Messrs Baruch and Hancock, in their report on reconversion, insisted that all sales of surplus Government property should take place "in a goldfish bowl." It is now possible to see just what the goldfish bowl is likely to contain. A special committee of the House has just released a report on the Colmer Bill, dealing with the disposal of surplus property. It estimates the value of such property at from \$50 to \$60 billion, compared with a total war output, from July, 1940, to June, 1944, of about \$130 billion. About half of the surplus will be ships and aircraft. Guns and munitions constitute another fourth, leaving only about a quarter in goods suitable for civilian resale. But of this remainder it is believed that about half will be abroad, and probably will be sold there. The value of the goods to be disposed of on the domestic market is put at about \$6 billion, about six weeks of retail sales in the United States before the war. They consist mainly of clothing, textiles, motor vehicles, food, raw materials, machinery and tools. In this grand sale, the most keenly debated issue is the protection to be afforded the small businessman. Champions of the little man, like Mr Ickes, and Mr Maverick, head of the Smaller War Plants Corporation, insist that this is an opportunity to recompense him for his "decimation" during the war. They put the number of small businesses which have gone under at about 500,000. Mr Clayton, head of the Surplus Property Administration, is on record as favouring the sale of war goods with a view to aiding small business and discouraging monopolies. This will be easier in the sale of bicycles and lorries than in the disposal of Government plant. About \$2 billion of Government-owned plant is of value mainly to the companies which now operate them, in conjunction with their privately owned plant. Of the remainder of the \$15 billion Government investment, a very large part is in plants of the white elephant size. Three-fourths consist of projects of \$10 million or more, and nearly one-third is in units of \$50 million or more. The problem is to find a way of breaking down these vast agglomerations, Mr Maverick has suggested a multiple rental scheme, by which one factory would house, say, six tenants. But it will hardly be the smallest of businessmen who will be able to afford a sixth of even a \$10 billion plant.

Cornucopia

The biggest wheat harvest in American history is just around the corner. Mr Marvin Jones, the War Food Administrator, has just returned from an inspection trip, and predicts that the wheat crop will be 100 million bushels larger than the biggest crop ever before produced. A great Panzer division of combines has been shipped south, and is now following the harvest northward to the Canadian border. There is too much wheat to store. It has been piled in the fields, along the railroad sidings, stored in temporary bins, and in one small town Mr Jones saw a paved street topped off and piled high with wheat. This is a far cry from the Wheatless Wednesdays of the last war, and the requirement that to buy wheat flour, one must buy an equal quantity of wheat substitutes—corn meal or grits, oatmeal, and rice. On July 1, 1918, the wheat carryover was 40 million bushels. In 1944 it was 350 million. The corn harvest also is expected to be good. The immediate significance lies in the use of both cereals as feed grains. Corn, however, is by far the most important, and on the size of the corn crop depends the amount of milk, meat, and eggs that will be available in the next two years. It looks now as though the heavy reduction in livestock which was thought to be the inevitable result of the feed shortage, could be avoided; and that the use of wheat for livestock feed, a result of the corn shortage, could be reduced. Both livestock and grain farmers can count on a continuation of the boom days. The uses to which farmers are putting their bigger incomes is shown, in part, by the repayment figures of the Farm Security Administration. Over seven years, the FSA has granted \$212 million of long-term farm ownership loans.

Although it was expected that only \$32.7 million would have been repaid by the middle of 1944, actually \$43.4 million has been received. The FSA's Rural Rehabilitation Loans, designed to provide operating capital for farmers unable to obtain commercial credit, have been almost entirely cleared off. This is the bright side of the picture. The darker is a recent warning against the characteristic wartime tendency of farmers to buy more land at inflated prices. It is suggested that a land-inflation comparable to that of the last war is in progress, and that it may be followed by a similar collapse.

Bargains in the Bases

The demand for bases has been raised again. The theme is capable of endless variations, like those musical exercises in which a simple tune is played "in the manner of various masters." Strummed by Senator McKeolar, it is harsh and insistent. Taken up by Senator Reynolds, it is played in thunderous double forte with patriotic embellishments. Islands, including Bermuda, must pass to Uncle Sam, not only for his defence, but in repayment of the debts incurred in the last war and for Lend-Lease in this. When Senator Connally, the chairman of the Foreign Relations Committee, renders the tune, it is muted, and much more graceful—"We just can't go out and take bases," he declares, "but the question will undoubtedly be dealt with in the Peace Conferences." When the President, the Paderewski of them all, comes to give his variation of the theme, all is harmony and sensitive ears affrighted by the Senate performers are soothed again. Mr Roosevelt sees the problem as one of joint defence and of common interest. Apprehension over occasional ebullitions in the Senate need not be too serious as long as the leader of the orchestra continues to perform with such statesmanlike moderation.

Philippine Dilemma

The courage and the loyalty of General MacArthur's Filipino troops in the defence of Bataan have become an integral part of the wide and deep-rooted American Pacific legend. The loyalty of the Filipino population was given as the main reason for the recent advancement of the date upon which independence might be granted to the islands. It comes as a surprise, therefore, to find the usually well-informed *Washington Post*, in an article published last month before President Quezon died, issuing a warning about the difficulties of re-establishing a native government. According to its correspondent, Bill Costello, virtually every Philippine official became a Japanese collaborator as soon as Corregidor had fallen—on the naive assumption that the Americans would never return. If this is true, there will be a few men eligible for public service when the islands are liberated. Mr Costello suggested that President Quezon, when he went to the Philippines, might wish to welcome back his former supporters, now deeply compromised by collaboration with the Japanese, and that this might easily provoke civil war. With President Quezon's death the dilemma seems to have been heightened. His successor, President Osmena, formerly Vice-President, has nothing of Manuel Quezon's commanding qualities, and it is impossible to predict what sort of a following he will enjoy when his government returns. The State Department's rich experience in the thorny problems of recognition may once more be put to the test in the near future.

Letters to the Editor

Terms for Germany

TO THE EDITOR OF THE ECONOMIST

SIR,—Your article "Terms for Germany" indicates that you are embarking upon a campaign for a "Just Peace" which does not concern British internal politics only—in which case I would not think of writing any letter to the Editor—but deals with a matter of vital concern, not only to the Continent of Europe, but to the peace of mankind.

I belong to the rather rare species of Czech liberals. I wish very strongly that Great Britain's influence on the Continent should grow, that its liberal traditions, its political institutions should be shining examples for the Continent, and I wish especially that Great Britain's ties with my own country should be strengthened still more so that it may succeed in its task of becoming the solid bridge between East and West.

Your views on the treatment of Germany, however, seem to me the best way for Great Britain to lose its influence on the Continent, including Germany.

What is your argument for moderation towards Germany? That a moderate peace only will be enforceable in 15-20 years' time, and that Germany must be treated fairly in order to prevent the reoccurrence of violent campaigns for revision.

It is a new kind of appeasement you are preaching, based on the naive belief that a "fairly" treated Germany will be a better safeguard for peace than a "badly" treated one.

Do you really believe that a beaten Germany—even if treated as you suggest—will ever forget its defeat, and will not try its revenge again? Do you think any concessions can make the Germans forget that they were beaten? And don't you know that the Germans will try—following their national instinct—in any case, to undo defeat? And that the only policy to prevent it is to keep Germany as long as possible as weak as possible? And that your suggestions will not only fail to preserve peace, but hasten the next war?

If your proposals would have been adopted in 1919 this war would have started years earlier, because the Germans could have saved the time which was necessary for the "preliminaries," like the introduction of conscription in Germany, the occupation of the Rhineland, etc.

Every country is responsible for its leaders. Great Britain for Churchill, Germany for Hitler. The Germans have to realise that a Hitler as their leader pays still less than a Wilhelm. The problem of Germany is a problem of social criminology, and it cannot be solved with reference to the psychology of the police as you do by stressing the probable reaction of the British public in twenty years' time.

You say: "If the German campaign for revision has to begin with a naked demand for bombers and tanks, it stands a good chance of being resisted by even the crassest isolationist or the blindest idealist." Do you want to base the peace of the world on a "chance"? Do you really think Germany will ever make "a naked demand for bombers and tanks"? Did it ever make it before this war? It produced them under the noses of the former Allies, and there is nothing to guarantee that the Allies will this time exercise a better control than last time, and especially that they will be less split in their attitude towards Germany. And this is the *punctum saliens*.

Don't you realise that the whole of Europe hates the Germans as no Englishman can probably ever hate? Do you want to be regarded as Germanophiles? Do you want to repeat in your relationship with Russia what you did with France between 1919-1939? Or do you think you will ever be able to recover from a "fairly" treated Germany all the money you put into it in the first appeasement period?

May I impress upon you that the surest way for Great Britain to lose the sympathy of Europe is to plead in favour of Germany. The peoples of Europe know their Germans; you don't.—Yours faithfully,

DR ALFRED DRUCKER.

Czechoslovak Legal Council.

[Dr Drucker's views are worthy of the closest attention; but it is unfortunate that he has not read our article more carefully. Moreover, Dr. Drucker, who is a distinguished Czech, and knows very well what the attitude of *The*

Economist has consistently been since 1933 (and, most conspicuously perhaps, in 1938) towards the Germans, and their unhappy victims, is surely most disingenuous—and perhaps ungenerous—when he accuses us of "appeasement," in whatever form. The following points are worthy of his notice:—

(1) There was no hint of a plea in the article that the peace should be "just" or "fair," no trace of any suggestion that Germany should not be "badly treated"; for this reason alone Dr Drucker's criticisms almost all fall at once to the ground. Our argument was, in fact, that the peace should be as "strong" as possible—that is, as strong as would be enforced, absolutely, by us and others ten years or a generation from now. It is a question not of anything that is due to Germany, but of the obligations that we and our children are likely, in our fallibility, to be prepared to honour. We must not promise what we will not perform.

(2) Does Dr Drucker (or, for that matter, the British Minister of Information, who has made a similar criticism of *The Economist* in a less direct and less straightforward manner) really believe that our proposals for the rigorous punishment of war criminals, for physical reparations and for absolute disarmament, add up to "soft words" towards Germany?

(3) Finally, is Dr Drucker (or the many other distinguished European exiles who speak so confidently for Europe in these matters) quite sure that he does, automatically, echo every accent of the authentic voice of his own and the other European peoples? Does a study of the various underground presses entirely bear this out?—EDITOR.]

TO THE EDITOR OF THE ECONOMIST

SIR,—I quite agree with the general thesis that our ability to enforce the Treaty is the prime consideration. Schwartzchild in his book, "World in Trance," though he writes from an obviously French point of view, brings out in a most forcible manner the way Germany got point after point of the Peace Treaty altered, incidentally making nonsense of the idea that either Hitler started Germany on her aggressive campaign or that the unfortunate Conservative Party were solely responsible for appeasement.

While agreeing, however, with the general thesis, I am not sure that I go all the way with the article in its denouncement of the territorial readjustment. For instance, I should say that there was a strong case for making all Germans in the Sudetenland opt either for a return to the Fatherland or for becoming unhyphenated Czechs. Even if *The Economist's* policy is pursued, I can see very difficult times in this country and the USA in ten or fifteen years when the Idealists (I should call them woolly-headed sentimentalists!) join with the Isolationists and those out for an easy life in modifying the peace conditions in favour of Germany.

Incidentally, is it not rather a misnomer to talk about our possibly having a Carthaginian peace? The slogan in those days was "*Carthago Delenda Est*," and it was carried out in drastic fashion. Does the most fire-eating Allied national really propose to go to these lengths with Germany? Also one cannot forget that the Carthaginian peace was an entirely successful one. I do not know how many peace settlements in the world have been as successful. Should not somebody write a companion book to Creasey called "Decisive Peace Treaties of the World"?—Yours sincerely,

L. J. CADBURY.

TO THE EDITOR OF THE ECONOMIST

SIR,—In a leader you argue that a Carthaginian peace will lead to another war. May I suggest, with very great respect, that the history of the last 25 years does not bear you out.

For the Carthaginian treaty of Trianon has lasted, while the moderate treaty of Versailles has broken down.

Is there not a chance that another moderate treaty may be wrecked in exactly the same way as Versailles was wrecked? On the other hand, a really tough treaty would break the hearts of the Pan-Germans and leave our own Isolationists and Idealists (what a strange alliance) without a focus for their misguided endeavours.

THE ECONOMIST, August 26, 1944

To those who still attach great importance to language and "race," I would point out that Hitler and Henlein had much trouble in manufacturing even a façade of discontent among the three million Austrians placed under Czech rule by the Treaty of Trianon, for they were members of an enlightened democracy.

If the trade unions are strong, and the "two hundred families" weak in the new France, I cannot help feeling that German workmen west of the Rhine will soon make good Frenchmen.

Again, unless he is unique, the Pomeranian peasant is more interested in land than languages. Whether he makes a good Pole or a bad one depends mainly on what the new Poland does about land tenure, marketing and money-lending.

Your article does not mention the coming resurrection of France, which seems to me of the greatest importance. For, even if England and America neglect their duty, France and Russia together should easily be able to uphold the treaty, provided it is a strong one and not a second Versailles.—Yours, etc.,

Oxford.

H. B. BARWISE.

TO THE EDITOR OF THE ECONOMIST

SIR,—Many of your readers must disagree with your leading article, "Terms for Germany," in *The Economist* of August 12th.

We know that the peace of Versailles left the German will for war unimpaired, and that its moderateness did not, in fact, make its guarantors willing to fight in support of its terms; indeed, they could hardly have been less so. But there is a good chance that the Germans may be sickened of war by the severe terms which you discuss, and it may be remembered that the Carthaginian peace at least ensured that Carthage never rose again.

In your "moderate" peace you propose to "concentrate everything on disarmament," while admitting that it is "by no means to be taken for granted" that the Western Powers will be prepared to enforce this provision in, say, 1965. Let us assume that by this time Germany wishes to start another war and that we are unable to prevent her rearming: then whereas the "moderate" peace would leave her strategic and industrial position as strong as ever, the "Carthaginian" terms proposed will have deprived her of much of her industry and of the bulk of the territory from which she could have mounted a direct assault on her victim.—I am,

Sir, Your obedient servant,
Boars Hill, Oxford.

HUGH SISAM.

TO THE EDITOR OF THE ECONOMIST

SIR,—Your article "Terms for Germany" in your issue of August 12th seems in some of its arguments to be very illogical. If "it is probable that both the American and the British peoples will accept the heavy burden of permanently enforcing the absolute disarmament of Germany," this being, as you say, "a moderate aim," how will it be possible for Germany to embark on another war to recover, say, the Rhineland, Westphalia or Pomerania?

Perhaps you think that future wars will be carried on without armaments. This is surely as fantastic a notion as is your implied faith in Germany's future peaceable intentions, providing she is given a "moderate peace."

No matter what are the terms of peace imposed, moderate or Carthaginian, Germany will do her utmost to start another war, and will succeed unless she is permanently disarmed. If she is, then, so far as future peace is concerned, it does not matter, though the terms of peace are Carthaginian, which Germany's record richly deserves.

Every possible effort must be made in the years to come to maintain in the people of Britain and America a united inflexibility against any easing of the terms, and with this object in view such men as Lord Vansittart will, it is sincerely hoped, play a vital part. Such horrors as the shooting in cold blood of RAF prisoners in Germany should never be allowed to fade from our memories.

In short, only by perpetuating the present hatred felt by the big majority of our people for the Germans and their foul deeds, and by a recognition of the fact that the whole German nation will always be ready to give its support to any leader who will make the enslavement of its neighbours by war its be all and end all, will there be any chance of permanent peace.—Yours faithfully,

Winchmore Hill, N.21.

J. P. MIDGLEY.

TO THE EDITOR OF THE ECONOMIST

SIR,—Surely your contentions regarding the terms to be imposed on Germany are answered in your own article. You admit that the Treaty of Versailles was a reasonable one; but that, and the fact that the Germans were very soon readmitted into the comity of nations, made no difference to their schemes to start another war.

I edited the English edition of Stresemann's Papers, and believed him a man of good will. I find, on later evidence, I was deceived. I trust the nation will not again be deceived.—Yours faithfully,

E. SUTTON.

G.E.C. In war or peace—at the service of the Empire

The development by G.E.C. of every type of electric furnace is only one of the many fields of pioneering in heavy industrial plant which stands to the company's credit.

When war came this development work proved of incalculable value to the nation. Overnight the metal industries were faced with the need to produce metal parts in gigantic quantities. The G.E.C. furnaces provided the answer, affording all essential heat treatments with absolute accuracy and uniformity. Control is simple, precise, automatic.

Under the stress of war, G.E.C.'s progress in every sphere of electrical operations, including electronics, has been rapid and continuous. When peace returns, the great technical advances made by G.E.C. will be available for electrification schemes—one of the first needs of reconstruction—in any part of the world.

Electrification Schemes

G.E.C. Electrification Schemes have been applied to all industries, including: Aircraft Factories; Chemical Works; Collieries; Food Factories; Gold Mines; Iron, Steel and Copper Works; Motor Car Works; Oil Refineries; Ships and Shipyards; Textile Mills, etc.

G.E.C.—always in the forefront of electrical progress

THE GENERAL ELECTRIC CO., LTD., MAGNET HOUSE, KINGSWAY, LONDON, W.C.2

How do flies land on ceilings?

KODAK high-speed camera studies split-second action

The camera which, following the memorable "Brains Trust" question, filmed this fly making its "half roll" landing, is today busy serving industry and science. It enables the study of motion too fast for the eye... the whirr of a propeller, the air-flow on stream-lining, fuel injection in aero-engines and various secret processes. Many of the advances made possible by this 'Kodak' Camera, and by 'Kodak' Film, will be appreciated when industry can incorporate the fruits of wartime research in peacetime production.

THE BATTLE OF COMMUNICATIONS

PRIORITY MESSAGES

The Prime Minister cables the President... A commander in the field presents his report to the War Cabinet... An exchange of messages decides the number of tanks that can be sent by the next convoy to Murmansk. Words are weapons in war.

- ★ For security reasons, all Government messages must be sent by cable. Partly as a result of this, a slight delay of other messages is unavoidable.
- ★ 45 new transmitting stations have been put into service since the war and more are being added. Technical developments, which save time and labour, are constantly coming into operation.
- ★ Approximately two million words pass through the central telegraph station of Cable & Wireless every day.

C&W

INSURANCE IN WAR AND AFTER

TABLE OF CONTENTS

THE FUTURE OF BRITISH INSURANCE	283	FIRE AND ACCIDENT INSURANCE	284
LIFE ASSURANCE	283	MARINE INSURANCE	286
THE EXPORT OF INSURANCE	289		

The Future of British Insurance

ONE of the articles in this survey of insurance in and after the war is on the important subject of British insurance as an invisible export and some of the difficulties with which the industry must grapple in its efforts to retain and extend its overseas markets. The remaining articles go more specifically into the position and prospects of the individual branches—life, fire, accident and marine. It is characteristic of British insurance, as of so many institutions in this country, that it is held in greater esteem abroad than at home. Its case is not always well presented in discussions in Parliament and elsewhere; moreover, the ability of an industry to develop overseas cannot be entirely disassociated from the measure of understanding and support which it enjoys at home. From every point of view, therefore, the creation of a more informed public opinion should be one of the first tasks of leaders of the industry in the world of to-morrow.

To a considerable extent the views held by the community in relation to any industry are formed by its contacts with the industry's representatives. Insurance education has been good for at least 20 years; plans are being formulated to make it even better after the war and to enable men whose studies have been interrupted to make good the loss during working hours. This will ensure that the industry is maintained at a high level of technical efficiency. But under the present agency system the public has little contact with the trained full-time employees of the companies; its associa-

tions are with men whose main occupation is not insurance and whose interest in it is a subsidiary, and often quite trifling, one. The agency system is a relic of times when insurance offices operating for one class of risk only, could not afford their own full-time representatives, and therefore selected people in other walks of life who seemed best suited to their purpose—the banker or solicitor for the life office, the auctioneer or estate agent for the fire office, the railway booking clerk for accident insurance, the garage proprietor for motor insurance, and so on. In modern times it is a complete anachronism. The difficulties involved in making a change are formidable, and legislation would probably be needed; it is believed that the industry is working on the problem, and it is to be hoped that concrete proposals will soon be forthcoming.

If, as seems possible, the industry should lose the handling of workmen's compensation—a question further discussed in the article on fire and accident insurance—there will be a powerful stimulus to make good the loss by expansion in other directions. The assumption by the State of provision for the basic needs of the people still leaves a wide field for private enterprise in ministering to requirements above the statutory minima, and it is here that British insurance will find one of its greatest opportunities in the post-war world. The development of civil aviation will also provide a new field for private insurance, which in course of time may well attain substantial dimensions.

Life Assurance

WAR is diametrically opposed to the well-being of life assurance. It destroys life in its normal course, and therefore the very basis of the mortality tables on which life assurance is designed. It creates difficulties in the investment of funds by destruction of trade and property, by closing the ordinary avenues for investment, and substituting other and—from the direct viewpoint of policyholders' interests—less desirable ones. It also brings high taxation. The value of money tends to lose its stability; this makes for discouragement of long-term engagements. The peace-time activity of disseminating further life assurance itself gives way to more warlike pursuits. Yet as the war approaches its end the condition of life assurance offices in this country cannot be regarded as other than highly satisfactory. True, their condition is not comparable with what it would have been in the absence of war. Nor would it be correct to say that the war period has been one of "suspended animation"; the departure from normal investment principles, for example, will need many years to rectify. But, in the absence of further trials, the offices will be well placed to resume the phase of vigorous expansion which was interrupted by the war.

How is it that life offices have been able to ride the storm of war so well? Taking first the question of mortality, this nation has happily been spared a repetition of the slaughter of its young life on the battlefield which occurred in 1914-18. This has to some extent been offset by civilian war casualties,

but many of these have been older lives, and the strain on life assurance funds is not nearly so great on the death of a policyholder who is nearing the end of his normal span as it is on the loss of a young life. Civilian deaths from ordinary causes have been lower than before the war, largely, perhaps, because of the more equitable distribution of food between the poor and well-to-do classes. The result has been that many offices have been able to shoulder the burden of war deaths without having to meet a greater aggregate liability than that provided for in the tables of mortality. In November of last year the influenza epidemic brought a severe increase in deaths, but fortunately it was rapidly surmounted; the possibility of further outbreaks of disease during the war or immediately afterwards cannot be ruled out, but the nation's health is in general so good that the outbreak of any epidemic, such as that which occurred after the last war, seems less likely this time.

Next, there is the investment problem. This has two aspects: first, an office needs to maintain the values of its investments so that when the time comes to realise, it can do so without loss, and, secondly, it desires to earn for its policyholders the maximum rate of interest on its funds. The outstanding feature of war-time investment has, of course, been the placing of all available funds in Government securities at low rates of interest; how far this has gone to alter the character of life offices' investment portfolios is illustrated by one office with Government securities

representing no less than 52.8 per cent of total assets. Investment values generally, although subject to substantial depreciation in the crisis of 1940, are now for the most part above book values. In the uncertainty of the post-war period, the holding of large sums in Government securities should be a source of strength rather than weakness; they are redeemable at fixed values and definite dates, and intermediate fluctuations are unimportant so long as—a remote contingency—the office does not have to realise before maturity. Nevertheless, it is clear from the speeches of many chairmen that the offices are eagerly looking forward to a return to their principal normal investment function, which is the provision of long-term capital for industry. There has been much discussion lately of the part the banks will play in post-war financing of industry, but little has been heard of the plans of life assurance offices. In general, the deposit banks prefer to have their assets in a form realisable at short notice, and are therefore best suited to the provision of working capital. Life assurance offices, on the other hand, need a long-term outlet for their funds, which in consequence are best employed in financing capital projects. It remains to be seen whether the offices will in course of time return to their pre-war policy of investing part of their funds overseas.

★

In the meantime, the continued investment of new funds in Government securities at a net return of less than 2 per cent is reducing still further the average rate of interest earned by the offices on their total funds; but there is a tendency for the rate of reduction to slow up, due no doubt to improved yields from properties and variable interest securities. One or two offices actually show an improvement in net yield in 1943, but the reason has in each case been adjustments of tax. As, even before the war, the trend in interest rates was downward, a return to higher yields after the war seems likely to be a gradual process; the net position will be largely affected by the decisions of the Exchequer on the question of income-tax, fixed at 7s. 6d. in the £ on life assurance funds while the standard rate remains 10s. in the £. The majority of offices have been steadily strengthening their valuation interest rates to correspond with the lower earnings, and the lead established by the United Kingdom Provident Institution in reducing the rate to 2½ per cent has been followed by two other offices.

A feature of the past year has been the tendency towards more generous bonus distributions. It will be recalled that on the outbreak of war the allocation of reversionary bonuses was discontinued. Interim bonuses on policies becoming claims by death or maturity, however, were maintained by most offices at moderate rates, but some took the ultra-cautious view and suspended these also. The adverse effects of the war having proved less serious than was feared, and with substantial surpluses showing up at valuations notwithstanding more stringent reserves, there has been a steady retreat from the policy of the early war days, and some offices have made distributions of reversionary bonus on a scale as liberal as two-thirds of that before the war; in one or two cases this has involved reopening settled claims on which no interim bonus had been paid. Quite a number of offices, however, are still refraining from making distribu-

tions—probably a wise course, since after the war it will be possible to make much fairer allocations between the different groups of policyholders.

An interesting legal case bearing on the question of bonuses (*Sun Life of Canada v. Jervis*) was decided in the Court of Appeal in July, 1943. At the time the policyholder effected the contract he was presented only with a proposal form for completion and an "Illustration" designed to show the amount payable on maturity, the words, "The examples given are based on the assumption that the 1929 dividend scale is maintained throughout the life of the policy" being added in small print. Later the profits fell off considerably and a much lower dividend was declared during the years the policy was running. It was held by the Court (one of the judges dissenting) that the proposal form related to the particular insurance set out in the illustration, and on acceptance by the company these documents formed the contract between the parties, the policy to be rectified accordingly. The case was taken to the House of Lords, but as the company had already settled with Mr Jervis their lordships decided that they could not hear the appeal. It is, of course, fully understood by the majority of policyholders that bonuses must vary with the profits actually earned, and most offices take care to bring the position clearly to their notice.

★

New business in 1943 was remarkably well maintained in view of the many war-time handicaps and the elimination, following the recommendations of the Kennet Committee, of staff engaged wholly or for a substantial part of their time in the quest for new business. The aggregate for all offices of 68 per cent of the pre-war (1938) total of ordinary life assurances was actually a slight gain on the previous year. This ratio was not uniform for all types of office. The industrial-cum-ordinary offices had a larger ratio at 85 per cent of pre-war and the specialist offices a considerably smaller one at 42 per cent, the composite offices keeping roughly in line with the 68 per cent average; the reasons for these varying ratios are inherent in the impact of war on the different types of organisation, the industrial-cum-ordinary and composite offices being much better placed than those specialising in ordinary life assurance because of their need to maintain organisation primarily for other purposes, but available incidentally for producing new business.

Although the industrial-cum-ordinary offices held their ordinary new business in 1943 at about the 1942 figure, their industrial new business fell by at least 10 per cent to something like three-quarters of the pre-war level. The conclusion seems justified that the industrial offices are intensifying their efforts to persuade their clientele to effect policies in the ordinary rather than the industrial branch, a procedure which cannot but earn commendation in view of the much smaller cost of handling ordinary business. The industrial offices also report increases in the average sums assured under industrial policies. Both industrial and ordinary offices show surrenders much below pre-war figures, a feature chiefly arising from relatively stable employment in war-time. It remains to be seen whether this improvement will be maintained after the war.

Fire and Accident Insurance

IN comparison with the earlier war years, 1943 was relatively uneventful for fire and accident insurers. The special problems of wartime operating had already been largely overcome, and the "standstill" agreement discouraging transfers from one insurer to another must have been a help to an industry working on a minimum staff. Premiums were higher in the fire departments and—contrary to expectations—held their own in accidents. Profits were exceptionally good, rather better than in 1942 for fire and for accident again at the high level of the previous year; these profits were largely absorbed in home and overseas taxation and did not, therefore, result in the large increases in balances carried forward which would have been a feature in similar circumstances in peacetime. The influences of war are not entirely harmful to insurance companies; in fact, certain factors, such as the high level of industrial activity and employment, and the reduced motor traffic, have in some ways been beneficial. It may well be that the adjustments involved in a return to peacetime conditions will

involve problems more difficult to surmount than have been those of war; especially is this likely in the accident department.

Examining first the results in fire insurance, the year brought an increase of about 6 per cent in premiums against 1942; since the last pre-war year (1938) fire premiums have now risen nearly 25 per cent. The reason for this upward movement is, of course, the general increase in values of property and goods; the process of bringing sums assured into line with present-day prices is still far from complete, as many chairmen have emphasised in their addresses to shareholders, with the result that insurers have sometimes to invoke the average clause—providing that in case of under-insurance the sum paid shall be only that proportion of the loss which the sum assured bears to the full value—in loss settlements.

Loss ratios on home business were lower than in the previous year, due to a smaller number of heavy losses; it is impossible to prove that the improvement resulted directly

from the publicity campaign of the Fire Officers' Committee aimed at reducing the national waste from fire loss, which began to get into its swing early in 1943, but the association in time was, as one observer put it, "at least a welcome coincidence." Unfortunately the improvement has not been maintained in the current year. The figures collated by *The Times* show estimated fire losses for the United Kingdom and Eire for the first six months of 1944 at £6,814,000, an increase of 41 per cent on the figure of £4,830,000 for the corresponding period of the previous year, although less than that of £8,552,000 for the first half of 1942. *The Times* figures are arrived at by estimating the cost of fires causing losses of £1,000 or more and adding a flat 60 per cent to cover smaller outbreaks. This method undoubtedly exaggerates the fluctuations, since the smaller fires will tend to be more constant in the aggregate than the larger ones. Also, the larger total to some extent reflects increased values, so that the increased physical destruction is not proportionate. Nevertheless, the figures make it clear that the scourge of fire waste needs continued watchfulness, and the Fire Officers Committee's campaign has been and is serving a valuable purpose in constantly stressing the importance of personal care.

In fire insurance overseas, the year 1943 brought heavy fire losses in the United States; according to the National Board of Fire Underwriters they rose by 21 per cent on the previous year. British offices generally report a deficit or at best a trifling profit on the year's operations in that field. The upward trend continues in 1944 in spite of energetic counter-measures taken under the aegis of the American National Fire Protection Association. The situation in the United States should be less difficult than in Great Britain, since there is not the hazard of the black-out, and war-strain is less advanced than here; on the other hand, the concentrations of risk at individual locations are greater. In other overseas territories British insurers enjoyed a good year in 1943, but the current year may prove less satisfactory in reason of the serious bush fires in Victoria (Australia) in January and the explosion at the Bombay docks in April.

The maintenance of premiums in accident insurance at the level of 1942 was a feature of both home and overseas operations, further reductions in motor premiums being offset chiefly by higher income from workmen's compensation, and also to some extent by increases from miscellaneous types of risk such as burglary, where, as in fire insurance, influences calling for additions to sums assured make themselves felt. Loss ratios in motor insurance were excellent. Claims are costing more to settle individually, but the number is very much reduced because of the lesser density of traffic on the roads, so that even with the 20 per cent war-time discount at home and similar concessions overseas the business was profitable. In workmen's compensation insurers have assumed the additional liabilities under the temporary war-time measures, involving an increase in benefits in comparison with pre-war estimates at 75 per cent, without rating adjustments; but they have had the *quid pro quo* of higher wage rolls, so that with strong inducements to workpeople to remain on duty the experience has not been unsatisfactory. Burglary insurance, which at one time began to develop badly because of the increased marketability of stolen goods and the absence of many people from their homes, improved in 1943 as people returned from reception areas; a further deterioration will doubtless result from evacuation caused by the flying bomb.

★

Looking now to the post-war prospects of fire and accident insurers, the outlook in the former branch seems very much more favourable than in the latter. Provided that Government measures for maintaining economic stability and avoiding trade depression are successful, there do not appear to be any special problems facing fire insurers apart from the reconversion of industry from a war to a peace basis, a process which can be performed at greater leisure, and should be less hazardous than, the reverse movement. These remarks do not, of course, apply to the liberated countries, where conditions may be expected to be difficult for some years. Fire premium income, at present 25 per cent above pre-war, should continue to rise as sums assured are brought into line with the level at which prices are eventually stabilised, a level which is expected to be not less than 50 per cent above pre-war. In motor insurance, on the other hand, the return to peace will bring a large increase in the frequency of road accidents which, applied to the higher cost of settling the average claim, may be expected to produce a total loss expenditure at least half as much again as before the war.

The 20 per cent war-time discount is likely to be rescinded immediately, and adjustments of insured values will bring some premium increases. Whereas in fire insurance, however, adjustments in values carry proportionate premium increases, in motor insurance increases are very much less than proportionate. Upward revisions of the basic scales of motor insurance premiums may therefore be necessary, and past experience suggests that, in this country at least, such revisions will not be easy of accomplishment. Mere striving for higher premiums will in any case prove a bankrupt policy unless efforts are also made to improve road safety. This is primarily an official matter, but insurers with their specialised knowledge can do much. The assurance given by Mr E. B. Ferguson in his presidential address before the Insurance Institute of London in March this year, that "the practice of the science of fire and accident prevention will be greatly developed in the world of to-morrow, and the insurance industry will be found ready to play the full part that essentially and properly belongs to it," is therefore a very welcome one. An essential pre-requisite of such action in accident insurance is co-operation between all types of insurer, tariff and non-tariff companies and underwriters at Lloyd's. In fire prevention matters the companies' members of the Fire Offices Committee have been able, by virtue of their strong market position, to take the lead without waiting to secure the support of other insurers, but similar action in accident prevention matters the companies' members of the Fire Association, the corresponding tariff body, is not possible.

★

Apart from the difficulties which will arise in adjusting motor insurance rates to meet the reduced value of money, accident insurers will also go through an anxious period until all their claims on old commitments have been run off. It seems likely, for example, that there may be considerable outlay after the war through delayed and reopened claims under workmen's compensation policies.

Overshadowing all else in the post-war accident insurance outlook is the threatened permanent loss of workmen's compensation business in Great Britain, coupled with the possibility of some loss in public liability premiums, motor

and otherwise, in the event that the introduction of social security for all should lead to some amendment of the law of civil wrongs. The loss of their workmen's compensation portfolios may not be a very serious matter for composite companies—in 1938 it constituted only about 8 per cent of their combined world-wide accident incomes—but they will naturally relinquish with regret a sphere of activity in which they have taken an important part for over 25 years. The offices in general have discharged their obligations faithfully and well within the framework of the existing system. If there is a lesson to be learned it is that the

Marine Insurance

INDUSTRIES which have been connected most closely with the war will be most affected by the coming of peace, and for this reason the marine underwriter is likely in the near future to have many special problems to solve. What is likely to happen to the marine market under the impact of peace?

Perhaps the most convenient way of searching for an answer is to picture a man who has been invited in August, 1944, to become an underwriting member of Lloyd's and to join an established well-managed reasonably successful marine syndicate. He will, if he accepts, start underwriting in January, 1945—a date that may fall either a little earlier or a little later than the collapse of Germany, so that his underwriting career would lie outside—let us hope permanently outside—the era of European warfare. He is a man of average enterprise and average caution willing to run reasonable risks, not overawed by the thought of post-war taxation, and ready to welcome a new source of income if the chance of making it is not unfavourable. Being a prudent man he takes advice, and goes to two expert friends of his for their opinion of the future. He finds that their opinions differ widely from each other, friend No. 1 recommending him to wait, friend No. 2 advising him to close with the offer and start from the first of January next. Let us put down in black and white the arguments with which the two men would be likely to support and justify their respective views.

You must first bear in mind, says friend No. 1, that the marine market for nearly five years has been living under very artificial conditions. Underwriters have been doing well enough. Their premium incomes have been large and the percentage of profit—so far as in the present unnatural circumstances it can be ascertained—is satisfactory. But the bulk of it comes from war risks which will disappear; much of it is already dwindling even before the war ends; voyage risks are rated by agreements which after the war will be most difficult to keep in being; time risks, profitable enough on pre-war standards of calculation, are an unknown quantity because of deferred repairs, deferred returns, and the cost of ship repairing; and over all hangs the great question mark—what will happen to international trade on which alone the marine underwriter can live. Are the trade barriers coming down after the war? Or will they be built up, raised and reinforced?

★

Take first the time market. The essence of time underwriting is to apportion rates to the cost of repairing damaged steamers, not as it is now but as it will be twelve months, eighteen months, two years ahead. That cost has risen since 1939 by about 150 per cent and has not stopped yet. If you begin writing "time all risks" next January you will, in effect, be betting on where the increase in the cost of repairs will have got to by 1946 and 1947. Do you think your prospective underwriting agent so clever that you will trust him to guess rightly on that vital and perplexing point?

When we came to voyage underwriting the problem is different. Risks run off more quickly and it is not so necessary to be right on the long view. What is important with voyage risks is for the underwriter in the face of competition and against the pressure of merchants to keep his rates up to the paying level. Unless the flow of business to the market is well maintained that is never an easy task; and after the war it is likely to be more difficult than ever. For years now voyage underwriters have been working on a scale of rates ordained voyage by voyage by a small committee of underwriters which decides what surcharge an underwriter must add to his basic voyage premium. He is free to quote any basic premium he likes, but the sur-

charge is fixed for him. The result is inevitable. The competitive underwriter will attract business by cutting the basic rate and will rely for his profit on the surcharge. That that has been happening is beyond question and if the compulsory surcharge were removed to-day and business were written at the current basic rates there would be no profit. After the war if international trade expands it may be possible to keep the surcharge going. But if competition for business is keen, something drastic will happen to the surcharges. Whether international trade expands or not depends on many factors. Freedom is the breath of life to the marine underwriter and especially to the Lloyd's underwriter who has always got his business by giving his assured something better than he can get anywhere else. If the course of trade is to be dictated by the plans now resting in departmental pigeon holes (adviser number one might say) the underwriter may well find himself left with the dirty end of the stick; for in nine cases out of ten a departmental plan, however honestly intended, has had an egg laid in it by some interested party before it sees the light—and that interested party is not usually a Lloyd's underwriter.

So much for adviser No. 1. Number 2, taking a more cheerful line, would probably use the following arguments. There never has been, he would say, a time when the market croakers did not take a gloomy view of the future of underwriting, and some of the most prosperous periods in our marine history were heralded by just such gloomy anticipations as your friend is producing now. His theories about economic barriers may sound impressive, but experience shows that marine insurance, though it obviously depends on the volume of trade flowing, can look after itself better than some other departments of the insurance industry. It is easy enough, for example, for a protectionist Government to pass laws forcing their nationals to insure against fire in the home market. It is much less easy for it to prevent importers and exporters from placing the insurance of their cargoes in whatever market offers them the best terms. Unless a government is prepared to ban c.i.f. imports and enforce c.i.f. exports it cannot say to its merchants, "You must not insure your cargoes there but must insure them here." In marine insurance the wind bloweth where it listeth, and so long as international trade continues—as it must continue—the bulk of the insurance will drift to the strongest and most favourable market. If you want proof of this, consider the inter-war period, when economic nationalism was rampant, and you will see how British underwriting flourished in spite of all the barriers and all the restrictive legislation of all the governments in the world.

As regards the cargo rates agreements in which your friend sees so great a peril, they are nothing but a war-time expedient which will vanish as soon as peace is restored. But it is not true to say that they will leave a legacy of embarrassment to underwriters. Surcharge or no surcharge we shall be quite capable of quoting rates on cargo that will be fair to both parties, and this time we shall be free of at least one troublesome obstacle which after the last war was a nuisance and did no little harm. Then we had to compete with a number of mushroom companies that went all out for cargo business at any rates they could get, and for five or six years after 1918 were a bother to everyone—merchant and underwriter alike. If there are any such companies to-day (and they are very scarce) they are living on reinsurances and their competition can be neglected. This is a point of great importance when we compare 1944 with 1918.

Finally, Time. What your friend says about delayed repairs and the rise in costs is perfectly true, but he is not the only man who has seen the truth and it has not been

UNITED KINGDOM PROVIDENT INSTITUTION

(Established 1840).

CLAIMS PAID OVER £44,000,000.

This Office is conducted on the Mutual principle. There being no shareholders, the profits belong to the members. Bonuses to the extent of £11,377,477 have been paid up to December 31st, 1943.

The Chairman, Sir Ernest Benn, in his speech at the 1944 Annual Meeting, said:

"I have always held that our primary object is to provide against the contingency of death of the policyholder and to provide for the needs of the family that then arise—in a word, to take some thought for future generations. The national good will be served by all those who have the wisdom to defer their spending until the tendency to boom and boom prices has evaporated—and life assurance is the very highest form of deferred spending. The benefit is national as well as personal, for a premium paid to an insurance office, like a deposit in a bank, adds to those large accumulations of resources without which much necessary reconstruction cannot proceed. I therefore ask the public to be more 'Insurance-minded.'"

The Institution's rates of premium for Whole Life Assurances which share in the profits are most competitive.

overlooked by the leaders of the time market, on whom the whole time structure largely depends. An experienced and watchful underwriter is not going to run headlong and unprepared on to such an obvious danger as this and if, as he watches his settlements—which at present are much better than the normal—he is satisfied that he has enough in hand to cover a reasonable estimate of outstanding

liability, he is probably right. It is not often that the whole market is wrong on such an elementary point of underwriting as this. Your friend's argument is really a bogey.

So having balanced the opinions of his two advisers, the prospective underwriter must decide what to do for himself.

The Export of Insurance

CONSIDERABLY more than half of the combined fire, accident and marine business of British insurers is derived from overseas. Insurance is an old-established export industry that has its roots back in the eighteenth century. It would be wrong, however, to suppose that the industry is one which developed in the era of British commercial predominance and has since been carried along by its own momentum. The process of expansion has, in fact, been fairly continuous; even during the twenty years preceding the present war, when the free flow of international trade was progressively restricted, the industry continued to develop; loss of business in the fire and marine branches was more than made good by expansion in accident insurance. After the outbreak of war a substantial income from European territories over-run by the enemy was temporarily lost, and this situation was aggravated by the entry into the war of Japan and by the consequent loss of Far Eastern markets. Nevertheless, business elsewhere has shown remarkable resilience, with the result that there has been no reduction in the contribution made by the industry to Britain's invisible exports—a very welcome state of affairs at a time when income from overseas investments and from other export trades has been shrinking rapidly.

The amount of premiums on overseas contracts of British companies and underwriters at Lloyd's has been variously estimated at between £80 and £90 million annually, and the net contribution to the balance of trade—that is to say, the premiums less losses and commission and expenses incurred locally—is of the order of £12-15 million. A large part of this business comes from the United States, and the Dominions also contribute a substantial share, but in the aggregate it is the product of a vast network of branches and agencies situated in almost every country in the world; one of the larger groups of companies may issue policies in as many as a hundred different countries. Most of the work is performed by nationals of the countries concerned, a feature which tends to identify British insurers with the business life of the countries in which they operate; it has also enabled the industry to function with a minimum of British manpower during the war. But highly-qualified British staffs are needed both at the head offices and overseas—resident or travelling—to handle the complicated problems of administration, underwriting and investment which such a far-flung business involves. Its value to the national economy was officially recognised in 1939, when the Treasury departed from its established principle of not insuring Government property in order to avoid the heavy loss to the market of premiums on insurances of food and supplies which would otherwise have resulted, and which would have been used by the enemy as propaganda material

for the purpose of damaging British interests in neutral countries.

The financial principle on which the overseas development of British insurance has been based has been that of maintaining a strong central fund, the resources of which can be used in any country in the event of need. In many calamities the generous settlements of British insurers have been of great value in relieving distress, the classic example being the San Francisco fire of 1906, when gross claims estimated at £15 million were paid—a large sum against the scale of operations at that time. During the period between the wars the conduct of operations on these lines has been made increasingly difficult by the more onerous deposit requirements in many countries. Deposit legislation may take two forms; it may require a fixed deposit of moderate dimensions in order to prevent the establishment of concerns of little substance, on the lines of the Assurance Companies Act, 1909, or it may compel insurers to maintain in the country technical reserves commensurate with the scale of operations. It is legislation of this second character which chiefly handicaps the conduct of operations on traditional British lines. British insurers point out that under no system can the deposits maintained locally be adequate to meet the losses which would arise in the event of a catastrophe, and the local deposits, being established at the expense of the central fund, merely serve to reduce the general security.

In such a vast area of operations as the United States, the scale on which business is done is now so great that there is a tendency for the area to become self-supporting; in these circumstances the need for a central fund tends to weaken. It has also been contended that modern methods of building construction and improved methods of fire-fighting render occurrences such as the San Francisco fire increasingly unlikely, and there is doubtless much truth in this. Nevertheless, calamities of one kind or another do continue to occur; at the time of the great economic depression of 1929-32 British offices had to remit substantial sums to meet their United States obligations, and as recently as 1942 there was considerable outlay from the London marine market on account of American war risks insurances. The need for a strong central fund is therefore still in evidence, even in support of such a large market as the United States, and the same consideration applies *a fortiori* in smaller fields. It is chiefly a feature of fire and marine insurance, but also has some relevance to accident business. Life assurance is, of course, conducted on quite different principles.

CORNHILL, E.C.3

So long as deposit legislation is not intended to discriminate against foreign insurers, there is little that can be said beyond pointing to the consequences already discussed. In many countries, however, the device of deposits has been used as a means of discouraging foreign competition and conserving the market for domestic insurers, a policy which proves short-sighted when a period of adverse experience is encountered. Deposits have also been employed for the purpose of compelling foreign insurers to support national loans. These are practices which it may justifiably be hoped to see removed in the world of freer trade to be established after the war. Another means of keeping funds within national barriers which was gaining popularity before the war was the device of "reinsurance banks," that is to say, national reinsurance offices to which insurers are compelled to cede a proportion of their business; in at least one country insurers were also obliged to accept a share of the business retroceded by the "reinsurance bank," whether good or bad. In one country—Argentina—a discriminatory premium tax of 7 per cent—against 1.4 per cent for national offices—was levied on foreign insurers, notwithstanding the provisions of a Commercial Treaty between Great Britain and Argentina. Exchange restrictions, too, were becoming an increasingly serious handicap to British insurers in the pre-war period.

One of the first tasks to be undertaken after the war will be that of renewing connections in liberated territories. In the impoverished condition in which many countries will unhappily find themselves, the reappearance of British insurers should be a valuable factor in re-creating confidence. It seems likely that one way in which help can best be given will be by reinsurance support of domestic offices, especially on the sudden removal of German reinsurance concerns. A great deal of reinsurance has always been effected with British insurers and at Lloyd's, but the preference of British offices generally has usually been for contracts subject to annual cancellation, long-term commitments being avoided. Since business can hardly be expected to be profitable in the immediate post-war period, it may

be that circumstances will dictate some modification of this policy. It is to be hoped that the conditions being imposed by the French National Committee on companies re-entering French overseas territories are not a foretaste of what may happen when Metropolitan France is liberated. Companies have been obliged to reconstitute deposits originally made in Paris, to lodge security for outstanding claims under old contracts, to cede business to pools, to modify tables of limits and to furnish complete lists of re-insurers. The latest moves are the establishment of an *Office des Assurances Privées*, which is to be the organ for supervision of private insurers while at the same time engaging in business on its own account, and a requirement that foreign insurers must centralise all their operations in French overseas territory in one controlling office, a requirement which would be found difficult to fulfil. It may be that these excessive measures of control are merely the reflection of present conditions, and that when France is liberated wiser counsels will prevail.

The traditional avoidance by British insurers of long-term contracts perhaps explains why life assurance has not been extensively developed overseas. In the United States, for example, where British insurers transact a large volume of fire, marine and casualty insurance, there is not a single British office transacting life assurance—although it was a British office, the Pelican (now merged in the Phoenix), which introduced the level-premium method of life assurance to America in 1807. Nevertheless, a moderate volume of business has for many years been transacted, chiefly in the Dominions and India. The terms of the Versailles Treaty concerning life assurance were not of a kind to encourage Continental development, but among offices which transacted business on the European Continent at the time war broke out were the Norwich Union and Gresham. The chairman of the Prudential stated at the last meeting that his office has been developing life assurance overseas during the past 20 years, and in 1943 had a premium revenue of £2½ million from this source. A settled post-war world would offer good prospects for further developments in this sphere of activity.

THE BUSINESS WORLD

Equities after the War

BY using an express service after the Battle of Waterloo, and buying heavily on the Stock Exchange, a famous financial house sizeably increased its fortune. The Battle of Normandy, 1944, will rank as an equally decisive military engagement, but only the bear operators have so far benefited from its effect on market prices. That, in itself, is not surprising; for the present-day function of the stock markets is less to react to major developments than to anticipate them. Security values started to rise in Europe's darkest hour at the end of June, 1940, and investors have been discounting Allied victory by buying shares "for post-war recovery" for the last couple of years at least. Moralists, therefore, may spare their strictures when the imminent possibility of the happening of something the markets have been anticipating for so long—in other words, the return of peace—releases a moderate amount of profit-taking. So it was, in happier times, when the announcement of a correctly anticipated increase in a company's dividend was the signal for a drop in its shares.

The economist and investment expert may, nevertheless, read into the present air of indecision which pervades the entire Stock Exchange a real, urgent and intricate problem. What kind of Britain will emerge from the war? What sort of world will be created for investors to live in? So long as "discounting victory" merely meant buying shares in as "discounting victory" merely meant buying shares in industries depressed by war, which could not fail to benefit by the return of peace, under any conditions, the investor's task was easy. Now, however, when the post-war picture may soon have to be filled in, and success will depend on the accurate forecasting of its details, investors are finding that their judgments are painfully incomplete and the material on which to form them depressingly scanty. The Government has disclosed little concrete information about its post-war plans, beyond a fairly full list of chapter headings. The average investor feels, vaguely, that this country will be poorer, more heavily taxed, shorn of most of its overseas investments, and burdened with increased internal costs after the war. Arguing from history after the last war, he tends to look for a relatively brief re-stocking boom and, afterwards, a stern era of scraping.

★

It happens, moreover, that, at the present moment, the messages given by students of neo-Stock Exchange astrology are cautionary rather than expansive. Those who believe that market charts know all, reflect everything and are never wrong are indubitably impressed by the fact that the present rise in share values has nearly exhausted what, under normal conditions, would be deemed its allotted span. The great bull market of the 1930's started in June, 1932, and reached its peak in November, 1936—that is, after rather less than 4½ years. The present upward movement started in June, 1940, and, on the same time-table, would be due for a reversal of trend this autumn. According to the *Actuaries' Index* (December 1928=100) ordinary share values in the 1930's rose between the extreme figures of 43.8 and 91.6—that is, by 110 per cent. The present rise has carried prices from 38.9 to 86.7—that is, by 123 per cent. Yet, the average yield on ordinary shares is still higher to-day than at the peak of 1936. According to the *Actuaries' Index*, it was 4.08 per cent at the end of last month, against 3.54 per cent then. But it is now less than 1 per cent higher than the yield on "riskless" consols (in November, 1936, the margin was 0.6 per cent), and it has fallen this time, by 5 points, from a 1940 maximum of 9 per cent; at the end of 1936 it had declined only by 2½ points from a record 1932 level of 6 per cent. Here is a planetary conjuncture which, to diviners by chart-analogy, suggests danger for those who contemplate a long Stock Exchange journey after the next few weeks.

To express the opposite opinion—that the omens favour

a very considerable rise in ordinary share prices in the post-war period—demands, perhaps, a certain steadfastness of faith in the future of this country and in the vision and resourcefulness of the framers of its economic policy and a belief that the lessons of history will be learned, not repeated. It is a view which, nevertheless, is gradually increasing its adherents among more thoughtful market opinion, and it is based on assumptions about British post-war national income to which economists, as a whole, would assent. As propounded in *The Financial News* (where its statistical background has, perhaps, been analysed in the closest detail), it starts from the unchallengeable axiom that the basic determinant of share prices in the money value of the national income and that at least three factors are likely to maintain that level at a considerably higher figure after the war than before. The first is the rise in technical productivity, which in the past has tended to increase at an average annual rate of about 3 per cent and in the economy as a whole at about 1½ per cent per annum. The war has given a great impetus to technological progress, and it is suggested by some holders of the optimistic view of post-war share prospects that an increase of something around 15 per cent between 1938 and, say, 1946 or 1947 (the "transitional" post-war years) may not be an excessive estimate.

The second factor will be the post-war level of national employment, and the third the level of general prices. If it is assumed that the unemployment ratio is maintained below 10 per cent and that the eventual price level, after the elimination or reduction of food subsidies, will be around 45 per cent above pre-war, then, on the basis of the White Paper estimates of the Central Statistical Office, the national income (at "factor cost") of a notional post-war year would be of the order of £7,500 to £7,750 million, against £4,600 million in 1938—an increase of 68 per cent.

The particular figures are of secondary importance beside the central fact that, by all available evidence, the money value of the national income must be considerably higher after than before the war. Readers may attach whatever co-efficients they choose to the three main factors, according to their own views of the success or otherwise of the Government's full employment policy, the attitude of organised labour, and all other matters which are the basis of discussion in the series of articles on "A Policy of Wealth," which are appearing elsewhere in *The Economist*. But, once the relevance of the different factors has been admitted, and some working figure however approximate has been attached to each, the relative orders

Steady progress

The Canada Life Assurance Company's Report for 1943 reveals progress in every important feature. This fact reflects public confidence in the future, and also in the faithful service that this Company renders to an ever-growing section of the community.

Throughout its ninety-seven years' history, in war and peace, the Company has made similar progress. In every way it has sought to serve the community; typical of this wide concept of service is the large assistance given in 1943 to the war effort.

The following are outstanding features of the 1943 Report, a copy of which will gladly be sent on request.

Total Business in Force	£163,143,503
Assets increased to	£62,941,047
New Policies issued for	£11,212,436
Payments under Policies, Annuities, etc.	£4,596,098
Surplus Funds and Special Reserves	£3,305,337

The rate of Interest earned on the funds of the Company was £4 4s 4d%
Investment in Government War Bonds in 1943 was again very considerably greater than the entire renewal premium income.

The BRITISH MUTUAL BANKING COMPANY LIMITED

Founded 1857

The Bank provides prompt and individual service for customers in all parts of the country. In addition, it acts as a Registrar for Companies. This service includes the preparation of dividend warrants, etc.

LUDGATE CIRCUS, LONDON, E.C.4

of magnitude disclosed come out on much the same lines, whatever adjustments and refinements are introduced into the argument. For example, it has been suggested that, if allowance is made for increased "real" Government expenditure on a scale over 70 per cent greater (in money terms) than in 1938, a national debt interest of £600 million against £200 million and other "transfer payments" by the Government to individuals of £400 million against £278 million—then private incomes after taxation would show an increase of slightly over 60 per cent, compared with the assumed rise in national income (at factor cost) of 68 per cent. Again, presuming only a moderate relaxation of taxation which, like EPT (or whatever its post-war equivalent, if any, may be), falls directly on equity profits, and a tendency on the part of companies to plough back a sizeably increased total of undistributed profits through reserves, the resulting estimates of property incomes (on the White Paper definition) show a rise of the order of 75 per cent and those of profits (including rent and interest) received by persons a rise of 60 per cent to 65 per cent over 1938. The results, in fact, are independent of the precise statistical procedure; however the changes are rung, the fact remains that the "national equity" will be worth considerably more after than before the war.

★

Investors in ordinary shares, so far, have been ready to acknowledge the relevance of each of the three main factors in the post-war prospect for ordinary shares, but have hesitated to accept what they add up to, doubtless because of the extreme difficulty of putting a precise value on any one of them. Of the three, the concept of increasing productivity is least familiar, explicitly, to investors as a body, though implicitly they have acknowledged its existence and persistence in the most appropriate of all possible ways; representative ordinary share values rose 2½ times in a couple of generations before this war. Recognition of the validity of the assumption of reduced unemployment after the war is implicit in the general admission that to allow the army of unemployed workers to reach the dimensions of the 1930's will be fatal to any Government after this war. Finally, the prospect of some further price "inflation" has

been a topic of market discussion for months past. But for such inflation, properly so-called, the national income estimates quoted above made no allowance at all. The general price increase they assume reflects merely the completion of the process of adjustment to prevailing price, wages and cost of living levels after the post-war removal of existing factors which have "enshrined" them. Fresh "inflation," of the type the market has been freely discussing, would involve a scaling up, *pro tanto*, of the national income estimates previously suggested.

In 1938, about a quarter of the total profits of 2,389 companies, whose figures were examined by *The Economist*, was absorbed by debenture and preference service. This "gearing" of company capitalisation would, of course, tend to increase the ordinary shareholder's equity more than in proportion to the suggested rise in total income after profits, after the war. All in all, it would seem that the markets, by over-concentration on the immediate difficulties and uncertainties of the post-war transitional period in Great Britain, may be in danger of overlooking the essential fact that total profits available for ordinary shareholders after the war may render comparisons of share prices with those of 1938 beside the point. It may be that after the war the ordinary share market, as a whole, will continue to have the broad rhythm, up and down, which it has always had, though its fluctuations may be confined within narrower compass if endeavours to smooth out the industrial trade cycle are even partially successful. But if the bases of the views expressed in the present article are sound, then the mean level around which post-war share prices fluctuate should be appreciably, and perhaps quite considerably, higher than in pre-war days.

It is certainly not beyond the bounds of possibility that the trend of existing share prices may turn downward in the near future. But sooner or later, adjustment to a changed national income will have to be made. Its incidence will vary, industry by industry and even share by share. But it would need the decisive intervention of some *deus ex machina*—by way, for example, of confiscatory Government policy on a scale which present omens do not justify—to vitiate the conclusion that ordinary shares as a whole, at anything like pre-war prices, may appear greatly undervalued in two or three years' time.

Intra-European Payments

(By a Correspondent)

THE clearing arrangements between the enemy and enemy-occupied countries on the Continent have now been in operation from four to ten years. With the progress of the liberation of Europe the question arises whether parts of the existing machinery could with advantage be maintained and carried into the post-war system of intra-European payments.

In essence, the Continental clearings represent an attempt to transfer to the field of international payments the principles and practices of the clearing-houses for cheques. A comparison with one of these institutions, the London Clearing House, will bring out the accomplishments and shortcomings of the Continental clearings in their present form.

The functions of the London Clearing House can be divided into three stages. First, 11 member banks, holding altogether about one million cheques (approximate daily average) meet and exchange their cheques, one bank with another on a bilateral basis, leaving each member with 10 balances, some credit and some debit. Secondly, 110 balances (55 credit and 55 debit) are reported to the Clearing House and summed up for each member. This is a multilateral operation and leaves each member with only one final surplus or deficit in relation to the Clearing. Thirdly, 11 final balances are ultimately settled by transfers to and from the accounts of the members with the Bank of England. The whole process is one of reducing the number of outstanding claims from about one million to 55, 11 and 0 respectively, and the result of the day's transactions is that the deposit of each member bank with the Bank of England rises or falls according to its final balance at the Clearing.

The same three stages and principles can be discerned in a system of free international payments, even if they are not

so distinctly separated. The innumerable transfers by individual customers through their banks correspond roughly to the first; the banks' covering of their positions in the open market to the second; and the transfer of funds between central banks or exchange equalisation accounts to the third stage.

Under the bilateral clearing system on the Continent all payments between the clearing partners are concentrated in the Clearing Office of each country. The outstanding characteristics of the further procedure are that the transfer forms are exchanged between the clearing partners on a bilateral basis and the resulting balances left unsettled inside the clearing machinery. Under this system only the first principle of cheque clearing is applied. It is the absence of any further machinery for the adjustment of balances on a multilateral basis, and for the ultimate payment of each country's final balance, which constitutes the main weakness of the bilateral system.

Although not necessarily an advantage to the member countries, the introduction of the Berlin Central Clearing was in one respect a technical improvement on this state of affairs. Countries participating in this arrangement have discontinued their direct clearing connections, each country sending instead all its payments to the other members through its clearing with Germany to the *Deutsche Verrechnungskasse* in Berlin. Here the transfer forms are sorted according to the several countries of destination and forwarded to these countries through their respective clearings with Germany. The result of this procedure is that the balances owing by and to each country are adjusted, leaving only one final balance with the Berlin Central Clearing. This corresponds to the result arrived at in the second stage of cheque clearing. The Berlin Central Clearing goes no further, the final balances of member countries being

left unsettled inside the clearing machinery at this stage.

At first glance it may seem a rather cumbersome method to send all the individual payments through the Berlin Central Clearing, instead of letting member countries exchange their payments direct, and merely report the totals or balances to Berlin for entry in the books. However, taking into account Berlin's central position among the countries concerned, and considering the necessity for Germany to censor the payments, it is quite possible that the procedure adopted is as simple as any other. (The Berlin Central Clearing system is, of course, only being judged on its merits as a means of regulating payments. Like other technical devices, it can be utilised for good or ill; but this is another matter.)

The chief deficiency, technically, is the lack of appropriate means for settling final balances in the third stage of payments. According to the Joint Statement on the Establishment of an International Monetary Fund, it is contemplated that this function will be performed in future by the transfer of gold or foreign exchange reserves in the same way as under the old system of free payments, with the additional assistance only of the facilities to be offered by the proposed International Monetary Fund.

Next in importance comes the need to substitute some other machinery of the multilateral adjustment of balances (on clearing or other kinds of accounts) for replacing the Berlin Central Clearing in the second stage. This institution would presumably at an early date be split up into the separate bilateral clearings of which it is composed. According to the Joint Statement the adjustment of balances should in future be carried out in the foreign exchange market, again in precisely the same manner as under the old system of free payments, but without any assistance from the Monetary Fund. In the original White Plan the Stabilisation Fund was granted a somewhat wider scope, as it was expressly allowed to act also as an international clearing-house for balances of this kind. Whatever the final decision on this point may be, there will hardly be any difficulty in finding after the war one or more suitable institutions—

whether new or old and whether operating inside or outside the market—to exercise this function.

Last in order of urgency comes the need for finding other forms of transmitting individual payments in the first stage, to replace the present clearing accounts. There are plenty of alternatives: registered accounts, special accounts, area accounts, free accounts, and so on. The Joint Statement does not declare itself in favour of any particular alternative, nor, indeed, does it demand any change at all in this respect, if only the balances on clearing accounts can be disposed of in some way or other.

