so used, apparently not as much as 10 per cent in 1943. The failure of the Chilean authorities to implement the sinking fund provisions of their own proposals, coupled with the fact that the average rate of interest paid has been around 1½ per cent, gives the bondholder every cause for protest. His feeling of injustice is not lessened by the fact that, despite the exceptional demand for Chilean copper, the net proceeds of the levies on the copper companies appropriated to the service of the bonds have fallen during the war. This is held to be due to the fact that the export duties on copper bars are unduly high. It is evident that the authorities can arrange matters so that the bondholder suffers, if they so desire. In fact, no reliable statistics of either copper exports or the profits of the companies are obtainable. Copper taxes are used for railway improvements, while the USA is engaged in assisting Chile to develop the copper industry. While there is some shortage of sterling, there is an ample supply of dollars from a large favourable balance of trade, and Chile has, evidently, funds which could, and should, be employed to provide at least the service on her loans which she herself proposed. The matter ought to be taken up and pursued with energy. If, as is suggested in some quarters, the Chilean authorities have bought up stocks outside the official sinking fund, it would be interesting to know whether these are available for resale.

### New Currency Candidates

Two candidates have to be added to the list of proposed international currency units—not, it should be added, because of any likelihood of their ultimate adoption, but merely to complete the records. The first is the Libra sponsored by the Liberator Council, a body which is issuing a certain amount of literature on its currency scheme. This is the Liberator plan which provides for the creation of a "costless international currency"—a description which indicates strong affinity with the social credit family. The Libra would be used for all external payments, but would not in any way interfere with internal currencies, each nation being free to handle its internal monetary affairs as it thought fit. How this dissociation of the internal and external values would be achieved has not yet been explained. The memorandum on the subject states that the full plan is at the moment only in draft form, "as certain major details, including the question of the advisability or otherwise of recommending an international police force, are still receiving consideration." The promoters of the plan are quite sure of one thing. They will have nothing to do

with gold, and for that reason condemn the Keynes and White plans out of hand.

The other currency unit represents another extreme. As its name "Euricor" would suggest, it is strongly tainted with gold. It comes, quite appropriately, from Johannesburg, where it was launched by Mr. Norbert Erleigh, chairman of New Guinea Goldfields, at the recent annual meeting of that company. The Euricor is to be a basic monetary unit to which all European currencies are to be attached. It is to have a fixed and unalterable gold parity and is to be issued against specific gold backing. That backing is to be obtained in the first instance by lend-lease deliveries of gold from the United States. This gold would then be repaid to the United States over a long period out of the production of gold from the Empire—and especially from the new Orange Free State goldfields in which Mr. Erleigh's company is interested. The two proposals appear to be of about equal merit and cancel one another out very nicely.

### Anti-Inflation Drives

A number of belligerent Governments have recently been showing increasing concern at the growing symptoms of inflation in their respective countries, and have taken counter measures. Last week the South African Minister of Finance, Mr. Hofmeyr, described the measures by which his Government had combated inflation. He could afford to do so with a certain measure of self-satisfaction, for South Africa has been reasonably successful in avoiding the perils of inflation, and during 1943 has slowed down the rise in the cost of living. One of the most helpful factors in countering inflationary forces has been the extent to which South Africa has repatriated external debt, and has placed it in the domestic capital market. The South African Government has repatriated about £75 million of sterling debt, which leaves virtually no South African stock in London. This exhaustion of Government stock deprives the South African authorities of one of their most powerful anti-inflationary solvents. Mr. Hofmeyr, therefore, urged private, corporate and public investors in South Africa to keep the movement going by buying securities in the London market. This is not a new note. Since the beginning of the war the repatriation of shares in South African enterprises—mainly gold mines—has probably amounted to one-fifth of the Government stock repatriation. The movement has received active support from the South African authorities in the form of the discriminatory tax levied on dividends paid to non-resident holders of South African securities. If it is to be considerably accelerated, Britain must be prepared to see further considerable inroads made into its holding of South African mining and industrial shares.

In Mexico President Camacho has this week approved a fourfold plan for dealing with the persistent rise in the price level, and with the accumulation of redundant purchasing power. The first proposal is one which has already become familiar in India, Egypt and the Middle East. It is the marketing of gold. The Bank of Mexico is to make the necessary gold available in the open market. The second will be a drive to encourage the sale to the public of Government stock and railway bonds now held largely by the banks. The third item is an announcement that taxes on annuities will remain unaltered—no doubt as a means of encouraging investment in this form of security. Fourthly, the system of collecting income-tax is to be revised, making the collection half-yearly, and thus evening out its impact on redundant purchasing power.

### Record Asbestos Earnings

Despite the wide variety of the group's products, it is probably still the case that the mainstay of the business of Turner and Newall consists of goods containing asbestos. No doubt the range of uses has increased under war conditions, and this may explain the recovery in the pre-tax profits of the parent company to a new high level of £2,710,000 odd for the year to September 30th last. Details of appropriations for the past three years are set out on page 55, and all that need be said is that they suffice to cover the dividend at the reduced wartime rate and the usual appropriation of £100,000 to general reserve with a modest margin to spare. The accounts are weakened by the fact

that there is no consolidated profit and loss account. It is true that the bulk of the subsidiaries have been consolidated with the parent, but important appropriations may be hidden in their accounts. The consolidated balance-sheet suggests relatively modest capital outlays on the year which are much more than offset by depreciation of £457,000 and amortisation of mining properties of some £91,500. The result is a decline of £200,000 in fixed assets. Against this, gross liquid assets are up by £1,200,000, the rise being mainly in cash and tax certificates. Stock in trade is temporarily lower, but the report states that every effort is made to keep this figure up. It would be interesting to know what proportion of the total of stock and work in progress of £4,000,000 odd represents goods which can be used directly for the satisfaction of post-war demands. During the year the company has sold about one-third of its holding in British Oxygen, reducing the amount held to £83,000 nominal value. This is written down to £1, and the sale has yielded a profit of some £114,000, which is used to strengthen the reserve against depreciation of mining and other subsidiaries operating overseas. Incidentally, the group's interest in a South African concern making asbestos cement has been increased during the year, and the holding shows a rise of £35,000. The rise in total reserves, including that already mentioned, is some £275,000 on the year to £3,935,000. A weakness of the balance-sheet is the fact that creditors and provisions are given in one omnibus item. This all too common practice should be ended. The statement of the chairman says little of the future. The main problem of the group has been to secure factory labour, and this state of affairs is likely to continue. As to the post-war position—the chairman hints at the possibility of changes in demand during the current year—asbestos and magnesia compounds, in which the group specialises, are likely to enjoy an increasing demand, especially if, as is probable, new uses have been discovered during the war.

### Lancashire Cotton Earnings

A further chapter is added to the history of the cotton textile trade during last year by the full report of the Lancashire Cotton Corporation for the twelve months ended

October 31st. The company's own profit, struck after all appropriation other than depreciation and tax, except tax on dividends, shows a substantial recovery from the sharp fall of 1941-42, while revenue from other sources has continued to rise. The total is, however, still inferior to that of 1940-41, and virtually the whole increase on the year is absorbed in providing £100,000 for postponed repairs. If this means that that much extra ought to have been spent already to maintain equipment in the same state of repair there is, of course, no improvement on the year, but there is nothing to throw any light on this point. The main trouble of the group is that it remains impossible to obtain the necessary labour to run the mills which remain open, and it appears that twelve mills and parts of two others have been closed throughout the period. In the circumstances, a further rise in stocks is, presumably, in stocks of raw materials. Details of the accounts are set out on page 55. In his statement the chairman, Sir John Howarth Grey, draws attention to the problem of obtaining the requisite labour supply once the mills can be reopened. He states that merely to raise wages will not solve the problem, and goes on to talk of canteens and other amenities provided by the group. In regard to canteens at least, the company's experience is disappointing, for, as in some other industries, workpeople fail to make much use of them. There is fairly wide agreement that the concentration of the cotton trade was too drastic, and Sir John is probably right in urging employers and operatives to get together to make new working and staffing arrangements so that the supply of workers, skilled and unskilled, can be used to the best advantage.

### Future of Clothing Industry

Hitherto the reconstruction reports issued by trade associations have been concerned primarily with the conditions in which private enterprise should be allowed to operate after the war. The report issued this week by a Council of Clothing Trade Associations refreshingly concentrates on the problems of its industry on the basis of a number of assumptions about Government policy. It contains recommendations under these headings: Recruitment of personnel, wages, working conditions and education; the restoration of factories now engaged on war production,

OVER a century's experience of sound construction is behind the making of Milners' Office and Factory Steel Equipment.

Milners' technical experts will be pleased to advise on all matters of storage equipment for industrial purposes.

Write setting out your problems to:

MILNERS SAFE COMPANY LTD., 21, HAMPSTEAD LANE, LONDON, N.6. Telephone: MOUNTVIEW 6655

with special reference to the provision of efficient plant and adequate amenities; the supply of cloth and other materials and the introduction of standards; the future of the utility scheme, of price control, of the retailer and the disposal of Government stocks; the future of overseas trade; research, costing, consumer surveys, industrial statistics. The detailed recommendations made under these headings deserve careful scrutiny; some of them are debatable, but others, such as those concerned with standards of quality and standardisation, reveal an encouraging measure of agreement on the need for new and better methods.

#### Burma Corporation Position

Although evacuation actually took place on April 25th, after the plant had been immobilised at short notice, the accounts now presented by Burma Corporation cover the period of fifteen months to September 30, 1942. That is to say, five months of occupation and ten of trading, the closing weeks of which were rendered difficult by lack of shipping. In the circumstances, a gross trading profit of £776,820, compared with one of £382,362 for the preceding twelve months should probably be regarded as very satisfactory. Further, the profits of the earlier year included a credit of £82,500 for stocks of metal. For the latest year nothing is included on this account, stocks being revalued at £643,800 and the whole neglected both in the profit and loss and balance sheet. The new figure includes metal in all stages of processing, and is included to obtain an estimate of the total losses of the corporation, which include also £262,551 for stores. These stocks and stores were all abandoned to the Japanese. Apparently, total metal stocks were previously greatly undervalued. Out of profit, £420,000, representing approximately the company's tax liability, has been carried to a new war contingencies and taxation reserve which, with unexhausted balances of the old tax reserve, amounts to £990,938 against £1,055,187 in the old account. Of the final dividend of 3 annas a share for 1941 approximately half has been met by raiding the carry forward. Although much must depend upon tax claims, the liquid position appears strong with net liquid assets in the neighbourhood of £1,500,000. There will, of course, be questions of compensation, with the promise of the home Government to make good local deficiencies so far as general obligations permit.

#### Recognition of Supervisors' Union

An agreement has been reached between the Engineering and Allied Employers' Federation and the Association of Supervisory Staffs and Engineering Technicians, by which the Association has been recognised as a negotiating body. This agreement, which has been reached after long negotiations, may be of considerable significance in industrial relations. ASSET, which started life as the National Foremen's Union, has developed rapidly in recent years and now claims nearly 13,000 members. It caters

**TEMPORARY RESEARCH ASSISTANTS** are required in provincial offices of Government Department. The salary range will be £245-£475 for men and £245-£430 for women. Candidates should possess an Honours Degree in Geography with subsidiary Economics or Honours Degree in Economics with subsidiary Geography, or Joint Honours Degree in both subjects. Applicants should write to the Ministry of Labour and National Service, Advertising Section, Alexandra House, Kingsway, London, W.C.2, for the necessary application forms. The reference No. F.1849A must be quoted.

Only men between the ages of 21 and 30 who have been discharged from the Forces and who are not liable for Military Service on health grounds will be considered. Commencing salary £400-£600 per annum, according to qualifications and experience, plus cost-of-living allowance, free quarters, light, fuel, normal medical attention and home leave every three years. Write, giving full details, to Box No. 361, c/o. DAWSONS, 31, Craven Street, London, W.C.2.

**C**OMPANY requiring investment in ships Mortgages invites applications from accountants. Write Box 119, THE ECONOMIST, Brettenham House, Lancaster Place, W.C.2.

**J**OURNALISTS. First-rate contributions wanted on miscellaneous subjects germane to the export trade. Good rates, regular opportunities. Box "Export," c/o Davies & Co., 95, Bishopsgate, London, E.C.2.

not only for foremen, but for all types of superintendents, technicians, planning engineers and supervisory grades. The general secretary of the Association has expressed the belief that the agreement will have the effect of entitling such staffs to be represented on joint production committees. There is nothing specific in the new agreement about representation on joint production committees, which is normally a matter of arrangement at individual factories, and it is obviously desirable that technical and supervisory staffs should be represented on committees whose object is to increase productive efficiency. Recognition of their trade union may make it easier for such staffs to serve on production committees, since it may well have a beneficial effect in lessening any friction which may exist between the workers at the bench and the supervisory grades.

#### More Dollar Sterling Parities

A comparison of the economic war efforts of the UK and USA in the December 25th issue of the *Bulletin of International News* soon meets the inevitable stumbling block of devising the correct dollar sterling exchange rate for converting the national income data expressed in these currencies. The author of the article, who signs himself A. J. B., meets the difficulty by calculating a variety of parities each applying to certain types of goods and services. They are as follows:

|                                                                                        |                |
|----------------------------------------------------------------------------------------|----------------|
| Consumers' durable goods and services ...                                              | \$6.5 to the £ |
| Consumers' non-durable goods ...                                                       | \$5.9 "        |
| National defence goods and non-defence goods and services bought by the Government ... | \$6.5 "        |
| National Defence Services ...                                                          | \$10 "         |
| Investment and disinvestment ...                                                       | \$5.5 "        |
| Consumers' non-durable goods and services ...                                          | \$6.1 "        |
| Consumers' durable goods ...                                                           | \$5 "          |

The weighted average of these various rates, deriving the weights from official statistics of the distribution of national income, is \$6.4 to the £.

#### Tin Prices

On January 1st, the domestic price of tin was raised from £275 to £300 per ton, delivered at consumers' premises. This is the first change in the price since December 9, 1941, when the London tin market was closed owing to the outbreak of the Pacific war and the Ministry of Supply's Non-Ferrous Metal Control took over the regulation of prices. The reason given for the increase is a general upward movement in the cost of tin to the Ministry of Supply during the past two years, resulting in a burden on public funds. Measured by pre-war prices, the new price is a high one. The highest annual average price in the pre-war decade—reached in 1937—was only £242 6s. 7d. per ton. The new price, however, remains well below the price paid to Bolivian producers—at present £333 10s. per ton with a new increase pending—which implies that producers in the other supplying countries—chiefly Nigeria and Cornwall—receive much less for their tin. The Nigerian price, despite the inclusion of certain compensation payments for the excessive working of the existing tin properties, is believed to be well below £250 per ton. Whereas the Ministry of Supply's policy seems to be to sell tin on a cost basis, in the United States the metal is supplied below cost. The selling price for the highest grades of tin has for more than two years been stabilised at 52 cents per lb., while actual refining costs at the US Government-owned Texas City smelter are believed to be about 75 cents per lb.

(Continued on page 55)

#### INDEX TO VOLUME CXLV

The Index to Volume CXLV (July to December, 1943) will be available in about two weeks' time, and will be sent to all those who have asked for the Index to be regularly supplied to them. Any other readers who wish to receive the Index (post free) are invited to apply to The Publishers,

THE ECONOMIST, Brettenham House, Lancaster Place, London, W.C.2

# REPUBLIC OF CHILE

## SERVICE OF THE EXTERNAL DEBT RELATING TO THE YEAR 1943 (LAW No. 5580, 31st JANUARY, 1935)

The Caja Autonoma de Amortizacion de la Deuda Publica de la Republica de Chile, in accordance with the provisions of Article 6 of the Regulations of Law No. 5580 of 31st January, 1935, approved by Supreme Decree No. 3837 of 24th October, 1938, declares that in the year 1943 it has received the following revenues:—

|                                                                                                                |                |
|----------------------------------------------------------------------------------------------------------------|----------------|
| Profits of the Chilean Nitrate & Iodine Sales Corporation ...                                                  | \$2,357,389.16 |
| Income-tax of the Fourth Category and additional tax on the Copper Companies ...                               | \$6,044,262.01 |
| Quota of the duties on petroleum for the Nitrate Industry (Article 7 of Law No. 6155 of 6th January, 1938) ... | \$ 57,561.72   |
| Quota of the duties on petroleum for the Copper Companies (Article 7 of Law No. 6155 of 6th January, 1938) ... | \$ 108,031.70  |
| Total ...                                                                                                      | \$8,567,244.59 |

Fifty per cent. of this revenue, or the sum of \$4,283,622.30, will be applied to the payment of interest at the rate of U.S.\$1.428 per hundred dollars nominal capital, \$0.33558 per hundred Swiss Francs nominal capital and £1 8s. 6.72d. per hundred pounds nominal capital.

By reason of the suspension of exchange operations in most of the foreign markets on account of the war, it has been impossible this year to make the conversions necessary to provide in Swiss Francs the sums required for the service of the bonds denominated in that currency. The Caja has accordingly been obliged to state in U.S. Dollars the rate of interest to be paid to the holders of these bonds and to maintain in that currency the funds required to cover such interest payments.

Out of the remaining 50 per cent. of the revenue received, bonds have been redeemed to the nominal amount of U.S.\$1,700,000 and £600, and have been withdrawn from circulation.

After making the above-mentioned redemptions, the balances of bonds of the External Debt are as follows:—

|                    |
|--------------------|
| £27,742,471        |
| U.S.\$162,736,500  |
| Sw.Fcs.108,662,500 |

SANTIAGO, CHILE.

29th December, 1943.

## COMPANY MEETINGS

## BANK OF MONTREAL

MR G. W. SPINNEY ON  
NATIONALISATION

The 126th annual general meeting of the Bank of Montreal was held on the 6th ultimo at Montreal.

Mr George W. Spinney, C.M.G., the president, said that he could not see that under nationalisation the varied banking services would be performed with greater efficiency and dispatch than they were now. He could find no need for nationalisation in order to place the nation's supply of money under governmental regulation, since the regulation of the money supply was a function already performed by the Government-owned central bank.

The alternative which proponents of nationalisation offered in exchange for the present system of competitive banking was a banking monopoly under governmental control. Under such a system, once the borrowing requirements of a customer were denied, for whatever reason, he would have no recourse except through the channels of special pleading or political influence.

In its primary aspects the matter of nationalised banking was one of monopoly versus competition in the field of credit; and even within these limits it concerned everyone owning or dependent upon a Canadian enterprise that might have need of day-to-day or seasonal credit accommodation. In its broader implications the issue was that of individual liberty of action as opposed to the concept of a central Government supreme not only in the field of legislative powers and responsibilities but in the spheres of business, industry and finance as well. That would inevitably mean the domination by the central authority of all bodies, whether public or private, which must have recourse to credit facilities.

After warning against the dangers of inflation and of complacency at this stage, the president referred to the spectacular war-time achievements of Canadian industry and to the great contribution made to the war effort by agriculture and transportation. The bank's own role in the war effort, he said, had been one of increasing responsibility. Volume of commercial and financial loans had shown little change, but in other directions the work had vastly expanded.

He referred to the effect on the bank's operations and affairs of the low level of interest rates, which had been a matter of Government policy—in peace-time years with a view to stimulating business, and since the war for the purpose of keeping down the carrying charges on the debt to the lowest possible level. That had, he said, been clearly reflected in the interest return on savings deposits.

For 126 years the bank had played an important part in the commercial and industrial development of the Dominion. He was confident that it was well equipped to do its important part towards meeting the problems and opportunities of the post-war years in a continued spirit of enterprise and helpfulness to the whole community.

## GENERAL MANAGER'S REMARKS

Mr B. C. Gardner, the general manager, dealt with changes in the balance-sheet since last year, including an increase of \$138 millions in total assets to a new high level at \$1,313,065,000, an increase of \$115.7 million in investments to \$799,848,000, the gain being mainly in holdings of Dominion of Canada deposit certificates, and other short-term obligations of the Dominion Government.

Current loans and discounts were little changed. Commercial loans continued to reflect the reduction in inventories, the shortening of credit terms, the reduced activities of companies engaged in the financing of durable consumer goods, such

as motor-cars, the inactivity of financial markets, and the reduction of private debt.

The rise in bank deposits had been accompanied by a growth in the number of current and savings accounts and the bank now provided banking facilities for about 1,200,000 customers under those headings. The increase had been accompanied by an even greater growth in the volume of transactions handled at branches, including the special war-time services. The services of the bank had been maintained at a high level of efficiency in spite of the greatly increased volume of routine resulting from war-time conditions. The volume of Canadian business activity had reached new peaks in the twelve months just closed.

The report and accounts were adopted.

CHARTERHOUSE  
INVESTMENT TRUST,  
LIMITEDIMPORTANT SERVICES TO  
BRITISH INDUSTRYSIR ARTHUR H. MARSHALL'S  
REVIEW

The eighteenth annual general meeting of the Charterhouse Investment Trust, Limited, was held, on the 31st ultimo, in London.

Captain H. Nutcombe Hume, M.C., the vice-chairman, presided.

The following are the remarks of the chairman, Sir Arthur H. Marshall, K.B.E., which were circulated with the report:—

Taken as a whole, the results show improvement over any other war year, both the Charterhouse Finance Corporation and the Charterhouse Industrial Development Company having had more profitable years. In the case of the former company the business which I mentioned in my last year's remarks as being in prospect matured satisfactorily, and since the close of the year stockholders will have noticed from the Press that we have purchased some 80 per cent. of the ordinary shares of the old-established and successful publishing company Methuen and Company, Limited, a transaction which we have reason to believe will prove profitable.

PROSPECTS OF THE INDUSTRIAL  
DEVELOPMENT COMPANY

The Development company has continued to secure good business, and I feel quite sure that in the section of the group's activities covered by this company there is the prospect of greater activity after the war in connexion with the re-establishment on a peace-time footing of the smaller and medium-sized commercial and industrial businesses. Stockholders will recall that we have important and influential co-shareholders in this company, and with their collaboration I am hopeful that the Development company will be able to make a most positive contribution to the constructive financial services which the City of London can render to British industry. Private financial enterprise has supported industry and commerce successfully in the past and can do so in the future, and I have no doubt that the several responsible concerns engaged in this class of business will prove the truth of this assertion and be ready to meet the demands which will be made upon them. The Charterhouse Industrial Development Company has now had nine years of experience in financing the smaller and medium-sized industrial company and has accumulated a fund of knowledge which should place it in a favourable position to secure and undertake good business in this field.

## THE FUTURE FOR PUBLIC ISSUES

It is not so easy to foresee the course of business for the Finance Corporation, although I believe that generally the introduction of capital into productive enterprise will still have to take place through

the machinery of public capital issues, and I hope that accredited issuing houses will not find their business unduly hampered by restrictions in their efforts to meet the genuine long-term financial demands of industry.

The trust's property interests have all shown better results during the past year, but while the burden of war damage contribution remains we cannot expect any return from them. At the moment demand exceeds supply in almost all classes of property except shops.

## THE GROUP'S RECORD SUCCESS

Since its formation in 1925 the Trust and subsequently the Finance Corporation and the Development company have handled some ninety-five capital issues for seventy-nine different companies. I am sure that our stockholders will take pride in the knowledge that apart from three companies which were taken over on satisfactory terms the remaining seventy-six are all going concerns to-day and with five exceptions (two of which are London property companies) are paying dividends. This record reflects the policy of the company and its associates in the Charterhouse group have always followed, namely, to concern themselves only with good-class business which will bear close independent investigation and which has every prospect of yielding satisfactory results to those who subscribe the capital.

By the time we meet again I most sincerely hope we shall be no longer at war—in Europe at any rate. It is our intention that at that time your companies shall be well placed to secure and handle good business and thus to make their full contribution to the work of constructive finance to which I have already referred. To that end we have taken offices in No. 6, Old Jewry which we intend to occupy until we can build again on our freehold site in St. Swithin's Lane.

The report was unanimously adopted.

APEX (TRINIDAD)  
OILFIELDS, LIMITED

## DIVIDEND OF 30 PER CENT

The 24th ordinary general meeting of Apex (Trinidad) Oilfields, Limited, will be held in London on the 13th instant.

The following is an extract from the report of the directors which incorporates the annual statement of Mr Walter Mac-lachlan, the chairman:—

The profit for the year amounted to £394,565, making with the balance of £143,168 brought forward from the previous year a total of £537,733. Against this amount there is chargeable interim dividend No. 46 of 12½ per cent., directors' additional remuneration, provision for taxation and provision for deferred drilling operations, totalling £292,188, thus leaving a balance to the credit of profit and loss account of £245,545. The directors now recommend a final dividend of 17½ per cent., less British income-tax at 5s. 0½d. in the £, making a total dividend of 30 per cent. for the year. The balance of unappropriated profits to be carried forward will amount to £144,483.

At September 30, 1943, the current assets, less current liabilities and taxation and other provisions amounted to £494,415.

In the national interest, this company, in common with other oil companies, does not now publish figures of drilling and production, but it is generally recognised that the Trinidad oil industry is contributing to the war effort on a substantial scale. It will be appreciated that the extent to which we are thereby drawing upon our reserves of oil and the allocation to us of materials for drilling to maintain those reserves are matters at present outside our control. Under the circumstances the directors have appropriated £30,000 from the profits of the year and £20,000 from general reserve to institute a provision in respect of deferred drilling operations.

## TECALEMIT LIMITED

SUCCESSFUL YEAR—INCREASED  
PROFIT

## MR S. G. GATES'S SPEECH

The ninth annual general meeting of this company was held, on the 5th instant, in London, Mr S. G. Gates (the chairman) presiding.

The Chairman, in the course of his speech, said:

Ladies and Gentlemen, in presenting the accounts for the year ended July 31, 1943, we have introduced certain alterations in the grouping of assets and liabilities in the balance-sheet. We trust that these will commend themselves to you as giving a clearer and more logical picture of the company's position.

## YEAR'S RESULTS

I hope that by the time we next meet we shall have achieved victory over our principal enemy, and that I shall then be free to give a more interesting account of your company's wartime activities than is now permissible. Once again, the year's operations have shown a notable expansion, which is reflected in the rise of stock in hand and work in progress from £403,801 to £647,534, and has resulted in a trading profit of £91,055 as against £63,403 last year. This profit figure has been arrived at after setting aside £610,000 as provision for taxation, an estimate which is calculated to cover the E.P.T. liability for the company and its subsidiary and in addition for income-tax on the company's profits earned up to July 31, 1943.

A maiden dividend has been received from your Australian subsidiary, and I should add in this connection that the figure of £13,165 shown as due from this company in the balance-sheet is not a fixed loan; it merely indicates the trading position on current account between the two companies as at July 31st last.

You will also have noticed that we have acquired a shareholding in T.K.S. (Aircraft De-Icing), Limited. This represents a one-third interest in a venture in which we are associated with the Sheepbridge-Stokes Centrifugal Castings Co., Limited, and the Kilfrost Manufacturing Company, Limited.

## THE FUTURE

As regards future prospects, you will hardly expect me to indulge in prophecy, especially while the Government's policy

remains undeclared on so many vital questions, such as the disposal of surplus war stocks and the measures to be taken to revive British export trade. Your directors are neglecting nothing they can rightfully do to assure to Tecalemit, Limited, its proper place after the war; meanwhile, they take the view that it is in your best interests to maintain a conservative policy. For this reason the rate now recommended for a final dividend remains unchanged at 12 per cent., less tax, making 18 per cent. for the year.

Mr W. J. Parslow, formerly joint managing director, has become sole managing director during the year, owing to the resignation of Mr R. A. Chalmers, after completing twenty years' service with the company.

## TRIBUTE TO STAFF

Man-power shortage has made the past year in many ways the most exacting we have yet encountered. Staff is reduced to a bare minimum, and has worked throughout under extreme pressure. I am sure, therefore, that you will wish to join me in paying a tribute to the exertions of those who have surmounted many formidable difficulties and rendered possible the satisfactory results achieved.

The report and accounts were adopted.

SYDNEY S. BIRD AND SONS,  
LIMITED

## INCREASED TURNOVER

The seventh annual general meeting of Sydney S. Bird and Sons, Limited, was held, on the 30th ultimo, at Cydon Works, Enfield.

The following is the statement of the managing director, Mr Sydney S. Bird, which was circulated with the report and accounts and was taken as read:—

Sir Ian Stewart-Richardson's military duties have taken him out of the country, and I have been appointed to act as chairman in his absence. I am sure you would like me to send him our good wishes.

As regards the accounts, you will appreciate that our profits are limited by excess profits tax to rather more than £20,000 per annum, subject to income-tax, so that there is little or no indication in the accounts of the exceedingly busy year we have had.

The company was incorporated in 1936, and since that time provision has been made each year for income-tax on a conservative basis. As a result, the income-tax reserve is now sufficient to cover the estimated liabilities up to April 5, 1945.

This means that, since 1936, we have provided for an extra year and a half's income-tax, which is, of course, desirable in view of the fact that the company is assessed to tax on the basis of profits earned in the preceding financial year.

The balance-sheet again shows a satisfactory position, and you will observe that the company has been able to finance the much increased turnover without having had to raise any loans.

I should like to place on record the board's appreciation of the efforts made by all concerned.

The report and accounts were adopted.

TARRAN INDUSTRIES,  
LIMITEDMR ROBERT G. TARRAN'S  
SPEECH

The ninth annual general meeting of Tarran Industries, Limited, was held, at the company's registered offices, Clough Road, Hull, on the 30th ultimo, Mr Robert G. Tarran, chairman and managing director, presiding.

Mr R. G. Tarran, in the course of his speech, said: The past year's result, which reduces our carry-forward from £61,000 last year to £16,000 this year, is disappointing to workers, shareholders, management and directors alike, but with a more reasonable attitude on the part of Government departments, the promising outlook for our factory-produced products, and the enormous potential demand for our services in the field of building and civil engineering, I hope to be able to present a more favourable report at our next annual general meeting.

The directors, after their customary cautious scrutiny of the accounts, feel that this is a time when the reserves which were built up before the war should be used to assist in keeping the financial structure of the concern on sound lines ready for the reconstruction years ahead, a policy which, I am certain, will have the concurrence of every shareholder. The directors propose that instead of paying 8 per cent. to 10 per cent. this year, as we have done in recent years, the dividend shall be 5 per cent., which makes an average of 5.8 per cent. per annum since the formation of this company.

No building concern is better equipped with new methods and materials for the building industry than we are. It is our intention to keep the lead, which we have achieved and which we feel will result in great benefit accruing to all associated with the company in the years ahead.

The report and statement of accounts were adopted.

(Continued from page 52)

## FINANCE AND BANKING

**THE MONEY MARKET.**—The transition from credit scarcity to abundance over the turn of the year 1943 into 1944 has been as marked as usual. Although credit has been absorbed in large quantities by official open market sales of bills, the market has this week been glutted with funds, and all the banks have been keen buyers of bills. The banks had to pay £80,000,000 against Treasury deposit receipts this week, of which about £40,000,000 represented new money. The process of rebuilding the discount market's somewhat depleted bill holding was helped this week both by official resales (discussed in a note on page 48) and by the 41 per cent. allotment which the market obtained at last week's Treasury bill tender. The easing of the credit position has been helped by the return of notes from circulation, this week's Bank return showing a net reflux of nearly £5 millions.

**MONEY RATES, LONDON.**—The following rates remained unchanged between Dec. 31st and Jan. 6th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months 1½-1¾%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates ½%. Discount deposit at call ½%; at notice ¾%.

**Exchange Rates.**—The following rates fixed by the Bank of England remained unchanged between Dec. 31st and Jan. 6th. (Figures in brackets are par of exchange.)

(Continued on page 59)

## GOVERNMENT RETURNS

For the 13 days ended Dec. 31, 1943, total ordinary revenue was £95,337,000, against ordinary expenditure of £170,025,000, and issues to sinking funds of £455,000. Thus, including sinking fund allocations of £9,995,735, the deficit accrued since April 1st is £2,398,808,000 against £2,297,689,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £240,846 to £3,029,227, the other operations for the week (no longer shown separately) raised the gross National Debt by £75,316,993 to £19,246 million.

## THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1853)

**CAPITAL (PAID UP) - £3,000,000**  
**RESERVE FUND - £3,000,000**

Branches and Agencies throughout INDIA and the EAST  
 AFFILIATED BANK IN INDIA

THE ALLAHABAD BANK LTD., with 15 Branches & 30 Sub-Agencies

The Bank offers a complete Banking Service and provides exceptional facilities for financing every description of trade with the East.

Deposits for Fixed Periods or repayable at call or at short notice are received at rates which may be ascertained on application. The Bank also undertakes Trusteeships and Executorships.

**Head Office: 38, BISHOPSGATE, LONDON, E.C.2**

West End Branch:

**28, CHARLES II STREET, HAYMARKET, S.W.1**

Manchester Branch: 52, MOSLEY STREET

New York Agency: 65, BROADWAY, NEW YORK CITY

## THE UNION BANK OF AUSTRALIA

ESTABLISHED 1837.

LIMITED

Capital Authorised and Issued ... £12,000,000  
 Paid-up Capital ... £4,000,000  
 Reserve Liability of Proprietors ... £8,000,000

£12,000,000

(Not capable of being called up except in the event of and for the purpose of the bank being wound up)

Reserve Fund ... £3,500,000  
 Special Currency Reserve ... £1,500,000

**Head Office: 71, CORNHILL, LONDON, E.C.3**  
 West End Agency: 15, CARLOS PLACE, W.1

Drafts are granted on the Bank's Branches throughout the Australian States and Dominion of New Zealand. Telegraphic Remittances are also made. Commercial and Circular Letters of Credit and Travellers' cheques issued. Bills are purchased or sent for Collection. Deposits are received for fixed periods on terms which may be ascertained on application.

## THE BANK OF AUSTRALASIA

Incorporated by Royal Charter 1835.

Paid-up Capital ... £4,500,000  
 Reserve Fund ... 2,500,000  
 Currency Reserve ... 2,000,000  
 Reserve Liability of Proprietors under the Charter ... 4,500,000

£13,500,000

Court of Directors:

D. F. ANDERSON, Esq. HON. GEOFFREY C. GIBBS.

## Church and School

FEW measures have been so widely or so warmly welcomed as Mr Butler's Education Bill. Opposition comes from two quarters. From one, where the Bill is criticised for being too vague in timetable, too costly in terms of local rates and unbacked yet by decisions on the raising of teachers or the subjects to be taught, the criticism will speed the Bill on its way. From the other quarter, the Roman Catholics, who stand in solitary and impending hostility to the proposed place of religious education in the new system of national schooling, the opposition may be both delaying and damaging.

Formally, the Roman Catholics, through their Bishops, while approving many of its reforms in educational method and organisation, have refused to accept the Bill as it stands in any circumstances. Ever since the state began to build a state structure of education, first, by public aid to voluntary church school societies, nearly a century ago, and then in 1870 by starting secular schools to fill in gaps left in the system of schooling provided by voluntary bodies; the place of schools run by religious bodies, still a majority of the total, has been a stumbling block. Every important Education Bill has been threatened with shipwreck by the churches or the chapels or both. But, this time, the Butler Bill is generally regarded by the non-Catholic denominations, Anglican and Nonconformist, as extremely generous. Only the Roman Catholics stand apart.

What does the Butler Bill propose in this matter? It

proposes, first, that the school day shall begin with "a corporate act of worship," whether the school be lay or religious; secondly, that there shall be religious instruction in lay schools on the basis of an agreed and undenominational syllabus; and thirdly, that parents shall be able to withdraw their children from the act of worship or from the religious instruction and, if desired, send them for a specified period to receive denominational religious instruction elsewhere. It is not these provisions that have provided the actual bone of contention. Battle is being joined, instead, on the financial issue. The main trouble of national education so far, especially at the elementary stage and in rural areas, has been the poor quality of both accommodation and teaching in non-provided (that is, church) schools. The Bill aims to bring these schools into line with the proposed reforms in equipment and methods. Only in this way can the black list of sub-standard schools, mainly Anglican schools in country districts, be remedied.

If the owners of non-provided schools cannot find half of the cost of providing and maintaining the external fabric of an adequate school—this is applied in the Bill, generously, to new as well as existing schools—they will lose the right to appoint a majority of the managers or to appoint and dismiss teachers, though they will still have the right to the appointment of a limited number of "reserved" teachers, selected for their religious qualifications. Few Anglican village schools will be able to find

the money to maintain their independence of national standards; and the Anglicans, like the Nonconformists, have accepted the prospect, with the proposed guarantees for corporate worship and religious instruction.

The Roman Catholics, however, stand in a quite different position. It is supervision by a lay state over the life of the individual, particularly when exercised over the education of Catholic children, that the Catholic church chiefly resents. They demand as an article of faith, not only the right to teach the dogmas of Catholicism within the framework of state education and at the state's expense, but also the right to have other subjects taught to Catholic children against a Catholic background by Catholic teachers. Their belief is that the religious view of life affects more than just the teaching of religion itself, and that, even apart from specifically religious subjects, wholly secular education is, for Catholics, not only inadequate but wrong. The present position of Catholics is, from this point of view, most disadvantageous in the many rural areas where the only available school is Anglican, and in poor crowded urban areas where Catholics are numerous, but are lacking in funds to provide new schools at their own expense; in both, Catholic children may have to attend non-Catholic schools. The Catholic argument is that, as a substantial and sincere minority in a democratic community in which universal free education is provided, they have the right to ask the state to bear the whole cost of instituting sufficient Catholic schools to provide Catholic education for all Catholic children. They contend that the state should pay as fully for church schools as for any others.

This argument is a perfectly tenable one, and if the majority were indifferent, it might be accepted. Minorities in a democracy have every right, not only to state their opinions, but also to expect that, when the majority opinion is accepted, it shall not needlessly flout minority convictions. But in this case the majority is not indifferent, and the majority's view can be flouted even less than the minority's. Concessions to the Catholic claims would rouse a storm of opposition. Whatever the general view may be about the place of religion in education, the majority is emphatically not prepared to put state-provided schools under religious control. The only compromise that has been proved workable is the established practice of giving aid to church schools under strict limitations as regards curriculum and teaching.

The Roman Catholics, in an honest attempt to escape this dilemma, have offered a number of alternative suggestions. The most important is the proposal that there should be introduced into England and Wales an adaptation of the Scottish system. In Scotland there has always been agreement between the churches that schools should be denominational; and, in substance, the state pays the full cost of denominational schools, deciding the curriculum and appointing the teachers from among those certified by the churches in respect of their religious belief. But to suggest this solution for England and Wales is to ignore the fact that there is in England (as there is not in Scotland) a large body of opinion—probably a majority, and certainly more numerous than the Catholics—which definitely and emphatically objects to the use of public funds for denominational teaching. It also ignores the fact that the Episcopal and Catholic schools in Scotland are a tiny minority of the total number of schools, while in England the non-provided schools are a majority of the whole. Furthermore, there is the fear that, under such a system, the Catholic Church would build many new schools and attract into them many more children than can now be said to be Catholic. Whether this fear is justified or not, it would give rise to sufficient opposition to reject the proposal. One of the other proposals is that state loans free of interest should be made on demand to Catholic communities wishing to build schools. This involves again the fundamental question of public provision for denominational schooling, without public control; and it would invite, inevitably, the same request from all other denominations, and widespread and vehement public protest.

These alternative proposals do not exhaust the Catholic case. If it is not possible for the state to provide in

full for religiously controlled schools, it is then unjust, they argue, that they should be called upon to pay for state schooling, in addition to the heavy expense of providing their own schools. In other words, if the state will not give them the schools they want, the Catholics ought to be allowed to contract out—that is, either to pay no taxes or rates for education or to receive back as much as they pay.

It is, to say the least, a doubtful proposition that minorities should be allowed to contract out of policies, approved by the majority, which they do not like. To take only one example, if this argument applies to the churches in the matter of education, it ought also in logic to apply to the rich who do not send their children to state schools. It would then be practically impossible to finance public education. Moreover, the argument, to be discussed at all satisfactorily, would have to be documented with facts and figures which only the Board of Education, presumably, can provide: Mr Butler might do well in the debate to produce them, to show how much Catholics now pay and how much they receive in aid to their schools and in schooling for their children. It should be emphasised, however, that the number of Catholics involved in such a balance-sheet—ratepayers and taxpayers on one side, schoolchildren on the other—must mean, not those formally registered by the church, but those whose adherence is so firm that they would feel themselves seriously aggrieved by the necessity of sending their children to any but a Catholic school.

On the face of it, without these facts and figures, it would appear that the church communities, Anglican as well as Catholic, will get back at least as much under the Butler Bill as they pay, and probably more, if only because what they receive in aid to their schools from rates and taxes will be based upon the actual number of children attending their schools, which is much greater than the number of pupils who are, themselves or through their parents, "conscientious objectors" to secular education. This is obviously true of Church of England schools, which are often the only ones available and very often have a large majority of children whose parents are either indifferent, or in some cases even actively hostile, to the denominational character of the religious teaching. The argument also applies, though not in such full measure, to the Catholic schools. Indeed, it can be argued that wherever a Catholic school contains any non-Catholic or indifferent children, there is a presumption that the Catholic community is getting back from the state a greater sum of money than is paid by those among the Catholic parents who would have a conscientious objection to any other form of education. It is—to say the least—highly probable that the Catholic community would lose, rather than gain, by being allowed to contract out.

Finally, a straight retort must be given to the complaint that the Butler Bill represents an attempt either to "take away" the church schools from the churches, or to impose upon them a new and intolerable burden. The truth is simply that the state is now to insist that all schools in receipt of aid from public funds shall be brought up to set standards. If these minimum conditions can be fulfilled, with the use of voluntary funds, the churches can keep their powers of control. The new Bill actually makes more concessions to the churches than any previous measure. Admittedly, it offers, not simply more public money, but a higher proportion of a higher total expenditure; and this will increase the commitments of church communities which wish to hold their place in the national system of schooling and at the same time remain free. But the Government's offer is being made solely to raise the standard of national schooling to a decent minimum throughout the schools. There is no ulterior motive, no wish to reduce church influence, certainly no intention to diminish the place of religion. It is above all important that this should be realised and that the issues raised by the Catholic challenge should be discussed, on both sides, fairly, reasonably, objectively and with a due sense of the importance of this Bill to the future of British democracy.

## The Insurrection of the Steppes

VON MANSTEIN'S one-day visit to Hitler at his headquarters marks the end of one of the historic periods of the war. The subject of the conference has not been revealed. It is safe to assume, however, that in the course of that brief and pregnant discussion the Fuehrer and his generals discussed the whole of the six months that have elapsed since the German offensive against Kursk broke the lull on the eastern front. A hundred and eighty thousand square miles of Russian territory, an area the size of Germany in 1933—has had to be abandoned. The defensive belt of space, which was to secure Germany's European conquests in the east, is no longer even a theory for General Dittmar. The German front, which, before the July offensive, measured 1,400 miles, was shortened by the end of September to 1,250 miles. But, on the day of Manstein's visit to headquarters, it had not only gone back another 150 miles nearer to the German border but had increased once more to a total length of 2,000 miles between Leningrad and Sebastopol.

Against these German failures have to be set the achievements of the Red Armies. In these six months they had advanced along no less than 28 main lines of operation which, added together, covered over 6,000 miles. They had fought twelve major campaigns, each ending with the Russians achieving a strategic objective and with a German withdrawal. A new Soviet campaign began as each old one ran its course. The twelve operations in 1943 can be classified as follows:

1. Opening German offensive against Kursk (July);
2. Russian counter-offensive and capture of Orel (July-August);
3. Bielgorod-Kharkov offensive (August);
4. Donetsk advance (August-September);
5. Break-through to Konotop on the Dnieper opposite Kiev (September);
6. Bryansk-Smolensk offensive (September);
7. Advance from Donetsk to Dnieper (October);
8. First Nevel-Vitebsk offensive (October);
9. Russians form Kiev bridgehead (November);
10. German counter-attack against Kiev (November-December);
11. Second Vitebsk offensive (December);
12. Third battle for the Kiev salient and Russian break-through (December-January).

Such is the German adverse balance—and the account is not closed. The real crisis, the accumulation of all these retreats, evasions and errors, has still to come.

It is once more safe to assume that it was upon this approaching climax that the attention of the conference at the Fuehrer's headquarters was focused. The situation facing the German High Command is so fantastically

unlike what it had anticipated that the psychological shock may materially affect its decisions. Time and again since the Orel offensive in July, German reports from the front have been guilty of most extraordinary forms of vain optimism. The High Command was over-confident about the power of Orel to resist; only a few days before its fall, it assured German newspapers that

Orel has become the symbol of Germany's internal strength, a symbol in which one will always see the test of the German soldiers far beyond the successes they have achieved so far.

As the German public was reading these reassuring words, Orel was stormed by the Russians. Later, the German public was assured that the Orel offensive had exhausted Russian strength for a long time to come, that the German High Command was less concerned with keeping territory intact than with the security of the areas economically important to Germany, in particular the Donetsk and the Ukraine.

The same reassuring tone appeared again when the Red Armies paused on the east bank of the Dnieper. Germans were assured that the retreat had ended and that the German front in the east would be stabilised on the Dnieper. For eight months the Todt Organisation had laboured to create this defensive "cushion." In the period between the loss of Orel and the fall of Kiev, the German armies retained their flexibility and homogeneity. They carried out their retreat with care, and saved themselves from being cut off or encircled. It would be a mistake to underrate the fighting which preceded each German withdrawal. But battles were less bloody, the sheer attrition of war less, than a year before. On both sides the quality of generalship had risen; manoeuvre, encirclement and indirect approach parried by evasive action took the place of the pitched frontal battles of earlier campaigns. The need to husband manpower won first priority on the eastern front.

For the Germans, the process of whittling down the complement of their divisions has gone on ever since the failure of their autumn offensive in the Volga in 1942. The effectives of their infantry divisions have shrunk from the normal thirteen thousand to ten and often only eight thousand. In this way the German High Command has maintained the formal total of 190 divisions on the eastern front; in practice, the total strength is at least one-fifth below what it was eighteen months ago.

Something similar, however, is also true of the Red Army units. They suffered severely in 1941 and 1942, and the winter successes of 1942-43 and last summer's advances have not been gained without loss. Soviet losses for 1942 were estimated at three to four million men, and

those for 1941 at twice that total. On this basis, the Soviet Union up to now may have lost almost fifty per cent of the men called up, in killed, missing or disabled. It is not hard to understand the sense of urgency with which Soviet statesmen view the progress of the war. Few nations have ever made such sacrifice to ensure survival.

But modern wars are not won by human sacrifice, however imposing. What, then, has enabled the Soviet leaders to transform the war situation so dramatically?

Barely four months passed between the end of last winter's offensive and the battles for Kursk and Orel which heralded the present sensational course of the war in the east. During these months a drastic reorganisation took place throughout all sections of the Red Army. Units were regrouped, command, tactics and supply adjusted. Divisional organisation was abolished in many cases. Armoured divisions were turned into independent brigades; cavalry divisions were allotted little more personnel than normal brigades; and infantry shock units were also formed into independent brigades instead of the earlier clumsy divi-

sional organisations. This enabled corps commanders to maintain direct communication with individual brigades without the intervention of the "middlemen" of divisional commands. These reforms were applied also to the organisation of supply; the Soviet Supreme Command must have realised last winter that any deep penetration into the enemy's elastic defence could be maintained only by the freeing of the Soviet armies from the burden of a complicated organisation which made swift and deep movement, away from the main base, impossible. Like all great victories in war, the secret of Soviet success has been new methods of flexible and mobile organisation and supply.

With this new Soviet Army Marshal Stalin proposes to exploit the sixty days' campaigning that now lie ahead. The method of erupting from the Kiev salient simultaneously with six separate armies has disconcerted the German High Command. The Germans may hope that the Russians will extend themselves here, tempted on by the proximity of Warsaw, and become entangled in the deep net of German defences on the Polish River Bug. But it is unlikely that the Russians will repeat this error of 1920; already signs are pointing to a far deeper design in Soviet strategy. Just as Soviet strategy, during August and September, proceeded by means of a series of deep penetrations, which compelled the German High Command to withdraw over a wide area, so now it appears that there will be a series of offensives in the Southern Ukraine, across the Pripiet Marshes, and in the north. Each of these will bring the Soviet armies face to face with politically inflammable areas. In the south, the German armies in the Dnieper bend hold not only the river defences but also the political defences of the Balkans. Their defeat in the bend will therefore mark not only the end of the occupation of Soviet territory but also the beginning of the disintegration of the Balkans. In the north, an advance from Vitebsk would affect the entire Baltic and possibly also Finland and Norway; in the centre, the complicated Polish powder magazine has already been touched off by the thrust forward from the Kiev bridgehead. Politically, each of these offensives will bring the German leaders face to face with a gigantic police problem; militarily, it will disorganise their dispositions and lengthen their front, and so minimise their general power of resistance.

These are all likely considerations for the next sixty days. It appears that, if the Russian plans reach fruition, the Allied attack in the west may come at a moment when large areas of Nazi-dominated Europe are already in process of political as well as military disintegration. The "insurrection of the steppes," which Dr Goebbels thought he had exorcised, has become a startling reality for the German High Command.

### The Principles of Trade—III

## Trade and Employment

THE first article in this series re-stated the fundamental principles of Britain's attachment to international trade and found them, in general, as sound today as ever, but left over for later discussion two specific obstacles to an immediate return to an uncontrolled and unrestricted regime of trade. The first of these obstacles is the disequilibrium in the balances of payments of the nations that will result from the war, and of which the embarrassments of the pound sterling are only the most discussed example. The conclusion was reached that "there are no means—at least for a long time to come—of balancing the British accounts that are both orthodox and non-restrictionist. . . . The case is made out for an exploration of the alternatives [to orthodoxy]." The present article discusses the second possible obstacle. Will the concentration of public policy upon full employment, which will be imposed upon all governments by electoral pressure, require any modification of the principles of international trade?

In the main, full employment is necessarily a domestic

matter for the great majority of countries. So long as the world is divided into a number of different currency areas; so long as budgets are made, and sovereignty over the credit-creating process is exercised by national, and not international, governments; so long as the mobility of labour and capital within a country is substantially greater than mobility across frontiers or overseas—so long as these conditions are unchanged, each nation will have to have its own employment policy. This is not, of course, to say that there are no international implications or that international trade has no influence on employment conditions within a country. But the course of foreign trade is more likely to be a consequence of the state of employment in the world than its cause. Far and away the best method by which one country can assist the full employment policies of another is to be prosperous itself—provided only that the methods of securing prosperity do not reduce its purchases from the outside world. The problem, broadly speaking, is not so much to find means by which international trade can positively assist

in the attainment of full employment as to ensure that there is nothing in international trading relationships that obstructs national employment policy. What, if the matter is looked at from this angle, does full employment require of international trade?

The first and most obvious point to be made is that there is nothing contradictory between full employment and a large volume of foreign trade. Indeed, full employment is, almost by definition, incompatible with any form of restriction, and it will certainly be difficult to go far wrong if we lay down as a first principle that, just as full employment requires the fullest exploitation of all other economic resources, so it demands that the fullest advantage should be taken of the enrichment that can come from international exchange.

To this general statement, however, there is one important proviso. The existence of a negative, or unfavourable, balance of payments is a hindrance to the attainment of full employment. This can be explained either in crude practical terms or in the formulae of the theoretical economist. To the man in the street, exports "give employment" and imports "take away employment"—and the man in the street is, in this case, quite right. From the economist's point of view, the process of trading is that of substituting one type of employment—that "given" by exports—for another—that "taken away" by imports—with the object of deriving from the substitution a net increase in productive efficiency. But, clearly, if the trade is unbalanced, if imports exceed exports, the process of exchange takes away more employment than it provides and there is a net deduction from the total of employment. This argument is, of course, merely another aspect of the fact, obvious in war-time, that the running of a large deficit in the balance of payments—huge imports uncompensated by exports—is an economy of manpower.

The matter can also be stated within the framework of Lord Keynes's familiar doctrine. It is a condition of full employment that the community's Saving and its Investment should be balanced at a high level. The factor named Investment by Lord Keynes is the sum of the domestic expenditures of the community on durable goods plus the amount of its Foreign Balance, or excess of exports over imports. A positive balance of payments adds to Investment and helps towards full employment; a deficit in the international accounts is a subtraction from Investment and a detraction from full employment. An excess of imports is thus to be avoided for the same reason as a deficiency of Investment—because of its strategic position in the whole causation of movements in the national income. Economists have long mocked at the man in the street for his fear of an "unfavourable" balance of payments, and they have put inverted commas round the word to point their sarcasm. But the man in the street has not been so badly wrong after all.

The main principle and its proviso can be brought together in a single statement. What full employment requires of international trade is that a country's imports and exports should be balanced at a high level.\* And this carries with it the corollary that, whenever the balance is threatened with disturbance, it should be restored, not by cutting down the excessive side of the balance, but by extending the deficient side, not by shortening the long leg, but by lengthening the short. If international trade is to fit smoothly into full employment policy, it must be possible for a country with an unfavourable balance to remove it by increasing its exports rather than by reducing its imports, and for a country with a favourable balance to restore equilibrium by increasing its imports rather than by having its exports cut down. Any lack of balance, in fact, should be cured by expansion, not contraction—at least until such time as full employ-

\*An attempt has been made to keep the argument clear of technical details. It should, however, be remarked that "imports" and "exports" should here be interpreted to mean all those items entering into the current account of the balance of payments, together with such normal and continuing long-term lending and borrowing as is appropriate to a country's economic structure and stage of development.

ment is not merely attained, but inflation is threatened.

With this principle established, the next step is to enquire whether there are tendencies inherent in the old orthodoxy of uncontrolled trade which would produce this balance at a high level. Unfortunately, it is all too clear what the answer must be. The experience of the inter-war period would seem to throw doubt on whether there were any natural equilibrating tendencies in the liberal system of trade; and it is certain that such balancing forces as there were produced the balance by restriction rather than by expansion. And if it be objected that the misfortunes of the inter-war period were due to the failure to apply the principles of commercial liberalism, then it must be answered that the restrictions were imposed, very largely, by countries which could not any longer stand the strain on their balances of payments or on their employment situations. The number of countries that imposed trade restrictions for deliberate reasons of autarky was small compared with those that found their hand forced either by an exhaustion of foreign exchange reserves or by a mounting unemployment register. The truth would seem to be either that there is no tendency of liberal trade to produce a balance at a high level, or else that the tendency works too slowly and uncertainly for practical politics.

There is a sense in which the exercise of some control over the movements of trade can conduce to expansion when complete lack of control would lead to contraction. For example, the net national income of the United Kingdom in 1938 was £4,490 million. On the average of the year, 12.8 per cent of the insured population was unemployed. For this and other reasons, it is reasonable to assume that a net national income of about £5,000 million would have represented adequate employment. Let it then be supposed that in 1938 the British Government had set about the task of raising the national income to the point of full employment and, by stimulating an increase in investment and by other means, had increased the flow of income by £500 million a year. Other things being equal, something like £120 million more would probably have been spent on imports, without there being any reason for exports to rise correspondingly. This addition of £120 million to the adverse balance would have been unwelcome in a double sense. It would have represented that much wastage to the full employment programme; and it would have drained the foreign exchange reserves to the same extent. It would have been entirely proper for the Government to take measures, either by tariff or by quota or even possibly by exchange control, to limit the increase in imports and in the adverse balance to, say, £40 million. These restrictions would have been an essential part of the full employment policy, which could not have been carried out without them; and so long as there was any increase at all in British purchases, the rest of the world would have been helped, not hindered. Which country is best assisting its neighbours, one that acts in the way just described, breaking the rules of liberal orthodoxy, or one which, though not imposing trade restrictions, nevertheless allows itself to sink into depression and halves its foreign purchases?

The conclusion towards which this discussion leads is adequately clear. There is no incompatibility between the categorical imperative of full employment and the objectives of the old orthodoxy of international trade. But the combined objective of maximum trade plus maximum employment cannot be achieved by the orthodox instrumentalities—that is, by the lack of conscious instrumentalities on which the old orthodoxy relied.

Thus, on a double count—both because of the far-reaching dislocations from which the post-war world will start and because of the clamant necessity of ensuring a reasonable volume of employment with which it will be confronted—we are forced towards the conclusion that there must be some purposive direction of international trade. Whether that purposive direction, aimed at a maximum volume of trade, can operate in the framework of a world-wide, multilateral, non-discriminatory system, or whether it will inevitably lead to bilateral solutions, is the next question to be taken up.

## NOTES OF THE WEEK

### The Russian Offer

The Polish-Soviet conflict has now entered its critical stage. Either a satisfactory and reasonably fair solution will be reached now or, if the opportunity for a settlement is missed, events will drift in an incalculable and almost certainly disastrous direction. On January 11th, the Soviet Government officially replied to the statement made by the Polish Prime Minister on January 5th, when the Soviet armies crossed the 1939 Polish frontier. The most important point in the Russian declaration is that—

Poland's eastern frontiers can be established by agreement with the Soviet Union. The Soviet Government does not regard the 1939 frontiers as immutable. Those frontiers can be modified in Poland's favour so that areas in which the Polish population forms the majority can be turned over to Poland.

The so-called Curzon line of 1919 is suggested as the basis for the new frontier between Poland and Russia. Compared with the Molotov-Ribbentrop line of 1939, the Curzon line is somewhat more advantageous to the Poles. Under it, they would regain the Bialystok district, and possibly also the Grodno district. Press reports have spoken about the possibility of the return of Lwow to the Poles. The Russian offer can hardly be described as excessively generous, if one considers that in 1920 it was Lenin himself who rejected the Curzon line as prejudicial to Polish interests, and offered them a frontier far to the east of it. What is important in the Russian offer is, however, not the exact frontier line, which may be modified in the course of negotiations, but the fact that the Soviet Government has now adopted the principle of a negotiated settlement, instead of a unilateral decision imposed by force. Moscow itself has thus implicitly questioned the validity of the "plebiscite" carried out in eastern Poland in 1939, and the references to the "democratic" character of the plebiscite, which were never very convincing, have now become to this extent irrelevant.

### The Polish Reply

The Polish-Soviet dispute is much wider and more complicated than the frontier dispute itself. On both sides it is a problem of confidence and of mutual fear. As a rule, the weak have more good reasons for fear than the strong. Can the Poles be quite sure that, if they make a striking territorial sacrifice in favour of an Ally, they will be immune from further Russian encroachment, and especially from Russian interference in Poland's internal affairs? The Russian declaration gives no definite reply to this. It contains a number of unjust and polemical sallies against the Polish Government, which far from being "isolated from its people," at any rate represents it more fully than former Polish Governments did, in spite of the political errors and *faux pas* it may have committed. The Russian declaration implies the threat of the setting up in Poland of a new Government, of which the Union of Polish Patriots in Moscow would form the nucleus. It ought to be made quite clear that such a Government would be regarded as a puppet Government by all the Allied Powers, and that it could hope for no recognition. It seems that the wisest step Moscow could now take, in order to make a Russo-Polish rapprochement possible, is to dissolve the Union of Polish Patriots altogether, and to make up its mind to use normal methods in dealing with neighbouring nations. The Polish Government can only be advised to use the present opportunity—perhaps the last one—for reaching an agreement. True, Polish constitutional scruples are weighty enough. Rarely has a Government been called upon to cede territory without having the chance to consult its own people. But then totalitarian war has upset normal, constitutional ways all over Europe; and the Polish Government should be able to explain frankly to the people the circumstances which imperatively dictate reconciliation between Poland and Russia. Unfortunately, the whole issue has so far been confounded by internal Polish politics. The Pilsudskists and some other nationalist extremists have done all they could to paralyse official Polish policy by constant pressure against any agreement with Russia. The leaders of that unscrupulous opposition are well aware that, if they were in the Government, they themselves would now have

to make territorial concessions to Russia; but they are bent on using the anti-Soviet trump-card in the struggle for power in Poland. By doing so, they hasten on an even graver crisis, in which more than Poland's eastern borderlands, where the Poles form a minority anyhow, may be at stake. The only constructive reply which can now come from the Polish Government is a clear and unequivocal statement of its willingness immediately to resume relations, and to start negotiations, with Russia on the basis of the Russian proposals.

### Farmers in Arms

When Parliament meets, the Government will face three assaults. Two, the Catholic attack on the Education Bill and the Tory attack on the Tomlinson Bill—and on Mr Bevin—are discussed elsewhere (on pages 61 and 68). The third, the strong attack of the farming interest on Mr Hudson and the Government's farm price policy, is perhaps the most menacing of the three, politically. The farmers are dissatisfied with both the level and the structure of wartime prices. The immediate issue is the gap between the latest list of prices and their higher wage costs this year. But their basic contention can be more precisely stated; they wish farm prices to be fixed in such a way that all farmers, including the smallest and relatively least efficient, will earn enough to cover increased war costs, especially wages, with a sufficient margin to pay off back debts, to replenish the capital resources of their land, to provide an adequate amount of working capital and to leave a comfortable profit. They want to earn on the wartime swings what so many of them lost on the peacetime roundabouts; and they want an assurance that there will be no more roundabouts, no slump in prices or turnover and no depression, when the war is over. The principle that war profits should cancel out peace losses is not applied to any other industry; and the claim of farming to be *sui generis*, because of the special qualities of "the land," is not convincing. It is true that, while most farmers are doing well out of the war—turnover has more than doubled and tax is being widely paid on excess profits—the least efficient are not doing so well. But there is no evidence that, at the present prices, only recently adjusted, these marginal producers are failing to make both ends meet, with something to spare; and there is no known way of putting them in clover, at the community's expense, as they demand, without at the same time giving a large rake-off to the more efficient majority, who would benefit greatly from such higher prices, if only by the return after the war of a fifth of EPT. There is to be an early debate on this subject. Mr Hudson cannot be too strongly urged to put all the cards on the table, to show precisely how much money the farming community is at present receiving for its hard wartime labours, how turnover, profits and tax payments have grown, despite the big rise in wages, and how wildly extravagant and uneconomical it would be to raise farm prices to make the worst-off farmer as well-off as the best-off—and most efficient—farmer now is, which seems to be the demand.

### Skipton: Swallow or Spring?

In the Skipton by-election a week ago the Government candidate, a worthy Tory of, 61 years of age in a traditionally Tory constituency, was significantly beaten. Sir Richard Acland's Common Wealth party, crying "down with property," thus obtained a second Member of Parliament—the third, Sir Richard himself, was elected as a Liberal—in the person of a serving officer of half the official candidate's age. The majority in an unusually large wartime poll—70 per cent, it is estimated, of the "live" register—was barely 200 votes; but the "Opposition" vote was split by a well-known Labour Independent who, though he forfeited his deposit, polled nearly a quarter of the votes obtained by either of his rivals. The Government's minority was unmistakable, affected but hardly caused by the discontent of farmers in a largely rural constituency about official farm prices. This election, like the recent one at Darwen, where an Independent

Liberal almost won a famous victory, shows the determination of electors, party truce or no party truce, to choose their own Members. Picked Coalition nominees are not in favour. Moreover, with the war set for victory, no Coalition candidate, for all the glamour of Mr. Churchill and all the talk of "food, work and homes," has so far any peace policy to put before voters. The Labour Party, as it sees its spoil stolen by Independents in these contests, while its own hands stay tied, is no doubt as shaken as the Government by the signs of the times. One swallow, or even two, does not make a spring. But spring will surely follow the present winter of discontent, and it is pretty sure that in a real election, when the shadow Opposition of Common Wealth and the rest is replaced by more substantial party conflict, an appreciable proportion of electors will look not simply for success in war and a trusted leader, but for freedom to make their own choice, and for positive policies to choose from. Nevertheless, it still appears that, even if it leaves the Coalition when the fight is over, the Labour Party, which lacks both a forceful man and a definite policy, may have only a small chance of success against the entrenched and more realistic Tories—whose turn it may be, at the first post-war General Election, to produce ex-Service candidates in great numbers.

### Members' Choice

The most troubled persons in the choice between party and coalition politics in the near future are the Members of Parliament themselves. Broadly, Conservative MPs do not care. Whether they figure at the next election as members of Mr Churchill's National team or as members of Mr Churchill's Conservative team, their position is equally strong. Mr Churchill is their umbrella, just as he is the umbrella under which Ministers of all parties cluster. Even vigorous, disorderly, progressive, outspoken Tories, of the new Reform vintage, feel this way. They approve Coalition, including themselves in a key place, to pull the strings as much as possible in their direction. Most Independents, of the National brand, share these views. They look forward to a future of Coalition, with ginger groups of able individuals within, calling the tune in a way in which the old-style party politics would not permit. There is, however, one other factor for which all Members, Conservative, Labour and Independent, must allow; that is, the wish of the electors themselves, almost completely forgotten in these astute reckonings, to choose not only their own Members without official nomination, but also, when the time comes, their own Government and Prime Minister. The Conservatives and Independents have a partial solution for this—namely, to mix the continuance of Coalition, now and after the war, with free elections on a party basis. To some extent, this proposal is simply the recognition of facts; by-elections are being fought. Moreover, it is difficult to see what other alternative is available while the war lasts. It is not possible to break up the Coalition—that is, for Ministers to leave the Government and go into opposition—until Germany has been beaten. But this way out will not be open when the war ends. This is the dilemma which confronts especially Labour MPs. Two-fifths of them have been restive for a long time about their position in the Coalition. They see seats won by Independents which Labour candidates might have won, and they see themselves associated with policies, or the lack of policies, for reconstruction and in foreign affairs, with which neither they nor their supporters agree. In a sense, all this political introspection is beside the point. Almost certainly, party politics will come back apace when the war ends. The real question, for Labour MPs, is whether they will have a leader and a programme capable of placing the issues of peace successfully before the public. In short, are they too mesmerised by their own past and by the stature of Mr Churchill to work out their own destiny, for the good of all, themselves included?

### Business for Parliament

When Parliament reassembles, its first business, according to present arrangements, will be to take the Committee stage of the Disabled Persons (Employment) Bill. The Bill has received wide general support in principle; but a considerable number of amendments have been put down. One group of these amendments attempts to

distinguish between persons disabled on active service for their country during a war and those disabled otherwise. This distinction has already been rejected by the Government. The chronic dispute over war pensions has shown the unfortunate results of establishing a class of war privileged, to which others, similarly hurt but less compensated, attempt to climb. Moreover, the outstanding defect of the British social services has been the anomalies created between one set of people and another. Now a chance has arisen to establish a uniform system in one important branch of them, and to give one set of people priority, a distinction which could only be enforced at the cost of endless claims and counterclaims, would be a retrograde step. The other important group of amendments concerns the rights given to the Minister by the Bill to administer it by regulation. Thus, conditions of registration as a disabled person, and conditions of disqualification, are matters which may be prescribed by regulation. So, too, are the records which employers will have to keep about the number of disabled they employ. These amendments are important, not as amendments to the Bill, but as marking another stage in Parliament's attempt to curtail the powers of Ministers to make regulations which cannot receive proper attention until it is too late. The regulations made for the administration of unemployment assistance and supplementary pensions have to receive the approval of Parliament before they become effective. The regulations under the Disabled Persons Bill, however, will be valid unless they are specifically made void by resolution of either House within twenty-eight Parliamentary days of their being laid before it. This is the usual wartime procedure, which certainly seems unnecessary for a peacetime measure.

### An Unmended Breach

The breach between the partisan movement in Yugoslavia and the Cairo Government is still unhealed. When, two weeks ago, a statement appeared in Cairo reporting that a group of officers of the Royal Yugoslav Government had started a movement in favour of joining Tito, it was widely assumed that the Cairo Government were taking the first

hesitant steps towards reconciliation. The impression was strengthened by the fact that, on the day the laconic announcement was made, Marshal Stalin sent New Year greetings to the Yugoslav Prime Minister. However, the rejoicing was premature. There has been apparently no change in the attitude of the Cairo Government. Thus the anomalous position continues in which the Allied Powers give political recognition to Cairo and military recognition to Tito. This division has been further underlined by the appointment of Mr Kiek, a former Slovene member of the Royal Government, to serve as Yugoslav representative on the Italian Advisory Council. It will be remembered that one of the first claims of Tito's Committee was for representation on that body. The distinction between military and political recognition is doing less harm than it might, since all three Great Powers have accepted it, the Russians as well as the Americans and the British. True, the Russian-backed "free Yugoslavia" radio takes a politically pro-Tito line, but the Soviet Government's official attitude is to accept the Cairo regime. The long-term results of maintaining the distinction must, however, be disastrous, with political jockeying and civil war ahead. The Allies have worked together so far. They must now use the joint weight of their diplomacy to secure some kind of workable reconciliation.

### Arab Unity

A Lebanese Mission, headed by the Prime Minister, Mr Riad es Solh, has started conversations in Cairo on the question of Arab unity. Meanwhile, Syrian and Iraqi delegations have discussed more detailed projects in Baghdad. Nothing is known yet of the nature of the plans discussed, but it is an encouraging sign that the Lebanese are prepared to co-operate, and that, in general, unity of view was discovered between Mr Riad es Solh and the Egyptian Prime Minister, Nahas Pasha. One of the obstacles to Arab Union, even in its limited form of restoring a Greater Syria, is the position of the minorities, among whom are the Lebanese Christians. If arrangements can be made which fully safeguard their position, precedents may perhaps be worked out for the protection of the other crucial minority, the Palestinian Jews. If an Arab Union is created there are various possibilities before the Jewish people—for example, a special minority status inside the federation or the creation of a small separate Jewish state, which might be linked to a Greater Syria in a Confederation, which also included Iraq and possibly Egypt. The Cairo and Baghdad talks may have covered some such possibility; but there will certainly be no settlement of the Jewish problem without the active intervention of the British Government. The day for the reconsideration of Jewish emigration to Palestine is only two months away, but there has still been no definite statement on British policy. Until there is, one of the principal data for the discussion of Arab Union will be missing.

### Industrial Assurance Defended

The Industrial Life Offices have issued a pamphlet in reply to the criticisms of industrial assurance contained in the Beveridge Report. The tone of the pamphlet is naturally defensive, but it is well argued. The main points can be summarised as follows:

1. The status of the agents employed by the offices has been greatly raised. The typical agent is now a permanent employee, often enjoying valuable pension rights and earning between £4 and £7 weekly.
2. Burial assurance is now only a small part of the total business done. Of the total new premiums, over half is for endowment assurance.

### INDEX TO VOLUME CXLV

The Index to Volume CXLV (July to December, 1943) will be available in about two weeks' time, and will be sent to all those who have asked for the Index to be regularly supplied to them. Any other readers who wish to receive the Index (post free) are invited to apply to The Publishers,

THE ECONOMIST, Brettenham House, Lancaster Place, London, W.C.2

3. Every policy issued bears a statement that complaints can be referred to the Industrial Assurance Commissioner. Nevertheless, in 1938, out of over 100 million policies in force, only 2,179 cases were referred to the Commissioner.

4. The amount of "pressure for increase" has been greatly exaggerated. Industrial assurance has not, in general, grown faster than other forms of working-class savings. Systematic canvassing for business and house-to-house collection of premiums are essential for the conduct of the business. Without them, the Post Office insurance scheme, after 60 years, had in force a number of policies "less than the number normally issued by any one of several Industrial Life Offices in one week." Moreover, "healthy competition between the Offices has been an important contributory factor in the great improvement in benefits and conditions" in the last 20 years.

5. "Lapses" are chiefly due to social insecurity. In any case, their importance is greatly exaggerated. The "average duration of the Whole Life policies in force" of the Prudential at the end of 1942 was 19½ years. [It would be interesting to be given the method by which this surprising figure is calculated; it is an average of policies in force. of policies taken out.] In the Post Office scheme, where there was no canvassing and no "pressure for increase," the ratio was 51 per cent. The Offices have gone a long way to mitigate the consequences of lapsing by sympathetic treatment far in excess of their legal obligations.

6. The figure of 32.9 per cent quoted by Sir William Beveridge for the expense ratio was incorrectly calculated. Two alternative correct methods of calculation give figures of 24.1 per cent and 25.6 per cent. It is true, as stated by Sir William, that the amounts going to persons other than policyholders (i.e., expenses, dividends and income tax) stand to the premiums paid in the ratio of 7s. 6d. to £1. But it is also true that outgoings to policyholders (claims paid, bonuses and additions to reserves to meet liabilities to policyholders) amount to 18s. 2d. out of every £1 received in premiums. The reconciliation between the two statements lies in the interest earnings of the Offices, which are higher than any public department could achieve.

7. A Funeral Benefit incorporated in a comprehensive social insurance scheme would not be cheaper than the equivalent benefit provided by means of industrial insurance.

The details of these arguments will no doubt receive close attention—Sir William Beveridge has already returned to the charge on the matter of expense ratios. But it is important in the public interest that the issue—at present somewhat confused—should be clarified. The Offices' claim is, in substance, that they—or at least the best of them—are now conducting the business of industrial assurance as efficiently and as fairly as it can be conducted in the framework of a competitive, privately managed system providing for house-to-house collection, and that, when the business was built up, life assurance for the working classes had to be provided privately and competitively or not at all. It is a claim which, on examination of the facts, is very difficult to resist, and if battle is joined on this issue, the Offices can put up a very good fight. But is this really the issue? The critics, though they disperse their attacks, are fundamentally arguing that industrial assurance could be conducted much more cheaply if it were not competitive and—a different point—if it did not depend upon house-to-house collection. On the whole, a monopoly might have a lower expense ratio, though the Offices make a telling point when they contend that it would also be restricted to trustee securities and would have lower interest earnings. Moreover, there would be real savings from the removal of "pressure for increase"—the Offices will hardly succeed in convincing the public that a competitive system does not lead to such pressure. But the abolition of house-to-house collection—the only large economy that could be achieved—is a rather different matter. It might lead to a very substantial fall in the volume of business done, and though it would be open to the critics to say that such a fall would be in accordance with the wishes of the public, the reply is not wholly convincing. There is a lot of force in the Offices' contention that, for a working-class family, other ways of spending are always more attractive and that their long-term interests are served by a weekly visit from a collector. That has certainly been the experience of other schemes of voluntary saving, such as the National Savings movement. In fact, house-to-house collection may very well be an essential part of voluntary industrial assurance—and, apart from the proposed Funeral Benefit, compulsory assurance has not been, and obviously should not be, suggested. It may be, therefore, that in the final analysis the argument comes down to this—Is there a case for (a) a compulsory Death Benefit, and (b) a State monopoly of industrial assurance, still depending upon house-to-house collection?

### Nor Any Drop to Drink

In total war everything is scarce, including, apparently, water. Last year's lack of rainfall was ominously like that of 1934 and 1938. The levels of wells are down to danger level; and there is barely two months of the "fill dyke" season to put matters right. A serious shortage of water for domestic, industrial and agricultural purposes is possible. Wartime farming makes bigger demands, because of its bigger scale, than peacetime farming; and wartime shifts of population throw sudden large strains upon the system of water supply, which varies astonishingly in character, resources and organisation, from place to place. Periodically since the last war efforts have been made to improve the country's water defences against drought, but the position remains almost as precarious as ever. In some country districts the inhabitants have already spent waterless Christmases. The trouble is that droughts are too soon forgotten for adequate precautions to be taken against the next one; and, in wartime circumstances, the prospect is more of a facing than usual, when Service requirements are high and hardly calculable, and when both time and equipment are lacking for rapid remedies. It will be odd, but in line with the traditional confidence of Britons in their famous rainfall, if water has to be added to the list of rationed articles in 1944.

### Water, Water Everywhere

There is no reason why this country's water supplies should not be sufficient, even after low rainfall. There is no reason, indeed, according to the experts, why it should not be sufficient in bad years and good, for a much higher consumption of water than before the war, when the consumption per head in the London Metropolitan Area for all purposes was less than two-fifths of all-American consumption, and British rural consumption per head, which was less than half London's, was barely half the consumption of most European countries. It is a question, first, of calculating all the supplies available, underground and overground; secondly, of tapping these supplies fully and effectively; and, thirdly, of distributing them evenly throughout the country. The present methods of organising supply and distribution are inadequate to carry out these tasks; this has been proved time and again when the rain has failed. There has been some attempt recently to make this matter an issue of private versus public interest. This is misleading. It matters little by whom the tasks of development, supply and distribution are done, provided they are carried out according to an effective national plan to make available all the nation's water, in the most efficient way, to all the nation's consumers. At present, the basis of organisation—and of planning and policy—is mainly local and scattered. There are just over a thousand statutory water undertakings, four-fifths of them local authorities or joint boards, and the rest companies; and about the same number of water suppliers without special statutory powers, almost all private proprietors. There is little or no control over the sinking of wells, and no national, or even regional, programme to make the most of the supplies available, regardless of local or private interests. It is true that some steps have been taken. In 1924 and again in 1934, some sort of survey of inland water resources was set on foot—by the timing of these, each ten years, another survey is surely due. But underground resources remain largely unknown and a matter for guesswork. In 1930, the Land Drainage Act set up Catchment Boards to prevent flooding, provide drainage and thus exercise some control of over-ground water; and in 1934 nine regional advisory committees were set up. But the initiative remains entirely in the hands of local authorities without national guidance, except when the worst happens, and economy in consumption must be commanded.

The whole business of water supply is unco-ordinated. Some of the multitude of local authorities are small, poor, rural undertakings, drawing upon narrow areas for their water, often by means of shallow and unhygienic wells and with no up-to-date equipment. The large cities have sufficient resources to run large undertakings, drawing upon larger areas for their water, and provided with adequate storage capacity; but, even here, sudden shifts of population and shortages of rain cause difficulties, while the growth of dormitory towns and suburbs in the countryside has often much dislocated water supplies. In 1929 the borrowing

powers of rural authorities for the supply of water were increased, and county grants instituted. Five years later, an emergency grant of £1,000,000 was established for the poorer water authorities. But, as the events of this year may unhappily show, the problem was at the best mitigated, not solved. It has been plain ever since 1908, when a Royal Commission reported, that some kind of central water authority is necessary to plan and procure the fullest exploitation of the nation's water supplies; and that, however reasonable it may be to preserve the present mixture of public and private, local and industrial, large and small undertakers, a much greater degree of common policy, co-operation and the pooling of resources is urgently required. Unfortunately, the process of obtaining statutory powers only tends to make confusion worse confounded; it is cumbersome, competitive and costly. Until the whole system has been overhauled the danger of drought, reaching serious dimensions in some districts, will always be just round the corner.

### German-Swedish Trade Agreement

For some time past, a kind of political tug-of-war has gone on between Sweden and Germany, the Swedes protesting about the treatment of Norway and discovering that technical difficulties made it essential to reduce shipments of iron ore from the north, the Germans rudely dismissing the protests and cancelling safe conduct permits for Swedish ships through the Skagerrak. While this went on, a new trade agreement was under discussion between the two Governments, and its terms, which have been published this week, suggest that the political balance between the two countries has not been very seriously changed by the events of 1943. Neither side has secured fresh concessions, and the figures of German exports and imports is fixed at about the 1943 figure, Rm. 900 million. Judged by the results of earlier years, such a figure would mean that Germany would provide about half Sweden's total imports, and over one-third of Sweden's exports would go to Germany. It has been suggested by some reports that one

### WILLS'S THREE CASTLES CIGARETTES

20 for 2'8

Issued by The Imperial Tobacco Company (of Great Britain and Ireland), Ltd. T.T.21

result of Germany's military defeats has been the insertion by the Swedes of an escape clause. If Germany again falls short in deliveries, they will severely cut exports of iron ore.

### Ciano's Execution

In the fantastic nightmare world of Axis Europe, dog bites dog, quislings are shot by other quislings and gradually any pattern or semblance of rationality fades from the bloody and hate-crazed gangs which carry the insignia of office. The shooting of Ciano is only a rather more sensational example of the fury of killing which is descending on Europe. He, the arch fascist and arch friend of Germany, has been shot by fascists acting under German orders. Why should the Germans, if they mean to keep up any farce of "republican fascism," limit still further their circle of Italian supporters by shooting eighteen fascists who have in their turn their own followers and hangers on? All these are men committed to fascism who would have had no chance on the Allied side and who, on their own showing, got rid of Mussolini in the belief that Badoglio would fight the war more successfully. The truth is that the Germans are abandoning the farce of fascism. The "fascist" radio station at Munich has been closed down long since, and more and more the organisation all over the north is being approximated to the German military administration of the Rome area. The Italians are not in a mental, moral or physical position to provide themselves with a functioning governmental system. The collapse appears to be as complete in the south. Hunger, disease, the barest struggle for existence occupy the feeble energies of the civilian population. Seen against this background, the execution of Ciano, De Bono, and their companions has no political significance. It can neither rally nor appal the fundamentally apathetic. It is the sheerest act of spite.

### Amery on India

In announcing the end of "the chapter of actual famine" in his speech on the Indian situation at York on Saturday, Mr Amery apparently brought good tidings. But a second reading of his words shows that they must not be interpreted too optimistically. All that "the chapter of actual famine" may mean is that the deepest trough of starvation has been passed, and that the prospect of increased food supplies is now more assured. In fact, no more favourable interpretation is yet possible. Food shortage, disease and deaths are still reported from Bengal, though in smaller numbers. But there are nevertheless several signs of improvement. It is encouraging to learn that the rice harvest is expected to be well over the average, and that the Central Government has been able to make a definite undertaking to find all the food required for Calcutta in the coming year. Even so, the dragging effects of the worst famine period cannot possibly disappear for a long time. Some of the effects of malnutrition, especially on the children, are permanent. In less severe cases prompt medical treatment might do much to remove the marks of starvation from the people of Bengal. Diseases of all kinds have been aggravated, and if adequate preventive action is not taken and maintained, epidemics may prove a worse menace than famine itself. It is to be hoped that the 18 military hospitals and 30 mobile treatment centres drafted to the Province from the Army will, in addition to the 200 existing civil hospitals, be sufficient. The civil government cannot depend indefinitely on the military for help in these crises, and, when he assumes his duties, Mr Casey, the Governor Designate, will be under the obligation of initiating new measures, as well as rendering full support for "all measures calculated to prevent any recurrence of the ordeal, first of famine, then of disease."

### Colonial Regionalism in Practice

The modern tendency to regard regionalism as a solution for all problems makes the first report of the Anglo-American Caribbean Commission a document of considerable importance. Here is an example of two powers co-operating in social and economic matters for the development of their territories in a certain region; and since, in the only official pronouncement on colonial regionalism, the Secretary of State for the Colonies specifically referred to the Caribbean Commission as the idea to be followed in other spheres, the experience of the Commission will be studied

closely. Its first report does not, it is true, give a normal picture of how it will function. For, as soon as it was established, it had to consider the abnormal problems arising from the submarine menace in the Caribbean; in particular, it had to consider the best means of averting the threat of starvation in the islands. The local governments themselves had already realised the importance of increasing local production of food, but the Commission was able to make recommendations on how sugar production could best be regulated in order to leave maximum land storage capacity for other foodstuffs. It was also instrumental in the opening of the "Emergency Land-Water Highway," which provided a safe transport service from the mainland of the United States to Puerto Rico, and in the organisation of the West Indies Schooner Pool. But the submarine danger in the Caribbean has now receded, and the Commission is at present concerned with its original function of mutual collaboration on long-term social and economic problems. For this purpose three regional organisations have been set up: the Commission itself; the Caribbean Research Council, which acts as an advisory body to the Commission; and on which the Netherlands are represented; and a regular system of West Indian Conferences, to which each territory is to send two delegates, for the discussion of Caribbean affairs by the territories concerned themselves, the chairman being one of the joint chairmen of the Commission. By this means it is intended to keep in touch with local opinion, though how far it will be successful in this depends on how the delegates themselves are chosen in view of the nature of the constitutions of many of the islands. Possibly, the Conference may turn out to be the most important development of the Commission. It is at present only to be an advisory body, like the Commission itself, but it is envisaged that it should become "really influential" and

it would be open at any time to the interested Governments to agree . . . to delegate to it any specific powers which they might think desirable.

Thus has the way been prepared, not only for mutual advice, co-operation and collaboration between the colonial powers, but for common action by the colonies themselves.

### Labour's Food Policy

The Labour Party's adoption of a memorandum prepared by Sir John Orr as their own official nutrition policy, is perhaps a welcome sign of a non-partisan approach to the vitally important problem of food. Sir John Orr is not a member of the Labour Party, nor of any other political party; but he is one of the world's greatest food experts, and did more than any one else to focus attention on the pre-war under-nourishment of the lower income groups of our population. His central thesis in this, as in his other writings, is the relation between food and income, a relation made even more evident by the war. During the war full employment and the application of a roughly scientific nutrition policy in the determination and distribution of rations have led to tremendous improvements in the nation's well-being. Consumption of milk among the poorer classes has increased by about 30 per cent, especially among mothers and children. A survey of families in Scottish industrial towns showed an increase of about 20 per cent during the war in the intake of important vitamins and minerals. But there is still a long way to go. According to a recent estimate by a House of Lords Committee, to bring the diet of the whole population up to reasonable health standards would necessitate an increase of 65 per cent in present supplies of milk; of 70 per cent in fruit supplies; of 60 per cent in eggs and vegetables; and of 25 per cent in meat. The Labour Party's policy, as set out by Sir John Orr, is fundamentally the same as that agreed upon by the nations at the Hot Springs Conference. The proposal is made for a permanent Food Commission, appointed by the Minister of Food, which would act as a Food Import Board and undertake the wholesale buying and selling of basic foods. The Commission would take over the main food depôts and processing centres and improve them in order to ensure the maximum saving in food, and the maximum reduction in distribution costs—a crucial question. The Commission would be a non-profit-making body: "its only dividend would be in the form of improved health and physique and the extension of the expectation of life." During the war, private enterprise has acted, with reasonable efficiency, as the agent of a set public policy; and, though the food trades might conceivably be picked out as

suitable for state control, for social as well as economic reasons, there is nothing inherently hostile to national diet and nutrition in the making of profits. It is more than a pity that nothing is said in this report about the food production end and very little about the actual mechanism of distribution. The question of why it should be more efficient and socially valuable to have a non-profit-making body in charge of food distribution is not—except in the most general and undocumented terms—answered.

### Contradicting the Contradictions

The American Communist Party has celebrated the twentieth anniversary of Lenin's death in a somewhat surprising fashion. Mr Earl Browder announced, in effect, the New Revolution: capitalism and socialism have now found a way to peaceful and prosperous co-existence and collaboration in the future; the lion and the lamb can now lie down together. Political parties do, of course, change with the times, but it has always been assumed that parties based on doctrine, as distinct from parties based on personalities and passing policies, must hold their central faiths steady. For tactical reasons, they may adopt this or that line according to circumstances, but the Communist, it was believed until lately, must still remain a Communist, in his own Marxist sense. This is not after all, true. The once-despised Social Democrats are now, it seems, right: "Labour will achieve its ends through the instruments of collective bargaining." Painless prosperity, under free enterprise, and with perpetual popular fronts, is just round the corner. No longer is it believed that capitalism must collapse because of its inherent economic contradictions. On the contrary, there will be jam to-morrow, the day after and the day after that, without any old-fashioned revolution or dictatorship of the proletariat, without even any nationalisation of banks, railways or industries, without any socialism, without even any radical reform. Frankly and logically, therefore, the American Communist Party has, in effect, liquidated itself. In future it will be known as "The Communist Association for Political Education"; it will work within the frame of "the two-party system traditional in our country . . . without partisan or class advantages." There must be some interest after this move in the next steps of the Communist Party of Great Britain. This would not be the first time that coming events have cast their first shadows on the other side of the Atlantic; the American Communist Party left the Comintern before that body, too, went into liquidation. Obviously the great transformations that have taken place in wartime Russia have deeply affected the notions as well as the deeds of Communists elsewhere.

### Pioneers of Planning

The chairman of First Garden City, Sir Eric Macfadyen, has outlined again the advantages of creating new towns as self-contained units. Their economic life can be integrated, so that there is a diversity of work for all on the spot. Their layout can be planned, so that industry gets suitable sites and does not jostle housing. Their size can be regulated, so that the countryside is kept within walking distance and neighbouring farmers can supply the town market. What is less realised—when the question is asked of how these desirable places can be brought into being, by what policy, persuasive or compulsory—is that towns of this kind can be promoted by private companies, as experience proves, while nothing approaching the completeness of such schemes has been undertaken by any public authority. The essential condition for such a town is unified control of land use which a company can obtain by outright purchase of an appropriate area. Further, Sir Eric Macfadyen maintained that the finance of such concerns is capable of proving self-liquidating as has happened in the case of Letchworth, though not in the case of Welwyn, where the land was purchased at boom prices after the last war. There is scope in the pattern of the post-war building programme for new private schemes. Such schemes are greatly preferable to the unco-ordinated private development of land. It will be a pity, however, if they are forced, in the absence of guidance to select sites without reference to some scheme of national planning policy. It is also to be hoped that individual ventures of this nature are not to represent the only attempts made to integrate urban life. Not all England can be made into a garden city, even were this desirable. The Government's task, in making policy, is to put First Garden City into its proper perspective as a pioneer, and not to regard it as a stunt or, alternatively, as the last, or even the most important, word on planning.

### Shorter Note

A long dispute between panel doctors and the Ministry of Health has been temporarily settled by the offer, which has been accepted, of an increase of 9d. in the former's capitation fee, bringing it up to 10s. 6d. a year. The doctors have based their claim for an increase partly on the rise in the cost of living, but also on the fact that the drafting of the healthier members of the population into the Forces has increased the proportion of the unhealthy on their panels and therefore made them bad risks—or at least worse risks than when the previous capitation fee was negotiated. In earlier discussions the Ministry has refused to accept the argument, and has pleaded that it must await the Beveridge Report—an excuse which is no longer available.

## AMERICAN SURVEY

### A Win-the-War Deal

The President's Message to Congress seems to give some evidence that he has decided to return to that earlier bold leadership which his supporters have been demanding and for which the obstructionist and dilatory tactics on Capitol Hill have provided so admirable an opportunity. The New Deal may have gone into temporary retirement, but its spirit goes marching on. Mr Roosevelt's new slogan of "Win the War and Peace" is to have the benefit of all his old force and fighting spirit. There will be widespread, though perhaps not unanimous, satisfaction that he chose to pull no punches in his references to faulty perspectives in Washington, to the noisy clamour of the pressure groups, to the dangerous growth of over-confidence, and the continuance of "business as usual, politics as usual, luxuries as usual." The substance of the Message was perhaps less startling than the vigour with which it was expressed. On only one new issue did the President demonstrate his willingness to do battle. That was the question of the soldier's vote. Mr Roosevelt left no doubts that the action of the Senate in leaving the absentee Serviceman's vote purely to state laws would, in fact, disfranchise the majority, and that

this was thoroughly understood by the Forces; and he buttressed his argument by the statement of the Army and Navy that it would be impossible for them to administer effectively the voting laws of 48 states. His five-point programme, which was the heart of the address, in effect offered a bargain to the Conservatives in Congress. If that body adopts a "realistic" tax law, ceases its attempts to weaken the machinery for recovery of excess profits on war contracts, and supports the Administration's food programme and extends the Stabilisation Act, Mr Roosevelt announced that he was ready to support a National Service Act. Beyond this, he proposed what many will regard as a post-war resurrection of the New Deal, in the form of a second Bill of Rights based on economic security for all. Urging Congress to take steps to implement this new basis of security and prosperity, he gave the warning that if no adequate progress was made, "I am certain that the nation will be conscious of this fact." No doubt Mr Roosevelt will do his share to stimulate the awareness. The suspicions of the Opposition that the New Deal would prove an all too punctual Phoenix have been proved not far wrong.

## National Service de Luxe

Details of Mr Roosevelt's five-point plan were necessarily kept to a minimum in the address, but on at least two of them the President appears to have been guilty of a certain optimistic gloss. The definition of a "realistic" Tax Bill might well have stressed the need for increased taxation on middle-incomes, as well as war profits—indeed, with that omission, it is hardly "realistic" at all; and the description of the proposed National Service Act showed similar signs of a desire to have the best of both worlds. A Bill to establish the responsibility of all able-bodied adults to undertake National Service (the Austin-Wadsworth Bill) has been in existence for many months, and has had the support of the Services, but has hitherto failed to secure the President's blessing. It would give powers of compulsion to the Manpower Commission in cases where voluntary methods were proved to have failed. The main considerations which led Mr Roosevelt to give the principle his conditional endorsement almost certainly are the Administration's difficulties with the unions and the violence of the anti-strike feeling in Congress, throughout the country and in the Services. Probably it is the President's hope that a National Service Act would head off the inevitable Congressional agitation for drastic extension of the Smith-Connally-Harness anti-strike Act of last summer, and that the unions would accept the restrictions of this "essentially democratic way of waging war" more gracefully than an anti-strike curb aimed purely at labour. According to Mr Roosevelt, such an Act would be a means of extending the "inner satisfaction" which comes from participation in the war effort; it would be a "unifying moral force." But he was on more dubious ground when he argued that, in the light of experience in Britain and other democracies, it would not involve widespread compulsion, and would not mean reduction in wages, loss of seniority rights, or any substantial disturbance of workers. On the contrary, British experience suggests that if a national service law is to serve any practical purpose it must involve all these, in varying degree. On the President's interpretation, it would become a pious hope, perhaps a moral force, but not an effective instrument of total mobilisation. But the chances of its becoming law are probably remote. The President himself admitted the Act was not essential to victory, although it would hasten the day; and, rightly or wrongly, the defenders of the rights of the individual will certainly point to the current cancellation of war contracts as further evidence of the lack of urgency. The labour unions are already on the warpath. Congress, indeed, is all too likely to regard the whole proposition as a bold bluff to secure its co-operation on the very points on which it has most clearly proved its obstinacy. Mr Roosevelt himself is probably not over-optimistic about the prospects of collaboration on Capitol Hill. But at least the record is clear. The responsibility is firmly passed to Congress. The country will have its say next November.

## Weapon for Victory

Education in the history of the methods and the consequences of Lend-Lease has reached flood-tide this week, with the publication in the United States, by the Macmillan Co., of Mr Stettinius's book, "Lend-Lease, Weapon of Victory," and by the President's Thirteenth Lend-Lease Report, which brings the picture up-to-date. As the outstandingly successful administrator of Lend-Lease from August, 1941, until his appointment as Under-Secretary of State last year, Mr Stettinius brings to his story of the growth of Lend-Lease a comprehension and a wealth of detail as yet available to no one else. After the war there may be freedom to expand on the later stages in a way not yet possible, but this is an invaluable and most timely contribution to American understanding of how Lend-Lease came about, and how it has worked as a weapon for victory. It is usefully supplemented by the latest Lend-Lease Report, which, beside providing the most recent figures on the size and distribution of American aid, lays the unruly ghosts of some of the rumours started at the time of the Five Senators' return from their world tour. The total of Lend-Lease aid furnished from March, 1941, to November 30, 1943, totals \$18.6 billions, of which \$10 billions was provided in the first 11 months of 1943. Lend-Lease now has absorbed 13.5 per cent of American war expenditures. Within the total the most striking trend is the increased export of finished munitions, which has risen from 21 per

cent in 1941 to 61 per cent in 1943, an index of the achievements of the American war production programme. The most interesting aspect of the present report is its emphasis upon the equality of the contributions made by other countries, whether in terms of men, weapons, or ruined cities, the degree of self-help they have manifested, and the fact that Lend-Lease has been in most cases only a supplement, though an essential one, to their own productive efforts.

In this vein the Report goes on to answer the endemic criticisms of the inadequacy of Reverse Lend-Lease, and of the responsibility of Lend-Lease for shortages of farm machinery, butter, coal and petroleum. The most incisive passages deal with the export of petrol, in which it is pointed out that total war exports are a smaller proportion (12 per cent) of American production of crude petroleum than peace-time exports were in 1938 (18 per cent). Allegations of misuse of petrol abroad, and of the failure to share alarm over the future of US reserves, the Report urges that after the war fair and equal access by all nations to petroleum will be guaranteed by agreed action for the expansion of production, the elimination of discriminatory treatment, and the reduction of trade barriers. Another vexed question—that of access to American-built airfields—should, it is suggested, be left to the continuing collaboration of the United Nations in international commerce and the development of a system of general military security. This is the most vivid, comprehensive and vigorous Report the Lend-Lease Administration has yet submitted. But such reports are read by comparatively few. Mr Stettinius's book shows every promise of catching the imagination of many thousands of readers, and winning for the historic concept of Lend-Lease a popular appreciation of its immense contribution to victory.

## Tu Quoque

Mr Willkie, who only a few months ago warned the British not to meddle in American politics, has this week been himself rebuked, in no uncertain terms, by *Pravda* for interfering in Russian affairs. The cause of the trouble was an article in the *New York Times* called, innocently enough, "Don't Stir Mistrust of Russia," in which Mr Willkie at one point remarked that

What Russia intends to do about the political integrity of the small states around her borders, Finland, Poland, the Baltic and Balkan States, is one of the most pressing problems in everybody's mind.

*Pravda* said flatly that Mr Willkie must not meddle in Russian internal affairs, and charged him with "muddying the waters" and being a political gambler. Mr Willkie, who has prided himself on being the sympathetic interpreter of Russia to America, was described as being stunned into silence at being thus wounded in the house of a friend. The State Department must have blended a gentle amusement with its sympathy at the discomfiture of the eminent amateur diplomat. The Russian attack may well have been the culmination of a series of irritations with earlier American comment, which has, on occasion, been far less friendly than Mr Willkie's mild observation. This comment, as might have been expected, has been stimulated by the incident, with most of the American papers rallying to Mr Willkie's defence. The *New York Times* warned the Russians that "any attempt to settle the problem of frontiers unilaterally or on the basis of force will greatly discourage American participation in any future organisation to uphold post-war settlements." There is no doubt that, in many quarters, the Polish frontier is regarded as a test case, not only of Russian intentions, but of the validity of the Atlantic Charter. The stream is not altogether as pure as this, however. There are enemies of the whole concept of collaboration who are not above using the Atlantic Charter to make any practical agreements impossible. Nor can the existence of a substantial Polish vote in the United States be left out of the account. There are said to be something like five and a half million citizens of Polish origin in the United States, and they are largely centred in key states such as New York, Michigan and Pennsylvania. At the last election, the Polish vote inclined heavily to Mr Roosevelt, in some cities by as much as 10 to 1. The Poles can also be expected to carry with them the sympathies of many of their co-religionists. A political stake of this magnitude cannot fail to be reflected in the attitude toward the Polish question.

## The Favourite Son Crop

The Republican Convention, at which the party's presidential candidate will be chosen, has been fixed to take place at Chicago on June 26th. Already there are firm prospects of a bumper crop of favourite sons. The newest candidate is Governor Warren, of California, whose gracious yielding to the demands of the Republican state organisation throws doubt upon earlier reports that he had agreed to stand down in favour of Mr Willkie. Governor Bricker last week edged himself out of the shadows with an attack on President's Roosevelt's "Win the War" slogan, which he declared belonged, not to the Democratic party, but to every citizen. General MacArthur's name is already down in Illinois, and Governor Stassen's supporters are busy in Minnesota. This nation-wide activity is probably not unconnected with the recent trip round the country of Mr John D. M. Hamilton, Mr Landon's campaign manager in 1936 and popularly believed to be the spark-plug of the anti-Willkie forces. The theory is that, with a sufficient number of favourite-son delegations, a deadlock might ensue at the convention which would provide the opportunity for a back-stage wangle eliminating Mr Willkie. The fact that isolationist Chicago has been chosen as the convention city is also regarded as a blow for Mr Willkie, who, it is thought, would have preferred the more sympathetic background of interventionist New York. The dress rehearsal of Republican ma donnas at Chicago certainly has an anti-Willkie cast. A warning of Governor Wills, of Vermont, that only Mr Willkie could be certain of beating Mr Roosevelt brought the sharp reply from the National Chairman that the Republicans could elect any candidate they chose. In his exhilaration Mr Spangler referred to a so-called poll of American soldiers in Great Britain which purported to show that they would vote Republican by an impressive proportion—an evidence of political concern and activity which the War Department is said to regard with disfavour. Meanwhile, the favourite of all favourite sons—the man who might be called the rising son if it were not for certain unpleasant connotations—is still discreetly silent on his political future, though admirably energetic in pushing popular post-war measures in New York. Recent polls have shown Governor Dewey leading Mr Willkie by 35 per cent to 22 per cent in the latter's home state and by even more in the East Central states. But Mr Willkie's legendary unpredictability is still fluttering Republican dovescotes. The most recent rumours report the possibility of a deal between Mr Dewey and Mr Willkie to eliminate any Middle Western non-interventionist from the running, and even a deal between Mr Roosevelt and Mr Willkie whereby the latter would become President—if nominated—on condition that Mr Roosevelt headed the peace delegation. The early industry of Mr Willkie's opponents in the party shows that they mean to take no chances.

## Crusade Against Monopoly

The deep-seated and historic American distrust of big business found fresh expression this week with the filing, in the New York courts, of a suit charging Imperial Chemical Industries, Limited, and the American DuPont de Nemours Company with violating the Sherman Anti-Trust Act. The allegation is of a "conspiracy" or cartel

agreement to divide up world markets in certain chemical products, dating from before 1920. A vigorous denial has been issued by Lord McGowan for ICI, defending the company's policy of co-operation with the American corporation on the grounds that it was of public benefit both in the United States and Great Britain. The Attorney-General, after a lengthy recital of the Government charges, stated that the aim of the United States was to obtain the abrogation of the alleged illegal contracts and a perpetual injunction against ICI from violating the American Anti-Trust Acts. The procedure of a big anti-trust case in the United States is strange to British ideas, and calls for some explanation. It may well begin with the unusual spectacle of the Assistant Attorney-General in charge of the case devoting a press conference to denouncing the defendants. There follows the preliminary trial in the newspapers, in which the comments, if made in Britain, would bring speedy reprisals in the form of charges of contempt of court, if not libel. The process, in other words, is as much a political as a judicial one, and has been ever since Theodore Roosevelt found that the reformist zeal of the country could be satisfied by trust-busting. It made the little man feel that his interests were being protected; it made the Western Liberals happy, because the trusts were usually concentrations of Eastern capital. The interest of the present suit is that for the first time a British corporation has been associated with an American in a spectacular anti-trust case. This will not make the spectacle less popular. The occasion is being taken to stress the differences between British and American practice, rather along the lines of Mr Eric Johnston's sorrow at the hankering after monopolies and cartels shown by the British business men he met last summer. Thus the political debate which conventionally accompanies an anti-trust suit may, in this case, have wide repercussions on the American attitude toward post-war economic collaboration.

## Shorter Notes

The American press has shown considerable restraint in its comments on the Bengal famine. When this tragedy was at its peak, both news reports and leading articles showed a manifest unwillingness to add to the difficulties of the British. Recently, however, a series of "horror pictures" of the famine have been appearing in a number of daily newspapers and weekly journals. These pictures are the result of normal journalistic enterprise. There have been demands—some of them from quarters inimical to Britain—that American food should be sent to India, or that the machinery of UNRRA be extended to include relief in Bengal.

Warning that housing, transportation and other community facilities were strained to the utmost in Pacific Coast areas, President Roosevelt's committee for congested production areas has appealed to every one except qualified and registered war workers to stay away from this expanding war industries area. The statement of the committee, which represents all the major war production agencies, said that the physical capacity of all community facilities had been exhausted.

## Saving Canada's Bacon

(From Our Ottawa Correspondent)

December 6th

THE new bacon agreement, under which Canada will supply 450 million pounds to the United Kingdom in 1944 and in 1945, compared with 675 million pounds in 1943, has come in for a great deal of criticism, some of which is a testimony to the affection of Canadians towards the people of Britain and the wish of Canadians to pull their fair weight in the distribution of sacrifices. We on this side of the Atlantic have been acutely conscious of our good fortune; and the proposal that Canadians restrict their consumption of bacon and pork products so that Britons could enrich a somewhat monotonous diet met with approval and co-operation. It was a small thing to do, but Canadians liked the idea that it was being done. Now it is suggested that as a result of the new agreement the British ration may fall from four ounces to three ounces a week, and sharp comment is being printed. The *Winnipeg Free Press* predicts that "consternation and anger will be felt by Canadians generally" at the result, adding that the Canadian people do not share the views of the Government on the subject, and hoping that the matter can still be re-opened. What especially annoys the *Free Press* is that we are not only cutting down our shipments of bacon to the United Kingdom but are taking off the restrictions on home supply at the same time, so that we ourselves will be allowed to eat all the bacon we can buy under our own very generous rationing system. A writer in *MacLean's Magazine* asserts:

You could have knocked out a lot of Ottawa people with much less than a feather when knowledge of the new bacon contract got around,

and added that the reduction was "a purely political move." Other editors have been equally outspoken.

The truth about the considerations which led the Government to modify the agreement downward by 225 million pounds for each of the next two years came out under this barrage of criticism. The first explanation was that the coarse grain supply available from the 1943 harvest was not adequate to repeat the 1943 production, that under the new coarse grain prices the profits on hog production would fall and some marginal production would cease. This was true, but it was not the whole truth.

If the Government had been determined to maintain the 1943 flow at any cost, it could presumably have been done in spite of the coarse grain problem. Canada has been shipping enormous quantities of coarse grains to the United States. The departmental solution is said to have been to offer a subsidy of three cents a pound to hog producers and to continue restrictions on the flow of pigs into the home market. This step would, presumably, have permitted the export to Britain in 1944 of a total approaching the 1943 level. The Government, however, increased the market value of oats by a bonus of 10 cents a bushel, of barley by 15 cents a bushel, while increasing hog prices by only ½ cent a pound. At the same time, they removed the restrictions on the domestic marketing of hogs.

The Minister of Agriculture, Mr Gardiner, answering the widespread criticism, proceeded to explain that the step was in a measure deliberate and was being taken to protect the interests of Canadian farmers in the post-war transitional period, which might not now be very far away. Having digested the Minister's statement, the *Toronto Star* neatly answers the question, "Why has the reduction been made?" as follows:—

It has been made because at the end of the war Britain will return to her pre-war market for the purchase of bacon, and that market is Denmark, not Canada. And why will Britain not now contract with Canada to take Canadian bacon after the war? Because she prefers Danish bacon, and Denmark will buy British products in payment whereas Canada imposes a tariff upon them.

On behalf of the Minister of Agriculture, it can be said that the abrupt collapse of Canada's export markets for

food products after the First Great War is still a bitter memory, and the Government would not be held blameless if it failed to look ahead and prevent if possible a similar catastrophe this time. If Canadian agriculture is geared to a production of hogs capable of yielding 6 million pounds for export, and the demand suddenly fades even to the pre-war peak of 192 million pounds, the glut and the decline in prices would be ruinous to many thousands of producers (in 1931 Canada shipped only 11 million pounds to Britain). Even after production had been stepped down to the equivalent of 450 million pounds for export, a sudden reduction of British imports to, say, 200 million pounds would create a serious situation. Mr Gardiner is now able to say to the Canadian farmer: "Let us face the fact that peak production of hogs has passed and that we must contemplate post-war export levels more of the order of 200 million pounds. The Government has assured you of markets during 1944 and 1945 of 450 million pounds annually, plus what you can sell in a non-restricted domestic market. This gives you an opportunity to re-adjust your production and cultivate new markets for these or alternative products."

### Liquidation of Hogs

The immediate effect of the new agreement and the higher prices for coarse grains has been a serious congestion at the stockyards and packing plants. Hogs in large numbers have been held in stockyards, and farmers have hauled their loads to town only to be told to haul them home again until the glut was relieved. There have been numerous hot protests to Ottawa. If the farmers keep their hogs on full rations while awaiting shipping facilities, their costs rapidly wipe out all profits. If they do not, the weight of the hogs rapidly declines and they lose in another way.

Among the more thoughtful of the farm leaders the situation has been accepted as inevitable and the Government solution as reasonable. They are grateful for a good guaranteed price for high production for another two years. They feel that the present sharp liquidation of surplus hogs is a better outcome than to wait until after the war for a drastic readjustment. In a few weeks, the present flush run will be over, and the farmers will be able to decide on future policy. If they want to go out of the hog business they can do so in a gradual manner, while those who are well equipped to produce hogs efficiently can stay in the business.

The post-war prospects for Canadian hog producers are bound up in such uncertainties as the length of the war, the speed with which countries like Denmark and Lithuania can resume export sales, and the overall world need of food. The Canadian Government is likely to approach the British Government to enter into a long-term post-war agreement to accept substantially larger quantities of Canadian bacon than before the war. As Dr J. A. Scott Watson, Agricultural Adviser to the British Embassy at Washington, has been saying, this raises the question of where Britain is to get the exchange.

In this connection, it is interesting to note that Canada no longer has a political party committed to high tariffs. John Bracken, who succeeded R. B. Bennett (now Viscount Bennett) as national leader of the Progressive Conservative party, understands perfectly well the intimate relationship between the agricultural prosperity of, say, Manitoba (of which he was premier for about twenty years) and the tariff policy of the Dominion. Recently, Mr Bracken has disavowed the traditional high tariff policy of his party and has come out for relative freedom of international trade. There are powerful interests within his own party opposed to drastic reductions of tariffs, but it is safe to say that if Mr Bracken becomes the next Prime Minister of Canada he will not call a special session immediately afterwards to raise tariffs sky-high against the world.

## Swiss Agriculture

[BY A CORRESPONDENT]

January 10th

IN spite of a great and sustained effort, Switzerland is still dependent on imports for the maintenance of its relatively small food rations. The improvement in the Allied military situation has not eased the situation, and the continuation of the war into a fifth year has meant a new stage in the agricultural effort. At the beginning of the war, when, according to a rough estimate, four-fifths by value of the total consumption of agricultural products was produced at home, the "Wahlen Plan," named after its author, was put into operation. Its main provisions were the reduction of cattle, dairy cows and pigs by one-third and a gradual expansion of arable land by ploughing up pastures, reclaiming waste land and clearing forests until self-sufficiency was reached on the basis of minimum food rations. As long as some imports of cereals for bread and fodder were reasonably certain, the plan could be carried out satisfactorily. Imports of fertilisers were small but adequate. Lack of fuel for tractors was overcome by the use of wood-gas generators. It was, in fact, only the labour shortage that produced difficulties, for already before the war Switzerland had experienced a flight of labour from the land.

Big price increases were a sufficient incentive for most of the peasants and farmers to carry out the instructions laid down in the plan. But though the production plan was comprehensive, the rationing of foodstuffs proceeded piece-meal until, in October, 1942, bread and milk were included. As in other countries, the agricultural production plans were accompanied by the strange propaganda proclaiming the virtues of going back from the specialised dairy industries to the husbandry of mixed farming, where the peasant was again a "real" peasant and not only an industrialised breeder of livestock.

During four years of war, the expansion of arable land has made it possible to reduce imports of bread cereals, amounting to 70 per cent of total consumption before the war, to 50 per cent. In the agricultural season 1942-43, the arable land was almost doubled compared with pre-war years. Cereals, potatoes, sugar-beet, vegetables, oilseed and tobacco cultivation were increased more or less according to plan. The ultimate goal of the Wahlen Plan is an area amounting to 500,000 hectares, and during 1942-43 roughly 400,000 hectares were actually under cultivation. These figures seem small compared with the changes which have been made in other countries. They mean, however, a complete change for Swiss agriculture. If the ultimate goal is reached, the share of grassland in the total agricultural land will have been reduced from 83 per cent in 1937 to 54 per cent in 1944.

Even during the 1942-43 season, the steady progress in expansion could no longer be maintained, and the new season seems to have seen a limit put to a further overall expansion. The agricultural plan aims, therefore, at intensification, in other words, at higher yields from the land already under the plough. The peasants appear to be reluctant to expand arable land by clearing forests. Apart from this reluctance, which is motivated by the high labour costs of the work and the difficulty of maintaining the expanded area under the plough after the war, when unrestricted imports of cereals should again be possible, the peasants have also stopped reducing their livestock herds. Since the end of last year a slight increase in the number of cattle and pigs has even been noticed.

The 1943-44 agricultural plan indicates that Swiss agriculture has reached its limit. It cannot escape the problems faced by other countries when planning their wartime agriculture. The expansion in the cultivation of cereals and root crops involves a reduction in the number of livestock. But when expansion has been carried to its practicable limits and intensification is attempted, it is found that higher yields of cereals and root crops cannot be achieved because of the inevitable shortage of labour, machinery and fertilisers. Switzerland is to all intents and purposes fully mobilised, and general conditions are in this respect not different from those in belligerent countries.

Owing to the strenuous efforts made, there has so far been no shortage of potatoes and vegetables. At the same time there has been a steady reduction in the consumption of meat and fats. A particularly interesting feature of Swiss agriculture is that the rations or allowances for the so-called self-suppliers, that is, the peasants, are generous. The result is that there is a tendency to black market activities which

cannot be limited simply by exhortation and propaganda. Townspeople naturally try to augment their rations by breeding rabbits and by allotment gardening.

### Uneven Price Changes

Superficially, the finances of agriculture seem to have improved. The Swiss Peasant Secretariat has estimated the value of the agricultural production as follows:

(In million Swiss francs)

|                               | 1938         | 1941         | 1942         |
|-------------------------------|--------------|--------------|--------------|
| <b>Total production</b> ..... | <b>1,297</b> | <b>1,707</b> | <b>1,784</b> |
| Potatoes .....                | 39           | 95           | 136          |
| Cereals .....                 | 88           | 92           | 107          |
| Vegetables .....              | 68           | 92           | 133          |
| Fruit .....                   | 66           | 154          | 171          |
| Dairy products .....          | 472          | 522          | 550          |
| Pig breeding .....            | 166          | 199          | 167          |
| Cattle breeding .....         | 242          | 292          | 231          |

The total value increased during this period by 37.5 per cent. The value of the cattle and pig breeding decreased, but whereas the total milk output was smaller in 1941, the value had increased by 17 per cent. On the whole, the table reveals an uneven price development, and it can be assumed that certain sections of the agricultural industry even incurred losses, whereas others gained considerable profits. The hazard of these far-reaching changes is actually greater in Switzerland than in other countries. There are many instances where prices were changed for purely political reasons, and the conditions of a compulsory war economy, with rationing and price fixing, make it impossible to arrive at prices which are justifiable for purely economic reasons.

It may be doubted whether there has been an actual increase in agricultural production measured in terms of nutrition. No doubt, the bulk has certainly increased. Generally speaking, it can, however, be said that a policy of agricultural self-sufficiency in peacetime has been rejected by Switzerland. Experience shows that it can never be achieved. The country depends on its highly specialised industries, and the present population could never be maintained on the agricultural products of the Swiss soil.

... but STILL,  
it's a compensation

This famous British Table Water—in Sparkling form—has disappeared for the moment but it will return with victory. An understanding public will appreciate our difficulties.

## Germany at War

### The Housing Disaster

AT the beginning of the war, there was an acute housing shortage in Germany. Official sources estimated that from 2½ to 4½ million additional flats would be necessary, if the population in Greater Germany were to be housed adequately. The building of flats in single houses or in blocks of flats was stopped in February, 1940, and the total number of flats completed and built under special permission during four years of war has been estimated by Dr Ley, the Housing Commissar, at roughly 400,000, or slightly more than the net increase in flats in Greater Germany during the record building year before the war. At the end of the second year of war, the additional number of flats needed after the war was estimated at six million, and the press discussed whether the building programme for the post-war period should be spread over ten or twenty years.

Before the war, Autobahnen, palatial party buildings, public buildings in large towns, new factories, barracks and fortifications were built, and no labour or material was left for an adequate housing programme. Serious overcrowding of small flats again developed in many German towns, and particularly in the industrial towns of central Germany, which were still villages when Hitler came to power. Most of the boasted housing programmes remained plans. A number of workers' and peasant settlements were created as show pieces.