On the Continent clearing accounts and exchange control are closely linked together, so much so that to many people the two terms have acquired a nearly identical meaning. But even if it is appreciated that it is perfectly possible to separate the two, it does not follow that it is wise to do so. There may be a good case for maintaining in the first stage of payments the now existing intra-European clearing accounts, firmly established and smoothly running as they are, until such time as exchange control can gradually be relaxed.

In sum, it may be said that it is not only desirable, but necessary, to introduce new forms of adjusting bilateral balances (on clearing or other kinds of accounts) and of settling the final balances owing by or to each liberated country. On the other hand, it is not necessary, and in the first transitional period probably not even desirable, to make radical changes in the operation of the bilateral clearing accounts themselves. Each country can safely be left to choose for itself the kind of accounts best suited to conduct its foreign payments. It may well be that a country with a backward banking organisation would feel obliged to uphold complete concentration and rigid supervision of payments in one clearing office, while a country with an advanced banking organisation and highly trained bank staffs may choose to share the responsibility of exercising control with certain specially authorised banks. An entirely free system of payments cannot be contemplated so long as the necessity for exchange control exists.

Business Notes

Currency in Liberated France

The agreement signed between the United States and British Governments, on the one hand, and the French Provisional Government on the other, grants the latter complete authority for the issue of currency in liberated France. The agreement is made retrospective to D-day, and, therefore, the Provisional Government has taken over responsibility for the "tricolour" military notes issued in France by the American and British military authorities. It is probable that these notes will as soon as possible be exchanged for other currency printed in the United States some time ago for the Algiers Committee. As yet the Provisional Government has not put its monetary policy for liberated France into operation. There has been no wholesale attempt to call in the present circulation of Bank of France notes, and to exchange it for other currency, or to block bank accounts and other assets, or to put into effect the other items of fiscal policy, the details of which had been worked out and settled before the liberation of France began. What has been done on the initiative of M. Coulet has been to block two categories of bank accounts in liberated territory. The first of these are the accounts of persons temporarily residing in German occupied territory. Their accounts cannot be freely operated, not because there is any ultimate intention of sequestration or other penalising measures, but as an obvious security measure designed in the main for the benefit of the French holder of the account in question. The second category of blocked accounts are those of active collaborators and other suspect persons whose assets have been immobilised pending fuller judicial inquiry into the activities of the owner. In such cases the blocking has been tempered by special concessions allowing funds to be withdrawn up to specified modest maxima to provide for the maintenance of the owner's dependants. The basis of any satisfactory settlement of the currency problem in France must be an effective control of prices and wages in the liberated territories, and after an excusable interregnum during which developments in this respect were unsatisfactory the position is now rapidly

improving. A good deal of evidence is accumulating that a serious compression of fixed prices will have to take place if the rate of exchange of 200 franc to the £ is to be made permanent. The immediate intention in fixing that rate, namely, the limitation of the purchasing power in the hands of Allied soldiers in France, has been wholly realised. It has more recently been reinforced by the tightening up of the system of food rationing in the liberated territories, and by restricting the serving of meals in restaurants to those able to produce food cards. In this way a good deal of military competition for the available supplies of food-stuffs has been satisfactorily excluded.

★ ★ ★

Bombay Silver Deadlock

The situation on the Bombay silver market has been abnormal since July 27th, when normal silver trading was suspended. The cause of the deadlock was a serious "bear squeeze." Normally this would have been solved by the natural device of declaring the bear speculators defaulters, but it has caused a complete deadlock owing to Court injunctions restraining the Bombay Bullion Exchange from enforcing its sanctions against defaulting speculators. Bear speculation in silver began to develop in Bombay when news broke of the large silver purchases made by the Indian Government first from Persia, then from the United States. The operators assumed that these purchases were a prelude to official sales of silver, and that these sales would have a depressing effect on its rupee price. By June 20th the spot price of silver (per 100 fine tolas) had fallen to Rs.127/8, against a high record of Rs.143 reached on April 24th; the forward delivery price had slumped to Rs.121/8, the discount on forward being such as to indicate a dangerously strained position. The hopes on which the bear sales had been made were not realised as rapidly as the speculators had expected; no official sales of silver were made. By June 20th the bears were being squeezed. There was said to be a short position of about 6,000 bars,

or rather more than 6,000,000 ounces. The bears were unable to deliver the silver they had sold, and their attempts to cover themselves in the market led to a steady bidding up of the spot price which had risen to Rs.135 on July 27th.

*

Meanwhile the Bombay Bullion Exchange Board had applied a penalty of Rs.1 per 100 tolas for the extension of contracts due to the non-delivery of silver by the bear speculators. This is a penal rate, though it should be noted that these arrangements for carrying over contracts hardly comply with the Defence of India rule prohibiting speculation in silver. These arrangements did not satisfy the bulls, who began asking for their pound of flesh, that is, for actual delivery of the silver they had bought, and not for penalties, however severe they might appear when expressed in terms of an annual percentage figure. As the market was short of silver, this demand for actual delivery would have sent the price of the metal rocketing, and would probably have involved the failure of some important firms in Bombay. The "bulls" were in an exceptionally strong position, and a leading operator suggested a rate of Rs. 139 at which the open accounts might be squared. One firm was actually declared a defaulter by the Bullion Exchange, but then obtained an injunction from the courts restraining the Exchange from enforcing this resolution. At this point, on July 27th, the Exchange Board suspended silver trading until further notice. The Reserve Bank then came to the belated rescue of the bears, but did so in rather hesitant manner. It began making silver available to the market in daily quotas of 200 bars, which were first offered at Rs. 131, the price gradually rising to Rs. 131/12. The position is gradually being eased by these official sales; meanwhile there are improving prospects of agreement between the various parties concerned on the figure at which the remaining open contracts should be settled. By Thursday of this week the position had become sufficiently normal to allow a resumption of official dealings in silver. Spot was quoted at Rs. 131 and forward at Rs. 130.

US Coal Mission

A commission of American technicians and economists has recently examined production and distribution methods in the British coal industry. Its report to the Coal Committee of the Combined Production and Resources Board has not been published. This is a pity, for the detailed views of American technicians on British methods would have been of special interest because of the much higher productivity of the industry in the United States. The summary of the report issued on Tuesday is colourless, inevitably perhaps. It records that the machinery supplied by the United States has been put to good use. With the aid of American machinery it should be possible to raise the output of open-cast coal from the current rate of 10 million tons to 18-20 million tons a year and deep mine production by about 12 million tons a year. The report emphasises the scope for the adoption of new methods of exploitation. In its view, 40 million tons of the current rate of deep mine production of 190 million tons could be mechanised immediately, with a resultant gain in efficiency and economy of manpower that "can be a major contribution to the war effort." Moreover, a large part of the remaining 150 million tons could be mechanised gradually,

after major changes have been made in transportation preparation and methods of dealing with difficulties of converting from complete longwall operations to complete room and pillar systems of mining.

Obviously, as the Mission points out, American equipment does not work as well in British as in American mines because of different geological conditions. The report, even in its summary form, once more underlines the need for speedy technical reorganisation.

A United Effort

In his statement to the shareholders of Amalgamated Anthracite Collieries, the chairman, Mr F. A. Szarvasy, emphasised the need for the introduction of modern mechanised technique in coal mining. He recorded two difficulties. First, the greatest difficulty which his company has experienced in introducing new methods has been in finding adequate labour to prepare the pits for the installation of modern plant. Secondly, while the leaders of the miners realise that technical reorganisation is essential to the progress of the industry and the well-being of its workers,

there is a reluctance on the part of the workmen themselves to change from the older methods and they have not a clear perception that the new methods, although they may mean revolutionary changes, are really for their benefit and in fact the only security for the continuation of high wages under good conditions for labour.

One of the obstacles in the way of reorganisation in the past has been resistance to change, not merely by coal-owners but also by workers. However, Mr Szarvasy's strictures apply with no less force to the owners. Of course, there have been exceptions on both sides. A united effort will be required if the coal-mining industry is to be brought into line with modern technique as speedily as this is necessary.

An Institute for Distribution

A conference presided over by Dr. Leslie Burgin was held last week, and attended by a number of Members of Parliament, scientists, economists, business men, and representatives of trade associations, who agreed that an institute whose main object would be the scientific study of distribution was needed. Constitutional and organisational plans will be considered at a further meeting in September. It is proposed that the Institute's principal objects should be to obtain a census of distribution and the setting up of educational courses, scholarships and chairs of distribution at universities. It would also follow and advise on legislation, collect information and statistics, publish pamphlets and periodicals and co-operate with other bodies. Membership would be open to companies, trade associations and individuals on a wide basis, and the Institute would have scientists and economists on its permanent staff. It is hoped that since the Institute would be scientific in character it would qualify for a Government grant towards its research. It would, in addition, be financed by the subscriptions of members. The meeting felt, quite rightly, that the Institute should be independent of party politics and control by vested interests.

* * *

Research in Distribution

There is no doubt that the complexity and cost of distribution have grown. There is in existence no single organisation which concerns itself with the problem of the industry as a whole, although there are a number of specialised associations, whose interests are confined to those of their members. It is unfortunate that, whereas there have been a fair number (although too few, as has been recognised) of research bodies serving manufacturers and industrialists, no such body has yet been formed to assist distribution, either wholesale or retail. In this respect, this country is far behind America. Research in distribution is no less needed than research in production. New methods might be found to simplify distribution so that costs can be reduced, while at the same time the functions performed by the various distributors who provide the links between producers and consumers can be retained and possibly extended. An institute dealing with the problems of distribution can be of immense value in dissecting problems and suggesting improvements on scientific lines. This would be of benefit, not only to commercial practice, but also to distribution in its wider aspect. In all the Institute's work, one thing is essential above all others: it must be unbiased. Its approach must be completely uncoloured by any preconceived notions on the merits of any particular type or process of distribution. No vested interest or retail cartel must be allowed to influence the conclusions drawn as a result of any piece of research. The Institute should represent every aspect of distribution, and concern itself with every type of business in the trade, whether it be department store, chain store, co-operative society, mail order business, independent trader, market stall or trolley-

man. The interest of the consumer should be clearly appreciated in all the Institute's work, since in the last analysis all distribution exists to serve the ultimate consumer. If the Institute is prepared to work on these lines, it will receive support from disinterested observers, and the Government should be generous in recognising its claims on the Treasury.

* * *

Bulk Purchases

The method of purchasing in bulk, and for a period ahead, raw materials and foodstuffs in war has obvious advantages. It is designed to ensure supplies by providing a guaranteed market to producers; it prevents an undue rise of prices in a period of scarcity; and it has certain administrative advantages at a time when supplies of raw materials and foods have to be rationed to manufacturers and consumers. But the fact that the method of bulk purchase is advantageous in war does not mean that it will be equally beneficial in peace. During a period of plenty, when there is no need for rationing, there is no need to ensure supplies by bulk purchases, and the use of the system has less administrative advantages. Nor will they necessarily ensure lower prices than a free market. During a recent address to the British Federation of Commodity and Allied Trade Associations, Mr Harold Johnstone, Secretary of the Department of Overseas Trade, expressed the hope that Government bulk purchases would end as soon as adequate supplies of commodities are available, on the ground that the operations of the commodity markets can ensure foreign produce in better quality, in greater variety, and more cheaply than any bulk contracts. This does not mean that the system of bulk purchases should be discarded completely. Exceptionally, they might be used to provide a guaranteed market for producers; they might also be used as a means of price control in conditions of monopoly. But there seems to be no case for their general substitution for free markets in primary products.

* * *

Journalist Brokers

The question of the relationship between Stock Exchange personnel and the press has long been closely exercising the Stock Exchange authorities. The crux of the matter lies in the fact that at certain (and fairly limited) phases of market activity, the press is a potent factor in influencing prices by its comment and recommendations. Insofar as these comments and recommendations are the responsibility of journalists unconnected with the Stock Exchange, the authorities have little power to check the occasional abuse of a privileged position which may occur; the public's safeguard must rest in the moral integrity of financial journalists, and on the vigilance of their employers. When, however, members and others directly connected with the Stock Exchange, and under the jurisdiction of its Committee, add journalism to their professional activities, the Committee is clearly within its rights in taking cognisance of their journalistic activities. Just how far control and surveillance should go is a very moot and very difficult point. The Stock Exchange and the financial press are mutually dependent on each other. To suggest, as has been done, that the only effective course is to impose a complete embargo on the journalistic activities of House personnel would not only be a serious interference with the liberty of members; it would impair the efficiency—and the freedom—of the financial press. Nor could the embargo be in fact effective. Having doubtless considered all these points, the Committee has contented itself by stipulating that when a member, or a clerk, writes regularly or performs other services for the press on a professional basis, he must first obtain official consent in writing, such consent to be subject to annual renewal and terminable at any time. The Committee, in fine, wishes to "keep tabs" on journalist-members. That is reasonable enough. Yet there may be a sting in the apparently innocuous ruling. Provided that the Committee knows which of the members is also acting as a journalist, it can already use sanctions against misconduct first by means of a warning, and if that fails to have effect, by expulsion from the House. Yet under Rule 93A, it would be possible for some future Committee, less sympathetic towards the press than the present body, to withdraw "permission to write" from a member whose only offence was perhaps to write unkind words about the Committee. The new rule is typical of the loosely-knit regulations by which the Stock Exchange is governed. However

suitable such widely drawn regulations may be in other directions, it would seem that in this matter compulsory disclosure of duality of interest, coupled with the existing very effective sanctions against unprofessional conduct, would have been sufficient safeguard.

* * *

The Tinplate Industry

Richard Thomas and Company continue to ride a favourable tide, and the full accounts for the year ending April 1, 1944, show the gross profits of the group higher by nearly £300,000, and past the £4,000,000 mark, while the net profits of the parent company are over £100,000 up at £740,000. The ordinary dividend, as already announced, is raised from 10 to 12½ per cent, and it is stated, in what could be taken as an optimistic aside, that this step is not inconsistent with the policy of maintaining a relatively stable dividend. Figures for the last three years are given on page 297. Taxation adjustments, due largely to the granting of wear and tear allowances in respect of furnaces—a factor which will continue to better the company's taxation position—make available this year an extra £325,200, which is used to write down the book value of subsidiaries. It is pointed out that much of their plant is becoming obsolete. This is in line with the company's aim of further modernisation of the tinplate industry which, it is pointed out, will involve heavy capital expenditure, for which purpose strong liquid resources have been conserved. Insofar as this outlay is to be directed to technological improvements, it is very much to the good. The company's strip mill at Ebbw Vale is already an example of efficient mass-production in an area affected by industrial decay, and during the war this plant has handled a rapidly increasing share of the country's total output of tinplate. It is well known that the industry is faced with considerable redundancy. Last November a scheme was submitted to the Board of Trade, and subsequently three-quarters of the interests concerned set up a company, "Tinplate Processes, Limited," to solve the problem on a co-operative basis. Although final agreement within the industry has still to be reached, Mr Lever, the chairman of Richard Thomas, in his annual statement, restates his belief in a co-operative solution. Everything hinges on what form this is to take. The payment of heavy compensation in respect of redundant plant would not only, by diverting liquid resources, slow up the process of modernisation. It would prevent consumers getting the benefit of the cheap and efficient plant now in existence. It would handicap exports—although here the position is in any case complicated by the question of a return to international control. Finally, shareholders of Richard Thomas may wonder whether any scheme of compensation can benefit them, since they own such good plant as the industry possesses, as well as the liquid resources to improve it further.

The Hill Empire

The death of Mr Philip Hill at the age of 72 not only closed one of the most remarkable careers the City has seen (not until he was over 50 did he come into real prominence with the Beecham's Pill-Covent Garden deal); it has caused considerable conjecture about the future of the many companies with which he was connected. This conjecture is understandable when the catholicism of Mr Hill's interests is recalled. In addition to Beecham's Pills and Covent Garden Properties, he was connected during the last twenty years with the financing of, or transactions affecting, Woolworths, Hawker-Siddeley Aircraft, Timothy Whites and Taylors, Ranks, Scribbans, Olympia and Odeon Theatres, to mention only the more important. The very breadth of his interests, however, emphasises that it was mainly as a provider of capital for industry that he func-

tioned; remarkable man though he was, he could hardly have been a technical expert on such varied matters as cakes and hurricanes, films and laxatives. His death is likely to have little, if any, effect on the many companies with which he was associated. The gap it leaves in the machinery for financing industry may possibly be filled east rather than west of Temple Bar. His issuing house business was conducted through Philip Hill Investment Trust and its subsidiary, Philip Hill and Partners; and this week it has been announced that Sir Edward Mount, Bart., becomes chairman, and Mr Hubert A. Meredith managing director, of these companies.

Price Control in Cotton

The movement in favour of price control in the cotton industry after the war—this was advocated by the Cotton Board Committee's report on the industry's post-war problems—not unexpectedly, is gaining strong support within the industry. Last week a meeting of spinners of Egyptian-type cotton—this section comprises more than a third of the spinning section of the industry, with some 15 million spindles—came out in favour of the establishment of price control after the war. The view is expressed that price control is a necessary preliminary to reorganisation. It is certain that price control will fail without reorganisation and the adoption of the most productive methods in manufacture and marketing. It will fail because overseas consumers will only buy British cotton goods in large volume if they like the goods and if they are offered at competitive prices. The Government cannot provide the industry with a large and guaranteed overseas market; it can only press for a system of world trade that gives the industry access to overseas markets on equal terms with other exporting countries.

United Molasses

The delayed accounts of United Molasses for the year to December 31, 1943, show little change in the profits of the group, which amount to £834,781 gross and £344,952 net. The same appropriations are made as last year—an ordinary dividend of 20 per cent, plus a cash bonus of 2½ per cent, tax free, paid out of capital reserve, and the transfer of £100,000 to general reserve. It is stated by the chairman, Mr Kielberg, that income from molasses, over which the company continues to act as sole agents for the Ministry of Supply, continued to decline, so that it represents less than 10 per cent of the year's consolidated earnings. On the other hand, if the increased prosperity of Tankers (in which the group have a majority holding) is a reliable guide, the group's shipping business has not done badly. The most interesting feature disclosed by the accounts is the increase in net liquid assets, which for the group as a whole amount to £5,766,264, against £5,045,323. They are, in addition, more liquid with a big increase in Government securities and a fall in debtors. Capital reserves of the group are up by over £550,000 to £2,465,000 odd. Of this increase, £112,917 represents the profit on investments realised during the year, which is credited direct to capital reserve, and does not appear in the profit and loss account; by con-

trast, the payment of the 2½ per cent bonus required £48,866 from capital reserve. Mr Kielberg points out that the re-employment in the company's trade of the large liquid assets now accumulated will be a major responsibility in the years to come, and that this is the motive behind the recent directorial appointments. In view of this statement, and the company's strong position, a new move to extend its interests, along the lines indicated by its unsuccessful bid for Lamport and Holt, would not come altogether as a surprise.

Boom in Beer

The full accounts for Watney Combe Reid for the year ending June 30, 1944, show that the increase in the deferred ordinary dividend from 18 to 20 per cent is well covered by over £250,000 rise in gross earnings from £1,720,000 to over £1,990,000, and by a rise in earned for ordinary capital from 21.3 to 29.3 per cent. Full figures for the last three years are given on page 299. In each of the last three years a total of £450,000 has been allocated between the reserve for deferred repairs and the reserve for property improvement and contingencies, but considerable variations in the respective appropriations indicate the optional nature of a particular year's distribution. This fact tends to distort the figures for earned for ordinary, which are struck after deferred repairs. These allocations represent a considerable strengthening of the company's reserves, which are further augmented this year by a provision of £53,765 against future taxation. From the accounting viewpoint, this year's best feature is the emergence of a consolidated balance-sheet, which does not, however, include comparable figures for 1942-43. The explanation of the rising profits can presumably be only the still rising thirst of the public, under pressure of another year's war strain and the further dwindling of competing attractions. Beer, like films, has enjoyed an expanding war-time market. Doubts are being expressed, however, about the industry's post-war prospects, when there will be a widening field of alternative enjoyments. It is possible that there is a sufficiently solid core of demand for beer to guarantee to the industry a reasonable prosperity over the next decade; and, who knows, there may even be a reduction in the beer duty.

Seaweed in Scotland

Seaweed is a source of supply for chemicals used in the making of textiles, transparent paper, plastics, food-stuffs, sizing materials and medical materials. The Ministry of Supply, the Scottish Council on Industry and the Scottish Agricultural Organisation Society have realised that the collection of seaweed might well be developed to provide a profitable part-time occupation for crofters. To discover the potentialities of this new industry, the Scottish Seaweed Research Association has been established. It will have three divisions. The survey and littoral division will make surveys which will indicate where and when seaweed should be collected. The engineering division will maintain the *Prospecto*, a ship specially equipped for the survey and collection of deep-sea weeds. In addition, this division will develop equipment for collecting seaweed, and investigate the possibilities of pressing, drying and milling equipment. The chemistry division will study seasonal variations in the constituents of the various Scottish seaweeds, and provide information to those engaged in the extraction of chemicals and to those who use it for animal feeding stuffs and for fertilisers. As a fertiliser seaweed has been used extensively in some parts of the British Isles for centuries. The Association will work on these lines for two years, and has up to £50,000—derived from private and public funds—at its disposal. Whether a flourishing industry can be established will depend largely on the results of the Association's research. If large quantities of seaweed can be assured regularly and obtained at economic prices, then chemical industries will be developed near the place of collection to eliminate the heavy transport costs which would otherwise be involved. Scotland's established rivals in the industry are mainly in the Pacific, where extensive and easily harvested weeds are found.

Potatoes

The potato is the only food in which this country is completely self-supporting, and the acreage grown has been

nearly doubled during the war. Acreages under potatoes in England and Wales have been as follows:—

1939	454,327 acres	1942	898,385 acres
1940	537,186 "	1943	957,043 "
1941	777,307 "	1944 (approx.)	950,000 "

Potatoes are now grown on 233,000 farms in Great Britain, and 60,000 in Northern Ireland. The increase has been achieved partly by compulsion but mainly as a result of fixed growers' prices, the guaranteed market, and the £10 per acre payment which has been made since 1942. The general principles of the scheme have been followed since February, 1940, although adjustments have been made from time to time. Potatoes are sold through normal trade channels, limited only by price, grade, transport (there is a zoning scheme) and other regulations. The Ministry of Food buys potatoes from growers and holds stocks for end of season distribution and to cover temporary shortages. When surpluses arise, they are dried or sold to stock-feeders. The Ministry is responsible for supplying the Forces overseas and for exporting seed potatoes—last season, 90,000 tons were sent to the Dominions and to the Mediterranean. Every effort is made to increase potato yields. These vary from the 10 tons per acre achieved by good growers, down to only 3 tons per acre. The aim is to make the average of 7 tons the minimum yield per acre. The Ministry of Agriculture advises growers on how to raise their yields. One way is to use good seed, and Scotland, Northern Ireland and Wales have expanded their acreages of certified seed. So far as the consumer is concerned potatoes have been available in sufficient quantities with scarcely a gap, and in the face of shortages of other foods, consumption has risen steadily. Prices have been kept at a pre-war level by means of subsidies, the cost of which has been as follows:—1940-41, £200,000; 1941-42, £14,400,000; 1942-43, £23,000,000; and 1943-44, £28,000,000.

Potash

Developments in fertiliser production during the last war radically changed the international supply position of the two main groups of fertilisers. Germany, isolated from Chilean nitrate supplies, began to produce synthetic nitrogen, while the United States, cut off from German potash supplies, developed domestic resources. A Note in *The Economist* of July 29th last (page 162) indicated that the international nitrogen industry has undergone further changes in this war. The wartime expansion in potash production has been as important as that of nitrogen. Although United States production rose from 4,374 short tons of low-grade potash salts in 1915 to 546,757 tons of high-grade salts (containing 312,201 tons of K₂O) in 1939, it was still one of the best customers of the European suppliers. Since the war, the United States has become an exporter. Details released by the US Bureau of Mines show that output has expanded year by year since 1939. In 1943 production totalled 1,428,480 short tons of potassium salts with a K₂O content of 739,141 tons. A further increase is expected this year. The Bureau of Mines points out that "present producing capacity is more than enough to care for normal domestic requirements under postwar conditions." In addition, other countries have expanded their production. The expansion has been on a large scale in Russia, where, it is believed, the world's largest undeveloped potash resources are to be found. Palestine has extended production from Dead Sea brines. Spain has reorganised its own young industry which was hit by the Civil War. New minor sources have been worked in Chile, Australia and India. Although the potash industry will end the war with a larger productive capacity than ever before, large quantities will be needed by many countries to replenish potash reserves in the soil. The weakened position of the former German-controlled cartel will be an advantage in achieving this object.

Shorter Note

The consolidated statement of the International Nickel Company of Canada and subsidiaries for the first six months of 1944 shows that the reduction of profits, already revealed, for the first quarter of this year has been repeated in the second quarter. Altogether, the company's net profits for the half-year to June 30th amounted to \$13,686,390, representing, after paying the preferred dividend, 87 cents a

share on the common stock, which compares with earnings of \$1.04 for the first half of 1943 and \$2.00 for the whole of 1943—exactly sufficient to maintain the usual quarterly dividends of 50 cents throughout 1943. The quarterly dividends in 1944 have, however, fallen to 40 cents, and it was announced on August 8th that the third quarter's dividend would be at the same rate.

MONEY IN THE DARK

You keep a lot of money in the stores at your works and nowhere else is money so easily lost.

Everything in those stores has cost money—everything in those stores must be immediately available when it is wanted, that is to say your store-keeper must be able to find it—to see it.

Properly planned lighting is the only way to be sure that everything can be found. Benjamin Lighting will light your stores to increase their efficiency and to look after the money you keep there.

There are Benjamin Engineers stationed all over the country who will gladly supply details for your stores.

THE COMPANY ALSO ACTS AS
EXECUTOR & TRUSTEE

FROM THE DAY you convert your money into Savings Bonds it starts to earn its keep at 3%—payable every six months. This interest, in the case of the Post Office and Trustee Savings Banks issues, though subject to Income Tax, is paid you *in full*. This means you will not need to make any rebate claims. In the case of the Bank of England issue, interest payments of over £5 per annum are taxed at source.

You can buy Savings Bonds in multiples of as little as £5, with a minimum first subscription of £10, in the Post Office and Trustee Savings Banks issues. Maximum subscription £1,000. Or, in the case of the Bank of England issue, where there is no limit to holdings, you can invest any odd amount, inclusive of shillings and pence, provided it is over £50.

Savings Bonds are full of good points. That is why over £1,000,000,000 was invested in the previous issue. Ask for Prospectus and Application Form—from any Post Office, Bank or Stockbroker.

COMPANY MEETINGS

BRISTOL AEROPLANE COMPANY, LIMITED

MR W. G. VERDON SMITH'S
STATEMENT

The thirty-fourth ordinary general meeting of the Bristol Aeroplane Company, Limited, was held, on the 24th instant, at Bristol, Mr W. G. Verdon Smith, C.B.E. (the chairman), presiding.

The following are extracts from the chairman's statement circulated with the report: After providing for depreciation and excess profits tax the amount available is £1,108,224.

During 1943 production was again maintained at a high level. Bristol aircraft and Bristol engines have operated in every theatre of war with every Royal Air Force Command and with the Fleet Air Arm. In addition to continued deliveries of Beaufighter aircraft and Hercules engines, newer types of aircraft, engines and armament have begun to make their appearance. Beaufighters have now succeeded Beauforts in the production factories of the Australian Commonwealth. Progress has been made with the design and development of our large Type 167 Transport aircraft (sometimes referred to as the Brabazon Type 1) and an increasing proportion of design effort is now being devoted to this project. Meanwhile Bristol Pegasus engines in the Empire flying boats have throughout the war been giving service which compares very favourably with the much publicised American claims for reliability and performance.

POST-WAR AIMS

The unmistakable signs of victory at last justify even those most closely concerned with the provision of essential war equipment in devoting considerable thought to the post-war period. The course of our technical progress is well defined. British design and construction can challenge the world and our company intends to be in the forefront of the challengers. I have mentioned our big transport aircraft. In addition, an extensive programme of other developments, both of aircraft and of aero engines, is in hand.

Looking forward, conditions of modern industry demand increasingly long-term planning. This is particularly true of the aircraft industry; each year is marked by intensely rapid progress: it is useless to take part in the race for technical supremacy without a programme for a number of years ahead. But the planning of industry is impossible without the previous determination of Government policy, without which the aircraft industry cannot be progressive and at the same time establish that measure

of stability and organised control which alone makes possible the practical realisation of the Government's own programmes of employment and social security.

If reasonable stability can be achieved there exists today the opportunity for industry to be the means of obtaining continuity of employment and broadened interests for the community as a whole. It is our determination that our company will be enabled by its initiative in post-war years not only to give a fair return to those who have by their investment made possible the position which we hold today but also to devote ourselves still further to welfare and working conditions generally.

Finally our primary duty for the present is to contribute our maximum effort to the war; when that is done we must apply ourselves to the transition from war to peace; we must push forward our new projects, reopen our foreign markets and, above all, return to the fundamental principles of industry and commerce which war conditions have for so long overshadowed. You, as stockholders, may depend upon it that no effort will be spared to bring about the results at which we are aiming.

The chairman, addressing the meeting, paid a tribute to the work of the staff during the past year.

The report and accounts were unanimously adopted.

UNITED MOLASSES COMPANY, LIMITED

EARNINGS WELL MAINTAINED

The eighteenth annual general meeting of the United Molasses Company, Limited, will be held in London on the 29th instant.

The following is an extract from the statement by the chairman (Mr F. K. Kielberg) circulated with the report and accounts:—War restrictions again prevent me from giving a detailed survey of the activities of the company and its subsidiaries, but it will be seen from the statement of combined results for the year that earnings were well maintained and the consolidated balance-sheet demonstrates the financial strength of the company. Profits were sufficient to maintain the dividends, cash distribution, allocation (£100,000) to general reserve and to leave the carry forward unchanged.

In the United Kingdom the company continues, in respect of all dealings in molasses, to act as agents for the Ministry of Supply. The income from this part of the company's business continued to decline during 1943 and amounted to less than 10 per cent. of the consolidated earnings for the year, but since the early part of 1944 there has been a marked

improvement and prospects for the remainder of the year appear promising. Athel Line, Limited, suffered further shipping losses during 1943, but I am happy to be able to report that no additional losses have occurred since January 1st of this year. Taking the group of companies as a whole, trading during the first half of 1944 must be considered satisfactory.

The consolidated balance-sheet shows that combined current assets continue to accumulate and that at the end of last year they exceeded current liabilities and appropriations by £5,766,000, represented by investments in short-dated Government securities. The re-employment in the company's trade of this large sum will be one of your directors' greatest responsibilities in the years to come, and the management has been strengthened in preparation for this task.

BROADCAST RELAY SERVICE, LIMITED

CONTINUED EXPANSION

The sixteenth annual general meeting of Broadcast Relay Service, Limited, was held, on the 17th instant, in London.

Mr Allan Miller (the chairman) presided.

The following is an extract from the chairman's statement issued with the report and accounts:—

I am very glad to be able to report continued expansion in all departments of our business all of which have reached new high level of volume of business and profits earned. Last year's profits had the benefit of excess profits tax deficiencies, whereas the whole of our profits this year have been subject to excess profits tax. This accounts for the decrease in the balance of profits as compared with the previous year.

We have disposed of one of our manufacturing companies in Canada on very satisfactory terms. The new item of "Notes receivable" appearing in the consolidated balance-sheet represents part of the capital proceeds of this sale.

The company is in a strong position financially, with ample reserves, and we are giving continued consideration to post-war plans for extension and improvement of the company's business.

Despite the many difficulties which exist to-day, our businesses have maintained their high standard of service and further improved their efficiency of operation.

Your directors recommend payment of a final dividend of 3½ per cent. free of tax, which is the same as last year.

The resolution adopting the report and accounts was carried.

FINANCE AND BANKING

THE MONEY MARKET.—The banks were called upon to pay £60,000,000 against TDR's this week. This represented some £30,000,000 of new money as the effective maturities, allowing for pre-encashments amounted to about £30,000,000. The discount market had to tackle the very considerable task of taking up a 42 per cent allotment on its applications for the £110,000,000 of Treasury bills tendered for on Friday of last week. As funds continued to be immobilised in Government accounts at the Bank of England to a greater extent than is now customary, rather difficult conditions were experienced in the money market during the first part of the week. Special help had to be given to the market by way of official purchases of bills. The Bank return reflects the easing of the position which was becoming evident by Wednesday of this week. Bankers' deposits at £178,361,000 are £6,473,000 higher on the week. The main counterpart to this movement is a rise of £4,140,000 in Government securities. Another small helpful factor has been the continued reflooding of currency from circulation, the notes in issue being £2,507,000 down on the week.

MONEY RATES, LONDON.—The following rates remained unchanged between August 17th and August 24th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, 1%. Discount deposit at call, ½%; at notice, ¾%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between August 17th and August 24th (Figures in brackets are par of exchange).

United States. \$ (4.86) 4-02½-03½; mail transfers 4-02½-03½. **Canada** \$ (4.86) 4-43-47; mail transfers 4-43-47. **France** (25.22) 17-30-40. **French Empire.** Francs 1971-2001. **Switzerland.** Francs (25.22) 17-30-40. **Belgian Empire.** Francs 1971-2001. **Syria.** P. 8-81-85. **Sweden.** Krona (18.159) T.T. 16-85-95. **Dutch West India.** Florin (12.11) 7-56-62. **Portugal.** Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. **Panama.** \$4-02-04; mail transfers 4-02-04. **Brazil.** 83-64½ cr. GOVERNMENT RETURNS

For the week ended August 19, 1944, total ordinary revenue was £51,969,000, against ordinary expenditure of £110,032,000 and issues to sinking funds of £100,000. Thus, including sinking fund allocations £3,480,239, the deficit accrued since April 1st is £1,244,759,000 against £1,272,104,000 for the corresponding period a year ago.

Total	609,709	224,784	228,593	113,229	112,282

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £113,361 to £2,628,280, the other operations for the week (no longer shown separately) raised the gross National Debt by £59,985,551 to £20,824 million.

Churchill's "simple, practical" definitions—concrete rather than abstract, human and real rather than academic—are timely and penetrating. They go to the heart of Europe's terrible experiences and to the root of our own more fortunate lot. Properly employed, they can bring a new hope and inspiration to millions, and prevent the beaten enemy from being able to prolong the fight indefinitely in the tangled undergrowth of war-mauled Europe. These Seven Points are the message and inspiration that we can bring to an enslaved continent.

The time has come—indeed it is overdue—when politics must be brought in to secure the ultimate victory and the lasting peace that success in battle can alone make possible, but can never gain. For the Nazis and fascists, in their turn, are going to ground. That is the meaning of the French civilian snipers in Notre Dame. That is the meaning of the bitter defence, after disaster, of SS troops. That is one reason why the Allied leaders will not forecast an early end to the fighting. A resolve has been made by the Nazis, to be binding on all Germans, to continue the struggle after the military defeat. The probable return—from all present signs, and in spite of other, more authoritarian tendencies—of the mass of Frenchmen to sober republicanism is encouraging evidence of the resistance there will be to the fascist resisters. But elsewhere in Europe there may be both anarchy and chaos.

The wheel is turning full circle; as the Allied armies move forward, the Nazis hope, when the worst comes to the worst, to carry on their evil work by becoming, as they were twenty years ago, an underground and gangster movement. Their setting now, as then, will be the aftermath of war; but this time it is the aftermath of confusion and desolation that they themselves, as brief conquerors and controllers, have contrived. A shattered Europe of wandering, homeless and masterless men is the surrounding that they have made for their escape and survival.

These Nazis seek an endless series of rearguard and guerilla actions, long after the war has been won by the Allies, in every demoralised city of Europe. They want to drag with them in this ceaseless civil war many hopeless thousands, not only of their own people, but of those they have driven half-mad and wholly desperate. Even in their armies there is collected a polyglot host of peoples. It is to the bewildered, rootless people, uprooted by them, that the Nazis look, in Germany and other countries, to bring down Europe in ruins in face of the Allied triumph in battle. With the military war already decided, however hard and costly the final clashes, it is this political war—without-end that the Allies must at all costs stop if their battle honours are not to be barren. To purge Europe from "the foul German taint," as Mr Churchill put it, means winning these political battles as well.

The temptation to regard the present Allied supremacy in arms as sufficient for victory has been strong and natural. No amount of desperate, last-ditch resistance by German troops in French garrisons, on the rivers of France or, soon, on German soil can stay the Allied advance. There will be power enough in the Allied armies both to destroy the organised will to resist and, when the Reich is reached, to police the Nazi-made "bad lands" with a ruthless hand. The soldiers may, and do, expect protracted defence and prolonged fighting, perhaps, until long past twelve o'clock. But they are confident in the strength of their big battalions.

The big battalions will indeed be needed to burn out the poison. This unholy resistance movement must be put down, as the lawless Nazi revolution unhappily was not, by all the force of civilised justice. But the conditions in which that lawlessness thrives must be ended also. Coercion alone, implacable though it must be where necessary, will not save Europe. Europe—not Germany only, but many men in many countries—is under a spell. Force by itself will not break that spell, though it will not be broken without force. There is needed also light and leading to bring fresh hope to those Europeans who have been brought by the horror and debasement of these past

years terribly close to the status of Milton's "hapless, helpless herd."

The demand for a full use of political warfare against the enemy in this final phase of the war is not new—nor, in official circles, has it been popular. Its unpopularity has been due to the belief that any attempt to weaken the enemy's will to resist, by political means, must weaken both the military effort of the Allies and their determination not to be cheated of the victory that escaped them last time. To deliver the knock-out blow in an unmistakable fashion has come to be seen as an end in itself. The knock-out blow must be complete and, militarily, it is now assured. But it is only one means even to victory. The real argument for a political approach to the problem of Germany and Nazi-soiled Europe is precisely that, unless military victory can be accompanied by a corresponding political victory, the Allies will, after all, be cheated. This is, in effect, what the Prime Minister himself has now announced in his statement of aims in Italy.

*

It is a war of liberation that we are fighting, not a war of conquest. The criterion of the Allied victory will be the extent to which all Europe can be rid of both the totalitarian nightmare and the social and political strains that permitted this nightmare to become real and menace the world. We have to finish, not only a war, but a civil war as well. We have not only to get rid of the Nazis, but also to assist and lead in the task of ridding Europe, to which we belong, of poverty and unemployment. We have not only to put an end to the brute force, bad faith and intolerance of the enemy, but also to aid in the rebuilding of liberty and the rule of law, and to make our frank contribution to the setting-up in Europe of governments that will observe these freedoms—which is fundamental—and, at the same time, be strong enough and efficient enough to deal successfully with modern social and economic tasks—which is fundamental also.

It cannot do harm to the Allied cause, or delay the victory, for use to tell, not only the Italians, but all the peoples of Europe, and especially the Germans themselves, where and how we differ from the Nazis: that neither force nor fraud are our ways, even when our strength is triumphant and overwhelming; and that the aim of the liberation which our armies bring is the liberty that has been the basis of our strength. If, instead, we simply say "All Germans are Nazis"—which for to-day and yesterday is no doubt, to all intents and purposes, true—then it will be so tomorrow. There must indeed be no tenderness or "soft words" for Germany. No penalty can be too harsh for the crowded list of German war criminals, no restraint or tutelage too rigorous for this thrice-offending nation. There must be complete disarmament and an absolute surety that it will not be possible for the Germans to make war again against their neighbours. The only obvious limit upon the hardness of the peace—and it may prove to be a definitely restraining one—is that it must be such a settlement that its guarantors will be willing and able to enforce, or fight for it, in future years. But if there is a cure for Germans, it must be by the way of individual freedom which the Nazis have deliberately destroyed. Mr Churchill's Seven Points have a universal application. We cannot say, in this country or that, "Evil be thou our good."

A great part of Europe—most of all the enemy peoples which have earned their stern and righteous punishment—is submerged in despair; there is the platform for the continuing civil war and the Nazi resistance movement. Our aim is to end that civil war and to break that resistance. It can only be done, not by force of arms alone, but by the hope we bring. The hopelessness of Europe was the breeding ground of Fascists and Nazis; it can still sustain them. It can be the biggest obstacle to the real achievement of the victory that is being won in the field. Mr Churchill has done more than well to draw upon the reserves of democratic hope for the final assault. His Seven Points should now be noised abroad

The Balkan Mosaic

At a stroke, the Soviet advance from Bessarabia has upset the whole military and political structure of the Balkans and cut the ground from under German strategy in South-East Europe. The appearance of General Malinovsky's and General Tolbukhin's soldiers in Jassy and Kishinev was the signal for King Michael's *coup d'état* on August 23rd. Three days later, the Bulgarian Government, in order to assert its "full neutrality," presented an ultimatum to Hitler asking for the immediate withdrawal of German troops from Bulgaria.

To this double challenge from the satellites, until lately so obedient and subservient, Hitler has been unable to give any effective reply. A year ago, when Marshal Badoglio signed the armistice with the Allies, the German army was capable of a quick and effective reaction: lightning, the whole of Italy was occupied. Since then, German propaganda has pointed out "the lesson of Italy" to all satellites suspected of vacillation or of a propensity to seek "re-insurance." For some time the fate of Italy was a deterrent to all those who contemplated, in Goebbels' words, "jumping off the moving train." Events in Rumania and Bulgaria have now shown that jumping has become quite remarkably safe.

The military consequences of Rumania's defection showed themselves immediately after the coup in Bucharest. Even before, the advance of General Tolbukhin's and General Malinovsky's armies had shown the marked Russian superiority over the combined German and Rumanian forces. Now the advance has gained extraordinary momentum. In a week the Russians have forced the Galatz-Focsani gap, captured Buzau and occupied the oilfields of Ploesti. On the Black Sea coast, they have landed at Constanza, barely thirty miles from the 1940 frontier between Rumania and Bulgaria. Soon they will be wheeling south-westwards along the Danube towards the Iron Gate, from which they can reach out for Belgrade, and strike into the Banat and the vast plain of Hungary. At the same time, the German divisions in Northern Rumania are fighting with their backs to the Carpathians; behind them the Rumanians hold the passes that lead into Hungary from the east. It is an ironical reflection on the decline of German might that it should be the shoddy and inefficient Rumanian army which has now become capable of such "dynamic" moves against its erstwhile Ally and master.

The military consequences of Bulgaria's change of front have so far been less spectacular; and the Russians have questioned its genuineness. Even so, the stated decision of the Sofia Government to disarm and intern all German soldiers that cross the Bulgarian frontier represented a shrewd threat to the Wehrmacht. The German divisions in south-eastern Rumania can no longer be saved

by a retreat southwards. The occupying forces in Greece are left with only one line of communication with the Reich, the line along the Vardar and Morava that connects Salonika with Belgrade. The withdrawal of the Bulgarian occupying forces from Yugoslavia—and, inevitably, also from Greek territory—is bound to put an unbearable strain upon the German garrisons there. Plain military logic would seem to dictate a prompt evacuation by the Wehrmacht of Greece at least. This would be the only way in which the German Command could possibly save some precious divisions for the defence of the gateways to the Hungarian plain. But it seems more likely that Hitler, in his now familiar fashion, will leave his isolated outposts in Greece to certain doom.

But Bulgaria is not to be allowed to buy herself off even with "full neutrality," and the barring-out of the Germans. Inevitably, the frontiers of Bulgaria must also be opened to the Russians. General Malinovsky's columns may soon drive through the Bulgarian mountains and descend upon the Aegean coasts or join hands with Marshal Tito's partisans. The formidable barriers of these mountains, which until quite recently filled the military experts with the same awe as once did the Maginot Line or the Atlantic Wall, have suddenly, by the shifts of politics, lost all their strategic value.

*

Germany has virtually lost the Battle of the Balkans to a combination of Russian strategy and Soviet political warfare. Rumania was encouraged to break with Germany by Mr Molotov's statement that, after the incorporation of Bessarabia and Bukovina, Russia has neither any further territorial demands on Rumania nor any intention of interfering in the social and political life of the country. M. Tilea, former Rumanian Minister in London, has now disclosed that the Russians would have had no objection to concluding the armistice with the "Conducator" Antonescu himself. But Antonescu tried to bargain for an "unoccupied zone" that would not become a theatre of war. Militarily, this was an impossible demand; and so Antonescu had to go.

In addition, the Russians have held out the promise of reversing the Vienna Award of 1940 and restoring the Transylvanian lands to Rumania. In the eyes of the Rumanians, the surrender to the Allies, so far from being an act of unconditional humiliation, has become an act of national *revanche* on Hungary. In line with Russian tradition, the Soviet armies have appeared in the Danube Valley as liberators, while King Michael and General Senatescu, having written off Bessarabia and Bukovina, now wish apparently to conjure back the memories of

1877 (when the Rumanians helped the Russians in the famous siege of Plevna) and to the Russo-Rumanian friendship of the last war. It is in this way that they hope to redeem their country from its aggression against Russia and from the crimes committed by the Rumanian soldateska in Transdnistria.

*

The radical change in Rumania contrasts with the dilatory politics of the Bulgarian Government. The rulers of Bulgaria did not apparently expect the Rumanian *volte face*. Until it occurred they acted under the illusion that the key to the Balkan situation, now as in 1918, lay in their hands.

They hoped to be able to sell that key to the Allies at a high price. On the eve of the coup in Bucharest, the Bulgarian Foreign Minister, Draganov, was still restating the principles of his foreign policy in familiar revisionist terms. His tirades against the Treaty of Neuilly were demonstratively applauded by the Sobranye. Peace feelers to the Allies were accompanied by a loud and impudent clamour for the retention by Bulgaria of its "access to the Aegean" (that is, of Western Thrace grabbed from Greece), as well as of southern Dobruja, acquired from Rumania under the Vienna Award.

In staging this campaign the rulers in Sofia presumably hoped to capitalise their somewhat spurious neutrality towards Russia. They may even have recalled the precedent of the Treaty of San Stefano, concluded in 1878, when Russian policy, dominated by Pan-Slav motive, favoured, and secured, "Great Bulgaria" at the expense of its other Slav ally, the Serbs—only to be undone in the Berlin settlement. This time, the territorial claims so insolently put out from Sofia have brought forth sharp rejoinders from Bulgaria's neighbours. Public opinion in Turkey has been alarmed; and the Greeks have replied with an official demand for the Greek control over the Bulgarian passes that lead into Northern Greece, as well as for a total occupation of Bulgaria by Allied forces. Bagryanov's Government has, in effect, compromised its position to such an extent that a reshuffle, if not a total change, of the Government in Sofia is now a precondition for the signing of an armistice.

This belated outburst of Bulgarian revisionism might be regarded as merely a grotesque episode, were it not for the fact that it has thrown some light on the awkward and incoherent Balkan mosaic of states and nationalities as it is emerging from German servitude. The old scene has not changed; the component parts of the mosaic are not very likely to fit better or more smoothly now than before the war. From the Carpathians to the Aegean coast and from the Black Sea to the Adriatic, inveterate territorial disputes and nationalist feuds, all familiar,

already threaten to frustrate the approaching peace. The experience of a whole century of recurrent eastern crises, wars and slaughters goes to prove that not one of those disputes can be really settled, if the solution is to be sought on traditional lines and if each of the fragments of the Balkan mosaic is to aspire to complete independence and sovereignty. In an atmosphere of heated nationalism, the Balkan powder barrel is bound to blow up soon after the last shots of the Second World War have been fired.

*

The redeeming feature of the situation is the collapse of the dictatorship of those corrupt and narrow-minded soldateskas under which all the Balkan countries lived before the war. Almost everywhere in the Balkans new Governments, based on popular resistance to the Nazi Order, have come, or are coming, into being. Almost everywhere, those Governments are broad Coalitions of National Union, with the Communists strongly represented. After the last war it was the radical peasant leaders, Stamboulisky and Raditch, the moderate Maniu and the liberal Venizelos, who spoke on behalf of the Balkan peoples. Their place has now been taken by Marshal Tito, M. Papandreou and the leaders of the EAM, by M. Maniu (once again) and his Left colleagues in the new Rumanian Government. A reshuffle of the Government in Sofia would probably see the return of M. Dimitrov to a prominent rôle in Bulgaria's political life. Whatever the weaknesses of those new Governments there is at least the chance that they may be less obsessed by narrow parochial interests than were their dictatorial predecessors, and that they may perhaps be able to act as unifying—and not disruptive—factors in Balkan politics.

But the spokesmen of the new era in the Balkans will have to struggle with very formidable difficulties. The short-lived experiment in popular government in the Balkans after the last war failed lamentably for two chief reasons. The peasantry of those countries continued to live in utter poverty; the absence of economic security accounted largely for the triumphs of political insanity. And the Balkans continued to be the scene of intense rivalry between the Great Powers, a rivalry which in the thirties led to the virtual economic conquest of the Balkans by the Third Reich, bringing its own Greek gifts of assured trade and industrialisation. After this war, German and Italian influence in the Balkans will have passed away—for a time, at least. Will the Allies be capable of filling the gap by constructive co-operation for the benefit of the Balkan peoples? Will they be immune from the folly of the old wild scramble for exclusive spheres of interest? It is upon the replies to these questions that the economic welfare and the political stability of the liberated Balkans will to a large extent depend.

A Policy of Wealth—III

The Supply of Capital

THE two preceding articles in this series have not only set up the target of a doubling of the national productivity within a generation—that is, an increase of 2½ per cent per annum in average output per man-hour—but have found the chief means to such an end to be a rapid increase in the productive equipment of the community. This article begins the discussion of how the formation of capital can be speeded up. There are only two methods by which a nation can increase its capital equipment, and since one of them, foreign borrowing, is out of the question for Great Britain, the full reliance must be on the other, on saving. What is meant is, of course, real saving—that is, a decision by the community to consume less than the whole of its output, so that resources can be devoted to making capital goods—but it expresses itself in money form. Indeed, in a modern community, those who save do so in money, and the largely different set of persons who place the orders for the

capital goods have to possess themselves, by some means or other, of the money necessary to cover the cost of those capital goods. The familiar modern doctrine finds in these transactions the roots of many of the economic disorders of the community.

The first question to be asked is, therefore, whether the speeding up of capital formation is impeded by any lack of money savings, or by any diversion of them to ends other than the creation of productive equipment, or by any failure of the financial mechanism to place them at the disposal of industry. Is there an adequate supply of money capital?

It is easy to imagine circumstances in which a country such as Great Britain would not be saving enough to meet its requirements for capital—the easier because the circumstances of war are closely analogous. But it is certainly not true that there has been any shortage of savings in peacetime. On the contrary, the major economic pre-

occupation, as all the world knows, has been the constant tendency of the volume of savings to outrun the employment of them and thus to produce general unemployment. The volume of capital formation has, indeed, been lamentably small. In 1938, it amounted to only £250 million out of a net national income of £4,604 million—that is, a proportion of only 5½ per cent. But there is no evidence that this result was produced by a shortage in the supply of savings. What the position will be after the war is not easy to forecast. On the one hand, the wartime redistribution of incomes (after tax) has been heavily in favour of the poor and against the saving classes; if this is perpetuated in any degree (as is likely), it will tend to reduce the supply of savings. But, on the other hand, the increase in employment from 87 per cent of the insured population (the 1938 figure) to, say, 95 per cent would be likely to result in a more than proportionate increase in savings. And it may be that some of the victories achieved by the Savings Campaign will turn out to be permanent. On balance, the nation seems likely to be willing to save, after the war, at least as high a proportion of its income as before the war. Whether this will be enough depends upon how much is needed, which is the subject of this whole enquiry. But at least there should be room for some increase in the use of savings. If the supply of savings may be the limiting factor in the future, it has certainly not been in the past, and the future limit is not so close that a beginning with the process of expansion could not be made.

*

Another possible obstruction may be that, out of the total of capital formation, too high a proportion may go to forms that do not increase productivity and too little into productive equipment. The building of dwelling houses, for example, is a form of capital formation. It is certainly desirable, and it certainly increases the welfare of the community. But it does not increase productive capacity. If a worker is provided with a new machine tool, he can produce more next year than this year; if he is provided with a new house, this does not follow. This is not to say that house building is wasteful or undesirable or unnecessary; but it is to say that a community bent on increasing its wealth-producing capacity must take care to see, not only that its annual volume of savings is adequate, and not only that the whole of it is used for some variety of capital formation, but also that a sufficiently large proportion of this capital formation is in forms that increase the national productivity.

The position in 1938 is shown by the following figures taken from this year's Budget White Paper:

	£ Million.
Private Net Investment at Home:	
Fixed Capital, Works, etc.:—	
Public Utilities	65
Other—	
Buildings	255
Plant and machinery	20
Other fixed capital	10
Change in value of stocks, etc.	—45
Total private net investment at home	305
Private and public net investment abroad	—55
Total	250

(N.B.—Net investment at home by public authorities other than the Post Office and the housing and trading services of local authorities is excluded.)

The position thus revealed can hardly be called satisfactory. The total of £250 million is small relatively to the national income. But of this total, by far the greater part went into buildings, and of that in its turn by far the greater part, by common knowledge, went into residential building. The figure of £20 million spent on plant and machinery by all industries other than the public utilities—or £85 million if the whole net investment of the utilities is included—is quite shockingly small. The total of productive investment, in the sense that has been used in this article, cannot have been, all told, more than about £125 million, after allowing for the negative figure

for overseas investment (which is productive, since the interest on foreign investment can only be paid in goods, which add to the consumable income of the community). The national income of previous generations had not accumulated a large amount of equipment for us to use. Yet the national income in 1938, for all its wealth, provided less than 3 per cent of its income for the purpose of continuing the process.

This was the position before the war. But it would be a mistake to assume that the productive investment was shouldered out of the queue by other forms, and prevented from getting the supplies of capital it needed. There were issues before the war, but it had no restrictive effect on the supply of capital for productive investment; on the contrary, the Government's activities in guaranteeing public utility loans increased the amount of productive investment in the London area can be so described. If there had been so easy to keep interest rates down, the obvious fact is that productive investment would not have been out of the queue because there was no queue. In general, the capital market was a buyers'—that is, borrowers'—market.

It is not quite so certain that the same will be true after the war. Very large prospective demands for capital, with the priority demands of investment that are necessary to increase the productive capacity and desirable, but domestic housing is again the leader. of the country—this will have to be watched with great care.

Another possible explanation of the low level of productive investment is that, in spite of the ample funds awaiting investment, the would-be venturer is prevented, by defects in the financial mechanism, from getting at them. The Macmillan Committee found that there was a "gap" in the machinery of the capital market and that small industry had a difficulty in getting medium-term loans. This may be true—though those whose interest it would be to make such loans have never been able to find much demand for them. It is much more likely to be true that the small businessman has difficulty in finding money into his business not as a creditor but as an equity holder. These are interesting questions which deserve fuller treatment. But it is very difficult to believe that their quantitative importance is enough to have much influence on the general level of productive investment. Their relevance is more to the necessity for seeing that the small business gets its fair share of the total of investment than to the size of that total. In general, the machinery of the market is adequate to put those needing capital in touch with those reeding investment. Indeed, it is a familiar complaint that the market periodically overplays its hand when the prospects for investment are good.

*

"When the prospects for investment are good"—therein lies the key to the whole matter. For the basic explanation of the low level of productive investment is not in any deficiency of savings or defects of machinery, but simply in the fact that industry has not desired to increase its scale of capital formation. And the basic reason for that, in its turn, is that the prospects for increased investment did not seem good enough.

Why? The greater part of the remaining articles of this series will be concerned with the attempt to answer that question. But one of the more obvious answers can be dealt with at once. This is the answer, which every businessman will give, "because of high taxation." In the sense in which it is usual meant—that is, that a high income tax reduces the yield on investment—there is probably not very much in it. Most business calculations are relative to a universal income tax affects all way or in that?—

alike. It is, in fact, to the gross yield that the businessman usually looks. Nevertheless, there are some ways in which taxation reduces the rate of investment—or at least some ways in which relief from taxation could be used to stimulate the formation of capital. The effect of an inadequacy of depreciation allowances has been much discussed in recent months, and needs no more mention here than to say that the concessions announced by the Chancellor of the Exchequer in April are by no means the subject of relieving the industry of taxation on any expenditure incurred in the upkeep of its existing capital. Clearly, the more fully the maintenance of capital is provided for, the greater will be the willingness to bring it into existence. Beyond that, it has frequently been suggested that there should be some tax relief for profits retained in the business and “ploughed back” into additional productive equipment. There are a number of difficult questions of abstract equity involved in such a proposal, but if the test is pragmatic the verdict must be favourable: tax relief given in this way would certainly and directly result in a substantial volume of productive investment. Indeed, following the pragmatic argument further, it might be held that there should be some relief of taxation on the yield, in the early years, of all investment in new productive capital. Social justice requires heavy taxation on rich individuals; but it is most important that, in the process of achieving this, taxation should not impede, or fail to encourage, the

accumulation of capital, on which social wealth depends. It can never be a sound fiscal policy to impede the growth of taxable capacity. There is a fruitful field here for the fullest enquiry.

Taxation could, and should, be used as a lever to secure that the savings of the community are transmuted into the quickest possible increase in the national dividend. But a lever requires a fulcrum and the fulcrum on which taxation works is profits. If investment in productive capital does not yield an adequate return, then no concessions that the tax gatherer may make on the disposal of the product will have much effect. If the owner of the capital cannot afford to replace it when it is obsolete, no increase in depreciation allowances will encourage him to do so. No tax relief on profits “ploughed back” will avail if there are no profits to plough back. The inadequate level of productive investment in Great Britain may be partly due to defects in the system of taxes; it is partly due, no doubt, to myopic vision among managements; but in the main it is due to the fact that investment in additional productive equipment cannot be relied upon to pay.

We must, therefore, turn to the reasons why this should be so. And the first line of enquiry must be to ask whether any change in the structure of British industry would be likely to make investment pay better or, alternatively, to induce the managers of industry to disregard the prospects of profit. This will be the subject of the next article.

NOTES OF THE WEEK

Demobilisation

It was the best of news when, a few days ago, it was widely reported that Mr Bevin had prepared, and was putting into operation, his programme for the release of men from the Forces when the fighting finishes. Unfortunately, the Minister of Labour has found it necessary to deny these reports. It is true that his denial is specifically of the details of the demobilisation scheme which had been reported, rather than of the suggestion that such a scheme already exists. On the other hand, his statement that the problems of demobilisation are still being examined and worked upon inevitably creates the impression that no final scheme has yet been prepared. If this is so, then this is a matter for considerable alarm and responsibility. To say this is not to take for granted that the war will end in a matter of weeks. Even if there is to be a winter campaign and many more months of war, it is important that the actual programme of demobilisation should have been decided upon now, for it is the view of the highest military authorities that it will take at least six months to translate any scheme of release into a practicable operation in terms of Service records and administrative preparedness. It is plain what the broad outlines of any demobilisation programme must be. The only possible criterion—in the eyes of the men themselves, whose views must count for most—for keeping men under arms is military need. Those men whose services will no longer be required when the war in Europe is won will expect, rightly, to be freed as soon as possible; they joined to serve, not to stand and wait. This means that the first step must be to decide what categories of men and what formations will be required after the war in Europe for service in the Far East or for occupation and police duties in Europe and elsewhere. The second decision, which ought also to have been made already, is the order in which those who will no longer be wanted can be released. This cannot be made dependent, as some have suggested, merely upon the time-table of industrial needs for particular kinds of workers. Obviously, at this stage, the popular principle of “first in, first out,” weighted to some extent by age and family responsibilities, must be applied as far as is practicable. Even so, there must be exceptions to this general rule in the interests of the men themselves. One exception which is very evidently necessary is, for instance, the early release of building labour. This will be essential, if only because the first requirement of the men when they come home will be a home; and there is already the possibility of a desperate short-term scarcity of accommodation. No exceptions, however necessary, will be popular; and it is all the more necessary, therefore, not only for the programme to be

settled, but also for both its principles and its details to be made known and explained to the men concerned. At present there is a very dangerous atmosphere of uncertainty about the whole of this matter, which more than anything else is uppermost in the minds of the men in uniform.

The Need for Houses

Nothing is more likely to cause trouble when demobilisation begins than a shortage of places for the reunited families to live in; and, with the present hold-up of both the Temporary Housing and Planning Bills, nothing is more likely to happen, unless a new urgency inspires the approach of Ministers, MPs and local authorities to these tasks. Both Bills could no doubt be much better, and both call in any case for additions and changes in detail. But the paramount need is for both to be passed into law as soon as Parliament meets again, so that the sites for the houses can be made ready at once. Nor is it only the sites that should now be prepared. It has been officially stated that cuts in war production are being carried out, and it is well known that the building programme for both British and American Forces in this country was virtually completed many months ago. If there is to be any chance at all of meeting the demand for houses when the war ends and the scattered families reassemble, work on the actual dwellings must begin also—in the factories, the assembly shops and on the sites themselves. There is little or no case for civilian production while war needs persist; but the need for homes for returning soldiers and war workers, when they are released, is itself a war requirement.

Freedom in Paris

Paris has lived through great and historic days. After three or four days' fighting, the city was liberated. On Friday, August 25th—a memorable date—the German garrison in the city surrendered to the French Forces of the Interior. The nightmare of occupation passed and the humiliation of four long years of servitude was suddenly removed. On Saturday morning last week, the people of Paris awakened to find that they had regained freedom. The deeply-rooted urge to celebrate the great moments in their national life on the streets and squares of the capital brought hundreds of thousands of Parisians out for huge mass demonstrations and processions. Paris greeted General de Gaulle, the symbol of French resis-

tance, the man who in June, 1940, proclaimed that France had lost a battle but not the war, with a joy and a gratitude which only very few leaders and statesmen have ever been received. For years Vichy propaganda labelled the General as a “traitor,” an “outcast,” or “a British agent.” But none of this propaganda stayed the Parisian enthusiasm. This enthusiasm was disturbed by sniping in the streets and by a dramatic fusillade inside Notre Dame. But the sniping and the shooting were not so surprising as the speed with which calm and order returned to the city. That fanatics from Darnand's militia or Doriot's organisations—or real, live Germans—should have tried their hand at provoking civil war was only too natural. This was the last miserable rearguard action of the “*Revolucion Nationale*” in Paris. It has added a number of victims to France's and freedom's list of casualties. But it did nothing to hinder France's majestic march towards her new destinies.

Back to Work

Paris has gone back to “normal.” The strike of the workers has ended; and so has the strike of the Parisian police which, curiously enough, was the prelude to the patriotic rising. The picture of the French capital is not very different from what could be expected. Food in the luxurious hotels is plentiful and the black markets flourish. The ordinary Parisian, however, received the first meat ration since the liberation of the city on Tuesday—half a kilo of horse-flesh per week. British food lorries have appeared in the Halles; and the supplying of the capital by the Allies seems to be going well and “according to plan.” The administration of the French Provisional Government is taking the first steps to organise new life in the city. Paris has been speedily transferred from American to French military administration, and General Koenig is the Military Governor of the capital. The civilian authorities have started to scrap the legacy of Vichy. The punishment of industrial collaborators “who have profited from France's defeat” has been officially fore-shadowed; and the *Comité d'Organisation Industrielle*, the chief instrument for industrial collaboration, has been disbanded. Appeals have been issued to the farmers and to provincial authorities to supply the French towns with food and to build up stocks. Otherwise, few concrete economic measures seem to have been taken so far. No doubt it will take time before the turmoil is entirely over and the new administration settles down to work. Meanwhile, the main preoccupations are military and political. The leaders of the Resistance have come into the open; France learns the names of her new men. The people's anger against collaborators and traitors is being kept under control; and the first steps are being taken to turn some units of the French Forces of the Interior into regular army detachments. But a tremendous work of political renovation and economic reconstruction lies ahead, and it has still to be started.

Belgian Hopes and Difficulties

The continued progress of Allied armies in France and the liberation of Paris, as well as a letter of encouragement to the resistance groups by General Eisenhower, have given Belgians the hope that their liberation may happen soon. A noticeable increase in the activities of the Underground movement, armed and unarmed, has been admitted by the official German news. A few days ago the communiqué of the High Command of the Wehrmacht reported for the first time that a number of French and Belgian “terrorists” had been killed in fighting. The clergy, and particularly the lower grades of the civil and local administration, have become bolder. The liberation of Paris caused a considerable stir at the Brusse's Bourse. The totalitarian “Workers' Union” set up under Nazi patronage complains about workers who still pay contributions to the so-called “Black Trade Unions.” The list of attacked and assassinated quisling Burgomasters is growing. The Underground press is more insistent than ever on the fact that a number of industrialists and the higher grades of the Civil Service have been the chief collaborators. It is, however, doubtful whether all the different groups of the Underground movement, and particularly the armed resistance movement, have reached the remarkable degree of unity shown in France. On the face of it, the armed resistance movement is still mainly recruited in Belgium from those who resist

deportation to forced labour in Germany; and the armies activities of the diff still too far away to weld together the seems to have splintered groups. Much of the activity, which cerned with the racead lately to railwaymen, is still con- for foodstuffs. But liding of offices for food cards and even Belgian people hav there is no doubt that the mass of the liberation. It is ne been gripped by the prospect of early Belgians bolder. Apot only this hope that has made the in the general situother cause is a considerable worsening coastal districts as tion in Belgium. The flooding of the many families of an anti-invasion preparation has robbed many Belgian towneir homes. The continued bombing of transport difficulties by the Allied air forces has created sation in Germany. In addition, the so-called total mobili- German administrat has had its effect in the attempt by the for forced labour tion to accelerate the call-up of Belgians there has been a sin Germany. Since the end of April most important footradual reduction in the rations of the reduced from 10.6dstuffs. The daily bread ration has been ration is 12.4 ounces ounces to 8.8 ounces. The total fat and the potato and a month, against 17.6 ounces in April; thirds of the April cheese rations have been fixed at two- have been adversely May rations. Milk production seems to lands, which have affected by the flooding of the coastal year's crop of oilse the richest pastures. In addition, this generally speaking, eds will be smaller than expected, and, Most important of harvest prospects are only moderate. made farmers relucall, the hope that liberation is near has official programme; tant to continue deliveries under the requisitioned the farand, here and there, the Germans have harvesting extremelymers' horses and wagons, which makes difficult.

The Western Front

The stir caused by the liberation of Paris grows fainter with the distance of the occupied countries from France. The geographical of the occupied countries from France. different reactions. Distance is not the only cause of the Nazi occupation havNational traditions and the methods of e their effect. Holland, with her coastal

LANCHESTER

THE LANCHESTER MOTO COMPANY LTD. LONDON AND COVENTRY

provinces flooded and with a long frontiers with Germany, has shown elation and new confidence in an early defeat of Germany. There is no open sign so far that the activities of the Underground movement have increased at all considerably. But a steady number of executions reported by the controlled press shows that the army of occupation demands still more labour, and special guards have been placed at frontier towns for the purpose of checking the evasion of compulsory work. In Denmark, as in Holland, the idea of a new European Order has been definitely replaced by the hope of early liberation, and the sabotage of public utilities seems to be on the increase. The recent successful strike in Copenhagen seems to have created a wave of strikes of various sizes in almost all the towns, and they usually seem to attain their object. The Nazi underground press maintains that the Nazis are pursuing a policy of underground provocation for the purpose of bringing the real Underground movement into the open on the anniversary of the resignation of the King and Government which took place on August 29, 1943. In Norway the situation seems to be extremely quiet. The large-scale theft of ration cards, the evasion of compulsory work, and acts of sabotage here and there, are not new activities for any German troops have been moved out of Norway. The number of German troops is still estimated at some 200,000 and German civilians are said to number at least 50,000. There is, however, no doubt that Norwegians intensely admire the French resistance movement, just as they fear the unhappy results of the early rising in Warsaw. The Norwegian Underground movement has warned the people against premature action. "Our country has waited for so long, it can wait a little longer now."

Food in Europe

Stories of the food convoys bound for Paris, "Vivres pour Paris" chalked on their sides, bringing the first signs of danger of famine in Paris and elsewhere in France has receded, are, fortunately, no longer supplied by the Allies may become the joker in the pack of political card-parties. As the battle-tasks of supervising the distribution of relief food will be transferred more and more completely from the military authorities to local officials acting under the provisional Government. There need be no dispute over the right of the de Gaulle administration, as the provisional rulers of liberated France, to distribute the food to Frenchmen. Their full responsibility will bring with it plenty of knocks to balance up the bouquets. This pattern of gradual and easy transfer will not, however, be reproduced in every country in Europe. In spite of the acknowledged responsibility of UNRRA to distribute supplies without racial, religious or political discrimination, the existent or potential political cleavages among some of the European nations will inevitably involve the Administration in problems of political choice. The situation in Poland is a case in point. It is not impossible that it may be repeated elsewhere. UNRRA in Poland will, according to its rules, have to act under the Soviet Supreme Command and to distribute its food through the National Committee of Liberation, thus putting into the hands of a rival organisation of great importance. To risk the multiplication of this situation in other European countries is to invite a repetition of the political pushing and shoving that happened over food relief after the last war. More clearly than ever, this illustrates the imperative need for united action among the Allies. Agreement on the recognised administration of countries soon to be liberated cannot, for this reason alone, be further delayed. With it, of course, must go whatever degree of assurance that the Government itself does not take political advantage of its responsibilities. It will be too late if the choice is left to the military commanders in the field, or to a functional organisation such as UNRRA, whose essential work can be both distorted and frustrated if a sure political foundation is not prepared for it.

European Agriculture

The most vital responsibility of UNRRA is food. The agricultural conference at its London headquarters

last week was concerned with the restoration of farm production in the various European countries rather than with direct relief. The scale on which bulk supplies of food-stuffs will be sent to Europe has not been revealed, but in the initial stages the only limit to assistance of this sort should be that set by shipping space. As regards the task of restoring European agriculture the detailed work of organisation is felt to be best left to the various Governments, with UNRRA acting mainly as a supply and advisory organisation. The supply of a limited range of modern equipment is absolutely vital for a speedy increase in productivity, and high on the list of priorities will be seed, cultivating instruments, fertilisers, and pest-control agents. Supplies are to be varied to suit the pre-war usages and present conditions of individual countries. The advisory work of UNRRA will include, besides the dissemination and fostering of scientific research, the re-establishment of international contacts and the setting of each country's economy against its European background. It is this last function which is still the weakest link in the chain. To get maximum production, it is clear that there must be some division of labour between the various European countries so that, over and above immediate local needs, each specialises in the products to which it is relatively best suited. Further, a balance must be struck between European and world economy—a point that has been little considered. In a starving world, short-term needs must necessarily restrict a policy of full specialisation. But UNRRA's rôle should not be envisaged as one of supplying the minimum of food needed to keep Europe alive, and meanwhile fostering a rough self-sufficiency within each country. It would be much better, to take one example, for western Europe to procure its grain and meat in bulk from the American continent—if necessary, on favourable credit terms—while it builds up its livestock and dairying, rather than to be forced to fend for itself as quickly as possible. The co-ordination of world food production remains an urgent necessity.

Conditional Surrender

Mr Churchill's message to the people of Italy (discussed on page 305) was notable for the warmth of sentiment which the Prime Minister expressed towards a nation which last year was still a chief partner of the Axis. First-hand contacts have apparently persuaded the Prime Minister of the sincerity of pro-Allied feelings in Italy; and he has willingly surrendered to the Italian anti-Fascists, though by no means unconditionally. Though he does not absolve the Italian people from the record of Fascism, he nevertheless looks forward to the time when Italy "will resume her place among the leading Powers of Europe." It can be safely assumed that the Prime Minister's visit to Italy was used by all sorts of Italian pressure groups as an occasion to involve him in Italian domestic affairs. In particular, the Right Wing elements, who until recently were coalesced with Fascism, must have tried to impress "the leader of the British Tories" with the danger of internal revolution and the need for a strong, conservative Government to stave off that danger. It is from those quarters that alarming warnings against Bonomi, "the Italian Kerensky," have come, and attempts were made to reinstall Badoglio in power. Judged by his message, Mr Churchill has not only withstood the pressure, but he has persuaded himself of the futility of any attempt to reimpose compromised rulers on a reluctant people. The Prime Minister's emphatic exposition of the principles of freedom can probably be interpreted as an implied endorsement of the Bonomi regime. The important rider attached to that endorsement is his warning against "political excitement and the clash of many parties," an ailment to which Italian democracy has been more than prone.

Mobility of Industry

The Government's decision, noted in the White Paper on Employment Policy, to rechristen the depressed areas as "development areas" was generally accepted as a sign that the piecemeal pre-war attitude had been abandoned in favour of more positive measures for a better distribution of industry. Neither the details nor the framework of the policy have as yet been clarified, and at this stage it is impossible to say how far the proposed measures—such as priority in building materials and clearing of premises for formerly depressed areas, supervision over location and the "steering" of industry into the development areas—will be effective. It is, of course, an indisputable fact, as Mr Dalton

pointed out in the House of Commons' debate on the location of industry, that British industry "for good or ill is located already." Its mobility is limited by proximity to coal and other sources of raw materials, by railways and shipping, by the existing services and communications in industrial areas, by the size of productive units and in some cases by the conservatism or apathy of local employers and employees. But recently the number of factors favouring industrial mobility have been increasing. Electricity, road transport, the telephone, standardisation of parts, the increasing use of light metals, must all be taken into account.

The latest PEP broadsheet on "The Location of Employment" takes the view that, though certain industries and services will necessarily be rooted, these favourable factors will offset the limitations on mobility, and the range of mobile industries is likely to increase. The pamphlet approaches the problem of industrial location from a fresh angle, and lays emphasis on employment opportunities rather than on industrial location. It suggests that the proper distribution, rather than the dispersal, of industry should be the aim, and that areas or regions, rather than towns, should be regarded as "employment orbits." This would provide entrepreneurs with a wider choice of labour and with necessary links with services and other industries, while at the same time affording more scope and variety of employment to the local workers. There has often been a tendency to regard the introduction of light industries to the depressed areas as a universal panacea, irrespective of the type of employment provided, and the idea, as PEP points out, of artificially stimulating new industries in any particular South Wales valley, is far less sensible than schemes to improve transport facilities within the region, so that workers can travel to the most suitable centres of employment. General principles, however correct, are sometimes difficult to apply in practice, especially in such a complex matter as the location of industry. Their realisation depends perhaps less on Government action than on the co-operation of both sides of industry. Labour, as well as employers, must be ready to accept greater mobility. At the same time local authorities or planning bodies will have to discard parochialism and accept planning on a wider, regional basis than they have been willing to do in the past.

A Rural Scandal

The Women's Institutes have performed a valuable service in bringing to the public's attention some very disturbing facts about rural water supplies and sanitation. Most people know about the general lack of amenities, and the bad housing conditions in the countryside, but some of the unpalatable details disclosed in the Institutes' report of a survey of 3,500 villages in different parts of the country, would shock even the most complacent townspeople. The report makes no comments and draws no conclusions other than those of the countrywomen themselves, and is in consequence the more telling. A few examples, taken at random from a very long list, will show that bad conditions are not confined to any one part of the country. In Sheepscote, Gloucestershire, a number of wells have been tested and condemned, but there is no alternative water supply. Upham, Hampshire, has no water or drainage, and five out of its seven wells were condemned five years ago. At Clee St. Margaret, Shropshire, 56 householders have to carry their water more than 200 feet, and all but two houses have earth closets only. The thirty houses in Shottlegate, Derbyshire, share a pump, and all have earth closets. Two hundred and three out of 260 households in Hoghton, Lancashire, have only bucket lavatories. In Farley Hill, Berkshire, which has long paid water rates, 80 of the 100 householders carry their water up to a distance of half a mile. Twenty-six counties estimate that over half the number of houses surveyed have earth, bucket or chemical closets only. There have, of course, been improvements in rural workers' conditions between the two wars, but progress has been much too slow in relation to the advance of scientific and hygienic standards. In the light of conditions such as those described in the Women's Institute survey, it is hardly surprising that so many workers should have left the land to seek better-paid employment in more congenial and healthier surroundings.

New Brunswick Votes Liberal

Provincial elections in New Brunswick follow those in Saskatchewan, Ontario and Quebec. This time the Liberals, hitherto defeated, managed to win the election with 36 members returned out of a total of 48. The balance of seats was gained by the Progressive Conservatives, led by Mr Hugh Mackay, whose financial connections were strongly and critically played up in the Liberal campaign. New Brunswick being a small province—it returns only 11 members to the Federal House of Commons, numbering 245 seats—the significance of the Liberal victory is necessarily not so great as that of their defeat in the larger provinces. Moreover, the election was fought largely on local issues, in which the educational policy of the Liberal administration helped to win votes for Premier McNair. Further support came from the strongly Liberal French Canadian community in the north of the province. The Co-operative Commonwealth Federation, on the other hand, was unable to get even one of its 41 candidates elected, a fact which can be partially explained by the large agricultural nature of the electorate in a province of many small mixed and dairy farms.

Centralised Municipal Borrowing

To judge from a memorandum prepared by the Council of the Institute of Municipal Treasurers and Accountants, officials of the local authorities are not fully satisfied with the scheme of the Treasury for centralised borrowing by these bodies. The memorandum, which appears in the September issue of *Local Government Finance*, starts by emphasising the advantages which have been gained in the past by the practice of financing capital expenditure out of revenue to the greatest extent possible, and points out that the official scheme makes no reference to any means of finance other than borrowing. This subject, touched on in the White Paper on Employment Policy, is one which calls for amplification by the Treasury. The second point raised by the memorandum is that, while the case for centralised local borrowing immediately after the war is so strong as to be almost irresistible, great im-

In my Morris, on the highways and by-ways of Britain, I keep my appointments on time. Speed and power for all my needs, smartness and comfort that have outlasted five long years of war, reliability that has triumphed over war-time servicing—these my Morris still faithfully provides. When the post-war Morris comes along—more reliable than ever as it will be—we men-of-the-road will be among the first of the many waiting to own one.

MORRIS

... one of the fine cars
of the NUFFIELD ORGANIZATION

portance is attached to the undertaking of the Chancellor of the Exchequer that the suggested arrangement will be temporary. The Council expresses the view that competition for loans has played a large part in producing the present-day efficiency in loan and debt management, and is, evidently, very averse to any plan which would permanently remove the liberty of the authorities to borrow as and when they think fit, provided, of course, that the requisite "sanction" has been obtained. With these reservations, which are considerable, even crucial, the Council believes that this temporary scheme should benefit all local authorities, if it ensures "fair shares" to all concerned. It is, however, doubtful whether the Council's attitude squares with the ideas of the Treasury, or even whether it corresponds with the long-term requirements of the local situation. Provided the status of a local authority as a borrower is due solely to the relative efficiency of its financial officers, individual borrowing may be an excellent means of securing economies. But, insofar as its creditworthiness is affected by inherent local disabilities, which no amount of local efficiency can remove, some means must be found of overcoming these handicaps or else the additional cost of borrowing in these areas will become an added impediment to their recovery and adjustment after the war. It is the purpose of the centralised scheme to provide this means.

For the rest, this memorandum deals mainly with technical details of no great interest to the public or with ambiguities in the Government's proposals which call for elucidation. Among the latter the Council, very properly, asks that the provisions for borrowing should be sufficiently flexible to ensure that local authorities can raise money and repay debt, within certain general, national limitations, as and when it suits their convenience. Further, it is suggested that permission to borrow should automatically carry with it the right to obtain advances, and that the "exhaustive and onerous enquiries" at present made by the Public Works Loan Board should therefore no longer be necessary. Certainly one enquiry should suffice, but whether the Treasury will be prepared to shoulder the added responsibility of backing the loans without some additional control may very well be questioned.

Reparations

Mr. Charles Davila, former Roumanian Minister to the United States of America, said in New York at the time of the Roumanian surrender, that he had been informed that the terms of the surrender included the payment of a £150 million indemnity. By an odd coincidence Russia asked for exactly the same indemnity from Finland during the Finnish-Russian peace negotiations. It is interesting, and not unimportant, to inquire on what criteria these indemnities have been worked out. These indemnity demands by Russia, if in fact they have been made in these terms and amounts cannot be taken as an exact or approximate valuation of the damage inflicted by the Roumanian and Finnish armies. Eventually the Russians will be able to estimate the total damage done by their enemies, but the problem of distributing this damage between German, Finnish, Roumanian, Hungarian and Italian armies will hardly be soluble. Probably the Russian Government has provisionally fixed the indemnities to be paid by Roumania and later by Finland according to rough and ready principles, perhaps according to the productive capacity of the two countries, which is a complex of natural resources, manpower, plants, factories, communications, and the relations with other countries expressed by their respective foreign trades. If they are actual claims, they are based on ability to pay. Their economic importance can be seen from the fact that £150 million is roughly the equivalent of the total value of six years of Finnish exports and of five years of Roumanian exports. If the indemnities were to be paid out of the export surpluses of the two countries (again based on average surpluses over imports before the war) Finland would have to hand over its export surplus to Russia for 44 years and Roumania for at least 16 years. But both countries will have lost important districts after the war, which would decrease the likely export surpluses and therefore increase the time over which payments would have to be made. The problem actually goes deeper. If Russia, or any other victor, were to ask for the entire exports of Roumania and Finland, both countries would be unable to import the necessary machinery and manufactured articles for maintaining agriculture and industry. Some other country would have to supply these

materials on credit or would have to grant loans. If the payments were to be spread over a greater number of years according to the annual surpluses over imports there remains this further problem. Both the countries paid interest on foreign loans and investment and services by means of part of their export surpluses. Again some other country would have to provide loans or credits if these interest payments were to be continued. The pre-war trade of Finland with Russia was negligible. In 1938 imports from Russia amounted to 2.7 per cent of total imports, and exports to Russia to 1.6 per cent of total exports. Roumania's trade with Russia was proportionately even smaller. In other words, if the indemnities were to be paid by Roumania and Finland, international assistance would be necessary to enable the payments to be made. Russia could, of course, require payments in kind; but there again it would only be possible by direct requisitioning from a steadily declining national production. The Great Powers will have to consider with care and in great detail all the implications of this old and thorny reparations problem—and its relation to their own trade in investments.

Women Tories' Peace Plan

With the apostolic blessing of the Tory Reform Committee, a group of women of the Conservative Party have published their programme for post-war reconstruction under the title "When Peace Comes" (Conservative Women's Reform Group, 6d.). Under the leadership of Mrs Cazalet Keir, MP, the group of eight includes Miss Irene Ward, MP, Mrs Sybil Eccles and Miss Eleanor Plumer. Their plans are comprehensive, even if there is little in the way of original suggestions. As the programme is written "from the standpoint of women," emphasis is given to the need for equality between the sexes, both in political responsibility and in economic reward. A broad outline of policy is given for maintaining international security on the basis of the present military alliance and the development of functional co-operation. On other subjects—employment, health, housing, education, agriculture and the work of women at home, as part-time helpers and in full-time jobs—the group hold opinions of "enlightened reform," which nevertheless suggest the rather rarified and ladylike atmosphere of the tea-table. The aims and objects outlined in the pamphlet have no very real foundation in a comprehensive plan of national reorganisation that would be strong enough to avoid the major mistakes of the last post-war period. The foundations of the Tory Women's better world are no more clearly defined than "the Christian ideals of truth and goodness, spiritual freedom and brotherhood." It seems hard to criticise good intentions alone, but the real problems of reconstruction will probably need something more than pious hopes and gentle admonitions. Probably something more concrete will follow upon this beginning.

Aviation Anniversary

Twenty-five years ago the first British commercial air service was inaugurated; it provided an air link between London and Paris. The anniversary is appropriate. On the occasion of a celebration last Friday Sir Archibald Sinclair, Secretary of State for Air, recalled that it was also the first daily service in the world. Since, then, however, other countries have gone ahead and Britain has not kept its lead, either in the operation of air services or in the production of transport aircraft. Sir Archibald asserted that Britain means to keep its place in the first flight of international air transport. But there are serious doubts about the adequacy of the Government's preparations for effective participation in the world's air commerce after the war. The international framework for the world's air services remains yet to be built—and this limits what can be done. But, as the preparations made in the United States have shown, the lack of framework need not delay the formulation of plans for British participation and the development of the necessary machines. These are essential for a speedy take-off at the end of the war. Sir Archibald said that the time had now come when more resources could be devoted to preparations for civil aviation. Lord Brabazon, who, as the head of a committee charged with the duty of drawing up specifications for air transport machines, is familiar with the state of preparations, did not share Sir Archibald's optimism. He declared bluntly that Britain is far behind the United States in the development of civil aircraft, and strongly drew attention to the dangers of further procrastination.

Letters to the Editor

Terms for Germany

TO THE EDITOR OF THE ECONOMIST.

SIR,—*The Economist's* view of the ultimate results of terms for Germany are, of course, *The Economist's* views. They are not, however, demonstrably nor even necessarily accurate; and to say that the inclusion of "strong" territorial terms would ultimately and disastrously weaken the settlement is to make a statement which must be qualified by the words "in the view of *The Economist*."

The one factor which appears to be insufficiently weighed in the article which you recently published under the title which heads this letter is that of the German mentality as we know it; or perhaps I should say the mentality which has been clearly shown during the last thirty years to be shared by a very large majority of Germans. It is hardly useful to argue whether this mentality is, as Lord Vansittart appears to think, a racial characteristic of Germans, or whether it is an acquired characteristic resulting from generations of evil education imposed on a nation which is certainly prone to some sort of servility. The immediate result is the same, and I doubt whether any serious student of history would deny that the German nation at present, or a very large majority of it, is dangerous to the peace of the world and is likely to remain so even after defeat.

Those of us who believe this to be true are certainly entitled to say to *The Economist* that we believe its views, if acted upon, would lead to a situation of greater danger than the strong terms against which it argues. There is ample evidence that Weimar Germany was plotting revenge for the German defeat in the last War for all its camouflage of Democracy. In a matter of opinion, then, we are entitled to adapt your own words, and to say that "weak" territorial terms would ultimately and disastrously weaken the settlement, because it would leave the central corpus of Germany too strong.

We went to war for Poland. Circumstances over which we certainly have no control will result in our being unable to honour our bond, given to the Polish State in 1939, to restore Poland. In these circumstances it can hardly lie with us, in view of our original war aim, to seek to deny to Poland the compensation which is offered by a State which, while it was still in pact with our enemies, undertook the latest partition of that unhappy country.

I suggest then that certain factors in connection with territorial rearrangements might well be taken into consideration. Silesia, I understand, was Polish before the first partition of Poland. If so, there are historical grounds for its restoration. Schleswig-Holstein were Danish until the first aggression of the Germans in 1864; there are therefore historical grounds for the restoration of those provinces. It is very widely held that the breaking up of the Southern German State after the last War was an error of the worst kind, largely based upon ignorance of history. The reformation of a South German Catholic State centred on Austria would do something to restore the balance; while a separation of Catholic and Protestant Germany would be based on a factor strongly (consider Ireland) inimical to centripetal tendencies.

All these territorial rearrangements, based on history, might well be expected to last, especially since those portions of Germany thus incorporated in, or joined to, other Powers would be comparatively easy to control by those stronger Powers. It might well be argued further that East Prussia should go to Poland as a direct punishment to Germany, and as a potential source of trouble sufficiently small and isolated to be effectively handled and controlled by Poland. It might reasonably be argued that the Rhine frontier should be given to France as forming a better strategic basis for a re-built Europe, and as involving an annexation not too large to be effectively held and controlled by France. And if all these things were done, the remaining quadrilateral of Germany proper should be sufficiently reduced both to minimise the German danger and to facilitate the re-education, or what you will, of the remaining Germany.

One last word. The obsession with the question of minorities is an evil legacy of the last War, with its over-emphasis upon nationality, self determination and the rest.

That there should be German populations in Transylvania or in the United States, that the Austrian Empire included a mixture of races, and so on, did not thus obsess the statesmen of the nineteenth century. Plan transfers of population if you will; but in the cases which I have specifically mentioned it would seem enough to let the Germans now in the territories which would revert to Poland or Denmark or France or Austria leave those countries if they preferred to do so and make their way back to their Prussian slavery. Otherwise, and many of them might prefer it, let them remain as peaceful citizens of the States in which they would find themselves incorporated.—Yours faithfully,

London, E.C.2.

GUY P. DAWNEY.

[It is, of course, obvious that every matter of opinion which is stated editorially in *The Economist* is only *The Economist's* opinion. We have never claimed that what we think to be true is gospel truth; it would be absurd to do so. In this case, however, there is a great deal of past experience to go upon, and General Dawney does not cite a single piece of evidence to support his own opinion that the rulers and people of this country will be more willing to act, and if need be to fight, to keep Germans under the rule of, say, Dutchmen or Poles, in ten or fifteen years time, than they were between the wars. All he says is that they *ought* to be more willing, which is a very different matter. Our view, simply put, is that we must be desperately careful not to promise now what we will not perform then, because that is the way to provide the enemy with the opening for his Third Attempt. In other words, the Peace must be as strong as possible.—EDITOR.]

TO THE EDITOR OF THE ECONOMIST

SIR,—Perhaps you will allow me to say that those standpoints, which have been expressed in the polemic regarding your much-noted article "Terms for Germany," do not touch the root of the problem, neither did your article.

The European "Balance of Power" had been irretrievably destroyed by the disappearance of the Austro-Hungarian Empire. The last hope to retrieve the European political situation to some sort of balanced status, lay with an eventual German policy of extremely wise, cautious, obliging and courteous statesmanship. Instead the world had to witness the German people calling in the stupid, vulgar, ignorant and uneducated Hitler bulls in order that these beasts may surely and safely destroy the finest china shop in the world, the Continent of Europe. Can it be expected, Sir, and is it fitting to ask for it, that a crowd of fools who did such a thing, though the whole surrounding world asked them to desist from it, may again be a Big Power?

At present—and this is so as a consequence of that policy of "intuition," entrusted to a horde of megalomaniac hooligans of petty bourgeois descent—Russia, now the one real Big Power on the European Continent, turns against the, in itself organic, idea of an integrated Europe (which, of course, would be the "ideal solution"). But here again it becomes manifest, how disastrous the consequences of Germany turning Nazi were bound to be. It is only understandable that Russia does not (and cannot) show, after the experiences which she has had, enthusiasm for the establishment of a compact Continental Power on her Western borders. German policy in Europe—and not only since they turned Nazi—did sow wind and reaped storm. Neither can it be overlooked that a peace settlement with Germany must necessarily bear a different character after and with disclosure of the flying bomb-institution as compared with one which would perhaps have been still possible before and without that revealing proof that the "Neandertaler," the antediluvian monster, is amongst and at us. German policy having definitely destroyed the possibility of European integration on a fair and decent basis, and on the principle of "politics as the art of the possible," no other way is left than that of producing the entire political disintegration of Europe, at least east of the Rhine.

This will practically mean that the area inhabited by

Germans will not be divided in three or four "states," but probably in at least ten to fifteen territories, each of which will be separately administered by one of the Allied Nations. This will be the only way to "re-educate" the German people in a truly reliable and successful fashion, by acquainting them forcibly with those methods of a free communal constitution, which is the only possible basis of living and working peacefully together in the densely populated and highly cultivated area of Continental Europe. He who is able to think of future social, economic, political and cultural developments of mankind with some imagination, might find that even this settlement carries the germ of a future integration of Europe in it, and that it does no injustice to the great merits, which the German people acquired in the past in the sphere of art, spirit and science. Germany's greatest men—and especially those, who, like Leibniz, Kant, Goethe, Herder, Humboldt, Heine, Nietzsche, Thomas Mann and many others, have pondered over their national problem, did always envisage Germany as a teacher of the world rather than its master.

Certainly it is one of world history's most gigantic tragedies (and blasphemies) that a people, designed by destiny to be a nation of teachers, turned out to be one in bad need of being re-educated. But it is the inherent character of tragedy, that its conflict cannot be "solved," that it must be lived through with all its implications and consequences—and that, therefore, it must be considered futile, as you did, Sir, to try to persuade Clio, the Goddess of history writing, to appease her infuriated mind by dictating to her iron pencil an idyllic happy end on top of the bloodiest story she had ever to put down.

To the present and guilty German generation one can, even if deploring their actual fate, but say: "Tu l'as voulu, Georges Dandin."—I am, sir, yours truly,

FREDERICK JELLINEK.

London, W. I.

TO THE EDITOR OF THE ECONOMIST

SIR,—As one who has made some study (dispassionate my reviewers say) of the German problem, I was perturbed by your article on "Terms for Germany." But I admire your courage in voicing an unpopular view, and still more I admire your generosity in publishing six letters in one issue, all of them critical.

There is one point, however, which neither the article nor its critics stress—the limited duration of any terms imposed on Germany.

The inconstancy of parliamentary democracies, the traditional inability of the English to sustain hatred, and the probability that in 1965 or so we shall be far more interested in domestic issues than in Germany strengthens your arguments that only a moderate peace (if any) will be enforceable.

But Mr Sisam's point that a moderate peace would shorten the time needed by Germany to re-arm seems sound. What we really need is firmly to control Germany until, by re-education or a realism of the folly of fighting the world, she undergoes a change of heart. That is unlikely to take place until this Nazi-trained generation has passed away—say 40 or 50 years. Shall we do it?—Yours, etc.,

T. H. MINSHALL.

Reform Club.

TO THE EDITOR OF THE ECONOMIST

SIR,—The letters you have published on your article "Terms for Germany" are a sad commentary on the state of mind produced in many people by five years of war and are an ill-omen for the future peace. It is, for instance, nonsense to suggest that "German workmen west of the Rhine will soon make good Frenchmen" or the Pomeranian peasant "A good Pole." In actual fact, the nearer one gets to the frontiers, the stronger are the national feelings in all classes of the population.

Your contention itself is unassailable. If we really want peace, not only in our, but also in our children's time, there is no alternative to a settlement which will continue to command active moral support among the chief Allies—save a genuine "Carthaginian peace" involving the utter annihilation of the German people. As this latter stands no chance of gaining general support, let alone being put into practice, it is essential that we do not make another war a certainty by trying to go half-way.—Yours faithfully,

Eton, Bucks.

J. JUXON STEVENS.

TO THE EDITOR OF THE ECONOMIST

SIR,—May an ordinary human mortal of British nationality and Czechoslovakian origin, a believer in democracy and one who, since 1910, has been a regular traveller to the Continent—excepting, of course, the years of war—with due diffidence be bold enough to present his views on your "Terms for Germany"?

The principal argument at issue may be resolved into two questions, viz.:

- (a) Is a peace the stronger for being enforceable in 15-20 years' time; and/or conversely
- (b) Is it the weaker for not being so?

We are little concerned with German psychology, which, I hope, we are out to destroy. We are eminently concerned with the psychology of the democratically-minded human being, whether he be a British or Czech Liberal. Democracy is an indivisible unity and belief in "Right and Justice." Take away the sense of right and justice and you have an empty shell.

The British, American and French have alternately refused in the past to resort to arms, and preferred to remain at peace when the Treaty of Versailles plus the League of Nations Covenant were violated, not because these instruments were either "weak or strong," "moderate or hard," but because democracy in this country and elsewhere considered that the violations of the treaties were not equal to the sacrifice required to counter them.

Had we thought it better to "enforce" the reparations clauses, or to counter the German conscription laws or to prevent the re-militarisation of the Rhineland (which I feel every experienced Continental traveller knew, would have been easy), we had the physical means at the time of doing so. Why did we not? Because the judgment of democracy fifteen years after the last peace was against it, for better or worse. In other words, the Treaty of Versailles became inoperative in consequence of the reluctance of the people to go to war for "points" that they did not consider urgent or important enough to "enforce." This is a vindication of *The Economist's* "Terms for Germany."—Yours respectfully,

Cobham, Surrey.

E. WUNDERLICH.

* * *

It is proposed to continue this correspondence in the next weeks so far as, and for so long as, considerations of rationed space will permit; and to follow the original article on "Terms for Germany," which has been so widely criticised, by a further statement of *The Economist's* views in which these criticisms will be examined.

Meanwhile it may perhaps be useful if two particular points which have arisen in the course of this discussion are made plain here.

(a) *The Economist's* argument has not been concerned in any way with the suggestion that the peace terms to be imposed upon beaten Germany should be lenient; nor, indeed, has it been concerned with the contentious and incalculable problem of German psychology. The sole purpose of our original article was to consider the problem of enforcing whatever peace settlement may be made in the light of British psychology and British political possibilities. Our statement that the peace must be both enforceable and enforced, whatever its strength or moderation, has not been challenged by any correspondents. Nor has our view that "we must not promise what we cannot perform" been opposed.

(b) In the last issue of *The Economist* it was stated—in a comment on the suggestion, made by Dr Drucker, that our original article was, in effect, "soft words" to the Germans—that this view had also been voiced by the British Minister of Information "in a less direct and less straightforward fashion." By this was meant that, according to our information, this opinion had been expressed by Mr Bracken to a meeting of journalists, without any contact having been made with the Editor of *The Economist* itself. It must be stated, however, in fairness to the Minister that this view was expressed by him, without deliberation, in reply to a specific and spontaneous question at a confidential gathering of press representatives. The meeting was a regular and routine "off the record" gathering, at which *The Economist* was not represented. It was unfortunate that the only information about this incident which reached *The Economist* came in an indirect and misleading form.—EDITOR.

AMERICAN SURVEY

Boom Days on the Mississippi

(From a Correspondent in St. Louis)

MANY people think that the heyday of Mississippi river transportation occurred during the last century, when gleaming white packet-boats loaded with freight and passengers plied the river and its tributaries. This was the romantic era of river transportation chronicled in the writings of Mark Twain and others, the time when rival river pilots challenged each other to boat-races for high stakes and the waterfronts of the principal cities were filled with boats and teeming with activity.

Yet in 1942 net traffic on the Mississippi waterways system above New Orleans amounted to over 92 million tons, and available information indicates that this record was exceeded in 1943. This tonnage compares with about 69 million tons in 1939, slightly over 10 million tons in 1860, and an average of about 25 million tons a year during the final quarter of the last century. On a ton-mile basis the increase during the year is still more striking. To-day a slow-moving tow-boat with its string of barges transports cargoes equal in tonnage to those carried by 24 of the typical packet-boats of that earlier period.

The wartime boom comes on the heels of a steady, though unspectacular, growth. The twenty years prior to the war witnessed marked changes in river traffic. In the previous period of railroad expansion, the rivers had been neglected to such an extent that the President of one of the major railroad systems of the area is reported to have remarked: "Why should I be worried about water competition on the rivers? In winter the ice prevents shipping, in spring the floods are so high that the boats can't go under the bridges, and in the summer and fall there isn't enough water to float them."

The improvement of the rivers in recent years is the principal factor responsible for growth of traffic. The original stimulation to inland waterway development came from the transportation crisis of World War No. 1. Under successive Congressional appropriations, Army engineers have created a permanent nine-foot channel from New Orleans to Minneapolis and St. Paul on the Upper Mississippi, to Chicago via the Illinois waterway, and to Pittsburgh on the Ohio River system. In addition, important channel improvements have opened traffic on the Tennessee, Cumberland, Missouri and other tributaries.

The development of navigable waters was accompanied by great improvements in tow-boats and in special barge equipment for new types of cargoes. The river-boat operators became more active in soliciting new business, and new ports with terminal facilities for handling shipments were established. In 1939, although coal and coke, and sand, stone and gravel products still accounted for 65 per cent of the tonnage moved, general cargo freight, including petroleum products, lumber, steel, and package freight, had shown a spectacular growth of 150 per cent since 1920.

During the war a substantial change in the character of river traffic has occurred; much of the war-time increase represents diversion from normal peacetime carriers. For example, oil and petroleum products are now the most important commodities transported on the Mississippi system. This is largely the result of the submarine threat to the ocean-going tankers that formerly supplied East Coast refineries, though important crude oil movements on the river have also been necessary to supply the needs of the new high-octane gasoline plants in the Middle West. Another traffic diversion is of sulphur, which is moving to eastern chemical plants up the Mississippi through the Great Lakes and down the Erie Canal, instead of by coastal vessels.

On the other hand, the cutting off of foreign markets, the restricted production of durable goods, and the need for speed have reduced the movement of many of the commercial cargoes upon which river transportation lines were dependent in normal times. The elimination of this traffic was not all a net loss. For example, in the few years before the war a considerable river business had been built up for delivering new cars to southern markets on special barges with racks carrying nearly 200 automobiles. During the war these barges have been used to transport military vehicles to the South, where many of the country's major training camps are located.

In addition to the movement of necessary materials, and the relief thus given to the over-burdened railroad system, river traffic has reflected the tremendous expansion in ship-building along the Great Lakes and inland waterways. More than one thousand military and naval vessels of substantial size and various types were built at inland shipyards during the years 1942 and 1943, and moved without serious accident to the tidewater ports of the Gulf via the improved channels of the Mississippi River system.

Much of the present river traffic is clearly uneconomic, but river-men are hopeful that they can find replacements after the war—taking the steady pre-war growth in traffic as a solid basis for this confidence. Inland water transportation of bulk raw materials and of commodities suitable for warehousing and stock-piling has clear cost advantages over other forms of transportation. Even in the case of oil,

ABDULLA
A BLEND OF VIRGINIA & OTHER CHOICE TOBACCOS
"VIRGINIA" No. 7
20 CIGARETTES
ABDULLA & CO., LTD., 173, NEW BOND ST., W.I.

At 2/8d. for 20, Abdulla No. 7 is a cigarette* of outstanding quality with a charm of its own—a charm which comes from superb tobacco and masterly manufacture. It's larger and firmer than the ordinary cigarette, too.

P.S. In the wardrooms of H.M. Navy, they smoke literally millions of No. 7 every year—and you know what sailors are!

* For Virginia smokers
ABDULLA No. 7

barge operators hope greatly to expand pre-war tonnages—barge movement of petroleum products is substantially cheaper than truck or rail, and closely approaches pipeline costs—and barges have the advantage of greater flexibility. (Sea-going tankers, of course, enjoy a tremendous cost advantage over all other forms of transportation.) Much depends upon the post-war use made of the famed "Big Inch" pipeline which, according to rumour, may then transport natural gas; in that case, the refinery capacity in the Mississippi Valley may require more water-borne movement of crude oil. With the expected expansion of water terminal facilities and arrangements for truck connections, the barge lines hope to carry on much of the local distribution of gasoline and petroleum products which formerly moved by rail, and particularly to supply inland airports with high-octane gasoline.

Among normal lines of traffic which will return to the barge lines when the war is over are such commodities as automobiles, automobile parts, agricultural implements and various consumers' goods. The up-river movement of imports cut off by the war will be regained. And since farmers in the southern states have greatly increased their livestock numbers, grain-feed supplies from the Corn Belt states are expected to move down-river by water in larger volume than before the war.

Certain factors that will sharply affect post-war traffic are, however, beyond the control of the river-carriers. River-borne tonnage of industrial raw materials and building materials shows substantial swings in response to changes in industrial activity. The movement of products down-river for overseas shipment will depend to an important extent upon the amount of dollar exchange available to foreigners, and on the types of products they decide to use their dollars to purchase—farmers in the Mississippi Valley are not too optimistic about exports of agricultural commodities, though Middle Western manufacturers see possibilities of large sales to South America and other countries via the Mississippi River.

River transportation is also likely to be stimulated by the boat-builders of the large new inland shipyards that have spawned so many military craft during the war, who are hopeful that the designs for military ships may be modified for use on the rivers. Already a luxury streamlined cruise-liner that incorporates certain features of the LST (Landing Ship, Tanks) has been designed for post-war weekly round trips on the Tennessee River.

Less novel, but probably more practical, are the ideas for adapting the designs of the LCT (Landing Craft, Tanks) and the LCI (Landing Craft, Infantry) to river use. The increased speed and flexibility of such boats might make possible a modern version of packet-boat service on the inland streams—loaded truck-trailers might be moved on such boats and provide a service rivalling fast rail freight between river points such as St. Louis and Memphis. The likelihood of these and similar developments would be enhanced if twelve-foot channels were made on major stretches of the rivers, a possible public works project in the event of a major post-war depression.

No doubt gains in the operating efficiency of river-craft will result from the gradual improvements in design of the successful types of tow-boats and barges now in service. Recent developments have included rubber-lined barges for acids and special barges for high-octane gasoline. Current plans project refrigerated barges with deep-freeze units to freeze Southern fruit and vegetable crops on the rivers close to the farms; they would move up-stream as the season advances and finally transport the products to northern and eastern distribution points.

The Transportation Act of 1940 placed common and (with certain exceptions) contract water-carriers under regulation of the Interstate Commerce Commission. This legislation was bitterly opposed by the water-carriers both because of their general suspicion of regulation and because of their belief that the ICC in the past has supported the railroads in unfair competitive practices. Now, however, although still fearing the political and economic power of the railroads, many of the water-carriers feel that regulation will aid them in the long run by a greater stabilisation of transportation rates and service. One of the leading barge operators in a recent speech laid down the following objectives for management. "Management should diligently pursue efforts to accomplish lower cost by research and investigation. . . . If the barge lines base their rates upon determined cost, and can afford to do so, it is good policy that the public should benefit from lower costs."

American Notes

Governor Dewey's Opportunity

There are fewer fireworks in reports of the conversations between Secretary Hull and Mr Dulles, Governor Dewey's foreign affairs expert, but it is encouraging that they were able to declare themselves in agreement on so many points. Mr Dulles added to the official statement the suggestion that, where there were differences, they were of emphasis rather than principle. In particular, both insisted that it was of the highest importance to keep foreign policy completely above the political considerations of an election year. Governor Dewey, through Mr Dulles, has made only one reservation. That is his right to stimulate full, non-partisan, public discussion of any and all issues. It is Governor Dewey's contention that this is necessary if the security arrangements are to be so solidly based in American public opinion that they will survive changes of Administration. It has been suggested that this condition amounts to an escape clause, whereby the Republicans can feel free to descend from the level of non-partisan discussion when it suits their book to do so. There is little evidence for this interpretation. There are irresponsible men in both parties, but they hardly require an escape mechanism from so informal an agreement. There is no reason to doubt the sincerity as well as the soundness of Governor Dewey's reasoning. It is only a short time ago that Secretary Hull was bemoaning the lack of public interest in the problems of peace and security. Dumbarton Oaks itself received scanty notice until Governor Dewey made it front-page news. And it is natural enough that Governor Dewey, who has ambitions to play lead, should demand more than a walking-on part between now and November. So long as the spirit of the agreement is maintained, it will be both interesting and instructive to hear more of Governor Dewey's views on foreign policy. So far he has shown a certain delicacy in committing himself on the more controversial issues which Mr Willkie has attacked with such zeal. In contrast with the candidate, Mr Willkie is, of course, a free agent. He has nothing to lose but his own skin. But despite his party and his bi-partisan responsibilities, there is an opportunity for Governor Dewey to show that he has the same capacity to sacrifice a short-term advantage to the larger good.

Mr Willkie's Campaign

Mr Willkie has discovered another good cause, and one close to his heart. The story, confirmed by Mr Willkie himself, is that he has been trying to convince Republican leaders, particularly in Congress, that the President must be given the power to use American forces to stamp out aggression without first being required to gain the consent of the Legislature. This is believed to be a basic feature of the American plan put forward at Dumbarton Oaks. Mr Willkie is probably right in thinking that it is the major stumbling block in the way of Congressional ratification. In the Constitution, the right to declare war is expressly reserved to Congress, although the Executive may have taken such preliminary steps as to make the final declaration not much more than a rubber stamp. Nevertheless, the overriding of this prerogative in the American plan sets up a real difficulty in the minds of all good Constitutionalists; and it may easily be played upon by those whose devotion to the Founding Fathers is less disinterested. Mr Willkie is said to fear that discussions on this point may be so long drawn out as to make possible the eventual defeat of the peace settlement. He has urged, with even more force, that the requirement of Congressional consent would make the decisions of the proposed Security Council

mere prayers addressed to the United States Congress, and the international organisation soon would prove itself impotent in meeting threats of aggression.

Mr Willkie has gone on to urge his fellow-Republicans to approve American participation in the security organisation without waiting for the formal drafting of peace treaties; and he has advised them to take a lead in building up a public opinion favourable to responsible American participation in the new organisation. Once again, Mr Willkie has proven himself the most liberal, and apparently the least calculating, of Republican politicians.

After each demonstration of his political foolhardiness, Mr Willkie bobs up again, not noticeably discouraged. This is one of the toughest rows he has chosen to hoe. Seasoned Republicans in Congress regard Mr Willkie with profound suspicion. They were mainly responsible for his elimination from the Presidential campaign. Their suspicions will be confirmed by Mr Willkie's efforts on behalf of the Administration proposal, his belief in straight words and direct action. It is not impossible, however, that a bargain may have been reached between Governor Dewey and Mr Willkie, with the latter's support, or at least friendly neutrality, being promised in return for Governor Dewey's support in the campaign to save the security talks from being spiked on a Congressional veto. Mr Willkie made a rather tart reply to the invitation to exchange views with Mr Dulles, but their meeting took place without delay.

Oil

One of the things that President Roosevelt's adversaries find hardest to forgive is that he is always springing surprises on them. The President's critics were taken aback this week by his sudden announcement that the Oil Agreement would be submitted to the Senate for ratification as a treaty. What might have been more reasonably expected was its submission as an executive agreement, which would have required a majority vote of both Houses, rather than a two-thirds vote of the Senate. There have been periodic rumours that, in order to get round the veto power over treaties exercised by one-third plus one of the Senate's membership, very nearly every important international arrangement would be called an executive agreement and treated as such. There had been a strong clamour that the Oil Agreement should be regarded as a treaty. The President, whose shrewdness in these affairs is incontestable, probably thought that this was a good opportunity for placating the Senate, and at the same time challenging its members to say where they stand toward international agreements in general. Oil was made a highly contentious issue by the Five Senators in their well-publicised travels a year ago. Public opinion was alarmed by stories that the British were selfishly withholding their own stocks while America was prodigally expending her fast-diminishing supplies in the war effort. The charges were exploded, but the uneasiness remains. The President may have preferred, in dealing with so explosive a subject, to confine debate to the Senate, and he may have welcomed the prospect of sharing the responsibility. There have been certain rumblings that the Agreement was unfair to American interests, but that is common form in all undertakings to which the United States is invited to subscribe. What is more important is the hope of the relevant Senate Committees for speedy clarification from the American and British Governments on such subjects as allocation, price fixing, and the possibility of a Government-approved cartel.

The Life of Lend-Lease

The Administration answer is now available to the question, how long a life for Lend-Lease? In his letter transmitting the Sixteenth Lend-Lease report to Congress, Mr Roosevelt urged the continuance of Lend-Lease until the unconditional surrender of both Japan and Germany, on whatever scale is necessary to make the combined striking power of the United Nations as overwhelming as possible. The President's remark sprang from something more than the approaching end of the German war. The span of Lend-Lease has been a subject of heated controversy ever since *Nam News* published an article to the effect that it was intended to prolong Lend-Lease aid to Britain, not only until the end of the Japanese war, but into the peace period. The author created a stir by insisting that the British were demanding Lend-Lease aid, not for war purposes, but to bolster up their post-war economy and to prevent any increase in Britain's external debt until she is on her feet again. To this unfriendly tale, the attitude of conservative and anti-British circles was a foregone conclusion, and even liberal and friendly groups confined themselves in the main to defending Britain's right to military aid if she cooperated in the Pacific war. More recently, both Senator Connally and Senator George, who helped to shepherd the original Act through Congress, have declared themselves opposed to its continuance after the war. Even Mr Roosevelt, in his press conference, has spoken of the need for post-war credits to

take the place of Lend-Lease. But it is not certain that Mr Crowley's assumption that aid will be continued to England, and to Russia and France, between the end of war in Europe and war in the Pacific will be accepted without a struggle. A Washington dispatch in the *Wall Street Journal* last week quoted "official circles" as admitting that to continue Lend-Lease, even to a Britain engaged to the hilt in war with Japan, would speed up reconversion to civilian production in Britain, and correspondingly retard it in the United States. Apparently this line of reasoning, as so often in Anglo-American discussions, is not intended to work both ways; for any questioning of the admitted fact that the United States, with both wars still raging, has already gone vastly further than this country in the direction of reconversion, would arouse a storm of indignation from precisely these same American critics of Britain's post-war intentions.) The American argument is that if the United States supplies military goods to Britain for the Pacific war which could be produced in Britain, certain British factories would be freed from the demands of war production, and a corresponding number of American plants would be delayed in the change-over. It is suggested that as a minimum protection to American foreign trade, it might be agreed that increased civilian production made possible in England must be for domestic consumption rather than for export. There is no explanation as to how such an agreement might be enforced without acting as a fatal brake on the essential expansion of British exports. This may, indeed, be the price which some commercial interests would put on the continuance of Lend-Lease beyond the German collapse.

Hot Potatoes

There were times, in the early stages of the war production drive, when it was difficult to tell from day to day who was in and who was out of office. That climate of confusion reappeared last week. When it was announced that Mr Nelson had been given an important mission to China, it was assumed in many quarters that he was being thrown overboard in favour of his deputy, Mr Wilson, who had adopted the Service line against premature reconversion. As the anti-Administration papers put it, "China seems to be becoming a kind of handy cooling chamber for hot potatoes"; and Mr Roosevelt's refusal to commit himself on the question of whether Mr Nelson would return to the War Production Board seemed to clinch the matter. It was only a matter of days, however, before Mr Wilson himself insisted on resigning, on the grounds of wanton and repeated attacks upon him, instigated, in his belief, by members of Mr Nelson's own staff. Mr Wilson insisted that there had never been any difference of opinion over the need for reconversion between Mr Nelson and himself, although he emphasised that his first care had always been for war production. At this distance it is difficult to judge of the rights of this complicated and sensational *embroglio*. There is no doubt that Mr Wilson's going is a distinct loss to the Board. He was unquestionably responsible for many of the successes of the war production programme. What is more serious, however, than the going of any one man, who may conceivably have already done his best work, is the revelation of such widespread dissension in one of the most important war agencies. It is no proof of skilled administration that such exceedingly dirty washing should be exposed to public view. Dewey will make the most of this latest example of muddle at Washington. The nation is justifiably anxious that plans for reconversion should be progressing smoothly, and that they should be far advanced, and it will await with some alarm the results of yet another Congressional investigation.

THE WORLD OVERSEAS

Stirrings in India

(From Our Calcutta Correspondent)

Calcutta, August 11, 1944

AT the time of writing, the forthcoming Gandhi-Jinnah meeting dominates the headlines, so far as domestic news is concerned; and the recent increased quota of newsprint is fully utilised to accommodate the spate of statements ("the statement" is a feature peculiar to Indian journalism) that issue from all and sundry on the subject of the partition of India.

In the interval since July 30th, the day on which Mr Jinnah announced that a meeting would take place between Mr Gandhi and himself, opinion has been rapidly crystallising. Hindus of the older school, Congressmen and otherwise, have received a severe jolt. Few of them seem to have noticed the tremendous strides in the political organisation of the Moslems during recent years, or the solidarity which the League and the community have attained under Mr Jinnah's leadership during the war. Pakistan may remain undefined and undefinable, but it is none the less a live political issue for every Indian today. Said the veteran Liberal Srinivasa Sastri in Madras the other day:

the oneness of India is a reality, an actual possession. The absolute independence of India would be an attractive prize, but it is now a mirage . . . but Mr Jinnah has got his prize and needs only to close his fingers upon it.

And, as for Mr Jinnah himself, he is in terrific form. The fact that the Mahatma made the first approaches for a meeting is ample compensation for his earlier political reverse in the Punjab of which, incidentally, we have probably not heard the last. Mr Jinnah's reported decision to maintain a residence in Lahore is an earnest of his intention to square accounts with the Unionist Party Ministers, and the Punjab Governor and the Viceroy, who are said to have encouraged the former to resist the League leader's *diktat*.

Sterling Balances

Meanwhile, the perennial question of the sterling balances continues to occupy a strong second place in the unending debate on the subject of Indo-British relations. The fact that the Finance Member, Sir Jeremy Raisman, and the Governor of the Reserve Bank, Sir Chintaman Deshmukh, are staying in London on their way back from Bretton Woods, whilst their non-official colleagues are returning to India, is taken as a sign that negotiations are on foot between the British Treasury and the Government of India for a long-term funding agreement in respect of India's sterling balances. It would obviously be greatly to the Finance Member's advantage (and credit) to bring such an agreement with him when he returns to India, for it would make participation in the International Monetary Fund and the International Bank a good deal more palatable to Indian opinion.

The essence of Indian criticism of the Bretton Woods agreements is that they make no provision for the liquidation of abnormal war balances which, in the case of this country, means her recently acquired sterling assets. That criticism will lose much of its force if Sir Jeremy Raisman is able to confront the Legislature with acceptable proposals for funding the sterling balance at the same time as he asks for India's adherence to the International Monetary Fund; and if this is his intention it represents obvious political wisdom.

One begins to sense the first glimmerings of reason breaking through the dark clouds of suspicion and misunderstanding that hang over the question of India's sterling. Speaking at this week's annual meeting of the Engineering Association of India, the President, Mr Darab Cursetjee Driver, an Indian engineer associated with the house of Tata, put forward a plea that it is in India's own interests to assist Britain's post-war export trade and

take as much as possible from Britain both in capital goods, consumers' goods when necessary and technical and expert services in preference to taking these from other countries.

Mr Driver added that he advocated this course, not because India loves Britain, but because so far as the liquidation of Britain's large debt to this country is concerned, it is the only way Britain can pay. "In other words," said Mr Driver,

in our own self-interest, as business men, we have to secure and safeguard the solvency of Britain by co-operating with her and helping her as much as we can in spite of all the political differences of the past.

There are some signs that this more realistic view of Britain's indebtedness to India is beginning, even in sound nationalist circles, to replace the extreme and impracticable demands of the more extreme economic counsellors of *Swaraj*. The same subject naturally received a reference in the recently issued annual report of the directors of the reserve bank. During the twelve months ended last June, sterling balances with the reserve bank continued to accumulate, the net accretions during the accounting year being Rs. 358.40 crores as against Rs. 296.43 crores in the previous twelve months, and Rs. 932.49 crores since the beginning of the war. The total holdings on June 30, 1944, amounted to Rs. 1,002.07 crores. "With the practical completion of repatriation operations," says the Report,

the problem before the Government and the Bank now is that of utilising these resources to secure capital goods and equipment for the various post-war reconstruction schemes now under consideration, and to a lesser degree for obtaining a supply of those consumer goods from a shortage of which India has suffered during the war years. The problem is, to a large extent, that of diverting productive capacity in the United Kingdom towards satisfaction of the demands represented by these balances, and it is expected that it will be possible to secure a satisfactory arrangement with the UK for the orderly liquidation, over a period, of these resources.

The language of the Report suggests a rather more oblique approach to the subject than that employed by Mr Driver, but the idea is the same. Incidentally, the second postponement of the projected visit to the United Kingdom of the nine leading Indian industrialists (announced today) is beginning to make people wonder whether the visit will ever take place. It was originally scheduled for June and then put off to September. Now it is said it will take place in the winter, and your correspondent, among others, wonders if it is regarded as essential to the promotion of post-war trade between Britain and India.

As a tailpiece, I may revert to the Reserve Bank survey which points out that, from June, 1943, to June, 1944, notes in circulation showed a relatively smaller increase of Rs. 198.89 crores to Rs. 931.37 crores as against an increase of Rs. 285.25 crores during the previous accounting year. This decrease in the expansion of note circulation, despite the growing war expenditure, is in a large measure due to the success of Government's anti-inflationary measures. The Deputy-Governor pointed out that the rate of expansion of the note issue had in fact declined from 63.2 per cent in 1942-43 to 28.8 per cent in 1943-44.

The Canadian Confederation

[FROM OUR OTTAWA CORRESPONDENT]

INTERNAL tensions are inherent in a Federal system combining in one political structure several regions of differing economic status. In the case of Canada, this was never revealed with greater clarity than in the findings of the Royal Commission on Dominion-Provincial Relations just before the war. Politics in the Canadian Confederation have been founded in large part upon these internal conflicts, upon claims for "provincial rights." The war removed them to the background, but they soon began to emerge

once the crisis passed. Provincial autonomy is rapidly occupying the field of Canadian politics since the election of new Governments in the provinces of Ontario, Quebec and Saskatchewan.

Key position in this situation necessarily falls to the Premier of Ontario, whoever he may be, since Ontario is the largest and wealthiest province and one which has possessed a sense of racial homogeneity—though this is now disappearing because of steady shifts of population. In Quebec, too, provincial autonomy has always operated influentially near the surface of politics, and the return of Maurice Duplessis to the Premiership this year has brought back a vigorous autonomist to a post of responsibility. Premier George Drew, of Ontario, has also become a strong autonomist after a year in office devoted to less disruptive politics. Mr Drew's predecessor, Mitchell Hepburn, once declared that Ontario would not be "the milch cow" for the poorer provinces, a manner of saying that he was opposed to Federal funds collected on a substantial scale being devoted to maintaining uniform social services throughout other provinces. Mr Hepburn's last appearance as a national figure came in January, 1941, when he scuttled the Dominion-Provincial Conference, aided by Aberhart of Alberta and Pattullo of British Columbia.

The case of Mr Hepburn is being recalled now, as history seems to repeat itself in the case of Mr Drew, who has just opened a campaign of opposition to the Federal Government's new scheme of family allowances, which will cost Ottawa \$200 million net each year. He said that nearly half the money to be paid out in family allowance would come from the people of Ontario. "Millions of dollars from the pockets of the people of Ontario will go to the province of Quebec," he said. He spoke of "Ontario dollars" being used for the special benefit of the people of Quebec. He criticised Quebec's share in the war, and declared that "the most alarming constitutional crisis since confederation" had arisen.

At the outset, one notes nothing in the Canadian Constitution that prevents the Federal Government from spending its funds on any scheme it desires. The paradox of that Constitution, written in 1867, is that it allotted the field of social services to the provinces, but the economic development of Canada since has determined that the financial capacity to maintain such services has been distributed unevenly. The "Ontario dollars" of which Mr Drew spoke are dollars that are produced and earned throughout Canada, and taxation is concentrated in Ontario, mainly Toronto, because of the concentration of wealth there.

The Sources of Taxes

But at the same time, the concentration of wealth and population in Quebec has developed on a scale second only to that of Ontario. Quebec is a province, like Ontario, in which the concentration of wealth makes feasible and plausible the case for provincial autonomy in the sense of possessing sources of revenues with which to support adequately the services demanded by the people. There is therefore a deep economic reason for collaboration between Ontario and Quebec, and the Quebec autonomists have recognised the identity of aim they have with Mr Drew, despite the nature of his onslaught upon Quebec's rôle in confederation.

A comparison of the collections of direct taxation by the Federal Government and the payments likely to be made of family allowances in the five economic regions of Canada discloses the true economic relationship. In the following tabulation, Federal tax collections of income tax, excess profits tax and succession duties are based on official figures for 1943, and the distribution of family allowance payments are official estimates.

	(Millions of dollars)			
	Direct Federal Taxes	%	Family Allowances	%
Maritimes	51.0	3.1	25.0	10
Quebec	429.0	31.1	80.0	32
Ontario	695.0	50.3	80.0	32
Prairies	87.0	6.3	50.0	20
British Columbia	115.0	8.3	15.0	6

A small percentage of Federal taxation is collected in the Yukon and directly at the head office at Ottawa. The payments of family allowances shown represent the total proposed disbursements of \$250 million. Most striking confirmation of the economic balance within Canada is found in the fact that 81.4 per cent of all direct Federal taxation is collected in Ontario and Quebec. This is why these provinces must always play a crucial rôle in efforts to reform the Constitution and redistribute the benefits of confederation among all provinces. During the war, all provinces agreed to vacate the field of income tax in favour of the Dominion, which in turn has made grants to the provinces to indemnify them for losses on the scale of their 1940 collections. The fight launched by Mr Drew is designed to recapture for Ontario the right to collect and disburse funds collected in the income tax field by the Dominion.

Of course, the other provinces have recourse to various measures of defence, if rational processes of constitutional reform and financial readjustment fail. A new provincial Premier, Mr Douglas, of Saskatchewan, has already warned that his Government proposes to tax outgoing interest payments after the war, a step which would greatly cripple the operations of financial institutions with head offices in Toronto and Montreal. The old case of Alberta refusing to honour its interest contracts on its public debts is based primarily on the same consideration.