After two years of heavy bombing, the housing situation in Germany is more than a problem; by normal standards, it is more like a disaster. Industrial and military building cannot be stopped. If millions of people have become homeless as the result of bombing, no major part of building machinery, labour and material can be diverted to the construction of dwellings. It is not necessary to search for statistical proof of the extent of the housing shortage; the so-called "housing emergency work" inaugurated by Dr Ley in the autumn of last year confirms it. The immediate solution is the construction of makeshift dwellings in or around the bombed towns.

#### Hut Dwellers

It is a characteristic feature of German towns that generations of industrial workers and small businessmen have tended small plots of land on the fringe of the towns, usually known as the "gardens of the little man." Each of these gardens had a "summer house," varying in quality according to the skill of the gardener. Most of these summer houses were small wooden structures, but large enough to accommodate a family for the best part of the summer. These summer houses, or *Lauben*, are the models for Dr Ley's makeshift houses, the shelters of the bombed-out families. There is no provision for modern sanitation, for main water, gas or electricity. There is no lack of beautiful designs for these *Lauben*. Exhibitions have been opened, and simple instructions have been published for building them. It is an essential part of the relief scheme that, where possible, the bombed-out people are urged to build these huts themselves, preferably from salvaged material.

Phase by phase, the housing situation in Germany has reflected the changing fortunes of the war. Shortly after Hitler came to power before the war, tens of thousands of large flats in big towns were redivided into small flats of one or two rooms, mostly at great cost in material and labour. Innumerable new state organisations converted flats into offices, and the general trend was that more people were crowded into smaller flats. It was estimated that, before the war, at least 17 to 20 per cent of the flats in towns were overcrowded. The building industry was so seriously overtaxed that major military and public constructions were only possible by using forced labour, which found its clearest expression in the Todt organisation. Dr. Todt's buildings were at least of real military importance apart from the Autobahnen. The pre-war schemes of the present Minister for War Production, Speer, were just grandiose; the finest materials were used. But for human dwellings, the use of iron and steel was cut down to a minimum, bricks were replaced by inferior substitutes, cheap plastics replaced metals, and so on.

In the war there have been two distinct stages. After the defeat of France, a grandiose plan of "social building" was announced, and Dr Ley was made Commissar for Social Building after the war. At the same time, innumerable military and civil departments took over more flats for offices; and already in 1940 flats, and even single rooms, were put under compulsory administration, which meant that no landlord was able to let out or sell his property. During 1941, the experience of 1934-35 was repeated, and a campaign was begun for dividing the large flats that had survived into still smaller units. This time, however, actual conversions remained negligible in number, because of the lack of labour and material. At the same time, bombing on a large scale began.

During 1942, the authorities remembered that a large number of flats and whole houses had been converted into offices. Organisations and administrative departments were therefore forbidden to take over any flats. A campaign was made at the same time for moving offices out of former flats; and offices as a rule had to find accommodation in huts built of timber. At that time, it seemed still relatively easy to get enough timber from Sweden and Finland for these purposes. Plans were made for erecting, in addition, prefabricated wooden houses imported from abroad. Yet more and more wooden barracks had to be constructed for prisoners of war, and millions of foreign workers, who were crowded in barracks near factories and on large estates.

#### Shifting the Burden

At the beginning of 1943, it seemed clear that the Government had given up any hope of relieving the shortage of dwellings by new construction. A decree entitled the "dwelling space steering order" was introduced, whose main point was a stop on taking up residence in a number of large German towns. From time to time, fresh towns were added to the list, and at present practically all large German towns are closed areas. Meanwhile, Dr Ley had been appointed Supreme Dwelling Commissar, and decree after decree has followed.

Each decree was designed to make better use of available flats. First, people were forbidden to have more than one flat, until it was stipulated that one room was the maximum that could be allowed for one person. As usual, statistics were prepared to show that these equalitarian principles actually produced a surplus of rooms; and Dr. Ley announced that, for the 89 million inhabitants of Greater Germany, which includes Bohemia and Moravia, 92 million rooms, kitchen and the corridors not counted, had been available, and that, at that time, June, 1943, only one million rooms had been destroyed by bombing. The stark contrast between this figure and the earlier estimate that there was a shortage of several millions of flats is impressive. It shows the supreme irresponsibility of totalitarian politicians. The stricter use of available flats has reached its limits. Rebuilding of destroyed houses is impossible because of the lack of material. So people have to live either in repaired houses or in makeshift huts like the *Lauben* on the outskirts of the large town.

An impressive organisation has been built up for repairing damaged houses, in spite of the fact that the greater part of building workers and independent artisans are engaged on war work. At the same time, all building material still in the yards of builders and building firms has been requisitioned for the purpose of preserving stocks for necessary industrial and war building purposes. Bombed-out people are therefore either crowded together in houses that are still standing, and little more, or live in undamaged shelters, or are engaged in constructing somewhere with salvaged material wooden huts. The millions of foreigners who live in large camps are probably as well housed as the majority of bombed-out people. This is the actual, as compared with the statistical, situation. It is, however, not uniform all over Germany, nor equally bad for all Germans. The totalitarian regime is a hierarchy, and the actual differences in housing are indicated by constantly changing priorities. Disabled and decorated soldiers have first claim to a flat. Bombed-out people must be accepted in any flat. Large families are also on the priority list. In short, there are some at least who have not lost the hope of getting better accommodation.

## British Cinema Prospects

JUDGED by the rise in cinema share prices at the turn of the year, one of the Stock Exchange's New Year resolutions is to go more often to the pictures in 1944. But the markets, like true film fanciers, are hitching their wagon to their favourite star; for recent demand has been concentrated on the companies with which Mr J. Arthur Rank's name is associated and has passed others by. There have been many aspirants for leadership of the British cinema industry, but Mr Rank is the only one who has, so to speak, received the official insignia, by way of a request from the President of the Board of Trade that he should bring no new major film organisations under his banner.

It is difficult, at present, to envisage the future of the British cinema industry except in terms of Mr Rank and his projects. Possibly, the share market's emphasis is unduly exclusive, since the largest film exhibiting circuit in the country, owned by Associated British Pictures, is outside his control, and the organisation which aims to become the largest single film production concern after the war—Metro-Goldwyn-Mayer-London Films, Ltd.—is American-financed, under the chairmanship and managing directorship of Sir Alexander Korda. But Mr Rank has undoubtedly captured the public imagination and whetted it by his own recent speeches suggesting far-reaching post-war developments. He came with a reputation as a shrewd—even "hard"—but courageous man of business who had served a long and profitable apprenticeship with the great flour-milling concern which carries his family name, and with which he is still directly associated. He entered the film industry on the renting side, and became chairman of the board of Odeon Theatres on the death of Mr Oscar

Deutsch, who had built up a very profitable chain of super-cinemas. In 1939, before Mr Rank became chairman, Odeon had announced its intention of making an offer for Gaumont-British, the second (Associated British being the other) of the two large integrated groups in the industry. The projected merger fell through; but in 1941 it was announced that Mr Arthur Rank, apparently *in propria persona*, had succeeded in acquiring the majority holding of the brothers Ostrer in the Metropolis and Bradford Trust, which gave voting control of Gaumont-British.

The background and details of the resulting position have already been described in *The Economist* on July 3, 1943. Since *The Economist's* article was written, no further major acquisitions by Odeon or Gaumont-British have been announced—though the "gentlemen's agreement" between Mr Rank and the Board of Trade made an exception for contracts under negotiation at the time it was arrived at, and this, apparently, covered such deals as the acquisition, last October, by Odeon of the six cinemas owned by Joseph Mears Theatres. But there have been two developments which, jointly, seem to suggest that the outlook is much less settled than at one time it seemed to be. The Board of Trade's intervention was generally believed to have, as one of its aims at least, the prevention of any acquisition by Mr Rank of even a substantial voting interest in Associated British Pictures. The Government, generally, seemed to have gained its objective of ensuring the maintenance of reasonably competitive working conditions, and the position among the giants seemed fairly clear-cut, with Associated British on one side of the river and Gaumont-British and Odeon, under common leadership, on the other. But recent news has made it difficult to say what the strength of the link between the two last-named organisations really is.

In the first place, it has been disclosed in *The Financial News*, and subsequently confirmed by Mr Rank himself, that the transfer of the shares giving control of Gaumont-British to Mr Rank has not been made effective, because the necessary consent of the American interests holding the minority of the voting shares has not been given. Mr Rank has stated that the matter has been discussed in letters, but needs personal contact, which it has been impossible so far to arrange. In view of the fact that the deal took place over two years ago, and the American interests concerned had shown in the clearest possible way that they regarded their giving or withholding of permission as something much more than a mere formality—by vetoing an earlier attempted transfer of the controlling shares to the late Mr John Maxwell—the delay seems inexplicable, except on the assumption that the American consent, whenever it is asked for, will not necessarily be a foregone conclusion. In the meantime, both the brothers Ostrer, Mark and Maurice, remain on the Gaumont-British board, and one is joint managing director. The position is unusual in many ways. What it appears to amount to, in fact, is that Mr Rank holds something resembling a power of attorney from the brothers Ostrer to exercise the rights attaching to what are still their shares (because they have not been, and cannot be, without American consent, transferred to Mr Rank or anyone else), in return for a considerable sum of money which, presumably, is still in the nature of a deposit or pledge. If this interpretation were correct, the question would arise whether frustration might be pleaded, and the *status quo* restored, at the will of either party, if the conditions for "completion" of the ultimate transfer proved impossible and the pledge money were returned. It may, for the time at least, suit both parties that Mr Rank should control the Gaumont-British board without being legal owner of the majority voting shares. But from Mr Rank's viewpoint there is a material difference between *de facto* and *de jure* ownership, since any hypothetical future rival for Gaumont-British control, who was prepared to pay the price and was *persona grata* to the American interests, would be bound to approach Mr Rank himself if he were the out-and-out owner of the shares, but could go direct to the ultimate owners if he were not.

Whatever its precise legal status, in practice Mr Rank's protectorate over Gaumont-British can hardly be regarded as being on the same firm footing as his control of Odeon, and this seems to be the view taken by Mr Rank himself. At the last meeting, he expressed his ambition to see an Odeon theatre in "all the major cities" of Britain—including, inferentially, cities already served by Gaumont theatres. At the same time, he announced that the Odeon directors had been "exploring the possibility" of taking interests in theatres in liberated countries of Europe. This would indeed be an adventure into the unknown, and if the exploration has been really serious, something on a considerable scale would seem to be intended. Its declared object—to ensure "fair representation" on the Continent for British pictures—would be achievable only if the proposed chain of British-owned theatres were sufficiently widespread, numerous and attractive to compete successfully in a fair number of coun-

Odeon ordinary, respectively, suggest that investors are thinking in terms of higher future dividends, and, further, are differentiating in favour of companies in Mr Rank's orbit. By contrast, the present dividend yield on Associated British ordinary is as high as 5.00 per cent.

How far is this attitude soundly based? Clearly, there are two distinct factors in the equation, one industrial and the other personal. The film industry in all its branches—film exhibiting not excepted—has always hitherto been reckoned among the more "speculative" domestic trades, from the investor's angle. A vigorously progressive policy may be what the industry needs after the war—certainly, the Odeon super-theatres, with their studious care for patrons' tastes and comfort, have paid handsomely. But future development on the scale recently canvassed is obviously going to be costly—all the more so because it now seems certain to be carried out in a competitive environment. Mr Rank's challenge, if made effective, can scarcely be disregarded by the rest of the industry. Further, it may raise interesting questions about the relationship of different groups inside Mr Rank's own orbit. Many Gaumont houses are older and have less drawing power than the Odeon theatres. They might well feel the keen edge of competition if the latter were established in every large town in the country. Up to now, it has been impossible to say whether Euphelia or Chloe has the warmer corner in Mr Rank's heart, but as his affection constitutes the main link between them, the question may ultimately have importance in many varied and perhaps unexpected ways.

On a broader view, the maintenance of the industry's exceptionally high current profits depends partly on the maintenance or otherwise of the national income after the end of the European war and the subsequent transition period. Before the war, seating accommodation, in the country as a whole, was admittedly generous, if not excessive. The projected additions to its capacity will doubtless have to yield priority in construction to more urgent requirements for homes, municipal buildings and, probably, certain business premises. If so, the programme may well come to fruition at a time when many other activities, competitive with the pictures but now restricted or dormant, are re-established as claimants for popular favour. When the black-out has gone and a redistributed population (possibly with less overtime earnings) is free to choose between the pictures, football, dogs, horses, beer, shops with replenished shelves, holidays, "trips" and, not least, the restored amenities of its own homes, including television—then the cinema industry will need to be exceptionally enterprising or fortunate, or both together, to maintain its earnings at anything like their quasi-monopoly wartime level.

In the long run, nevertheless, Mr Rank may quite probably be right. A policy of steadily raising the quality of the industry's service may be the surest way—perhaps the only way—of maintaining or increasing its hold on the public purse. The post-war reduction or final disappearance of EPT will provide an appreciable "cushion" for shareholders against a fall in earnings; but a lavish dividend distribution policy would be difficult to defend in the conditions suggested in this article. All in all, the future of the cinematograph industry as a popular entertainer may be assured, for as far ahead as one would care to prophesy. But the claim of its leading shares to "investment" as distinct from "speculative industrial" ranking, will perhaps be more appropriate when its post-war programme has been completed, and when its outstanding personalities have proved the quality of their leadership, than it is at the present time.

\* Including taxation provision.

tries with the continental, and still more the Hollywood, product—and that would be no light undertaking.

From the investor's viewpoint, it seems virtually certain that the post-war expansion programme which Mr Rank has suggested would demand a very large capital expenditure. That, in turn, would suggest a highly conservative dividend policy in the meantime. The table above shows that a severe drop in earning power was suffered in the early years of the war by all the leading cinema groups—by Associated, as well as by Gaumont and Odeon. That position has now been reversed. Cinema profits are running high at a time when "the pictures" are one of the few forms of unrationed expenditure available to a fully employed population, many of whose members have been uprooted from their homes and deprived of normal "satisfactions." Some of the greatly increased gross takings of the theatres have percolated through to shareholders in increased dividends. But taxation—especially EPT—is taking a substantial toll of earnings. And the current financial position of all the groups is anything but liquid. Their consolidated balance-sheets, in every case, show a substantial excess of current liabilities over liquid assets. Nevertheless, dividend yields of 3.24 per cent and 2.42 per cent on Gaumont-British ordinary and

## Business Notes

### The Gold Cure

The process of combating inflation by sales of gold in the Middle East and India is gaining persistent momentum, and is apparently meeting with considerable, though still rather localised, success. In Egypt and the Middle East, the "gold cure" for inflation is now effective. The cost of living in Cairo has kept fairly stable since last summer, when it had reached a level nearly three times that of the first half of 1939. The volume of official gold sales needed to arrest the development of further inflation (no attempt has been made to correct the inflation which preceded the new policy) has been comparatively modest. The gold price in Alexandria has kept steady at 169.2 piastres per dirhem in recent

weeks. This is equivalent to a sterling price of slightly under £16 per ounce. In India the scale of official sales of gold has been gradually increasing. Last week about 50,000 ounces were sold in the Bombay market on official account. This week, this record will have been easily exceeded, for on Tuesday and Wednesday alone official sales totalled over 62,000 ounces. The official price, which was around Rs 78 per ounce when official sales began last autumn, has been reduced to Rs. 71½, at which it has remained since mid-December. Even at this lower figure the Bombay quotation, which is for one tola of fine gold, gives a sterling equivalent of £14 4s. 6d. per ounce. It will thus be seen that the volume of these official sales of gold is becoming substantial—

## COMMON COLD

### Common sense...

THE common sense approach to the problem of the common cold is "Serocalcin" and people who maintain that colds are "inevitable" ignore facts. For more than eight years "Serocalcin" has been prescribed by the Medical Profession and the efficacy of "Serocalcin" for treatment or prophylaxis in some 8 out of 10 cases is now a matter of established fact.

"Serocalcin" (reg. trade mark) is a sulpho-guaiacolic plasma precipitate which enhances the resistive capacity of the body against invading organisms that cause colds. It is contained in small tablets, easy and pleasant to take.

Three tablets, three times daily, will usually clear up a cold in 48 to 72 hours. Two tablets daily, for 30 consecutive days, provide immunity in some 8 out of 10 cases for a period of 3 to 4 months.

There are no "drugs" in "Serocalcin" and consequently no unpleasant reactions. It can be given to children with perfect safety.

A treatment pack of 20 "Serocalcin" tablets costs 3/4½ (inc. tax). The full immunizing course of 60 tablets costs 8/5½ (inc. tax). All who suffer from the common cold are invited to send 1d. stamp (to comply with regulations) for booklet "Immunity from Colds."

### SEROCALCIN PREVENTS COLDS

Harwoods Laboratories Ltd., Rickmansworth Rd., Watford, Herts

£700,000 last week and a figure probably approaching £1,000,000 this week. It is not altogether surprising that the progress of the Indian experiment in counter-inflation should be watched with a touch of apprehension in this country. It is remembered how insatiable a sink for the precious metals India proved in the half-century prior to 1931. The absorption of gold could, under present inflationary conditions, outdo any comparable achievement in the great days of India's gold acquisitions. It is, therefore, to be hoped that the other methods of combating inflation which the Indian authorities have prepared will soon come into operation. In particular, the premium bond issue is awaited with the keenest interest. While it is admitted that gold sales have proved a useful element in helping to mop up inflated purchasing power in India, it is asking a lot of gold to attempt single-handed the task of bridging the inflationary gap which is in essence equal to the amount of British and American Government expenditure in that country. South Africa's gold could be put to much better use than doing a job for which the Indian fiscal machine should be responsible.

### The Empire's Dollars

Interesting allegations of trade discrimination against American exports to British Empire countries were made this week at a meeting of American exporters held in New York. The specific accusation was that, although India had in recent years accumulated large dollar balances in the course of its trade with the United States, these dollars were apparently converted into sterling "as part of a deliberate effort by the British to bar Americans from the Indian market." This is as good an example of the demand to have one's cake and to eat it as has yet come from the United States. Admittedly, the dollar income of the British Empire and of other countries now within the sterling bloc is pooled and cleared through London. But the reason for this pooling is not to bar Americans from these sterling area markets but to mobilise every available dollar required to pay for essential imports from the United States. America cannot expect Britain to use the dollars twice over. If at the end of this war the dollar reserves of the sterling countries appear too exiguous for the liking of American exporters, the fault will lie not with any deep-laid British plot, but with the vigour with which the US Treasury will have encouraged the Empire to empty its pockets of dollars.

### Miners' Bonus

The fact that only one district (Leicestershire) qualified for the output bonus last month—the latest coal production figures are given on page 88—emphasises the unsatisfactory nature of the present bonus system. The Mineworkers' Federation have accepted Lord Greene's recommendation that the bonus should be transferred from a district to a pit basis, as a means of providing greater incentive, and the Government agreed, subject to acceptance by both sides of the industry. The owners' counter-proposal (as reported in *The Economist* of December 25th) is to increase the attendance bonus during the last two days of the week, making in all 10s. 6d. for a full six-day week worked, instead of the present 6s. (1s. a day would be paid for the first four days' attendance, 3s. for the fifth and 3s. 6d. for the sixth day). The present district output bonus scheme could be retained, and they suggest that the whole of the attendance bonus, now paid by the owners, should be paid from the Coal Charges Account. One of the miners' leaders, Mr Joseph Hall, of Yorkshire, has expressed himself as personally in favour of the owners' proposal, but the Federation as a whole has not made its view known. Their decision to change from a district to a pit bonus was reached on the basis of a vote taken in the districts. An attendance bonus of course bears no direct relation to output, except in so far as it would reduce absenteeism during the last two days of the week, when output tends to decline. It is not a "personal" bonus for increased output—such as would be provided by increased piecework earnings. The miners' leaders have also discussed with the Government ways and means of reducing absenteeism and improving discipline, in particular the extension of the system of voluntary fining as an alternative to prosecution in the Courts, and the speeding up of the settlement of local disputes. The miners' special delegate conference is meeting on January 27th, by which time it may be hoped that some of these matters will be positively settled.

### Housing for Pit Recruits

The controversy about whether it is better that the youths who are being directed into the mines should be billeted with miners' families or live in hostels is beside the point. If accommodation can be found in mining villages which is satisfactory and will not increase congestion in the miners' homes or add unduly to the burdens of miners' wives, then it is probably preferable that the temporary miners should live as miners, with miners, while they are in the pits. If there is a shortage of suitable billets, and there undoubtedly is in most coalfields, then the youths must live in hostels, and the Departments concerned must get on with the job of building them. Alternatively, there may be big houses in the neighbourhood which could be used, and, if so, transport will have to be arranged. Accommodation near training centres is not likely to be so hard to find as when the recruits are actually posted to work. Even so, shortage of accommodation may well slow up the rate of intake of trainees, and it is unlikely that Mr Bevin will get more than a fifth of his projected 30,000 recruits by the end of April. Most of the districts have already got plans for hostels, though building has not been begun. In Durham, two-thirds of the 3,000 recruits whom the county hopes to absorb by October are to be housed in five hostels. In Nottinghamshire, conditions are easier and miners' houses are more up-to-date. Yorkshire is planning to build twelve or thirteen hostels this year. The object of compulsory recruitment is to introduce productive workers who will help to produce more coal, and not to provide a sociological experience for a cross-section of British youth, valuable as this may be. It would, therefore, be unfortunate if the Minister of Fuel were to proceed on the basis of distributing recruits as evenly as possible between the different coalfields, so as not to offend the susceptibilities of district associations. It would be more useful to send them where the greatest contribution to production can be expected. And, in any case, it is plain that the recruitment and training of these youths, interesting and important though the process may be, cannot seriously be expected to solve the present coal problem.

### Essential Work

More than eight million workers are covered by Essential Work Orders, and on the whole the machinery has been operated smoothly, with the co-operation of most employers and workpeople. There are, however, anomalies in the Order, which lead to injustice in individual cases. A constant source of friction is the clause relating to "serious misconduct" as a reason for the dismissal of workers, otherwise forbidden; and the Trades Union Congress passed a resolution last year calling for an amendment of the Order to define this term more precisely. The TUC alleged that continual breaches by employers were left unchallenged. The case of Mr V. J. Jackson, shop stewards' convener at Desoutters, Ltd., a firm of machine-tool makers in the London area, has raised sharply the question of employers' compliance with the Order. Mr Jackson was discharged, so far as the facts are known, for placing a trade union notice on the factory notice board—an act which in the firm's opinion (nothing has been reported about Mr Jackson's previous conduct and attitude) constituted "serious misconduct." The Appeal Board upheld Mr Jackson's contention that he had been wrongfully dismissed. The National Service Officer directed the firm to reinstate him in his previous employment. Messrs Desoutters, according to Mr Bevin's statement in the House of Commons on December 1st, "maintained that they had no work to give Mr Jackson and complied with the reinstatement direction only to the extent of paying him his wages." A further notice, served on November 11th, to reinstate him was ignored. Mr Bevin then said that he had no alternative but to cancel the certificate which scheduled the firm under the Essential Work Order. Oddly, as it may seem, the work which Desoutters were doing became abruptly non-essential because of this unfortunate incident; the law must be applied. This was the first occasion on which a firm has been "descheduled" for failure to obey the National Service Officer. A statement issued by the Ministry of Labour last week reports that the Minister now contemplates prosecuting the firm. Quite apart from the fact that the firm appears to have taken the opportunity, scandalously, to discharge a worker who, as an active trade unionist, was no *persona grata* to them, Messrs Desoutters did deliberately flout the decision of the Appeal Board. On the other hand the problem of factory discipline—often not capable of

proof one way or the other by demonstrable evidence—is too important and ubiquitous for the incident to be wholly written off as one firm's unpardonable recalcitrance. If and when Mr Bevin decides to prosecute, he may well have a very strong case; but the problem, which vexes good as well as bad employers, will remain.

### Licence of Right

The latest contribution to the discussion on reform of the Patents Act is a pamphlet published by ICI entitled "Patents and Licences of Right." The object of the writer is to examine the relative merits of the exclusive patent and a wider licensing, and the conclusion reached is that

of all proposals to change the patent laws, compulsory licensing is probably the most dangerous to the effectiveness of the patent system for its intended purpose.

The argument falls into two sections of which the first is designed to show that, if cases exist in which Licences of Right ought to be granted, the position is covered by Sections 24, 27 and 38a of the Patents Act. To this there are two answers. First, the cost of putting the law in operation may be prohibitive—this appears to be admitted. Secondly, Section 27(2)(c) lays upon the Controller the task of determining whether "the demand for the patented article in the United Kingdom is not being met to an adequate extent and on reasonable terms." It has yet to be shown that there exists any means, other than the operation of competition, of determining what is in fact the elasticity of demand for an article. Certainly there is no reason to suppose that any enquiry which the Controller could be expected to make would put him in a position to give a ruling which took all important factors into account. The second part of the Pamphlet is designed to show that, under a general system of compulsory licensing, the public, industry and the inventor will all be worse off than at present. Most of the arguments advanced—and some which are not—were mentioned in articles which appeared in *The Economist* on January 16th and 23rd and May 15th of last year. Essentially the writer of the ICI pamphlet claims that, without a considerable period of monopoly exploitation after patenting, industry will not engage in research, and, if it does, will either conceal the results or fail to make use of them because the risk of loss is too high. It is to be noted that, with scarcely an exception, the statement reads as though the subject matter of patents were some article for sale to the consuming public, whereas some of the more valuable patents are those designed to cheapen production. It is surely very odd that the stress should fall in this particular manner. Surely the truth is that, under reasonably competitive conditions, industry will be compelled to research and to use the effects of research. What is required is that everybody should be free to use the results of research on payment of a reasonable fee. What the ICI pamphlet fears is that competition will lower prices and so make past investment in research and capital equipment unremunerative. What it nowhere mentions is that continuing research ought to be directed to new inventions which will reduce costs of production and so render possible a wider sale of the particular product in question. The real danger is that a period of restrictionist legislation may have so sapped the energies of the British industrialist that he is no longer prepared to exercise his proper function of risk-taking.

### Banking Profits

The results of all the English banks of which the bulk of the shares is held by the public and those of Williams Deacon's and the two Scottish banks affiliated to the Midland are now available. In every case the dividends are unchanged, but in all cases but one, the Midland, the profit is higher. There is no apparent reason why the experience of the Midland should differ from that of other banks, but a year ago its rise was smaller than that of any other of the big five, and it may be that the discrepancy is a result of a more conservative policy. In any case, the point is not worth a great deal of attention for it seems evident that the rise in disclosed profits is a large understatement of the expansion in net earnings. The actual increase is some £470,000, after all taxation, to £8,728,600 compared with an expansion of £410,000 for 1942 over 1941. A conservative calculation, based on the figures for eleven months, suggests an expansion in gross earnings of

the order of £4,000,000. Even so it is understood that the banks have not yet reached the point where they are paying EPT, so that the strengthening of hidden reserves must again have been very material. Since the profits are up and the dividends unchanged the percentage available for provisions and reserves is, of course, higher on the year.

Millions of Pounds

|                                | 1941    |          | 1942    |          | 1943    |          |
|--------------------------------|---------|----------|---------|----------|---------|----------|
|                                |         | Profit % |         | Profit % |         | Profit % |
| Published profit after all tax | 7,848.8 | ...      | 8,258.9 | ...      | 8,728.6 | ...      |
| Premises and defd. repairs...  | 410.0   | 5.2      | 460.0   | 5.6      | 760.0   | 8.7      |
| Pensions, including Widows'    | 880.0   | 11.2     | 700.0   | 8.5      | 600.0   | 6.9      |
| War Contingencies Res....      | 100.0   | 1.3      | 500.0   | 6.1      | 500.0   | 5.7      |
| Gen. and Contingencies Res.    | 1,200.0 | 15.3     | 1,300.0 | 15.7     | 1,400.0 | 16.0     |
| Dividends (net) .....          | 5,229.0 | 66.5     | 5,231.8 | 63.3     | 5,238.4 | 60.1     |
| Carry Forward (plus) .....     | 29.8    | 0.4      | 67.1    | 0.8      | 230.2   | 2.6      |

As is shown by the accompanying table, which covers the results of the big five and the two independent Lancashire banks, the District and Martins, the additional money has gone mainly to premises accounts, including provision for deferred repairs and rebuilding, while free reserves and carry forward are the next most important beneficiaries.

### Bank Share Yields

It may be recalled that the figures of *The Actuaries' Investment Index* showed a rise of some 5 per cent, from 111.7 to 117.4, in bank and discount company shares during the year 1943. The prices of all the English bank shares are now ex dividend, and it is possible to split up the general picture into its component parts. In the following table the ex dividend prices and yields on each of the shares of the seven English banks which are dealt in have been compared with the corresponding figures of a year ago. There are three classes of share to be considered: those with maximum dividends—these are all fully paid—and the partly and fully paid shares whose payments may still fluctuate. The movements are not consistent throughout, but in general the maximum dividend shares have fallen on

|               | Capital Value |       | Div. % | Price 1943 | Yield 1943 | Price 1944 | Yield 1944 |

† Maximum dividend. ‡ £12 reserve liability. \* Quotation for £1 of capital.

the year. Meanwhile the fully-paid shares have risen, but they have risen less than the partly paid. In other words, the price and yield margin between the two has narrowed. In terms of yields, the investor will now, on the average, sacrifice about 8s. per cent for the certainty that he will not be asked to put up additional capital, whereas a year ago he was prepared to forgo 9s. The average, however, makes the picture look a good deal more consistent than it really is, for, in the cases of individual banks, not only do the margins vary, but it is difficult to relate the variation to the amount of callable capital. Doubtless it represents a number of factors too complex to be easily

enumerated, but it is none the less strange that the deterrent effect of the remote possibility of a call on bank shares should be so great.

### Brazilian Aftermath

Despite reports to the contrary the agents for the Brazilian loans, with coupons dated January, have now received authority to proceed with the implementation of the agreement, and it is understood that cash payments to those who accept either of the options will shortly be forthcoming on these issues. The market has arranged to give three quotations: the first a "cum all" price for those who have accepted neither option, the other prices being based on this by deducting the net payments to be received by way of either capital or interest. The market continues weak, but so far there has not been enough business for the quotations under options "A" and "B" to have developed any independence of the basic price for the old bonds. That will doubtless come, and bondholders who can afford to go without income for the time being may be well advised to await developments. Holders have the rest of the year in which to reach a decision, and there is some reason for supposing that the present selling pressure will not continue indefinitely. Owing to the fact that the quotation and, therefore, the commission is based on the old holdings, however much these may have been written down by partial repayment, holders who have adopted option "B" are complaining of excessive charges. There is every reason for an overhaul of commission charges, but that does not mean that they would necessarily all be lowered. In this case the bonds are all to bearer, and the charges are based on the supposition that bearer bonds are easier to handle than registered. Under war conditions this is the reverse of the truth, but the commissions have not been raised. So long as the number of pieces of paper which the broker has to handle is not reduced, there is little logical justification for asking him to cut this particular commission. Meanwhile Messrs Lazard Brothers have produced a further statement, this time on the City of Nitcheroy bonds. The general arguments are now familiar, but there is the special point that the City is prosperous and well able to provide the full service of the bonds out of current revenue. Granted that the Federal authorities may still wish to prevent transfers of exchange, there appears to be no justification whatever for preventing the municipality from meeting the charge in local currency, or for insisting that the bonds of cities able to do so should be lumped in a general settlement of Federal debt.

### The Savings Record

Lord Kindersley last week brought up to date his review of the achievements of the war savings campaign. The annual record is as follows:

|             | (In million £'s)   |                    |       |
|-------------|--------------------|--------------------|-------|
|             | "Small"<br>Savings | "Large"<br>Savings | Total |
| 1940 .....  | 490                | 767                | 1,257 |
| 1941 .....  | 621                | 1,134              | 1,755 |
| 1942 .....  | 628                | 1,068              | 1,696 |
| 1943 .....  | 739                | 1,164              | 1,903 |
| Total ..... | 2,478              | 4,133              | 6,611 |

Lord Kindersley compared these savings figures with the estimated totals of wages and salaries since 1938. The figures from 1938 to 1942 are those which appeared in the official estimates of the national income and expenditure. The 1943 estimate has presumably been provided by the Central Statistical Office and thus gives an interesting preview of the figure which will appear in the next Budget White Paper. The estimates of wages and salaries are as follows:—

|            | (£ millions) |
|------------|--------------|
| 1938 ..... | 2,868        |
| 1940 ..... | 3,713        |
| 1941 ..... | 4,308        |
| 1942 ..... | 4,817        |
| 1943 ..... | 5,100        |

There is not complete affinity between these income and savings figures, since some of the savings represent the re-investment of profits and dividends, or direct bank pur-

chases. Nevertheless, the National Savings Committee is to be congratulated on the steady growth of genuine savings canalised to Government loans, especially if the size of the first cut on the national income taken by taxation and the exceptionally severe encroachment of taxation on the lower income groups are borne in mind.

### Record Diamond Sales

World sales of diamonds by the Diamond Trading Company—the selling agency for producers in Africa—reached a record in 1943. Turnover is unofficially estimated between £16 million and £20 million, compared with £10,500,000 in 1942 and the relatively low level of £4,050,000 in 1938. World production, which, according to the US Bureau of Mines, had fallen from the record level of 13,012,525 metric carats in 1940 to 9,254,200 carats in 1942, rose somewhat in 1943, although it is doubtful whether the 10 million limit has again been surpassed. This year there will be a further increase in output; apart from a planned intensification of production in the Belgian Congo and British West Africa, two of the South African gem diamond mines are producing again at a sizeable and growing rate. The reopening of the Kleinzee mine of De Beers last June was followed, in September, by the reopening of the Dutoitspan Mine, also controlled by De Beers. Late in December the directors of De Beers decided to extend operations at Dutoitspan by the introduction of a second shift as soon as sufficient labour could be obtained. The resumption of mining in South Africa—between the middle of 1940 and the middle of 1943 only some alluvial deposits were exploited in that leading gem diamond producing country—suggests that stocks of gem stones held by the selling syndicate have been substantially reduced. The value of the output of the world's diamond mines in 1942—inclusive of industrial stones—was estimated by the US Bureau of Mines at about £7,000,000, and in 1943 it does not appear to have been much higher. If these figures are correct the decline in stocks in the two years, taking 1943 sales at the lower estimate of £16 million, must have been somewhere between £10 million and £15 million. Such a reduction in syndicate stocks would, indeed, change the basic position of the diamond trade. It would enable the syndicate both to face a decline in sales after the war without a corresponding decline in current production and to make arrangements to secure all legitimate needs of industrial diamonds without at the same time endangering the position of the gem stone market. Even if world sales of diamonds in 1944 fail to reach the past year's level, they are likely to remain above the value of current production. The diamond market, therefore, appears to have reason to look into the future with considerable confidence.

### Belgium Stakes a Claim

Post-war preparations in the diamond industry are not confined to the trade in rough stones. In the cutting and polishing section of the industry all centres which have extended their activities since 1940—including the United Kingdom, the United States, Palestine, South Africa, and some smaller areas—are endeavouring to retain their new position after the war. But both Amsterdam and Antwerp, which before the war used to be responsible for over nine-tenths of the world's diamond finishing operations, hope to regain their former lead. Belgian interests, which over two years ago formed a "Correspondence Office of the Diamond Industry" with the aim of preparing the rehabilitation of the Antwerp diamond industry, recently published a report about their activities. It stressed that the Office has succeeded during the war in retarding the growth of overseas cutting and polishing centres by inducing the various authorities to limit shipments of rough stones. At the same time the syndicate has earmarked several millions of carats of rough stones, which are to be shipped to Antwerp as soon as work can be resumed there. Although only a limited section of the 25,000 Belgian diamond workers have succeeded in leaving their country since 1940, the Belgian interests are endeavouring to induce their return after the war. As the Belgian Congo is the world's largest diamond producing country—at least in terms of volume—and the Belgians appear to have made the retention of adequate stocks for Antwerp's post-war trade a condition of their maintenance of Congo production, the Belgian bargaining position is a strong one and Belgium may well succeed in its aims.

### The Clothing Ration

The basic clothing ration for the six months beginning February 1st is to be 24 coupons, the equivalent of four coupons a month. If a new set of coupons is made available on August 1st, this monthly rate will have been maintained for two years and a month. This is, without doubt, a great achievement. The clothing ration—despite the "industrial ten" coupons—presses unevenly on different sections of the population, according to individual stocks of clothing at the beginning of rationing. Unfortunately, it was administratively impossible to take personal stocks into account in fixing the ration, which has, therefore, to be maintained at a rate sufficient to clothe those people with no stocks, who cannot afford to buy clothes with lasting qualities. Inevitably, this places the more fortunate in a better position. The stabilisation of the ration for so long was scarcely to be expected at the outset. It has been maintained by strict economy in the use of material and labour, and by the concentration of the clothing industry—now nearing completion. The President of the Board of Trade declared last week that the clothing ration would be continued during the transition from war to peace conditions. Apart from the relief of Europe, the civilian clothing requirements of the demobilised Armed Forces will make the continuation of rationing absolutely necessary for a time.

### National Dock Labour Corporation

The formation of the National Dock Labour Corporation in 1939 marked an important advance in the decasualisation of the most casual industry of the country. The speech of the Chairman, Mr R. E. Garrett, at the Corpora-

tion's third annual general meeting in December shows that the scheme has been amply justified, and that the Corporation has done well both financially and operationally. It has been able to wipe out a deficit and accumulate a credit balance on its management fund and has substantially increased its reserve fund. In consequence, the Corporation has decided to discontinue the levy for the reserve fund and to reduce the normal percentage payments from 25 per cent to 12½ per cent in the case of allocated workers, and from 18½ per cent to 8 per cent in respect of weekly workers, the new rates of employers' contributions being subject to review after six months. The Corporation has extended the scope of its operations and the number of ports dealt with has increased from 32 to 59. It now covers 1,160 employers and 35,000 workers registered under the Essential Work (Dock Labour) Order. About 33,000 men are concentrated in 20 ports, but the smaller ports are difficult and costly to administer. The scheme has been extended to include coal trimmers, fish dock workers and riggers. One of the main problems has been to find sufficient labour to meet the greatly increased shipping load handled. Within the last few months a further 2,000 men have been added to the registers, but little fresh recruitment is likely. Training schemes for specialised workers have been developed. In the year ended last June, the average daily surplus of labour in the Corporation ports was 6,800; since June, it has only been 3,100. The surpluses are generally of short duration and coincide with shortages at many ports. In general the number of long distance transfers from port to port have been kept at a minimum, though the number of transfers on a daily basis have been increased and is now at the rate of 2,000 a week. It is satisfactory to learn that the rate of avoidable absenteeism has been low. In the first quarter of this year, it was 3.3 per cent of the live register,

and in the second, 2.4 per cent. This rate compares favourably with that in some other industries. On the other hand, the occurrence of unofficial strikes, which have often held up important shipments, has been a disturbing feature of the past year.

#### Merchant Bank Alliance

It has been announced this week that Arbuthnot, Latham and Company have acquired the whole of the issued share capital of John K. Gilliat and Company. Both firms are well known as merchant bankers in the truest sense of the word, with the emphasis of their activities falling as much on merchanting as on banking. Arbuthnot, Latham and Co., founded in 1833, thrived on the tea trade, but in the course of its business with India and Ceylon had, before the war, developed an important acceptance business. Gilliat's have been more interested in coffee and sisal and, therefore, with Central America and East Africa. They can trace their origin to 1786 and in 1921 merged with the firm of Wm. LeLacheur and Co., founded in 1860. The subscribed and paid up capital of Gilliat's is £190,000 and that of Arbuthnot Latham £590,000. The link up of these two institutions should prove to the advantage of all concerned. It conforms to a trend towards greater integration of the merchant banking firms of the city, which has been in evidence for some time past and which is likely to make further progress in the near future.

#### The Credit Turnover

The turnover at the Bankers' Clearing House in 1943 set up the expected high record, reaching £57,107,109,000, an increase of 17.3 per cent on the previous record made in 1942. This increase in clearings compares with an expansion of 11.3 per cent in clearing bank deposits if the average of these for the first eleven months of 1943 is taken and compared with the monthly average for 1942. This indication that the velocity of circulation of bank credit has increased between 1942 and 1943 is also borne out by the Bank of England's compilations separating clearing bank deposits into current and deposit accounts. These show that current accounts averaged £2,148 million in 1942 and £2,432 million in the first eleven months of 1943, an increase of 13.1 per cent. Deposit accounts, on the other hand, increased by 7.6 per cent only. The disparity between the increase in clearings and that in current accounts is explained in part by the fact that from July 1943 several of the provincial clearings were curtailed and part of the cheques until then cleared through them were routed through the Bankers' Clearing House at Stoke. The effect of this limitation of provincial clearing is responsible for the decrease of £312,299,000, or 21 per cent, in the aggregate of the eleven provincial clearings for 1943. The grand total of clearings—central and provincial—for the year show an increase of £8,138 million, or 16.2 per cent, on those for 1942. The adjusted evidence, therefore, still points to an increased velocity of circulation of credit.

#### Indian Railway Purchase

A further reduction of the opportunities for the British investor to participate in the development of India is imminent as a result of the negotiations for the Secretary of State for India to take over the Madras and Southern Mahratta Railway Company. The contract could be determined at the end of next year, or at any five-yearly period thereafter, and it was evident that the earliest date would be chosen. By agreement with the board, it has now been decided that, subject to the approval of the stockholders, the transfer shall take place at the end of March. The contractual payment is the guaranteed interest and share of surplus profits to the date of determination, plus par for the capital stock of £5,000,000. The offer is interest and surplus profit to March 31st, plus the capital amount plus £275,000 for the loss of 21 months' interest and profit. In recent years, the amount earned for dividend has declined considerably and this offer is almost exactly the equivalent of recent earnings, so there is no reason to suppose that the offer will not be accepted. It will permit a payment of £110 per cent in April, with some further distribution whose amount will depend mainly on costs, including tax assessments. The shareholders are being asked to provide

£5,200 for compensation for loss of office to the directors and £11,800 for similar payments to the London staff. In considering the payment likely to be received by the shareholders, it should be remembered that for some years past they have received payments of 1 per cent tax free out of reserves. Apart from the annuities, whose service is already covered, and certain debentures, the only railway stocks outstanding are £1,000,000 of South Indian Railway, repayable end 1945, and £3,000,000 of Bengal Nagpur, repayable five-years later.

#### Trade Union Membership

From data supplied by the Chief Registrar of Friendly Societies, the Ministry of Labour has compiled figures of the size of trade union membership at the end of 1942. Total membership was 7,781,000. It has only twice been higher: in 1919 it was 7,926,000, and in 1920 8,348,000. The rise between 1941 and 1942 was 9.7 per cent, as is shown in the accompanying table of the number of unions and total membership at the end of each year since 1937, taken from the *Ministry of Labour Gazette* for November. The increase in female membership was proportionately greater, at 21.4 per cent, than male membership, at 6.9, mainly due to the large numbers of women mobilised for industry during 1942. Engineering and metal industries absorbed the largest proportion of the increase in male membership, and the general labour unions in female membership. As the labour force reaches its maximum size—and if any additions can

| Year       | No. of Trade Unions | MEMBERSHIP  |           |             | Increased Membership from Previous Year |

| 1939 ..... | 1,028               | 5,258       | 975       | 6,231       | 2.9                                     |
| 1940 ..... | 1,089               | 5,460       | 1,082     | 6,542       | 5.0                                     |
| 1941 ..... | 983                 | 5,719       | 1,374     | 7,093       | 8.4                                     |
| 1942 ..... | 976                 | 6,113       | 1,668     | 7,781       | 9.7                                     |

be made, they are small—the trade unions can expect few new members from among recruits to industry. Any increase will have to be made from existing non-union workers. Since 1928 there has been a slow but steady decrease in the number of new unions. New unions are formed, but not in sufficient numbers to offset dissolutions and amalgamations. During 1942 two unions passed the 100,000 membership mark, and raised the number of unions in this class to sixteen, between them controlling 4,647,000 trade unionists, nearly 60 per cent of the total. There were eleven unions of between 50,000 and 100,000, with a membership of 846,000 between them, some of which may have overflowed into the largest class by now. If the experience after the last war is repeated, trade union membership can be expected to increase in the immediate post-war period.

## NATURAL v. SYNTHETIC

### A Controversy Among the Nutritional Experts Which is Being Resolved by Wartime Experience

A QUIET and gentlemanly controversy has been going on in laboratories, medical societies, and hospitals between two schools of scientific thought in the field of dietetics. If these two schools were football teams, one might be called the "Naturals"; the other, the "Synthetics."

Both sides are agreed on the vital need for an adequate supply in the national dietary of the protective food factors (vitamins). Moreover, neither side disputes the fact that the food we eat is often lacking in an adequate quantity of them for one reason or another.

Sometimes the vitamins have been destroyed in the refinement of food: white bread, in which the B vitamins have been largely milled out of the flour, is an example. Cooking often reduces the potency of vitamins. Time is an enemy of the vitamins: transport and storage account for a serious reduction in the vitamin content. Vitamin-bearing foods themselves vary in their potency. And on top of all this there is the

fact that an uninformed choice of food may deprive the family of an adequate vitamin supply.

#### TWO VIEWS

Where the two schools of thought do split is on the question of how to correct the vitamin deficiency in the post-war world.

The "Natural" school says: Don't refine foods; prohibit the milling of white flour. Educate the public to choose the right foods; to eat raw vegetables and fruit; to cook properly. Speed up distribution from grower to consumer. Provide plenty: in a world free from want there will be no vitamin shortage.

The "Synthetic" school, on the other hand, says: Let us do everything we can along these lines, but let us recognize, too, that this cannot be done in a short space of time and that the average person may not willingly consume enough of the right foods to give him the necessary natural vitamins. Therefore, fortify his food with vitamins made by man.

The opponents of this course are agreed that vitamins synthesized in a laboratory and mass-produced in a fine-chemical plant are the very same thing as the same vitamins synthesized by nature. Once the chemical formula of a natural vitamin has been discovered by isolation and analysis, there is usually no insurmountable difficulty in reproducing an identical vitamin in unlimited quantities. Nor can the "Natural" school deny that

synthesized vitamins are uniform and, in the form in which they are distributed, stable; and that they can be added in definite quantities.

Even so, the "Naturals" contend, it is safer to trust Mother Nature. If you substitute synthesized vitamins for the known natural ones, how can you be sure that there may not be undiscovered qualities natural to the food that you are not making good by supplying the known missing factors only? Not long ago, Vitamin B<sub>1</sub> (or B, as it was then called) was the only vitamin known to be

BLUE-PRINT OF A VITAMIN: A wooden model representing the chemical formula of Vitamin C (L-ascorbic acid), a water-soluble, crystalline substance. This formula is, of course, exactly the same whether for natural or synthesized Vitamin C. The two are identical.

affected by the milling of white flour; since then, the B Complex has been discovered, and it is now realized that some of the other vitamins of this complex are also partly milled out of the grain.

#### COMPROMISE

Granted, answer the "Synthetics." Let us not by any means abandon natural food. But let us at the same time, for safety's sake, supplement the diet of the people with synthesized vitamins; let us fortify or "enrich" our natural food. And when the natural food is difficult or impossible to provide, let us not despise our knowledge because it is limited; let us supply the known vitamins at least! This was done at Tobruk when fruit and vegetables were lacking; if it could have been done at Kut in 1916, many brave lives would have been saved from the dread diseases, scurvy and beri-beri.

This line of reasoning has pretty well won over the "Natural" school. They may prefer that the starving children of the occupied countries of Europe should get their Vitamin A from butter and fish, their Vitamin B from wholemeal bread, their Vitamin C from green vegetables and fruits, their Vitamin D from cod-liver oil. But they are at the same time glad to know that the children will at first get a life-saving supply of all four out of one block of "vitaminized" chocolate.

## LIGHTING SERVICE

A worker's output depends upon his ability to work well and that depends upon his ability to see well.

Lighting is an essential service in every industry, a service which can add to the efficient working of the whole plant if it is well planned to suit the needs of all the workers. It has been proved that good lighting pays, but it has also become well established that it requires skill and knowledge to plan good lighting.

That is a service offered you by Benjamin. For over thirty-five years Benjamin have been engaged in the provision of industrial lighting equipment, not only have they seen the many innovations in lighting technique, but Benjamin laboratories and Benjamin engineers have taken part in the pioneer work and have led the way in many developments.

To-day and in the approaching post-war period, a wide range of equipment and of methods are available; the best lighting is vastly improved since even recent years, and the Benjamin organisation is fully equipped and ready to help you to fit your lighting to the needs of your production.

### COMPANY MEETINGS

## FIRST GARDEN CITY, LIMITED

### THE POST-WAR HOUSING PROGRAMME

### SUCCESS OF LETCHWORTH EXPERIMENT

### SIR ERIC MACFADYEN'S VIEWS

The fortieth ordinary general meeting of the First Garden City, Limited, was held, on the thirteenth instant, at the Great Northern Hotel, King's Cross, London, N., Sir Eric Macfadyen, M.A., J.P. (chairman of the company), presiding.

The chairman said: Ladies and gentlemen,—Turning to the balance-sheet, the audited capital remains at £250,000 in ordinary and £150,000 in preference shares. Loan capital is higher at £962,299. The total of sundry creditors is on balance little altered at £136,799. Only two other items call for comment on the liabilities side of the balance-sheet—depreciation and renewals account is up from £387,355 to £424,487 and the reserve for contingencies is brought up to £17,158 by an appropriation from profit and loss account. The magnitude of our operations is continually expanding and our reserves must be augmented from time to time. On the present occasion your directors consider that an addition of £10,000 to contingencies reserve is called for. On the other side of the balance-sheet, fixed assets now stand at £1,853,910 compared with £1,727,358 a year ago. Sundry debtors and loans are rather down, while sinking fund policies are up by a roughly similar amount.

The profit available for appropriation is £24,461 against £19,495, and we have further available £8,300 released from taxation account owing to the settlement of questions which had been outstanding between the company and the revenue. The payment of the 5 per cent. dividend to which you have so long been accustomed and the appropriation to contingencies reserve to which I have already alluded will leave the carry forward appreciably higher at £31,327. I think you will agree that, having regard to the difficulties created by present conditions, and to heavily increased expenses, this is a satisfactory result. We are looking forward eagerly to the extension and improvement of the town when opportunity offers and are husbanding our resources with that in view.

### POST-WAR DEVELOPMENT

The Ministry of Health forecast a post-war housing programme of some 4,000,000 houses, and Lord Portal has envisaged a post-war labour force of a million and a quarter in the building industry. With up-to-date methods of construction the industry, so expanded, should be equal to delivering 400,000 houses per annum in addition to the other demands it will have to meet.

We may consequently anticipate that within a decade the face of the limited land we live in will largely be settled for some generations. Local authorities, including our friends of the Letchworth U.D.C., have received instructions to be ready for immediate action and are planning their housing programmes. They are doing so without guidance in terms of any constructive and comprehensive central policy, in the absence of which it is already apparent that we shall witness a new outbreak of the uncoordinated development which, in the past, has brought in its train so much social confusion and economic waste.

### CORRELATION OF HOUSING AND INDUSTRY

The lines along which our physical reorganisation should proceed have been exhaustively explored—the need to correlate the housing of the people with the

siting of industry; to check further aggregation where industry is already over-concentrated; to diversify the activities of existing single-purpose urban complexes; and to divert a proportion of both industry and population into smaller towns which, by-passed by the coal and railway age, are to-day qualified, thanks to modern road transport and the dispersal of electric power, to resume their place in the main stream of the national effort. In economic efficiency the country has as much to gain from orderly integration of its industrial assets as has an old-established industrial plant from conversion to a modern streamlined lay-out.

To any such reorganisation of the productive resources of the nation an important contribution will be made by the completely new industrial centre, designed, *ab initio* for a rational balance of population and industry. Letchworth, the freehold of which is owned by our company, was started and has consistently been developed as an experiment in the establishment of just such a town. Although the earliest, it is not, of course, the only pattern of the kind; but its experience is of special interest because its success, in the face of very slender original resources, provides the more convincing evidence of the soundness of the underlying principle. As a pioneer, Letchworth has had plenty of difficulties, and has not altogether avoided mistakes; but that it is a success there is no question.

### A NEW INDUSTRIAL TOWN

The town of Letchworth was designed for a population of 35,000. It covers at present about one-third of the 4,562 acres owned by the company; when it reaches maturity the remaining land will be reserved for agriculture in perpetuity. Starting operations before the earliest town-planning legislation, the company had no choice but to acquire the ownership of its own "green belt" in order to anticipate the land speculator. It could then ill-afford to do so; but we have had abundant reason to congratulate ourselves on the foresight in this respect of the original projectors.

The land is well farmed; the farms gain much from the market provided by the town; and the preservation of the countryside is one of the town's greatest assets. No part of the town has more than 12 houses to the acre; every house has its garden; and it is interesting to find that the gardens rival the farms in food production. One-seventh of the built-up area is occupied by recreation grounds, football and cricket fields, tennis courts, bathing pools, parks, a pleasant golf course, etc., and no house is a mile from open fields. The factory areas are compact and grouped round the power station and gasworks and the railway sidings. The residential areas are handy but segregated. People walk or cycle to their day's work; everyone living in Letchworth can go home to his dinner. There are trees and lawns everywhere. Even factory entrances have flower beds.

### AMENITIES OFFERED

The town at present accommodates about 22,000 people. It was growing rapidly before the war, and once we are able to resume development it will not be very long before we reach the 35,000 aimed at. It is an industrial town—but with a difference. It comprises 4,939 houses or, as I prefer to say, homes, 192 shops, four hotels, 216 factories and workshops, 15 places of worship, seven elementary and

three secondary schools, two cinemas, a theatre, a hospital, a maternity home, a public library, a public museum and so on. Its industries are the typically modern ones: they tend to expand. The company facilitates actively the establishment of new undertakings. Local administration for more than 20 years has been in the hands of a progressive Urban District Council. Its vital statistics are noteworthy—the more so at a time when population trends are a subject of general interest. For 1942 the birthrate was 16.6 per mille as against 15.8 for England and Wales urban and rural. The death rate was 9.06 against 11.6. The infant mortality rate (perhaps the most sensitive of demographic barometers) was the astonishingly low one of 14 per thousand live births, against 49. There has been no maternal death at childbirth since 1931.

The company lets land for buildings on a standard lease for 99 years, or in selected cases 999 years, with covenants conforming to our general objects. House building has been carried out by private enterprise, by the U.D.C., and by housing societies. More than half the homes of Letchworth have been erected with no subsidy: a result facilitated by the low ground rents. The demand for public utilities has been met by the company, which supplies power, gas, water and other services, and which constructed the original roads, sewers, etc., in the days before the U.D.C. was constituted.

### LESSONS OF LETCHWORTH

Our issued capital was at the outset £98,403, and even to-day is only £400,000 (in ordinary and preference shares), and as our fixed assets now stand in our balance-sheet in the neighbourhood of two million pounds, it will be obvious that finance has presented some problems. The company was engaged on what, to many wise heads, appeared a somewhat visionary project, and its future for a time looked precarious. Earnings for a good many years had to be ploughed back into the business and money borrowed at what, viewed in the light of the credit standing the company now enjoys, after paying annual dividends of 5 per cent. for more than 20 years, seem burdensome rates. With our experience behind us, I have no hesitation in saying that a similar project, which could count on the backing of public credit in one form or another, could be carried to fruition in a quarter of the time over which our experiment has extended; and that under skilled control completely new towns of thirty to fifty or sixty thousand inhabitants can be planted in the country, and to the great benefit of the countryside, on a self-liquidating basis as regards finance: towns which will furnish every facility for modern industry and offer conditions of life for the workers which will amount to a social revolution.

And may I add this on the strength not only of our own but of other later experiments in town-building? There is no question of life in such a town being dull and restricted. The corporate existence of a place like Letchworth is marked by vigour, public spirit, and independence. It has its own tradition. It tends to become a place in which people generally take their share in common activities, instead of merely looking on at them. Cultural, educational, recreational needs can be amply cared for in a place of quite moderate size, and the amenities of modern life can be more freely provided than in the unplanned chaotic industrial town. From the social point of view it should be a prime object of policy at this stage to promote and facilitate the free development of new towns of moderate size by local regional or central authorities, by the great municipalities, and by specifically authorised associations. From the economic point of view, there being no waste of capital, the new town is the most paying proposition in rehousing and the dispersal of industry.

The report and accounts were adopted and the retiring directors re-elected.

# UNION BANK OF AUSTRALIA, LIMITED

## DIVIDEND OF 6 PER CENT.

The annual general meeting of the Union Bank of Australia, Limited, will be held, on the 31st instant, at 71, Cornhill, London.

The following is an extract from the statement of the chairman, Major-General Sir John H. Davidson, K.C.M.G., C.B., D.S.O., circulated with the report and accounts:

Since my review of a year ago the war situation in the South-West Pacific has appreciably changed for the better. In

Australia the 1942-43 wool clip totalled approximately 3½ million bales. The wheat harvest yielded about 156 million bushels. Seasonal conditions have been somewhat variable. In New Zealand the wool clip amounted to approximately 962,000 bales, compared with 986,000 for the previous season. Seasonal conditions generally were only fair.

In the balance-sheet, the item deposits, bills payable, etc., calls for comment. An increase of about £8½ million is shown, mainly in demand deposits, and is almost entirely due to expansion of credit brought about by increased Government expenditure and the depletion of stocks for civil consumption. The increase in our deposits' funds is reflected in our larger holdings of Treasury bills and public securities,

each more by some £2,000,000, and by the substantial increase of over £5,000,000 in the special wartime deposit with the Commonwealth Bank of Australia. With those items totalling some £29,000,000, it will be seen that the abnormally high degree of liquidity to which I referred last year has been accentuated. Loans, advances, etc., show a small increase, and this may be regarded as satisfactory in view of Government restrictions on loans to the public.

Gross profits total £1,451,795, a decrease of £48,932. Expenses under all heads are down. The net profit is £173,144 (last year £174,068). The interim dividend was 2½ per cent., less tax, and we have declared a final dividend of 3½ per cent., less tax.

# RECORDS and STATISTICS

## INDUSTRY AND TRADE

**Coal Output.**—The output of saleable coal in the four weeks ended December 25th averaged 3,662,600 tons, compared with 3,815,100 tons per week in the previous four weeks.

## AVERAGE WEEKLY OUTPUT OF COAL (Weekly Standard Tonnage 4,161,800 tons)

| Four Weeks ended* | 1941 tons | 1942 tons | Four Weeks ended* | 1942 tons | 1943 tons |

| April 17th        | 3,739,800 | 4,005,200 | Nov. 27th         | 4,126,600 | 3,815,000 |
| May 15th          | 4,103,900 | 3,624,600 | Dec. 25th         | 3,880,100 | 3,662,600 |
| June 12th         | 3,724,800 | 3,936,600 |                   |           |           |

\* The actual dates given relate to 1942 and 1943.

The production from opencast workings averaged 86,613 tons per week. During the previous four weeks, an average of 107,400 tons per week was produced. Only Leicestershire qualifies for the output bonus.

**Retail Trade.**—The index (1937 = 100) of the average value of daily sales fell from 109 in October, 1943, to 106 in November, according to the retail trade report published in the *Board of Trade Journal* for January 8, 1944. The greatest fall was in apparel sales, from 104 to 88; this is 12 points below the average for the year ending October, 1943. There was a rise only in the food and perishables category.

## FINANCE AND BANKING

**THE MONEY MARKET.**—Although the banks have had substantial transfers of tax money to make to the Exchequer this week, credit has remained in ample supply. The position has been helped by the £10,000,000 excess of Treasury bill maturities over payments. Treasury Deposit Receipt payments, amounting to £40,000,000 have been approximately balanced by the effective maturities. The Bank return provides ample explanation of the prevailing ease. The cash basis is still considerably extended, and the year-end inflation of this item has not as yet been corrected. Bankers' deposits last Wednesday totalled £188,216,000, showing an increase of £4,162,000 on the week. There was a net return of £8,634,000 of notes from circulation, and this partly explains the increase in bankers' deposits, though it should be noted that a contraction of £7,116,000 in Government securities accompanied the reflux of notes and largely neutralised its impact on bank cash. Open market sales of securities have not been in evidence this week, though on the evidence of the Bank return they would not have come amiss. The position should, however, be largely corrected by the heavy tax transfers made towards the close of this week.

**MONEY RATES, LONDON.**—The following rates remained unchanged between Jan. 7th and Jan. 13th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¼%; 6 months, 1½-1¼%. Treasury Bills: 2 months, 1-1¼%; 3 months, 1-1¼%. Day-to-day money, 1-1¼%. Short Loans, 1-1¼%. Bank deposit rates 1%. Discount deposit at call ½%; at notice 1%.

**Exchange Rates.**—The following rates fixed by the Bank of England remained unchanged between Jan. 7th and Jan. 13th. (Figures in brackets are par of exchange.)

United States. \$ (4-8½) 4-02½-03½; mail transfers 4-02½-03½. Canada. \$ (4-8½) 4-43-47; mail transfers 4-43-47. Switzerland. Francs (25-22½) 17-50-40. Sweden. Krona (18-150) T.T. 16-85-95. Dutch West Indies. Florin (12-11) 7-58-62. Portugal. Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. Panama. 54-02-04; mail transfers 4-02-04½. Brazil. 83-64½ cr. (buying). Uruguay. 7-6597 p. (buying).

**Fixed Rates for Payment at Bank of England for Clearing Offices.** Spain. Peseta 40-50 (Official rate). Turkey. Piastres 520. Italy. 71-25 lire.

**Market Rates.**—The following rates remained unchanged between Jan. 7th and Jan. 13th:

## GOVERNMENT RETURNS

For the 8 days ended Jan. 8, 1944, total ordinary revenue was £87,216,000, against ordinary expenditure of £143,324,000, and issues to sinking funds of £261,384. Thus, including sinking fund allocations of £10,257,119, the deficit accrued since April 1st is £2,455,175,000 against £2,354,120,000 for the corresponding period a year ago.

A charge has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £466,832 to £3,496,059, the other operations for the week (no longer shown separately) raised the gross National Debt by £46,011,530 to £19,292 million.

the removal of named members of the Polish Government naturally lead to fears that the "strong and independent" Poland that Moscow desires will turn out to be nothing but a Soviet Poland. (The representative character of the Polish Government is discussed in a Note on page 100.)

These mutual suspicions, to repeat, are only too natural. The prospect of a satisfactory issue thus turns on the efforts that each country will make to fight down its distrust. The basis of suspicion is fear, and there can be no question that the Russians have far less to fear than the Poles. They possess overwhelming strength; their armies are advancing victoriously across territory that was Polish; nothing that this or any other Polish Government could do in isolation could interfere seriously with any plan the Soviet Union might have for a settlement in

Poland; with the defeat of Germany there will be no other Great Power in the world with either the desire or the ability to take any action in that area. Beyond question the Russians should have shown the greater willingness to conciliate, to allay fears, to display magnanimity. But it is the Poles, in the recent phases of the dispute, who have behaved with moderation—what better proof could there be than the willingness to discuss the cession of a third of the national territory?—while the Russians

have based the most sweeping actions on the smallest pretexts, and if they have offered any concessions, it has been only to snatch them away. Only men determined to take offence could have twisted the Polish statement of January 14th to mean a rejection of the Curzon Line. It is not pleasant to record these judgments—on the contrary, it is most painful—but none other is consistent with the truth.

It is difficult to see what can be done next. The Russian attitude will only strengthen the influence of the intransigents among the Poles, whereas the opening of negotiations would have led almost automatically to the exclusion or self-exclusion of the anti-Soviet elements. The ascendancy of the intransigents may well be taken by the Russians—though they will themselves have brought it about—as proof of their contention. The British and American authorities are clutching at the word "official" in the Soviet statement—"the Soviet Government is not in a position to enter into official negotiations with [the Polish] Government"—and they are pinning their hopes to the possibility of bringing the two sides together unofficially and without publicity.

But will American and British mediation be accepted? The Polish statement of January 14th was known to be favourably regarded by the British Government, and its summary rejection must be read as a rebuff to others as well as the Poles. The publication in *Pravda* of the astonishing allegation that high British officials had been negotiating "not without result" with Ribbentrop for a separate peace is another straw in the wind. Added together, the Russian reply and the Russian *canard* look very much like a war of nerves against Britain and America on the eve of the Second Front.

It would be incorrect—or at least uncharitable—to ascribe this attitude to any weakening in the basic Russian attachment to the alliance of the United Nations. Their purpose, no doubt, is to insist on a free hand for themselves in the eastern settlement, in return, presumably, for a free hand for the democracies in the western settlement. If this is so, then there is a misunderstanding to be cleared up. No interests of Britain or America are involved in the location of the frontier between Russia and Poland. But they are vitally concerned with the methods by which the settlement is reached. Nor is this merely a punctilious insistence on the diplomatic proprieties. It arises from the belief that no nation can be dictated to by another without harm to the fabric of world peace. British and American adherence to this principle has not, in the past, been unwavering; but nothing has been more conclusively proved by events than that "peace is indivisible." Without acceptance of this principle, the hopes, so widely based on the Teheran Conference, that a solid peace could be constructed upon an American-British-Russian basis will turn out to be mere delusions.

#### The Principles of Trade—IV

## The Multilateral Approach

THE point at which the argument of this series of articles has arrived may now usefully be summarised. It has been argued that there is nothing in the circumstances of the modern world which substantially diminishes either the necessity or the desirability of reliance by the British community on international trade. The two new factors—the severe disequilibrium in the nations' accounts which will be left by the war, and the concentration of national economic policies upon the attainment of full employment—in no way contradict the desire to have a large and increasing volume of international trade. On the contrary, it is only within a framework of flourishing international trade that either one of these problems can be satisfactorily solved. On the other hand, neither one is likely to be solved, or even advanced towards a solution, merely by a return to the "orthodox" state of affairs in which trade was either free or, if interfered with at all, was not planned as a whole.

Whatever else may solve the problem of the balance of payments of the United Kingdom, the United States and other countries, leaving it alone will certainly not. Full employment requires that any limping balance of payments shall be cured by lengthening the short leg, not by shortening the long leg, and this, to judge by past experience, is most unlikely to happen in an uncontrolled system. Some degree of purposive direction of international trade is necessary.

This is an important preliminary conclusion. But it leads at once to a further question. Should and can this purposive direction be aimed at the reconstruction and maintenance of a universal system of trade, one that is world-wide, one in which all countries are treated with substantial equality, one in which there is the fullest scope for three-cornered, four-cornered and multilateral trade? Or does the purposive direction of international trade necessarily involve a recourse to discriminating,

regional and bilateral arrangements? If a nation starts to plan its international transactions, will it find that they have to be planned separately in relation to every other country in the world, or will some overall direction, leaving room for freedom and elasticity, be enough? The present article is intended to discuss these questions.

#### Advantages of Multilateral Trade

There is no room for doubt about which answer should be hoped for. Both in general and also more particularly for a country in the position of Great Britain, a world-wide, multilateral system, if it can be attained is very much to be preferred to a system of barter, or of restricted bargains. Only if, in the particular circumstances, some alternative would produce a larger volume of balanced trade should it be considered. There are three main reasons for this preference.

First, the benefits to be derived from exchange, reposing as they do upon the international division of labour, are obviously greater, other things being equal, the wider is the range of trade. Any limitation of the possibilities of exchange excludes some transactions which could bring benefit to both parties. The extent to which world trade is multilateral has, perhaps, been exaggerated. But it is certainly true that the reconstruction of British foreign trade will start under a grave handicap if it cannot follow the natural channels of exchange wherever they lead. British trade, admittedly, must operate on a basis of paying for what is bought. But if we have to pay each country individually for what we buy from it, the difficulties will be much greater.

Secondly, bilateral arrangements, or anything short of universality, necessarily involve the authorities in fairly close and intimate control of specific transactions. This is objectionable, in part because of the much greater apparatus of administrative supervision that is needed, with all the delay and frustration involved, but also for a more important reason. The great danger in any system of purposive direction is lest, however good the intentions may be at the outset of working for an expansion of trade and of ensuring only the common interest, it may in fact work out to be restrictive in operation and more oliticous of sectional interests against the community than of the general good. Any system of control over foreign trade which operates case by case, or even class by class, runs this danger, which is mortal. If the object of intervention by the state is to maintain a universal system, the danger is reduced to a minimum. If the object is to operate a system into which any element of discrimination enters, the danger is at a maximum.

The third and final reason for preferring a universal system is that it is the solution on which American official policy, and a large and most responsible section of American opinion, have set their hearts. It is true that such a policy serves American interests, at this juncture, more than British. It is also true that American

expositions of the doctrine allow for those departures from it that are in fact practised by the United States and prohibit those that are practised by other countries. But British opinion, which has for so long dominated both the principles and the practice of international trading, can hardly complain of such eminently Anglo-Saxon foibles. And the general desirability, on the highest and widest grounds, of a concert of doctrines between Britain and America would be enough by itself to dictate a preference for that solution which would meet the desires of both countries.

If, then, there is to be purposive direction of international trade, it should, so far as possible, be planned multilaterally.

But how far is this possible? The chief defect of an uncontrolled system is its tendency, especially combined with the gold standard or any other closely cohering currency system, to secure the necessary balancing of trade by cutting down what is excessive. The chief purpose of a directed multilateral system should be to ensure that any balancing is secured by balancing upwards what is deficient. If that could be achieved, international trade would be making its best contribution to the attainment of full employment. And if the general tendency of international trade is upwards, the particular embarrassments of the pound sterling and of other currencies can be expected to disappear. The problem is one of amending the existing peacetime system in such a way that it will tend to secure balance by increasing trade, not by cutting it down.

#### Keynes and White Plans

This aim was very clearly in the minds of the draftsmen of both the British and American currency plans. Their purpose was to remove from a debtor country the pressure of an immediate necessity to secure balance between income and outgo by restricting outgo. The acceptance of either plan, or of an amalgam of the two, would undoubtedly be a step in the right direction. But it would not be a very long step. All that either plan purports to do is to postpone the necessity of restriction for a short time, in the hope that it will disappear. But if the necessity for restriction does not disappear, the plans, so far from removing it, are at pains to enforce it. A country which persistently runs a deficit in its international accounts can draw on its quota only for a limited time. Thereafter—under both schemes—it must take such steps to balance its accounts as the international authority prescribes. And these steps are almost of necessity restrictionist, for almost all of the things that a deficit country can do, of its own motion, are various forms of cutting down its purchases. The one possible exception is exchange depreciation which, in some circumstances (but in those circumstances only), can enlarge the trade of the country applying it; and may even conceivably result in a net increase in the trade of all countries. But the Keynes

1844—1944

Entering our Centenary Year we extend greetings to our Policyholders and Agents confident in the hope that peaceful and happier times will soon be with us again

Plan very severely limits the amount of exchange depreciation that is permissible, and the White Plan, for all practical purposes, prohibits it altogether.

It is true that both plans speak of bringing pressure to bear, not only on the deficit countries, but also on the surplus countries, and that corrective measures undertaken by a surplus country *might* be of an expansionist, rather than of a contractionist, nature. But the nature of the pressure to be exercised by the world authority on a surplus country, as described in either plan, was very mild, and it is difficult to treat it as more than a pious hope. There is the germ of a truly expansionist scheme in the provision of the original Keynes Plan whereby the Clearing Union might create *bancor*, over and above the trading surpluses and deficits of its members, but this line of thought (barely hinted at in any case) is not likely to find favour in America.

#### Development Loans

It has, however, been made clear that the currency plans are to be regarded as only one part of a wider scheme, to be completed by arrangements for international lending on a large scale and for the holding of large buffer stocks of standard raw materials. It could be argued that, though a currency scheme by itself can only postpone, and not reverse, the need for cutting down, these further projects will secure the aim.

Here again, the answer must be that anything achieved by these schemes will be of assistance, but that it is very difficult to believe that they will go far enough to resolve the difficulty. The magnitude of the problem should be borne in mind. Even after British exports have regained their pre-war volume, there is likely still to be a gap of at least £250 million (or \$1 billion) on the credit side of the British account—or still more if the value of money is lower than it was in 1938. The gap in the American accounts, though on the debit side, is likely to be still larger. There will be many other deficit countries and several other surplus countries. If these gaps are to be closed by loans, the scale of international lending will have to be very large indeed.

Furthermore, the loans would have to be much larger than the gaps to be filled. The only way in which large and continuing loans can be justified, either economically or politically, is by granting them for the development of backward areas. But it may not be the backward areas that have gaps in their international accounts. Great Britain, for example, is hardly to be classed as a backward area—at least not yet. It is true that a loan granted, say, by America to China would, in a multilateral world,

seep round the world and bring some benefit to Britain, but a great deal of it would be lost on the way. Moreover, a loan relieves the exchange problem only to the extent that it is *not* spent on additional exports from the country making the loan—a proviso that is likely to be most unwelcome to the politicians. By the time allowance has been made for these factors, it might take something like £4 of international development loan to do £1 worth of good to the basic problem of balancing the deficit countries' accounts. And finally, loans—unless the word is to be a euphemism for charity—can never be a permanent solution. Interest has to be paid on them and in due course they have to be repaid. The world has tried once before to buttress a limping multilateral system by means of loans, and the results do not encourage a repetition of the experiment, especially since it would have to be on so much larger a scale.

Much the same arguments apply to the proposed international commodity scheme. If the very great practical difficulties can be solved, such a scheme would be worth while for its own sake. If the finance for it could be drawn from countries with a surplus in their international accounts or as hinted in the Keynes Plan, by the creation of international credit, it would help towards a solution of the problems of international currency and trade. But, even in the most favourable circumstances, the magnitude of the assistance given (except perhaps in the first period of building up the official stocks) would probably be small, and there is no assurance that it would be directed to the countries which, on currency grounds, would need it.

The conclusion of this section of the argument must therefore be that none of the schemes that have been authoritatively propounded seem likely, even in combination, to be large enough to serve the purpose. Moreover, from what is known or can be inferred of the discussions that have been proceeding in Washington, it would appear that the expansionary elements in these proposals have been somewhat whittled down, and that it is the much more rigid and orthodox views of the United States Government that are prevailing. If so, it is even less likely that the element of management that is to be injected into the multilateral system of world trade will be sufficient to make it serve the purposes either of full employment within countries or of expanding balanced trade between them.

The next step will be to enquire whether there are any other means, going beyond those hitherto under official discussion, whereby a multilateral system could be purged of its sin of contraction. This will be the subject of the next article.

## The Post Office

WHATEVER surprises this year's Budget may have in store, it seems improbable that there will be any increase in postage rates. The public in wartime is paying what would normally be regarded as excessive rates for its correspondence, and, like other wartime impositions, the increased charges have been accepted with good grace. A table on p. 132 shows the volume of Post Office business in the past two years, compared with 1938-39. The increased postage rates, introduced in 1940, seem to have made surprisingly little difference to the number of letters written; 6,270 million letters were carried in 1942-43, compared with 8,150 million in 1938-39. At the same time the value of the Post Office's transactions with the public have been doubled (it rose from £1,062 million in 1938-39 to £2,138 million in 1942-43), while the Post Office surplus increased from £10,255,000 in 1938-39 to £26,274,000 in 1942-43.

The Post Office provides a steady and convenient source of revenue for the Exchequer, and, from the point of view of a nation at war, there can be no valid objection to this form of taxation. But for a nation at peace to use the Post Office primarily as a revenue-producing department would amount to applying a clumsy and re-

gressive method of taxation. The Bridgeman Committee on the Post Office in 1932 deprecated a growing tendency to regard it mainly as a source of revenue, which impeded its prime function of serving the public. Cheapness of communication is of vital importance in a progressive and expanding economy. Any loss of revenue which might result from a reduction of postal rates is likely to be more than offset by the encouragement given to trade.

A parallel may be drawn from history. When Rowland Hill first proposed penny postage, a century ago, he was violently criticised on the grounds of the loss of national revenue. The Postmaster-General, the Earl of Lichfield, declared in the House of Lords:

Of all the wild and visionary schemes I have ever heard or read of, it is the most extraordinary.

But there was a tremendous response from the public to the proposal to substitute cheaper carriage and uniform charges for the exorbitant rates and inefficient methods then prevailing. Two hundred petitions were laid before the Speaker, and a deputation of 150 Members of Parliament went to Lord Melbourne, the Prime Minister. The Government was forced to give way, and the penny post became general in 1840. *The Economist*, in its first year,

blessed Rowland Hill, and described the benefits resulting from his invention:

The penny postage suggests manifold feelings of the deepest interest—of increased business and increased intercourse between thousands who only a year ago were too poor to spare even their pence for letters . . . the increased circulation of literature and science; increase, in short, of all that contributes to the social, moral and physical happiness of our country, or to the pleasures and blandishment of private life.

When the revenue of the Post Office dropped from £1 million to £500,000 after one year of penny postage, the critics thought their forebodings more than justified, and Rowland Hill was temporarily disgraced. But after a very short time, the increased traffic vindicated the scheme, and a century of Post Office development has shown the wisdom of the early reform.

The Post Office in 1944 is a very different undertaking from the organisation whose foundations were laid by Rowland Hill. It is by far the largest branch of the civil service, employing about 300,000 people. The Bridgeman Committee described it as "the largest trading organisation in the country." Its functions extend far beyond the carriage of mail, though postal services still represented some 50 per cent of its revenue before the war. The telephone and telegraph services, postal and money orders, the inspection of wireless and wireless licences, the payment of old age pensions, and the collection of contributions not only for these but also for national health insurance and unemployment insurance, are all a part of its multifarious routine business. The war has added many activities to the list. The Post Office has helped in the distribution of ration books and identity cards; it has often had to act as a kind of advice and information bureau, and there has been a tremendous increase in war pensions, service and billeting allowances, and in savings business. The number of telephone calls, in spite of appeals to the public to "use the phone less," has increased, mainly as a result of extended Government and industrial activity, and so has the number of telegrams. The only branch which has declined is the postal order business, the number having dropped by nearly a third, with the decline of football pools.

At the same time the war has created many organisational difficulties for the Post Office. One out of every three of its employees is serving in the Forces, and the places of skilled men have been filled by inexperienced, or part-time, workers. Women now represent nearly half the total number of its employees. The organisation has shown an adaptability to war conditions not generally associated with public concerns. Its record during the air raids, when telephone cables had to be repaired overnight and communications rapidly restored, was highly creditable. The introduction of the airgraph service is an example of public enterprise, and also of its successful marriage with private enterprise. Kodak, Ltd., is responsible for the technical arrangements of the service, and the GPO for its organisation. Since airgraphs were first introduced as a tentative experiment in April, 1941, to enable troops in the Middle East to send messages home, about 180 million messages have been sent to and from this country.

The Post Office, in common with other organisations, both public and private, is beginning to think about the future and how to adapt itself to the needs of a peacetime economy. There should be plenty of scope for development and for the fulfilment of plans interrupted by the war. For instance, there might be a rapid extension and cheapening of telephone facilities. Britain stands only ninth in the list of countries, with 5.4 telephones per 100 inhabitants, against 13.7 for the United States and 11 for Canada. The telephone is regarded as a luxury by most working-class people, and with apprehension by many. But the elasticity of demand for the service is shown by the fact that when the night trunk calls maximum of 1s. for any distance was introduced in 1934, the number of such calls increased by 169 per cent. The Post Office can play a valuable part in breaking down the isolation of country districts by developing rural communica-

tions. There might well be further development of automatic exchanges—about 70 per cent of London exchanges are automatic—with a saving of time and temper, as subscribers to the remaining manual exchanges in London will testify. Even on the automatic exchanges, the technical efficiency of the service before the war was very much less than in the United States and in several European countries. Another field for development is in air mail services. The improvements in facilities and the progressive cheapening of rates before the war brought about an increase in the number of air mail letters carried from just half a million in 1927 to 19 million in 1936. A revision of the regulations concerning the posting of newspapers and periodicals is long overdue. The existing regulations impose unnecessary and old-fashioned restrictions upon format. The convenience of publishers, of subscribers, and (almost certainly) of the Post Office itself, would be served if newspapers and magazines could be posted flat and unwrapped, with the address stencilled on the margin of the paper itself, as in America. The mechanism of the Post Office Savings Bank might well be made less cumbersome, and there is also an obvious field of activity for the Post Office as a paying and receiving agency in connection with extended schemes of social security. It might, indeed, become a general purpose department for detailed contact between the state and its citizens.

The Post Office, on the whole, has a reputation for efficiency, but the needs of postwar communications will call for improvements in its organisation and methods. There is a danger, inherent in any undertaking of its size, that it may become unwieldy and bureaucratic. A scheme for increasing the degree of democracy within the organisation has been put forward by the Union of Post Office workers. The proposal indeed is not new—it is based on a conference resolution of 1916. It suggests setting up a Post Office Administrative Council, composed of equal representatives of administrators and the union, under the chairmanship of the Postmaster-General and the vice-chairmanship of a trade unionist, which would be directly responsible to Parliament. Sectional councils would deal with the different branches of activity, and sub-committees with staff problems and welfare. The union's argument is that the active participation of the workers' representatives in the organisation would increase their desire to provide the public with an efficient service. It is certainly desirable that the Post Office workers should feel they have a voice in management. But it would be a disaster if the idea grew up that the Post Office should be run solely in the interests of its staff—a frequent failing of public utilities.

There is another scheme which the Post Office might do well to consider, a proposal which the Postal Reform League has been patiently advocating for many years past. It is that non-urgent communications, posted before mid-day, should be charged at a lower rate than late posted matter, so as to relieve the pressure on the evening collections and morning deliveries. The League estimates that 50 per cent of letters and 90 per cent of printed matter can be regarded as non-urgent and that their scheme would clear the decks for the more rapid handling of really urgent material. Successive Postmaster-Generals have inclined favourably to the proposal, but continuity in office has not been their characteristic, and the Post Office has continued to rely on voluntary appeals to the public to post early, rather than adopt a system of differential rates. The chief objection to the scheme is said to be the purely practical one of getting the public to comply. According to a recent survey, nearly 60 per cent of the letters posted in the London area were wrongly posted or addressed, and the public apparently finds it difficult to put letters for London and the country in the appropriate boxes. This argument is a sorry reflection on the level of intelligence in a democracy.

The really important thing, in any schemes for reform, is that the Post Office should not forget the lessons of 1940, and should never lose sight of the fact that it is first and foremost a public service whose principal objectives

## NOTES OF THE WEEK

### Music, Maestro, Please

There was a sense of early spring in London this week, despite mists and murk in the Straits of Dover. The reason was the return, in buoyant health, of Mr Churchill. It is an indication of the Prime Minister's quite remarkable position and prestige that his mere appearance on the scene gives hope, on all sides, that the pace of events will at once be speeded up, that dull doubts and delays will be ended and history hastened on. His reception, in London, in Parliament, in the press and wherever men meet, was very like the peacetime ovation given to a Test team, successful at Manchester and Leeds, coming out to play at the Oval. He has on his hands not only a Second Front but also a second chance in twenty-five years to place the social and economic destiny of this country under conscious guidance, to release by apt measures the springs of enterprise and achievement that persist among the people, and to give the country he has saved in war the chance to lead again, by its example and sagacity, in the arts of peace and the science of industry. There are, admittedly, doubts in some places about the batting strength of his team, about the quality of his bowlers, and even about the wisdom and sufficiency of their captain's instructions for the coming match. To vary the metaphor, there is unqualified praise for the conductor's skill and artistry, but some reservations about the range of his repertoire, and some disposition to disagree with his insistence upon being, simultaneously, first violin. His preference for martial music has indeed been more than justified by the performance, but he still has the first movement at least of a New World Symphony to get through before the leaves fall again.

### Farmers' Welcome

The farmers had their own special greeting for Mr Churchill on his return. The National Farmers' Union sent him a telegram—demanding an audience before the forthcoming debate on farm prices. In the debate Mr Hudson will state the Government's case, with facts and figures. Alarmed at this prospect, the NFU hastens to deny both the case and the facts and figures, before they have been made public. The farmers' contention is that the Government was pledged to increase prices *pari passu* with costs, while the Government says in reply, very reasonably, that turnover and profits must also be taken into account in making the calculation. The Minister's statement, unless the NFU succeeds in silencing him, will presumably give details of all the items in the agricultural balance sheet to show precisely where the farmers stand. The farmers' retort is a double one: first, that these facts are irrelevant; secondly, that the figures are wrong. Probably Mr Churchill will not find time, or be inclined, to intervene. Certainly, if the Government's pledge had been in the terms claimed by the NFU, it would have been contrary to public policy. Equally certainly, it is Mr Hudson's duty to go ahead undeterred and tell everything.

### School Fees

Any fight that there is to be over the Education Bill has been postponed to the Committee stage, and this week's second reading debate produced little that was new. Meanwhile, the London Labour Party, by a resolution passed at a special conference, is urging an amendment to the Bill, which would prohibit the charging of any fees whatever by schools receiving money from public funds. This would clearly be aimed at those "Direct Grant" schools where, although the Bill will provide for a greater proportion of State-aided scholars than ever before, there will still remain a large number of children whose education is paid for entirely by their parents. Lord Latham, the leader of the LCC, has denounced this system as "a travesty of equal educational opportunity." The London Labour Party is not alone in deploring any system of education which allows of a differentiation in the quality of education given to different classes. But there is surely a confusion of ideas in this protest; whether or not the education given to the children of

the rich and the poor is "equal" will not be settled by an abolition of fees in all varieties of secondary schools, "direct aid" as well as those maintained or aided by local authorities. Indeed, it can be argued that, so long as school education to the age of 18 is not universal, the abolition of fees, at the expense of rates and taxes, compels those who cannot afford to keep their children at school to pay for those who can. This is an unfortunate instance of the misdirection of an admirable motive. Although the Labour Party might not feel inclined to do more than take a hint from the domestic policy of Soviet Russia, there is a clear hint waiting for them, whatever way they wish to take it, in the decision taken some years ago to reintroduce fees in Russian secondary schools.

### Counter-Thrust

The main feature of last week's fighting was Manstein's counter-offensive in the Ukraine between Vinnitza and Uman. It was here that Vatutin's offensive had created the gravest threat to German supply lines, and especially to Zhmerinka junction on the Lvov-Odessa railway. The counter-offensive does not seem to have taken the Russians by surprise; they had rightly expected a thrust from the Upper Bug. After vigorous fighting, which lasted six days, the counter-offensive has now been brought to a standstill in the Vinnitza region, as well as at Uman. Manstein's armies have not even been able to push back the Russians for any considerable distance. Compared with the German counter-offensive against the Kiev salient in November and December the result suggests a further weakening in German striking power. Zhmerinka is so important for the Germans in the Ukraine that a renewal of their efforts to relieve it from the Russian threat would not be surprising. On all the other sectors of the front the Russians have recorded new gains, though none of them is comparable with Vatutin's earlier drive from the Kiev salient. In Poland, the Russians have advanced from Sarny along the railway which runs to Kovel; and they have advanced towards Rovno, the main centre in Volhynia. Further to the north they have taken Mozyr and Kalinkovich, the "gates" to the centre part of the Pripiet marshes, a region swarming with well-armed and numerous guerrillas. The Germans are likely to evacuate this region by the railway to Pinsk and Brest Litovsk, the only line available. The fighting on this sector may thus shift rapidly far to the west, beyond the marshes. Should this happen, then the German position in the whole of Byelorussia will become suddenly much worse and enormous salients, similar to those thrusting into the Ukraine, will be formed, stretching the front line to the utmost. In the far north, Russian penetrations are reported from the region of Lake Ilmen and from the Leningrad sector; but none so far is comparable with the gains in the Ukraine and Eastern Poland.

### The Marrakesh Meeting

The meeting between Mr Churchill and General de Gaulle at Marrakesh took place against the background of intensified preparations at Algiers for the liberation of France. The Prime Minister's previous visits to North Africa had occurred when the political horizon there was more clouded. During the Casablanca meeting, the aftermath of the *affaire Darlan* was still fresh. At the time of the Lebanese crisis there was tension and uneasiness. Throughout, the Prime Minister remained the devoted and staunch friend of France. The tradition of the *Entente Cordiale* survives in him despite France's defeat, collapse and humiliation under Vichy. In his vision of the world after the war, France has not been relegated to the grey background. At Marrakesh Mr Churchill could see the first fruit of his untiring work for the recovery of France. He saw the French army once again marching with the Allied armies towards victory. And, in his talks with General de Gaulle, he undoubtedly reviewed the problems that arise from the ardent desire of Frenchmen to play the most active part in the liberation of their country. Almost on the eve of the meeting at Marrakesh, the Consultative Assembly at Algiers unanimously passed a resolution asking the Allies for more military aid for the French underground movement. M. D'Astier, Commissioner for the In-

terior, stated in the debate that the "shock troops" of Fighting France have so far been able to arm only one in twenty of their men. The Assembly expressed the view that the French underground, if it is well armed, and recognised by the Allies as their vanguard fighting in France itself, could inflict more harm on the German war-machine in France than even Allied bombing; and that it could do so in a way less costly to and destructive of French life and property as well as of Allied matériel. This is a view that deserves the most friendly consideration and the closest examination.

### Purges and Trials

One of the subjects most prominent in the recent debates of the Consultative Assembly at Algiers was the purging of the French administration and the punishment of collaborators and Vichy-men. The Commissioner of Justice, M. De Menthon, announced the trial of Flandin, Peyrouton, General Bergeret, and 283 other defendants. The trial, he declared, will not be postponed until France is freed. It will be begun within the shortest possible time. A dramatic discussion on the legal basis and procedure of the trials and purges has developed both in the Assembly and the French press. The Commissariat of Justice has expressed the view that the trials should take place before normal courts, and that they should be based on the Penal Code. This viewpoint met with opposition in the Assembly. The members of the Assembly feared that normal legal procedure would not be able to cope with the problem. Can the crimes of the men of Vichy be judged at all on the basis of the Penal Code—they asked—in view of the political character of these crimes? The Assembly unanimously passed a motion asking the National Committee to set up extraordinary courts, and to prepare special laws which would create a legal framework for the purges. This amounted to a vote of no-confidence in the Commissariat of Justice. It remains, however, to be seen which viewpoint—that of the Consultative Assembly or that of the National Committee—will ultimately prevail. The dilemma is not an easy one; and its solution is of the highest importance to French political life. The demand for a radical and thorough purge has undoubtedly become very widespread and outspoken in recent months. The suspicion has been widespread that former supporters of Vichy have only too often been allowed to entrench themselves in the Army and in the Civil Service. Undue leniency to them is likely to breed political cynicism and to heat the atmosphere. On the other hand, the reluctance to enter on the risky path of ruthless reprisals and extraordinary measures is well justified. Once the journey along such a path is started its end can never be foreseen. It may even be the "holy guillotine."

Years of defeat and occupation have produced sad cleavages among Frenchmen, cleavages likely to be further deepened by the recent reshuffle of the Vichy Government. Pétain's new Minister for the Interior is Darnand, the chief of the Militia. His job is to intensify the terror in France on the eve of Allied invasion. The victims of that terror, ruthless enough even before Darnand's appointment, have every right to expect punishment for their French oppressors. The issue has been further complicated by the different shades and degrees of complicity, as well as by the fact that many Frenchmen who at one time or another supported Vichy later joined the movement of resistance. The atmosphere at Algiers has often been disturbed by recriminations and accusations against such people; and the argument that somebody was pro-Vichy at one time or another has tended to confuse the solution of serious political problems. It is to be hoped that common sense will help stop the practice of excessive recrimination; and that the Assembly will refrain from paying too high a tribute to the shadow of Fouquier-Tinville, Attorney-General to Robespierre.

### Who Represents Poland?

Is the Polish Government in London really representative of its people? This question is being asked in connection with the Polish-Soviet conflict. Some answer can be found in an analysis of its composition. M. Mikolajczyk's Cabinet was formed by a coalition of four political parties. These are: one wing of the Nationalist Party; the so-called

Front Morges (the right centre grouped around the Christian Democrats); the Peasant Party; and the Polish Socialist Party. The other wing of the Nationalists and the Pilsudskists, as well as the Communists, have remained outside the coalition. Between 1918 and 1930, when free elections were held in Poland, the Nationalists, Christian Democrats, Peasants and Socialists—that is, in substance, the present Government parties—between them regularly represented roughly four-fifths of the Polish electorate (not counting the votes of the national minorities, Ukrainians, Byelorussians, Jews and Germans, who were represented by their own political parties). Between 1930 and 1939 elections in Poland took place under police terror, and very frequently their result was falsified so as to produce a majority for the party of Pilsudski and Beck; the parties of the present coalition remained in opposition during all that time. But in all municipal elections, where less administrative pressure was applied, they still commanded an absolute majority. The Soviet-sponsored Union of the Polish Patriots, on the other hand, cannot claim to represent any body of Polish opinion. The Polish Communist Party was disbanded by the Comintern a few years before the war as "consisting of enemies of the people"; and the Union of Polish Patriots was only formed in 1941 by non-political "fellow-travellers," artists and poets who played no part in Poland's political life before the war.

### Back to Work

It is only right that a man (or woman) called up for war service should without question get his job back when released; but in many cases, it will be difficult, if possible at all, to do this. The Reinstatement in Civil Employment Bill attempts to recognise both justice and facts. The right to reinstatement, already provided in the National Service Acts and Defence Regulation 60 DAA, is reaffirmed and extended to cover volunteers as well as conscripts; illogically, perhaps, though not unnaturally, it covers only members of the Forces and not men or women directed into factories or ordered into pits. But the corresponding obligations upon employers to reinstate ex-employees, though made very plain, with strict penalties for wilful breach, will in practice be tempered by mercy in cases where it is demonstrably not "reasonable" or "practicable" either to reinstate them at all or to reinstate them in precisely their pre-war work on precisely the terms and conditions of their pre-war employment. The truth is that, often, the pre-war jobs will not exist, certainly not in their pre-war form; it is inevitable, and, from the national standpoint, desirable that no employer should attempt to restore the pre-war structure of employment down to the last detail, and clerk and office-boy. In some cases, as the Bill recognises, the same job has been filled successively by several employees, later called up, who will have the right to reinstatement when the war is over; and only one of them can be reinstated. Nor, similarly, will it by any means be always "reasonable" or "practicable" to keep on reinstated employees for the six-month period suggested in the Bill.

### "Back to the Job"

There is no single claim made by Service men which is more strongly felt, more powerfully supported, and more likely to cause widespread bitterness if not met, than this claim to their old jobs; and it is correspondingly important that the right to determine what is in fact "reasonable" or "practicable" by way of reinstatement, given in the Reinstatement Bill to Ministerial regulation, subject to the findings of committees appointed by the Minister, should be most jealously guarded. This is the view of MPs who are seeking, with good grounds, to expose the Minister's regulations in this matter to positive Parliamentary scrutiny before they take effect. But it is obviously impossible for Parliament to pass judgment on every case of reinstatement, or even on every category of case; and there is an equally obvious danger that individual cases may become the subject of political passion, personal pressure or heated controversy—the same danger as in pension cases. Moreover, it should be recognised that, though the right to work should be unqualified and reinstatement should be automatic wherever possible, with the onus on employers to prove that it is not possible, re-employment and resettlement cannot possibly be provided by reinstatement alone. Side by side with the employer's obligation to take men on again, there is the wider and immutable obligation of the community, through the Government and by means of all forms of enterprise, public and private, to provide jobs for all. Large-scale unemployment will tear the Reinstatement in Civil Employment Bill wide open.

### Rehabilitation

At the end of last week it was announced that the Minister of Health had asked the principal hospitals of England and Wales to develop rehabilitation facilities for their patients. They are to provide not only for fracture cases, but for all sick persons, except where treatment prescribes otherwise, and out-patients will be included. It is suggested that every patient should have a planned day's programme to include—according to the nature of the case—remedial drill and exercises, physiotherapy, handicrafts, organised games, workshop handicrafts and gardening lectures and brains trusts. Considerable success has been achieved on these lines in the Ministry's emergency hospitals, where Service and industrial patients have been treated in the last three years. Most of these patients, however, have been cases of injury. The very laudable aim is to extend it to the sick—to prevent post-operational neurosis from developing, to relieve the boredom, depression and anxiety all too often associated with hospital cases. But, however desirable such full-blown rehabilitation may be, it may be doubted whether hospitals will be able to achieve them in anything like the near future. Training courses are being provided for hospital staffs, and the Ministry is supplying some of the necessary equipment. But rehabilitation of this kind is not the sort of job that can be undertaken in the spare time of the hospital staff. It needs at least one whole-time organiser, quite apart from the physical training instructors and occupational therapists, and it is continual uphill work. It is particularly difficult where medical cases are concerned. For the disabled there is often some excitement in learning to use an artificial limb or in finding the use of his own limbs again. But many of the sick tend to be chronically apathetic, and it seems likely that those who will take part willingly and vigorously in games of deck quoits will be those less in need of being taken out of themselves—who would recover rapidly and completely in any case.

Far the most important aspect of rehabilitation, in fact, is fitting a man to resume his old job, or training him for a new one. Much of the anxiety felt by sick people is caused by fear that they will be out of work after their discharge from hospital. Thus the Tomlinson Bill is the better part of rehabilitation. What the hospitals can best do is perhaps to provide more adequately for the follow-up of cases after they have been discharged. A report by the Department of Health for Scotland,\* issued last October, described the follow-up, after three months and again after six months, of 1,000 men and women invalided out of the Services early in 1942. Of the 975 for whom full records are available, 360 reported that they were having difficulties of varying kinds,

\* "Health and Industrial Efficiency. Scottish Experiments in Social Medicine." 1s. net.

and it was found necessary in 188 cases to take serious exception to the nature of the work done . . . in view of their medical disabilities or, in some cases, their failure to seek medical treatment which they urgently required, and the absence of which could not fail to prejudice their working efficiency.

Rehabilitation may make a man fit for work, and the Tomlinson Bill may ensure that he is given employment, but it still remains to be seen that he obtains the right job in the right conditions.

### Priority for Servicemen

The Committee stage of the Disabled Persons (Employment) Bill was reached in the House of Commons on Tuesday. A sharp controversy arose over the Conservative amendment, moved by Major Manningham-Buller, that

until such time as facilities are available for training all disabled persons, selection for such courses shall be given to those disabled as a result of a war injury, a war risk injury, or detention, or a war service injury

—in other words, that priority shall be given to disabled ex-Servicemen. Both Mr Tomlinson, who had fathered the Bill, and Mr Bevin, who urged the movers not to make this a political issue, promised the House that, in practice, first consideration would be given to disabled servicemen, who would be assured of a place at "the right end of the queue." They argued that the amendment, if carried, would limit the ability of the Ministry of Labour to train civilian disabled, and that it was better to allow the preference to be maintained by administrative action. This assurance did not satisfy the Conservatives, and Mr Bevin finally conceded that he would draft a suitable formula for discussion when the Committee stage was resumed, to meet their point. This is the limit to which concession should go. There can be no question that the public will tend to insist that ex-servicemen should have first call on facilities for retraining. On the other hand, the Conservative amendment—however genuine the motives of its supporters—may well have the effect of driving a wedge between soldiers and industrial workers. There seems no reason why workers in reserved occupations—many of which have a high accident rate—or the young men directed into the mines who would otherwise have been called up for the Forces, should not be treated on an equal level with serving men. And should the women directed into factories, where they often work in conditions highly detrimental to their health, have to stand aside in favour of members of the women's services, where, generally speaking, conditions of work and leave are far better? There is also the point whether it is fair or expedient to give statutory preference to a less severely wounded soldier rather than to a badly disabled civilian. Should not preference, if there is to be any preference, be given to the most sick and the worst injured, and—when it comes to employment—to the more efficient rather than to the less efficient? There is only one answer to the problem, and that is to extend and speed up the provision of rehabilitation and training centres, so that all disabled persons, whatever the origin of their injuries, may benefit. Ultimately, the only safeguard lies in the successful maintenance of something like full employment.

### By Their Fruits

Spanish oranges are suspect, and meanwhile the distribution of a pound a head, to adults as well as children, is delayed. It is not easy to take the idea of Nazi agents painstakingly sewing gun-cotton into empty orange-skins very seriously, but, nevertheless, such a disappointment over an expected treat is bound to demonstrate to the public, in as direct and personal a way as possible, the vices of "non-belligerency." Luckily, no one has yet been injured by these time-bombs, though the labour of examining carefully each case coming from Spain represents an appreciable loss of man-hours to the war effort. The childishness of the affair does not lessen the harm and irritation which it causes, and the Foreign Office has rightly made a strong protest to the Spanish Government, and demanded a satisfactory inquiry. The wording of a protest, whether mild or strong, however, can only be in the nature of a warning. As long as Franco's Government is in control of a strategic Mediterranean coastline, and the Allied position in Southern Europe has not been militarily secured, a limit is imposed on the lengths to which relations with Spain can be strained. At the same time, the Spanish Government, if only for the sake

of post-war trade, would be wise to heed the warning, and in future to keep the flies out of the ointment and the time-bombs out of the oranges.

### Collective Security

Last August, Mr Evatt, Australian Minister for External Affairs and a rising statesman, called for the establishment of "a great South West Pacific zone of security." In Christmas week, the Australian Labour Party, to which Mr Evatt belongs, and of which Mr Curtin, the Prime Minister, is leader, formally renounced its old-established attitude of isolation in foreign policy. Now, at Canberra, the first positive step is being taken towards applying the lessons which the war has so hardly, and so perilously, taught. The first aim of the common foreign policy which the Australian and New Zealand Governments are beginning to work out in conference at Canberra will be, for reasons made obvious by recent history, to provide protection for their two countries by making their northern screen of islands permanently safe against any aggressor. The moral of the Japanese War is very clear: the Dominions cannot themselves defend the islands; nor is the loose, though lasting, connection of the scattered British Commonwealth sufficient to do so; it can only be done by collective action, before wars break out, with other nations having Pacific possessions to defend. The Australian and New Zealand Governments, therefore, intend to work out, with their military staffs, proposals for common defence schemes and joint bases, bringing in the United States, Holland, France and Portugal as well as Britain and themselves. The inner ring of collective security for Australasia will be closer co-operation in defence and foreign policy, in peacetime, within the Empire; and these proposals will be submitted for discussion to the Conference of Commonwealth Prime Ministers which is to meet in London some time soon. The outer ring will be, Mr Curtin hopes, a Pacific Defence Council of all the countries concerned.

### Example for Peace

It is by the making of practical schemes for the joint defence of particular regions, such as the Pacific area, that progress can best be made towards the realisation, in fact, of the wider and more general international pledges of the Great Powers, now leagued against aggression across the world. There can be no suspicion that a Pacific defence system would have aggressive intentions, any more than that the British Commonwealth itself has sought conquest. There are two sides to the medal. On the one hand, security in any region is impossible without the participation of the great industrial powers to furnish the sinews of modern warfare; despite their remarkable wartime efforts, Australia and New Zealand can contribute only a tiny fraction of the munitions and machines required to keep them safe. On the other hand, security calls for the utmost co-operation and self-help from the small as well as the Great Powers; the proportion of resources put into the common pool by countries with similar standards of living must be the same, whatever their size. All this has now been realised by the men at present in full control of Australia's future, despite the past indifference of their party's creed, like that of other Labour parties, to these considerations. It has often been said that the British Commonwealth has provided an example to the world of peaceful co-operation, and of solidarity in danger. If the findings of the Canberra Conference can be translated into deeds, internationally as well as within the Commonwealth, this will be true many times over.

### More Colonial Regionalism?

It was announced at the end of the conference of the New Zealand and Australian Governments that steps would be taken to establish a South Seas Regional Commission, comprising representatives of the United Kingdom, the United States, France, Australia and New Zealand, with advisory functions relating to the welfare of the native populations. This list does not include all the powers with jurisdiction in the region. The absence of Holland must surely be a clerical omission, since it was named by Mr Curtin as one of the countries whose co-operation in Pacific defence is essential. (Or are "the South Seas" being narrowly—and wrongly—defined as merely the present South Pacific area?) Chile is also absent, but its only dependency

is Easter Island, on the far eastern fringe of the group. The third missing power—apart from the conspicuous absence of China, which has many people, if no territory, in the Pacific—is Japan. It may be assumed that, after the Pacific war is over, the Japanese mandated islands will not be handed back to the Japanese. Still less is it likely that they will be restored, in accordance with the declarations of the Cairo Conference, to their previous owner—Germany. But under whatever sovereignty they are ultimately placed, the South Seas powers will still have to take into account the large Japanese population in the mandate, which outnumbers the native population. Few details are yet available of what the Commission's functions, if it is established, are to be, except that they will be advisory, and will be mainly concerned with native welfare. But that there will be work for it to do cannot be doubted. Long before the war, the white man's prestige had suffered in the South Seas because the natives blamed him for the economic depression that hit them badly. Now that their islands have become the white man's battlefield and are only painfully and slowly being won back, this prestige can hardly have recovered. It will need vigorous international co-operation in carrying out development and welfare schemes to convince the natives that their islands are regarded as more than pawn in international strategy.

### War-time Strikes

Professor Bowley has done a valuable service in broadcasting the results of his analysis of the time lost by strikes during the present war. He calculates that the total number of days lost during four and a quarter years of war, officially stated to be 33 million days, if spread over the wage-earning population of just over 50 million, would work out at barely half a day lost. In the last war the strikes were more serious in number and duration; but, even so, they probably averaged less than two days if spread over the working population in the fifty-one months of fighting. Half the days lost by the strikes of this war occurred in coal-mining, where 2,000 disputes were recorded. Professor Bowley estimates that the resulting loss of output has been less than 2½ million tons, less than one per cent in over four years of the pre-war output in a single year. (Incidentally, the rule that "when in Rome, do as the Romans do" seems to apply in the coalfields. The new pit conscripts in the Midlands, after one day's training, threatened to come out on strike unless their pay is raised.) Engineering and shipbuilding accounted for a quarter of the days lost in both this and the last war. The remaining quarter of the days were lost in this war in a variety of industries; compared with the last war, cotton, clothing and building were hardly affected. The great majority of disputes have been localised, and have lasted for less than a week. In many cases, they were due to minor grievances over interpretation of an agreement, or resentment at disciplinary action against individual workers. Surprisingly few were for higher wages, and the negotiating and arbitration machinery seems to have worked smoothly on the whole, despite a few serious and much-publicised exceptions. Professor Bowley concludes that the direct effect of stoppages on production has been "unimportant," except in the key industries, although the indirect effects may be considerable. At the same time, such figures should not be used to excuse strikes. Nearly all are unofficial, frowned upon by trade unions, and tend to jeopardise negotiating and arbitration machinery. It is interesting to compare Britain's strike record with that of the United States. There, in the

first eleven months of 1943, 12.8 million man-days were lost, compared with 4.2 million in 1942; but two-thirds of the days lost in 1943 were due to coal-mining strikes. Spread over an estimated working population of about 55 million, and excluding coalminers' strikes, days lost up to December 1943 would work out at about three-quarters of a day lost.

### To Speak or Not to Speak

The newly-elected Common Wealth MP for Skipton, an Army officer, has been forbidden by military order to make political speeches outside his constituency; and the matter has been raised in Parliament, as a question of privilege. There is no suggestion of victimisation. The order is general, and not new, though previously it has been honoured in both the breach and the observance. It derives from the regulation that forbids serving soldiers from taking an active part in politics; but it has not prevented M.P.s from attending and speaking at party conferences—and cannot, of course, prevent them from performing their Parliamentary duties at Westminster, nor, judged by the way in which the rule is phrased, from performing their duties in their constituencies as well. Strictly, the position is anomalous. As an MP, a man is free to speak, protected by privilege; as a soldier he is not. The existing rule is an attempt at compromise, and has worked so far because, on the one hand, blind eyes have been tactfully turned, and, on the other, MPs have not abused their actual freedom. Mr Churchill made it plain, when questioned in the Commons, that he thinks it desirable that this compromise should continue. The argument that a serving MP cannot be allowed to criticise the conduct of the war, and, openly or by implication, his superiors is, admittedly, not watertight when it means, in practice, that he can do this in Parliament and one other district, namely, his constituency, but not elsewhere, even though his platform may be simply in another part of the town or district in which his constituency lies. Perhaps the only really logical solution is the one in force in the United States, that is, to insist on separating the two functions; to require a serving soldier either to put off his uniform when he becomes an MP, or to place his Parliamentary work in abeyance while he serves. Neither remedy would seem entirely satisfactory; the first would rob Parliament of any direct voice from the Forces; the second would either disfranchise whole constituencies, in effect, or make serving soldiers ineligible for election. It will be a pity if common sense, rather than logic, cannot continue to be the guide, as hitherto. But if the matter has to be brought to a head, now or later, it may be that the American rule is the only way out.

## STOCK EXCHANGE OFFICIAL YEAR-BOOK

*Under the Sanction of the Committee of  
The Stock Exchange*

**68th Year of Publication.**

The 1944 Edition is now being prepared for the press and all Subscribers and others are definitely urged to send in their orders forthwith.

Owing to Paper Restrictions, the number printed must be STRICTLY LIMITED.

The Publishers regretted last year the book was out of print before the date of publication, and in consequence they had to disappoint many subscribers whose orders were not received IN TIME.

**THERE CAN BE NO REPRINT**

**ORDER NOW**

Price £4 net; by post British Isles, £4 1s. 6d.

ADDRESS, The Publishers: 330, Gresham House,  
Old Broad Street, London, E.C.2.

### Aliens in Peace

The day will soon be coming when it will be possible to look beyond the Allied invasion of Europe, to the ebbing tide of European refugees returning to help in the reconstruction of their own countries. The question will then arise—among others—of what to do with those who prefer to stay here. Among these will be members of Allied fighting forces who have married British wives and have little or nothing to return to in Europe; students with British training and qualifications; and others with personal or professional ties with this country. For them, naturalisation will be the easiest and most sensible foundation for their future lives. Their numbers will be relatively small, a mere 6,000 odd (according to an estimate in the latest issue of *Planning*, PEP's broadsheet\*), including Czechs and Poles; and it will not be over them that hot discussion will arise. It is the 50,000 German and Austrian refugees, 90 per cent of them Jewish, for whom provision for the peace-time future must specifically be made. It is estimated by PEP that only 12-16 per cent of them—mainly Austrians and political refugees—will wish to go back, and of those remaining, over 10,000 will probably re-emigrate, if allowed, to the United States, to the Dominions, or to Palestine. The number who will want to remain in Britain will, by this estimate, be about 40,000, or the equivalent of the population of Dover—a percentage of the existing population no greater than the proportion of aliens in 1931. On the evidence of pre-war years—indeed, on the whole evidence of British history—refugees have proved a valuable element in the national economy. The high proportion among the present British-domiciled aliens of skilled professional and business men will not only help in increasing employment, but will assist the British effort to regain and expand foreign trade. In recognition of this, and of their contribution through the International Labour Branch and the armed forces to the war effort, full assistance should be given to them to share in the rights and obligations of British subjects.

### Shorter Notes

The last recorded quarterly returns of the Registrar-General, recently issued, on the third quarter of 1943, show that the birth rate has leapt to the 1930 level, with a surplus of boys over girls of 5,702. This simply reflects the high marriage rate of the early years of the war, now well past its peak, and offers no evidence of any likely turn in the downward trend of the population, which depends, first, on the number of mothers-to-be and, secondly, on the size of families. The number of marriages in the quarter actually fell lower than in any September quarter since 1917, which makes the maintenance of the number of births unlikely.

It was stated in *The Economist* on January 1st, on page 8, that one of the reasons for the grave risk of famine in Italy was the failure of this year's harvest, which proved to be only 65 per cent of normal. The statement should have run that the 1942-43 harvest was only 65 per cent of normal. It was this unexpected shortage, and the consequent scarcity of stocks, which threw out all the calculations upon which the Allies had based their estimates of Italy's civilian needs. Their underestimate, aggravated by German destruction, impossible communications and lack of transport, accounts for the severe shortages.

The following table gives the number of civilian casualties in air-raids since September, 1939:—

|                         | Killed | Injured and<br>Detained in<br>Hospital | Total<br>Serious<br>Casualties |
|-------------------------|--------|----------------------------------------|--------------------------------|

# AMERICAN SURVEY

## Rails and "Little Steel"

(From an American Correspondent)

[The letter printed below describes the background of the wage disputes on the American railroads, which at one time threatened to precipitate a strike. The disputes have now all been settled, and the Secretary of War has ordered that the railways be returned to their owners. The settlement with the fifteen unions of non-operating employees, which was the last to be arranged, provides, according to early reports, for a sliding scale of wage increases from nine to eleven cents an hour, which is retroactive to December 27. Presumably this is the "sliding scale" recommended by the Shaw Board, and accepted by the unions several weeks ago. It is not yet clear what action has been taken on the unions' subsequent demands for overtime pay. The President's award to two of the operating unions was extended to and accepted by the other three operating unions last week.—EDITOR.]

Washington, December 6th

THE Senate Interstate Commerce Committee has now reported favourably a resolution upholding a wage increase of eight cents per hour for the 1,100,000 non-operating employees of the railroads (that is, employees other than train crews). Despite the blunt warning by Mr Vinson, the Economic Stabilisation Director, that "Congress itself will have broken the Little Steel formula" and "will have told the country that a privileged group is outside the stabilisation programme," there is little doubt that the Senate and House will pass the resolution by substantial majorities.

The progress of this wage case offers a lesson in how not to apply wage controls. It is now more than a year since the wage movement was begun, and the railroad workers are understandably angry at the long delay without a final decision. The Administration, for its part, has seemingly proceeded on the theory that the lapse of time alone would somehow provide a solution.

The railroad unions first served demands on the carriers in September, 1942. In accordance with the requirements of the Railway Labour Act, negotiations were undertaken, and in due course the National (Railway) Mediation Board was called upon for assistance. When the Mediation Board was unable to compose the parties' differences, a three-man Railroad Emergency Board was appointed in February of 1943.

While the Emergency Board was deliberating, the President issued his "Hold-the-Line" order which narrowly limited the bases upon which wage increases could be justified. On May 12, the "Hold-the-Line" Order was clarified and expanded by a policy directive of the Economic Stabilisation Director. Then, on May 29, the Emergency Board brought forth its report recommending an increase of eight cents per hour for the non-operating railroad workers.

Although the railroad unions went through the customary motions of expressing disappointment at the amount of the increase, it was soon evident that the report would be satisfactory from their point of view. But the newly appointed Director of Economic Stabilisation, Mr Vinson, was not satisfied. In disapproving the Emergency Board recommendations, he suggested that justification for wage increases might nevertheless be found in two of the exceptions allowed by the policy directive of May 12th as reasons for wage increases—namely, those relating to "substandard wages" and "interrelated job classifications."

Then in August, railroad labour and management met together and came to voluntary agreement upon the eight-cent increase. Railroad management qualified its agreement by specifying that the new wage schedules would be applied only with the approval of Director Vinson. Representatives of the employees, on the other hand, expressed the con-

viction that the agreement was valid and binding regardless of approval or disapproval by any Governmental authority, and began talking publicly about taking a strike vote.

The next formal step was a Presidential order creating a further special Emergency Board to make a new investigation of the wage dispute. This Board made known its recommendations on November 4th, and as had been expected, they reflected the views which Stabilisation Director Vinson had put forth earlier. Instead of a flat increase, the recommendations called for a sliding scale of increases beginning with a raise of ten cents per hour for the lowest-paid workers and scaling down to an increase of four cents per hour for the highest-paid groups. This award, Mr Vinson let it be known, would not be disapproved.