Mr Drew's campaign is widely related to anti-Quebec feeling now strongly evident in Ontario and to some extent in other parts of Canada, as a result of controversies during the war over conscription and other issues. But the figures show that his battle is not with Quebec, as far as disbursement of "Ontario dollars" is concerned, but with all other provinces with the exception of British Columbia which shows a "surplus" position. In the light of Mr Drew's opposition, Prime Minister King postponed the proposed Dominion-Provincial Conference on Financial Readjustments, until after an election has been held. Mr King indicated the election would come immediately after the war in Europe ends, and that he would be opposed to extending the life of the present Parliament beyond its fixed limit which will be reached next April. A Federal election is therefore imminent; and not the least of the issues to be resolved, if they are capable of resolution, lies in the provinces versus the Dominion issue.

Germany at War

Foreign Trade

IT may seem strange that, at this stage in the war, the Germans should have published some foreign trade figures for the years from 1939 to 1943. But even in peace time foreign trade figures could be grossly misleading, and there is no doubt that this sudden publicity is not meant to give anything like a true picture of Germany's foreign trade relations. The figures are simply intended to give an appearance of economic strength, and to demonstrate the totalitarian organisation of the entire European economy. In addition, it is no doubt hoped that German manufacturers and companies may be thereby encouraged to maintain their trade connections with the various European countries, particularly the neutrals.

Dr Kirchfeld, head of the department for foreign trade in the Ministry for Economic Affairs, gave the following figures of the total value of Germany's imports and exports.

Million Reichsmark			
	Imports	Exports	- Import Surplus + Export Surplus
1938	6,050	5,620	- 430
1939	4,800	5,200	+ 400
1940	5,000	4,900	- 100
1941	6,900	6,800	- 100
1942	8,700	7,600	- 1,100
1943	8,260	8,590	+ 330*

It is not clear whether the figures cover throughout only the territory of Greater Germany as in 1938, that is, the Reich and Austria, or whether year by year the newly incorporated territories have been brought in; probably the latter is the case. This increase in the area called Germany would partly explain the rise in trade in 1940 and 1941. At best the figures suggest that, after the sharp decline in 1939, which was the result of the loss of Germany's entire overseas trade, the volume of trade was brought roughly back to the level of the last pre-war year. If detailed figures of the territory of the so-called "Old Reich" were available it would almost certainly show a decline.

Year by year the different phases of the war are more or less clearly revealed even by these trade figures. In 1939, the conquest of Poland was no compensation for the loss of overseas imports and it was thus possible to achieve an export surplus. The year 1940 was mainly a year of readjustment; imports increased slightly, but exports fell heavily. The policy of industrial collaboration with Western European countries is clearly reflected in the rising figures of 1941. After the first winter disaster in Russia, there is the remarkable drive for emptying all occupied countries of raw materials and manufactures during 1942; the import surplus rose to Rm. 1,100 million or eleven times the import surplus in 1941 and 1940.

The surprise in the figures, however, is the return for 1943 when it is claimed that a substantial export surplus, amounting to Rm. 330 million, was achieved. Probably there are three reasons for this. The first is that this export surplus is in large part the result of statistical changes made for the purpose of propaganda against the undeniable fact of mounting German clearing debts. Secondly, the figures also reflect changes in import prices, and particularly in export prices, to the advantage of Germany. Thirdly, the number of foreign workers employed in Germany increased by several millions in 1943 to at least 6½ to 7 million; and if these workers had remained in their countries and the products of their labour had had to be exported to Germany, the figures would have been very different.

Overall production in Germany and the occupied European countries is certainly smaller than before the war. The millions of soldiers in the German and satellite armies have not been replaced by imported Russian workers. Destruction by bombing is widespread. Waste is the inevitable accompaniment of a regimented totalitarian war economy. The productivity of labour in general and of forced labour in particular is small and declining as the war drags on.

This overall picture is not shown by these trade figures. On the contrary the increased concentration of industrial activity in Germany during 1942 and 1943 made imports and exports necessary far beyond the trade relations of normal times during the first years of the war. The stability of Germany's foreign trade in this war is thus the reflection of more extensive German conquests and greater experience

in the regimentation of economic activities. In 1914 Germany's foreign trade was actually and proportionately much larger than during the years 1934 to 1938. There was during 1914-18 a steep decline.

From this point of view the huge German clearing debts become a new significance. The annual import surpluses from 1940 to 1942 add up to Rm. 1,300 million and would leave, after the deduction of the 1943 export surplus, a trade debt amounting to a round Rm. 1,000 million. This is the debt resulting from direct trade relations. The next biggest item in Germany's clearing debt to European countries is estimated by German sources at Rm. 2,000 million; these are the remittances sent home by foreign workers employed in Germany during the period from 1940 to 1943. In addition to these items, almost all European countries have accumulated large credits from services, but an estimate of the total clearing debt is hardly possible.

There is a marked difference in Germany's trade relations with South-Eastern countries compared with those with Western European countries. The official figures show German export surpluses with South-Eastern countries and with Norway. In 1942 Germany exported to all South-Eastern countries goods valued at Rm. 2,020 million. Her imports from the same countries were valued at Rm. 1,862 million. These figures show how Denmark, Holland, Belgium and France were systematically emptied in the same manner as occupied Poland.

It is officially stated that these figures do not include German deliveries of war material and army equipment to the satellite countries. This may be possible, although it is extremely difficult to draw the line between general exports and army equipment. The official German figures almost certainly err to the advantage of the export figures in order to demonstrate Germany's capacity to export even under the most difficult war conditions.

It was obvious during 1943 and the first half of 1944 that Germany was very anxious to meet the demands of the neutral European countries. Exports actually increased compared with 1942. But this fact is no reflection of an increasing export capacity. Germany's overall production is still large enough to enable certain industries to export to neutral countries. The fact that, even to-day, in Sweden, Switzerland, Portugal and Spain German manufactures are still on the markets does not show greater ability to manufacture and export. It is easy for a completely regimented economy to set aside relatively very small quantities for these propaganda purposes. As in peace-time the largest single item in the export list is very likely coal and coke. Before the war exports of coal and coke amounted to 10 per cent of the total value of exports. The percentage may even be larger to-day. Next in importance are, again as in peace-time, chemicals.

The main object of this publicity in foreign trade relations is an attempt to demonstrate that Germany is quite capable of supplying all Continental countries with sufficient quantities of manufactured articles once the war is over. Under German domination, trade relations on the Continent have changed considerably. Partly by the accident of bad weather and partly by the necessity of accumulating food reserves, South-Eastern countries exported only relatively small quantities of foodstuffs during 1940 to 1943. The character of the agricultural industry itself was changed out of recognition. The Western countries which had depended on imported feeding-stuffs were forced to grow more cereals. All over Europe the acreage under cereals, root crops and oilseeds has been increasing. Readjustments will not be easy and will take time. The familiar exchange of industrial commodities has been redirected first by industrial collaboration and later by the concentration of industries on German territory.

All these changes have found expression in Germany's foreign trade during the war. At the same time, there has been some standardisation of Europe's manufacturing capacity, particularly in the engineering, textile and chemical industries. Much of the valuable industrial specialisation of some of the occupied countries has been sacrificed to the needs of Germany's war industry. Some of the results are expressed in Germany's clearing debts, others in the transfer of workers and others again in entirely new industrial or enlarged old industrial areas. These war-time relations will end with the war, and new concentrations and new specialisations will have to be worked out.

THE BUSINESS WORLD

The Future of Inland Transport—I

CHEAP and efficient public transport will be as essential to a prosperous Britain after the war as access to cheap food and raw materials and an increase in the productivity of labour in manufacturing industry. The problem of transport is, in fact, an integral part of the general and pressing problem of raising the output per British man-hour which is being examined in a series of articles entitled "A Policy for Wealth," of which the third appears on page 308. The special importance of public transport in this connection is that something like a fifteenth of all private and public expenditure is spent upon it.

In the past, the problem of public transport has been approached generally in "competitive" terms—that is, in terms of one means of transport *versus* another. Before the war, it was regarded almost exclusively in terms of road *versus* rail. The reason for this approach is quite natural. It represented the facts of the situation. The business of transport actually consisted of competition between financially independent agencies. The question is whether the national interest is best served by the perpetuation of this state of affairs. It is whether, however natural it may be, say, for the railways to seek protection against loss of the revenue, by which they live, arising from the "encroachment" of the road, national resources can possibly be best used, or the national economy most benefited, by a kind of competition that consists in the establishment of checks and balances between conflicting financial interests.

If the object is to raise the productivity of transport, then the problem is not one of this means of transport *versus* that, but of ensuring, through a flexible combination of facilities and adequate incentives, the most efficient service at the lowest possible total real cost at which it can be had within the limits of technical knowledge. And in the peculiar conditions of transport operation, this flexibility and efficiency are not produced by the pre-war processes of competing for traffic. During the war the Government has come to regard the various means of transport as so much, partly interchangeable, carrying capacity, and so been able to make the attempt to use them to the best advantage. It is a reasonable proposition that they should still be so regarded in peacetime, with the overriding emphasis on achieving a progressive reduction in real costs.

In theory, the transport problem is no different from that of other financially independent branches of an industry producing similar goods or providing similar services. As in cotton and rayon, or in the case of the chain store and the unit shop in retail trade, it is one of adjustment to changes in technique and costs. Normally, the adjustment, though often painful, takes place—or, at least, it should take place—through the price mechanism, with the consumer as the final arbiter. The problem of productivity is to speed up the adjustment.

In practice, however, transport has characteristics that render the problem of adjustment peculiarly complex. Without a careful examination of the technical and economic facts of transport it is impossible to devise the kind of policy likely to ensure the most rapid increase in productivity. Unfortunately, these facts have never been fully ascertained and expertly analysed; the layman can do no more than present some of them in broad outline.

One of the characteristics of public transport that must influence the formation of policy is the fact that the various means of transport are not competitive over the whole field of their operations. The non-competitive area is much larger than is generally supposed. It is large in both passenger and goods services, either because of the lack of alternative physical facilities or because of a difference in cost and charges that cannot be bridged at present. The road provides some public facilities—local passenger and goods delivery services—that the railways do not pro-

vide; the railways can move some traffic at charges with which the road cannot compete. (The railway companies, of course, operate road services as well as the railways.) To a point, that is, they operate in separate compartments; and the policy best suited to the competitive area is not necessarily the one that is likely to be most advantageous in the non-competitive area.

This, indeed, is the key to any rational solution of the problem of transport efficiency, and should be one of the foundations upon which a policy for transport should be erected. It is impossible to assess the precise extent of the non-competitive and competitive areas—they are, of course, continuously changing—or to estimate the proportions of the total revenue of the various means of transport derived from each. On the passenger side, the proportion of the total receipts derived by both rail and road from the non-competitive area must have been substantial before the war, and may actually have exceeded that derived from the competitive area. For example, in 1937, when main-line receipts were £58.6 millions and road passenger receipts (in 1937-8) were £89.6 millions, the average fares per passenger were 10.86d. and 2.03d., respectively; the size of this difference suggests that much the biggest part of road receipts is derived from short-distance local traffic.

On the goods side, coal falls almost exclusively into the non-competitive cost area, and is an excellent example of the bi-partite character of the transport situation. In 1937, rail receipts from coal were £34.4 million, no less than 37 per cent of total receipts from goods traffic. In its report, issued in 1939, the Transport Advisory Council reported

BALKAN SOBRANIE CIGARETTES & TOBACCO

FOR the BROWNED-OFF

When the world is made of corrugated iron and persons are merely numbers, when clothes are merely kit and all is blanco, when dinner is a haversack ration and the week-end an exercise, when leave has just been left behind and extra summer-time simply means an even earlier reveille, then is the moment when smoking can change the scenery, screen the irritation and camouflage the gloom... But the careless puffing of any old cigarettes or the nervous pulling at any old pipe tobacco may only deepen your browning-off. Let your smoking be circumspect and less promiscuous so that your sanity may prevail. In the cigarettes and pipe tobaccos of the House of Sobranie you have the perfect answers to present discontents and it's so much less bother than a visit to the Welfare Officer, and so much more satisfactory than a letter to your M.P.

SOBRANIE LTD. LONDON E.C.1.

that some 95 per cent of the inland trade in coal is "tied" to the railways. Heavy materials—building materials, minerals and steel—are also largely tied to the railways; in 1937 these brought in £14.6 million or 16 per cent of total goods receipts. The TAC was informed that only a tiny proportion of the steel tonnage is capable of transference to the road. The competitive area, in fact, is found chiefly in general merchandise; rail receipts from this were £41.7 million or 45 per cent of the total in 1937. As a broad guess, the railways probably derived about half their receipts from the competitive area in 1937; the position of the road cannot be ascertained accurately because of the complete lack of statistics.

The rate of diversion of traffic from rail to road is difficult to estimate for passengers. In the case of goods traffic (exclusive of coal) originating in places where the railways are operating the average annual rate of diversion between 1934 and 1938, in terms of tonnage, was about 0.75 per cent. Diversion at this rate means that over the five-year period alone, the cumulative loss of traffic amounted to some 3,700,000 tons; equivalent to an annual loss of receipts of about £1,900,000. If the rate of diversion had been the same between 1923 and 1933 as between 1934 and 1938—it was probably higher—the cumulative loss would have been some £6,000,000. Moreover, in order to slow down the rate of diversion, the railways had to advance their charges. Within limits this tendency benefits the consumer.

The problem of competitive and non-competitive areas

DISTRIBUTION OF RECEIPTS FROM RAIL AND ROAD SERVICES IN 1938

	Distribution of Receipts from Railway Passenger and Goods Services	Distribution of Road Passenger Receipts of Public Service Vehicles (excluding LPTB)	Distribution of Receipts from Railway-Operated Road Haulage
<i>Truck Costs:—</i>			
Working expenditure...	16.33	13.00 (a)	12.82 (a)

Surplus	...	8.09	15.81
Total Receipts	100.00	100.00	100.00

(a) Licence and petrol duties.

is, of course, not confined to rail and road; these have been singled out as the most important means of public transport. Moreover, the issue is further complicated by the existence of a substantial competitive area between private and public transport, that is by the private cars in passengers and the "C" licence in goods.

*

A second leading characteristic of transport as organised before the war, is that the various agencies or facilities do not compete on equal terms. First, there are legal differences in the treatment of the various means of transport. The "common carrier" principle is applied unilaterally to the railways; within broad limits, they cannot pick and choose. Again, while the road haulier is free to charge rates as he thinks fit, railway charges are subject to comprehensive regulation. The conditions of entry, on the other hand, favour the railways. While the railways can increase their rolling stock at will, the entry of additional commercial vehicles is restricted by the machinery of licensing. True, the railways have to obtain Parliamentary consent in providing new lines; but this condition can nowadays hardly be said to have a restrictive effect.

Thirdly, there are economic differences in the conditions of supply, especially in tracks—shipping and air, of course, have no track costs at all. Although the railways obtain a comparatively small contribution to their track costs from private owners of rolling stock, they are responsible for the whole cost. The commercial road user, on the

other hand, shares his track costs—consisting of licence and petrol duties—with the private user. The problem of refining road track costs and of apportioning them between public and private users is extremely complex and has caused many headaches. Another important difference between rail and road tracks is that the one is owned by the railways and the other by the state—that is by local authorities and the central Government. Within limits, total rail and road track charges are both fixed irrespective of variations in the volume of traffic. But whereas rail track charges are fixed to the railways, road track charges are fixed to the state, and not to the individual road user. This gives the road user an important advantage. The amount of petrol tax he pays varies with his mileage; in bad times he can also reduce his licence duties by laying up some of his vehicles or by reducing his fleet; and he can transfer his vehicles from an unprofitable to a profitable area.

Again, the lack of adequate data—especially about road haulage—renders it impossible to give precise statistical expression to the effect of legal discrimination and of differences in conditions of supply of the various means of transport. Assuming a 4 per cent rate of interest on capital, a broad picture of the differences between road and rail costs can, however, be given by the accompanying analysis of the distribution of receipts in 1938 from railway passenger and goods services, from the road passenger services provided by public service vehicles (excluding the LPTB), and from the railway-operated road haulage services. These figures provide one of the chief clues to the success of the road. Track charges represent one-third of the costs of the railways; they represent only about a seventh of those of the road passenger and haulage services (on the assumption that the experience of the railway companies with their road haulage services is broadly representative of that of road haulage as a whole). Even if the interest on the capital invested in rail tracks were halved, the road would retain a substantial advantage.

The most important of all special characteristics of the pre-war regime of British public transport is that it could not secure the lowest possible total cost of moving traffic in the area where the alternative facilities were actually competitive. The diversion of traffic from rail to road that could be handled with existing capital equipment, but requires additional expenditure on the road, increases total costs by the amount of the additional capital and maintenance cost of the road. In other words, by carrying specific goods hitherto transported by rail more cheaply, the total cost of transport may actually rise. The problem would remain even if the railways could ensure financial stability by raising rates in the non-competitive area. Nor could it be solved satisfactorily—though there is some scope here—by a reduction in the fixed costs of rail through the closing down of lines. Competition between road and rail is not merely competition in given areas, but competition in given traffics. Moreover, wholesale closing down of lines would reduce traffic not only in the competitive but also in the non-competitive price area.

If the road could take over from the railways the solution of the problem would be painful, but would not present special difficulties. The railways would gradually go out of business through the diversion of traffic, speeded up by capital consumption. But, although some 60 per cent of the volume of goods traffic (excluding coal) originating in places where the railways are operating goes by road, the road cannot take over from the railways, at any rate for as many years as it is possible to look ahead in the formulation of policy. Hence, the railways must be kept efficient; that is, they must be able to earn enough to keep their equipment in line with technical progress.

*

Because of these special characteristics of the pre-war regime of public transport—they are, of course, special only in the sense that they are different in degree from those of other industries—transport requires special treatment, if the aim of the lowest possible total cost is to be achieved. The urgency of the matter depends, obviously, on the difference between the cost of the present regime and the cost of alternative schemes to the community. It is impossible to assess this difference; but even if it was not excessive in the past, it may well show a progressive increase under the pre-war regime after the war, first, through the further duplication of facilities; and, secondly, through the possible financial inability of the railways to maintain their necessary facilities in line with technical progress—by main-line elec-

trification, for example. The position is complicated by the fact that commercial road transport is not the only determining factor influencing additional expenditure on road improvements. A better road system must in any case be provided to carry a growing volume of private transport.

The future volume and nature of traffic, inevitably, is of great significance in the treatment of the transport

Business Notes

Control of French Assets

The rapid progress made in the liberation of France promises fairly early consideration of the status of French assets in Great Britain. Since June, 1940, these assets have been under the control of the Custodian for Enemy Property, and have either been wholly immobilised or convertible within the limits of a small and strictly defined selection of investments. The unfortunate necessity of having to regard France as enemy territory has created some awkward and delicate situations. That of the French banks in London may be given as an example. They had substantial sterling funds, held in the main for account of clients in France. In 1940, these assets came under the control of the Custodian. The French banks here were at first given considerable initiative in the utilisation of these funds. Later the Custodian gave a stricter definition of the assets in which these funds could be utilised. These included British Government securities, the discount of bills of exchange, and money market loans. With the gradual freeing of the French Colonial Empire, and of North Africa, the London offices of these banks have, by this control, been deprived of many opportunities of re-engaging in active commercial banking operations. These offices may have to exercise their patience a little longer before they regain their full liberty of action. In liberating French assets and opening the doors to unfettered commercial and financial dealings with France, the Custodian for Enemy Property and the other authorities concerned must hasten slowly. The liberation of France will need to have proceeded much further before such a step can be taken. Moreover, some answer will have had to be given to such a pertinent question as the ownership of the greatly increased capital of the French banks concerned. All these institutions have issued substantial amounts of fresh capital during the years of occupation, and there is a strong supposition that part of this additional capital came under German control. Such difficulties will not arise in the case of the French branches of English banks. The main problem in these cases is the physical one of re-establishing contact. Once this has been solved, some attempts will have to be made in tracing back the operations made while these branches were under enemy control. It was in July, 1943, more than 18 months after Algiers had been freed, that the Trading with the Enemy regulations were lifted by Great Britain from North Africa. In the case of Italy, the regulations remain in full force. It is hoped that there will be no unnecessary delay before the ban is lifted from metropolitan France.

* * *

Portal Houses or Motor Cars

In the course of a speech on August 26th, Sir Miles Thomas, vice-chairman of the Nuffield organisation, suggested that there might not be enough sheet steel after the war to meet all demands. In particular, he raised the question whether there will be enough steel sheets for Portal houses and motor cars. The sheet manufacturing capacity of the British steel industry is about 1,500,000 tons a year. The construction of Portal houses at the rate of some 100,000 a year is said to absorb more than 400,000 tons of sheets. On the basis of 8 cwt. per unit, the production of motor cars at the pre-war rate of about 350,000 a year would require some 140,000 tons of sheets. There will, of course, be demands from many other sheet-consuming industries, such as the tinplate trade, for example. It is quite possible that the supply of steel sheets will be inadequate to meet all demands. But scarcity will not be confined to steel sheets during the period of re-stocking after the war. The solution of the steel sheet problem—as that of other scarce materials—is a system of priorities. So long as there is not enough to go round there must be rationing; first things must come first. But there is every reason to believe that motor cars for export will be high on any list of priorities.

problem. No doubt a steady upward trend in traffic would appreciably ease the problem and render it less urgent. But it should not delay its prompt consideration and the thorough examination of the possibilities of alternative transport regimes. It will be the purpose of two further articles to indicate what these possibilities are, and to suggest which solution seems most preferable.

Unit Trust Control Council

Three unit trust management groups—Municipal and General, Allied, and Orthodox—have formed a Unit Trust Control Council, with the principal object of reinforcing the literal (and mainly negative) regulations recently issued by the Board of Trade by observance of their "spirit" and of a supplementary code of conduct. The Council is not a trade association concerned with managers' interests, but a body which has submitted itself to the principle of protecting the unit investor. This is a new conception of unit trust management; it is welcome to-day, and should be of even greater benefit when the unit trust closed season is ended after the war. The Council is open to all management groups who are prepared to conform to its charter. Its members are obliged to quote repurchase (or "bid") prices for their units calculated on a basis symmetrical with that enforced for "offered" prices by the Board of Trade Regulations; this rule is a valuable supplement to the latter, and closes an unfortunate gap. Inflation of distributions—at the expense of capital—by artificial cum-dividend purchases, or the inclusion of wasting assets, will be prohibited or brought into the light. Member trusts undertake to reduce "that part of the preliminary charge . . . which is not attributable to formation or promotion expenses or agents' commission" by a proportion "related to the life of the trust." Complaints by unit holders (supported if necessary by a deposit of up to £5) will be investigated by an independent Comptroller (Mr. E. D. Basden, F.C.A.), who will have wide powers to confirm or remove members of the Council, to approve or disapprove trusts,

**SEE WHAT YOU SAVE
WITH FUEL WATCHING**

A fuel watching system is as good as management makes it. Backed by personal interest and enthusiasm it will pay and pay handsomely. Without managerial drive it may be a failure. *The choice is yours.* A well-directed fuel watching system is, in many instances, the only real answer to the factory fuel supply problem. Economically, it is a sound business proposition.

PRACTICAL SUGGESTIONS. See that every point of usage of heat, light, and power is a Fuel Watcher's responsibility to prevent waste. Make sure that your system covers each department. Post in each department practical directions for the economical usage of steam and water, gas, electricity, oil, and compressed air in that department. Encourage suggestions and schemes from all your Fuel Watchers for even greater savings of coal, steam, hot water, gas or electricity, oil, and compressed air. Give every suggestion personal consideration.

Together, a good Fuel Watching System and the intelligent use of your Fuel Efficiency Bulletins cannot fail to yield immediate and very welcome economies of coal gas, and electricity.

Look up Fuel Efficiency Bulletin No. 7 without delay for further information. If you've mislaid your Bulletins send to your Regional Fuel Efficiency Secretary for further copies.

ISSUED BY THE MINISTRY OF FUEL AND POWER

and to inspect their records. Appeal from his decisions will lie to the Referee (Mr J. C. Burleigh, C.A.), whose decision will be binding unless over-ruled by 90 per cent of the votes of the Council (excluding those of the appellant). Voting power will be allotted to groups on a scale varying with the aggregate value of their trusts.

The Council thus comes into the world equipped with the highest motives and a written constitution; it has disavowed any restrictive aims, and it deserves success. Its usefulness will be greatest in legislating for points which are not covered by the Board of Trade Regulations, for the latter, if reasonably adequate, are less than perfect. The Comptroller will have much control over detail in such matters as pricing and advertising which, in part at least, are already the concern of trustees, auditors, certifying brokers, and the Board of Trade; it is important that this supervisory aspect of his work should not take precedence over the more judicial and formative functions which he will also exercise. Much will depend upon the guiding principles by which he performs his duty of approving trusts as a condition precedent to membership of the Council—a matter on which he has the widest discretion. Indeed, no stereotyped rules are possible. The main business of unit trusts, after all, is to sell units of sound quality at fair prices, but in an active period of unit trust formation; managers are bound to emphasise the selling points of their trusts irrespective of their merit—which, indeed, may be considerable. Hence the Comptroller's discrimination between an intrinsically poor investment and one whose qualities are hidden rather than revealed by attractive wrappings will be crucial. There remains the final question of the support which the rest of the movement will accord to the Council. Will it be content to rest itself on the Board of Trade regulations? Will it be prepared to sink rooted distinctions of practice and personal differences, and join the new body? At present there are three distinct groupings in the unit trust movement—those forming the new Council under the leadership of Municipal and General; the Faber group; and the Lawson group. The two latter groups will doubtless respect the intentions of the Council, but for various reasons they may not find it easy—at any rate, for the present—to subscribe to its constitution.

US Industrial Reconversion Loans

The process of reconversion of industry from war to peace production in the United States has now reached the point at which the help of the commercial banks has been sought to finance contractors whose war contracts have been terminated. On termination of such contracts the contractor concerned or any of his sub-contractors is entitled to convert into cash at his local bank approximately 90 per cent of the "sound value" of the war assets frozen by the action of the US Government. These loans are described as termination loans (T-loans). The lending banks are protected in full on these loans by a Federal Reserve Bank guarantee. In order to speed up the granting of small loans of this character, Federal Reserve Banks, as fiscal agents, have been authorised to approve T-loan guarantees of a maximum of \$500,000 for each borrower. T-loans are granted as part of the programme of the Office of Contract Settlement, whose functions, as defined in the Enabling Act approved on July 1st, are as follows:—

- (1) To facilitate maximum war production during the war and expedite reconversion from war production to civilian production as war conditions permit.
- (2) To ensure to prime contractors and sub-contractors, small

and large, speedy and equitable final settlement of claims under terminated war contracts, and adequate interim financing until such final settlement.

(3) To assure uniformity among government agencies in basic policies and administration with respect to such termination settlements and interim financing.

(4) To facilitate the efficient use of materials, manpower and facilities for war and civilian purposes by providing prime-contractors and sub-contractors with notice of termination of their war contracts as far in advance of the cessation of work thereunder as is feasible and consistent with the national security.

(5) To assure the expeditious removal from the plants of prime-contractors and sub-contractors of termination inventory not to be retained or sold by the contractor.

(6) To use all practicable methods compatible with the foregoing objectives to prevent improper payments and to detect and prosecute fraud.

Cement Re-Financing

With the average rate on industrial debentures at about 3.85 per cent, Associated Portland Cement Manufacturers are doing well to be able to convert their second debentures to a basis slightly lower than $3\frac{1}{2}$ per cent. The existing issue of £1,321,385 $4\frac{1}{2}$ per cent second debenture is optionally repayable at 102 on December 1st of this year and the board is to exercise the option. Twenty per cent of the capital sum, together with part of the premium, is to be repaid out of the resources of the group and the remainder will be replaced by a $3\frac{1}{2}$ per cent issue at 101, redeemable at any time after December 1, 1954, at 102, and by purchase or tender at or under that price, or by drawings at that price, through the operation of a cumulative sinking fund of 2 per cent per annum commencing next year. Interest and sinking fund on the stock and the two senior issues are covered some $5\frac{1}{2}$ times by the earnings of 1943 and the capital value of the three issues some $3\frac{1}{2}$ times by net assets in the latest balance sheet. This is a substantial under-estimate, as the large holding of British Portland Cement is taken into the accounts of the parent at far less than its present market value. As the leading group in an industry which has in recent years been very closely co-ordinated, Associated Portland Cement enjoys a very strong position. The secular trend of the demand for cement is almost certainly upward, while the immediate post-war requirements are likely to keep the industry very fully employed. Even in these favourable conditions, a gross running yield of under $3\frac{1}{2}$ per cent, with the prospect of a very moderate profit on redemption, is distinctly low. If this level is to be typical of post-war borrowing by progressive industries, the whole of their finance, whether it is raised by debenture or equity issues, should be obtained on terms which will appear very low compared with pre-war experience.

Coast Lines Improvement

On the face of it, Coast Lines have had a much better year in 1943 than 1942, total profits, at £390,000 odd, being up by nearly £50,000, and although increased taxation provision absorbs half of this increase, earned for ordinary working out at 6.9 against 4.6 per cent. Full figures for the last three years, so far as they are published, are given on page 329. The difficulty is that every year a considerable but greatly varying amount is taken into the accounts of the parent company in respect of past profits of subsidiaries, profits that arise "on settlement of normal trading matters." In other words, the profits actually revealed may be merely a matter of convenience, and there is no means of knowing what reserves may be held by subsidiaries, or whether a draft is made on them. It is impossible to discover, even roughly, the actual earnings of the group for any given year, and the only real pointer to increasing prosperity lies in the raising of the ordinary dividend—previously increased for 1942 from $2\frac{1}{2}$ to 3 per cent—to 4 per cent. Also, net liquid assets appear to have risen by nearly £150,000, and, in addition, the assets concerned have become more liquid, with an increase of nearly £200,000 in both cash and tax reserve certificates and a reduction of £150,000 in debtors. The absence of a consolidated balance makes these figures also of uncertain value. No doubt liquid assets were built up for the purchase, which has taken place since the date of the balance-sheet, out of the liquid reserves of the group, of the Tyne-Tees Steam Shipping Company and its subsidiary, Free Trade Wharf Company. In addition to vessels,

this company owns wharf and dock properties at Newcastle, Middlesbrough, and London. It is stated that this move will bring about a satisfactory and economical dovetailing of shipping services on the East Coast. The increase in operating assets revealed in the balance-sheet is mainly due to the earlier acquisition, in April, 1943, of the business of Robert Gilchrist. The expanding size and importance of the Coast Lines group, as well as the large proportion of total assets which consist of inter-company items, make it all the more imperative that a consolidated balance sheet should be produced, as being an indispensable condition of any evaluation of the group's true position.

Sudan Plantations Disappointment

A further indication of the probable post-war attitude to the overseas investor is provided by last week's announcements by the Sudan Plantations Syndicate and the Kassala Cotton Company. In both cases the companies' concessions are due to expire in 1950 and before the war negotiations had been commenced, with apparently favourable results, for an extension. Last week it became known that the Sudan Government had decided that, on political grounds, no extension is possible. The shareholders have, of course, no grievance. Indeed, the ordinary shares of £1 of Sudan Plantations, which controls Kassala, are said to have a break-up value of 45s. It is impossible to say what the figure will be in six years' time, June 30, 1950, when the concessions expire. Meanwhile, the quotation is 43s. 6d., while that of the Kassala rs. ordinary is 2s. 3d. The Sudan Government makes it clear that the considerations they have in mind are political. It seems evident that the sphere over which development by concession will in future be possible is very restricted. In this case the break is apparently to be complete. There is no question of forming a Sudanese company with British capital to continue the work. Evidently the local accumulation of sterling holdings will make any such expedient unnecessary. But at a later period, when the accumulations due to the artificial war-time conditions are exhausted, most of the less developed countries will again require outside finance, unless they are to adopt the heroic methods of Soviet Russia. The indications at present are that, when that time comes, foreign capital will only be welcome if it is used to set up companies operating under the local law and controlled in no small measure by local nationals. Past experience suggests that, under such conditions, money will only be forthcoming if the gross return to be expected is much higher than that obtainable in the country which produces the capital.

Underground Gasification of Coal

Much has been made recently of the possibilities of the underground gasification of coal as a means of revolutionising present coal-mining methods and of using coal deposits more efficiently. In an article in the *Iron and Coal Trades Review* of August 25th, Dr Foxwell, the fuel technologist, has examined these possibilities in the light of the processes adopted in Russia and the experiments and research carried out elsewhere. Underground gasification involves the burning of coal to carbon monoxide *in situ*; in principle the process is the same as that of gas-producer operation. He reaches this conclusion:

Whilst there is no inherent difficulty in obtaining a low grade of producer-gas by underground gasification there are very serious difficulties to be overcome before coal can be used efficiently by this means. The gases which are obtained could be used for boiler firing, but would require a great deal of expensive purification and re-formation before they would be suitable for chemical utilisation. We shall have to solve the problems of the supply of sufficiently cheap oxygen for enriching the air used for gasification; we shall have to regulate the temperature in order to produce a gas low in CO₂ and we shall have to discover means whereby adequate contact can be maintained at all stages of the gasification between the coal and the air. Finally, there is the problem of coal left unconsumed in the mine.

Dr Foxwell's survey may disappoint those who saw in underground gasification an immediate short-cut to the solution of the British coal problem, which is essentially one of low productivity in relation to that of the coal-mining industries in some other countries and in relation to other British industries. If the productivity of the coal-mining industry in this country is raised to the limits of technical possibilities, it can afford to pay good wages and supply

coal at a price that will not handicap the consumer. If underground gasification provides at present no short cut to the solution of the British coal problem, the experiments made, especially in Russia, stress the need for exploring and trying out new ideas. The rejection of new ideas, simply because they are not of immediate application, is a negation of technical progress.

Five Years' War Finance

The Exchequer and debt returns bringing figures up to August 26th last complete the fifth 52-week period since September 3, 1939, the date of the last return to be published before the outbreak of the war. Details of the expenditure, revenue and borrowing in each of these five war years, and of changes in the national debt, are given in the accompanying tables. Total expenditure for the five-year period amounted to £23,671.7 million while tax revenue at £10,511 million represented 44.4 per cent of the amount spent. In the fifth year the ratio of expenditure covered by taxation was 51.4 per cent.

BRITISH WAR FINANCE

catering and domestic service. As shown in the accompanying table, the average weekly earnings of all workers in January, 1944, were 95s. 7d., an increase of 3 per cent over July, 1943, and of 79 per cent over October, 1938. The average of women's earnings is about half those of the men, but the higher average percentage increase shown for women is attributed by the *Gazette* to the increase in the number of women employed on work formerly undertaken by men. The general increase in earnings over October, 1938, is due to a combination of factors, such as increases in wage rates, longer hours, night work and overtime, extension of payment by results, and changes in

the proportions of men, boys, women and girls employed in different industries. Wage rates, obviously, though they have increased in relation to the level of October, 1938, have not increased to anything like the same extent as earnings. The average level of rates for a full normal working week was 32 per cent higher in January, 1944, than in October, 1938, compared with the 79 per cent increase in earnings. The average hours worked by all workers covered in the survey were 49.2, compared with 46.5 in October, 1938, an increase of 6 per cent. The hours worked by men were 52, by youths 47.1, by women 45.2, and hours worked by girls 44.6. Although mining is excluded from the Ministry of Labour survey, figures collected by the Ministry of Fuel show that miners' earnings increased in roughly the same proportion as those of factory workers. Average earnings per manshift in the three months ended March, 1944, were 20s. 3½d. compared with 11s. 5½d. in the corresponding period of 1939, an increase of 77 per cent. In the same period, miners' weekly earnings increased by about 74 per cent.

Industrial Catering Wages Board

The Industrial and Staff Canteen Undertakings Wages Board, the composition of which has now been announced by the Ministry of Labour, is the first Wages Board to be set up under the Catering Wages Act, 1943. The Board consists of 15 representatives of the employers and 15 representatives of the workers, with three independent members, one of whom, Mr William Gorman, K.C., is chairman. Its functions have been described as being to fix wages and prescribe meal and rest intervals and holidays with pay; it can also make recommendations about health and welfare. Though the Catering Commission reported an absence of satisfactory voluntary negotiating machinery in industrial catering in general, a considerable proportion of workers are covered by agreements. For those employed by outside caterers, organised in the National Society of Caterers to Industry, wages have been fixed by the Joint Industrial Council. They range from 62s. 6d. for a 48-hour week for male porters to 80s. for male cooks, and from 41s. 6d. for women cleaners to 55s. for women cooks, with corresponding gradations for juniors. Extra pay is received for night duty, and, in addition, emoluments, such as meals and overalls, are provided. An agreement covering canteen staffs in Royal Ordnance Factories, has just been concluded, and though no details of the agreement have been published, it is understood to prescribe somewhat higher rates. Presumably one of the Board's aims is to bring about a measure of uniformity between the different sections of the industrial catering trade. Since factory canteens are a feature of wartime legislation, which has presumably come to stay, it is highly desirable that the conditions and standards of canteen workers should be regularised. It will in any case be interesting to watch the development of the Board's work, in view of the stormy history attached to the Catering Bill. This aspect of catering is, however, straightforward in comparison with the wider field, to which the Catering Wages Commission is now turning its attention. It has begun to collect evidence about wages and conditions in hotels, restaurants, boarding-houses, and the holiday and entertainments trade in general, and its report is awaited with great interest.

Wardrobes and Rationing

Unfortunately, there are no records of the average quantity of clothing in individual wardrobes before the war, so that the effect of rationing on them cannot be estimated. Rationing has reduced the stock of clothing available for purchase by about half, but this does not help to estimate the diminution of the individual stock. The Board of Trade conducts surveys into wartime wardrobes, questioning a controlled sample of the population consisting of about 3,000 people of each sex. The results of the most recent one are summarised in the accompanying tables. They show that the average person possesses what is for practical purposes an adequate wardrobe, although it must be remembered that there must be a wide variation in the size and composition of individual wardrobes. On the whole, however, there are sufficient numbers of the various items to allow for changes and for laundering, cleaning and repairing. On the whole, men seem to be slightly worse off, relatively, than women, particularly in

shirts and underwear, although the coupon value of their clothes compares favourably with women. In April, 1942, the average man owned 230 coupons-worth of clothing, and the average woman 229. The comparable figures for December, 1942, were 237 and 241, and for April, 1944, 223 and 219. From the tables it would be possible to

calculate the average length of life of particular garments. For example, the average life of a man's suit is three years, and of a woman's nearly 4½ years. All the figures relate to civilians only, so that the relatively young and old are represented in greater numbers than they are found in the population as a whole.

Floating Debt Changes

The debt return for the four weeks to August 26th shows a marked falling off in the public's subscriptions to the Government's tap issues. Their combined total for this period was £60,749,000, against £95,635,000 in the preceding four weeks and £196,050,000 in the period from May 30th to June 30th. The tapering off of the Salute the Soldier campaign is mainly responsible for this change. Despite the reduction in the flow of savings to the Government's long-term issues and the maintenance of total borrowing at £218,355,000, compared with £226,826,000 for the previous four weeks, the floating debt borrowing has been kept down to £26,480,000. The small scale of short-term borrowing during August was due to the investment during the month of £120 million by the National Debt Commissioners in 3 per cent terminable annuities. This operation represented the investment of funds accumulated by the Post Office and Trustees Savings banks. Until they are permanently invested, such funds are normally lent to the Government in the form of Ways and Means advances; the latest debt return shows a reduction of £92,985,000 in the total of such advances from public departments. Both other floating debt items are higher. The net amount raised from the banks against Treasury Deposit Receipts was £60,500,000, while an additional £60,215,000 was raised by Treasury bills. The total of Treasury bills issued through the weekly tender remained unchanged at £1,430 million throughout the four weeks in question, and the increase, therefore, represents additional bills issued through the tap, probably for the investment of overseas funds accumulating in London.

Shorter Note

Retail sales of British co-operative societies in 1943 amounted to £331,547,123, an increase of £12,125,647 over 1942, and the highest figure ever reached; increased sales of

foodstuffs offset the decline in sales of clothing, household goods and furniture. Membership of societies increased by 157,350, bringing the total to 9,082,218. Share capital of retail societies amounted to £201,021,757 at the end of 1943, an increase of £21 million on the 1942 figure. Loan capital increased by £6,626,000, and reserve funds by £67,185.

THE INVESTMENT THAT ATTRACTED OVER £1,000,000,000 IN A LITTLE OVER 2 YEARS

£1,000 million and more—that is the huge sum invested in Savings Bonds since the previous issue appeared in May 1942.

Why are Savings Bonds so popular? Because they offer so many advantages... because they earn a generous 3% interest... because the wise man and woman with money to invest know they can do nothing safer or more patriotic than use their money to back Britain itself—now, and for the future.

POST OFFICE & TRUSTEE
SAVINGS BANKS ISSUES

Purchasable in multiples of £5, with minimum first subscription of £10. Maximum subscription £1,000. Interest paid half-yearly. Although subject to Income Tax, this interest is paid you in full, which means you will not need to make any rebate claims. Can be sold at any time through your Savings Bank.

BANK OF ENGLAND ISSUE

No limit to holdings. Purchasable in any odd amount, inclusive of shillings and pence, provided it is not less than £50. Income Tax is deducted at source where interest payments are over £5 per annum.

COMPANY MEETINGS

STANDARD BANK OF SOUTH AFRICA, LIMITED

ACCOUNTS DISCLOSE SATISFACTORY POSITION

DISTRIBUTION AGAIN 14 PER CENT.

MR J. F. G. GILLIAT'S REVIEW

The 131st ordinary general meeting of the Standard Bank of South Africa, Limited, was held, on the 30th ultimo, at the head office, 10 Clements Lane, London, E.C.

Mr J. F. G. Gilliat presided.

The secretary (Mr H. Dales) read the notice convening the meeting and the auditors' report.

The following is the statement of the chairman circulated with the report and accounts:

In view of the prevailing war-time conditions the proceedings at the annual general meeting will again be confined to the necessary formal business. This brief statement on the affairs of the bank is, therefore, being circulated to shareholders with the report and balance-sheet as at March 31st last.

It will be seen that the balance-sheet shows a satisfactory position. Compared with the figures for the previous year, deposit, current and other accounts show an increase of nearly £21 million, mainly due to the volume of money put into circulation in consequence of war-time activity. Cash in hand and at call and short notice rose by about £14 million, and investments were higher by £4 million as the result of purchases of Government stocks. The item of bills discounted, advances to customers and other accounts reflected an increase of nearly £3 million.

ALLOCATION OF PROFITS

The balance of profit for the year, after making an appropriation to contingencies account, was £567,351, being slightly less than the figure for the previous twelve months. With £173,835 brought forward the amount for disposal was £741,186. The interim dividend paid in January last absorbed £125,000, and after appropriating £50,000 for bank premises there is a balance of £566,186.

It is recommended that £150,000 be allocated to the officers' pension fund, that a final dividend of 7s. per share be paid, together with a bonus of 2s. per share, making a total of 14 per cent. for the year, and that £191,186 be carried forward.

It will be observed that the form of certificate by the auditors which is appended to the balance-sheet and profit and loss account is much fuller than that given on previous occasions. This has been rendered necessary by the provisions of the Banking Act, 1942, which came into force in the Union of South Africa on July 1, 1943.

UNION'S ECONOMIC POSITION

The events of the year under review brought no material change in the economic position of the Union, and the contribution of the gold mining industry in the form of wages paid, stores purchased and taxation and dividend disbursements was again the main stabilising factor.

In the farming industry very fair production results were achieved, and, as the general level of prices was higher, virtually all farming districts enjoyed another year of prosperity. Industrial output was, on the whole, fairly well maintained.

THE CURRENT YEAR

As regards the present year, one of the chief problems will doubtless continue to

be the difficulty of obtaining supplies, but it is expected that the volume of business will be maintained at approximately the same level.

We all know of the great part played by the Union in the war effort. In the systematic planning to make the transition from war to peace as effective and smooth as possible, the exhaustive investigations of the Social and Economic Planning Council and the report of the Reconstruction Committee of the Department of Agriculture and Forestry have given the authorities well-considered guidance in regard to the basic long range principles that are deemed essential for the welfare of the country in general.

THE RHODESIAS

In Southern Rhodesia trade and industry were sustained at an active level, principally under the stimulus given through the heavy war-time expenditure of the Government. The mining industry is receiving valuable assistance from the Government for expansion and development over a period of years. In addition to gold mining Southern Rhodesia continues to make a considerable contribution towards the war effort by the production of other minerals.

While the main agricultural crops are tobacco and maize, greater attention has been given in recent years to the cultivation of wheat, cotton and other farm produce. In Northern Rhodesia the production of copper was again of great value to the United Nations.

In Nyasaland business generally was well maintained. Internal trade is not expected to show any material change during the present year. In South-West Africa business activity continued at a high level, and prospects would seem to be favourable.

In East Africa endeavours were concentrated on increased production to satisfy both the large internal market and export demands. Notwithstanding the higher efficiency of internal organisation the efforts did not meet with entire success, owing mainly to the lack of adequate rainfall and the recurrence of pests. In some districts, however, agricultural conditions have since shown an improvement.

TRIBUTE TO STAFF

In conclusion, I would make special reference to the very efficient service that has been rendered by our staff. With Mr Milton Clough and his colleagues in the administration in South Africa, and Mr Ralph Gibson and his colleagues in London, the conduct of the bank's affairs has remained in very capable hands. The extremely difficult nature of the times has imposed heavy strain not only on those officers in the more responsible positions, but on all who serve under them, and our thanks are due to the whole of the staff in Africa, London and New York for the excellent work they have done.

Our deputy-general manager at Cape Town, Mr R. W. Normand, has relinquished his duties after many years of loyal and devoted service. He carries with him our best wishes on his retirement on pension. Mr C. M. Hutchinson has succeeded Mr Normand as deputy-general manager in South Africa and Mr A. McK. White has been appointed an assistant general manager.

PROUD WAR RECORD

We are justly proud of the war record of our staff. At the outbreak of hostilities the male members totalled 4,600, and over 1,400 have been serving with the Forces in various spheres. Nine of these men have been awarded decorations and six have been mentioned in despatches.

It is with deep regret that we now have to record the loss of 79 of our young officers who have laid down their lives. To those who are wounded we wish a complete recovery and to those who are prisoners of war a speedy return.

The Chairman moved: "That the report and balance-sheet to March 31, 1944, now presented, be adopted."

Mr R. E. Dickinson seconded the resolution and it was carried unanimously.

THE DIVIDEND

The Chairman: I have now to make the following declaration: "As empowered by the Articles of Association, on behalf of the board, I now declare a dividend for the six months ended March 31, 1944, of 7s. per share on 500,000 shares, as a final dividend for the 12 months ended on that date, with a bonus of 2s. per share (making, with the interim dividend, a total distribution of 14 per cent. for the year), both payable in British currency and subject to income-tax, to be paid to those shareholders whose names appeared on the register on the 9th day of August and to become payable on the 2nd proximo."

On the motion of the Chairman, seconded by Mr Stanley Christopherson, the retiring directors, Mr Edward Clifton-Brown and Mr Bertram Lowndes, were re-elected.

On the proposition of Mr J. Seyd, Nissim, seconded by Mr R. E. N. J. F.C.A., the auditors Mr Roderick M. Peat, F.C.A., Sir Nicholas E. Waterhouse, K.B.E., F.C.A., and Mr Leonard J. Osmond, F.C.A., were re-appointed.

VOTE OF THANKS

Sir Frederick Eley, Bt., said that he was sure that shareholders who were not present would wish to join with those who were at the meeting in placing on record their appreciation of the directors' conduct of the bank's affairs during the past year. He therefore had pleasure in moving "That the cordial thanks of the meeting be accorded to the directors for their attention to the affairs of the bank and to the chairman for his conduct in the chair."

Mr B. A. Glanville seconded the vote and it was unanimously accorded.

The Chairman, acknowledging the compliment, said that he wished to emphasise their gratitude to the management and staff. Such an expression at an annual meeting tended to become a matter of habit and to be taken for granted, but when they realised the number of the staff who were on active service and also the fact that in spite of that the account was brought out as usual and all the difficulties overcome, he was sure that the warmer appreciation of what the staff had done. The existing conditions imposed tremendous strain on all and yet they had all carried on. (Applause.)

The proceedings then terminated.

RICHARD THOMAS AND COMPANY, LIMITED

ANNUAL GENERAL MEETING

The ninety-fifth ordinary general meeting of Richard Thomas and Company Limited was held, on the 30th ultimo, Grosvenor House, Park Lane, London.

Mr E. H. Lever (chairman of the company) presided.

Sir Harold Howitt, F.C.A. (representing the auditors, Messrs Peat, Marwick Mitchell and Company) read the report and the accounts.

The chairman moved the adoption of the report and accounts and the payment of an additional dividend on the Preference shares of 3½ per cent., less tax, and of a dividend of 12½ per cent., less tax, on the ordinary shares.

Mr John E. James (deputy chairman) seconded the resolution and, after the chairman had replied to questions, it was carried.

The auditors, Messrs. Peat, Marwick, Mitchell and Company, were reappointed and the proceedings then terminated.

THE RHODESIAN RAILWAYS, LIMITED

INCREASED GROSS REVENUE

CHAIRMAN'S STATEMENT

The annual general meeting of the Rhodesian Railways, Limited, was held, on the 30th ultimo, at 11 Old Jewry, London, E.C.2, Mr Arthur E. Hadley, CBE, presiding.

The following is the chairman's statement circulated with the report and accounts:

The gross revenue of £6,242,237 shows an increase of £239,244 as compared with the previous year, while working expenditure was £172,432 higher, leaving net earnings with an increase of £66,812 at £2,623,472.

After adding to this sum the various amounts credited in the net revenue account (including a special amount of £223,722 for taxation provided in the previous year and no longer required as the Southern Rhodesia Government have refunded Excess Profits Tax in that year), there was a total amount of £3,328,236 to meet debenture stock interest £883,582, debenture stock redemption £217,120, Excess Profits Tax in the Dominions £180,247 and income-tax in the United Kingdom and the Dominions £1,491,683, leaving a profit of £554,604 as compared with £398,680 in 1941-42. £430,604 of this profit is transferred to the rates stabilisation account, making it up to £1,943,429 at September 30, 1943, while £125,000 goes to the dividend account and enables the directors to recommend to members the payment of a dividend of that amount, less income-tax at 5s. 5.574d. in the £.

STRONG LIQUID POSITION

The liquid position of the company remains strong, with £740,538 in cash and nearly £8,000,000 in quoted investments, of which some £6,800,000 are gilt-edged.

The temporary war-time legislation passed in 1941 applying until September 30, 1943, was renewed until September 30, 1944, and the Governments of Northern and Southern Rhodesia have now issued Bills extending this legislation for another year to September 30, 1945.

The company is much indebted to the general manager and all ranks of employees who successfully dealt with even higher traffics than in the previous year.

It is specially gratifying to the directors that the work of the company and its employees should have been recognised through Mr W. J. Skillicorn, the general manager, being created a Commander of the Order of the British Empire in the King's Birthday Honours List.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring directors, Mr C. Hely-Hutchinson and Brigadier-General F. D. Hammond, C.B.E., D.S.O., were re-elected and the auditors, Messrs Cooper Brothers and Company, having been reappointed, the proceedings terminated.

WATNEY COMBE REID AND COMPANY, LIMITED

SATISFACTORY PROFITS

The ordinary general meeting of Watney Combe Reid and Company, Limited, was held, on the 31st ultimo, in London.

Colonel O. P. Serocold, C.M.G. (the chairman) said that the profits had been satisfactory. The result had been obtained in the face of the difficulties imposed by war conditions. The chief trouble was shortage of labour, a shortage which had in recent months materially affected their output, and was likely to continue to do so in the future so long as the drain on man and woman power, attributable to the war, continued. They did not appear to be the only brewers in that predicament, as complaints from the public of the stringency of beer supplies were widespread. It was the lack of the right sort of labour in the breweries and the shortness of staff in public-houses which had led to the unfortunate result that the would-be consumer might so often fail to obtain his requirements at the public-house of his choice. They could not fail to recognise the danger of the public becoming aggravated by reason of shortage of beer, but only the Government could take any effective steps to alleviate the position. Whether they considered it expedient to do so must remain to be seen.

OPENING HOURS

As a brewer, he wished to meet the public demand, and he also believed that the licensed victualler was the servant of the public and was there for its convenience. He would like to see the public-house open as long as possible, whether for the sale of intoxicating liquor during permitted hours or of other articles of food and drink beyond those hours.

They were still much in the dark as to the outcome in the re-development of the public house and other property damaged by enemy action and the legislation which must ensue, but there were two events of some importance which had happened since last year. They were the Town and Country Planning Bill which was still before Parliament, dealing with powers of purchase, etc., which local authorities would need in that connection, and the report of the Departmental Committee appointed by the Home Secretary. The report—known as the Morris Report—had been issued and outlined a very intricate and important plan affecting licensed premises in or connected with war-damaged areas. The provisions required for that purpose had not yet been given legislative form and, so far as they were concerned, they must still be content to wait and see.

DEFERRED REPAIRS

They considered that their customers were entitled to expect the best conditions of service and surroundings which could be reasonably provided and that their tenants should similarly enjoy decent domestic accommodation, but the time had not yet arrived when they could satisfy those requirements. What little they had been able to do had to be done at an enhanced cost and, applying that percentage increase to their accumulated deficiencies, they arrived at a very substantial total, which called for the appropriation of a further £300,000 in this year's accounts.

The trading profit had gone up by £211,000, to which had to be added increases of £34,000 on investment income, £30,000 from rents and £2,500 more brought in—a round total increase of £277,000.

The report and accounts were adopted and a final dividend of 9 per cent., making 15 per cent. for the year, and a bonus dividend of 5 per cent. on the deferred ordinary stock were approved.

JAMES HOWDEN AND COMPANY, LIMITED

CONTINUED HEAVY DEMAND FOR PRODUCTS

The thirty-eighth ordinary general meeting of James Howden and Company, Limited, was held, on the 25th ultimo, at 195, Scotland Street, Glasgow.

Mr Crawford W. Hume, M.I.N.A., the chairman, presided.

The following is the chairman's statement circulated with the report and accounts:—

Since the last meeting we have suffered a sad loss through the sudden death on September 11th last of Mr. William Hay Howden, the younger son of the founder of the business. Although still in his fifties, he had been a member of the board since 1907, and we miss him not only in the affairs of the company, but also on the personal side, where he was held in the greatest affection and esteem by all who knew him.

During the year the board has co-opted Mr Norman Burke and Mr Charles E. H. Eckersley, who have both served the company faithfully and well for a number of years as senior executives. It is my confident opinion that their services as directors will be of great value to the company.

BALANCE-SHEET ITEMS

The directors' report sets out the appropriations in the usual form and, apart from the provision for deferred repairs referred to below, it requires no comments. The consolidated balance-sheet shows the general reserve increased to £130,000, and this with the share premium account and the balance from the appropriation account brings the total of the reserves and undistributed profits to £167,373 after payment of the recommended dividend. The debenture stock has been further reduced by redemption to £92,400. The buildings, machinery and plant have been carefully maintained, but owing to war restrictions certain repairs have been deferred and £31,000 has been provided to cover the future cost of these.

MANY MONTHS' WORK IN HAND

Our order book remains in a very satisfactory condition and ensures a busy time for many months to come. While during the war we have, like many similar companies, undertaken work of a special character, there has at the same time been a heavy and continuing demand for our own products. This fact should help us in the coming change over to peace conditions. During the year we have again benefited by the wholehearted co-operation of the administration, the executive staff, and the workpeople, and on your behalf I should again like to thank them for their efforts.

The report and accounts were adopted and a dividend at the rate of 1s. 6d. per share on the 476,000 Ordinary shares of 10s. each, less tax, was approved.

THE ASSAM RAILWAYS AND TRADING COMPANY, LIMITED

The adjourned sixty-third ordinary general meeting of this Company was held, on the 30th ultimo, in London, Mr. E. A. A. Joseph (the chairman) presiding.

The following is an extract from the statement by the chairman circulated with the report and accounts:—A preliminary arrangement has been made with the Government of India, the result of which is that the rent payable for the first year of the lease appears in the revenue account as £120,000. Negotiations are continuing and it is hoped very shortly to settle the details of the working agreement and the rent for future years.

In the general revenue account the

The report was adopted.

Colonel J. G. Gaskell, T.D., D.L. (chairman and managing director) said that the accounts disclosed a successful year's trading notwithstanding the restrictions that had controlled their business during the year. The profits amounted to the record figure of £334,000. That result had been obtained by an increase in trade of almost 10 per cent. on the previous year.

12. "																	

that was not just and right"; the sketch of Clemenceau who "alone both had an idea and had considered it in all its consequences." Whether there are, or will be, historical and personal parallels in this second peacemaking, only the record will show. But the warnings are very clear; there is cause for the greatest care and the deepest humility on the part of the new peacemakers.

"It was the task of the Peace Conference to honour engagements and to satisfy justice; but not less to re-establish life and to heal wounds"; neither part of the task was performed. Now at Dumbarton Oaks, spokesmen of the Great Allies have met again to work out the preliminary material and military arrangements "to honour engagements and to satisfy justice." It is absolutely essential that this should be done, that a system of world security with power, and will, to enforce the peace should be founded, in fact as well as in name. But much more must be asked of the peacemakers. What of the re-establishment of the life of Europe and the healing of wounds?

The purpose of the present conferences at Dumbarton Oaks is simple, direct and to the point. It is to secure that the Allies, having won this war, will remain in alliance to prevent its recurrence. They will be the only Great Powers left after the defeat of Germany and Japan, and only Great Powers have the force to make or prevent modern wars. The conception of a World Security Council of Great Powers is thus a straightforward recognition of the executive responsibility which must rest upon the possessors of industrial power. It also represents the learning of one lesson at least from the inter-war failure. The League of Nations was equipped with sanctions against aggressors, but the Great Powers declined to employ them. In this respect, therefore, the World Security Council may be an improvement upon the League, not because unlike the League it excludes small states, but because it includes all the big ones, under pledge of action.

But this improvement is only a possibility. It cannot be ensured beforehand by any constitutional formula. The test of the Council, as of the League, will be quite simply whether the Powers (and their peoples) will be willing to go to war in order to prevent it; and this willingness will depend, in turn, on conditions and circumstances which are not on the agenda at Dumbarton Oaks. Even in the narrowest sense of security, the preservation of peace means more than preventing a renewal of German, Japanese or Italian aggression. Indeed that task itself will not be carried out by Allies grown unfriendly. If Germany, Japan and Italy are stripped of their power to fight, the only Powers capable of making war will be the Allies themselves; and it has already been made clear at Dumbarton Oaks that the members of the World Security Council will not accept the possibility of the Council being used against them. Fundamentally, therefore, future security will not depend upon the Council at all, but on the relations between the Great Allies.

Dumbarton Oaks is thus only at the beginning of the road to real security. Indeed it may well be that, by their exclusive concentration upon sanctions against the aggressors who brought about this war and upon the special responsibilities of the Great Powers—both crucial and essential points—these discussions, and their continuation at the highest level of statesmanship, may miss what in fact will be the conditions of a lasting peace. One of those conditions, clearly, is a sense of security and an absence of suspicion on the part of both large and small nations. Already, both fear and resentment have been expressed by the spokesmen of several countries at the possibility of "Great Power domination."

Whether there will be war or peace depends, in fact, upon the readiness of the Great Powers to be good neighbours, not only to one another, but also to other states. It is therefore imperative, if it is to be effective, that the World Council should be broad enough to bring in, permanently, or in rotation, smaller Powers; that there should be joint security arrangements and joint bases in particular regions between Powers of all sizes; and that great stress

should be laid upon the creation of a climate and a habit of international cooperation by means of joint bodies to deal with specific problems of an economic, social and technical character.

The project of Dumbarton Oaks is indispensable and urgent. It is, in brief, to organise a police force—though the functions of the force will necessarily be limited by the fact that its members will be their own judges. But to make a world society which is simply a police state is obviously insufficient, indeed most perilous. The object of ensuring that the Great Powers, in certain circumstances at any rate, will pull their full weight is imperative; but it is no less necessary that the other Powers also should be permitted to pull their weight. Indeed, it is only by the continuous working-together of all countries, according to their abilities, in policies of common concern that real peace can be made at all possible.

*

It is at this point that the argument comes back, in 1944 as in 1919, to the continent of Europe. Again the continent is in "fearful convulsions." Again it is "a matter of life and death, of starvation and existence." Again it is wilful folly to deny, in the smoke of the battle, that Europe is "deeply and inextricably intertwined by hidden psychic and economic bonds." Again it is vital to recall that there are essential liberties and rules of law, the legacies of the civilised growth of this continent which have been trampled down, not twice but many times by our foes in this Thirty Years War. These are the liberties and the rules that Mr Churchill himself pronounced in Rome a few days ago, in his own fine words.

Again, as in 1919, "we have been moved already beyond endurance, and need rest." But again, as in 1919, "the calculations of 'diplomacy' lead us nowhere." The temptation to leave the entire settlement this time to the private deliberations of the Big Three is very strong indeed. But it is we and our children who have the deepest interest of all in the establishment, in this second great peacemaking, of the conditions of real peace. It would be a poor end to all that has passed since September, 1939, and an ill-reward for the Allied soldiers who are now moving forward to the kill, if it could be said of this peacemaking, as Lord Keynes wrote of the last, that

The future life of Europe was not their concern; its means of livelihood was not their anxiety. . . . The Treaty includes no provisions for the economic rehabilitation of Europe—nothing to make the defeated Central Powers into good neighbours, nothing to stabilise the new states of Europe. . . .

It can be said already that no new Keynes will be able to level quite this reproach at the peacemakers this time. The Conference at Dumbarton Oaks is only the latest of a series, and all the earlier ones, at Hot Springs, Atlantic City and Bretton Woods, have dealt with the economic aspects of reconstruction, with food, relief and money. This is indeed a great advance. Nevertheless, it is still a question whether any security has in fact yet been provided for the future life and livelihood of Europe. It was not Lord Keynes's point twenty-five years ago that separate discussions should have been held, in Paris or elsewhere, to consider the economic future of Europe. It was rather that the peacemakers themselves, at the highest level of diplomacy and power, should have put that economic future first in their deliberations, as the foundation of the peace they were making.

The point made by Lord Keynes in 1919 is still sound of this other victory. If the peace cannot make of Europe a going concern, politically and economically, it will not last, and the security arrangements which are being devised at Dumbarton Oaks will be written down in history, like the League, as illusions. To say that UNRRA already exists for the relief and rehabilitation of Europe is to beg the question. Necessarily, UNRRA is a non-political body. It will serve Europe as well or as badly as the European political set-up to which it is attached. The fallacy is to suppose that economics and politics

can be separated. The political situation, in fact, will determine the economic outlook; and it is here that doubts about the peacemaking, which has been based so far upon the exigencies of the war itself and of power, must crowd in. Has any real attempt been made by the Great Powers or the small to create the conditions of good-neighbourliness, even among Allies?

*

The principles of the peace so far—inasmuch as they have been revealed to impertinent enquiry from outside the chancelleries—are four: the permanent impotence for war of the enemy and the punishment of all his criminals—all of which is most sound and necessary; the piecemeal stripping of enemy territories by annexations; the restoration, as far as possible, of the *status quo* in Europe; and the setting up of expert economic bodies. There are no signs yet of plans for a "viable" Europe. The essential elements of an enduring peace—after the immediate tasks of defeating the enemy and rendering him powerless—are still lacking. It is apparently proposed to erect the peace of Europe upon history's biggest minorities problem, and—to take examples of the political vacuum—upon such relationships as those which at present prevail between Russia and Poland, or upon the unloosing, after the Nazi heyday, of old Balkan feuds.

Upon this foundation no peace can be built, however wisely and completely the specific task of Dumbarton Oaks may be done. It is only by a recognition, and a realisation, of the unity of Europe's regions, and probably, for economic matters, of Europe as a whole, that

the continent's future can be rendered hopeful and the prospect of world peace be made bright. It is only by realising that there are principles of good neighbourliness, applicable alike to both persons and nations and made explicit in Mr Churchill's Rome speech, that the possibility of European accord, political or economic, can be established. It is only by the recognition of certain rules of good and expedient conduct, in both political and economic matters, by both Powers and smaller states, that the conditions of sincere peace-seeking can be set up.

The cry will no doubt go up again—at this moment of righteous pride and boasting—that these are "soft words" and a plea either for kindness to the enemy or for disputes with powerful Allies. In fact they are no more than a commonsense plea for frankness, for realism and for peace. No doubt there must be several categories of Powers after the fighting. There cannot be, either in fact or pretence, an equality between the nations. There will be Great Powers, with the responsibilities of their power; there will be smaller states; and there will be defeated foes, under the strictest pains and the closest vigilance, shorn of every chance to renew their horrid crimes. But unless each of these has a practical and appointed place in a working European system, unless there is a common rule which the most chastened German citizen can follow, unless there is protection for Poles as well as for Russians, and unless there are common and concrete schemes for European employment, production and trade, yet another page of history will be rewritten—the sad page that spans the twenty years between 1919 and 1939. There will still be darkness in Europe after the victory and the lights; the lamps will remain unlit.

French Crossroads

THE last acts in the liberation of France are taking place. Only isolated German garrisons on the outlying fringes still defend themselves. The main towns, the centres of communication and almost all the countryside are back in French control. But the re-constitution of political life is only just beginning. The Provisional Government has moved from Algiers to Paris. General de Gaulle has been establishing contact with the leaders of the resistance movements on the spot, and he has slightly reshuffled his Government without bringing in any new representatives of the political parties and of the Resistance inside France. There may still be more radical changes.

The liberation of France has been accompanied by an internal upheaval which has overnight swept away all the laboriously constructed edifice of the "National Revolution," preached by Vichy. The work of the French Forces of the Interior has been directed, not only against the foreign invader, but also against the grotesque authori-

tarian régime of Petain and Laval; and the Resistance has shown a political élan which has sometimes defied all attempts to keep it within the framework of schemes prepared abroad in advance or of particular political conceptions. The rising in Paris was itself an almost spontaneous act, a *levée en masse* which in part took by surprise even the leaders of the Underground. When the hour struck the response proved stronger than even the most optimistic had dared to expect. The struggle for liberation and its accomplishment have let loose popular energies with their own momentum.

This is the first conclusion to be drawn from the record of the great days that France has just lived through. Another is the craving of the French people for freedom of speech and expression. Four years of enforced silence have pent-up the irrepressible urge to speak minds freely and loudly. While the rising in Paris was still going on fourteen dailies began to appear in the capital. At a stroke, the course of events obliterated all the press laws and

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

regulations so carefully prepared at Algiers. The editors paid no attention at all to their elaborate provisions. The incident is an early and eloquent reflection of the unreality of some of the schemes produced at Algiers. The motive advanced to justify these restrictions on the freedom of the press—the desire to eliminate the collaborationist press—proved in practice meaningless: the collaborationist press disappeared automatically. And to the resisting Frenchmen nothing seemed more natural than that they should come out into the open, without let or hindrance, to state their convictions and set out their programmes. The re-birth of France is, at this early stage, the re-birth of French democracy.

The political parties, too, have returned to the stage. The press of Paris reflects all shades of French opinion, from Left to Right. Together with the political parties the Trade Unions (CGT) have emerged from the Underground. But it would be wrong to suppose that the new party alignment is the same as it was before the war. There have been important changes in personnel. Many old leaders have gone, either in consequence of their defection to Vichy or because they fell victims to persecution. New leaders have appeared, younger men steeled in the hard school of resistance but lacking the political experience of their predecessors.

The politicians are younger, and they are strikingly more radical in their social outlook. At first sight, indeed, it might seem that socialist ideas had won the day in most of the political movements. The demand for the nationalisation of key industries is voiced with equal zeal by Communists, Socialists, Gaullists, and Radicals. But it would be an error to over-simplify this development. More often than not these demands are formulated in patriotic rather than in socialist terms. The expropriation of industrialists is being demanded, not on grounds of doctrine, but as a means to punish the collaborators. The CGT, for instance, has proposed the confiscation of all factories whose owners have fled to Germany. Among the 4,000 collaborators arrested in Paris there are not a few members of the "two hundred families," the governors of the Bank of France, and the directors of trusts and concerns which, like the Renault plants, worked for Germany.

The radical mood of the people of Paris is reflected in the circulation of the papers which are now being published. The Communist *L'Humanité* heads the list with 200,000. The Socialist *Populaire* follows with 160,000. The other twelve dailies together have a total circulation of 120,000. Recruitment for the French Forces of the Interior provides a similar illustration. At first it was carried out independently by various organisations, including the political parties. In Paris, the Communist offices attracted the greatest number of volunteers for the FFI. Eventually recruiting by political organisation was forbidden. The relation of political forces in the capital is almost certainly not indicative of the political mood in the provinces. Even so, there can be no doubt that the Left has had a marked predominance in the ranks of the active resisters.

It would be quite wrong to deduce that the spectre of revolution is now haunting liberated France. During the years of the occupation the French Communist Party acted, not as a party of social revolution, but as the most energetic and vigorous faction inside the patriotic movement of resistance. Much of its increased prestige and influence is due to its fervent advocacy of French national interests. It is extremely unlikely that French Communism will now go back to its old revolutionary policy or that it will try to repeat the experience of the Paris Commune of 1871. Almost certainly, in France as elsewhere in Europe, the Communists will this time play a role very similar to that played by the Social Democratic parties after 1918. They will act as the Left wing in democratic coalitions rather than as an irreconcilable opposition to bourgeois governments. M. Marcel Cachin is not the French Lenin and M. Duclos is not another Blanqui; and revolutions do not succeed without their Lenins; nor can even abortive revolutions do without their Blanquis.

This is not to say that the great growth of Communist influence in France does not expose French political life to the risk of internal convulsions. Without necessarily being the party of revolution, the French Communists may be disposed to play with revolution, and so to stir the fear of revolution among the French middle classes and the peasantry. It was on such fears, more often than not unreal and exaggerated, rather than on real dangers of revolution, that all the authoritarian and fascist regimes of the inter-war period thrived. It was that fear that bedevilled French political life during the period of the Popular Front and gave rise to the outcry for "strong" government.

It is against this broader background that the role of Gaullism in liberated France must be viewed. For the mass of the French people, Gaullism has until now symbolised simply resistance to the invader; it has stood for no distinct political programme. Certainly the general acceptance of Gaullism has not meant, in the least degree, that the French people are willing to accept another authoritarian programme so soon after the failure of the ill-fated experiment of Petain. As the movement of resistance, pure and simple, Gaullism has nearly exhausted its glorious and memorable role. The question is whether it will be able to transform itself into a political party—into the ruling party of France.

This is the question to which General de Gaulle is now trying to find an answer. As a symbol of resistance Gaullism has swayed the whole of France. As a political movement it is still only a sect. It can stay in power only in a broad coalition with the other political movements. But it cannot form any such coalition without giving up some at least of its authoritarian aspirations. This is the dilemma confronting General de Gaulle.

The programme which he has brought with him from Algiers to Paris is so far largely negative; it has consisted mainly of the abrogation of old laws. The Constitution of 1875 has been abolished. The Chambers and the President (President Lebrun, who has never resigned from his office, is now in liberated France) have been swept aside. Confusingly, General de Gaulle appears in the double role of Head of the State and leader of the Government. In fact, he has also assumed the legislative powers of the two Chambers, since the Consultative Assembly, set up in Algiers, is itself only an advisory body. It is doubtful whether the political parties can agree to such an extraordinary concentration of powers in the hands of one man. If they do agree, then they will have voluntarily submitted to something very like a despotism, however benevolent or provisional the intentions of the despot may be held to be.

General de Gaulle may try to base his administration on the purely Gaullist Resistance only, and largely ignore the political parties; should he attempt to do this he will inevitably discover the weakness of Gaullism as a political movement. The Provisional Government would be a minority Government; and this in itself would at once give rise to fears of dictatorship—fears which might lead to just as lamentable consequences as the fear of revolution.

It would be a gloomy and misleading picture, however, which (from these first reports) presented liberated France as faced merely with the choice between fears of revolution and fears of dictatorship. There is no reason to believe that the prospects in France are nearly so grave as this. General de Gaulle has just been given the most cordial welcome by the people of Paris. The popularity and the confidence which he enjoys are quite exceptional. To suppose that he will squander these well-earned assets pursuing an unsound and perilous political path would be gratuitous and premature.

Apart from all the hopes and needs and hazards upon which the future of free France hangs, the war is not yet over, and the peace has yet to be made. France cannot afford internal dissension. But the difficulties which lurk in the present situation can only be overcome by the sustained and common effort of all Frenchmen to rebuild the Republic on the twin foundations of freedom and efficiency.

Industry and Capital

THE point at which the argument of this series of articles has arrived may usefully be summarised. The first article contended that a policy for increasing the productivity of British industry should take its place alongside the more familiar objectives of Full Employment and Social Security, which are indeed dependent upon it. It was suggested that the goal should be a doubling of the average output per man-hour within a generation. The second article argued that, though there are many factors in productivity, by far the most important is the volume of mechanical equipment with which each pair of hands is assisted; "Horse-Power per Head = Wealth" is the rule-of-thumb formula. The problem of increasing productivity is, therefore, very largely, one of increasing the rate of investment in productive equipment. The third article examined the supply of savings and reached the conclusion that, whether or not there would be enough savings to finance a greatly expanded programme of capital investment, there has been no shortage in recent decades. The small scale of productive investment is rather due to the apparent unwillingness of industry to engage in it. This may be partly due to the effect of taxation, which should be adjusted accordingly. But taxation affects only the disposition of profits, and the basic difficulty would seem to be that further investment is apparently not deemed to be sufficiently profitable to encourage industry to engage in it. The present article is designed to enquire into one aspect of why this should be so. Is the present structure of British industry limiting its willingness to expand its productive equipment, and would any reforms of structure or ownership increase the rate of capital formation?

The Socialist would, of course, answer Yes at once, without further enquiry. It was not the original contention of Socialism that public ownership would increase the productivity of industry but rather that it would improve the equity of the distribution of the product. But by natural extension, most latter-day Socialists argue that nationalisation is a specific for efficiency as well as for fairness. It is very doubtful, however, whether the argument holds any water at all. Productivity is very largely a matter of equipment, and unless any store is set by the contention that workers in a nationalised industry would feel so much happier that they would work well—a contention which is not borne out, but is rather contradicted, by experience—then the only way in which public ownership, as a general matter, could be better for productivity than private ownership would be if it speeded up the rate of capital investment. It is difficult to see why this should happen. It cannot be presumed that the managers of socialised industries would be any less careful or timid in assessing the prospective yield of new investment. Nor would they be in a position to ignore the prospective yield. A socialised industry would either be subsidised out of public funds or else it would be expected to pay its way. In the former case, its capital expenditures would be under Treasury control and would not be likely to gain as a result. In the latter case, the state manager would have to scrutinise the profit-and-loss estimate as carefully as the private manager. It is not as if the private manager, in the great majority of cases, insisted on an excessive rate of return, whereas the state manager would be content with less. Both would necessarily measure the prospective yield, after allowing for the risk of loss, with the cost at which they could raise money. The state manager might conceivably be able to raise money at a fractionally lower cost (though, if that involves a guarantee, only at the risk of Treasury control), but he is likely to have far more of his capital in fixed-interest form. On balance, if there is any difference at all, in this respect, between public and private ownership of industry, the verdict must be in favour of private ownership.

Nationalisation may or may not be desirable on other

grounds, either in general or in any particular industry. But it is not likely to speed up the accumulation of productive capital and thereby the rate of growth of the national income. There are examples in the contemporary world of the rapid accumulation of capital both under capitalism and under socialism. It seems overwhelmingly likely that the argument between private and public ownership can be dismissed as an irrelevance from the problem with which these articles are concerned. What is important for the growth of wealth is not the ownership of industry but the policy it pursues.

But there are, of course, ways in which ownership and structure do affect policy. The clearest and most familiar case is that of the coalmining industry which, on the testimony of every public enquiry for the past thirty years, is divided into units too small for technical efficiency. In this particular case, most people have probably made up their minds that public ownership is inevitable. Nevertheless, it is not the fact that the ownership is private, but the fact that private ownership is so diffused, that obstructs the path of technical reform. If the political and psychological conditions of the industry would permit, a series of large-scale privately-owned amalgamations might be the best way of increasing the efficiency of the industry. But, whether private or public ownership is decided upon, the crucial point is this: there is need for a reorganisation of the coal industry on the basis of technical rationalisation. Without rationalisation, both capital investment and efficiency will remain low; with rationalisation, both might advance very rapidly.

Another case in point is the iron and steel industry, where output per man-hour is very low in comparison with American experience. Here, too, the prescription should be for a technical rationalisation, in which the present complicated structure of ownership is disregarded, and the problem is thought of in terms of furnaces and mills, not of firms and companies. This could be done while preserving private ownership, or it could be done after nationalisation. The important thing is to leave on one side the sterile quarrel about ownership and to insist, in the national interest, that the technical task of rationalisation be carried through, as the prelude to a thorough modernisation of the whole industry. A similar necessity has long been recognised in the electric power industry. There also, the necessary technical rationalisation of the industry is being delayed by arguments over ownership, in which neither side is wholly right.

The only way in which these arguments can be brought to an end is by the Government abandoning its negative attitude of waiting until all the parties can reach agreement. It is not true that the state is an impartial umpire in these matters; it is the guardian of the greatest interest of all. At present, as has often been urged in these columns, the country is drifting into a position where the conduct of industry is dominated by the actions and the prohibitions of the state, but where the state has no policy to govern its actions. A Government that was really conscious of its responsibility would survey each of the major industries in turn, and wherever it found that, on strictly technical grounds, some degree of rationalisation would open the way to more rapid progress, would insist on its being carried through—under private ownership if desirable or under public ownership if necessary. Output per man-hour is the foundation of all wealth, and should be the objective of policy.

*

An even clearer example of the effects of negativism in Government policy is the great growth in the past two decades of restrictive practices in British industry. Not only has the Government—in this case, chiefly the Board of Trade—failed to prevent this growth; it has

actually been encouraged, not least during the war. In 1939, it was an extreme rarity to find a manufacturing industry where anything approaching genuine competition prevailed, where no control was exercised over either prices or the scale of production or the conditions of sale—and such exceptions as existed before the war will be found to have disappeared at its end. Even in the various forms of trading enterprise, where a few pockets of competition can still be found, the principle of restriction has made great headway in recent years. Moreover, this trend, so much in evidence in Britain, has been largely confined to this country, at least among the English-speaking nations. If there is some peculiarity of British industry to explain, then this is more likely, *prima facie*, to be the explanation than anything else.

It would be inappropriate to recapitulate here the whole of the case against the restrictive cartel or trade association; the argument must be confined to its effect on the pace of capital formation. The main purpose of all cartels is to restore, maintain or increase the profits of their members, and it may be that in years of depression an industry thus protected has larger profits and can engage in greater capital expenditure, than if it were open to the full blast of competition. It has been argued, for example, that the very tight restrictions imposed on the British steel industry in the 1930's were the direct cause of much renovation work being undertaken. If true, this applies only to the particular industry in question; there is no economic magic by which restriction can lead to a higher real income for the whole community, and if the steel industry was more prosperous than it would have been without the protection of the cartel, the community must have been poorer. Nevertheless, it is just conceivable that restrictive cartels in heavily capitalised industries may serve to keep up the level of investment in years of general depression.

But this is the limit of the concession that can be made. In years of reasonable prosperity, there can be no doubt at all that restrictive trade associations greatly reduce the volume of capital investment. They are designed to protect the profits of the industry. Fair words, of course, are spoken; it is only the "reasonable" profits of "efficient" producers that are to be protected. But these are weasel-words, and the decision is given by a trade association elected by the producers themselves. It cannot afford to have too many dissidents; the managers must retain their majority. So a firm has to be manifestly incompetent before it is refused the cachet of "efficient," and profits become extortionate before they are adjudged "unreasonable." And if the existing costs of production, using the existing methods and the existing equipment, can be protected in this way, what inducement is there to spend a lot of money and take a lot of risks in lowering costs? Machinery will, indeed, be replaced when it is worn out, or when the slow and stately process of saving up cash to replace it has reached its leisurely conclusion. But the machinery-makers are also protected and cartelised, so that the new machinery is not likely to be

very much of an advance on the old. And in any case, there is no incentive to undertake any radical departures. If any member of the ring is ill-advised enough to try to get the cost of production down and thereby put pressure on his fellow-members to make themselves efficient too—well, he can usually be tripped up in his financial arrangements or brought to heel by some other method. In the sacred name of Security, no one should be allowed to disturb any established interest or practice. Why, somebody might be thrown out of work.

There is, unfortunately, very little element of caricature in this portrait of British industry. So far has slump-mindedness gone that the whole economic process is regarded as a desperate rearguard action utter collapse rather than a constant pioneering into fresh ground. The *entrepreneur* used to be a venturer, but in too many cases he has become, in sad literalness, an undertaker, an embalmer of corpses. To this state of mind the purely negative attitudes of the Government, obsessed with protection and blind to efficiency, have contributed, and continue to contribute, very powerfully.

★

For a bold and positive prosperity policy two things are necessary: first, that there should be adequate profits to attract and reward investment in productive equipment; and secondly, that there should be the most powerful and unrelenting pressure to reduce costs of production, so that every keen mind in industry is on the alert to discover means whereby capital can be used to reduce human toil—the mechanism of progress. If the profits are not there, or not in prospect, there will be no investment and it will be hard to prevent the *saute qui peut* of restrictionism. But profits depend on general prosperity, and that is the function of a Full Employment policy. To the extent that the Full Employment policy succeeds, the justification for all restrictive practices will disappear; indeed, they must vanish if Full Employment is not to be a static concept but is to be transmuted into rapid progress. Nothing stimulates the formation of capital quite so strongly as the combination of prosperity with keen competition.

This is not the place to enter upon a discussion of the methods by which restrictionism can be prevented, and the good activities of trade associations be distinguished from the bad. But this is the place to insist that without some such campaign, there is only an extremely poor prospect for a Policy for Wealth. It is, tacitly, a bargain that must be struck between the state and industry: the State will do its duty by seeing that there is no recurrence of general depression; industry will do its duty to razing the constricting earthworks it threw up during the siege of the early 30's and thereby clearing the way for a rapid and general advance.

The argument of this article has been addressed to the managers of industry. But much of it applies almost equally to Labour. This aspect of the matter will be the subject of the next article.

The Co-ordination of Statistics

IN the past the function of the state in this country has been largely confined to treating the industrial and personal casualties of the economic system. In the future, however, whatever the precise blend between private and public enterprise that may be decided upon, the purpose of the state's activities will be more and more to control the arrangement and the environment of the system itself, and so by conscious direction to prevent casualties from happening. For this purpose the primary need will be accurate and complete intelligence about what is going on throughout industry and trade; and the secondary requirement, without which this information would be useless, will be the recruitment and efficient organisation of men capable of understanding, putting together and using the facts so gathered. It is not too

much to say that the new economic policy will stand or fall by the arrangements which it makes for the collection and co-ordination of statistics.

The recent White Paper on Employment Policy made the point strongly that the success of the Government's plans to maintain a high and regular level of employment will depend "on the skill which is shown in putting general ideas into day-to-day practice." The critics of bureaucracy can only be convinced by the "know-how" which is shown by Government servants and by the actual results which their policies achieve. It is, for instance, plain that the success of an employment programme, which involves preserving a delicate and shifting balance between the supply of, and demand for, both capital and labour, must depend on the

and accurate analysis of approaching dislocations and the almost simultaneous application of effective adjustments.

It is in recognition of the fact that employment policy will depend on there being a sufficiency of intelligence (in both senses of the word) that the Government intends to create "a small central staff qualified to measure and analyse economic trends and to submit appreciation of them to the Ministries concerned." This body clearly cannot function at all without complete information about economic movements; and the White Paper lists the following new classes of statistics which must be available if the efficient operation of an employment policy is to be made possible:

1. Statistics of employment and unemployment, including quarterly or monthly statements of present and prospective employment in the main industries and areas in the country, based on returns from employers.
2. Regular information relating to savings and projected capital expenditure by public authorities, and, as far as possible, by private industry.
3. An annual census of production showing the structure of the main groups of industries in the preceding year, including, *inter alia*, details of the quantity and value of output, stocks and work in progress.
4. Monthly figures of production, consumption and stocks, and, if possible, figures of orders on hand, based on sample returns obtained periodically throughout the year from large firms, trade associations, and public institutions.
5. Annual and quarterly estimates of foreign capital movements and balance of foreign payments.

The announcement of these proposed changes in the Statistical Service has already produced signs of restiveness in the business world, for the danger that the Government's proposals will involve the business world in a tiresome and burdensome overdose of questionnaires is not wholly imaginary. If the machinery of investigation works no better than it did before the war, then there will be much needless delay and duplication. Without adequate co-ordination between all the statistical branches of all the Government departments the necessary information will only be obtained by wasteful methods that would pester the business man continuously without achieving a corresponding measure of results.

Nor is it only the amount of information which it is proposed to collect that accounts for this restiveness on the part of business men. Even more, it is the kind of information that will be solicited. British business men are notably secretive about their financial and technical dealings and records. Largely, this is an attitude of mind rather than a considered policy. It is well known that some men carry discretion so far that they withhold a knowledge of the size of their incomes even from their wives or hide the nature of their work under, say, the comprehensive title "something in the City." At another level, there is the same covertness in the numerous items that are "hidden" in the average company's balance sheet. Partly, of course, this distaste for publicity is due to more or less vague fears of "giving the game away" to business rivals; and it is to counter this apprehension that the White Paper states clearly that the information provided for the employment programme

will, of course, be treated in confidence; and figures will not be published in a form which would prejudice the position of any individual firm.

Even so, it is surely time that the business world reconsidered its attitude to statistics. Secretiveness is not a stimulant to the competitive system; and it does not, in the long run, safeguard a business unit against the "predatory" inclinations of its rivals. In the United States, business is more intensely competitive than in any country in the world; but the American business man is far more ready to put his record-cards on the table. This is not to suggest that either the disposition towards secrecy or the disinclination to co-operate in the pooling of information is confined to non-official circles. It may be that the Government's proposals will not meet with the unanimous approval of departmental officials either. Government departments have themselves a tendency to

autarky in these matters and not infrequently acquire a possessive attitude to what they sometimes call "our figures." Even this attitude is not entirely unreasonable. The practical difficulties of ensuring a high degree of accuracy and the strict comparability and continuity of the statistics gathered are so great that the departments' reluctance to delegate duties of collection and co-ordination is to that extent understandable. Consultation in fact-finding may often mean either inexactness or delay.

But these are only potential dangers and weaknesses which can quite well be avoided. During the war the statistical branches of administration have been greatly strengthened, and many of the fears which have in the past produced an attitude of departmentalism have been much diminished, if not swept away—though there are still not a few departments where statistical organisation is inexpert.

★

The task of refitting the Statistical Service is, therefore, two-fold: there should be an overhaul of methods of collection, and a new approach to the problem of co-ordination. Before the war, it was customary to regard the collection of statistics as a by-product of ordinary administrative work. Even the major departments, in some cases, had no statistical branches. This was true of the War Office and the Admiralty. No department possessed powers to collect such information as it might need—although the Board of Trade and the Ministry of Agriculture were empowered by statute to conduct the particular inquiries involved in making censuses of production and agriculture.

More statistics need not mean more forms of inquiry: if co-ordination between statistical branches is efficient, the relevant information may possibly be collected by the asking of fewer questions. It is clearly a great help to the precise use of figures if industrial information in respect of employment, production, earnings, etc., is secured in the same way by the different bodies concerned, and with some agreement as to the most useful periods to be covered. Before the war (as at present, in most cases) inquiries which might have been complementary could not be linked, because of easily avoidable differences in coverage and definition. The Government is committed to an annual Census of Production; but in the conduct of a policy of full employment even more frequent returns of production and employment will be needed. It would be most useful if they could be designed to match. If the terms of inquiry were common and constant for the two types of investigation the annual censuses could be compiled very largely each year from figures already in existence.

The necessary changes in methods of collection and co-ordination can be effected within the existing framework of the Statistical Service. It would be quite wrong to divorce completely the duties of collection from the administrative duties which bring departments into close contact and good relations with those who supply the information. But collection should not remain only incidental to these duties. It should be the task of the statistical branch of every Government department to control and formulate such inquiries as are needed. The first need is to strengthen the staffs of statistical branches. This involves a wider and more generous recognition of the status of statisticians with commensurate improvements in remuneration and opportunity for promotion. Much new talent has been recruited during the war, and a nucleus for the new Service is already in existence.

The trade associations are the chief repository of industrial statistics. For their own purposes these associations conduct inquiries of the most detailed character among their members; and there is a striking contrast between the willingness of companies to supply the associations with the most private details of production, sales and orders on hand and the many objections raised against the mildest Government inquiry.

Should this work of the trade associations be duplicated by that of Government departments, or should the duties of collecting Government statistics be delegated to them?

If the Government could be assured that the statistical service of the associations was expert and complete, there might be much to say for a considerable amount of delegation. But the terms of delegation would have to be made very clear; the form of the inquiry would have to be controlled by joint agreement, and the Government should have access to the complete returns as of right. That is, the securing of these data should be regarded as a Government function—albeit delegated.

But in no trade can the delegation of this statistical function be complete. Private (that is, non-association) firms would object very strongly to co-operation with the associations in this matter. If the associations were appointed to be the collectors of statistics for an entire trade or industry, there would be a danger that the information supplied by private units could so be used as to prejudice their chances of remaining private for long. It is fairly certain that the collection of statistics from private firms must remain a direct task of Government departments.

The machinery of co-ordination is also already in being embryonically. In 1941, the Central Statistical Office was formed to reduce the mass of departmental data to

terms that could be of service to the War Cabinet. Successful co-ordination between the various branches of the Statistical Service does not require a superior body but a catalyst. There must be a real co-ordination; and it is a well-tested principle that co-ordination works most smoothly and most efficiently if those whose work is to be co-ordinated are brought together to do the co-ordinating. Efficient co-ordination could most easily be achieved by continuous co-operation between the CSO and a committee chosen from the heads of the departmental statistical branches.

Internal co-operation is only one half of the story. Whatever form the organisation of the Statistical Service may take, the success of its labours will depend finally on the co-operation afforded by trade and industry. The Government's White Paper proposals on statistics must be regarded as a most significant step towards the rehabilitation of the British economy. They are in the interests of private enterprise itself; and it requires no great wisdom for industrialists and traders to see that, if they wish for public aid in avoiding depressions and idle resources, they must be ready to supply the facts upon which such a policy must necessarily be based.

NOTES OF THE WEEK

Mehr Licht

Certain newspapers are falling over one another to claim credit for having brought about the relaxation of the black-out and of civil defence duties that will begin next week-end. In fact, of course, the credit for this most welcome and symbolic relief belongs solely to the Allied armies. It was the capture of France four years ago that thrust the civilians of this country, and especially Londoners, into the front-line; had it that line had broken, even as lately as a few days ago the course of the war would have been very different. It is the liberation of France that now makes it possible to lighten the darkness and the labours. There could be no better proof of the imperative need—even apart from the two countries' common concern for popular and national liberties—of a lasting and peaceful accord between Britain and a strong, free and self-reliant France. When the lights go dimly on again on September 17th, the worst of the ordeal will be over, and the assurance and sense of victory-at-last will be nation-wide. Defence posts will not be deserted. Fire guards will still stand by. The black-out will remain in reserve for twelfth hour raids. But the long night will be over.

At Ease

The Canadians have gained in battle the reward of their long vigil in Britain. The Home Guard, which shared that vigil for over four out of five long years, have their reward in the absence of battle—for it was the existence of this national militia which helped to decide the enemy, after his first failure to overrun this country by victory in the air, not to try the hazards of an opposed invasion. Fittingly, the Home Guard will end their service as it began in the most dangerous days, as volunteers. There will be no compulsion either to join or to do duty. Wardens and firemen have been in action while, except as disciplined helpers in the air raids and bombardments, the Home Guard have not. But they have had the most laborious days of all. On top of their night duties, they have spent continual week-ends in parades and exercises, and the record will tell how they became highly trained and much-skilled soldiers. With the ARP men and women, they have written a page of history.

The Next Election

There is some confusion about the likelihood of a general election in the near future. It has been commonly supposed by ordinary folk that the question of whether or when there should be a general election, for the first time since 1935, would arise immediately after the end of the fighting in Europe; and this impression has been confirmed by the assiduity with which the political parties are

making their preparations for electoral battle. Local authorities, however (it is reported) have been told by the Home Office, when they have expressed their difficulties in preparing the emergency register of electors, that they can work on the assumption that there will be no election this year. This is, to say the least, surprising, for it is hardly for the Home Office to decide. Mr Attlee and, presumably, the other Labour Ministers are under an obligation to seek permission from the Labour Party, immediately the German war is over, for continuing in the present Coalition; and the signs have been that this permission would not be granted. Certainly the break-up of the Coalition, however good the intentions of Mr Attlee and his colleagues, would seem to make necessary an appeal to the electors. On the other hand, it is constitutionally for the Prime Minister, and for him alone, to decide whether or not such a swift dissolution would be either necessary or desirable. He has planned the programme of "food, homes and work" as an all-party agenda for the approval or disapproval of the people—which would seem to require the earliest possible election on the least possible partisan lines. Obviously, Mr Churchill envisages such a programme being carried out by some sort of Coalition. The question is whether the present Coalition, even if refreshed by new MPs, is best suited, with its great Conservative weight on the back benches, to carry out this programme.

Unfortunately, Mr Churchill is tied to the Conservative Party much more than his national prestige really requires; and it seems likely that, as a consequence, the election, whenever it comes, may be on the bitterest, rather than the frankest and most fruitful, party lines. There is also a case for some delay, if only because the reconstruction programme, though professedly only an agenda, contains items which are of a most immediate and most urgent importance for the earliest post-war period—before the election. Moreover, it is not likely that an immediate post-war election would be concerned with the real political issues; it would rather be a Victory March, with the Conservatives banking upon the fame of Mr Churchill, and the Labour Party, though equally responsible for the reconstruction programme, left somewhat helpless. On the other hand, as many members of the Labour Party see, to remain in a Conservative-controlled Coalition might be to invite the fate of the Liberal Party twenty-five years ago—whereas it is its members' wish, instead in the next election, or the one after, to capitalise the trend towards progressive ideas which is much evident among the people. Altogether, it seems an insoluble dilemma for the politicians; but the probabilities are that the next election, even though it may be on the most misleading lines, may come very quickly after the fighting stops.

The Balkan Scene

Two military events have dominated the political situation in the Balkans during the past few days. To the south of the Danube the Russian armies have reached the Bulgarian frontier; to the north of the Danube they have captured Brasov, a Rumanian town beyond the main chain of the Transylvanian Alps. The impact of the Russian advance in the south on Bulgaria's political life became clear, when a week ago the Bagryanov Government resigned and was replaced by the Government of Muraviev. The latter announced a comprehensive programme of internal democratisation (similar to that which King Michael of Rumania had outlined in his proclamation); and expressed the desire of his Government to adhere to "strict and genuine neutrality." On Tuesday night, the Soviet Government declared war on Bulgaria, accusing its Government of allowing the Germans retreating from Rumania to escape through Bulgaria or to regroup their units on Bulgarian soil. Five and a half hours later, Bulgaria asked the Russians for an armistice, after the shortest war in the embattled history of the Balkans. It is to be expected that this Soviet-Bulgarian crisis will be followed by further changes in the Bulgarian Government, as well as by some changes in the Regency, if not by an expulsion of the dynasty. The Russians will now march into Bulgaria. The paradoxical situation in the Balkans was best illustrated by the reports about clashes between the Bulgars and the Germans which occurred at the time when Bulgaria suddenly found itself in a state of war with Russia. The capture of Brasov, beyond the Transylvanian Alps, has not yet been followed by any startling political development. But its significance consists in the fact that, even before they reached the Iron Gate, the Russians had already opened a road that leads into the Banat and the Hungarian Plain. The range of the Balkan earthquake is spreading; and it may reach Budapest sooner than was expected.

The Unrepentant Satellite

The logic that governs the behaviour of the various satellites of the Germans and the attitude of the Great Powers towards them is one of the strangest diplomatic puzzles. Announcing Finland's break with Germany last Saturday, the new Finnish Prime Minister, Mr Hackzell, gave an extremely "realistic" account of the German-Finnish alliance. The Finns, he said, fought on Germany's side as long as they hoped that Germany would win. Finland decided to sue for peace when the signs of Germany's defeat became unmistakable. There was not the slightest trace of repentance in Mr Hackzell's speech. On the contrary, he warmly recalled Finland's brotherhood-in-arms with Germany and spoke of the good memories which the Germans would leave behind in Finland if they withdrew their forces before September 15th, the date fixed by the Russians. Yet this unrepentant satellite has been treated by the Russians with real generosity. No demand for unconditional surrender has been made. The Russians will probably not lay down conditions harsher than those presented to Finland earlier in the year. Finland has not been asked to abandon neutrality. If the Germans withdraw in time, which they have apparently agreed to do, there will be no Russian occupation of Finland. The Russian consent to allow six German divisions to leave Finland unmolested is due to the fact that wherever those divisions go to they will either be vulnerable to attacks en route or, if they retreat into Norway, they will be to all intents and purposes immobilised. Hitler will not be able to use them as reinforcements on any front. The most difficult issue between Russia and Finland is still the problem of reparations, which accounts for the fact that the Finnish mission to Moscow includes many economic experts. It can be assumed that, on the issue of reparations, the Russians will remain adamant to the end; and it will be interesting to see the form that the eventual reparation payments will take.

Liberation in the Low Countries

Belgium has been all but liberated in a few days. The liberation of the remaining part and of Holland cannot be long delayed. While pockets of German resistance may cause some trouble, it seems likely that the rapid Allied advance will not be delayed before the German frontier. The Governments of these two countries and of Luxembourg are expected to leave London at any moment to take up the administration of their country where it was severed

so abruptly more than four years ago. In the Low Countries themselves, the arrival of Allied forces has been followed by a spontaneous movement to restore the officials of the local government who had been removed by the Germans. The Burgomaster of Brussels, deposed by the Germans and then forced to live quietly in a village outside the town, has returned to his rejoicing city. This will mean that the work of the Civil Affairs Commission in deciding which are to be regarded as the legal authorities with whom the Allies can deal will be made much easier. The transitional period when the Commission would have acted as intermediary between the Belgian Government and the Allied military command will be greatly shortened and the Government and the Commission should soon be working side by side. The situation clearly differs from that in liberated France. There, the Provisional Government was evolved independently of the pre-war political system and of Vichy. In Belgium, the Government could hardly be held responsible for defeat, and it was generally accepted as the representative abroad of the Belgian hope of ultimate freedom. M. Pierlot has gone back to report as soon as possible to his Parliament and to strengthen his Cabinet by the co-option of leaders of the resistance. The Government was originally a coalition of Socialist and Catholic parties and, as most of the resistance groups are Socialist, Communist or non-political, there should be no difficulty in constructing a temporary Government acceptable to the people. The Degrelle Fascist Party has been thoroughly discredited by its collaboration with the Germans; and Belgian politics should be troubled no more by the Rexists—although it is possible that the movement may continue to work underground and in other forms. The constitutional dilemma caused by the removal of King Leopold to Germany will make necessary some adaptation of the existing law. It seems likely that Prince Charles, the Prince de Liège, will act for the King where necessary, until King Leopold can be released.

The Size of the Arsenal

President Roosevelt's sixteenth Lend-Lease report to Congress, for the second quarter of this year, is impressive

THE WISDOM OF MAKING A WILL

Unless you make a will the provision for your dependents may be different from that which you had intended. Several reasons, including unwillingness to place the responsibility of executorship upon the shoulders of an intimate friend or relative, who may pre-decease you, may have caused you to defer completing plans for the future.

No need exists for further delay, since you can appoint this Company as executor and/or trustee, either solely or jointly with your wife or husband, a relative, or a friend, and thus be assured of continuity of administration and of security. You are invited to ask any branch manager of the Bank for particulars of this service. Alternatively, you may apply to one of the Company's own offices at the following points:

Head Office: Poultry, London, E.C. 2.
Branches: 70 Pall Mall, London, S.W. 1, and in Bangor, Birmingham, Bournemouth, Brighton, Bristol, Carlisle, Hull, Leeds, Leicester, Liverpool, Manchester, Newcastle-on-Tyne, Nottingham, Oswestry, Sheffield, Swansea and Torquay.

MIDLAND BANK
EXECUTOR & TRUSTEE COMPANY
LIMITED

not only for the size of supplies made available to the other members of the United Nations, but also for their direct contribution to the decisive victories of this summer on the numerous battle fronts. During the three months ended on June 30th, American Lend-Lease supplies were valued at \$4,045 million; the cumulative total of supplies since March, 1941, is no less than \$28,270 million, equivalent to about 15 per cent of America's total expenditure on defence during that period. Some 54 per cent of these supplies consisted of munitions, 21 per cent of industrial materials and products, 13 per cent of foodstuffs and 12 per cent of miscellaneous goods and services. Of all the munitions produced in the United States, 15 per cent were transferred to the Allies by way of Lend-Lease, 3 per cent were purchased for cash and 82 per cent were retained by the United States. But the ultimate recipients of Lend-Lease supplies, the President said, are not the Allies; they are the Germans and the Japanese whom the Allies are able to kill or capture by using these supplies. A rapid "tour" of the battlefields enabled the President to prove his statement. He listed the supplies sent to each of them, and he demonstrated the decisive part played by American supplies in the great victories achieved in France, Italy, Russia and in the Far East. Nor did he belittle the efforts of other countries. America has received Lend-Lease in reverse to the extent of over \$3,000 million, mainly from this country; this compares with Lend-Lease shipments to the United Kingdom of some \$9,322 million, but it must be remembered that the population of the United States is two and three-quarters that of this country. Man for man, the difference is not unduly large. Mr Roosevelt paid tribute to the war production of this country, and to the sacrifices made by Britain's workers in accepting a lower standard of living. Perhaps the most significant conclusion from the President's latest Lend-Lease report is that America has been able to raise and equip at record speed a large and tremendously powerful striking force, to contribute decisively to the striking power of its Allies by way of Lend-Lease supplies, and to do all this without reducing the volume of consumption of its civilian population, and without reducing the value of its cash exports.

British and American Exports

One of the most significant and, to British readers, startling facts revealed by President Roosevelt's report is the course of British and American exports. Britain's exports, exclusive of munitions, have declined by more than 50 per cent in value and by 70 per cent in volume since the outbreak of war; on the other hand, the value of America's cash exports during the first six months of 1944, at the annual rate of \$2,800 million, was somewhat above the average annual rate of shipments during the four years from 1934 to 1938. In the matter of exports, Britain will therefore start from a much lower level than the United States after the war; this is a serious disadvantage if it is remembered that Britain's merchant shipping fleet—normally an important source of foreign exchange—and the stock of its foreign investments have both been severely depleted during the war. No doubt, the President mentioned the facts about foreign trade in order to restrain ill-informed comment about Britain's economic position and intentions at the end of the war, and in order to put the case for prolonging some Lend-Lease shipments at least until the defeat of Japan. He assured Congress that, in any case, American industry will enjoy a greatly expanded foreign market; but he wisely emphasised the need for devising economic policies that "will make it possible for these nations to pay for their purchases." But America will not merely be able to start its peacetime exports from a higher level in relation to pre-war trade than Britain; the United States is also well ahead of Britain in its preparations for an expansion in the production of the goods of peace, and has, in fact, already begun the change-over. It would be ridiculous to deny America the right to utilise all surplus war production capacity for the purpose of civilian production. But it should not be impossible, through the agency of the Combined Boards in Washington, to ensure that Britain will participate in some measure in the reconversion for peace purposes of productive capacity no longer needed for war requirements. This does not mean that resources should be set free on a strictly proportionate basis in the two countries. But it does mean that there should be no needless time-lag or difference between them in the curtailment of war production programmes. Any unnecessary delay in the resumption of British export trade, or in meeting the very urgent needs of British civilians who have sustained serious

war damage to their houses, and whose stocks of durable goods have steadily dwindled for a period of five years, would be unjustifiable—on the American President's own statement of the facts.

Objections Answered

The local authorities do not like many of the provisions of the Planning Bill. Their objections have been answered in various memoranda recently published by both the Tory Reform Committee and the Central Landowners Association. In so far as the local authorities argue that the powers and grants given to them for the redevelopment of blitzed areas should be extended to all areas, they are mistaking the purpose of the Bill—and it seems to many a wilful and specious mistake. The Bill is intended to hasten and to guide rebuilding where it is most urgently needed, and not to present local authorities with what, as the Tory Reform Committee rightly remarks, would amount to a whole new code of powers for land acquisition. To demand, as the local authorities do, that all land should be liable to compulsory acquisition by the accelerated procedure recommended for blitzed areas, is to raise large issues which not only require a considered and unhurried judgment, but which do not need to be settled immediately. Their concession might, in fact, lead to the diversion of the country's strictly limited materials and resources from the areas where they are most needed at present.

The Landowners' Case

The Central Landowners' Association has, however, quarrels of its own with the Planning Bill. It is pleased with the clause which prevents development by the planning authority where other competent developers exist—though planning circles think that this refusal to allow a statutory corporation to undertake the sort of wholesale development that was done privately at Welwyn Garden City is one of the Bill's worst defects. But it objects to the ban on the creation of new freeholds in compulsorily acquired land (unjustifiably, since the real issue is whether such land should pass out of state ownership at all). The association naturally opposes the 1939 price level as a basis for compensation, and urges that the Uthwatt Committee itself intended "1939 values" and not "1939 prices" to be taken as the basis. The Landowners' Association speaks with most authority and feeling on the subject of agricultural land. It urges that farm buildings should not, as is now proposed for the first time, be subjected to planning restrictions. Perhaps the pleas that such procedure causes delays and nuisance, and that agricultural efficiency should not be prejudiced "by the aesthetic predilections of planning authorities," are too specious to be altogether convincing. The case is otherwise with the justifiable and inexpensive claims that new building and improvements carried out since 1939 should be paid for at actual cost, less wear and tear, and not on a 1939 basis; and that no land should be compulsorily acquired at less than its *post-war* agricultural value.

Compensation for War Damage

The Government's War Damage Scheme has been administered, so far, with efficiency and a commendable lack of bureaucratic fuss. From the start of the scheme, the War Damage Commissioners have laboured under big difficulties. Their first task was to clear off the large arrears of claims made in anticipation of the legislation which brought them into being. The long lull in the enemy's bombardment of Britain provided a much-needed breathing space; but the flying bombardment has increased the work of the Commission to an altogether unexpected extent. The strain has been taken without any sign of dislocation and, more important, without any complaints from the public. It is the Commission's task to administer relief—and relief depends for its effectiveness on the speed with which it dispels anxiety. The evacuees' lot is rendered incomparably more difficult when there is delay and uncertainty in the provision of documentary claims to compensation for lost or damaged property. In pursuance of their essential task, the Commissioners have very wisely shelved all delaying formalities. By the end of 1942 at least

2,750,000 houses had been damaged by enemy action, and of this total 250,000 were either totally destroyed or rendered unoccupiable. With shops, factories, churches, schools, hospitals and other buildings the total number of properties damaged during the major period of bombing was about 3,000,000. Recent estimates have put the property casualties in the flying bombardment at about one million houses. The two annual financial statements made so far by the WDC show that contributions (in respect of land and buildings) are well below payments out. In the period 1941-42 (March 31st) the difference amounted to £10 million; in the following year it was almost £20 million. The figures for 1943-44 are likely to reveal a much wider discrepancy. Most of the compensation paid during the 1941-43 period related to temporary and minor repairs, but the continued inactivity of the Luftwaffe encouraged the repairing of more seriously damaged property. When the accounts opened by the flying bombs come to be settled, and value payments for the whole war period are made, the finances of the WDC in respect of land and buildings may well reveal a total deficit greater than the £200 million tentatively fixed as the initial limit of Government liability. If this is the case, property-owners and landowners may be asked to increase their contributions.

Value Payments

In its memorandum on the War Damage Acts and the Town and County Planning Bill, the War Damage Committee of the Association of British Chambers of Commerce urges the Government to make a statement of their policy on value payments. It is recommended that owners who will receive value payments or "converted" value payments should be guaranteed compensation at a level sufficient to leave them in as good a position financially as if they had received a cost of works payment. A further recommendation urges that a "portable cost of works payment" (i.e., a cost of works payment in respect of rebuilding on a new site) should be awarded, where all owners of proprietary interests are agreed, on a basis not less equitable than that afforded by the WDC in respect of ecclesiastical buildings under section 69 of the Act. While the extent and variety of national war damage preclude anything more than the administration of rough justice in matters of compensation, it is very necessary that every reasonable care should be taken to spread the burden of loss. The equitable reconciliation of standards of compensation will depend on the successful modification of "standard" pre-war values by "escalator" treatment. Absolute changes in the value of money and relative changes in the costs of building materials have already thrown the two methods of compensation widely out of account. The suggestion that claims and appeals in respect of war damage payments and compensation under the Town and County Planning Bill should be afforded equal treatment has much to commend it. It would mean the setting up of a single tribunal for the purpose. On the question of "portable costs of works payments," the Committee's plea for equality of treatment with the churches is largely irrelevant. It was a particular and exceptional aspect of Government policy that determined the course of action to be followed in the replacement of churches—an example of Government paternalism in the interests of religion. Quite apart from this, there can be no parallel between the monetary assessment of a church and of property with a commercial market value.

Czechs and Slovaks

The rising in Slovakia, which has created a not insignificant threat to Germany's communications with Hungary and Yugoslavia, has abounded in quite sensational features. Father Tiso, the head of "independent" Slovakia, dismissed his commanding general, Catlos, for his alleged cooperation with the insurgents. Large parts of the quisling administration have been in sympathy with the partisans. Judging from this, one would think that the Slovaks had been definitely disappointed with the gift of "independence" which they were given when the Czechoslovak Republic was torn into pieces in 1939. Dr. Benes' Government takes the view that, by rising in arms against the Germans, the Slovaks have now as it were opted for their return into a reborn Czechoslovakia. It is also claimed that the insurgents take their orders from Dr Benes' Government. The Slovak nationalists in London have vehemently refuted those claims. The Slovaks, they claim, are not Czechoslovakia's prodigal sons now doing penance.

They fight against the Germans, but are determined to maintain their independence after the war. It would be wrong to generalise on the subject. The Slovaks, at home as well as abroad, are probably divided on this issue. While some of them look back to their association with the Czechs without bitterness and certainly look for reunion, others may continue to dream of separate sovereignty. In this controversy, Russia's attitude will be decisive. The Soviet Government, it will be remembered, has pledged itself to assist in the reconstitution of Czechoslovakia in its pre-Munich frontiers; but it favours a more federal structure in the Republic than there was before the war.

Pacific War

Admiral Nimitz's campaign in the Pacific islands goes steadily on. Japanese harbours and airfields are being bombed along an ever-widening arc, and everywhere this invasion of the air precedes invasion by sea and land. The Philippines have now become a major target. The port of Davao on the southern island of Mindanao, with its neighbouring airfields, has been heavily hit, and the Japanese air forces are being driven back to the north and west. In the north, Volcano Island and the naval base in the Bonin Islands have been attacked from the air—an action which follows naturally from the capture of Saipan, 900 miles to the south. An attack from the sea, however, will have to wait on further defeats or retreats of the Japanese navy, as these islands are only 700 miles from Tokyo. Equally encouraging are signs of increasing exhaustion among Japanese garrisons in the islands already partly held by Allied forces. In New Guinea, the chief object of the depleted garrison is to escape, either to the west and then by sea, or overland to the Vogelkop Peninsula to Sorong. Elsewhere, in New Ireland, New Britain and the Solomons, the stubbornness of the remaining troops is gradually being weakened by the running-out of supplies, by disease and by exhaustion. The slow defeat on the islands is undoubtedly quickened by the effectiveness of Allied attacks by air and sea on Japanese shipping. A ship of over 2,000 tons venturing east of the Celebes, is now a rarity, and the toll of merchant shipping is gradually mounting. In the three months April to June last year, 29 merchant ships were

accounted for; this year the total for this period was 70. By contrast, the number of naval ships sunk was less, seven against ten last year. This may be taken as an indication that the Japanese are withdrawing their much-diminished fleet nearer to home waters. Meanwhile, the gradual transfer of British submarines and naval craft of all kinds to Pacific waters may help to quell the wholly-ungrounded suggestion that the British intend to play no more than a token part in the Japanese war—in which their direct interest is at least no less than that of the Americans.

Advising Mr Morrison

The Home Secretary is not, apparently, going to allow his Advisory Council on the Treatment of Offenders to think they have an easy task. The members of the Council were only appointed on the last day of the Parliamentary session. They have now had their first meeting, and have been told what they have to do. Their chairman will be Mr Justice Birkett, and among the 20 other members of the Council there is a good sprinkling of social workers, with representatives of law, politics, economics, local administration, and the Church. In an introductory speech on Tuesday, Mr Morrison outlined the problems he is expecting them to tackle. In the first place, he would like advice on how the courts, and particularly the magistrates' courts, by whom the bulk of criminal justice is administered, can be helped to make right decisions about the offenders who are brought up before them. The whole question of juvenile delinquency will cover another part of the Council's work, and, linked with it through the present practice of imprisoning young people with hardened offenders, the difficult problem of reconciling the reformatory and deterrent purposes of imprisonment. Mr Morrison extended an open invitation to the members of the Council to go and see for themselves the prison conditions which they will be planning to reform. Lastly, the Council was asked to see if it could devise methods of spreading ideas accepted by "the best instructed and most enlightened administrators, magistrates, lawyers and other experts" among those who will have to administer the law and its penalties, and among the general public, whose opinion on the reform of criminal justice will be a major factor in determining the rate of progress achieved.

Letters to the Editor

Terms for Germany

TO THE EDITOR OF THE ECONOMIST

SIR,—With reference to the correspondence aroused by your article "Terms for Germany," so far no single writer has touched upon the main issue, which is, that the restriction of war is not a judicial, but instead a pathological problem. War is the effect of a diseased state of peacefulness. Call this disease "Nazism," then the question is, what gave rise to it? Should the answer be "Hitler," then the next question is, what forced him to the fore and gave him power over 65,000,000 Germans? The answer is well known, it is 6,000,000 unemployed. And what threw these men out of work? A world-wide financial and economic crisis resulting from the victorious nations imposing on the world a financial and economic system which did not fit its needs.

Lord Keynes saw this no sooner than the 1919 Peace Conference was concluded. In his book *The Economic Consequences of the Peace* he wrote: "To what a different future Europe might have looked forward if either Mr Lloyd George or Mr Wilson had apprehended that the most serious of the problems which claimed their attention were not political or territorial but financial and economic."

Does not the same hold good to-day? It does not matter how just, how Carthaginian or how moderate the peace is, for so long as the financial and economic causes of war remain, Nazism will sooner or later break out again, and if not in Germany, then somewhere else.

In 1925 Mr Churchill said: "The causes of war have been in no way removed; indeed, they are in some aspects aggravated by the so-called Peace Treaties and the re-

Empire Casualties

The latest total of casualties to all ranks of British Empire forces is 925,963. This number comprises:—killed, 242,995; missing, 80,603; wounded, 311,500; prisoners of war and internees, 290,865. Of the three categories of killed and missing (together), wounded, and prisoners of war, each accounts very roughly for a third of the total. The casualties of merchant seamen in British ships number 33,573 (29,381 killed; 4,192 internees). Civilian air raid casualties in the United Kingdom have been 132,092 (56,195 killed or missing, believed killed; 75,897 seriously injured). The complete casualty total of fighting forces, merchant seamen, and civilians is 1,091,628. These totals cover roughly, but not completely, the first five years of war. They are up to July 31, 1944, in the majority of cases, but to the middle of August in the case of some categories of the Armed Forces. By contrast, the total casualties to British Empire forces in the four years and three months of the last war, which exclude prisoners of war, were 3,490,907, comprising 1,089,919 killed and 2,400,988 wounded. The war has so far cost the Empire in total casualties rather under a third of its losses in the First German War—or, if prisoners of war are left out of the calculation, less than a quarter. On the other hand, the proportion of killed or missing to wounded appears to have doubled in this war; even so the total of killed and missing is only, to date, a third of the last war's total. The war in Europe is not yet over, much less the war against Japan. But it would be an unexpected and unkind fate which now upset this comparison at all considerably. These casualties are lighter than would have appeared possible to the pre-war observer, impressed with the destructive powers of modern engines of war, or indeed to any average citizen who attempted a cold calculation in the summer of 1940. This does not alter the fact that the totals are heavy and grievous enough. Other countries, especially Russia, Poland and Germany, have suffered much more severely—and the experiences of occupied Europe make plain enough that figures are no precise guide to the sufferings or even the losses of a nation. No calculation of world casualties in this war is yet possible; but when and in so far as the full story is told, there is evidence to suggest that the world as a whole will have suffered at least as heavily as in the almost unbelievably heavy and localised carnage of 1914-18.

actions following thereupon." And in 1938: "I have always said that if Great Britain were defeated in war, I hoped we should find a Hitler to lead us back to our rightful position among nations."

In this scientific age the judicial method of restricting war is alchemical. Are we then going to return to our old sorcery of 1919 and once again bind the poison up in our war wounds—this time with hangman's rope? Or are we going to play the part of peace pathologists whose object is not exorcism but cure? Should the majority of the letters you have received reflect the answer, then it would appear that World War No. 3 is inevitable, yet it does not necessarily follow that Germany will next time be our enemy.—Yours faithfully,

J. F. C. FULLER.
Limpsfield, Surrey.

TO THE EDITOR OF THE ECONOMIST

SIR,—The letters published in your issue of August 26th show how profoundly some of your readers disagree with your views on the kind of peace to be made with Germany. Mr L. J. Cadbury agrees that the Carthaginian Peace was entirely successful, but asks "Does the most fire-eating Allied national really propose to go to these lengths with Germany?"

There is a method of destroying Germany as effectively as Carthage was destroyed without the physical destruction of a single individual.

Most of the Allied nationals would doubtless approve in principle to the annexation of some German territory. Why not go a stage further and parcel out the whole

German Empire? The German language would be replaced by the languages of the succession states. Germany as a nation would disappear and, except for the dialects surviving in Austria and part of Switzerland, the German language would be relegated to the classics.

This would be the modern equivalent of a Carthaginian Peace, and in my opinion only such total destruction of Germany will be effective in destroying future German aggression.

When Germany succumbs, the Allied Powers will be all-powerful, and it only needs agreement among themselves to make such a peace possible.

In their first flush of victory the Nazis boasted that they would settle the fate of Europe and the world for a thousand years. Let us take a leaf from their book and give them a totalitarian peace, such as they would have made if they had been victorious.—Yours faithfully,

J. LANDMAN.
London, W.1.

TO THE EDITOR OF THE ECONOMIST

SIR,—Referring to the correspondence published in your issue of August 26, 1944, concerning your leader "Terms for Germany," I would like to point out that the Carthaginian treaties of St. Germain and Trianon, while crushing Austria and Hungary, did not in the long run benefit Czechoslovakia, Yugoslavia and Rumania nor, for that matter, Italy and Poland. Carthaginian terms, amply justified by her conduct, could be imposed on Germany, but this would ensure that Europe will never rise again.

Taken by itself, the problem of Germany is insoluble. The maintenance of future peace, however, depends primarily not so much on Germany as on the solution of the Polish-Baltic, Danubian and Balkan questions. If a real working order can be inaugurated in these regions, good relations between Britain and the USA and Russia could be maintained, and Germany permanently reduced to the status of a second-rate Power. Lacking settlements which will safeguard security and prosperity for those small nations, there is no doubt that the Germans will not fail to restart their well-known practices.—Yours faithfully,

Highgate, N.6.

LEO GESTETNER.

TO THE EDITOR OF THE ECONOMIST

SIR,—As you have printed so many letters disagreeing with your leading article "Terms for Germany," may I for one say that I believe you are entirely right.

To-day we see Germany in the blackest colours. I think we are justified in doing so. Yet what likelihood is there that in another twenty or thirty years, when Germany has for long been disarmed and helpless, when a new disposition of forces confronts us in Europe, we shall still keep the crimes and aggressions of the Nazis in the front part of our minds? Did not some of us condemn the very moderate treaty of Versailles almost as soon as it was made? Did not others of us help the Nazis to rearm? Did not our Government, after Munich, negotiate a trade agreement with them at the expense of the USA? Who can guarantee that we shall not repeat, I do not say exactly these things, but something like them? Or, if not ourselves, then that Russia or America will do so? Let those who deny this indignantly stop and reflect on the changes that history brings.

The only solution to the German problem is to cure the Germans. To-day we are showing that aggression does not pay—that is the first part of the cure. But to-morrow we must show that good conduct and a civilised attitude bring rewards—that is the second and equally essential part. Let us then punish crimes that can be traced to individuals: let us exact suitable reparations and apply such precautions as may be feasible: but let us also bear in mind that the one over-riding requirement of the peace treaty, on which alone it will be judged by our successors, is that it should create conditions in which the German people can live, work and respect themselves as equal members of the European family.—Yours truly,

Marlborough, Wilts.

GERALD BRENNAN.

TO THE EDITOR OF THE ECONOMIST

SIR,—"Every country," writes Dr Drucker, "is responsible for its leaders." In other words: Hitler and the Nazis rule Germany; therefore they reflect the will of the German people; therefore all Germans are Nazis. Dr Drucker sup-

ports the Nazis' myth of the monolithic Nazi State which has been recently so rudely debunked by highly placed members of an essential part of the German State apparatus.

However, it did not require the "revolt of the Generals" for one to recognise this as a myth. The following voting figures show clearly that, up to March, 1933 (after Hitler became Chancellor, January, 1933), the majority of Germans opposed Hitler:

	Social Democrats	Communists	Republic	Nazis	Nationalists
1928	9,151,000	3,263,000	8,838,000	809,711	4,380,000
1930	8,572,000	4,587,000	8,054,000	6,401,000	2,458,000
1932 (July)	7,951,000	5,278,100	6,581,000	13,732,000	2,172,000
" (Nov.)	7,247,000	5,974,000	6,313,000	11,713,000	3,064,000
1933 (Mar.)	7,176,000	4,845,000	6,260,000	17,265,000	3,132,000

After Hitler became Chancellor, and before the election of March, 1933, a campaign of terrorism against, and violent oppression of, the Socialist and Communist opposition was waged. No observer in Germany, with any claim to objectivity, failed to realise that the Nazi Party played not merely with marked cards—but with guns by their hands. Yet even in these conditions 18 million odd German men and women voted against Hitler, while a minority of 17 million odd voted directly for him!

That Hitlerism is by no means the "natural" expression of the German people's will is surely made clear by the measures taken by the Nazis to crush all political, or even potentially political, opposition, and to forever prevent any such opposition from again crystallising.—Yours faithfully,

London, S.W. 11.

H. DEWAR.

TO THE EDITOR OF THE ECONOMIST

SIR,—Arising out of the correspondence in your columns of August 26th, may I be allowed to ask two questions?

First, there is much use of the word "Peace." Does not an Armistice usually precede a Peace? And why should there be any peace with Germany for, say, ten years or more, so as to give us all breathing time during which we can only hope she can get rid of her gangsters big and small, overcome the internal dissensions and killings that are bound to arise over the next few years, and possibly develop gradually some form of stable and reasonably trustworthy democratic Government under honest, decent but strong leadership?

Secondly, there is constant mention of the word "Disarmament." What is disarmament in these highly technical times? It not only embraces material but mental planning and experimentation. While the Allies are destroying German guns, airplanes and so on, the German General Staff, their boys in the back room and the industrialists will be preparing their plans and experimenting for V5 to V15 without the people of the world being aware of what is going on in the cellars or forest wilds of Germany.

On the last occasion, say what one will, she was not disarmed materially or mentally, nor had she any really stable Government until the Nazis came into their own. Added to this, the General Staff never stopped functioning, while internal strife and small foreign wars (the Chaco, Spain, Abyssinia, &c.), gave the fighting elements, young and old,

continuous opportunity over two decades to keep their hand in for practice and experimentation.