It should be noted, parenthetically, that while the sliding scale formula was rather broad as an application of the sub-standard wage rule, it did make good sense. The low-paid groups, made up largely of the maintenance-of-way workers, are most in need of higher wages. A raise in their wages, further, would provide an important incentive from the standpoint of management, since it is here that the railroads have suffered most seriously from manpower shortages. Moreover, the railroad industry's top-heavy wage pattern would be corrected in some measure by narrowing wage differentials.

But the railroad unions, dominated by the skilled craft organisations, would have nothing of this award. Instead, they went ahead with the strike vote and simultaneously went to Congress seeking a legislative mandate upholding the eight-cent increase.

Since rail labour has staunchly supported President Roosevelt for 12 years, the present situation is an extremely unpleasant one for the Administration. Congressional opponents of the President, not excluding those within the Democratic Party, are quite ready to use the wage issue to alienate labour support from the Administration. The President, of course, has no satisfactory means of reply. To appease the railroad workers by overruling Mr Vinson would be to sacrifice a capable administrator along with the wage stabilisation line. And already, Labor, organ of the railroad unions, is hinting that Mr Roosevelt may no longer be labour's good and deserving friend.

The daily press has been inclined to stress the Administration's inept handling of the wage dispute. There is enough substance here to make it unnecessary, as some editors have done, to exaggerate the matter. In fact, the major error was committed before the railroad wage movement was begun. This lay in the Administration's failure to centralise all wage control in one agency. By keeping railroad wages outside the purview of the National War Labour Board, the way was open for an *ad hoc* board to make its own interpretation of wage stabilisation policies. The result may not have been inevitable, but neither was it surprising.

Quite independently of the railroad wage case, both the CIO and AFL have undertaken a large-scale attack on the "Little Steel" formula (which prohibits any increase of more than 15 per cent above the levels of January 1, 1941). The CIO Steel Workers' Union is currently in the van of this move, with other powerful organisations close behind. A new and higher wage line would certainly help the National War Labour Board to weather this storm, but it would also mean another long step toward really dangerous inflation. It is not surprising, therefore, that some voices are being raised for a re-examination of the whole approach to the wage stabilisation problem.

The *New York Times*, for example, is editorially thumping for a wage formula which would permit wage increases only in response to rises in the cost of living. This device, it is argued, would be simple, fair, and non-inflationary. It would put an end to high-pressure drives by organised and articulate workers and it would give clear meaning and

direct support to the price control and food subsidy programmes.

Much of what the *Times* and other critics have been saying must be granted. The wage stabilisation policy does operate to the relative advantage of those workers who have powerful organisations to carry their cases through the complicated and time-consuming procedures of the War Labour Board. In spite of the "Little Steel" formula, there are loopholes which permit the granting of substantial wage increases even to highly paid workers. In the absence of an inflexible formula, the tendency is to look for ways and means of satisfying the demands of strategically placed groups.

But it is to be doubted whether a drastic change in wage policies would be as practicable as the Administration critics seem to believe. There would be considerable administrative difficulties in an inflexible wages-cost of living approach, to say nothing of the strenuous labour resistance that would be aroused. The problem of constructing satisfactory cost-of-living indices would alone be a substantial one. And, unless far more rigid controls were to be placed on other segments of the economy, labour's opposition to wage freezing would deserve a hearing.

There does remain the possibility that a change in wage control standards and procedure will be forced by labour itself. The tripartite character of the National War Labour Board has been a source of both strength and weakness. Labour has been forbearing toward the Board's policies, in part because its own representatives on the Board nominally helped to formulate them. While the public members—Messrs Davis, Graham, Morse, and Taylor—have thoroughly dominated the Board, the place of labour's own men in the inner councils has apparently been reassuring to the unions. Now, however, in the heated atmosphere left by the coal miners' controversy, there are signs that the honeymoon is coming to an end. Recently, the AFL has sharply attacked the public members for making the mild suggestion that present controls over strikes perhaps are inadequate. A concerted resignation of the Board's labour membership would wreck the Board just as effectively as Mr John L. Lewis, in the days before Pearl Harbour, wrecked the National Defence Mediation Board by withdrawing the representatives of the CIO, with which he was still then associated.

Furthermore, organised labour may quite possibly urge a change in the relationship between the National War Labour Board and the Office of Economic Stabilisation. During the past year it has become progressively clearer that basic wage policies are originating in the Stabilisation Director's office and not, as originally contemplated, deriving from the War Labour Board's deliberations. Labour has accepted this development with reluctance and much grumbling. The industry-labour-public organisation, labour's spokesmen insist, should have authority to formulate as well as to administer policy. Lacking this power, it is reasoned, the Board is not the independent judicial arbiter which labour accepted in exchange for its no-strike pledge.

Should labour press vigorously along these lines, the next move is anybody's guess. Weak as the War Labour Board's defences may have been, it is one of the chief bulwarks against inflation and the Administration can ill afford its destruction and the confusion that would necessarily follow.

## American Notes

### The Second One Hundred Billion Dollars

The Budget Message sent to Congress last week by the President estimates total government expenditures for the fiscal year 1945 (ending June 30, 1945), on the assumption that the war continues at full scale, at \$100 billion, approximately the same as for the fiscal year 1944. Of the 1945 total, \$90 billion is for war expenditures, compared with \$92 billion in 1944; \$3.75 billion is for interest on the public debt; and \$1.25 billion is for veterans' pensions and benefits. Both these latter expenditures are, of course, indirectly war costs. The changing apportionment of direct war expenditures is demonstrated in a table which shows the steady increase in the proportion spent on munitions, including ships, from 50% in 1940-41 (the preparedness period) to 63% in fiscal 1945; the decline in construction of war facilities, which reached its peak in 1942 at 22% of the whole, and now stands at 4%; and the relative stability of expenditures on pay and subsistence, including agricultural Lend-Lease which now absorbs 33% of the total. The appropriations for war purposes already made, and those which the President

expects to request in the spring, substantially exceed estimated expenditure, because of the lag between authorisation and spending. For 1944, appropriations will total \$115 billion; for 1945, \$108 billion; and by the end of fiscal 1945 total war appropriations will have reached \$397 billion. Of this total, it is estimated that \$105 billion will then still remain unspent, and will be available either for further military needs, or, if the war is over, for the costs of demobilisation and reconversion to peace-time economy. Under war conditions, the expenditure side of the Budget as submitted by the President, is more realistic than any estimates of revenue, for while Congress has shown an admirable spirit of co-operation in passing the appropriations requested, its willingness to accept the tax proposals of the Administration is far less conspicuous. Estimated net receipts for 1944 stand at \$41 billion, or about 41.4% of total expenditures. Under present tax laws, for fiscal 1945 they will drop to just under that figure, or about 41% of total expenditures. The amounts left to be financed by borrowing in 1944 are \$58 billion, in 1945 \$59 billion. This dependence on heavy borrowings, combined with the size of the American war bill, is responsible for the growing elephantiasis of the public debt, which by June 30, 1944, is estimated at \$198 billion, and a year later at \$258 billion. With interest rates payable at less than 2%, this will mean an annual charge of \$5 billion annually, which, the President suggested, need not prove oppressive if the national income could be maintained at \$125 billion, and with appropriate fiscal and economic policies.

### The Double Task

The major assumption underlying the Budget proposals is that the war will continue through June, 1945. But, as the President pointed out, this does not mean that preparations for peace can be neglected; at this stage the Budget must provide both for victory and the peace which will follow it, which should be conspicuous for high levels of income and standards of living. Already certain problems of the return to a peace-time basis are cropping up. More than \$12 billion of war contracts have been terminated and a million men and women have been discharged from the Services. Among the questions urgently recommended to Congress for consideration were standards for contract termination, the need of assistance both to Servicemen and war workers in finding peace-time employment, the planning of Federal public works to supplement private investment and employment, and the extension of social security, with particular reference to the needs of ex-soldiers for unemployment insurance and other legislation to ease the transition from Service to civilian life. The success of domestic demobilisation schemes would, Mr Roosevelt pointed out, affect the success of arrangements now being made for international economic collaboration through the effect on American willingness to buy abroad. Many of the more vigorous passages were, however, designed as a stimulus to the President's Message last week on the State of the Union. There was a renewed appeal to Congress to reconsider its Tax Bill, which at present adds only \$1.5 billion over \$2 billion to revenue, as opposed to the Treasury's request for a \$10½ billion increase. The failure to enact an adequate tax programme has aggravated the difficulty of maintaining stabilisation, and Congress was warned that if stabilisation was not maintained, Government estimates of expenditure might have to be revised upward. This is the ideal time to increase taxation, it was argued, and the Congressional contention that the country could not bear further increases was refuted by figures showing that individual incomes, after payment of all taxes, Federal, State and local, would be about 40 per cent greater in the calendar year 1944 than in 1941, and that corporate profits, after taxes, were at an all-time high. Wages, profits and farm prices have reached levels which should not be exceeded except for "special war requirements" (an escape clause?). Also connected with the President's five-point programme was his sharp rap at Congressional attempts to emasculate the law governing the renegotiation of war contracts and his warning that next year's planting might be affected by the failure of Congress to pass, without weakening amendments, the Commodity Credit Corporation Bill, which provides for subsidies and support prices. The Budget has been received soberly by the country, although there is some conservative criticism of the failure to support a sales tax and some suspicion of the post-war passages as "campaigning." But it does not yet appear that Congress

will respond any more enthusiastically to White House suggestions conveyed in the Budget than to those of last week's Message.

### Cold Storage?

Response to the President's endorsement of a National Service Act has been heated. While progressives generally have given their grudging approval, stressing the safeguards for labour promised by the President, labour itself and most conservatives have joined hands to call it dictatorship, and at least one Congressman has declared it would violate the Thirteenth Amendment abolishing slavery and involuntary servitude. Paradoxically, this heat looks like putting the proposal on ice, a not unexpected result. The Military Affairs Committee of the House has voted to defer action indefinitely, although the Senate will begin hearings shortly. The fact that national service is being debated on its own merits, and only to a microscopic extent as part of an "all or nothing" programme, would also, as last week's Message made clear, leave it without support from the White House. There is, indeed, some scepticism in informed Washington circles as to whether the proposal was ever meant as more than a demonstration of strong-arm tactics on the home front. Where, it is asked, would one find a man competent to administer such an enormously complicated and delicate mechanism? Mr McNutt, War Manpower Commissioner, who probably would not get the job, has administered a carefully phrased dash of cold water. Even a paper like the *Herald Tribune*, after its initial enthusiasm, is now speculating about whether the proposal was not a bold bluff designed to bring labour into line. Labour leaders themselves have been quick to point out that the main purpose stressed by the President, the elimination of strikes, has not been achieved by the British National Service law. Mr McNutt's estimates of reduced man-power needs in the coming year are also being used by the critics. One aspect of the Presidential bombshell which is securing its full measure of attention is its possible use as a campaign document should Mr Roosevelt choose to stand for a fourth term. So sagacious an observer as Mr Walter Lippmann finds it very good election material indeed. As he points out, the appeal to "blood, toil, sweat and tears"—so alien to American politicians—has succeeded abroad, and might survive transplanting, though it should be added that abroad its use has generally been accompanied by an acute sense of national peril which is not conspicuous in the United States to-day. On this interpretation the consignment of his programme to cold storage might not altogether displease the President. Mr Roosevelt looks like being, next autumn, in the enviable position of a man who appealed for toil and sweat without the practical disadvantages of having had to exact them.

### Streamlining the State Department

Strenuous efforts are being made to bring the State Department up to date and to improve its public relations. It is a sign of the times that the Department recently has gone on the air in a series of programmes designed to explain and popularise its policies and personalities. The reorganisation announced this week is a more solid rejoinder to criticisms, epidemic a few months ago, that the Department's procedure and machinery were hopelessly inadequate to deal with the modern world and its new responsibilities in the field of economic affairs. The main purposes of the overhaul are to free the principal officers of the Department from as many administrative duties as possible so that they may be freer to devote their energies to large issues of foreign policy; and to clarify responsibility by eliminating overlapping jurisdiction. Twelve major "line" offices are created, five to deal with specific geographical areas such as Europe and the Far East and with special political problems. Others are set up to deal with Economic Affairs, Commodities, Financial and Monetary Affairs, and Wartime Economic concerns. One new and encouraging departure establishes an Office of Labour Relations in recognition of the "importance of international labour and social problems and the interest of labour in broad international policy." The Office of Public Information, which groups together various already existing units, includes the dashing innovation of a Motion Picture and Radio Division. Better co-ordination between the higher officers is assured by the creation of two committees, a Policy Committee and a Committee on Post-War Programmes. In addition, an Advisory Council on Post-War Foreign Policy apparently is intended to give the Secretary of State the advantage of consultation

with men of eminence outside the Department's official family, although its three founding members, Mr Norman Davis, Dr Isaiah Bowman and Mr Myron C. Taylor, can hardly be counted as new hands. It is true, as the habitual critics still maintain, that this involves no change in fundamental policies and that no new blood has been brought in. But it is at least proof that last autumn's transfusion—when Mr Stettinius became Under Secretary—has had its intended effect; and that the Department is not so deaf to constructive criticism as might have been suggested by its irritation with the critics. The burden of responsibilities borne by the Department has been enormously increased in the war years. This modernisation of its structure should enable it to deal more efficiently with its duties. It has not come too soon.

### Smoking Dewey Out

Among the rumours which fly thick and fast in a Presidential year is one that Mr Willkie soon will try to "smoke Dewey out," to force him to declare himself in advance, rather than to continue his alleged policy of waiting in the wings until brought forward by last-minute acclamation. *PM*, the New York liberal newspaper, has provided the ready-made slogan: "Dewey or Don't he?" There are some grounds, in American electoral procedure, for thinking that Governor Dewey, if he has receded from his earlier iron-clad self-denying ordinance, might soon come out into the open. Presidential primaries will be held this spring in seventeen states, and in another, Georgia, the State Executive Committee can order a primary if it chooses. At these preliminary elections citizens registered as Republicans, or Democrats, choose state delegations to the party convention and by so doing express their preferences for candidates for their party's nomination. In eight of these seventeen states, the name of no candidate can be put before the voters without his express authorisation. The earliest primary, in New Hampshire, is in March, with others in April, but in Illinois there is a provision that if a candidate wishes to be considered he must go on the record sixty days earlier. In the case of Illinois, Governor Dewey—or his supporters, since in this state the candidate's assent is not needed—would have to take action by February 11th. But Mr Willkie is probably not relying on facts of this kind to disclose Governor Dewey's intentions. If recent evidences of a Dewey landslide inside the Republican party have indeed induced any change of mind, there is every legal opening for the sending of Dewey delegations to the conventions without any prior authorisation having been given. In nine states a candidate can be entered in the primaries without his consent, and there are thirty states with no primaries where the delegations—chosen by party conventions—are not bound by the preferences of the rank and file and where no expressions of intention are required. These last alone send 471 delegates out of the total of 1,003 at the Republican convention. Some test of Governor Dewey's intentions may appear from the vigour with which he takes the steps he has promised to stop any "Dewey-for-President" movement. But Mr Willkie will have to find more tempting bait than this to get a final answer.

### Shorter Note

The House Foreign Affairs Committee has approved a Bill to enable the United States to take part in UNRRA. Limiting amendments set a ceiling for American financial participation at \$1,350 million, and prohibited the use of funds for purposes other than actual relief, rehabilitation and the costs of administration. The Bill now goes to the House for action. This is not an appropriation; another Bill will be necessary to authorise the expenditure.

## Educating the African

BRITISH colonial policy in Africa has always been based on the principle that progress should not be imposed upon the people, but should be offered to them and they should be taught to accept it. Inevitably, this has meant that progress has been slow and in some respects almost imperceptible. But to its critics the Colonial Office has always pointed out that it has, over most of Africa, avoided creating an unrooted discontented native people with a thin veneer of alien economics and alien culture to which they have been unable to adjust themselves.

Into this slow march of colonial policy the latest report\* of the Colonial Office Advisory Committee on Education comes, therefore, as something of a bombshell. For, in contrast to this principle, it urges that mass education for the African colonies should be achieved by shock tactics; that targets should be set, and "time-schedules" planned. It has been estimated that nineteen out of twenty Africans are illiterate. The Advisory Committee has produced recommendations not only for the wide extension of schooling for children, but also for the abolition of illiteracy among the adult population, urging that

definite objectives and financially realistic targets should be taken in particular areas so that the co-ordinated and comprehensive plans for the general progress of a particular community or group of communities may be put in hand and carried out within a specified period.

It considers adult literacy "of primary importance in the light of present needs of colonial peoples" for several reasons: the attainment of literacy makes people aware of the need for social and economic improvements, and therefore more willing to co-operate with agencies working for them; the rapid changes taking place in family and village life can be understood and acceptable only to a literate people; literacy is a prerequisite of progress towards self-government.

### Combined Operations

The Committee therefore recommends the appointment of mass education officers in different areas to undertake the planning and execution of a mass education project and to co-ordinate and combine the educational activities already being carried out by other agencies. Thus in, for instance, a certain type of rural community there might be official experts, consisting of Europeans and Africans, who are already engaged in improving the community's health or agriculture or in training it in co-operative systems or in trade unionism. These should be mobilised in a team for the carrying out of a mass education project as well, under the directions of a mass education officer. In another community the expert team might be unofficial, consisting of missionaries. In another—a mine or a plantation—the expert team might consist of the welfare workers of the company concerned. But in all, the official team would work in close co-operation with members of the community itself—the literate, advanced members whose enthusiasm should be aroused for the education of their fellows. These should be formed into a local association, which the mass education officer should consult when the local project is drawn up.

How far do these shock tactics fit in with the British system of indirect rule and with the principle that progress must come from within? At first sight, the tactics seem alien. But the strategy is inherently the same. Throughout its report the Committee emphasises that the co-operation of the people is essential.

Africans themselves must be the main agents in improving African life.

Guidance by Governments is "of the first importance," but guidance from above will be cold and ineffective unless it is able to inspire the wise leadership among the people

themselves without which mass education is largely meaningless and fruitless. Measures taken by authority must carry with them the active and understanding participation of the community itself.

That is why the Committee lays so much importance on co-operation between the teams of experts and the local associations formed from the communities themselves, on enlisting the help of the literate Africans and particularly of those who during the war have served in the armed forces, where they have learned lessons in hygiene, in diet, in the three R's, in English, and where, through foreign service and contact with other nationalities, they have come to regard themselves as Africans "even as 'nationals' of a territory such as Northern Rhodesia, playing a part in world affairs."

### New Policy?

This recognition of potential leaders among the rank and file of Africans seems indeed to be a big divergence from official policy. But it is a divergence from the recent practice of British colonial rule rather than its principles. The system of indirect rule has frequently meant that too much reliance has been placed on the native administrations, on the tribal system and the chiefs, even when they are found to be corrupt or inefficient. Thus the principle that progress should be based on indigenous cultures and customs has often given way to the practice of keeping indigenous forces in being, even though through them the people cannot progress. This has had the effect not only of keeping the people more backward than they might have been, but of creating discontent among the more advanced Africans who might otherwise have become their society's leaders. The Education Committee, however, does not agree that backward systems should be bolstered for their own sakes. It recommends, it is true, that an educated and progressive native administration should form an important part of the local association for the mass education project. But

where an area is otherwise suitable for an experiment, that is, where other local elements are progressive and the need is great, we do not think that a backward Native Administration should be allowed to hinder the sanctioning of mass education plans.

Further, there are private individuals, Africans, "who are capable of viewing their community in a more or less critical and objective fashion," who realise that the schools and welfare organisations set up by Governments and voluntary bodies are extraneous, not spontaneous, growths, and are consequently incapable by themselves of leading the community in its need for adjusting itself to the changes inevitably taking place.

We are of opinion that these . . . should be given the fullest recognition in the organisation of a mass education system. . . . It is true that they may be vigorously critical of both local and central Government. . . . Their resentment may be intensified by a belief that they are regarded as ignorant and troublesome aspirants to a position and influence far beyond their merits. But we are convinced that officers in charge of mass education would find many of them potent allies.

There is another aspect in which the Committee's report seems to diverge from official opinion, and that is in its actual objectives. Expert opinion in recent years has pointed out the inadequacy, even the folly, of regarding literacy as an end in itself. The plight of the African clerk, who drifts to the towns in search of work, has been well described by Major Orde Browne, Labour Adviser to the Colonial Office, in his report on labour conditions in West Africa. There has consequently been a tendency to lay more stress on technical education for children, on teaching them the sort of things they need to know in their own, primarily agricultural, background. The right use of the hoe, it is urged, should be taught as much as the use of the pen. But the emphasis placed by the Committee on the attainment of literacy makes the divergence wider than it really is. Universal literacy is essential if a people is to make social, economic and political progress. But neither

in the schools nor in the mass education projects does the Committee regard it as an end in itself.

Widespread literacy should be an immediate objective, but the acquisition of the skill of reading and writing should at no stage be the sole aim of a mass education system. The content of the material used in teaching reading and writing should be related to the people's needs and interests. . . .

Thus it recommends that the curriculum of the educational project should be built around the needs of the particular community in which it is being carried out. In one community it might be built around a soil erosion campaign; in another around a drive to reduce infant mortality; in another around the organisation and functions of a trade union or co-operative society.

The procedure of selecting outstanding problems would give a purpose to the teaching of the three R's and of all other techniques and subjects which would be readily appreciated by the community. . . .

### The Cost

There is, however, one gap in the Committee's bold and vigorous plan for mass education, and that is any estimate of the cost—which was not within its terms of reference. But the cost in money and physical terms is likely to be very great. It was, for instance, pointed out in Sir Frank Stockdale's report on development and welfare in the West Indies (Colonial No. 184) that the number of teachers required to provide for a 90 per cent school attendance of all children aged 5-15 in the whole area would be about 20,000, more than double the present number. If an average salary of £100 per annum is assumed, they would cost about £2,000,000 a year, whereas the total expenditure on elementary school teachers' salaries in 1941 was approximately £640,000. The proportionate increase in the cost in the African territories, where salaries may be lower but where even more leeway is to be made up, will be far greater. And in addition to greater numbers of teachers, if they can be found, there are buildings and equipment to be provided; libraries to be established; film units, broadcasting and other means of propaganda to be started. Clearly, the cost of mass education cannot be provided by the African colonies themselves; but it will almost certainly be more than the Colonial Development and Welfare Fund can bear if its present limits are adhered to. Additional calls on the British taxpayer will have to be made.

But made they must be. Here, in the report of this Committee, is a definite target, a plan which can be pursued without any inhibitions about possible harmful effects on backward peoples. Unlike development—industrialisation and so on—welfare projects can be pursued without restraint provided they are related, as in this plan, to the people's background, and no other scheme of welfare is so essential to native progress as education. At last the Colonial Office has a chance of answering its critics without renouncing its well-tried principles. The opportunity must not be lost.

## Swiss Difficulties

[BY A CORRESPONDENT]

IN the autumn of last year, difficulties in Switzerland's economy were frequently explained as due to a "peace psychosis" which had seized hold of the people—or at least some of the people. Clothing retailers thought people were deliberately refraining from spending their coupons on wartime products of poor quality in the hope that the war would end soon. A new wave of notes and gold hoarding was evident, and at the end of the year notes in circulation had reached 3,000 million Swiss francs against 2,637 million at the end of 1942. Household consumers rejected the low-grade home mined coal, and the unexpectedly steady import of coal from Germany actually resulted in the abandonment of the attempt to mine more coal in Switzerland. During 1943, coal imports amounted to roughly two million tons, against 1.9 million tons in 1942 and an average of 3.7 million tons during the last year before the war.

It would, however, be wrong to assume that the peace psychosis was the only reason for Switzerland's growing economic difficulties. The Swiss war economy was quite prepared for a duration of several years, and during the first two years of the war industry was comparatively well supplied with raw materials because of the huge pre-war stocks and continued German deliveries of coal, iron and steel and chemicals. Switzerland's particular wartime difficulty is that

even for the manufacture of artificial fibres, necessary for replacing imported wool and cotton, raw materials like coal and sulphuric acid have to be imported. This is also true of the chemical industry and the machine-building and engineering industry, which are entirely dependent upon imports of steel from Germany. There are also no non-ferrous metals. Only aluminium is produced in adequate quantities—from imported bauxite. It is used for replacing copper and other metals. Industry as a whole could not, therefore, expand appreciably, and already during 1942 the total number of workers employed in industry showed a small decline. The cotton, wool and clothing industries showed a marked fall as well as the foodstuff industries; but in the engineering and metal-working sections, the wood-working and the chemical and silk industries the number of employed increased.

Compared with pre-war years, Switzerland has achieved full employment. In the autumn of last year, barely 5,000 persons in search of work were registered, against 76,000 in January, 1939, and 41,000 in January, 1941. But a considerable number of men have been called up for military service, and agriculture has absorbed every available man. Actually, Switzerland's over-all industrial production is smaller than before the war. This is explained by the fact that the volume of imports during 1943 shrank to below 50 per cent of pre-war imports.

At present, Switzerland is probably the only country on the Continent where industrial and residential building is still on a comparatively high level. There has also been a steady expansion of hydro-electric power stations. During 1943, two new stations began operations, and a third one is under construction. In exchange for German coal and steel, Switzerland exports electric current to Germany. If pre-war figures can be taken as a guide, it may be assumed that at least one-eighth of the present generation of 8,000 million kWh go to Germany. Because of the lack of coal, some electric furnaces have been constructed. It has not, however, been possible to replace coal for household use during the winter months. Owing to the coal shortage, the boilers of shunting locomotives are heated by electric current, for the engineering industry had not enough raw material to build electric shunting locomotives.

During the fifth winter of the war, Swiss engineering and electrical machinery industries are complaining about the lack of orders from overseas countries. One of the leading electrical concerns has reported that, during the business year 1942-43, overseas orders had decreased to 3.8 per cent of total orders, compared with 30 per cent in 1939-40. Between a number of Swiss and German concerns very close connections exist, and it can be assured that German orders placed with Swiss firms or with Swiss subsidiaries of German concerns increased during 1943. Whether the famous Swiss armament firm, Oerlikon, actually delivers material to Germany can, however, be doubted, for Switzerland's own armament has obviously kept this firm fully occupied. The Swiss motor-car and repair industry is, however, fully occupied with the repair of German lorries. In short, the greater part of Swiss manufactures is exported to Germany, and the blockade of the Continent makes it impossible for Swiss firms to find other outlets than Germany and German-occupied or satellite countries.

In contrast to its comprehensive plan for agricultural expansion, the Swiss Government has been trying to steer a

\* Mass Education in African Society. Colonial No. 186. 1s. net.

compromise course between a fully regimented war economy and a relatively free peacetime economy. The rationing of clothing, shoes and soap was introduced piecemeal. The use of scrap and salvaged material was not organised for a long time. During the first year of the war, the sorting of textile waste and rags was still looked upon as work for the poor, or even as a form of charity for the poor. In 1943, a serious attempt was made to utilise steel scrap by the introduction of an "iron tax." This is not a money tax. It means that engineering firms are compelled to deliver their scrap just as a tax has to be paid. The more serious attempt to use waste and scrap material is one aspect of the war economy in 1943. The other aspect is an attempt to manufacture synthetic rubber as well as more artificial fibres. Here, again, the necessary raw materials have to be imported from Germany or other continental countries. There is no escape from the dependence on outside resources.

Price and finance control also show the mark of a compromise. In some industries maximum prices have been enforced; in others, price-stops after the German model have been declared. Yet effective price-stops depend on full regimentation and novel methods of costing, which were rejected as incompatible with Swiss opinion on the return to a free economy. The wholesale price index has, in fact, more than doubled during the war. The cost-of-living index has increased by 49 per cent, and average wages in industry by roughly 30 per cent. The standard of living has thus declined considerably.

A particularly interesting aspect of the financial situation is the traditional tax evasion of the Swiss population, as well as the hoarding of banknotes. Tax legislation recently recognised the tax evasion, which has grown during the war, by introducing a "Verrechnungs" tax—a tax for balancing accounts. From January 1, 1944, 15 per cent of all income from interest, dividends, etc., has to be paid as tax. It is deducted, together with the defence tax and coupon tax, at source. But this new tax is only an advance payment of taxes. The actual payments will be balanced at the end of the revenue year, and any amount in excess of the assessed total tax will be paid back. The Government thinks that in this way tax evasion will be reduced to a minimum. It is expected that this "advance" tax will yield from 30 to 40 million francs per annum. At the end of 1943, Switzerland had spent on military and direct war purposes 5,650 million francs beyond the ordinary Budget, of which only 30 per cent was covered by taxation. During 1944 the deficit will amount to roughly 1,000 million francs, which will have to be covered by loans.

## Eire's Finances

[FROM OUR DUBLIN CORRESPONDENT]

January 10th

THE Exchequer returns for the nine months of the financial year ended December 31st show that revenue amounted to £28,229,786, and expenditure to £31,860,930, leaving a deficit of £3,631,144. The figures for the corresponding periods in recent years show a steady increase of both revenue and expenditure:

|                  | Nine Months ended December 31 |        |        |        |
|------------------|-------------------------------|--------|--------|--------|
|                  | 1940                          | 1941   | 1942   | 1943   |
| Revenue.....     | 22,718                        | 23,424 | 25,231 | 28,229 |
| Expenditure..... | 26,319                        | 28,493 | 29,399 | 31,860 |
| Deficit.....     | 3,601                         | 5,069  | 4,168  | 3,631  |

In view of the extreme dislocation of the economic life of the country caused by the war, the revenue displayed a remarkable buoyancy. The following table shows the amounts received from the principal taxes in the last four years:—

|                                      | Nine Months ended Dec. 31 |       |       |       |
|--------------------------------------|---------------------------|-------|-------|-------|
|                                      | 1940                      | 1941  | 1942  | 1943  |
| Customs.....                         | 9,609                     | 8,647 | 8,428 | 9,128 |
| Excise.....                          | 4,820                     | 5,432 | 5,670 | 6,363 |
| Estate, etc., duties.....            | 1,028                     | 942   | 952   | 1,125 |
| Property, income tax and surtax..... | 2,600                     | 3,498 | 4,409 | 4,904 |
| Corporation profits tax....          | 243                       | 322   | 1,127 | 2,028 |

The deficit was bridged without the issue of any public loan. The balance in the Exchequer on April 1st amounted to £1,129,792. This was reduced by £866,000 to £263,449 on December 31st. Savings Certificates issued amounted to £862,000, and those paid off to £337,000. The net sum received in respect of these certificates was therefore £525,000.

The net amount borrowed by ways and means advances was £1,008,000. Large sums were recovered by way of repayment of advances from the Local Loans and other funds. The experience of other years was that the deficit at the end of the third quarter was greater than that at the end of the financial year, owing to the large receipts of income-tax in the fourth quarter. There is no reason to doubt that the same inflow will take place this year. In that case the Exchequer balance should be considerably higher on March 31st, and the financial year will finish without any further borrowing.

### The Capital Market

In the absence of any flotations of loans by the Government, the Dublin capital market has been very idle. The Waterford and Limerick Corporations issued two loans of £358,300 and £755,000 respectively both at 99 with interest at 3½ per cent. A large addition to the contingent public debt is foreshadowed by the proposal that the Great Southern Railways should be transferred to a new public corporation with an ordinary capital of £4,000,000, and State guaranteed 3 per cent debentures amounting to £16 million. Holders of guaranteed stock are to receive the equivalent of half their nominal stock in the new debentures and holders of the railways debenture stock are to receive an equivalent amount of these debentures. When these terms were revealed considerable speculation took place in Great Southern issues. The guaranteed stock rose from 51 to 62, and the debenture stock from 68 to 86. Allegations have been made that large fortunes were made by persons possessing confidential information regarding the proposed deal, and a judicial tribunal has been appointed to investigate these accusations.

On the morning of New Year's day, the shareholders of the Dublin United Transport Company were surprised to receive a circular from their directors stating that it was proposed to transfer the Dublin transport system to the new corporation. The basis of compensation is that the holder of every £10 preference share or £10 ordinary share is to receive State-guaranteed debenture stock of the nominal amount of £14 10s. The proposal has not been well received by the shareholders or by the Dublin public. The former are not satisfied that the value placed upon the shares represents their true earning capacity, while the latter fear that the transport services of the city will not be so efficiently managed by the new quasi-public corporation as by the existing company. The Government's policy is apparently to create a complete transport monopoly, and to entrust its operation to the new corporation, whose debentures will, in the last resort, constitute a liability on the state.

## Portugal Fights Inflation

[FROM OUR LISBON CORRESPONDENT]

December 7, 1943

FROM 1939 and, indirectly, from an even earlier period, Portugal has put up a hard fight against inflation. Forced to give ground, it has only done so inch by inch. The Government seeks to impress on the citizens that they are indeed front-line troops in this economic war; unfortunately they fail to realise it, probably because the daily casualties are so insidiously widespread, taking the shape of steadily rising prices which repressive legislation and official limits cannot in practice control. This is not a fault directly chargeable to the Government; the culprits are the members of the public, and in this matter of inflation they are digging their own graves. Broadly speaking, Portugal to-day is one black market; black, that is, as regards obedience to legal restrictions. For this reason the authorities have been morally forced to increase the pay of civil and military servants of the state by 20 per cent, which will come into force on January 1, 1944, and will add £1,300,000 to the Budget. Welcome as it is, it still falls much under living costs, which, calculated on official figures, are 65 per cent above 1938-39 and more than double when most unavoidable household charges are reckoned on what one pays in shops.

Bank deposits rise steadily. The figures of the six leading Portuguese banks in July, 1942, stood at 14 million contos, and to-day the sum is 19 million, with no possible productive outlet and the bulk of the money held in Lisbon. Perhaps closer ties with the United Nations may eventually help Portugal's economic plight. If, for instance, Portugal joins the crusade against Japan—as it has every cause to do—a way out may appear, beneficial alike to the country's current economy and to its future morale for many years to come.

## NUFFIELD

WHEN you bought your Wolseley in 1937, did you expect to be its owner five years later? Or that it would stand up as it has? But you can expect that sort of reliability of anything that bears the name Nuffield.

An announcement by THE NUFFIELD ORGANIZATION  
A CORNERSTONE OF BRITAIN'S INDUSTRIAL STRUCTURE

## More NEWS of WHITE HORSE

### When distillation ceased

You can make bricks without straw, but you cannot make Scotch Whisky without barley. Since the war began the fruits of each golden harvest have been called up for National Service. No more whisky is being made: distillation has ceased.

Yet in this fifth year of war you can still, with good fortune, obtain White Horse. This is because stocks have always been laid down many years ahead of the time when they will be released for your pleasure. White Horse was growing old when this war was young. It is therefore in your own interest that supplies should be very carefully regulated so that in the years to come you may still be able to enjoy White Horse, fine as a fine liqueur.

MAXIMUM PRICES: Bottles 25/9; Half-bottles 13/6

## G.E.C.

### IN WAR—AS IN PEACE at the service of the Empire

The correct illumination of docks and harbours is one electrification field in which the G.E.C., the largest British electrical manufacturing organization in the Empire has specialized.

In the days before the war "G.E.C." was a name which was always in the minds of engineers when complete electrification schemes were being considered. A G.E.C. installation is always an example of British enterprise and thoroughness.

Just now, the Company's vast research and manufacturing resources are devoted to providing equipment to help win the war quickly. When peace comes, however, the big technical advances made by the Company in all applications of electricity, including the important one of electronics, as a result of the urgent and ever-changing problems connected with the needs of war, will be available to all concerned with reconstruction plans in any part of the world.

### ELECTRIFICATION SCHEMES

G.E.C. Electrification Schemes have been applied to all industries, including: Aircraft Factories; Chemical Works; Collieries; Food Factories; Gold Mines; Iron, Steel and Copper Works; Locomotive and Railway Carriage and Wagon Works; Motor Car Works; Ships and Shipyards; Textile Mills, etc., etc.

**"If we are together nothing is impossible."** (Mr. Churchill)

The first Anglo-American lend-lease was a new kind of international "trade." It proved that the spirit of sharing is just as important in the economic field as it is in the battle-field.

To-day this all-in system of collaboration is growing and spreading among all the United Nations. Already it is being carried over to problems of peace by conferences on relief, reconstruction, agriculture and currencies.

It is the responsibility of world industry to bring its productive powers into line with these new "combined operations" for a just and durable peace. It is the responsibility of the citizen to see that such powers are used for the good of the many and not for the few.

Mr. Churchill has said that responsibility is the price of greatness. "If we are together nothing is impossible. If we are divided all will fail."

## IODINE: mystery story

It may seem strange to some of us to call iodine a mystery when so much is already known. Isn't iodine an element, vital to life and health? Isn't it true that no organism can live without it? It is the best known germicide, and for some purposes the only effective one. It is a counter-irritant, an aid in arthritis and rheumatism, a specific in the prevention of goitre. Lack of it will kill animals as well as men. Its importance is recognized and growing. Where is the mystery?

The mystery lies in what is yet to be discovered. Biochemists, veterinary surgeons, industrial scientists, working on a hundred facets of the subject, are finding in iodine one of the most fascinating problems of research. Consider some of iodine's recent applications: "Thermometer" Paints, which reveal in colour changing temperatures; Polaroid, which makes possible such diverse magic as non-glare headlights, stereoscopic films and visible representation of changing strains in plastic materials; and infra-red photography which makes hitherto invisible things visible.

So many new facts have been brought to light in the last hundred years that it has been necessary to set up an organization to disseminate this knowledge. This organization is the IODINE EDUCATIONAL BUREAU. It was formed in 1938. The services of this bureau are available free to any industrial or commercial undertaking with an iodine problem.

# THE BUSINESS WORLD

## American Indices

(From Our New York Correspondent)

WHILE post-war programmes, plans and proposals proliferate on every hand, suggesting objectives for the future, questions are being asked with increasing insistence as to where we are now. And despite the familiar American phenomenon of masses of statistics—a phenomenon not much lessened even by some wartime withholding—the questions do not evoke a ready answer and certainly not one that is convincing, either to many of the laity or to the professional initiates who ask them. This curious condition surrounds many of the measurements of basic aspects of our economic environment—and many others as well.

Industrial production is indicated for most observers by the venerable index of the Federal Reserve Board. The recent revision of this index—the second major one in four years—moved the index upward by about 40 points, or by about a fifth, to 247 (unadjusted for seasonal variations) for September, 1943. The extent of this jump has, despite official explanations, aroused a certain amount of scepticism, especially since some students felt that even before its revision the index was overstating output. The technicians apparently are going to argue about the matter for a long time to come. At root, the problem seems to be one of definition: the index is intended to indicate the physical volume of industrial output, and not the overall volume of business activity. It is not intended to be an indicator of the output of raw materials or of semi-finished goods, nor, on the other hand, is it a measure of effort expended, since man-hours, to the extent that they are used, are adjusted for productivity. The statement of these negatives may indicate the complexity of concept, and something of the reasons, quite aside from technicalities, for confusion about what it is that is now  $2\frac{1}{2}$  times the 1935-39 base. Probably whatever it may be defined as being will prove more unstable than the output of raw materials, and so the post-war adjustment may appear more drastic as measured by this index than it would by one of crude products of earth, air and sea.

Commodity prices are indicated for most students by the Bureau of Labour Statistics' index of some 800 items at wholesale, which came in for extensive criticism a decade ago in connection with questions about the value of the dollar when this country departed from gold. To-day its twin, the BLS index of the cost of living, has become highly controversial, due to its widespread use in connection with wage disputes. Last winter the Bureau invited a committee of experts of the American Statistical Association to examine the index. The report of this committee, headed by Professor F. C. Mills, was largely favourable, though to a considerable extent the committee defined away the basic questions of alterations of quality, black markets and higher prices of the only available substitutes for items in short supply. The precaution of an examination by an erudite committee, however, did not lay the question, and now an official committee of the War Labour Board is at work on the question of the cost of living as a part of the settlement of the continuing wage dispute. Probably, here again the root of the question is one of definition, and the wide regional and other differentials in this vast country, together with the great internal migration of workers, the changes in buying habits and alterations of supplies make arrival at anything like Websterian precision anything but easy. Just what it is that is 123.2 per cent (August) of 1935-39, or what the change in the cost of living has been, and where, is more likely to be determined by economic historians than current students.

Interest rates have always evoked the question of measurement, whether it was "the interest rate" of much theoretical writing or the question of choice of some typical paper in the market. More recently, as the paper of the federal government has been the preponderant item in money and investment markets alike, most measurements have been made in terms of such issues. But what rate or rates can be used for economic analysis to-day has become a very perplexing question. The

Government pays a different rate on new issues depending on their life:  $2\frac{1}{2}$  per cent for 22-27 years, 2 per cent for 10 years,  $\frac{3}{4}$  per cent for 1 year,  $\frac{1}{4}$  per cent for 3 months. But holders are developing an increasing tendency to amplify their interest income by holding for awhile and selling to take the appreciation which occurs as a security with fixed coupon approaches maturity. By this process the 1 year  $\frac{3}{4}$ s produce more than 1 per cent, and longer paper yields can be increased even more. Then the tax collector takes a major but differing slice of whatever has been reserved, depending upon the type of the return filed, the total income and the type of income. The Treasury also pays different rates on securities of the same maturity, the circumstances of the purchaser and his choice both being involved: e.g., 2 per cent on 10-year marketable issues,  $2\frac{1}{2}$  per cent on 10-year F and G bonds, and 2.9 per cent or more on E bonds. Here again definition enters, but, while a rate can be determined by defining away all but one alternative, the rate thus arrived at hardly can be held to be useful for any functional analysis.

Real property values have never been the subject of much generalised measurement, in spite of their great importance. But warnings have just been issued from official quarters that they are departing from stability. The Secretary of Agriculture, Mr Wickard, has sounded the tocsin regarding farm land prices, and the commissioner of the Federal Home Loan Bank System and of the Home Owners Loan Corpora-

LONDON DISTRICT HEAD OFFICE: 68 LOMBARD STREET, E.C.3  
HEAD OFFICE: WATER STREET, LIVERPOOL, 2

tion, Mr Fahey, has done so regarding urban real estate. Mr Wickard said on November 18th: "The evidence available to the Department of Agriculture clearly indicates that a genuine farm land boom has gained momentum in some of the important agricultural regions of the country," and a heavy tax on second transfers is being proposed in Congress to lessen speculation. Mr Fahey said, on November 30th, referring to Mr Wickard's speech: "It is very evident that the prices of urban homes are moving up with almost equal rapidity, and the trend is as serious as that of farm land prices. . . . The figures on 1,186 loans made . . . during the last three months are certainly disturbing as an indication of present trends." Mr Fahey stated that the new mortgages made were \$1,793,723 in excess of the outstanding loan balances on the properties, an average increase of \$1,500 a property. (The properties are, by definition, residential.)

Moreover, the new loans were 4.2 per cent in excess of the original HOLC loans on these properties, which, it should be remembered, were inflated by delinquent principal and interest and usually overdue taxes, insurance and repairs. The houses on which these new loans were placed averaged over 22 years old. Yet the Department of Agriculture farm land price index is but 105 per cent of the 1912-14 base, and in some sections, including New York, urban values are considered still depressed.

The layman has a great advantage over the technician and the statistician in all these regards. He says simply that production is "high," that the cost of living is "high," that interest rates are "low," and that property values are "improving." If these terms do not satisfy the technician, neither does his jargon satisfy the layman. Which is more conducive to thought about the future is itself probably debatable.

## Business Notes

### The Bankers' Speeches

The chairmen of the Big Six have now made their pronouncements on the state of the nation. They follow a fairly cohesive pattern. Their remarks on the banking situation are necessarily colourless because its changes have been lacking in the spectacular. Lord Wardington showed, perhaps, the greatest candour in admitting that the balance-sheets now present a picture which in former days "would have been considered much more applicable to an investment trust than to a bank." Mr Stanley Christopherson, on whose shoulders has fallen the mantle of Mr McKenna, pointed to the exceptionally high liquidity of the banks—a figure of 55 per cent had been reached by the Midland, and this without the spurious aid of window-dressing—and from this turned to the problem of the banks in financing the switch-over from a war to a peace economy. The Midland Bank has already established a "committee on post-war business problems"; the policy of the bank will be

to furnish the fullest possible support for promising enterprise under good auspices, support which shall be based as much on the character, integrity and business capacity of the borrower as upon the extent and nature of his own material resources.

Lord Wardington, on the same subject, suggested that, given their exceptional liquidity, the banks might in future "be more elastic in their views as to what constitutes a legitimate banking loan," and might look more leniently on loans for capital purposes.

The chairmen devoted their main attention to post-war problems. Most of them showed some proficiency in the jargon of "full employment," and, with reservations, stressed the need for economic controls in the transition from a war to a peace economy. Mr Edwin Fisher argued that

no one will want to see the continuance of any control which has outlived its purpose, for, though there must always be safeguards to protect the interests of the state and the community, the very same interests are best served by giving full rein to those priceless assets, individuality and enterprise, which can flourish only in an atmosphere of freedom.

Mr R. E. Beckett pointed out that it was mainly on the export side of trade that unemployment had been most marked and proved so obstinate to cure, and added that in this respect difficulties had not decreased but multiplied. Mr Colin Campbell stressed that

legislation alone cannot create prosperity, however important it may be in its own realm; it is to the sound and energetic development of industry that we have to look.

Sir R. Noton Barclay pointed out that "it was under free exchange and normal trading that successful commercial enterprise was built up," and warned his audience not to

regard the operations and results of wartime controls as a reliable criterion of their behaviour in peace. On the whole, there is no doubt where the bankers stand on this issue.

### Waiting on Events

For those who expected the new year to bring a distinct rally in market prices, the first three weeks of January have proved disappointing. It is true that both indices of *The Financial News* show a steady rise, but it amounts to only a fraction of one per cent since the end of the year, and other indices are less favourable. The average broker has tended to talk of falls almost every day, but such declines as have occurred have either been small or have occurred in the frankly speculative mining shares and in foreign bonds. In view of these movements, it is not surprising to find that, apart from a couple of days at the beginning of last week, there has been very little expansion in the money volume of business. When the number of bargains increased, a number of small sellers emerged, but on most days demand and supply from the public were more or less in balance. The only fresh factor of general interest to emerge is the statement that a number of industrialists, outside the war industries, are finding that they can employ more money in their business, or are hoping shortly to be able to do so. This would suggest some miscellaneous selling and it is all the more remarkable that there is a re-emergence of the belief that before long, possibly as soon as the Second Front is definitely in being, equities will achieve a new high level. This can only be based on the belief that there will be some relief of the limitation on profits when the war is won, which is no doubt an incentive to an energetic drive for maximum production at minimum prices. Before this happens, some of the promised Government steps towards post-war reconstruction will have been taken. Anything which makes the Government's intentions clearer is likely to produce opportunities for switching investments.

### Coal and Steel Prices

The overriding need at the moment is for more coal at almost any price to prevent a serious shortage during coming months. But there is another aspect of coal which may well become its number one problem after the war, that is its price. In an address on the future of the chemical industry last October Lord McGowan expressed anxiety about the rise in the price of coal. He stated that pit-head prices in the United States were lower than in Great Britain by the equivalent of 10s. a ton, that is by an amount little less than the pre-war cost of coal at the pit in this country. The problem has again been raised, not by an industrialist, but by Mr John Brown, General Secretary to the Iron and Steel Trades Confederation. Here are some sentences from an article contributed by him to the January issue of his union's journal, *Man and Metal*:

Our one-time industrial supremacy was based on cheap coal, and we firmly believe that without a plentiful supply of coal at a reasonable price it is doubtful if the country will be able to hold its own against world competitors possessing both modern plant and cheap coal. . . . We believe with coal at a reasonable price we should have no difficulty whatever in meeting world competitors . . . but it is certain that

the iron and steel industry cannot carry any further increase in the cost of fuel, if it is to remain an effective competitor for world trade in the post-war world.

Mr. Brown did not merely state the problem; he also proposed its solution in realistic terms. He suggested the technical reorganisation of coal-mining as a means to higher productivity which would make it possible to combine good wages with reasonable prices, and he pointed out that competent mining engineers claimed that if 50 per cent of the coal mines were fully mechanised and the long walks of miners underground to the coal face were eliminated, output per man could be substantially raised. In the view of Mr Brown it is doubtful whether the requisite technical reorganisation of the industry will be carried out within the present system of private ownership; but he readily admitted that mere nationalisation would not necessarily "cure the trouble." Indeed, he pointed out,

in conversation with rank-and-file miners, we have formed the impression that they appear to look forward to nationalisation of the mining industry as a means of improving their wages and conditions of employment rather than of reducing the cost of coal to the consumer.

Mr Brown has not merely shown courage in speaking bluntly; he went straight to the heart of the problem; and he gave an example of the sort of constructive criticism which spells progress. But cheap coal alone cannot ensure the future of the iron and steel industry. Perhaps Mr Brown can be equally outspoken about the problems of his own industry.

### Grouping of Coal Mines

Although both the Mining Association and the Mineworkers' Federation agreed some time ago in principle to the Government scheme for the grouping of pits in order primarily to facilitate supervision, and to secure the more effective employment of the best available expert technical advice in the service of the industry as a whole, the conditions in which the new production directors are to be engaged are still under discussion. The contemplated grouping will not affect either the ownership of the pits or the financial structure of the companies concerned; this is a serious weakness, for it is unlikely that the full benefits of grouping can be realised without financial pooling. Nor does the scheme impose any new executive responsibility for day-to-day management or the safety of the pit. Colliery managers are to continue to discharge the administrative functions entrusted to them by the terms of the White Paper of June, 1942, but the new group production directors will be required to resign their present directorships of coal-mining undertakings as well as their present executive posts in the industry. Each group of pits will be an administrative unit, but in the choice of the pits to be included in each group the regional controller must enter into informal consultation with the representatives of the workmen as well as those of the owners. Once the groups have been determined, the responsibility of advising individual undertakings on the steps necessary to increase production will rest with the new directors, and, to use the terms employed in the official intimation of the scheme to the industry, "if the Group Production Director fails to secure his object his function will be to advise the Regional Controller to use the powers of the Minister under the Defence Regulations." It is intended that as far as possible the new directors shall supervise the pits of the companies to which they were formerly attached, but, when desirable and convenient, other pits may be brought under their supervision.

### BAT Profits Recover

The preliminary statement of the British American Tobacco Company for the year ended September 30th last shows a rise in net profit after tax from £3,065,348 to £3,321,735, and an increase in the total tax-free dividend from 10 per cent to 10 5-6ths per cent. The recovery in profit is about one-quarter of the heavy fall suffered in 1941-42, and rather more than sufficient to cover the increase in distribution. Of the increased earnings, £100,000 is transferred to employees' benevolent fund, but, if this is treated as being part of the amount earned for the ordinary capital, the earned percentage is 11.5, against 10.4 for the preceding year and 14.7 per cent for 1940-41. The effect of the announcement on the market was a rise of almost 2s. in both BAT and

Imperial shares, with smaller advances in most of the other tobacco shares. So far as Imperial Tobacco and Tobacco Securities Trust are concerned, some rise is justified by the holdings they both have in BAT, but it is very doubtful whether the improvement in results just disclosed is any real guide to probable earnings and distributions of companies whose operations are restricted mainly to this country. At the closing price of 109s. 4½d., BAT £1 ordinary yield some £1 19s. 10d. per cent, tax free. The Imperial dividend is expected in the course of a few days, and, if the payment is unchanged at 17½ per cent tax free, the yield on yesterday's close of 8 will be some £2 4s. 4d. per cent tax free.

### Remuneration of Capital

There is a growing tendency to suppose that a number of expedients, probably necessary in wartime, can be transferred to our peacetime economy with benefit to the public. Into this category falls the familiar practice of gearing the profit on Government contracts to the capital employed in the business. This particular point is discussed at length in the current issue of *Accountancy*, where it is defended on the ground that the investor is entitled to no more than interest on his money plus an allowance for the risk involved in the particular industry. No allowance is given to him as a reward for the efficiency of management because management salaries, which are the main cost element corresponding to enterprise, are put down as a cost in advance of the calculation of profit.

Except insofar as it is to be implied from the general matter under discussion, it is nowhere suggested that this argument is applicable only, or even mainly, to wartime conditions. If it is intended to be so restricted, it remains the case that many efficient managements are far from satisfied that their enterprise should receive no more reward in the way of profit to the concern they run than does the inefficiency of other managers. There is little evidence that it is the efficient managers who secure, under this system, the highest remuneration. Methods have been developed even in wartime by which differential efficiency is rewarded and if in peacetime there is to be a retreat to less flexible systems, it would destroy the whole basis of private investment. One of the principal risks which the holder of equities is called upon to take is that the management will prove inefficient and the investor who takes the trouble to attempt wise selection has to be rewarded for that as well as for other contributions. Further, if retainable profit is to be based on capital employed and not on earning capacity, the efficient firm will be no better placed than the inefficient, either to retain profits for expansion or to obtain new money capital from the market.

### Purchase Tax in US Imports

On Friday last week the United States Customs Court decided that the purchase tax should not be taken into account in the assessment of import duties on British goods. This interpretation of the American tariff laws is of considerable importance in that it should facilitate British exports to the United States, especially of luxury goods. The purchase tax was introduced in October, 1940, at the rate of one-sixth of the wholesale value of the more essential items of clothing and household goods and of one-third of the value of the less essential and luxury goods. The tax chargeable at the rate of one-third of the wholesale value was raised to two-thirds for a large number of goods in 1942, and to 100 per cent in 1943. The list of goods chargeable at this high rate is

a long one, including, by way of example, many high-quality textiles, clothing made of fur, jewellery, musical instruments, cameras and ornaments. The court's decision means that the import duty on these goods will be substantially lower than it would have been if it had been calculated on the value as inflated by purchase tax. Indeed, the latter basis might possibly have involved the exclusion of many British goods from the American market. Since the purchase tax on non-essentials can hardly be expected to be abolished immediately after the war, and as a tax on luxuries might well become a more permanent feature of the British fiscal system, the effect of the decision may influence British exports to the United States after the war, especially as there may be a good demand for luxuries.

### Revising Motor Taxation

It is excellent news that Sir John Anderson is engaged in a review of the system of motor taxation and that full weight is to be given to the possibility of encouraging the construction of higher horse-power engines by this country. A plea for this revision was put forward in *The Economist* on August 28th last, when it was pointed out that the immediate post-war period was likely to present particularly favourable opportunities for the entry of the British car into the export market. The matter is one of some complexity. The question of what total taxation should be paid either by the private motorist or the commercial vehicle is too large to be discussed here, but it is apparent that there is room for a change in method of levying the tax. It is true that the horse-power tax has proved a protection for the home market, but it has also meant that, in a large measure, British motor manufacturers were restricted to the home market and that cars were dearer than they might have been had wider opportunities offered. The present time, when the stock of cars in this country must be very low and when technical progress will call for a drastic overhaul of models as soon as possible after the war, is propitious for a change so far as the domestic trade is concerned. The great shortage of cars in almost every country presents an excellent opportunity for Britain to enter the export trade on a substantial scale, while the excess productive capacity—now largely employed in aircraft but

convertible, in part, to cars—gives a reasonable assurance that men and machines will be available to meet any demand which arises. If, as was suggested in August, a tax on the price of the car were substituted for the horse-power tax the way might be open for Britain to make types of car which would meet the requirements of overseas as well as home demand.

### Future of Gas

The report on the future of the gas industry published by the British Gas Federation last November—it was discussed on page 620 of *The Economist* of November 6, 1943—is the subject of an interim report issued by a Committee of the Association of Municipal Corporations. The British Gas Federation had proposed a detailed scheme of integration and technical development within the present organisation of the industry; nationalisation was held to be unnecessary at this stage. The committee of the Association of Municipal Corporations does not accept the conclusion of the British Gas Federation that the transfer of the gas industry to municipal ownership would solve few, if any, of its problems, and, instead, suggests that this demands "earnest consideration." Like the distribution of electricity, the gas industry has its patches of inefficiency in public as well as in private undertakings; these should be eliminated, but a general transfer of the ownership of private undertakings to municipalities seems a solution of doubtful value. The AMC is on sure ground when it says:

We are of the opinion that, if the integration of the gas industry is to take place, a review of the industry as a whole must be undertaken by an independent body, and proposals on the findings of such a body should be presented to Parliament with a view to legislation being passed.

This is the right sort of approach to the problem. A controversy in terms of municipal versus private ownership is likely to end in a cul de sac rather than to pave the way to technical reorganisation and cheaper gas.

### Housing Policy

The principal theme of the joint conference on post-war housing, held by the Royal Institute of British

## AN ESSENTIAL OF WARTIME DIET

Stored in this tiny capsule are two vitamins without which it is impossible to maintain health. They are 'protective' vitamin A and 'sunshine' vitamin D and, unfortunately, they are not always readily obtainable in a wartime diet.

A daily dose of Crookes' Halibut Oil—one of the richest natural sources of these vitamins—will build up your resistance and stamina and prove of inestimable value during this fifth winter of war.

## CROOKES' HALIBUT OIL

Obtainable only from chemists

Architects, the National House-builders' Registration Council and the Building Societies Association last autumn, is the need for an early announcement on Government policy. Their report states:

The total absence of any definite lead as to Governmental intentions prohibits the formulation of any practical plans for post-war development. . . . The Conference urges the Government to announce its policy with regard to housing, planning and post-war development generally.

The delay in announcing any decision, it is stated, may well impede the development of the programme for building four million houses in the next ten years. The Conference's specific recommendations are that the planning of sites should be subject to the approval of the Ministry of Town and Country Planning (or appropriate central planning authority); that the design and planning of houses should be subject to approval by the local authority, approval being the responsibility of the authority's qualified technical staff where one is employed, or otherwise by a statutory panel as recommended by the Scott Committee; that the local bye-laws should be properly enforced; and that the quality of workmanship and materials should be certified by the Housebuilders' Registration Council, which would be provided with statutory authority. The present procedure, by which a building owner sometimes has to apply to seven different authorities should be replaced by a single application to a single appropriate authority. The report is interesting mainly because it gives the architects' and builders' point of view. They urge the need for greater co-operation between their two professions, a co-operation which can only be brought about by greater public education, and if more attention is paid to design by architectural schools. Neither body seems to like the idea of pre-fabrication, but the Conference is prepared to have an "open mind" about its merits. The report stresses that private enterprise should play a leading part in the provision of houses.

#### Building Labour

It is widely recognised that a bottleneck in post-war housing may be the shortage of building labour. The publication of the first report of the Building Apprenticeship and Training Council, whose chairman is Sir Malcolm Trustram Eve, is therefore timely. Proceeding on the assumption that the industry will require 500,000 craftsmen, the Council estimates that an annual intake of 15-20,000 apprentices will be required to offset normal wastage, and in order to raise the total apprenticeship strength to 75-100,000 a year. The aim should be a force after the war of 600,000 craftsmen, including apprentices. The Council emphasises the need for a great development of pre-employment education. It suggests that boys who have had such education should be given priority for apprenticeship and that attendance at technical courses should be made compulsory for apprentices up to 18 years of age. It recommends a minimum apprenticeship age of 15, and five years' apprenticeship. The Council also recommends the compulsory registration of apprentices and the supervision of the apprenticeship

schemes by the joint apprenticeship committees in the industry. The Board of Education and the Scottish Education Department have been urged to facilitate the expansion of junior technical education. At present there are only 4,400 annual places in building technical schools. The report points out that

as post-war reconstruction will depend fundamentally upon the building industry, which in turn will be very much affected by the opportunities for technical education in building, the adequate supply of capable teachers and instructors . . . is a matter of urgent and capital national importance.

At present there are only between 150 and 200 teachers and instructors; the estimated number required is 1,500. The Council asks for special consideration to be given in demobilisation to suitable teachers. Another limiting factor may be the shortage of premises, and, wherever possible, it is urged that priority in building labour and materials should be given. In its calculations, the Council emphasises that in the absence of a Government decision on the building programme and priorities, it is difficult to make precise estimates.

#### Foreign Loans—Market Representation

Dissatisfaction with the result of recent debt negotiations with South American countries appears to have stirred brokers throughout the country to attempt some action with regard to future settlements. It is not, of course, the case that brokers and jobbers have in the past not been consulted prior to and during negotiations, but they have been consulted as individuals, and there has been no body which could make the weight of the profession felt. In the past, the matter has been left wholly to the Council of Foreign Bondholders, on which the profession has not necessarily any representative. There are many who feel that the whole machinery of the Council requires drastic overhaul, but the present suggestion appears to have nothing to do with that aspect of the matter, and so far suggestions are purely tentative. What is immediately required is the constitution of a small standing committee, representative of both London and the provincial exchanges, whose duties it would be to ensure the collection of, and to make available, all information bearing on the question of foreign loans, to sound opinion on any matter of interest, and to put forward authoritative recommendations as to what considerations ought to be kept in mind in any particular case. Obviously, at this stage, some form of consultation and, probably, co-operation with the houses responsible for the issues would be indicated, and, if agreement were achieved, any suggestions advanced ought to have very great weight with those to whom the actual negotiations were entrusted, whether the existing Council or some alternative body. This would be a long step forward, and it would tend to ensure some measure of agreement among different classes of British bondholders as to the equity of the final arrangements. Also, agreed recommendations would have more influence both on the borrower and on competing creditors than the unsupported opinion of the negotiator, however eminent.

#### Insurance Exports

The export in "insurance" during the war has been particularly valuable in that it has demanded no shipping space and a minimum of manpower. In the post-war period the relative importance of the industry in comparison with pre-war days will be enhanced by reason of the shrinkage in income from overseas investments. On these questions there can be no two opinions. Differences sometimes appear, however, in estimates of the amount of insurance earnings in the past, present and future. Mr E. B. Ferguson, the chairman of the Insurance Institute of London, stated last November that the sum earned in a recent year was about £15 million. Mr J. Dyer Simpson, the general manager of the Royal Insurance Company, in a letter to *The Times* on January 10th, put the annual rate immediately before the war at £11 million and the present figure at £12 million. Underwriting experience will vary, of course, from year to year, although the global canvas on which operations are conducted to some extent compensates local fluctuations. Apart from this, a distinction must be drawn between earnings in the shape of underwriting profits and interest income, on the one hand, and the extent to which these are received here as remittances and dividends, on the other. It is earnings in the latter sense which enter into the balance of trade on current account, and these are both more constant and lower in amount than profits plus interest income; differences retained overseas constitute, in effect, exports of capital, often used to finance expansion of business. Mr Simpson takes exception to a suggestion in the Conservative sub-committee's report on the future of industry that earnings from British insurance will "for the time being" be reduced after the war, and points to the increase which has occurred since 1939, notwithstanding the loss of business in enemy and enemy-occupied territories. The trend is certainly upwards, but Mr Simpson is perhaps a little over-optimistic, since the increase since 1939 is largely associated with the wartime expansion of industry in the United States and the Dominions, and the conclusion of hostilities may bring a return to more normal levels; moreover, re-establishment of connections in liberated countries may well involve some years of unprofitable trading. Nevertheless, it is gratifying to record the fact that there is one export industry whose contribution to the balance of payments is, and can be expected to remain, of the same order of magnitude as before the war.

#### Research in Shipbuilding

The shipbuilding industry will be as vital to Great Britain in the future as it has been in the past, but it must remain an industry not merely capable of building ships economically, but of building ships which fulfil their purpose as efficiently as possible in terms of running costs, speed and so on. If the fleet of merchantmen is to be restored to anything like its pre-war volume by British shipyards, they will be fully occupied for a number of years after the war. Their task will be to re-equip the merchant fleet with the best ships that it is possible to construct. There are indications that the industry is alive to its responsibilities. For example, the Shipbuilding Conference, the industry's trade association, has announced its decision to supplement research by individual companies with collective research through an association to be called the British Shipbuilding Research Association. This will consist of a Research Council—a policy committee on which the Department of Scientific and Industrial Research is to be represented—and of a Research Board whose members are to include experts on shipbuilding, marine engineering and ship-repairing, as well as on shipping. The inclusion of representatives of the shipping industry, that is of the "consumer," is symptomatic of a new outlook.

#### The Discount Year

The experience of the London discount market in 1943 was very similar to that of 1942. The rate structure underwent no alteration, and the margin between the price paid for money and that earned on discounted bills remained exiguous. For the market as a whole, it is doubtful if the profit earned on running and reselling bills succeeded in covering overhead costs. The substance of the market's earnings came from operations in short-term bonds. The prices of these underwent inconsiderable fluctuations in the past year, and the opportunities for profitable jobbing in these securities can have been few. The average profit on "running" bonds must, however, have worked out at

slightly over one per cent, and a glance at the accompanying table showing the bills, investments and profits of the three public companies in the market will show that it is from this source that the bulk of the profits have been derived. The chief feature of the discount companies' figures for the past

EVERY BANKING FACILITY

sion is a minor facet of the growth of banking credit during the year. The clearing banks, as far as may be judged by the balance sheets hitherto published, have contributed only a part of the additional funds left with the discount market. At least as large a contribution must have come from Empire banks and other non-clearing bank sources, and represents part of the accumulation of abnormal sterling balances in the London market. The discount chairman's statements accompanying the reports do not break much fresh ground. Mr A. A. Jamieson, of the Union Discount, argues that his company, "by assisting in making a market for short-dated Government bonds has contributed to the smooth working of the financial machine," and thus acknowledge that the discount market has, in effect, become an extension of the gilt-edged market. Sir Sigismund Mendl, of the National Discount, points out that his company has been able to extend its operations in the short bond market during the year, and adds that these operations were largely responsible for the satisfactory results achieved. Of the three, only Mr Colin Campbell, of Alexanders Discount, turns his eyes to the future and there discerns the hope that the discount market will be able to play its part in the change-over of industry from war to peace. This suggests that the domestic acceptance credit will have an appreciable part to play in post-war industrial finance. Provided the existing margin between bank loan and discount rates can be held, there should be scope for the development of the domestic bill.

Two developments reflecting the financial strength of the market should be noted. The Union Discount has increased its reserve fund from £1,000,000 to £2,000,000 by transferring £700,000 from the hidden reserve for contingencies and £300,000 from undistributed profits. The National Discount, which at the end of 1943 had a paid-up capital of £1,000,000 and a reserve fund of £1,576,667, is capitalising £576,667 of the reserve by paying up £2 10s. of the £5 uncalled liability on the "B" shares of £7 10s. This will reduce the uncalled liability to £2 10s. per share, increase the paid-up capital to £1,576,667 and reduce the reserve to £1,000,000.

#### CPRB Textile Committee

The Combined Production and Resources Board has appointed a Textile Committee, consisting of Col. W. A. Grierson DSO, for the United Kingdom, Mr H. L. Bailey for the United States, and Mr S. G. Dixon for Canada. The new Committee takes the place of the former sub-committee, and its formation is due to the importance of textiles in war production, and the part to be played by them in post-war relief. The main tasks of the Committee are to survey the requirements of the United Nations, relating them to capacity, and to recommend to the Combined Board the contribution of each country to the total required. In this country, the limiting factor in production is shortage of

labour, but in the United States production is greater than it was before the war. Government orders, despite a gradual decline, absorb well over half the supplies of wool and cotton textiles, and a larger share of other textiles. Although the quantities left for civilian consumption fall short of demand, clothing has not been rationed in the United States. Special measures have recently been taken to ensure a sufficient supply of essential civilian clothing by changes in price control designed to diminish the disparity in profit margins between different classes of goods. The bottleneck in American textiles is in manpower and machinery, and endeavours to improve the supply of civilian goods by lifting quota restrictions from cotton and wool have failed. The size of American contributions to foreign and relief textile requirements depends in no small measure on future military requirements. The peak has apparently been passed, but any decline in orders cannot be more than slow and gradual.

#### Woolcombers' Wages

The report of the Court of Inquiry into wages and hours in the woolcombing section of the wool textile industry, which was appointed in September, 1943, under the chairmanship of Sir Harold Morris, makes a number of important proposals for simplifying the extremely complicated and anomalous structure of wages. The present rates consist of a basic rate, plus 10 per cent, plus a cost-of-living addition of 112½ per cent; they vary from 42s. 0.73d. to 76s. 0.89d., and are applicable to no less than 35 different categories of workers. The operatives cannot understand how their pay is calculated, and trade union officials spend a great deal of time explaining the basis of calculation. The Court suggests that the rates should be revised to fall into five groups, and that they should be flat rates consisting of a basic rate plus a war advance, instead of the cost-of-living sliding scale. This would mean rates ranging from 47s. to 51s. a week for women, an increase of approximately 5s. a week, on the average, and 66s. to 74s. a week for men on day work, and 74s. to 82s. a week for men on night work, an average advance of approximately 3s. a week. The Court finds that the present system of bonus on production is unsatisfactory, and is not observed by the majority of firms, and suggests that a new scheme on clear and simple lines should be formulated. It also proposes that a wage-for-age scale should be introduced for youths, and that the Wool (and Allied) Joint Industrial Council, which ceased to function in 1931, should be revived. The Court's report is in no sense an award, and is submitted to both sides for consideration. But employers and unions alike are agreed upon the need for simplification. There is no doubt that the present complex structure creates a great deal of dissatisfaction, and is an ever present cause of industrial strife.

#### Silver Consumption in the US

The annual silver review of the New York firm of Messrs Handy and Harman contains some exceptionally interesting information on the volume and nature of US consumption of silver during 1943. It was last year that action was taken by Congress to make Government-owned silver available for sale or lease, and 1943 was the first year since the inauguration of the silver purchase programme in 1934 during which the holdings of the US Government decreased. No foreign silver was bought during the year and the acquisition of newly mined domestic silver amounted to only 54,000,000 ounces. Considerably more than this amount was made available by the US Treasury to American industry and for lend-lease shipments abroad. Messrs Handy and Harman estimate that during 1943 a total of 125,000,000 ounces of silver was used in the arts and industry in the United States. This was 10,000,000 ounces more than in 1942 and about four times the average maintained during the five years prior to 1941, the first year in which any appreciable use of silver was made in the war effort. There was a considerable increase last year in the production of silver lead solders ordinarily employed in the canning industry. Larger quantities of solder were also used for airplane engine bearings and contacts and other electrical parts. Silver brazing alloys continued in more diversified use in war production, being utilised to make joints in metal parts such as ships, planes and tanks. In non-essential fields the manufacture of silverware jewellery was limited to the use of domestic silver only (which costs 71.1 cents an ounce as against 45 cents for imported silver),

and since February 25, 1943, the amount of silver for such non-essential purposes has been under quota restrictions by the War Production Board. Production figures for 1943 have been difficult to obtain. Tentative estimates for the four largest producing countries have been made by Messrs Handy and Harman and are as follows: United States, 44,500,000 ounces, a reduction of 18 per cent on 1942; Canada, 18,500,000 ounces, a reduction of 16 per cent; Mexico, 87 million ounces, an increase of 8 per cent; Peru, 16 million ounces, unchanged. The sharp reduction in US production is mainly due to the scarcity of mine labour and materials.

#### Hill Sheep Farming

Before the war hill sheep farming probably suffered more from the general decline in agricultural prosperity than other types of husbandry. The changing character of British agriculture in the last seventy years, with its shift of emphasis from wheat and wool to milk, dairy products and vegetables, was bound to affect hill sheep farming. Upland grazings are not so amenable to improvements as lowland grass, and higher upland sheep came to be more a source of raw material for lowland grazing than direct suppliers of the meat market. The exodus of workers from the land affected the hill farms to a greater degree than the lowland farms. Thus, hill sheep farming has become a problem within the general one of agriculture. This has

been recognised in two reports, published this month: the Report of the Committee on Hill Sheep Farming in England and Wales (Cmd. 6498) and the Report of the Committee on Hill Sheep Farming in Scotland (Cmd. 6494). The terms of reference of these committees, which were appointed by the Agricultural Improvement Council and the Department of Agriculture for Scotland more than two years ago, were to investigate the present position of hill sheep farming, and to suggest measures to improve grazing, the quality of sheep, and systems of management. Both committees agree that the position is deplorable, and that firm and long-term measures must be taken if this branch of farming is not to die out. Their recommendations are largely similar. They agree that without Government assistance nothing can be done, and a long-term policy is suggested for a period of ten to fifteen years. Both reports deal in detail with the kind of improvement wanted, in the grazings themselves, and in the sheep. The problem of the return of labour to the hills is discussed and the desirability of improving amenities stressed. More research, and the setting-up of hill sheep research stations, is recommended. The war has arrested the decline in hill sheep farming, but its share in the general agricultural wartime prosperity is small. If it is desirable that hill sheep farming should be rescued from the depression and waste into which it has fallen, measures will have to be taken by the Government to implement many of the Committee's recommendations.

## ALEXANDERS DISCOUNT COMPANY, LIMITED.

24, LOMBARD STREET, LONDON, E.C.3. Telephone: Mansion House 8151. Established 1810.

**CAPITAL AUTHORISED** ... **£1,800,000.**  
Capital Subscribed, £1,800,000. Paid-up, £1,000,000. Reserve Fund, £1,000,000.  
£200,000 in £2 (fully-paid) 6 per cent. Cumulative Preference Shares. £1,600,000 in £2 Ordinary Shares (£1 paid).

**DIRECTORS:**  
COLIN FREDERICK CAMPBELL (Chairman).  
SIR AUSTIN EDWARD HARRIS, K.B.E.  
ROBERT ALEXANDER  
GEORGE CLEVERLY ALEXANDER.  
FRANK NEWCOMB.  
**JOINT MANAGERS:** EDWARD J. BOWIE. ANTONY MACNAUGHTEN. ASSISTANT MANAGERS: C. C. DAWKINS. E. P. B. BAGGALLAY.  
**BANKERS:** BANK OF ENGLAND and BARCLAYS BANK LIMITED. SECRETARY: P. C. TONG.

#### SEVENTY-SIXTH REPORT OF THE DIRECTORS.

To be submitted to the Shareholders at the Ordinary General Meeting to be held at the Offices of the Company, 24, Lombard Street, in the City of London, on Wednesday, the 26th day of January, 1944, at Two o'clock in the afternoon.

The Directors beg to submit to the Shareholders the statement of the affairs of the Company for the year ending 31st December, 1943, and in doing so would draw the attention of Shareholders to the form in which the Accounts are set out, which differs from that of previous years. The figures as now presented give a simpler picture of the financial position of the Company, and are submitted after consultation with the Auditors.

After making provision for rebate, taxation and contingencies, the Accounts show a gross profit for the year of £139,028. After allowing for current expenses, there remains a net profit of £94,216, which, with the balance of £179,406 brought forward from last year, gives a total of £273,622.

From this sum the Directors have transferred £5,000 to the Staff Pension Fund, and have paid Interim Dividends (less Tax), totalling £23,000. They now recommend the Payment of the Preference Dividend for the six months (31st December, 1943, and a Dividend on the Ordinary Shares at the rate of 20 per cent. per annum for the final half-year (making 17½ per cent. for the year), leaving £192,622 to be carried forward to the next account.

The Members of the Board retiring by rotation are Mr. Frank Newcomb and Mr. Robert Alexander, who being eligible, offer themselves for re-election. The Auditors of the Company, Messrs. Price, Waterhouse & Co., who retire in accordance with the Articles of Association, offer themselves for re-appointment.

The Dividends will be payable on and after 27th inst.  
24, Lombard Street, LONDON, E.C.3.  
12th January, 1944.

By Order of the Board,  
P. C. TONG, Secretary.

|                                                                                                    |   | £57,411,956 |                                                             | £57,411,956 |

#### AUDITORS' REPORT.

We report to the Members that we have obtained all the information and explanations we have required. We have examined the Securities and Bills in hand and verified those in the hands of Depositors. In our opinion the Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Company's affairs according to the best of our information and the explanations given to us, and as shown by the Books of the Company.

## MR S. CHRISTOPHERSON'S VIEWS

The ordinary general meeting of the Midland Bank Limited will be held on the 27th instant at the head office, Poultry, London, E.C.

The following is the statement of the chairman, Mr Stanley Christopherson, circulated with the reports and accounts:—

## THE LATE MR McKENNA

We shall gather at our fifth war-time annual meeting under the shadow of a great loss. Some people will remember Reginald McKenna first and foremost as a statesman; some as an outstanding banker; some as a champion and exponent of progressive monetary ideas. Mr McKenna's annual statements to our shareholders, along with other published works, were everywhere regarded as models of clear exposition; much more, they provided a beacon for the advancement of monetary thought and practice. We have in truth lost a great chairman.

To his colleagues in the bank, however, the loss is primarily a personal one. I have been deeply touched by the innumerable messages of condolence and appreciation received since Mr McKenna's death. Many have come from bankers at home and abroad, many from men of discernment in other walks of life; but perhaps most impressive of all have been the expressions of sorrow from members of the management and staff of the bank, to whom collectively and individually he was a staunch and understanding friend.

I have accepted the chairmanship of the bank, to which your directors have called me, with a deep sense of the responsibilities involved; but my strength lies in the knowledge that I can rely on the fullest possible support from directors, management and staff in carrying the burdens of office.

We are glad to welcome to our board the Right Hon. the Earl Peel, who has important business interests in Lancashire. Mr Clarence Sudd has also been elected to a seat on the board; he is chief of executive, and I wish especially to mention the outstanding and invaluable service he gives to the bank. With him, ably supported by the chief general manager, Mr Lederer, and the joint general managers, we can be assured of continued strength, efficiency and enterprise in the conduct of our business.

## THE STAFF

Before reviewing the affairs of the bank I would convey my respect, and yours, to the still growing army of members of our staff who have joined the Forces. The sacrifice demanded of every one of them is large, and as the tempo of war has quickened the sacrifice of life itself has been exacted from an increasing number of them. We mourn the death on active service of 201 of our young men, and with our grief for their loss and our sympathy with their relatives we mingle our tribute of honour for their bravery and devotion. Moreover, 29 men are missing, and 109 are known to be prisoners of war. On the home front, 25 members of our staff, men and women, have been killed in air raids.

Altogether, well over 8,000 men from this bank—the great majority of them from the pre-war staff—have joined the Forces since the war began. The honours won have been many and varied. Forty of them have been decorated—no less than seventeen for outstanding courage in the air; eleven for bravery on the battlefield; and twelve for distinguished conduct on naval or other operations. In addition, nine have been mentioned in despatches. We glory in

their deeds of conspicuous gallantry; we rejoice no less in the knowledge of steady duty devotedly done and hardship cheerfully borne.

With the further outflow of men, our total staff has gone down in numbers by no less than 650 over the past year, and, at about 11,100, men and women together, is below 85 per cent. of the pre-war figure. The manner in which added burdens of responsibility and routine tasks have been shouldered has been most gratifying. The Staff Association has been of great value in co-operating with the management in handling the wide variety of problems of organisation and personnel that arise under war-time conditions, and our appreciation should be expressed to the chairman and committee of the Association for the loyalty with which they devote their time and study to these problems as well as to the faithful representation of the interests of the staff. To the staff as a whole, moreover, recognition is due, and gladly paid, for another year of eager and competent service.

## THE PAST YEAR

Little change has occurred in the trends revealed by a comparison of our latest balance sheet figures with preceding war-time returns. Deposits continued to expand during the year, and rather more of the increase than previously went on to deposit accounts. It is proof of wise official management of the country's economic and financial affairs that the continued enlargement of the supply of money has been prevented from bringing about any general rise in prices. Assuming, however, that a state of maximum productive activity had already been attained, the expansion of deposits last year must be seen as resulting from budgetary needs rather than from any further growth of the public's requirements of money with which to transact its daily business.

Similarly, the persistent increase in the quantity of currency outstanding can have only a partial justification in real public needs. In short, the amount of surplus cash in the hands of the public, whether held as currency or as liquid bank balances, is growing, and it would be to the advantage both of the nation and of the owners of the money, now and in the future, if a larger proportion of these unused resources were turned into holdings of Government securities. We are doing our best, by advertisement and otherwise, to further this process, and shall continue our efforts thus to consolidate the general monetary position against the time when war-time restraints upon the free use of purchasing power in the possession of the public are removed.

## GREATER LIQUIDITY

The degree of liquidity shown by our assets has risen still further over the year. The downward trend of advances has not ceased; nor have we added to our holding of investments, which on the contrary has diminished. We have preferred to place all additional funds at the disposal of the Exchequer in the form of Treasury deposit receipts, now the largest single asset. Not only does this arrangement assist the Government in its effort to finance the war on the most economical terms; it provides us with an assurance of ample resources, readily forthcoming without risk of capital depreciation, for meeting any expansion in the demand for advances to industry and trade as the country switches over to an economy of peace. Taken together, our liquid assets, that is cash, balances, short

money, bills and Treasury deposit receipts, as shown in our latest balance sheet, cover more than fifty-five per cent. of our deposit liabilities—an unreasonably high figure judged by pre-war records. This, moreover, is not merely a balance sheet ratio; it faithfully reflects our regular practice, for it is not our custom to take any special steps to secure a higher cash or liquidity ratio in our published returns than is ordinarily maintained.

Our net profit for the year shows the trifling decrease of £13,000 by comparison with the figure for 1942, the apparent addition to our earning power arising from the expansion of deposits having been offset by taxation, heavier working expenses, and provision for outlays, as on repair of premises, which cannot be undertaken in present conditions. Income tax and N.D.C. still comprise our total liability under the first heading. Dividends absorb the same amount as in the previous year, the same allocations have been repeated, and the balance of profit and loss account carried forward is slightly higher on the year.

## AFFILIATED BANKS

Our affiliated banks have shared in the general expansion of financial resources and, overcoming the difficulties common to all of us, continue to play their full part in the war effort and in the economic life of the areas they serve. The business of the Midland Bank Executor and Trustee Company continues to grow, with increasing recognition by the public of the advantages of employing an expert and efficient corporate body for the wide variety of duties that fall to executors and trustees in the complicated conditions now prevailing.

Here I would like to say a word about those branches of the bank, in the Channel Islands, which have been cut off from us by enemy invasion. Our plans are made for resumption of our former activity at the earliest practicable moment in the course of liberation; and I would assure Channel Islanders, whether refugees in this country or serving in H.M. Forces, that they shall not lack the fullest possible financial support from this bank when the time comes for them to embark upon the task of rehabilitation. All aid will be given in re-establishing the normal economic activities of the Islands and in restoring conditions in which their people can once again go about their business in peace and prosperity.

## POST-WAR BUSINESS PROBLEMS

I turn now to broader issues, which nevertheless have a close bearing on the future of our own bank. The tasks of reconstruction and readjustment to a state of peace will be no less complex than those arising in the course of war, and for our own part preparatory action has been taken. We have established within the bank a "Committee on Post-war Business Problems," in an attempt to foresee and prepare for the difficulties which will confront our business customers and ourselves in the period of transition from war to peace economy. We believe that, notwithstanding the many uncertainties in the outlook, an effort of foresight and preparedness will prove helpful in overcoming the problems that will arise and in promoting that expansion of trade and enterprise at home and abroad which is indispensable to the attainment and maintenance of healthy economic conditions.

With ready adaptability to circumstances and needs as they develop, we feel confident that—subject always to our obligations as custodians of our customers' funds—we in this Bank shall be able to play our part in the great national effort of revival, expansion and advancement.

## NEED FOR ADAPTABILITY

To this end constant adaptability is required in the types of financial services rendered and in their availability to banks, ever-changing and infinitely differing needs. Looking to the future, we hold the conviction that the economic progress of the

country will depend very largely on the enterprise and resourcefulness of the small business undertaking and the individual business man, in whatever branch of industry or trade. Too often in the past these qualities have been stultified or misdirected through inadequacy of financial resources, and it is of the very first importance that this obstacle should be removed as part of the preparation for the process of industrial reconstruction and expansion, with due emphasis on the special needs of the country in the export trade.

We are earnestly studying possibilities of so improving or widening our banking service, always presupposing the maintenance of cheap money as a primary essential, as to furnish the fullest possible support for promising enterprises under good auspices—support which shall be based as much upon the character, integrity and business capacity of the borrower as upon the extent and nature of his own material resources.

## ECONOMIC AND MONETARY POLICY

Everyone recognises that the post-war transition, through conditions which cannot yet be clearly foreseen, will be beset by difficulties. To make the most of the opportunities of victory will require, not only patience and self-restraint on the part of the public and the business community, but great wisdom and understanding on the part of the authorities, supported by the full collaboration of primary and manufacturing industries, trade and finance. With these qualities assured, the pitfalls in the path from war economy can be avoided, and nothing will be allowed to stand in the way of our attaining the objective of a steadily expanding trend in economic life, with ample opportunity for enterprise on the basis of lasting peace.

During this war the Government, profiting by experience, has to a large extent avoided the evils of inflation, partly by direct restrictions on the use of purchasing power, partly by controlled distribution of supplies, and partly by the use of subsidies to hold in check the spiral of price and wage increases. The same methods will be called for, on a gradually diminishing scale, in the immediate post-war period until demand and supply are judged likely to be in equilibrium in a free market. On the other hand, we can be assured that this time there will be no misguided attempt to enforce a decline in prices through measures of deflation; the authorities are alive to the inherent dangers of such a policy.

## LESSONS OF EXPERIENCE

Some adjustments of price will follow naturally from reductions in transport and insurance charges, curtailment of overtime working, higher standards of efficiency brought about through renewal of equipment, and restored competition in production and distribution. But no one, at this stage of our knowledge, would dare subject the nation, as a matter of deliberate choice, to monetary contraction, for everyone now sees that such a procedure would bind burdens upon our economy in respect of outstanding debts and taxation which could not be borne and repress that initiative without which a healthy expansion of economic life would be beyond our powers. Mankind is not blind to the lessons of experience; we see clearly that our best interests lie in building upon an established equilibrium of wages and prices, avoiding the perils of both inflation and deflation.

In the period following the transition, as well as during that process, we shall enjoy the advantage of a deeper understanding of the working of the monetary system and fuller appreciation of its effects upon the economic life of the nation. In late years the Government has expounded in word and deed its perception of the unity which subsists between all branches of financial policy—taxation, public borrowing and repayment of debt, monetary management, and the treatment of private investment. To the over-riding purposes

of full employment and a rising standard of welfare this deeper understanding, improved technique, and wisdom ripened by experience can make; I firmly believe, a great contribution. Who can doubt that, with goodwill and a common acceptance of clear ultimate aims, we shall find the way to a healthful economy which, while calling forth hard work and high endeavour, inventiveness and initiative, will assure full employment and an ever-rising standard of living.

## ALEXANDERS DISCOUNT COMPANY, LIMITED

## MR COLIN F. CAMPBELL'S STATEMENT

The seventy-sixth ordinary general meeting of Alexanders Discount Company, Limited, will be held at the offices of the company, 24, Lombard Street, London, E.C., on Wednesday, the 26th instant.

The following is an extract from the statement by the chairman, Mr Colin F. Campbell, circulated with the report and accounts:—

Shareholders will notice a further change in the form of the accounts, which is due to the continued urgent need for economy in the use of paper. The shillings and pence have been dropped from the figures in the balance sheet and profit and loss account, which effects a considerable economy in space, and I would draw special attention to the manner in which the results of the year are given in the report of the directors for the past year.

The form now used is more in keeping with modern practice, and I think it will be agreed that it states the results of the year more clearly.

The business of the company during the past year has been carried on without any particular feature to report, due largely to the fact that there has been no alteration in the rates for money and only unimportant fluctuations in the prices of short-dated securities. The Bank rate remained at 2 per cent. throughout the year. In my view we must now wait till after the war for development affecting the discount market. When post-war conditions begin to operate there is, I think, no doubt that the discount market will be able to play its part in the change-over of industry from war to peace.

## RESULT OF YEAR'S OPERATIONS

The gross profit, after making provision for rebate, taxation and contingencies, is shown in the profit and loss account at £139,028. After deducting current expenses amounting to £44,812, there remains a net profit of £94,216, which with the balance of £179,406 brought forward from last year gives a total of £273,622.

Out of this sum £5,000 has been transferred to staff pension fund, and interim dividends on the preference and ordinary shares were paid as usual in July, absorbing a net amount of £33,000. It is proposed at the forthcoming meeting to declare dividends for the final half-year at the rate of 6 per cent. per annum on the preference shares and at the rate of 20 per cent. per annum on the ordinary shares, these being the same as in the previous year, and to carry forward £192,622 against £179,406 brought in a year ago.

## THE STAFF

I am happy to be able to say that though more than 50 per cent. of the staff are now on active Service with the armed forces of the Crown, they have suffered no casualties during the year so far as we have received information of them. We send them our best wishes coupled with the hope that they will soon be able to return to civil life.

To Mr Bowie and all those who have carried on the work of the company during the past year, we extend our sincere thanks for the efficient manner in which its affairs have been conducted.

## HORROCKSES, CREWDSON AND COMPANY, LIMITED

## LIEUT.-COL. T. M. BROOKS' STATEMENT

The annual general meeting of the shareholders of Horrockses, Crewdson and Company, Limited, was held, on the 19th instant, at the registered office, Yard Works, Stanley Street, Preston, Lieut.-Col. Thomas M. Brooks (the chairman) presiding.

The secretary (Mr F. Leadbetter, F.C.I.S.) read the notice convening the meeting.

Mr T. B. Robson, F.C.A. (of Price, Waterhouse and Company) read the auditors' report.

The chairman said,—My statement has been circulated to all shareholders, so I do not propose to read it, but I would like to apologise to the shareholders for the delay which occurred between the publication of the directors' dividend recommendations and the circulation of the accounts.

The delay arose from the desire of the directors to announce the dividend recommendation as soon as possible in order to counter hints which have been given, needless to say with any initiation or authority from the board, in the Press suggesting the possibility of an increased dividend. At the time of the announcement the accounts were not finally completed, but were sufficiently advanced to enable the directors to make their recommendation.

I have every hope that if staff difficulties become no worse during 1944, we may be able to complete the next accounts earlier than in 1943. It is obviously desirable that a company whose accounts end at August 31st hold its meeting before the end of the calendar year. It is our aim, conditions permitting, to do this in future.

The following is the chairman's statement circulated with the report and accounts:—

During the year Mr Donald Beith resigned his seat on the board, and the directors have elected Mr W. M. Murdoch to fill the vacancy. Mr Murdoch has long connection with the industry, and the company is very fortunate to secure the benefit of his advice and experience.

Dealing with the accounts, the balance from the trading account is slightly higher than last year, but I would draw the attention of the shareholders to the note on the profit and loss account that owing to the incidence of E.P.T. the considerable fall in profits is not reflected therein. The shareholders will remember that last year I informed them that our turnover was augmented by the sale of stock, and the profits of the year materially increased thereby. This could not be maintained and we have now arrived at a position where we cannot expect adventurous profits of the kind to influence our trading profit appreciably.

## YEAR'S PROFIT

The receipts from dividends, etc., that year are higher by approximately 5 per cent. and the deductions for directors' fee, venture interest, depreciation and dividend stock sinking fund and war tax premiums do not, I think, call for comment. The net balance for the year, therefore, is £85,949, to which I added £16,731 brought forward from year and £34,751 now released from provision, mainly due to amounts charged to a subsidiary company, served an available balance of £137,431 as in the £171,598 last year.

I emphasised last year the importance of increasing the amount standing to interests serve for renewals and modernisation, and figure more in keeping with the large Gold which will be required for these purposes, and we have, therefore, as last year, necessity for this reserve the amount now released from the provision for E.P.T. of general reserve.

## GENERAL RESERVE

Although it is impossible to visit the the moment the amount of expenditure which will be required for develop

post-war years, your board are convinced that large sums will be needed in this direction, and the shareholders will be gratified to note that with this in view we have been able to make a start in perhaps a modest way by the creation of a general reserve in the sum of £40,000.

After allocating from the profits of the year a sum of £10,000 for contingency reserve and £24,867 in respect of the proposed dividend of 5 per cent. for the year, there remains £27,813 to carry forward to next year.

I would here remind the shareholders that owing to past losses the profits are not as yet chargeable for income-tax, but when these losses are absorbed the net results will be affected accordingly.

There is little to comment on in the balance-sheet. The shareholders will notice that £15,047 debenture stock has been redeemed during the year. The reserve for deferred repairs has this year been included with the provision for E.P.T., as these two items are closely related.

The reserve for contingencies stands at £100,000 as against £75,000 last year, the additional £25,000 being made up of £10,000 allocated from profits previously referred to and £15,000 transferred from a provision made in former years against possible losses on certain forward contracts. This provision, I am glad to say, appears to be no longer necessary.

#### PROPERTY ACCOUNT

There has been very little addition during the year to the property account, an indication of the impossibility under present conditions of making capital improvements. It will be observed that the amount standing to the credit of renewals and modernisation reserve is now almost equal to that of the property and plant accounts, but I would point out that this figure bears no relation to the amount which your directors consider will be necessary for the replacement and modernisation of our plant after the war, and, in fact, they are of the opinion that further sums will have to be provided in the future for this purpose if circumstances permit.

This remark applies also to our stock-trade, the quantities of which now being carried are lower than for many years. These quantities are quite inadequate for handling the volume of production and sales which we can reasonably expect when some of the more onerous restrictions upon the output of our mills are removed. We shall find then that the replenishment of our stocks is a clamant necessity, and we shall need to invest considerable sums of money if we are to offer to our customers home and abroad the quality and range of service to which they are entitled.

All these are important matters in considering the liquid position of the company, without consideration of them a false impression may be derived from our balance-sheet as to the funds required for the company's business.

With these remarks that I complete our year's report, I am glad to say that our year's results are higher than last year's, and we are able to reduce by £70,000 the cash at the bank.

I am in a position under the scheme of conversion to remain unchanged, and only 10 per cent. of our plant is killed during the year. Research, so far as it has been found possible, has been carried on during the year, and staff feel that the progress which began in this direction will be continued in post-war years.

As present conditions will allow, comments in working conditions of our staff have been carried out. We have recently opened a day nursery, where the children of our workpeople are in expert care during working hours.

#### THE FUTURE

I do not propose to forecast our future at this stage in the war, but I

feel I should emphasise again a point mentioned in my statement last year. Although it will be necessary to maintain after the war a modified control for a limited period, it must not be of such form that individuality and private enterprise cannot play their full part.

It is reasonable to assume that industry abroad after the war will be rebuilt on the most modern lines, particularly in devastated countries, and it will only be by a quick appreciation of the rapid changes in the nature of our trade, together with our ability to keep ahead in the production of new fabrics, that we shall be able to keep our place in the world's markets.

#### TRIBUTE TO MANAGEMENT AND STAFF

The board express their gratitude to the managing director, Mr H. H. Mallott,

for the way he has guided the affairs of the company during the past year. Although he and the departmental directors have been unceasing in their efforts, and the results will, I think, give them cause for satisfaction, I should like to record the thanks of the board to all members of the staff and employees who have so loyally supported the management in this difficult time.

To those of our employees now serving in H.M. Forces I extend our good wishes, and to the relatives of those who have lost their lives since our last meeting I express the deep sympathy of myself and my colleagues.

The report and accounts were adopted. The directors retiring in accordance with the articles of association were re-elected to the board, and Messrs. Price, Waterhouse and Company were reappointed auditors. The meeting concluded with a vote of thanks to the chairman.

## BARCLAYS BANK LIMITED

### DEPOSIT AND CURRENT ACCOUNT FIGURES ANOTHER RECORD

#### POST-WAR RESTORATION PLANS

#### "A FERTILISING STREAM OF CREDIT"

#### MR EDWIN FISHER ON BANKS' ROLE

The following is the statement by the chairman, Mr Edwin Fisher, on the report and accounts for the year ended December 31, 1943, to be submitted at the forty-ninth ordinary general meeting of the stockholders, to be held at the head office of the bank, 54 Lombard Street, London, E.C.3, on the 24th instant.

It has been decided once again that the proceedings at the annual general meeting should be restricted to formal business, and, instead of my usual address, I am accordingly sending to stockholders, with the report and accounts, a few remarks on the position and progress of the bank during the past year.

#### CHANGES ON THE DIRECTORATE

Before I pass to our own affairs, I would wish to express on behalf of this bank the sense of grief which we all feel at the death of Mr Reginald McKenna, who held the position of chairman of the Midland Bank for many years with such distinction.

Through the sudden death of Sir John Caulcutt, in April last, we have lost one of the most able bankers of the day. His name will live long in our memories, and I, for my own part, have lost a friend who counted for much in my daily life. We also record with deep regret the death, in October, of Sir James Fortescue Flannery, Bart.

It gave much pleasure and satisfaction to learn that the honour of a Baronetcy had been conferred upon our deputy-chairman, Sir William Macnamara Goodenough, in the 1943 New Year Honours. In May last he was appointed to succeed Sir John Caulcutt as chairman of Barclays Bank (Dominion, Colonial and Overseas).

Mr Walter Osborne Stevenson has been elected a vice-chairman of the bank and Sir John Donald Horsfall, Bart., chairman of our West Yorkshire local board, and the Hon. Patrick Charles Kinnaird, M.C., a local director at Pall Mall East, have been appointed directors.

We record with sorrow that since our last report was issued to stockholders a further 92 members of the staff have lost their lives in the service of their country, making a total of 252 fatal casualties since the war began. In addition, there are now 43 reported as missing and 199 known to be prisoners of war.

Following the notice of meeting there is a notice given of an extraordinary general meeting to be held on Wednesday, February 9, 1944. The purpose of this meeting is to sanction an alteration in our articles

of association so as to permit of the appointment of an additional deputy-chairman of the bank.

#### CURRENT, DEPOSIT AND OTHER ACCOUNTS

Our current, deposit and other accounts at December 31, 1943, attained the record high level of £822,499,871, compared with £720,976,569 at the close of 1942. The aggregate figures of the eleven London clearing banks, so far as they are available for comparison, show that this movement conforms in a general way with that for the banks as a whole, but stockholders will be interested to know that our own bank has again somewhat enlarged its proportionate share of the total increase.

In each month during the past three years the number of current accounts in our books has grown substantially, and the rate of growth has gained momentum from one year to the next. This movement is spread throughout the country with an evenness which is quite remarkable, and the large and continuous advance in the number of banking accounts must, in the aggregate, represent an appreciable economy of time and effort to the business community and the private individual.

#### CASH IN HAND, ETC.

Our cash in hand and with the Bank of England; balances with other British banks and cheques in course of collection; money at call and short notice; bills discounted and Treasury deposit receipts have risen to a total of £458,109,009, which represents a proportion of 55.69 per cent. of our current, deposit and other accounts. Treasury deposit receipts, which have increased during the year from £191,500,000 to £291,000,000, have become the largest of our assets, as it has been evident for some time that they would. The rise in our investments, excluding those in subsidiary banks, from £206,459,854 to £216,391,769 was smaller than in the previous twelve months. Advances have undergone a further reduction from £169,213,319 to £160,976,408, but notwithstanding this contraction in the most remunerative outlet for the employment of our funds, the larger resources at our disposal have helped us to show an increase in our profit for the year.

#### NET PROFIT

The net profit of the bank for the year ended 31st December last, after payment of all charges and after making provision for

bad and doubtful debts and for contingencies, amounted to £1,584,113 11s. 5d., which compares with the figure of £1,529,743 17s. 7d. for 1942. As will be seen from the report, the directors have located from the profit £250,000 to contingency account and £250,000 to premises reserve account (for deferred repairs and re-statement). Interim dividends at the same rates as in 1942 were paid on August 9th last. The directors now recommend the payment of final dividends of 5 per cent., making 10 per cent. for the year, "A" stock and 7 per cent., making 17 per cent. for the year, on the "B" stock, less income-tax in each

#### TRIBUTE TO STAFF

What we owe for the untiring devotion of the staff has not become less, and an expression of our gratitude to them will be proposed at the meeting. Stockholders will be interested to learn of the extension of the bank's scheme of awards for the education of sons of members of the permanent clerical staffs and pensioners of this bank, of Barclays Bank (Dominion, Colonial and Overseas) and of the British staff of Barclays Bank (France), Limited, and that similar arrangements are being considered for the benefit of their daughters. Awards, which up to the present have been confined to St. Edward's School, Oxford, are now available at about 20 schools up and down the country.

#### POST-WAR PROBLEMS

As our belief in ultimate victory has been gradually transformed from a dogged act of faith into a well-founded conviction, thoughts have turned more and more urgently towards the aftermath and the problems which will follow. It is well that this should be so, for events do not wait upon plans. It seems now to be widely recognised that without international collaboration we cannot look forward with confidence to the future. But no international system can be expected to do more than provide conditions favourable to the fruitful development of international relationships. Within such a system the ultimate prosperity of each State must chiefly depend—as the prosperity of the individual within the State depends—upon its own efforts, and it should be borne in mind that the progress of one brings advantage to all. Therefore we owe it as much to our neighbours as to ourselves to devote our energies early and effectively to the task before us.

Our purpose must be to achieve and maintain maximum efficiency in every department of national life. Full employment, which is our declared policy and ardent desire, can be attained in its true sense only by this means, for effort ill-applied is but one step in advance of no effort at all and can do very little to further the objects upon which our hopes are set.

#### QUESTION OF CONTROL

We ourselves have seen, as our balance-sheet demonstrates so forcibly, the bank's vast and growing deposits directed mainly to Government use for the furtherance of the war effort and our commercial advances shrinking. But after the war, houses will have to be built, stocks replenished, repairs of all kinds put in hand, machinery installed or brought up to date for peacetime requirements, and through these and the other manifold processes of the great transition from war to peace, changes may be looked for in the composition of our balance-sheet. I need scarcely say that our own bank, in company with the other British banks, will add its full weight to the forces of restoration. One does not expect a sudden or violent change-over, for the period following the war will be dominated by scarcity, emphasised by the latent demand which will then spring to life. For this reason we must anticipate a measure of control, with the exercise of priorities, until the whole machine adjusts itself to the new conditions. But no one will want to see the continuance of any control which has outlived its purpose, for although there must always be safeguards to protect the interests of the

## RIO DE JANEIRO FLOUR MILLS AND GRANARIES, LIMITED

The annual general meeting of the Rio de Janeiro Flour Mills and Granaries, Limited, was held on the 18th instant in London, Mr G. M. Sheppard presiding.

The chairman said that during the year ended September 30, 1943, the company had had more than the usual difficulties to contend with. There had been but little if any shortage of flour supplies, but, owing to reduced transport, distribution had been interfered with.

So far as the future of Brazil was concerned, the development of local industries seemed to be almost unending and it appeared as if many of the new developments had come to stay. Such being the case, the company's future could be looked upon with a certain amount of confidence. The following cable had been received from the general manager in Rio:—"Demand for all products satisfactory future prospects promising."

The report and accounts were adopted and the dividend for the year of 8 per cent., less tax, was approved.

## OROVILLE DREDGING COMPANY, LIMITED

### LARGER REVENUE FROM INVESTMENTS

The thirty-second ordinary general meeting of the Oroville Dredging Company, Limited, was held, on the 20th instant, in London, Mr F. W. Baker (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the report and accounts:—"Dividends received from the company's holding of shares in Pato Mines (Colombia) Limited, Pato Consolidated Gold Dredging, Limited, and Asnazu Gold Dredging, Limited, amount to £46,921. Other credits in the profit and loss account amount to £3,795. From the total credits of £50,717—after debiting all charges in London, including income-tax—the balance to the credit of profit and loss account for the period carried to the balance-sheet is £36,334. Adding to this amount the credit balance from the previous year and deducting the dividend paid in January, 1943, and the dividend recommended for the year, a balance of £104,925 is carried forward at September 30, 1943.

The income from dividends during the year amounted to £46,921, against £28,750 for the previous year, an increase of £18,171, which is accounted for by the fact that, although no dividend was paid by Bulolo Gold Dredging, Limited, during the year, a dividend of 5 cents per share was paid by the Asnazu Gold Dredging, Limited, and the cash position of Pato Mines (Colombia), Limited, permitted that company to declare a dividend of 6s. per share, free of income-tax.

The directors have decided to recommend the payment of a dividend for the year to September 30, 1943, of 9d. per share (18½ per cent.), less income-tax at 7s. in the £, payable on January 29, 1944.

#### THE COMPANY'S INTERESTS

I feel no useful purpose could be served by repeating the details as furnished in the report, which should give shareholders the fullest information. I should like to state, however, that operations on our interests in Colombia, both at Pato Consolidated Gold Dredging, Limited, and Asnazu Gold Dredging, Limited, are continuing very satisfactory, and, apart from the necessity of the closing down of two dredges on the Pato property owing to the difficulty of getting supplies, the profits of the company are being well maintained by the handling of higher-grade gravel, and up to present the payment of dividends at the rate of 30 cents

per annum is being continued. With regard to Bulolo Gold Dredging, Limited, it is satisfactory to learn that the dredges are generally intact, excepting that certain equipment has been taken from some of them for war purposes, also that as the enemy has been cleared from Lae and Salamaua, the company is a step nearer to getting personnel on the property, although I feel that,

owing to the difficulty of getting supplies, air transport, etc., it will not be until after the war before operations can be resumed. A preliminary claim for war damage, amounting to about £740,000 (Australian), has been filed with the Australian War Damage Commission.

The report and accounts were unanimously adopted.

## NATIONAL PROVINCIAL BANK LIMITED

### RESERVE EQUALS PAID-UP CAPITAL

### BANKS' POST-WAR DUTIES

### BENEFITS OF PAST ACCUMULATIONS

### MR COLIN F. CAMPBELL'S STATEMENT

The one hundred and eleventh annual general meeting of the National Provincial Bank, Limited, will be held on 27th instant at 15, Bishopsgate, London, E.C.

The address of the chairman, Mr Colin F. Campbell, was posted to the members on January 19th with the annual report and balance-sheet in order to shorten the business of the meeting.

In his address Mr Campbell stated: "I propose to continue the plan, which has been adopted during the recent years of war, of submitting to shareholders by means of a circular some of the main features connected with the work of the bank during the past year. The proceedings at the annual general meeting, to be held on January 27, 1944, will be confined to the necessary formal business."

#### BOARD OF DIRECTORS

The changes during the past year have been very few in number. The Rt. Hon. Lord Burghley relinquished his seat on the board in September, upon his appointment as Governor of Bermuda, and in his place the directors have appointed Mr F. G. Robinson, who had been a local director of the bank for a number of years. Mr Robinson is chairman of E. S. and A. Robinson, Limited, of Bristol, and enjoys a wide business experience which cannot fail to be of great advantage to this bank.

#### GRINDLAY AND COMPANY, LIMITED

It is with deep regret that I have to report the untimely death of Colonel Stuart Low, chairman of Messrs. Grindlay and Co., Limited. Colonel Low decided to proceed to India in November, 1942, in connection with the business of the bank, and the ship on which he was travelling was torpedoed and sunk off the west coast of Africa. All the passengers on board were reported as missing and ultimately as lost.

The experience of Colonel Low, together with his knowledge of the business of the bank both in India and London, will be greatly missed by his colleagues. The directors of Messrs. Grindlay and Co., Limited, have appointed Mr Trevor J. Matthews, who has been a director of the bank for many years, to become its chairman.

#### MANAGEMENT AND STAFF

During the year Mr W. Hadwick was appointed deputy chief general manager under Mr Ernest Cornwall, while Mr R. H. Cutting and Mr L. J. Williams were appointed additional joint general managers. The calls made upon the bank by the Ministry of Labour for the release of both men and women in connection with war service continued throughout the year, and I am glad to say that we have been able to meet their requirements and have also carried out the recommendations of the Kennet Committee. This has not been accomplished without a very great effort on the part of all concerned, and I take this

opportunity of placing on record the thanks of the directors, both to the management and staff, for the loyal and untiring way in which they have faced the situation. I do not hesitate to say that the efficiency of the work in the bank has been maintained, and this is due to the patriotic manner in which all members of the staff have fulfilled the tasks allotted to them.

The close co-operation between the staff association, ladies' guild, messengers' guild and the directors has continued to our mutual interest throughout the year.

I would also repeat this year my appreciation of the considerate attitude of our customers towards any inconvenience to which they may have been subjected through war conditions.

#### MEN WITH THE SERVICES, AND CASUALTIES

It will interest shareholders to know that we now have over 4,000 members of the staff either serving in the Forces or directed into industry, and we continue to receive news of decorations awarded. We extend our good wishes for their welfare and a safe and early return to their homes.

I greatly regret that a number have made the supreme sacrifice in defence of their country, and to their families we express our deepest sympathy.

### STATEMENT OF ACCOUNTS

#### RESERVE FUND

In 1931, we, in common with other banks, thought it prudent to meet the situation arising from the heavy fall in values of gilt-edged investments by making a transfer from our reserve fund to our internal reserves. The amount so transferred, viz., £1,479,416, reduced our reserve fund from £9,479,416 to £8,000,000. In 1937, we increased the reserve fund to £8,500,000 by transferring to it £500,000 from the balance carried forward in profit and loss account.

It will be observed in the accounts now presented to shareholders that the reserve fund again equals the amount of the paid up capital at a figure of £9,479,416. To accomplish this the bank has transferred from its internal reserves to the reserve fund the sum of £979,416.

The principal item in the balance sheet, that of the bank's liability on current, deposit and other accounts, stands at £521,342,279, an increase of £47,654,739 in the year.

#### STRONG LIQUID POSITION

The balance sheet continues to show a strong liquid position, cash, short money, bills and Treasury deposit receipts representing 50.2 per cent. of the deposits.

It is worthy of note that as against the increase in our deposits of £47,654,739 our holding of Treasury deposit receipts has increased by £57,500,000 during the same

period. 25.9 per cent. of our deposits represented by securities, mostly short-dated British Government issues, with only 20.8 per cent. is represented by advances.

#### PROFIT AND LOSS ACCOUNT

The net profit accruing as a result of the year's work amounts to £1,256,394 19s. 5d. as compared with £1,132,018 7s. 4d. for the year 1942. A sum of £564,175 5s. 7d. is brought forward from the previous year.

Dividends at the rate of 15 per cent. per annum require £710,956 4s. 0d. net, and after allocating

| a sum of £609,614 1s. 0d. is left to be carried forward to the next account. |         |

#### THE OUTLOOK

So long as the war lasts, the relatively low figure of advances is likely to continue as the banks confine their advances to those connected with the war effort, but the minds of all men are now being directed towards post-war problems, and from this point of view a condition of liquidity is essential.

It can be assumed that the standard of living in this country will be sustained only so long as our export trade is maintained and developed. When the war restrictions on advances are removed, expenditure for reconstruction purposes and for the rehabilitation of the trade of the country will be heavy. The Banks, with their huge deposits, will be called upon to find a great deal of the money required, and this demand will come not only from the public bodies and great industrial companies, but from the merchants and the small traders, in an effort to re-establish their connections at home and abroad.

#### HELP FOR MERCHANTS AND SMALL TRADERS

This bank has always kept in touch with the merchants and the small traders and, in view of the heavy sacrifices which the war has imposed on many of them, it will be our policy to continue to extend to the utmost possible degree such credit facilities as they require so that they may be able to restart and to develop their businesses.

It is not surprising that there should be anxiety in the minds of many people whose livelihood depends upon regular employment after the war. The recollection of the conditions in the labour market after the last war has left its mark. Legislation alone cannot create prosperity, however important it may be in its own realm: it is to the sound and energetic development of industry that we have to look. In the sphere of finance, which is largely in the hands of the joint stock banks, far-sighted and sympathetic collaboration will be essential, and it will be our wish to provide a full measure of support.

#### THE NATION'S SAVINGS

The past year has witnessed further satisfactory progress in National Savings, and it may be hoped that the saving habit, once begun, will continue in times of peace and not gradually fade away. The temptation to ease off will arise as the stress of war diminishes, while the need for saving will increase rather than decline in face of the necessity for rebuilding the nation's capital resources.

It is probably not recognised how greatly we have benefited in recent years from the vast reserves of capital which were accumulated in days gone by, and it is, therefore, no exaggeration to say that without these great capital reserves, the task of financing the war would have been well-nigh impossible.

In the meantime, with the war at the height of its intensity, we are all urged to support to the utmost of our power the forthcoming "Salute the Soldier" Appeal in order that it may be an outstanding success.

## LLOYDS BANK LIMITED

### INCREASED RESOURCES AND EARNING POWER

### PROBLEMS FOR THE FUTURE

### RE-ESTABLISHMENT OF EXPORT TRADE

### LORD WARDINGTON'S VIEWS

annual general meeting of Lloyds Bank Limited will be held on the 28th inst. at the head office, 71 Lombard Street, London, E.C.

The following is the statement of the Chairman, the Rt. Hon. Lord Wardington, circulated with the report and accounts:—

My Lords, Ladies and Gentlemen,—I am circulating my address to the members in advance of the general meeting to be held on the 28th instant, thus following the procedure of the last two years. I have again to deplore the loss through death of two of my colleagues. Sir Guy Garnet joined our Board in 1927 and was held in the highest regard and affection by us all. The practical common sense, derived from long experience, which he brought to bear on all questions, was of great service to our deliberations, while his high principles and courageous outlook made him a most valuable colleague and friend.

The same may be said with equal truth in regard to Lord Luke, who died last February. Not only had he the advantage of long experience at the head of a great business, but his wide sympathies and connection with so many charitable objects made his name known wherever suffering and illness were experienced, and his death will be deplored by all.

Since our last annual general meeting we have had the pleasure of electing the Rt. Hon. Lord Luke of Pavenham, D.L., a son of our late director, and Major Egbert Cadbury, D.S.C., D.F.C., to seats on our board.

#### BALANCE SHEET

The story which our balance-sheet has to tell for the year 1943 is simply another chapter of the plain tale it has had to recount for each of the war years. Under the influence of deficit borrowing by the Treasury our deposits have continued their upward trend at about the same rate, and the whole of our additional resources has gone directly to the promotion of the war effort in the form of extended credit to the Government. Thus the rise of £82 million in our deposits is more than balanced by the increase of £70 in Treasury deposit receipts and £18 million in our gilt-edged investments, whilst loans and advances to customers have suffered a further decline of £7 million.

#### PROFIT AND LOSS

Naturally, such an important addition to our resources has meant increased earning power, but no one who has followed my remarks in previous years will expect the whole of the increased earnings to have found their way into our net profits. To take one item alone, a further drop in our advances to customers, which is our best interest-earning asset, counterbalances, so far as profits are concerned, the greater part of the increase in our Treasury deposit receipts. Then, too, we have felt it only right, in these difficult and costly times, to help our loyal and hard-working staff to balance their family budgets by a cash bonus which we paid to them just before Christmas. Nevertheless, after meeting our heavy charges for income-tax and national defence contribution, there remains a balance of profit available for distribution of £1,515,000, an increase of £151,000 on the preceding year.

We made a start last year towards building up a separate war contingency fund for certain purposes, the nature of which I broadly indicated to you at that time. We have thought it very desirable to make a further addition to that fund this year and

at the same time to allot £200,000 to our general contingency fund and £100,000 to our premises account. Having regard to the continued growth in our figures and the uncertainties of the post-war period, shareholders will I am sure agree that these are prudent and reasonable provisions. We are then able to recommend the payment of our usual dividend, leaving quite a substantial amount to increase the balance carried forward.

#### NATIONAL SAVINGS

I have shown how the whole of any increase in our deposits is at once made available to HM Government in the form of Treasury Deposit Receipts or National War Bonds. From the point of view of the country as a whole, however, it would be preferable if the public were to subscribe direct for Government loan issues, rather than keep their deposits with the bank and leave it to us to invest the money in Government securities. As I pointed out in my speech to the shareholders in January, 1942, the necessity for saving and investing all that is possible still holds good.

The deposits of the public represent potential purchasing power, and in order to assist the Chancellor of the Exchequer to keep his promised intention of repaying Savings Certificates, and other savings securities, in money of the same value as when it was received, it is desirable that the purchasing power inherent in deposits should not be kept in a form liable to the temptation of expenditure, but should be removed temporarily out of harm's way into one of the forms of Government savings securities. Every increase in purchasing power, unaccompanied by a commensurate rise in the amount of consumable goods, only adds to the difficulty of the Chancellor of the Exchequer in laying the bogey of inflation.