On this occasion, and for the sake of the youngsters, let us hope that the Allies will face up to long-term reality in dealing with this whole question.—Yours faithfully,

London, S.W. 1.

G. J. SCOVELL.

TO THE EDITOR OF THE ECONOMIST

SIR,—The recent correspondence following your article "Terms for Germany" appears largely to miss the main point of the submission.

As I see it, your view is that the peace terms must not only be such as to preclude Germany from entering into another war in our time, but must be of a kind certain to be enforced by succeeding generations, who will not have the penalties of false sentiment so vividly before their eyes.

Few of us would quarrel with that view, but most will hope that the terms imposed—while initially severe—will be capable of adjustment, so that a new generation of Germans, having proved their sincerity, may be permitted to take their place on level terms with members of all other peace-loving nations.

Clearly some such hope must be given to Germany if there is to be any prospect of future peace; but we have been deceived as to her sincerity before, and it is vital that this time we make no mistake.

Fortunately there is one stipulation which can be made in the Peace Treaty which, if all other prohibitions are relaxed, will still ensure that Germany can neither prepare for nor wage war, and it is of such a commercially minor nature that its imposition could not reasonably be looked upon as punitive.

It is not generally realised that mechanised warfare would be impossible without alloy steels, i.e. without steels to which have been added greater or lesser amounts of certain special metals.

These special metals, the principal ones being tungsten, vanadium, molybdenum, chromium and nickel, give to the steel the hardness, toughness or heat-resisting characteristics which alone have made modern armaments possible, and without adequate supplies of these materials no nation could contemplate war.

Because of their nature, it is usually necessary before adding them to the steel to convert the ores of these special metals into ferro alloys (i.e. into an alloy of iron and the particular metal concerned) and, as a result, most steel-producing countries also possess a ferro-alloy industry.

Since Germany does not produce sufficient of the ores of these special metals to supply even her normal commercial needs, it is clear that a complete prohibition of the manufacture of ferro-alloys and the control of imports of these materials, together with a total ban on imports of the ores of the special metals would effectively prevent the production of armaments and ensure that Germany's wars of aggression are not repeated.—Yours faithfully,

F. C. MANNOX

Hornchurch, Essex

TO THE EDITOR OF THE ECONOMIST

SIR,—I think that many of your correspondents are treating you hardly. Your point is quite clear to me, and I am sure it is valid.

There is a myth which is being sedulously propagated that "appeasement" was a disease which afflicted only the "Right." This is as dangerous as the German "stab in the back" myth. It overlooks the Fulham by-election, the speeches of Labour Ministers at the ensuing General Election and the Peace Ballot. It overlooks, too, the happy visits of Sunday-school parties to Germany, during which the Hitler Jugend, strictly to order, showed off the Germany which Hitler and his predecessors did not create. It overlooks further that the attacks on Lord Vansittart, who knows what he is talking about, come mainly from the "Left."

What is now happening at Dumbarton Woods, has a bearing on this issue. A friend said to me years ago, "The trouble about the League of Nations is that people thought they were taking out a fire insurance policy, while really they were joining a fire brigade." I have never heard the point better put. The peace must provide effective machinery for enforcement, and must be so framed that American, British and Canadian voters now in their infancy or as yet unborn will fight or tax themselves to uphold it, if that should become necessary.—Yours, &c.,

Peterborough.

GEOFFREY TOULMIN.

TO THE EDITOR OF THE ECONOMIST

SIR,—Your article on "Terms for Germany" and the correspondence so far published seem agreed that the sole guilt for this war rests with Germany. The point at issue concerns the nature and degree of punishment.

Personally, I challenge the whole basis of your own and your correspondents' approach to the problem. It savours to me of blimpish righteousness. Neither war-mongering, racial arrogance nor organised brutality are peculiar to Germany.

The problem of Germany is the problem of Europe and the world—the problem of so ordering social relations that men in pursuit of their vital needs, their rights and their vanities, will find their collective and their individual good coinciding.

This will not be achieved by any scheme of punishment for Germany—Carthaginian or otherwise. It will be achieved only by destroying the roots of conflict among men: by a process of institutional changes that will take away the power of one class or nation to batten upon another.

In making those changes the common people of Germany have as much to contribute as the people of any other nation.

GEORGE LAWSON.

Glasgow.

TO THE EDITOR OF THE ECONOMIST

SIR,—I enjoyed *The Economist's* article, and I think its case against a Carthaginian peace is final, though it might have been put even more strongly.

But is there any real objection to a generous peace? We have it from Mr Morrison himself, no friend to the Germans, that Germany aggressed because she was poor, and there seems no reason to doubt Hitler's statement of January, 1939, that Germany must export or die. Why not see to it that Germany becomes prosperous and has a fine export trade?

Your anti-German correspondents would object that it would be easy for her in that case to make a successful bid for world power. But nations are composed of people, and people who are comfortably off do not want to boss the world. People who are poor want to get their own back on the world, tend to hate the Jews and develop other peculiar psychological manifestations. I know this because I have been poor myself.—Yours faithfully,

Oxford.

TERENCE GREENIDGE.

TO THE EDITOR OF THE ECONOMIST

SIR,—In his letter which you published on August 26, Mr Midgley writes: "Perhaps you think that future wars will be carried on without armaments," and he dubs the idea "fantastic." But is it?

Much of this war, both before and after 1939, has been carried on in just such a way, by propaganda, suggestion and skilful demoralisation. Almost throughout Europe the Nazi machine was at work before 1939. It is this that you call "the political war without end" in your leader of September 2nd. It is something to be feared as much as German rearmament—because the majority will not understand that it is going on.

It is, in my view, quite arguable that the political war would be easier to counter were Germany to be partitioned, not as a means of reward or compensation to surrounding countries, but into constituent states for her own good—these states to have a customs union and possibly some common system of communications, but no other unifying machinery (no unified police or bureaucracy and, of course, no arms).

The traditions of the old German states are many of them worthy to be remembered and might well prove satisfying to their inhabitants. Almost all the greatest Germans belong to the period before the Empire.

Is there not a great hope of regeneration in Germany by reviving the traditions of which Germany and Europe can be proud—the traditions of a culture which flourished before "kultur" was invented. Is not this a way to introduce into our policy that positive element which is now lacking but which is essential for a lasting peace settlement.—I am, Sir, yours faithfully,

M. P. MURRAY.

Bramley, Surrey.

AMERICAN SURVEY

Businessmen's Expectations

(From a Correspondent in Boston)

AMERICAN businessmen have no affection for crystal gazing. Yet expansion of their type of private enterprise requires much forecasting of events. The turn of the fighting finds them well advanced in the timing and planning of their post-war activities.

That this looking forward is done with relish is indicated by their advertisements. These have gradually changed from the "Whee-look-at-me-in-the-war" theme to pictures of the White Knight of American Business, astride his championing steed and eager to be off to rescue suffering American housewives from interminable war hardships, by carrying to their doors new cadmium-plated, plexi-glass kitchens that will automatically cook the meals and wash the dishes, at the simple touch of lily-white fingers on two-ball-bearing push buttons.

In this transition of business thought from war to peace certain time-table assumptions and certain economic limitations have shaped up. The current *Harvard Business Review* (Summer, 1944), among other publications, affords a basis for the following postulates:—

1. *The European phase of the war will end by late autumn this year; the Pacific phase by the middle of 1945. The initial stage of demobilisation and reconversion will continue until June, 1946, when the "normal decade" will begin.*

2. *There will be such an organisation of peace as will secure a tolerable world security during the decade. The United States will have an active, but not disproportionate, share in that organisation.*

This seems to be a safe assumption in the light of the Dumbarton Oaks Conference. Secretary Hull has already let the cat out of the bag about the World Security Organisation. President Roosevelt's endorsement is inevitable. So is that of the Republican nominee, Governor Dewey, although he may feel under some compulsion to advance a few points of criticism for the benefit of his following in the Middle West—who still feel they can patch up the hole in their window that the war has made, and once more aloofly peer at the queer world outside. But Mr Dewey's principal adviser on foreign affairs is John Foster Dulles, a New York lawyer and internationalist who has been a State Department visitor for some years and whose views in a general way parallel those of Mr Hull.

Incidentally, this assumption indicates how casually Americans in general are taking extremist demands for continued vast armaments in the post-war period, and the equally extreme insistence in some minor quarters of Congress for outright possession of strategic island bases.

3. *There will be no further shifts of enterprise from the private sector to the Government.*

This slips off the tongue rather easily, but it is possible that it represents wishful thinking on the part of business rather than hard realities. It is difficult to reduce anything so complex as an American political campaign to a single, simple issue. Yet if there is one dominant philosophical point of divergence between the Republicans it is the extent to which the agencies of Federal Government should be used in helping the people to meet the economic shocks of an industrial society.

The position of business in this is clear. For years it has lined the highways with great billboards proclaiming "The American Way of Life," and insisting that this "way" is one of private enterprise and Government *laissez faire*. Labour, in turn, has raucously dubbed it, "The National Association of Manufacturers' Way of Life," and has energetically insisted that when industrial wheels slow down it is the duty of democratic government to do what it can to speed them up, while simultaneously cushioning the hardships of those who suffer most. The Kilgore-George fight that occupied Congress through much of the hot Washington summer revolved around the amount of money to be given to those unemployed during the period of reconver-

sion, and whether the Federal Government (Kilgore Bill) or States (George Bill) should disburse it.

4. *The average United States price level will be close to that of 1942.*

In relation to the previous decade the 1942 price level was quite high. It entailed wage payments and standards of living that exceeded any previous level of American experience—even that of the lush and lamented 1920's.

In terms of trade it means that American business is assuming it will have a high price product to sell in a generally deflated world. It conjures questions as to how American business proposes to trade competitively and reciprocally in the global markets that are from time to time so glowingly portrayed in the press. The answers are not forthcoming; it cannot be said that American business is even pondering them yet.

5. *America's average annual net income will range between \$115 and \$125 billion during the "normal decade," 1946 and 1956.*

This is a middle ground assumption. Liberals believe it will require an income of \$130 billion to supply adequate employment and living standards. But a \$115 to \$125 billion average means that business contemplates a reasonably happy way of life.

6. *Finally, business assumes that the Federal Budget will be balanced.*

It seems to be agreed that the post-war Budgets will run around \$20 billion (during the war they have reached \$100 billion). If this \$20 billion is balanced with revenues, it means that the present heavy war taxes cannot be cut by more than half; that the good old days when a middle-class family paid only \$50 or \$60 a year to the Federal Government in income taxes will never return. This family, it is true, can look forward to relief from the taxes that now take \$500, but even half of that amount still represents a new fiscal era for Americans, and perhaps portends a more acute interest in how their Government is conducted.

American Notes

The Farmer's Future

The American farmer has enjoyed quite exceptional prosperity as the result of the war and, as is only natural, Congress, the Administration, and the farmer himself wish to see this desirable state of affairs continue. The pro-

rection of farm prices is already guaranteed for a two-year period after the end of hostilities. What is most encouraging about current discussion is the hope that a return to the scarcity economics of the thirties may be avoided. Then, measures of agricultural restriction failed to solve the "farm problem" and destroyed food desperately needed by the undernourished one-third of the nation. The war has shown that, when adequate purchasing power is available, all but a very small proportion of American production can be absorbed at home. Department of Agriculture experts now estimate that, with full employment, 95 per cent of American farm produce will be consumed in the United States, leaving only 5 per cent for export. Mr Wickard, the Secretary of Agriculture, in testimony before a House committee, has stated that the three conditions necessary for adequate, permanent demand for all farm products are full employment at fair wages; assistance to low income families in obtaining more food and textile production; and the possibility of exporting a certain volume of farm products. Presumably the assistance to low-income families might take the form of the food stamps already tried out, whereby commodities declared to be surplus were distributed free to needy families. Where it came to more strictly agricultural policies, however, both Mr Wickard and Mr Jones, the Food Administrator, were more cautious, and emphasised such uncontroversial measures as soil conservation, the retirement of sub-marginal land, rural electrification, better roads, and improved marketing facilities. Both mentioned the desirability of the family-sized farm, and Mr Wickard insisted that the farm problem was primarily one of people, rather than economics; that the main aims were the provision of abundance to the consumer and a good way of life for the farm family rather than—although he did not say so—the most efficient production. It is hard to avoid the conclusion that in some respects agriculture was over-extended in peace-time; and that basic maladjustments have only been glossed over by wartime demands. It is certainly true that continued guidance of production in accordance with estimates of demand might avoid the repetition of unsaleable surpluses. But it is unlikely that farmers would stand for the extension of wartime controls. The result may be a heavy, if concealed, charge upon the taxpayer and consumer if the need for reducing the farm population and increasing agricultural efficiency are not met.

Leakages

The speciality of Mr Drew Pearson, columnist, is leakages, and he has been severely taken to task in the past by President Roosevelt. But his most recent effort has caused more than the usual sensation. In his syndicated column, Mr Pearson asserted that the resignation of Mr William Phillips from General Eisenhower's staff was due to the demand of the British Government, who declared him *persona non grata* as the result of a critical secret report sent to President Roosevelt when Mr Phillips was in India as special Ambassador. This is a fabrication, but the effect of denials by Lord Halifax and the State Department was merely to elicit from Senator Chandler (who once said, "I am neither anti-British nor anti-Russian, but I am prepared to be both") what purports to be the full text of Mr Phillips' letter to President Roosevelt in 1943, and in addition, what he declared was the decoded version of a recent cable from Sir Olaf Caroe, Secretary to the Department of External Affairs, India, to the Secretary of State for India, dealing with the publication by Mr Pearson of excerpts from Mr Phillips' letter. In Congress there have been sharp demands that the British Government should cease meddling in American affairs, and a resolution was even introduced into the House demanding that Sir Ronald Campbell and Sir Girja Bajpai be declared *persona non grata*. This has now been pigeon-holed. It is the election season, and on the fringes of both parties no holds are barred, no matter what restraint prevails at the centre. Indeed, at any time, irresponsibility is one of the cardinal features of the American political system; and Senator Chandler is distinguished neither by his caution nor his discretion. What remains a mystery, and something of a scandal, is how American confidential documents and even coded British telegrams came to find their way into Senator Chandler's hands, for him to make political use of, and to misinterpret in the most mischievous way.

Wedding March

There is a popular American song, "They're Either Too Young or Too Old," bemoaning the miserable lot of the war-time spinster. Facts bear out the catastrophic decline in eligible bachelors. In February, 1944, there were only 2,500,000 single male civilians from 20 to 44 years old, compared with 8,400,000 in 1940. This decline is not entirely due to the ruthless demands of Selective Service. There has, in fact, been a most impressive increase in the number of marriages in the war years. In 1940 there were about 30 million married women, constituting not quite 60 per cent of the female population 14 years and older. In February, 1944, this number had increased to 32.9 millions, nearly 63 per cent of the total. This is a striking change from the decade 1930-1940 when there was practically no change in the proportion of married women. Some of these "war marriages" unquestionably are the result of better wages and postponements from the "thirties." More, however, are the direct, rather than the indirect consequence of war, as is shown by the fact that the main increase has been among women under 25. In 1940, 28 per cent of the female population aged 14 or over were married; in 1944 the proportion was 33 per cent. About 2.7 million women report that their husbands were in the Armed Forces in February, 1944. Almost half of these women were under 25. Of the married women from 14 to 19, about 40 per cent were married to Servicemen, and of women from 20 to 24, the proportion was about 30 per cent. But marriage is in the air. Even among men over 45 the proportion of those married has gone up, significantly more than the figures for women of the same age group. This trend is not likely to continue for long. For one thing, as more Servicemen are sent overseas opportunities for marriage will fall. In the long run, too, the present march to the altar will prove to have robbed the future. Some of these marriages, as is the nature of war marriages, may prove to be less than permanent, although as yet there is no change in the proportions of widowed and divorced persons in the population. But in the years following the war, it would seem wise to expect a substantial increase in the demand for new houses, furnishings, baby carriages, lawn mowers, and all the other equipment needed for a large population of newly-married people, enabled for the first time to set up housekeeping.

The Railroad Suit

The most recent of the Department of Justice's many pending anti-monopoly suits was instituted last week against Western Railroads, the Association of American Railroads, the Western Association of Railway Executives, J. P. Morgan and Co., and Kuhn Loeb. The charges are those of violating the Anti-Trust Act by collusive rate-fixing and by discouraging improvements in service and equipment. It was alleged that the two investment houses control substantially all the financing operations of the railroads in question. The case has its special geographical and political, as well as economic, interest. The West and the South have long complained that their industrial development and agricultural well-being were retarded by discriminatory freight rates, which were used to maintain the industrial supremacy of the North-East. This is the last remnant of the bitter hatred of the railroads which characterised the Middle West at the end of the last century, and led to increasingly strict control of railroad rates, financing and policy. In the defence of the Western roads, it is probably fair to say that returns on heavy capital investment are less in the more thinly populated West than in the East; and the position of the railroads has been very adversely affected by competition from motor transport. What the conservative Eastern press finds difficult to understand is the possibility of collusive rate-fixing when rates are controlled by the Inter-State Commerce Commission; and it has concluded that this is a campaign gesture on the part of the Administration for the benefit of the South and West. If this be so, it appears to have been a successful move. The Middle West, Conservative and Liberal, has endorsed the allegation of unfair rates, although there is some doubt as to the wisdom of pressing the case during the war. It is their contention that the Interstate Commerce Commission now does little more than accept the rates fixed by the railroads. If this is true, Attorney-General Biddle's housecleaning might well begin in Washington.

ARE YOU OVER 17 YEARS OLD?

UNLESS you are over 17, there have been no Black Magic Chocolates since you were 14; and at that age (if we remember aright) chocolates were chocolates and never mind the name.

But if you are over 17, the words "Black Magic" probably strike a chord in your memory.

Let us help a little.

A very plain box—glossy black, with a few white lines on it.

Twelve different kinds of chocolates, in simple paper cups, without any fripperies.

Truffle-and-Nougat, Hazel Cluster, Liquid Cherry, Orange Cream, Strawberry Cup . . . heigh-ho. The girls loved 'em; and the boys took no poor view of them, either.

And now, you say, here it comes—"Come Peace, come Black Magic." But nothing of the sort. There will be a lot of pre-war goods back in the shops before Black Magic; for though we shall move fast, we shall take no short cuts—no half measures, no skimping.

Don't expect to buy Black Magic on Armistice Day; but when you do buy it, it will be as good as ever. We believe it will be better, but that will be for you to say.

Black Magic

ROWNTREE & CO. LTD., YORK

WHITE HORSE

still as fine as
a fine liqueur

Suppose that good fortune has brought you a bottle of White Horse, as sometimes it may, even in this fifth year of war.

You pour out a modest measure of this genial spirit into your glass. What is your immediate reaction? First you recognise the delicate and distinctive aroma of the White Horse you have known in times of peace. You raise the glass to your lips and at once your palate confirms your first impressions—that White Horse Whisky was never better than it is to-day.

This is quite true, and here is the reason. The White Horse Whisky in your glass is a whisky of the past and was growing old when this war was young. Stocks laid down long ago, matured and maturing, provide the White Horse supplies for to-morrow as well as to-day. Whisky as great as the White Horse you knew in time of peace, whisky which will always be 'fine as a fine liqueur.'

The present system of regulated supply is an essential provision to ensure for you the enjoyment of really good whisky both to-day, and in the years to come.

MAXIMUM PRICES:—Bottles 25/9d.; Half-bottles 13/6d.
as fixed by The Scotch Whisky Association.

"When
your
tobacco
smokes hot—

take my advice
and cool it down with Grand Cut"

Grand Cut

FLAKE OR READY RUBBED

2 oz. for 5/-

Obviously a pipe of GRAND CUT alone
smokes even cooler and more slowly.

ISSUED BY GODFREY PHILLIPS LIMITED · 1844-1944

AN ESSENTIAL OF WARTIME DIET

STORED in this tiny capsule are two vitamins without which it is impossible to maintain health. They are 'protective' vitamin A and 'sunshine' vitamin D and, unfortunately, they are not always readily obtainable in a wartime diet. A daily dose of Crookes' Halibut Oil—one of the richest natural sources of these vitamins—will build up your resistance and stamina and prove of inestimable value during this sixth winter of war.

CROOKES' HALIBUT OIL

OBTAINABLE ONLY FROM CHEMISTS

Capsules—per bottle of 100—8/6 Liquid—per phial—enough for 16 days 2/-

The stage is set . . . There is a first-night atmosphere in the radio and electrical industry today. And when the curtain rises on the post-war scene, the star turn will be provided by the Philco Group. This new alliance of progressive manufacturing companies is going to play an impressive part in the development, manufacture and distribution of radio and television as well as electro-mechanical productions of the widest possible variety . . . The stage is set for the great post-war programme of the Philco Group.

COUNTER ESPIONAGE

IODINE plays its part in the detection of messages written in invisible ink. This is one of the formulas for a developing reagent: potassium iodide 4 grammes, iodine 0.1 g., sodium chloride 5 g., aluminium chloride 2 g., glycerine 3.5 g., water 30 c.c. This is applied to the suspected letter by means of a cotton wool pad, and only in exceptional cases does it fail to reveal secret writing. Iodine is used for the development of invisible fingerprints. Farmers use it for increasing the yield of dairy herds and preventing animal diseases. Engineers use it for detecting heated bearings. It plays its part in photography and optics. In fact, the uses of this element are legion. Perhaps you have an iodine problem of your own. The IODINE EDUCATIONAL BUREAU exists to help institutions and manufacturers and its advisory services are free.

THREE NUNS SAVES MONEY

—because of its

SLOW-BURNING CUT

There are two special reasons why 'Three Nuns' Empire Blend Tobacco saves the smoker money. It is scientifically cut to burn slowly, each ounce lasts longer, you smoke fewer ounces a week. It is made from fine leaf which is favoured by the lower duty on Empire Tobacco. To enjoy the fullest pleasure of smoking at a moderate cost, take to 'Three Nuns' Empire Blend.

AND WHEN THE WAR IS WON

Back to the battle for markets!

In the kind of world that will exist when the 'Cease Fire' sounds there will be no place for the old, narrow, economic rivalries. We believe that the success of lease-lend has proved the principle of industrial collaboration to be a working formula not only for victory but for a just and durable peace.

We, in this Company, feel convinced that the same principle, carried over into post-war reconstruction, will not only furnish ample scope for private enterprise but will help to build that stable and confident kind of world in which enterprise can thrive.

In the interests of all, including ourselves, we therefore invite support for this principle from industrialists and business men on both sides of the Atlantic who believe with us in International Industrial Collaboration for Peace.

THE MOND NICKEL COMPANY LIMITED

THE BUSINESS WORLD

The International Bank

DISCUSSION of the Bretton Woods Agreements has been almost wholly occupied with the merits and shortcomings of the Monetary Fund for exchange stability. Yet it may be that the proposals for the International Bank for world investment will prove to be of greater importance. Certainly the Bank may have better prospects than the Fund of being put into operation. If the Monetary Fund proposals were not to be ratified by the United States and Britain, as might happen, it is safe to assume that some workable alternative would take their place. International trade will not stop if the Bretton Woods recipe for arranging the relationship of the world's currencies is rejected. Some other temporary system of exchange stabilisation, perhaps resembling the Tripartite Agreement of the pre-war years, would take its place. But if the plan for an International Bank miscarries, it is by no means certain that there will be an alternative to take its place. As long as there is international trade, currencies must find some relationship one to another, and that relationship must be rationalised into some sort of system—however elastic. But there is no comparable necessity for capital to flow from one country to another, however great the need for such a movement. It is all too probable that, without some international institution such as the proposed International Bank for Reconstruction and Development, the international capital market would in the immediate post-war years be crippled.

It is, therefore, some consolation that, in the present political temper of both this country and the United States, the Bank probably stands a better chance than the Fund of being accepted and implemented. As defined in the Final Act of the Bretton Woods Conference, the purposes of the International Bank are as follows:

- (1) To assist in the reconstruction and development of territories of members by facilitating the investment of capital for productive purposes, including the restoration of economies destroyed or disrupted by the war, the reconversion of productive facilities to peacetime needs and the encouragement of the development of productive facilities and resources in less developed countries.
- (2) To promote private investment by means of guarantees or participations in loans and other investments made by private investors; and when private capital is not available on reasonable terms, to supplement private investment by providing, on suitable conditions, finance for productive purposes out of its own capital, funds raised by it and other resources.
- (3) To promote the long-range balanced growth of international trade and the maintenance of equilibrium in balances of payments by encouraging international investment for the development of the productive resources of members, thereby assisting in raising productivity, the standard of living and conditions of labour in their territories.
- (4) To arrange the loans made or guaranteed by it in relation to international loans through other channels so that the more useful and urgent projects, large and small alike, will be dealt with first.
- (5) To conduct its operations with due regard to the effect of international investment on business conditions in the territories of members and, in the immediate post-war years, to assist in bringing about a smooth transition from a wartime to a peacetime economy.

The Bank is clearly intended to fit into a state of world affairs in which there is comparatively free multilateral convertibility of currencies; it is the present widespread doubts about the likelihood of this state of affairs which has caused corresponding doubts about the practicability of the Bank and the Fund. It is specifically stated that "the Bank shall impose no conditions that the proceeds of a loan shall be spent in the territories of any particular member or members." Currencies paid into the Bank by way of capital subscriptions are to be loaned only with the approval of the member countries whose currencies are involved, but in most other respects the currencies held by the Bank will be available without restriction.

There can be no quarrel with the declared objectives of

the Bank. The desire to aid reconstruction and development and the intention to do so, while fostering the balance of international trade, and within the framework of a steadily expanding world economy, are unexceptionable and most necessary. The means by which the Bank intends to operate is to assist and supplement private investment—not to supplant it. The proposed size of its resources should not, therefore, be judged by the criterion of post-war needs for international investment. There will be other sources from which the need will be fed. The capital of the Bank will in any case be quite sizeable—\$10,000 million, which about equals the vast outpouring of capital over the frontiers of the United States during the decade following the last war.

It is only intended to call up 20 per cent of this capital, but this does not necessarily mean that the direct loans of the Bank will be limited to \$2,000 million. The Bank is to have power to issue its own obligations in the market and to use the proceeds to make direct loans. Such loans, however, will only be made "when private capital is not available on reasonable terms"; and it may be assumed that the credit of the Bank will be used primarily to guarantee loans made by private investors. This mechanism of guarantee will mean that international loans are placed in the countries best able, by the state of their balance of payments, to provide such capital, but that there will be a true international responsibility for the loans. The risk will be taken by all, but the actual cash will be provided by those best fitted to furnish it.

But it is quite impossible to pass judgment on the Bank merely on the basis of the Bretton Woods description. It all depends on the conditions in which the Bank will be called upon to work. Its capitalisation might look much less than adequate if the Bank were saddled with the task of filling every prospective deficit in international balances of payments; but that cannot be its responsibility. The temporary balancing of such deficits will be the rôle of the Monetary Fund or of whatever organisation takes its place. On the face of it, therefore, the adequacy of the resources of the Bank should not be judged by estimated variations in international balances of payments. On the other hand, those variations in balance and the policies adopted in regard to them will have a powerful influence on the prospects of international investment and, most of all, repayment. Large international loans can, should and, no doubt, will be made. The Bank will be a most valuable and necessary instrument and aid in making them. But will they, or can they, be repaid? That is the crux on which the maintenance, though not the resumption, of international investment depends.

If reasonable conditions for the much-needed resumption of international investment do exist—as it is most devoutly to be hoped—then the success or failure of the Bank will be decided, first, by the quality of its management; secondly, by the fiscal policies of the investing and creditor countries; and thirdly, by the measure of financial honesty in the post-war world. Perhaps the last of these points deserves first mention. At the basis of every loan operation there stands the willingness, as well as the ability, of the debtor to pay it back. No ingenuity of lending technique, no freedom from customs barriers, no full employment policy on the part of the lender will serve if the debtor's policy is one of default. Some recent events do not perhaps augur too well for such honesty.

The success of the Bank's loans, given the willingness of debtors to repay, will then be a function of the wisdom with which its operations are conducted, especially of the judgment shown in choosing borrowers, and—inexorably—of the kind of world in which it will operate. In comparison

with these two factors the mechanism of its loans and the form they take will matter very little. The first problem will be that of selecting honest borrowers and constructive investment projects. The second will be to see to it that the creditors are prepared to accept the service of their loans in goods or services. The experience of the inter-war years has naturally caused this subject of international investment to be regarded in a defeatist light. There is, of course, no inherent difficulty in fitting the flow of international capital and of the subsequent service on international debts into the pattern of a reasonably well-balanced account of international payments. Between 1870 and 1914 Britain invested abroad to the amount of about £3,700 million, and, on the whole, those investments proved extremely profitable. By and large, they were wisely chosen and brought profit to creditor and debtor alike. Nor was the slightest difficulty ever encountered in remitting the service of these loans to Britain, even in years when Britain was comparatively depressed. British money opened up the Argentine and British mouths ate Argentine beef and wheat.

In quality the post-1918 international loans did not, on the whole, compare well with those made before 1914; and

the conditions were different. The loans often appeared under far more impressive auspices. The League of Nations had its reconstruction loans and Government guarantees abounded. But many of these loans were mere "deficit plugging"; their proceeds were not used productively. Moreover, and even more important, many borrowers were not in a position, whether the loans were productive or not, to make the necessary exchange transfers for service and repayment. Debtors must be able as well as willing to repay. The multiplication and heightening of tariff barriers made it increasingly difficult for the loan services to be remitted. The readiness of the creditors—and for the time being that must largely mean the United States—to accept payment of the service on these loans in goods or services is crucial; and this readiness to import as befits a creditor will in large measure depend on the level of national income and employment maintained in the creditor countries. The International Bank can play a vital rôle in the right conditions; and there is nothing in its proposed size or constitution to prevent it from fulfilling that rôle most successfully. It represents a hope for the return of mutual aid, economic sanity and political honesty as the principles of world order.

The Future of Inland Transport—II

THE post-war aim of public transport policy, as of economic policy generally, must be to ensure the conditions of rising productivity. In the case of transport, a rise in productivity means the provision of an efficient service at the lowest possible total real cost within the widening limits of technical knowledge. What is needed is a system of incentives designed to ensure a flexible integration of the various means of transport, in which the test of the efficiency of rail, road, air, coastal shipping and canal will be their contribution to national efficiency.

In a first and fact-finding article last week an attempt was made to show why the pre-war regime of public transport did not adequately satisfy these conditions. It could not bring about the distribution of capital expenditure on the various transport facilities, and the allocation of traffic between them, that would have ensured the lowest total real costs. This was due, not so much to the inefficiency of the parts, as to peculiar technical, economic and legal obstacles.

It has long been recognised that this pre-war set-up could not be maintained indefinitely. But there is anything but unanimity about the lines on which a satisfactory solution should be sought. It would be naive to explain this lack of unanimity simply in terms of a conflict of interests between the various means of transport or of opposed political views. It is due in large measure to the complexity of the problem and to the lack of relevant facts. The solutions that are advocated may be grouped under three headings. A large body of transport (rail and road) and independent opinion sees the solution in price competition on the basis of equality of opportunity. Among the less orthodox, one group (including certain of the transport interests) advocates joint price-fixing and a sharing of traffic between the financially independent means of transport, with "competition in service"; another (favoured by a growing body of independent opinion) suggests the creation, under the auspices and supervision of the Government, of a community of interest between the various facilities as the best and quickest way to achieve technical integration. The merits of these suggested solutions can be ascertained by submitting them to two tests. First, how far do they satisfy the criterion of efficient transport? Secondly, are they capable of practical application?

★

At first sight price competition on the basis of equal opportunity seems undoubtedly the most attractive. Its advocates believe that it would automatically ensure the right kind of "balance" between the various means of transport and provide the necessary incentives to technical progress and adjustment. If, for strategic reasons, unprofitable facilities have to be maintained, or if, for social or economic reasons, certain goods and passengers have to be conveyed at prices lower than market prices, the cost should be borne by the community in the form of a subsidy and not by the owners of transport.

The creation of conditions of equal opportunity would

inevitably involve the abolition of legal discrimination between the various means of transport. This means, for example, that the railways would be able to enjoy the same freedom as the road in fixing its prices—they pressed for this before the war—and that the road would be able to enjoy the same freedom as the railways in adding to its rolling stock. Such general regulations as may be necessary to ensure reasonable wages, conditions of work, safety, and so on would be applicable to all means of transport. The sweeping aside of legal discrimination, while not necessarily preventing the road from carrying an increasing proportion of the light traffic in the area of business where road and rail present in fact competitive alternatives, would enable the railways to charge more in the area of business where (for the reasons given in last week's article) there is, for practical purposes, no competition—that is, the carriage of coal and bulky goods and, presumably, certain passenger journeys.

The abolition of legal discrimination alone, however, will not create conditions of equal opportunity. One of the difficulties of the railways is that, in planning capital expenditure, they have to look much farther ahead than road operators; the average length of life of railway equipment is about four times that of road equipment (exclusive of the roads themselves, which are owned by the state). More important is the difference in track costs which, as was shown in last week's article, is one of the chief clues to the success of the road; track charges represent a much higher proportion of costs for the railways than they do for road operators.

On this matter of track costs, the views of road and rail are diametrically opposed. Road users define track costs as the amount actually spent by the Government in interest charges and maintenance, and, on this basis, point to the fact that the total revenue derived from the taxation on public and private vehicles actually exceeds the Government's road expenditure. Railway spokesmen, on the other hand, contend that the main reason for the lower track costs of the road user is the fact that the bulk of past expenditure on road construction has been met from taxation and therefore does not carry interest; that the petrol engine, in fact, has inherited a large part of its track free of charge; and that, if the railways had "written down" their own track below its present value the railway user would have had to pay higher charges in the days when they had a virtual monopoly of inland transport. The difficulty is a real one, but none of the many schemes proposed by railway interests can offer an adequate solution. Most of them, inevitably, are based on the "handicap" principle in that their object is to deprive the road of its inherited advantage. This applies to the scheme for the pooling of track costs between the various means of transport that has been recently under examination.

In spite of the difficulty about track costs, it would no doubt be possible, with rough justice, to devise conditions of greater equality of opportunity between the various transport facilities. But even then it is doubtful whether price competition would automatically bring about the desired result—that is, the lowest possible total real costs of public transport.

The second solution, which involves joint price-fixing, has few sponsors among independent students of transport, for it would confer a private monopoly upon the public transport industry. It has some adherents on the road side; its railway exponent, Sir William V. Wood, president of the LMS, outlined the scheme in these words during an address on October 12, 1943:

I consider that the way is now clear for the adoption of complete equality in regard to charging powers, leaving the users of public transport free to choose the system they prefer to use at a particular time, thus achieving a natural allocation of traffic between the various forms of transport. It would permit a system of correlated charges, not necessarily uniform, agreed between the forms of transport, and that in turn should lead to a re-routing of various traffics, "through" movements of both passenger and merchandise traffic by two or more forms of transport and pooling of resources. Such natural flow would be very greatly facilitated by area fusions or associations of road hauliers (apart from purely local hauliers) like those already achieved by the omnibus undertakings. There would be competition in service to provide the stimulant to progress, but it would be regulated competition and not wasteful. There would be scope for expansion and for the development of new facilities for all forms of transport, leading to a balanced general scheme. One example is the electrification of the railways for main line purposes. In the past, the lack of consideration of transport requirements as a whole, and the undue risk incurred in expending large capital sums on fixed plant have been the chief obstacles to such developments.

Sir William's ultimate objective is evidently the technical integration of the means of transport. His means are joint price-fixing and, apparently, a sharing of traffics. True, there would be safeguards in the form of profit limitation, competition in service, tribunals to investigate and settle complaints about charges and facilities, as well as alternatives to public transport in the "C" licence for the haulage of goods and in the private car and the cycle for the conveyance of passengers. But would a private transport monopoly of this kind necessarily ensure the conditions of

efficient transport? And is it likely to be accepted as a solution by the public and Parliament? Even if the solution were generally acceptable—which is most unlikely—there is a great danger that, in spite of the best intentions, it would not achieve its object. There would inevitably be a tendency for rates to be fixed at a level that would provide a return on the capital of the party with the highest costs; profit limitation would be to the disadvantage of the party with the lowest costs. The incentives to cost reduction and technical progress are not likely to thrive in conditions of financial security. Joint price-fixing would be a step in the wrong direction.

★

Both price competition on the basis of equal opportunity and joint price-fixing as proposed by Sir William V. Wood have as their ultimate objective a "balanced" transport system. In most fields of industry and trade, competition secures efficiency and the necessary technical adjustments, but in the peculiar conditions of British transport the competitive solution is not only beset with a host of practical difficulties, but it may also be a remedy of doubtful efficacy. Joint price-fixing and traffic sharing by an all-embracing private monopoly, though no doubt technically feasible, might, in spite of good intentions and safeguards, impose upon this country a regime of high costs to which the consumer of transport would take the strongest exception.

There is a third solution, and it seems likely that this is the one that is most practicable as well as fulfilling the conditions of efficient transport. The basis of this solution is the technical (as distinct from financial) approach to the problem. Its aim is to create the technical conditions that will ensure the efficiency of the whole as well as of the separate parts. The form in which this solution might be put into practice will be outlined in a final article.

Business Notes

Paris Bourse Re-opens

A week ago the first of the stock exchanges of the Continent to be freed from German control, the Paris Bourse, recommenced business. It will, presumably, be followed in the immediate future by Brussels and after no very long delay by Amsterdam. Although these exchanges will now be free from the German yoke, their contact with the outside world must, for some time, be of a very modified character. In the first place, assets of the nationals of the liberated countries in Britain are still under the control of the Custodian of Enemy Property. Every effort will be made to remove this control, but the process must of necessity be a lengthy one in view of the difficulty of ensuring that no freed assets should pass into German ownership or control. Further, there is the question of protecting the value of the pound. It is to be hoped that there will be all-round relaxation of controls, but the movement is likely to be a slow one. There can certainly be no question of an immediate resumption of arbitrage business between the liberated countries and Britain. Nonetheless, the liberation is a large step towards an eventual restoration of market contacts, and it is probably a realisation of this which has caused a considerable fall in the so-called "internationals," dollar securities such as Canadian Pacific, Brazilian Traction, and International Nickel. It seems probable that, after a delay which may be long or short, the holders of such securities, or their Governments, will be sellers of these stocks in order to obtain dollars. Granted some freedom of intercourse between markets, all these will be sold in London so long as the price here is above parity, and, even after the recent fall, there is still a considerable margin in favour of London. This argument does not apply with the same force to other securities, such as South African gold mining shares, in which the Continent is largely interested. But it may be the case that there will be some selling pressure in this market also.

The Setback in Equities

The country is now sufficiently adjusted to the Allied armies' great exploits in the west for it to be possible to assess the effects on Stock Exchange securities. Although the extent of the reaction in prices was, at its greatest, much larger in some of the market leaders, the extreme range in the equity index of *The Financial News* was a fall from 116.9 on August 9th to 111.0 on August 22nd, a drop of 5 per cent. The weekly average figures of the same index, of which a chart is given on page 364, show a maximum decline of under 4 per cent. Meanwhile, fixed interest stocks improved by rather less than 2 per mille. An even less striking picture is presented by the equity share figures of *The Actuaries' Investment Index*, also given on page 363, which is made up to a date a week after the fall had reached its maximum. Here the recession is approximately 1½ per cent on the month to 85.4. This is still above the June figure. This index also shows that there were exceptions even among industrial equities to the general rule of falling prices, for the figures for investment trusts, cotton, electrical distribution and gas are all slightly higher on the month. So far, the picture is of a fall which is sharper but shorter than any of its recent predecessors. Owing to its shortness it is not yet equal in extent to that of last autumn. It is scarcely necessary to point out that the events are moving much more rapidly now than then. The actual fall of August, like that of September and October, 1943, was largely due to the technical position. Whether there will be a further decline or a renewed rise, and the extent of either of these movements, will depend upon how far the natural tendency for abundance of money to push up prices of shares—of which the supply is still fixed—is offset by doubts as to the intentions of the authorities and their ability to carry them out. The immediate prospect may be one of quiet markets with little movement, but it is probable that, in the comparatively near future, the upward trend will be resumed with rather larger fluctuations in individual prices and, perhaps, in equity indices than have been common in the past three years or more.

Liberation Currencies

The progressive liberation of Belgium and Holland has brought into operation arrangements made long ago for the supply of Belgian and Dutch currency to the Allied armies. In each case the notes required by the military authorities have been provided by the Governments and are expressed in local currency. A substantial quantity of National Bank of Belgium notes was taken out of that country at the time of the German invasion in 1940. In addition further considerable quantities of Belgian notes have been printed in England from the original plates, which were removed from Brussels before the Germans entered. An issue of new currency appears to be essential to the currency plans of the Belgian authorities because these plans envisage a recall of the whole of the currency—other than coins and notes of small denominations—circulating in Belgium and its conversion, partly into new notes and partly into blocked credits available for investment in long-term Government loans. The Dutch Government has made guilder notes available for the Allied armies of liberation. The notes thus issued by the Belgian and Dutch Governments will rank as part of the mutual claims between the Allied countries that will have to be cleared after the end of the war. The rates of exchange at which the claims are being booked is 176½ Belgian francs and 7.60 guilders to the pound.

Currencies for Germany

The currency arrangements for the Allied armies when they enter Germany have not yet been announced. Three types of notes that would serve for the purpose exist. They are the yellow seal Federal Reserve dollar bills and the British Military Authority sterling notes that were used in the initial stages of the Italian campaign. In addition a special issue of military mark notes has been prepared. All three may ultimately find their way into circulation; the present disposition of the Allied armies suggests that the dollar bills may be the first to establish themselves. A rate of exchange between reichsmarks and the Allied currencies will have to be fixed as soon as any sizeable part of Germany is occupied. The pre-war rate of 11 marks to the pound was at that time a wholly artificial quotation, and a nearer approximation of the true relationship between the two currencies was provided by the travel mark rate, which stood at approximately 60 per cent discount on the official rate. The divergence of price movements in Germany and Britain during the war years has not been considerable. The measure of currency inflation would seem to have been greater in Germany than here, but direct comparisons of note circulation and bank credit are vitiated by the largely increased territories which, until recently, the Reichsmark circulation had to serve. The rate of conversion to be fixed between marks and Allied currencies need not, therefore, depart greatly from the former gold parities of 20 marks to the pound, with an equivalent of 5 marks to the dollar. It remains to be seen what will be the actual rate chosen by the military authorities.

The Price of Houses

The Government was quick to freeze the rents of unfurnished houses at the outbreak of war, and has thus prevented, over a large field of housing, the rise in rents that would otherwise have taken place as a result of the growing shortage of houses and the rise in incomes. Since rent control did not make provision for adjustments to rising living and repair costs, tenants of controlled houses have enjoyed a special advantage. By contrast, the Government has done nothing to control the price of houses. Inevitably, prices have risen steadily; such information as is available suggests that, apart from the temporary inflation caused in safe areas by the flying-bomb, the rise has often outstripped the advance in building costs, for many houses are now changing hands at double and even treble their pre-war market value. During the war, the advance did little harm; land and houses provided one of the outlets for surplus purchasing power—and for the speculator. But, if unchecked, the rise in prices will cause a serious problem during the period of shortage after the war. Prospective purchasers—especially those who cannot find accommodation to let—will be faced with prices altogether out of relation to the average increase in many incomes or in the cost of living; moreover, they face the prospect of a loss. In the absence of general and sustained inflation, prices will

tend to decline after a few years when the housing shortage will be less acute. The Government has shown much more ingenuity than during the last war in controlling the prices of scarce commodities. The Board of Trade has even tackled the formidable task of controlling the price of second-hand furniture. Why not tackle houses now?

Furniture's Future

Homes, in the physical sense, are made up of two parts, houses and furniture. Despite the Government's slowness in coming to decisions which can be translated into actual houses, aims have been expressed and preparations are being made. Little, however, has been heard of a policy to provide furniture, without which the new houses would be useless. The demand for furniture depends upon the speed with which families set up homes, and it is likely to follow closely upon the execution of the building programme. The present demand for furniture is relatively small, and the utility scheme, in a fair measure, keeps pace with a section of it, within the limits of a narrowly defined need. Those who require better furniture, or who are not eligible for utility furniture, have more difficulty, although the new price regulations for second-hand furniture have brought prices down to some extent. In the Portal house period of reconstruction, utility, or at any rate good quality furniture at reasonable prices, furniture will have to be produced in considerably larger quantities than at present. Assuming that each house would have the present ration of 60 units each for a couple, 15 million units' worth of furniture will have to be produced. Designation of firms has been speeded up, and as the labour position is eased this quantity would present no major problem within the utility scheme, even if the programme for 250,000 houses is completed before October, 1947. The demand for low-priced furniture will not, of course, be confined to occupiers of Portal houses. Some 300,000 permanent houses are provided for in the Government's two-year post-war building programme. In addition, some families who have been bombed out of their homes (some 4,000,000 buildings have been destroyed or damaged since the war began) and whose furniture is destroyed will want to refurnish.

The Government's housing plans can only provide a minimum guide to demand after the war. The planners of furniture will have to reckon with a larger demand—probably a large number of the nearly 2,000,000 couples who have married since the war will want new furniture. Again, in addition to domestic requirements, furniture will be wanted in schools, offices and shops. The problem which faces the Board of Trade and furniture manufacturers is not only one of providing an adequate quantity of low-priced furniture—which must be given priority and which will have to be utility—but to meet the demand for better quality and more varied design. To bridge the space between utility furniture and freedom from control, a scheme for a better-grade furniture with a wider choice of design could be evolved. The recommendations of the manufacturers themselves (outlined in a Note in *The Economist* of March 18, 1944, page 380) for the gradual relaxation of control might provide a solution. Utility furniture has been accepted as being the best of a bad job—and it has done its job on the whole admirably—but no one would wish to see every home in the next ten years confined to utility or the dwindling and often hideous stock of second-hand furniture. Room must be left for experiment. The war has produced many new materials and processes which can be used in furniture manufacture. Some of them may perhaps be incorporated into utility furniture schemes, but some will only flourish in an atmosphere free from control, and especially in an industry which is a craft.

Exports of Motor Cars

There seems to be a fairly widespread impression that the motor car industry will be able to go full speed ahead after the war on the production of large numbers of private cars. Doubts are, however, beginning to be expressed about the rate and size of the expansion in production. For example, Sir Miles Thomas, vice-chairman of the Nuffield Organisation, recently questioned the adequacy of steel sheet supplies, especially if Portal houses are to be constructed in large numbers. (This point was discussed on page 325 in *The Economist* of September 2nd.) This week

Lord Nuffield himself drew attention to the difficulty of industry in looking and planning ahead.

Until a much-needed pronouncement is made by the Government on such matters as the continuance of war-time controls, EPT, purchase tax and labour restrictions.

It may well be necessary, at any rate until some of the more pressing shortages have been met, to limit the manufacture of private cars for the home market. On the other hand, there is a strong case for encouraging manufacture for export as a means of securing much-needed foreign exchange to finance essential imports. It might, of course, be said that a large home market is essential for the adoption of large-scale methods of production which is necessary to market cars abroad at competitive prices. But this argument only holds good on the assumption that exports are likely to be comparatively small after the war. Is it not conceivable that total export demand will be large enough, at any rate for a few years, to enable the industry to sell abroad, if not the major but at least a substantial part of its output, to prepare some of its designs on the basis of export rather than home demand, and thus to ensure a permanent expansion in exports? In view of the prospective hunger for cars and the anxiety of the Dominions and Latin American countries to convert their sterling assets into goods, such a policy might, perhaps, hold out better prospects than is generally realised.

Tilling Enters Insurance

Considerable interest attaches to the statement, made at the end of last week, that Thomas Tilling has acquired a substantial interest in Cornhill Insurance. There is no direct indication about the size of the interest, but Sir Frederick Heaton, chairman and managing director of Tilling, is joining the board of the Cornhill and retiring from that of the Alliance. He joins, however, as an ordinary director and there is no other change in management. This would seem to suggest that the "substantial" interest is to be read as about 50 per cent. Nor is there any indication as to the reasons for the acquisition. One can infer from the past history of the group that it is not likely to be unprofitable and if, as seems certain, it is to do the insurance business of the Tilling companies there is an added advantage which may be expressed either as cheap insurance or an important expansion in lucrative business to the Cornhill Insurance. It appears that this company engages in all types of business other than life, so that the investment marks a considerable widening of the field of interest of the group. But Sir Frederick seems to be bent on expanding its influence by taking on only new fields of activity which have some direct connection with the central business of running road transport. In view of the large reserves of the associate companies, there would seem to be room for considerable further expansion without raising new money. This policy of limited diversification can hardly be other than beneficial to the group as a whole. As to the suitability of the present venture it may be recalled that Sir Frederick was the founder of Road Transport and General Insurance, subsequently sold to General Accident.

Diversion of Railway Traffic

The accompanying table shows, by way of a footnote to the article on the future of inland transport in *The Economist* of September 2nd, the estimated rate of diversion of goods traffic from the main-line railways to the road during the five years preceding the war. Details are given for general merchandise and for minerals other than coal, which is largely tied to the railways. The tonnages originating in places where the railways have facilities vary, of course, with changes in the total volume of traffic. Changes in the volume of railway traffic due to variations in the total volume of traffic are, of course, excluded from the figures of diversion from rail to road. The cumulative loss in tonnage during the five-year period was about 3,700,000 tons. Taking the average receipts per ton at 17s. 6d. for goods and 5s. for "other minerals," the cumulative loss in railway receipts from diversion amounted to about £1,900,000; this figure does not, of course, take into account the loss in receipts due to reductions in charges made by the railways in order to slow down the rate of diversion. In contrast to the fairly even rate of diversion in the general merchandise category, the rate of diversion in the "other minerals" category rose steadily during the five-year period. Unfortunately, the lack of data precludes the recalculation of the rate of diversion to the time when the

first haulier appeared on the road. A rough estimate shows that of the freight (excluding coal) of 88.3 million tons originating, in 1938, in places where the railways have facilities, some 53.7 million tons, or about 60 per cent, were moved by road. In so far as the growth of road transport

ESTIMATED GOODS TRAFFIC ORIGINATING IN PLACES WHOSE RAILWAYS POSSESS FACILITIES AND DIVERSION OF TRAFFIC FROM RAIL TO ROAD, 1934-38

	1934	1935	1936	1937	1938
<i>General Merchandise</i> —					
Total originating tonnage (000)	43,240	43,329	46,269	48,189	42,394
Diversion to road (000)	303	397	228	220	584
Percentage	0.70	0.92	0.49	0.46	0.91
<i>"Other Minerals"</i> —					
Total originating tonnage (000)	49,307	49,228	53,258	57,013	45,919
Diversion to road (000)	33	112	276	328	1,416
Percentage	0.07	0.23	0.52	0.58	3.08
<i>Total (excl. Coal)</i> —					
Total originating tonnage (000)	92,547	92,557	99,527	105,202	88,313
Diversion to road (000)	336	509	505	548	1,800
Percentage	0.36	0.55	0.51	0.52	2.04

actually "created" new traffic, the total diversion of traffic from rail to road is smaller than the tonnage actually carried by road in 1938. But it does provide a broad indication of the importance acquired by road haulage in modern transport.

Municipal Conversions

The announcement of the Chesterfield Corporation conversion appears to inaugurate an important series of such operations with regard to corporation stocks with first optional maturities in 1945. The actual offer is to convert up to £300,000 of £470,000 4½ per cent maturing stock into a 3 per cent issue at 99. This is the same price and yield as the Sheffield conversion of January, but the average and minimum life of this new stock are rather shorter, 1964-69 against 1967-69. The offer is open until November 1st, and, as has been the case since conversions were permitted once more in 1941, any of the £300,000 not taken in con-

"FIRST of all I know I can trust its judgments. Then, if you share its political colouring, its opinions are especially valuable to you. But they're stimulating even if you're on the other side of the fence! Then it's what I call a good paper. It has always been noted for its sane and balanced views on all subjects. It also has a reputation for giving a first airing to subjects which eventually become of national importance. In these days we've got to remember that distances no longer divide interests like they used to. In the area where *The Yorkshire Post* is published there are four and a half million people and what goes on among them is of real concern to the rest of us."

version will be covered by the Treasury. It is to be noted, however, that over one-third of the total is being paid off out of the corporation's own resources, and it seems that local authorities are to be encouraged to reduce their replacements in marketable stock to a minimum by increasing their borrowing on mortgages. Read in conjunction with the Treasury scheme for centralised borrowing, this seems to constitute a plan for the reduction of all marketable securities of local authorities to a minimum. To some extent, however, investors, as a body, have the matter in their own hands, and the disappearance of marketable loans of large authorities seems improbable. Nonetheless, the operations to be undertaken shortly may show a substantial reduction in the amount of stock outstanding. The total to be dealt with, excluding Chesterfield, is some £51 million of some 23 authorities. The whole bears interest at rates of 4½, 4¼ or 5 per cent, the largest issues being some £28½ million 4½ per cent London County Council 1945-85, £3,395,000 City of London 5 per cent 1945-65, and a Glasgow issue of £2,896,000 5 per cent 1945-55. Partial redemption of this block of stock and the conversion of the remainder into 3 per cent issues must cause a further levelling down of yields on other fixed interest stocks, especially those of trustee status.

The Tinplate Scheme

South Wales manufacturers are anxious that the President of the Board of Trade should no longer withhold his approval from their scheme for the elimination of redundant plant in the tinplate industry, which they have submitted to him under the provisions of Section 25 of the 1935 Finance Act. This scheme appears to have the unanimous support of the tinplate industry. Its main proposals follow those of the Essendon Report of October, 1941. The intention is to scrap mills representing about 30 per cent of the pre-war nominal capacity of the industry, thus adjusting its effective maximum capacity to the 1937 peak production of 20½ million boxes (approximately 958,000 tons); and to compensate the owners of eliminated mills from a levy on the production of the surviving firms, spread over three or four years. During discussions in 1941 the large groups agreed to scrap a percentage of their plant at their own expense and proportionately to reduce their claims for compensation, and it is understood that some such discrimination in favour of smaller manufacturers is embodied in the present scheme. Producers take the line that the solution of the redundancy problem must precede the ensuing scheme for the reorganisation and modernisation of manufacturing methods—an attitude which has the support of the Joint Industrial Council of the industry, the British Iron and Steel Federation and the Welsh Reconstruction Advisory Council. Mr Dalton, on the other hand, is said in some quarters to be demanding fuller details of the reorganisation scheme, particularly how many strip mills it is proposed to build and where they are to be located. The difficulty is that such plans for the future cannot be definitely fixed until it is known for certain which plants will be officially scheduled as redundant. Further, the manufacturers urge the specific point that agreement has not yet been reached between

Tinplate Processes, Ltd. (representing 75 per cent of the industry), and two important outside firms, largely engaged in sheet manufacture, who have their own plans for post-war improvement. Another argument by manufacturers is that Mr Dalton has ample powers to influence the location of new plant, anyway. Some of the manufacturers' objections to looking beyond the immediate problem are somewhat specious. It is in the interest of the industry to submit a reorganisation scheme on the basis of the compensation for redundancy which appears to have been agreed already. There is no evidence that Mr Dalton objects to the proposed compensation. It is, however, quite clear that, redundancy apart, a good deal of the plant for the scrapping of which compensation is suggested is merely obsolete. It is not at all clear why future consumers of the industry's products, including exporters, should be saddled with the cost of compensation for plant which is not capable of competing with modern methods.

Dust in Steel Foundries

Silicosis is an industrial disease commonly associated with mining, but in practice any workers engaged in dusty operations are subject to it. The wartime expansion in the production of steel castings for the engineering and ship-building industries has resulted in a serious increase in silicosis cases in steel foundries, and in addition to those certified there must be many cases of damage to lungs which will only be apparent in later years. Silicosis is contracted by inhaling very small particles of silica in the free or uncombined state, the most dangerous particles being so minute as to be invisible to the naked eye, so that the air in which there is little or no visible dust may be highly dangerous to breathe. This makes it very difficult to control the dust, but a special committee, appointed by the Ministry of Labour in January, 1943, has made a number of valuable recommendations for reducing the risks and tackling the problem at source. In a report on Dust in Steel Foundries (HMSO) it suggests certain measures for the reduction of the use of siliceous materials, such as prohibiting the use of "parting" powders containing free silica and of sand or other siliceous materials in "blasting" operations. Certain general precautionary steps, such as effective ventilation, the periodic examination of "blasting" plant, and the use of protective helmets, gauntlets and overalls, are proposed, and it is further suggested that no boy under 18 should be employed in "blasting" operations. The actual numbers affected by silicosis are small. In 1942, six died, nine were totally disabled and eleven suspended on account of the disease, but the total of 26 workers lost to the industry represents a fourfold increase on the 1937-39 figure. Sir Wilfrid Garrett, Chief Inspector of Factories, urges firms to adopt the Committee's recommendations, since these "would go far to remove the dangers in certain of the processes."

Patons and Baldwins

The fall in the earnings, after taxation, of Patons and Baldwins from £520,000 to £480,000 is perhaps not surprising in the light of the reasons given by the chairman, Mr Forrester-Paton, of reduced turnover for which shortage of labour, and to some extent rationing, were responsible, and of increased costs without any counter-vailing advance in selling prices on a substantial portion of total trade. These conditions are unlikely to improve while the war lasts, but there can be no doubt about the urgent and vast demand for textiles which will follow close upon the heels of an armistice in Europe, and bearing this and the company's strong liquid position in mind—net liquid assets are now over £4,500,000—the present price of the shares perhaps undervalues the company's immediate prospects. It is true that—as well as reduced turnover—there is another fly in the ointment in the shape of a smaller EPT recovery this year—£80,000 against £122,000 refund, and nil against £134,000 reserve not required. The EPT refund, it is pointed out, will not for the future make good partially or wholly any further deficiency against standard profit for EPT purposes. The total amount available, excluding carry forward, is thus lower by nearly £200,000, but last year's figure was exceptional. The ordinary dividend has, in fact, been reduced from 20 per cent to 17½ per cent, but a fall in the rate of taxation payable

from 9s 4d to 8s 6d almost offsets the loss to shareholders. Buildings and plant reconstruction reserve receives £185,000 against £250,000. The increasing cost of replacing plant is clearly Mr Forrester-Paton's chief worry. The statutory depreciation and obsolescence allowances, being based on the original value of the plant in question, can only now provide for two new machines for three old. The Chancellor's Budget concessions are welcomed, but

they do not begin to deal with the hard core of this vital problem.

Sickness Records

There are, unfortunately, no general statistics relating to the ill-health of industrial workers. Certain specific industrial diseases and poisonings must be reported, under the Factory Acts, 1937, or the Lead Paint Act, 1926, and the cases notified are published monthly in the *Ministry of Labour Gazette*. Nothing, however, is known of the time lost through ordinary sickness, although it is certain that it is the main cause of lost time. Sickness records are generally inadequate, but the value of keeping them is increasingly recognised. In response to demands for practical methods of recording, the Industrial Health Research Board set up a sub-committee, whose report the *Recording of Sickness Absence in Industry* (Industrial Health Research Board Report No. 85, HM Stationery Office, price 4d.), has been published this week. It deals with the forms required for the records and methods of dealing with them. The cost of keeping them is estimated to be small—for example, £400 a year in a factory of 4,000 workers, a cost of 2s. per worker a year. For this trifling sum, much information of value in the administration of the factory can be obtained, and the cost can be more than covered in the saving made by improvements in employees' health and consequent higher output. Other more general advantages would result from the collection of more detailed records. Information about the health of groups of workers can assist in determining the best conditions for their work. Knowledge of the collective health of industrial workers would provide valuable data for research and for assessing the value of preventive measures. Although statistics can assist in these and other ways towards a healthier nation, industrial health depends basically on the general level of fitness, which in turn will be influenced by a comprehensive health service with a preventive outlook. The number of doctors in industry seems lamentably small. At the end of 1942 there were about 850 works medical officers, of whom only about 180 were full time. There were 4,000 trained nurses in industry at that date, but the number has since risen considerably. There is a need for more doctors in industry, to study the special factors bearing on the health of industrial workers. These studies will be aided by statistics, and, as merit, would assist in the raising of productivity in this country.

Stock Market Co-ordination

It would appear from the evidence of Mr Anthony Alan Fisk before the Cohen Committee on Company Law Reform that the arrangements for co-ordination between the stock exchanges of the country, while generally excellent, are insufficient as regards the treatment of new issues. Mr Fisk, who is chairman of the Liverpool exchange, represented the Associated Stock Exchanges, and it appears from his statement that there is no formal machinery by which one exchange advises another of a refusal to grant permission to deal. He was unable to give any information as to "placings" in the provinces, a fact which may arise from the circumstances that Liverpool is less devoted to industry, and more to commerce, than several other members of the Association. This is unfortunate. On issues by prospectus or offers for sale it is, perhaps, probable that the news of a refusal would "get round." A private placing is another matter. It has been the case recently that placings which London was not prepared to accept have been made in the provinces. These, however, had been rejected by London for reasons connected with the Treasury ban, on which there was for some time plenty of room for a difference of interpretation between two authorities. The matter of capital issues, however made, is one of the first importance, and the closing of this apparent gap should be dealt with speedily. It is a matter which can easily be handled through the machinery of the Joint Committee of the London exchange, the Associated Exchanges and the Provincial Brokers' Stock Exchange.

Free Gold and Silver

The lure of the high free market prices for gold and silver as quoted in India and the Middle East has reached the United States. A joint resolution introduced in Congress last week by Senator Scrugham and Representative Engle would permit the movement of newly mined United States gold and silver out of the country and its free disposal in the world markets. The spokesmen for the resolution have indulged in special pleading which does not altogether carry conviction. One of their arguments is that, since the US Treasury already holds too much gold and silver, it should welcome the prospect of seeing the newly mined metal exported. Another is that the countries to which the gold would be exported would welcome the opportunity of obtaining more gold, because they have all underwritten the Bretton Woods proposals and would, therefore, have more metal to contribute to the Monetary Fund. Unfortunately, for the silver and gold lobbyists, there are arguments on the other side, and they carry rather more weight than those used to support their case. If any profit is to be made on the abnormal price for bullion quoted in certain isolated free markets, there is every reason why it should be made by the US Treasury and not by the producers. They are pampered enough as it is. In any case, the countries in which these free markets exist are, for the most part, in the sterling area, and the demand for dollars arising within that area is heavy enough not to be further burdened by the proceeds of free silver and gold sales by United States producers.

Tankers Dividend Arrears

For the second time in four months the directors of Tankers recently announced the payment of 2½ years' arrears of dividend on the 8 per cent cumulative participating preference shares of the company. The previous payment was one of 8 per cent only, made just previous to the offer of three years ago, in virtue of which United Molasses acquired virtually the whole ordinary and preference capital

(Continued on page 363.)

£1,000,000,000

(Yes, it's a lot of money)

In a little over two years all this money was invested in the previous issue of Savings Bonds. That's how attractive they are!

Why are so many people putting their money into Savings Bonds? Some, because Savings Bonds offer so many advantages. Others, because Savings Bonds help the war effort and earn 3% into the bargain. All, because they have confidence in Britain's future prosperity and in the acknowledged worth of Savings Bonds as a security.

Post Office & Trustee Savings Banks
Issues. Purchasable in multiples of £5; with minimum first subscription of £10. Maximum subscription £1,000. Interest paid half-yearly. Although subject to Income Tax, the interest is paid you in full, which means you will not need to make any rebate claims. Can be sold at any time through your Savings Bank.

Bank of England Issue. No limit to holdings. Purchasable in any odd amount, inclusive of shillings and pence, provided it not less than £50. Income Tax is deducted at source where interest payments are over £5 per annum.

THE NEW ISSUE

3% SAVINGS BONDS

1965-1975

A full Trustee Security. Ask for Prospectus and Application Form from any Post Office, Bank or Stockbroker.

Issued by the National Savings Committee

Important Notice to our Sherry Customers

COMPANY MEETINGS

ASSOCIATED BRITISH
PICTURE CORPORATION,
LIMITED

SIR PHILIP WARTER'S STATEMENT

The seventeenth ordinary general meeting of this company was held, on the 7th instant, in London.

Sir Philip Warter (the chairman) said that the total trading profit of the group as a whole, after providing for E.P.T. and deferred repairs, amounted to £2,106,460. The gross income of the Corporation amounted to £1,240,523 and after deducting directors' fees, interest on debenture stock, provision for depreciation and amortisation, and income tax, there remained a net profit of £389,389, to which must be added the amount brought forward from last year, making £489,729. Out of that had been provided provision for war damage, balance of costs of debenture conversion, transfer to general reserve £100,000, preference dividend, and an interim dividend paid last February, totalling £255,201. The directors now recommended the payment of a final dividend of 7½ per cent., less tax, and a bonus of 2½ per cent., less tax, leaving £134,528 to be carried forward.

A RECORD YEAR

Notwithstanding the difficulties in adequately staffing the cinemas, the restrictions on repairs and renewals of equipment and the continued shortage of product, the Corporation had had a record year's trading, providing first-class entertainment for an average of 4,500,000 people per week.

The report which had been recently submitted to the President of the Board of Trade by the Cinematograph Films Council, in which they submitted their advice on what further practical measures, if any, were necessary to check the development of monopoly in the film industry, included a broad and detailed survey of the whole industry. Whilst the export of British films was both desirable and essential, a virile and prosperous production industry could, in his view, only be built up on the solid foundation of the home market. It was this Corporation and the other large circuits who had, by building modern and well-equipped theatres and providing the finest entertainment obtainable, made the cinema part of the daily life of the community. Although it was a popular cry to protect and assist the small independent producer and exhibitor, by the very nature of the industry, it must rely for its healthy development on the strong progressive combines and, if those were to be weakened and restricted, then the future of the industry would be seriously prejudiced. The view of the board was, therefore, that in the interests of the shareholders they must oppose the recommendation for any form of control of the industry contained in the committee's report.

CURRENT YEAR'S TRADING

As to the current year's trading, the attendances at the cinemas in London and southern England had, naturally, been affected by enemy activity, but notwithstanding these attacks, the trading profits of the group were being maintained and the results for the year should be in every way satisfactory. He looked forward to the future with confidence. The Corporation, due to its conservative dividend policy, the large sums placed to general reserve and the amounts available for deferred repairs, would, as soon as conditions permitted, be in a position to re-equip and modernise its properties.

Whilst they must anticipate some falling off of attendances after the war and were already faced with increased expenditure, the improved quality of the films they were obtaining from both British and American sources should, given reasonable prosperity in industry, enable the Corporation to maintain and improve its financial position. The report was adopted.

MORRIS MOTORS LIMITED

ANNUAL GENERAL MEETING

Accounts for the year ended December 31st, 1943.

NET PROFIT - £1,980,852
TOTAL DIVIDEND - 17½% TAX FREE

The Eighteenth Ordinary Annual General Meeting of Morris Motors Limited, was held on the 5th September, 1944, at Cowley, Oxford.

The recommendations of the Directors, which were unanimously adopted, included the following provisions:—

An interim dividend of 10% free of income tax on the Ordinary Stock as declared on the 17th December, 1943, accounted for £265,000 of the profit earned. After meeting that sum and the dividend on the Preference Stock (£225,000), Taxation (£997,899), Air Raid Precautions Expenditure (£52,790) and Special Provision for Rehabilitation of Factories for Post-War Production and Deferred Repairs (£100,000), there remained a balance of profit of £340,163, to which must be added the balance brought forward from last year of £248,361, giving a total of £588,524.

This sum is dealt with in the following manner:—

By payment of a Final Dividend of 7½% on the Ordinary Stock, free of income tax ... £198,750
By Transfer to Dividend Equalisation Reserve Account ... 100,000
And by carrying forward to next year the balance of ... 289,774
£588,524

Chairman:

LIMITED

IMPROVED POSITION

The forty-ninth annual ordinary general meeting of this company was held, on the 6th instant, at Grantham, Mr Edward Barford, M.C. (the chairman), presiding.

The following is an extract from the chairman's speech circulated with the accounts: The profit amounts to £90,446, against £84,223 last year, while the net amount available for distribution is £42,854, against £42,669. The liquid position has improved very considerably. Liquid assets total £1,284,172 and current liabilities £880,235, showing a balance of £403,937, as against £244,875 last year.

The company's interests and prospects rest upon a broad foundation, since its manufactures embrace several distinct fields, in each of which there should be scope for further development and consolidation. Our products include road rollers and concrete road surfacing machinery, a wide range of contractors' and builders' plant, large-scale cooking apparatus and hospital sterilising equipment, and certain dairy and other machinery for the farmer.

It would appear that much of our machinery will assume high priority directly the war is over for reconstruction and housing at home, for the rehabilitation of Europe and for the development work which will be so necessary in many parts of the world.

Aveling-Barford, Limited, were expanding rapidly before the war, and we see no reason why this progress should not be resumed when we are free again to concentrate upon our commercial activities. For more than three quarters of a century this company has devoted much effort to export trade, and its principal specialities are known the world over and hold a reputation second to none.

The report was adopted and a final dividend of 5 per cent. (free of tax), making 10 per cent. (free of tax) for the year, was approved.

A boon to mankind

The original idea behind the steam engine may not have been James Watt's, but it was his painstaking research that eventually produced the first successful model, and thus opened a new era of industrial development. At the Christie Hospital doctors and scientists are engaged in ceaseless research to find the cure for Cancer. To maintain and extend this vital work funds are needed. Will you make your contribution by sending a donation?

of the company. The 10s. shares of the latter class were taken over at 12s., and that is still the nominal price, there being in effect no market in the very small fraction of the total preference capital still held outside United Molasses. The two payments recommended this year amount to some £156,000 after deduction of tax at the full standard rate, and they leave an equal amount still due to bring the payment up to March 31st last. The first of the two absorbed virtually the whole distributable profits of 1943, but in respect of the current year there will, presumably, be a further distribution. It is impossible to say how long the improved earning power will last, but it is clear that United Molasses are receiving a handsome return on their investment in the preference shares. It is reasonable to suppose that the parent company sees its way to obtain dividends on the ordinary, on which no payment has been made in the history of the company.

Shorter Notes

A new denomination of Treasury bills for £25,000 was issued to the market this week. This increases the range of denominations to five, namely, £5,000, £10,000, £25,000, £50,000 and £100,000. Bills of larger denomination are probably issued through the tap for investment of public departments' funds, but they never appear in the market. The new £25,000 bills made available through the tender were asked for by the market, for whom they are particularly convenient. Most money market loans are made in units of £25,000, and the new denomination of Treasury bills, therefore, provides a convenient collateral for deposit with the lending banks. The larger Treasury bill denominations—£50,000 and £100,000—are a wartime innovation.

*

As shown in a Note on page 327 of *The Economist* of September 2nd, the change in the monthly earnings of workers between July, 1943, and January, 1944—the date

of the latest census—was comparatively small. A table on page 364, based on the statistics published in the *Ministry of Labour Gazette* for August, shows, for the different groups of industries, earnings in the last pay week of January, 1944, together with the change in earnings from October, 1938, and July, 1943.

Film production rights, etc.	189,474	213,346	£200,464
Government securities	...	300,000	£1,060,325

* Gross trading profits for the whole group, after E.P.T. and deferred repairs, came to £1,579,550 in 1942, £1,510,443 in 1943, and £2,106,460 in 1944; out of which, the net profits applicable to the parent company were stated to be £406,667 in 1942, £381,321 in 1943, and £490,501. These net figures do not square with the net profits given in the parent company's own profit and loss account.

† Consolidated figures for 1944 include, for the first time, the Union Cinemas group, which makes them not comparable with the figures for previous years.

‡ Including investments in subsidiaries having a different accounting date of £550,159 in 1942 and £1,262,606 in 1943. This item disappears in 1944.

§ After deducting provision for war damage insurance.

¶ Not included in gross liquid assets.

⌘ Tax reserve certificates.

The 5s. units of ordinary stock, standing at 17s. 10d. ex dividend, yield £4 17s. 11d. per cent.

INDUSTRY AND TRADE

Trade Disputes.—Although the number of working days lost through disputes was higher in July than in June, the number of workers involved were fewer. Days lost numbered 63,000, compared with 42,000 in June and 98,000 in July, 1943. The number of people involved last July was 9,000, compared with 27,100 in June and 34,900 in July, 1943.

* In calculating the average s for women and for all workers, given in this table, women employed as part-time workers for not more than 30 hours a week have been included, on the basis of two part-timers taken as representing one full-timer. † The number returned in this group was very small. ‡ In the case of the Government industrial establishments, the comparisons between the average earnings in October, 1938, and January, 1944, are materially affected by the fact that the returns for the latter date covered a number of establishments, employing large numbers of workers, which were not in operation in October, 1938.

"The Economist" Sensitive Index.—There was no change in the index during the week ended September 6th. The complete index (1935=100) was 158.6; crops 135.6; and raw materials 185.5.

FINANCE AND BANKING

THE MONEY MARKET.—With the turn of the month conditions in the money market have become much easier. The banks have been keen buyers of bills from the discount market. The market for its part has had fewer Treasury bills to take up, its allotment at last week's tender falling to 30 per cent. of the applications as compared with the previous week's figure of 34 per cent. This reduction in the market's share of the £110,000,000 of bills issued was due to increased outside competition evident in the fact that applications for this week's bills reached £222,530,000, the highest total ever recorded. The banks had to pay £100,000,000 against TDRs this week which compared with effective maturities of about £70,000,000. The Bank return reveals a considerable contraction of credit, correcting the previous week's end-month and window dressing expansion. Government securities have fallen by £15,717,000 partly as a result of the maturing of bills bought by the Bank in order to help the market during the previous week. Other securities are £12,982,000 lower, a customary drop at this period of the month. The main counterpart to these movements is a fall of £30,099,000 in bankers' deposits to £171,790,000.

MONEY RATES, LONDON.—The following rates remained unchanged between August 31st and September 7th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%.

(Continued on page 366)

GOVERNMENT RETURNS

For the week ended Sept. 2, 1944, total ordinary revenue was £76,570,000, against ordinary expenditure of £148,858,000 and issues to sinking funds of £2,353,926. Thus, including sinking fund allocations £6,174,165, the deficit accrued since April 1st is £1,430,144,000 against £1,379,069,000 for the corresponding period a year ago.

A change has been made in the method of showing excess of Post Office Expenditure over the Post Office revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £23,899 to £2,664,840, the other operations of the week (no longer shown separately) used the gross National Debt by £7,759,290 to £20,931 million.

Far Eastern Stake

THE first meeting between Mr Churchill and President Roosevelt in Quebec in August, 1943, plotted the course of military events which led first to the final defeat and unconditional surrender of Italy and thence to the rout of Germany. Few years in history have been more momentous, few military plans as decisive. Now Mr Churchill and the President are meeting for a second time at Quebec. A new course is to be set to include the final defeat and unconditional surrender of Germany and the rout of Japan. The new phase will be as momentous as the year that has passed, the new plans as decisive as the old. The only question mark is the time which must elapse before the last enemy is defeated and peace restored.

There is no secret about the Allies' military success. The advance which took them from Tunisia to Rome, and the invasion which has carried them in three months from the Channel ports to the frontiers of Germany were both based on one supremely successful principle of organisation—the complete pooling of two nations and three Services in a series of the most gigantic combined operations the world has ever seen. It is safe to affirm that if, in the plans which must now be laid, there is any depar-

ture from this principle of pooling the victory will not be as rapid and the cost will be far heavier.

It is therefore disturbing to find that, on the eve of the Conference, considerable criticism has arisen in the United States over the part the British Empire is expected to play in the Far Eastern war. The critics vary the details of their tale, but the burden is always the same. The British are not prepared to give the United States anything like their full support in the Far East. To quote the unfortunate phrases of Mr William Phillips, who in the last two years has advised the President upon the political situation in India and General Eisenhower upon the politics of Europe,

there is no evidence that the British intend to more than give token assistance . . . We alone sumably will have the major part to play in the struggle with Japan.

It is difficult for the British observer to fathom why many responsible American publicists can have come estimate the likely British contribution so poorly. nation's participation in a war tends to equal its stake victory. It can be argued perhaps that the stake of British Isles in the Far East is rather less than tota-

is not, as Hitler's war has been, an immediate affair of survival. But for two of the most progressive members of the Anglo-Saxon world, Australia and New Zealand, the issue is precisely survival, and the effort in both cases matches this total stake. At one remove, the interest of Canada in a peaceful Pacific is as great as its interest in Atlantic security. South Africa's eyes are turned as much to the Indian Ocean as to the South Atlantic. The sum of interest in the Far Eastern war represented by all the members of the Commonwealth is at least equal to their interest in the struggle in Europe.

Even if the Dominions had no particular stake, Great Britain's own interests are quite important enough to warrant an all-out effort. Singapore has for the British quite as much emotional content as has Pearl Harbour for the Americans. That gloomy February of 1942 represented the nadir of British policy and British arms. There were taken in Singapore alone some 60,000 prisoners who have since been submitted to indignity, torture and worse. The British score against Japan has behind it a deep desire to revenge a wrong, wipe out a disgrace and vindicate a proud tradition. It is no small thing for a sea-faring people to lose one of its greatest naval bases. It might even be said that no defeat in Europe cut so deep as the tragic and still unavenged sinking of the *Repulse* and the *Prince of Wales*.

There is indeed a sense in which the British stake in the Far East is greater, not less, than that of the United States. The United States, like Russia, is a continental power. It may need Pacific bases to build up the outer wall of its defences; but neither Far Eastern trade nor Far Eastern bases are vital to its existence as a Great Power. For Britain, and in similar measure for France and Holland, the Far East is a necessity of greatness and wealth. The stability and strength of the maritime commercial empires of Western Europe depend upon the use of bases, on the ability to trade in all parts of the world and on free passage across every sea. From all these—and in an area whose economic potentialities have barely been touched—the Japanese would have excluded the Western Powers. The conception of the Co-prosperity Sphere was an inconvenience to the United States. To Britain, to the Netherlands and to France it was a death sentence passed on their fundamental way of life. To suppose that they would not fight to their utmost to remove such a threat is to attribute to them an innocence and an indifference to their own interests which American critics have been very slow to detect in other aspects of their policy.

★

Thus some part at least of the American criticism of Britain's supposed Far Eastern Policy is not very tightly anchored to the facts. Much of it is confused. Some of it is disingenuous. Like so much else in this momentous year, the Far Eastern war has become involved in election politics. Ever since Mr Roosevelt transferred fifty destroyers to Britain in the summer of 1940, a strong body of Isolationist opinion has accused him of having been drawn step by step into an Atlantic war by the machinations of Mr Churchill. The result of this policy, they maintain, was the neglect of America's real interest, the Pacific, the tragic unpreparedness of Pearl Harbour and the subsequent diversion of American military strength from its real enemy, Japan, to fight Mr Churchill's enemies in Europe. The presentation of Uncle Sam as an innocent abbad never fails, for some peculiar reason, to strike a responsive chord in the breast of the American voter. Thus, though it may be bad neighbourliness, it may also be good electioneering to suggest that, after pulling Britain's chestnuts out of the fire, Mr Roosevelt is now to be left in the lurch in the Pacific.

There is also, strangely enough, the unanswered question of how much assistance the American military and naval leaders will really welcome. The power and capacity of the American fleet in the island hopping warfare it has of its own accord so great that the temptation must be to finish the job alone. On the land fronts, there has been some friction between General Stilwell and the

British commanders. It is possible that he increased British contribution might be viewed, not as an effective reinforcement, but as an interference in a primarily American sphere. If such an attitude exists, it should be brought into the open and thoroughly exploded now, while the Quebec meetings have brought all the Chiefs of Staff together. As a theory, it is fundamentally pernicious. It underestimates the help the British army, air force and navy have already given; it contradicts the whole principle of pooling upon which the European war has been so speedily won; it rests on the quite fallacious assumption that, in view of the might of the American naval concentration, more ships and more aircraft thrown against the weakening power of Japan would have no effect on the speed and effectiveness of victory; finally Britain is not only willing to make a full contribution to victory in the Far East. She is determined to do so; and her utmost participation is indispensable. Any suggestion to the contrary has in it the seeds of disastrous political misunderstandings in the period after victory.

For it is to the post-war world that a number of the critics are looking when they attack British policy in the Far East. The strong American prejudice against "imperialism"—British, French or Dutch—has led many of the post-war planners to assume that the old sovereignties will not be re-established in South-East Asia and that some form of international control, or the transfer of the imperium to local peoples, will take the place of the old authority exercised by the Western nations.

Since this attitude exists and is even backed by some of the most widely distributed American journals and newspapers, it is time that the future intentions of the British, the French and the Dutch were frankly and fully explained. Since none of them has any intention of abandoning its colonial empire, but on the contrary regards the restoration of Malaya to the British, the East Indies to the Dutch and French Indo-China to the French as an essential part of the destruction of Japan's Co-prosperity Sphere, it would be inviting the worst sort of misunderstanding, and even accusations of bad faith, if the three nations allowed any doubt on the matter to continue in the mind of their American ally.

★

But this clearly is not the whole story. If it were, the election gibes at the sacrifice of American blood for the British Empire would long outlast election year and continue to foster bad relations between the Western Powers. The British, the French and the Dutch will go back to the Far East, but there is a condition attached to their return. That return will be effective and fruitful—and justifiable—only if it marks a turning point in their colonial policy. Economically, the plantation system must be modified, agriculture diversified, the dependence of the different territories on single crops reduced, the building up of local industry fostered. Politically, there must be new energy, purpose and positive planning in the preparation of the different peoples for full self-government; the goal must be independence. The area of the colonial dependencies lends itself to some extent to a federal solution. A definite political obstacle to such a development is obviously the existence of three different sovereignties among the metropolitan Powers. The new era of Western influence in the Far East will therefore have to be based upon a far closer assimilation of the colonial policies of Britain, France and Holland—a step which requires to be set on foot now, when the fortunes of war and the strategic necessities in Europe have thrown them into so close a comradeship.

A joint Anglo-French-Dutch policy for economic development and political progress would make a definite break with the compromised past. Even so, it would require to be supplemented by an even wider association in the sphere of economics and strategy. The prosperity of the millions in South-East Asia depends upon the economic well-being of China, Burma and India, and on world-wide conditions of prosperity. Effective defence, as this war has shown, depends upon the security of the

Pacific as a whole and thus upon the participation of the United States. For this reason, a wider regional council for economics and defence would be necessary to complete the re-ordering of Japan's present sphere of co-prosperity. Colonel Stanley has spoken in favour of such councils in the Commons. Australia and New Zealand drew up plans for a similar regional organisation, including all Pacific Powers, at their meeting in Canberra last January. The difficulty is that with the project of the wider council, as with the possibility of a smaller association between the British Empire, the Netherlands and France, the schemes have not reached the stage of positive policy and, as far as is known, no work at all is being done to work out the details.

Hitherto, the demands of Europe on the thought, time

A Policy for Wealth—V

Labour and Wealth

THERE is inevitably something paradoxical about the attitude of organised labour towards the process by which wealth is increased. On the one hand, the only way in which the standard of living of the working man can be increased is by enabling him to produce more. If the wage-earner of to-day enjoys a standard of living higher than that of all but the very richest two hundred years ago, the reason is to be found in the very great increase, since the Industrial Revolution, of mechanical aids to production. In the strictest sense, the only way to save labour is by labour-saving machinery. Nevertheless, the Luddite passion is both very strong and very natural. The first impact of labour-saving machinery may be quite disastrous on some individual workers, while its benefits to all workers (though certainly greater) may be imperceptible.

This instinctive passion has been reinforced in more recent, and more sophisticated, decades by a further misconception about the relationship between wages and profits. At any one moment and in any one industry, wages and profits may be competitors for the divisible product. But this is only a qualifying footnote to the much greater truth; that wages and profits are partners in increasing, and then in dividing up, the product of industry. Whether the comparison be made over the centuries, or from one year to another, wages and profits go up and down together, not in opposition to each other. In determining the worker's standard of living, it is the size of the cake that matters most, not the angle of the slice he demands. Indeed, the proportion of the total product that goes to labour quite naturally and inevitably diminishes as wealth rises. When there are no machines and no capital, when all labour is unassisted hand labour, then the whole product (minus the exactions of the landlord) can go to wages—and they will be miserably low. The

and energy of the Government have excused a shelving of the urgent problems of Far Eastern reconstruction. The day is coming when further postponement may have disastrous effects. The existence of a definite and positive British policy, co-ordinated with that of France and Holland, would meet the American critics who accuse the Western European Powers of lack of interest in the Far Eastern crisis. At the same time, it would go some way to pacify those other American critics who accuse the British, the French and the Dutch of too great and too exclusive an interest in the Far East. And, quite apart from criticism, it is obvious that if Britain's return to the Far East has been prepared by no forethought, no consultation, and no planning, the likelihood of settled peace and co-operation after the war is remote indeed.

first introduction of capital requires that some part of the product go to providing it, to maintaining it, to increasing it. And as man gets machines to do more and more work, the proportion that goes to capital necessarily rises.

This does not necessarily mean that the proportion going to rich men rises. If that is the result, it is an accident of the social structure. But it is not the result. In "capitalist" countries such as Britain and America, a rising proportion of the national income going to the provision and nourishment of capital has for a long time past been combined with a falling proportion going to the rich. In Soviet Russia, the proportion of the national resources devoted to capital was steeply increased by a regime which entirely abolished the rich. Nevertheless, the wage earner's natural feeling that the rich man gets too much and the poor man too little is transmuted into a bias against profits. It is difficult for the working man to see that profits are the best friend of wages, not their worst enemy.

Thus, for two quite separate reasons, there is a tendency for Labour to obstruct its own interests. Short-sightedly, it opposes the rapid introduction of more efficient (that is, more labour-saving) machinery. And if profits can be whittled down to such a level as prevents the growth of capital, Labour is more apt to rejoice than to complain. In past ages, when organised labour had little influence on business policy, these attitudes were perhaps unimportant. But to-day they cannot be disregarded. It may be no coincidence that the years in which capital formation has proved more difficult have been those when Labour has been in the ascendant or that, of the trio of leading industrial nations, the one that was falling behind in productivity was the one where the influence of Labour was greatest.

A CAPITAL ANNUITY

Part capital, part interest . . . £315 per annum guaranteed for twelve years . . . of which, on average, £271 is capital repayment and £44 is taxable interest . . . and, after the twelve years, an annuity of £472.10s. (subject to tax) continuing for life . . . this can all be secured by a male life aged sixty for a present investment of £5,000

EQUITY & LAW LIFE ASSURANCE SOCIETY
LINCOLN'S INN FIELDS

* Temporarily removed to
163/4, STRAND, LONDON, W.C.2

Let it be said at once and with all emphasis that the argument does not lead to the conclusion that Labour's advance should be reversed or the trade unions shorn of any of their power. But it does lead to the conclusion that the ends for which that influence is exerted need to be brought very carefully into accord with the interests of the community, of which the workers themselves are the greatest part. Any gang of workers who went round with sledge-hammers smashing machinery would be very properly condemned. Yet many practices of organised labour have precisely the same effect.

*

The chief reason for saying that the present is the time for re-examining the objects of labour organisations lies in the new policy of Social Security or (as it could be better called) the National Minimum. What inspired, and partly justified, the Luddites was the fact that they were starving. The nearer the community can get to the goal of ensuring that no man suffers when his livelihood fails through no fault of his own, the more complete is its justification for refusing to countenance any obstruction to the march of technical advance. The more completely the victims of progress are succoured, the less need is there to make progress itself the victim of humanitarian scruples. The present generation is making a very rapid advance towards Social Security. Moreover, within the last few years, the state has shown a willingness to go beyond the mere succour of the unfortunate and to use its powers to reinstate him: that is the purpose of the new policies of location, transfer and re-training. All these will be very costly; but not if they are made the means towards a more rapid growth of wealth. The necessary corollary to Social Security is Social Flexibility, and the most important element in that is the abandonment by organised labour of all of its many obstructions to technical progress. At present, the slump-mindedness that afflicts Labour as it does Capital may be an obstacle. The effect of their experience over the last twenty years has made the fear of unemployment an obsession with British workers. If the great experiment of Full Employment succeeds, there should be a complete change of mood, and there is here an opportunity for the leadership of the unions to show their capacity for constructive statesmanship.

Possibly this abandonment of old prejudices will be easier if it is made clear that there is no assault on wages. If wages should recognise profits as a partner, the converse is also true. Indeed, high wages are good for technical progress. This can perhaps be most easily seen by considering the case of a poor country such as, say, China. Firms which operate both in China and in Western countries find that it does not pay to mechanise in China because labour is so cheap. And the labour is cheap because its productivity is low. The best way of breaking out of this vicious circle is by insisting on high wages. It is a commonplace that the high degree of mechanisation in the new countries is very largely due to the fact that labour has always been expensive there. The employer was compelled to find means of economising labour and—the obverse of the medal—the saving to be derived from each new invention was the greater. Thus there is justification for the belief that the high wages came first and the high productivity as a consequence. Whether the argument could be transplanted bodily to this country, and used to justify an immediate and general increase in all wages, is perhaps questionable; but at least it is clear that a steady pressure for higher wages is more likely to speed up than to slow down the pace of technical progress. True, there are more or less convenient occasions for preferring wage claims, and to say that wages should be high does not exclude the desirability of imparting some flexibility into them, as between the upward and downward phases of the trade cycle. The two desiderata are combined when there is an element of profit-sharing in wages. The coal-mining industry has not much to teach other industries, but the principle of the "ascertainment" by which, after the payment of

standard wages and standard profits, any balance is shared between the two in a pre-arranged ratio, is one which could be copied with much advantage.

But if the pressure for high wages is, in this respect, one that coincides with the interests of the community, the same cannot be said of many other claims put forward by organised labour. Apprenticeship regulations and demarcation disputes are often the cause of great wastefulness in the use of labour. Some trade unions (the bricklayers are the standing example) engage in the direct limitation of output. When new machinery is introduced, the unions, if they are strong enough, will insist on as many men being employed on each new machine as have hitherto been employed on the old machinery—even though this may remove the whole purpose of the improvement. All machinery is necessarily and intentionally labour-saving, and if it is not allowed to have its desired effect, it is purposeless. The Americans have the expressive name of "feather-bedding" for all these devices. They have one feature in common—they increase the number of man-hours that are needed to produce a unit of product. Indeed, to the extent that they originate in a fear of unemployment, that is their purpose. But they are none the less wrong and anti-social, and a Policy for Wealth will need to provide for the removal of the restrictive practices of labour just as much as those of capital.

*

If pressure for higher wages is good and "feather-bedding" is bad, pressure for shorter hours comes halfway. Since the national income is the product of the number of workers multiplied by what each worker produces in a year, any general reduction in the amount of work done must result in a national income lower than it would otherwise have been. In the particular circumstances of Great Britain to-day, a rapid increase in the total output of the whole community is most necessary to enable the nation to carry the burdens it has assumed. But once the emergency has passed, the community will have a free choice between more wealth and more leisure. The economist can properly insist that it is a choice, and that the workers should not be deluded into thinking that they can have both at once. But if, understanding the choice, they choose more leisure and shorter hours rather than a higher standard of material consumption, the decision should be final. Leisure, after all, is a boon and a sign of wealth. A productivity policy should take as its criterion the output *per man-hour* and should leave to the democratic process the decision whether the wealth brought into existence by rising productivity shall be consumed in material goods or in leisure. In this general sense—and provided that the implications are understood—pressure for shorter hours does not run counter to the objects of a productivity policy.

But man-hours are one thing and machine-hours are another. To work an expensive machine for only 40 or 48 hours out of the possible 168 hours a week is very wasteful. The machine, to be sure, suffers less wear, but it obsolesces just as quickly, and the capital charges have to be spread over a much smaller output. In peacetime, multiple shift working is practised in this country only in industries where continuous working is technically necessary and in transport. But if the necessity of raising productivity to a maximum is recognised, a great extension of shift working should be considered. Nor need this involve night work in the usual sense of the word. It is perfectly possible to have, say, a 45-hour week for the men and women and a 90-hour week for the machines without asking anyone to work earlier than 7 a.m. or later than 10 p.m. If this were done, not only would more be got out of the existing machines, but the increased yield to be expected from machinery would lead to a larger volume of investment. The effect, within a few years, might be a surprisingly large increase in overall productivity, and therefore in real wages. In fact, it is difficult to think of anything that could be done quickly that would have as large an effect on the national productivity. The Labour

movement might be asked to consider whether the comparatively small inconvenience would not be well worth undertaking in view of the prospective benefits to the wage-earners, as well as to the economic health of the community at large.

*

A Policy for Wealth is thus likely to contain some elements that will be immediately pleasing to the Labour movement, and some that are likely to run counter to its established prejudices. It was suggested in the preceding article that, in return for the state's newly assumed responsibility for ensuring adequate and stable employment, a bargain should be struck with industry for the abandonment of the restrictive practices that have grown up in the last few decades. Perhaps there is a bargain to be struck with Labour, too. On the one hand, the state could declare its purpose of doubling the standard of living in a generation, and could give a pledge that the first claim on the results, as impartially ascertained year by year, should accrue to wages. As a *douceur*, the state might very well agree to the principle of the universal

"closed shop"—that is, that in principle every wage-earner should belong to a union. On the other hand, the Trade Unions should undertake to abandon—or at least to submit to impartial examination—any rules or trade practices or "feather-bedding" customs which make for more man-hours than is strictly necessary. They should agree to refrain from demands for shorter hours until the national income had reached a specified figure, and thereafter to take into consideration the effect of shortened hours on national output. And they should agree to lend their assistance to arrangements for making fuller use of all machinery by means of shift working.

The object of the whole endeavour is to increase the material welfare of the ordinary man. This being so, is there not here an opportunity for genuine economic statesmanship and for a demonstration by the Labour movement that it knows how to go over from its earlier, and necessarily negative, phase to a constructive participation in the economic life of the community?

The next subject to be taken up in this series is the contribution that scientific research can make to the Policy for Wealth.

Finances of the Church

THE established and national Church of England, like any other large organisation, has to find a large sum of money every year to carry on its activities. It differs from other large organisations in the variety and complexity of its sources of income. This article will set out the main facts about the payment of the ministry; a subsequent article will analyse suggested reforms.

The Church does not itself pay the clergy, like an ordinary employer. Until recently, the Church in its corporate capacity could own no property at all. The Enabling Act of 1919 set up the Church Assembly as the administrative and legislative organ of the Church; previously the only representative body had been the two Houses of Convocation, which confined themselves to spiritual affairs. The Church Assembly appoints a Central Board of Finance; somewhat earlier, in 1916, Diocesan Boards of Finance had been established. In 1938 (the last year for which comprehensive statistics are available), the Central Board's budget was £145,000; and the total budgets of Diocesan Boards came to £618,109, of which £257,498 was spent directly on various schemes for the training, maintenance, and welfare of the clergy. Most of the necessary finance (over £400,000 in 1938) is raised by the parishes, each parish being assigned a quota determined by the diocese, often on the basis of its population, number of communicants, and past generosity. These sums still represent a very small part of the total cost of supporting the ministry, and, unlike the position in the secular realm, central is less important than provincial finance.

*

The clergy are paid partly by annual voluntary contributions. In 1938, parishes contributed £550,000 for their incumbents, and £480,000 for assistant clergy. The main source of payment, however, consists of statutory charges and endowments. These are tied, almost entirely, to the individual parishes and ecclesiastical corporations. The "parochial system," as it is called, dates from medieval times and earlier, and still remains the basis of the Church's financial structure. It means that the incumbent of a parish (or benefice) is the Church's principal and best-established wage-earner; that his income is paid to him, not as a variable or terminable stipend, but as the fixed and inalienable property of his living (which is, for legal purposes, a corporation sole); and that he is, to a greatly varying degree, financially independent of the Church itself and of his own parishioners. The inherited wealth of benefices is of two kinds; the older kind being tithes and glebe lands, the more recent being grants, benefactions and bequests, which are mainly held by two

statutory and independent bodies, Queen Anne's Bounty and the Ecclesiastical Commissioners.

The inherited wealth of benefices has accumulated, in historical sequence, under the three categories of produce, land, and trustee securities. Tithes represented originally one-tenth of the produce of the local soil, but in 1836, these dues were finally commuted to a money charge, varying with the annual value of corn. The 1925 Act stabilised the charge at a low level, set up a redemption fund, and transferred the collection of tithe to a central body, Queen Anne's Bounty. Finally, since anti-tithe agitation increased, the 1936 Act abolished tithes and paid compensation on the basis of £91 of Government stock for every £100 of tithe rent-charge that could be proved valid—a difficult task. Annual payments in respect of tithes, made at 3 per cent, now amount to roughly £1,500,000—25 per cent less than previously. Still in existence as well, however, are various corn rents (representing tithes commuted under local Acts prior to 1836), which yield about £300,000 annually. In the same group of antiquities may be placed house rents, levied mediævally on certain houses in certain towns—notably Battle in Sussex—which are still collected. Glebe land belongs to the clergy by tradition or gift, and in a few parishes is valuable enough by itself to support the incumbent. It cannot be evaluated for the country as a whole.

The second source of inherited wealth is the funds held by Queen Anne's Bounty and the Ecclesiastical Commissioners as trustees. The first body was set up in 1704 to provide "for the augmentation of the maintenance of the poor clergy," the second was set up in 1836, the offspring of two Royal Commissions and of the reforming zeal of that period, to "make provision for the cure of souls." The aim of both has been to help poorer benefices. Both were originally financed exclusively from ecclesiastical sources—the former out of the "first fruits and tenths," dues originally paid to the Pope and confiscated by Henry VIII, which yielded a standardised sum of about £15,000 and were only abolished in 1926; the latter out of surplus revenues created by the adjustment of ancient episcopal and cathedral endowments. Later, however, Queen Anne's Bounty was granted, a total of £1,100,000, by Parliament. Both bodies have made numerous capital grants from their funds to individual parishes, originally of land and later of securities. Some funds are held at the risk of the benefices concerned, but most at the risk of the two central bodies, which allow a fixed rate of interest, currently 3 per cent. Both bodies, by skilful capital investment throughout a long era of high yields, have increased their original resources almost a hundredfold. The common fund of the

Ecclesiastical Commissioners, much the more important body, now yields annually about £3,250,000, of which approximately £2.11 million represents guaranteed payments to clergy. Queen Anne's Bounty is now responsible for annual payments to clergy of about £270,000.

★

The main sources of income of the clergy can now be usefully summarised. According to the pre-war figures parochial incumbents receive annually (a) £2.34 million from Queen Anne's Bounty in respect of tithes compensation and grants; (b) £1.6 million from the Ecclesiastical Commissioners in grants; (c) £1 million odd from private endowments held by the Commissioners; (d) £0.55 million from voluntary local contributions. These sums total £5½ million—the same figure, curiously enough, as was reached, after excluding certain items, by the 1924 Commission of Enquiry into the Property and Revenues of the Church. In addition, incumbents receive smaller amounts from the lease of glebe land and property, from private endowments held locally or by the diocese, from charitable sources, diocesan funds, and voluntary societies, from private gifts by the patron and by parishioners, and from manorial rights. Curates receive £480,000 from local contributions, £190,000 in stipends under schemes of the Commissioners, £90,000 out of the income of incumbents, and comparatively small amounts from endowments, voluntary societies and diocesan funds. Bishops are entirely paid from the funds of the Commissioners at a cost of £120,000, archdeacons and the chapters of cathedrals mainly so, at a cost of £30,000 and £182,000 respectively.

The fact that the incumbent of a parish has the longest and most complicated wage-sheet in the world does not mean that he is well or even adequately paid. In fact, he is, for the most part, paid shockingly badly by comparison with any other comparable profession or occupation. The estimates of the 1924 Commission indicated an average income of £426 for beneficed clergy and £225 for curates. Incomes of benefices are still very unequal. The Commissioners now operate a scheme designed to secure fixed minimum incomes varying between £350 and £400 according to population. But in cases, of which there are still a number, where population is less than 300, their standard is £300, and any assistance is conditional upon an equivalent grant from the Diocesan Board of Finance. The recent Commission of the House of Bishops estimated that nearly three-quarters of all incumbents have incomes between £300 and £500, but several hundreds have still less than £300, while an eighth get from £600 up to £2,000 and more. The Commission's first recommendation was that a calculation of all net benefice incomes should be made on a single standardised basis.

The Church needs new money. To attract it, the Commissioners and the Bounty frequently meet private benefactions with grants of their own. The value of the Church's endowments, far from multiplying as in the last century, is now on the decline. The Commissioners currently set aside £150,000 annually for investments depreciation, and until recently had to allow £80,000 against the redemption of coal royalties. The Commissioners have, as well, a certain moral need to prove themselves good landlords, which impartial investigations have in the main showed them to be. Clearance of bad property on their London estates has been extensive, if uncompleted, and they have adopted the sympathetic methods of house estate management introduced by Octavia Hill. The more lurid stories of Church income derived from immoral or slum houses relate to property over which the Commissioners have no effective control. Their especially vulnerable position perhaps limits the profits of the Commissioners. They expect a return of 3 per cent on new housing schemes.

So far attention has been confined to the incomes of the clergy. In addition, recent measures of the Church Assembly have provided increased finance and supervision for various welfare purposes. The "parochial system" has necessitated steps to prevent an incumbent placing extra burdens on his successors by his own remissness.

The Dilapidations Measures (1923 and 1929) set up diocesan dilapidations boards which make quarterly necessary surveys of all parsonages and authorise the rent, estimated repairs. Annual contributions from the incumbents on Anne's Bounty, which acts as central financial authority for the scheme and is also, since 1938, responsible for the sale and repurchase of all parsonage houses. The whole grants annual surplus, roughly £75,000, is now used in the improvement of parsonages. The Commissioners also demerit tribute towards the latter object. The Church Assembly set up its own Pensions Board in 1926, which replaced the older method of taxing benefices down to a minimum of £300 in favour of the retired incumbent by a contributory scheme. Assistance to this scheme is given by annual grants from the Central Board of Finance (£50,000) and from the Ecclesiastical Commissioners (£187,000 in 1938).

★

The picture that has been drawn is one of a localised and immobile financial system, with its foundations unchanged and many of its anomalies intact from the medieval era—a picture calculated to delight the antiquary and to infuriate the efficiency expert. The Church's resources, chained to particular benefices, could not be shifted to accord with the tremendous shifts in population and in needs, created by the Industrial Revolution. Nor has there been any central body to shift them, while the new Church Assembly has only a minor control over finance. Indeed, with the passage of time, the variety of financial authorities has multiplied, not diminished. New needs have certainly produced greater activity but less centralisation. The Church can now boast a division of powers which would have pleased Montesquieu, and which possesses indeed many of the advantages he enumerated. Queen Anne's Bounty and the Ecclesiastical Commissioners are independent and disinterested bodies, with a tradition of benevolent administration and of personal attention, free from the dangers of over-centralisation and bureaucracy which might affect a representative central authority. They are in no sense democratic. The Bounty possesses nearly 700 Governors, which include all King's Counsel and the Mayors of certain cities, although in practice only a majority of the bishops and a dozen or so laymen attend its meetings. The Commissioners comprise most prominent ecclesiastics, five Ministers of State, two Judges, and twelve laymen—nine appointed by the Crown and three by the Primate. At the same time, the parson's freehold and his (more or less) guaranteed income help to ensure his freedom of action and of doctrine. Even the system of patronage, now rendered virtually unsaleable and involving an increasing transfer of rights from lay to ecclesiastical patrons, does, by making a great variety of persons responsible for clerical appointments, help to secure a corresponding catholicity of viewpoints within the Church. Many claim that the "parochial system" has secured a sturdy parsonical independence and a resilience of new movements within the Church of England.

But, even if great advantages can be conceded to the present system—and there are offsetting disadvantages, such as the immobility of the clergy, the irresponsibility of some appointments, and the damaging effect of a guaranteed income—the fact remains that the Church has failed, under it, to find the powers or the initiative for a redirection of its resources to meet new needs. Much work has been done towards establishing minimum standards of income and satisfactory schemes of welfare and housing. But it is not enough to prop up from below; financial—quite apart from moral—considerations demand that any surplus on top should be scooped off for the general good of the ecclesiastical community. Closely connected with the redistribution of finance is the reorganisation of areas, towards which only moderate progress has been made or is possible under the Union of Benefice Measures. These needs are urgent. It has been agreed by successive commissions of enquiry that, without the work of patching up done by the Commissioners and the Bounty, the parochial system would have collapsed long ago.

Interregnum in France

IN the course of the last week or so General de Gaulle twice reshuffled his Government. The first change altered the composition of the Provisional Government, as fixed at Algiers, very little. Two representatives of the Resistance in France became Ministers; but the Algiers team remained in control of all the politically important departments. This first Ministry on the soil of liberated France was short-lived. General de Gaulle had not taken into account two factors in the new situation: the understandable desire of the men who had led the resistance in France to have a decisive say in the management of affairs; and the vigorous reassertion of the political parties. After a protest from the National Council of Resistance, which was strongly echoed by a large section of the reborn French press, he reformed his Government last Saturday.

The readiness of General de Gaulle to meet his critics half-way, and to do so promptly, points to two conclusions. In the first place, disappointment with the composition of his Algiers Government must have been strong and unmistakable. In the second, General de Gaulle has shown himself a much more realistic and shrewd tactician than many of his critics supposed. He has correctly realised that only a Government based on a broad political coalition has any chance of leading France out of the inevitable confusion of these days—and that only in such a coalition can Gaullism play the leading role to which it aspires.

The formation of the new Government was accompanied by two political acts. The much discussed Press Law, conceived at Algiers, has been happily discarded. A nation reawakened to independent life could hardly be expected to accept official tutelage over its newspapers. In fact, the peculiar feature of the present position in France is precisely the uncommonly important role which the press is playing in the absence of any normal representative institutions. The Fourth Republic may or may not become a parliamentary democracy; but in the first weeks or months of its existence its press is the only genuine expression of public opinion.

The other political act was General de Gaulle's solemn declaration that *L'Etat Français à la Pétain* has been abolished and that "legally the Republic has never ceased to exist." Instead of producing the birth certificate of a new Republic, as had been forecast, General de Gaulle has certified that old one is still alive; and the orthodox believers in the Third Republic may well regard this as a triumph. But the triumph is not very real. If the Republic—one might ask—has legally never ceased to exist, why has M. Lebrun, its last President, not returned to the Champs Elysées? Is the Constitution of 1875 still valid or only its invalidation, voted at Algiers? The fact is that France has now entered a period of constitutional and political interregnum. In making this declaration, General de Gaulle paid tribute to the undefined but determined popular desire to see the restoration of freedom and civil liberties rather than of specific constitutional forms. France is living through another "spring of the people"; and now as in 1848 its people take almost for granted the continuity of *Liberté, Egalité, Fraternité*, the articles of faith of its First Republic. It is the Republic that goes on, not a particular version of it.

The actual state of affairs is most clearly reflected in the composition of the new Government. At first sight, this Government looks very much like one of the typical Governments of the Third Republic. It is based on a coalition of parties; it might easily be confused with a Government of the *Cartel de Gauche*, or of the Popular Front; and its composition would seem to reflect a balance of political forces in France. But it also reflects an implicit break with the Third Republic. Its Minister of State is M. Jeanneney, the President of the last Senate. The last occasion on which M. Jeanneney acted as President of the Senate was towards the end of 1942, when, together with M. Herriot, the President of the

Chamber of Deputies, he addressed the courageous letter to Pétain in which, *ex officio*, they accused the Marshal of having abused his constitutional powers. By accepting office in this new Government, M. Jeanneney has automatically surrendered his title of President of the Senate. He is the link in the Government between the Third Republic and the new regime; but he also symbolises the former's self-effacement.

The orthodoxy of the Third Republic is dead. But the orthodoxy of the Fourth Republic has not yet asserted itself. Among the Algiers Ministers who have now disappeared is the former Commissioner of the Interior, M. d'Astier, whose uncompromising Gaullism made it impossible for him to remain in control of the Ministry of the Interior. His successor is the Socialist, M. Tixier. This is another of General de Gaulle's realistic concessions to the radical, Left wing mood of liberated France. Together with M. d'Astier went M. Bonnet, the author, or co-author, of the unfortunate Press Law, as well as M. Philip, General de Gaulle's right-hand man at Algiers. These dismissals are counter-balanced by the exclusion from the Government of personalities whose political complexion has not been Gaullist—Messieurs Monet, Massigu, Grenier and Le Troquer.

M. Bidault, the President of the National Council of Resistance and now Minister of Foreign Affairs, is a Christian Democrat. So are M. de Menthon, M. Plevin and M. Tietgen. The Christian Democrats will exert a considerable influence. Control of the Ministry of Justice will presumably put them in a position to direct, or guide, the "purge"—a crucial process in French politics now—with moderation. They also control the Ministry of Information, an inestimable instrument for shaping public opinion.

The strictly Gaullist faction controls, through M. Diethelm, the army, which General de Gaulle, if his views expressed in the "Army of the Future" are not to be regarded as out-of-date, considers to be the decisive instrument of any political coup. The Ministries of Education and War Prisoners are also in the hands of pure Gaullists. These, too, are key-positions, especially since the mood of the returning prisoners will have a decisive influence on the outcome of the first elections. The Socialists will have to struggle with administrative chaos in the Ministry of the Interior, and with the high prices of agricultural produce at the Ministry of Agriculture. They have also taken over the traditional department of continental Socialists in coalition Cabinets—the Ministry of Posts and Telegraphs. The Communists hold the non-political portfolios of Air and Health; and they have expressed their discontent with the small number of seats in the Government allotted to them. The Radicals have taken over the departments of Food (M. Giacobbi) and of National Economy (M. Mendes-France).

This last Ministry has been newly created in order to coordinate the activities of all the economic departments. M. Mendes-France will try to steer a cautious economic course in face of the widespread demand for the nationalisation of industries; and he will have under him as Minister of Production the trade unionist, M. Lacoste. The Ministry of Finance has been taken over by M. Lepercq, an industrialist and a resister since 1940, whose appointment seems calculated to refute the identification of Big Business with "collaboration"—though some people on the Left will argue that Sodom ought not to be allowed to escape because of the few righteous in its midst.

This then is the balance of forces in General de Gaulle's new Government. It seems very likely that this Coalition will be able to weather the storms with which the interregnum may be fraught—though more slight shifts inside the Coalition are likely. General de Gaulle himself has somewhat cryptically described its programme as "*la révolution par la loi*." The course of events has still to reveal the real content of that "revolution" as well as that of the "law" which is to govern it.

NOTES OF THE WEEK

The Last Act

These weeks, with the war brought at last on to German soil, are a time of the strongest contrasts. While the most bitter fighting is still going on in the Battle of Western Europe, with no public sign from the beaten enemy of any wish to abandon the hopeless struggle, the people of this country, freed from the black-out and from the most irksome of home defence duties, are already discounting the approach of peace by a spreading mood of half-holiday. While it has still to be shown whether the Germans, so characteristically dogged in their use of purely malicious devices against the obdurate inhabitants of this island, are in a position, after their military disasters and retreat, to renew the bombardment of Britain by other means, and from remoter sites, Londoners are crowding back from the safe areas, sure that the Battle of London is as decisively over as the Battle of France. While the duration of both the fighting and (technical difficulties apart) of the domestic danger still depends upon the unsolved problem of whether the Nazi leaders can induce the docile German population to continue their resistance after the defeat of the German Army—which is practically accomplished—it is generally believed that the winning of these last battles will promptly make an end of the war itself.

It is abundantly right and very well deserved that, after five dreary years, the people should feel to the full the assurance of victory; and there has been no slackening of work. The last battle and the final resistance may be hard-fought and costly, but the delay cannot be long. All this is good ground for a lightening of hearts. But it is no ground at all for undoing the good work achieved by the mass evacuation of London, until it is quite sure that the last Parthian shots have been fired. There may still be danger—as indeed several Ministers have said, somewhat quietly. The trouble is that they have also said, much more loudly, that the Battle of London is over, which is strategically and tactically true, but not in the sense that no more hostile fire can now be expected. The Government should be frank. Families will not be kept away from London by manacled statistics about the number of damaged houses. They will either come back in the hope of speeding up the repair of their own dwellings or else, if their homes are undamaged, they will not take the warning as applying to them. If Ministers are sure the last shot has been fired, then of course the flow back can continue without risk. But if they are not, it is their duty to make their appeal for patience much more explicit.

State of Emergency

When Parliament meets the Government will quickly be made aware of a deep anxiety about the adequacy of the preparations that have been made for the first and immediate needs of peace. The reply that a very great volume of preliminary work has been accomplished on all the major matters of peacetime policy will be admitted, but not regarded by any party as a sufficient answer. Beside the White Papers (to be rounded off in a few days by three more, on demobilisation, social insurance and workmen's compensation) there has been only one Act, the Education Act; and that is to be, *sine die*, a dead letter. In the tens of thousands of words in these Government pronouncements, there is a dangerous dearth of actual decisions. This is no more, and no less, than Mr Churchill promised—the agenda for the next election, but not a policy. But the consequences of this painstaking diffidence may be disastrous. Towns cannot be planned, sites cannot be chosen for houses or schools, homes cannot be built for returning soldiers, the conversion of industry and trade to peace purposes cannot even be contemplated. This, it seems, is the consequence of Coalition—abundant good intentions, but no results. The contrast between this alarming state of confusion and indecision and the bold, imaginative and triumphant planning of the war itself is tragic. Only by acting when Parliament meets with the urgency that marked the proceedings in May, 1940, can the Government avert a grave setback in our home affairs in the very moment of military victory.

Quebec Again

The gathering of Service officials round the President and Mr Churchill at Quebec suggests that military planning will have a high priority on the Conference's agenda. From this it should follow that discussions on the Far East will occupy the centre of the stage, for in Europe most of the military planning has presumably been already completed, and it is in the Pacific that the principles of collaboration and joint action have now to be clearly mapped out. There is another reason for supposing that European problems may take a second place. Marshal Stalin, though invited to the Conference, has excused himself on the grounds of his military preoccupation with the Eastern Front. Nor would it be possible to come to final decisions about Germany in the absence of any representative of France. Nevertheless, it is to be hoped that the British and American delegates will take the most pressing European problems into consideration and reach common decisions on their solution, or, at any rate, on the principles according to which solutions should be sought. There has been too much evidence during the last two years that the British and American Governments have allowed themselves to be drawn away from their original outlook and statements of principle, and led almost to the position of adopting policies in direct contradiction to their own pledges and interests. Today the military balance has been redressed in their favour. American troops have entered Germany—the first of all the Allies—and British forces are within a few miles of the German frontier. Any sense of modesty which an inadequate military performance may have induced in the past can now be laid completely aside. If the principles of the Atlantic Charter on the rights of nations, on national self-determination, on the treatment of a defeated enemy, really represent the considered views of the British and American Governments, they can now be stated without any diffidence. The only thing that could weaken the position of the Western Allies on these points of principle would be a failure on their part to speak with a single voice. Thus, although no final decisions on Europe can be taken at Quebec, the opportunity must be grasped to formulate a common Anglo-American approach and confession of faith. A final decision must always be the outcome of bargaining and compromise, but they bargain least efficiently who least know their own minds.

Belgium: The First Phase

The liberation of Belgium has revealed a country very far removed from the perplexing problems and the revolutionary fervour of its neighbour, France. The Government has now been back over a week and the political and economic life of the country is being restored in a calm and orderly fashion. The reason is not only that the Belgians are, on the whole, a stable and unexcitable people, but that the political life of Belgium during the occupation has not been disturbed by any major political rift, such as was created by the existence of Vichy. Even the King's position does not seem to be creating any real difficulties. There appears to be little popular support for him in any of the political groupings, and while it is generally assumed that the monarchy will continue, it is quite possible that King Leopold himself will have to give way in favour of his son. The Pierlot Government is to report to both Chambers of Parliament on September 19th. M. Pierlot will give an account of the Government's conduct of affairs in London and M. Brunot, Minister of State, will reply on behalf of Parliament. On the two succeeding days the two Chambers are to fill the gaps in their ranks created by death or collaboration, and will go on to discuss the problem of the Regency. This quiet resumption of ordinary political life has been made possible by the extent to which the three great political parties—the Liberals, the Catholics and the Socialists—have kept in contact during the years of occupation and concerted together their plans for the reorganisation of Belgium's political life. They will almost certainly demand the resignation of M. Pierlot and the formation of a new Cabinet based on the men who have remained in Belgium throughout the occupation. The only problem is the extent to which these men will be drawn from groups other than the three official

parties. The resistance movement has not been on a very large or on a very political scale. The Government seems to be having little difficulty in bringing it under organised control. An assembly representing most of the groups has already decided on measures to register the right of resisters to carry arms and has apparently agreed unanimously to a Government suggestion that the resisters should be demobilised as soon as possible. The only likely source of friction is the Communist Party. The Communists were a negligible group before the war, but they have grown considerably during the course of the occupation. They now demand seats in any reconstructed Cabinet. The three main political parties are reported to be divided on this issue, the Liberals in favour of the inclusion of Communists, the Catholics sceptical about their continued influence, the Socialists divided but partly hostile. If it proves impossible in the course of the coming months to reorganise Belgium's economic life and to remedy the desperate food situation, this dispute may well swell up into proportions of a first-class political crisis.

Dominions Conference

There is no set agenda for the Conference of British and Dominions Labour parties which opened in London this week. The discussion, which is expected to last for three weeks, will cover a very wide range of war and peace problems. The Conference will not be in any sense conclusive or binding, but the fact that Commonwealth Labour representatives should meet at this final stage of the war, is in itself valuable, and it is very fitting that the meeting should coincide with the loftier discussions at Quebec and Dumbarton Oaks. The delegates represent Labour movements at different stages of development, and with varying degrees of influence in their countries. In Australia and New Zealand, Labour is the Government. In Britain, it is a part of the Government. In Canada, the Co-operative Commonwealth Federation is a young body, whose influence in Canadian politics has been growing strongly. In South Africa, on the other hand, the Labour movement is relatively weak. There is unanimity among the parties about the immediate aim—the defeat of Fascist aggression; and if the Australian or New Zealand delegates had any lingering doubts about British Labour's determination to wage total war on Japan, these should have been dispelled by Mr Attlee and Mr Morrison at the opening session. The Conference (with the explicit support of British Labour Ministers) has also reaffirmed its agreement about the long-term aim of Socialism, and about international cooperation for the raising of world standards of living. Quite apart from questions of political organisation, there are many issues of deep concern to Labour which transcend party or sectional considerations. Some, indeed, have already been agreed upon by the Governments, and incorporated in the Philadelphia Charter of the International Labour Organisation. And, though problems of full employment, international trade, social security, colonial welfare and emigration, can only be settled by the Governments concerned, the Labour movements in each country, whether or no they are represented in the Government, must make their contribution to the solution. If this Dominions Conference can agree about the means, and can devise a practical programme, in addition to paying lip-service to well-worn principles, time will have been well spent. The next step might well be to extend the discussions, and for the British Labour movement to call the much-postponed world conference of trade unions.

Labour and the Coalition

As the end of the war in Europe approaches, speculation is increasing about the Labour Party's attitude towards a general election and about the general alignment of political parties immediately after the war. Labour's National Executive met on Wednesday to discuss its attitude, and though no statement has yet been issued, it is possible to assess the general lines of policy agreed upon. Labour is at all costs determined not to have "another 1918"—that is, Labour is opposed to a "coupon" election. The election of 1918 resulted in a resounding defeat for Labour which stood in opposition. To hold such an election again, it is argued, simply to capitalise the fact of victory, without any policies or clear cut issues, would be quite unrepresentative of opinion in the Armed Forces, and possibly of the mass of the electorate. The Labour leaders have also stated a determination not to have "another 1931,"

though some of the rank and file have their doubts. Mr Attlee gave a pledge to last year's Conference that the Labour Ministers would be bound by the decision of the party whether or not to continue in the Coalition, and that this decision would be taken by a special party conference, to be called when hostilities with Germany ceased, or as soon as the question of a general election arose. The postponed Whitsun Conference is now to be held in London in December, by which time the first of these conditions should have been fulfilled. But the war with Japan will go on. Mr Morrison, speaking to the representatives of the Dominions Labour parties, emphasised the indivisibility of the war against Germany and Japan; and he recalled the circumstances and the reasons which had caused Labour to take office in the all-party Government. But when Labour joined the Government there was of course no Japanese enemy, and when the party at Bournemouth in 1940 authorised its representatives to "support the Government in its effort to secure a swift victory and a just peace," it was thinking of Germany alone. Whether the Labour Members should stay in the Government until Japan also has been defeated, whether Mr Bevin should remain to organise the orderly demobilisation of the millions he has mobilised, whether the Labour party would not earn public censure if it left the helm as the ship reached harbour—these are considerations which the Conference, when it does meet, will be asked to weigh. There will be a strong demand for the immediate withdrawal of Labour Ministers from the Government by constituency parties which have all along been pressing for an end to the electoral truce. But it is possible that the view that Labour should see the Japanese war out first will prevail. Both sides will be preparing their plans for an appeal to the country. Marital relations will become increasingly strained, but Labour will probably cling on, rather than precipitate a divorce.

Russian Armies on the Turkish Border

The Red Army, in its advance across southern Dobruja, along the Black Sea coast, is approaching Turkey's European frontier. German propaganda has been using this fact

The merry
monarch
had a bright
idea . . .

He made good the deficiencies in his budget by personal borrowing from those early bankers, the City goldsmiths, on terms which were highly satisfactory—to His Majesty! No wonder the limits of the Royal Prerogative took so much thrashing out in Charles II's days. Subsequent and more enlightened Governments have deemed it wise to encourage the Banker, with the result that today the advantages of a complete banking service are available to every citizen. The Westminster Bank with its network of branches offers you the security and convenience of a Current or Deposit Account, while its Trustee Department offers the testator the advantages of corporate executorship. Call and discuss these and other services with your local Manager.

WESTMINSTER BANK
LIMITED

to arouse fears in Turkey; when the Russians reach the Turkish border, it is said, they will declare war on Turkey, just as they declared war on Bulgaria when their armies advanced to the Bulgarian frontier. The boggy may perhaps have some effect in Ankara. The undercurrent of tension between Russia and Turkey has never quite disappeared. The Russian press a short time ago vented its discontent with Turkey's neutrality in terms almost as sharp as those used against Bulgaria. Turkey, too, was accused of giving shelter to the Germans and of spinning an anti-Soviet intrigue. What the German propagandists have overlooked is the military and political differences between Turkey and Bulgaria. The Russians insisted on the transit of their troops through Bulgaria when those troops were engaged in the pursuit of the Germans, and wanted to join hands with the Yugoslav guerillas. Turkey cannot possibly be regarded as transit ground, and Turkish territory has not been used by the Germans as a base of operations against Russia. In addition, Bulgaria has been in a state of war with Great Britain and the United States, whereas Turkey, though neutral, has been an ally of Great Britain.

The Outlook in Bulgaria

The Russian declaration of war on Bulgaria was followed by the formation of a new Bulgarian Government last Saturday, headed by M. Kimon Georgiev and Colonel Veltchev, the well-known leaders of the Military League, an organisation with a somewhat chequered record in Bulgarian's domestic policy. In 1923 the Military League organised the *coup d'état* against the Peasant Government headed by Stambulsky and paved the way for military dictatorship in Sofia. In 1934 the League carried out another successful *coup d'état*, but a year later it was unsaddled by King Boris. Georgiev and Veltchev were the "colonels of the Bulgarian Left." Their programme was a curious combination of dictatorial methods and opposition to the Saxe-Coburg dynasty, an opposition which bordered on plain Republicanism. In foreign policy the League was opposed to the pro-Axis orientation of Bozhilov and Filov, though in recent years its leaders had no chance of making their voices heard in Bulgaria. Only the newly appointed Foreign Minister, Petko Stainov, who was a member of the Sobranie, was able to put on record a cautiously dissentient viewpoint. The first step of the new rulers were to depose the three Regents who were responsible for Bulgarian foreign policy in recent years, and to appoint new men in their place. The reports that one of the Regents, Pavlov, has been a Communist have so far not been borne out; nor is it clear whether or to what extent the *bloc* of the Bulgarian Left—the National Front—participates in the new Government. If it does not participate, then a reconstruction of the Government may be expected soon. It is a fact that in the Balkans, as elsewhere in Europe, the defeats of the Third Reich and the collapse of native dictatorship bring popular forces into action; and that the form of Government held to be most suitable for the time being is a coalition of pro-Allied military groups with the peasant parties and the Communists. How stable these coalitions will prove cannot be foreseen. In Bulgaria the new outlook

is most likely to lead to the expulsion of the Saxe-Coburg dynasty and possibly to the establishment of a Republic.