#### POST-WAR RECONSTRUCTION

Our balance-sheet of to-day bears little resemblance to those of pre-war days. Not only are the figures greatly swollen, but their proportions one to another have completely altered. It is true that they show a greatly increased condition of liquidity, but they represent a picture which in former days would have been considered much more applicable to an investment trust business than to a bank. This raises problems which become more and more immediate every month the war draws nearer to its end. When that happy day arrives it would seem inevitable that there will be great demands for financial assistance of various kinds in the great work of reconstruction. Countless firms will require help in the turn over from wartime to peace production. Machinery will have to be replaced or converted; destruction of buildings made good; new houses erected; demobilised men from the Forces will want capital with which to start new businesses, or to reopen those which have been shut down in their absence; and many millions of pounds will be required for these purposes.

It is probable that the capital market will remain closed to the general public for a time, as the demands of the Government will not cease immediately after the last shot has been fired, and the necessary money for reconstruction will have to be found elsewhere. I have no doubt that the banks will not only be anxious to play their part in the great tasks then facing the country, but they will be also willing to be

more elastic in their views as to what constitutes a legitimate banking loan. It has been generally regarded as a principle in deposit banking that medium or even short term loans for capital purposes ought not to form part of their business. In theory that is perfectly sound, but banks are at present so strong and enjoy such a liquid position, that some departure from strict principles would seem to be justified in the conditions which are likely to confront us after the war.

#### ADVANCES AND LOANS

A glance at our figures, and they are very similar to those of other banks, shows that if we returned to anything like the proportion which our advances bore to our deposits in more normal times, we could increase our loans by over £200 million and still be lending only 50 per cent. of our deposits. If this change-over took place in all the banks there could be an increase of well over £1,000 million in their advances to the public, without in any way laying them open to the criticism that they were "over-lent." Admittedly, on the figures of our balance-sheet, this result could only be obtained by the equivalent realisation of our more liquid assets, by turning Treasury Deposit Receipts and short-term Government bonds into cash as they mature; but this would only take place gradually, as shortage of material, and possibly also for a time of labour, would prevent anything like the whole amount being required at once, and the demands on the Treasury and on the banks would in consequence be staggered over a period. Apart from the banks, there will no doubt be other agencies ready to finance the re-starting of our peace-time activities.

#### AN IMPORTANT POINT

On the whole question of post-war reconstruction an important point was stressed in the report of the delegation appointed by the League of Nations last year, over which Sir Frederick Phillips presided. It is a point in which industry generally is very closely concerned, and I have no doubt the authorities are giving it careful consideration, but it would be a great relief to industry if some definite announcement could be made. The report states, "The post-war problems created by the construction of war plants will be particularly serious if provision is not made to allow producers to amortise their plants adequately during the war. If, in interests of national revenue, amortisation rates are kept low, so that at the end of the war the unamortised capital value of the plant greatly exceeds its capital value as determined by the income it can earn in the production of peace-time goods, a powerful factor of dislocation will have been created." It will be seen that the whole question of the equitable working of the Excess Profits Tax is closely connected with the point raised by the Delegation's Report.

#### EXPORT TRADE

Of all the tasks before us, none is more important than the re-establishment of our export trade. Without it we can neither eat nor work. Both food and raw material are essential for our livelihood, whether we are engaged in production for our home or foreign consumption, but without an adequate export trade we shall be unable to pay for the food and raw materials required for both. It is idle, therefore, to suppose that we can exist on home markets alone. Our means of payment for necessary imports have been largely curtailed during the war.

Not only have our exports been reduced, but there has been a great reduction in our foreign investments, the interest on which provided one of our chief invisible exports, and as other invisible exports have also been cut down, we shall be more than ever dependent on restoring our visible exports to the fullest extent. It is highly desirable, therefore, that no unnecessary obstacle

should be placed in the way of our doing so, and that the paths for our export trade should be kept as fully open as possible.

#### TRIBUTE TO STAFF

I cannot conclude these remarks without paying a very sincere tribute to those who carry on the daily work of the bank, and reminding the shareholders of what they owe to the very hard-working members of our permanent and temporary staff. It is an outstanding fact that, in spite of our having released for national service more than half our pre-war male staff, we are running the bank to-day with hardly any

serious diminution of our services to the public and with a smoothness which, in the circumstances, is truly remarkable, and can only have been attained by good organisation, hard work and a strong sense of duty.

For this we have to thank not only our head office executive and the staff in general, but perhaps more particularly our sorely tried branch managers who, in many cases, have been left with hardly a single trained man to help them in the office. I am sure that the shareholders will wish me to express on their behalf our highest appreciation of the work of the staff during the past year.

## WESTMINSTER BANK LIMITED

### INCREASED RESOURCES LEAD TO LARGER PROFIT

### POST-WAR CURRENCY AND TRADE PROBLEMS

### MANPOWER AND EQUIPMENT NEEDS

### THE HON. RUPERT E. BECKETT'S VIEWS

The annual general meeting of the Westminster Bank, Limited, will be held on the 26th instant at the head office, 41, Lothbury, London, E.C.

The following is the statement of the chairman, the Hon. Rupert E. Beckett, circulated with the report and accounts:—

This statement is circulated to shareholders together with the balance sheet and profit and loss account of your bank and its subsidiary Ulster Bank, Limited. The Westminster Bank has made a profit of £1,347,815, which is an increase on last year of £110,230, and has resulted from the increased resources which have been at our disposal during the past year. These augmented figures of money lodged with us are, of course, observable in the case of all the clearing banks, though the Westminster has not shown the same proportionate increase as some others. This may be ascribed to the fact that the Westminster Bank is a comparatively late-comer in some districts where war-time production is most intensive, and therefore, compared with other banks longer established in those neighbourhoods, has a lesser share in the expansion of deposits, which results from continuous and heavy Government disbursements. The tendency of our loans to customers is still in a downward direction, which, again, is a feature common to all banks.

After paying dividends, less tax, of 18 per cent. on the partly-paid shares and 12½ per cent. on the stock, the directors have decided to make the usual provision of £300,000 to officers' pension fund and to allocate £250,000 to the bank premises reinstatement and rebuilding fund. The Ulster Bank figures speak for themselves. They show satisfactory progress and call for no special comment.

#### STRONG POSITION TO MEET CALLS

As is disclosed by the balance sheet of Westminster Bank, the large increases in our resources over the past year appear as assets in the form of Government loans, maturing at varying dates, nearly a half within ten years, and Treasury deposit receipts, which have a currency of six months and represent the largest item on the assets side of our balance sheet—£149 million. Thus we are in a strong position to find the wherewithal to meet all calls made upon us by our depositors when the inevitable demands ensue, and to meet liberally requirements for loans and overdrafts, which, at the present time, have sunk to a figure out of all proportion to the accepted canons of joint Stock banking. For the domestic side of banking, therefore, we can say that we are fully equipped.

But many other questions that will demand solution are by no means clear, and yet are vital to us as a nation. Among these are the post-war value of our currency, the question of exchanges, and the

means by which international trade may be got going again in an impoverished world.

#### A WORD OF WARNING

In the limited space at my disposal it is impossible adequately to discuss the various schemes that have been put forward by economists and others in different parts of the world. I will, however, utter a word of warning, which may be unpalatable, but which I feel we must heed. It is the unwisdom of accepting at this stage *obiter dicta* as to what we can or cannot afford. There is danger here: human nature, being what it is, is ever ready to accept easy phrases and pleasant prognostications. Some cry out for immediate legislation to give permanent sanction to what can be no more, at the present time, than ideas.

Just reflect that after the last war the Government debt stood at some £8,000 million, and the intervening period between the two wars was a time of continued economic stress and makeshift, arising, as I interpret it, out of the fact that Europe had not emerged from the welter of poverty and uncertainty which was the legacy of the nations having exhausted their resources by more than four years of war, 1914-1918. Already the Government debt in this country has risen to more than £18,000 million, and the end is not yet. The costs of service of the debt will have increased considerably. All nations in the world war are in the same dilemma and are spending on a similarly prodigious scale. I repeat, then, how can anyone say at this stage what we can afford when the longed-for days of peace at last arrive?

#### ESSENTIALS FOR TRADE REVIVAL

But to get world trade going again will be a paramount necessity, and the opportunities of so doing will devolve upon the shoulders of the Allied Nations. The obvious essentials, in order to achieve early success, are that all nations work peaceably together exchanging goods and services on a mutually beneficial basis, but I imagine that some considerable time will elapse before the nations of the world can be envisaged as working peaceably together. The aftermath of war will, I am afraid, produce some very natural but unpleasant reactions in the hearts and minds of those who have been under the harrow, and undergone the miseries of invasion, starvation and slavery.

The prime need for them will be an adequate supply of food, shelter and clothing, and it will not be until these wants have been supplied that the rebuilding of industry, whereby they can exchange goods and services, can be undertaken. Thus for some time after the war the Allies will have to be, as it were, self-contained, and perform the rôle of general provider to the stricken nations and re-creator of

their industries. The first essential step then is for the Allies to thresh out inter-ally the means towards these ends. America, Russia, China and ourselves should be able to achieve miracles so long as our solidarity as war comrades can be continued in years of peace.

#### CURRENCY SCHEMES AND GOLD

Second only to the task of rehabilitation of the stricken nations will be that of starting up the machinery of trade and commerce again. To assist in making this feasible, various currency schemes, emanating from both sides of the Atlantic, have been put forward, though as yet we cannot say that any practical development has been achieved. Obviously, credit on a large scale will be needed, and endeavours are being made to find a "token" or "common denominator" upon which this edifice of credit is to be based. The idea that gold should be the token, either directly or remotely, must be seriously considered, and it certainly presents some possibilities that are not apparent in other media. Long habit and usage of gold by all nations since the dawn of history has made it a means of trading and exchange familiar to all peoples. It is but natural, too, that American opinion should favour a currency medium based upon gold.

It is true that America holds a preponderating stock, but the British Empire and Russia are the principal producers, and it would seem that, in order to secure America's support and collaboration, which is invaluable and indeed essential for any workable scheme, it would be well to try to build on this premise. I am keenly aware of the difficulties which such a course raises; aware also of the merits and defects in the past working of a gold standard. A means must be devised to avoid the rigidity of the gold standard as we knew it in the past.

But America is a large creditor nation, with the responsibility towards securing trade equilibrium which that status implies. A creditor country cannot remain passive as hitherto, allowing gold to enter freely in payment for goods and services, but should for this purpose so adjust its economy as to permit the easy entrance of foreign goods. Goods and services must surely be a better exchange for exports than gold which passes forthwith into sterility.

#### PROSPECTS OF RECOVERY

I will turn now to a more domestic topic—what are the prospects of our recovery after the war? It is obvious that we have suffered considerable losses in many directions: our stock of gold, our foreign investments, our ships at sea, our factories and houses. The total loss from all these sources cannot be easily computed; it is certainly severe, but should not be unduly large either in comparison with our pre-war total national wealth or with our current productive capacity.

Our ability to make good this loss rests primarily on the effects of the war on our available manpower. It seems not improbable that the decrease in our national productivity through loss of manpower in the war will be more than offset by the additional output of the residual of war workers electing to remain in industry after the war. Numbers of workers called up for the Forces will have interrupted their education and training in special spheres, but the greatly augmented labour army in factories and training centres will have added considerably to their normal skill, knowledge and personal equipment in relation to industry.

The position as regards the country's industrial equipment is also of cardinal importance. It has been influenced in opposite ways. Buildings, plant and machinery have been destroyed, and a huge legacy of repair work, left undone through stress of war, remains to be undertaken. On the other hand, the Government has been responsible for the creation of a great many new factories, fully equipped with up-to-date tools and machinery, and a considerable number of these will be convertible to peacetime uses.

#### TWIN FACTORS

Our potential recovery rests in these twin factors of manpower and equipment, supplemented by the continued intensive scientific and industrial research and the application of the results of that research to industry, and it is encouraging to see that in these respects. It holds out the prospect of success, giving the will and determination to achieve it. Much, however, will depend upon the character of the peace settlement. If peace is established with the appearance of durability, the possibilities of recovery, not only for ourselves but for the world at large, will be greatly stimulated and will be rendered more favourable than at any other time during the past quarter of a century.

Great importance will attach to orderly demobilisation at such a pace as will enable industry gradually and regularly to reabsorb recruits. This may well prove to be one of the major transition problems. With the Government's declared policy of full employment, however, we should never again see an army of nearly two million in enforced idleness, as we did even as late as in 1938. If we succeed in this—putting the whole nation to work in peacetime—we should witness a vast improvement in our productivity.

#### EXPORT PROBLEMS

But it has to be remembered that it was mainly on the export side of our trade that unemployment was most marked and proved so obstinate to cure, and in this regard the difficulties have not decreased, but multiplied. We shall find ourselves operating in a world where marked changes in the form and direction of export trade have been brought about by the war. We have had to neglect certain of our impor-

## MARTINS BANK, LIMITED

### EXPANSION OF BUSINESS

### PREPARING FOR POST-WAR SERVICES

### MR. F. A. BATES COUNSELS WISE SAVING

The one hundred and thirteenth annual general meeting of Martins Bank, Limited, will be held on the 25th instant at the head office, Water Street, Liverpool. Along with the report and accounts which have been sent to shareholders, the chairman, Mr. Frederic Alan Bates, M.C., A.F.C., D.L., has issued the following statement:—

I commence my remarks on a note of sincere regret as I have to record the resignation of Mr. W. R. Glazebrook after twenty-two years of outstanding service to the bank and the general board. We shall miss his customary presence, his wise counsel and the very valuable contribution he brought to our discussions by reason of his great ability and grasp of affairs. He carries with him the good wishes of us all in the leisure he feels he should now take. As mentioned in the report, Sir Nicholas Cayzer, Bt., and Mr. A. Claude Morrell, O.B.E., M.C., whose main interests are shipping and the provision trade, respectively, have recently joined the general board, who warmly welcome their election. Major A. H. Aykroyd has been elected to the Manchester board. He has many interests, and his wide experience will be of great value to that board. I have pleasure in taking this opportunity of expressing thanks to the district boards for the close attention they give to the bank's policy in their respective areas.

#### CHIEF GENERAL MANAGER'S JUBILEE

This month Mr. J. M. Furniss completes fifty years in the service of the bank. He began his notable career with the bank, and, I am happy to say, retains his energy after this long period. I cannot speak too highly of that service, and more especially of his able guidance since March, 1933,

tant trade connections, and these will need cultivating anew.

America will emerge as a more powerful competitor in the export field, but, on the other hand, Continental and Japanese competition will be much less formidable. American countries, formerly among our customers, have turned energetically towards industrialisation of their own economy, as have also important countries in the Empire, from which it follows that the demand from these sources for some classes of our goods will be smaller than heretofore. It is therefore up to us to be ready with new and attractive lines of goods so as not to miss the chance of at least maintaining our trade with these countries at its pre-war level. Then some of our principal exports demand imports of the raw material, but we cannot pay for imports except by exports.

#### OUTLOOK FAR FROM SIMPLE

Another part of our imports consists of food of all kinds; whilst continuing to foster our own increased agricultural output, we can, if need be, cut imports to a minimum, but we shall to that extent prejudice the purchasing power of the primary producing countries, with inevitable adverse repercussions on our own trade. All these, and other factors, render the outlook for our export trade far from simple and straightforward, and resolution of the complex problems involved will call for vision, energy and perseverance.

That these qualities will be forthcoming I have little doubt, for they have been amply shown in our great war effort. I will conclude by recalling to your minds the words of General Smuts: "The British Empire and the British Commonwealth remain as one of the greatest things of the world and of history, and nothing can touch that fact."

## MARTINS BANK, LIMITED

### EXPANSION OF BUSINESS

### PREPARING FOR POST-WAR SERVICES

### MR. F. A. BATES COUNSELS WISE SAVING

when he became the head of the executive as general manager. In 1939 he joined the board of directors, and since 1941 has been chief general manager. The period has not been without its difficulties, including those arising from the war, and he has overcome them all with outstanding success. You will, I know, welcome this opportunity of joining his colleagues on the board and all his fellow members of the management and staff in congratulating him on the occasion and thanking him for all the ability and enthusiasm he applies to the bank's affairs. We were very pleased to see his name in the list of New Year Honours, and warmly congratulate him upon the honour of Commander of the Order of the British Empire conferred upon him by His Majesty the King.

At the end of the year Mr. E. T. Nicholson, North Eastern district general manager, retired after forty-seven years of loyal and able service. He has been succeeded by Mr. M. Conacher, formerly assistant district manager.

Before I deal with the accounts, I should like to pay tribute to all those members of our staff, men and women, who have joined the Forces or are engaged in other forms of national service. We are proud of their achievements, and we look forward with hope to their early return. Our men in the Forces have further distinguished themselves, and have gained many more decorations. To them and their families I send our warmest congratulations. Our losses in those who will not return, or who are missing, also increase, and our sympathy with relatives in bereavement or anxiety is indeed deep and sincere. The spirit of the men in enemy hands is fine, and you will read with admiration that numbers of them are keeping up their banking studies and

passing their Institute of Bankers' examinations while in prison camps.

In previous statements I have given the numbers of our staff withdrawn for national service. Those numbers continue to grow. The course of the war, although favourable as it has now become, imposes, with its daily difficulties, a strain upon the remaining staff, but they take the strain cheerfully, and from the chief executive officers downwards the work is done with great efficiency and loyalty.

#### SOUND PROGRESS

From the balance-sheet accompanying this statement, you will see that the bank has progressed soundly, very much on the lines of the previous year. Our total resources now exceed £197,558,000. Customers' deposits and current account balances have reached the new record figure of £180,131,000, which is an increase of £12,793,000 on a year ago. The increase has been almost entirely absorbed by Treasury deposit receipts, which have risen during the year to the large amount of £58,000,000. On the other hand, advances (formerly the bank's main asset, but now taking third place), after a steadily reducing tendency for some years, were fairly stable last year, and at the date of the balance-sheet were somewhat higher than twelve months ago.

The bank's high degree of liquidity, which is itself a reflex of the liquidity of our customers, amounts, quite apart from our large holding of short-dated investments in British Government securities, to 55.03 per cent. of our public liabilities. That percentage represents our holdings of cash, balances with other banks, market money, Treasury bills and Treasury deposit receipts, amounting in all to £99,123,000, and places us in a strong position to meet any post-war demand for accommodation. When that time happily comes, and controls have been relaxed, we shall welcome requests for banking assistance, and ready consideration will be given to the requirements of small traders whose businesses have been affected and will need re-establishment after the ravages of the war years. In the consideration then given, the problem of the returning ex-Service men will have a full share.

The net profit for the year is £606,700, which is £30,066 in excess of the figure for the previous year. After bringing in the balance from that year's accounts, the amount available for distribution is £994,346. The two dividends of 7½ per cent. each, less tax, will take £312,003 net, and this will leave a sum of £682,343, which has been dealt with in the following manner. A further amount of £100,000 has been placed to the published reserve, increasing that fund to £3,800,000. Reserve for future contingencies again receives £100,000 and reserve for pensions £50,000. The balance of £432,343 is carried forward to next account.

#### GROWTH OF THE BANKING HABIT

In spite of war conditions, and in fact to a large extent due to those conditions, the bank's business has been remarkably active, with expanding turnover and a notable increase in the number of new accounts. The last-mentioned feature is particularly encouraging, for, notwithstanding the folly of the hoarding of currency notes, to which public attention has been frequently drawn, it is a clear indication that the people generally are becoming increasingly banking-minded and are making still greater use of the bank's many services. This is all to the good, for the years immediately following the termination of the war will be not less difficult, having in mind the dangers of inflation, than those through which we are now passing. The increasing note issue is a warning, and in this connection it may be relevant to say that the proper employment of currency notes is not to keep them in wallets or private hoards, where there is great risk of loss, but, so far as saving is possible, in investment in Government

loans. All notes not required for immediate need should be taken out of circulation by such investment, or by paying them into banking accounts, whence they can be transferred into Government loans as savings can be made by the account-holders. In this way the public who are in receipt of the money dispensed on account of war production will become not

## DISTRICT BANK LIMITED

### SATISFACTORY RESULTS

#### STATEMENT BY THE CHAIRMAN, SIR R. NOTON BARCLAY

The chairman, Sir R. Noton Barclay, has issued the following statement to the shareholders of District Bank Limited prior to the 114th annual meeting to be held on the 28th instant at the head office, Spring Gardens, Manchester.

Since last year's meeting the Board have elected Sir Samuel Turner to succeed the late Mr Francis J. Dickens as deputy-chairman, and I am indeed grateful to have Sir Samuel's support, for, as you know, his experience is very wide and varied. I am also pleased to welcome the Right Hon. The Earl of Crawford and Balcarres as a member of the board.

#### STAFF

With a deep sense of loss I have to record a growing list of war casualties amongst members of the staff. Since hostilities commenced the total of those who have lost their lives has now reached 43, 9 are missing, and 22 are known to be prisoners of war. We honour these gallant men and tender sincerest sympathy to their families, who are now called upon to bear so grievous a burden of trouble. During the past year more of our men have been rewarded for bravery in action and for conspicuous service. On behalf of us all I desire to express our congratulations to them and also say that we look forward to welcoming our staff back again.

The fourth year of war has presented more difficulties as regards the maintenance of essential banking services. In twelve months of planning we have been much pre-occupied with the urgent need for the release of manpower. While accomplishing this, however, we have also endeavoured to continue serving our customers with maximum efficiency. That this policy has brought its reward is clearly indicated by the trend of our business, which in war, as in peace, steadily expands. Not the least important factor in this connection has been the loyal support of our much reduced permanent staff and the unflagging efforts of our temporary employees. In particular I would mention the services of the many retired members of the staff who have so willingly sacrificed well-earned leisure and thereby to some extent made good the depleted ranks of our experienced personnel. To the staff, in acknowledgment of excellent service and of the attendant results, the board for the second year in succession have been pleased to approve the payment of a bonus, which was distributed in December.

#### THE YEAR'S FIGURES

In terms of earnings, our progress is marked by an increase of £12,595 in net profit as compared with the previous year.

only banking-minded but savings-minded, to the great advantage of the country and of themselves. A very large amount has already been saved wisely during the war years, but it is essential that the habit of saving and investing, as opposed to spending, engendered throughout those years should be carried forward to the post-war period.

in satisfying innumerable demands. Admittedly, to meet an emergency, a nation may spend well ahead of income, but cannot continue such overspending indefinitely. It must not be overlooked that sooner or later war debts have to be paid. These considerations should not, however, lead to drastic curtailment of expenditure such as resulted in precipitating calamitous depression after the last war. On the other hand, whilst avoiding foolish optimism, we should continue to spend freely on economic reconstruction and development. This implies carefully controlled expenditure and priorities until supplies become normal: indeed these are requisite conditions for a regulated development which alone will ensure a sufficiency of the necessities of life and progressive social improvement.

#### EXPORT TRADE AND SCIENTIFIC RESEARCH

In planning for our future it should, from the outset, be appreciated that the hoped for development will mean larger imports of raw materials and foodstuffs. Also that war-time losses and overseas investments will necessitate increased exports to pay for these essential supplies. It is vital, therefore, that the rehabilitation of our export industries must be in the forefront of any reconstruction programme. The world's urgent need will be the expansion of purchasing power, coupled with maximum production at minimum cost. Profiting by war-time experience in production and distribution, our future contribution should not be by way of cheap labour but through first-class organisation and equipment. Industrial concentration and mobility of labour will also play their parts, but a proper and full measure of scientific research is equally essential. It is again the war which has enabled us to appreciate more fully the value of the scientist, and the opportunity should be taken to widen the future scope of his activity in industry. That adequate scientific expression cannot be achieved without adequate finance is a matter which the Government should recognise, and should provide incentive by a generous attitude towards progressive technical experiment and research. Furthermore, industry can itself help by exploring the possibilities of collective research where this is beyond the reach of individual concerns.

#### POST-WAR CONTROLS

Economic problems cannot well be considered without some reference to the future course of the many Government controls now so familiar. The apparent prosperity which at present prevails whilst these are widely imposed is no doubt largely responsible for increasing pressure for their continuance. Although some control will be essential in the immediate post-war period, nevertheless it is well to remember that, under war-time limitations of supply and abnormal demand, such apparent prosperity can scarcely be regarded as a reliable criterion as to the results of control on a return to peace-time conditions. It was under free exchange and more normal trading that successful commercial enterprise was built up, and which, *inter alia*, enabled us to develop a banking system that has successfully withstood the shocks of world wars and of depressions.

#### PRESENT AND FUTURE PROBLEMS

The war has brought extraordinary developments in economic and political conditions, and further far-reaching changes are likely before hostilities cease and a post-war order is established. Nevertheless, while prosecuting the war to the utmost, it is, of course, essential to prepare for peace. I should, therefore, like to express an opinion on certain important problems which lie ahead.

#### MONEY POLICY

The welfare of mankind will largely depend of progressive economic expansion permitting full employment and maximum consumption whilst controlling the sequence of booms and depressions. In this, success will be limited by the degree of monetary expansion that can be allowed without adverse inflationary consequences, and the problem seems best approached by world agreement and co-operation within the broad outline of the much discussed proposals for an international monetary mechanism.

#### NATIONAL EXPENDITURE

Turning from more general aspects of monetary planning to specific problems as they may affect this country, it seems that urgent attention will have to be given to the growing assumption that if we can spend without limit during war-time we can continue to spend lavishly afterwards

# RECORDS and STATISTICS

## FINANCE AND BANKING

**THE MONEY MARKET.**—Credit has again been in comparatively short supply this week. Heavy revenue payments have drained funds from the market while the January making-up is already under way. The market had the benefit of a £10,000,000 excess of Treasury bill maturities over payments on fresh bills, but the effective Treasury Deposit receipt maturities approximately balanced the new payments of £40,000,000 under this head. The market obtained a 26 per cent. allotment at last week's tender for Treasury bills, and in

order to take up its quota had to receive small assistance from the special buyer. The banks are operating on an exceptionally ample cash basis, the latest Bank return showing bankers' deposits at £177,001,000. This is a reduction of £11,215,000 on the week, but is still a relatively high figure. The net return of notes from circulation over the past week amounted to £7,916,000. The main counterpart to this movement and to the fall in bankers' deposits is found in a reduction of £19,860,000 in Government securities.

(Continued on page 130)

## GOVERNMENT RETURNS

For the week ended Jan. 15, 1944, total ordinary revenue was £125,938,000, against ordinary expenditure of £107,917,000, and issues to sinking funds of £580,000. Thus, including sinking fund allocations of £10,837,119, the deficit accrued since April 1st is £2,437,735,000 against £2,383,854,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £322,261 to £3,173,798, the other operations for the week (no longer shown separately) reduced the gross National Debt by £16,222,157 to £19,276 million.

## Industrial Policy

THE substance of the Report submitted to the President of the Board of Trade by the Post-War Committee of the Cotton Board is analysed in an article in "The Business World" on page 150. Cotton is still one of the largest of the nation's industries, a vital constituent of the export trade and the chief support of a whole region. But issues of general industrial policy are raised by this Report which greatly transcend the importance of any single industry. The Cotton Board's Report is one of the first to be presented by a major industry in response to the request of the Board of Trade, and precedents will be set by its reception.

Indeed, from this point of view, the congratulations that are due to Sir Raymond Streat and his colleagues for their promptness are tinged with a certain regret that it is cotton, of all industries, that comes forward as the test case. For cotton is not a typical industry. It is that rarity in modern Britain, an industry that is more dependent on exports than on the home market (though only just, nowadays). And, partly because of this dependence on exports, it is one of the few industries that is much smaller than it was thirty years ago, and is nevertheless still suffering from over-capacity. Nevertheless, the general issues having been raised by cotton, it is against a background of cotton that they must be faced.

The circumstances in which the Report has been produced are worth noting. As the Committee observes, the Report has had to be written in "the absence of anything in

the nature of a lead from the Board of Trade" on the major issues of economic policy "in such matters as the terms of international trade, international exchange arrangements, the policy as regards raw materials of world-wide importance, the location of industry, national policy in regard to stability of employment, price control and so forth." Obviously, the Government cannot be expected to answer all these questions at once. But still less can a single trade; and if nevertheless it is asked to make its requests for the future, the result is bound to be somewhat self-centred. If industry is left in the dark, it will naturally ask for the moon. Moreover, the Committee making the Report was a body of 28 members representative of every section of an industry which, more than most, is divided horizontally, vertically and locally. With the exception of a reservation by three members on one small point, the report is unanimous. In the circumstances, the fact that it contains any specific recommendations at all is a tribute to the chairman, and the plethora of bromides and ambiguities should not be a matter of surprise. Clearly nothing new or sharp or forceful can be expected from the highest common measure of so many diverse factors.

The main outline of the Report's proposals is that maximum and minimum prices for cotton cloth should be fixed by law; that there should be an organised redundancy scheme, financed by compulsory contributions, in any section where redundancy can be proved to exist;

and that the whole plan should be administered by a Board designed to be representative of the industry. On these central recommendations everything else is made to depend. The report attaches its hopes for the industry's future prosperity to price management, to the reduction of capacity and to "self-government." With prosperity attained by these methods, there will be no difficulty about research, re-equipment and progressive efficiency. Without it, nothing can be done.

The only sound general attitude to take towards schemes for fixing minimum prices is one of intense suspicion. There are few occasions on which the interest of the general community can be served by preventing those who are willing to sell cheap from doing so, and many occasions on which the power to fix prices, whether conferred by law or by agreement, can be turned into a device to protect and enrich a special interest against the generality. The restraint of trade by the fixation of minimum prices should be permitted only in exceptional cases, and even then only under close supervision.

This doctrine has been stated the more emphatically because it may well be that cotton is one of the justified exceptions. When permanent over-capacity is combined with a large number of unorganised producers, the phenomenon of "weak selling" appears. The frequency of "weak selling" has perhaps been exaggerated. But it does exist, and it cannot serve the interest either of the consumer of cotton cloth or of the nation at large that the cotton industry should be forced to consume its capital.

But if, as a hypothesis and by way of exception, the advisability of price-fixing be conceded, a further question immediately becomes pertinent: by what criterion are prices to be fixed? The draftsman of the Report shows his awareness of the problem; but he takes refuge from it in a flurry of ambiguities:

The principle to govern the level of prices . . . should be that of securing a reasonable rate of return in the long run to an efficient firm as determined by an investigation of the average results of a representative group of efficient concerns.

This is almost meaningless. What is reasonable? What is representative? What is efficient? What, indeed, is cost? If anyone believes that these questions can be answered by the agreement of "reasonable" men, let him observe the present controversy over farm prices, or let him study the past history of any price-fixing scheme. There is, indeed, one economic test of a fair price. The fair price is that which, in conditions of competition, will in the long run bring forth exactly the amount that is demanded at that price, neither more nor less. But if any conclusion emerges from the history of price fixing with any clarity it is that the attempt to fix any such economically justified price is met with screams of anguish from the producers. Any price in the fixing of which the producers have the dominant say will, naturally and inevitably, be too high for the long-run stability of the industry. That can be propounded almost as a maxim of universal validity.

It follows that the state will be running counter to its own interests if it gives its consent, or its assistance, to any price-fixing mechanism without first laying down on what principles the prices are to be fixed, and without first making certain that the persons who are to do the fixing can be relied upon to abide by the principles. And what should those principles be? It is easier to say what they should not be. They should not be the average costs of a representative collection of firms deemed by themselves to be efficient—for that would probably turn out to be an endowment of the complacent. If the fixed price is intended to be a minimum—one below which no one is to be allowed to sell—it should not attempt to cover the total costs of most of the firms in the industry—for otherwise no newcomer of enterprise and efficiency can increase his share of the trade. The avowed object of a minimum price, after all, is to prevent weak selling, not competition. As one example of the sort of principle that could be set up, it might be provided that no minimum price should exceed the total costs of the most efficient firm, or the prime costs of the lower quartile—that is, of

the firm whose costs stand one-quarter of the way up from the lowest to the highest. Whether or not this would be appropriate, the important point is that the Government should never grant legal power to fix prices without laying down some principle, this or some other. And if such a principle were laid down, it is almost certain that the appropriate body to implement it would not be a representative board.

In short, it may be that a case can be made out for price-fixing in the cotton industry. But before it can be accepted the Government must provide itself both with a price policy and with an agent to execute it.

Much the same considerations apply in the matter of redundancy schemes. He would be a bold man who denied the existence of permanent over-capacity in some sections, and perhaps in all sections, of the cotton industry, and if there is redundant plant the industry can most quickly be placed on a sound footing by removing it. But the particular method proposed in the Report for the removal of redundancy is open to the most serious objections. Briefly, the Report follows the precedent of the Cotton Spinning Industry Act of 1936, the "spindles scheme." No firm is to be compelled to reduce its plant, but a price is to be offered for the purchase of plant for scrapping, the cost being recovered by a compulsory levy on the plant that remains in production.

Undoubtedly, this method is politically the easiest—which explains its enactment in the era of soft options. But it is thoroughly bad in principle. Since the scheme is voluntary, the bribe offered has to be considerable and the addition to price by means of the levy is significant. There is therefore (especially in the case of an export industry) the risk of a vicious circle. Excess capacity leads to a levy, which increases prices, which reduces sales, which swells the excess capacity. The only method by which excess capacity can be removed without adding to the costs of those who remain—that is, without reducing the efficiency of the industry—is by giving the owners of the scrapped spindles or looms a share in the equity profits, if any, of the industry. And the only method by which that result can be brought about is a policy of amalgamations, voluntary or compulsory. But before this alternative can be pursued, the Government must again go through the painful process of making up its mind what it wants and of finding agents to execute its wishes.

The preceding paragraphs have contained some severe criticisms of the Cotton Board's report. But it would be a mistake to regard the criticisms as being directed chiefly at the Board. Their concern, after all, is with the interests of the cotton industry, not with the requirements of general public policy. It is rather to the Board of Trade and to the Government generally that the complaints should be addressed. It is true that the economics of the future cannot now be laid down in all its details. But industry has a right to demand of the Government at least as much as the Government is demanding of industry—that it should consider the main outlines of its post-war policies and announce the results. To judge from public pronouncements, or their absence, the Government has very little notion of its industrial policy. Are price-fixing, quota-determining cartels looked upon with favour or not? If they are to be permitted, within what limits are they to work? What does the Government regard as the greater danger, "cut-throat competition" or restrictive monopoly? Can productivity be best secured by protecting what exists, or by leaving an open road for innovation? Which is better, high prices so that no one works at a loss, or low prices so that trade can expand? If the Government does not approve of the prescriptions that industries write for themselves, has it any medicine of its own? No one outside official circles has any idea what the Government's answers to these questions may be. Does anyone inside know?

Some answer will presumably have to be given to the Cotton Board's report, and to the others that will follow. Nor can the Government return either a simple Yes or an unexplained No. They will have no option but to give this whole complex of questions the hard thought of which it has hitherto been deprived.

## Japanese Strategy

JAPAN has entered the third year of war in a more sober mood. The exaltation of the early victories has passed. The rapid disintegration of the Axis position in Europe and the steady success of the Allied counter-offensive in the South-West Pacific are both danger signals of a world situation which is steadily turning against the interests of Japan. So far, perhaps, the people are not conscious of any striking change, but the note sounded by General Tojo and by most Government spokesmen has in it now an undercurrent of warning.

Yet the military and political leaders are not depressed. The political and economic position of Japan appears to be still fairly stable. Very little news percolates through the strict cordon of censorship and inaccessibility, but obviously the Japanese authorities are not facing any immediate crisis. There appear to have been no breaches in the political unity of the country. The economic situation is relatively speaking under control. As in other war economies, the workers are enjoying high wages and assured employment. Rationing is functioning fairly well, and the people are contributing fully to the war savings movement. The Japanese are a disciplined race, and although there is a big black market and a growing threat of inflation—almost no consumer goods are available and clothing is a special problem—the controls are adequate.

Yet there are undoubted danger signals, politically and economically. Since the suppression of all the political parties two years ago, there has been no open criticism of the Government in the Diet; but the political groupings still exist and still represent the opposition of the business world to the policy of the military leaders. This opposition expresses itself in restiveness under the growing pressure of Government control, and in apprehension at many of the profound changes which war has made necessary in the Japanese economy. The structure of Japan, in which effective power lies with the military and industrial leaders, has often been compared with that of Nazi Germany. The analogy is not exact. The struggle for power lay between the military and the business world, with the military leaders little by little gaining the upper hand. Up to the time of the attack on Pearl Harbour and beyond, the industrialists still held their own in the economic sphere. What control there was, they exercised, and Japan had by no means a total war economy.

The strain of the last two years has entailed very great changes. It has been necessary to introduce strict priorities and to concentrate industry; the textile industry has been cut down drastically; and such is Japan's shortage of steel that textile machinery has been scrapped whole-

sale and the materials used for machine building in the armaments and chemical industries. The balance of Japanese industry has tipped over from textiles and consumer goods to heavy industry. The process of transfer and rationalisation has been pressed through increasingly under the influence of military leaders. The process culminated in the changes introduced by General Tojo in September, 1943. Until that time, the old Ministries of Finance, of Commerce and Industry, and of Agriculture and Forestry had continued to guide the war economy under the direction of a Cabinet Planning Board, whose chairman was a Cabinet Minister. This machinery proved too cumbrous to put through the sweeping changes demanded by the worsening of the war situation. General Tojo abolished the Planning Board and the Ministry of Commerce and Industry. All non-war economic activities were placed under a Ministry of Commerce and Agriculture, and war activities came under the control of a new Ministry of Munitions of which Tojo is head, combining the post with those of Prime Minister and War Minister. Among the first acts of the new Ministry was to establish new priorities. Aircraft production occupies first place, shipbuilding second.

The centralisation of power under military leadership is displeasing to the business world, who have seen in Manchuria how far "military socialism" can oust them from control. But concern is more widespread than the grumbings of business people. Any Japanese leader, business man, court politician or soldier must have misgivings about the long-term effects of the war economy. There is the fact already noted that the traditional basis of Japan's export trade—textiles and cheap goods—has been undermined. It is true that the policy of concentration has been mitigated recently by a counter-policy of dispersion—Japanese experts are in Germany carefully watching the effects of the air offensive. But the top-heaviness of Japan's economic and social structure has been increased by the gathering of further resources and controls into the hands of the few giant concerns and the wholesale closing down of medium and small businesses and workshops. More and more independent artisans have become workers. The countryside has been so drained of manpower that the army, anxious for the future quantity and quality of its recruits, has demanded that the percentage of country dwellers to town dwellers shall not be allowed to drop below 42 per cent. At present, the flight from the land, the swollen proletariat, the topheavy industry, the lack of consumers' goods, present no immediate threat. But if a crisis were to develop under pressure of mass bombing and of defeat? If the collapse of Government credit were to ruin all the small savers?

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

If the cutting-off of all outside supplies were to lead to famine? The long-term prospects of stability are absolutely conditional upon staving off defeat. In a complete military disaster, it is by no means certain that the traditional docility and loyalty of the people or the religious character of the Emperor's position would stave off revolutionary change.

Japan's leaders still believe that they can stave off defeat. Although it is only possible to guess at their intentions, it seems likely that they envisage a long war of attrition, in the course of which the British and Americans, deterred by enormous losses and the passage of time, will finally agree to a compromise peace. The military basis for this strategy would be the "impregnable" position of Japan, occupied China—or at least North China—and Manchuria. There is evidence to suggest that the Japanese are prepared to abandon their more scattered conquests—for example, in spite of the occupation of the Netherlands East Indies and the plethora of oil supplies, the production of synthetic oil is still going on in Manchuria. But the China-Manchuria-Japan triangle would be defended to the last. The new concentration on aircraft and shipbuilding is probably designed more to make the sea approaches to the triangle impregnable than to protect all the sea lanes of the Co-Prosperity Sphere.

The flaw in this strategy is the equivocal position of Russia. The Far Eastern Red Army threatens the Manchurian base and the Siberian air bases threaten Tokyo. The Japanese are working for one thing only, the neutrality of Russia. For example, after one incident two years ago, when a Japanese submarine sank a ship bringing in American supplies to Vladivostok, there has been no interference with the flow of war supplies across the Pacific to Russia even though the ships pass through the Tsugaru Straits between two islands of Japan. As a reinsurance, the pick of the Japanese army is kept in Manchuria, and the frontier is constantly reinforced. For the rest, the Japanese rely on Russia's war weariness and on the chance that the Russian leaders will be inclined to allow the brunt of the Far Eastern fighting to fall on the less tested Americans and British.

If, in spite of Russian abstention and in spite of delays and losses, the British and American forces succeed in getting within striking distance of the Japanese "triangle," then probably the Japanese Government will attempt to use the bogey of Bolshevism. Their own social equilibrium will be unstable enough to give some basis to their case. They will point to deep underground links between Japanese, Korean, Manchurian and Chinese Communism. It is of incidental interest that the Japanese Communist leader, Okano, arrived recently at Yenan at the headquarters of the Chinese Communists and issued

an appeal to the Japanese armies to return home, overthrow the tyrants and set up a "People's Government" to determine Japan's future. The Japanese militarists and business groups will protest that unless the Allies cease their attacking or bombing, they will be unable to resist the tide of revolution or the emergence of people's governments in Japan, Korea and Manchuria which will exclude all future American influence, look to Russia for leadership and bar British and American commercial interests in China. As an alternative, the present leaders would offer to abandon all their conquests, to set up a liberal regime under a "constitutional deity," to accept the Chiang Kai-shek regime in China and to enter into advantageous economic relations with American and British business. Obviously, an appeal of this sort, coupled with some such bait, might well tempt the timid in the United States, in Britain and in China. For example, the position of the Emperor, as a bridge to a more liberal system, is already under discussion in the United States.

Nor should it be ruled out that, if the four Great Powers do not co-ordinate their policies, revolutionary Governments might more or less spontaneously appear in the "triangle" in the hour of Japan's collapse, and the Far East might come to be sharply divided into spheres of conflicting interest and ideology, with North China, Manchuria, Korea and Japan looking to Russia and practising national planning on autarkic and exclusive models, while central and southern China looked to the United States and Britain and attempted to remain in contact with a world-wide economy. The possibilities of conflict need not be underlined.

The solution can only lie at the level of the Great Powers. Russia is the key to the rapid military defeat of Japan. Russia is equally the key to Japan's long-term plans for military and political stalemate. If the Great Powers cannot agree on a common policy for the Far East, on the type of regime they will jointly find acceptable, on the economic policies they will jointly pursue, on the wider political framework into which they will fit the liberated and restored territories—ultimately including in these Japan—then the likelihood of splits and divisions and the building of hostile spheres of influence cannot be dismissed. The problem is very similar to the problem of finding unity in Europe, although Russia's Far Eastern neutrality represents a further element of ambiguity in that region. Russia, China, the United States and Britain have an overwhelming interest in Far Eastern stability and prosperity. These cannot be achieved unless they all contribute their part. If they are not prepared to do so, the Japanese may achieve what Hitler has so far failed to achieve—the disintegration of the Grand Alliance.

return, you face starvation. And thirdly, the compulsory preoccupation of governments with full employment makes it much more difficult for them to ignore even a small and temporary adverse balance of payments. There is no inherent bias towards restriction in the multilateral system—on the contrary it has in the past been the great principle of expansion—but in the actual circumstances of the post-war world, it is probable that an unplanned multilateral system would, in fact, achieve a balance of debits and credits by the harmful process of cutting down the larger.

Nor, as was argued last week, do the projected international currency and development schemes promise to go far enough to remedy this defect. The Keynes and White plans defer the debtor's necessity to cut down his imports—but only for a time and at the cost of supervised restriction thereafter. The scheme for an international development bank—though highly desirable for its own sake—would not direct enough funds to the right places in the international credit system to prevent the necessity for

restriction. The economic thinking on international matters exemplified in these plans is still only at the point reached by orthodox thinking on internal employment policy before the Great Depression. A deficit country is in much the same position among the nations as an individual who, within a community, cannot buy as much as he wishes owing to the lack of demand for his labour. It is no longer the orthodox view that nothing at all should be done and that events should be left to take their course. But official thought has not yet got beyond the view that temporary loans are all that can be offered to the unemployed, and that all public works must be "remunerative." This is an advance, and it may be as far as it is possible to get in the present climate of opinion; but it is not enough.

The next step in the argument is to enquire whether there are any means by which an international policy of balance-through-expansion could be built up within the multilateral framework, to match the modern ideas on the maintenance of income within each national economy. Two proposals that have been put forward in public within the last two years can be selected as fair examples of the lines on which thought might proceed. The first is simple in its basic conception, but is not complete. The second meets the theoretical requirements, but would be complicated in operation.

The first example is the proposal put forward in the January 1942 issue of the American review *Foreign Affairs* by Mr Herbert Feis. (Mr Feis was at that time on the staff of the State Department, from which he has since resigned; but he was writing in his unofficial capacity.) Reduced to its essentials, Mr Feis's proposal was that if any country, in any year, incurred a favourable or positive balance of payments—that is, broadly speaking, if it sold more than it bought—the amount of the balance should stand to its credit on the international books for two years. Within that period, the country could use its credit to buy goods or services of any kind from anywhere; but any credit that remained outstanding at the end of two years should be cancelled. Cancellation would, of course, wipe out a corresponding amount of the deficits of countries with unfavourable balances of payments.

The merit of Mr Feis's scheme is that it puts the responsibility for balancing the accounts on the only person who can, by his own volition, balance them upwards—namely, the creditor. To the extent that a creditor increased his imports rather than lose all benefit from his sales, the Feis plan would induce upward balancing. But it does not compel upward balancing and, political pressures being what they are, most creditors would probably submit to cancellation rather than increase their imports. The debtor would be relieved of the necessity of balancing his accounts by cutting down his imports—which would be much better than nothing at all—but the Feis plan would not achieve the ideal solution of increasing the debtor's exports. It is a halfway house between expansion and contraction.

The proposals that can be taken as an example of the second line of thought are those put forward by Mr Kalecki and Mr Schumacher of the Oxford Institute of Statistics in August last. The essence of this plan is that, in addition to any balances arising out of ordinary trade, international credit should be created by the Clearing Union or other international authority; that it should be placed at the disposal of countries requiring international help in their development, industrialisation or reconstruction (these countries would define themselves as those willing to accept foreign capital goods for development purposes); and that it should be spent only in countries having a debit balance on ordinary trade. This would be closely analogous to the financing, in the domestic sphere, of "unremunerative" public works out of a credit expansion, with the further stipulation that the money should be spent only in depressed areas. Provided that these "international public works" could be set on foot at the right time and to the right amount, and provided also that the deficit countries could provide the capital goods required—two large provisos—this scheme satisfies

the theoretical requirements. It would cure any lack of balance in the international accounts by creating additional trade which would not otherwise have existed.

But neither the Feis plan nor the Kalecki-Schumacher plan can be regarded as practical politics. If American opinion is inclined to look with suspicion on the much more orthodox Keynes plan, it would clearly be quite impossible to get assent to these bolder proposals. It is true that the United States would not suffer any real disadvantage. On the contrary, America stands to gain from any successful balancing of world trade, since the alternative is a vicious spiral of restriction in which American exports, and therefore American employment, would certainly suffer. Nevertheless, it cannot be expected that the American politician should be in favour of a plan that would lead to the regular cancellation of large American credits, or to the financing, with international help, of exports of capital goods from countries of which America would not expect to be one.

It would be unfair and incorrect, however, to pretend that the only difficulty is an insufficiency of logic in Washington. There is a real difficulty involved as well. It is most unlikely that either the forgiveness of debts or international public works could be organised on a scale large enough to solve the problem. The probability is that the total of the world's favourable balances of payments (or of the unfavourable balances, which in the final analysis are the same thing) will, in the absence of special restrictive or bilateral devices, be of the order or magnitude of \$5 billion a year. Gaps as large as this cannot be closed by the methods hitherto discussed.

It may seem to some readers that too much of a fetish has here been made of the necessity of seeking balance in international trade by expansion. May there not be occasions when a country's international trade difficulties are due to mistakes in its policies, and can best be corrected by compelling it to set its internal house in order? May there not be times when an insistence on expansion may merely lead to inflation? There may be substance in these doubts; but they run counter to the economic philosophy which is the deliberate choice of the present generation. There is, once again, an analogy between the relations of individuals within a nation and of nations within the world community. There is a risk in the policy of full employment that it may let fundamental distortions go uncorrected. But the corrective force of adversity is arbitrary and uncontrollable, it disturbs harmony more often than it corrects distortion, it inflicts a ton of misery for every ounce of healthy correction. For good or evil, the fundamental postulate of economic policy the world over is expansion, and the system of international trade must conform. There may be times—the present is one—when the task is to compress a limitless demand within the measure of the available supply, and at such times all the rules work in reverse. But in peacetime the presumption is that inflation will always be less to fear than deflation.

The conclusions to be drawn from this long discussion of the prospects of a universal, multilateral system are thus three. First, no system will better suit the interests of Great Britain than a universal system, if it can be attained. Second, there are means by which a multilateral system could be made to serve the interests of a general policy of economic expansion. But third, these means are not at present attainable, partly because of a lack of agreement upon them, partly because of the magnitude of the present dislocations. The course of British policy is thus, in outline, clear. The re-establishment of a universal system, with an expansionary bias, should be the objective of our long-term policy and we should do everything in our power to persuade the commercial world to accept the means by which it can be established. But until this agreement is attained, and until the present enormous gaps in the nation's balances of payments can be closed, we have no option but to examine the less-than-universal, the less-than-fully-multilateral, the less-than-completely-orthodox alternatives. It is with them that the next article will be concerned.

### The Principles of Trade—V

## Planned Expansion

THE universal or multilateral system of international trade has served the world well in the past. Without the ability to seek profitable exchanges wherever they could be found and to engage in buying and selling free from the restrictions and complications of bilateral barter, the volume of world trade could never have been built up to the dimensions it reached, to the great advantage of living standards, in the years before the Great Depression and Hitler's War.

But in the circumstances in which the world will find itself when the war is over, it is unlikely that a simple reversion to unplanned multilateralism will meet the requirements of economic policy. The international accounts of most nations, including those of America and Britain, will be too badly unbalanced to be left to the natural curative processes of unplanned trade. Moreover, to work a multilateral system requires that all the participants, or at least the larger participants, shall have substantial reserves. It is foolish to cast your bread upon the waters of multilateralism if, before the due season of its

## NOTES OF THE WEEK

### Mr. Hudson Speaks

Mr Hudson's exposition of the Government's case in Wednesday's debate on farm prices necessitated, as many people expected, the use of a number of figures hitherto unpublished. The large increases in the gross receipts of agriculture were shown to have exceeded very considerably any increases in costs of production, whether arising from wages or from other causes. The gross receipts of agriculture on the pre-war basis were £270 million. By 1940-41 there had been an increase of £110 million to a total of £400 million. Against this, gross costs had risen by £46 million, of which £26 million represented wage increases. Up to 1940-41, therefore, farmers had a net gain of £64 million. By December, 1941, there had been a further increase in costs of £30½ million, of which £19½ million represented wages. Against this the farmers claimed price increases of £55 million and were granted £23 million. Then again at the end of 1943 there were wage increases amounting to £15 million, against which price increases amounting to £6 million were given. The gross receipts of farmers increased by £110 million up to 1940 and have increased by a further £130 million since; over the whole period the gross income has risen faster than the gross costs. These were the main disclosures; for the rest, Mr Hudson's case was well and fairly explained. He resisted the temptation to sharpen the controversy; and both by the tone of his speech and by the timely offer of a concession to small milk producers, he went a long way to allay the hostility of the farmers, which received only softened expression in the subsequent debate. Indeed, when the issue is fully explained (as it has never hitherto been) the charge of a breach of faith can hardly be sustained. The underlying issue, of course, is future policy. But if nothing else of value has emerged from over three months of acrimonious dispute and indignation, the proposals to set up a permanent mechanism to fix guaranteed prices for agriculture, beyond doubt in its impartiality and beyond question in its accuracy, are most welcome.

### Whose Minister?

This week's debate in Parliament on farm prices raises a consideration of very great general importance. A new and dangerous doctrine of representation is creeping into our politics. The corporative idea, according to which legislators or Ministers represent interests and special groups within the community, has never been accepted in this country—though it was proposed, by Mr Churchill of all people, as the basis of an additional Economic Parliament, in his Romanes Lecture nearly twenty years ago. It is the community, mirrored in its constituencies, that Parliament represents, and the communal interest that Cabinets should be concerned to defend and further. This is both traditional and right. But there are those who would have it otherwise. Mr. Hudson is sometimes attacked, not because he has let the country down, but because he has let the farmers down. Mr Bevin openly speaks on behalf of trade unionists. Sir Archibald Sinclair is expected by the Air Marshals not only to press the rightful claims of his department, which is his duty (within the limits of Cabinet policy), but also to press their views and stratagems in inter-Service controversies. Sir Stafford Cripps is regarded askance by the aircraft industry because he has tried, with mixed success, to be not their man but the community's. In part, this nonsense arises from the conditions of wartime Coalition. The setting-up of Mr Churchill's Government in 1940 was, largely at least, a process of bargaining between groups and interests. Mr Bevin had to be Minister of Labour to bring in the trade unions. So, in wartime conditions, the farmers must apparently be appeased by a Minister who, until now, has been ready—as “one of them”—to do them proud. But, whatever rules or expedients may have been needful three and a half years ago, the time has come to go back to a more wholesome and more democratic doctrine. Mr Hudson is not, or should not, be the “farmers' boy.” Mr Bevin is a Minister of the Crown and of the community, not Labour's mouthpiece. Coalition has many disadvantages; but none is greater than this tendency to regard its essence as collective bargaining, not only between

political parties, each seeking rights and staking claims in the distribution of offices, but also between organised interests, almost regardless, it would seem, of the common man—and elector.

### Stretched Defences

With the Allied landings at Nettuno on January 22, the Italian campaign again assumed the amphibious character that makes it possible for the Allies to overcome the important tactical handicaps of land warfare in the Italian peninsula. In striking contrast to the experience at Salerno, the Nettuno landing completely surprised the enemy. It met with almost no opposition in its initial stage. Even after five days only “gradually stiffening enemy resistance” has been reported. The disembarked divisions are by now well supplied with armour and heavy equipment. The nearness of the landing base to Rome perhaps led laymen to expect a lightning stroke at the Italian capital. In General Alexander's intention, however, the operation seems to aim rather at enveloping Kesselring's forces which are fighting to the south on the Garigliano and Rapido rivers. The German reaction has given a significant indication of their strategic position. Unable to meet the Allied forces at Nettuno quickly and in sufficient strength, they concentrated first on holding the Fifth Army on the Garigliano and the Rapido and then on launching counter-attacks against it. By doing so they hope to prevent the southern jaw of General Alexander's pincers from closing, and in the meantime to gather forces for action against the northern threat. They have the advantages of interior lines. But in practice it is very difficult for them to switch forces from east to west over the now snow-covered Apennines. The alternative is to switch forces from north to south. But the German lines of communication here are exposed to heavy air bombardment by the Allies. The latest reports speak of German reinforcements dropped by parachute; but such reinforcements can hardly be sufficient to prevent the consolidation and extension of the Nettuno springboard. In the last resort the issue will be decided by the reserves on which Kesselring is free to draw for the defence of southern Italy. So far the signs point to shortage of reserves to draw on, just as reports on the victories which the Russians are scoring on the Lenin-grad front speak of undermanned defences.

### Commonwealth Co-operation

Mr Attlee has told the House of Commons that a meeting of Commonwealth Prime Ministers will be held in London very soon. A few days ago, at Toronto, Lord Halifax made a remarkable and statesmanlike speech which might well inspire the Conference's work. The gist of his argument can be stated in a single sentence from the speech:

The Statute of Westminster was in a sense a declaration of independence, but it was more than that; it was also a declaration of interdependence, a recognition that in the world of the twentieth century no country can live by itself and for itself alone.

This recognition was embodied, in a very practical fashion, in last week's Canberra Agreement between the Governments of Australia and New Zealand; which set down specific proposals for the permanent and continuous co-operation of these two Dominions in, to borrow Lord Halifax's later phrase,

all fields of common interest, foreign policy, defence, economic affairs, Colonial questions and communications.

What Australia and New Zealand have learned from their wartime peril, and what Lord Halifax emphasised in his Toronto speech, was that

the magnificent response of the Dominions in 1939 was not, thank God, too late to save the cause for which the Commonwealth and Empire stood and stands, but there is a real sense in which it was too late to save peace,

—and all but too late to prevent disaster. “In the years of peace, there is a weakness which we should try to cure.” Lord Halifax, in pointing out that isolation has been the ruin or nearly the ruin of all small states, did not follow, say,

Mr Lionel Curtis by proposing a formal federation of the Commonwealth for all its external affairs; nor did he precisely follow Mr Curtin by proposing the setting up of some new and definite constitutional arrangement for the settlement of Commonwealth policy. All he did was to make it plain, and convincing, that

we shall find it desirable to maintain and extend our present wartime procedure of planning and consultation which itself adapted and extended the methods we practise in peace.

### Independence and Interdependence

Lord Halifax's Toronto speech has been criticised, somewhat unjustly, on the ground of its supposed implication that each of the Dominions might be compelled, for the sake of working out a common policy in their common affairs, to surrender some of its independence, and enter, perforce, some interdependent organisation. Lord Halifax did not, in fact, say or mean this, though perhaps he might have made the point somewhat more plain, speaking as he was to Canadians, who do not share some Australians' desire for a new institutional framework for Commonwealth affairs. Canada, close to the United States, is wary of closer Imperialism; so, too, indeed, is Australia, which looks beyond closer Commonwealth co-operation to more mutual action by all the nations in regional self-defence. But Lord Halifax was simply appealing to common sense, and asking that the necessity for the members of the Commonwealth to speak with a common voice, always, in fact, recognised in the hour of danger, should be recognised, more safely and more sensibly, at an earlier stage, while peace can still be preserved. As he said, “The Dominions are absolutely free to choose their path”; and they will remain so. It is merely reasonable, and not in any way dictatorial, to suggest that

in the field of defence, while there must be individual responsibility, there must also be unity of policy.

This is as true of all peace-loving nations as it is of the Commonwealth. War has shown that Russia and the United States—described by Lord Halifax as “the Titans”—are no more secure in isolation than the smaller and weaker states. If Europe is to look to Britain for leadership and guidance, then the best practical response will be the translation of Lord Halifax's principles, and proposals like those of the Canberra Agreement, into Commonwealth fact. Then there will be a unit sufficiently safe and strong to work in partnership with the United States, Russia and Europe, in order to provide the same safety and strength for the world at large.

### Mr Bevin's Concession

At the conclusion of the Committee stage of the Disabled Persons (Employment) Bill, a new clause, tabled by Mr Bevin, was moved which attempts, in accordance with his promise last week, to give statutory preference to ex-Service men and women, if in the administration of the measure priorities have to be established. At the time of going to press, it is not known whether the new clause satisfies the Tory critics who pressed for the preference. The wording runs that, if at any time it appears to the Minister that vocational training and industrial rehabilitation courses are insufficient for all disabled persons in need of them, he shall so exercise his discretion in selecting persons for these courses that, so far as is consistent with the efficient exercise of his powers, preference shall be given to men who have served whole-time in the armed forces or the mercantile marine, and to women who have served whole-time in any of the women's auxiliary services. A similar preference is to be given to the same categories of men and women in the submission of names for employment. Thus the wording of the amendment apparently includes within the preference ex-Service men and women who are injured or fall ill after they have been discharged, perfectly fit and well, from the armed forces where they may never have been near the firing line. It excludes, however, men and women who have served in the civil defence service—including London's firemen injured in the blitz—young men conscribed into the mines, and young women directed into factories. Mr Bevin has given the Conservatives the chance to catch the ex-Service man's vote after the war. But if he really intends this preference to be administered strictly, he has come near to spoiling what was a good comprehensive measure, which aimed high and created no anomalies. It is possible, however, that he has still saved it by the phrase “so far as is consistent with the efficient exercise of his powers”—which, in effect, will leave

him considerable administrative latitude. The Bill, when it becomes law, can only be administered efficiently if, first, rehabilitation and training facilities are adequate for all, and there are jobs for all, and if, secondly, until this is achieved, any preference is given to those who are worst injured, most sick, and best fitted to take up a job.

### The Finance of Religious Teaching

The Education Bill has now entered the Committee stage in the Commons. A majority of the speeches in last week's very friendly debate on the second reading of the Bill dealt with the position of church schools. No discussion in Parliament, with religion as its centre, has ever been so amiable and mutually understanding. The truth is that the topic of debate was really not religion, but finance, not God but Mammon. The Roman Catholics did not vote against the second reading. If they could be sure of raising the money needed to maintain the present freedom of their schools, built up by voluntary levies on their community, they would not oppose the Bill at any stage. The position is, according to their own calculations, that they will need to raise £10,000,000, voluntarily, in the next twenty-five years, against £3,000,000 raised in the past twenty-five years. They do not believe they can do it, and so they seek greater aid, from taxes and rates, for wholly Catholic schooling. But public funds already meet the overwhelmingly larger part of the total cost of all church schools, and the Butler Bill proposes to increase the total public charges for this purpose. The Government rightly judges that to meet the Catholics' demand for sufficient extra public aid in every instance to enable Church control of the schools to be retained might raise opposition enough from other quarters to wreck the Bill. The fact is that, while the Church of England, like the Nonconformists, can accept the compromise by which, in schools transferred to public control for lack of voluntary funds, an agreed syllabus of religious teaching will meet the need, the Roman Catholics, by their immutable dogma, cannot. The terms offered to all denominations are identical; but the Roman Catholics cannot agree to any transfer of control, because their principles are different. On the other hand, the Government cannot agree to any special concessions to their viewpoint—which is shared by some minorities in other churches—because the weight of public opinion has been, and is, definitely on the other side. Probably, when the Bill passes, the Roman Catholics will find themselves able, by their sense of community and mutual devotion, to save their schools from transfer; and the project of guaranteed loans, at low interest (but not interest-free, as has been suggested), is being discussed between them and other churchmen.

### Local Burdens

The finance of religious education was only one part, if the largest, of the time applied in last week's debate on the Education Bill to money matters. Stress upon the burden laid upon local rates was, in weight though not in time, at least as heavy. Again, in the cost of the proposals to local authorities as in the cost to churches, the Government can, and did, claim that its own contribution will be increased by the Bill, both relatively and absolutely. “A total increase of £51.2 million—increase over pre-reform expenditure—will be borne by taxes, whereas only £28.6 million will be the extent of the increase which is to be

## THE BRITISH LINEN BANK

Incorporated by Royal Charter, 1746

Head Office: 38 St. Andrew Square, Edinburgh

expected from local rates," said Mr Butler; but he could not, and did not, deny that the extra local expenditure will be a very heavy burden upon rates in general (perhaps a fifth of present rate expenditure), and especially heavy and grave in the case of local authorities with many children and low rateable value. This is, of course, a criticism, not of Mr Butler's Bill, but of the distribution of public expenditure between taxes, which are uniform and even-handed throughout the country, and rates, which are not. Mr Arthur Jenkins, in the debate, put the position very plainly. In 1939 the average rate liability throughout the counties of England and Wales for elementary education was 2s. 10d. in the £ yearly; but, while in Surrey and the Isle of Wight it was 1s. 7½d., in Carmarthen it was 7s. 5d. and in Durham 5s. 6½d. In Surrey or Middlesex the produce of a penny rate brings in going on for 10s. per child in average attendance; in Glamorgan or Durham it brings in only about 2s. Mr Butler hastened to call the allocation between taxes and rates "transitional"; not even the provision of £900,000 from central funds to aid the poorest authorities appreciably alters the picture. Mr Ede, Parliamentary Secretary, spoke of a "transitory arrangement," and suggested that early reform was inescapable. As it is, the scope and quality of the education open to a child depends, capriciously, upon the rateable value of the area he lives in and the number of other children in that area—which is indefensible. Moreover, the Butler Bill is only, in the Minister's own words, "the first of the Government's measures of social reform." When the full tale is told, the total rate burden may even be doubled—and, in many localities, it may be unbearable.

### Protests to Spain

The most recent British protest to Spain concerns the continued presence on the Russian front of Spanish volunteers. After the withdrawal of the Blue Division, it appears that a few hundred Spaniards (many of them probably men General Franco would have been glad to leave on the field of battle) remained behind as a sort of Spanish Legion. This breach of neutrality is naturally a matter of grave military concern to the United Nations. Other recent protests were not aroused by matters of such importance. They covered time-bombs discovered in cargoes of oranges and the attack made on the British Vice-Consul at Saragossa; and the Spanish Ambassador in London has assured Mr Eden that the authorities have taken the strongest measures to prevent further acts of sabotage. Both actions, like the telegram sent to the puppet government at Manila, are probably due to the existence of a lunatic fringe in Spain among the Falangists. The Falange's relations with General Franco have grown more and more uncomfortable in recent months, and resentment against the Government finds easy outlet in resentment at the line it has adopted in foreign policy. The Falange lost caste during 1943 as the group most closely identified with Fascism and Nazism, whose stars were so evidently on the wane. General Franco, the Conservative elements, the Army and the Church had at least the prestige of having kept Spain clear of illusory Mussolinian adventures and of their subsequent collapse. A number of cautious pro-Allied steps have been taken—some economic concessions, some relating to the censorship, the publication of BBC programmes in the Spanish press. The withdrawal of the Blue Division, even though the gesture was bungled with characteristic clumsiness, was an attempt at conciliation. All this has increased the fretfulness of the Falange. Its extreme members have chosen thuggery and time-bombs to express their spite; and General Franco cannot control his wild men. Some observers are beginning to feel, with Mr Shinwell, that these verbal protests to the Spanish Government are of little avail, and that it might be necessary to take stronger and firmer action. It is doubtful, with the Second Front on the horizon and the military balance in Western Europe as precarious as it is, whether that time has come. But General Franco should be straightly warned that come it will.

### Stronger Line in South America

The Government of Argentina, after much internal stress and strain, has broken off diplomatic relations with Germany and Japan, on the ground of the violation of Argentine neutrality by Axis agents. The sequence of events shows the external pressure which produced this belated

decision. The Governments of Britain and the United States decided a few days ago not to recognise the revolutionary Government of Bolivia. They reached this decision after close consultation with the other Latin American governments through the Advisory Committee for the Political Defence of the Western Hemisphere. Evidence was at the disposal of the Committee to confirm the suspicion that the Bolivian coup was due, in the words of the State Department, to "groups hostile to the Allied cause." The implications of this for Argentina were obvious. The German Embassy there has been notoriously the greatest centre of Axis activity in South America, and the vigorous line taken by Britain and the United States over Bolivia was a warning that Argentina could have no hope of playing one of the Great Powers off against the other. The attitude of the other South American Governments indicates a growing sense of indignation and a readiness to follow the Anglo-American lead, which must have come as an unpleasant shock to the rather complacent officials at Buenos Aires. The Argentine Government seems to have seen the red light.

### Poland, Russia and America

Hope that the Russian Government may still be induced to resume relations with the Polish Government, or at least to start discussions less formally, cannot yet be altogether abandoned. For the moment, the matter is apparently being dealt with in direct diplomatic contact between Moscow, London and Washington. Mr Cordell Hull has announced that, while thanking the United States Government warmly for its offer, the Russian Government has refused the American offer of mediation; and Mr Eden, in Parliament, has explained the British Government's approach. The British Government now, as in 1941, does not recognise any territorial changes which have been effected in Poland since August, 1939; and, as in 1940, is not prepared to recognise changes unless with the free consent and goodwill of the parties concerned. But, as the Prime Minister said three and a half years ago, "We have not at any time adopted the line that nothing could be changed in the territorial structure of various countries." In the meantime, the Polish Prime Minister, M. Mikolajczyk, is leaving for Washington, presumably to discuss the issue with the President and the Secretary of State. In the United States M. Mikolajczyk will find a very difficult and delicate political situation among the Americans of Polish descent and the Polish émigré colony. It is now possible that the Polish-Soviet issue will loom largely in the Presidential election campaign. Polish votes number more than three million, and may play a crucial rôle in states like New York and Pennsylvania, where the chances of the opposing parties may depend on a relatively small margin of votes. There has been close connection between isolationist Republican elements, anxious to use the anti-Soviet card against the Administration, and the anti-Russian extremists among American Poles. The chief spokesman of this attitude in the United States is M. Matuszewski, former Minister of Finance in Pilsudski's Governments. On the other hand, an important and influential section of American Poles have come out in support of the Soviet-sponsored Union of Polish Patriots. The pro-Republican allegiance of anti-Soviet Poles has almost automatically led to a link-up between pro-Soviet Poles and the Democrats. M. Mikolajczyk's visit will almost certainly be used by the Pilsudskists as an occasion to put pressure on the Polish Prime Minister, and to involve him in the tangle of American-Polish politics. It is to be hoped that during his visit he will find it possible to avoid commitments or statements which would compromise Polish-American relations as well as further embitter the relations between Poland and Russia.

### More Judges

The Supreme Court of Judicature (Amendment) Bill, which was due to come up for its second reading this week, does little more than to increase the maximum number of puisne judges of the High Court from 29 to 32, and allow a simplified procedure by which, within a minimum of 25 and a maximum of 32, the actual number of High Court judges and their distribution among the different Divisions will be determined by the Lord Chancellor, having regard to

the state of business in the High Court as a whole. But the Bill is the direct result both of the growing congestion of divorce business and of the recommendations of the Matrimonial Causes Committee, which sat under the chairmanship of Sir Ralph Wedgwood, and presented its report (Cmd. 6480) in October of last year. From the end of the nineteenth century until the last war, divorce was a luxury for the rich, but after the Poor Persons' procedure was instituted, the number of cases grew rapidly. Thus there was a tendency for divorce business to become congested even before the Matrimonial Causes Act came into force in 1938, and, by adding desertion *inter alia* to the grounds for divorce, caused such business to get virtually out of hand. The position has been further complicated by the different procedure for the trial of "rich" persons' and Poor Persons' cases. At present the latter, whether defended or undefended, may be tried in the provinces at assize courts. Non-Poor Persons' cases, however, may only be tried in the provinces if they are undefended. If they are defended for the purposes of the regulations—and this includes cases where the court is asked to exercise its discretion—they have to be tried in London, which greatly increases the costs. The position is made more illogical by the fact that cases in the provinces are heard by King's Bench judges, as part of their assize work, whereas those heard in London are reserved for the specialised Probate, Divorce and Admiralty Division. The Wedgwood Committee, therefore, recommended that all divorce cases, whether defended or not, and whether Poor Persons' or not, should be allowed to be tried in the provinces. But by itself this recommendation would throw an even greater burden on the present assize judges, who already find that too great a part of their work is divorce work of which they often had had no experience prior to their elevation to the Bench. Thus, the Committee made the further recommendation, after dismissing the suggestion that there should be special separate divorce assizes, that, wherever practicable, a judge of the Probate, Divorce and Admiralty Division should go circuit in order to relieve the King's Bench judge of the divorce work at assizes, and that at least two additional judges should be appointed. The new Bill does not state that the additional judges will be appointed to the Probate, Divorce and Admiralty Division, nor that they will go circuit. But it authorises a simplified procedure transferring judges from one division to another, and the Attorney-General has stated in a written parliamentary reply that it is intended that some of the divorce judges will be available to go circuit, and that the regulations will be altered to allow "contested divorce suits in appropriate cases to be tried and disposed of in the provinces."

### Coalmining Wages

The fourth award of the National Reference Tribunal for the coalmining industry, of which Lord Porter is chairman, raises the weekly national minimum wage of underground miners from 83s. to £5, and that of surface workers from 78s. to £4 10s. (The details of the new rates are shown in a table on page 160.) The new rates are substantially above the present level, but considerably below the £6 a week for underground workers and £5 10s. for surface workers claimed by the miners. The reasons for granting this increase are the need for output and recruitment and the compulsory direction of boys to the mines. The Tribunal emphasises that the award is only a "temporary expedient . . . pending an overhaul in the general wage structure of the industry" (sic) which is "long overdue." It points out, very correctly, that

the granting of the minimum wage is an unsatisfactory method of increasing wages, since it fails to provide an incentive for increased production or more efficient work.

The claim for advances in piece rates is rejected as inconsistent with the granting of merely a minimum wage. The Tribunal has revised its award on juvenile wages. The rate paid to an 18-year-old boy on the surface is increased from 44s. to 60s. a week, and the 19 and 20-year-olds receive increases of 17s. on 48s. and 53s. respectively. Rates for underground youths are correspondingly increased. These increases will apply immediately to the "Bevin boys" now in training. It is well that their grievances should have been so speedily settled, otherwise the whole scheme might have foundered. By an incredible miscalculation, 18-year-old trainees were left with a few shillings a week, after deductions had been made for lodging, dinners and travelling. In some cases the award for youths is above the rates asked for by the miners in their original claim. The Tribunal awards double rates for week-end work and 1½ rates for overtime.

The award will not fully please either side, although they are bound to accept it; but it corrects the anomalies in juvenile rates, and, more important, opens the way for a revision of the outmoded structure of wages generally.

### The Government on Monopolies

On Tuesday, Lord Strabolgi, in the House of Lords, asked the Government to state its policy "with regard to trusts, cartels and combines, national and international, in post-war reconstruction." The topic is of crucial importance, but the debate on Lord Strabolgi's motion served only one useful purpose. This was to elicit from Lord Woolton, on the Government's behalf, a promise that, within very few months, a White Paper on policy for full employment will be published, which will include, as an integral part, the Government's attitude towards this particular form of restraint of trade and production and, therefore, of employment. What the Government will in fact decide, and do, about these problems is, as in every aspect of reconstruction, still unknown and, almost certainly, still unsettled. All that can be said by the looker-on is that the Government does at least appear to be making a careful and conscientious survey of the right territory. The danger is that the serial of White Papers will do little more than state the problems and ask the questions, and will not provide the solution and answers without which legislation and action cannot be even begun in time. This is especially the case with full employment. The Government has been converted to the view that full employment is of the first importance, but the tendency of Ministers and their advisers, it would appear, from indirect evidence, is to rest upon this praiseworthy discovery and, by concentrating on the immediate and critical tasks of demobilisation and the adjustment of industry to changed peacetime conditions, to set aside for later decision, when in fact it will be too late, the wider and deeper tasks of maintaining output and work.

### UNRRA Debate

"The moral obligation to make UNRRA a success," in the words of Mr Law, was acknowledged and welcomed in Tuesday's debate, and the first measure of practical support from this country has now been assured. The sum of £80 million—which is approximately the 1 per cent of national income assessment which the leading Allied nations will contribute—will be allocated for relief and rehabilitation purposes under the auspices of UNRRA. But Sir John Anderson, in moving the Vote of Credit in which the £80 million is included, made clear that this figure was only provisional and that, owing to uncertainties about the state of the territories concerned and the availability of supplies, it was impossible to say whether the proposed contributions would be adequate for so immense a task. The place which UNRRA may occupy in the gradual erection of an international system still remains obscure. Is UNRRA to be permanently limited, as it is now, to providing supplies for relief and the bare necessities of

services and rehabilitation, or can it be given some sort of directing force? There will soon arise the need for international marketing and investment boards, but even before the need arises, it must be decided, in conjunction with the other United Nations, whether these should be developed within the framework of UNRRA, or whether they should be allowed to work out their own machinery according to their special needs.

### Domestic Service

Mr Bevin's latest proposals for domestic service have both an immediate and a long-term significance. There is a pressing need to staff hospitals and institutions and the school meals services, and to augment the home helps service run by the maternity and child welfare authorities. Priority is to be given to these kinds of domestic service, and the Minister of Labour is hoping to recruit between 20,000 and 30,000 women. This is quite apart from the replacement of the normally high rate of wastage, due to marriage and other circumstances. Appeals for volunteers, both for part-time and full-time work, are being made, but where necessary powers of direction will now have to be used. It seems unlikely that women will volunteer in large numbers for work which is in the main unpleasant, or at least is regarded so; and perhaps Mr Bevin will have to adopt the expedient of the ballot here too. Conditions of employment will be those laid down by the Hetherington Committee. Non-resident workers in general hospitals will get rates of pay ranging from 52s. 6d. a week for cleaners to 65s. a week for cooks. Hours are 96 a fortnight, and provision for meals, holidays and general welfare will be made. The scheme will come under the supervision of the recently appointed Standing Advisory Committee on Institutional Domestic Employment. Over and above these essential needs, a limited number of domestic workers may be available for service in private households, where there are special difficulties, such as in doctors' houses, or in homes where there are invalids, expectant mothers and young children. The Ministry's local offices, assisted by women's panels in difficult cases, will determine the degree of need in private households. One hopes that as far as possible help may be supplied to such houses. The experience of the influenza epidemic in December showed the exceptional difficulties of families where the wage-earner or the housewife was sick, and where help in the house could not be found. The Minister of Labour's long-term object is to improve the status and conditions of all domestic servants, and to remove the stigma hitherto attached to this occupation. With the Catering Bill, it represents a bold attempt to raise the standards of a (very often) badly paid, barely organised and eminently exploitable section of the workers.

### Civil Service

In one sense the policies of post-war Governments will stand or fall, not by their skill or even, wholly, by their successes, but by the quality of those who administer them. This is very obvious in wartime. Much of the common attitude to state-run schemes and public policies is determined not by the achievements of public direction in wartime, but by the personal frictions and delays too often arising between the public and the public's servants. It is almost as easy now as it was twenty-five years ago for amoral newspapers to lash millions of readers into a consistent state of fury and irritation about the sins of bureaucrats—with the intention, no doubt, of building a public opinion in favour of as little Government interference as possible after the war. The truth is that the public is already irritated before these articles and cartoons do their work. To begin with, they are irritated by the monstrous regiment of regulations under which they live their wartime lives and do their wartime work. Then they have all had experience of some incompetence, some ignorance and some incivility on the part of the minor and intermediate officials with whom they have had to deal. Business men have all a store of almost unbeliev-

able stories, albeit very one-sided, about needless correspondence with wartime Ministries. The country's mobilised millions have a wide fund of acquaintance with apparent inefficiency and lack of understanding at this or that labour exchange—as the unemployed had before the war. Partly, of course, this has been inevitable in wartime, if only because skilled labour has been as scarce in Government service as elsewhere, and Ministries could not pick and choose to find precisely the right men and women to deal with business men, or to handle applicants for war work—though they might have tried harder to do so. But there is a more fundamental reason for the friction. The lower grades of these departments and institutions which are in contact with the public at large have never been given, either in training, selection, pay or status, the consideration which their importance requires. It is for this reason that the decision of the Assistance Board, announced in a statement sent to all its officers by the Board's Whitley Council, to raise the status of its investigating staff is of immense importance, not only for the efficiency of its own work and the avoidance of personal discords and grievances, but also for the standing of government after the war—when, with the return of private enterprise, a considerable sector of public enterprise will remain. Whether the measures proposed—short lecture courses and discussions, as well as the allocation of interviewing work to officers of a higher grade—will in themselves be sufficient must be doubted. Much more is needed than rules of thumb and "the human touch." Social administration, in addition to its personal implications, is a science, to be studied with the same intensity and the same skilled acquaintance with its data as any other science; and this has never been done in this country, where the aptitude for social service is taken to be an inborn art. Nevertheless, the Board's aims, and its first small steps, are of the highest importance in the growth of government.

### Agricultural Education

Mr Hudson's proposals for the development of agricultural training represent a new departure in the training of farmers. As the Luxmoore Report, on which the proposals are largely based, pointed out, present methods have resulted in a dull and narrow training, locally controlled, into which any progressive measures of the Board of Education aimed at broadening and integrating technical education were not allowed to penetrate. Now Mr Hudson is to propose that the Local Education Authorities should take over control of farm institutes. But the Board of Education will not be, as in the case of other technical training, the directing Ministry. Financial control, through the power to give grant-aid, will be left with the Ministry of Agriculture. These proposals will do much to bring back the lost sheep into the fold of a cohesive educational system, with its parallel academic and technical branches; but it is not proposed that agricultural education should be put on all fours with, say, engineering education. The scheme does, however, involve less separate treatment of agricultural education than the idea of a National Council responsible to the Ministry of Agriculture, put forward by the Luxmoore Committee. By means of a joint committee between the Board of Education and the Ministry of Agriculture, which will advise the Ministry on general educational policy and the methods of training at farm institutes, and through the right to inspect the education given in the institutes in every subject except the theory and practice of agriculture, the Board of Education will, in fact, acquire a very much wider control of this particular technical education than it has ever had before. It remains to be seen whether such dual control will gain more from its partial co-ordination into the national system than it will lose through the division of responsibility which it involves. These proposals, together with the reorganisation of the agricultural advisory service, which is, in fact, agriculture's method of adult education, represent a valuable addition to the armoury of weapons which the Ministry will be able to use in revitalising policy for agriculture.

### Shorter Notes

According to a written Parliamentary answer, the consumption of gas and electricity was greater than consumption in the corresponding months of 1942 by the following percentages:

|                | Gas<br>Per Cent. | Electricity<br>Per Cent. |
|----------------|------------------|--------------------------|
| October .....  | 9                | 9                        |
| November ..... | 6                | 11                       |
| December ..... | 12               | 13                       |

## AMERICAN SURVEY

### Fourth Term

It is hardly headline news that the Democratic National Committee favours the President's nomination for a fourth term. The Republican *Herald Tribune*, indeed, cynically comments that the party has arrived at this decision

with all the grace, forethought, and cheerful acquiescence of a stout man falling downstairs.

Certainly there is no visible alternative. There is no more striking contrast than between the Gallup polls of presidential preferences among Democratic and Republican voters. The former shows a steady, solid 80 per cent vote for Mr Roosevelt, the latter a far more usual scattering of choices. The resolution passed by the Democrats in Washington firmly reasserted the party's grasp on Mr Roosevelt's coat-tails, endorsed his liberal leadership, "both at home and abroad," urged him to continue in his role of "great humanitarian world leader" and set forth two elemental post-war aims, the maintenance of a secure peace, and the provision of work for all. The Republicans were charged with frankly appealing to the "weakness and selfishness they believe to be inherent in the American people." Most surprising, in view of recent huffy warnings to foreign countries to cease meddling in American politics, was the insistence that

our Allies are praying with us for the continuation of Mr Roosevelt's services, both in war and peace.

This is a daring, and, perhaps, inspired attempt to capitalise on what in Opposition circles is being played up as a major Democratic weakness. The main function of the meeting, besides launching the "draft FDR" movement, was to make arrangements for the coming campaign. Like the Republicans, the Democrats have chosen Chicago for their convention, at which, if Mr Roosevelt decides to run again, the main choice will be that of his running mate. It appears now that Mr Wallace may be replaced by someone like Mr Rayburn, Speaker of the House, who would carry more weight with the South. Meanwhile, Mr Robert Hannegan, of St Louis, has been elected to the Chairmanship of the National Committee. He was a famous American football player and is spoken of as a second Farley. He will need the attributes of both if he is to score the winning touchdown. Mr Wallace has been busy keeping the banner of the New Deal flying, while mending Democratic fences south of the Mason-Dixon line with his endorsement of the South's grievance against freight-rate discrimination. But there are thornier issues ahead, like the campaign against race discrimination in war industries. It will require all Mr Roosevelt's fabulous skill, not to mention a great deal of hard campaigning, to steer his party between the Scylla of offending the Conservative Southern Democrats and the Charybdis of alienating labour and the negroes, without losing sight of the need to win back the farm vote, which has been registering steady Republican gains. These considerations do not make any easier the working out of a strong and successful policy for the home front.

### States Rights v Soldiers' Rights

A new Bill to assure the participation in the Presidential election of the Armed Forces, and certain other persons serving overseas, is now being considered by the Senate. The Bill has been supported by a Presidential message and by Mr Willkie's statement that he did not wish to be elected President unless every member of the services had the chance to vote. In this second version of the Lucas-Green Bill a compromise has been attempted between the need for simplified Federal distribution of the ballots and the insistence that the states retain their constitutional control over elections. Like the earlier Bill, which was emasculated by the Senate a month ago, it provides for a War Ballot Commission, but the Commission is to have only the functions of a "messenger boy"; that is, it will be responsible for drawing up a Federal ballot from states lists

and with the co-operation of the Army and Navy will undertake to distribute it overseas to "the fullest extent compatible with military operations," giving the transmission of ballots priority over unofficial communications. The gist of the compromise is contained in the provision that state officials, and not the Commission, shall have powers to determine the validity of ballots. The Bill has been approved by the Senate Elections Committee, but its opponents, both Republican and Democratic, are using every stratagem to defeat it. Ostensibly the main reason for opposition is the invasion of states' rights, but Senator Taft descended from his constitutional high horse this week to accuse Secretaries Knox and Stimson, both Republicans, of taking a "partisan position" in their insistence that it would be impossible for the Services to distribute the ballots of 48 separate states, and alleged that they were "running for a fourth term." In addition to this intemperate language, Senator Taft attempted to postpone consideration of the Bill by pressing forward the Commodity Credit Corporation Bill, but this move has been defeated. The fear inspired in many, but not all, Southern Democrats is that the Bill will break down the poll-tax and other barriers erected in their states to prevent the negro and poor white from voting; and this line is still being argued, despite the fact that the present compromise specifically reserves to the states their right to pass on the validity of ballots. It is significant that, now that the issue has been put squarely before the country, a poll taken by the National Opinion Research Centre of the University of Denver showed 92 per cent of those questioned in favour of soldier voting, 75 per cent in favour of Federal control, and 77 per cent in favour of negro participation in the vote. The majority believed, however, that it was a matter of simple justice, and would not materially affect the election results—a conviction which is apparently not shared by the party leaders. The present agitation in the Senate is probably not more than a rearguard action. Now that full state control has been identified with the disfranchisement of the soldier serving overseas, there will be few Congressmen who will care to go on record as preferring states' rights to soldiers' rights.

### Debate on UNRRA

The House of Representatives, by an overwhelming and non-partisan vote of 338 to 54, has passed and sent to the Senate the resolution authorising the appropriation of \$1,350 million as the United States contribution to UNRRA. The most significant aspect of the measure was the employment, for the first time, of the device of an executive agreement, to be validated by a simple majority of both Houses, rather than a treaty, which would require a two-thirds vote of the Senate. The agreement of the leaders of both Houses on this formula means that, in certain limited spheres, a way has been found round the power of a one-third minority in the Senate to block post-war arrangements, and it has the advantage of associating the House with the Senate and the Administration in some aspects of foreign policy. The debate which preceded the vote does not appear to have been very enlightening. The opposition, which consisted mainly of a familiar line-up of pre-Pearl Harbour isolationists, made a number of equally familiar charges, such as that UNRRA was nothing more than a "gigantic WPA" (the American form of made-work) for Europe; that it would encourage Soviet dictatorship; and that no part of the funds should be used for education or rehabilitation. Much of what was said seemed half-hearted, a sort of isolationist conditioned reflex. The most dangerous amendment was that of Mr Hamilton Fish, of New York, which would have required that 90 per cent of the American contribution should be spent on purchases of American goods. This, however, was defeated by 135 to 78. The Republicans appeared at first to have scored a substantial coup by the passage of an amendment making the State Department, rather than the Foreign Economic Administration, the link with UNRRA. This would have been a characteristic expression of Congressional dislike

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so before the date of expiry. If they fail to do so, their subscriptions will be automatically cancelled as soon as that date is passed, which will mean a gap of many months before the despatch of copies can be resumed.

for the agencies established under the President's emergency powers, but later the Administration appears to have rallied its forces and reversed the decision. What apparently has been accepted, by a voice vote—and consequently is open to reversal—is the principle that any area important to military operations should receive help from UNRRA. This is interpreted as a reference to India, and as such would be contrary to agreements reached at Atlantic City. Probably it is to some degree an expression of anti-British and pro-Indian feeling; this particular amendment was originally part of the isolationist attack on UNRRA. It does not detract, however, from the fact that the action of the House is encouraging proof of non-partisan support for the principles of international collaboration.

### Labour Politics

The Executive Council of the American Federation of Labour, meeting at Miami, has made known its expected refusal to attend the world trade union conference in London on June 5th. The rival labour organisation, the Congress of Industrial Organisations, has, on the other hand, already accepted. Both organisations have acted in character. The AFL has consistently maintained that it can have no relations with the Soviet trade unions because they do not "truly represent free and democratic labour movements." The Council's explanatory statement paid lip service to the desirability of a world conference of labour "under proper auspices and at an appropriate time," but its charge that the proposed London conference lacks proper sponsorship and is untimely makes it difficult to see how any world conference could meet its requirements. More interesting, although still obscure, is the progress of negotiations with John L. Lewis for the re-entry of the United Mine Workers into the Federation. It has been Mr Lewis's contention that the Federation should welcome the prodigal's return without conditions—that is, without requiring the Mine Workers to abandon District 50, their catch-all branch whose jurisdiction conflicts with that of several already established AFL unions. This the executive council has refused, proposing instead that the Mine Workers

should return with only the jurisdiction they possessed when they left the Federation. A resolution was passed, however, favouring the return of the UMW, and the way is now open for some sharp bargaining by the "clarifying" committees. It looks as though Mr Lewis is reasonably certain of readmission on not too unfavourable terms. He will bring a formidable addition of numbers, money and vigour to the Federation, but, to put it mildly, he will not have a liberalising effect. Mr Lewis's mouthpiece, the *United Mineworkers' Journal*, is still a platform for isolationist and rabidly anti-Administration sentiment, and the extension of his influence will increase the difficulties of keeping Federation policy in step with that of the Administration on both political and economic issues.

### Shorter Notes

Insistence that current "cutbacks" in the war production programme represent switches to other kinds of war production, rather than over-all reductions, has been the theme this week of Mr Nelson, of the War Production Board, and Mr. McNutt, of the Manpower Commission. This probably is more than a coincidence, and suggests that the Administration is concerned by public enthusiasm for rumours of large-scale reconversion to civilian production. Mr Nelson emphasised that any such movement would be folly; and that until it was certain that war production facilities would not again be needed, they would not be reconverted.

A War Refugee Board, consisting of the Secretaries of State, of the Treasury, and of War, has been created by President Roosevelt by Executive Order, to take action for the rescue from the Nazis of as many as possible of the persecuted minorities of Europe, consistent with the successful prosecution of the war. This step is probably a response to the very vigorous public campaign to urge the Government to make every effort to save European Jews from extermination.

## THE WORLD OVERSEAS

### South American Survey

IN the last six months, dictatorial systems have been established by force in two Latin American states, Argentina and Bolivia, and in at least two others, Chile and Peru, the governments claim to have put down attempted military coups d'état, both with Axis backing. This evidence of political instability and unrest is disturbing and surprising. It is, of course, true that in the nineteenth century, Latin American politics were traditionally violent and unstable. A century ago, Bolívar, the great liberator, said of the republics he helped to create:

These countries will fall into the hands of the unbridled multitude and pass afterwards under the sway of little tyrants. . . . A thousand revolutions will make necessary a thousand usurpations.

His prophecy was borne out. In the nineteenth century, Colombia had ten civil wars as well as many lesser disturbances, and Bolivia alone had sixty revolutions. Yet the coming of the twentieth century brought with it some stabilisation and a promise of better things. In many states the rule of the single leader, *personalismo*, gave way to democratic methods; governments changed less frequently, and when they were changed it was by normal political methods. It is, therefore, a matter for concern why, at this time, when the two most powerful democracies of the world seem likely to defeat the Nazi dictatorship, there should be this reversion to dictatorial methods in South America. What are the reasons for it? And in which states is the infection most likely to spread?

There is no denying that some seeds of dictatorship lie in most South American states. In certain political and social

atmospheres these seeds develop, in others they lie dormant; but they are there. It is truer to speak of dictatorship than of fascism, as some of the basic elements of fascism in the European model are missing. In few of the South American countries is there a large but desperate and impoverished middle-class, or any possibility of setting-up the administrative apparatus of a totalitarian state. In none of the states, except Peru, is there a mass movement of the Left to call into being a mass movement of the Right. None of the recent dictatorial regimes has based itself on a mass party of the Nazi, Fascist or Falange type.

The dictatorial tendencies in Latin America have hitherto been more of the traditional pattern—the seizure of power over the central organs of the state by a single man, or a small group, backed by the army, and by one or more factions among the politically conscious minority of the people. For this type of dictatorship there is no difficulty in finding explanations. The chief reason is the smallness of the political elements in contrast with the ignorance and poverty of the mass of the inhabitants. Public opinion, as understood in mature democracies, hardly exists. Nationalism is a strong force in each republic, and is fed by the fact that so much of the continent's capital is in foreign ownership. Land ownership is a perennial source of conflict. In every republic there is an army (many of them German-trained) with little to do but play politics. Many of the young officers are perpetually in debt and anxious to better their fortunes; successful political intrigue can lead to the dizzy ascents of fortune, and Nazi agents are believed to have laid out large sums of money, with considerable

effect, in paying off officers' debts. There are also foreign settlements. There are German colonies in almost every republic. Italians have settled in large numbers in Argentina and Brazil. Peru has a flourishing Japanese colony, so has Brazil. Not all the colonists are Axis-minded. Some of the older German immigrants, and the newest wave of refugees, are not trouble-makers and the Italians as a rule are non-political. But the extremist groups and the Nazi cells are there, and in every plot and counter-plot of recent years, Axis agents have been concerned at some point.

The war, on balance, has encouraged the forces of stability. The sense of pan-American unity has been fostered by the three Conferences at Panama, Havana and Rio de Janeiro. The leadership of the United States has made for coherence, and American economic assistance has brought both enrichment and common objectives. But there have been influences on the other side. Shipping difficulties have led to some economic distortions. Producers without markets and consumers without supplies are both of them potential centres of discontent. Moreover, the economic predominance of the United States, its leasing of bases, the ubiquity of American officials have set a hundred chords of fear and xenophobia vibrating. Axis propaganda, great as it was before the war, was increased enormously in the early years of the conflict and has only recently been driven underground.

### The Dividing Line

If the South American states are taken one by one, it is possible to divide them into two groups, one in which the tendencies are democratic and those in which there is actual dictatorship or the tendencies seem to lie in that direction. Curiously enough the line which divides the two groups crosses the continent almost diagonally, from the mouth of the River Plate to the frontier of Ecuador and Colombia. The distinction is not absolute. Chile, to the west of the line, has a parliamentary, middle-of-the-road government. Brazil, to the east of the line, is a benevolent dictatorship under President Getúlio Vargas. Yet even so, there are forces at work in Chile making for dictatorship while in Brazil the tide of affairs is moving towards a democratic conclusion. The line of division is roughly valid; on one side of it, Brazil is the dominant Power, on the other, Argentina.

The reasons explaining the establishment of a dictatorship in Argentina need not be rehearsed here. Fear of United States domination, strong nationalism, disgruntled army, Axis support, deep economic discontent, were all present. To these were added the political corruption and disintegration of the former Castillo régime. In Bolivia, too, the classic causes of dictatorship were there—the appalling poverty and distress of the mining populations and the Indian labourers, army control of politics, German propaganda and attempted plots, a turbulent tradition, the Gran Chaco war with its ghastly, pointless slaughter. The present Villaroel government is a mixture of radicals, army men, pro-Nazis and right-wingers. It is still not certain whether the main emphasis of its national socialism will be on socialism or nationalism.

The three states in which a coup of the Bolivian type would not be impossible are probably Paraguay, Peru and Ecuador. Paraguay is already a dictatorship. In 1940, General Morinigo, after assuming the Presidency, proceeded to announce his intention of setting up a new state on the basis of discipline, hierarchy and order. It would have advanced social legislation and no politics. Behind Morinigo is a group of officers and intellectuals. In setting up the "new state," violence was employed to purge opposition and a number of conspiracies have been crushed since 1940. There is a dangerous German element. Economically, Paraguay is desperately poor and has hitherto been almost completely controlled by Argentina. The Morinigo administration has co-operated in the anti-Axis measures decided upon at the Rio Conference and taken action against its own Fifth Column; it is prepared to accept American economic assistance, for example, in developing its roads and hopes for closer relations with the growing economic power of Brazil. Thus, although Paraguay has a dictatorial form of government, it is not politically under Argentina's domination.

Peru is politically a semi-dictatorship. The President, Dr Prado, is a genuine liberal, but he is tied to the dictatorial tradition of Leguía and inherited office from the turbulent President Benavides. The constitution is democratic in form, but if free elections were held it is likely that the Apristas, an indigenous left wing movement, would sweep the country. The present regime rests on an army-landowner backing,

and struggles unsuccessfully with Peru's devastating poverty. There is a German fifth column and possibly a Japanese one, too. This month the Government alleged the discovery of a German and Japanese plot. Xenophobia is strong, but Peru officially supports pan-Americanism, has welcomed American capital in developing its new plans for iron and steel, and American Canal Zone aircraft use Peruvian bases.

Ecuador resembles Peru in that its government is democratic in form but the President governs in fact by decree. President Arroso's term expires this year, and, so turbulent have the politics of his country been, he will be the first President since 1924 to complete his term of office. Some of the classic elements of unrest are present in Ecuador—extreme poverty, some Fifth Column activity, great landowners, no industrial development. As recently as 1941 the Ecuadorians were fighting Peru over a frontier dispute. It was settled in 1942, but has left an aftermath of bitterness.

Chile is far more mature in a political sense than most Latin American countries. It is now governed by a union of centre and radical parties. The Communists are not included and President Ríos gets some moderate right wing support. The country's economic life is unbalanced, for industrial development is still small and little has been done, even by this supposedly radical Government, to divide up the vast estates. There is a large German colony, the army contains disaffected elements, and there are a number of

extremist nationalist groups who resent Chile's participation in hemisphere defence, look with hostility at the United States and might perhaps flirt with Argentina. These groups and some militarists caused trouble last month. The existence in Chile of Left Wing parties and some degree of organisation among the working class is regarded on the Right as a special incitement to violence. Obviously, the inflammable material is there and the Ríos Government has some of the inevitable instability of a coalition.

### The Eastern Republics

It is unsafe to risk generalisations about Latin American politics, but it is probably true that the smallest danger of a spread of dictatorial rule lies in Uruguay, Brazil, Venezuela and Colombia. Uruguay, under the presidency of Dr Amézaga, is a socially progressive democracy. The Vice-President, Dr Guani, is a leader in the pan-American Movement. The social legislation of Uruguay is well in advance of any other South American state and preceded Mr Roosevelt's New Deal by many decades. Although much has still to be done to equalise the distribution of wealth, there are less extremes and a better land system than anywhere else in South America. Uruguay has a troublesome Fifth Column and is economically over-dependent on Argentina, but fewer of the seeds of dictatorship lie here than among any of its neighbours.

Brazil is a very mild personal dictatorship. Dr Getulio Vargas has controlled Brazilian politics since the *coup d'état* which brought him to power in 1930. The regime is tolerant. Even its enemies admit that, in a population of over 40 millions, there are only some 500 political prisoners. The death sentence has never been enforced. Dr Vargas is friendly and popular and goes about unguarded. He has no mass party and relies on no particular ruling clique. No country has gone so far in welcoming participation by the United States in the defence and economic development of Latin America. Brazil is using the opportunity of war and of lavish American credits to get schemes of industrialisation under way. The Government's economic policy resembles that of Turkey—étatist in the main, but not to the dogmatic exclusion of private capital. The standard of living has risen in the last ten years. There is a large body of German immigrants, but many of them are old-established and non-Nazi. There are still remnants of the old Fascist *Integralistas*, and the army had until 1941 a reputation for German sympathies. However, Brazil is fully committed to the war (in which, with Colombia and Bolivia, it is a belligerent), and President Vargas has promised a broadening of the political basis of his regime and a movement towards more democratic government.

Venezuela is remarkable in that, until 1935, it was ruled by one of the most ruffianly dictators ever produced by South America's erratic politics. When President Gomez died, his Minister of War, Lopez Contreras, took over the presidency, ended the tyranny, introduced a Three Year Economic Plan, restored at least a beginning of parliamentary rule, freed the press, and allowed the growth of parties. His successor, President Medina, is following the same path. Venezuela has this advantage, that there is virtually no German settlement or Fifth Column; and the army is barely a factor in political affairs. Its disadvantage is its hopelessly lopsided economy; over-dependence on the oil industry led to the neglect of other economic activities, especially agriculture. This is being remedied, but poverty is still great. Yet here, too, the new Venezuelan regime has pursued a moderate policy. There have been no expropriations on the Mexican model, but a new oil law came into force in 1943 after negotiations with the foreign companies. The new law assures an increase in the revenue derived by Venezuela from the industry.

Colombia, along with Uruguay, has had the best record in the continent in recent years. The standard of education among the wealthy is high and among the masses of the people a strong sense of regional autonomy has left the provinces strong and taken much of the passion out of federal politics at Bogota. There is little disgruntled nationalism in Colombia, and the army is not a great factor in politics. There has been some danger from the German Fifth Column, but that is past, and Colombia is now at war with the Axis.

In spite of the encouraging stability of many of the South American republics, the outlook is unsettled. Between the two groups a polarisation of opposed forces may come into being—the Argentine "group" representing isolation, political and economic, opposition to foreign countries and dictatorial governments; the Brazilian "group," working with United States backing for the pan-American ideal, the industrialisation of the continent with American and possibly British aid, and the return to democratic methods.

## Canadian Fuel Resources

(FROM OUR OTTAWA CORRESPONDENT)

December 20, 1943

A PARLIAMENTARY committee on reconstruction and re-establishment has been giving Canadians an interesting survey of their post-war problems and resources. Its examination of the latter has been, on the whole, impressive, but a more sober note has been struck from time to time. For example, Canadians have now obtained for the first time a realistic estimate of the resources of the Athabaska bituminous tar-sands.

In the past the most extravagant statements have been made about this field, some of them from high places. Dr R. C. Wallace, president of Queen's University and chairman of one of the parliamentary sub-committees, speaking in March, 1943, said:

We know that there are 100 billion [a thousand million] barrels of oil available there some day, and I hope to live to see the day when it becomes one of our great fundamental industries of Canada.

Premier E. C. Manning, of Alberta (as late as November 26, 1943), told the committee,

Geologists of the Dominion Department of Mines and Resources declare that, long after the deep well fields of Texas, California, Borneo, Russia, and the Near East and South America have been exhausted, the bituminous sands of Alberta will be supplying the world's requirements of fuel oil. . . . The vision of 100,000 barrels of oil per day flowing through pipelines to tidewater from the oil sands of the Athabaska River Valley is not a dream but an objective.

A few days later, these rosy pictures were dimmed by a quartet of geologists and engineers of the Department of Mines and Resources, who placed on record the results of core-drilling conducted this past summer, and some facts and figures of actual mining and separating experience in the Athabaska field. To those holding such views as those expressed by the Premier of Alberta the evidence came as a shock. It begins to appear that much earlier "literature" on the subject was guesswork or promotion propaganda. The existence of "billions of tons" of bitumen was not challenged; but it is clear that earlier ideas about availability and cost of conversion into motor fuels will probably require drastic revision.

The effect of the earlier reports about the Athabaska field was to convince the general public, and even those well posted in Canadian economics, that the bituminous sands were readily available in vast quantities, that the problems of mining and separation had been largely solved, and that the chief—if not the sole—barrier to commercial development on a large scale was the competition of petroleum from flowing wells. Production figures had been published purporting to show that gasoline could be produced from the tar-sands at a figure between 20 and 30 cents. The assumption was that the Athabaska field would lie undeveloped only until such time as a more favourable cost relationship should arrive, either by lower production costs in the Athabaska field, growing scarcity and higher price of petroleum, or a combination of both. But now, it appears, there are serious mining and separation problems to overcome. Until they are overcome the oil cannot be extracted in large quantities, no matter how favourable the economic position, and therefore the question of competition with other sources is still hypothetical.

The evidence given to the committee by the geologists, physical chemists and engineers of the Department of Mines and Resources may be summarised as follows:—

1. Diamond core-drilling conducted this summer over an area classified as one of the most favourable has shown that layers of clay as much as several feet thick are commonly found in the deposits. The engineers did not think any process would handle tar-sand with more than 10 per cent clay content. The general exploration by core-drill has not gone far enough to measure this obstacle. Four years of intensive drilling will be necessary before a decision can be reached as to the wisdom of undertaking a major development.

2. While the total area underlain by tar-sands has been estimated at 1,500 square miles, the overburden above most of it is too deep to make open-cut mining feasible. Only 2 to 5 per cent of the total area is estimated to be suitable for open-cut methods.

3. The remaining 95 to 98 per cent can only be recovered by some process of *in situ* mining. A number of schemes for pumping hot water, cold water, or some other fluid into the bitumen beds so as to melt it free from the sand have been examined by the department, but all of these have been rejected as too expensive for commercial production.

4. The tar-sands which can be cheaply mined by open-cut methods were estimated as capable of producing of the order of 750 million barrels of oil. This is equivalent to about ten years' supply for Canada, but is only one-third of world production as estimated for the year 1942. (It is clear, therefore, that the Athabaska field can be classed as a world source only if—or when—some method of mining the bitumen *in situ* is developed.)

5. Open-cut mining of the tar-sands where the overburden is not excessive is possible at low cost (records were quoted showing costs of less than 10 cents per ton for these operations), but, unless the terrain is favourable for the disposal of the overburden and subsequently the spent sands and tailings, a very difficult problem is faced.

6. Much work is still necessary before separation plants can be expected to work safely and continuously. The first plant erected by the Abasand Company (now taken over by the Dominion Government) burned down from gas or fumes created by the separation process. Fine sand getting into the machinery caused costly shut-downs and replacement of equipment. No experience in winter operations has yet been gained, and it may prove impossible to work the full year.

7. Bitumen content as high as 17 per cent has been encountered, but an average of 10 per cent was quoted as a working figure. As hydrogenation tests have produced 194 Imperial gallons to the short ton of bitumen, this suggests a yield of about 20 gallons per ton of sand mined.

8. Beds vary considerably in thickness. Present operations are taking place on a 40-foot seam of sand, but a range of from 25 feet to 75 feet has been found in drilling. Lower horizons are richer than the higher ones, but no evidence has been obtained of free bitumen, and geologists have predicted that free petroleum will not be found in association with these deposits.

This evidence was given following the presentation of a brief in which the officials of the Mines Branch urged that sums should be included in the estimates for the coming year for the erection of a semi-technical hydrogenation plant at Ottawa capable of producing about 200 Imperial gallons per day, using Canadian bitumens, bituminous coals, lignites, heavy crude oils and residues from petroleum refining. So far, the tests at Ottawa, begun in 1929, have been confined to laboratory-scale operations, using a modification of the Bergius-Fischer process.

### An Oil Shortage?

The Director of the Mines Branch reminded the parliamentary committee of Canada's vulnerable and unsatisfactory position in liquid fuels. At present 83 per cent of Canada's consumption has to be imported. The committee was reminded of the growing concern by the United States over its own reserves and the rapidly rising consumption of liquid fuels in nearly all countries. It was necessary to face the possibility that Canada would be compelled to lean much more heavily upon its own resources in future. Even the semi-technical plant as recommended would take eighteen months to put into operation, and only then could a useful start be made on commercial development.

The discouraging data on tar-sands does not, of course, leave Canada without vast fuel resources. The proved coal reserves are among the world's largest, and laboratory tests on hydrogenation of Canadian coals have been promising. Canada's best coals for this purpose compare very favourably with samples imported from Durham and Pittsburgh. Yields from 50 to 143 Imperial gallons per short ton of Canadian coal have been obtained, compared with 121 gallons from Durham coal and 129 gallons from Pittsburgh coal. Allowing for fuel actually consumed in the process, the yield of one ton of liquid fuel from 4 to 5 tons of Canadian coal is predicted.

## EXTRA VITAMINS ESSENTIAL TO HEALTH

Colds and influenza cannot be resisted when your diet is deficient in vitamin A: the daily dose of Crookes' ensures you the necessary amount. Adults cannot keep healthy and children cannot grow up with straight bones and strong teeth without sufficient vitamin D: the daily dose of Crookes' keeps your supply well above the safety level.

This extra supply of vitamins A and D will work wonders in building up your resistance and stamina through this fifth wartime winter.

## Russia at War

### Party and Army

ON January 22nd, Russia celebrated the twentieth anniversary of Lenin's death. The tributes paid to the memory of the founder of Bolshevism and of the Soviet state coincided with the victories around Leningrad; and the celebrations were closely connected with the war. The occasion was not used for any retrospective review of the Party's internal history, as was customary in peacetime. The war, it seems, effaces memories of the bitter struggles which filled the stormy period from Lenin's death up to the late 'thirties. For two and a half years now, the Soviet press has hardly ever mentioned any "enemies of the people." There can be no doubt that the dramatic chapter of internal Party strife during the post-Lenin period was closed shortly before the war; and that the war itself has resulted in a strong consolidation of the regime.

The Party has radically changed its outlook since those days in January 1924 when, over the tomb of Lenin, Stalin took his historic oath to fulfil the testament of the dead leader of Bolshevism. The meaning itself of that testament subsequently became the subject of conflicting interpretations. The interpretation of Bolshevism now established is that of a national set of ideas and doctrines, more or less reconciled even with the pre-revolutionary past and Russia's long traditions.

#### Revival of Nationalism

The revival of nationalism in Russia has found many expressions during the war. It has been most strongly pronounced in the life of the Red Army, which has re-adopted most of the symbols and customs of the Imperial Army. The war has naturally resulted in an all-pervading militarisation of the country. A martial hierarchy has been introduced in many fields of civilian life; even railway staffs have been given the titles of majors, colonels, and generals. Yet, parallel with this process, there has been the growth of the Party. More than one and a half million new members have been admitted to the Party since the outbreak of war.

The unity of Party and Army has been the guiding principle. The embodiment of that unity is Stalin himself—the Supreme Commander and Leader of the Party. The great majority of the new Party members are soldiers on active service. The tendency to link Army and Party with the closest possible ties from top to bottom has been reflected in a series of measures, such as the conferring of the highest military ranks on a number of political leaders and the reduction of the probation period for soldiers who apply for Party membership from one year to three months.

Even so, differences in outlook between Army and Party are undeniable. Both Army and Party emphasise their national, Russian character. At the same time, both look to their revolutionary origin. But, whereas the Army recognises in the Revolution simply one element of Russia's national tradition, and looks beyond it far back to the Military Regulations of Peter the Great, the Party adopts the new nationalism as a post-revolutionary fact, and seeks to interpret it in terms of Party doctrine. To the officers' corps, with its newly developed *esprit de corps*, Lenin seems to be the legitimate descendant of the Russian Empire builders—Peter the Great, Suvorov, Kutuzov. In the eyes of the Party, it is Lenin himself, without this historical parentage, who dominates Russian history.

For the moment there appears to be no conflict between the cult of Leninism and the rediscovery of the Russian heritage. Beneath the surface, too much is still in flux for any final judgment. But this at least is clear: during the greater part of the war, most of the startling changes in ideas and

attitudes have taken place in the Army; it is the Army that has seemed to take the initiative in almost every change, reform or counter-reform. This was particularly so in the most critical period of the summer of 1942, and in the first phases of Russia's stupendous recovery during the first half of 1943. It was supreme crisis that made Russia's leaders turn sharply to traditional sentiments and slogans as the means by which to sustain the mass of Russia's fighting men in their heroic effort—first, to defend and then to attack. It was then that the political commissars disappeared; that the Guards were re-established, the orders of Kutuzov and Suvorov, as well as the epaulettes, introduced, the military hierarchy reorganised along "orthodox" lines, exclusive officers' clubs set up.

Since then there have been no new conspicuous developments of this kind. Amid the thunders of great victories on the battlefields, the Army itself has even slightly faded from the limelight. The names of victorious generals appear regularly in Stalin's Orders of the Day; but it is the Party rather than the Army that has received the warmer tributes in recent months, and been hailed as the real architect of victory—though it must be remembered how closely the two are now linked in personnel and leadership.

The Lenin anniversary was a fresh occasion for a tribute to the Party. The speaker at the anniversary meeting was Alexander Shcherbakov, who, as Party leader, now ranks almost next to Stalin. He is Chief of the Political Administration of the Army, that is, spokesman of the Party in the Army, and also the Secretary-General of the Party organisation of Moscow. In his speech, he contrasted the position of the Red Army in this war with the position of the Tsarist Army in 1914-1917. Old Tsarist Russia, he said, was backward in all respects. It was unable to arm its soldiers.

The country was then travelling a road which would inevitably have brought it to the loss of independence. It was the Bolshevik Party that saved our country from this disgrace.

He described the great work done by the Party in the Five Year Plans; the vast construction of a modern industry "over enormous expanses from the Baltic Sea to the Pacific Ocean, from the Arctic Ocean to the Black Sea." This work has enabled Russia to withstand the German onslaught, though its armies have now had to fight 260 enemy divisions compared with the 127 divisions which the Germans threw against Tsarist Russia in the last war.

#### Foreign Relations

M. Shcherbakov pointed to the growth of Russian prestige abroad, which he contrasted with the underestimation of Russia's fighting capacity during the earlier stages of the war.

In the early months of war not only the Hitlerites, but, one can say without exaggeration, the majority of political leaders and statesmen in Allied countries, regarded the temporary reverses of the Red Army as a manifestation of the military and economic weakness of the Soviet state. . . . The unity of the Soviet people and the strength of the Red Army were underestimated in those days not only in Berlin, but also in Washington and London.

Coming on the morrow after *Pravda's* canard about secret negotiations between Britain and Germany, this remark was perhaps not altogether free from a topical purpose. But it was carefully balanced by the listing of yet another achievement of the Party's policy:

The USSR's foreign political connections have grown stronger and more stable. The Nazi plans, aimed at provoking a split among democratic countries, fell through. The confidence and unity of the countries of the anti-Hitler coalition have been strengthened. This is proved in the first place by the decisions of the Moscow and Teheran conferences.

The interplay of the two trends in Russia's internal policy will probably not leave its foreign policy unaffected. The "conservative" party line, as it crystallised in the 'thirties, was orientated towards the League of Nations and collective security. The new nationalism, which appears as the inheritor of age-old traditions, may well develop the aspiration to "recollect" the lands of the old Empire, and to bring them back under Russian rule. In the Lenin period Soviet foreign policy was dynamic and expansive, not in the nationalist or military sense, but in the revolutionary sense. After Lenin's death it was "static" in its attitude of defensive isolationism. The new nationalism may perhaps make it dynamic again. The issue seems to depend on whether the Army is going to remain *La Grande Mueite* in politics or not.

## THE BUSINESS WORLD

### The Banks Look Ahead

EVERYTHING conspires to turn the bankers' eyes to the future. The new adventures that will open when the war is over are now approaching with visible acceleration. On the other hand prevailing conditions are dull in the extreme. How uneventful they are may be gauged from the accompanying table showing the principal clearing bank balance sheet items for the end of each year since 1938. The changes recorded during 1943 faithfully followed trends well established since the beginning of the war. The whole structure of credit has continued to expand and by the end of last year the clearing banks' deposits had crossed another milestone—the £4 billion line. Within this expansion of credit, bank loans have again contracted. Treasury Deposit Receipts, the new instrument of war-time short-term finance, have become the most important banking asset and their growth over the past year has in itself required explanation of the expansion in deposits. The other chief feature in the banking position during the past year has been the increased liquidity. Before the war a figure of 30 per cent was the figure around which the banks endeavoured to maintain the proportion of their quick assets (cash, cheques in course of collection, short loans and bills) to their deposits. In December, 1938, the ratio was 32 per cent. The figure has been rising steadily since that time and by the end of 1943 quick assets, now reinforced by TDR's, represented close on 55 per cent of the total of deposits.

The interest in the future is in part, therefore, an escape from the tedium of the present. But, in addition, the tempo of war developments is calculated to turn the attention of bankers to post-war problems and, in particular, to the rôle which the banks will play in financing the industrial and commercial transition to a peace economy. This interest was reflected in the chairmen's "statements" attached to the 1943 reports and, in particular, in those of the Midland Bank and of Lloyds Bank. The main and understandable concern of the bankers is to re-establish their genuine banking business—that represented by their loans and advances—which has had such huge inroads made into it during the war. As Lord Wardington has pointed out, the banks' balance sheets in these days bear all too close a resemblance to those of an investment trust. To what extent will the wartime distortion in the distribution of bank assets be remedied after the war? How will any increase in bank loans be "financed" by the banks themselves? These are the two questions to which the bank chairmen applied themselves.

Lord Wardington assumed that there would be a considerable expansion in the demand for bank credit after the war—"machinery will have to be replaced or converted; destruction of buildings made good; new houses erected; demobilised men from the forces will want capital with which to start new businesses, or to reopen those shut down in their absence." He might have added that when industry ceases to be so largely preoccupied with Government orders it will lose the financial aid of "progress payments" which now provide Government contractors and their hosts of subcontractors with the bulk of their current short-term finance. But even after generous allowance has been made for all known factors making for increased demands for credit, it must be admitted that those acting in the other direction may go a very long way to offset them. The exceptional liquidity of industry, in particular of its larger units, is a phenomenon which the end of the war will not remove. The greatly increased deposits are held by someone—and the possibility is that most of them are held by business concerns which might otherwise be in need of loans. Refinancing may present itself more as a problem of accommodating sales of gilt-edged and other securities by industrial enterprises than as a demand for additional bank loans. Moreover, a substantial part of the industrial switch-over to peace may be financed by the EPT refund of 20 per cent (less tax). The banks may, in fact, find themselves very fortunate to recover in the "transition years" the £250

million to £300 million of bank loans which they have lost during the war and which would restore the ratio of loans to deposits to only about half the 1938 figure. Too much should not be made of Lord Wardington's figure of £1,000 million as the total by which the banks could increase their loans. This was merely the result of an interesting but simple calculation of the kind of assets structure which the banks could maintain within the existing framework of credit. If that framework is defined by the total of £4,000 million of clearing bank deposits shown in the accompanying table, and assets were redistributed in such a way that £1,000 million were deducted from TDR's and added to loans, the total of quick assets would be reduced to £1,214 million and the ratio of these assets to deposits from 54.9 per cent to 30.1 per cent. In other words such a redistribution would still leave the banks' liquidity ratio slightly above what used to be regarded as the reasonable minimum. Lord Wardington was proving this point and not estimating the size of the potential demand for new bank loan facilities after the war.

The fact that the bankers look upon the redevelopment of this part of their business with no excess of confidence may be gauged from their readiness to explore new and rather unorthodox fields of loan policy. Mr Christopherson, in common with several other bank chairmen, dealt with the problem of the "small man." Too often in the past, he said,

the enterprise and resourcefulness of the small business had been stultified or misdirected through inadequacy of financial resources. This, in so far as the Midland Bank can help it, will never again occur. Lord Wardington was more revolutionary. He pointed out that it had generally been regarded as a principle in deposit banking that medium or even short-term loans for capital purposes should not form part of their business. Lord Wardington added: "In theory that is perfectly sound, but the banks are at present so strong and enjoy such a liquid position that some departure from strict principles would seem to be justified in the conditions which are likely to confront us after the war." These two bankers thus propose to fill the two "gaps" in the British capital market defined by the Macmillan Committee, namely the capital requirements of the small business which is too modest to make its appeal in the new issue market and the provision of finance for capital purposes covering too short a period to appeal to the new issue market.

There is a great deal to be said for and against the proposal that the banks should fill these gaps and the subject promises to be the centre of bank policy debate for some years to come. Any conscious departure from a tradition which has stood British deposit banking in such good stead for so long needs very careful consideration. So far as medium-term capital loans for the larger enterprises are concerned, it is probable that the Macmillan gap, if it existed at all, has been an extremely small one. Given the liquidity of industry, it will be smaller than ever after the war. The provision of credit for the small business is, perhaps, the greater of the two needs, and political exigencies,

apart from any other consideration, will probably call for some initiative on the part of the authorities and the banks. It remains to be decided whether the banks should provide such capital facilities from within their own organisation, or whether it would not be preferable for them, either singly or in concert, to establish special subsidiary institutions for the purpose. The latter would seem to be the preferable alternative. It would, in effect, separate the long term commitments which the banks would be undertaking from their current and short-term commitments to their depositors and might encourage the subsidiaries to raise some of their own finance on terms appropriate to the type of risks they were financing.

It remains to be discussed how any substantial increase in the demand for bank advances after the war would be "financed." If the increase occurs within a comparatively stable volume of bank credit, it will be financed by allowing other assets such as bills or TDR's to run off. The decision to repay Government debt held by the banks will, how-

ever, rest not with the banks but with the Treasury. It is possible that the end of the war may see budget surpluses out of which floating debt would be repaid, though this is a prospect about which it would be unwise to be unduly sanguine. There may be large funding operations through issues of Government stock to the public aiming, at one and the same time, at draining purchasing power (which will be redundant during the period of post-war scarcity) and repaying floating debt. If, however, neither of these occurs, any increase in bank loans would call for an appropriate increase in the basis of bank cash. But if there is a genuine demand for bank credit it may be presumed that the authorities will be willing to have it met; it would be difficult to reconcile any other course of action with the repeated promises of cheap and abundant credit or with the determination to avoid any post-war deflation. The task of the banking system, it would therefore appear, will be to find the borrowers, not the funds to lend.

## The Cotton Industry

THE Report on the post-war problems of the cotton industry, prepared for the Board of Trade by an imposing committee of the industry, headed by Sir Raymond Sreat, chairman of the Cotton Board, has the merit of containing not merely a set of recommendations but also the facts on which they are based. This method of presentation—one that might with advantage be followed by other industries—enables the critic to draw his own conclusions and to examine alternative remedies. The object of this article is to set out briefly some of the salient facts given in the Report of the industry's recent history, the estimates used in the Report of future demand for cotton and rayon, and the conclusions reached. Some comments on the issues raised are contained in an article on page 133.

### Past Experience

The most significant feature of the industry's recent history is its persistent shrinkage; during the twenty-five years preceding the war it shrunk by a third in size. It is common knowledge that the direct cause of this shrinkage has been the loss by the industry of more than three-quarters, measured by volume, of its exports. It is equally well known that the loss of exports has been due not merely to the growth of competition from other exporting countries, notably Japan, but also to the development of protected cotton textile manufacture in countries such as India, which formerly imported large quantities of goods from Great Britain. In other words, the British cotton industry was caught in the vice of a declining world trade and growing competition. The vice continued to close during the pre-war decade; between 1927-28 and 1937-38, though the total of world production rose by 13 per cent, the volume of world exports of cotton piece-goods fell by 27 per cent and Great Britain's share of the total declined from 44 per cent to 25 per cent. An interesting footnote to the decline in the British share of the export trade is provided by a table giving the change in the distribution of British exports before the war. Between 1929 and 1937, exports of piece-goods to the Dominions, to colonies in which quotas were imposed in 1934 on the imports of certain foreign textiles, and to twelve countries with which Great Britain concluded trade agreements, actually rose from 914 million square yards to 1,029 million square yards; but during the same period shipments to India fell from 1,374 to 356 million square yards and those to all other countries from 1,384 to 319 million square yards. British exports, in fact, have been steadily squeezed out of markets in which they did not enjoy special advantages by way of preferences, quotas and trade agreements. This trend reflects the growing disparity of costs between the industry in Great Britain and in other exporting countries.

Almost inevitably, the cotton industry has suffered from all the symptoms that go with industrial decay, such as surplus capacity of plant and labour, the reluctance of investors to throw good money after bad, and of young persons to run the risks of entering a declining industry. The number of new spindles and looms installed in recent pre-war years has been small, and that of young people

entering the industry fell from an average of 27,000 a year in 1925-27 to about 14,000 ten years later. Not unnaturally, a declining industry tends to become permeated with pessimism, that is to say decay tends to breed further decay. The industry has been carrying out a bare minimum of collective technical and scientific research, and only a few firms have been maintaining adequate research facilities. Unfortunately—this is a serious deficiency—the factual part of the Report does not include a survey of the financial experience of the industry; moreover, it deals with the position of the industry as a whole and therefore neglects its bright spots, for there are examples of enterprise rewarded by success.

As hitherto unpublished statistics show, the war has brought a further and severe shrinkage in the industry. Yarn production fell from 1,090 million lb. in 1939 to 730 million lb. in 1942; the output of woven goods declined

from 3,400 million square yards to 1,970 million. The labour force was sharply curtailed. In the spinning and doubling sections the number of persons employed was reduced from 186,000 to 108,000 between 1937 and 1942 as a result of the cut in output and its concentration into the fewest possible mills; in the weaving section the reduction was from 206,000 to 104,000. The elimination of plant was less drastic, for idle machinery was put on to a care and maintenance basis by compensation schemes; the mule equivalent of spindles in place declined from 40,100,000 in 1939 to 39,000,000 in 1942 and the number of looms from 490,000 to 475,000. The following table of comparative production and exports of four countries in 1937 and 1942, reproduced from the Report, tells its own story of markets lost by Great Britain—this time through Government restrictions on exports—and gained by other countries, and

f a drastic cut in British consumption and expansion elsewhere.

### Post-War Estimates

The Report's estimates of post-war demand are intended to relate to the period after the replenishment of stocks. Home market requirements are raised slightly above the average for 1935-37; they are put at 790 million lb. of cotton and rayon yarn, and 2,300 million square yards of woven goods, including a small allowance for imports on the pre-war basis. A decline in the demand for cotton goods, from 1,820 million square yards in 1935-37 to 1,570 million square yards is expected to be offset by an increase in rayon and mixed goods. Three varying estimates are given of export demand; the first is based more or less on the maintenance of the *status quo*, the second envisages adverse, and the third favourable, changes. These are given in Table II. Table III shows combined home market and export demand, together with the requisite needs in operatives and machinery, on the basis of the three estimates of exports.

At the end of 1942 the number of persons in spinning and doubling mills, including staple fibre, was 108,000; in weaving the number of operatives was 104,000. The present labour force in both sections is therefore inadequate even on the most pessimistic of the three assumptions. The mule equivalent of the present number of spindles is 39,000,000, of which 15,000,000 are in closed mills; the number of looms is 475,000, including 160,000 in closed mills. Spindle capacity is therefore excessive except under the third estimate, but the number of looms is excessive under all three estimates. It is recognised that the assumptions underlying these calculations are not necessarily valid; their significance lies in the range of probabilities envisaged by the advisers of the Cotton Board Committee.

### Proposals

This, broadly, is the background of facts with which the Committee was faced; it is hardly a cheerful one. What remedies did they prescribe to arrest the decay of the industry, that is, to restore prosperity through efficiency?

The Committee's main recommendation is for a strong statutory central organisation, coming close to the pattern of industrial self-government, to administer such remedial prescriptions as will in its view be necessary to restore the industry's health, that is, to ensure

a suitably sized cotton industry, affording stable and congenial employment to workers, a fair return to capital and a solid contribution to national well-being. Such a central organisation would take the form of a post-war Cotton Board, appointed by the Government after con-

TABLE II.—ALTERNATIVE ESTIMATES OF EXPORTS

|                                             | 1937  | Estimate I | Estimate II | Estimate III |
|---------------------------------------------|-------|------------|-------------|--------------|
| Cotton yarn (million lbs.)                  | 159   | 124        | 96          | 215          |
| Cotton piece-goods (million sq. yds.)       | 1,921 | 1,284      | 648         | 2,090        |
| Rayon piece-goods (million sq. yds., woven) | 63    | 70         | 23          | 130          |

sultation with the industry, responsible to the Government rather than to trade organisations, but free to take decisions in the interests of the community and of the industry as a whole. The Board would have "a whole-time chairman who would be independent." In view of the "immense" future importance of rayon, the problems of the cotton industry could only be successfully overcome if the Board's "constituency" included firms "wholly or partly engaged in spinning rayon staple fibre, weaving rayon yarns, finishing rayon goods, and merchandising rayon goods." Rayon would be assigned a quarter of the Board's membership.

Next, the Committee is anxious to ensure a balanced and efficient capacity.

On the machinery side, the Government and the industry should proceed on the assumption that the spinning section should be of approximately the same size as in 1937. Mills closed down by the concentration of industry scheme would be reopened, but "for the time being at least" the installation of new spindles should be under suitable control. In the weaving and finishing sections there is excess capacity that would have to be eliminated by means of redundancy schemes; but such schemes, to be effective, would involve control of new entrants. This would in any case be necessary during the period of deconcentration. The Committee also

holds the view that there are too many merchants in the trade, and that reforms are necessary in distribution, but does not propose any specific action. But an adjustment of capacity is not enough; the remaining capacity should be efficient, which would involve a good deal of re-equipment. Inquiry has shown that a representative cross-section of firms intend to place orders for £43,000,000 (on the basis of pre-war prices) during the five years after the defeat of Germany. The Government could do much to encourage re-equipment and greater expenditure on research by an appropriate taxation policy.

On the labour side, the need is for an increase; indeed, the shortage of operatives will be one of the industry's most serious problems after the war. The immediate problem could be mitigated by the Government in encouraging former operatives to return to the industry; the Committee realises that the recruitment of young persons is a matter of restoring confidence in the industry, backed by improvements in working conditions, better training methods and other reforms, and that this problem is on a par with those of the "recruitment" and expenditure of capital.

A system of price control administered by the post-war Cotton Board is, therefore, an "indispensably necessary" part of the Committee's plan. It points out that the need for

TABLE III.—ESTIMATED TOTAL POST-WAR REQUIREMENTS

|                                       | 1937    | Estimate I | Estimate II | Estimate III |
|---------------------------------------|---------|------------|-------------|--------------|
| Spinning and Doubling:—               |         |            |             |              |
| Spun yarn output (million lb.)        | 1,375   | 1,125      | 927         | 1,418        |
| Persons employed                      | 186,000 | 152,000    | 125,000     | 192,000      |
| Spindles (mule equivalent, millions)  | 39      | 32         | 26          | 40           |
| Weaving:—                             |         |            |             |              |
| Woven goods output (million sq. yds.) | 4,530   | 3,700      | 2,947       | 4,626        |
| Persons employed                      | 206,000 | 169,000    | 134,000     | 210,000      |
| Looms required                        | 420,000 | 344,000    | 273,000     | 429,000      |

imposing maximum prices during the period of shortage after the war is widely recognised as a means of avoiding an inflationary rise; but legally enforceable minimum prices are held to be necessary when pent-up demand has subsided if the industry is to succeed in adapting itself to post-war conditions. Wherever possible, however, a "price band" should be adopted in order "to provide for flexibility and to encourage competitive efficiency." There should be at least a five-year mandate of reconstruction—with continuation beyond if "approved and sanctioned"—for producers

could not and would not take the steps we want them to take in the first and second years unless they know that the price system will be in operation in the fourth and fifth years. . . . In the horizontally organised Lancashire industry, with its very numerous separate units at each stage of production it has been impossible for any of the interested parties to know for certain at what point it would or would not pay the industry as a whole to accept a certain price. Consequently, throughout the long period of contraction, the buyer at each horizontal stage has thought it essential to drive his supplier down in price, in the hope of thereby making his position as a seller in the next stage so much the stronger and thus preserving his own volume of trade against his domestic competitors. The result has been innumerable orders booked at a loss.

It admits, however, that departures from standard prices may be desirable in certain conditions, such as sales to special markets. In the Committee's view

the principle to govern the level of prices in the various schemes should be that of securing a reasonable rate of return in the long run to an efficient firm as determined by an investigation of the average results of a representative group of efficient firms.

On exports, the mainstay of the trade, the Committee finds that the industry's future is in the hands of the British and overseas Governments. It has this to say:

It is clear that if the very low labour cost countries are going to enjoy equal terms of access to markets; if they are going to expand their production; and if their wages and conditions are going to remain where they are whilst our conditions improve as we intend them to, only a limited export trade in specialities will remain to the British cotton industry after the world shortage is overcome.

The Committee holds that during the period of shortage after the war, quantitative control may be necessary in the international cotton trade. It has an open mind about the future, but "could fit itself into a picture of that kind."

## Business Notes

### Civil Aviation

Lord Beaverbrook's speech during the debate on civil aviation in the House of Lords on January 19th was in the nature of a progress report. First, he stated that the Government is now ready for an international conference and is, in fact, waiting on the United States to complete its surveys. Since the rights of innocent passage and of landing for re-fuelling and other non-traffic purposes have been accepted as fundamental principles of civil aviation by both Governments, such a conference would presumably deal mainly with the problems of traffic regulation and arrangements. Secondly, Lord Beaverbrook remarked that although the British Overseas Airways Corporation has a monopoly of subsidies for overseas traffic, there can be no statutory objection to shipping and other private concerns engaging in international air traffic; but he did not say whether it is the intention of the Government to reconsider the position of BOAC. For example, is there to be equality of opportunity for all who wish to engage in overseas air transport, or are private concerns to be given an opportunity by restrictions on the field of operation of BOAC? Thirdly, he revealed that preparations were now going ahead for the provision of suitable types of transport aircraft. The two types of transport which he said were in preparation are the "Tudor" and the "Brabazon Type I." The first, which will have an all-up weight of 32 tons, may be ready before the end of the war, but it may be some years before the second, of an all-up weight of 100 tons, will make its regular appearance on the world's air routes.

### Road Plans

In reply to a question in the House of Commons on January 25, Mr Noel-Baker, Parliamentary Secretary to the Ministry of War Transport, gave some indication of the Government's attitude to the problem of improving Great Britain's road system after the war. He pointed out, rightly, that any proposals for an improvement or an extension of the road system must be "viewed in relation to the efficiency and development of our inland transport system as a whole." By this test there is, in the opinion of the Government, a clear case for extending the present trunk road system; it is the intention of the Government to draft legislation which would substantially increase the existing mileage of trunk roads—some 4,500 miles—which is at present vested in the Minister of War Transport. This would involve not merely the taking over by the Minister of additional existing stretches of road and, possibly, of by-passes, but also the planning of some new roads where existing facilities are inadequate. About motorways Mr Noel-Baker had this to say:

While the Government do not think that there is sufficient justification for embarking upon the construction of a wide-spread system of entirely new roads reserved exclusively for motor traffic, they are satisfied that it will be expedient and economical to construct suitable lengths of roads of this type, where engineering and traffic considerations make this course preferable to the extensive re-modelling of existing roads, in an attempt to make them more suitable and safer for mixed traffic. In selecting lengths of road for this treatment, the Ministry would be guided by the proper development of our transport system as a whole, by the convenience of road traffic. . . . Due regard would be paid to cost and amenity.

In other words, the motorway is to be regarded as one of the alternatives in improving facilities between any two points; the test is to be not whether motorways in general would be desirable, but whether a motorway linking any two points is the best solution of the traffic problem between them. This is the practical approach suggested in *The Economist* of January 1st. The execution of the Government's highway programme is to be related to general economic conditions. The order of priority is to be broadly as follows: the overtaking of arrears of maintenance; the resumption of works closed down during the war; the extension of works essential to public safety and the reconstruction of blitzed areas; the elimination of traffic obstructions; the execution of other works of high economic importance.

### Help for Lombard Street

Borrowers in the money market have again been hard put to it this week to make ends meet and they have had to seek special assistance from the Bank of England agents. This help has been readily forthcoming through official purchases of bills at 1 per cent. The main influence at work on credit conditions has been the heavy flow of revenue payments to the Exchequer. For each of the past two weeks revenue surpluses have actually been achieved. For the past week this factor should to some extent have been offset by the £10 million excess of Treasury Bill maturities over payments, and by the maturity of close on £10 million of Treasury Deposit Receipts against which no fresh payments have had to be made by the banks. The January making-up has, however, again affected the situation, and it is largely owing to the calling of funds by the clearing banks and to the absence of bill purchases on their part that the discount market was compelled earlier in the week to seek official assistance. The opinion prevails in money market circles that the impact of clearing bank window-dressing is likely to decrease this year. It has not escaped notice that the cash ratio revealed by balance sheets of December 31st was only 10.47 per cent, against 10.76 per cent for the end of 1942 and was easily the lowest end-of-year clearing bank cash ratio on record. The stunt of window-dressing, however, is to be measured not only by the figure to which the cash ratio is worked, but by the normal and unpublished level from which it is raised each month. The recent reminder from one of the banks that its own liquidity ratios owe nothing to window-dressing may also encourage the others to do likewise. The money market should not be unduly affected by the repayment of the £318 million of 5 per cent Conversion Loan on May 1st next. There is to be no special conversion offer in connection with this repayment.

### Gold and the Rupee

The volume of official sales of gold in the Bombay market is beginning to make its effect felt. The price quoted in the market has broken again; although the fall is only from Rs. 71½ to Rs. 71, it is significant owing to the relatively long period of stability which preceded it. The daily offtake in Bombay has slightly declined during the latter part of the week, and fallen below the average of 40,000 tolas maintained during the past five months. It is estimated that since August 17th, when the official selling programme became a decisive factor in the market, some 3,500,000 tolas have been sold through the Bombay market at prices ranging from Rs. 87, to Rs. 71 per tola. The proceeds of these sales must amount to the equivalent of about £20,000,000. At the price now ruling, gold in Bombay is still quoted at over £14 per ounce. Given the size of the official gold poured into the Indian market, it may be asked why the Bombay quotations should still diverge so widely from the parties indicated by the official prices for gold in Britain and America. There can be no real expectation that the sterling and dollar price of gold will ultimately come up to the equivalent of the present rupee quotation. As soon as the existing insulation of the various gold markets is ended, these abnormal disparities must disappear. One explanation of their persistence is found in the fact that the buying of gold in India, stimulated by inflationary forces, is for hoarding purposes, and not with the object of resale. The up-country cultivator who buys gold does so because in existing circumstances all his instincts tell him to invest his surplus in precious metals. Consumer goods are in short supply, prices are high, and bullion seems the obvious medium of investment. The long-term prospects for the rupee price of gold do not consciously enter into his calculations. None of the gold is, in fact, being bought for speculative purposes, since the facilities for such operations have now disappeared. The wide disparity between the rupee and sterling prices for gold might after the war be narrowed by a depreciation in the sterling value of the rupee. The scale of wartime inflation in India has been far greater than in Great Britain, and though over the same period the creditor-debtor position between the two countries has been revolutionised in favour of India, the resultant of these two opposing forces may still be to drag the rupee to a somewhat lower

exchange parity than the present rs. 6d. figure. It would, however, be unwise to count upon such a development to remedy the whole of the existing disparity between gold prices in India and elsewhere.

### LMS Airline Deal

In view of the insistence that air services should be run by shipping lines in more extended fields, a recent development concerning the provision of services at home is of interest. For some time past, Isle of Man Air Services has been owned by the Isle of Man Steam Packet Company, the LMS and Olley Air Services in equal proportions. Following the purchase of the last-named company by the LMS, the railway has decided that the holding in IOMAS should be split in equal proportions between itself and the Steam Packet Company. A sale of shares has, accordingly, been arranged and a new board installed on which the two companies are equally represented. The board is planning a wide expansion of services as soon as conditions are suitable and aircraft available. This concern has already some ten years' experience and has run considerable services even under the restrictions of wartime transport. It appears confident that there will be a very large expansion in the business in the post-war years, and this, presumably, applies to a number of other sections of internal and inter-island transport, almost the whole of which is in the hands of concerns in whose control the railways have a large, if not a predominant, place. If, as seems probable, such services are granted a relatively high priority, the way seems clear for development. This is in distinct contrast to the position of the overseas concerns, about whose arrangements little has been heard in recent weeks. Two shipping companies have, however, mentioned the matter, the managers of Orient Steam stating that they are looking into the costs of air operation and its effects on sea transport, while Houlder Line commit themselves to the policy of taking participations in air line companies rather than entering the business themselves.

### Shipping Replacement Costs

The accounts of Orient Steam Navigation for the year to June 30th last show a fall in the omnibus item of fixed assets amounting to some £424,000, of which £200,000 is due to depreciation. Against this there is a rise of £2,880,000 in a reserve item of which fleet replacement is, presumably, the main component. Since, however, depreciation on investments is now included under this head, instead of being written off holdings as heretofore, and contingencies—previously grouped with creditors—are also included, it is impossible to give an exact figure of the difference between book and insured value of the ships lost. Nor does it seem useful to base a calculation upon the figure of Government Tonnage Replacement Account. This stood at £409,700 when it was included in ship replacement reserve of £1,258,281. In the latest accounts the former figure has increased to £895,900 and is now shown separately. No doubt the new form of presenting the accounts is an improvement, but, in the absence of comparative figures, the shareholder is left more mystified than ever and the only conclusion that can be drawn from the great change in the reserve position is that investments, which have risen by some 50 per cent to almost £7,000,000, were heavily written down as well as the fleet. In the absence of the market value it is impossible to place a value on the reserve, but the assumption from the managers' statements from year to year is that investments are not now overvalued. If this is so the position is somewhat as follows. Depreciation of £1,200,000 apart, the balance sheet value of fixed assets has fallen by £985,000 since June, 1939. During that period, net liquid assets have risen by £6,750,000, thanks to excess of insured over book value of ships, the write-up in investments, revision of accounting practice and additions of £428,000 to reserve and carry forward. Of the last item almost half may not be available for general purposes. In addition, the company has the Government Tonnage Replacement Account to draw upon, making almost £7,650,000. This is to replace ships whose written-down value was of the order of £1,000,000, but the managers still express doubts whether these funds will be equal to the task.

### Planning the North-east

The absence of any Government decision on the post-war planning and location of industry has prompted local

industrialists and individuals in many areas to take the initiative; and the projected formation of a Northern Industrial Group, in succession to the old North-East Development Board, is the latest example of this tendency. The object of the Group is to prepare and co-ordinate development schemes for the area, and to keep its problems "before the attention of the Government." Its sponsors include Lord Ridley, Sir Colin Forbes Adam (a former Special Area Commissioner) and a number of leading industrialists and trade unionists in the area. Their report stresses the conclusion arrived at in *The Economist* on November 6th, that the war has actually worsened the region's prospects of post-war employment in relation to other more balanced areas. The principal remedy proposed is a greater diversification of industry in the region, by such measures as the encouragement of trading estates; the building of suitable factory premises; the revision of transport freight rates; the provision of suitable houses for business executives; and improvements in amenities. The report urges the need for unifying existing local authority administrations, and attacking the vast housing problem; it suggests that the policy, interrupted by the war, of transferring and rehousing the populations of the derelict villages of South-west Durham, should be resumed. It attaches great importance to the development of coal by-products and coal-based chemical industries, so as to utilise to the full the area's greatest asset. The report, quite correctly, emphasises that any plan for the north-east must fit into the framework of a national plan. It urges the Government to adopt the policy of taking work to the worker rather than workers to the work—a suggestion which has disadvantages as well as advantages—and to assume additional powers for the location of industry. The figures quoted illustrate the magnitude of the north-east's post-war problem. On the basis of pre-war statistics, it estimates an unemployment level of 130,000, out of a total insured population of 720,000. Before the war, two-fifths of the insured population were employed in mining, shipbuilding, engineering and iron and steel. The report's recommendations will not solve the problem of the north-east coast, which is fundamentally bound up with the future of heavy industry, though the measures proposed would alleviate it. But, in any case, little can be done in the direction of establishing a better geographical

balance in industry, until the Government comes to a decision about the Barlow and Uthwatt reports.

### Uruguay's Sterling

Uruguay's favourable trade balance is causing a persistent increase in that country's reserve of foreign exchange. The excess of exports for the first nine months of 1943, expressed in US dollars, amounted to \$29,495,000, compared with \$473,000 for the corresponding period of 1942. The current review of the Bank of London and South America points out that the foreign exchange reserves of the Banco de la Republica now total \$58,519,000. This total is made up to the extent of \$42,039,000 of U.S. dollars and \$16,479,000 of sterling. During the recent debate on the national budget in Montevideo a suggestion was made that Uruguay's sterling funds standing on special account in London might be used to redeem part of Uruguay's consolidated debt. The Banco de la Republica has made public certain objections to this proposal. It has pointed out that as the sterling funds in question are not the property of the Government, but of the central bank, it would be necessary to float internal loans to raise the required pesos at a time when the capacity of the domestic capital market is already strained by large issues on the part of the Government. In addition, it was pointed out by the Banco de la Republica that the possession of a large foreign exchange reserve was not undesirable, especially in the case of a country like Uruguay, whose dependence on a limited range of exportable products was likely to lead to substantial fluctuations in the year-to-year balance of payments. The abundance of the foreign exchange reserve has, however, led the Uruguayan export and import control board to remove some of the restrictions on the grant of import licences. For the time being, therefore, the British holder of Uruguayan bonds can sleep o' nights.

### Raw Material Supplies

On Tuesday the Colonial Office announced that the Government's purchases of Rhodesian copper would be reduced by an amount equivalent to between 20 and 25 per cent of the aggregate rate of production achieved in 1943 by the four mines; to facilitate the transition the cut is to be made by stages, beginning in April. On the same day, the board of Roan Antelope, one of the companies, made public its decision not to pay a dividend in respect of 1942-43 on its issued capital of £4,993,160. The decision of the Colonial Office is symptomatic of a decisive improvement in the supply-demand ratio of a wide range of raw materials required by the United Nations for war production. It is due to a multiplicity of factors. On the

supply side they include the increase in shipping tonnage and the reduction in the loss of cargoes, the rise in the production of natural and synthetic materials, and the fact that the military advances of the United Nations have given them command of the battlefield, and, consequently, of the supply of "battle-scrap." Factors on the demand side include the completion of the greater part of the war plant and machinery production programme in the United States, and the experience gained during the period of scarcity in the economical utilisation of materials. Materials which are still scarce include rubber and aviation spirit, as well as timber and timber products. Supplies of many war materials required for munition production may become progressively easier this year, but there are a number of others, such as textiles, used mainly for civilian purposes, which will still be scarce at the end of the war.

### Non-Austerity

The lifting of restrictions is always welcome and as a general rule should never be delayed longer than necessary. The end of austerity restrictions on men's clothing has been received with acclamation. The President of the Board of Trade was influenced by the decision of the War Office that suits given to soldiers on demobilisation shall not be of austere design, and he has decided that civilians shall not be in a worse position in regard to turn-ups, buttons and pockets. There is, however, an element of doubt whether the new freedom can be afforded for everybody at this stage of the war. The savings effected by austerity have been considerable, although some of the restrictions could scarcely be described as economical in the long run. It is not possible to estimate the extra labour required to make suits free of restriction, but additional pockets, buttons and button holes will take longer to make. The number of buttons on a non-austere jacket varied, but was as high as twelve in some cases. The average may have been about nine, so that austerity dispensed with two-thirds the quantity needed. It is unlikely that button manufacturers will be able to meet increased demand on this scale. Labour and supply conditions generally may set a limit to the extent to which a return to the pre-war suit is possible. A number of questions are raised by Mr Dalton's decision. The price of utility suits of the non-austerity variety may have to be raised to take into account the higher cost. After March 1st, non-austerity suits can be delivered and austerity suits will require only 20 coupons. There will be no rule against adding "trimmings" to suits, but will six coupons have to be surrendered for this service? Some compensation may have to be given to retailers for the loss of coupons involved in the sale of austerity suits. It is hoped that the extent of the down-

## BENEFACTORS OF MANKIND

JOHN FREDERIC DANIELL (1790-1845)

*This brilliant life, all too short in point of time terminated at the peak of its activities. His great reputation as a scientist was equalled by his high personal character. In the prime of life he passed the torch to other pioneers.*

# Versatility

DISTINGUISHED in his research on the atmosphere, meteorology, chemistry and electricity, he brought together scattered knowledge, re-applying it, and adding the results of his own versatile gifts. He insisted upon accuracy of measurement, and invented the hygrometer which bears his name, for measuring atmospheric moisture, and also a new pyrometer for registering high temperatures. In the field of electricity his work was original; it included the invention of the Daniell cell, of great utility for telegraphic and other purposes. He added much to the knowledge of voltaic combinations and of electrolysis. The products of the Brush Electrical Engineering Co. Ltd. are versatile, comprising a very wide range of world renowned machines for the generation and distribution of power and electricity.

31st December, 1943.

pointing will have a favourable effect on sales, so that disposal of stocks will not be a problem. In any case, it will be some time before ready-made suits of the new designs reach the market. Men have disliked austerity suits since their introduction in March, 1942, but women, less conservative in their taste, have been less critical of the restrictions imposed on their clothes. It remains to be seen whether they will demand equality with men in this respect.

### Dearer Coal

On February 1st the price of coal will be increased by 3s. a ton to meet the rise in cost. The *Board of Trade Journal's* index of the wholesale price of coal rose by 58.2 per cent between August, 1939, and December, 1943. As a result of the new advance the war-time increase will exceed 60 per cent. It will naturally raise costs to consumers and substantially to industries with a large fuel bill, such as iron and steel. In an article in the January issue of *Man and Metal*, discussed on page 112 in *The Economist* of last week, Mr John Brown, general secretary of the Iron and Steel Traders' Confederation, drew attention to some of the post-war implications of dear coal. On the basis of a coal output of 200 million tons a year, the new increase in prices would add about £30 million to the nation's fuel bill.

### Winter Milk

The Minister of Agriculture announced last Wednesday that a temporary bonus would be paid to milk producers in England and Wales of 1½d. a gallon on the first 400 gallons of winter milk each month and ½d. a gallon on the first 500 gallons of milk each summer month. At a press conference last week, Mr J. L. Davies, the Milk Production Officer of the Ministry of Agriculture, said that the production of winter milk had made substantial strides since the outbreak of war. The trend of the index of sales of winter milk in England and Wales, shown in the accompanying table, indicates the large increases obtained:

SALES OF LIQUID MILK, OCTOBER-DECEMBER

|      | 1938=100 |      |     |
|------|----------|------|-----|
| 1938 | 100      | 1941 | 120 |
| 1939 | 96       | 1942 | 125 |
| 1940 | 114      | 1943 | 130 |

During the last quarter of 1943, production increased each month, compared with the corresponding month of the year before. In October, the percentage increase was 1.8; in November, 5.7; and in December, 7.5. Mr Davies was confident that the upward trend would continue this month, and he forecast an increase of 10 per cent. Priority consumers are taking up their allowances to a greater extent than before, and it is for this reason that the ordinary consumers' allowance remains low, and has not been raised with expanding production. The benefits of milk as a food are now more appreciated; consequently, demand after the war is likely to remain at a high level. Thus farmers will have no cause to regret the emphasis placed by the Minister of Agriculture on winter milk, or their efforts to raise production. Winter milk is paid for at higher rates, and its production does not reduce summer output. Nonetheless, bearing in mind the present dependence on home-produced feeding stuffs and the difficulties of autumn calving, the dairy farmers' performance is a fine one. There is every reason to believe that production next winter can be larger, since not all farmers have yet turned to a winter milk basis. The bonus should provide an additional incentive.

### Woolworths and Imps

Both Woolworths' and Imperial Tobacco are to pay the same final dividends for 1943 as for 1942, namely 30 per cent gross and 10 per cent tax free—of which 2½ per cent represents a bonus—respectively. The dividends of both concerns, not unnaturally and to no alarming extent, have been falling away during the last few years from their pre-war peak. Woolworths' total dividend for the year will amount to 40 per cent, which compares with 50 per cent for 1942, 55 per cent for 1941, and 65 per cent for 1940 and the two preceding years. Imperial Tobacco's full

### COMPANY MEETINGS

## WILLIAMS DEACON'S BANK, LIMITED

### SATISFACTORY RESULTS—INCREASED PROFIT

### BANK'S LIQUID POSITION

### MR G. P. DEWHURST'S STATEMENT

In place of his usual annual address, the following statement has been circulated by Mr G. P. Dewhurst, chairman of Williams Deacon's Bank Limited, in advance of the annual general meeting to be held on January 27, 1944.

TRIBUTE TO THE LATE COLONEL SIR ROBERT WILLIAMS AND THE LATE MR THOMAS FREDERICK TATTERSALL

From the report in your hands you will see that during the past year we have had to deplore the loss from our board of two of our most prominent and valued colleagues in Colonel Sir Robert Williams and Thomas Frederick Tattersall. Sir Robert was the great-grandson of the founder of Williams Deacon and Company and was himself a partner in that old private banking firm, who were the London agents of the Manchester and Salford Bank since the latter was formed in 1836. After the amalgamation of the two banks Sir Robert became a director until his death last April in his ninety-fifth year. Possessed of a strong personality, Sir Robert, in spite of his great age, retained his full powers to the end, and his good judgment and sound common sense were highly valued by the board, and by his London colleagues in particular. Thomas Tattersall had been a director of this bank for nearly twenty-one years, and deputy chairman since 1936. He was also chairman for many years of the English Sewing Cotton Company and a director of the Manchester Royal Exchange, and it is not too much to say he was a conspicuous success in those various capacities, but, apart from his business ability, his colleagues will best remember him for his sterling character, unfailing good humour, and, last but not least, his genius for friendship. We salute his memory and feel proud to have been associated with him.

### THE NEW DIRECTORS

To fill the vacancies thus caused, we have invited Mr Frank Longworth and Mr Douglas Thornbury Garrett to seats on the board, and the meeting will be asked to confirm their appointment. President of the Manchester Chamber of Commerce, a director of Jas. Williamson and Son, Limited, of Lancaster, and a member of a well-known family with large industrial interests in East Lancashire, Mr Longworth needs no introduction from me to business circles in Manchester. Mr Garrett is senior partner of Messrs Parker, Garrett and Company, solicitors in the City of London; he is also a director of the Legal and General Assurance Society. To both of these gentlemen we offer a very hearty welcome to our board, and are confident that their business ability and influence will be of the utmost value to the bank.

Before referring to the accounts, I would like in your name to offer our heartiest congratulations to two of our colleagues, Sir William Whyte on the honour of Knighthood which was recently conferred on him, and Mr Kershaw on receiving the C.B.E. in the New Year's Honours List.

We have to record, I regret to say, the death on active service of 10 of our staff, with a further 5 missing and 9 prisoners of war, these out of a total of 519 members of the staff serving with His Majesty's Forces. To the relatives and friends of those who have given their lives for their country we take this opportunity of offering our sincerest sympathy.

### BALANCE-SHEET ITEMS

Turning to the figures of the balance sheet, our current, deposit and other

accounts, in conformity with other banks, show a further considerable expansion, and at £74,341,000 constitute a record high level for the bank. At the same time, in spite of the above figures, we have evidence that the placing on tap of Tax Reserve Certificates has definitely slowed down the rate of increase of deposits.

On the other side of the sheet, and taking the first five items, which rank as the bank's most liquid form of assets, our cash, balances with other banks, money at call, bills discounted, and Treasury deposit receipts, give us a total of over £39 million, or 53 per cent. of our deposits.

Government investments are also up by £2,000,000, while advances show a small but welcome increase of £850,000. We have further reduced the figure at which our bank premises stand in our books by some £44,000, advisable in view of the possibility of further capital expenditure in that direction in the future.

### PROFIT AND DIVIDEND

Turning now to the figures of profit and loss, our net profit, after making the usual provisions, appears at £201,844 12s. 4d., as compared with £189,057 3s. 11d., or an increase of £12,787. This profit, with the balance of £127,275 15s. 2d. brought forward from last year, gives us a total of £329,120 7s. 6d. now to be dealt with. After transferring £30,000 to bank premises account and £30,000 to property maintenance reserve account to meet overdue repairs which will have to be faced after the war, we are in a position to pay a dividend at the rate of 12½ per cent. on both our "A" and "B" shares, and carry forward to next year's account £151,932 17s. 6d., as against £127,275 15s. 2d. brought in.

These figures, I submit, not only give ample proof of the extreme liquidity of the bank's resources, but emphasise the continued progress of our business, of which the increase in the number of customers' accounts is perhaps the most satisfactory feature. Since last July, the Manchester clearing, which was the largest provincial clearing, has been restricted to offices approximately within a quarter of a mile radius from the Clearing House, the remainder of the area covered by the clearing being diverted to the Central Clearing House, with the result that 75 per cent in value of the Manchester clearing is now dealt with by the Central Institution, thus enabling a further saving in manpower to be effected.

### POST-WAR PROBLEMS

Whilst the whole energies and resources of the State and individual alike are entirely pledged to the successful prosecution of the war, it is still essential for us, without any relaxation on the main issue, to look ahead and plan, as far as we can estimate them, for the problems which will arise in the early days of peace. Without entering into the vexed question of State control versus private enterprise, it is, I think, a matter of common agreement that a certain measure of control of money, prices and commodities must remain in force for a time, and can only be dispensed with by degrees. If such a policy is necessary for the trade of the country as a whole, it should apply with special force to the cotton industry, where control of every stage and process from the raw material to the type and destination of the finished article has been of the strictest, and where its premature removal would merely be inviting a repetition of the troubles that

overtook the trade after the conclusion of the last war. On the other hand, State control, however onerous and irksome in its incidence, has given the benefit of stable prices, and if the industry is to qualify for such benefit it is essential that it should produce evidence of its efficiency in an overhaul of its organisation and its willingness to adopt new ideas, and by the aid of research in the introduction of the most up-to-date plant and machinery.

### NECESSITY FOR EXPORTS

A successful export policy, we are all agreed, is vital to this country, and Lancashire has only to live up to its past record in this connection to play an important part in the restoration of the nation's finances. While our attention is thus directed to post-war planning, should we not spare a thought for that vast number of young men who, we hope, will be returning to our midst to take up a variety of occupations in civil life? These men, after their service in H.M. Forces and whatever their rank, will have graduated in the hardest of schools, where courage, initiative, and enterprise have been the first essentials; in other words, they will have imbibed the art of leadership. This priceless asset must never be allowed to fade out through want of appreciation or opportunity, and we must see to it that these qualities which have appealed so strongly to our imagination while on active service should be given their fullest scope in the years to come.

### TRIBUTE TO STAFF

And now may I on behalf of the board offer to the staff, permanent and temporary alike, our best thanks for their services and assure them of our keen appreciation of the manner in which they have performed their duties in the bank, whilst to our general manager, Mr Thomson, the assistant general managers and the other officials of the bank a special word of thanks is due for the manner in which their responsibilities and duties of management have been discharged.

## BARCLAYS BANK LIMITED

### ANNUAL MEETING OF STOCKHOLDERS

The forty-ninth ordinary general meeting of Barclays Bank, Limited, was held, on the 24th instant, at the head office of the bank, 54, Lombard Street, London, E.C.3.

Mr Edwin Fisher (the chairman) presided.

Mr. P. J. Diboll (the secretary) read the formal notice convening the meeting and the report of the auditors.

With the concurrence of the stockholders present the report and accounts and also the statement by the chairman, which had been previously circulated, were taken as read.

The chairman moved: "That the report of the directors produced, together with the annexed statement of the company's accounts as at December 31, 1943, duly audited, be received, approved and adopted, and that a final dividend of 5 per cent., making 10 per cent. for the year, on the 'A' stock, and a final dividend of 7 per cent., making 14 per cent. for the year, on the 'B' and 'C' stock respectively, less income-tax in each case, be declared, payable on the 8th proximo to the stockholders registered in the books of the company on December 31st last."

Sir William M. Goodenough, Bt. (deputy-chairman), seconded the motion, which was carried.

The retiring directors were re-elected, and the auditors, Messrs Kemp, Chatteris and Co. and Messrs Price, Waterhouse and Co., were reappointed for the ensuing year.

A vote of thanks to the staff and a vote of thanks to the chairman for presiding at the meeting were unanimously accorded and the proceedings terminated.

**WANTED.** Copies of *The Economist* for the years 1940, 1941 and 1942. Offers to Wm. Dawson & Sons, Ltd., 43 Weymouth Street, London, W.1.

# TURNER AND NEWALL, LIMITED

## SATISFACTORY RESULTS

### SIR SAMUEL TURNER'S STATEMENT

The annual general meeting of Turner and Newall, Limited, was held on the 21st instant in Manchester, Mr W. W. F. Shepherd, the deputy chairman, presiding in the absence of the chairman, Sir Samuel Turner, through indisposition.

The secretary, Mr John L. Collins, read the notice convening the meeting and the report of the auditors, Messrs Deloitte, Plender, Griffiths and Company.

A statement by Sir Samuel Turner, as the chairman of the company, had previously been circulated to the stockholders with the directors' report and balance sheet. This statement first referred with regret to the death of Mr A. P. Strohmeier, a director of the company, on January 23, 1943, also to the fact that two other directors, Messrs B. E. Williams and Harold Jones, having retired from the business after very many years' service with the company, did not offer themselves for re-election to the board, appreciation of their long and valued services to the company being expressed.

#### OPERATING TO CAPACITY

After dealing with the accounts of the company at some length, the statement proceeded as follows:—

Owing to limitations of space, I do not propose this year to attempt to give you an itemised survey of our operations during the past financial year, as in my case such a survey could not, for security reasons, be very informative. I can, however, say that generally speaking our mines and our factories at home and abroad are operating to capacity, and in so doing are producing, in very large quantities, materials which are essential for the prosecution of the war.

So far as our factories are concerned, our principal difficulty during the past year has been to obtain an adequate supply of labour to enable us to carry out our very large manufacturing programmes, but in view of the importance of our products to the war effort, we have been assisted by the Government to maintain and even, in some cases, to extend our labour force as far as circumstances would permit.

The pension scheme of the group has now been in operation for seven full years, and continues to progress satisfactorily. With regard to the Robert Turner Fund, your directors again recommend the contribution of £10,000 to Turner and Newall Welfare Trust, Limited, for account of the trustees of this fund, which, as you know, is being built up for the purpose of dealing with exceptional cases not adequately covered by the pension scheme itself. Last year I advised you that the total cost to the group of pension fund contributions and of the holidays-with-pay scheme for the workers amounted to £111,500; for the year ended September 30, 1943, the comparative figure was £127,500.

During the year under review significant expenditure has again been incurred in connection with air raid precautions, mainly in connection with the provision of additional shelters and other passive air defence measures, but also including fire-watching costs. Last year the cost of this programme was £35,083, in comparison with £45,535 during the previous year.

I am pleased to be able to report that during the year no significant damage has been caused by enemy action to any of your company's factories or equipment.

#### THE DIVIDEND

The final dividend recommended by the board makes, with the interim dividend already paid, a total distribution of 12½ per cent. for the year on the ordinary stock, and this is the same total rate as the dividend declared in respect of each of the previous two financial years. While the present

abnormal conditions of war continue, and with our factories already working to capacity, it is very unlikely that any of our production costs can be reduced. On the contrary, they will probably increase still further, and accordingly, it is most improbable that any significant increase in available profit will be forthcoming. At the same time, however, I feel sure that stockholders will agree that the maintenance of a 12½ per cent. dividend over the period of the past three years is eminently satisfactory, when the punitive effect of present taxation rates is borne in mind.

#### THE FUTURE

I have, on previous occasions during the war period, pointed out that it is impossible under the abnormal conditions prevailing to make any specific forecast as to the future. So far as the current year is concerned, one would not anticipate that conditions will be very different from those which have obtained in the recent past, and I hope before the date of our annual general meeting about a year hence, that it may be possible to see at least the beginning of a return to more normal conditions. Meanwhile, planning for the future, and research work to form the basis of future progress, are not being neglected, and I feel that we can confidently hope when conditions of peace return, to maintain and even to increase the status of our organisation in industry.

In conclusion, I would like once again, on behalf of the board, and on your behalf, to express to the officials and employees of our various undertakings, both at home and abroad, our high appreciation of their continued efforts in the interests of our business, and our confidence that these efforts will continue unabated both now and in the post-war period.

The usual resolutions were then passed approving and adopting the directors' report, the accounts for the year to September 30, 1943, and the balance sheet as at that date, and authorising the payment of the ordinary dividend of 8½ per cent., making 12½ per cent. for the year, subject to income tax, following which Mr R. H. Turner was re-elected as a director of the company, and Messrs Deloitte, Plender, Griffiths and Company, chartered accountants, were reappointed as Auditors for the current year.

## NATIONAL DISCOUNT COMPANY, LIMITED

### CAPITALISATION OF RESERVES

The annual ordinary general meeting of the National Discount Company, Limited, was held, on the 26th instant, in London, Sir Sigismund F. Mendl, K.B.E. (the chairman), presiding.

The following is an extract from the statement by the chairman circulated with the report: The continuance of cheap money during the past year has been accompanied by the small margin of profit between interest and discount which has characterised the war years. We have, however, been able to extend our operations in the short-bond market, by doing which we may fairly claim to have been of assistance to the Government with their war finance. These operations are largely responsible for the satisfactory report which we now present to the shareholders.

With regard to the balance-sheet, you will see that the company's turnover has continued to expand. The total shows an increase of £10 million over the previous year's figures and has now reached £79 million. This increase, as last year, has again taken place in deposits, which now stand at £72 million. There has been a

corresponding rise in investments and bills and short-dated bonds discounted. The total of bills re-discounted is again £4 million. We have seen no evidence of an increase in commercial paper, and I think it is very satisfactory that this figure has been maintained. The reserve fund, which now stands at £1,576,667 10s., has been increased to this figure by the transfer of £100,000 from the profits for the year and by the transfer of the sum of £76,667 10s. from a contingency account no longer required.

The profit and loss account shows that after making provision for rebate and taxation and providing for all foreseeable contingencies, our gross profit stands at £251,125. It is proposed to pay a dividend of 2s. 6d., less tax, on the "A" shares, making 10 per cent. for the year, and 7s. 6d., less tax, on the "B" shares, making 26 per cent. for the year.

For some time past the directors have had under consideration the desirability of capitalising part of the company's reserves and applying the amount so capitalised in paying up part of the uncalled capital on the "B" shares. We consider that the company's present reserve fund is more than sufficient to justify this proposal being put into effect, and a resolution will be submitted to capitalise £576,667 10s. out of reserve and to apply the same in paying up £2 10s. per share on each of the 230,667 issued "B" shares of £7 10s. (£2 10s. paid), thereby reducing the uncalled capital to £2 10s. per share. The paid-up capital will then be £1,576,667 10s. with a reserve fund of £1,000,000.

The report was adopted and the proposed capitalisation of reserves approved.

## MARTINS BANK LIMITED

### ANNUAL GENERAL MEETING

#### HELP FOR THE SMALL TRADER

The 113th annual general meeting of Martins Bank, Limited, was held, on the 25th instant, at the head office, Water Street, Liverpool.

Mr. Frederic A. Bates, M.C., A.F.C., D.L., chairman, who presided, said that normally the remarks he would have made had been issued in the form of a statement to members along with the report and accounts, and he had nothing to add.

In answer to an observation by Alderman E. A. Cookson, a shareholder, the chairman assured the meeting that what was called the "small man" was the special care of the bank. They did all they could to assist his interests, and in the post-war world it was their intention to continue to help the small man in his difficulties in the reconstruction of his business. It was universally recognised that the continuance of the small trader throughout the country was of the utmost importance to our general welfare. (Hear, hear.)

The chairman proposed the adoption of the report and accounts and the distribution of a final dividend of 7½ per cent., making 15 per cent. for the year.

Mr A. Harold Bibby, one of the deputy chairmen, seconded, and the motion was adopted.

Speaking to the re-election of directors, which was agreed to, Mr F. D. Sharples and Lt.-Col. W. B. Armitage expressed appreciation of what the board, management and staff had done.

The reappointment of the auditors was proposed by Mr E. M. Hodgkinson, seconded by Mr Bryce M. Hanmer and unanimously approved.

Upon the conclusion of the business, Col. J. G. B. Beazley proposed the thanks of the meeting to the chairman for his devoted attention to the bank's interests and the excellent results achieved during the past year.

The chairman returned thanks, and said that a message would go to members of their staff in H.M. Forces welcoming their return to the service of the bank. (Applause.)

## DLAND BANK LIMITED

### ANNUAL MEETING OF SHAREHOLDERS

The ordinary general meeting of shareholders of the Midland Bank Limited was held on the 27th instant at the head office, 1, Abchurch Lane, London, E.C.4.

Mr Stanley Christopherson (the chairman) presided.

The shareholders present agreed to take read the report and accounts, together with the statement by the chairman previously circulated and reproduced in these columns on January 22nd.

The chairman then moved the adoption of the report of the directors and the audited statement of accounts for the year ended December 31, 1943.

This motion was seconded by Mr F. Idley Docker (director) and carried.

The following resolution, also moved by the chairman, was seconded by Lord Davies (director) and carried:—

(Continued from page 156)

dividend for the year of 17½ per cent tax free is the same as those paid in 1942 and 1941, but contrasts with 20 per cent for 1940 and 23 per cent for 1939. Although the Woolworths' result was a satisfaction to the market while Imperial Tobacco's was something of a disappointment, a common feature, judging from the preliminary returns, seems to be that the final dividends can be comfortably afforded, although there is hardly room to spare for any increase. Thus the net profit figure of Woolworths' is only lower by about £238,000, so that, after allowing for the saving due to the cut in the interim dividend by 10 per cent, carry forward can be increased by £156,000. Considering the mounting effect of restrictions on supplies and on selling-space, this result cannot be considered unsatisfactory, and future prospects, if the way in which wartime difficulties have been dealt with is any guide, are moderately hopeful. In the case of Imperial Tobacco, earned for ordinary is higher at 21.6 per cent against 19.0 per cent, tax free. This improvement is perhaps not great enough to justify an increase of dividend, but it does enable the carry forward to be raised by £168,000 and it is a hopeful omen for the future.

### Tinsley Park Developments

The offer by United Steel Companies of one ordinary share of £1 for every five shares of equal nominal value in Tinsley Park Colliery Company has raised something of a storm. The offer has been accepted by holders of 57 per cent of the capital, but a section is, very properly, not prepared to act until it sees the accounts for the year to the end of September last, while a further section, representing over 25 per cent of the capital, is said to have applied for the appointment of a committee of inspection. It may be recalled that both the main colliery and the coke works of the parent company were closed down at the instance of the authorities, and that sums, which it was stated to be impossible for the company to raise, would be required for the rearrangement of the collieries of two subsidiaries. One of these, the Wells Colliery, is contiguous to colliery properties of United Steel, and the latter company has been managing Tinsley Park under the Government scheme. A letter issued by Tinsley makes no mention of a demand for a committee of inspection, but states that United Steel is prepared to keep the offer open until seven days after the annual meeting of Tinsley, and that it will also permit those who have accepted the offer to withdraw their acceptance up to that date. While, on the face of it, the United Steel offer seems reasonable, there is no means of telling whether it really is or not until fully informative accounts of Tinsley have been published and the board of that company has given a detailed explanation of the position. This may convince shareholders that the scheme should be accepted, even although they may still consider it desirable to continue the project for an investigation of how the existing position arose. The scheme is conditional upon acceptance by holders of 90 per cent of the capital, subject to the usual

## LLOYDS BANK LIMITED

### ANNUAL GENERAL MEETING

The eighty-sixth ordinary general meeting of Lloyds Bank Limited was held, on the 28th instant, at the head office, 71 Lombard Street, London.

The notice convening the meeting and the auditors' report having been read, the chairman, the Rt. Hon. Lord Wardington, said that he assumed that the report and accounts which had been circulated would be taken as read as usual and that, as his address to members had also been circulated, he did not propose to take up the time of the meeting by reading it.

The report and accounts were adopted and the usual business transacted.

The proceedings ended with votes of thanks to the chairman and directors and to the staff, and a resolution of sympathy with the relatives of those members of the staff who have lost their lives in the war was passed.

proviso that less may be accepted by United Steel. If the position is as stated by United Steel and agreed to by the Tinsley directors, shareholders of the latter will probably be well advised to accept the offer.

‡ Net.

\* Includes credit at Government tonnage replacement account of £409,700 for 1941 and 1942, and £895,900 for 1943.

a The reorganisation of the balance sheet in 1943 included reserves against depreciation of investments and other contingencies in the total of fleet replacement account. This partly explains the increase in the item Government and other securities. See note on page 153.

b Includes tax reserve certificates.

f Free of Tax

The ordinary shares of £1, at 45s., yield £2 4s. 5d., tax free, ex dividend.

# RECORDS and STATISTICS

## INDUSTRY AND TRADE

**Limitation of Supplies.**—Under the Limitation of Supplies (Miscellaneous) (No. 22) Order (S.R. & O., 1944, No. 60) for the period February 1st to July 31st, quotas for lighting fittings, photographic goods, and toys and indoor games are raised to 12½ per cent.

**"The Economist" Sensitive Index.**—There was no change in the index during the week ending January 26th. The complete index (1935 = 100) was 151.1; crops, 123.0; and raw materials 185.0.

**Transport Statistics.**—Some figures of the war-time transport record have recently been released, including the following facts. Excluding coal, twice as much merchandise as before the war is moved by rail. Coal freights have increased by 25 per cent. Every week about 900,000 loaded wagons are despatched, and special trains for troops and Government traffic average 2,000 a week. The total number of wagons operated by the railways is 1,250,000. The Government road haulage organisation controls 14,000 long-distance vehicles, 5,500 short-distance, and 1,600 meat vehicles. The total weight handled is more than half a million tons a week. Canals move a million tons a month, and 500,000 tons of coal in 8,000 boats and barges, over 2,500 miles of inland waterways. Coastwise vessels are making 40,000 journeys a year, and in the first eleven months of 1943 moved 19 million tons of coal.

**Onion Crop, 1944.**—The Ministry of Food and the Agricultural Departments announce that owing to the increased output of home-grown onions, the crop will be decontrolled this year, except in regard to maximum prices. The Ministry of Food will not acquire home-grown onions, and growers will be free to offer their onions at any time to licensed wholesalers or selling agents. The import of onions was recommenced on a small scale this winter, and further imports may be expected from December, 1944.

**Utility Cloth Ration.**—Instead of a yardage for each type of cloth, the designated clothier is to be given a total yardage for men's, women's, boys' and girls' cloths separately, for the May-August ration period. He cannot exceed his yardage for any one type, but within each section he can buy any number he can obtain. Orders must be placed by February 12th. The mills have been informed what quantities of each cloth specification numbers they can make, on the basis of their output since March, 1943.

## FINANCE AND BANKING

**THE MONEY MARKET.**—The position in the money market is discussed in a note on page 152. The latest Bank return reveals the effect of end of January making up in an increase of £10,784,000 in bankers' deposits which have thus risen to £187,785,000. The counterpart to this movement is an increase of £10,505,000 to £215,130,000 in the holding of Government securities. This movement partly reflects the open market purchases of bills made during the first part of the week by the authorities. The note circulation remains virtually unchanged over the week at £1,067,263,000.

**MONEY RATES, LONDON.**—The following rates remained unchanged between Jan. 21st and Jan. 27th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%. Treasury Bills: 2 months, 1½%; 3 months, 1½%; Day-to-day money, 1½%. Short Loans, 1½%. Bank deposit rates 1½%. Discount deposit at call 1½%; at notice 1½%.

**Exchange Rates.**—The following rates fixed by the Bank of England remained unchanged between Jan. 21st and Jan. 27th. (Figures in brackets are par of exchange.)

**United States.** \$ (4.86½) 4.02½-03½; mail transfers 4.02½-03½. **Canada.** \$ (4.86½) 4.43-47; mail transfers 4.43-47. **Switzerland.** Francs (25.24½) 17.30-40. **Sweden.** Krona (18.159) T.T. 16.85-95. **Dutch West Indies.** Florin (12.11) 7.58-62. **Portugal.** Escudos (110) 99.80-100.20; mail transfers 99.80-100.30. **Panama.** \$ 4.02-04; mail transfers 4.02-04. **Brazil.** 83.64½ cr. (buying). **Uruguay.** 7.6597 p. (buying).

**Fixed Rates for Payment at Bank of England for Clearing Offices.** **Spain.** Pesetas 44-00. **Turkey.** Piastres 520. **Italy.** 71.25 lire.

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £391,259 to £3,565,057, the other operations for the week (no longer shown separately) reduced the gross National Debt by £2,622,713 to £10,267 million.

that, apart from the specific Canadian objections to British Commonwealth integration, it is wrong in principle for smaller and special groupings to be engineered within the wider framework of a universal system. "Behind the Halifax and Smuts ideas there lurks an inevitable rivalry between the Empire and other countries." It is an idea that is frequently voiced in the United States and it found expression, though without specific reference to the British Empire, in the speech made by Mr Cordell Hull on his return from the Moscow Conference. There are domestic reasons. A great mass of ex-isolationist opinion has now been painfully brought to about the position occupied by Woodrow Wilson twenty-five years ago, and Mr Hull is rightly concerned that it should not be frightened back into its shell by anything that looks like a specific and permanent commitment to named countries. Mr Mackenzie King, too, is moved in part by an anxiety not to get badly out of step with his southern neighbour, but also and more powerfully by even more closely domestic considerations. He is struggling hard to retain the allegiance of the Province of Quebec to the Liberal Party, an allegiance which is more seriously threatened at this moment than at any other time for many years and the withdrawal of which would smash his party. But the *Québécois* are the great isolationists of Canada; their susceptibilities must be soothed rather than flouted.

But though these domestic springs of action should not be forgotten, it would be equally mistaken to overlook the fact that there is a large and sincere body of opinion, especially but not entirely in North America, which, for entirely disinterested motives, stands in opposition to any special groupings. This universalist opinion is passionately attached to the ideal of international co-operation; indeed, it is the very intensity of that devotion which leads them to look with disfavour on any less inclusive arrangements. It is their jealousy for the League of Nations ideal that generates their distrust of anything that smacks of the "balance of power"—a phrase that has come to stand for the antithesis to an international order of justice. Because a system of alliances has often led to war, no special arrangements between one nation and another can be permitted.

It is not difficult to show that this attitude is almost absurd in its exaggeration. Is the existence of the British Commonwealth a danger to world peace? Which would have been the greater menace to world stability in the 1930's—a further weakening of the Commonwealth or an access to its strength? Is the fact that the ties of unity

between the United States and the Latin American Republics have been drawn tighter during the past an advantage or a danger? Is it reasonable to have alliances appropriate for the winning of wars, thereafter those who have shed their blood in the right have no more in common with each other than they have with the neutrals and the enemy? It is only necessary to ask these questions to prove that not all special groupings are bad. On the contrary, if they did not exist, there would be little chance of achieving world order. The ill-intentioned will not be restrained from banding together by respect for any principle of universalism, and it can hardly be a sound principle that only those who wish the world association ill should be allowed to enjoy the benefits of unity. The object of all international reconstruction is to build the Parliament of Man, but, like other Parliaments, it will not work unless those who believe in like principles join together in an effective party within its walls. Let us look to it that it is our part which gains the initiative and exercises the power.

It would be a very great pity if, in this matter, reality were drowned in phrases. Marshal Stalin and Mr Molotov have their eye on reality. Their sixteen republics will hang together because of the party and police structure invisible to the constitutional lawyer. It would be the height of folly to say to ourselves, merely from lawyer's punctilio or because the conduit pipes of our relationships run above ground, what the Russians will certainly enjoy. No sight is more pathetic than to watch the perfect impede the good. Whether special groupings are an assistance or a hindrance to the world-wide solution depends entirely on their purpose and their nature. Where the association is truly free and good-neighbourly, and where the members are the champions of world order, not the aggressors upon it, it can surely do nothing but good.

Within the British Commonwealth or the wider association into which it might grow, there is no suggestion that any country should be coerced to do what it does not want to do. But there is a suggestion that where unity exists it should not be dissipated by lack of common organs. Mr Mackenzie King's blunt negative creates a problem. The Canadian decision will be accepted in a spirit of friendliness. But if there would be one thing worse than the coercion of the one by the many, it would be the obstruction of the many by the one. It has been proved that five out of six of the fully self-governing members of the Commonwealth can wage war together. It is surely possible for four out of six to concert their policies in peace without insult or injury to the others.

tendency to create industrial corporations of Fascist type in which capital and labour enter into a pact with little or no regard for consumer interests"; the large majority of opinion agrees with him—if only because, whatever our differences, we are all consumers. He advocated the bulk purchase by the Government of "standardised but well designed goods," to reduce the cost of necessities and ensure greater stability of employment; this proposal, first put forward by Left wing economists, recently appeared also in a Conservative Party report.

The degree of agreement is obviously very great—and to a considerable extent real. Nevertheless, caution is needed before it is too hastily assumed that Sir Stafford Cripps is, in fact, marching shoulder to shoulder with, say, Sir Patrick Hannon or Lord Beaverbrook. One test will illustrate the sort of reservation that must be made. What does Sir Stafford Cripps mean by control, by what he calls "the over-all planning and supervision [by the State] of the economic life of the nation"? He gave an example—"an Investment Board of independent persons with a knowledge of industry who can work under the general guidance of the Government." "We must (he said) definitely make finance the servant of our industrial development, and not its arbitrary master." What would this Investment Board do? Sir Stafford Cripps' intention can be deduced from the reasons he gave for setting it up. He regards the "control of investment" as absolutely essential. He pointed to "the orgy of company promotion which ruined so many enterprises and individuals after the last war" and to the "old-fashioned financial ideas and methods which led to millions of people being plunged into misery for the sake of financial orthodoxy." It would seem, therefore, that the Board's functions would be to direct investment into desirable channels and divert it from undesirable ones. It would thus be a funnel or channel through which all, or almost all, investment must pass, in order to prevent abuse. Issues of capital would be examined to see if they were likely to prove sound or not. The object, to prevent the waste of investors' capital, would be a very worthy one; but would the results be conducive to the enterprise, initiative, ingenuity and risk-taking, which this country will most of all require in the post-war world? With the best will in the world, would not such a body, armed no doubt with statutory powers, and carrying a heavy load of responsibility, be inclined to play for safety and, in fact, to act as a brake on the wheel?

The truth is that what will be needed after the war is not less bad investment so much as more good investment. New instruments will no doubt be needed, as was argued in an article on page 149 last week, to bring investible funds in touch with industry's post-war requirements for re-equipment and development and an Investment Board will certainly be needed. But whether the functions which Sir Stafford Cripps suggests for such a Board would be helpful is another matter. Almost certainly the functions

of scrutiny and advice could be done as well by non-statutory bodies. Almost equally certainly, a Board with purely permissive functions would act, perforce, as a restrictive mechanism.

Sir Stafford Cripps may very well not have meant his proposal to be interpreted in this way; and it must be admitted that most other parts of his speech showed a proper appreciation of the need for enterprise of whatever kind may prove most suitable for particular tasks. Nevertheless, there must remain a suspicion that Sir Stafford Cripps, like so many other spokesmen of progressive views, including, on occasion, Mr Morrison, has himself been somewhat deceived by the magic word "control." If control means that every economic activity must be subject to public scrutiny, that, in effect, there must be a system of private enterprise by public licence, a system of checks and balances in which every individual action must be watched and weighed by some official, then the doctrine is dangerous, misleading and may be fatal. To interlace private enterprise and public control at every single point is to make the worst of both worlds.

It would be wrong, in this day and age, to entertain any bias against public enterprise, as such, where it can be proved necessary to secure economic efficiency or social justice; each case must be judged on its merits. But it would be even more wrong to assume that control, of the negative variety, which would simply set up public Peter to police private Paul, is ever desirable, or that it should be permitted, save by way of exception. Marriage between private enterprise and public organisation there must indeed be. But marriages can be happy or unhappy. A happy marriage would be one that left each partner as free as possible to develop the potentialities of which it is capable. A marriage which left one partner with all the initiative and responsibility, and all the risk of loss, but made him subject to the permits and prohibitions of the other, would certainly be unhappy.

It is for the community, through Parliament, to establish the rules of economic conduct; and for the Government, with Parliamentary backing, to execute those policies which no private individual or body can execute in the way the community wants. It is for the state to employ or hold in reserve the fiscal or physical instruments of control which may be required, from time to time, to prevent the entire economy from rushing into depression or inflationary disaster. It is for the state to step in and take over wherever the ends of policy cannot otherwise be achieved. But what those ends of policy are should never be forgotten; they are the fullest possible use and distribution of the community's resources in the freest possible way. Restrictive practices can never be justified, whether done by public servants or private monopolists. Government by perpetual surveillance would be impolicy of the worst sort, for the police state is no more acceptable to democrats in the economic sphere than in the political.

## Words and Meanings

WHAT the Government is thinking about reconstruction has still to be White-papered. What individual Ministers, of all parties, are thinking is being told in a score of speeches; and a notable amount of agreement can be discerned. There is, however, a snag—indeed, a positive danger—in this agreement. Being men of much goodwill and not a little shrewdness, Ministers tend to lean over almost backwards to demonstrate that "we are all agreed." This tendency, natural enough in leading members of a Coalition, results in some distortion—in two ways: first, fundamental disagreements tend to be pushed out of sight; secondly, the same words and phrases are used by different speakers to mean different things. It is immensely important that people whose votes will decide these issues should get behind these verbal screens; otherwise, many of the most important problems will be permitted to go by default. It is just as important to bring out real disagreements of view as it is to discover agreement; the danger of cant is never far off.

Perhaps the most important, and perilous, obscurities attach to the words "private enterprise" and "public control." By private enterprise is meant by one speaker the small shopkeeper or craftsman, and by another

Imperial Chemicals or Unilevers. By public control is meant by some simply laws and taxes, and by others something like a civil servant or even a policeman, in every office, factory or bank. Obviously, the general agreement that there should be "a blend of private enterprise and public control" does not, in itself, mean much.

The striking speech made by Sir Stafford Cripps at Bristol last week-end is only one illustration of the importance of definitions in these matters. For the part, it was unexceptionable, to either Left or Right, its phrasing and its scope. He rejected both all-nationalisation and complete *laissez faire*; no one could disagree. He said that there must be "an infinite variety of forms of organisation under public and private ownership"; no sensible man would say otherwise. He said that it would be necessary to build up "a new public service of first-class business and technical men, selected for their practical ability and experience"; this is a major lesson of the war. He asked for "an economic plan for the nation, carefully worked out but flexible and easily adaptable to changing circumstances, and capable of delegation to both public and private enterprises"; this point, too, in various interpretations, has been conceded by both Tories and Socialists. He spoke strongly against "the

## Representative Government

FOR two days this week the Commons have debated electoral reform. The immediate tasks are to bring the register of voters up to date and to redraw electoral boundaries in order to make the number of voters in each constituency roughly equal. But another, and deeper, issue has been involved in these discussions. There is a demand, among a strong and vocal minority, for a change in the entire electoral system, in order to secure that the number of seats held by each party in Parliament will precisely reflect the proportion of all the electors in the country voting for that party. Briefly, this proposal is best known as Proportional Representation.

There is no dispute about the need for a new register and the redistribution of seats. Since 1928 there has been adult suffrage in this country, including all men and women over 21 years of age, except for a few minute categories, such as peers and lunatics. But for various accidental reasons, a large part of the electorate is not in a position to make good its right to vote. No register has been made since 1939, which means that, in fact, nobody under 26 is at present entitled to vote. Moreover, there has been a vast wartime movement of population; a great number of voters of all ages are registered in places where they no longer live. Already, a new electoral register is in preparation, on the basis of the National Register; but clearly there is need for some continuous arrangement to keep registers up to date and voters "in benefit."

Similarly, the facts about the present size of constituencies speak for themselves. A White Paper was published on Monday giving the situation revealed by the 1939 register. If the number of voters—or, rather, the number of votes, since some electors still have two, because of the business and university franchises—is divided by the number of seats in the House of Commons, the result is about 50,000 which, on the principle of equal electoral districts, should be the voting strength of each single member constituency. In fact, according to the 1939 register, there are 20 constituencies with more than 100,000 electors, and 17 (excluding the universities) with fewer than 30,000. Hendon, with nearly 210,000 voters, has one member; Camberwell, with about 160,000 voters, has four. Plainly, the present distribution of seats, based as it is on the census of 1911, should be revised. One difficulty is that, if the revision is done on the basis of either the 1931 census or the wartime distribution of population as shown by the Ministry of Food's figures, it may be soon put out of date by the shifting of workers and families that will follow the end of the war. Nevertheless, 1931 or 1939 would obviously be a much better basis than 1911; and it is important that, at the same time, some permanent body should be set up to keep the boundaries of constituencies continuously in line with the facts.

This should be plain sailing. The only obstacle is likely to be the disinclination of this party or that to surrender safe seats in the process of revision—say, Labour seats in London or Conservative seats in country districts. Such motives, however natural, are wholly unworthy, and should carry no weight. Many people, possibly a majority, would go further and say that this is all that needs to be done; that, in fact, the well-known disparity between the votes cast for each of the parties and the seats obtained will be sufficiently reduced by the equalisation of the size of constituencies. But this is clearly not true. In theory it would be possible, with precisely equal electoral districts, for one party to poll 51 per cent of the votes in each—or, with three parties contesting each seat, only 34 per cent of the votes—and obtain 100 per cent of the seats. This is the point upon which the advocates of a more fundamental reform in the method of election base their case.

The facts shown by an analysis of votes and seats in the elections between the two great wars are, indeed, disturbing to anyone who believes that the House of Commons should be precisely representative of nation-wide

popular opinion. A table, which analyses the results of all these elections, is reproduced on page 195 from an interesting and important book ("Coupon or Free?" Published by Secker and Warburg) which has just been written by Mr R. W. G. Mackay in support of Proportional Representation; and a few items from his statistical conclusions make remarkable reading. It is commonly believed that in the General Election of 1918 the Coalition swept the country; its majority of contested seats in Great Britain (excluding universities) was 347. Yet more than two-fifths of the total votes cast in these constituencies were in opposition; if seats had been won in proportion to votes cast, the Coalition majority would have been only 75, barely a fifth of the majority actually obtained. A comparison of the 1922 and 1923 elections is equally instructive. In each of these years, the total of votes cast for the Conservatives was about 5,400,000, and for the other parties about 8,800,000. Yet, in 1922, the Conservatives had a majority in contested seats of 45, and in 1923 a minority of 121. In 1924 and 1929, it was the third party, the Liberal party, which suffered most from these vagaries. In the former year, the Liberals' 34 seats should have been, in proportion to votes, 105; in the latter, their 59 seats should have been, correspondingly, 143. Perhaps most startling of all were the elections of 1931 and 1935, crucial polls for the future of Britain, which broadly created the Commons we still have. In 1931 the Government parties won 493 out of the 548 seats contested; yet over 7,000,000 votes were cast against them, a third of the total votes polled. In 1935 a Government majority of 235 in contested seats should have been, in proportion to votes cast, no more than 41; of the total votes polled, the Government parties obtained just 53 per cent, yet they won 70 per cent of these seats.

These over-all anomalies are, of course, the sum of local anomalies. In 1929, in the counties of Surrey and Sussex, the Conservatives polled just over half the votes and got all the 21 seats, while in Durham in the same election, Labour polled half the votes and got all but one of the 18 seats. Similarly in 1935, in the eleven southern counties from Kent to Cornwall, the Government parties polled less than two-thirds of the votes and got all except two of the 79 seats.

This, then, is the basis of the case for Proportional Representation; and it is, on the face of it, impressive. Some caution is necessary, however, before swallowing it whole. Its assumption is that representative government means the precisely arithmetical reflection in the membership of Parliament of the way in which the total of local votes is distributed nationally. Historically, this is not what representative government has meant. When Edmund Burke wrote and spoke on these subjects 150 years ago, representative government meant the election to Parliament of men each representing a majority in a particular place or community; it was the sum of local opinions; and this territorial principle remains. It is true that there have been fundamental reforms since Burke's day. New principles have been introduced, of which the three most important are: first, the abolition of property qualifications (with the exception of the business vote) for electors, which ended the old idea of each member representing only those with a stake in a particular locality; secondly, the acceptance, in principle, of equal electoral districts, first demanded by the Chartists a hundred years ago; and thirdly, the introduction, by stages, of universal suffrage, making the franchise a right of age and citizenship and not one of property or sex. In other words, the principle of numerical representation has been added, by five Reform Bills, to the territorial basis.

The result is a mixture of intentions. The present electoral system attempts to do, simultaneously, two things which are not entirely compatible. The first is to represent places: the second is to represent roughly equal blocks of voters. The advocates of Proportional Representation recognise this dual aim, and themselves suggest

a compromise. Logically, the right way to get what they want would be simply to count up the total votes cast for the various parties throughout the country, without any distraction of local representation, and to apportion the seats in the House of Commons accordingly, giving one for every 50,000 or so votes cast. Instead, to preserve the territorial principle, they propose a regional scheme which would divide the country into constituencies, returning five or seven members, and then elect members in each such constituency by allotting one seat for every quota of votes obtained, with a complicated process of transferring "surpluses" or "deficiencies" from one candidate to another according to the preferences stated by voters.

The kernel of this scheme, and the point at which it most directly assails the present system, is the abolition of single-member constituencies. And, side by side with this proposed departure in practice, there is also an important departure in principle. The aim of the present method of election, however unsatisfactorily it may be achieved, is to find majorities. The object of Proportional Representation is to find minorities. Both these points require careful scrutiny. It is true that the principle of equal electoral districts, accepted already though poorly applied, reduces the case for regarding all single-member constituencies as sacrosanct, since they tend often to be mere arithmetical divisions and not communities at all. It may even be that, say, Bristol, with 5 seats, or Bradford, with 4 seats, is, as a city, a more real community than the constituencies into which it has been divided; and, if so, the territorial principle might be best served by electing the 5 or 4 members at a single poll.

But to say that in some towns it might be reasonable to regroup separate constituencies into one—or, as in the case of a city such as Birmingham, which has 12 members, into two or three—is far from suggesting that single-member constituencies should vanish for the sake of Proportional Representation. To do so would be a radical break with tradition and mean the end of the compromise by which an essentially local system of representation has been modified to take account of the total balance of national opinion. Once the basic principle of local representation, local responsibility and local competition is too much weakened, the process of election becomes artificial and unreal, as was seen, say, in Republican Germany, where the parties tended both to multiply and to become academic abstractions.

### *Principles of Trade—VI*

## The Regional Solution

THE re-establishment of a universal system, with an expansionary bias, should be the objective of British long-term policy, and we should do everything in our power to persuade the commercial world to accept the means by which it can be established. But until this agreement is attained, and until the present enormous gaps in the nations' balances of payments can be closed, we have no option but to examine the less-than-universal, the less-than-fully-multilateral, the less-than-completely-orthodox alternatives.

These were the concluding sentences of the preceding article in this series. The point needs to be made with all due emphasis that "less-than-fully-multilateral" does not mean a reversion to narrow two-sided bargaining, and that "less-than-completely-orthodox" does not mean the acceptance of all the tricks of trade distortion that were invented by Dr Schacht and his disciples in the decade before the outbreak of war. It might have been thought that, in a discussion among reasonable persons, this very obvious distinction need not be drawn. But a theological aura clings to the principles of international trade, and there is a tendency—not only, or even mainly, in this country—to speak of the whole subject in terms of black and white, of sin and virtue. Let it be said with all necessary clarity that British policy should eschew Schachtian bilateralism as it would the plague. To this generalisation

Even this, however, does not get to the heart of the matter. The main purpose of a General Election is not to produce an exactly representative House of Commons but to produce a Government. The reality behind the formalities is that a General Election, nine times out of ten, is a plebiscite to choose a Prime Minister, and it is right that the Prime Minister chosen should have a majority behind him. The present system is not, it is true, ideal for this purpose. With three parties in competition it is possible for a Prime Minister to get into office, with a Parliamentary majority, when more than half of the electors would have preferred to have the Leader of the Opposition in office. But the way to cure this defect is not by Proportional Representation—which would frequently give no candidate for the Premiership a majority—but by the Alternative Vote in single-member constituencies, which gives every voter the right to change his mind if his first choice is not elected, and would ensure that no MP was elected against the wishes of a majority of his constituents. It is true that the Alternative Vote would tend to work against the smallest of the three parties—that is, the Liberal Party. But it would compel both the larger parties to compete for the second choices of the central block of voters, which would certainly be good for moderation and liberalism.

Electoral reform of this kind at the present stage cannot go too far without endangering the British system of Government, based as it is on solid majorities, the two-party system and local representation. Almost certainly the right solution would be a fresh compromise: a register kept continuously up to date; constituencies kept continuously in line with population changes; with some measure of regional representation, with, perhaps, some PR devices, in large homogeneous areas; and, almost certainly, the introduction into single-member constituencies, which would remain the great majority, of the simple device of the Alternative Vote to prevent the election of members by local minorities. (It is noteworthy that PR in the large boroughs and AV elsewhere was the recommendation of the Speaker's Conference of 1918.) The British system has stood the test of modern government conspicuously well, despite many personal and party defects; and, for the still greater tests of the future, it is far better that common sense, rather than ruthless logic, should be the guide.

there is only one common-sense qualification. If other countries, despite American and British urgings to the contrary, find themselves compelled to adopt a system of strict bilateral clearings, Great Britain should be prepared to drive as favourable a bargain as can reasonably be obtained, even if that means operating the technique of exchange clearing at the London end. There should be no purely sanctimonious refusal to touch the unclean thing. But this is said by way of exception; in general, the British path must be to secure as much freedom and as much multilateralism as can be attained. If the perfect solution of the problem of international trade is unattainable, there is no need to rush to the other extreme. We must rather retreat upon the solution which, while not perfect, has in it the maximum of good.

There are, in fact, middle courses between what is generally known as "multilateral" and what is usually referred to as "bilateral." The terminology is defective. For example, the wartime pattern of British trade and exchange agreements is usually referred to, and frequently condemned, as being "bilateral." But the standard pattern of these agreements permits many-cornered trade throughout the sterling area, or at least the British Colonial Empire. Sterling earned by foreign countries by their sales to the United Kingdom does not, in general, have to be spent in this country only but can be used any-

where within a wide area comprising a large part of the whole world. This is, in the most literal sense, multi-lateral trade, even if the system within which it takes place falls short of being completely universal. What has been discussed in previous articles, and found impossible of attainment in the near future, is the universal or omnilateral solution. The multilateral solution, in the narrower definition of the word, remains a possibility. If a tolerably free system, with an expansionary bias, cannot be constructed in the world as a whole, the next best policy is to apply these same principles over as wide an area as is, in fact, possible.

How wide would that area be? The question can best be answered by detailing the conditions that would have to apply within it. They are, in the main, three. The first is that the accounts of each member with the other members of the grouping taken together would have to be substantially balanced, or capable of being brought into balance without undue difficulty. The second is that members of the grouping would have to give an assurance that they would co-operate in removing any disequilibria that might appear by increasing their trade by some such methods as those described in the fifth article of this series. The third is that members would have to give satisfactory assurances that they would, within their borders, avoid large-scale depressions. Apart from these positive conditions, there would also need to be certain negative prohibitions, such as that no country should, by exchange control, restrict its purchases of current goods from any of the others, and that quantitative restrictions of trade, if imposed, should not be smaller than the average of some previous period. If these conditions could be observed, a grouping of this nature would provide a working model of the principles of trade expansion which it would be hoped to extend, when conditions permitted, to the whole world.

It stands to reason that such a region of expanding trade

## The scene changes

LITTLE more than a hundred years ago Britain was an agricultural island. Its resources were undeveloped, its roads often incredibly bad; power-operated machinery was almost unknown. Then James Watt invented the steam engine . . . and by the middle of the nineteenth century the tide of industrial development was in full flood. In almost the span of a lifetime, Britain became the centre of the world's trade and in this vast change the Westminster Bank (founded in 1836) played its part, providing—as it does today—a complete banking service for industry and the individual.

**WESTMINSTER BANK**  
LIMITED

should be open to membership by any country which would comply with the conditions. But the non-exclusive character of the relationship would need much more specific emphasis than this. The very greatest pains would have to be taken, not merely to prevent it from being injurious to American interests in fact, but also to prevent it from seeming obnoxious in American eyes. This would be a task of very great difficulty. Until the intractable problem of the dollar is solved, the United States could hardly enter into such a grouping—the first condition could not be attained. But if the formation of such a grouping were taken in America as a declaration of economic war, the results would be wholly disastrous. Indeed, in such circumstances there are very few countries that would wish to join.

The hurdle is a stiff one, but it is not quite insurmountable. It is a matter of common agreement that the existing exchange controls will have to remain in being for some years after the war. The sterling area is already operated in many respects as a single area for exchange control purposes, and there should not be any overwhelming difficulty in assimilating the currency systems of certain other countries to the sterling area, notably the contemplated Belgo-Dutch area. For some few years, then, a grouping of the general nature here discussed will come into existence quite naturally. Before the transitional period is over, there will be time both to give proof of the fact that it can operate to the advantage of its members without injuring the interests of the United States and also to see more clearly what the commercial policies of the United States itself are likely to be. The basic principle should be to subject trade between the grouping and America to no differential restrictions except such as can be manifestly shown to arise out of the shortage of dollars, of which a strict accounting should be made every three months. The logic and the necessity of this would be so apparent that they could hardly fail to be convincing. There should be a constant willingness to discuss and defend what was done, a constant and sincere emphasis upon the desire to extend the arrangements from the multilateral to the omnilateral plane at the earliest possible moment, a steady invitation to the Americans to judge by results, not by dogmatic views on the methods adopted. In this way it might be hoped that a bargain could be struck between the short period and the long. In the long period, British agreement with American views should be neither stinted nor hypocritical. And, in return, American assent should be invited at every stage to the measures that necessity compels in the short period. There is no reason to suppose that this bargain could not be struck, or that it would ever be necessary, failing agreement, to rely upon the armoury of weapons that Great Britain, the world's largest international market, would have at her disposal in a more narrowly horse-trading world.

In these conditions it might be supposed that the grouping—the sterling area converted to a deliberately expansionary basis—would have a wide membership. The United Kingdom and the Colonial Empire would be founder members. The importance of the United Kingdom market would attract Australia, New Zealand and South Africa, and also India, which would furthermore be drawn in by the desire to draw upon its huge wartime credit accumulations in London without the complication of a controlled exchange intervening. It should not be impossible, granted American benevolence, to arrange the closest interworking with Holland, Belgium, Denmark, Norway and possibly France and Portugal, with their overseas dependencies. Canada, Newfoundland and possibly some other areas would necessarily remain outside, but even so it should be clear that the field for an experiment in planned expansion of trade would not be a small one.

In response to many enquiries, it is hoped to reprint the series on "Principles of Trade"—which will be completed in two more articles—in pamphlet form

## NOTES OF THE WEEK

### All the Russias

On Tuesday the Supreme Soviet in Moscow took a decision which will have important consequences in Russian foreign policy. Each of the sixteen republics of which the Union of Soviet Socialist Republics is composed is now to have its own Commissariat of Defence and its own Commissariat of Foreign Affairs. They will have

full powers to enter into relations with foreign states, and to make treaties with them.

Soviet foreign policy is at present entirely concentrated in the hands of the *Narkomindel* in Moscow. Under the new reform, the central Foreign Office in Moscow will remain in existence, and continue to act for the whole of the USSR. The reform does not make clear the relationship between the All-Union Commissar and the sixteen Republican Commissars. Will treaties with foreign states, for instance, concluded by, say, the Ukrainian Commissariat of Foreign Affairs, have to be countersigned by Moscow or not? To what extent will responsibility for the foreign policies of each of the sixteen republics still lie with Moscow? But these questions are, at this stage, almost entirely formal. Outwardly, the change does indeed look like a radical attempt to decentralise the multi-national Soviet state; it was in this light that M. Molotov presented it to the Supreme Soviet. In fact, however, there is no evidence of any immediate and real decentralisation. To break up the Red Army in mid-combat into sixteen separately-controlled armies is unthinkable, no matter how many Commissariats of Defence may be set up. The war has, if anything, strengthened the centralised political structure of Soviet Russia. Independence means very little, according to British ideas, unless it involves the same freedom for the republics to fashion their own politics and decide their own policies as the Dominions enjoy. Under the constitution of 1936 each republic already possesses the right to secede, now stressed again; but, so long as agitation for secession is forbidden and treated as an act of treason, the right is Pickwickian, to say the least. In the early thirties, all agitation, not for secession, but even for a greater measure of autonomy, was suppressed in both the Ukraine and in Byelorussia, as well as in the Caucasus. In the late thirties similar aspirations in the Asiatic republics were similarly treated. Nothing suggests that the position has been fundamentally changed.

For the moment, then, these dramatic reforms can only be explained in terms of Russian foreign policy. The Soviet armies have reached the Estonian border, and the future of the Baltic republics must now be decided. Estonia, Latvia and Lithuania may more willingly accept incorporation into the Soviet Union if they are given formal, constitutional guarantees of wide autonomy. Similarly, there are settlements to be made in both Poland and Finland. Claims against Poland can now be laid from Kiev, the seat of Ukrainian Government, and from Minsk, the capital of Byelorussia; in fact, on the morrow of the announcement of the reform a Ukrainian protest was lodged against any undue cessions of territory to Poland. Claims against Finland can be raised by the Foreign Commissar of the Karelo-Finnish Republic, claims against Roumania by the spokesman of Soviet Moldavia. Russian diplomacy will have more room for manoeuvre. The claim may be made that all the Russias should be represented in inter-Allied councils. Almost certainly the Ukraine and Byelorussia, two republics which have suffered most from German occupation, will ask for seats on the Commission for the Investigation of War Crimes. Of course, the principle of multiple representation, if carried too far, might easily become grotesque. It would be just as impossible for Russia to speak with sixteen voices at a Peace Conference as it would be for the United States to speak with forty-eight. The watering of stock as a means of increasing the vote of a group of shareholders at a general meeting is familiar enough, but often it has brought more harm than benefit to the companies concerned.

### Two Precedents

Two precedents in history can be found for the changes now proposed by the Supreme Soviet. The first dates back to the years immediately after the Napoleonic wars, when Tsar Alexander the First was contemplating certain reforms of a semi-liberal character. The Novosiltzov scheme of 1818, named after a famous Russian Governor, provided for the administrative division of Russia into ten provinces, each possessing autonomous government and ruled by a Viceroy. Alexander the First also intended to extend—mainly to the west—the territory of the Kingdom of Poland, which, under the Treaty of Vienna, though linked to Russia dynastically, still enjoyed semi-independence. However, these changes never took place. The last remnants of Polish autonomy were removed after the suppression of the Polish insurrection of 1830-1831; and the same fate befell Finland, which had been annexed by Russia during the Napoleonic wars. The second precedent was set by Lenin himself in 1918. Under its first constitution the Soviet state was a federation of independent republics; and, most important, each of the republics did possess a fully-fledged Government of its own. In the negotiations which led to the conclusion of the Treaty of Brest-Litovsk, a representative of the Ukraine, first an anti-Bolshevik and then a Bolshevik, sat beside the Russian delegate. Up to 1923, separate Ukrainian and Byelorussian legations functioned in the capitals of neighbouring states. This was a genuine experiment in federal union; the October Revolution had taken place in an atmosphere of awakened national aspirations among the Russian peoples. But the constitution of 1922 abolished the federal structure and replaced it by the Union. In subsequent years centralisation grew in strength until, in the thirties, Moscow looked much more like the old Imperial capital than the capital of that loose federation of the early twenties. Which precedent is most in Moscow's mind to-day?

### More Pay-as-You-Earn

The Income Tax (Offices and Employments) Bill—which is to extend the principle of pay-as-you-earn to all Schedule E incomes over £600—is a simpler affair than might have been expected. The main clause extends the provisions of last November's Act to "all emoluments assessable to income tax under Schedule E, other than pay, pensions or other emoluments payable in respect of service in or with the armed forces of the Crown." The provisions of the earlier Act concerning both the "discharge" of tax in the course of collection on April 5th next, when the new arrangement is to start, and also the deduction of tax on a cumulative basis thenceforward, are not amended except in minor particulars. There are, of course, points that the Chancellor of the Exchequer will be asked to explain—such as the degree of complication in the tax tables resulting from such a large increase in the range of incomes covered, and the effect of the new procedure on surtax liabilities—but the Bill itself is a simple measure. The clauses on which attention will be focused are those dealing with the prevention of tax evasion and with the special case of temporary civil servants. The former is framed so as to meet most of the objections raised by the Chancellor's somewhat vague forecast of its nature. A special assessment, not ranking for discharge, is to be levied on any increases in Schedule E income for 1943-44 arising from additional remuneration, or changes in conditions of service, granted after September 20, 1943 (that is, the date of the first announcement of "pay-as-you-earn"). Ordinary promotions, increments, overtime and "any other similar increase of an ordinary character" are specifically exempted. This is an attempt to stop the deliberate evader without penalising the taxpayer who is innocently lucky, and it should prove acceptable.

The provision for the temporary civil servant, on the other hand, is wholly unsatisfactory. It should be recalled that his grievance arises from the fact that, on entering the civil service (frequently at sacrifice of income), he suffered a period, averaging seven months, during which he paid double tax. This he bore in the expectation that, on leaving the employment of the Crown, he would enjoy a corresponding period free of tax. The only concession the Bill offers is that if, on April 5th next, there is any part of the assessment for 1942-43, or earlier years, in respect of pre-civil service private employment that has not been paid, it shall be discharged. What this means in plain language is that if the temporary civil servant, unable to bear the double burden, has arranged with his Inspector to spread the payment of his 1942-43 tax (i.e., the tax assessed on the earnings of 1941-42) over a longer period, and if any of this longer period will still remain on April 5th next, the balance shall be discharged. If he drew on his reserves to pay up in full on the due date, he is forgiven nothing. This is a double injustice. It penalises the prompt payer as against the laggard. And it does nothing to meet the basic case. The temporary civil servant was heavily mulcted when he came into public employment, usually from patriotic motives. This penalisation was quite unnecessary and would not have happened but for the stiff-necked and unimaginative attitude of the Inland Revenue. It is intolerable that the same obstinate inflexibility should prevent him from getting the counterpart of the sacrifice he made. The temporary civil servant, who has saved the state in the last four years, has been treated with unpardonable meanness. The Inland Revenue have harried him, and the Treasury, while giving him neither security nor pension rights, have paid him, grade for grade, 20 per cent less than his permanent colleagues. The just way to treat him would be to offer him a discharge of seven-twelfths of any income tax he is called upon to pay in the twelve months after leaving Crown employment. If the Government find that the temporary civil servant draws from this episode the conclusion that the only way to get his deserts is by collective pressure, they will have only themselves to blame.

### Ex Machina

Brighton is doubly honoured. It has been customary in by-elections for the Prime Minister to send a formal note of support to the Government candidate, drawing the electors' attention to the need for recording national unity. Brighton has had two letters from Mr Churchill, neither of them in routine terms. The first suggested that it was "a swindle" for a candidate to pretend to back the Prime Minister and at the same time to stand against the Government's nominee; the second underlined this argument, with some asperity. It is not surprising, perhaps, that some observers have thought that this correspondence may be the prototype of the coupon which may be given at some future date in a more general election. Certainly, the occasion was badly chosen. It was not a question in Brighton, at this by-election, of some political group with its own peculiar views seeking to use support for Mr Churchill as a cloak for faction. Indeed, it is doubtful whether this would be in any way a true description of any recent by-election; at both Darwen and Skipton, for instance, the opposition candidates did faithfully reflect the views of a large section of the electorate which does in fact, whatever the logic of it may seem to be, wholeheartedly back Mr Churchill, but at the same time doubts the drive and direction of many of his Government's policies. But, in Brighton, this is not the issue at all. The fact that the Government was entitled to regard the seat as more than usually safe is beside the point. The question is simply whether a constituency still has the right, even in wartime, of free election. Brighton's by-election, even more than the pending by-election in South Derbyshire, was deliberately hurried to minimise the chance of

local opinion or national groups arranging to fight it. The candidature of Mr Briant, a local barrister, is a local protest against both over-haste and central nomination; and it seemed to many people, including Conservatives both in Brighton and elsewhere, to be quite justified, despite the Prime Minister's invective. Brighton, like every other British town, will follow the Prime Minister into battle, and admires his strong words—in the right place. But some citizens of Brighton refuse to be silenced—even by the voice of Jove. That is all. The result of the election, which has not been announced at the time of writing, even if it shows a comfortable majority for the Government candidate, will register a rightful protest, however limited it may be. It is a thousand pities that Mr Churchill, partly by reason of being the leader of the Conservative Party, should have to compromise his renown by coming down to the arena so flat-footedly.

### Fair and Free Elections

The two days' debate in the Commons on electoral reform, discussed in an article on page 168, was occasioned by the Government's proposal to set up a Conference of Commons and Lords, under the Speaker, to recommend changes. Of greatest political importance, apart from the arguments for and against Proportional Representation, are the next, and final, steps in the more-than-a-century-old march of franchise reform. There is a wide desire for uniform adult suffrage, Parliamentary and local, which would involve the identification of the two for all citizens over 21 years of age, and the abolition, in the Parliamentary franchise, of the extra right to vote given by occupation of business premises or membership of a university. Hardly less important, in its way, is the question of election expenses. Certainly, as Mr Eden suggested on Wednesday in the debate, they should be further restricted to prevent money from having a pull. Possibly, in order to enable candidates of ability and no wealth to seek election, without sordid party bargaining or unjust impediment, they should be paid, in whole or part, by the state.

### Pressure on Spain

A new phase of Allied relations with Spain opened last week with the United States embargo on oil and petroleum products to that country. The action of the State Department was taken after consultation with the British Government, pending a general reconsideration of trade and other relations in view of recent trends in Spanish policy. The hardening of the Allied attitude was foreshadowed by Señor Jordana's speech, reported the day before, which hotly defended the sincerity of Spanish neutrality and gave a strong warning to saboteurs and foreign agents that their activities would in future be strictly dealt with. The reasons for the embargo included such incidents as the unsatisfactory state of the Blue Division question; the export of vital war materials, like wolfram, to Germany; the freeing of peseta credits for the payment of German agents; and the continued internment of Italian warships and merchant ships in Spanish ports—not all of which, it should be observed, are strictly prohibited under customary international law. Spanish policy during the war has not been distinguished either by its valour or its dignity; if its nuisance value has been of little major assistance to the Axis, so much irritation has been caused to Britain and the Allies by such childish subterfuges that it has become hard to regard Spain as an entirely adult state—and harder still to regard her as a neutral. It is most unfortunate for Spain that the Allies have been obliged by the Spanish Government's own folly to turn the economic screw; it must inevitably result in a less sympathetic consideration of Spain's grave economic problems both now and in the reconstruction of the world after the war. But the resources of shipping and supplies which the Allies can afford to release for non-war purposes, at this critical period of the war, are in any case very limited. The oil embargo will demonstrate the reserves of power, if not of oil and ships, at the disposal of the United Nations—and, in fact, the wisdom of neutrals being neutral.

### Starving Italy

Southern Italy is starving. Reports from the spot leave no doubt about it; and German propaganda makes the most of it. Conditions of life in northern Italy, under German

occupation, are better than they are in southern Italy, under Allied occupation. The mere statement of these facts is not in itself a condemnation of Allied policy; everybody knew that conditions would be difficult, and the problems with which the Allied authorities have had to wrestle have been severe. Shipping is limited; the internal transport services, which depend largely on the railways and thus on electricity, broke down for a period; local administration was never efficient and is now largely disrupted. But what is disturbing is the evidence now accumulating that the Allied authorities have done very much less well than they ought to have done. In the case of food, for example, southern Italy is normally an exporter, and though the harvest was deficient, barely six months have elapsed since it was reaped. Hoarding is given as an explanation; but southern Italy is a land of large estates, where control should be far easier than among peasant holdings. Moreover, monetary policy enters into the matter. Whether or not the exchange rate of 400 lire = \$4 = £1 was properly fixed in relation to the official price-level is difficult to say. But many goods are available only on the black market at higher prices; a "wages stop" is enforced (in northern Italy wages have been doubled); and the Allied armies exercise a purchasing power which, in relation to that of the civilian population, is enormous. This last factor is perhaps the most important. No doubt there is less intention among the Allied troops of stripping the country than among the Germans; but the very high standards of provisioning that are set, especially by the Americans, and the failure to impose any effective ban on spending by messes or by individual soldiers combine to give the impression of an army of locusts. With the best intentions to the contrary, the land is being stripped. The effect on the living standards of the civil population of the presence of large numbers of highly-paid American soldiers is perceptible in England; it is very much greater in the much more difficult circumstances of Italy. To complete the tale of woe, it must be said that very little good seems to be coming from the political arrangements that were made at the time of the Italian armistice. The only basis on which the alliance with the King and Marshal Badoglio could be justified was one of the purest expediency, and the results by which it is to be judged seem to be very poor.

It would thus appear, in general, that the non-military part of the invasion of Italy has been pretty badly bungled. Public opinion has hitherto accepted, and *The Economist*, among others, has echoed, the official apologia. But this is daily becoming more difficult. It would be unjust to blame the men on the spot. Their numbers were small and they were inadequately briefed and instructed. It is at home, and in the sphere of policy-making, that penitence and reform are needed, and in Washington more than in London. The whole business is the greatest gift to Goebbels that he has ever received; no doubt this paragraph will be seized upon with the customary eagerness, and if the question were entirely one of the past and the present, it would be better to keep silent. But the purpose, or the necessity, of criticism is to secure a change of policy. New and larger invasions are impending; and they will not be assisted if the oppressed populations discover that all they get from their liberators is spoliation and dearth.

### The Bari Conference

The conference of the five Italian democratic parties at Bari has repeated the demand for the abdication of King Victor Emmanuel. It is not merely a change of King, but a change of system that is being asked for. Benedetto Croce, who spoke for the Liberals, portrayed a grim picture of a collapsed administration, which cannot cope either with economic chaos or with the dangers of political anarchy. Amgot proceeds along the lines of administrative and military expediency which dictate a minimum of experiment in reshuffling Italian personnel. The result is that Fascist personnel is, on the whole, being left in charge of the administration. As there is little doubt that that personnel is utterly corrupt and discredited, the collapse of administration has been hardly surprising. Are non-Fascists available to do the work, after two decades of Fascism? The defenders of Amgot say no. The reply of the Bari Conference was yes. Only experience can show which is correct. But the present vicious circle must somehow be broken. One must hope with Benedetto Croce that:

This time will not happen what once happened in the history of Italy, when, after having exalted the people of Italy to shake off the Napoleonic rule and vindicate their independence and freedom, the victorious Powers returned them to the old and abhorred regimes. Then, one of our poets, the most moderate and thoughtful of our poets, Alessandro Manzoni, bitterly reproached them: "Foreigners, your flags are besmirched by a broken oath."

### Russia and the Balkans

Last Sunday it was semi-officially announced by the Yugoslav Government in Cairo that Russia had refused to conclude with Yugoslavia an agreement similar to that signed with Czechoslovakia towards the end of last year. This is hardly surprising. What was perhaps surprising was the Yugoslav Government's hope that Russia would accept its offer. There can be no analogy between Czechoslovakia and Yugoslavia. After the war, Czechoslovakia will have a common frontier with Russia to the south of the Carpathians. The Russian-Czech Treaty was meant as an alliance between Russia and a neighbour. The clause in the Treaty which gave other states the chance of joining was also addressed to Russia's neighbours. The Yugoslav Government may have hoped to assist its position in Yugoslavia itself by being able to claim Soviet friendship. It does not seem, however, that this episode has had any close connection with the conflict between Tito and Mihailovitch. True, Russia supports the Partisans; but so do the other Allies; and in line with those Allies, Russia still officially recognises the Government in Cairo, of which General Mihailovitch has been a member. The fact that Russia refused the offer of a separate alliance with Yugoslavia seems rather to indicate that Russian diplomacy does not regard the Balkans as an exclusive sphere of influence; and that, in this region at least, there are signs of co-ordination of Allied policy. A similar indication can be seen in Moscow's recent appeals to Bulgaria, which is not at war with Russia. The appeals have called on Bulgars to oppose the pro-German policy of their Government; to refuse to fight against the Yugoslavs and Greeks; to pray in Orthodox Churches for the victory of Soviet arms; and so on. The appeals did not contain direct attacks on the Bulgarian Government or on the Regency. The appeal to Slav solidarity is traditional, and Russia does not seem so far to take any closer interest in Bulgaria's internal affairs.

### The Copper Cut

The announcement, made last week, that the British Government is to reduce its purchases of Northern Rhodesian copper by an amount equal to between 20 and 25 per cent of last year's production raises two important questions. The first is: why has it been decided to make the first cut, if a cut had to be made, in purchases from one of the most efficient, and lowest cost, centres of production. Was transport the determining factor? Or is a cut also to be made in the production of other suppliers of copper to the United Nations? The second question is whether any plans have been made by the Northern Rhodesian Government to deal with the unemployment problem which the cut will create. The official notice merely stated that some reduction in

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so before the date of expiry. If they fail to do so, their subscriptions will be automatically cancelled as soon as that date is passed, which will mean a gap of many months before the despatch of copies can be resumed.

employment will be involved, and that the British Government had therefore agreed to make the cut by stages in April, May and June. But no indication was given of the numbers of workers likely to be involved or of what was likely to happen to them. Before the war the number of African workers in the copper mines was about 20,000, and the number of Europeans about 2,000. At present the figures are roughly 30,000 and 3,000 respectively. Figures of production have not been published since the war, and it does not follow that the labour force will be reduced to the pre-war level; nevertheless, the cut in output which has now been decreed is a big one, and the reduction in employment will apparently be considerable. The Mineworkers' Union is already taking the matter up, and protest meetings have been held throughout the copper belt. But the Mineworkers' Union speaks for the European workers only. Most of these are skilled workers, and most of them—certainly of those taken on since the war—come from South Africa, where they should without difficulty be able to find work again. But who speaks for the African? For many years, before the war and since, the copper belt has been a source of native labour troubles—for a variety of reasons, including discontent over wages and over the ban placed by the European workers on the promotion of Africans to skilled jobs, but mainly because of the general unrest caused by the absence of any official policy towards the industrialised native. Has any policy now been formed, or are the natives displaced by the copper cut merely to be sent back willy-nilly to their villages? Northern Rhodesia is also a test case. In other parts of the colonial empire the production of raw materials has been stimulated by war demands. There has, for instance, been a big increase in Nigeria's output of minerals, palm products and ground nuts, and rubber production has been started. The war has, in fact, completely distorted the raw material position, and the effect on colonial peoples must have been considerable. Are there any plans for rehabilitation and resettlement?

#### Good Enough for the Duke

It was a damning indictment that Lord Faringdon made of official policy in Kenya in a House of Lords debate this week. Citing as authorities Lord Hailey, Lord Lugard and Sir Alan Pim, he showed that in Kenya, where there is white settlement, the African has not made the same progress as in other parts of British colonial Africa where there is no such settlement. It does not follow, nor did he claim, that white settlement everywhere and necessarily works against native progress. But that it has had that result in Kenya can hardly be doubted for a moment. What are the facts which Lord Faringdon produced in support of his case? In the Highlands less than 3,000 European farmers occupy five million acres of the six million which have been alienated to them from the natives, but they actually cultivate only about 11 per cent of the land in their occupation. In 1936, Sir Alan Pim estimated that the European farmers had received in subsidies of one form or another £474,000. Since the war, according to a Parliamentary answer from the Colonial Secretary, there have been subsidies amounting to £117,000. Thus, white settlement has not justified itself economically, quite apart from its effect on the African. For the latter, the result of the alienation of his land has been that in, for instance, the Kikuyu reserve—according to Lord Lugard, who himself quoted from other authorities—there are areas where the density is as high as 1,800 per square mile. Overgrazing and soil erosion have been the natural consequences, and, as is well known, last year there was a serious food shortage amounting in some areas almost to famine. But the land problem is not the only result of European settlement. As Sir Alan Pim pointed out, difficulties arise from the very existence of two communities with such different needs and desires. The Europeans demand services and communications beyond what is customary for rural Africa and beyond what the colony can bear—which means that the amount available to be spent on African development is curtailed. In 1936, according to Lord Hailey, the Government spent £26 7s. 5d. per head for European children and only 16s. for each African child at school. In reply, the Duke of Devonshire attempted to minimise the picture and excused such facts as the conscription of native labour to work for European farmers, the subsidies given to them since the war, and the proposed further settlement, on the classic ground that they were very little ones. He also gave a welcome account of the Kenya Government's post-war plans for African development and of the sums to be spent thereon from the Colonial Development and Welfare Fund. But these plans exist only

on paper, and what was most disturbing about the Under-Secretary's speech was its complacency with regard to official policy hitherto. In the light of the known facts and at a time when British colonial policy is under constant fire at home and abroad, it is very unfortunate that the official spokesman should say that

Kenya has gone ahead, and, far from being ashamed of our record there, this country and the Colonial Office have every right to be proud of it.

What is "good enough for the Duke" is certainly not good enough for other people.

#### India's Future

Sir George Schuster's broadcast on Tuesday put the future of India in a true light, too rarely admitted. His point was simply that, to be free, India must also be safe; and that, to be safe, India cannot act in isolation, but only in co-operation with the Powers which control the strategic keys to the Indian Ocean area. Politically, it is ironical that India should have come to the point of independence at the very stage in history when national independence means little or nothing without deliberate dependence for defence upon outside aid. There is a sense in which India will never be free from Britain—certainly not so long as the British Commonwealth holds both the Suez Canal and the bases for defending Australia and Malaya, still to be recovered and remade. Sir George Schuster's intention was not to use this argument, disingenuously, against the grant of political independence to the Indians, which they can have when they will. It was rather to suggest that, for their own sake as well as ours, their independent policy must be set in an interdependent framework which will restore and extend the *pax Britannica* in these regions, with the aid of other Powers with concerns in the same zone. India, for reasons of geography, cannot rely upon the mere accident which has permitted it to have its cake and eat it—to be independent and refuse interdependence, simultaneously, and still to stay safe. This is another special and critical corner of the problem of regional security within the British Commonwealth, which the Australian and New Zealand Governments have recently been discussing; and India, in its pivotal strategic position, cannot be forgotten when the question comes to be discussed, more widely, by the Prime Ministers of the Empire in London.

#### The Encouragement of Productivity

The word of the moment is research. Almost every speech, statement or report about post-war industry says the right things on this subject: industry and commerce must be kept up to date; and the state, by its taxation policy and other means, must encourage the use of funds for this purpose. But do these arguments for state-encouraged or state-aided research sufficiently recognise that, whatever forms of organisation may be devised, the future of industry and the standard of living of the people depend entirely upon an increase in total productivity—upon what Mr J. E. Currie, in an address to the London and South Eastern Regional Board on Wednesday, called, succinctly, "an increase in output per man per hour." That is to say, the imperative task of research is not simply to maintain particular industries in a particular state of employment or profits but to increase the national income, even at the cost of very radical adjustments in the structure of industry and employment, and in the use which is made of the nation's total resources. Plainly, of course, this will best be done by individual enterprises seeking to better their individual position, provided they are not protected by monopolies, exclusive patents or state guarantees—and provided the fruits of research are opened to enterprise at large. The profit motive, much abused, can do the job, if it is accompanied by a readiness to risk losses and by sanctions against improper gains, due to restriction. In other words, the state's duty in the encouragement of research and development is, primarily, to foster self-help, under fair conditions and not, in the main, to do the job itself; it is to favour enterprise of the right kind, and to lend public aid where private effort is insufficient. The latest recommendations have come from the London Chamber of Commerce. It suggests that a Central Board should be set up to plan and direct industrial research. This Board would be the link between the Government and "the research

activities of the country at large." Private research would continue, but the Board would make grants towards the cost of discoveries handed on. Pure research would be done by the universities, on a much larger scale than hitherto, and be paid for by the Government. The money available for research, private and public, and for the payment of researchers, would be much increased. Judgment of these proposals depends entirely upon, first, the degree of enterprise that would be demanded from individual firms and researchers—a central plan might well be stifling—and, secondly, upon the guarantees of public use and general availability that the Government would require in return for public money. The economics of this problem have been examined by Dr Balogh in the latest Bulletin of the Oxford Institute of Statistics (volume 6, No. 1 January 1943). His conclusion is that, directly or indirectly, the Government must bear the cost of most of the extra research required to bring British industry, as a whole, up to the level of pre-war productivity in the United States; and that, correspondingly, the results of this extra research must be used in the common interest. Both the London Chamber of Commerce and Dr Balogh agree that the research of firms should be a charge on revenue for taxation purposes; and a good start might be made in translating precept into practice by incorporating this provision into next April's Budget.

#### The Next French Government

The second session of the Consultative Assembly at Algiers finished a fortnight ago; and the third session will not be held before March. Compared with a normal democratic assembly with legislative powers it reached few practical decisions, but as a deliberate assembly it did outstandingly well. In the beginning it was not designed to be a real Parliament, and its rapid development is an impressive evidence of the democratic mood of its members; of their deep distrust of any form of personal rule in republican disguise; and of their determination to make a break with the mechanisms of the Third Republic that were inefficient, as well as with the personalities of the Vichy administration. The number and content of questions put to the members of the Committee is, in itself, proof of the "parliamentary" character of an Assembly which, though not elected, yet feels itself representative of, and responsible for, metropolitan France. The question of the provisional government of France, after liberation, is to be referred back to the Committee of National Liberation, which will, at the next session, bring forward revised proposals based on the views expressed in the debates. The Assembly has shown itself capable of sound political theory in the rejection, on the one hand, of the conception of a Provisional Government irresponsible to the electorate, and on the other, of a temporary Government too weak to exercise economic or social control. But it has not been able to work out for itself a practical alternative to the devil or the deep blue sea. The eventual solution will probably be based on three principles: first, that no general election will take place before a Constituent Assembly can be called, through universal suffrage, which will include votes for women, and under entirely regular conditions; secondly, that, until the convocation of a regular Constituent Assembly, the present Consultative Assembly, progressively enlarged, shall function in its place; and thirdly, that some compromise shall be found to reconcile the need for re-establishing municipal authorities which can proceed to the nomination of delegates, with the secure foundation of such authority on the approval of the electorate.

#### The TUC and Industrial Training

The TUC's reported acceptance of the principle of obligatory industrial training as an essential part of the plans for demobilisation and resettlement marks an important advance. A veil of secrecy has too long shrouded the unions' views on this vital point; one of the crucial proposals of the Beveridge Report was that, after a period of idleness, unemployment benefit should be replaced by "training benefit," which would be conditional on the workers' willingness to retrain. In the past, the trade union contention has been, with little or no qualification, that a man is entitled to his customary kind of work and, accordingly, to be maintained in unemployment if such work cannot be made available. This is still the unions' general

attitude. But there have been some significant qualifications already. The General Council in its 1943 report stated that, if controls are to be maintained over industry, some measure of control over labour would be necessary, and Mr Bevin has often reminded the unions that, if they hope to retain some of their wartime advantages, they will have to accept continued responsibilities. The Mineworkers' Federation, who have bitter experience of the necessity for industrial transfer, have suggested that industrial training and re-employment facilities should be made available for displaced miners. Now it is reported that the General Council of the TUC is proposing that any worker who "unreasonably refuses" to be directed to work shall lose his unemployment benefit, subject to the right of appeal to an independent tribunal. Its other recommendations include the compulsory registration of persons seeking employment; the compulsory use of employment exchanges and approved trade union machinery; and direction to employment after consultation with the industries concerned. The proposal about unemployment benefit may well lead to sharp controversy when the Labour Party next meets at Whitsun, though no final decision can be taken until the TUC's own meeting in September. If the General Council's recommendation is endorsed, it will mean the removal of a formidable obstacle to industrial mobility. Rigidity of labour, and excessive insistence on trade demarcation—ship-building provides an outstanding example—must hamper the adaptability of the industrial structure to meet post-war needs.

#### Shorter Note

The Committee stage of the Disabled Persons (Employment) Bill was concluded on January 27th. The wording of Mr Bevin's amendment, providing priority for ex-Servicemen and women (discussed in *The Economist* last week, page 139), satisfied the Conservatives. But their attempt to curtail the Minister's power to administer the Bill by regulations which need not have the prior approval of the House was defeated by 72 votes to 18.

### TIMELY UNION

The union of two great building societies—  
—the Abbey Road and the National—  
has come at a time when millions of  
home-loving people are looking forward  
to the freedom and security of home  
ownership. The future happiness of  
these people will depend very much on  
the efficient and courteous service of the

## How Ready is the Right?

(From Our Washington Correspondent)

"MANY of us in the 1930's feared that a left-wing reaction would draw labour so far away from the main body of American sentiment that the gap could not be closed without a disastrous struggle. I do not want to be an alarmist—perhaps I exaggerate, since I spend so much time in Washington, where politics is always exaggerated—but I tell you frankly that I am deeply alarmed to-day over the possibility that a right-wing reaction may draw some sections of capital so far away from our traditions as to imperil the entire structure of American life as we know it." These sentences are from the closing paragraphs of the speech made on December 8th before the convention of the National Association of Manufacturers by Mr Charles E. Wilson, Executive Vice-Chairman of the War Production Board and in private life President of General Electric. Mr Wilson further said:

In my view, although American industry will have the task of carrying out the production programme, the fulfilment of that task by no means ends our responsibility to the nation in 1944. There is another responsibility that I consider equally important. Without mincing words about it, we who are assembled in this room have a substantial influence on the morale of America as well as its material strength. That spiritual or psychological responsibility is easy to evade—for who is there to check up on us? For that very reason, because we answer to no one but ourselves for our influence upon the spirit of the nation our responsibility is the greater.

I know of no other period in American history, except perhaps the Civil War, when there has been so much need for unity in our country, and so few signs of it, as at the present time. From where I sit in Washington it is an appalling thing to see the separate groups and cliques and special interests separating out of the main body of the American war effort in order to work for their own special purposes and private ambitions . . .

Now we are coming into an election year, when passions and prejudices are likely to be accentuated through the normal interplay of party politics. I submit that if we give way to those passions and prejudices, if we allow them to influence our actions, if we lend ourselves to the breaking up of the society into partisan groups and cliques, we are playing into the hands of the enemy. More than that, we are jeopardising our entire national future.

The NAM and the Chamber of Commerce are the two overall organisations representing American business. It is probably true that they over-represent it, sharpening and intensifying what individual business men think is to their interest. Perhaps that is why Mr Wilson chose the particular occasion he did for his speech.

For the direction which the Right takes at this time has the importance of being the dominant direction.

In interpreting the election returns of this past November, and likewise the elections of the previous year, many reporters have thought they discerned something that looks very much like a trend—something that has reversed the standing of the parties. This change has already been reflected in Congressional attitudes—but it has not yet come up against the electoral power of Mr Roosevelt. The comments have usually ended with the warning that state results should by no means be taken as conclusive with regard to national results in 1944.

But (to take an opposite tack for a moment) has not a good deal been conclusively proved already with regard to 1944? In the course of the past year, Mr Irving Dilliard, of the *St. Louis Post Dispatch*, has written a series of articles for the *New Republic* tracing the story of Republican regains of local and state control. After the elections of November, 1942, he pointed out that, for the first time in fourteen years, the Republican candidates for the House actually polled more votes in the country, including the Southern states, than the Democrats did: the percentages were 50.6 Republican, 47.4 Democratic, 2 other. Then in April came the Chicago election, when Mayor Kelly of the Kelly-Nash machine won a fourth term by a majority of 116,159 in a

vote of 1,259,133—about one-sixth of his margin of 1935, and the smallest margin since the Democrats accomplished Big Bill Thompson's defeat. Mr Dilliard made two comments:

For his margin of victory Ed Kelly can thank his city payroll. There are about 30,000 municipal employees, and every one of them is good for three or four votes. In a sentence, the Mayor won by the advantage which was already in the ballot-boxes for him when the polls opened;

the second,

it was perhaps best put by a cultured Republican lawyer, with many corporate connections, who said that the machine had over the years organised the assessments and levies on business, so the operators of Chicago businesses knew how much they would have to pay and could count on the machine's scale of charges. He said it was a relief to businessmen to have this sort of thing on a stable basis—and so Mayor Kelly enjoyed the support of thousands of Chicago's businessmen who are eagerly sharpening their anti-New Deal axes as they wait for the 1944 Presidential Election.

Meanwhile the gains of 1942 were pressed in the states. Most state legislatures meet in the odd years; in 1943, in a compact block of five Middle Western states of prime importance in the electoral college—Indiana, Illinois, Michigan, Wisconsin and Iowa (where the Congressmen elected in 1942 were 88 Republicans to 8 Democrats)—the new Republican legislatures passed memorials to Congress asking it to initiate a constitutional amendment which would limit tenure of the Presidency to two four-year terms. (In 1940, comparable memorials had been passed by the legislatures of New Jersey, Rhode Island, New York—it is perhaps pertinent to remember that the first of all suggestions for limiting presidential tenure was presented to Congress by New York on July 4, 1788.)

Following a line similar to that of the above memorials, Senator Bailey, of North Carolina, introduced Senate Joint Resolution 65 on June 3, 1943. Oneness of purpose between Republicans and Southern Conservative Democrats has been a familiar story in this past year's Congressional record; their differences have been confined to party mechanisms, not to ideas about desirable agenda. Yet even in the matter of party auspices, Republican pressure upon the solid South is like a narrowing ring. The Baltimore mayoralty contest was one indication. The loss of Kentucky from the list of states with Democratic governors—the Republicans, with newly won New Jersey, now hold a majority of the state Governorships—and the Congressional special elections in the 6th Missouri District in January and the 4th Kentucky District in November have all been handwriting on this wall. Then there is Oklahoma, one of the normally Democratic border states that went for Mr Hoover in the last big reversal, in 1928. The Republican national landslide of that year carried Republicans in to a number of state offices, including three on the Supreme Court. Prudently, Oklahoma Democrats then put through a law providing separate ballots for presidential electors and for nominees for state office. But in 1942 Democrat-turned-Republican Edward H. Moore defeated Democrat Josh Lee for the Federal Senate by over 40,000 (and the Republican candidate came within 11,000 votes of the governorship); also, ex-Democratic Governor Leon S. Phillips has announced that he will register and work as a Republican in 1944. With these figures in sight, the Oklahoma legislature decided to take no chances: 1944 voters will be handed four separate ballots, one for presidential electors, one for the Federal House and Senate, one for the State legislature and one for county offices.

So much for formal Republican control. On the state level it is in the majority. In the Federal Congress, the Republicans are within 10 seats of the Democrats in the House now, with five vacancies and five seats held by other

parties. In the Senate, it would take a shift of 11 seats to cause a change-over—21 Democrats' terms expire next year. Where Republicans control the machinery, the policy of the right is certain of support. But that is a decided understatement. On most issues, conservative policies can demonstrably count on backing in both parties, in which both Southern Democrats and Republicans join. Beyond that is the political magnetism which a trend exerts on the President. Events in Congress showing collaboration between Republicans and Conservative Democrats in recent months can be matched by events in the Administration showing Conservative triumphs within the Democratic Party. These too are facts which must be included in any estimate of the current importance of the right-wing attitude toward the future over which Mr Wilson has expressed concern.

During the early 1930's the NAM's currently outgoing president differed very little from hundreds of the other business men represented by his organisation. On his office wall, hung upside down by a long string, was a picture of Mr Roosevelt. When given a poke, the picture described a wide arc—there he is, going round in circles, as usual. Another item on exhibit—those were the days of the Works Progress Administration—was a shovel with a little gadget attached that rendered it entirely stable when sat on. Those were also the days when the professors and slide-rule boys were vituperatively denounced as ruining the country from Washington. Yet today something curious is happening, while too sporadically to call it a trend. Many of those same professors and slide-rule boys are appearing as technicians under the most impeccable corporate auspices—names that were among the Abu Ben Adams of anathema are now on such payrolls as the Committee for Economic Development and Standard Oil. Does this indicate an averaging out of irresponsibility? Mr Leon Henderson, long denounced as the prize heel of the bureaucratic collection, is sponsored on the radio by one of the largest producers in the rubber heel industry. At what point does a Democratic boondoggle become a Republican boon?

## American Notes

### Plight of the White-Collar Worker

The "Little Steel" formula for wage stabilisation has now been decently and publicly buried by one of its best friends. Mr William Davis, head of the War Labour Board, in his testimony before the Senate sub-committee on wartime health and education, stated that the formula "has passed out of the picture" and that its usefulness was now confined to determining the validity of demands for wage increases from white-collar workers. The overall wage, he said, has increased beyond the 15 per cent maximum laid down in the formula, making it obsolete, except as a "wedge in the door, holding it open so that some poor devil who has not been raised can get in." The committee is holding hearings to determine the plight of the white-collar worker in the face of the rising cost of living, which was put by Mr Philip Murray, head of the CIO, one of the witnesses, at 50 per cent rather than the 25 per cent claimed by the Bureau of Labour Statistics. It was Mr Murray's contention that the BLS index of living costs took no account of the scarcity of inexpensive goods, the consequent necessity for purchasing higher-priced substitutes, black market prices, and poorer quality. Mr Davis submitted some figures to the committee, showing that while over 101,000 voluntary applications from Regional War Labour Boards for wage increases were submitted by all industry, covering 5,655,000 workers, between October 3, 1942, and November 30, 1943, only 40,433 applications were made on behalf of 1,219,000 white-collar workers in wholesale, retail, financial and service branches of industry. According to the 1940 census, white collar workers make up about 32 per cent of the whole working population; and in addition, more substantial wage increases were almost certainly won by the highly organised workers in the mass production industries. Any substantiation of the difficulties of the unorganised white-collar worker, and of the large number of fixed-income receivers, would bolster the arguments for more effective control of the cost of living, and consequently of price stabilisation through subsidies, on which Congress has not yet taken final action. But no matter how strongly the sub-committee may be convinced, it will remain one small voice crying against the loud-speakers of the inflation bloc.

### The Bottom of the Barrel

Every available "pre-Pearl Harbour father" between the ages of 18 and 38 may have to be inducted during the first six months of 1944, according to a speech of General Hershey, Director of Selective Service, to the National Automobile Dealers' Association. His emphasis on the tightness of manpower for the Forces was in close harmony with recent warnings against optimism from other high administration officials. He was particularly anxious lest false conclusions be drawn from the fact that 100,000 men are discharged monthly from the forces. This is attrition, not demobilisation. By June 30, 1944, when the forces are expected to total 11,300,000, approximately 1,300,000 more men will have to be inducted, 600,000 to take the places of those discharged during the period. In the present manpower pool there are, he said, about 9,000,000 men. In addition, about 300,000 of those reaching the age of 18 will become available for service. The pool is reduced by the deferment of 1,500,000 agricultural workers. Of the 7,500,000 remaining, about 1,000,000 are in a class now available for service, and probably half of these will prove fit. The balance in the pool consists of 3,000,000 deferred on account of their importance to war production, and about 3,500,000 "pre-Pearl Harbour fathers." Owing to their family responsibilities, higher age, and possible occupational deferments only about 500,000 can be expected to be inducted from this latter group. This would just satisfy the demands of the Forces, but would mean taking every releasable and able-bodied pre-Pearl Harbour father between 18 and 38. In the occupationally deferred group there are probably a substantial number of young single men, and in view of the expressed wish of Congress that no father of a family should be taken until every fit single man has gone, there no doubt will be some reclassification to permit their induction. The "bottom of the barrel" is, of course, a relative conception, fixed by the physical standards and the desire to minimise domestic hardship, as well as the demands of war production and essential civilian supplies. The United States is fortunate to be able to raise Forces of eleven millions without interpreting these exceptions too severely.

## NEWS of WHITE HORSE

*This famous blend of Whisky was  
never better than to-day*

It would be easier to buy White Horse Whisky as and when you like to-day if there were not so many people trying to do the same thing. Like so many of the comforts of peace-time, White Horse is scarcer because of the war.

It takes long years to bring this famous whisky to ripeness and maturity. It took forethought and a provident care to provide the present regulated supply. And the same care and forethought are your assurance that to-day and in the years to come the quality of White Horse will be guarded as jealously as ever.

More White Horse could not be released without broaching stocks still growing old and ripe for your future pleasure. And for no consideration will the good name of this great and famous blend be put in jeopardy.

## Stand Up and Be Counted

The showdown on the soldiers' vote Bill is close at hand. In his Message to Congress last week the President unkindly challenged members to "stand up and be counted," instead of taking refuge in an unrecorded vote, so that members of the Forces and the nation at large could see how their individual representatives had acted. The House has already refused to allow a roll-call on the Bill, perhaps through pique, but it will be interpreted less generously. Mr Roosevelt's language was blunt. He characterised the Senate alternative to the Green-Lucas Bill as a "fraud upon the soldiers, sailors and marines now fighting for our sacred rights . . . and a fraud upon the American people." This was the recommendation, supported by Southern Democrats and the Republicans, that would have left it to the individual states to improvise or adapt election machinery to permit absentee soldier voting. Mr Roosevelt insisted that this was tantamount to disfranchisement. State voting requirements are unlikely to be amended in time. Two states would require Constitutional Amendments—a lengthy matter—and so far only 17 state legislatures are going to hold sessions this year. The difficulty with state ballots lies not only in the fact that four states permit no absentee voting at all, and 11 others require registration in person, but in the time factor involved when ballots cannot be printed until after the primaries, which in fourteen states do not take place until September. Mr Roosevelt pointed out that the intolerability of these conditions was recognised by Congress when it passed Public Law 712 in September 1942, which waived registration and poll tax requirements for Servicemen voting in a Federal election, and required the Army and Navy to distribute postal cards for soldiers to request ballots from state officials. Yet even with these improvements, out of 5,700,000 members of the Forces, only 28,000 valid ballots were received in the 1942 Congressional elections. Nor do the Services consider it practicable to administer a voting scheme characterised by 48 different procedures. On the question of registration and poll tax waiver, which is the heart of Southern resistance, Mr Roosevelt pointed out that the present Bill goes no further than the earlier one passed by overwhelming Congressional majority. He admitted that it would be impossible, for reasons of time and air-mail transmission, to include the names of state and local candidates on the Federal ballot, but pointed out that soldiers would still have the right to request state ballots for these elections. The logical arguments for the Bill seem irresistible, but they do not meet the Republicans' main objection, which is their fear that it may guarantee a Fourth Term for Mr Roosevelt. But they have bungled badly, and cries of "demagoguery" will not avail them much. Through sheer political ineptitude, they have cooked their own goose, and handed it to Mr Roosevelt on a silver platter. The President is in the rare and happy position, for a politician, of doing battle for a popular democratic principle which by general admission is unquestionably to his own advantage. It is a measure of political progress from the Civil War election when Stanton, Secretary of War, felt impelled to furlough large numbers of Republican soldiers to ensure President Lincoln's re-election.

## Alas, Poor OWI

The luckless Office of War Information is being rent by yet another internal, though by no means private, dispute. A recent investigation of the Overseas Branch, of which Mr Robert Sherwood, the dramatist and close friend of the President, is head, prompted Mr Elmer Davis, Director of the Office, to ask for the resignation of three high officials of the Branch, Messrs Barnes, Warburg, and Johnson. This Mr Sherwood has refused to accept, and the decision is now in Mr Roosevelt's hands, with the suggestion that if he is not upheld Mr Davis may resign. Both Mr Barnes and Mr Johnson have been extensively investigated by the Federal Bureau of Investigation and the Civil Service Commission for alleged left-wing sympathies. Mr Barnes was Mr Willkie's mentor on his trip to Russia and other One World stops, but the main difficulty seems to be that the Overseas Branch and the New York Office were felt to be insufficiently amenable to central direction from Washington. Whatever the defects of OWI's internal organisation, the dispute has provided a wide opening for the agency's genuine critics and its numerous political enemies. The Republicans have never attempted to conceal their suspicions that OWI was nothing

more than an election agent for the Fourth Term; and allegations of extravagance, high-handedness and muddle are heard on both sides of the political fence. Congress may be expected to go over next spring's appropriation with a fine tooth comb. Within the Administration family there is more than one aspirant to the Davis inheritance despite its grim resemblance to the Hope Diamond. Rumours of long standing credit General Donovan, of the Office of Strategic Services, with a wandering eye for OWI preserves. Another report has it that the State Department would not be averse to controlling the foreign branch, with Mr Byron Price, now Censorship Chief, setting a safe and inoffensive course for what would remain of the domestic side. OWI's present predicament is a sad commentary upon the high hopes which greeted the news last year that a distinguished newspaperman was to be given a free hand with information policy. No fair critic would deny that in many respects the agency has tackled an immensely difficult job with substantial success. But it is plain now for all to see that first-class individualists and technicians are not enough, without influential, day-by-day political championing. The limitations involved in placing OWI under the mantle of an established political figure like Mr Hull would no doubt have been very real, but relations with the Services, other agencies, and Congress would have been put on a much more solid footing. As things are now, Mr Davis's very inadequate armoury consists of the possibility of catching the President's necessarily intermittent attention—a privilege which is not his alone—and the threat of resignation.

## Pacific Atrocities

The American reaction to revelations of Japanese atrocities was bound to be even more violent than that of the British, despite the decline of the Pacific First group. That school of thought is not entirely dead; and it is probably fortunate that plans for the invasion of Europe are too far advanced for looking back. But, on the whole, the emotional response has taken the sounder form of appeals to greater sacrifice and unity on the home front, and the soaring of war bond purchases. Two growths which withered overnight incidentally are the organisation known as "Peace Now" and the more tentative idea, first advanced by ex-Ambassador Grew, that Hirohito might prove to be a useful United Nations puppet in the stimulus of a liberal Japan. War criminals, rather than peace puppets, are uppermost in the American mind. One dangerous possibility, which the Administration is certain to have taken steps to deal with, is the likelihood of reprisals against the American-Japanese who have been released from internment. The wisdom of removing them from the Pacific Coast, where feeling is running the highest, is now proved beyond any question. Whether the ghastly details of Japanese brutality will have any repercussions upon the political future of General MacArthur, who in the public mind is identified as Japan's Nemesis, is more debatable. The Scripps-Howard papers have taken the exemplary line that hatred of the Japanese should not be used to spread insinuation, that the Administration was starving the Pacific of supplies because of political animus against the General. This *canard* no doubt has some life still, and it must be said the General MacArthur's reported utterances have not completely dispelled it. There is, indeed, a certain vagueness about all the General's statements for publication. As there is no certainty that he looks with disfavour on the "MacArthur for President" movement. There is some speculation this week on a letter from a visitor to his headquarters who is said to have written—

It would not be surprising if MacArthur felt—as do a good many here—that the shortest way to victory would be to place an experienced military man in the White House.

The fact that this Message was passed by General MacArthur's stringent censorship is being discussed in conjunction with the approving letter written by one of his press officers, Mr Philip La Follette, to Colonel McCormick, who is backing the MacArthur boom. The military candidate is a familiar figure in American politics; indeed, the period after the Civil War was distinguished by regular "waving of the bloody shirt." But even in American politics it is unusual for a serving officer with General MacArthur's heavy responsibilities to take part in an electoral campaign.

## THE WORLD OVERSEAS

## Soviet War Economy

ON January 28th, the Commissar of Finance, M. Zverev, made a Budget report to the joint session of the two chambers of the Supreme Soviet. Its significance lies in the fact that this is the first official statement on war finance made in Russia since 1941. For nearly three years no figures of national revenue and expenditure had been published. Military secrecy was not the only reason for this silence; in 1941 and 1942 Russia's entire economy was thrown out of gear by invasion and war; and neither the losses of economically important territories nor the industrial evacuation lent themselves to statistical computation. The Commissar of Finance was in the position of a quartermaster who might try to compute in monetary terms the cost of a gigantic battle while it was still being waged. Even now, when Russia has triumphantly passed the test, the time for stocktaking and steady planning has not yet come; and Commissar Zverev's Report shows all the marks of provisional reckoning and estimation. There are important gaps. The reports on the budgets of 1941 and 1942 are, inevitably, largely nominal, containing only a few fragmentary, though important, items, but no comprehensive figures. The preliminary report on the Budget of 1943 and the estimates for 1944 are more complete, though here, too, there are gaps which make any neat analysis of revenue and expenditure impossible. But the totals and some of the separate items give a much clearer picture of the present state of Russian economy than any information so far published. Their meaning can best be understood by comparison with Russia's last pre-war Budget, that of 1940.

| (In billions of roubles)                  |       |       |       |       |       |
|-------------------------------------------|-------|-------|-------|-------|-------|
|                                           | 1940  | 1941  | 1942  | 1943  | 1944  |
| Revenue . . . . .                         | 180.2 | 216.8 | ...   | 210.0 | 245.6 |
| Turnover tax . . . . .                    | 105.8 | 124.5 | 105.9 | 71.1  | 80.2  |
| Expenditure . . . . .                     | 174.3 | 216.0 | ...   | 210.0 | 245.6 |
| Defence . . . . .                         | 56.0  | 70.9  | 108.4 | 124.7 | 128.4 |
| National Economy . . . . .                | 57.1  | 73.2  | ...   | 31.1  | 44.7  |
| Social and cultural development . . . . . | 43.0  | 47.9  | ...   | 37.2  | 51.4  |

The table requires some explanation. The figures for 1941 are the figures of the plan for that year; practically nothing has been said about the actual results of the year, except that, in the second half of 1941, defence expenditure rose by 20 billion roubles above the plan. The figures for 1943 are based on a preliminary calculation of the year's results. Moreover, pre-war budgets were computed in "stable roubles" (that is, at the value of 1926-27); in what sort of rouble the war Budgets have been worked out is not stated.

The first feature is the comparatively small increase in the budgetary totals compared with before the war. In 1943, both revenue and expenditure were slightly smaller than those planned for 1941 and only 30-36 billion roubles more than the figures for 1940. In this, the Russian budget is probably unique among the budgets of the belligerent nations—which merely reflects Russia's intensive pre-war preparations for defence. Even the rise in purely military expenditure seems to be surprisingly small. The expenditure of the Commissariat of War in 1942 and 1943—the years of the most gigantic and costly battles—was only about double the expenditure in 1940, when Russia fought only the small and short war against Finland; it was only 70-80 per cent higher than the expenditure planned for 1941 in peace-time.

## Cuts in Consumption

One important wartime change in revenue is reflected in the figures of the turnover tax. The turnover tax used to be the main source of revenue. In the thirties it accounted for more than two-thirds of the budget, and in 1940 still yielded about three-fifths. In 1944 it is to yield no more than one-third.

As most of the turnover tax is derived from the sale of consumers' goods, this clearly indicates a drastic curtailment in consumption. At first sight, this seems to be contradicted by the yield from the turnover tax in 1942, when it was equal to the yield in 1940. But the explanation was a drastic increase in the rate of tax, an increase of at least 100 per cent. This makes the fall to 71 billion in 1943 even more significant.

If the revenue from the turnover tax is taken as a rough index of consumption in Russia—and it is a pretty accurate index for consumption in towns—then the conclusion seems to be that in 1943 about two-thirds of Russia's normal population consumed only one-third of the total quantity of goods consumed in Russia immediately before the war. Consumption during the war appears to have been halved—and the comparison is with 1940, a year of relative under-consumption.

If the revenue from the turnover tax covered only one-third of the expenditure in 1943, from what sources did the Government cover the remaining two-thirds? To this Commissar Zverev has given no detailed reply. But he did make it clear that

the income and reserve funds of the state enterprises and organisations have now become the basic sources of financing expenditure.

Not less than 320 billion roubles have been "mobilised" from those sources in the course of the war. (This does not seem to include the tax on profits which yielded 20 billion roubles in 1943.) To this, special war taxes which brought in 33 billion should be added, as well as 38.6 billion raised in loans during the last two and a half years.

But all these sources together do not account for more than about a quarter of the funds "mobilised" from state enterprises. In other words, the main burden of war finance has been borne by the industries themselves, which is inevitable in a country where the state is the sole master of industry. Economically, state and industry were identical even in peace-time; but an elaborate system of accountancy still made each enterprise a financially self-contained and "independent" unit. Not much of this system can have survived the shocks of 1941-1943. One of the main purposes of the budget of 1944 seems to be to reconstruct the pre-war system and to restore the technical "control by the rouble" of Soviet economy.

## Expansion in Output

The most interesting item in expenditure is "grants for national economy." What is meant by this is the financing of capital construction from state funds. In 1943, 31 billion roubles were spent in this way compared with 57 billion in 1940 and 73 billion planned for 1941. If the turnover tax can be taken as an index of consumption, then the "grants for national economy" show primarily the rate of industrial expansion. (Usually, two-thirds of the total expenditure arising from the construction of new plant or from the expansion of old plant was covered by the state and one-third by the enterprises concerned.) In 1943 the budgetary allocation for "national economy" was roughly half the corresponding sums in 1940 and 1941 (31 billion against 57 and 73). If it is assumed that the industrial capacity of the Russian "rump" economy is about half of the pre-war capacity, then the pre-war rate of expansion seems to have been roughly maintained, but not increased, during the war. If it is, however, assumed that, through evacuation, Russia has managed to maintain and to save more than half of its pre-war industrial capacity, then the figure seems to suggest a decrease in the rate of expansion. Whatever the truth, the sober figures given by the Commissar of Finance do not seem to support a belief in the uninterrupted growth of the "Russian colossus."

In the estimates for 1944 the budgetary grant for "national economy" has been put at 44.7 billion roubles. Out of this, 16 billion have been allocated for reconstruction in the liberated and devastated areas. Only 29 billion remain for new

construction in other areas. The sum of 16 billion roubles for reconstruction shows that the Government is resolved to tackle the problem seriously; but that the scope of the work of reconstruction is severely limited by the needs of war. Only about seven per cent of Russia's Budget this

year can be devoted to recreating normal life in the towns and villages which have been devastated by fighting and "scorched earth" tactics. What M. Zverev portrayed in his Report was the vastness of Russia's war effort as well as the deep wounds which his country has suffered.

## Germany at War

### Totalitarian Propaganda

HITLER's yearly speeches commemorating the day when the Nazis came into power are a special item in Nazi propaganda. The one broadcast on January 30th, the eleventh anniversary, echoed the new line of "realistic" internal propaganda which is in striking contrast to the mystical and erratic performances of the greater part of last year—and to the lies which are being told, in straight news, about the recent small air raids on London. Last autumn the Nazis were uncertain about the effects of bombing and defeats in the East. Their New Year messages, however, expressed some relief; and on Sunday Hitler summed up the position in his own peculiar way.

As usual he covered the main points of his speech with rambling and cloudy phrases about Jews, Bolshevism and Great Britain's war guilt—the usual trimmings. The real substance of what he said was that the Second World War of 1939 is the repetition, internationally, of the Nazi party's own internal struggle before 1933. Nazi Germany's existence depends, he argued, on success in the struggle for a totalitarian Europe. Germany is able to continue the war, he said, because the Nazis have succeeded in abolishing the class struggle, in centralising the State, in creating a Wehrmacht, and in gathering all parts of Europe where Germans live into one new Reich.

All this sounds trite enough. It gave Hitler another opportunity of saying that totalitarian Germany is immune from Bolshevism or any other foreign propaganda. To this purely negative statement, he added, with strong emphasis,

the statement that German socialism and "the people's community," hardened, as he thinks, by bombing, will be powerful enough to carry on the war.

Hitler himself, like the entire internal propaganda of Nazi Germany, follows events. Administrative measures taken in critical moments produce at the same time the appropriate line of propaganda, filtered down from the leading figures like Dr Goebbels to the least party member responsible for a block of flats, a section of a factory or an agricultural locality. Totalitarian propaganda is essentially a routine affair worked out according to a central plan for a vast bureaucratic organisation. It is correspondingly inflexible; not infrequently the plan is faithfully carried out regardless of profound changes in the political or military situation.

Leader writers in newspapers and journals and the heads of sectional departments are given some little latitude in presenting the details of the propaganda. The Wehrmacht has its own propaganda departments. Generally speaking, the tendency is for each section of society to have its special propaganda, written, spoken or broadcast. Sometimes the most astonishing contradictions are produced, reminiscent of Nazi propaganda before 1933, when within twenty-four hours employers were promised the suppression of strikes and the abolition of trade unions, while, at the same time, special meetings for workers promised higher wages and, if necessary, the support of strikes.

Propaganda in a totalitarian country is a tactical instrument of administration. It is not necessarily any indication of the morale of either the people or the Wehrmacht, and it would be dangerous to conclude from articles, speeches and

broadcasts that morale is good or bad, growing stronger or nearing its breaking point. The tolerably informed average German is a myth. Only informed party members, who are under constant observation, or informed military and economic experts or business men may, during a crisis, be able to form their own opinion and act accordingly.

### Psychological Methods

Public opinion is made by the party, not by the people. From a psychological point of view the method is flawless, but politically it has produced a generally apathetic attitude unbroken either by victories or defeats. At times the Nazis have seemed to be aware of this by-product of totalitarian centralisation. After Stalingrad, Goebbels tried his revivalist stunt, without success, in order to break down the apathy. The heavy bombing of some of the big towns seems so far to have left the other parts of Germany unmoved. The inspired cry for retaliation seems to have been hardly echoed. Nevertheless, after months of bombing, the hard crust of apathy has been at least pierced for the first time, and Nazi propaganda has made use of this. All the available evidence (newspapers, broadcasts, speeches, neutral reports and letters written by Germans) shows that bombing has either revived a flagging will to resistance or actually strengthened this will. Nazi propaganda seizes on this, and goes farther. It speaks of the "social melting pot" of bombing. Poor and rich, middle class and workers, are alike hit and reduced to the clothing they stand up in. Large-scale evacuation is another levelling factor. Propaganda consequently revives the old slogan of socialist Germany fighting against the rich countries. Under bombing it is not necessary to conduct a propaganda of fear. Fear is there as a hard and inescapable fact, projected into the future by propaganda about the intention of the Allies and Russia to annihilate Germany. No doubt this propaganda has had some effect. This is Nazi propaganda shorn of the vaguer idiocies of *Wehianschauung*. Their commentaries on the political and military situation are sometimes very interesting and suggestive, in this light. Social and political conditions in Britain and the United States are analysed to show the inevitable tensions in a democracy, as distinct from a totalitarian dictatorship, at war.

### New Realism

Against this background a remarkable change in internal propaganda has happened, which has incidentally widened the existing gap, and contradictions, between home and foreign propaganda. The military crisis at the beginning of 1943, the political crisis after the fall of Mussolini, the heavy bombing and, since the Teheran conference, the threat of invasion from the West, are the immediate causes. In defence, propagandistic activities must be realistic. If the danger is not clearly shown, the defence is half lost. If the defence, in the widest sense of word, becomes passive, the war is lost. These points are axioms in the German lexicon—and, for that matter, in the totalitarian philosophy of war. The first principle of defence is the husbanding of resources and fighting strength; the second is offensive action, where possible, with the smallest number of men and material; the third is preparation for the major offensive of the enemy, on whom is thrown the burden of ending the war as quickly as possible.

Nazi propaganda has acted on these principles. The original talk of retaliation against bombing, coupled with an appeal for endurance, has been dropped. Slowly there emerged propaganda about the need for breaking the offensive power of the bombers before any retaliation could be attempted. When some successes against bombers could be shown propaganda explained that, from a military point of view, mere retaliation would produce no real results. Instead of retaliation, there appeared talk of offensive action within the scheme of defence, particularly during the course of the coming invasion from the West. Rommel's propaganda tour of the fortifications was published. The continuous Atlantic Wall was now pictured as a string of fortified positions and strong points, and the utmost emphasis was placed on the reserves ready to intervene, instead of upon the mere strength of the fortifications.

At the same time the Germans were discouraged from believing that any single weapon, known or secret, could decide the war. The idea that single weapons could be decisive was openly ridiculed, and emphasis was laid in military commentaries and political articles on the co-ordinated use of weapons.

This is propaganda. It is not necessarily, as already

indicated, a true picture of the actual situation. Yet it is realistic enough to show the actual line of Nazi policy. In contrast to this home propaganda stands the fantastic propaganda about secret weapons put out for foreign consumption, the endless repetition of the Bolshevik bogey, again for foreign, not home, consumption, and the innumerable stories planted abroad for the purpose of testing opinion in Allied countries. Here Nazi propaganda is

as diversified, and as contradictory, as it was before 1933 in Germany. It is not only an attempt to drive wedges between the Allies; it is also necessary to sustain satellite countries and to confuse political and military opposition in occupied countries. This kind of propaganda is political warfare. Feints, ruses, deception, camouflage are used as in military campaigns. Truth is of minor importance, and only success is rewarded.

## Letters to the Editor

### The Dead Weight Debt

TO THE EDITOR OF THE ECONOMIST

SIR,—I have been reading with a mixture of agreement and disagreement, but with constant admiration for the ingenuity of the writer as he threads his way through the complexities of a hypothetical future, the series of articles on post-war conditions and post-war economic policy.

To comment on them from the standpoint of our classical economists would require far more space than you could afford, however anxious you might be to promote the true judgments that emerge from a collision of opinions.

But there is one passing observation on a remark of Lord Woolton's about our internal debt which perhaps you will allow me to dispute in favour of his view. You said, in effect, that, so long as the debt is internal—i.e., raised at home—its size does not much matter: the theory that it does "is of course almost entirely fallacious" (see *The Economist*, December 18th, p. 802). Your reason is that "the whole of the sum thus raised goes back into another of the community's pockets—its debt-holding pocket"—and therefore cannot be "a real impoverishment of the community."

Since reading Robert Hamilton's most able (and as I have always thought conclusive) "Inquiry concerning the National Debt," I have never been able to see much substance in this distinction between an internal and an external debt. The true distinction is between "the dead weight debt" spent on unproductive or destructive purposes, and that small fraction of our national debt, such as the purchase of the Suez Canal shares, which represents capital employed for useful and productive purposes. It is the same with private enterprises; some investments are lost, others pay interest and repay the capitalists.

The question whether a nation borrows for war at home or abroad is a question of convenience. We know to our cost that foreign countries have generally confounded or confiscated the huge loans they borrowed from our Government, or from private investors in Great Britain.

I need not remind your readers that an honest government which has raised money abroad, and finds that the rate of interest at home is lower than that which it is paying on the foreign loan, can usually convert its external debt into an internal debt.—Yours, etc.,

FRANCIS W. HIRST.

The Athenæum.

### Jews in Hungary

TO THE EDITOR OF THE ECONOMIST

SIR,—An article on Hungary in your December 4th issue contains the following sentence:

In the persecution of Jews, Socialists and Communists the Government Party is as experienced as the Nazi Party.

What are the facts? 1. There is discrimination against the 900,000 Jews of Hungary; but their situation is such that the Zionists, who ought to know what they are talking about, place them at the bottom of their priority list for emigration to a Jewish National Home.

2. The Socialists, though the number of their representatives in Parliament is limited to sixteen, are an influential political party; and their daily paper, the *Népszava*, prints their views pretty freely.

3. The Communist Party as such is illegal; but individual Communists have trouble only if they go in for active propaganda.

All three counts illustrate the limitations of Hungarian democracy, but I fail to see how they add up to persecution, let alone to persecution on Nazi lines.

Hungary is an enemy country. But it would be a pity if, for that reason, in relation to Hungarian affairs, *The Economist* relinquished its splendid standard of accuracy.—Yours, etc.,  
JUDITH LISTOWEL.  
16 Chester Row, S.W.

### Industrial Assurance

TO THE EDITOR OF THE ECONOMIST

SIR,—In your paper of January 15th, under Notes of the Week on page 68, in reviewing the booklet recently issued by the Industrial Life Offices, you referred to the statement that the average duration of the Whole Life policies in force of the Prudential at the end of 1942 was 19½ years. You then intimated that it would be interesting to be given the method by which this "surprising figure" is calculated, and I have much pleasure in giving you the following information.

The details for purposes of the annual actuarial valuation of the policies in force in our Industrial Branch are ascertained according to the year of issue of the policies and, consequentially, it is a simple matter to ascertain the average duration of these policies by multiplying the total number of such policies for each year of issue by the corresponding period of years for which they have been in force at a given date. By adding together all these products and dividing by the number of policies in force at the same date, the average duration of all these policies is at once obtained. As stated, in the case of Whole Life policies the average duration at the end of 1942 worked out at 19½ years.—Yours faithfully,  
W. J. FULFORD, Joint Actuary.

The Prudential Assurance Company, Ltd.

### The World Trade Alliance

TO THE EDITOR OF THE ECONOMIST

SIR,—In your issue of January 8, 1944, there were observations as to the proposals of the World Trade Alliance Association.

Constructive criticisms as to the possible implications or results of proposals are useful and welcome; but only if those proposals are correctly stated. The proposals you have attributed to the World Trade Alliance are not only incorrect but are the antithesis of our policy.

We must protest against your statement of the "intentions" of our supporters as a misrepresentation of the purpose and methods of the World Trade Alliance policy.—Yours faithfully,  
W. P. BRIDGE,  
Secretary-General.

## CONVERSATION PIECE

PAM, 1942, obviously finds a bedroom conversation with Miss Clara, 1892, no easy matter. The difference in their outlooks is reflected in their underclothes. Look at them. No longer ago than our mothers' day these were made from vegetable fibres (cotton and linen) or animal, that is protein, fibres (wool and silk). About 1850 chemical research began to examine how it might improve on these natural fibres. Cotton was cheap but harsh. A British chemist, John Mercer, devised the process of mercerising which greatly improved its softness and appearance, though without approaching the softness and beauty of silk. Yet silk was far too costly for the average woman. Accordingly the chemist set out to build new silk-like fabrics. He began with vegetable fibres, treating cellulose from wood pulp to give the "artificial silks" now generally known as rayon. But as Nature had made the cellulose, the chemist in building up these fabrics only entered at the half-way stage. During the last ten years he has shown his ability to start at rock bottom. In the discovery of nylon, the chemical industry has proved its ability to create its own raw material and to produce a fibre that is an improvement on natural silk. At the moment nylon is playing its part in the national effort, and will not be available to the public until the war is over. Whereas Miss Clara's underclothes were grown on a cotton plantation or the back of a sheep, Pam's "scanties" are discovered in the laboratory and produced in the chemical factory. The modern girl has good reason to be grateful to the chemist who has brought soft and beautiful fabrics within the reach of all.

# COAL for FACTORIES

## urgent ANNOUNCEMENT

At this moment coal is a major problem in every factory and public service establishment. *Unquestionably the situation is critical.* It would be rash to assume that you have touched rock bottom with the 10 per cent. cut. Intensified military operations will demand vast and rapid movements of men and materials. *Nothing must stand in the way of meeting that demand.*

At this crucial stage everything depends upon the immediate personal attention of managers in industry to their own coal position. They are urged to make use of every possible expedient in reducing consumption.

### How management should act

- ★ It is your personal responsibility to see that economy measures in every department ensure the greatest possible saving. Review them now and check your progress weekly.
- ★ Impress upon your departmental heads the gravity of the situation. *Insist upon stringent economy of coal, steam, oil, electricity and gas at every point of usage.* The smallest saving counts.
- ★ Strengthen your Fuel Watching System. Encourage suggestions, keenness and ingenuity.
- ★ Read carefully the Ministry's Fuel Efficiency Bulletins. Adopt immediately every economy suggestion which you have not already put into practice.
- ★ If any recommendations, following a Ministry survey of your plant, have not yet been put in hand, find out why. Further delay may be costly.

Every fresh economy now is added provision against a possible decline in the coal supply position.

## What Price the Franc?

SOON after the moment when Allied troops step ashore on French soil, a rate of exchange will have to operate between francs, dollars and pounds. The problem is, no doubt, being given the immediate attention it demands from the American, British and French Governments. The rates fixed, however provisional they may seem to the authorities directly concerned, will immediately acquire all the strength and rigidity of an accomplished fact. It will be extremely difficult to dissociate the more permanent monetary settlements made with a fully liberated France from the exchange decisions that will have to be made in the near future. It will, therefore, behove the authorities to tread very circumspectly in this matter and with full appreciation of what is at stake.

The way to a decision may seem to have been eased and almost predetermined by the establishment of a precedent, that of the North African franc, of which 200 go to the pound and 50 to the dollar. There is a long and strong tradition of interdependence between the metropolitan franc and the currencies of overseas French territories. It should, however, be realised that the metropolitan link has in fact been broken now for more than three years. Although French Government securities have continued to provide the backing of the various non-metropolitan francs, the economic experience of these external territories began to differ widely from that of France itself from the moment of the French armistice. The full measure of monetary inflation deriving from the German expenditure of "occupation costs" did not reach non-metropolitan France. The break became complete in November, 1942, with the Allied invasion of North Africa and the German occupation of the whole of France. For more than a year the structures of costs and prices in France and in other franc territories have been moving independently of one another and under the stimulus of widely contrasting influences. It does not follow, therefore, that a rate of 200 francs to the pound, which may meet the requirements of equilibrium in North Africa to-day (and even on this score there is considerable room for doubt) will necessarily be the rate best suited to the conditions prevailing in France itself.

Occupied Europe has for so long been divorced from the impact of a free economic system that any estimate of the correct parities of the franc and other European currencies must be hedged with considerable reservations. No reservations, however, can altogether obliterate such direct evidence of inflation as is provided by increases in the note circulation and bank credit, by the growth of the national debt—especially that part of it held by the central bank—and by the rise in the price of equities. On all these points reliable, though not particularly up-to-date, information is available for France. The Bank of France note circulation had risen from 151 milliard francs at the end of 1939 to 500 milliard francs at the end of 1943. This increase of 230 per cent compares with one of 90 per cent over the same period in the United Kingdom. French commercial bank deposits, which totalled 42 milliard francs at the end of 1939, had risen to 98 milliards by May, 1943, an increase of 133 per cent. Over the same period the deposits of the clearing banks in this country had risen by 49 per cent. The French public debt, which stood at 445 milliard francs at the end of 1939, had by May, 1943, risen to 1,163 milliards, an increase of 162 per cent, whereas over the corresponding period the British national debt rose by slightly under 100 per cent. The main factor in the expansion of the monetary circulation and of the public debt is the amount levied by the Germans for so-called "occupation costs," financed largely by Bank of France advances to the State and withdrawn by the Germans in the form of cash. Another item is the clearing debt owing by Germany in respect of the excess of goods "bought" from France over exports to that country. French exporters are paid from credits made available in the first place by the Bank of France. In both these cases the inflationary effect of this monetary expansion is two-

fold: the purchasing power circulating in the country is increased, and when issued in the first instance it is used by the Germans to drain the country of both consumption and capital goods.

Evidence of rising prices is more difficult to obtain. France no longer publishes indices of prices and of the cost of living. If they were published they would be entirely meaningless, because the administrative machine of rationing and price control has broken down completely and virtually the whole country lives by and on the black market. This administrative collapse may be regarded as part of the resistance movement; but it holds rather frightening prospects for the moment when some semblance of order has to be restored. Indices of ordinary share values, however, continue to be published. The index, comprising 300 ordinary shares, which averaged 134 in 1940, stood at 517 last June, having touched 644 in January, 1943. The *Investors' Chronicle* index of British ordinary shares for last June was 27 per cent higher than the 1940 average, compared with the increase of 285 per cent in the French index. The contrast between the two is all the greater if allowance be made for the fact that there is scarcely any large French institution which has not increased its capital by cash issues of additional shares over the past three years.

What pointers these comparisons give to the proper rate for the franc is anybody's guess. If it be assumed that the rate of 178 francs to the pound of the immediate pre-war and early war period was somewhere near equilibrium, the divergence in the indices quoted above suggests that the present economic parity would be well above that figure. But whether at 200 or 250 or even at 300 francs to the pound it is, without more definite knowledge of the situation, difficult to decide. The French authorities, if they err at all, will probably err in the direction of overvaluing the franc. One important aspect of the situation to which they are fully alive is the need to restore domestic confidence in the currency once it is freed from the contagion of German occupation. That confidence, they argue, would be immediately undermined if the franc were severely devalued in terms of other currencies. It will be necessary to make a good first impression. The French authorities will be driven in the same direction by a less rational but even more understandable motive, that of national prestige. The resurgence of France as a great power will be symbolised by many things, among them the active military participation which the French will take in the liberation of their own country; but not least by the standing of their currency.

If, however, the French feel compelled to take a prestige decision in this matter, they might be well advised to look back at the results of another such decision: that which made sterling "look the dollar in the face again" after the last war. To give the French franc an exchange value greatly in excess of its purchasing power will be to call upon France to go through a deflation crisis. The additional currency which has gone into circulation cannot be cancelled simply because it was issued as the counterpart of German occupation costs. That currency will not be conveniently found in German accounts or pockets. The Germans for a time held considerable unspent balances of their occupation receipts with the Bank of France. But that policy has changed. The occupying authorities have for some time past spent their francs as soon as they were received. The additional currency will be found largely in the pockets, stockings and mattresses of the French peasantry. Nor must it be forgotten that a host of deals in property and other capital goods have taken place at the inflated prices ruling during the occupation; that a sizeable volume of private debt will have been built up in respect of transactions based on current prices; that the equity capital of a great part of the French banking, industrial and commercial system has been increased to correspond to the plethora and depreciation of the currency. The expansion in the national debt cannot be repudiated

because it occurred under German occupation. That debt is held by French banks, insurance companies and private investors. Nor can these awkward financial problems be spirited away by the phrase "*le boche paiera*," whose deceiving reassurance caused such damage after the last war. The necessary deflation can be accomplished, and if the French authorities think its attendant hardships a reasonable price to pay for giving the franc a prestige value, there is no one to gainsay them. But it is to be hoped that if they

embark on this course the French authorities will do so with their eyes wide open and after having carefully and objectively weighed up all the factors in the situation. On the other hand, the perils and pains of undervaluation can be as great as those of overvaluation, as the unhappy experience of Southern Italy (discussed in a Note on page 173) amply shows. Not the least important task in the process of liberating Europe will be to steer between this Scylla and this Charybdis.

## How Many Houses?

**T**WENTY-FIVE years ago, the Government's housing policy consisted of a slogan; this time a plan has been formulated for the construction of between 3,000,000 and 4,000,000 houses in ten to twelve years. Those who remember, perhaps with some bitterness, that "homes for heroes" took shape in Great Britain at the rate of a mere 75,000 a year during the first five post-war years and at the rate of only 138,000 a year during the first ten years, leaving a serious shortage in 1929, may derive comfort from a programme envisaging the construction of nearly three times as many houses during the ten years after the present war. But an undefined statistical target no more amounts to a practical housing policy than a slogan. The first task in an approach to a realistic housing policy is to define the need for new homes in the context of resources for which there are competing claims; the second is to examine the financial and other devices that are needed to translate policy into practice.

A sharp distinction needs to be drawn between the short-period housing problem and the long-period housing problem. In the short period there are two needs. The first and most urgent is to put right the damage done by the war—both the visible destruction by bombs and the invisible damage done by the cessation of normal building work. This may be called the emergency standard, and when it has been attained, the country will be back, in housing matters, about where it was in 1939. The second short-period need is to remove the shortage of houses that existed in 1939—or more exactly, the shortage that will exist when the emergency standard has been met. This need will have been met when every family or person wishing for individual accommodation has a separate dwelling; this may be called the dwelling-per-family standard, and in it, for convenience sake, may be included the clearance of

slums in the sense of definitely insanitary dwellings. Behind these short-term needs there is the long-term demand for housing, and now that the increase in the population has almost ended, it consists entirely of the demand for new houses to replace old houses because they are no longer fit or do not conform to modern standards of comfort or amenity or are not in the right places.

If a housing plan is to rest on a sound basis it is essential that the short-term problem and the long-term problem should be considered separately. Ten years is too long for the short run and ridiculously too short for the long run. And a rate of building of 300,000 to 400,000 houses a year is too little for the short run and too many for the long run. What is needed is not one building plan but two.

The restoration of the pre-war standard of housing—the emergency standard—must clearly have first claim on available resources after the war, and should be started and completed as quickly as possible. This is largely a matter of making good the backlog of deferred repairs, of replacing the houses demolished by bombing, and of providing emergency homes in areas that have become seriously congested as a result of the geographical redistribution of the population. The volume of deferred repairs that will have to be carried out after the war is likely to be substantial. These consist, on the one hand, of ordinary maintenance neglected during the war, and on the other hand, of the arrears of work necessary to restore the houses damaged in air raids. Before the war, in 1937, no less than 28 per cent of the total outlay on building was spent on repairs. This does not mean that arrears have been accumulating at that rate, for urgent repairs have been made good during the war; but it may mean that something like a third, or even half, the work has been deferred. Again, of the 2,750,000 units damaged by bombing up to November, 1942, the majority has been restored, at least in part; but much remains to be done. The number of houses "destroyed or irretrievably damaged" was stated to be 135,000 in November, 1942, but, by the present time, the number may well have reached 200,000; a proportion of them may not qualify for immediate replacement under the emergency standard. Finally, there will be need for emergency houses in districts that have become seriously congested as a result of wartime population movements which are likely to be permanent; at present the need under this heading cannot be estimated.

It is possible to put an approximate figure on the houses needed to meet the dwelling-per-family standard—that is, to do away with overcrowding. The total number of dwellings in Great Britain was 10,597,000 in 1931 and 12,600,000 at the outbreak of the war, and since about 200,000 houses have been built during the war, the attainment of the emergency standard would bring the total to 12,800,000. The number of families and individuals requiring a separate dwelling is a complicated calculation. On the basis of a number of assumptions, Mr M. A. Abrams, in the November issue of *Agenda*, reaches a figure of 12,785,000 at the end of the war—that is, almost exactly equal to the number of dwellings. But a supply of dwellings equal to the global demand does not suffice to meet actual demand. A reserve is needed to permit geographical mobility as well as mobility between districts and types of houses—unlike furniture, houses cannot be moved. A surplus in a district which is losing population gives no relief to the shortage in a district whose population is increasing. In recent census years, this reserve of unoccupied houses was: 1901, 6.6 per cent; 1911, 5.8 per cent; 1921, 3 per cent; 1931, 3.1 per cent. The wartime shifts in population may well require a rather larger reserve, and if the figure is put at 5 per cent, about 670,000 houses would be needed to attain the dwelling-per-family standard.

The Minister of Health has put the total short-term demand for houses at 1,500,000. These will all be needed

February 5, 1944

THE ECONOMIST

187

quickly—more than half of them very quickly indeed. To supply them at the rate of 300,000 or even 400,000 a year might be regarded as disappointingly slow. Moreover, they will be needed at a time when those rates may be difficult of attainment. The labour force of the building industry has been severely depleted, and there will be an equally urgent need for repairs in the years immediately after the war. It is clear that the only way by which this short-term problem can be solved is by novel methods both of designing houses and of using the available labour force, with the object of getting the numbers built up to 500,000 a year or even higher. The houses thus provided will necessarily be temporary, but they need not, and should not, be unsightly. It is believed that the Minister of Works is shortly to make an announcement on this subject.

The long-term demand for housing is an entirely different matter. With the attainment of the two short-term objectives, there will be rather less than 13,500,000 dwellings in the country, and it may be hoped that this point will be reached well within the ten-year period. The permanent size and shape of the building industry from that time onwards depend upon the continuing demand which, in its turn, depends upon the rate of replacement. An annual demand of 300,000 houses a year implies the replacement of every dwelling in the country, on the average, every 45 years; an annual demand of 400,000 implies replacement every 34 years. Is either one of these a reasonable assumption?

Either one would be very greatly in excess of anything previously known. In the decade between the censuses of 1921 and 1931 the volume of replacement (excess of new houses built over increase in total number of houses) was only 27,000 a year, and in the 8½ years from 1931 to the outbreak of war, replacement, other than slum clearance, amounted to only some 28,000 units a year. If this was the rate of voluntary replacement during a period of most active building and rapid progress in the design and equipment of houses, it is difficult to see why it should spontaneously increase after the war. The fact overlooked by the "rebuilders" is that replacement, though possibly desirable on social grounds, is an extremely expensive proposition. Voluntary replacement in built-up areas—that is, the substitution of a new dwelling-house for an old one—seldom pays, because the selling price or rent of the new house must include, besides a return on the capital spent in construction, the purchase price of the old house and the cost of its clearance. If so little replacement on the site has taken place it is simply that builders could not find customers willing to pay a price high enough to include the cost of the old house and its demolition. In fact, the price of old houses would have to fall very substantially before replacement on the site would show any appreciable expansion. Such replacement as has taken place in the past has mainly taken the form of a substitution of blocks of flats for houses; this has been made possible because the cost of old houses and of clearance could be spread over a number of flats greatly exceeding the number of houses pulled down; in other words, the ratio between the cost of old houses and their demolition, on the one hand, and new capital expenditure, on the other hand, can be much greater by the substitution of flats for houses than of new for old houses. In replacement on a different site, such as suburban development, the new house is not saddled with the cost of the old one. Nevertheless, it must be remembered that the rapid development of suburban construction during the thirties took place in a period of shortage of housing, when there was consequently little fall in the value of old houses, or rents charged for them. After the standard of one dwelling per family, plus a reserve, has been reached, any further suburban building for replacement purposes would be followed by a fall in the rents of old houses, which would not have to go very far before the new houses became relatively too expensive to attract occupiers.

In the absence of a complete change in conditions after the war, the rate of voluntary replacement is most unlikely to amount to more than a fraction of the 300,000 to 400,000 total officially envisaged. If the total demand is to be sustained, there must be "induced" or "forced" replacement. How large should it be? There is a large number of conflicting factors to be taken into account. First, there is no doubt that many of the houses in the country are unsightly and inconvenient; there are some 4,000,000 houses over 80 years old, many of them doubtless verging on the slum category or well inside it; these will be emergency houses which will need replacement. There would seem, from this point of view, to be a case for inducing rapid replacement in the earlier years even if it cannot be sustained. But,

secondly, a long-term housing plan needs to be calculated over a much longer period than ten years. It would be an act of cruelty to the building trade to induce it to expand to a size that could be maintained for only such a short period. The majority of the 80-year-old houses are not in such poor condition that they cannot be lived in for a few more years if by so doing the demand for houses can be stabilised. Thirdly, the early post-war years are likely to be precisely those in which there will be greatest competition for capital resources. The total net volume of private domestic investment in all forms of capital in 1938 was only £287 million. A building programme of 300,000 houses a year would cost (at average 1938 prices) some £140 million. With all the other competing demands for capital, does the community really wish to devote quite so much to the replacement of its existing houses at such a rapid rate? Fourthly, the number of families will soon be falling. Mr Abrams estimates that it will fall slightly in the 1950's and at the rate of 50,000 a year in the 1960's. If we wait, the obsolete houses can be removed without being replaced. Would it not, in many cases, be a waste of resources to replace, at high cost, a house that will not be needed in 20 or 30 years' time? And if the volume of necessary replacement is, so to speak, used up in the immediate future, will there be any demand at all for houses by 1970? Would it not be far better to think in much more conservative terms of the volume of replacement to be done in the near future, with the object of stabilising the demand for houses, not over ten years, but over 20 or 30?

There is thus a conflict between the requirements of the immediate post-war years and of the longer run. This conflict cannot be entirely resolved by any means. But the best method of reducing the clash to a minimum is to stop thinking about a ten-year plan, which will be unsatisfactory for both purposes, and to treat each, so far as possible, as a separate problem. Let the building industry be planned over a period of 25 or 30 years. And let there be superimposed upon this long-term plan an emergency scheme for using special methods to build 1,500,000 dwellings, of the cheaper design consistent with the necessary standards, in the shortest possible period of time.

## HISTORY, CURRENCY, AND PROPHECY

**Before the War**, when quality was what we cared to make it—we at Rowntrees made it high. You will remember Black Magic—Chocolate Crisp—Aero Milk Chocolate. These were typical of the standard at which all our production was fixed.

**During the War**, quality can be only what we are able to make it. Nevertheless, we find, somewhat to our surprise, that in spite of Hobson's choice in the matter of ingredients, we are able to make Chocolate and Clear Gums which the people who eat them are kind enough to call excellent. Even so, owing to Zoning we can sell them only in certain parts of the country, mainly in the North and East.

**After the War**, when at length the quality of our products again comes completely under our own control, we shall make our post-war products to our pre-war standards. Unhurriedly, as the right materials come into the country, we shall again produce Black Magic, Chocolate Crisp and the others—and sell them from Penzance to the Pentland Firth. And that's a promise.

## Washington Currency Talks

The arrival in Washington of a Soviet currency mission, headed by M. Nicolai Chechulin, of the State Bank of the USSR, has caused a new spate of rumours concerning the early assembly of a full-scale monetary conference in that city. The reports have been spiced with hints that M. Chechulin, having already discussed the position with Dr Harry White, of the US Treasury, had given indications that the full weight of the Soviet delegation would be thrown behind the American proposals for a \$5 billion Stabilisation Fund and against the British Clearing Union scheme. The reports have been received with a certain amount of surprise in London. Official quarters here still appear to be unaware of the reported American invitations to a full-scale monetary conference in the near future. The Chancellor of the Exchequer's recent statement that any such report must be "premature" is still the last official British comment on the reports and is probably to be taken as a characteristic under-statement. The other cause for surprise is the suggestion that there is still a substantial clash between the American and British proposals allowing for the intervention of Soviet influence on one side or the other. The impression which prevails in London is that most of the differences between the two plans are in course of resolution and that the plan which now holds the field is a White-Keynes compromise, admittedly bearing closer resemblance to the Stabilisation Fund than to the Clearing Union scheme, but standing in the name of the American and British experts. On the most glaring, though not necessarily the most important, difference between the two original plans, namely the capitalisation of the new international organisation, the British plan has probably been made to accord with the American. The Fund, in other words, would start operations with an initial capital fund to which the participating countries had contributed their quotas partly in gold, mostly in their own currencies or securities. But though general agreement has been obtained between the American and British experts, the stage does not appear to have been reached for fuller discussions at ministerial levels, though bilateral expert discussions of post-war monetary problems may be expected to continue in Washington for some months to come.

## Equity Adjustments

For some weeks past a number of brokers have been commenting upon the improved quality of the buying in the market, while continuing to complain of the meagre quantity. It is to be noted, however, that the brokers who are still reasonably busy are just those who have always discouraged speculation on the part of their clients. If the quality of buying has been good, the volume of selling has been sufficient to prevent any spectacular rise in prices, but the figure of *The Actuaries' Investment Index* shows a further rise similar to that of December and is now slightly above the October level, having recovered well over three-quarters of the fall from the end-September peak. The chart of the index compiled by *The Financial News*, set out on page 196, tells a similar story. At the moment of writing equities are still suffering a trifle and the Funds are on the up-grade, but the market believes that this may be a purely temporary phase. The interesting point in the recent movements is the adjustment which has occurred as between different classes of industrial equity. Thus, the Actuaries' figures show rises against end-October of 5.4 points in air-

craft manufacturing, about 2.5 points in electrical distribution and home railways and 1.5 in brewery shares, while there are falls of rather over one point in building material, iron and steel and store and catering shares, and one of no less than 3.5 points in coal shares. Over the same period the yield figures suggest that the investor takes a much more favourable view of aircraft shares than he did three months ago—but the yield is still by far the highest in the list—while a marked improvement in motor share dividends has had virtually no effect on the price index.

## Electricity Distribution

Two reports on the future of electricity have been published this week. The one consists of a memorandum submitted to the Minister of Fuel and Power by various sections of the industry, including the Incorporated Municipal Electrical Association, the Provincial Electric Supply Association, the London Electricity Supply Association, and a group of power companies; another group of power companies has already published a separate report, discussed on page 753 in *The Economist* on December 4th. The other is a memorandum proposed by a post-war planning committee of the Institution of Electrical Engineers. The report of the various sections of the electricity supply industry is concerned mainly with the distribution side of electricity. Their recommendations are based on the assumption that the consumer should be able to choose freely the fuel service he wishes to use and that no drastic alterations should be made in the ownership and organisation of existing undertakings unless these can be proved to bring substantial and permanent benefits to the consumer. In the light of these considerations the report advocates a "policy of organised co-operation" in these words:

Briefly, it is the linking up of undertakings in specified areas with a view to the removal of anomalies and difficulties, and to the adoption of a common policy of service to the consuming public. This work of co-ordination would be done through area committees, who would also ensure the carrying out of items of national policy. Such a scheme would retain the present structure of the industry so far as this may be efficiently utilised, and introduce means whereby any inefficient undertaking would be brought up to the required standard for the area.

In order to carry out this policy the Report suggests the appointment, by the Electricity Commissioners—under the powers conferred upon them by section (4) of the Electricity (Supply) Act, 1919—of an advisory committee to make recommendations for the division of the country into a number of electricity distributing areas. Next, in each area determined by the Electricity Commissioners a permanent committee should be established, to be appointed by the authorised undertakings in the area on a basis which would give them "equitable representation"; the chairmen of these area committees, however, would be appointed by the Electricity Commissioners. These committees would have the task of advising the Electricity Commissioners on the steps necessary to co-ordinate the development of electricity supply in their areas, and they would "expedite" the adoption of items of national policy. Pending the formation of the area committees and the completion of their investigations, the rights of local authorities to purchase company undertakings whose licences have expired should be suspended. In sum, the report advocates that such reorganisation as may be necessary in the distribution of electricity should be carried out "within" the industry.

## Technical Reorganisation

The report of the post-war planning committee of the Institution of Electrical Engineers is concerned mainly with "technical matters of immediate urgency." First on the list of recommendations is that for the standardisation of voltage and of system on all low-voltage distribution systems; this should be carried out as a national scheme, and could be completed during a period not exceeding five years. On the basis of 1939 prices, the cost of standardisation is estimated at £17.5 million. Further, the report contains

a number of recommendations for speeding up electrification, especially in rural areas, for the reform of tariffs—"the time is ripe for securing uniformity of forms of tariff"—and on the subject of standards of equipment in consumers' installations. The layman cannot assess the merits of these technical recommendations, but there can be no doubt about the advantages of expediting the standardisation of voltages, which is also advocated in the report of the electricity supply industry.

## Five Per Cent Conversion

The decision of the Government to pay off the £318 million of 5 per cent Conversion Loan without making any special offer of stock in exchange should have caused no surprise, but it has been sufficient to stimulate the gilt-edged market to a small display of activity, accompanied by a modest rise in prices, particularly in those of long dated or irredeemable stocks. This rise is based on the belief that something like one-third of the total issue is still outstanding. Reduction to this figure has been effected by official purchases over a period of many months and, as the terms have been very favourable, it is another instance of the investor's apathy that so high a proportion should remain. It is supposed that the whole is in the hands of the private investor. In the case of the 4½ per cent Conversion the money market bought heavily, but was offered in exchange an unacceptable long dated stock, with the intimation that a demand for repayment would not be well received. They are understood to have sold the whole of their holdings of 5 per cent stock. In view of the fact that prices shortly before each of the recent ex dividend dates have ranged from over 5 points to some 4½ points premium, it is hard to believe that any other institutional investor has missed the chance to sell. The argument for a sale by the private investor is at least equally strong; since he will receive, on May 1st, only par plus 1½ points of net interest, it would be to his advantage to sell while the price remains at anything like 102½. The fact is that, for over a year, the authorities have been offering prices for this stock which amounted to forgiving the holder a considerable proportion of the income tax due by him. Presumably the terms offered will continue to be generous, since it would be inconvenient to have to deal with an additional £100 million of borrowing in one block, but such investors as still hold the stock might well sell and reinvest at once. How far the money will go into gilt-edged is doubtful. It is already apparent that the demand in this market is largely for the high yielding irredeemables, and some people will almost certainly wish to receive, in exchange for their present 5 per cent, something rather higher than can be obtained in Government securities.

## Licensed Stock Dealing

A further step in the plans for protecting the investor is to be taken in the near future by the putting into force of the Prevention of Fraud (Investments) Act, 1939. According to a statement of Mr Hugh Dalton, April 15th is to be the appointed day, and by that time all those who wish to deal in securities must have applied to his department for a licence. The business of investigation and granting of licences will take some time, but the Act is expected to be in full operation by mid-July, in so far as it affects this particular issue. Sections relating to industrial, provident and building societies came into force in 1939. Both principals and agents will require licences, and it is certain that very substantial progress has been made towards determining what classes of person will be entitled to receive them. A number of margin cases may cause some dispute. Members of the stock exchanges of the country, including the Provincial Brokers Stock Exchange, and possibly some other bodies, will not come within the scope of the Act, and it is believed that membership of the Association of Stock and Share Dealers, an association of outside brokers set up under the auspices of the Board of Trade, will confer the right to a licence without any further investigation. Beyond this field, and that of a number of concerns with established reputations in other fields of finance, there is a large and rather tattered fringe where the decision to license can only be taken, if at all, on the merits of the individual case. The Stock Exchange Committee, which has been anxious for a long time to have the Act made operative, has been working out its own plan for recognition, and it may be presumed

that there will be close consultation, although not necessarily identity of views, between it and the Board of Trade. In the circumstances, no great harm will have been done by four years' delay in implementing the 1939 decisions, if a well-thought-out scheme can be brought into operation before the lessening of the war tension permits the average man to pay rather more attention to investment than he has done in recent years.

## Crude or Refined Oil

In an address before the Institute of Fuel last Tuesday, Mr Harold Moore, petroleum consultant, stated the case for a large-scale oil-refining industry in this country. For some time to come, at any rate, the supply of petroleum will be large enough and its price low enough to render it uneconomic for Great Britain to meet more than a comparatively small proportion of its liquid fuel requirements from coal. Oil is at present obtained from coal as a by-product in the carbonisation of coal; the limit is set largely by the demand for coke. It is also obtained by the process of hydrogenation at a plant operated by Imperial Chemical Industries but only at the cost of a heavy subsidy. It could, further, be obtained by the Fischer Tropsch process—again only at the cost of a subsidy. For purposes of experiment and research Mr Moore suggested that hydrogenation should be continued and that a commercial scale Fischer Tropsch plant should also be set up. But in his view, Great Britain would probably have to import as much petroleum in the years after the war as before. The real question is whether this petroleum should be imported mainly in the form of finished products as before the war or whether a much bigger proportion of it should be imported in the raw material stage. Mr Moore strongly argued the case for the adoption of the second course. Since the average import price of finished products was nearly double that of crude petroleum before the war and may be relatively higher still after the war, it would save foreign exchange. Moreover, if Britain is to enter the new and growing oil-based chemical industry, large-scale oil refineries will be indispensable. In view of technological improvements, the disadvantages of carrying out the refining process far from the sources of the crude oil have been largely overcome; in the United States, for example, much refining is now carried out near the market, far from the oil wells. This is not the occasion for a judgment on the merits of Mr Moore's line of argument. But it cannot be ignored and requires an answer, especially as Britain's economy has been based largely on the conversion of imported raw materials into finished products.

## National Transport Board

In an article in *The Economist* on January 25th three possible lines of transport policy were briefly described. The first would be a return to open competition, with some equalisation between road and rail of the burden placed upon them by the State. The second would be the continued maintenance of road and rail as separate entities, but with agreement between them on the rates to be charged. The third would be some community of interest between the two which, by making it a matter of indifference to them whether traffic moved by one means or the other, would make it possible to regard and operate them as so much carrying capacity. In an address before the Engineering Industries Association on January 25th Major-General Gilbert Szlumper, a former manager of the Southern Railway Company and now Director-General of Supply Services at the Ministry of Supply, argued in favour of the adoption of the third line of policy; but the community of interest is to be achieved on the public board principle rather than by outright nationalisation. His National Transport Board would issue mainly fixed interest-bearing stocks, "leaving only a very minor proportion (of ordinary stock) to act as a tonic to those responsible for running the undertaking." Major-General Szlumper's solution is not a new one; its interest lies in that it comes from a former executive of one of the main-line railways. Some railway opinion still appears to be in favour of the first line of policy, while others, such as Sir William Wood, president of the LMS, have recently tended to favour the second. An interesting footnote to Major-General Szlumper's speech was added in the House of Commons on Wednesday when Mr Ellis Smith asked the Minister of Supply whether he had sanctioned it.

## NORANDA MINES LIMITED

### DIVIDEND NOTICE

Notice is hereby given that an interim dividend of One Dollar (\$1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable March 15, 1944, to shareholders of record at the close of business, February 15, 1944.

By Order of the Board,  
Toronto, J. R. BRADFIELD, Secretary.  
January 27, 1944.

## Gold Ousts Jewels

The most convincing evidence so far received of the extent of recent gold imports into Persia is the announcement from Teheran that the Persian crown jewels are to be replaced by gold as backing of the note circulation. These jewels have appeared in the accounts of the Persian National Bank at a face value of 344 million rials, equivalent to £2,650,000; their market value is well in excess of this figure. The announcement by the Governor of the National Bank that they would be replaced by gold was doubly interesting because it disclosed the sources from which the gold entering Persia had come. Recent imports of 130 million rials, or £1 million, had come from South Africa and the United States, while a similar amount awaits shipment from the United States. The total influx of gold into Persia since the Allied occupation is probably greater than this. The metal has been sent in by Britain and the United States to mop up the purchasing power created by the abnormal Allied expenditure in that country. Most of this metal goes into hoards and thus fulfils

the purpose for which it was sent. But some of it has dribbled through to the National Bank. The operations totalling £2 million to which the Governor of the National Bank referred were probably made direct for the National Bank and represent the conversion into gold of part of the sterling and dollar balances which the National Bank has acquired as yet another result of the phenomenon of abnormal Allied expenditure in Persia.

## Debt Repaid

The national debt returns covering the first 29 days of January are the first, since January, 1941, when the publication of these monthly returns began, to show a net repayment of debt. This achievement was probably the first of its kind since the outbreak of the war. The repayment was a very small one, namely, £2,836,000 in a total debt turnover of over £4,000,000,000 during the month, but it is none the less significant as evidence of the levelling in the curve of national expenditure. The ability to achieve a net repayment of debt is wholly due to the seasonal compression of certain tax payments in the first few weeks of January, and is unlikely to recur again in the near future. It should be reasonable, however, to assume that the revenue deficit will henceforth run at a somewhat lower level than in the corresponding period of last year. Certain heavy items of war expenditure of a capital nature are likely to drop sharply in the near future; the recent decision to curtail purchases of copper from Rhodesia suggests that, even as regards the current output of certain types of munitions, the curve is now downward. Last month's debt reduction was wholly contributed by the floating debt. In large part this was explained by the fact that a £120,000,000 3 per cent terminable annuity was issued last month to the National Debt Commissioners as an investment of Savings Bank funds. This is accompanied by a reduction of £76,350,000 in ways and means advances from public departments—a movement which indicates how these funds were previously invested. Tax Reserve Certificates have now fully come into their own as a means of tax payment, and last month the total so tendered was £100,088,000, compared with only £23,731,000 in January, 1943.

## Stopping a Gap

The Committee of the Stock Exchange, London, has this week taken a step towards ensuring that a further slice of what it regards as its legitimate business should remain within its own domestic circle and not go to other members of the financial community. There is no change as regards dealings on provincial exchanges, except that the bargain must be marked, and no change as regards dealing on foreign exchanges, except that the deal must be direct and not through any agency. In the event of a member desiring to deal through any agent, the business must first be offered on the same terms to the London market, and only if the actual dealing terms there are less favourable may he place it outside. The matter largely arises from the fact that certain houses, who are able to give a broker orders, offer an alternative channel of communication to the market. The ground taken by the Committee is that the larger the volume of business in one place, the better the service to the investing public, other things being equal. Therefore, unless the use of the alternative outside channel would result in a direct benefit to the client, the broker's first duty is to his own institution. The criterion is in every case the immediate benefit of the client, but provided that point is met the market must have the first refusal of the business.

## Licence of Right

A further contribution to the literature of the relative merits of the exclusive patent and the licence of right comes from the Boots Pure Drug group. Written by Mr A. Sugden, with a preface by Lord Trent, chairman and managing director of the Boots companies, it gives an almost direct negative to the contentions of the ICI pamphlet, discussed on page 81 of *The Economist* of January 15th. The final conclusion is

that by reference to hard facts it has been shown that the present system is quite inadequate to meet the serious actual abuses; that the procedure is impracticable and unsuitable; and that the adoption of a compulsory licensing system would appear to be a great step in advance.

Of the 30 cases in which ICI claimed that the procedure of Section 27 had been operated, the records of the Patent

Office show some six or seven successful applications. One unsuccessful case occupied the Comptroller three and the Court nine days and took 21 months to settle. In the "successful" case of McKechie Bros., who had been refused licence to work German IG patents here, the figures were 10 days of the Comptroller's time and nine of the Court's, and it took over 18 months to establish the claim. It is a pity that more instances are not given, but these at least show that only the largest undertakings can face the expense, and that the delay may be sufficient to make the eventual grant of licence—if obtained—of much reduced value. Mr Sugden goes on to deal with the general position of IG patents, which, he claims, cover almost every industry, and to state that the intolerable position which such a system permits cannot be eased by restricting compulsory licensing merely to foreign patentees. On the general question of the public interest the sound view is taken that the broadening of manufacturing opportunity must be the real concern, and that the system of restrictive patents means that the manufacturing interest dictates the amount of production and largely determines the price.

## In Defence of Private Enterprise

On Tuesday Lord McGowan, chairman of Imperial Chemical Industries, gave the Glasgow Chamber of Commerce an account of his company's war-time achievements. The record, as revealed by him, is an impressive one, both in the range of activities of ICI and in detailed achievement. It also shows the all important rôle in modern warfare of the chemical industry, which, in this country, is dominated by ICI. The personnel of the company has been increased from a peace-time establishment of 70,000 to a war-time strength of 120,000. Since the outbreak of war ICI has been responsible for building factories, on Government account, involving the expenditure of £61 million for the production of materials of which the company either had manufacturing experience or on which it had carried out research. It has also been responsible for providing or training the staff necessary to operate these plants. Lord McGowan was able to give detailed examples of achievements in the field of explosives, ammunition, aviation spirit, drugs, agri-

culture, synthetic textiles and others. It would be interesting to set these achievements alongside those of the American chemical industry. His decision to lift the veil from some of his company's activities might with advantage be followed by other industries. The immediate purpose of Lord McGowan's address was to defend the British system of private enterprise and to refute, by way of example,

the argument that the substitution of operation and control of industry by the state would presently usher in a new Utopia.

In stating the merits of private enterprise in general terms, Lord McGowan was on solid ground. But, except in statements of political dogma, the argument is not formulated in general terms. The question at issue is not whether private enterprise should be abandoned in favour of state enterprise, but how it can be kept free from the shackles of restriction and made as efficient as possible in the fields of activity in which it is most appropriate.

## The New Coal Prices

When the Minister of Fuel and Power announced in the House of Commons on January 20th that the price of coal and coke would be increased, from February 1st, he estimated the average addition at 3s. per ton. Before the formation of the Ministry of Fuel and Power it was the practice of the Mines Department of the Board of Trade to authorise price increases which were differential in their application as regards the amount per ton, the grade of coal, and the coalfield. Normally, higher prices were authorised for anthracite than for bituminous coals, and higher prices for exporting than for inland districts. For example, while the increases authorised between the outbreak of the war and July 2, 1942, and applicable uniformly to all districts, amounted in the aggregate to 7s. 11d. per ton, additional increases of 2s. 2d. per ton were granted on bituminous coals and of 4s. per ton on anthracite coals in the South Wales coalfield. On the present occasion the Ministry of Fuel and Power delegated the distribution of the average 3s. per ton increase to the District Executive Boards, subject to its approval, and the schedule of the increases was communicated by the

## COMMON COLD

## Common sense..

THE common sense approach to the problem of the common cold is "Serocalcin" and people who maintain that colds are "inevitable" ignore facts. For more than eight years "Serocalcin" has been prescribed by the Medical Profession and the efficacy of "Serocalcin" for treatment or prophylaxis in some 8 out of 10 cases is now a matter of established fact.

"Serocalcin" (reg. trade mark) is a sulpho-guaiacolic plasma precipitate which enhances the resistive capacity of the body against invading organisms that cause colds. It is contained in small tablets, easy and pleasant to take.

Three tablets, three times daily, will usually clear up a cold in 48 to 72 hours. Two tablets daily, for 30 consecutive days, provide immunity in some 8 out of 10 cases for a period of 3 to 4 months.

There are no "drugs" in "Serocalcin" and consequently no unpleasant reactions. It can be given to children with perfect safety.

A treatment pack of 20 "Serocalcin" tablets costs 3/4 (inc. tax). The full immunizing course of 60 tablets costs 8/5 (inc. tax). All who suffer from the common cold are invited to send 1d. stamp (to comply with regulations) for booklet "Immunity from Colds."

Ministry to the trade on Monday. There has been no change in the quotations of some of the inferior lines but on other grades the increases range from 6d. to 3s. 10d. per ton at the pithead, Leicester and S. Derby, Shropshire, and Kent being the only coalfields in which a 3s. increase applies to all the coals marketed by them. As part of the arrangement under which the railway rebate on export coals was suspended last year, South Wales, Northumberland and Durham have been granted special allowances on their export coals, and under the advances now authorised South Wales is given an additional increase of 10d. per ton on all shipments—coastwise as well as foreign—and Northumberland and Durham 3½d. per ton. The rise in the price of blastfurnace coke has not yet been determined, but for coke breeze it is 1s. 6d. per ton, for hard and gas coke 3s., and for foundry coke 4s. 6d. for shipment as well as for inland consumption. On current commercial disposals of coal and coke the average rise in price is estimated to yield approximately £30 million per annum.

### Engineering Wages

At the meeting between the engineering employers and trade unions in London this week, two important, and quite separate, issues came up for discussion. The unions comprising the joint trades movement of the engineering industry presented their claim for an advance of 10s. on the district base rate. The present district base rate is 66s. a week; this was arrived at under the award of the National Arbitration Tribunal (No. 326) in March, 1943, which transferred 20s. of the national bonus to the base rate of 46s., in force since 1922, leaving 13s. 6d. as a national bonus for pieceworkers. The award also laid down that a pieceworker of average ability should be able to earn a premium of not less than 27½ per cent on the district rate; plain time workers were given an increase of 6s., bringing their national bonus to 21s. 6d. In effect, the union's new claim would bring the total minimum wages of a skilled fitter (the standard on which the wage is based) up to 89s. 6d. for a 47-hour week. Actual earnings are considerably higher in many categories. The average in the metal engineering and shipbuilding group in January, 1943, according to the latest Ministry of Labour survey, was 131s. 6d. a week for adult male workers. This is largely due to the amount of overtime worked in engineering factories. The other subject under discussion is the Amalgamated Engineering Union's proposal for grading engineering wages according to the processes, irrespective of whether these are performed by men or women. For the last six months the union has been working on a scheme with the object of simplifying and rationalising the wages structure. The employers do not have any objections to grading in principle, but they point out that there are many practical difficulties in applying a national scheme. The trend towards simplification of wages is developing in many industries at the present time. Last month the Industrial Court made recommendations for simplifying the wages in the wool-combing section of the wool textile industry, and the Porter Tribunal has urged the need for a complete overhaul of the complex structure of mining wages.

### Small Farm Mechanisation

In any discussion of the extent to which British farming should be mechanised, the small farm is of great importance, since about 80 per cent of the farms in this country are of less than 100 acres. That this fact must dominate the discussion and influence the conclusions reached was well borne out in a paper by Professor D. B. Johnstone-Wallace, deputy director of the National Institute of Agricultural Engineering, presented to the Institution of British Agricultural Engineers on January 25th. Two main problems arise when the purchase of machinery for the family or small farm is contemplated. Firstly, one labour-saving machine calls for another; otherwise bottlenecks are created. Secondly, a full set of mechanised equipment can deal as easily with 200 or 300 acres as with 100 acres. Thus, in addition to the initial difficulty of finding capital, more is needed in proportion on a small farm than on a larger one. These problems can be solved by collective ownership of machinery or by the provision of a service by a contractor on the lines of the motor-hire business. During the war, increased production has depended on a greater degree of mechanisation than formerly, and the war-time solution of the problem can be continued in peacetime. Through the county war agricultural executive committees, machinery is lent to farms and work is done on contract. The difficulties of this solution lie not so much in the timing of operations, as in the trouble involved in moving existing machinery from farm to farm. This can be avoided by designing machinery in the future capable of easy transport. Economy in machinery for small farmers can be achieved by the introduction of multiple-purpose machines, and it is obvious that there is a great demand for them from farmers. The National Institute of Agricultural Engineers, which was established in 1942, was a welcome sign of the importance attached to research. Mechanisation is not itself a complete panacea for the post-war future of British farming, and attention must be paid to an increasing extent to raising efficiency by better management, by introducing a well-balanced "assembly line" on the farm, careful co-ordination of work, and time studies. The results of research must be allied to the provision of better farm buildings, availability of electricity, cheap machinery, petrol, and fertilisers, if British agriculture is to be placed on an efficient level after the war.

### Labour in the Building Industry

One of the most interesting sections in the annual report of the National Federation of Building Trades Employers is that dealing with labour relations in the industry. The satisfactory degree of co-operation maintained since the war is reflected in the small number of strikes. Some 131,000 days were lost in building and public works contracting through stoppages in 1939, and whereas the time lost through strikes in industry generally increased progressively during four years of war, the figure for the building industry shows a steady decline. About 73,000 days were lost in 1940, 36,000 in 1941, 29,000 in 1942 and, in the first eleven months of 1943, only 23,000 days, compared with a total in industry of 1,676,000. The industry's National Joint Council has operated smoothly and has been an important factor in keeping industrial peace. An increase in wages was granted by the Council in April, 1943, increasing the standard rates for craftsmen by 1d. per hour and those of labourers by ¾d. per hour. The operatives had applied for an increase of 3d. per hour in standard wage rates and the adoption of the principle that labourers should receive 80 per cent of the craftsmen's rate. Another benefit gained by building operatives has been the agreement for holidays with pay, which came into operation on February 1, 1943. There has been co-operation between building employers and trade unions at a higher level. Both are associated with the Apprenticeship and Training Council of the Ministry of Works and on the Building Programme Joint Committee, dealing specifically with labour supply. The Federation's report emphasises the difficulties which employers have had to face, as a result of a lower level of efficiency through the call-up of younger workers and the growth of indiscipline since the introduction of the Essential Work Order.

### Marine Insurance

The speech made by Mr H. Lloyd Owen, chairman of the Institute of London Underwriters, at the annual meeting on January 18th, provides an interesting review of the marine insurance market in 1943. As regards the insurance

of hulls, the main problem for underwriters arises from deferred repairs, due to pressure on dockyard facilities and the need to maintain the maximum volume of shipping in service. Owing to rising prices the actual cost of repairs, when made, is frequently found to bear no relation to the original estimate. In these conditions the decision to maintain in force, for the time being, the Hull Understandings which regulate rate increases according to the experience of the individual shipowner is, Mr Owen believes, a sound one. The Understandings have, however, been amended so that in cases where the premium charged has been increased on at least two occasions by reason of one casualty, the owner shall not be penalised a third time—a change which should tend to stabilise rates after the continuous upwards trend of the last four years. In cargo insurance the principal event was the introduction last April of the Combined Marine Surcharge, which brings together the surcharge formerly paid for wartime navigational hazards—apart, of course, from the actual war risk—and charges for certain risks such as deviations, delays and trans-shipments, arising out of war conditions. The new surcharge makes provision for cover from the time goods leave for shipment until delivery at the final warehouse, irrespective of how long it takes, where or how often the goods are trans-shipped or re-shipped, or whichever route has been taken, and has been accepted by the mercantile community as a genuine effort to simplify work. Some merchants, however, have been suspicious of a proviso that the assured must act with reasonable despatch; on this question Mr Owen, while making it clear that in the last analysis an interpretation could only come from the Courts, gave it as his personal view that the proviso merely means that no merchant shall make a deliberate or calculated use of the extra cover provided. Another point touched upon is the excessive economy practised by some merchants in packing; apart from the risk of the merchant being unprotected by his insurance, Mr Owen feels that "goods which arrive overseas in a crushed condition due to insufficient packing are no advertisement for British merchandise." Some of these considerations are further stressed in the annual report of the Liverpool Underwriters' Association, since published, which also expresses concern at the continuance of heavy losses from theft and pilferage.

### Insurance Education

A letter addressed to employers in the insurance industry by the presidents of the Institute of Actuaries, the Faculty of Actuaries in Scotland, and the Chartered Insurance Institute, contains proposals for the post-war education of men whose studies have been interrupted by the claims of national service. The signatories of the letter have reached the conclusion that if these men are expected to pursue their studies only outside office hours, the burden will be too heavy, and many will be unable to make the effort required; they feel that every inducement and opportunity must be given to make good the time lost by an absence which in many cases will be as much as five years, and that the only effective way in which this can be done is by employers granting leave of absence to permit of organised and supervised daytime study. It is proposed that these daytime studies—supplemented, of course, by the usual evening classes—should absorb two or three half-days a week, and the signatories are convinced that the inconvenience to employers—which will include the loss of services of senior men needed to conduct the studies—will, in the long run, be fully offset by the resultant advantages, since in the absence of some such arrangement the industry will in a few years be faced with a real shortage of trained men. The proposals are already known to command a wide measure of

approval and it is hoped that they will be given universal support. Although the immediate object is merely to bridge the gap created by the war, there seems every prospect that a scheme of this kind, once initiated and smoothly functioning, might become permanent—an outcome which would be fully in keeping with the spirit of Mr Butler's Education Bill. Insurance education, on a technical plane, has been well organised for many years, both as regards tuition and examinations; in its higher aspects it suffers from a lack of liaison with the universities—but that is another question.

### Manganese Developments

There are indications that the increase in the supply of shipping and the decrease in the loss of cargoes have substantially alleviated the manganese shortage of the United Nations. In 1943 the production of steel ingots in the United States rose by another 3,000,000 short tons (of 2,000 lbs.) to 89,000,000 short tons, a record equivalent to an increase of about 75 per cent over the output of 1939. About 12½ lbs. of manganese ore are needed to desulphurise and deoxidise every short ton of steel. Before the war the United States imported some 97 per cent of its manganese supplies. Yet, as the recently published annual report of the United States War Production Board revealed, "several domestic manganese plants are no longer being pushed because they would compete with copper and zinc mines for labour." Recent official statements indicated that copper and zinc themselves are no longer in seriously short supply; the decision reported by the War Production Board therefore suggests that the manganese problem, which in March, 1942, induced the authorities in the United States to call for ten plants for the concentration of domestic low-grade manganese ore as a matter of urgency, has now in the main been solved. Despite the loss of the Nikopol deposit in the Ukraine to Germany, the United Nations have always controlled sufficient manganese resources in Transcaucasia, India, Egypt, West Africa, South Africa and Latin America to cover all needs; the problem was one of shipping. The reverses of the Japanese in the Indian Ocean brought the first improvement late in 1942. Last year the increased construction of ore carriers, together with the reduction in losses at sea and the reopening of the Mediterranean, greatly improved the position; at present the chief supply difficulties seem to arise from the internal transport conditions in certain producing areas, especially India and South Africa, where a shortage of rail-cars to move the large output has recently been reported. These shortages, however, are likely to be overcome with greater ease than the earlier difficulties of securing adequate loading space for the long sea hauls from the producing areas to the United States and this country, so that manganese supplies for Allied steel works will probably show a further improvement this year.

### New Zealand Conversion

Although there has been a marked improvement in the sterling assets of the Reserve Bank of New Zealand since the outbreak of the war, their total—which stood at about £24 million last November—is still insufficient to allow of heavy London debt repayments by the New Zealand Government. It has therefore been decided to convert and not to repay the £7,339,656 of 4½ per cent stock which is redeemable at par on March 1st next. Holders are offered conversion at par into 3½ per cent stock 1960-64. The issue is being underwritten by the British Treasury, which will make available the sterling required by holders who do not accept the conversion offer.

### DOMINION OF CANADA

TWO AND A HALF PER CENT. INSCRIBED STOCK, 1947

For the purpose of preparing the Interest Warrants due 1st April, 1944, on the above-mentioned Loan the BALANCES will be STRUCK on the evening of the 1st March, 1944, after which date the Stock will be transferred ex-dividend.

## COMPANY MEETINGS

LIEBIG'S EXTRACT OF MEAT  
COMPANY, LIMITEDRECORD VOLUME OF SALES  
MR KENNETH M. CARLISLE'S  
STATEMENT

The seventy-ninth ordinary general meeting of Liebig's Extract of Meat Company, Limited, was held, on the 1st instant, at Thames House, Queen Street Place, E.C.

Mr Kenneth M. Carlisle (chairman and managing director) presided.

The following is the statement by the chairman circulated with the report and accounts and taken as read:—

In order to come into line with recent recommendations of the Institute of Chartered Accountants we have decided this year to provide in a separate account for all taxation that may be expected to accrue from operations up to date of the balance-sheet.

In order to bring about this desirable position in the form recommended, we have brought in the sum of £150,000 from contingency account and have transferred the sum of about £260,000 to provision for taxation.

It is proposed to maintain the final dividend at last year's rate of 6s. per £5 unit of stock, and this will entail a reduction of about £21,000 in the carry-forward.

## FAVOURABLE RESULTS

Again a year of favourable trading has to be recorded, with the output of our factories in this country, which are operated by the Oxo Company, well maintained, notwithstanding a reduced personnel, and with the volume of sales at a figure which surpasses last year's hitherto best. Operations in our overseas factories were again conducted on a substantial scale commensurate with the number of cattle that could be brought to the plants, but drought, both in Africa and South America, retarded and impaired the conditioning of cattle, and weights and yields were lower than for several years.

Our South American factories have again concentrated upon production for the Ministry of Food and it is gratifying that their efforts have resulted in the output of important quantities of canned meats and other foodstuffs of particular value and convenience in time of war.

## MINISTRY OF FOOD CONTRACT

The new contract negotiated by the Ministry of Food and the Argentine Meat Board for the supply of corned beef and other canned meats to the United Nations during 1943 and 1944 was not finally settled until after the close of our season, and the revised prices, although showing a welcome improvement, proved to be barely sufficient to compensate the general increase in the costs of production.

Notwithstanding the severe drought which prevailed throughout the greater part of the three Republics of the River Plate during the spring and summer months, the herds and flocks on our estancias came through well, and mortality figures compare not unfavourably with those of more propitious farming years. The customary movement and transfers of stocks were interfered with, while uneven and retarded conditioning upset the smooth execution of farm routine and programmes, but the substantial increase which occurred in the price of all livestock rather more than offset these adversities and all the subsidiary companies which conduct our widespread farming interests enjoyed a prosperous year.

In Africa our plant in Kenya has had an active year in the production of preserved meat and foodstuffs for the East African Supply Board. In Rhodesia factory operations were on a smaller scale than for several years past and for the first time since 1937, in the ranching section a small adverse balance of trading has to be recorded.

DALGETY AND COMPANY,  
LIMITED

## BUSINESS MAINTAINED

The adjourned fifty-ninth annual general meeting of Dalgety and Company, Limited, was held, on the 3rd instant, in London.

The following is an extract from the statement of the chairman, Maj.-Gen. Sir John H. Davidson, K.C.M.G., circulated with the accounts:—

The war is affecting the company's activities in many directions. Our connection as shipping agents is considerable, but under present conditions the task of seeking and arranging freight for shipping principals has been seriously dislocated. On the other hand, the company is doing a large amount of routine shipping work on behalf of the Allied Governments for war purposes and, arising also out of war conditions, the work at the company's ocean wharves at Brisbane and Sydney has been heavy.

The merchanting business has decreased, partly through the temporary inaction of certain valuable agencies for overseas products, and partly because of the curtailed shipments and restricted imports from this country. Rationing of petrol, difficulties of travel, and the serious depletion of our personnel have had the effect that the services rendered by the company's staff to wool and stock clients in the country areas have necessarily been curtailed. The drain on the company's staff has, in fact, been severe.

The difficulties arising from the shortage of man power are, of course, widespread, and the pastoralists and farmers are encountering many perplexities on this account. There are difficulties in connection with shearing, the movement of live-stock, the maintenance of fencing, mills, etc., and the adequate control of dangerous pests. The Australian season has been variable, although in most States fairly good.

I considered it desirable to sound a note of warning last year about the probable results for this year, but I think we can congratulate ourselves that the business of the company has been reasonably well maintained. I feel, however, that it is not out of place to repeat this warning, for the disadvantages to which I drew your attention were not fully felt during the year under review.

## GROWING BURDENS OF TAXATION

I also drew your particular attention last year to the growing burden of taxation. This burden continues to increase. Our business in Australia and New Zealand is deep-rooted and solid. Our organisation is efficient and our staff, though stretched to its utmost capacity, is excellent. If I may be allowed to express a personal opinion, it is that the present Governments in both the Commonwealth and the Dominion, having the welfare of their countries at heart, will frankly realise that such concerns as ours perform a useful and well sustained service to the community.

With regard to wool, changes in the level of production were small, the Australian clip being somewhat larger in poundage though less in bales, and that of New Zealand rather below last season's record clip. Realisations were considerably higher owing to the 15 per cent. increase in price paid by the British Government.

Turning to the accounts, the increase in cash and decrease in advances are still further accentuated. While this greater liquidity must meanwhile result in a falling off of our interest earnings, nevertheless I feel that it is not altogether undesirable, as I believe that on the return to peace conditions we shall need to be in a strong financial position in order to provide for the requirements of clients and the development of our business. We recommend the payment of a final dividend of 3½ per cent., making 6 per cent. for the year—the same as last year—and, in doing so I feel sure you will agree that the year's result is satisfactory.

The reports and accounts were adopted.

CITY OF SAN PAULO  
IMPROVEMENTS AND  
FREEHOLD LAND COMPANY,  
LIMITEDCAPITAL REORGANISATION  
APPROVED

At the thirty-first adjourned ordinary general meeting, the meeting of the 7 per cent. preference stockholders and the extraordinary general meeting of the company, held, on the 27th ultimo, at River Plate House, London, E.C., the resolutions submitted were passed unanimously.

In the course of his remarks, Sir Arthur du Cros, Bart. (the chairman), stated that it was satisfactory that assets and revenue had recently increased, even at the reduced rate of 3d. per cruzero, and that profits on the present scale and basis were not likely to be liable to British income-tax for some years. Profits in suspense at £700,000 were three times higher than 10 years ago. The debtors at £1,217,000 were good, being secured on the land sold and carrying interest at 6½ per cent. Sales were 70 per cent. higher than in the previous year and continued high.

When dealing with the scheme for writing down the ordinary shares to 2s. 6d. and issuing 5½ per cent. income stock in consideration of cancellation of arrears of preference dividend, the chairman stated that he had received proxies with an overwhelming majority in favour. He stated that on the basis of profits for the past two years the income stock service would be covered four times, and the preference dividend three times in each case after providing for prior charges. The present financial year ending in February should show a satisfactory surplus after all prior charges and services. The accounts would show a clean sheet with the elimination of the exchange suspense account, the old debit balance on profit and loss account and the expenses of the scheme, and the surplus would be available for reserves or payment of ordinary dividend.

## JUTE INDUSTRIES, LIMITED

## MR J. ERNEST COX'S STATEMENT

The twenty-third annual general meeting of Jute Industries, Limited, will be held at the Association of Jute Spinners and Manufacturers, 5 Cowgate, Dundee, on the 24th instant.

The following is the statement of the chairman, Mr J. Ernest Cox, circulated with the report and accounts for the year ended September 30, 1943:

Trading profit, interest, dividends and transfer fees at £106,803 exceed the previous year's figure by £12,337.

The usual sum of £50,000 has been transferred to reserve for depreciation and obsolescence, and £25,000 has been added to the provision made last year to cover deferred repairs. The total amount for this purpose is now £50,000.

After meeting a dividend of 4 per cent. less income-tax, on the preference share there remains, with the amount brought forward, a sum of £35,424 to be carried to the next account.

Negotiations with the Inland Revenue relating to a capital and profits standard for excess profits tax purposes are still proceeding, but considerable progress has been made during the past year. We are advised that the provision made against this liability, as well as for income-tax and national defence contribution, is sufficient.

Your directors have decided that, in conformity with what has now become a practice of wide application, the shares of the company should be converted into stock, and on the conclusion of the annual meeting the necessary resolutions to that end will be submitted, for approval or otherwise, at the special meeting convened for that purpose.

ORIENT STEAM NAVIGATION  
COMPANY, LIMITED

## SHIP REPLACEMENT PROBLEM

The forty-fourth ordinary general meeting of Orient Steam Navigation Company, Limited, was held, on the 3rd instant, at 7 Bishopsgate, E.C., Mr I. C. Geddes (the chairman) presiding.

The following are extracts from the chairman's statement circulated with the report: The working profit has declined on account of the loss of ships and the substitution for their earnings of a much smaller sum from interest on investments. The amount of the reduction this year, as compared with the previous year, is £189,139. On the other hand, with a smaller fleet less is required to be written off for depreciation. We have transferred £50,000 from the profits of the year to pensions reserve account, so bringing it up to £200,000. We have paid the dividends on the preference shares and recommend the same dividend as last year on the ordinary shares—5 per cent., free of tax.

Before the war we had established reserves for the replacement of steamers and against the risk of a fall in the value of the securities in which our funds were vested pending the purchase of new steamers. In this year's balance-sheet these reserves, together with the outstanding balance of amounts provided for contingencies, have been collected in one account, the surplus of insurance recoveries the written-down value of steamers from enemy action. The total of this is £4,138,082. The amount now in credit in the Government tonnage account is £895,900. We shall be able to draw on this as we expend our money in providing substitutes for the ships we have lost during the war. Again we record our gratitude for

gallant service given at sea, on the land and in the air by all those of our staffs actively engaged in the present struggle. The report was unanimously adopted.

## BIGNELLS, LIMITED

## SATISFACTORY RESULTS

The seventh annual ordinary general meeting of Bignells, Limited, was held on the 28th ultimo, at Rushden, Mr Arthur J. Bignell (chairman and managing director) presiding.

The following is an extract from the statement by the chairman circulated with the report:—The accounts are presented in a revised form, and the appropriations recommended by the directors have been given effect to in this year's accounts, and will, I think, make it clearer for shareholders to understand how such proposals affect the accounts for the year under review.

The trading profit for the year amounted to £65,806 1s. 10d., which, after charging directors' fees, depreciation, War Damage Insurance and estimated liability for Excess Profits Tax, resulted in a net profit of £15,296 5s. 6d. The directors recommend that a final dividend of 5 per cent., less income tax, be paid on the ordinary shares, making, with the interim dividend already paid, 8 per cent. for the year ended November 27, 1943. The final dividend will absorb £1,875. The directors also recommend that the sum of £1,000 be applied in reduction of goodwill.

The appropriation account shows that after giving effect to the above recommendations (which are subject to the approval of shareholders in general meeting) and providing for income tax, the amount written off the goodwill out of last year's profits, the final and interim dividends on the ordinary shares paid January 29, 1943, and July 26, 1943, respectively, and

the half-yearly dividends on the 6 per cent. preference shares paid March 25 and September 29, 1943, there remains a balance of £7,267 11s. 11d. to be carried forward. Your board again feel justified in expressing satisfaction with the results for the year under review.

The report was adopted.

THE NATIONAL BANK  
LIMITED

## ANNUAL GENERAL MEETING

The one hundred and ninth annual general meeting of the proprietors of the National Bank was held, on the 27th ultimo, at the head office, 13 Old Broad Street, London, E.C.

Mr Michael J. Cooke, the chairman, presided.

The secretary read the formal notice convening the meeting and the report of the auditors.

The report and accounts, which had been previously circulated, were—with the approval of the proprietors present—taken as read, and the chairman reviewed the figures of the balance-sheet and referred to the payment of the dividend at the rate of 10 per cent. per annum, and the transfer of £10,000 to both the reserve and the premises accounts, which left £43,440—carried forward.

The chairman moved: "That the report and balance-sheet to December 31, 1943, be adopted by the meeting and entered on the minutes."

Sir George F. Murphy, Bt., seconded the motion, which was carried unanimously.

The retiring directors were re-elected and the auditors, Messrs Peat, Marwick, Mitchell and Company and Messrs Stokes Brothers and Pim, were reappointed for the ensuing year.

## Company Results

## FINANCE AND BANKING

**THE MONEY MARKET.**—The money market has returned to normal conditions of ease this week. Revenue payment have again been heavy, but their impact on bank cash has to some extent been offset by the £10,000,000 excess of Treasury bill maturities over payment for new bills. Although £20,000,000 was asked from the banks this week against Treasury Deposit Receipts, this amount was approximately balanced by the effective maturities. The banks, freed from the cares of window dressing have been more ready buyers of bills and the market which obtained a 32 per cent. allotment at last week's tender for Treasury bills, was able to satisfy their requirements. The Bank return shows the continued deflation of the volume of credit built up over the turn of the year and kept at a decidedly inflated level throughout January. Bankers' deposits at £169,619,000 are £18,165,000 down on the week.

**MONEY RATES, LONDON.**—The following rates remained unchanged between Jan. 28th and Feb. 3rd:—  
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months 1½-1½%; Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%; Day-to-day money, 1-1½%; Short Loans, 1-1½%. Bank deposit rates ½%. Discount deposit at call ½%; at notice ½%.

**Exchange Rates.**—The following rates fixed by the Bank of England remained unchanged between Jan. 28th and Feb. 3rd. (Figures in brackets are par of exchange.)  
United States, \$ (4.86) 4-02½-03½; mail transfers 4-02½-03½. Canada, \$ (4.86) 4-43-47; mail transfers 4-43-47½. Switzerland, Francs (25.21) 17-30-40. Sweden, Krona (19.159) T.T. 16-85-95. Dutch West India, Florin (12.11) 7-58-62. Portugal, Escudo (110) 99-80-100 20; mail transfers 99-80-100-30. Panama, \$ 4-02-04; mail transfers 4-02-04½. Brazil, \$ 63-64½ c. (buying). Uruguay, 7-6597 p. (buying).

**Fixed Rates for Payment at Bank of England for Clearing Offices.** Spain, Pesetas 44.00. Turkey, Piastres 520. Italy, 71-25 lire.  
**Market Rates.**—The following rates remained unchanged between Jan. 28th and Feb. 3rd.  
Egypt, Piastres (97½) 97½. India, Rupee (18d. per rupee) 17½-18½. Belgian Congo, Francs 176½. China, National \$ 3-3½. Iran, Rl. 128-134.

**Special Accounts** are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London. Rate for payment into Argentine special account: 16-03 pesos.  
**Forward Rates.**—Forward rates for one month have remained unchanged as follows: United States, ½ cent pm-par. Canada, ½ cent pm-par. Switzerland, 3 cents pm-par. Sweden, 3 ore pm-par.

## The Public Service

THREE years ago a committee examined the use of skilled men by the Services, and much of the mechanical efficiency of to-day's armies of invasion is due to its proposals; the new regiment, REME, was one result. Now, if the reconstruction programme that is being slowly fashioned is to be effective in action, the Civil Service should be similarly surveyed. What use is it going to make in peacetime of the sort of experts it has been compelled to call in to run the war? The conclusion in 1941 about the Armed Forces was that without radical changes in the recruitment and use of experienced craftsmen

the machines on which the lives of fighting men and the safety of the country depend may have to be entrusted to hands insufficiently skilled under inadequate supervision.

The same is now true, as peace approaches, of civilian government. If an Economic Civil Service is not promptly set up, properly staffed and paid, with proper status in the permanent hierarchy of administration—that is, if the machinery of government, which, directly or indirectly, will extend after the war farther into the economic field than ever before, is entrusted to unskilled hands inadequately supervised—not even the best projects to make the most of the nation's resources by a suitable marriage of public and private enterprise are likely to succeed. Government will be, in fact, what it is so often said to

be—a brake on the wheel; and the many tasks not suited for private management will either be undone or publicly botched.

The present danger is all in this direction. The after-war demand for cutting down the wartime Civil Service is already being anticipated. The apparent ill-treatment of temporary civil servants in the matter of pay-as-you-go income tax is only one instance of the casual esteem in which they are held. In numbers, necessarily, the Civil Service must be much cut down when the war is over, and the many thousands to go will be temporaries; there is a case indeed, as the Liberal Party report on demobilisation suggests, for the release of those of junior status at the first practical moment so that they can resume their civilian careers. But, in terms of skill and quality, if central administration is robbed at a stroke of the men of capacity from outside who have enabled the Government to mould the nation's industry, trade and finance into a working war economy, all hope of the successful execution of post-war plans, in the field of economics, can be abandoned.

The prospect, indeed, may be even worse. Without men of both intelligence and practical experience in technical matters, the Government will have no option, in its economic policy, but to do what it did before the war. For lack of both policies and agents, it will again hand

over responsibility to industrial bodies, and make them self-rulers and judges in their own cause; the industries are already filing claims. Many of the temporary civil servants doing industrial or commercial jobs, it is true, came to Whitehall from industry not entirely without interest; they came in to keep hold, and these can well be allowed to go when the wartime Ministries shrink. But there are others, now with the technique of administration added to outside skill and knowledge, who have developed a new sense of public responsibility and a new doctrine of public policy in industrial affairs. These are the men from whom should be drawn at least the skeleton of the new Economic Service, before they are dismissed out of hand or driven back to their old work by their present inferior status. These are the men who, with others like them, can staff the Boards and Commissions which may be set up between industry and the state; who can watch over public interests on the boards of private companies; who can serve the public corporations; and who, at the Board of Trade or in a Ministry of Industry, can be ready and equipped to scrutinise efficiency and prices if the public need requires. These are the men who will be able to watch over the community's interests and to fashion for their chiefs a consistent code of economic policy. Yet the doors are already being opened to bow them out of the Civil Service.

The number of competent temporaries who both could and should be kept is only small in numbers, though it is big in value. They are key men. Industry and the professions, especially the universities, will want their best men back. Many may go of their own accord, under contract or deliberate choice; but some, at least the minority needed to start economic government on the right road, should be kept in the public service. They can only be kept if the decision is made immediately to make it worth their while to stay, not merely in terms of money, but in authority and prospects of permanent and satisfying work. At present the most that they are offered is hand to mouth, piece-meal continuance in employment, more often than not as administrative beings of a lower order, up to some undefined date. If there is no change in attitude they will surely be lost—and with them much of the possibility of successful reconstruction.

## Baltic Vacuum

THE appearance of the Soviet army at Narva has thrown out of balance all the northern rim of Hitler's Ostland, just as the capture of Luck and Rovno by the Russians thrusts a wedge into its southern fringe. True, the Russians have still to fight their way through the deep and solid defences built by the Germans around Lake Peipus, before they can set their feet firmly on Estonian soil. But the result is apparently being taken for granted by the Germans themselves—and by the population of the Baltic states. The roads in Estonia and, to a lesser degree, in Latvia are reported to be blocked not only by military traffic but also by streams of refugees. The civilian authorities, German and Baltic, are packing up their baggage; and the German army is taking over the administration. German civilians have been ordered to leave Riga by February 15th; and a wild scramble for accommodation on board ships sailing for Copenhagen and Stettin has been reported from Riga harbour. Panic seems to be spreading behind the German lines.

But the army is not giving up the fight. The Germans themselves state that they have razed to the ground all villages east of Narva. Clearly they will "scorch the earth" in the Baltic countries not less ruthlessly, but perhaps even more ruthlessly, than they have done in the Ukraine. Here the routes for retreat are much shorter; and they lead straight into Germany. Before the Germans go back they drive before them the cattle and the manpower of the Baltic *Generalbezirke*—by now a familiar feature of all Nazi retreats.

The Government cannot do its job without men like these; and it cannot keep them without building immediately the kind of framework in which they can do their work, and to which can be attracted year by year similar recruits in a steady stream. Much more is needed than bits and pieces. It is not enough, say, to decide to keep on the Central Statistical Office here or a reconstruction department there, one good temporary in this Ministry or another in that. Unless there is a radical change in the Civil Service status of men with skill and knowledge gained outside, the economic departments, branches or offices which are retained or newly set up will be staffed either by permanents who, for all their good education, high intelligence and outstanding integrity, will not be competent to make a success of it, or by temporaries too poor to get good work elsewhere. It is not simply a question of administrative machinery; it is a question of personnel. And the problem can only be solved by the institution of an Economic Service to advise on and administer economic policy on every required point. Its cadre at the outset would be the wartime temporaries kept on; its new recruits, as the new Service developed, would be specialists, of Civil Service standard in education and intelligence, but up to ten years older at the age of entry, to permit a sufficient period, beforehand, of direct practical experience in industry or business or on the research side of applied economics. Their salaries would be appropriate to their age and qualifications, and they would no longer be regarded by the Civil Service, like the wartime pioneers, largely as hewers of wood and drawers of water.

Only by the permanent aid of such new professionals at the right places can the Government either make or apply the policies for which the nation must look in the post-war future. At present, as casual labourers, they do make it possible for the Government to devise post-war plans. To let them be swept bodily away on the tide of demobilisation would be crass folly. There are serious obstacles. Much of the press and, so, many of its readers will soon be up in arms against every "expendable" bureaucrat; inside, there are some permanent civil servants prepared to give the parting push. It is precisely because of these obstacles, as well as the gap to be filled, that action should be taken now to create the needed new regiment of modern administrators.

For all the undoubted determination of the *Wehrmacht* to make use of every inch of land for defence, the most recent German moves show distinct signs of confusion. The decision was taken very late in the day to conscript the nationals of the Baltic countries, whose contribution to the fighting had previously been limited to a few SS battalions of volunteers. But the call-up was no sooner issued than it was cancelled, at least in Estonia. It is not quite clear whether this was due to a realisation that it was really too late to train conscripts or to doubts about the political reliability of the Baltic peoples. In Tallinn, Riga and Kaunas emergency conferences of the chiefs of police, Gestapo and SS were held last week; and appeals have been issued to the local populations to lend a hand in the fight against Soviet parachutists and local partisans operating near the borders. Fear of Communism is being whipped up by the propagandists; but, despite previous promises, not even a last-minute extension of autonomy has been granted to the Estonians, Latvians and Lithuanians. The only concession is that in the *Generalbezirk* of Byelorussia a statute of semi-autonomy similar to that which was granted to the Baltic countries in 1942 has now been announced.

Lohse, the Reichsminister for the northern Ostland, apparently feels that the time for gestures and reforms has passed; and that, if they were to be made now, their yield would probably be negligible. The Nazis have to pay the penalty for their Ostland policy, which has managed to antagonise not a few of even their potential

allies. When, in the summer of 1941, they occupied the Baltic lands, they were hailed as liberators by some sections of the local population. Those who had lost their property under Soviet rule hoped to get it back. Those whose relatives and friends had been deported to remote Russian provinces—and the number of deportees was considerable, especially among the *intelligentsia*—welcomed the Germans as the foes of their foes. All of them hoped for a restoration, however nominal, of their independence.

But the hopes have been dashed in every particular. Neither states nor individuals have been given back their rights. Such changes in property as have been carried out by the Germans in the Ostland have merely added new and greater grievances to the old ones which had arisen under Soviet rule. The three Baltic states, it should be remembered, possessed no landlord class before the war. The Baltic land reforms of 1919-1922, which were the result of a happy combination of social demands with national aspirations, eradicated landlordism both peacefully and effectively. The great landowners in these provinces had been the famous German barons, except in Lithuania, where the big estates were owned by Poles. The destruction of the economic power of these alien landlords was meant to give national coherence to the young Baltic republics. The alliance between the peasants' hunger for land and national feelings was so strong that the reform easily achieved its purpose. When in 1941 Soviet political Commissars approached the Baltic peasantry with their customary denunciations of parasitic landlords, the reply was a shrug of the shoulders. The Baltic states were peasant republics, and remained so even in spite of the undemocratic regimes established there in the early thirties. The field for further agrarian revolutions was thus small. The Soviets undertook the splitting up of the larger holdings. Under the reforms of 1919-22 the general maximum size of holdings was 100 hectares (about 250 acres). The Soviets reduced this to 30 hectares in Estonia and Latvia and to 60 hectares in Lithuania. This involved the partial expropriation of about a quarter of the Estonian and Latvian farmers, but since the land was distributed to the landless and the poorer peasants, those who gained were in a majority. No large-scale collectivisation was attempted, though the fear of it undoubtedly haunted the countryside.

The Germans have, on the whole, left this position unaltered. Where they have changed it they have done so in favour, not of the former owners, but of German settlers. Here and there, the survivors of old baronial families have reappeared to "reconquer" their old estates. Only a few of the local "kulaks" have got their property back as rewards for services rendered to the occupying army or police. German agrarian policy has thus redressed no wrongs; but by partly undoing the reforms of 1919-22 it has injured national feeling. To this the utter impoverishment of the countryside should be added. Prices for agricultural produce have been fixed

at 60 per cent of the prices paid in East Prussia. In 1943 Estonian farmers obtained only 1 per cent of the quantity of fertilisers they had used in 1939; and it is unlikely that supplies have been any more plentiful in the neighbouring countries. Between 60 and 70 per cent of the cattle have been slaughtered.

Nor have the earlier expropriations in industry and commerce been reversed. In Latvia and Lithuania the middle classes consisted largely of Jews. "Aryanisation" meant therefore the destruction—and probably also the physical extermination—of the greater part of the middle classes, which had already been broken economically by the Soviets. The medium-size and large-scale enterprises nationalised by the Soviets have been taken over by the various German Ostland companies. No return of these properties to private ownership has occurred on any noticeable scale. The few concessions that have been made in the last few weeks have been negligible in importance. When the Red Army returns to the three Baltic republics it will find their outlook not an iota more "capitalistic," perhaps even less so, than it was in 1941 when the Soviets were forced to retreat. But will the victorious Russian soldiers be greeted by the Baltic peoples as liberators?

In the economic and social sense, the Baltic states have become almost a vacuum. The old structure of the three tiny republics has crumbled under the impact of the two gigantic and hostile steamrollers that have travelled over them. There is little likelihood that any appreciable centres of social resistance to the Soviets will emerge in that vacuum. Quite apart from all political and strategic arguments, the Russian case for the reincorporation of the Baltic states is greatly strengthened by this fact. But it is an argument of a purely negative character.

The pros and cons of the Baltic issue can be stated briefly. The arguments in favour of reincorporation in Russia are of a practical character. There is the familiar Russian need for safe strategic frontiers. There is the obviously precarious economic and military position of independent states of such tiny dimensions. There is also the advantage of their reintegration into the huge economic framework of Russia within which they lived and developed until the first world war—offset by the isolation from world trade that would probably be involved. There is, finally, the not very convincing argument that Estonia and Latvia had never until 1919 existed as independent states, while Lithuanian independence was many centuries back in history. What must be set against these arguments, each of which has some weight, is the right of the Baltic peoples to determine their own fate. It can hardly be conceded that the plebiscites of 1940, which gave a nearly 100 per cent majority for incorporation into the USSR, really did justice to the principle of self-determination.

The question is whether the conflicting viewpoints can somehow be reconciled. Can justice and expediency be brought together? It is in this context that recent changes in the Soviet constitution ought to be re-examined. The Baltic issue would become much easier to solve—and

reincorporation would cause fewer scruples to Allied opinion—if the federal structure of the USSR were more real than it appears to be so far. The Baltic peoples have now been assured that they would have their own Commissars of Foreign Affairs and of Defence. But they have probably learned from their own experience in 1940-41 that it is the control of internal affairs and of the police that really matters. And, in any case, what does the possession of separate commissariats mean, not in constitutional law but in fact? Are the constituent Republics going to be allowed to decide anything for themselves? Or will they merely get a *congé d'élire* from Moscow, the freedom

to decide to do what they are told? Does a Soviet Republic enjoy Dominion status?

The other question which may soon be uppermost in the minds of the Estonian, Latvian and Lithuanian peasants bears on the collectivisation of agriculture. After reincorporation, can they feel confident that there will be no forcible collectivisation with all its familiar harsh consequences? Will this also be one of the matters they will really be allowed to decide for themselves? In other words, can Moscow afford a certain margin of diversity and looseness in economic and political forms? The question can now only be raised. It cannot yet be answered.

### Principles of Trade—VII

## Prices and Markets

THE general pattern of an international trade policy for Britain that has been developed in these articles is that of an attempt to set on foot a regional experiment in the planned expansion of trade. The system should be so devised that international trade should neither be an impediment to full employment policies (as might happen if the attempt were made to return to a universal gold-standard system in the near future) nor the victim of full employment policies (as might happen if policies of rigid bilateralism were followed). There is reason for hoping that the "region" might from the start embrace a substantial part of the world, and that a system that was multi-lateral from the start would gradually become omnilateral.

It is not appropriate, in these articles, to enter upon the detailed and technical discussion of instrumentalities. The subject cannot, however, be left without some reference to such hotly controverted subjects as subsidies, quotas, state trading, trade agreements and commodity stabilisation schemes. Would these find any place in the sort of system that has been sketched out? Apart from the general framework of trade, what judgment should be expressed upon attempts to regulate or influence the prices of specific commodities, or to secure and protect specific markets?

Attempts are sometimes made to draw up lists of "permitted" and "objectionable" varieties of interference with international trade. Thus, in America, it is customary to argue that "moderate" protective tariffs and restrictions on immigration are, if not beneficial, at least comparatively harmless, while other devices, such as quantitative restrictions, exchange controls, Government trading and so forth are wholly bad. The Economic, Financial and Transit Department of the League of Nations, which is now located in the United States and is largely under the influence of American thinking, has recently published two studies,\* on quantitative regulations and on the relations between state trading and free economies, which reflect these views. It is very questionable whether any such distinctions can be logically sustained, apart altogether from the suspicion of self-interest that attaches to the particular arguments that have been mentioned. A high protective tariff may be much more noxious than a quota system which (to borrow the language of not a few economists) "supports without constricting." A monopolist private concern, trading in a "free" system, may wage far more aggressive economic warfare than a Government Board. There are really only two tenable positions to take up. Either all forms of interference with the free movement of men, money and goods should be removed; or else, if any of them are to be permitted, all of them must be judged on their merits, not by theoretical structures of casuistical dogma. And since it is clear that, as a matter of hard fact, all interferences are not going to be done away with, the second alternative is the only one that holds the field.

To say that Government interferences with international

trade must be judged upon their merits means that they must be judged by their results, and that, in its turn, means that they must be judged, in the great majority of cases, by whether their net effect is to expand international income—that is, the aggregate of all national incomes—or to contract it. If this test were generally applied, it would be possible to bring a certain amount of order into the present chaos of arguments. For example, it would immediately be apparent that a country which allows itself to sink into a violent depression, but which refrains from applying exchange controls or quota restrictions, is doing far more harm to the structure of international trade than one that practises the purposive direction of international trade as part of a consistent policy for keeping up its purchasing power, at home and abroad. The sharp American recession of 1938 reduced international trade by much more than it was expanded by the whole of Mr Cordell Hull's reciprocal agreements.

Nowhere, perhaps, is there more risk of ghosts being seen than in the matter of Government trading. Buying and selling by public boards might, it is true, be wholly aggressive and disruptive; but there is no very apparent reason why it should inevitably be so. Moreover, so far as Great Britain is concerned, there is a great deal to be said for the bulk purchase (as in wartime) of certain commodities, especially those where there is an international stabilisation scheme or where, as a part either of strategic or of economic policy, it is desired to hold special stocks in this country. Government intervention on selling side may, similarly, be harmful (for example, it leads to competitive subsidies) or helpful (for example, it is confined to securing the economies of large-scale operation). When it appears in the guise of an international Wheat Agreement, it appears to be acceptable in quarters where Government trading is undebatable. But in any case it would be foolish to express a judgment on state trading merely because of fears of what it might lead to. If there are dangers, let them be state trading specifically guarded against.

Quotas are another very clear example of the interference with international trade. In the case of the Baltic peoples, the political reliability of the Baltic peoples is the chief reason why an instrumentality can be used to and applied for a purpose. It is certainly true that the overwhelming bulk of the quotas that were imposed in the decade before the war were restrictive and bad. If no change in the ultimate objective of the economic policies of governments is to be expected, there might be a case for trying to do away with quotas—though, for exactly the same reason, there would be little chance of success. But if international trade is thought of in the framework of a deliberately expansionist economy, quantitative regulation is at once more valuable and less likely to be harmful. Its virtue in expansion is exactly the same as its vice in restriction—the fact that its effects are precise and calculable.

The same basic line of argument can be applied to the very vexed question of the proper limits of trade agreements. Is it ever right that a pair of countries, or a restricted group of countries, should offer each other concessions—relating either to tariff rates or exchange regulations or quotas—which are not generalised to all

other countries by means of the Most-Favoured-Nation clause or some similar device? The answer can, once again, be found in the actual effect of such agreements. If a bilateral agreement succeeds in increasing the trade between the signatories without reducing any other trade, it is good; if not, it is bad. The Ottawa Agreements of 1932 deserved condemnation, not because they set up a system of Empire preferences, but because they did so by raising the duties and restrictions on trade between British and foreign countries. Had they lowered the barriers to intra-Commonwealth trade without raising those to British-foreign exchanges, it would have been hard to object to them. Political realities should not be lost sight of. The fact that, for so many of the primary commodities, Great Britain is by far the world's largest purchaser is almost the only trump in the British hand, and it is in the highest degree unlikely that the British people could be persuaded not to play it. The effort should be to see that it is played in a way that helps British trade without hurting that of other countries. The realistic choice is not between a system that permits bilateral bargains and one that does not. It is between a contracting system of trade, in which such bargains will merely concentrate the contraction on the weakest bargainer, and an expanding system, in which the failure to permit such bargains would condemn the whole trading world to move at the pace of the slowest.

On all these difficult questions of trade procedure, then, the first test to be applied is whether the particular device in question would increase or diminish international income. In the particular case of British policy, however, there is a second criterion of hardly smaller importance—this is the effect that would be produced upon the Terms of Trade. This is the technical expression for the relationship between the prices at which the country buys its imports and the prices at which it sells its exports. One result of the last war and its aftermath was to make British imports cheap relatively to British exports. In 1924, a unit volume of foreign goods (or, more specifically, of imports into Great Britain) could be paid for by about one-fifth or one-sixth less volume of British manufactures than in 1913; the Terms of Trade had moved in favour of Britain by about 20 per cent. In the Great Depression there was a further move of another 15 per cent in our favour; the ratio moved back somewhat in the years of recovery, but in 1938 it was possible to pay for a unit volume of our imports with 30 per cent less of our exports of Trade in 1913.

It is not often realised how profound is the influence upon the British economy, and especially on the standard of living of the British people, of the Terms of Trade. It was by moving to the strong favourable shift in this factor that some of us suffered so much more lightly from the Great Depression than the other industrial countries. It is true even in those

that the shift in the Terms of Trade was associated, in the downward phase of the cycle, with mounting unemployment in the export industries, fewer exports being needed to pay for a relative stable volume of imports. But it was the additional purchasing power placed in the hands of the British public by the great fall in the cost of imported food and raw materials that touched off the building boom and the general buoyancy of the consumers' goods industries that were the backbone of British recovery. On balance, this movement of the Terms of Trade undoubtedly created much more employment than it destroyed (though in different industries); and it certainly gave rise to a remarkable increase in the standard of living.

In post-war Britain, struggling to keep up the national standard of living, it will be essential to keep the Terms of Trade as favourable as possible. No other single factor, in the early years, will so strongly influence the standard of consumption that it will be possible to provide. Moreover, there is only one conjuncture by which all three of the vital elements—favourable Terms of Trade (that is, high real wage rates), a large volume of trade (that is, high employment) and equilibrium in the balance of payments—can all be secured at once, and that is by low prices on both sides of the comparison. If the prices of imported food and materials are high, then either wages will have to be low, with consequent damage to the standard of living, or else British export prices will have to be high, with consequent damage to the volume of trade and to the balance of payments. The task of keeping British export prices as low as can be contrived is part of the whole complex of industrial policy and cannot be entered upon here. But the task of keeping British import prices low belongs properly in the discussion of international trade principles. It is, of course, by no means in the British interest to ruin the primary producers of the world. On the contrary, higher incomes among primary producers mean better markets for British goods. But it is most emphatically in the British interest to insist that those higher incomes shall be provided by greater efficiency, higher productivity per man, in the primary producing countries, and not by the artificial maintenance of high prices. There is no magic way by which we can get richer, or get anything but poorer, if we have to work harder for our food and materials. The ratio between an hour of British work and a ton of imports is a factor as basic to economic policy as the ratio of thermal efficiency is to the engineer. In all discussions of commodity regulation schemes, it is essential to remember that the interest of the United Kingdom is that of a consumer. And the British representatives can the more confidently insist on low prices through greater efficiency because they will be pleading the cause of world-wide economic expansion.

(It is proposed to conclude this series with one more article)

## NOTES OF THE WEEK

### Building.

Lord Po. ar building-and Caution

postwar war in Russia has reached a new climax. The Soviet High Command is now taking its winnings after one of the most hazardous operations of this hazardous war. As the Russians advanced from the Dnieper from October onwards, the front took on a fantastic shape. Great salients thrusting in different directions between Leningrad and Kherson served the Russians as the springboards for attack; but they also laid their flanks open to dangerous counter-blows. Even last week, the hazard seemed to be mounting to new heights. The Russians took Luck and Kowno in Poland; but, five hundred miles to the east, Manstein was still clinging to the Dnieper in the Smyela region, and had weathered all Russian attacks in the Dnieper bend. The contrast between the softness of the German defence in the centre and its stiffness in the south was amazing; and as long as Manstein held his ground in the south, and kept his supply lines open the possibility still existed that he might cut the Russian salient from the Dnieper to the southern fringe of the Pripiet Marshes. But the most recent

happenings—the encirclement of ten German divisions around Smyela and the capture of Nikopol by the Russians—have banished that danger for good. It is now the Germans who have to face the disastrous consequences of the game of chance. They staved off disaster once when they stopped the Russian advance towards Zhmerinka, and thus saved their main railway feeding the whole southern front. But now the same threat, on a much larger scale, has arisen further in their rear, where the Russians are advancing towards Lwow, the main base from which the German forces in the Ukraine have been marshalled and supplied. The entire structure of the German front in the south is now bound to crumble. But this is only the immediate implication. The less immediate meaning is even graver for the Germans. If, while retreating in the Baltic region, the German High Command contemplated the shortening of the front along a line, say, from Riga to Odessa or from Riga to the Carpathians, then the Russian threat to Lwow may cut this potential line before it is reached. There is no longer any coherent pattern in the

\* "Quantitative Trade Controls: Their Causes and Nature," 45 pages. 2s. 6d. "Trade Relations Between Free-Market and Controlled Economies," 92 pages. 4s. 6d. (Geneva) League of Nations. (London) Allen and Unwin.

German moves in the east. Their only purpose seems now to be to delay—no matter how wastefully or with what disastrous consequences—the Russian approach to the powder-barrels in the Balkans.

The situation in Italy has given rise to some criticisms and disappointment, because the fighting there has seen obviously lacking in the imagination and daring for which the Russians are now being so richly rewarded. Stalemate on the Garigliano and Rapido rivers has not yet been broken; and the fine start made in the Nettuno landing has not been followed up by any move either towards Rome or towards the front in the south. Even the beach-head itself has not been extended enough to put the landing beaches beyond the range of the enemy's artillery. Kesselring has been given three weeks in which to collect his forces, to harden his defences, and, finally, to counter attack. The notion that the Nettuno bridgehead is now to be another Tobruk seems unconvincing and out of date; in the Year of Invasions, the time for isolated and besieged coastal "hedgehogs" ought to be regarded as past. Yet criticism must clearly be qualified by the layman's insufficient information. It remains to be seen what is intended and what will happen; there may be other moves in Italy itself. Action in the West is planned. Time may still show that the Nettuno episode has after all a logic that fits it into a much wider pattern of operations.

### Anxiety in Finland

Diplomatically the Finns have so far refused the risk of leaving the Axis side. Mr Cordell Hull has told the press that the United States Government has recently made plain that the Finns must take the consequences of their continued collaboration with Germany. Militarily, their mind may soon be made up for them. The Russian armies have advanced to Narva, and may quickly occupy the greater part of the Estonian coast. Helsinki, after a long interval, has been raided by strong forces of Russian bombers; and air bases along the Estonian coast would make all southern Finland an easy target. Moreover, the Russian reconquest of all three Baltic States, and perhaps the Åland Islands, would cut off German supplies. Clearly Finland may be compelled by force to come to terms, a second time, with Soviet Russia; and for the moment diplomacy has apparently given way to arms in the Allies' attitude. On February 6th, when Helsinki was first bombed again, the official Soviet News Agency authoritatively stated that reports of separate Russian negotiations for peace with Finland "did not in the slightest degree correspond with reality"; and new threats of dire punishments when the Red Army reaches Finnish territory have begun in the Russian press. Meanwhile, with the threat overhanging, discussion for and against the war goes on in Finland. The Diet reassembled at the end of last month, and differences in view became more evident, not only between the Left and the Right, but also within the Social Democratic Party itself, the strongest in the Diet. The chief of the political police, Anthoni, reputed to be an ardent Nazi, resigned. In the Diet, the President or Speaker, Hakkila, a Social Democrat, was re-elected, but many Social Democratic votes went to Voionmaa, chairman of the Foreign-Affairs Committee, and closely linked in reports with the campaign for a separate peace. The Acting Premier Tanner—the Premier, Linkomies, is ill—is the most determined advocate of a fight to the finish.

It is still hard to measure the exact balance of opinion, though it seems that the Polish-Russian dispute has stiffened the will to resist in face of the Russian advance. Opinion on the margin is at present being swayed not so much by the choice between Nazi Germany and Soviet Russia as by the respective pulls of Swedish and German influences. The Swedo-Finns, 10 per cent of the population, make up the most influential section of the peace party. On the other side there has been a resurrection of the old Lapua Movement and greater activity on the part of the small Nazi Movement. But politics does not seem likely to decide the issue any more than diplomacy. The German counter to the nearing Russian danger is the threat to occupy all Finland. But this can only be done if the Germans can prevent the Russian armies from advancing farther into Estonia, which now seems uncertain, to say the least. Yet

even though the balance of force has swung in favour of the Russians, the Finns are no more inclined towards unconditional surrender than they were four years ago; it is this sense of national independence, rather than the influence of political ideas or diplomatic calculations, that keeps the Finns in the fight.

### The Russian Way

The federal reform in Russia is now in course of practical execution. The first step was the appointment of M. Alexander Korneychuk to the post of Commissar of Foreign Affairs for the Ukraine. The sequence of the various stages of the reform throws some light on the immediate meaning of the new "federalism." The problem which Soviet diplomacy puts first is the conflict with Poland. The first Ukrainian Foreign Secretary has been known for his extremist anti-Polish attitude. By formally devolving diplomatic responsibility upon M. Korneychuk, the Moscow Foreign Office may be able, ostensibly, to wash its hands while he, on behalf of the Ukraine, makes more exacting claims against Poland. The "Ukrainians" increase their demands almost daily. First, they protested against the proposal that the Curzon line should be made the basis of a new frontier settlement with Poland; they are reported to prefer the Russo-German demarcation line of 1939, the so-called Ribbentrop-Molotov frontier. Then it appears that M. Grechukha, the President of the Ukrainian Supreme Soviet, has laid claim to territories situated to the west of both lines—that is, to Polish districts which were not even occupied by the Russians in 1939. In the recent debates of the Supreme Soviet in Moscow, the speeches of the Ukrainian deputies had a threatening tone, absent from the statements of other Soviet spokesmen. This odd division of labour may be for bargaining purposes; and Moscow may well appear eventually as a more moderate influence in the dispute. Tactics of this kind have been used before in this part of Europe. Marshal Pilsudski secured Vilna for Poland when he ordered the Polish general Zeligowski to capture Vilna "on his own account," without involving the Polish Government. Two wrongs do not make a right; and Polish misconduct in the past would be no justification for coups of the same kind by their powerful neighbour. It is a pity that Russia should seem to be entering now upon a policy which would be almost certain to dissipate much of the huge moral credit won since 1941 by the sacrifices and the valour of her soldiers as well as by the immense exertions of her toiling peoples.

### False Dawn at Brighton

The narrow Government majority at Brighton in what has always been a very safe Conservative seat caused little surprise locally. The result should not be taken too readily as an injunction to Mr Churchill to eat the warning words of his two letters to the constituency. While creating a heated national controversy, it is doubtful whether in the end the famous letters made any decisive difference to the issue. The local reaction was one of indignation, but its effect in terms of votes may perhaps have been offset by the quieter section who were brought by the Prime Minister's words to give their attention to the election. Few of the supporters of the Independent candidate believed Mr Churchill's own insistence that by rejecting Flight-Lieutenant Teeling, they would be releasing him, and even after the Prime Minister had personally reassured his personal responsibility in the matter, they continued to believe that he was, in this connection, either the prisoner, by his own choice, of the party caucus or the victim of advisers. Brighton, in fact, was not concerned at the polls with the war at all. Local issues predominated; the nomination, yet again, of an outside Conservative candidate was widely resented. Reconstruction legislation is of special interest to a seaside resort which has been in the front line since the fall of France. It was natural that a popular local man, the brother of the mayor, should be considered by many, and especially by the business community, an appropriate spokesman to be at Westminster. In so far as the opposition vote did reflect a national opinion, it reflected the familiar protest against the sorry slowness to legislate for peace. But the electors were neither voting on Mr Churchill's leadership in war nor foreshadowing, necessarily, how they would vote under peacetime conditions of party politics. Brighton may still qualify for colours

of the truest blue. The present period, in fact, is the false dawn of politics in which many electors wish to indicate to the Coalition whips their rather bruised sensibilities, without meaning either to question the conduct of the war or to choose definitely between the main party platforms.

Meanwhile, nominations have taken place for the West Derbyshire by-election, and, despite the unexpected appearance of a farmers' candidate with a contempt for electioneering and with no apparent quarrel with the Government, the issue will lie in the struggle between the National Government and Conservative candidate and his Independent Labour opponent, who has Common Wealth support. The decision of the local Liberal Association to leave its members free to vote according to their own judgment is likely to help the opposition, and the Government will need every member of the heavy battery of speakers it has rushed up. Here again there is more than a strong local suspicion of manipulation—even of nepotism; and, in addition, the result, in a longer election with national organisations of some sort on both sides, is likely to give a somewhat more clear-cut reflection of national trends than did Brighton. But even the arrival of yet another Independent in the House of Commons would be no more than a straw in a wind, which, though plainly felt, is still light and veering.

### Counter-Offensive

Whatever the real meaning of recent by-elections may be, one thing is certain and significant. The word has gone out that the Government must prevent further losses. The Prime Minister's intervention at Brighton was the beginning of a new policy. In West Derbyshire, the policy has been carried a stage farther by the recruitment of minor Ministers to support the official candidate. Previously, members of the Government, in accordance with the party truce, had held aloof, and this is still to be the attitude of members of the War Cabinet. But the little guns, from now on, will be thrown into the breach. The Government, at least, does not underestimate the possible national meaning of these events. Side by side with the light governmental artillery go the forward elements of Conservative Reform. In 1943, the main aim of Tory Reformers was to underline their belief in Reform; now, for the time at least, the stress is upon the adjective Tory. Both at Brighton and West Derbyshire the progressive group of young Conservatives has demonstrated its determination, come what may, to stand by the party and the Coalition. The speeches of its leaders, in recent weeks, have had the same emphasis—the imperative need for continuing the Coalition; and the impossibility of Tories, however Reformist, acting in Parliament or outside "again the Government." These young men are good politicians who know that the way to effective action is through the party machine. This is not so well appreciated by members of the Labour Party—despite the example of some of its most able members, who, by party indiscipline, have made sure that their political efforts will leave little or no mark upon national policy. The game of politics, even in the age of Beveridge and Acland, is still won by those who play politics, not those who raise issues.

### Building, Housing and Planning

Lord Portal has stated a design for immediately post-war building, and referred, in general terms, to the shape of postwar policy for housing. Both items in his statement to the House of Lords are discussed in an article on page 216. Meanwhile the third and widest circle of policy in these matters namely, policy for planning, remains entirely undefined by any Minister. Lord Woolton's promised White Paper on planning will, presumably, fill the gap. As it is, while the Minister of Works has spoken specifically about the technique of house-building in the near future, all the hoary but vital questions raised by the Barlow Commission and the Scott and Uthwatt Committees remain unanswered; and the only new answer that is being widely forecast is No to the more practical Barlow proposals. It would be fantastic if a large-scale programme of even temporary house-building were to be begun without any positive Government policy on the location of industry, and the mobility of labour—or more aptly, as one expert has put it, about the location of labour and the mobility of industry. Every step taken to provide the houses which will be needed after the war,

urgently in the short run, less urgently in the long run, without a definition of national planning policy, in the physical and geographical sense, will make it more certain that building after the war will be even more chaotic and disastrous, in its social effects, than it was after the last war, when the face of Britain was so sadly spoiled.

### Neutral Turkey

With the approach of the climax of the war, the Allies are inevitably anxious to enlist as much support as possible beyond, as well as behind, their frontiers. The process of dividing the sheep from the goats, of rallying the one and coercing the other to the strictest of strict neutralities, is well under way. Portugal has freely given bases in the Azores. Pressure on Argentina, and now on Spain, is depriving the Axis of two remaining sympathisers. It is clearly essential to construct, as a background to further offensive action, such conditions in neutral countries as are most favourable to the Allied cause. While, for geographical reasons, little could be done, say, to alter the situation in Sweden, the place of Turkey, inside the fold or out, active participant or sympathetic spectator, has not yet been clearly enough defined. Far from achieving any agreement on the extent to which Turkey is prepared to stand by the obligations to the Allies that have repeatedly been acknowledged, the Allied-Turkish consultations, which have been going on ever since the conference at Cairo, appear to have reached a deadlock. Once it had been established that the Turkish Government would prefer, if it were forced to abandon the present status of a non-belligerent, to participate against the Axis as a full belligerent, rather than passively to allow Allied forces to make use of Turkish bases (which would have meant losing the advantages of belligerent rights while risking the danger of reprisals), two points of disagreement at once arose. The danger of a German invasion to forestall Allied plans was a greater risk, so the Turks held, than they could afford to take with the volume of war material at present given to them by the Allies. The Allied reply that such an invasion was improbable, under the present circumstances, and that, in any case, Allied supplies were already more generous than was warranted by Turkey's ability to absorb them and put them to proper use, does not, by itself, lead to any solution save mutual irritation and misunderstanding. Turkey cannot afford, at this late stage, to sacrifice the British good will which she won so hardly in 1940 and 1941 by her loyal refusal to come in against her ally. The Allies cannot afford to lose, through want of plain speaking and decisive action, the active help of an ally whose strategic position as guardian of the Straits and spring-board for south-east Europe is of first importance.

### The Status of Algiers

Only a few months ago the legal status of the French Committee of National Liberation was still disputed and questioned. The Americans recognised the Committee as the leading body of French resistance; but they made

explicit reservations about its position as a Government. The Russians, on the contrary, explicitly recognised the Committee as "the representative of the state interests of the French Republic." The British official statement refrained from making the reservations made by the Americans, but the recognition it gave was not so explicit as the Russian declaration. It is now certain that recent weeks have brought a decisive change in the attitude of the Allied Governments. The agreements on currency and on mutual aid between Great Britain and France announced on Tuesday (and discussed in a Note on page 217) are much more than a routine document signed by the Treasuries of two countries. They mark a political turning point. The recognition of the franc as an Allied currency foreshadows—so it may be hoped—the final restoration of the Anglo-French Alliance, which has never in fact been abandoned either by Britain or by resisting Frenchmen. The new agreements were made in the spirit that animated the makers of the economic treaties of November, 1939. The fresh start is still modest; but the scope of Anglo-French economic and political co-operation will widen very soon. Sir John Anderson has made it clear that the new arrangements are independent of such financial arrangements with France as may be made after the war. But it is at least equally clear that the new agreements are in an altogether different category from the agreement between the Prime Minister and General de Gaulle in August, 1940. A new attitude seems also to have been adopted by the State Department, which is now reported to be inclined to reconsider its relations with Algiers, and to give wider recognition to the Committee of National Liberation. This change of heart will be welcome in this country. It almost certainly springs from the realisation that Algiers has now really become the temporary political capital of France; and that, whatever criticisms may be made of General de Gaulle's personal policies, the Committee's claim to represent the sovereignty of France is genuine and justified. What is perhaps less clear, for the moment, is the state of relations between Moscow and Algiers. M. Vyshinsky and M. Bogomolov have both been recalled to Moscow for consultation.

### Control in Education

The attempt in the Commons on Tuesday, during the Committee stage of the Education Bill, to leave out the word "control" from the new definition of the powers of the President of the Board of Education did not succeed. There is some confusion about the purpose of the new definition. Discussions since the Bill was introduced have been largely dominated by the determination of the non-county authorities, urban and rural, expressed in a vigorous campaign, to fight to the last for every one of their powers which seems, however remotely, to be threatened. The possibility has not entirely gone, for instance, that the principle of the single administration of all schooling over wide areas (applied in the Bill in a rough and ready way to counties, with some anomalies) may be, in effect, considerably whittled away by further concessions. Suspicion of the President's powers of "control" has a similar origin, and it is shared by some county councils—who also tend to act in these controversies as, first and foremost, vested interests. If it was the Government's intention, by the wording of the new Bill, to ride roughshod over local initiative and responsibility, these fears would be justified; and something more might perhaps be done to define the word "control" more precisely. But, in fact, every party to the discussion knows very well why the new definition of central responsibility has been introduced. In the past the standards set by statute have not been realised because an appreciable proportion of the minimum requirements have been "permissive" and left to the willingness and ability of local authorities. Now it is the Government's intention, very rightly and very belatedly, to insist upon minimum standards of schooling for all children in all areas; to secure what Mr Butler called "the development of a real national policy of education"; and to make it "mandatory." Over and above the minimum, there should be, and will be, the amplest room for local diversity according to local needs and local wishes.

Unfortunately, the Government itself has not yet seen the problem as a whole. It is not enough to say "it shall be done." The local authorities must also be capable of doing it. Administratively, this has been recognised in the principle of single regional administration, which in some cases ought logically and practically to out-run even county

boundaries. Financially, with the accumulation of other rate burdens, the Bill may still be made abortive by the same financial incapacity which made it inevitable in past Bills that necessary policies should nevertheless be made "permissive." It may still be that, when the whole tale of new rate burdens has been told, some existing local services will have to be taken off the rates on to taxes and become national; and it is by no means sure that education might not be more suitable than some other services for such translation.

### Advice on Schooling

The disappearance of the Consultative Committee of the Board of Education, to be replaced under the new Bill by two Central Advisory Councils, one of them for Wales, should not pass without recognition of the Committee's remarkable work between the wars. What is needed in any Ministry, more perhaps than anything else, is the development within of a consistent code of administrative conduct and coherent policy, expertly and impartially evolved. Without such sustenance from his agents and advisers, no Minister can make progress in his duty to Parliament and people, and no Parliament can discharge its ultimate responsibility to make the most of the nation's laws and taxes in the interest of all the citizens it represents. It has not been for lack of advice of this order that educational policy has faltered and sometimes failed during the past twenty-five years; the faults have been local, financial and political. The reports produced by the Consultative Committee and the advice given day by day by HM Inspectorate have together constituted a notable body of doctrine, theoretical and practical. The Committee is not being replaced because it has fallen short, but rather because something still more continuous is required. Its function was limited to advising on matters referred to it by the Board. The Advisory Councils, which will include representatives of all branches of public life concerned with education, will have this function, but they will also advise the President on any matters they regard as important. In a sense, their setting up is a final tribute to the work of the Consultative Committee. There is a danger that, by broadening the field of work and widening the advisory personnel, to represent the national life and culture "in the broadest sense," the work so well done before may now become too diffused, and the hard core of expert and practical doctrine may be lost. If Mr Butler and his successors can avoid this dissipation of the present excellent intentions, the Advisory Councils will represent an important step forward in "the development of a real national policy of education."

### Demobilisation Debate

Discussion on demobilisation has passed through a series of well-defined stages. First, there was the controversy last year about the proper principles of release from the Forces, to which the outstanding contribution was the startling promise of Mr Bevin that "first in" should be "first out," without qualification. Secondly, there was the period, lasting until now, when various political and research bodies drew attention to the very complicated problems involved. This approach was epitomised in the proposal of the Tory Reform Committee that discharge should be guided by a "points" system which would allow, in a complicated calculation, for the continued requirements of the Services; for the immediate need of post-war industry for skilled men; for the strong view of members of the Forces that rough justice should follow Mr Bevin's formula; and for the particular family or other responsibilities of individual Servicemen. This "points" proposal was not a practical policy, but simply a succinct account of the many matters involved in a far from simple problem. Now the second stage of discussion is merging into the third. PEP has produced, in the latest number of its broadsheet *Planning*, an account of the military, industrial and personal aspects of demobilisation; and laid stress, rightly, upon the decisive importance of remobilisation for peace-work—that is, upon the obvious fact that, if lasting jobs cannot be provided for all, ex-Service men and ex-warworkers alike, demobilisation will be a failure, and politically a disaster. The third stage, that of practical proposals, has been well opened by the Liberal Party in a report just published. These proposals are based, in the first place, on experience after the last war, when "scientific" demobilisation caused the beginnings of mutiny, disaffection and political chaos—until Mr Churchill saw that, one way or the other, the overriding need was to get men out of the Forces as quickly as possible. Thus the Liberal report says:

If the total process of demobilisation of all those destined for early release can be speeded up to a sufficient degree, greater benefits will be obtained and the interests of each individual will ultimately be better served . . . if the basis of priority adopted is that of sheer practicability.

### Plan of Action

Not all can be released early. Peace will come in stages. Men will be needed after Germany's defeat, both in the Forces and industry, for the Far Eastern war, and for purposes of overseas occupation and home defence. The Liberals propose that this need for longer service should be met, over and above the key men and units who must be kept in any case, by voluntary enlistment; it is their view that volunteering would suffice if a sufficient inducement in terms of pay and allowances could be given to the volunteers. This may perhaps be regarded as by no means proven; but it is certainly right to say that it would be

the negation of both democracy and justice to retain the principle of compulsion merely to avoid the introduction of adequate scales of pay in the British Forces.

For the rest, the Liberal principles are speed and common sense; the promptest release of those who can be spared; the discharge, wherever and as soon as possible, of men long away from home; the spreading of military orders, after the war in Europe is over, to minimise local unemployment; the provision beforehand, not merely in paper plans, but in terms of labour and materials, of clothes, food, homes and household goods for returning men and reassembled families; and above all the re-employment in peacetime jobs of both ex-Service men and industrial workers. It is not hard to find work in the short term for those demobilised. Six months after the armistice of November, 1918, 3,300,000 out of 5,000,000 men had been sent home; and at the end of the year only 400,000 were drawing unemployment pay. Mass unemployment came later; and, similarly, demobilisation policy will be tested not one year, but two or three after most men have been discharged. The only way is a policy of Full Employment; and both PEP and the Liberals agree, not only that such a policy should now be fashioned, but also that

a clear announcement of plans for demobilisation should be made well in advance of the termination of hostilities in Europe.

### Manx Home Rule

A petition for effective Home Rule for the Isle of Man is now before the Home Secretary. The object of the radical reforms suggested is more democratic control over the Manx Government by the people of the island. At present ultimate authority is vested in the Lieutenant-Governor appointed by the Home Secretary and assisted, in an advisory capacity, by elected representatives in the House of Keys. A recent tendency to appoint the Governor and his official Secretary from the ranks of retired colonial administrators has not helped to bring about sympathy of views on the government of the island; and it is unfortunate that criticism of the chief Minister has necessarily to be directed against the person of the King's representative. In the petition it is proposed, instead, that an executive committee, responsible to the people's representatives, should take over the administration, appointing, among other Government officers, a Finance Minister with full control over the annual budget. This office has previously been held by the Governor himself, who, since the Isle of Man Customs Act of 1886, has had the power of complete veto on all measures of expenditure and taxation proposed by the House of Keys. It should be noticed that if the independence of government sought in the petition were to be granted, it would necessarily follow that the financial responsibilities of the Manx people would become heavier in proportion as the stringent control of the Home Office was lightened. While the status of the island is semi-colonial in character, an income-tax rate ranging from 9d. to 2s. 7½d. in the pound, with an annual contribution to the Imperial Government of £10,000, and an added £20,000 for war-time defence, can perhaps be tolerated; but the British Government could scarcely grant greater freedom of government without requiring sacrifices from the Manx people more commensurate with those of its own taxpayers. On the other hand, it would be difficult to find an arrangement, satisfactory in practice and to Parliament, for so small a territory that would, in effect, confer upon it quasi-dominion status. Possibly some modified form of freer local government, preserving the traditional House of Keys, together with representation in Parliament, might prove an acceptable compromise.

### Nikopol Manganese

If the Germans had been able to hold and make full use of the manganese mining area whose centre is Nikopol, their supplies of manganese ore would have been amply sufficient. Actually, they did not restore the mines to nearly effective working until lately; and now they have lost them to the advancing Russians. Nikopol's annual pre-war output of ore was about one million tons, or two and a half times Greater Germany's pre-war annual imports. Germany's occupation of Nikopol lasted almost two and a half years, and every effort was made to restore the mines. German sources suggest that at least 400,000 tons of ore were mined during this period. By the loss of Nikopol the Germans have not lost all this area's manganese capacity, because they have never had it all. On the other hand, if they could have kept their hold, output would certainly have increased further, and this would have meant that the low-grade manganese ore in other parts of the Continent as well as in Germany would no longer have been needed. Now, with its loss, Germany is thrown back entirely upon the low-grade ore. The German war machine will not become at a stroke bereft of manganese, which is absolutely essential for making any kind of steel; there is the low-grade ore available to be worked. The immediate consequences are, first, that the labour and machinery used to restore the mines have been utterly wasted; and, secondly, that new labour and new machinery, for the processing of low-grade manganese ore, will be needed at a time when labour shortage is the most serious single difficulty in the German war economy. Deficiency will follow. The loss of Nikopol demonstrates the main weakness of Germany, which is not the absolute lack of this or that vital war material, but the fact that the sweeping retreat from regions with important material resources compels the Germans to divert labour and material, with only problematical chances of success, in an effort to make good the loss.

### The Cost of Subsidies

The cost of maintaining low prices for essential commodities in the national wartime diet was demonstrated last week in answer to a Parliamentary question. A table, reproduced below, of prices paid by the consumer and prices paid by the Government, was accompanied by a list of the total cost of subsidy for the various commodities. Under the heading "Other Subsidies," the most important items are subsidies for fertilisers and animal feeding-stuffs, the cost of the Ministry of War Transport's operating loss in the carriage of imports, and a sum of £20 million needed to supply cheap and free milk under the National Milk Scheme and the Milk in Schools Scheme.

|                              | Present Price     | Unsubsidised Price | Cost of Subsidy in £ million p.a. |
|------------------------------|-------------------|--------------------|-----------------------------------|
| Bread . . . . .              | s. d. 9 per 4 lb. | s. d. 1 2          | s. d.                             |
| Flour . . . . .              | 1 21 " 6 lb.      | 1 91               | 60.4                              |
| Oatmeal . . . . .            | 31 " lb.          | 1 5                |                                   |
| Meat (home-killed) . . . . . | 1 11 " lb.        | 1 5                | 23.1                              |
| (imported) . . . . .         | 81 " lb.          | 91                 |                                   |
| Potatoes . . . . .           | 61 " 7 lb.        | 101                | 28.6                              |
| Eggs (large) . . . . .       | 2 0 " doz.        | 3 91               |                                   |
| (small) . . . . .            | 1 9 " doz.        | 3 61               | 11.3                              |

# AMERICAN SURVEY

## Four Midwestern Papers (From a Correspondent in Iowa)

THE great decisions made at the Moscow, Cairo and Teheran conferences have been represented to mid-west American newspaper readers in the most diverse ways: with whole-hearted support and hopes that the Republican party will rally round, and that freer post-war trade will be added thereto (*Des Moines Register*); with jubilation, marred only by misgivings lest Russia be allowed to re-occupy its 1941 boundaries and Britain, France and the Netherlands their Far Eastern Empires (*Cleveland Press*, *St. Louis Post-Dispatch*), and added misgivings about the United States and Britain backing reactionaries in Europe (*St. Louis Post-Dispatch*); and with scarcely veiled sneers at the motives and good faith of all concerned (*Chicago Tribune*).

The press in America is far from being a trustworthy index of public opinion, but these four papers do give a good idea of the spread of opinion in the area—and of the influences which are being brought to bear on still unformed opinions.

Each of our four papers has strong local roots, prestige and colouring. Chicago's boom-or-bust heartiness, gangsterism and mountebankery have influenced and been influenced by the *Tribune*, long its largest morning paper, with its gusty chauvinism and its slashing attacks on the objects of its publishers, Colonel McCormick's, personal dislikes. The *St. Louis Post-Dispatch's* liberal, crusading spirit, mixed with unpuritanical tolerance, stems partly from the German immigration to St. Louis in the 19th century which followed the leadership of the men of '48, and partly from the personal influence of Joseph Pulitzer, the founder, and the men who thereafter carried on the paper.

Cleveland's rich tapestry of immigrants from all parts of Europe, peasants turned factory workers in a new land, could be either a headache or a challenge and the *Cleveland Press* has taken it as a challenge. This ferment of new Americans, trying politics and trade unionism, making mistakes but trying again, has interacted with the original liberalism of the Scripps chain to produce a mixture which has not wholly succumbed to the growing conservatism that has been manifest in recent years in the rest of the chain, to which the *Cleveland Press* belongs. The output of the local columnists sticks to the old pro-labour, anti-monopoly line better than the leaders supplied by the chain from New York.

Something of the deliberate caution of the heavily capitalised Iowa farmers goes into the policy of their paper, the *Register*, which is dominated by the personality of its editor, Mr W. W. Waymack, a man of outstanding character and influence. Nearly half the Sunday edition's circulation goes outside the city's retail trade area.

All four of our papers describe themselves as "Independent" of political parties, but despite this avowed "independence," it is fair to say that the *Chicago Tribune*, the *Cleveland Press* and the *Des Moines Register* lean toward the Republicans on national and international issues to-day, though differing widely on which way the Republican party should go, while the *St. Louis Post-Dispatch* leans more nearly toward the New Deal.

Three of the four newspapers are pressing for a bi-partisan foreign policy of postwar collaboration to keep the peace, with the Moscow agreements as a hopeful start. The fourth (the *Chicago Tribune*) has long been willing and eager to disrupt the Republican party rather than have it go along with any such programme. Yet three of the four were isolationist before the Japanese attack on Pearl Harbour, and even the *Des Moines Register* never advocated intervention stronger than Mr Roosevelt's step-by-step process. The *Chicago Tribune* was isolationist in an angry way, imputing bad faith and betrayal of the nation's interests due to Mr Roosevelt's alleged snobbish eastern seaboard Anglophilism. The Scripps-Howard chain (in-

cluding the *Cleveland Press*) had broken with the New Deal on domestic issues by 1935, thought Mr Chamberlain's Munich was great stuff in 1938 and, while resenting the label "appeaser," opposed the Lend-Lease Bill in 1941. The *St. Louis Post-Dispatch* was isolationist because it feared for democracy and humanitarianism if what seemed to it hysterics and chauvinists plunged the United States into another war; it only became reconciled by the actual attack on Pearl Harbour. The *Des Moines Register* headed its "Platform" in 1939 with "Keep out of war," but supported every single step to extend greater aid to the Allies, with increasing urgency after the fall of France.

There is a strong element in America which considers the war with Japan the main show, emotionally, and sometimes intellectually, too, and this line of thought, or of prejudice, appears at its strongest in the *Chicago Tribune*. But for any but the hate-press, this issue has been dead since it became obvious that the United States was deeply committed to joining in a European offensive with good prospects, and since developments in the Pacific have shown that Allied forces can slowly move ahead there at the same time. The *Tribune* and its allies are therefore turning to the question of Russian relations, which is a glorious opportunity for them, since even sincere supporters of Allied harmony have misgivings about Communist Russia gobbling up little neighbours with somewhat greater claims to democracy. Both the Scripps-Howard papers and the *St. Louis Post-Dispatch* worry in public about that, as they do also about the iniquity of restoring Pacific colonies to imperialist Britain, France and the Netherlands.

Among the great majority of Americans who in general support Mr Roosevelt's foreign policy, much bitterness has also developed over what seems to some of them the Administration's consistent support of the more reactionary elements in Europe: MM. Darlan and Giraud, General Mihailovitch, King George of Greece, Marshal Badoglio, etc. The *St. Louis Post-Dispatch* is the one of our four which represents this viewpoint most vigorously, though the *Des Moines Register* likewise let out an anguished yelp when M. Peyrouton was dragged in from Argentina to high office. The Scripps-Howard Press tends to wish a plague on both sets of quarrelsome Europeans, and the *Chicago Tribune* alternates between that view and denouncing one side or the other as Communist or worse. (In Ohio and Pennsylvania, Scripps-Howard strongholds, there are enough old-country Europeans on both sides of these fences to make the issue well worth ducking for the cautious.) The *Des Moines Register* is cautious on principle, but leans to the "left" side of these issues when it can do so without feeling too disruptive.

The *Register* and the Scripps-Howard papers are inclined to take a kindly view of Republican leaders' gestures toward political internationalism, reading into them perhaps more than is there, whereas the *St. Louis Post-Dispatch* snorts with impatience on one side while the *Chicago Tribune* snarls on the other. Still more critical as an issue is economic internationalism, toward which the American people and Congress have moved so little since Smoot-Hawley tariff days. Only the *Chicago Tribune* and the *Des Moines Register* say much. The *Chicago Tribune* is against it. The *Des Moines Register* is for it, but sticks pretty much to tariffs as a target at a time when international trade barriers have become more administrative than fiscal.

Few people, even in the Illinois-Indiana-Ohio-Michigan region, where isolationism is strongest, fall for the whole *Chicago Tribune* "line." But a great many agree with some one or two elements of it: they may fear Russian Communism, or hate the Japanese more than the Germans, or dislike imperialism, or distrust those "clever diplomats" the British, or hate Mr Roosevelt, or fear an international charity scheme or a tariff cut. In 1919-20, Senator Lodge and

Senator Borah managed to win a victory for isolationism by working on each of these and other feelings separately, one at a time. Mr. Roosevelt and Mr Cordell Hull, forewarned, have performed prodigies and will doubtless perform more to present political internationalism to a suspicious American people in a form to which all but the extremists can agree—and to present it so they must say "Yes" in one swoop or lose the whole. But international economics are still a "local issue" in America, likely to be decided piecemeal on local grounds rather than once for all on broad considerations. Therein lies the gravest danger.

## American Notes

### American Oil Diplomacy

Seventy-five years ago the Mediterranean was connected with the Indian Ocean by the Suez Canal constructed by Ferdinand de Lesseps. Now there is to be another link, an oil pipeline from the refineries on the Persian Gulf to the Mediterranean, to be financed by the American Government and to be constructed by American engineers. The project, whose cost is assessed at \$130 to \$165 million, will be carried out by agreement with the Arabian American Oil Company and the Gulf Exploitation Company; the one is owned by Standard Oil of California and the Texas Oil Company and the other by the Gulf Oil Corporation. The consent of the rulers of Saudi Arabia and of Kuwait has yet to be obtained. Details of the scheme are not yet available, but Mr Harold Ickes, Secretary of the Interior, United States Petroleum Administrator and President of the Petroleum Reserves Corporation, gave a broad indication of its objectives last week-end. In one sense the decision to construct this pipeline is an economic one in that the United States is anxious to conserve its oil supplies by encouraging the utilisation of foreign resources. In the main, however, the objective of the project is one of strategy. Mr Ickes said that it will

greatly help to assure an adequate supply of petroleum for the military and naval needs of the United States in view of the obligations which this country must assume for the maintenance of collective security in the post-war world.

The pipeline system is to be operated and maintained by the American Government through the Petroleum Reserves Corporation; its facilities are to be available to oil producers other than those who are parties to the agreement; but the State Department reserves the right to stop supplies to the governments or nationals of any country where this would be unwise in the light of American foreign policy and the requirements of collective security. The project is the first that envisages the direct participation of the American Government in the development of overseas oil resources, and in its strategical objective it resembles the purchase of the Khedive's shares in the Suez Canal by Disraeli in 1875 rather than the construction of the canal by de Lesseps.

### The Sorest Point

There is to be a Presidential election in the United States next November. Presumably there will be a Republican and a Democratic candidate. That much is safe to say in a British newspaper; but the pitfalls which lie beyond were shown up luridly this week when the Republican press—from the stately and allegedly Anglophile *Herald Tribune* to John O'Donnell of the *Daily News*—pounced upon a leader in the *Church of England Newspaper*, gave it front page news standing, and then set their columnists and editorial writers in full cry. For a British newspaper, no matter how obscure, to insist on Mr Roosevelt's irreplaceability and to reflect on the sincerity of Governor Dewey's internationalism, shows, no doubt, a certain lack of tact and political *savoir-faire*. But in this case, surely, a very substantial mountain has been created out of a molehill, with a magnificent disregard of the facts. The *Church of England Newspaper*—estimable publication though it is—can hardly be accurately described as "an influential, authoritative, Government-supported organ of the established Church of England." It is not Government-supported; it is only one of five Anglican publications, none of which is run by the Church; and a telephone call—either in London or New York—would have

made this clear. The *World Telegram* speaks of the "ecclesiastical ineptitude . . . which, repeated, would virtually guarantee Governor Dewey's victory." The *Daily News*, with its characteristic flair for drama, suggests this may be Mr Churchill's "Kiss of Death" to Mr Roosevelt. The *Herald Tribune*, in accents of thunder, calls it an insult to many forces in America which are trying to make American participation in world affairs a non-partisan matter—"journalistic licence" . . . "which may diminish the hopes of the United Nations for a viable peace." The *Tribune's* leader ends on the hope that the responsible British press will recognise realistically the limits of international political discussion. The present incident is based in part on a misunderstanding of the rôle and importance of the newspaper concerned, though it might be added that in the United States the political freedom of British newspapers generally is underestimated and the extent of domestic censorship exaggerated. It is also true that some of the Republican papers are not above emphasising such a political *faux pas* as a means of identifying Mr Roosevelt with foreign intervention in domestic politics. But on the general issue, there can be few Americans who would care to maintain that the results of this election are matters of no interest or importance outside the United States, a sort of political skeleton not to be mentioned in polite society. Surely the country that produced the Five Senators, as well as the Four Freedoms, can afford to be magnanimous and let the British parson have his say.

### Sweat and Taxes

Mr Roosevelt's message on the state of the union a fortnight ago was interpreted as an appeal based on the now immortal psychology of blood and toil, sweat and tears. In it the President asked for a realistic tax bill. Mr Willkie, who does nothing by halves, has insisted that the Treasury proposals for taxes increasing revenues by over \$10 billions should be more than doubled. This virtuous competition as to the amount of sacrifice the American people will be prepared to stand—or even to demand—by election time does not extend to Congress. The Bill which has been agreed to by the Senate and House of Representatives provides for a revenue increase of only \$2,315 millions. Minor victories have been won for the Administration. The shameless attempt to emasculate the law governing the re-negotiation of war contracts has been abandoned. Court review of decisions under the law will not be general, but limited to cases where re-negotiation was imposed by the government. The definition of sub-contractors has been rewritten in a way which does not limit the application of the law to any considerable extent, and the exemption granted the machine tool industry has been struck out. But in other respects the tax Bill registered defeats for the Administration. The total to be realised is far below goals considered adequate by the Treasury. Income taxes have not been raised; indeed the victory tax has been lowered from 5 per cent to 3 per cent, although this is offset by the discontinuance of earned income credit. Social security taxes, which the Treasury would have liked to raise, are to be frozen at the present level of 1 per cent for another

Agency in New York

year. There is some speculation about the fate of the Bill. In some quarters it is believed that Mr Roosevelt might veto it. This is possible, but would be unprecedented; and there is no reason to think it would result in a more generous or realistic measure. Mr Roosevelt, being a practical politician, will probably argue that one-fifth of a loaf is better than no bread.

### The Soldiers' Vote

The Bill providing for a simplified Federal ballot for servicemen is having a stormy and confused passage through Congress. In the House last week the Administration measure was crushingly defeated by 224 to 167, the *coup de grâce* being administered by 48 Southern Democrats, who voted with the Republicans. The House then passed the Eastland-Rankin Bill, which merely recommends the states to make provision for absentee Service voting and requires the military authorities to give state ballots mail priority—the measure which Mr Roosevelt has characterised as a “fraud.” Since then the Senate has passed, by a narrow margin of six votes, a compromise Bill, which would establish a double system. The precise details are not yet entirely clear, but the original Danaher amendment, which was sup-

ported by the Administration, would limit the Federal ballot to Servicemen overseas and to those in the United States whose home states have made no provision for absentee voting by August 1st. The bitter partisanship which has consistently characterised the debate in Congress almost certainly is unrepresentative of the temper of the voters; and there is equally little doubt that in this case President Roosevelt has the popular end of the argument. Almost certain proof of this is the refusal of Governor Dewey to comment on a telegram of his to a member of Congress, which was widely interpreted as meaning he favoured the solution by state ballot. It is hard to avoid the conclusion that if the Senate compromise is adopted the President will have the substance, if not the whole, of what he wanted, as well as the credit of preventing a wholesale disfranchisement of Servicemen. State absentee voting provisions for Servicemen were not universally effective even within the limits of the United States in 1942, and they plainly stand a much smaller chance of bringing in that half of the Service vote which will be stationed overseas by next November. If, on the other hand, Federal aid is completely rejected the Republicans and anti-Administration Democrats will have added a most unpopular chapter to their record of Congressional obstruction.

## THE WORLD OVERSEAS

### The Falange Economy

[BY A CORRESPONDENT]

February 1st

It is almost five years since the Spanish civil war ended with a precarious victory for General Franco and the Falange. During the war, the Spanish economy had been reduced to a level of less than 50 per cent than it was previously. The Franco regime was not strong enough to tackle the work of reconstruction, and no effective help from outside could be obtained because of the outbreak of the world war a few months later. For years, the economic situation drifted, unreformed and undirected. Roughly 60 per cent of the population was employed in agriculture, but the urgent need for agricultural reform was not met and the shortage of draught animals and fertilisers, together with the unrepaired ravages of the war, have caused a complete stagnation in agricultural production. This is shown in the following table:—

|                 | In 1,000 Metric Tons |       |       |       |
|-----------------|----------------------|-------|-------|-------|
|                 | 10-year average      |       |       |       |
|                 | before 1936          | 1941  | 1942  | 1943  |
| Wheat .....     | 4,130                | 2,824 | 2,954 | 2,600 |
| Rye .....       | 580                  | 504   | 657   | 750   |
| Barley .....    | 2,230                | 1,525 | 1,600 | 1,550 |
| Oats .....      | 570                  | 557   | 600   | 550   |
| Maize .....     | 650                  | 634   | 473   | 430   |
| Potatoes .....  | 4,300                | 6,500 | 6,200 | 4,500 |
| Olive oil ..... | 360                  | 340   | 240   | 300   |

Unreliable figures indicate that the production of pulse and citrus fruit is on the same level; that is, during the last three years agricultural production reached roughly four-fifths of the ten-year average prior to the civil war. Spain thus became dependent on imported wheat and maize, which was mainly supplied by Argentina. By the middle of last year roughly half of the one million tons of wheat promised had been imported. Before 1936, Spain was the largest exporter of olive oil. Current production is barely sufficient for home demands. In addition, the supplies of animal fats have been greatly reduced by the destruction of a large part of the livestock population. Partly because of a deliberate plan for agricultural autarky, and partly because it was impossible to import cotton and other textile fibres, resources were diverted to the cultivation of cotton and other industrial crops. Growers were encouraged by a system of premiums, whereas irrigation, which was in urgent need of reconstruction, was neglected.

Superficially, the supply of foodstuffs improved during 1942 and early 1943. But this was mainly the result of a more effective rationing system which replaced the family

ration card by an individual card. The supply of rationed foodstuffs actually increased by almost 20 per cent in 1942 compared with 1941. The 1943 harvest was, however, disappointing because of an early period of drought. Yet the determined attempt to stabilise the currency and prices, against the background of a slow increase in the supply of commodities, actually put an end to black market activities for a time.

The prices which were officially fixed for agricultural products at the end of last year are almost unchanged compared with the price level at the end of 1942. During 1942-43 it was still possible to dispose of the greater part of the export surplus of citrus fruit and wine. But the new season's crop has not found ready markets. Germany seems to have reduced its imports of oranges.

### Industrial Plans

In contrast to its neglect of agriculture, the Government has been very actively engaged on a plan for general industrialisation. The mineral resources for an extensive coal, steel and metal industry are there, and the most important raw materials for a chemical industry are also available. The idea is to increase industrialisation to a point where most of the industrial demand can be covered by home production, while, at the same time, exports of, for instance, unprocessed raw materials such as ores are to be replaced by refined metals. But, at present, Spain still lacks sufficient coal and other fuel for a rapid industrialisation. The generation of electricity is in its early stages with an annual capacity far below what would be needed for even a moderate industrialisation programme. In fact, the output of iron and steel actually fell between 1940 and 1942:—

|                | (In 1,000 tons) |      |      |
|----------------|-----------------|------|------|
|                | 1940            | 1941 | 1942 |
| Pig iron ..... | 581             | 537  | 528  |
| Steel .....    | 780             | 687  | 638  |

During the first three quarters of 1943, there was a slight increase compared with 1942. The mining of iron ore and pyrites for which Spain was famous has also declined, mainly because of export difficulties. There is, too, still a shortage of skilled workers in the mining industry. The output of copper, lead and zinc has hardly reached more than 50 per cent of production prior to the civil war. There has, however, been a considerable expansion in the mining of wolfram. Disused tin and antimony mines have been reopened. New records have been established in the production of mercury, and the development of nickel and vanadium resources is contemplated. It is not difficult to see that Germany is responsible for these activities.

The suspension of oil deliveries to Spain will probably speed up the production of synthetic oil from lignite and from shale resources, which are considerable. The deliveries

of imported oil to the state concern “Campsa” were as follows:—

|            |              |
|------------|--------------|
| 1940 ..... | 109,633 tons |
| 1941 ..... | 197,039 "    |
| 1942 ..... | 215,678 "    |

These figures compare with pre-war imports amounting on an average to 500,000 tons a year. Thus, recent imports were not large enough to build up stocks.

### The Totalitarian Model

Italian and German totalitarian ideas play a considerable part in the moulding of Spain's economy. The foundation of new companies in the mining and chemical industry reveal the model of the German concern, H. Goering. The two leading concerns for the manufacture of artificial textile fibres use German and Italian patents and processes. Home-produced cotton amounted to 13,200 tons in 1942, and the manufacture of artificial textile fibres is planned to reach 23,000 tons. Imports of raw cotton have, moreover, been substantial, and it is possible that total cotton supplies have reached the pre-war level.

After many unsuccessful attempts, industry is now almost completely organised in compulsory “syndicates,” which are modelled more after the Italian Fascist Corporations than the German Economic Groups. The INI (*Instituto Nacional de Industria*) is a sort of planning department for industrialisation and for capital expenditure. Production itself is controlled by the syndicates, frequently down to the details of manufactured articles. Capital expenditure figures look impressive, especially in the chemical industry. New industries, including aluminium plants, are certainly under construction, but the expenditure on residential buildings is small. The general impression, in fact, is that plans are far beyond what can actually be realised. Machinery for new plants has to be imported, and Germany seems to be behind its promises. All that has been achieved so far in agriculture and industry seems to be the stabilisation of production on a level well below that achieved before the civil war. The record activity in the mining of rare metals and the construction of substitute industries is deceptive, and the strain which the Falange experiment in totalitarian economy is undergoing is very apparent.

## Middle Eastern Oil

[BY A CORRESPONDENT.]

February 8th

ON various recent occasions President Roosevelt has referred to the Allied oil supply position. In addition to stressing the fact that the wartime rise in the United States oil output has not been due to exports—lend-lease and commercial exports of oil in 1943 together remained well below exports from the United States in 1938—he has pointed out that the utilisation of oil resources outside the United States was limited by two factors, the tanker shortage and the shortage of refining facilities, especially those for certain types of oil products such as aviation petrol. In both cases important changes are at present under way. The tanker position has improved recently and may be expected to become more normal within the next few months. This will affect particularly the utilisation of the Caribbean oil resources. At the same time, the refinery position outside the United States is being improved and will allow the Middle Eastern oil areas to make a larger contribution to the requirements of the United Nations.

In view of its strategic situation between the two great theatres of war, the Middle Eastern oil industry figures prominently in Allied planning, and its adjustment to the war needs of the United Nations started more than two years ago. All existing oil refineries in the Near and Middle East—Abadan in Iran, Haifa in Palestine, Suez in Egypt, and Bahrain in the Persian Gulf—have been working at full capacity for some months past. The facilities of all these refineries are now being expanded both quantitatively and qualitatively. Abadan and Haifa are already producing aviation spirit, and the two other refineries are now being adapted to special war products. As a result of the changes so far completed, the output of oil and oil products in the Middle East has already surpassed the pre-war peak of 120 million barrels, after having fallen to less than 105 million barrels in 1941. To-day the area supplies not only the Allied armies in the Middle East and the Eastern Mediterranean, but also the Allied air forces, naval squadrons and

land armies in the Indian Ocean area, and in Western Australia. As a result of the refinery expansion projects now in course of construction, the use of Middle Eastern oil will be considerably extended, and, according to President Roosevelt's statement in his last lend-lease report, will this year cover a large part of all oil supplies in the entire Mediterranean theatre.

But in addition to the short-term expansion programme, which was first begun in 1941, and greatly intensified in 1942 and 1943, both the United States and Great Britain have taken steps towards the long-term development of the Middle Eastern oil resources. Although the production of sizeable quantities of oil in the Middle East started some forty years ago, the area remains one of the lesser developed regions of the world. The development programmes which are now taking shape are intended not only to raise output in the existing producing regions of Iran, Iraq, Bahrain, and Egypt to a level more in line with the reserves of these fields, but also to open the rich oil resources of Saudi-Arabia to the full. Oil was first struck in Saudi-Arabia (in the Damman field) in 1936, and the investigations since made by various United States and British interests have indicated that the Arabian Peninsula is capable of becoming one of the leading oil producers of the future.

The United States Government, after sending a technical mission to Saudi-Arabia some weeks ago, has now published the first details of projects to be financed by the US within the wider development scheme for the Middle East. These include the immediate construction of a new and large oil refinery in Arabia and the construction of a 1,250 mile pipe-line from the Persian Gulf area (Bahrain and eastern Saudi-Arabia) to the Mediterranean. While the refinery construction will be privately financed, the pipe-line, which is to assure large supplies of oil on favourable terms for United States military needs in the Mediterranean area, will be constructed with public funds. There are no official details yet about the drilling campaigns which will be necessary. But private reports from the United States suggest that certain plans have already been laid down, and that they include not only a very intensive drilling campaign in Saudi-Arabia, but also large-scale exploration and exploitation in Iran, Iraq and the smaller regions.

## HISTORY, CURRENCY, AND PROPHECY

Before the War, when quality was what we cared to make it—we at Rowntrees made it high. You will remember Black Magic—Chocolate Crisp—Aero Milk Chocolate. These were typical of the standard at which all our production was fixed.

During the War, quality can be only what we are able to make it. Nevertheless, we find, somewhat to our surprise, that in spite of Hobson's choice in the matter of ingredients, we are able to make Chocolate and Clear Gums which the people who eat them are kind enough to call excellent. Even so, owing to Zoning we can sell them only in certain parts of the country, mainly in the North and East.

After the War, when at length the quality of our products again comes completely under our own control, we shall make our post-war products to our pre-war standards. Unhurriedly, as the right materials come into the country, we shall again produce Black Magic, Chocolate Crisp and the others—and sell them from Penzance to the Pentland Firth. And that's a promise.

**ROWNTREES**

The fuller development of the Middle Eastern oil resources will certainly greatly help to ease the United Nations' supply position in the European and Far Eastern wars. But it will also greatly change the position in Asia and Europe after the war. Moreover, it will raise certain other problems, including the participation of Governments in oil production and the division of control over Middle Eastern oil between the various countries concerned. Information so far published suggests that oil production and oil refining in the Middle East will remain in the hands of private concerns and that the United States Government will confine its activities to securing priorities for materials and to the construction of pipe-lines. The future capital control over Middle Eastern oil is more obscure. The concessions for virtually all Middle Eastern oil regions were granted before the war. In certain areas British (together with Dutch) capital interests were predominant. In others, United States capital had exclusive rights. In most of the new areas, which appear to have the central part in the present schemes, the concessions were granted to companies controlled by both British and American capital together with certain other participations.

## Student Unemployment in Eire

[FROM OUR DUBLIN CORRESPONDENT]

January 29th

THE problem of finding employment for university graduates and other types of professional labour has become increasingly difficult in recent years. The problem is capable of being simply resolved into one of supply and demand. The supply of highly educated young men and, to an even greater extent, of highly educated young women has increased. This is partly the result of the abundance of scholarships awarded by the local authorities which subsidise students in the universities. There is a growing body of opinion that these scholarships are too numerous and too small. They do not enable the really poor man's child to go to the university, and the scheme would be improved if there were fewer scholarships of more substantial value. But the increase in higher education cannot be attributed to the scholarships alone. There is a widespread desire to get away from the countryside to the city, and three years at a university enables this to be achieved while preparation is being made for a career. Unfortunately, in very many cases, the career fails to materialise. Unemployed graduates are becoming increasingly numerous while others are driven to accept employment at a miserable rate of pay. Eire is in danger of producing an intellectual proletariat.

The magnitude of the problem can be seen from a study of the educational and occupational statistics. The number of students attending universities in Eire rose from 3,658 in 1920-21 to 4,311 in 1930-31 to 5,430 in 1940-41 and to 5,549 in 1941-42. The number is still rising. Fees have recently been raised, but so far no effect has been apparent on the number of students. A census of population was taken in 1926, and again in 1936. A comparison of the numbers engaged in the professions at the two dates is illuminating. Whereas the number of doctors, dentists and veterinary surgeons slightly declined, increases took place in every other profession, as the following table shows:—

|                                             | 1926          | 1936          |
|---------------------------------------------|---------------|---------------|
| <b>Total in Professional Occupations...</b> | <b>55,441</b> | <b>62,098</b> |
| Barristers .....                            | 320           | 360           |
| Solicitors .....                            | 1,036         | 1,399         |
| Architects .....                            | 199           | 279           |
| Civil Engineers and Surveyors....           | 978           | 1,047         |
| Chartered Accountants .....                 | 382           | 673           |
| Journalists and Authors .....               | 567           | 786           |
| Students and Articled Clerks .....          | 3,244         | 4,039         |

Among the "white collar" grades of labour, clerks increased from 24,710 to 30,405 and typists from 4,634 to 6,366. In interpreting these figures it must be remembered that the total population of Eire remained practically unchanged,

so that the rise in the professional groups was relative as well as absolute.

The demand for professional and clerical labour has not grown at the same rate as the supply. Indeed, it is likely that in some cases it has actually declined. Big incomes earned by members of the learned professions depend upon the existence of a rich class in the community; doctors and lawyers in particular depend for large fees on rich patients and clients. The whole policy of the Irish Government, however, has been egalitarian. The Land Purchase Acts have transferred the land from a class of rich landlords to small tenant proprietors, and high direct taxation has prevented the emergence of a new rich class. Other professions rely for employment on big business, but Eire is a country where big business is the exception rather than the rule. A complicating factor is that many Irish professional men regard British standards of fees and incomes as normal. Such standards are, to a large extent, quite unattainable in Eire. Home unemployment is preferred to working for what is considered inadequate remuneration.

### The Future Market

The future of the export market for Irish professional services is rather obscure. In the days before the Treaty, numbers of Irishmen found employment in India and other parts of the British Commonwealth. The Irish were in this respect like the Scots. Since the Treaty, fewer places have been secured in the Indian and Colonial services, but large numbers of doctors and engineers have continued to find employment in Great Britain. It is probable that these two professions will still enjoy the benefit of an export market after the war, but members of other professions and university graduates without any profession may find it difficult to find employment abroad. Apart from the question of what the external demand may be, the whole trend of educational policy has encouraged Irish youth to look inwards rather than outwards, and it is only natural that a generation bred to this standpoint should expect to find employment in its own country. Moreover, the type of education provided has been more suitable for a career in Eire than elsewhere.

If the absorptive capacity of neither the home nor the export market can be increased, the problem of the unemployed graduate may become very serious. The whole question of higher education in Eire is badly in need of investigation. Increasing numbers of students have been accepted by the universities and by the professional colleges without sufficient attention being paid to their prospects after graduation. The imposition of a *numerus clausus* would help to solve the problem, but it is an illiberal solution and one to be avoided, except as a last resort. A better line of approach would be an attempt to direct students into studies that might assist in the economic development of the country. Higher study in agriculture and in the applied sciences would result in the production of graduates for whose services employment should be available.

## Portugal's New Budget

[FROM OUR LISBON CORRESPONDENT]

IN a lengthy if straightforward preamble the Ministry of Finance has published the Budget estimates for 1944. Apart from the expected increase in outlay, equivalent to some £24 million sterling above the 1943 total, there is little that calls for special comment. Price control is admitted to be no more than a palliative of dear living, and the decision to grant an increase of 20 per cent to all government employees is roundly declared to be only a partial compensation. There is the usual division into ordinary and extraordinary sections, with both direct and indirect taxes calculated as bringing in more than they did in 1943. The increase will be obtained by numerous additional tax charges which, although individually light, will together serve to cover the increased expenditure. This is listed at 3,768,400 contos (1 conto approximately £10), with receipts reckoned to yield 3,769,300 contos; thus the established custom of budgeting for a surplus is followed. Hitherto that course has been successful; it remains to be seen whether an early cessation of hostilities in Europe, by reacting upon Portuguese exports and general trade, would prove detrimental. Tabulated, the 1944 Estimates compare with those of 1943 as follows:—

| (In contos—1 conto = approximately £10) |           |           |                    |           |           |
|-----------------------------------------|-----------|-----------|--------------------|-----------|-----------|
| RECEIPTS                                |           |           | EXPENDITURE        |           |           |
|                                         | 1943      | 1944      |                    | 1943      | 1944      |

# THE BUSINESS WORLD

## Short-Term Housing Policy

IN an article a week ago an attempt was made to define the outlines of a post-war housing policy in terms of needs and resources. It was suggested that a sharp distinction should be drawn in any realistic programme between, on the one hand, the short-term problems of making good arrears of maintenance and war damage, and of relieving overcrowding and, on the other hand, the long-term problem of raising the general standard of housing by replacement. The first task, which, besides a large volume of repairs, may involve the construction of some 1,500,000 dwellings, should be carried out as speedily as possible, but the second is essentially a long-term one and requires planning, not merely 10 years ahead—as the Government is doing—but over a period of 25 to 30 years. A mixture of the two is likely to produce confusion rather than houses. Each of these requires special treatment if the objectives are to be attained, and each of them raises complicated issues of general policy and detailed execution. Some aspects of the short-term problem are discussed below; considerations which should determine long-term replacement policy will be indicated in a subsequent article.

The fulfilment of the short-term programme will require a large measure of Government intervention. The Government's task does not end with the preparation of a global estimate of needs; it will have to be responsible for ensuring that its estimates are translated into accommodation within reach of the incomes of the people. This does not mean that the actual process of repair and building will have to be carried out by a Government department; but it does require detailed planning and supervision to ensure efficient execution in accordance with the degree of urgency. Unless the Government's responsibilities are clearly defined and adequate preparations made in good time for their efficient discharge, there is a real danger of delay and confusion at the end of the war.

The first task, obviously, is to translate the global estimates of need into a detailed programme of repairs and construction. This involves, as a starting point, a survey of housing conditions. The War Damage Commission already possesses information about the extent of outstanding repairs and about the number and types of houses that are beyond repair. A similar survey should be made by local authorities about the nature and magnitude of deferred maintenance and of overcrowding in each area. On the basis of this information, each local authority would be able to draw up a detailed repair and construction programme, arranged by degree of urgency of the work, and schedule any land which might be required for its fulfilment. By aggregating the local programmes the central Government would have a clear picture, not merely of overall needs, but also of the types of labour and materials required for their satisfaction. It would be in a position to prepare for the execution of the work according to the degree of urgency, to arrange for the supply of the requisite labour force and materials, and to assist local authorities in acquiring the necessary land. This essentially preparatory stage has not yet been reached. True, a number of useful decisions have been taken. For example, plans have been prepared to build up a large labour force and to ensure a supply of materials. As Lord Portal announced in the House of Lords on Tuesday, the Government has decided to turn over to local authorities, for the preparation of housing sites, plant and machinery no longer needed in the construction of airfields. Moreover, he expressed the hope that the recent increase in the permissible limit of expenditure would make it possible to repair the greater part of war damage, except total losses, by the end of this year. It was also announced a week ago that local authorities would be ready to start a quick programme of constructing 200,000 houses as soon as building could be restarted and that half the land required is already available.

The Government's responsibility, however, does not end with the compilation of a survey of housing needs and with the drawing up of a schedule of priorities on the basis of

the reserves likely to become available. These preliminaries, essential and urgent though they are, are merely a first step. The Government should be prepared to ensure that performance keeps in step with the programme.

During the early stages of the short-term programme—the emergency period—it will be necessary to combine a system of allocation of resources with stringent control over costs. Without the allocation of resources price control could hardly be effective; without price control priorities would be difficult to enforce, and the resultant cost inflation would make it impossible to provide homes within the incomes of those for whom they are intended. The new houses would find no buyers and no tenants and the whole programme would get stuck in the mud. An attempt to close the gap between the means of consumers and inflated costs by subsidy would be an expedient of doubtful efficacy; so long as the sellers' market persists and costs remain uncontrolled, prices would continue to rise and the size of the subsidy would have to be progressively raised without fully achieving its object. In proportion as the housing shortage becomes less acute, the physical and financial controls over repairs and construction can be loosened; but to allow free rein to money demand during the emergency period would defeat the whole object of policy. Price control might well be extended to cover interest rates. Houses to be built by the Government will naturally be financed at gilt-edged rates; but, in addition to this, there is a case for seeing that money is available at the same rates through both local authorities and building societies. Any such special financing should be limited in time to the duration of the emergency and in scope to the provision of working-class housing; and there should, of course, be no discrimination between different channels of financing.

Priorities and control over construction costs and interest rates will not automatically ensure cheap accommodation. So long as there is a serious housing shortage, the price of houses and rents would inevitably be driven up, causing hardship to the poorer section of the community. This raises the complicated problem of the future of rent control. At present rent control covers the great majority of houses; it applies to houses up to a rateable value of £100 in London, £90 in Scotland, and £75 elsewhere. In principle, rent control is an undesirable interference with the price mechanism; but in times of acute shortage it is an expedient that cannot be lightly discarded, in spite of its disadvantages. From the point of view of a short-term housing programme, the question is not whether rent control should be retained, but how it can be made into an efficient instrument for the prevention of an unreasonable rise in rents, not for freezing them in a world of rising prices. In other words, everything depends on how the instrument is handled. So far, the Government has not made known its intentions—the debate in the House of Lords on February 3rd added little to existing knowledge—but it has recently appointed a Committee under the chairmanship of Lord Ridley, "to review the question of rent control including the working of the Rent Restriction Acts."

The first question is whether controlled rents should continue to be frozen at the pre-war level, in spite of the rise in the cost of repairs, in the cost of living, and in incomes generally. Clearly there is a strong case for a periodic adjustment in accordance with a formula designed to take account of changes in the cost of repairs and of the cost of living, and of the extent to which a house is mortgaged. The indefinite freezing of rents amounts to statutory discrimination against one section of the community, that is, the payment of a subsidy to tenants by landlords. Secondly, there is a strong case for gradual decontrol, as soon as conditions permit, by lowering the upper limits of rateable values to which control applies. Thirdly, there is the thorny problem whether rent control should be applied to new houses as well, or whether a free market should be allowed to exist side by side with a controlled one. The problem

### IS THIS MAN YOU?

A persuasive speaker in public, a cool, calm thinker, never embarrassed, a good loser, a good mixer, making friends without effort? If not, you need **RAPIDISM**, the fascinating new course, endorsed by leading psychologists. Write now for free booklet to: **THE RAPIDISM INSTITUTE, C210, TUITION HOUSE, London, S.W.19.**

is a difficult one, because the inclusion of new houses in the system might easily prevent private building. Despite its many disadvantages, control is probably justified during the period of acute shortage, but only in respect of houses designed for the low-income categories and on a basis which shows a fair return on the capital invested. If the rent on existing houses is adjusted and the cost of new houses carefully controlled, the disparity between the rents of old and new houses will be less marked. If the differential nevertheless remains such as to put new houses out of reach of the poorest consumers, special allowances to them—children's allowances would mitigate the hardship of the large family—would be preferable to building subsidies, not merely because such general subsidies do not discriminate between the incomes of tenants, but also because they have a habit of not percolating through to the consumer.

The task of bringing the cost of new houses within the incomes of those for whom they are intended, as well as that of constructing the largest possible number of houses with given resources, would be greatly facilitated by a reduction in the real cost of housing, whether by using more efficient methods in the construction of existing types or by the use of new materials and processes. The Govern-

ment can do much in raising the productivity of the industry, and, as the most encouraging part of Lord Portal's speech showed, it is fully alive to its opportunities. He was able to give an impressive record of research and preparations. Apart from experiments with pre-fabricated emergency houses, the Government has sponsored and encouraged experiments in permanent houses made by new processes and new materials; some of these are to be put up by the Ministry of Works for the purpose of demonstration and ascertainment of costs. In consultation with industry, the Ministry has already achieved good results in the standardisation of fittings, an important item in the cost of houses, which should bring substantial economies. Standardisation should make it possible to include some of the modern amenities, such as refrigerators, in every new house. The Ministry has also taken the initiative in sending a mission to the United States to study building methods in that country; the report of this mission, published in outline this week by the Stationery Office—it is briefly discussed on page 219—contains many interesting suggestions designed to bring economies. There are, in fact, opportunities for building better houses at a lower cost in resources which, if taken, would greatly assist in improving the standard of housing in this country.

## Youth in the Mines

**BOYS** who are now being recruited to the mines, whether on a voluntary or a compulsory basis, have two great advantages over those who, less fortunate, entered the industry in earlier years.

In the first place, minimum wages are now determined on a national basis, and the Porter Tribunal's award places the wages of juvenile workers on a much higher level than ever before. In some cases, as was shown in *The Economist* of January 29th (p. 160) the new minimum rates are above those originally claimed by the miners. The "Bevin boys," quite apart from any sociological value they may have in breaking down the miners' isolation, have done the mining community a real service, for the compulsory direction of youths to the mines influenced the Tribunal in its decision to raise the wages of juveniles in the industry.

Secondly, and perhaps of even greater importance in the long run, there is the new provision for training. The Coal Mining (Training and Medical Examination) Order, which came into force on February 1st, provides that no one shall be employed in mining "except under competent instruction and supervision, unless and until he has been adequately instructed and is competent to do the work without supervision." From now on, no one may work underground until he has had four weeks at a training centre and at least two weeks' experience under a competent instructor, and no one can work actually at a coal face unless he has had at least 16 weeks' experience of work underground. This ruling applies to all coalfields, except South Wales, where special conditions obtain. The Order further stipulates that nobody under the age of 18 shall be employed until he has been medically examined; this is the responsibility of the Ministry of Labour's medical boards.

The provisions of this Order may seem elementary common sense. In fifty years' time, the idea of anybody being allowed to work in a coal mine without previous training or proper medical examination, may seem as barbarous as the idea of sending children under ten to work below ground appears today. Yet, hitherto, training has been the exception rather than the rule, and far too little attention has been paid to physical fitness. The Member of Parliament for one of the South Wales constituencies said in a recent debate that he had "never known of boys from our mining villages being medically examined before going into the pits."

The coming into force of the Training Order means in effect that the main provisions of the Forster Committee's Report on juvenile recruitment have, at long last, been implemented. This Committee, which was appointed by Mr Bevin when it first became apparent that the coal-mining industry was going to run into a manpower crisis, was shocked at the absence of training facilities in the industry.

When coal was hand-gotten, it was usual for a boy to work underground with his father or some near relation, who instructed him in his calling and supervised his progress. With the development of machine mining, this family link has been broken, and in many cases it has disappeared entirely.

Deputies and colliery officials, overburdened with responsibilities, have had little time to attend to the training and welfare of young entrants, who have been largely left to their own resources. A direct result of this lack of training and supervision has been the appallingly high rate of accidents among juveniles. Every year, about a thousand miners are killed and a hundred thousand injured in the course of their employment. The proportion is higher among youths; one boy in every four under 18 is killed or injured every year. Mechanisation and the increased speed of production, together with deterioration in the quality of supplies, have tended to increase the rate still further in wartime, and the recent reports of the Mines Inspectorate have urged the need for more training. One welcome development has been the introduction of a special school at Sheffield to train miners to handle the new American machinery.

Though Britain has lagged behind many European countries both in mechanising its mines and in training its miners, some of the more progressive collieries in this country have recognised the importance of preliminary training, both as a means of economising manpower and of reducing accidents. The Bolsover Colliery Company in Nottinghamshire, the North Staffordshire Collieries, the Wigan Coal Corporation and Ashington Colliery Company in Northumberland operate schemes which vary in length and in character. Ashington's course lasts for three weeks, with lectures, classroom instruction, physical training and practical training in a special gallery; it is short, but it does ensure that the boys acquire a modicum of "pit sense" and a rudimentary knowledge of the trade before they actually start work. Emphasis is laid on safety through good and careful workmanship. The company has recently introduced a scheme for training 20-year-olds—the age at which it allows boys to become face workers—at a special section of the face.

These schemes differ somewhat in practice, though not in principle, from the training which is being given to the "Bevin" recruits at the Ministry of Labour's training centres. These boys have come in at a more mature age and, in general, they have no pit background and no intention of making mining their career. But both the private and the state schemes serve an immediate purpose—the need to maintain output in wartime. The figures of the manpower shortage and the Government's target of 30,000 recruits a year to replace wastage are too well known to need underlining. But it is useful to recall some of the salient features of the pre-war trend. In the ten years from 1930 to 1940, the total number of youths under 20 dropped from 143,599 to 95,652. The number of underground youths fell from 108,033 in 1930 to 66,024 in 1940, or from 76 per cent of the total to only 60 per cent. Compulsory recruitment may meet the immediate manpower needs, though it is extremely doubtful how far it will contribute to increased output. The recruits should enable the upgrading of other workers, though here the question of willingness to be upgraded and to accept direction under-

ground may present difficulties. But what about the long-term problem? It seems certain that the vast majority of the "Bevin boys" will want to leave the mines as soon as they can be demobilised; some of the "optants" may feel differently, but their numbers are in any case negligible. The present expedient has only shelved the manpower problem, which may emerge in equal, if not greater, proportions when the war is over.

One of the chief reasons for the decline in recruitment before the war was the lack of security, both as regards wages and employment. This is, of course, a national problem and, as such, only capable of national solution. It is bound up with Britain's industrial future, with the peace settlement and the decisions about international trade, with the policy for developing coal-based industries and the location of industry. But there is much that can be done in the coal industry itself. It has the duty, common to all industries, of achieving maximum efficiency in its methods and organisation; and this achievement of efficiency is tied up with the training and welfare of its personnel. Coal has too long tended to be a blind-alley occupation, which educated or ambitious boys would spurn. It needs to provide training for its craftsmen, engineers, mechanics and electricians, and to offer the young men in its ranks more opportunities for promotion and advancement. Here again Ashington provides an example of what can be done. For the last 20 years the company has been operating a scheme for training 16-18-year-old boys as colliery officials. Promising boys are selected, and undergo a course which is spread over seven years and, in fourteen stages, of six months each, covers every phase of pit work and colliery administration. The Mining Association and the Institute of Mining Engineers are now working out a similar training scheme on a national basis. This is long overdue. The shortage of competent managerial personnel in the mines has been acutely felt during the war, and has undoubtedly aggravated labour difficulties.

The problems of recruitment and training in the coal industry cannot be viewed in isolation. They are part of the nation's broader education problem and of the coal question as a whole. The Education Bill, which will raise the school-leaving age to 15 and later to 16 and make

attendance at day continuation classes compulsory up to 18, raises new perspectives. One of the demands put forward by the miners in their "Boys' Charter" is that no boy should be allowed underground until he is 16. This is a desirable reform, which should be introduced as soon as practicable and not be postponed until the school-leaving age is universally raised to 16. Another urgent question is the times of shifts. It is obviously detrimental to the health of young boys to start work at 3 or 4 a.m. as they do in many districts. The Forster Committee raised many other points on health and welfare, all of which have a bearing on manpower. Some have been dealt with, or promised. For instance, the completion of the pithead baths programme is assured by the Mining Industry (Welfare Fund) Bill.

But even if juvenile wages are relatively high and the conditions of work made more attractive and safer, there would still be a tendency for youths to drift to the towns, unless something drastic is done to improve living conditions. The chief difficulties which the organisers of the "Bevin" scheme are facing are to find sufficient housing and to occupy the boys' leisure. Most mining villages have no amenities and no entertainments; there are no youth clubs or organisations; the pit-heap is literally the only outlook.

Coal is not the only industry with a manpower problem. The same considerations apply, in more or less degree, to all the "older" industries. Cotton lost manpower for precisely the same reasons as coal; young agricultural workers left the land to work in the towns. If these older industries are to compete with the newer occupations for young labour, they must be able to offer equally attractive conditions and equal prospects of economic security and advancement.

But these reforms will have to be paid for, and the mineowners have already announced that there is not the money in the industry to meet the Porter Award. To improve working conditions in the mines at the cost of dear coal would be to place a handicap on the whole of British industry. There is only one way in which the dilemma can be resolved—by a steep rise in the productivity per man employed. Not even the most drastic measures that would conduce to that end can henceforward be neglected or deferred.

## Business Notes

### Anglo-French Financial Agreement

The agreements signed at Algiers this week between the British Government and the French Committee of National Liberation provide for the settlement of financial relations between the two signatories and fix the exchange rate between sterling and the francs now under the control of the French Committee. The mutual aid agreement is, in effect, an extension of the Reynaud-Simon agreement of 1939. Sterling will be made freely available for French expenditure in the sterling area, and conversely francs will be made available to the British authorities in meeting their outlay in French territories—but with this fundamental difference, that, in contrast to that agreement, no account will be kept of mutual aid transactions. Regular consultations will take place between the signatories in order to maintain equilibrium, though it is evident that under the stress of war conditions the current of these transactions may well show a violent and persistent bias in one direction or the other. Consequently, nothing has been done to define the limits to which the expenditure of francs or sterling should be confined. Special provision has been made for the advances made by the British Treasury to the former French National Committee under the agreement with General de Gaulle in August, 1940. That part of these advances relating to military supplies is being cancelled and the balance is being recognised as a special debt by the French Committee of National Liberation. There will be many items to set off against that debt, among them the dollar debt owing by the British Government in respect of war material which had been ordered in the United States and paid for by the French Government prior to June, 1940, and which was then, in part, taken over by the British Government. These, together with the relics of the Reynaud-Simon account, will all be thrown in a gigantic melting-pot after the liberation of France, and no useful guess can be made at present as to where the ultimate balance will fall, what its size will be or how it will be settled.

### Unification of the Francs

The financial agreement unifies the rates of the various francs under the control of the French Committee and gives them all an exchange rate of 200 francs to the £. The longstanding disparity between the ex-de Gaulle franc of 176½ to the £ and the North African franc disappears. The new rate has had more than a year's run and is proving reasonably satisfactory, though it should be noted that a considerable body of opinion in Algiers is already beginning to regret having made the full jump from the rate of 300 francs to the £, which was originally fixed, to 200, and would now prefer a half-way house between the two. There is no question of the rate now fixed for the Algerian franc being necessarily that which will apply to the currency that will be in circulation in metropolitan France after the liberation. The rate that will have to be applied between the franc of the liberating authorities and that which will have been controlled by Germany through Vichy for about four years will necessarily be the responsibility of the French alone. The French Committee have already set some interesting precedents for differentiating between their own currency and the currency found in liberated French territories. Both in Tunisia and in Corsica considerable restrictions have been placed on the free convertibility into North African francs of the currency found by the liberators. These restrictions have, however, taken the form of blocking suspect accounts and notes, and in some cases converting them at a substantial discount. These measures have fallen far short of fixing a generally applicable exchange rate between the old and the new francs. They should rather be regarded as part of the campaign of *épuration*. That technique will no doubt be followed in metropolitan France, and a considerable measure of deflation may be achieved by the simple process of cancelling the currency and credit found in the ownership of active collaborators.

### The Levant Pound

The monetary problem of Syria and Lebanon provided perhaps the most difficult of the difficulties encountered by the negotiators of the Anglo-French financial agreement. Together with the other ex-de Gaulle territories these countries formed part of the sterling area and showed no wish to have their monetary link with sterling disturbed. On the other hand, regard for French political susceptibilities demanded that the Levant pound should be shifted to the franc area with the other French currencies. A neat compromise has been found which puts Syria and Lebanon formally into the franc area, but without any of the reality of such membership. The Syrian and Lebanese pounds retain their rate of 8.8 to the pound sterling. They are protected from the immediate depreciation of the ex-de Gaulle currencies and are given an exchange guarantee that whatever may happen to the franc rate their parity with sterling will remain inviolate.

The importance of these Anglo-French financial agreements is self-evident. Quite apart from the immediate ground which they cover, they are another welcome token of the readiness of the British Government to negotiate with the French Committee of National Liberation as the unquestioned representative of France. Even more important, the agreements lay the basis for what should become a more permanent sterling-franc alliance which can only reach its full stature when France is liberated. If that alliance can be achieved, a very powerful contribution will have been made to the wider problem of international exchange clearing and stabilisation.

### Higher Wages—Less Coal

The award of the National Reference Tribunal for the coal-mining industry, published a fortnight ago, raised the weekly national minimum wage from 83s. to £5 for underground workers and from 78s. to £4 10s. for surface workers. While the increase will add substantially to the wages bill of the industry, the precise amount involved is not yet known, but is estimated at somewhere between £20 million and £30 million a year. Nevertheless, the award has caused disappointment in that it does not benefit miners whose earnings are above the minimum. Dissatisfaction has apparently been reflected in production, for on Wednesday Major Lloyd George, Minister of Fuel and Power, said:

It is rather deplorable that after raising wages there is a greater loss of tonnage than in any week since the war started. The issue has been further complicated by the absence of decision by the Government about who is to foot the cost of the higher wages. The Mining Association, in a statement issued on Tuesday, pointed out that "the money is not in the industry." The owners expect that the necessary finance will be provided from the Coal Charges Order Fund, which is at present fed by a levy of 5s. on every ton of saleable coal. The rise in the price of coal by 3s. a ton at the beginning of this month did not provide for the advance in wages, but was meant to replenish the Coal Charges Fund, which had been running at a loss. If the fund is to bear the extra wages bill, presumably the price of coal—which is already appreciably higher than in the United States—will have to be raised still further.

### Holding Company Accounts

With their fourth list of recommendations on accounting principles, the Council of the Institute of Chartered Accountants enter a field which is of direct interest to the majority of investors and to all students of published accounts. This is the proper treatment of the results of subsidiaries in the accounts of holding companies. The Council point out that there are three possible methods; to submit detailed accounts of the subsidiaries, to present a consolidation of the results of subsidiaries and to present a consolidation of the latter with the accounts of the holding company. Of these three methods they consider that only the third is of general application, although the others have definite merits in particular cases. They accordingly recommend the publication with the accounts of every holding company of consolidated balance sheet and profit and loss account, or such other material as will enable the shareholders to obtain a clear view of the

financial position and earnings of the group as a whole. They go on to say that every consolidated statement should indicate:—

The nature and measure of control adopted as a basis for the inclusion of subsidiary undertakings, the reasons for the non-inclusion of any undertakings which would normally be included on the basis adopted by the group, the procedure adopted where the accounts of subsidiary undertakings are not made up to the same date as the accounts of the holding company and, in the case of subsidiary companies operating overseas, if relatively important, the basis taken for converting foreign currencies as affecting assets, liabilities and earnings.

For the consolidated balance sheet they merely recommend that the headings used shall be suitable, but they do lay down that capital and revenue reserves should be stated separately. For the consolidated profit and loss account no classification of earnings is suggested, but provision is made that aggregate earnings and those attributable to the holding company shall be disclosed and that it should be easy to reconcile this statement with the statutory profit and loss account of the holding company. Further, the amount of profit retained by the subsidiaries must be evident, and the aggregate results of any subsidiaries whose balance sheets are not consolidated in the published statement must be set out as a special item. Granted that the requirements about the information to be supplied by all companies in their statutory accounts were satisfactory, these provisions about consolidated accounts appear to leave few loopholes. It is to be noted that the Council does not attempt a solution of the problem of what constitutes a subsidiary, or give an opinion on the adequacy of the present definition in the Companies Act, but that is, presumably, the business of the Cohen Committee and the Board of Trade.

### Building Society Interest Rates

The decision of the Halifax Building Society to reduce its mortgage interest rate from 5 per cent to 4½ per cent is an event of first-rate importance. In form, it refers only to new mortgage advances, and is extended only as a concession to existing mortgages; in fact, it implies a wholesale readjustment of building society interest rates. To judge from the terms of the announcement, the reduction has been decided independently by the directors of the Halifax Society, without consultation with—or at least endorsement by—the Building Societies' Association, whose committees have for many months past been discussing the outlines of post-war lending and financial policy. It has always been difficult to persuade building societies to talk with one voice, despite the Association's efforts; but the Halifax is a loud enough voice in itself to ensure that its challenge will be taken up by the Abbey-National and the other large societies. The tidiness of an agreed financial policy, in any case, is no substitute in itself for lower mortgage interest rates, which (as was argued in *The Economist* on October 30th last year) will be an important ingredient in post-war rehousing policy. The Halifax reduction is, however, a lead from great strength, for a much larger proportion of this society's funds is obtained from deposits, at ½ per cent or so less than shares, than is the case for other societies. The average interest on its total funds can be roughly put at 2.207 per cent, compared with 2.428 per cent for a typical southern society. If other societies, with a much smaller differential between interest receipts and payments, are to follow this lead—as in fact they must—they will have to devise some means of obtaining their funds at lower rates. This will not be easy, although there is still some room for further adjustment of the overall rate on building society funds to conform with the present interest structure. But it is the timing of the announcement that seems most significant of all. At present the amount of new mortgage business is strictly limited, though it has risen from the trough of 1940-41. Hence the reduction, in effect, is a reduction in the charge on old mortgage balances and any substantial effect on new business in the future must await the revival of new owner-occupier building. According to general expectation, this branch of building will not reach its maximum output until about five years after the end of the war. Long before this the other large societies will have fallen into line; but the Halifax will still be able to claim the lead, both in size of resources and in its latest decision to cheapen the cost of house purchases. There may be chagrin among the other large societies, and the Association, after months of elaborate discussion toward

an agreed financial policy, may feel that its efforts have been in vain. But there is no doubt that the Halifax decision is forward-looking and right.

### Powell Duffryn Amalgamation

The long-promised scheme for the capital reconstruction of the Powell Duffryn group, now presented, deals with the whole matter in a simple and honest fashion. It proposes to place Powell Duffryn Steam Coal and Welsh Associated Collieries in liquidation and to pay off holders of all classes of share at par. Holders of all preference shares and of the ordinary of PDSC have the option to exchange their holdings for an equal amount of ordinary capital in Powell Duffryn Associated Collieries, while holders of 5 per cent preferred ordinary in PDSC are offered nine ordinary shares of PDAC for every ten shares now held. Not only have the contractual rights been fully recognised, but all holders are offered the option of taking up new capital whose market value exceeds that which they are to surrender. The simplification of structure will make for clarity and the actual fusion should result in appreciable economies. In these circumstances, it is ridiculous to suggest that the rights of the preference shareholders of PDSC and WAC have been, in any sense, infringed by putting those two companies in liquidation. The contract with these investors was not that they should have their dividends and other preferential rights in perpetuity, or until such time as disaster brought the company into liquidation. There has never been any doubt that a company may be wound up at any time when it appears desirable to those who hold the majority of votes. There is no reason why preference holders should be given better terms than their contract stated—just as there is every reason why they should be given as good. Certainly no conversion into preference capital of PDAC could have been considered. There is a reaction at the present time against heavy fixed charges. The proposed capital structure of PDAC after the fusion will be some 15.5 per cent in debentures, 23.3 per cent in preference and 61.2 per cent in ordinary, a gearing which appears, by modern standards, to make some concessions to opinions which flourished in the days when stability of trading conditions was much more probable than is now, unhappily, the case.

### American Building Methods

In July last year Lord Portal, Minister of Works, appointed an expert mission to survey building methods in the United States with the object of ascertaining if the adoption of American methods would assist in increasing the efficiency of the industry in this country. The central feature of the report of the mission on Methods of Building in the USA (HM Stationery Office, 4d.), which was published this week, is the following comparative table of the money costs of building in the two countries before the

war (the rate of \$1.68 to the £ has been used as the conversion factor):—

|                                            | COMPARATIVE BUILDING COSTS |               |
|--------------------------------------------|----------------------------|---------------|
|                                            | Great Britain              | United States |
| Cost of building .....                     | 100                        | 75-175        |
| Hourly wage rates:—                        |                            |               |
| Craftsmen .....                            | 100                        | 350-380       |
| Labourers .....                            | 100                        | 215-245       |
| Cost of materials (excluding timber) ..... | 100                        | 110-160       |

The table tells a familiar story. Wages in the United States, especially those of craftsmen, are appreciably higher than they are in this country, but total costs are only slightly higher, on the average. In other words, productivity per man-hour is greater in the United States. The American building operative enjoys the advantages of better organisation and better tools, and he takes a keen interest in output, and the consumer obtains his house at a price not much higher than in this country. Although conditions are in many respects different in the United States, the mission was able to make useful suggestions on design, building procedure, construction costs and on factory-produced building. Its detailed findings, which deserve careful study by the industry in this country, are to be issued in the form of appendices.

### Willing to Learn

A week ago it was announced that yet another expert mission—a mission of the cotton industry, headed by Sir Frank Platt, Cotton Controller—was going to the United States to investigate and report on American methods and on any changes which could usefully be made in this country to increase production. The fact that the first child of the industrial revolution is seeking advice from one of its younger brothers is significant; it is symptomatic of a growing consciousness of the need for new and better methods, which is also reflected in the emphasis placed on the importance of research in reconstruction reports. If some—mainly the older—British industries have been left behind by the United States in the striving for greater productivity, this has been due, at least in part, to an attitude of extreme conservatism towards new methods and a tendency to protect the income from plant and machinery by monopolistic practices instead of protecting earning power by the adoption of more efficient methods. There are indications that the war has broken some of the shackles of conservatism; the willingness to learn from other countries is one of the most encouraging of them.

### The Big Seven

The publication of the January clearing bank statements provides an opportunity of measuring the redistribution of banking resources among the largest of the clearing banks over the past six years without having to make allowances for the inevitable distortion of year-end

## BAY HALL TRUST LIMITED.

Summary of the Directors' Report for the year ended 31st December, 1943, and of the accompanying Statement by Mr. C. T. Pott.

### DIRECTORS' REPORT:

The gross revenue amounted to £119,009. After charging Debenture Interest, Income Tax, Directors' Fees, Management and General Expenses amounting to £34,283, the net profit is £84,726. Adding £90,012 brought forward, the total available for appropriation is £174,738 and a dividend of 7 per cent, is recommended which will absorb £70,966 and leave £103,772 to be carried forward.

At market prices on December 31st, 1943 (or where no market price existed at valuations by the Directors at that date amounting to £322,876), the Share and Debenture Holdings and British Government Securities had an aggregate value of £242,182, as compared with their book value of £1,882,587.

### STATEMENT:

In the absence of the Chairman, Sir Charles Hambro, who is in Washington on work of national importance, Mr. C. T. Pott states: The net profit of £84,726 compares with £79,984 for 1942, an increase of £4,742. The allowance for Dominion Relief amounts to 3s. 5d. in the pound, so that the net income tax to be deducted on the 7 per cent. dividend now recommended will be at the rate of 6s. 7d., and the dividend is, therefore, equivalent to about 9.4 per cent. less tax at the standard rate of 10s. 0d. At the end of 1943, the value of our investments showed an indicated appreciation of £440,595 over book cost. Over 97 per cent. of the investments, including British Government Securities, taken at the valuations at December 31st last, are situated in United Kingdom, South Africa, and other parts of the British Commonwealth. Similarly measured, but excluding British Government Securities, about 91 per cent. of the investments are in Ordinary stocks and shares and the balance in fixed interest bearing securities.

Copies of the full Report and Accounts can be obtained on application at the office of the Company, Princes House, 95, Gresham Street, E.C.2.

figures. The appended table shows the totals of the "big seven's" January statements for 1938 and for each year since 1941 and the proportion of the whole which each represents. It will be seen that the ranking of these institutions has not altered over this period, but that there has been some interesting narrowing of the gaps separating some of them. If the trends under way over this period persist, some reclassification of the order of magnitude may occur before long. The relative stability of the position should be no cause for surprise. There is a standstill in the competition for new business, partly because ceilings have been arranged for deposit rates, partly because of the gentlemen's agreement which forbids competition for advance business by offering lower rates or commission

(In £ million)

| January       | 1938      | 1941      | 1942      | 1943      | 1944      |
|---------------|-----------|-----------|-----------|-----------|-----------|
| Midland....   | 559 23.0  | 607 21.4  | 708 21.6  | 784 21.9  | 884 22.2  |
| Barclays....  | 465 19.1  | 581 20.5  | 662 20.2  | 760 21.2  | 854 21.5  |
| Lloyds....    | 451 18.6  | 553 18.9  | 615 18.8  | 684 19.1  | 767 19.3  |
| Westminster   | 404 16.6  | 446 15.8  | 500 15.5  | 524 14.8  | 567 14.2  |
| Nat. Prov.... | 347 14.3  | 408 14.4  | 481 14.7  | 506 14.1  | 549 13.8  |
| Martins....   | 108 4.4   | 140 5.0   | 170 5.2   | 175 4.9   | 194 4.9   |
| District....  | 96 4.0    | 113 4.0   | 134 4.1   | 151 4.2   | 164 4.1   |
| Total....     | 2,430 100 | 2,828 100 | 3,270 100 | 3,584 100 | 3,979 100 |

charges. Industrial and agricultural development during the war has been spread sufficiently evenly over the country as a whole to deprive its impact of any special favouritism for one bank or another. One interesting feature of the situation is the slight tendency of the two smallest banks in this group, Martins and the District, to represent a larger proportion of the combined total. The gap which separates them from the other five is still considerable, but in measuring it some allowance should be made for the item of "balances due to and by affiliates" which inflates the figures of certain of the larger banks but does not appear in the figures of these two institutions. The position has certainly been reached where the proper title of the group of large commercial banks in this country should be the "big seven" and no longer the "big five." And if the reckoning is by groups rather than by individual institutions, there is an eighth in the Royal Bank of Scotland—Williams Deacon's-Glyn Mills group.

### Electricity Debate Continues

A week ago various associations of undertakings engaged in the electricity industry published a joint memorandum on the future of its distribution side, presented to the Minister of Fuel and Power in June, 1943. One of the associations whose name appears in the joint memorandum as a signatory is the Incorporated Municipal Electrical Association, which represents some 95 per cent of the local authority electricity interests in Great Britain. The report, summarised on page 188 in *The Economist* of February 5th, was based on the assumption that no drastic alterations should be made in the ownership and organisation of existing undertakings unless these can be proved to bring substantial and permanent benefits to the consumer. Procedure was suggested for the elimination of patches of inefficiency which would "retain the present structure of the industry so far as this may be efficiently utilised." On Tuesday the *Financial News* published extracts from a Supplemental Memorandum drawn up by the Incorporated Municipal Electrical Association, some of which appear to conflict with the recommendations contained in the joint memorandum. As reported by the *Financial News*, the Supplemental Memorandum of the IMEA suggests

that in all cases where local authority rights mature, the undertaking should be transferred to public ownership as soon as practicable . . . where the distribution rights of, or to be acquired by, a local authority or a joint board are within the areas of power companies, it is recommended that, in order to eliminate dual rights of supply within the area, the rights and assets of the power company also be purchased and transferred.

In other words, the memorandum advocates a policy of local government control over the distribution side of the industry. There seems, therefore, to be a conflict of opinion within the ranks of the IMEA. This is not surprising, but it will be interesting to see which of the two policies will ultimately be adopted. It is understood that the Supplemental Memorandum will be discussed at a meeting of the Association on March 16th.

### The "Grey" Market

If, as is confidently expected, permission to deal in the shares of C. C. Wakefield and Co. is to be refused at the request of the Treasury, there will be a large addition to the amount of securities at the disposal of the "grey" market. The disadvantages of forbidding normal market dealings and permitting business to go on outside the house was last discussed in *The Economist* of December 18th, on page 818. Hitherto the issues for which this permission has been refused have been small, but the Wakefield operation involves some £3,000,000 at market values. It is true that the holders took the stock over with the full knowledge that permission to deal might not be granted, but that does not affect the main argument that dealings, if permitted, should be through the normal channels with all the protections which they afford. If these channels are closed there will still be ample facilities for business. One of the outside houses alone advertises dealing prices for well over forty stocks of some thirty odd companies to a total nominal value of £4,000,000 odd. It has just sent a circular, giving prices, dividends and yields, for all the securities in which it is interested to every stockholder of the thirty odd companies. On the assumption that the average holding is of a nominal value of £200, this means 20,000 circulars for this operation alone. Doubtless, it sends out other circulars, it advertises in the press and it is prepared to send, for five shillings, full particulars of each of the companies listed. It is only by such methods that it can hope to create a real market in the securities in which it deals and, in the circumstances created by official action, it is rendering a service to the community and one which members of the stock exchanges have no option but to advise their clients to use if they wish to deal in unquoted shares. But what a fantastic waste of labour and material in order to achieve a safeguard for the existing rate of Government borrowing, a safeguard which may well prove illusory against a threat which is, in any case, infinitesimal, given the right of the Treasury to refuse permission to raise new money for any but essential purposes.

### Mechanisation on the Rand

An official inquiry is being undertaken to estimate the possibilities of a more complete mechanisation of the Rand gold mines. This is the result, not so much of the wartime shortage of native labour in the mines, as of more long-term considerations about its future sources and status. In 1930, there were 214,570 natives employed in the gold mines, or only a handful more than in 1915, but by 1940 their numbers had jumped to 387,850, while since that date alternative wartime demands have drawn elsewhere some 100,000 workers. The increased supply of the 'thirties was not automatically forthcoming. The Witwatersrand Native Labour Association, the larger of the two recruiting organisations affiliated to the Transvaal Chamber of Mines, found it necessary to secure the permission of the Union Government to recruit from new areas north of latitude 22 degrees south, previously closed for considerations of health. Other new areas may perhaps be tapped after the war. But it must be remembered that, with the exhaustion of the less deep workings in the Witwatersrand, future mining operations, conducted on the present basis, are likely to bring a lower productivity per head. South Africa's decision, for making the best use of all its gold resources, to develop after the war the Far Western and the Far Eastern Rand will make further demands upon the labour pool, which will in any case take some time to return to its pre-war level. There is thus the likelihood that labour will be harder to get, that it will yield less, and the added possibility that it will cost more. Natives are normally engaged for no more than a year; they do only manual work in the mines; and they do it all. They receive wages which to them must seem initially a small fortune. On the other hand, they receive in cash and kind little more than one-tenth the income of the average European worker. In 1940, for instance, about 40,000 Europeans received a total sum of £19,818,126, while more than nine times as many natives were paid £13,199,126 in wages together with a provision of shelter, medical attention and food rations, which was estimated to cost the companies concerned a sum of around £7,000,000. It is, therefore, probable that public opinion will bring about further improvements in the conditions of the native workers, and, while any scheme of mechanisation which assigns to some of them more complex tasks will ensure a welcome acceleration of this process, it is unlikely to increase the net cost to the owners. Thus the problem of

# FACTORY COAL URGENT announcement

The industrial coal situation is extremely serious. Nothing short of drastic measures can meet the emergency.

Demands of military operations on a vast scale are putting an acute strain on transport. This is aggravating the fuel position, already critical.

Managers in industry now have two immediate responsibilities: to reduce their daily coal consumption still further, and to set rail trucks free with the least possible delay.

### How managements should act

- ★ Call together your departmental heads. Get at once a list of all possible savings of coal, steam, water, oil, electricity and gas that may be made in their departments. Impress upon them that industry is faced with an emergency.
- ★ Make it your personal duty to see that every point of heat usage is checked for unnecessary consumption. Space heating, in particular, is making heavy demands on the coal supply: great savings are possible in mild weather.
- ★ Tighten up your Fuel Watching System. Encourage co-operation, keenness and ingenuity.
- ★ Do not delay another day in carrying out the recommendations made by the Regional Fuel Efficiency Committee Engineers who surveyed your factory.
- ★ Search through the Ministry's Fuel Efficiency Bulletins for every economy suggestion which can be put into practice immediately. There are many.
- ★ Your next consignment of coal may be held up for those wagons standing in your works. Release them quickly.

Very fresh economy now is added provision against possible further decline in the coal supply position.

UED BY THE MINISTRY OF FUEL AND POWER

## EXTRA VITAMINS ESSENTIAL TO HEALTH

Colds and influenza cannot be resisted when your diet is deficient in vitamin A: the daily dose of Crookes' ensures you the necessary amount. Adults cannot keep healthy and children cannot grow up with straight bones and strong teeth without sufficient vitamin D: the daily dose of Crookes' keeps your supply well above the safety level.

This extra supply of vitamins A and D will work wonders in building up your resistance and stamina through this fifth wartime winter.

## CROOKES' HALIBUT OIL

LIQUID—PER PHIAL—ENOUGH FOR 16 DAYS 2/-

native labour, as well as the need to increase productivity, makes the further mechanisation of the Rand desirable, if production is to be increased or even merely maintained; while, however susceptible the gold industry may be to decisions of high international policy, it is doubtful whether the producers can do themselves any service by thinking in terms of a decrease in production.

### New Zealand's External Payments

The issue of the statistical summary of the Reserve Bank of New Zealand for September-October, 1943, contains an interesting account of the transactions of the New Zealand exchange control over the two years ended June 30, 1942 and 1943. Now that all exchange operations are centralised through the control, the current balance of international payments can be easily and accurately estimated. This should hold true of all countries with exchange controls, but New Zealand is the first of the facts public property. The main items are all figures being given in thousands of New Zealand pounds:

|                                   | Receipts |        |                           |        |
|-----------------------------------|----------|--------|---------------------------|--------|
|                                   | 1942     | 1943   | 1942                      | 1943   |
| Exports .....                     | 76,725   | 78,646 | Imports .....             | 38,383 |
| Private interest, etc.            | 8,081    | 8,632  | Private interest, etc.    | 5,927  |
| American personnel receipts ..... | 242      | 9,294  | Public debt service ..... | 35,951 |
| Sundry items .....                | 675      | 2,401  | American personnel .....  | 5      |
|                                   |          |        | Sundry items .....        | 1,448  |
| Total .....                       | 85,724   | 98,973 | Total .....               | 81,694 |
|                                   |          |        |                           | 95,578 |

The growth of outgoings on account of public debt is explained by the fact that the item includes Government payments in respect of certain direct imports. The increasing importance of net receipts in respect of American personnel in New Zealand is clearly brought out. That particular factor is likely to be of even greater relative importance in the case of the Australian balance of payments. The figures show a modest surplus in each of the years concerned. These surpluses are reflected in another table in the summary, showing the net overseas assets of New Zealand. Over the three years to August 1943, these have moved as follows:

| (In £N.Z. thousands) |              |               |        |
|----------------------|--------------|---------------|--------|
|                      | Reserve Bank | Trading Banks | Total  |
| August, 1940 .....   | ...          | ...           | 24,711 |
| " 1941 .....         | 15,082       | 10,007        | 25,089 |
| " 1942 .....         | 25,214       | 13,822        | 39,036 |
| " 1943 .....         | 26,964       | 8,651         | 35,615 |

Against this has to be set Memorandum Security debt due to the UK amounting to some £10 million in March last. The improvement has been marked, but it has not reached the point at which New Zealand can indulge the luxury of wholesale repatriation of external debt. Hence the decision to deal with the 4½ per cent loan maturing next March by way of conversion and not of outright repayment.

### The LMS Payment

Despite the general weakening of home railway equities on the mere maintenance of the dividend for 1943 on LMS ordinary, it is difficult to believe that any large body of responsible opinion seriously expected rise in the payment. After the £340,000 increase in net revenue in 1942, when bombing was at its lightest and non-official traffic approached its permitted maximum, it was difficult to see how any really substantial further increase could be obtained. After maintaining the £400,000 allocation for war contingencies, the raising of the ordinary dividend from 2 to 2½ per cent meant a draft of £103,000 on the carry forward, an expedient which could not be repeated. So a higher dividend must come, in all probability, from a cut in the reserve allocation, which seemed improbable. In the event net revenue is up by £96,000, or 0.1 per cent on the ordinary capital, the dividend and the war contingencies allocation are unchanged and the carry forward loses a further £8,000. The result was followed by a fall of ¼ in the LMS ordinary to 33, at which the yield is £7 17s. 6d. per cent. No further railway results are to be announced until Thursday next.

### Factory Lighting

In his annual report for 1942, the Chief Inspector of Factories expresses surprise that in view of the relative smallness of its cost, more attention is not paid to factory lighting. It is now recognised that good lighting, apart from its amenity value, is a factor which aids production and reduces accidents. Unfortunately, it is difficult to illustrate exactly by statistics to what extent an increase in output can be attributed to better lighting standards. An attempt has, however, been made by the Electric Lamp Manufacturers Association's Lighting Service Bureau in a memorandum entitled *How Good Lighting Aids Production Efficiency*. Some of the examples given are reproduced in the accompanying table. The amount of light needed varies from process to process, but the effect of good

| Causes alone                       | Illumination          |                      | Percentage Increase in Production |
|------------------------------------|-----------------------|----------------------|-----------------------------------|
|                                    | Original Foot Candles | Present Foot Candles |                                   |
| General engineering .....          | 6                     | 16                   | 9                                 |
| Cable making .....                 | 8                     | 12                   | 5                                 |
| Woodworking .....                  | 2.5                   | 8                    | 25                                |

lighting is felt in many directions. It lessens fatigue, and the workshop is made more cheerful. Better cleaning follows better lighting, since dirt is made more visible. Indeed, the Inspector of Factories in his report declares that

... it can be said that bad lighting, dirt and waste go together.

In the early days of the war, blackout arrangements, undertaken hastily, kept out the daylight even during daylight hours, and most factories built during the war were designed "black-out." It is difficult to alter the latter, but since the fuel economy campaign began, new arrangements have been made for blacking-out many of the older factories only at night. However good artificial lighting may be, it is recognised that daylight, where it is adequate, is better, and psychologically it is of great importance. It is clear that, as well as stressing the desirability of good lighting, advantage would be derived from the laying down of better standards in factories and that research into lighting methods should be undertaken both for the factory and the home.

### Shorter Notes

The Bank of Canada has this week reduced its rediscount rate from 2½ to 1½ per cent. Mr Graham Towers, the Governor of the Bank, said the step was designed to assure the continuance of the Bank's low-interest policy after the war. The rate has been at 2½ per cent since March, 1935, and for many years had been completely out of touch with Canadian open-market rates. The three months' Treasury bill rate in Canada has hovered for many years at about ½ per cent, while two-year bonds have for more than two years given a yield of 1½ per cent. The reduction of the official rediscount rate is therefore merely an overdue adjustment to prevailing market conditions.

Following the Anglo-French financial agreement all French territory overseas, excluding Indo-China, will, for exchange control purposes, form a single bloc outside the sterling area. A new payments order issued by the Treasury provides that moneys in the sterling accounts of residents in these territories may be used to make payments to residents of the sterling area and may be transferred to the accounts of other residents in the same territories. The franc currencies of the various territories, together with Levant pounds and Pondicherry rupees, are added to the list of specified currencies which, if held by a resident in the UK, must be offered for sale to the Treasury through a bank in the UK. The registration of securities denominated in any of these currencies is not at present required.

### AMALGAMATED ROADSTONE CORPORATION, LIMITED

#### RECORD RESULTS

The eighth annual general meeting of the Amalgamated Roadstone Corporation, Limited, was held, on the 9th instant, in London.

Mr G. F. Nalder, the chairman, presided. The following is the chairman's statement, circulated with the report and accounts: The year to March 31, 1943, again constitutes a record, trading profits amounting to £134,607, as compared with £114,480 for last year. The cost of maintaining all buildings, plant and machinery in the usual state of efficiency has been charged to revenue. After providing for depreciation, amortisation and contributions under War Damage Acts, there is a net profit, subject only to taxation, of £105,937, as compared with £92,681 for last year.

#### E.P.T. LIABILITY

Liability for E.P.T. has not yet been finally determined, but the auditors advise that adequate provision has been made, and that for the year under review the company's adjusted standard for E.P.T. is equivalent, after providing for preference dividend, to approximately 12 per cent. on the ordinary share capital. Following the policy adopted every year since the company was formed, your directors have, in addition to the amount of depreciation allowed for taxation, written off out of taxed profits substantial amounts by way of additional depreciation, amortisation of leasehold and freehold quarries, and war damage contributions, etc.; these provisions for the year under review have absorbed net profits equivalent to approximately 7 per cent. (gross) on the ordinary share capital.

During the year under review the company acquired, at a premium, nearly 90 per cent. of the entire share capital, preference and ordinary, of the Groby Granite Company, Limited, of Leicester. Your directors are satisfied that the Groby Company's quarries, buildings, land and cottages—all freehold—and plant and machinery are intrinsically worth a great deal more than the figure at which they stand in the balance-sheet of that company, which was formed nearly 80 years ago, and that consequently there was in fact no real payment for "goodwill." On the contrary,

your directors' assets are worth the purchase price. Since March 31, the issue of new pre-

st of the hold-ares has been recovered on a further increase of sharehold-ers reserves in the con-quisition of the Groby Granite Company, Limited, which has been paid by shareholders.

#### POSITION STATEMENT

Our quarrying activity has been local in Cornwall and North Wales, and delivery, were the Home Counties; this acquisition in Leicestershire is calculated to cope with the increased demand for quarry products which post-war public works should assure.

As far as can be seen, the earnings of the company and its subsidiaries for the year to March 31, 1944, will be found to be satisfactory, and with the 5 per cent. ordinary dividend now to be paid, there will be paid an interim ordinary dividend of 2 per cent., less tax, for the current year. The report and accounts were unanimously adopted.

### WANDSWORTH AND DISTRICT GAS COMPANY

The annual meeting of the Wandsworth and District Gas Company was held, on the 8th instant, at Wandsworth.

Mr Frank H. Jones, M.Inst.C.E., chairman and managing director, said that shareholders would be particularly interested to have a little further information regarding the Greater South London Gas Corporation. That corporation was created to effect the greatest possible efficiency out of the undoubted and available resources of three of the larger gas undertakings in London, namely, the South Metropolitan Gas Company, the South Suburban Gas Company and the Wandsworth and District Gas Com-

pany. Each undertaking would retain its identity and individuality, but, as far as possible, a common policy for the conduct of the undertakings would be recommended. The policy adopted should be so controlled by co-ordination that the interests of the consumers, the shareholders and the employees of all constituent undertakings were best served.

### F. W. WOOLWORTH AND COMPANY, LIMITED

#### MR W. L. SHEPHENSON'S STATEMENT

The fifth annual general meeting of F. W. Woolworth and Co., Limited, will be held, on the 18th instant, in London.

The following is an extract from the statement of the chairman (Mr. W. L. Stephenson) circulated with the report and accounts for the year ended December 31, 1943:

Conditions in the retail distributing trade certainly showed no improvement in the past year. We can feel some satisfaction, therefore, that in spite of shrinkage of personnel and curtailment of supplies of goods the board can place before you an accounting such as this. The falling off of profit can be mainly attributed to lack of merchandise.

The net profit is £5,203,654, £496,168 less than that of the previous year, a drop of 8.70 per cent. If you agree the final dividend of 1s. 6d. per unit, making 2s. per unit for the year, against 2s. 6d. per unit for the previous year, the balance to carry forward to the next account will be £7,232,840, which is an increase of £156,060. I am sure that your action through the years in agreeing to the retention of profits to build up this important sum will be rewarded.

When the company has come through the long period of this struggle, with all its necessary restrictions, the great paucity of men and goods, we shall face an enormous task. The stores are sadly shabby, understaffed and stocked with such goods as are available in these times; even the fixtures are in a condition we would not normally tolerate. It is going to be a gigantic job to re-equip ourselves with the kind of buildings, fittings, merchandise and personnel to put the Woolworth Stores in their right standing in post-war retail distribution. With this brief picture you can readily see that we need accumulated reserves of money.

## RECORDS and STATISTICS

### INDUSTRY AND TRADE

**Coal Output.**—The output of saleable coal in the four weeks ended January 22nd averaged 3,495,500 tons, compared with 3,623,600 tons per week in the previous four weeks.

#### AVERAGE WEEKLY OUTPUT OF COAL

(Weekly Standard Tonnage 4,161,000 tons)

| Four Weeks ended* | 1942 tons | 1943 tons | Four Weeks ended* | 1942 tons | 1943 tons |
|-------------------|-----------|-----------|-------------------|-----------|-----------|
| Jan. 23rd .....   | 3,824,800 | 413,400   | Sept. 4th .....   | 3,978,900 | 3,767,800 |
| Feb. 20th .....   | 4,028,000 | 416,400   | Oct. 2nd .....    | 4,076,100 | 3,819,400 |
| March 30th .....  | 4,074,500 | 413,700   | Oct. 30th .....   | 4,124,500 | 3,908,900 |
| April 27th .....  | 3,739,800 | 4,005,200 | Nov. 27th .....   | 4,126,600 | 3,815,000 |
| May 15th .....    | 4,103,900 | 3,624,600 | Dec. 25th .....   | 3,880,100 | 3,662,600 |
| June 12th .....   | 3,724,800 | 3,936,600 |                   |           |           |
| July 10th .....   | 3,987,200 | 3,579,700 |                   |           |           |
| Aug. 7th .....    | 3,539,300 | 3,097,800 | Jan. 22nd .....   | 3,813,400 | 3,495,500 |

\* The actual dates given relate to 1943 and 1944.

The production from opencast workings averaged 76,800 tons per week. During the previous four weeks, an average of 86,600 tons per week was produced. Only Leicestershire qualifies for the output bonus.

**Cotton Spinning Overtime.**—The current output of cotton

yarn does not adequately meet essential war demands, and the Cotton Controller has requested all spinning mills to increase the working week from 48 hours to 52 from March 6th. This move has been expected by spinners for some weeks past.

**The "Economist" Sensitive Index.**—There was no change in the index during the week ending February 10th. The complete index (1935 = 100) was 151.1; crops, 123.0; and raw materials 185.0.

**Retail Trade in December.**—The Retail Trade Report for December, published in the *Board of Trade Journal* of February 6th, shows that the index of the average value of daily sales (1937 = 100) rose from 106 in November to 126 in December. The rise can be attributed almost wholly to buying for Christmas, and it was noticeable in all departments. Compared with the average for the preceding twelve months and peace-time practice, the effect of the Christmas spurt in buying was felt least in the apparel and household goods departments. In all departments except these, more was spent for Christmas, 1943, than 1942. The amount spent per coupon last December was 5 per cent lower than in November, a usual December tendency since clothes rationing began.

# AVERAGE DAILY VALUE OF RETAIL SALES AND OF STOCKS, GREAT BRITAIN COMPARED WITH THE YEAR BEFORE

## INSURANCE

**Life Assurance in 1943.**—The volume of new ordinary life business was well maintained in 1943; of the 46 offices listed in the table, 25 show increases and 21 decreases, the net effect being a slight gain on the previous year of just under 4 per cent. For purposes of this note the offices have been segregated into three groups: ordinary life offices, composite offices (including in this group ordinary life offices which are actively associated with fire and accident companies) and industrial-cum-ordinary offices. The continued transaction of a substantial volume of new assurances—the 1943 total amounts to 68 per cent of the pre-war (1938) figure—withstanding all the many handicaps under which the offices are suffering, such as shortage of staff and the absence of many prospective policyholders on national service, has been cited as evidence of a growing public demand for this protection. There are, indeed, good reasons for believing that the benefits which only life assurance can bring are steadily gaining increasing appreciation. If, however, it is contended that the greater part of the business reaches the offices without personal solicitation, then the proposition is open to some doubt. As the figures in the table show, the ordinary offices, which right from the start of the war have been much the hardest hit in the way of staff, are only transacting 42 per cent of their pre-war new business; the composite offices, which have now to maintain their organisations at a certain strength in order to cater for fire, accident and war damage insurances, average 68 per cent of the pre-war level; finally, the industrial-cum-ordinary offices, whose door-to-door collecting staffs have been available for the incidental production of new business, are maintaining an activity as high as 85 per cent of the pre-war figure. In the case of individual offices there are other influences at work—some offices definitely discourage new business, some accept

## Factory Lighting

In his annual report for 1942, the Chief Inspector of Factories expresses surprise that, in spite of the fact that the small-scale factory cannot personal solicitation remains an important factor in securing business—seems inescapable. It is apart understood that an increasing proportion of the business now transacted comes from women and that nearly all the policies issued are for moderate sums assured, proposals for large amounts being virtually non-existent. The tendency to reduce or abolish the additional premium for war risks continues; where an additional premium is charged few policyholders, it seems, decide to avail themselves of the extra cover.

## UNIVERSITY OF OXFORD

## CHICHELE PROFESSORSHIP OF ECONOMIC HISTORY.

Applications are invited for the above Professorship and should  
reach the Registrar of the University not later than March 4,  
1944. Stipend £1,200 per annum. Residence required during six  
months in each academic year. Retiring age 65. Leave of absence  
can be given until end of German war. Further particulars  
may be obtained from the Registrar, University Registry,  
Oxford.

OFFICE ADMINISTRATION. Large industrial concern has  
vacancies for qualified accountants to assist in the co-  
ordination of office administration (including services and  
systems) in factories as well as offices. Applicants, who should  
be aged about 30 to 40, must be prepared to work in any part  
of this country, and should have had some factory office experi-  
ence. Knowledge of working and suitability of various types  
of office machinery and appliances an advantage. Liberal start-  
ing salary based on experience and qualifications and excellent  
prospects for advancement. Only men discharged from the  
Forces or who are not liable for military service on health  
grounds will be considered. Write, giving full details, to Box  
No. 370, c/o Dawsons, 31, Craven Street, London, W.C.2.

## Chickens to Roost

THE sky is black with chickens coming home to roost  
at the Ministry of Fuel and Power. Some of them  
are as old as the Sankey report; most are a reflection of  
the bankruptcy of recent coal policy. The war provided  
a real opportunity for bringing about a radical reorganisa-  
tion of the mining industry, which Commission after  
Commission had said should not be postponed, but only  
the fringe of the problem has been touched. In April,  
1942, *The Economist* wrote:—

The coalmining industry has been one of the out-  
standing failures of British economic policy in the present  
war.

There is no reason to revise that judgment after two  
years in which the coal industry has moved from crisis  
to crisis. Production has continued to fall and it is excep-  
tional for the national target of 4.2 million tons a week  
to be realised. Artificial respiration and palliatives have  
been applied; boys have been directed into the mines  
to make good the loss of manpower. Such measures may  
have provided temporary relief, while Mr Churchill's  
descent into the arena prevented the issue from coming  
to a head last October. But not even the Prime Minister's  
oratory could solve the present dilemma, or allay the  
very real disquiet about the handling of the mines.

The public may be excused a certain impatience. One  
week, it reads that the miners have been awarded a higher

national minimum wage, and the next, that output has  
fallen, and that 276,000 tons were lost in strikes in the  
fortnight following publication of the award. The Porter  
Tribunal made it perfectly clear that to grant a minimum  
wage was "an unsatisfactory method of increasing wages,  
since it fails to provide an incentive for increased pro-  
duction or more efficient work." It rejected the miners'  
claim for increased piece rates, as inconsistent with the  
granting of a minimum wage, and instead urged the  
industry to proceed with a fundamental overhaul of the  
wages structure, described as "long overdue."

But by only raising the national minimum, the award  
created a number of anomalies, which were apparently  
only discovered somewhat late in the day. The more  
prosperous coalfields, such as Yorkshire, Leicestershire and  
Nottinghamshire, where minima above the new national  
rate were paid, found that they derived no benefit  
from the award. The margin between piece-workers and  
day workers was narrowed, and to eliminate this would  
mean in fact an application for increased piece rates,  
which the Tribunal had rejected. The Government's  
refusal to provide the funds to meet the cost involved in  
the adjustments, either from the Coal Charges Account  
or by a subsidy, is therefore technically justifiable, and in  
conformity with the terms of the award. "Anomaly" is  
a convenient word, but a disingenuous one. It was

obvious to everyone from the start that the grant of a higher minimum, below which no one in the industry was to fall, would disturb the existing relationship between those workers who are at the minimum and those who are not. If what was being asked for was, in fact, a general increase of wages, the miners should have said so from the start. To grant a general increase in the guise of correcting "anomalies," and at public expense, might only lead to a string of new claims for financial assistance. The effects of the Government's refusal of assistance, however, are unfortunate; output is bound to decline still further and there will be no incentive to earn above the £5 minimum. The decision seems to have been taken without sufficiently explaining the reasons to the miners, who appear to have assumed that the funds would be provided, in the interests of securing industrial peace and maintaining output.

The miners' attitude is understandable. They have been treated alternately to threats and cajolery, and have been led to expect, from declarations by the Prime Minister, Major Lloyd George and Mr Bevin, that their interests were so much a matter of national concern that they would get nearly everything they asked for. Now that the men have got the whip hand, with labour at a premium and a desperate demand for coal, they seek to exploit their position. With bitter memories of broken pledges, they prefer to get what they can now, rather than to rely on promises of post-war security. At the same time, it would be a short-sighted policy for them to discredit their own Tribunal, and the present situation is dangerous in that it is tending to revive the old district divisions, fostered in the past by the owners, but which had recently been breaking down.

The miners also argue that wages in coalmining are still low by comparison with other, less dangerous and arduous occupations. Weekly earnings have risen from about 56s. in 1938 to 111s. 6d. in January, 1943, compared with 148s. 7d. in motor vehicle and aircraft manufacture, 130s. 8d. in shipbuilding, and 126s. 3d. in electrical engineering. Both out of general sympathy with the conditions of a miner's life and also as a means of maintaining the labour supply of an essential industry, most members of the general public would agree that good wages in coalmining—perhaps even better wages than the present—are desirable.

But wages cannot be treated in a vacuum. They must be related to output. And while wages have been rising from 56s. to 111s. 6d. a week, output has been falling from 22.9 cwt. to less than 20 cwt. per man-shift. The inevitable result has been a steep rise in the price of coal. The wages bill has increased from £67.1 million in the first half of 1941 to £90.9 million in the last six months of last year. The Porter Award requires more money, and the correction of the "anomalies" would require still more—to be provided either by a further rise in prices or out of the public purse.

Now it may be that nothing very catastrophic would follow, in wartime, from either a subsidy or an increase in prices. Other things are subsidised, including steel, and there is no absolute reason why coal should not be added to the list. As for prices, a rise would chiefly affect the consumer (whose consumption ought to be reduced), the railways (whose very large profits accrue to the Exchequer), public utilities (an increase in whose rates could not harm the economy campaign), and general industry (most of which is directly or indirectly engaged on Government contracts).

But the future cannot be left to take care of itself in this way. Coal is almost the only natural resource which this country enjoys; it enters in greater or less degree into every industrial process. Dear coal would be a most damaging, and possibly quite ruinous, policy both for British industry in general and for the coal-mining industry itself. On the other hand, whether or not subsidies of any sort will find a place in permanent policy, subsidies to keep wages at a level that is not matched by the productivity of the labour force are permanently quite indefensible.

It is not, therefore, the immediate crisis in the coal

industry that is so alarming, it is the evidence that a very difficult long-term problem is merely being tinkered with or let drift. During the war, one concession after another has been made to the miners, relating to their conditions of work, their wages and the method of determining wages. Each concession has raised costs. It would be wrong to say that these concessions should not have been made—or indeed that more ought not to be made now. But the only way in which they make long-term sense is if they are combined with a policy for quite drastically increasing the efficiency of the industry, the average productivity per head. Of such a policy there is less than no effective sign. The public interest demands that a stop be put to the Danegeld policy. Let there be no further additions to cost until there is some visible sign—something more than verbal optimism—of an increase in efficiency. And if putting a stop to concessions leads to an explosion, an explosion there must be. The responsibility for it will lie, without possibility of shifting, on the Government. They were warned, in the most explicit terms, two years ago that this would happen. They preferred easy optimism and they must now face the consequences.

There can be very little doubt that a considerable increase in efficiency in the industry is fully possible, though it would no doubt take time. The mere regrouping of pits, without any other change in methods, would do something. A determined extension of mechanisation could do more. The limits to mechanisation have been repeated *ad nauseam*. They undoubtedly exist, and the British mining industry will no doubt never be as fully mechanised as many others. But if the methods used in the best British collieries were generally applied a great step forward would be taken. And if new devices now in process of development are as productive as they promise to be, still more could be done.

One thing, however, is certain. This sort of technical reorganisation is quite incompatible with the present structure of the industry. It is not so much that the industry is privately owned (though that has its psychological importance) as that it is owned in so many units of differing size, financial strength, efficiency and competence. A system of "control" or "direction" from central authority is of very little effect if it leaves the basic structure untouched. That, at least, has been the experience of the last two years. The Government, in its anxiety not to raise political controversies, has tended to rely in the main on voluntary economy in fuel consumption to perform the miracle. The proposals put forward by the miners for improving the control scheme have been largely ignored, and the Government's present scheme for the grouping of pits in each area will not have much more result, unless it leads to real technical integration, which is unlikely with the present structure of ownership. The outsider's comment is Campbell-Bannerman's to Arthur Balfour: "Enough of this fooling."

The curse of the mining industry for a generation has been the politics played by both sides. Salvation now can only be found through a rigidly non-political, technical approach. Let the mines of the country, or of each district, be regarded as a whole, and a plan drawn up for getting the estimated requirements of coal from them at the lowest possible cost in labour. Let this plan be drawn up by non-political technicians, of whom there is no lack in the industry. And when this plan is complete, let the structure of ownership in the industry be fitted to it.

If to follow this procedure means to arrive at nationalisation or some other form of public ownership, there should be no shrinking from it. Indeed, it is probable that not only the Left, but the whole of the Centre and a large part of the Right, have already made up their minds that public ownership of the mining industry is inevitable. But it is essential that everybody should realise what sort of nationalisation is intended. The miners, with their emphasis on "psychological" factors and the resistance they so often put up to the introduction of machinery and the closing of inefficient pits, seem to mean by nationalisation the injection of public funds into an in-

dustrial that is otherwise left unchanged. That would be disastrous. The nationalisation that is needed is not one that is wanted for its own sake, but one that is wanted as the only way of securing a sharp increase in efficiency. That sharp increase in efficiency will, in its turn, bring many things the individual miner will strongly dislike. But it is the only means by which his very reasonable demand for good wages and good conditions can be met.

## Outlaw Europe

SOON the Allied armies will descend on the European mainland. The commanders, the planners and the organisers of the greatest military adventure in history are brooding over maps of the coasts across the Channel, and of the communication lines behind them. With equal eagerness others try to pierce the political West Wall and catch a glimpse of the social and political picture of Europe after nearly four years of German occupation. Only stray features can be seen at all distinctly. In the foreground is the foreign oppressor; the people are hidden or underground. The life of Europe has been ruthlessly uprooted. Describing the mood in which he saw the outbreak of the First World War Mr Lloyd George once wrote: "... I felt like a man standing on a planet that had been suddenly wrenched from its orbit by a demoniac hand and that was spinning wildly into the unknown." Nothing could describe better the position of the European peoples on the eve of invasion.

Europe, as we knew it before 1939, exists no longer. After the last war, too, changes were great and deep. Three powerful monarchies lay in ruins. The Communist Revolution in Russia was in full swing. Repercussions of war dominated the peace. Yet, compared with the Second World War, the First was only a prelude. The bloody, wasteful fighting was limited to narrow strips of land. So was the destruction it entailed. Behind the mud and slaughter of the trenches, civilian life still kept the air of some normality. Only in the present war has all the fury of total warfare broken upon the European continent; but it has broken, and is still mounting.

So Europe on the eve of another invasion is a huge melting-pot, with the greatest heat and turbulence still to come. No social or political forms have any stability. There have been expropriations, during the occupation, on a larger scale than in any revolution, not of one social class by another, but for the benefit of the ruling class of Germany at the expense of most of the occupied peoples. The loot has been lifted in many different ways, direct and indirect. In some cases, the restitution of property after the war can be achieved without great technical difficulties. Where German capital has taken control of entire foreign industries by buying up con-

It is not easy, of course, to enter upon a drastic scheme of re-organisation now. Both politically and industrially, the moment is ill-chosen. It would have been much better to have begun in 1942 and to have had something to show for the change now. But it never will be easy to begin, and when it is a question of putting a stop to a policy of weakness and drift, there is never any time like the present.

trolling blocks of shares the process can easily be reversed. But such cases affect only small groups of owners—at the top of the social pyramid. In most European countries the middle class has been practically wiped out. Shopkeepers, homeowners, independent entrepreneurs and artisans have disappeared. In Eastern Europe they have been directly robbed. In Greater Germany and Western Europe they have been squeezed out by industrial concentration. Nor are bombing, bombardment, demolitions and "scorched earth" merely military operations; they strike straight at the property and standing of the middle classes.

Black markets, too, have undermined social structures everywhere in Europe—except in Germany. Black markets have long ceased to be a marginal anomaly. In France, Poland and the Balkan countries they are the norm. The great majority of all economic transactions are done in them. To trade illicitly and anonymously is a matter of self-preservation. It is also a deliberate political weapon against the occupying authorities, a form of economic sabotage. Everywhere it is a function of gnawing shortage. The social consequences of this phenomenon cannot be lightly dismissed, as the staff of Amgot has discovered in Italy. For long after the war they will remain all over Europe. To restore economic discipline will take much time, much effort, much skill and much understanding—which the Allied Governments and UNRRA should know already. The black market, too, is a great shuffler of social classes. Often the professionals come from the most surprising quarters; professors, teachers, lawyers, journalists, civil servants, intellectuals become *déclassés* after their pigeon-holes—their universities, schools, newspapers and offices—have been taken from them. And the black markets are also the breeding ground for a new "middle class," the upstarts of the Second World War, Europe's war profiteers.

And so the story of turmoil and the destruction of normal life and normal values, of lawabidingness and loyalties and statuses, can be carried on. Some items are only too familiar, such as the deportation of millions of people and the shattering of families. The events of the last year or so have added new ones. There are the

*maquis* in France, the "bush rebels." Hundreds of thousands of young Frenchmen have fled to the mountains and forests in order to escape Sauckel's press-gangs. In every country of Europe ever-growing numbers live similarly outside the pale. In Poland and the Balkans it is the partisans who make up the "bush armies," and their military exploits are to some extent known. What is less known is the effect of these widespread and spreading outlaw movements on the social outlook of the countries concerned. To hold them in check, the Germans lay waste vast tracts of the countryside. In eastern Europe and the Balkans, the peasants have begun to flee bodily into the hills and forests; wherever outlaws visit a village its inhabitants suffer the most savage German reprisals, and so they make off. Villagers become outlaws. The partisans can only get food by requisitioning it from farmers who are again exposed thereby to reprisals and prefer to escape to the partisans' own hiding-places. Other recruits take to the bush through no political sympathy with the active rebels but because of senseless Nazi oppression. Others again are simply lawless and masterless men plying their trade. This, increasingly, in greater or less degree as old frontiers are passed, is the European background. Until a year or so ago the outlaw movement was still confined to the mountains of Yugoslavia, the steppes of the Ukraine or the forests and swamps of eastern Poland. With the advance of the Soviet armies the peasants' rush to the woods is extending westwards; and it has now almost reached the borders of the Reich itself.

It is true that western Europe has not yet gone through the same ordeal as southern or eastern Europe; and the difference remains most important. But it is precisely here that the next and biggest battles, bombardments and repressions may take place very soon. What is the effect of all this on Europe, on its politics, its aims, aspirations, needs, wishes and possibilities? The core of it all is a gallant, heroic, desperate struggle for bare survival, not romantic, but with its own ideals and values. But very often this struggle is so desperate and so absorbing as to leave almost no time or energy for political thought or for any thinking ahead. Striking in the many reports from occupied countries is the negligible role which politics in the pre-war sense seems to play in the real life of the

weary masses. Social and political programmes preoccupy the minds only of small illegal parties and organisations. The party organisations themselves have been smashed; Europe has been politically beheaded. The first-rank political leaders have largely been killed or cast into German concentration camps. In some countries, second or third-rank leaders have been "liquidated," and command has been taken over by the n.c.o.s and privates of the pre-war movements.

But, tentatively, two features can be picked out from the seeming chaos. First, in *underground Europe*, there is a deep, tough, primitive nationalism, natural, instinctive, rather than political. Each nation in turn has been trampled down; each has drunk humiliation to the last dregs. The resisters in each country have had to hold out unaided for four long, dreary years. From their lonely posts they could not see the wider horizons of the war or grasp its logic. They are, exaggeratedly, self-consciously, patriots, because that is how they have comported themselves.

Secondly, less wide but fairly general, there is a somewhat vague and somewhat inarticulate social radicalism. In most occupied countries collaborators have been found more readily, but not entirely, among the extreme Right and the upper classes. The familiar demand in France to end the economic predominance of the "two hundred families" has been strengthened by motives of patriotic justice; and the position is only slightly different in other countries. Compared with the social and political aftermath of the First World War, the present "radicalism" seems to be more spontaneous and widespread, but less determined and much less clear-headed and organised. The end of the war will probably see the Right discredited almost everywhere in Europe, and the Left strengthened but immensely confused.

The picture is tragic. No European clash of arms since the Thirty Years' War has produced such a tremendous unsettlement. Against this must be set Europe's present-day powers of recovery. They are strong enough in modern conditions, if freed, to stave off for certain any decline akin to that which followed the Peace of Westphalia. But they will need aid and stimulation from outside; and every policy for post-war Europe must start from the magnitude of the all-European breakdown.

### The Principles of Trade—VIII

## The New Liberalism

AN apology is needed for the length to which this series of articles has extended. But the subject is not only complicated in itself; it is one that requires delicate handling and the most careful exposition. In matters of trade, national susceptibilities have always been near the surface and are very easily bruised. The cynic may say that national self-interest is, in this sphere, all too easily transmuted into high moral principle. That may be; but the translation is sub-conscious and the moral indignation that can be aroused by heresy is none the less formidable for being invisibly based on the profit motive. There are some most influential circles in the United States that are prone to regard other nations' views on the methods of international trade as the acid test of whether or not they are sincere in their adhesion to the cause of the United Nations. It is not enough, in these matters, for a country to be well-intentioned; it must be manifestly seen to be well-intentioned. Moreover, there is another aspect. For accidents of history, the doctrine of Free Trade came to be, especially in Great Britain, the keystone of the arch of the liberal philosophy. More particularly, for a journal like *The Economist*, piety alone demands that the classical principles of international trade be handled with loving care.

Yet the conclusions reached in this series of articles are not, after all, so very different from those of the classical theory. The driving force behind the philosophy of Adam Smith and his successors was a strong belief in the natural tendencies of the economic system towards material ex-

pansion. In this expansion they saw—and rightly saw—the hope of rescuing mankind from penury, and it was their passionate will that expansion should not be blocked that led them to lay such stress on economic freedom. But it was the expansion that was their end; free trade was only the means. In their day and age they were right in their assumption that any form of conscious intervention in economic processes would necessarily be restrictive and bad. The idea of planned expansion would have been very foreign to them. But we have learned that freedom of commerce may not be so completely synonymous with expansion, nor planning with restriction. To insist to-day that it is the expansion that matters most, not the exclusive use of one means of securing it, is not to revolt against the liberal doctrine, but to restore it, to rescue it from the latter-day corruption which mistook the means for the end.

It is important that this point should be realised. All over the world to-day, the spectacle can be seen of the perfect busily impeding the good—but nowhere more clearly than in international trade. Mankind has quite obviously made up its mind to control its own economic environment. This is in the trend of all human development, and there is no possibility of stopping it, even if that were desirable. The determination appears in the categorical imperative to prevent great depressions, mass unemployment and poverty in the midst of potential sufficiency. It may be that in some parts of the world these are still debatable questions, or that, while the end is

accepted, the inevitable means are not. This appears to be still true of the United States, but it is becoming less true every day in Great Britain. And in Europe, as it emerges from the war, it is likely to be taken for granted, not only that the state has a responsibility for the condition of economic affairs but also that it must largely administer its own responsibility. In short, we are moving into an era of purposive direction of economic affairs, and those who think that international trade can remain an exception to this world-wide trend are cherishing an illusion. In theory, three possible systems of international trade can be set up—the wholly uncontrolled; the planned expansionism that has here been sketched out; and the narrow restrictionism of two-sided barter. In fact—at least until conditions of far greater stability than the world has known since 1914 can be restored—it is only the last two that come into question. Those who reject the middle solution, hoping to get the first, are far more likely to find themselves saddled with the third.

There is another most potent reason for appealing to the liberal opinion of the world to support a policy of planned expansion. Such a policy would necessarily be empirical. Once it departs from the simple absolute that all interferences with trade are bad, it must inevitably rely on judgment. Intervention in trade is sometimes good, sometimes bad; only judgment, based upon principle, can decide which is which. But in these highly political matters judgment and principle can be expressed only by an informed and disinterested public opinion. As things have been hitherto, bewildered bureaucrats, caught between the insistent necessities of the balance of payments and the clamours of the vested interests, have had nowhere to turn for guidance or help. Their natural recourse to the economists and the publicists has been met only with an unhelpful general commination. This has not, of course, in the least prevented an endless array of interventions in trade and of interferences with free commerce. But it has meant that there has been no principle or judgment in the process save that of yielding to him who can shout loudest.

Where the economists and the publicists could help would be in drawing up a body of practical principle by which proposals for action can be judged. For if the new doctrine of planned expansion turns out to be merely protectionism writ large, then it is predestined to damnation. This point cannot be sufficiently emphasised. The technical devices by which a policy of planned expansion would be administered would be much the same as those by which the protection of vested interests is secured. This is inevitable; it is the risk that has to be taken once the shelter of the absolute prohibitions is left. All through the ascent of man, the tools he has fashioned could be used for good or evil, and to be a democrat is to have the faith that they will, on balance, be used for good. Throughout the field of economic policy, and more particularly in international trade, the real controversy is no longer whether there shall be deliberate interference with economic processes—events have

decided that long ago—but on whose behalf the state shall intervene, on behalf of the community as a whole or of particular interests. The fight is not an easy one, and it will be lost if those who can best lead public opinion persist in remaining neutral.

It is difficult to draw an exact frontier between planned expansion and protectionism. As a first-instance rule of thumb, it may be laid down that any intervention whose direct effect is to stop some trade that would otherwise be carried on is suspect, that any intervention that brings specific benefit to a specific industry is also suspect, and that anything that does both at once is doubly suspect. But the only real safeguard is principled vigilance. The only real solution is the same combination of clear-headed public opinion and honest servants of the state as has saved the modern democracies from financial debauchery.

This need and this danger should be borne in mind in devising the machinery of the state to administer the policy. The device invented by Chamberlain's Import Duties Act—the Import Duties Advisory Committee—might well be taken as a model of what to avoid, since it exhibits all the major defects. It is compelled by its constitution to consider applications, industry by industry, without any effective guidance on the needs of the public interest. It is prohibited from doing the one thing that is essential—that is, studying the economic problem as a whole. Even its air of judicial impartiality is a defect, for a judge who has no law to administer must arrogate to himself the legislative function. To make IDAC "independent" is merely to secure that its decisions cannot possibly fit into the framework of any economic policy. There can be no dodging of responsibilities; the control of international trade is an essential element of economic policy, which is rapidly becoming, in peacetime, the central part of the Government's job. Instead of an "independent" Committee, exposed to the blast of every vested interest, policy should be administered by a responsible Minister answerable to Parliament and people. It would be an advantage if his Department had no other responsibilities to confuse the issue—if the domestic industrial responsibilities of the Board of Trade could be set aside in a separate Ministry of Industry—both, of course, subject to the higher command of economic policy.

The greatest need of all, however, is to rescue international trade from the atmosphere of theology. It is an instrumentality, not an end in itself. To increase the wealth of the community, to abolish individual destitution, to put an end to disastrous economic fluctuations—all these are objectives worth while in themselves. There is nothing so absolute about international trade. Its humbler duty is to do what it can to help in the attainment of these more absolute aims. We are moving into an age of new techniques and new responsibilities. If international trade can be rescued from the doctrinaires and submitted to a technical assessment of the contribution it can make, the largest step will have been taken towards recasting the principles of trade.

## NOTES OF THE WEEK

### Russia and Finland

The last act of the Russo-Finnish drama is drawing to an end. The Soviet victories on the Leningrad front and the Russian drive into the Baltic countries, followed by heavy bombardment of Helsinki, have emphasised the hopelessness of Finland's military position. The Finns are now in the pass to which they were brought four years ago when the Russians broke through the Mannerheim Line. Public opinion in Finland has now definitely swung in favour of peace. M. Paasikivi, the author of the Treaty of Dorpat of 1920 and of the Peace Treaty of 1940, has arrived in Stockholm in order to sound Russian intentions or to receive the terms of armistice from Madame Kollontay, the Soviet Ambassador. The immediate prospects depend on how severe the Russian terms are going to be. Moscow has, of course, the right to demand nothing less than unconditional surrender. The Casablanca formula applies to

the satellites as well as to the chief partners of the Axis. Yet very much depends on the spirit in which Russian diplomacy makes use of its strong position. The frontier issue is naturally in the forefront; although the Russians have not yet formulated their claims, there has been no evidence so far of any intention on their part to demand drastic revisions of the 1940 frontier. At this stage it is not the peace terms but the armistice terms that matter most. A partial occupation of Finland by Soviet armies may be a military necessity. The Russians will naturally be anxious to dispose—possibly with Finnish help and as soon as possible—of the seven to ten German divisions left in the north of Finland. They will also be anxious to use against the Germans in the Baltic sea the naval and air bases in the Gulf of Finland and on the Aaland Islands. They will probably also refuse to parley with the governmental team of Ryti, Mannerheim and Tanner, the men

formally responsible for Finland's participation in the war on the side of Germany. These are the indisputable implications of "unconditional surrender." But it is only here that the real difficulties start, and they are inherent in the peculiar Finnish background. Finland was the only Axis country in which the war against Russia in 1941 was backed by a more or less democratically expressed public opinion. In the eyes of very many Finns, 1941 was to be the legitimate revenge for 1939. Finnish public opinion has in the meantime discovered that it had committed a fatal mistake, and the Russians are certainly right in refusing to treat the Finnish war as a separate matter. War is indivisible, and Finland's fight against Russia inevitably merged with that of Germany.

But the fact still remains that the war in Finland was not an intrigue of a dictatorial clique. It was the people's democratic and patriotic sin. It is to be hoped that Russia, in its triumph, should be able to pay some attention to these peculiar psychological and political complications. It is vital that such Russian occupation of Finland as may be necessary for military reasons should not make the Finns feel that they have lost their political independence. Similarly, the change of Government ought not to be carried out in such a way as to destroy the Finnish democracy. Fortunately, nothing that the Russians have done or said so far seems to point to any intention on their part to repeat the sad and abortive experiment with the Kuusinen "Government" of 1939-1940, though the fear that it might be tried again has not been altogether dispelled from Finnish minds. The rewards of a fair settlement of the conflict can hardly be exaggerated. A separate peace between Russia and Finland would be Germany's greatest defeat since the collapse of Italian Fascism. It would encourage defections of German satellites everywhere and it would effectively counter Goebbels' Bolshevik bogey. A prolongation of the conflict, coupled with an unduly harsh treatment of the beaten Finns, would clearly be a heaven-sent gift to the Nazis. The political repercussions of Russia's attitude are almost certain to affect the military position too. It does not seem very likely that Hitler would be able to carry out in Finland the rapid military counter-moves that he was able to make in Italy. It will be extremely difficult for him to switch substantial forces to the Finnish front, if only because of his precarious communications with Finland. In this respect, the position of Finland is much more fortunate than the position of Italy was in the summer of 1943. The German forces in the north can probably be pretty easily isolated and put out of action. Perhaps the only last-minute assistance which Hitler may still hope to receive in Finland is a fresh exacerbation of Finnish political feeling.

### Guarding the Baltic?

Attempts to bring together the Polish and the Soviet Governments have not been given up. The recent exchange of letters between the Prime Minister and Marshal Stalin shows that informal British mediation has been going on despite the previous refusal of Moscow to accept any Allied "interference" in the Polish-Soviet conflict. The principal issue now is the Soviet insistence on the reconstruction of the Polish Government in London. *Pravda's* attack on the Polish Government last Saturday was very violent. The paper made a number of grave charges against the Polish military underground as well as against the Mikolajczyk Government. Presumably in connection with Mr Churchill's mediation, M. Mikolajczyk has now postponed his visit to the United States. The new and most important question now raised is the proposed partition of East Prussia. This new Russian proposal is believed to cover the annexation of part of East Prussia, with

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so before the date of expiry. If they fail to do so, their subscriptions will be automatically cancelled as soon as that date is passed, which will mean a gap of many months before the despatch of copies can be resumed.

Koenigsberg, by Russia and the annexation of the Masurian Lakes in Eastern Prussia as well as of Danzig and Pomerania, with Stettin, by Poland. Russia is said to claim Koenigsberg as a naval base for the Red Fleet to enable it to guard the Baltic Sea. Should this plan be accepted by the Allies, this would imply that a more comprehensive policy towards Germany, apart from the Soviet-Polish dispute, had been roughly agreed between the Allies; and that the policy was one of dismemberment or partition. This is an issue of paramount importance, vital for future peace or war. It requires the fullest public discussion. No arguments of "assistance to the enemy" or of military secrecy can possibly be involved. There is an odd contrast here between the state of public opinion now and in the first year of the war. "War aims" and "peace aims" were favourite subjects of political writers in the months of the "phony war" when, not only victory, but also the most grievous setbacks, were still ahead. Now, in 1944, when victory is at least in sight and when diplomatic arrangements for peace must have reached some more advanced stage, public opinion is enjoined to keep an inscrutable silence about what we are fighting for, and may have to fight for again.

### Absentee Members

Last week was the third occasion on which the House of Commons Disqualification (Temporary Provisions) Act has come up for re-enactment. It is a good barometer of the state of the Government's relations with Parliament. It was first passed at a time when there was considerable criticism of the way the Government was conducting the country's war effort, and the promise of a Select Committee to investigate the whole position of office-holders under the Crown was needed to diminish the Commons' dislikes. A year later, after the military disasters of the Far East, there was considerable criticism of the Government's conduct of the war, and though the Act was renewed without any difficulty, the debate on the Select Committee's Report showed that Members had not modified their distaste. Last year, at the time of the North African victories, the Bill passed almost without notice. This year, however, Parliament is becoming increasingly critical of the Government's peace effort, and the second reading was not carried without a division—which the Government won by 91 votes to 10. That the measure was originally justifiable, and even necessary, can hardly be denied. In those days it was a case of mobilising the most suitable people for every important post, and the disfranchisement of constituencies when Members were, as a result, sent abroad was an argument that carried little weight at a time when the national danger was paramount. But now, as that shrewd Parliamentarian, Mr Maxton, pointed out,

not only have external things become less pressing than they were, but . . . internal things, the definite work of this House, is becoming more and more important.

He may be wrong in saying that the war situation is less pressing, but he is certainly right in declaring that fateful and far-reaching decisions will have to be made during the next term of the Act. Mr Bevan's charge that the Government is corrupting the House of Commons through the Act is absurdly untrue. The number of certificates that can be granted under it is limited to 25, and only 21 have been issued—two in respect of one Member—and 13 of the Members concerned are available for their House of Commons work. The attitude of the Commons during the debate—and indeed throughout the war—shows that they are in no danger of becoming a Parliament of placemen. But though the principle which underlay the original provision in the Act of Settlement—that Parliament's control of the Executive must be upheld—has not been endangered, the principle that certain offices are incompatible with membership of Parliament should now be reaffirmed. It is time for the Members concerned to decide whether they wish to be politicians or to follow a diplomatic—or other Governmental—career, and for the Government to show, cause why, though it may be in the public interest for these Members to be appointed to the posts in question, it is also in the public interest for them to retain their seats in the House of Commons.

### Electoral Reform

Mr Speaker has chosen 32 members, 29 M.P.s and three peers, to make up his Conference on Electoral Reform. Colonel Clifton Brown sought party guidance in making his

choices, and Parliament has accepted his decision without criticism. To some outsiders—who are also electors—it may perhaps seem somewhat unfortunate that the selection should have been contrived to give the Conservative Party a majority over all the rest, Labour, Liberal, and Independents combined; for the recommendations of the Conference on constituencies, the franchise and elections will obviously be intended to cover at least the next generation of politics, during which the fortunes of all parties will ebb and flow much. It is especially important that the redistribution of seats should be proposed solely on grounds of principle without any reference whatsoever to the present balance of representation. To some others it may seem strange—as it did in 1918 when five peers were appointed to the last Speaker's Conference—that members of the unrepresentative and unenfranchised Upper House should be invited to take part in discussions so close to the peculiar preserves and privileges of their jealous neighbours. Yet, the precedent is firm. Such a Conference without the counsel of Lord Margesson, who handled the electoral reins so decisively for so long, might in any event have seemed vastly incomplete; and the only other doubt that can arise in the mind of the most sceptical observer is again a minor one—whether, with the representation of peers accepted, Lord Ammon, whose seat in the Commons has hardly yet had time to cool, was—for all his obviously very great personal suitability—the most logical choice for one out of a mere three.

### The Path to Parliament

The work of the Speaker's Conference has been slightly and significantly widened since the intention to set it up was first announced. It will include, not only the expenses of candidates at elections, but also the expenses of Members when elected. In this part of its discussions, the Conference will touch the heart of the present political dilemma. For a considerable time there has been a distrust, not of the Parliamentary and party system, but of professional politicians and the rigging of electoral choices by party arrangements. These arrangements which determine, usually from central offices, what men shall go forward as local candidates are largely based upon monetary considerations. A Conservative has usually to provide a considerable sum for expenses, cash down before election, and year by year after. On the Labour side, it works the other way; men who have served trade unions or party organisations well, and so have some kind of pension claim, backed by seniority, are appropriate choices to receive Parliamentary salaries from the State—made up perhaps by other payments from party funds. Whatever else the trend of dissatisfaction with official candidates at wartime by-elections may mean, it does reflect a long-standing impatience with candidates selected on these grounds; and it does not yet reflect any tide in the direction of Labour, which, politically, is under the same cloud as the Conservatives. The Speaker's Conference will have nothing whatsoever to do with party behaviour. But it will be within its power to advise upon changes in the conditions of a parliamentary career which would make it easier for able and popular candidates to be brought forward by the parties, without overriding attention to considerations of finance. One principle, the limitation of expenses by law, is already applied to elections; there is no reason why it should not be made much more strict, and applied much more widely, to rule out the kind of local benefactions which are a common way of keeping seats warm, even when won. But if the road to Parliament is to be made democratically free for men of ability, there is another principle which must be very carefully considered and, probably, accepted; that is, the payment by the State of a fixed maximum sum towards the expenses of both candidates and Members. Only in this way can the present situation be ended in which the bulk of MPs are men with money, party hacks or hangers-on. It is from MPs that Cabinets are chosen, and so long as the standard is kept so low, the revulsion from parties and politicians will continue—with perhaps the most unfortunate consequences.

### Local Choice

Meanwhile, the right of local voters, apart from personal and party ties, to choose their own representatives, without feudal or caucus dictation is being tested again

at West Derbyshire. By the time these words are read the result there will be known; whatever it may be, the votes cast for Mr White will be as much a vote for local freedom of choice as for this or that policy or party. It is very hard to see why, in the present situation, the parties do not defer to this obviously deep local desire to have a say in picking the actual individuals who seek to speak for them in Parliament. The Communist Party has a plan by which a local constituency committee would vet the candidate officially put forward by the Government parties; the plan belongs, of course, to the period, until quite recently, when the Communist Party was quite unswervingly on the side of Coalition and the electoral truce, and seems to bear some slight resemblance in technique to the choice of local representative by "show of hands" proposed by the French Communists for the first provisional stage in the liberation of France. Plainly, everything would depend on how and by whom the local constituency meeting was called. Much better, if some temporary device of this kind is required to overcome the chronically unrepresentative character of almost all representatives, would be some adaptation of the system of party "primaries" used in the United States—as was suggested in *The Economist* in September, 1942. By this means the local members and supporters of each party would choose their local candidate by popular vote. It would be perfectly simple to entitle every voter to one vote, but only one, in a party primary, as well as in the subsequent election; and it is not suggested, if the other deadening weights on British party politics can be lifted, that the system need be retained sufficiently long for it to acquire the defects with which its advantages are alloyed in America.

### Bloodless Decision

Tuesday's Commons discussion on Clause 6 of the Education Bill ended, surprisingly, in its passage without a division. Mr Butler deserves very high praise for having kept intact, in the main and so far, the principle that, in every district, one authority should be responsible for all types of education—nursery, primary, secondary and further. His tactical mistake, perhaps, was to make certain concessions to Part III authorities in the Bill itself, instead of, now, at the Committee stage. The trouble is that a good principle of administration has to be applied to a far from perfect administrative structure. It would indeed be anomalous if provedly efficient, populous boroughs and urban districts had to surrender all their jurisdiction over schools to less competent counties; or if small, poor, inefficient counties were now to become all-powerful simply because of historical accident. But, in spite of all the tumult and the shouting, these are really not the issues. Admittedly, all the present county councils and county borough councils are not uniformly the best of all educational authorities in the best of all possible administrative worlds. But this point has been vastly exaggerated for interested reasons. The provision in the Bill for the delegation of all school powers, including secondary, to county districts is an extension, not a lessening, of existing powers. The number of boroughs and urban districts, not county boroughs, which have a case to make is,

Export  
and  
Import  
Banking  
on  
Sweden

SKANDINAVISKA BANKEN

in fact, very small; and, given good will at the Board, which is certain, and tolerance in the counties, which is desirable, the Bill can in practice be worked to the satisfaction of everyone, without the wrecking of its central idea—the unification of costs and policy over wide areas to cover all kinds of schooling.

### Indian Alternatives

Lord Wavell's speech to the Indian Legislature on Thursday of this week was an occasion of no little importance, and might well have been dramatic. It was the Viceroy's first public statement of policy since he took office. He spoke, first, as a soldier. He surveyed the war outlook on India's frontiers, India's own contribution and problems of supply. He stated the unanimous wish of Britain to see India self-governing, prosperous and strategically secure. He listed three obstacles to the swift achievement of Indian self-government: the over-riding need to beat Japan and Germany; the duty of Britain, in any settlement, to guarantee the interests of those Indians who have assisted in the war, the soldiers, the ordinary people, the Indian States and the minorities; and, biggest of all, the continued absence, since the Cripps offer was refused, of any positive willingness on the part of leading Indian politicians to co-operate in working out what India wants, and will peacefully accept. In short, Lord Wavell felt obliged to repeat the older speeches of lesser men; the only hint of fresh policy was a straightforward appeal to Congress members to accompany their demand for the release of their leaders from detention with some practical proposals for Indian agreement. At least, the issue has been narrowed to a single point. Many Indians, in Congress and outside, claim that Congress co-operation would now automatically follow the release of the leaders. Lord Wavell, and behind him the British Government, say that some assurance of co-operation must precede release. The Indian reply is that to ask this is, in effect, to ask Mr Gandhi and his colleagues to convict themselves out of their own mouths; and that, released, they would do of their own accord, if only for political reasons, what they would not do under compulsion. It is now for Parliament and British public opinion to decide which is the better way: to take the risk of release in the hope that the new mood of Indians, disillusioned by the over-bargaining of 1942, would at once press their leaders to go forward in order to keep their lead; or to play the waiting game, and rely upon slow attrition to bring up new leaders or new policies, pointing towards co-operation. So long as Lord Wavell, a soldier, has the choice, he probably has no alternative—and so his chance of political greatness ebbs.

### Pay-As-You-Earn

The second reading of the Bill to extend pay-as-you-earn to all Schedule E employments was passed in the House of Commons on Thursday of last week, and the Committee stage is to be taken on Thursday of this week, so that comment is inevitably a stage behind. In the second reading debate, controversy was raised only by the treatment of the temporary civil servant. The Chancellor of the Exchequer took the astonishing line that there was a real grievance, but that he could do nothing about it. He "had sought long and earnestly" for a solution, but had had to give up the attempt. He gave no reason other than the familiar one of "administrative difficulty" (which was said, until very recently, to prevent any form of pay-as-you-earn), and the impediment is probably the customary attitude of the Inland Revenue in preferring that ninety-and-nine should suffer unjustly rather than that one should, however unexpectedly, get more than his deserts. Nor unnaturally, this attitude failed to convince the House. Mr Eccles suggested, on the spot, two alternative ways of dealing with the question, and every private member who spoke urged the Chancellor to think again. This, it is to be hoped, he has now done. Mr W. J. Brown attempted to extend the argument to the permanent civil servant, who, indeed, has an analogous grievance, though on a very much smaller scale and referring, on the average, to a much more remote period; but he failed to convince the House, and was, as usual, obstructed by his own immoderation of language. Some members of the Services also have a grievance, which should be put right. But the outstanding, the flagrant, the intolerable injustice is that which the Chan-

cellor, by his own confession, proposes to inflict on the temporary civil servant.

### Dual Government in Italy?

The Government of Marshal Badoglio has now taken over the administration of Southern Italy from Amgot. The line between the area still under Amgot and that under Marshal Badoglio runs from Salerno to Bari. Ten million Italians are now under entirely Italian rule. The decision of Amgot to withdraw into the immediate military zone north of Salerno and Bari seems certainly expedient, and probably right. But it does not solve, nor could it solve, the problem of Italian government. This remains more acute than ever. The conference of democrats at Bari does not so far seem to have impressed the head of the Italian Government by its appeals against the predominance of Fascist personnel in the new Administration. The opposition parties now appear to have gone a step farther—if some reports are to be trusted—and threatened to set up a Government of their own—how, and of whom, is not stated. Perhaps the "warning" is simply intended to strengthen democratic pressure on Marshal Badoglio. Rivalry between two Italian Governments would be very harmful so close to critical fighting. Nor, surely, is it likely that either Signor Croce or Count Sforza, both moderate and conservative liberals, really aspire to a rôle similar to that of General Tito in Yugoslavia. Yet, the crisis in Italian administration—and the dearth and disease of Southern Italy—are undeniable; and Marshal Badoglio cannot even attempt to better things without the widest aid. Even so, it is still doubtful whether any political *dénouement* in Italy can happen before the capture of Rome by the Allies, now promised by Mr Churchill himself.

### Reconstruction

Last week's Commons debate on the powers of the Minister of Reconstruction was at times another good example of the wrong-headed way in which problems of this sort tend to be approached by many MPs. The Deputy Prime Minister was without doubt right to resist the demand that Lord Woolton should have a large departmental staff to duplicate or take over the reconstruction work of almost every other Ministry. The obvious fact is that reconstruction, now in the planning and policy-making stage, will be the routine day-to-day work of all departments when the war is over; it is departmental work in preparation, and the departments must prepare it. Far more sensible and relevant than calls for a super-Ministry was the demand for decisions and action. On the face of it, there is nothing wrong with the machinery. Lord Woolton has a small expert staff and, he has said, the full backing of the Prime Minister, while, in the various departments and at the War Cabinet Offices, the Government has specialists busy at work on reconstruction programmes. The only question is—and it is a crucial one—what is it that Lord Woolton has been given Mr Churchill's backing to do? Optimistically, it was believed before Christmas that his job was to induce or even compel departments, Ministries, even Cabinet committees, to make up their minds; to insist upon every important question being brought as near as possible, and as quickly as possible, to the form of a draft Bill. The popular notion of Lord Woolton's job was the right one: he was "going to make them get a move on." This, so far, he has not done, unless crowds of rich surprises are waiting to appear suddenly, all at once—and even if this is true, the critics will want to see the proof before relaxing. For the moment, it seems that, on the whole, power to act and decide is still withheld, and Lord Woolton himself runs the risk, no doubt undeservedly, of being described as a founder-member of the New Fabianism.

### Employment Policy

After several speeches saying again the obvious things in general about the transition from war to peace, the Minister of Reconstruction had a chance in the Lords on Tuesday to say something more specific. His theme was full employment, the duty of the Government to see that con-

tinuing employment is provided for all those willing and able to work. Unhappily, he still had no news to give. First, he said the Government would build emergency houses; then, that work would have to be found for men as they came out of the Services; and, finally, that it would be imperative to prevent post-war activity from collapsing as soon as immediate replacement was done—it would be necessary to have public works, central and local, ready whenever employment threatened to fall off. Lord Woolton cannot perhaps "scoop" his own White Paper on this subject, which is months ahead. But already, it seems likely, from certain sombre notes in official speeches and statements, that the "radical" idea of planning for full employment over a long period by a policy of deliberate expansion in all branches of economic activity is being treated as if it were mere unprofessional amateur dream-making. This would, indeed, be the Great Surrender. It would mean that, by a different route, the Gadarene descent of 25 years ago would bear a fair chance of being repeated, probably with much worse social and political consequences. At any rate, it is quite fallacious to say, or imply, that the first and exclusive task of the moment is to find jobs for demobilised men. Such jobs will be as easy to find as they were in 1918-19, when all but a small fraction of between three and four million ex-Service men found work. But how long did the work last? That is the point. A demobilisation policy which is not part of a full employment policy—that is, which does not set out to provide lasting jobs continuously—will invite untold disasters.

### The Size of the Market

Lord Woolton's approval of an expansionist policy might seem to be mere commonplace. In actual fact, the adoption of an expansionist policy involves a far-reaching change in outlook, not merely in Whitehall, but also in the world of business. It involves the elimination of monopolistic practices and a drive for the adoption of new processes and better methods in production as a means of raising productivity and the national pool of goods and services. There are still industrialists who explain the success of American industry in combining high wages with low costs in the production of modern amenities, such as motor cars, wireless sets, typewriters, vacuum cleaners, refrigerators, by reference to the difference in the size of the populations of Britain and the United States. This explanation—excuse would be a better word—is based on two fallacious assumptions which should be discarded if there is to be a broad advance in the British standard of living after the war. The first of these two fallacies is that the size of the market for consumer goods depends on the size of the population. The size of the market is not measured by the population, but by the proportion that can afford to buy the modern amenities. In the United States the proportion is much bigger because the goods are produced at lower cost, despite higher wages. Population, it is true, sets an upper limit to the *potential* market; but the size of the *actual* market for goods and services is largely determined by industry itself. The second fallacious assumption is that the population of Britain is too small for the achievement of costs comparable to those of America's mass production industries. It is fallacious because it assumes that the optimum unit of production is too large for this country. The optimum unit of production is fairly large, but it is ridiculous to suggest that it is too large for this country. After all, the population of the United Kingdom numbers 48,000,000. True, that of the United States exceeds 130,000,000; but the modern amenities that sell more cheaply across the Atlantic are produced, not in one plant, but in a series of plants. The second fallacy, in fact, is derived from the first.

### Water Policy

On Thursday of last week, Mr Willink, the Minister of Health, promised, simultaneously, a new Bill and a new White Paper, without any noticeable notice being taken. He pledged himself to produce a Bill to give additional Exchequer assistance for the supply of piped water and sewerage facilities in rural districts, together with a White Paper stating a comprehensive water policy, including the ascertainment of all resources, presumably both under and over ground, as well as the control and co-ordination of their use and distribution. These steps are very necessary. The near danger of another of the grave droughts that come periodically upon this country still remains. The outlook for some country districts is bad; and, over and above the immediate prospect, there is still the outstanding problem of tapping all the nation's available water and bringing into

line the use made of it by the 2,000 or so water undertakers and water-takers. Even now, it seems that the pace of events may still outstrip the tempo of Government. There are several private Water Bills, of the old piecemeal unco-ordinated kind, due to come before Parliament soon, and Mr Willink could not say whether the Government will or will not have produced its water policy before the Bills appear. The Government's left hand, in this matter of water, may for a little longer still not know what its right hand is doing. Obviously, the provision of a sufficient supply of water to prevent thirst and disease—even if the threat comes only at intervals of seven or seventeen years—can be regarded as part of the first charges upon national resources. On the other hand, there is obviously a limit to this kind of argument. No Government can accept the view that a man or household is entitled to piped water and sewer engineering whether he may choose to dwell on the top of Snowdon, in the Outer Hebrides, or plumb in the middle of Exmoor. Like all matters of social reform and reconstruction, it is a question of priorities—or, in the economist's jargon, of marginal utility. Is it more worth while to spend this extra amount of money or resources on water supply in this or that part of the wilds than it is to devote it to, say, transport or schools or, housing or what you will, elsewhere? This, indeed, is one of the outstanding examples of the fact, so obvious that it is commonly forgotten, that policy, at least in matters economic, must always be a consistent whole. This argument does not, of course, affect the imperative need to prevent drought in the established communities at present threatened; and there is just a chance that this White Paper, which will be Mr Willink's second, may be the basis for a real advance in policy, within, say the next ten years, when all the local and private interests concerned have been tidied up.

### Penicillin Production

A Member of Parliament has scented a monopoly in the production of penicillin, and his Parliamentary questions on the subject have now been followed by a public statement from the companies concerned and by his own reply. Penicillin was a British discovery, but, very properly in view of its success as a bacteria killer, the British scientists concerned in it have collaborated in research with scientists in the United States. In that country production is now well ahead of what it is over here, and the substance of Mr David Robertson's charges is that Britain has fallen behind because a monopoly has been given to three or four companies which have not been able to produce 1 per cent of the demand. In his Parliamentary questions he has asked why the Ministry of Supply has refused to support the request of a representative of the International Chemical Company to visit the United States, since the company's associates in that country and Canada are the largest manufacturers of the drug. He has also asked for details of the new buildings being erected for the production of penicillin, elaborating this question in his public statement by pointing out that they are being built on to the existing premises of at least two of the companies, and will not be completed in time for the second front, whereas if production had been carried out in requisitioned premises it would now be well

### INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

under way. To this latter question the Ministry of Supply refused to reply, pleading the public interest. On the former point, Mr Peat, Parliamentary Secretary, has stated that there was no need for Mr Gormley's visit because technical experts are already in the United States, and any information they obtain about processes and equipment will be made available to any manufacturers

who satisfy the Ministry of Supply that they are in a position to undertake the production of penicillin.

The alleged monopolists—the five big drug houses comprising the Therapeutic Research Corporation, together with Imperial Chemical Industries and Kemball, Bishop and Co.—have also issued a reply. They point out, first, that penicillin can at present only be manufactured by biological as distinct from chemical methods; in other words, that it has not yet been synthesised, which means that each batch has to be assayed if its standard of activity is to be guaranteed—it is not stated whether American and Canadian output is thus assayed. They point out, secondly, that also concerned in penicillin are the Medical Research Council, the Committee on Medical Research in the United States and the General Penicillin Committee of the Ministry of Supply, and that consequently "anything less like a monopoly has never been seen."

It is impossible to say how much substance there is in Mr Robertson's charges or whether the companies' final claim is justifiable. On their behalf, it may be stated that the existence of the official committees, on whom are the two scientists—Professors Fleming and Florey—with whose names the discovery of penicillin is associated, should mean that there is an adequate watchdog of the public interest. On the other hand, it cannot be forgotten that when the Therapeutic Research Corporation was set up, combination in marketing seemed to be as important an objective for it as collaboration in research. Moreover, the two technical experts now in the United States belong to Glaxo, Ltd., one of the TRC's constituent firms, and Imperial Chemical Industries. All in all, there certainly seems a case for the Ministry of Supply to answer in full.

#### French Colonial Dilemmas

The revival of political discussion at Algiers has inevitably brought up the problem of French colonial policy, which has been in abeyance since the failure of the reforms proposed by the Popular Front in 1936. The political calm which reigned among the Moslem populations of French North Africa between 1938 and 1942 now seems to have ended. Politically-minded sections of the native populations have grown more vocal, and the recent discussions on colonial policy in the Consultative Assembly took place against the background of sporadic disturbances in all the three North African dependencies of France. That the problem should have come to the fore now is by no means surprising. When all the problems of the future of France are coming under review the status of *La France d'outremer* can hardly be left out, and this is realised by Arabs as well as by Frenchmen. The discussion has so far tended to be in vague and abstract terms. But the underlying dilemma is pretty clear. The traditional French policy of "assimilation" seems to have come to a deadlock. It was based on the assumption that the Moslems in most of the dependencies were potential Frenchmen, but had to be "assimilated" in order to become real Frenchmen. The gulf between precept and fact was wide. The Moslems of overseas France were French subjects, but not citizens. They possessed no voting rights.

Access to administrative posts was barred. General de Gaulle recently tried to overcome this by granting citizenship to the educated Moslem "élites." The concession does not seem to have met with any satisfactory response. The demand for its extension to groups wider than the *élites* has been raised both by Arabs and by the French Left. Simultaneously, economic claims have been made, such as the equalisation of wages for Moslems and Frenchmen; reform of the French tariff policy; and wider autonomy for the dependencies in their trade with foreign countries. Some of these demands—equalisation of wages—have been partially granted. Others cannot even be considered before the general political framework of France is reset. Most Frenchmen waver between "indirect rule" and "assimilation," or try to mix both, not always most happily. M. Pleven, the Commissioner for Colonies, has put forward a scheme of an Imperial Federation with a Federal Assembly, representing all the dependencies, functioning beside the Chamber of Deputies. The scheme does not, however, provide for the establishment of any legislative bodies elected by the dependencies. M. Pleven explains that, in future, the dependencies ought not to have any seats in the Chamber of Deputies. But he has not defined the powers of the new Federal Assembly. In the Algiers debates the scheme met with strong criticism; and it does, in fact, seem to combine the least good features of the alternative solutions. "No assimilation, no French citizenship"—says M. Pleven. Almost in the same breath he says: "No autonomy," which means nothing except in the context of the old policy of "assimilation." Confusion is probably inevitable at this early stage.

#### Nazi Europe

An article on page 231 looks at the state of Europe on the eve of invasion. This is also the first concern of the Nazis themselves. What can they do to rally support round them when attack from the West follows retreat in the East? In recent months they have learned that the old-style racial and anti-semitic ranting is a boomerang as soon as military successes cease, that success in propaganda—however "professional" or "scientific" or "organised"—depends entirely in the last resort on success in battle. As Nazi fortunes have faded, national resistance in the occupied countries has grown; even quislings and collaborators have had second thoughts; the satellites seek ways to peace and, as the collapse of Italy showed last year, the network of Nazi control is not enough to hold them. Can the grip be tightened while the war is being lost? The new measures which the Nazis are using to attempt this are the old, old ones—with, perhaps, a new twist. The organisation of Germans abroad has been overhauled; they supplement the Gestapo—no longer all-powerful—and in South-Eastern Europe constitute "political hedgehogs." Then, side by side with the familiar "tourists," there are the natives of the occupied and satellite countries themselves. Up and down Europe fascist groups, many in number but minute in membership, still look to Germany—they have no other choice—and have become newly active in politics in Hungary, Finland, France and other countries. The third way has also been refurbished lately. This is the recruitment of volunteers from European countries for the S.S. and national detachments under German officers; these, too, seem lately to have grown in numbers. Some are at stations in the West, and others have been mentioned in German communiqués. But all this propaganda and pretence of "comradeship in arms" is a sham. The purpose is to show Europe—to Europe, including Germany, and to the Allies—rallying to defend "European totalitarianism" to the last. Backed by sufficient force, the sham might for a time be kept up. Allied victories will blast it into nothingness and the scattered, unhappy, uprooted handfuls of desperate or misled men will disperse into a chaos beside which this neat Nazi propaganda picture is ridiculous.

#### Shorter Note

Questions were asked in the House of Commons last week about the effect of the copper cut on employment in the Northern Rhodesia copper belt. Replying on behalf of the Colonial Secretary, Mr Emrys-Evans stated the matter was to be discussed between the Northern Rhodesia Government—which will also represent the African workers—the managements of the companies, the Mineworkers' Union—which represents the European workers—and the staff associations. He also said that there was no reason to expect unemployment to arise from the cut, but gave no details about the measures to be taken to absorb the displaced labour.

## AMERICAN SURVEY

### Only Fear Itself

(From Our Washington Correspondent)

December 27th  
"WHAT are we all going to do now?" The question was asked at a meeting of a county business and professional women's club. Part of that particular county serves as a bedroom for wartime Washington; part of it is agricultural land whose owners are more conscious of their state than of the nation's capital. Since petrol rationing, meetings have been few and far between, and a roll-call had to be taken to bring the group up to date on their new occupations. As it was starting someone interjected: "When you tell us what you're doing now, say what you think the world is going to be like after the war."

Of the thirty or so women present, not everyone did more than state her present job. But of those who said something specific about the future, none anticipated it as other than a hard time. Mostly, they did not think of the hard time in strictly personal terms, though two or three staff members of Washington war agencies commented on the search for a new opening, which they expected to be an immediate post-armistice event in the organisations now charged with consumer controls. Mostly, their concern was with the fortunes of the people with whom they deal from day to day. The county juvenile worker's concern was with the youngsters whom she sees and pursues daily. She remarked that the war may be bringing discipline to boys and girls who had been graduated or been about to graduate from high school and were more or less at a loose end when hostilities started, but that the generations immediately following them are going to include far too many uprooted, untended youngsters who will have a hard time fitting in. She had cases to back up what she said.

The phrase "fitting in" was picked up by a music teacher with sons in service; how can the gap be bridged between the experience through which they are now going and the experience, during the same time, of the civilians at home in the communities to which those boys will return? How can the mutual ignorance be compensated without complacency on the one hand and scorn on the other? The mother's concern about the awkward sensitivity of returning service men was repeated with emphasis by a woman who had been a nurse in France last time and who is working in a veterans' hospital to-day. The county welfare worker saw it from the standpoint of the homes the men left behind them, the young families that are hardly started before they are broken up—"If you run into someone whose face is familiar but whose name you can't place, it's a safe question these days to say 'How's the baby?'" she commented.

A Government lawyer, who handled compensation cases for land taken for military uses, illustrated present anxieties from a letter written by a pair of Texas parents whose farm is now an airfield:

My husband and I had fought with everything people have to fight to secure for our children a chance at an education and had them ready so they could ride a steer through college, but since the Government has got through with us our children will do well to drag a cotton sack through high school.

The wife of a local doctor now serving overseas was apprehensive about the future of medicine, about the absorption of former practices by doctors who have not gone into service, and—here she repeated the line at present being sponsored in mass circulation by the American Medical Association—the threat to all doctors contained in such proposals to socialise medicine as the current Wagner Bill.

Two teachers had just come from a meeting whose agenda included some difficult questions about racial facilities in the schools.

#### Local Leaders

The meeting was a cross-section of the American middle class. None of the members has a job that is very important;

all of them have some effect on the fabric of community life, through the county services, private and public, and the lower professional civil service at the federal level. They are the group from which local leadership comes, particularly during a time when a fair proportion of the men of the vicinity are away. They are the group whose sense of uncertainty and insecurity would increase with the continuance of inflation; the concern they expressed at the meeting, calm enough that night, might take on a shrillness then.

The important fact about their very matter-of-fact preoccupations with the world after war's end was that, of the entire company, no one saw the days ahead as a time to get something better going, difficult though that process may be; the shape of things to come was uniformly seen as a dislocation of what had been before.

The mood of these typical people from a typical county may be an index of the price the country is paying for leaving everything ahead undefined. The enthusiastic illusion that the world can and will be made fit for heroes to live it would indeed be as dangerous after this armistice as after the last. But neither is it an asset to go backwards into the future. Is it not about time for the post-war world to hear a Presidential inaugural speech that, among other things, would point with assurance to the fact that "the only thing we have to fear is fear itself"?

### Pipeline Reactions

A departure from established practice, such as the building of the Arabian pipeline represents, inevitably invited comment from all sides. The more so because the policy of Government action taken in partnership with private companies has now been extended to a storm-centre of world affairs, and is no longer a matter of purely domestic interest. While comment outside the United States is inclined to withhold criticism or approval until more is known of inter-Allied discussions on Middle East oil reserves, the Administration has been attacked at home on a multitude of widely differing platforms. The "Liberal" element leans toward a denunciation of the project as a further step in the cartelisation of the oil industry, stressing the status of the Government as a privileged buyer rather than as controlling operator of the pipeline. On the other hand, conservative opinion views with some apprehension the degree of Government intervention in private enterprise which is involved in the agreement concluded between the Petroleum Reserves Corporation and the oil companies in the Gulf area. More irresponsible comment, such as that which suggests the project was inspired by anti-British ambitions, is likely to die down as Administration assurances sink in that the only design is to secure adequate reserves against a dwindling home supply and against military and naval commitments outside the Western Hemisphere. Meanwhile, questions to Mr Stettinius about the likelihood of an agreement on Middle Eastern oil reserves between Britain, the United States, and Soviet Russia brought the promise of an overall statement by the State Department. Despite the President's disclaimer, it can hardly be claimed that no political questions are involved. It is, for example, inevitably being asked whether the whole arrangement involves a naval commitment to keep the Mediterranean open.

### Bankhead Bill

The attempt of Congress to stop the Government subsidising consumer prices for food after June this year will most probably meet with the use of the Presidential right of veto. Mr Roosevelt has conferred with the leaders of the House and the Senate and with Mr Rayburn, the Speaker of the House of Representatives, and it is generally inferred that this means he will veto the Bankhead Bill. The Senate's action in passing the Bill, by a majority of 43 to 28, must be viewed in conjunction with other efforts to attack Administration price and wage controls. Although the President may feel strong enough to stand against the Bankhead Bill, it is improbable that he will be able to resist the passage of the Tax Bill as well. This Bill, which denies the Administration three-quarters of the additional taxation for which it asked, may yet, it has been pointed out, provide half the necessary sum, through the clauses providing for the re-negotiation of contracts, which will save the Government some \$3 billion. Nevertheless, to permit an insufficiency of taxation to meet the demands of war-time administration, side by side with a refusal to keep the prices of consumer goods down to a reasonable level, is to ignore every essential lesson of war economy and to imperil not only the security of future Administrations, but the whole economic balance of the nation. The President has many times made this clear in the strongest terms, and he would certainly be consistent in vetoing both Bills. But if he succeeded in killing this Tax Bill he might not get another.

### Lend-Lease Repayment

The repayment of Lend-Lease aid is a topic of steady discussion in American public opinion. A recent tendency is to advocate repayment in kind, and, in particular, in raw materials. It is generally believed that the forthcoming Report of the Truman Committee on the oil industry will recommend British repayment of Lease-Lend oil in kind. Whether, in face of a shortening of home supplies and a big jump in postwar demand, this will meet with the support of the industry is not yet clear. The *Journal of Commerce* is apparently following the same line in suggesting that the United States finance the reconstruction of world trade through the grant of credits repayable in raw materials. It is fairly clear now that there is little support for any use of money in the settlement of outstanding inter-Government

debts, and it is widely held that only Russia will be expected to repay in gold, platinum, or other precious metals. It would be wise to remember, in advocating repayment in materials, that, if the net balance due to the United States on Lend-Lease account stands at a very high level, there are considerable dangers inherent in such a scheme, unless carefully regulated and planned well ahead. The old story of Ruhr coal sent to France in reparation of the 1914-18 war holds a very apt moral. Nor does the mere substitution of materials for money get over the basic difficulty. If the materials are those that America would have bought in any event, to regard them as Lend-Lease repayment merely means that the supplying countries are, to that extent, short of dollars they could otherwise have used to pay for American exports. There is some talk, in which Vice-President Wallace has joined, of special strategic stockpiles. But this is very far yet from being a practical project.

### Talk v. Silence

While it is almost universally believed that if Mr Roosevelt consents to run for a fourth term, there will be little difficulty in deciding the Democratic nomination, the Republican field is already being shown round the paddock and the main lines of choice can be discerned. Mr Wendell Willkie has, with the appointment of a campaign organiser, formally announced his intention of running. Against his more personal appeal, his demand for national unity, an overhaul of corporation taxation, and for whole-hearted international co-operation—in short, against his flood of talk—there is the appeal to the tradition of the Republican party, coming, in different ways, from Governor Dewey and Governor Bricker. Mr Willkie's candidature is dependent for support on popular belief in his personal leadership; there is little attempt here to win through on the party line. Governor Bricker, whose Lincoln-day speech did not meet with much general approval, seems to be attempting a return to the "old principles" of the GOP rather than fight the Democrats on the more specific issues of the day. His views on foreign policy are still obstinately ambiguous, and the pro-Administration press has not hesitated to pour contempt on the "ideal leader of the horse and buggy Republican Party" and the "honest Harding." Governor Dewey, whose prestige in professional political circles is high, is also in the lists, and is using the old bogey of Federal dictatorship and New Deal bureaucracy to win support against war-time measures usurping State rights, a question which was brought to prominence with the subject of the soldier vote. But in the main Mr Dewey's tactic is silence. Meanwhile, the primary elections will begin next month, and before the Republican convention late in June, there is some time for new candidates to put in an appearance and for new issues to be raised on which the final Republican platform will be made. In any case, as in 1920, the Republican strength lies more in the psychological desire for a change of party, than in the personal attributes of any particular candidate for their nomination. There lies the danger.

### Shorter Notes

Mr Wallace, the Vice-President, may not himself be a candidate for re-election this year, but he is doing useful spade-work for the party. His recent endorsement of the fight against freight-rate discrimination against the South was received with great enthusiasm by a recent conference of Southern Governors. The abolition of this long-standing grievance would, it is alleged, end the "colonial" dependence of the South on the East and North and allow it to compete on more equal terms in the national market for manufactured goods, rather than restricting it to primary products.

The Senate and the House of Representatives have passed a Bill to grant Service personnel mustering-out pay, amounting to a maximum payment of \$300 for service of any length overseas or in Alaska, \$200 for service of sixty days or over in the United States, and \$100 for these honourably discharged with less than sixty days' service.

## Quality of Reproduction

For nearly half a century the world's greatest artists have entrusted the permanent reproduction of their art to "His Master's Voice"—exclusively. Purity of tone and quality of reproduction have therefore become a tradition with "His Master's Voice" . . . a tradition which ensures that "His Master's Voice" radio sets and radio-gramophones enable you to hear the world's greatest artists as they would wish to be heard.

## NEWS of WHITE HORSE

*Supplies of White Horse were growing old when this war was young*

If you have wondered how it is that you can still get White Horse Whisky from time to time, and how it is that the quality and flavour of this famous whisky were never better than to-day in this fifth year of the war, here is the answer in one word . . . age.

All the flavour, fullness and smoothness of the White Horse you have known in the past is in the White Horse you may buy to-day. For to-day's White Horse is itself a whisky of the past. In the early days of the war it was already growing old. It has been ageing ever since.

It was the stocks of maturing whisky, laid down in years gone by with a prudent eye on the future, which provided the great blend that is White Horse to-day. And our unrelaxing, provident care of the whisky still maturing is your assurance that this famous Scotch will remain as always — whisky fine as a fine liqueur.

## HISTORY, CURRENCY, AND PROPHECY

Before the War, when quality was what we cared to make it — we at Rowntrees made it high. You will remember Black Magic — Chocolate Crisp — Aero Milk Chocolate. These were typical of the standard at which all our production was fixed.

During the War, quality can be only what we are able to make it. Nevertheless, we find, somewhat to our surprise, that in spite of Hobson's choice in the matter of ingredients, we are able to make Chocolate and Clear Gums which the people who eat them are kind enough to call excellent. Even so, owing to Zoning we can sell them only in certain parts of the country, mainly in the North and East.

After the War, when at length the quality of our products again comes completely under our own control, we shall make our post-war products to our pre-war standards. Unhurriedly, as the right materials come into the country, we shall again produce Black Magic, Chocolate Crisp and the others — and sell them from Penzance to the Pentland Firth. And that's a promise.

"At your service"

# G.E.C.

IN WAR—AS IN PEACE  
at the service of the Empire

Before the war, G.E.C. electrical equipment was installed on ships for every class of service. Many important vessels, including turbo-electric luxury liners, electrical self-discharging cargo vessels and diesel-electric tugs and ferries, were completely equipped by the G.E.C.—the largest British electrical manufacturing organization in the Empire. During the war there has probably not been a British ship of war or cargo vessel built without some G.E.C. electrical equipment.

The G.E.C. serves every essential industry in a similar way and the magnitude of such a task has necessitated a complete reversal from peace-time production to war priorities. Changes in design and technique have been constant, and these will have far reaching effects in the future.

When peace returns the Company's experience embracing every application of electricity, including the important one of electronics, will be at the disposal of all concerned with reconstruction in every part of the world in carrying out complete electrification schemes of any magnitude.

## ELECTRIFICATION SCHEMES

G.E.C. Electrification Schemes have been applied to all industries, including: Aircraft Factories; Chemical Works; Collieries; Food Factories; Gold Mines; Iron, Steel and Copper Works; Locomotive and Railway Carriage and Wagon Works; Motor Car Works; Ships and Shipyards; Textile Mills, etc., etc.

## Post-War Ulster

[FROM OUR BELFAST CORRESPONDENT]

February 10th

THE King's Speech at the opening of a new session of the Northern Ireland Parliament, on February 1st, emphasised the increasing preoccupation of the Government—and, indeed, of the country at large—with post-war planning. The Speech struck an optimistic note with regard to the progress of the war effort, and referred to "the continued progress made towards the maximum mobilisation of the industrial resources of Northern Ireland for the prosecution of the war, resulting in a substantial increase in the production of ships, aircraft, munitions and textiles." It was also stated, however, that "the transition from war to peace conditions will create intricate problems affecting the entire community," and a substantial part of the Speech dealt with the steps being taken by the Government in regard to the framing of post-war policy.

For a number of years before the outbreak of war the level of unemployment in Northern Ireland had been much higher than in Great Britain. Conditions were indeed rather akin to those in the special areas, and the encouragement of new industries was being actively pursued. For a period of at least twelve months after the outbreak of war, a high level of unemployment continued in Northern Ireland. In September, 1940, there were 73,591 persons unemployed—an increase of over 10,000 compared with just before the outbreak of war. During the past three years, however, there has been a steady growth in the volume of war work placed in Northern Ireland. In addition, employment has been helped by the great amount of constructional work that has taken place in the building of aerodromes, defence works and air raid shelters. By October, 1943, the number of unemployed workers over 18 had fallen to 11,305.

Ulster industry rests upon three main bases—agriculture, shipbuilding and engineering, and the linen and textile trades. All three were depressed before the war. It is apparent that the cessation of hostilities will affect seriously the volume of employment in shipbuilding, aeroplane construction and some branches of engineering. The need for broadening the basis of Ulster industry is evident, and it is the desire of the Government to do everything possible to establish new industries. The absence of either coal or raw materials—other than those derived from agriculture—has meant that industry in Northern Ireland has normally had to import both its fuel and its primary material. In these circumstances, the provision of cheap electricity is a matter of first importance. A big increase in generating capacity has occurred during the war, and discussions are proceeding between the Government and the Electricity Department of the Belfast Corporation with regard to the development of electricity supplies after the war on the most economic basis. The spread of industry can also be facilitated by an improvement in transport organisation. Both industry and agriculture are largely dependent upon imported raw materials. Both find their principal market in Great Britain. Both require a cheap and efficient transport service. The main obstacle in the way of achieving this lies in the existing duplication of road and rail services. The rapid development of road services in the inter-war years—and the great volume of short-distance traffic in Northern Ireland was particularly favourable to the development of road services—had resulted in a redundancy of goods transport facilities before the war. The question has been the subject of an interim report by the Agricultural Enquiry Committee at present sitting under Lord Justice Babington. The Committee foresees the possible breakdown of public transport after the war, unless steps are taken to co-ordinate the existing transport undertakings, and recommends the amalgamation of road and rail services under a new Transport Board appointed by the Government.

In the case of agriculture—which is by far the most important single industry—the wartime expansion of production has been enormous. Questions regarding the future of the industry are being examined by the Babington Committee. Certain wartime developments are, however, en-

couraging for the future. A great increase in mechanisation has taken place, while there have also been important developments in milk production and marketing. For the first time, a uniform price for milk is being paid throughout the whole country, and this has encouraged production in the outlying areas. Recently published figures show that annual sales off farms have increased from 40 to 55 million gallons since before the war, while sales for liquid consumption in Northern Ireland have risen from 15 to 29 million gallons a year. The extension of mechanisation and the development of a greatly increased market for milk should prove two highly important assets to the agricultural industry after the war.

The prospects of the linen industry depend largely upon the supply of the raw material. During the war, flax production has been increased to almost 100,000 acres, compared with just over 20,000 acres before the war. This has been done through the payment of satisfactory guaranteed prices by the Government. The flax is largely used for direct war requirements such as aeroplane fabric, parachute harness and webbing. Before the war the great bulk of the flax used by the Ulster linen trade was imported, and the maintenance of home production will depend upon the ability of the trade to offer prices that are attractive to farmers. In particular, some means of eliminating the widespread fluctuations in prices from year to year that occurred before the war will be necessary. These fluctuations were a constant source of worry to farmers, and contributed largely to the steady decline in acreage that had been taking place for many years prior to 1939. Meanwhile an expert Committee is conducting an investigation into the post-war prospects of the linen industry.

## A Building Boom?

One industry in which considerable employment will be afforded for several years after the war is building. Belfast suffered severely in the air raids of 1941, while house-building has been at a standstill since the war. It was stated recently that, whereas 172,588 houses had been completed in Great Britain since the war, the number in Northern Ireland was only 626. An interim scheme for the erection of 750 houses in Belfast has now been approved by the Government, subject to the necessary materials being available. It is proposed to give a subsidy of £390 per house.

Finally, reference may be made to the development of public health services, which have been the subject of a recent report by a Select Committee of the House of Commons. The Committee states,

It is clearly evident that, viewing the situation as a whole, the public health services generally in Northern Ireland are inferior to the comparable services in England and Scotland.

The Committee finds this to be partly due to the multiplicity of bodies dealing with public health in Northern Ireland—Rural District Councils, Urban District Councils, County Councils and Boards of Guardians all share responsibility. The recommendations of the Committee relate largely to questions of administration. The establishment of a Ministry of Health, to be responsible for all health services, is recommended.

## Spanish Trade and Finances

[BY A CORRESPONDENT]

February 15th

DURING 1941 and 1942, the volume of Spain's exports remained unchanged at 1,870,000 tons, which is less than one-third of the volume of exports during the last normal year of 1935. It would be wrong to take this comparison as a precise indication of Spain's inability to gain real economic recovery. Yet more than three-quarters of Spain's foreign trade is carried on with continental countries whose demand for imported goods is very great. It can be assumed, therefore, that the unsatisfactory state of agricul-

tural production and the Falange's policy of autarky, together with the general disruption of foreign trade by the war, kept Spain's exports and imports at a very low level. By value foreign trade, excluding trade with Spanish colonies, was as follows:—

|                       | Million gold pesetas |         |
|-----------------------|----------------------|---------|
|                       | Imports              | Exports |
| 1935 .....            | 879.7                | 588.2   |
| 1939 (9 months) ..... | 317.7                | 207.7   |
| 1940 .....            | 527.7                | 294.8   |
| 1941 .....            | 438.9                | 403.9   |
| 1942 .....            | 480.1                | 492.6   |
| 1943 (6 months) ..... | 358.8                | 412.2   |

These figures show that the policy of autarky has been successful in so far as it has reduced the large import surplus which was characteristic of Spain's foreign trade. During 1942, and again during the first six months of 1943, there was actually an export surplus. But the increase in value from 1941 to 1942 was accompanied by a decrease in the volume of imports and a stabilisation of the volume of exports. During the same period average export and import prices increased considerably, and this tendency continued during 1943.

Since 1941 Germany has taken the leading place in Spain's foreign trade, and during the first six months of 1943 Germany's share in Spanish imports and exports amounted to 24.3 per cent and 39.2 per cent respectively. As regards imports, Argentina, the United States, Brazil, Switzerland and Great Britain came after Germany; in exports, the order was Germany, Switzerland, Great Britain, Italy, the United States. During 1941 Germany ran up a large clearing debt; but in 1942 it doubled its exports to Spain and reduced its imports by 15 per cent. During the first half of 1943 German exports and imports continued to increase and were almost twice as large by value as in the first six months of 1942. Germany's trade policy towards neutral countries, which consisted of making a great attempt to supply their demands, was particularly marked in its foreign trade with Spain. German machinery and chemicals were exchanged against Spanish foodstuffs and, above all, valuable metals. It can be assumed that mining machinery and railway rolling stock formed an important part of German exports.

Great Britain's share in exports and imports varied considerably. Imports from Spain fell from 89.8 million gold pesetas in 1940 to 40 millions in 1941 and rose to 71 millions in 1942. Exports to Spain during the same years were 18.8 millions, 21.1 millions and 30 millions. United States exports to Spain fell from 38 million gold pesetas in 1941 to 16 millions in 1942. Germany's share is no doubt impressive, but it is not so overwhelming as it is with other continental countries. Spain is not landlocked, but is still relatively free to trade with overseas countries, particularly Argentina, the main supplier of wheat and maize.

A considerable effort has been made to restore Spain's merchant fleet. Fairly large building programmes have been carried out, and official figures state that the total merchant fleet, amounting to a million tons, is as large as it was in 1935. At present Spain's foreign trade is of considerable importance for Germany's strained supply situation. But this should not lead to an exaggeration of the general importance of Spain's foreign trade, whose total imports and exports in 1935 amounted to roughly 1 per cent of total world trade. This suggests that it should be relatively easy to squeeze Germany out.

## Germany at War

### Coal and Steel

LARGE potential resources of coal, iron ore and manganese have been lost to Germany's war industry by the retreat from the Donetz and the Ukraine. Not long ago German hopes ran high of integrating the entire continental coal and steel industry from France and Belgium in the west to the Donetz in the east. The centre would have been Upper Silesia, formed out of German, Polish and Czechoslovak territory.

Already, before the retreat, Upper Silesia was being supplied with Krivoi-Rog iron ore and N'kopol manganese, but exploitation of Russian resources still did not cover any substantial part of the total supplies available to

### Financial Policy

It cannot be doubted that Franco's Government has tried to stabilise Spain's financial situation, although the period of acute financial difficulties has by no means passed. The methods of price, finance and exchange control have been demonstrated in most countries, and only an extremely weak Government would be unable to effect some stabilisation at present. The price indices suggest that, since the autumn of 1942 internal prices have been relatively stable at roughly more than 300 per cent of the 1935 price level. It is, however, difficult to obtain an accurate picture of price movements since the end of the civil war. For several years the black market, with its exorbitant prices, was the only market in Spain. Compared with black market conditions, price reductions have been considerable. Unfortunately, it is impossible to measure the standard of living because of the lack of adequate statistics on wages and earnings. Summary estimates suggest an increase in the nominal national income from 31,600 million pesetas in 1935 to 41,900 millions in 1942, which, measured by the increase in prices, means a substantial decrease in real income. An estimate of national expenditure in 1942 shows that 66 per cent of the total is spent on foodstuffs. This is a high percentage and indicates general poverty.

General financial reforms were long overdue in Spain, and it appears that the new regime has so far succeeded in centralising the system of taxation by abolishing provincial taxation. A considerable percentage of revenue is still derived from indirect taxation. Recently a tax on wolfram was added. The excess profits tax, introduced in 1940, was abolished at the beginning of 1944, and instead a surtax on high incomes gradually increased the basic income tax from 7.5 per cent to 44 per cent. Tax revenue was as follows:—

|            | Million pesetas |                  |
|------------|-----------------|------------------|
|            | 1940 .....      | 1942 .....       |
| 1940 ..... | 5,380           | 8,170            |
| 1941 ..... | 6,930           | 7,520 (9 months) |

The ordinary budget estimates balance revenue and expenditure for 1944 at 10,300 million pesetas, against 9,400 millions in 1943. The extraordinary budget amounts to 2,600 millions. The deficit will be covered by the issue of Treasury bonds and by a Government loan. The interest on this new loan, amounting to 1,000 million pesetas, is tax free. The total national debt, which stood at 21,300 million pesetas in 1935, rose to 29,071 millions at the end of 1943, according to a statement made by Gomez Gorordo, director of the Department of the National Debt.

The gold holdings of the central bank, which had decreased to 462 million pesetas at the end of 1941, against 2,202 millions in 1936, reached 927 millions in October, 1943. The reason for this is that the bank took over the gold from the exchange equalisation fund. Notes in circulation remained fairly stable during 1942 and stood at 15,609 million pesetas in October, 1943.

The most characteristic feature of the new economy is the large state capital expenditure on industrialisation programmes. The road-building programme has, however, been largely sacrificed in favour of the renewal and repair of railways. At one time Spanish circles believed that railways could be neglected to the advantage of modern motor and air transport. Residential building amounts to roughly 10 per cent of the annual demand for new houses, and the much-advertised comprehensive social insurance policy is for the most part still a paper programme.

German industry. German railways in the Ukraine were dependent on German or Polish coal. The iron and steel-making capacity of the Donetz basin may have sufficed for field repair purposes, and Donetz coal was being used to produce a very small supply of electric power.

Retreat from the Ukraine throws Germany back on the resources available after the fall of France. The German and other continental coal and steel capacity has been worked for war purposes for more than four years, and the present state of these industries is not comparable now with their state during the last year before the war.

The first fact that emerges from the evidence available—no statistics are published—is an almost exact repetition of what happened in the last war. This is the considerable increase in the output of brown coal, which is easily mined.

Production is almost completely mechanised and most of the coal is mined in open-cast workings by means of giant dredgers. In the Ruhr area, apart from the interruption caused by bombing, coal production has been largely maintained during the war. Output in Upper Silesia has been increased—but is certainly short of the announced goal of 100 million tons a year. In both the Ruhr area and Upper Silesia production is mainly a manpower problem, which has been tackled by the employment of large numbers of foreign workers and prisoners of war.

German miners, like other "heavy" workers, are in a privileged position. Their food ration is almost three times the ration of normal consumers. Large wage bonuses are paid and, formally at least, benefits from social insurance have been improved. Occasionally the full light of propaganda publicity has been turned upon the miners. Some have been decorated; others have been given priority at health resorts; in general, they have been put at the top of the totalitarian hierarchy of industrial workers.

### Concentration and Economies

Actual working conditions in coal mines, however, have grown worse. From propaganda it would appear that during the war a new technical revolution had been achieved, at least in the Ruhr area and some parts of Upper Silesia. Full mechanisation of mining by the use of combined coal-cutters and loaders has, however, remained largely experimental. These machines, called "Iron Henries" in the Ruhr area and "Armoured Joans" in Upper Silesia, have produced a remarkable increase in output, but their number is still small. Even if they could be generally used—which is not possible because of varying geological conditions—the manufacture of these machines in quantity would be impossible in wartime. It is mainly concentration on the most favourable coal seams in combination with the mechanisation of underground transport and the almost universal use of pneumatic drills and cutting machines that has increased the output per man shift.

Compared with Great Britain and the United States, Germany needs much more coal for her substitute industries. This demand has so far been met by a considerable restriction in the use of household coal. More low-grade brown coal is diverted to households. Peat is used wherever possible. High-grade coking coal no longer goes to the towns, but is diverted to steel making. Coke from the carbonisation of brown coal is delivered for household use. There is no longer any pretence that coal output can be further increased. Household coal is extremely scarce, and all industrial coal consumers are under strict economy regulations.

Coal mining is a relatively simple industry compared with the production of iron and steel. In coal mining, difficulties can be overcome by employing masses of unskilled workers, but in steel-making much depends on the right kind of raw materials, the state of repair of the plant, the skill of workers and engineers and research work. Supplies of German low-grade ores and French minette ores are abundant. Imports of Swedish iron ore fell gradually from 13.7 million tons in 1939 to 8.6 million tons in 1942 and perhaps 9 million tons in 1943. In future, Swedish iron ore will be divided between the Ruhr area and Upper Silesia. The only sources of high-grade iron ore are in Austria. The production of pig-iron from low-grade iron ore requires greater quantities of coke, and coking capacity is limited.

With the declining supplies of scrap, Germany has been forced to change over from Siemens steel (open hearth steel) to Thomas steel (basic Bessemer steel). In other words, high-grade steel has been replaced by steel of inferior quality. German metallurgists claim that the new basic Bessemer steel has in many respects the same properties as open hearth steel. The fact remains that Germany expends proportionately much more labour and resources in producing a given quantity of steel than before.

In fact, steel making has become wasteful. The ruthless scrapping of machinery for building up new stocks of scrap, ordered in 1942, cannot be repeated. Possible supplies of high-grade manganese ore are now very restricted indeed, though there are supplies of low-grade manganese ore of an average metal content amounting to 12 per cent. More labour and more elaborate processes are needed if these ores are to be used. Furnace slag has been treated for some time to gain manganese and vanadium; but the process seems still to be in an experimental stage.

Growing difficulties in the production of steel, mainly apparent in a decline of quality, find their expression in frequent changes in the control of the industry. The former German steel cartel which was largely used for integrating the French, Belgian and Luxembourg steel industry, exists only in name. The new controlling body is the *Reichsvereinigung Eisen*. The allocation of iron and steel to manufacturers is based on the "iron cheque" system, and gradually all civilian industry, including the manufacture of agricultural machinery, has almost entirely been deprived of supplies. All steel output goes into the manufacture of weapons, munitions and other war materials. If it is assumed that this total production of Germany and occupied countries is still in the neighbourhood of 40 million tons armament production must be considerable.

This rough estimate is not comparable with the steel output in Allied countries, where proportionately more steel is used for shipbuilding, for the oil industry and for civilian industries. Nails and simple iron and steel household goods are almost unobtainable in Germany. A short time ago all stocks of building iron were requisitioned. The supply of heavy rails for railways has been suspended. Structural steel has been replaced by substitutes.

Propaganda naturally asserts that large-scale bombing has not seriously reduced the output of coal and steel. It seems to be a fact that the coal-mining industry has not suffered much permanently; but there has undoubtedly been considerable damage to iron and steel plants. But plants have been repaired, and unused capacity has been put in operation in Central Germany, Upper Silesia, France and Belgium.

The inexorable deterioration of Germany's coal and iron industry is not an unbroken process. Difficulties in the coal industry are compensated by the mining of brown coal. Concentrated research activities in processing low-grade ores and in metallurgy somewhat arrest the decline. Shock production can break bottlenecks for a time, and the absolute command of the economic administration seems still effective. Private ownership has become nominal, and all changes are dictated by production or transport necessities.

## Long-Term Housing Policy

SINCE housing will inevitably play an important rôle after the war, both as a means of raising the standard of living and of providing employment, an imaginative and clearly-defined housing policy is an essential ingredient of post-war social and economic policy. To begin with, as was suggested in an article on the nature and size of the housing problem in *The Economist* on February 5th, a sharp distinction should be drawn between the immediate needs of making good arrears of repairs and of relieving overcrowding, and the long-term task of improving the standard of housing. There should be two housing programmes, a short-term one and a long-term one. The ingredients of the one were described briefly last week; it remains to consider the kind of policy best calculated to raise the general standard of housing within the limits of available resources.

The completion of the short-term programme means that every family (which may mean a single person) wishing for individual accommodation has a separate dwelling within its means. Thereafter, the only demand for additional houses (that is, other than for replacement) will be that which will arise from the growth in the number of families and from their geographical redistribution. But by the time the short-term programme is completed, the increase in the number of families may have virtually ceased; while the demand arising from population movements is likely to be comparatively small. In other words, the problem of improving the standard of housing will be essentially one of replacing existing houses. As was shown in the first article, spontaneous replacement has been very small during the inter-war years, amounting to less than 30,000 a year. It may possibly rise in the future, either as a result of a fall in the real cost of construction or because of a rise in the national income; but no conceivable increase can be relied on to achieve the aim of a progressive improvement in the standard of housing, because the houses that need replacing most, that is a large proportion of those inhabited by the poorer section of the community, are least likely to be replaced spontaneously. Hence, replacement will have to be induced—that is, it will be largely the Government's responsibility. The real issue in the formulation of long-term housing policy is the rate of induced replacement over a period of 25 to 30 years and the means of carrying it out.

From a social point of view it would be desirable to fix the rate of replacement at as high a level as possible. But houses have no exclusive claim on the national resources. The need for an improvement in the standard of nutrition is no less important; moreover, there are many other amenities, besides better houses, that people would like to enjoy. Again, the re-equipment of industry and transport must have a large claim on the national resources. A replacement rate of 135,000 houses a year would renew the stock of houses in 100 years; a rate of 270,000 would renew it in 50 years. Since the majority of houses are structurally still sound at the end of a life of well over 50 years, the desirable rate of replacement might be fixed somewhere between these two limits; the lower figure might be regarded as the minimum rate and the higher one as the maximum. It might be argued that if, through a substantial fall in construction costs or a rise in real incomes or both, the rate of spontaneous replacement were to show a substantial increase, the rate of induced replacement could be somewhat reduced. Much of the increased construction would probably take the form of new middle-class houses on free sites, not of demolition, and the rents of the houses rendered vacant would fall and enable poorer families to occupy them. To build for the sake of building would obviously be wasteful if there is a supply of structurally sound houses rendered vacant because their tenants or owners prefer to move into new ones. In the past, and especially in large towns, whole districts have descended from a comparatively high to a low rent category; their inhabitants moved out and a lower income category moved in. But the supply of "discarded"

structurally sound houses likely to become available should not be over-estimated; a large proportion of them might, in any case, be unsuitable for the poorer families or too costly to run.

The next question is whether the rate of replacement should be more or less the same year after year, combining a steady improvement in housing with stable employment in the building industry, or whether investment in building should be used as a "stabiliser" of employment. This question can only be answered by comparing the various outlets for Government, or Government-induced, investment at a time when total investment tends to fall below the level of savings, thus threatening a waste of resources through unemployment. There can be no doubt, on any such comparison, that investment in houses must rank high on the list of outlets. Quite apart from the fact that the improvement in housing standards is in itself desirable, investment in housing has two advantages as an economic stabiliser. First, the rate of building can be expanded more rapidly than the production of most other things; since many of its operations can be performed by workers without special skill, the building industry can rapidly absorb unemployed workers from other industries, without a prolonged period of training. There are, of course, limits to the dilution of the labour force of the building industry as there are to the rate at which the ancillary industries can expand their output. But these limits are probably wide enough to permit a substantial expansion in investment in housing at comparatively short notice. Secondly, investment in houses, unlike investment in most other industries, can be widely diffused geographically, or, if need be, can be diverted to given areas threatened by unemployment. The case for using the building industry as a stabiliser of employment is a strong one. It should be possible to fix a minimum rate of building over a long period, providing stable employment for a moderately-sized building industry which, in war-time parlance, might be termed the "garrison." This "garrison" industry should be large enough to handle the average volume of spontaneous demand for houses plus the long-term induced programme on a minimum, or at least low, basis. Whenever cyclical unemployment threatens in other industries, this garrison should be temporarily expanded, as the regular army is increased by the calling-up of the reserve of "territorials" in time of war. Replacement at a rate above the minimum should thus be regarded as one of the things the community can do when, and if, it is threatened with idleness of resources. The argument against this use of the building industry is an argument in favour of the kind of rigidity which can have no place in a progressive economy.

Finally, it is not enough for the Government to induce the erection of a minimum number of houses each year, subject to a higher rate of construction, when employment shows a decline in other industries. The new houses should be within the means of those for whom they are intended. If they are not, they will remain empty. It would clearly be wrong to move families into new quarters if these are more costly; this would mean compelling them to spend a bigger proportion of their incomes on housing, leaving them less to spend on food and other things. Induced replacement is only justified if new accommodation can be provided at substantially the same price as existing accommodation or at a differential that would not act as a serious obstacle to spontaneous movement out of sub-standard houses into new houses. Some of the devices necessary to achieve this end are the same as those that will be needed for the fulfilment of the short-term programme. Everything should be done to encourage the reduction in the real cost of housing, whether by using more efficient methods in the construction of existing types or by the use of new materials and processes. Hitherto the building industry has been one of the most conservative of all industries; it has made little

use of the new industrial technique, and costs, in terms of labour and materials, have remained high, both for the structure of houses and for modern amenities, such as refrigerators, heating systems, kitchens and bathrooms. Fortunately, there is a growing realisation of this need, reflected in recent reports from architects and builders, and in the initiative taken by the Ministry of Works in encouraging new methods. Moreover, in view of the importance of the rate of interest as an element in the rent of a house, finance might be made available for the "induced" part of the replacement programme through both local authorities and building societies at gilt-edged rates. The annual interest charge on a £500 house at 5 per cent is £25, and at 3 per

cent £15; the difference in the weekly rent is therefore nearly 4s., a substantial one for poor families. Lastly, if the drive for a reduction in building costs and low interest rates still puts the new houses beyond the reach of the poorest families, a subsidy would be necessary. This might take the form of special allowances to those who need them rather than that of a general building subsidy, which does not discriminate between the incomes of the tenants, and has a habit of not percolating through to them. There is, however, a limit to any subsidy; in short, it is through a reduction in costs that a progressive and substantial improvement in housing standards—as in the general standard of living—must be mainly sought.

## Wool: An Example

THE instability of the prices of raw materials has been as much of a curse to primary producing countries as the instability of employment has been to manufacturing countries. Successful full-employment policies in manufacturing countries may do much to mitigate fluctuations in the demand for primary products, and, hence, in their prices. But the abolition of the trade cycle is not yet an accomplished fact, if it can ever be accomplished. Consequently, there is a strong body of opinion in favour of tackling the problem of primary products at the primary products end by means of price stabilisation schemes. The publication of an objective analysis of the raw wool trade by one of the leading firms in the trade\* is a timely illustration of the problem.

About half of the world's production of apparel wool is grown in the British Empire—that is, in Australia, New Zealand and South Africa—while a sixth is produced in Argentina and Uruguay. The remainder is grown in importing countries, chiefly the United States. Seasonal variations in supplies have been comparatively small during the inter-war years—they did not exceed 10 per cent from one season to another in respect of the aggregate clips of the five large exporting countries. In contrast to many other primary products, there were never any huge accumulations of unsold wool at the end of the season; the clips were cleared almost entirely during each season, those of Australia, New Zealand and South Africa mainly by public auctions at central marketing points, and those of Argentina and Uruguay mainly by private contract in the central markets of Buenos Aires and Montevideo. The long-term trend of consumption has been steadily upwards, assisted no doubt by the method of marketing the clips for what they will fetch; this is reflected in a rise of 65 per cent in the combined output of the five exporting countries between the five seasons 1920-21 to 1924-25 and the similar period 1937-38 to 1941-42. The short-term trend of consumption, on the other hand, has varied, like that of other commodities, for reasons beyond the control of the wool-grower or of the retailer of woollen goods. Prices have fluctuated widely, not only from year to year, but during each year. In the following table the first column shows the fluctuations of prices that occurred, on the average of the period, within every year (that is, on the average, the lowest price for 64/67's raw wool recorded in any year was 20 per cent below the highest). The second column shows the lowest price recorded in the whole period as a percentage of the highest recorded in the whole period:—

VARIATIONS IN RAW MATERIAL PRICES

|                       | Average Annual Variation, 1921-38 % | Lowest Price, 1921-38, as % of Highest Price % |
|-----------------------|-------------------------------------|------------------------------------------------|
| Wool:—                |                                     |                                                |
| 64/67's raw wool..... | 20                                  | 22                                             |
| 64's tops.....        | 24                                  | 25                                             |
| Copper.....           | 26                                  | 27                                             |
| Tin.....              | 28                                  | 31                                             |
| Cotton.....           | 31                                  | 17                                             |
| Meat.....             | 22                                  | 36                                             |
| Rubber.....           | 47                                  | 3                                              |
| Butter.....           | 23                                  | 32                                             |
| Wheat.....            | 30                                  | 29                                             |

The salient features of these figures are not merely the range of price variations within each year and over the whole period, but, most significantly, the similarity in the range of

\* "Wool: A Review of the Past as an aid to the Study of the Future." Prepared and presented by New Zealand Loan and Mercantile Agency Company, Ltd., 17 St Helen's Place, Bishopsgate, London, E.C. 3.

the movements between wool and most other raw materials. The problem of wool is, in fact, an excellent illustration of the problem of primary products generally.

How important a rôle wool plays in the national economies of the five main exporting countries is illustrated by the next table, which shows the value of their wool exports in absolute amounts, as well as a percentage of total exports:—

EXPORTS OF RAW WOOL

|                         | Exports<br>of<br>Wool                |      | Wool as a<br>Proportion of<br>Total Exports |      |
|-------------------------|--------------------------------------|------|---------------------------------------------|------|
|                         | 1937                                 | 1938 | 1937                                        | 1938 |
|                         | (in millions of<br>local currencies) |      | %                                           | %    |
| Australia (£).....      | 47                                   | 43   | 34                                          | 36   |
| New Zealand (£).....    | 19                                   | 12   | 29                                          | 21   |
| South Africa (£).....   | 13                                   | 9    | 34                                          | 34   |
| Argentina (paper pesos) | 171                                  | 154  | 7                                           | 11   |
| Uruguay (pesos).....    | 45                                   | 42   | 46                                          | 44   |

Variations in prices from year to year of the magnitude shown in the first table have the effect of seriously disturbing the economies of the big exporting countries. But in this respect, too, wool does not stand alone. There are many other primary products, such as rubber, copper and wheat, which form a large proportion of the exports of some of the countries producing them. There are differences on the side of supply in that the production of some commodities can be more readily adjusted than that of others; again some raw materials are subject to more violent changes in demand than others. But they all suffer from a serious instability of prices. Hence, there is much to be said for applying any remedies that are to hand to a whole range of primary products.

The New Zealand Loan and Mercantile Agency Company, Ltd., does not profess to know the solution to the problem of price instability. It merely states the alternatives of a return to a free market and price stabilisation by some such form of bulk purchasing arrangement as has been in operation since the outbreak of war. There is one overriding principle, however, that should be observed in any scheme for price stabilisation—that is, the average "stabilised" price over a period of good and bad years should be no higher than the average price that would have been reached on a free market. Stabilisation, to be beneficial, should not be used as a means to obstruct long-term changes in prices due to changes in costs and demand. This is fully recognised by the authors of the pamphlet under review. They make it clear that, whether prices are to be regulated or not, the long-term demand for wool will depend largely on its attrac-

**FOR ALL  
INSURANCE  
NEEDS**

**Head Office:**  
LIVERPOOL LONDON  
North John St. Lombard St.

tiveness and price compared with those of other textile fibres. To this end, they strongly emphasise the need for intensive research and enterprise to cheapen the production of wool, to reduce conversion costs, and to develop new markets.

Finally, the problem of wool, as of other primary products, is not merely a social and economic but also a political one. Past attempts to stabilise the prices of individual commodities—such as the tin and rubber schemes—by unilateral

action on the part of producers or even of the Governments of producers, have been strongly resented in consuming countries, however well they were intentioned and however moderately they were applied. Any future attempt to even out fluctuations in the prices of primary products—this would inevitably involve some control over supplies—should therefore be truly international—that is, they should be initiated and controlled by the Governments of both producing and consuming countries.

## Business Notes

### Window Dressing

The recent bankers' speeches, with their emphasis on the liquidity of the banking position, have revived the debate on the vexed question of window dressing. If the banks are so abnormally liquid, why persist in the pretence of showing a higher cash ratio on making-up days than obtains on the average working day? One bank repeated its claim that its own published cash ratio is in no way window dressed. Other clearing banks are known not to indulge in calling loans from the market on their making-up days. But the majority continue to do so and are quite impenitent about the matter. Their main argument is that a bank which is prepared to let its cash position fluctuate within considerable margins is likely to be much more helpful to the market and to fit much better into the rather informal pattern of the British credit structure than one which adheres strictly to a 10 per cent cash ratio. The answer would be wholly convincing if these banks did not attempt on one day of the month to work up their ratios to an unrepresentative figure. The subterfuge, now that the justification for it, namely that it provided a useful test of the money market's liquidity, has disappeared, destroys much of the validity of this argument. The position as a whole, however, is showing signs of improvement. The window dressing revealed by the end of 1943 balance sheets was comparatively modest, and no greater than that which occurred in preparation for the November 1943 statements. In November, the published cash ratio of the clearing banks was 10.43 per cent, against a true ratio of 7.7 per cent. For December, the comparable figures were 10.47 per cent and 7.8 per cent. The published ratio for January was 10.5 per cent or actually higher than the figure revealed by the end-of-year balance sheets. The 10 per cent tradition still holds sway, but the efforts to work up the cash ratio well beyond this figure at the annual balance sheet dates are losing some of their vigour. This is a step in the right direction and may be followed by others in the course of the year.

### The Case for Oil Refineries

In an address before the Society of Chemical Industry in Manchester on February 4th, Dr Kind, managing director of Manchester Oil Refineries, Ltd., made an impressive plea for the establishment of a large-scale oil refining industry in this country. In his view, recent technical improvements in oil refining have made the big centres of consumption rather than the oilfields the right location for a modern refining industry. The quality of the refined product derived from crude oil and the proportions in which they are required can be adjusted in modern plants within wide limits; hence the argument that the import of oil in its crude form instead of in the form of finished products in the proportions in which they are required would involve waste no longer holds good. Moreover, a new chemical industry, based on materials set free in the refining of oils has come into being. This industry, which is largely complementary to the chemical industry based on the by-products of coal carbonisation, is likely to become of in-

creasing importance. But while the raw materials of the coal-based chemical industry—crude benzol and tar—are liquid and can easily be transported, those of the oil-based industry—hydrocarbon "bricks"—are gaseous and cannot be conveniently moved. If Britain is to enter the new chemical industry, the establishment of modern oil refineries is therefore essential. Dr Kind illustrated his case by calculations, based on the supposition that 10 million tons—the pre-war consumption of petroleum products was 12 million tons—of petroleum products were produced in this country from crude oil in modern plants. First, there would be a saving of about £2 a ton—a total of £20 million—in foreign exchange, on the assumptions that prices will be slightly higher and that a larger proportion of the more expensive products is required. Secondly, the refineries would yield about 1,000,000 tons of hydrocarbon "bricks"; in their final form as finished plastics, synthetic rubber, fibres, solvents and other chemical products, these would have an average value of at least £75 a ton—a total of £75 million—a price that is below current and pre-war figures. Dr Kind assumes that these products if not manufactured in this country, would have to be imported. By adding £5 million in respect of exports of refined products and of refining plant, Dr Kind concluded that, within five or ten years, a British refining industry of the size envisaged could benefit the balance of payments to the extent of £100 million a year. These calculations are of course hypothetical; but they illustrate the importance of the problem. The case for British oil refineries should be judged in the light of the technical facts. Dr Kind's contention that Britain should concentrate on industries of high productivity, and especially on those requiring great skill and a large proportion of scientifically trained staffs in operation and research, is unanswerable.

### Magnesium Production

The second report of the Select Committee on National Expenditure in 1944 investigates the production of magnesium and magnesia in the United Kingdom. Before the war, this country relied almost entirely on imported magnesium, mainly from Germany, and it was not until April, 1940, that the Government realised there was not sufficient magnesium to meet the need for aircraft, and for incendiary bombs. With improvements in research, the magnesium content of incendiary bombs has been reduced, and production in the United States and Canada has been so expanded that the total capacity is now in excess of demand. Production in this country has, in consequence, been curtailed. The report quotes British production costs for six months up to September 30, 1943. While one plant was able to produce at a cost of about 1s. 6d. a pound, another factory had an average cost of 3s. 11d. a pound, and had incurred a total expenditure of £850,000—most of which was "sheer loss so far as the taxpayer was concerned." This factory has been closed down, and the Committee comments that it should "never have been built on its present scale." High costs are also reported in the production of magnesia—the raw material of magnesium. The capital cost of one firm had risen to £1,600,000 from an estimate of £300,000, and production costs, expected to be £5 10s. per ton, were actually £24 12s. 5d. The Select Committee recommends that this plant should be closed down.

The report raises sharply the question of the competitive ability of British producers. The present official price for magnesium metal in this country ranges from 1s. 6d.

to 2s. 6d. per lb. according to quantity, while the selling price in the United States—which is not subsidised—is 20.1/2 cents (say 1s.) per lb. for large quantities, with slight additions for small lots. A precise comparison between costs and prices is, of course, impossible without full details of the composition of the cost figures. It is possible and, in fact, seems likely that the higher ranges of British costs, as quoted by the Select Committee, refer to magnesium alloys as well as magnesium ingot. It is not stated how far allocations for research and development as well as for plant depreciation enter the costs submitted by British magnesium producers. Nevertheless, the unfavourable comparison between British production costs and the present United States selling price is significant, especially as North America now produces magnesium far in excess of any possible civilian demand in the immediate post-war period. The United States output in 1943 alone was nearly ten times as large as the entire world output in 1939. It may be desirable, for strategic reasons, to maintain the production of magnesium in this country after the war; on the other hand, it would be highly undesirable to compel British industry to buy at high cost what may become one of the major industrial raw materials. Clearly the problem of costs, in which electricity is a large item, needs further investigation.

### A Canpac Dividend

After two disappointments, the holders of Canadian Pacific ordinary stock are at last to receive a dividend. The payment is 50 cents, the first since \$1.25 was distributed in respect of 1931. The \$25 shares, which fell to \$3½ during 1939, commenced to recover as soon as preparations for war brought an expanding demand for Canadian goods; but the board has been determined not to recommence distributions on the equity capital until prior charges had been reduced to what were considered reasonable proportions, or at least to the neighbourhood of the level ruling at the time of the previous dividend payment, that is \$22 million. According to the latest figures available, and they are a full year old, the reduction from the peak is some \$2,425,000 to \$22,955,500. The year 1943 brought a significant increase in net railway earnings, but no further figures are as yet available. The inference from the dividend is, however, plain; the board now considers its fixed charge debt to be not unreasonably high, and is, accordingly, prepared to pay out a moderate proportion of any cash it may have in hand. The idea that the payment would in no circumstances be large is now generally accepted, and the price which had touched \$18 last year was 16½ on the eve of the announcement. On the news it fell to 16½, at which the yield is some £3 3s. per cent.

### London Gas Payments

Very broadly speaking, the fortunes of gas companies during the war have been determined by two factors, the attention which the areas they serve have been given by the Luftwaffe and the social strata from which the bulk of the inhabitants of the areas are drawn. Densely populated districts are most attractive to the bomber, and the spread of damage is most difficult to prevent in such areas. Against this, the population finds it less easy to move away while their houses are reasonably intact. So far as gas stocks with a wide market are concerned, this has meant that the London companies have suffered most heavily and that there has been a wide diversity of experience between the four main concerns which share a large part of that area and the surrounding districts. In the absence of accounts, the only basis for any conclusions are the dividend statements. Those of the Gas Light and Coke Company and the South Metropolitan last week show that, more than two and a half years after the end of systematic bombing, the dividend-paying capacity of these two concerns was largely restored. The following table gives dividends of the past six years and the disparity of experience is striking.

|                       | 1938 | 1939 | 1940 | 1941 | 1942 | 1943 |
|-----------------------|------|------|------|------|------|------|
| Commercial Gas...     | 4.5  | 3.0  | 1.5  | Nil  | Nil  | Nil  |
| Gas Light & Coke...   | 5.6  | 4.5  | 2.25 | Nil  | 1.0  | 4.0  |
| South Metropolitan... | 5.5  | 4.5  | 2.0  | Nil  | 1.0  | 3.0  |
| South Suburban...     | 6.0  | 4.5  | 3.0  | 4.0  | 4.0  | 5.0  |

With the exception of the Gas Light and Coke Company, quotations now are some 15 to 20 per cent below the mean price for 1938. At that time the yields on the four stocks ranged from about 5.1 to 5.45 per cent. Now they are anything from nil for Commercial Gas to virtually 5 per cent for South Suburban. According to the figures of *The Actuaries' Investment Index*, the yield of a wider selection of gas stocks averaged about 5½ per cent during 1938. Over the past year it has been 3.11, but the very low figure is largely accidental, being due to the inclusion of concerns like Commercial Gas, which have been exceptionally hard hit. Some of the London prices clearly discount a considerable further recovery, but, in the absence of statistics, it is difficult to say how far these hopes are justified.

### Gresham Insurance Offer

An offer has been made by the Legal and General Assurance Society to purchase the shares of the Gresham Fire and Accident Insurance Society, the "running mate" of the Gresham Life, the entire share capital of which was acquired by the Legal and General in 1933. The Legal and General possesses already an important stake in the Gresham Fire—indirectly through the Gresham Life, which owns all the management shares and some of the ordinary shares, and directly through a substantial holding of ordinaries—and has, in fact, assumed administrative and underwriting control of the Society. It has now secured from the Gresham Life an option to acquire its entire holding of 150,000 fully-paid management shares of the Gresham Fire at a price of £2 10s. per share and is making a formal offer to purchase all the ordinary shares on the same terms, namely £2 10s. for each £1 fully-paid share and £1 5s. for each share, 10s. paid; the numbers of these two classes of share issued are respectively 50,000 and 200,000. The purchase excludes any dividend to be paid for 1943, which will belong to the present shareholders. The prices offered compare with market quotations of 35s. and 18s. respectively and the Legal and General chairman states that they are alone justified by the economies and advantages which may be expected to follow an effective fusion of the fire and accident accounts of the two societies.

and 45, Pall Mall, S.W.1.

If the Gresham Fire remains as a separate identity, the annual charge against profits required to establish its staff pension reserve on an adequate basis appears to preclude any increase in the present dividend of 6 per cent—producing just under 2½ per cent gross at the prices offered—for some years to come. The offer, which the directors consider to be in the interests of all concerned, is conditional upon acceptance by holders of not less than 90 per cent in nominal value of the shares affected, and will close on March 17th or such later date as the directors may determine. It is stated that the interests of the staff “will be fully protected by the fact that the responsibility of the Gresham Fire for pensions will be assumed by the Legal and General if as a result of this offer it acquires the whole of the share capital of the Gresham Fire.”