Greek Unity

The Greek Government has moved from Cairo to Italy, from where it hopes soon to be able to transfer its seat to liberated Greece. Before its departure from Cairo the Government was at last enlarged by the inclusion of five Ministers representing the EAM and the Communist Party. At the same time three Liberal Ministers, including M. Venizelos the younger, resigned ostensibly as a protest against M. Papandreou's unwillingness to disclose to his Cabinet colleagues the results of his talks with Mr Churchill in Rome. The reconciliation between the Greek Government and the EAM has now been followed by the dissolution of the Political Committee of National Liberation, which was the potential rival to the Government in Greece itself. This is the first case in which such a Committee has left the stage without fuss and bother. In Yugoslavia, even after the reconciliation between the King and Marshal Tito, which was emphasised by the King's message to Yugoslavia last Tuesday, the Committee of National Liberation continues in existence as the actual provisional administration at home. The conciliatory policy of the EAM is explained by the moderating influence of the Russian military mission in Greece, as well as by the fact that the EAM has not thrown up a leader of Marshal Tito's stature. Meanwhile, the Germans are reported to be withdrawing from the southern provinces of Greece; and the Greek Government—it is hoped—will be able to return home, with the risks of civil strife greatly lessened.

Policy for Restriction

While economists are trying to evolve a policy for wealth, and social reformers are grappling with the problems of a policy for health, certain retail trade associations and allied bodies are making careful plans to promote a policy for restriction. From the various fields of the distributive trade come proposals and projects that reveal, with striking clarity and ingenuity, the spirit of the united front. For example, the Typewriter Trades' Association, representing 403 firms or 97 per cent of the industry in this country, is seeking to expand its activities by trading in such mechanical devices as postal franking machines and duplicators—and by employing the special device of price regulation. This is admitted by the general secretary of the Association, who contends that some such method must be employed in the "tracking down and prosecuting of the black market." Similarly, the National Federation of Grocers' and Provision Dealers' Association in a report of its post-war plans committee suggests that a limit should be imposed on the growth of the big chain stores after the war:

Unless a halt is called to this extension of big business, consumers will find themselves with no shopping choice, but between the tentacles of the chain store octopus or the co-operative octopus.

This specious argument overlooks the real economic function of the chain store system with its advantages of bulk buying and standardised service. The chain stores have not so far been guilty of the major sins of monopoly control, and the benefits derived from their operational efficiency are not infrequently passed on to the consumer. It is, of course, a complete distortion of the facts to suggest that the co-operative societies are harmful to the public interest; and the distortion becomes an absurdity when it is coupled with the objection that dividends should not be distributed on price-fixed branded articles. Another association, that of the Motor Agents, is very worried about the used-car market—the black sheep in the white flock of manufacturers, dealers and distributing agents. The association suggests that used cars should be sold only through a licensed motor agent on a price-scale fixed by the Board of Trade. There would be a general welcome for any reasonable measures to check the wartime second-hand car racket, but it is evident that the association is thinking in terms that include the post-war years—and in particular of the time when ex-Service cars appear on the market. The association's declared view is that "not only for the welfare of the retail trade, but in the interests of the community," some control over all used vehicles and a control of entry to the trade is necessary.

Soldiers in Business

At a time when in the interests of the demobilised fighters every effort should be made to open the gates of the retail trades it would seem that energies are concerted in an attempt to keep them shut. Ex-shopkeepers who want to get a good place in the queue for resuming business are advised to obtain form RTR2 from their local Chamber of Commerce or Chamber of Trade or Citizens' Advice Bureau, and to make application to the Board of Trade. Thus, apparently, the soldier now at the front who hopes to re-start a business that has become a war casualty is to be penalised. He is unable at present to attend to the formalities that will earn him a place in the queue. There is something wrong here, surely. Meanwhile, the task of rehabilitating the businesses of ex-Servicemen is being undertaken by the British Legion. It is difficult to imagine a more unpromising approach to the task the Legion has set itself than by doing this in collaboration with the trade associations. The trade associations, if they are judged by their recent activities and schemes for development, are awfully restrictive. They have quite openly declared their attitude against non-shop trading in markets and street markets—a method of distribution which has been recommended by Sir Daniel Hall as one of the most useful means of reducing distributive costs. As the war comes to its close the trade associations become more outspoken.

A National Fire Service

The Government's decision to reduce fireguard duties and to introduce further cuts in civil defence personnel at the beginning of next week, raises sharply the question of the future of the nation's fire service. The National Fire Service as such is not directly affected by the changes which come into force on Sunday, though for some time the Service has been progressively reduced in strength as its members have been transferred to other Fighting Services. But it is easy to understand the concern for their future which members of the NFS now feel and the impatience expressed by the General Secretary of the Fire Brigades Union at the absence of any decision from the Home Secretary. This affects the wartime recruits, who will presumably be released according to the general pattern of demobilisation, and the prewar or regular firemen, who may or may not be returned to their former employers. Three years ago, when Mr Morrison took the step, necessary in the interests of the prompt and efficient handling of fire-bombs, of placing the fire brigades on a national basis, there were as many as fourteen hundred different municipal fire brigades in existence. These varied enormously in size, efficiency and funds. Though the 1938 Fire Brigades Act laid down an optimum standard of one fireman to every thousand inhabitants, some areas were under-serviced and others were over-serviced. In some places, firemen were paid on an hourly basis, so that as often as not, it was found more profitable to prolong a fire than to extinguish it as fast as possible. The wartime organisation has brought about a uniformity in pay, conditions and standards, a centralisation of training and a standardisation of equipment. It is essential that these advantages should be retained in peace-time, not only in the interests of the fire brigade employees themselves, but in order to ensure the adequate fire-protection of the public. At present, it seems possible that the brigades will be returned to their former owners. As an alternative the Fire Brigades Union has put forward a scheme for reorganisation in larger units than before the war, on a regional rather than a local basis. There is, however, something to be said for retaining the fire brigades on a national basis, and for running them as a national concern.

Drinking in Two Wars

One of the most striking differences between this war and the last has been the importance attached officially to national sobriety as an instrument of war production. In the last war, the drinking habits of the workers were generally held to be a direct menace to the efficient equipment of the fighting forces. There has been little such agitation this time. Sporadic, and for the most part unfounded, complaints against over-drinking by Service women, munition workers or young boys and girls have

found the public unwilling to believe that a few exceptions constitute a serious national danger. In the last war, Mr Lloyd George, as Minister of Munitions, was asked by employers to impose prohibition for the duration. Only by this means, so it was urged, could the war effort achieve the high rate of production required for victory. The Government finally set up the Liquor Control Board. By an Act of 1915, the Board was given full powers to control the sale of liquor in any specified area. It could acquire and close public houses and clubs, prohibit the sale of any particular liquor, and restrict the hours in which liquor of any kind could be sold. Permitted opening hours (since few public houses stayed open to serve only food or non-alcoholic drink) were reduced from 19½ to 5½ in London, and elsewhere from 16 to 6. This restriction of hours was only partially removed after the war was over, when hours were increased to 9 in London, 8 elsewhere and 5 on Sundays everywhere except in Scotland and Wales. The Board was also responsible for the No-Treating Order, which proved both unpopular and unsuccessful, and for the experiment in national ownership and control in the Carlisle area. Besides the Board, the Government used the weapon of food control to limit the consumption of liquor. The year's output of beer in 1913-14 was 36,397,000 standard barrels; by the Act of 1916 it was reduced to 26 million. Early in 1917, the newly-appointed Food Controller attempted to cut it further to 10 million barrels, but discontent among the workers forced the Government to allow greater quantities of low-gravity beers to be brewed. After April, 1918, output was further restricted to an annual rate of about 12½ million barrels. By the end of the war, consumption per head of beer had fallen from 27.8 gallons a year to 10 gallons, and of spirits, from 0.7 of a gallon to 0.33. It was plain from the facts, and is now even plainer, that a sharp line of distinction can, and should, be drawn between drinking and drunkenness. Moreover, the days of "Genuine Old and Stunning at 2d. the pint" had gone for ever, and the brewing of lighter beers—"Swipes" as it was contemptuously called during the war—was not entirely abandoned with the lifting of restrictions.

A Temperate People

In this war, production of beer has not been cut nor have further restrictions been imposed on when and how and where people may buy it. Output was pegged to the amount produced in the year before the war, and this quantity was spun out by another 15 per cent through a reduction in the gravity. For many reasons, the supply tends to be inadequate, and local and temporary shortages have occurred from time to time. Cereals were allocated for distilling spirits until after the 1943 harvest; imports of wine and spirits have been almost completely cut off. The duty on beer, which was raised in the last war from 7s. 9d. per standard barrel to 25s. in 1917, was £4 at the outbreak of the present war. Since then it has been raised to £4 16s. 5½d. Together with taxes on spirits and wines, the beer duty raised over £350 million in the year 1943-44, compared with £45.7 million in 1918 and £109 million in 1937. The steady increase in revenue, however, has been almost entirely due to higher taxes rather than higher consumption. The remarkable sobriety of the present war compared with the last is in part, of course, a reflection of a gradual change in the drinking habits of the nation. Alcoholic consumption, on the whole, has been decreasing since the turn of the century. In the five years 1915-19 the average person drank 17.5 gallons of beer and over half a gallon of spirits. Between 1930 and 1935 he drank only 13.3 gallons of beer and under a quarter of a gallon of spirits. Thus the agitation of extreme temperance reformers has tended to meet with a diminishing response, for lack of genuine grounds of complaint. Moreover, the unhappy experience of Prohibition in the United States has provided a warning rather than an example. Indeed, there are probably good grounds for reconsidering the wisdom of the Licensing Act of 1921. It may well be, of course, that the relatively temperate habits of this war have been partly due to the restrictions of the last war continued into the years of peace, and so into another war. Nevertheless, the partial removal of those restrictions in 1920 did not, except for a brief post-war boom, affect the gradual decline in alcoholic consumption—the result no doubt of changing social conditions and the widening choice of other leisure pursuits. At any rate, it is worth considering whether some extension of permitted hours after the war might not greatly improve the attractiveness of this country as a holiday resort for foreigners.—and as a place for free Britons to live in. On all the evidence, this could be done without increasing the risk of drunkenness. In any case, it is more likely that the unfortunately furtive air now associated with drinking might be better removed by improving the amenities and standards of public houses. To limit the times at which they may be used is to deny the real value of an integral part of our social landscape.

World Air Conference

A date has at last been fixed for the long-awaited world conference on civil aviation. On Monday the Government of the United States let it be known that it has invited more than fifty nations to the conference which is to begin on November 1st. The conference will come none too soon, for the absence of an agreed international framework for civil aviation at the end of the war would not merely delay its development, but it might easily bring confusion and conflict instead of expansion and collaboration. The mere fact of the decision to call a conference suggests, further, that there is at least some basis of agreement between the United States and the British Commonwealth and, possibly, Russia. At the anniversary dinner of the Air Transport Auxiliary, Captain Balfour, Under-Secretary of State for Air, claimed that "plans and programmes" do in fact exist for an "orderly system of civil aviation" in preference to "uncontrolled international competitive chaos." He did not divulge the nature of those plans or report on the stage reached in the informal discussions between Lord Beaverbrook and American experts. Much will depend, obviously, on whether the British Commonwealth, or at least the Colonial Empire, is to be treated as a single unit or whether British cabotage is to be restricted to the United Kingdom. The impending world conference once more emphasises the urgency of a decision on domestic policy, especially on the subject of departmental responsibility and on the conditions of participation in British air transport. A month ago Captain Balfour stated in the House of Commons that the Government had not made up its mind. On Monday he also admitted that in the construction of transports Britain was at a disadvantage

because, by agreement with the Allies, manufacturers in this country concentrated on combat types, leaving to others the supply of transports for joint use.

Australian Budget

The Commonwealth Budget for 1944-45 was tabled in the House of Representatives early this month. The background of the Budget is the partial completion of capital works needed for war purposes and the mounting proportion of the national war effort which is being transferred from the direct production of war material to the provision of essential food supplies for the United Kingdom and other Allied governments. A large part of these and other supplies go to the United States forces in the Pacific area. Reciprocal aid for this purpose amounted last year to £110 million (Australian currency), or 20 per cent of the total war expenditure of the Commonwealth and nearly twice that supplied in 1942-43. The heavy exports of food and war material, matched by stringent control of imports, have enabled the Government to repay a loan of £12 million raised in London in 1940 and 1941. It has also been able to pay for overseas war expenditure of £56 million. Rough estimates for this year's Budget compared with the actual revenue and expenditure in 1943-4 are as follows:—

	£ Million	1943-4	1944-5
War Expenditure	544	505	
Non-war Expenditure	142	148	
Revenue—Taxation	270	286	
Other Sources	39	39	
Deficiency	377	328	

The estimated increase in non-war expenditure is mainly due to extension of social services. The deficit of £328, £69 million less than that for last year, will have to be raised in loans, and the Government have committed themselves to keeping Treasury Bill finance to the lowest possible level.

Staple Inn

Staple Inn has been destroyed by a flying bomb—a sad and unlikely nemesis for a building which stood comfortably clear of the Great Fire of 1666, but uncomfortably close to the great fires of 1940. Holborn will sadly miss the Inn, which has faced it unchanged probably since the sixteenth century. Within the Hall, some stained glass of great beauty dated from a still earlier period. Dickens noted Staple Inn—"a legal nook . . . to what obstructive purposes devoted, and at whose expense, this history knoweth not." Nor did his contemporaries know either, although it seems certain that the legalism of the nook had by then ceased either to obstruct, construct, or instruct—for a Royal Commission, investigating rather later, found that the building belonged to the hospitable rather than the legal category of the word inn. Anyhow, its library had dwindled to a few books, reached by ladder to the gallery. Earlier than Dickens, Johnson wrote "Rasselas" there. Earlier still, legalism was much in evidence, the Inn being a recognised Inn of Chancery, junior to the superior Inns of Court, catering for solicitors to the latter's barristers. Yet earlier, in the thirteenth century—before the erection of the recently destroyed buildings—the word staple derives its connotation from the "stapel" goods in which the Hanseatic League were permitted by the Crown to trade on that spot. But later than Dickens, Staple Inn returned to an active rôle, and, when the blow fell, the Institute of Actuaries, who have been assiduous in nurturing the crumbling shell of their fine and worthy home, had just celebrated a half-century's residence. No skilful propping could hold modern explosive. The Institute—and London—have suffered a heavy loss.

Letters to the Editor

Terms for Germany

TO THE EDITOR OF THE ECONOMIST

SIR,—If the letters you have published in connection with your article "Terms for Germany" are typical of informed opinion on this matter, I have found the explanation for a curious and hitherto mysterious phenomena. I have the impression (and a certain amount of proof) that as the prospects of military victory improve so a certain pessimistic outlook about the nature of the Peace increases. I am not referring to the fall in stock market values.

Broadly stated, your correspondents appear to suppose that in a Total War the good of Total Victory is synonymous with military victory. All that military victory does is to give the victors an opportunity and grave responsibility. This is a great deal, but the rest of the story, i.e., what use is made of the opportunity is the more important part of the business.

In general, your correspondents and even your own article are almost wholly negative and destructive in their proposals. There is an implication in the correspondence that if we could abolish "The Germans," peace would be secure. A moment's thought will show that such abolition would produce a large uninhabited area, and that the question as to which sovereign state would "own" it would be a very likely cause of war. The circumstance of two World Wars in one generation cannot adequately be explained by pointing to the Germans. There are deep-seated evils in western civilisation, and modern Germany is the weak spot in the European polity.

Germany is the boil on the back of the European neck, and whilst applying suitable local treatment to the boil, we must also do something to eradicate the poison which breaks out via the boil. To squeeze the boil and hack it about will not disinfect the system.

As it is almost impossible to write sense about this subject without being accused of being "pro-German," will you permit me to remind your readers that from 1935-1939 you consistently opposed Fascism and Nazism by every means open to me, and that the last paragraph of the last official communication Hitler ever sent to the British Government was exclusively devoted to an attack on me.—Yours sincerely,

STEPHEN KING-HALL

House of Commons

TO THE EDITOR OF THE ECONOMIST

SIR,—I am surprised to see that no coherent case against your thesis has yet been made in the voluminous correspondence you have published. I suggest that there are at least two avenues of attack upon your solution of the German problem:—

The whole of your case is built on the assumption that public opinion in this country and elsewhere is what mathematicians call "an independent variable." In other words, you disregard the indisputable fact that public opinion is a highly influenceable entity, and choose to take for granted something which, first, is not strictly predictable, and, secondly, can certainly be influenced by the formidable array of modern propaganda tools.

The solution I tentatively put forward is a much stronger peace treaty than you envisage, backed up by continuous and relentless propaganda for its enforcement by the Allies, if and when this should be necessary.—I am, Sir, yours truly,

A. P. ZENTLER

London, S.W. 1

TO THE EDITOR OF THE ECONOMIST

SIR,—You argue truly that the Allies must make peace on terms which they will enforce, both in this and succeeding generations. What quality is it, above all, that will command this constant resolve? Not severity, in itself, nor leniency, in itself. Your correspondence shows that there is already disagreement about these.

Peace terms will be enforced if they are broadly just, and

if experience makes their justice increasingly evident. Or at least it may be said that otherwise they will not be enforced; we watched the destruction of the settlement of Versailles irresolutely, because, rightly or wrongly, we were led to doubt its justice. Thus your argument, so far from sidestepping the question of a just peace, leads straight to it.

States consist of citizens rather than of territory and a constitution. Actions are performed by conscious human individuals, not by abstract juridical personalities. By a figure of speech it is said that Germany is guilty. But there are millions of innocent sufferers in that country; I mean the children. In twenty-five years' time these will be mature, and many now unborn will be coming of age. Will "Germany" then still be "guilty"?

Reason demands punishment for the many individuals who have committed what conscience has always condemned, but rejects the badness of mass punishment. Let us acknowledge and protect in those who have not wronged us the fundamental human rights; a family life of frugal comfort, scope for talent and freedom of religion.

Nothing in this is necessarily an argument for the German state as such. It may be that the best thing we can do for the next generation is to relieve it of the heavy burden of history which belongs to that institution. If so let the position be made clear. The psychologist Rudolph Allers wisely said that for punishment to be salutary, not only must it be just, but its justice must be understood.

I think none of these requirements, and most certainly not the last, will be met by an arrangement which hands large groups of Germans over to foreign states as subject-minorities, hated as they will be, by the societies in which they live. There remains the suggestion to return to the older, divided and more civilised German states.—Yours faithfully,

MARY A. LYNCH

London, W. 12

TO THE EDITOR OF THE ECONOMIST

SIR,—That widespread unemployment provides fruitful soil for the demagogue is obvious enough. But why did economic distress in Germany produce Hitlerism? Why did it not cause a swing towards Socialism or even Communism, which is the reaction it tends to produce elsewhere?

The answer is that there is something in the psychological make-up of the German nation which makes it susceptible to a certain kind of excitation. Hitlerism with all its international implications is merely a rehash of the more advanced ideas of the Pan-Germans, and there is scarcely a paragraph in *Mein Kampf* which cannot be duplicated elsewhere in the vast Pan-German library.

While it is true that not every German holds or has held these peculiar beliefs on morals and ethnology, these beliefs have nevertheless been propagated for so long a time by an ardent minority that the great apathetic majority has gradually become conditioned. The result is that even those who disagree with such notions have for the most part ceased to look upon them as merely monstrous.

J. L. BENVENISTI

National Liberal Club

TO THE EDITOR OF THE ECONOMIST

SIR,—In the illuminating and most valuable controversy on "Terms for Germany," not one of your correspondents, excepting General Fuller, has got anywhere near the root of the matter. But General Fuller most certainly hits the nail on the head.

As General Fuller points out, no attempt at peacemaking will be of any avail that does not take into account the fundamental organic disease, financial and economic, with which the world is afflicted—that disease which can be crudely diagnosed by the terms "over-production" and "under-consumption." Any attempt at peacemaking that

ignores the lessons to be derived from the economic conditions of the world during the inter-war years, culminating in the world-wide slump of 1929-1931 and ending with the apparent coincidence (it was not a coincidence, however) that Hitler with 6,000,000 unemployed and Roosevelt with 15 million unemployed came into power in the same month—any attempt at peacemaking that ignores such circumstances and their causes is doomed to failure.—Yours truly,
Thornton Heath, Surrey G. K. HOLLIDAY

TO THE EDITOR OF THE ECONOMIST

SIR,—Mr Dewar quotes me rightly but interprets me wrongly. I wrote: "Every country is responsible for its leaders." Mr Dewar's conclusion that in my opinion therefore all Germans are Nazis is not correct. The only right and, I should think, obvious conclusion is that all Germans—whether Nazis or not—are responsible for German leadership as the British nation or any other nation for theirs.

Edmund Burke's famous words that it is impossible to draw an indictment against a whole nation may have been right in his time, when the modern state was in *statu nascendi*. But in our time of the modern national state you have to insist—in addition to the responsibility of each individual for its individual needs and misdeeds—on the collective responsibility of the national community as a whole for its social behaviour. (Rousseau foresaw the problem in behaviour—his "volonté-générale.")—Yours sincerely,
Northwood, Middlesex DR. ALFRED DRUCKER

TO THE EDITOR OF THE ECONOMIST.

SIR,—I beg to suggest that the proposal of dividing Germany into more or less its original constituents deserves a much closer scrutiny than it has received so far.

The main argument against it has been that it would contain the germ for history to repeat itself. That may be true, but it is by no means certain that the germ would have a chance to develop. The unity of Germany was largely a result of Prussian aggression, a fact which has by no means been forgotten by the victims. There has never been any love for Prussia in the smaller German states, where the feeling of being a Bavarian, Wurttemberger, etc., is still very strong, and could easily be strengthened further.

The unity of Germany is the core of present and coming trouble, and as long as she remains united none of the proposed petty remedies of Utopian schemes will have any lasting effect. Neither can you "cure" the Germans, as one correspondent suggests, because a leopard never changes its spots.

The restoration of the kingdoms of Bavaria and Wurttemberg, and all the archduchies with courts, royal guards, glamour and whatever goes with it, would leave the majority of Germans quite happy, and make them internationally impotent.—Yours truly,
Slough O. J. BRUUN

TO THE EDITOR OF THE ECONOMIST

SIR,—May I be allowed to correct one or two factual errors in General Guy P. Dawnay's letter?

(1) "Silesia was Polish before the first partition of Poland." Silesia (except for its eastern-most corner) ceased to be inhabited by Slav-speaking peoples before the end of the 13th century. It has had no political connection with Poland since 1201. It was taken from Austria by Frederick the Great in 1740. The first partition of Poland of 1773 did not involve Silesia at all.

(2) "Schleswig-Holstein was Danish until the first aggression of the Germans in 1864." The Schleswig-Holstein question is notoriously complicated. Briefly, the northern half of Schleswig has been Danish in population, the rest German. Until 1806 both principalities were united in personal union with Denmark, Holstein as part of the Holy Roman Empire.

(3) "The breaking up of the Southern German (Catholic) State after the last war was an error of the worst kind." There never has been one Southern German State. Until 1933 there were three: Bavaria, Wurttemberg, Baden. Their territorial structure was left unchanged in 1918. Of the three, Wurttemberg is overwhelmingly Protestant.

Finally, is it so certain that historical claims provide the surest foundation of a lasting territorial settlement?—Yours faithfully,
Manchester H. W. ARNDT

TO THE EDITOR OF THE ECONOMIST

SIR,—This discussion gets further and further from the real point at issue. May I hark back to what you actually said.

First of all, you did *not* say "We must give them steel and oil and coal and everything they need, for their peaceable intentions can be always guaranteed." On the contrary, you said that Germany must be chastened. So such ardent pro-Germans as rush to your support probably disagree with you far more fundamentally than Mr Cadbury or myself.

What you dislike (if I understand you correctly) is the idea of chastening Germany by frontier revision.

This is the point at which we critics diverge. We feel that frontier revision is the only way of doing the job without producing the six million unemployed that General Fuller so wisely fears.

General Fuller, who says so many things that I agree with that I feel he should come over to our side, quotes Keynes' "Economic Consequences." But surely that brilliant book criticises "making Germany pay," not the alternative policy of frontier revision. If it has a fault, it is that it does not stress the fact that Versailles was Clemenceau's concession to the western democracies. His first choice was the Rhine frontier, and looking back after 25 years I can only say, "How right he was!"—Yours faithfully,
Oxford H. B. BARWISE

TO THE EDITOR OF THE ECONOMIST

SIR,—There has always, since many centuries, been two Germanys, the Catholic, or Southern, and the Northern—Prussia: the former disliked the latter and the latter despised the former.

Why not make two countries, one known as "Germany"—comprising, from East to West, Austria with the Tyrol, returned by Italy as part of her restitution, Bavaria, Wurttemberg, and the Rhineland; the other "Prussia," comprising the rest of Germany excluding East Prussia—to go to Poland. The religious difference alone would keep the two apart and encourage the new "Germany" to consider itself entirely different from "Prussia"—then in the course of 10 years allow "Germany" to merge into Western Europe, but make the process very much longer and more difficult for "Prussia."—Yours, etc.,
Beaulieu, Hants A. EHMAN

Post-War Controls

TO THE EDITOR OF THE ECONOMIST

SIR,—May I ask you to correct a misapprehension that has crept into your comment (in *The Economist* of June 24th, on page 854), on my statement as chairman of Callender's Cable and Construction Company. This note makes it appear that I suggest the abandonment of *all* controls after the war, while in fact I ask for *fewer* controls; if more controls are to be added for essential peace purposes, then most of the controls used for war purposes should be cancelled so that the total of harassing controls should be fewer.

I think you will agree that it is essential to industry, when seeking orders at home or abroad, to know precisely what it will be permitted to do twelve months or even longer ahead. The White Paper, however, appears to envisage an increase in the already dangerous powers of Government departments, and to acknowledge (paragraph 80) that the exercise of these powers will be largely experimental in nature. The export trade, no less than agriculture, cannot await the results of experiments over untried ground. Nor can much comfort be gained from the White Paper declaration that "the Government will spare no effort to create the conditions favourable to the expansion of our export trade" (paragraph 5), in view of the present lack of Government action in aid of unfortunate investors in Argentina, Mexico, and elsewhere.

Whatever controls may be necessary will need the clearest definition if they are not to hamper a trade revival. It is the methods rather than the ideals of the White Paper which are being questioned by many industrialists, and it is these same methods which are apt to be accepted without thought as "inevitable trends."—Yours faithfully,
Godalming, Surrey MALCOLM FRASER

AMERICAN SURVEY

The Green Light

THE Administration's plan for the reconversion of industry after the end of the war in Europe (now officially known as V-E, Victory in Europe, Day) has followed close upon the plans for military demobilisation. Mr Byrnes, who is responsible for the report, estimates that war requirements will be cut by 40 per cent as soon as Germany is defeated, and he announces that the maximum increases in civilian production compatible with continued war production for the Pacific will be permitted at once. Not long ago Mr Nelson, former head of the War Production Board, estimated that with the fall of Germany there would be an increase of 30 per cent in civilian production, which would bring the output of civilian goods back to what it was in 1939.

It is believed that a cut-back of 40 per cent would make it necessary for some four million workers to change their jobs. But with the speedy relaxation of wartime controls Mr Byrnes is convinced that years of prolonged unemployment will prove to have been exaggerated. Among his main points was the desirability of a prompt return to the 40 hour work week, except in critical war production and areas of labour shortage, in order to spread work; the relaxation of controls on the movement of labour and on materials for civilian industry; and the need for Congress to legislate for maximum unemployment benefits of \$20 a week for 26 weeks, and for the states to liberalise their unemployment schemes.

Provisions of especial interest to American business include price increases to be allowed on goods coming back into production, the promise that the excess-profits tax will go after the end of the war with Japan, and the suggestion that manufacturers should be allowed substantial depreciation for tax purposes on new machinery purchased. Regulations have already been drawn up covering "T" or termination loans for war contractors to avoid freezing of their assets while their contracts are being liquidated. One particularly interesting decision is to release competitive units in the same industry from war contracts simultaneously, as far as this is possible. Mr Nelson ran into a hornets' nest some time ago by insisting that civilian production, from any source, must be given priority over the maintenance of pre-war competitive positions. Mr Byrnes also suggested that Congress should appropriate \$2 billion to support farm prices in the face of imminent surpluses.

One troublesome aspect of demobilisation, the treatment of Government-owned war plants, was dealt with by Mr Byrnes earlier in the week when he established a special inter-agency committee to set up a programme for their utilisation. In the letter establishing the committee Mr Byrnes suggested that the hard core of reconversion-unemployment may be found in these Government-owned plants, which employ several million workers. Over \$15 billion of Government funds have been invested in industrial plant during the war. About \$6 billion is invested in plants useful only for war production—shipyards, army and navy arsenals, ammunition loading plants and similar facilities. About \$5.5 billion is in plants for turning out products basic to both a war and peace economy—steel, chemicals, synthetic rubber, electrical equipment, and machine tools. Another \$2.8 billion is in plants that are capable of peacetime uses with some modification; and the remaining \$1.1 billion is in "scrambled" plants, facilities built by government funds to work in with private facilities.

There are three difficulties about the disposal of these plants. One is their size. The average investment is about \$6 million. Another is their high wartime cost. Speedy and efficient production was the main aim, rather than cheapness of building. A third complication is that in many industries Government-owned plant is so large a proportion of total investment that its disposal may well have a

decisive effect, not only on competitive relations within an industry, but also on competitive relations between vast geographical areas.

Mr Byrnes made no attempt to deal with all these problems. He insists in his recommendations that the Government must assume responsibility for converting plants, wherever possible, to civilian production under private operation. Some plants will be retained, even in the post-war period, as part of the country's defence resources; and Mr Byrnes urged that a list of these plants destined for "stand-by" purposes should be drawn up as soon as possible in order to facilitate arrangements for finding their workers jobs elsewhere. Plants that the Services do not wish to retain are to be surveyed immediately, and where their private operators wish to use them after the war they will be encouraged and assisted to do so. Where the operators do not desire to continue to run the plants, or their plans are not favourably regarded by the Government, attempts will be made to interest other private operators in them.

Mr Byrnes was optimistic about the chances of maintaining the present high level of national income, production, and employment. But, even with the most skilful management, there must be a period of heavy transitional unemployment, as millions of workers look for new jobs, frequently finding it necessary, not only to change their homes, but also to undergo retraining.

This "human side" of demobilisation is getting rough

TO BUSINESS MEN
WHO CABLE IN
WARTIME

By carrying out these three simple rules you will save yourself unnecessary bother, help to increase the efficiency of the service, free the Empire's tele-communication lines for vital war traffic.

1 When you dictate a cable by telephone listen carefully while it is being read back to you. Casual checking leads to errors which have to be corrected by more cables.

2 Allow your correspondents ample time to reply before enquiring about your cables. Remember that Government cables must be given priority over others in war.

3 Don't mislay cables sent to you. This causes your correspondents to cable for a reply and thus congests the Empire's circuits with unnecessary traffic.

treatment in Congress. Last month the Senate passed the George Bill, originally a measure providing only for a revolving Federal loan fund to assist state unemployment schemes and for the extension of protection to all Federal employees, including shipyard and arsenal workers, numbering about 3,500,000. Certain additional provisions were added from the discarded Kilgore-Murray Bill, such as the payment of transportation costs for unemployed workers; but most of the liberal features of the Kilgore Bill were defeated by a coalition of Conservative Democrats and Republicans, mainly on the plea of economy. These included a national standard for unemployment benefit, now determined state by state, and provisions for vocational training with compensation, and were vigorously supported by labour. Another Conservative coalition in the House has now emasculated the final Senate version to such an extent that even Senator George declares it inadequate. At the eleventh hour, an attempt is being made in the conferences between Senate and House to restore the less controversial provisions designed to relieve war worker and veteran of the whole burden of the transition.

The resistance on Capitol Hill to Administration plans for relieving the human distress and disorganisation which must accompany reconversion is based on deep-seated distrust of the Administration on the score of extravagance, authoritarianism, and "socialistic experiments." But the danger of allowing this problem to go unsolved until it is too late is obvious. It may imperil the whole reconversion programme, if workers and their families are stranded far from the new job opportunities and forced to exhaust their own resources. In the ranks of the labour unions, suspicious that they may receive a raw deal, there is already a movement to withdraw from the anti-strike pledge, and if each worker must sink or swim by his own efforts, the exodus from war production will become a flood.

American Notes

Launching the Campaign

Governor Dewey launched his campaign last week at a certain disadvantage. Events in Europe and the Conference at Quebec combined to divide the attention normally concentrated upon a Presidential election. Many Republicans, indeed, are watching the meeting of Mr Roosevelt and Mr Churchill for any shred of evidence that it has designed to detract from Governor Dewey's tour. The pattern of campaign laid down at Philadelphia and Louisville, Kentucky, was something new in election strategy. At Philadelphia, Governor Dewey attacked the Administration root and branch for its domestic incompetence and lack of faith in America. The next day found him endorsing the Administration plan for security, although he insisted that the plan for peace must be the "united, non-partisan work of many minds." The Louisville speech provided little further evidence that Governor Dewey intends to follow Mr Willkie's outspoken advice to grasp the nettle firmly; but it served to rebuke the diehards and to put the Republican Party—at least for the period of Governor Dewey's candidacy—firmly behind the general idea of American participation in a security organisation. It is being interpreted as a bid for the independent voter. The real dynamic of the campaign, however, lay in the attack on the Administration's alleged inability to provide jobs for all. In Governor Dewey's view the Administration prolonged rather than ameliorated the Great Depression; conceived in a fatal belief that the American economy is "mature," it is bound to accept unemployment and the dole as inevitable. He even went so far as to accuse the Government of planning to spin out demobilisation in order to conceal its inability to stimulate employment; and he pointed to the recent dissension in the War Production Board as proof of reckless incompetence. Governor Dewey made no imprudent attacks upon the social legislation identified with the New Deal. It was his contention that there can be security and jobs, and that the Republicans can and will deliver them both, by raking the bureaucratic shackles off industry and encouraging "job-producing enterprise." This is a recipe that might have been thought to have been tried by the last Republican Administration; but Governor Dewey has promised detailed discussion in future speeches of his plans for the relations between Government and business, security and freedom, and they may contain more than the traditional Republican aim of

less government. It has for months been Governor Dewey's plan to make reconversion the key issue of the campaign, and to insist that the next four years will see the importance of foreign policy greatly diminished. He was perhaps unfortunate that the opening of his campaign coincided, not only with the conference to secure victory in the Pacific, but also with the detailed and impressive plans from Washington for industrial reconversion and demobilisation.

The Irreconcilables

It is said that delegates to Dumbarton Oaks are beginning to feel that the rôle of the United States in keeping the peace will be decided, not at the Conference, but in the Senate. It would be an exaggeration to recognise the ghost of the implacable Lodge and his "irreconcilables" in the present Senate debate, but the opposition is crystallising; and it is taking the form of limitations and conditions rather than direct attack. There are few Senators anxious to oppose outright the use of American force to repress aggression; but there is a distinct group, composed in part of former isolationists, determined to preserve the Senate's right of veto over how and when that force shall be used. Senator Bushfield last week went so far as to say that to give the security organisation the right to call on American forces was to surrender American sovereignty to the caprice of one man. Senator Vandenberg, an able critic, has urged that the American delegate never should be free to pledge the use of American troops outside the Western Hemisphere, with Congressional consent. The opposition has another string to its bow, the argument that the creation of a security organisation should await the signing of the peace treaties. This is altogether too reminiscent of 1918, and the round-robin which declared 39 Senators and Senators-elect willing to consider the League only after the re-establishment of peace with Germany. Dispatches from Washington suggest that the Administration may be forced either to accept Senator Vandenberg's proposal, which would cut the heart out of effective American participation in any of the likely areas of major aggression, or compromise on the use of force by executive authority against Germany and Japan alone. The present opposition has only a dim reflection of Senator Lodge's deadly efficiency.

Surplus Soldiers

The approaching end of hostilities in Europe has led the War and Navy Departments to outline their plans for demobilisation. The Navy anticipates no demobilisation whatsoever until the defeat of Japan. Instead, recruitment for the Navy will continue toward a goal of 3,400,000 men next June. Tentative plans for demobilisation are ready, but the responsibilities of the Navy in the Pacific will be too heavy, both for strictly military operations and for the transportation of men and supplies to allow them to be put into effect until the defeat of Japan is accomplished. It is not expected, however, that it will be possible to employ the full present strength of the Army in the Pacific, and after the requirements for troops of occupation in Europe and combat troops in the Pacific have been met, men will be released on the basis of length of service, overseas service, combat credit, and parenthood, combined on a points basis. These standards are the result of a wide cross-section of soldiers' opinion, and they have been welcomed for their fairness. No combination of these considerations will necessarily serve to release a man needed in the Pacific; and the War Department has issued a warning that there may be a substantial delay in sending even surplus soldiers home, for the transport needs of the Pacific must come first. A problem of equal importance was raised this week by the publication of General Marshall's plans for a citizen army reserve as the basis of future military preparedness. General Marshall assumes that Congress will legislate for the military training of every able-bodied young American; and proceeds to enumerate the advantages of a citizen reserve over a standing army in a democratic country. The chief of these, in the United States, is that it stands some chance of adoption, being, as General Marshall observed, merely the perfection of a traditional national institution to meet modern requirements. But it is worth remembering that President Roosevelt, in raising the question of whether all Americans should not undergo a period of national service, was careful to point out that this need not necessarily mean military training; it might take the form of forestry or conservation. President Roosevelt is a more sensitive index of public opinion than the War Department.

THE WORLD OVERSEAS

The German Conspiracy

(By a Correspondent)

AFTER early two months of pretending that July 20th was only an insignificant episode, the Nazis have announced the hanging of six alleged political leaders of the movement. Now it is possible to guess at the wide scope of the anti-Nazi revolt. Of the hanged civilians, Goerdeler, who was, it appears, the rebels' choice for Reich Chancellor, is doubtless the most significant figure. His description as a previous mayor of Leipzig, though factually exact, is beside the point. He was for many years deputy-chairman of the German employers' union, and in this capacity, got along well with his opposite numbers from the trade unions. Under von Papen and von Schleicher he held the key position of Reich commissar for price control, with Cabinet rank. Even at that time, he was held to be eligible for the premiership. Later, the Nazis prevented him from accepting a leading job with Krupp. Goerdeler had a reputation for competence, solidity, character and poise. This level-headed representative of German big business is unlikely to have involved himself in a wild adventure. He would first have made sure of the support of the group to which he belonged. It must be added, though, that no proof beyond Himmler's statement exists of his actual participation in the plot. What is certain is that the Nazis believed that had the plot succeeded, he and his associates would have headed the rebel Government.

Goerdeler's Associates

Three of the six men now hanged must be regarded as belonging to the same political stratum—von Trott zu Solz, a diplomat with extensive knowledge of the West; Hassel, like von Trott, an influential man in the German Foreign Office, a former Ambassador to Rome and one of the signatories of the draft Four Power Pact; and Lejeune-Jung, who, before Hitler's advent, was a member of Treviranus' group of "popular conservatives." They were all moderate conservatives, with both Junker and big business associations.

The appearance of the name of Count Helldorf among the conspirators is suspect. It seems almost inconceivable that Goerdeler or any of the others should have cooperated with this worst type of Nazi gangster. He, however, had a notorious feud with Goebbels, which seems now to have cost him his life. The Nazis probably listed him with the others in a characteristic "amalgam" in order to discredit the conspiracy, both at home and abroad.

Dr Wirmer was not known to the public before the announcement that he was hanged. He seems to have been a product of the "underground."

The last of the group, Leuschner, stands in quite a different category. This timber worker and leading trade unionist became Minister of the Interior in Hesse in 1920 and held the position until the advent of the Nazis in 1933, when he was sent to a concentration camp because he was credited with the intention of organising armed resistance against the SA. Released, he was wooed by the Nazis and, together with Ley, was sent to an ILO conference at Geneva. There his activities were such that he was sent to a concentration camp again on his return. Released again, he disappeared from the surface. Leuschner, an efficient administrator, a vigorous and determined mass leader, and at the same time an old and possibly trusted associate of the conservatives, would in Goerdeler's view have been a suitable man to revive the trade union movement, especially as he had maintained his standing among the old trade union leaders. As vice-Chancellor he would have been Goerdeler's opposite number. The juxtaposition of the two suggests the basic conception of the group: an industrialists' and trade unionists' Government, a Government of national union. It can be assumed that Catholics too would not have refused to support a Goerdeler Cabinet.

Compared with the wide political background of the revolt, the generals' contribution appears in its true and limited proportions. One thing is certain. Whereas the Nazis have now hit their civilian enemies as hard as they could, they did not dare to strike with their full force at the leading generals. Instead of shooting Rundstedt, they made him a member of the special court which judged the military conspirators. They passed over Fromm's strange behaviour, played down Zeitzler's dismissal, and failed to notice Kesselring's ominous silence. The reason for all this is obvious enough. In order to make war, the Nazis need generals, and they have no generals of their own.

It is a fact, on the contrary, that every general who ever really threw in his lot with the Nazis has met a mysterious death—for example, von Reichenau, Udet, Todt, and Dietl. Even General Guderian is not a Nazi at all. He is simply a violent anti-Westerner who, while notoriously playing with the Utopia of a separate peace with Russia, would be sharply opposed to any compromise with the West. In order to find a man to direct operations, Hitler had to play up to this idiosyncrasy of Guderian's, which is so sharply opposed to his own likes and dislikes. Whatever else Himmler may have done during these last seven weeks, he obviously could not weed out the roots of an army revolt. Such a revolt was brought to a head by defeat. But, as in the case of the civilians, its origins go back to the days of the conquest of power by the Nazis. It seems that Germany's old ruling

Making the most of the NATION'S MILK

IN winter the supply of fresh milk falls, but in summer there is a surplus. This surplus can be conserved in a number of ways, one of which is to make Milk Chocolate. Cadburys Milk Chocolate retains the valuable milk solids (fat, protein and lactose) which contain calcium, phosphorus and vitamin D. Only the water which comprises roughly 87½ per cent. of the milk bulk is eliminated.

Milk Chocolate is a compact and highly concentrated food, easily kept and transported and requiring no elaborate packaging. It retains the full food value of the milk almost indefinitely without special storage or canning.

Cadbury means Quality

groups—army, diplomacy, Junkers, big business, the Church and the trade unions—were trying to reassert themselves in the *Götterdämmerung* of the Nazis.

Why did they fail? The plot was laid in an amateurish way. But the necessity of having recourse to assassination and a military *pronunciamento* was determined by the basic facts of a totalitarian regime. No regime can keep its army, its higher civil service and its diplomacy, as well as its economic leaders, away from all share in the framing of policy. It therefore cannot prevent them from forming political opinions and taking political action. But it can cut them off from the masses, and make the latter politically inarticulate, to such an extent that they are unable to act, and even to think coherently.

Demobilisation in Canada

[FROM OUR OTTAWA CORRESPONDENT]

PLANS for the demobilisation and rehabilitation of men and women in Canada's armed forces, as Prime Minister Mackenzie King said in a summary broadcast on a national network shortly after the recent session of Parliament ended, began early in the war. The problem of re-establishment dates not from the victorious conclusion of war, but from the first man discharged from service. The intake of manpower into the armed forces is reaching 1,000,000—it was 928,318 on March 31, 1944—and the strength on D-Day was 766,000. The difference represents casualties and discharges, so that re-establishment has been a growing problem.

The latest step in demobilisation is provision for the payment of war service gratuities, at an estimated cost of \$750 million, in the years immediately following the war. Five types of payments were included in this measure. Every Canadian service veteran will receive \$7.50 for each month of service in the Western Hemisphere and \$15.00 for each month of service elsewhere, regardless of rank. This will be paid in monthly instalments, possibly equal to pay and allowances before discharge. In addition, for

every six months of service overseas, a veteran will receive seven days' pay and allowances. This will be paid in a lump sum on leaving the Service. Men and women who served continuously for not less than 183 days will receive, as a lump sum on discharge, one month's pay and allowances as a rehabilitation grant. A clothing allowance of \$100 will also be paid, regardless of rank, and in addition personnel will be allowed to retain uniforms and personal necessities, but not other equipment. Finally, for specified purposes, such as purchase or equipment of a home or a business, a war veteran will be able to apply for a re-establishment credit equal to the gratuity payment.

The Cost of Release

To illustrate what these provisions will mean in cash, the following table shows what a soldier will receive if he has served one year in Canada and two years overseas:

	Single	Married Two Children
Gratuity	\$ 450.00	\$ 450.00
Pay allowances	77.00	135.90
Rehabilitation grant	45.00	108.12
Clothing	100.00	100.00
	672.00	794.12
Re-establishment credit	450.00	450.00
	\$1,122.00	\$1,244.12

The order of discharge of Canadian troops has not been announced. A man will receive free transportation back to the place in Canada where he joined up, or any other place that can be reached at no greater cost. Service personnel who came from another country to enlist may obtain transportation back to his home. Free transportation will also be paid for wives and children of service personnel overseas who wish to move to Canada.

The Canadian forces of this war were placed under the Pension Act at the start of hostilities and pensions for disabilities, and the pension system has been broadened. It now recognises family responsibilities of veterans and veterans' widows. Recently the family allowance scheme, to start on July 1, 1945, brought in children of war pensioners, and the allowances will not mean any deduction from the rate of pension paid. For pensionable disabilities personnel are entitled to medical care for life, and in all cases personnel will receive medical care for any condition for the first year after discharge. Thereafter, veterans who served in an active theatre of war will be entitled to medical care for causes not connected with service.

The main problem will not be medical care or pensions, but the re-establishment of physically able personnel in civil life. Early in the war the Reinstatement in Civil Employment Act was passed. It entitles Service personnel to obtain, within three or four months of discharge, employment on terms no less favourable than the individual left to join the Forces. Maintenance allowances, available for one year, have been fixed at \$50 per month for a single man, \$70 for a married man, with allowances of \$12 per month for first and second children, \$8 for other children, and \$15 for dependent parents. In cases where Service personnel take vocational training or continue their education, the payments will be \$60 per month for a single man, \$80 per month for a man and wife. Free courses in vocational training will be available for a period of one year, and those who take undergraduate or postgraduate university courses will be entitled to free tuition for a period equal to the veteran's service.

The veteran who secures immediate employment will receive, upon remaining in such employment for 15 weeks, the payment of back contributions to the Unemployment Insurance Fund from the date of enlistment or from July 1, 1941, the date when unemployment insurance came into effect. About 60,000 Canadian Service personnel have indicated a desire to enter agriculture, and the Veterans' Land Act provides that an applicant may receive assistance up to \$4,800 for the cost of land and improvements and up to \$1,200 for equipment. This Act also applies to veterans wishing to establish in the fishing industry. Provision for life insurance without medical examination, at reasonable rates, was made at the last session of Parliament. Preference to veterans in the Civil Service is also provided. Finally, a new Department of Veterans' Affairs has been created, though at the moment no Minister has been appointed to it. It will administer the whole field of veterans' re-establishment.

Russia at War

Reconstruction of the Donbas

IN the first days of September the industrial towns and mining villages of the Donetz Basin celebrated the first anniversary of their liberation from the Germans. According to custom, a letter from "the workers, collective farmers and intelligentsia" of the Donbas, signed by more than 700,000 people, was sent to Marshal Stalin. In it the results of the rehabilitation work done in the Donbas during the past year were summed up; 858 industrial undertakings, including 51 large mines, had been restored since the liberation of the province. The mines of the Stalino region had supplied the country with 6,000,000 tons of coal. A number of machine-tool works, furnaces and rolling mills had been reopened—among others, the famous Makeevka Works. The year's production of iron and steel was given as 200,000 tons of cast-iron, 430,000 tons of steel and 220,000 tons of rolled steel.

During the years of the German invasion the Donetz Basin, with its rich natural resources and manufacturing capacity, was of necessity written off. The whole attention of the Soviet public was focused on the development of the new industrial areas situated far behind the fighting lines. Kuznetsk, Karaganda and the Pechora area came into the limelight. It was on their output of coal, as well as on the metal output of the Urals, that the work of the war industries almost entirely depended; and no doubt the development of those new industrial centres has been chiefly responsible for Russia's sustained war effort. Kuznetsk, Karaganda, Magnitogorsk, and so on will remain Russia's great industrial assets also in peace. But for many years still the Donbas, restored, is destined to remain the mainstay of the Russian economy.

Before the war more than half of Russia's coal and iron was extracted on the Donetz. And though the Third Five-Year Plan aimed at the development of the new areas at a rate that would have considerably reduced the share of the Donetz Basin in the total output, the plan for 1942—the last year of the Plan—still assigned to the Donbas 49 per cent of the total coal output, and a percentage of the same order of the total output of iron ore. European Russia, in any case, could not rely on Siberian raw materials, if only because of the enormous haulages involved. During the war the loss of the Donetz Basin meant that the western unoccupied provinces of Russia were literally starved of fuel and metal.

Restoring the Pits

Chief emphasis is now being laid on the restoration of the coal mines. For the second time within the lifetime of a generation the pits on the Donetz have been flooded. The first time this happened during the civil war, and it then took five or six years fully to recover the mines. The destruction in this war has probably been even greater than in the years of the civil war. First, the Russians flooded most of the mines in the autumn of 1941, when it looked as if the Germans were just about to invade the area. However, until late in the summer of 1942 only the western fringe of the Donbas came under German occupation; in the Eastern part, the Russians tried to recover some of the mines and to work them under the fire of German long-range artillery. Then, during their retreat to the Volga, they damaged the mines again. For nearly a year the Germans tried, without much success, to repair some of the damage and to get some Donetz coal for themselves, only in order to wreck, in their turn, during their retreat to the Dnieper, the few mines that were working. On the heels of the advancing Red Army, repair squads arrived in Stalino and Shakhty. In the course of the past year the de-flooding work went on by day and by night, and 72 million tons of water have now been pumped out from the pits.

However, this is only the beginning of the work of restoration. The pre-war coal output of the Donbas was between 80 and 90 million tons (the plan for 1942 provided for 113 million tons); the present output is, at best, only about one-tenth of the pre-war total. The recovery of the iron ore mines at Krivoirog is, to judge from Russian press

reports, proceeding even more slowly, as is the restoration of the steel works. The figures of the year's iron and steel output, mentioned in the report to Stalin, represent a very small fraction of peacetime production in the Stalino province.

While the economic leaders of the Donbas are urged to speed up the production of coal and iron, little has been heard about the restoration of the steel-manufacturing plants in the Donbas. These have been evacuated to the east; and their return, it seems, is not yet contemplated. The tank and airplane plants (Voyenzavod) of Krivoirog are still working at Nizhny Tagil, in the Urals, just as the motor plants of Stalino (which were originally built underground) or the Mariupol works (specialised in armour plates) and many other combines. The re-evacuation of such plants would, of course, entail an interruption in the production of urgently needed war materials.

Resettlement

Great numbers of skilled workers have been evacuated from the Donbas, together with the factories. Among those workers there seems to have developed a tendency to rush home in disregard of all official prohibitions. They have now been emphatically warned to settle down for good in their new places of habitation.

Enterprises [writes *Pravda*] with a considerable number of workers, engineers and technicians were evacuated to the Urals, Siberia, and Central Asia. These enterprises will remain in the east. People have gone there not for a day or for a year. It is understandable that people from Moscow, Leningrad, Kiev, or the Donbas love their native cities. But the interests of the Socialist state demand that evacuated enterprises remain in the east, since the process of the parallel restoration of factories is going on in the liberated regions. This means that all conditions must be created for the evacuated workers and office employees to settle down in the new places, to settle down permanently and feel themselves satisfied.

THE BUSINESS WORLD

The Future of Inland Transport—III

THE object of this series of articles is to explore the possibilities of an increase in the efficiency of inland public transport. The first article argued, on the basis of known facts, that the pre-war regime of checks and balances between the various means of transport was not designed to achieve the lowest possible total real cost of transport. The second article listed the three alternative systems that have been advocated in various forms. The first, that is, price competition on the basis of equal opportunity between financially independent means of transport, would be the ideal solution, if it were practicable and likely to produce real transport efficiency. But the problem of creating the conditions of equality of opportunity presents serious practical difficulties (not the least of these is the lack of agreement between rail and road on what constitutes equal opportunity); and, even if these difficulties could be removed, it is doubtful whether price competition would produce most effectively the conditions of rising efficiency—in the peculiar circumstances of British transport. The second suggested solution, that is, joint price-fixing and traffic sharing between financially independent means of transport, must at once meet with the familiar, and not unjustified objections to autonomous price-fixing by monopolists, rings, or cartels; and, in spite of good intentions and safeguards, it might well impose high transport costs upon the public.

It remains, therefore, to examine the merits of a third alternative based on the technical and communal, rather than the financial and sectional, approach to the

problem. The fallacy of the sectional approach is the tacit assumption that the financial interests of the separate means of transport necessarily coincide with the national interest. It is not true that the efficiency of individual facilities, regarded in isolation, automatically guarantees the lowest total real costs of public transport as a whole. Since 1939, for example, both the productivity and the surplus of receipts over expenditure of the railways have shown a substantial increase. The real cost of moving passengers and goods by rail is now appreciably lower than in 1939; and though wage rates and the price of materials have risen by more than 50 per cent, against an average increase in charges of about 15 per cent, the surplus of receipts over expenditure (part of this is retained by the Government) was nearly three times in 1943 what it was in 1939; this is equivalent to a return of about 10 per cent on the railways' nominal capital. The reason for this improvement is to be found mainly in the higher "load" achieved by the railways during the war as a result of the curtailment of alternative facilities and the high volume of wartime traffic.

The wartime experience of the railways showed—fortunately, in the circumstances—that the capacity of their existing equipment is far in excess of the traffic carried by them in peace, and that the increased volume of traffic has brought a substantial reduction in unit costs, and an appreciable expansion in earning capacity. From the standpoint of the railways alone, the attainment of their maximum efficiency would require that all the traffic they can physically move should be moved by them, and not by other transporters. But very much the same argument could be used on behalf of the road. Given the existing road equipment—that is, the road track and rolling stock—the cause of efficiency would be served in this case, just as in that of the railways, by moving on the roads all the traffic that could physically be handled.

The fact is that the problem has been argued far too long in terms of road *versus* rail; driven to its logical conclusion this line of approach would require the suppression of one or the other in the cause of technical efficiency. It ignores the crucial fact—from the public point of view—where the alternative is possible, that some traffic can be moved at the lowest real cost by rail and other traffic by road. The various means of transport are, in the technical sense, essentially complementary.

Britain's inland transport problem is, above all, one of creating the technical conditions in which the various facilities—rail, road, air, coastal shipping and canals—can contribute as effectively as possible to the efficiency of public transport as a whole. Given a free hand and asked to take a long view, the efficient transport administrator, disposing of all the existing facilities, would be guided by two main principles. First, he would plan the operational integration of the means of transport at his disposal for the goods or passengers that can be carried either by rail or by road. On the basis of comparative costs, he would decide upon the traffics and the areas which would be best served by rail and road respectively, taking account the distances and the times specified by consumers. He would often use road and rail (and other means of transport) in combination, sending a given consignment partly by rail and partly by road. He would make the technical and operational adjustments necessary to ensure speedy and efficient transfer from one facility to another. In passenger traffic he would attempt to provide a combination of efficient facilities, with full regard to the convenience of the public, but he would eliminate redundant services.

Secondly, in his capital expenditure he would be guided by reference to the efficiency of the transport system as a whole; this would involve the technical integration of capital equipment as well. He would seek to canalise his expenditure into the most productive channels, whether they were rail, road, shipping or any other. He might

decide, on the basis of costs and demand for transport, that certain areas could be taken over entirely by the road, and that existing rail facilities would be scrapped. He might decide that capital invested in the electrification of the main line railways would contribute more to the productivity of transport as a whole than an equivalent amount spent on other forms of transport equipment. Unless there are overriding strategic and other special considerations, he would be guided continuously by the aim of achieving the lowest total costs.

Inevitably, the consumer of transport would forgo the choice of means of public transport. He would also forgo the advantage of "cut" rates for special traffics. But he would benefit from the overall increase in productivity, and he would still have the private alternatives of the "C" licence for goods, the private car and the cycle. Insofar as the "C" licence would lead to a diversion of traffic from public to private transport, its extensive use might detract from the efficiency of transport as a whole; but, within adequate limits, this is a cost that must be borne, for the consumer cannot be deprived of his right to private transport. The greater the efficiency of public transport, the smaller would be the demand for "C" licences.

The general and technical approach to transport would obviously involve a marked departure from the pre-war regime. The operational integration of movements postulates central allocation of traffic on the basis of comparative costs; hence it must be made a matter of indifference to the existing owners of transport facilities by what means each consignment is carried. The technical integration and improvement of capital equipment by reference to comparative efficiency postulates central guidance over new capital expenditure. This, too, means that the owners of existing facilities should be in a position to accept guidance likely to be most advantageous to transport as a whole.

The argument cannot be left at this rather general and academic stage. What is the framework within which such a policy could be carried out effectively while preserving—which is essential—adequate incentives to progress and safeguards for the consumer? The pre-condition is the creation of a community of interest between the various means of transport. This could be done on the basis of a private monopoly, the second of the three alternatives. But this would be undesirable, and there would be no guarantee that the end of efficiency and the lowest cost would be achieved. Rather the contrary. Obviously, this integration need only be applied to the area of traffic where the existing facilities are competitive. Purely local traffic, a substantial proportion of the whole, would best be served by competition.

Broadly, the creation of a real community of interest can take the form of the financial integration of the capital of all means of public transport or of an arrangement for the pooling of receipts without interference with existing ownership. Both arrangements offer a choice of alternatives. Financial integration might take the form of outright nationalisation, combining, state ownership with state management, as of the Post Office. It might also take the form of a specially designed public board, combining private ownership with public management. In a scheme for pooling receipts the London Passenger Transport Act, 1943, might serve as a model. The choice of a framework, obviously, should be guided by the principle of least interference. There is no merit in outright nationalisation or needless public control for its own sake, if the same or better results can be secured by less drastic means, especially if the support of a substantial body of the transport interests, which is essential to any successful scheme of reorganisation, can be obtained.

If the public board method were chosen, financial integration would involve the creation of a new capital structure. The owners of transport facilities, including the state as the owner of the road tracks, would be allotted an appropriate share in the capital of the board. The board could take the form of a complete financial amalgamation, or it could assume the role of a holding company, allocating the profits to the various means of transport in proportion to their holdings of stock, leaving them free to distribute profits among stockholders as they wish. Whatever the nature of the terms of financial integration, the board would be free to tackle the task of organising transport in the area of alternative facilities as efficiently as possible.

If a community of interests were to be brought about by some kind of arrangement for the pooling of receipts, the various means of transport would continue to exist as financially independent concerns. A central transport committee of the Ministry of Transport—staffed by a body of

experts who would be civil servants—would be responsible for long-term guidance in the matter of technical integration and capital expenditure. It would assist in the creation of, and supervise, with the assistance of its traffic experts, a regional organisation for the allocation of traffic and for operational integration. The various transport facilities, as it were, would act as contractors to the traffic allocating organisation. This organisation would also fix and publish schedules of charges on the basis of comparative costs, in collaboration with a staff of experts representing the central transport committee.

Instead of being remunerated on a day-to-day basis, the various means of transport would receive a fixed proportion of receipts, subject to periodical revision—say, at five-yearly intervals—to allow for changes in the capital employed which must ultimately determine the services rendered by each means of transport. There would be no incentive to "wasteful" competition or obstruction. But the incentive to efficiency could be provided by an arrangement whereby they would obtain, within limits, the benefit of any reduction in costs.

As a safeguard for consumers—which is vital—central and local tribunals would have to be set up to hear complaints; this safeguard might be strengthened further by the setting up of a standing Parliamentary committee on transport.

It is almost certain that some form of arrangement for the pooling of receipts would be preferable to the pooling of capital, first because it would interfere least with the independent financial existence of the existing undertakings; and, secondly, because a periodical adjustment of the distribution of the pool of receipts would make it possible to remunerate them on the basis of the services rendered by them. By contrast, the public board solution, for all its merits, might prove cumbersome and, indeed, unworkable.

Hitherto, the permanent damage done in the pre-war regime—measured by the difference between its cost and that of alternative schemes to the community—has probably not been very large. But the damage that would be done by its preservation might well be very large indeed. The urgency of finding a solution now is not so much the likelihood of excessive transport costs during the next few years as the danger of high costs later on through delay in or misdirection of new capital expenditure.

I rely on my
Wolseley

The doctor has had his Wolseley for six years now... "Like me," he says, "it's just got to keep going. Through blitz and blizzard my Wolseley has never failed me on my rounds. Just as my patients rely on me, I rely upon my Wolseley."

Thousands of Wolseleys, already well-used when war broke out, have given as good account of themselves as the doctor's, despite restricted war-time service facilities—testimony to the fine workmanship and high quality materials built into Wolseley models.

Business Notes

Production and Resources

The report of the Combined Resources and Production Board issued at the end of its second year of operations—the Board was formed in June, 1942, by Mr Churchill and President Roosevelt and was joined in Canada five months later—reveals the story of international collaboration in the field of munitions production whose success is reflected in resounding victories on the battlefield. In June, 1940, the munitions production of the British Empire and the United States lagged far behind that of the Axis; two years later, when the Board was set up, their rate of output was twice that of the Axis; in June, 1944, it was no less than four times that of the Axis. Although the need for munitions is likely to remain heavy for some time, the Board can now look forward to a period, when resources will become available for other purposes. It is increasingly directing its attention to the prospect of substantial relief requirements in European liberated areas and to the possible increase of civilian production at a later date, with special reference to the timing of reconversion after the defeat of Germany. The supply of relief requirements, chiefly coal, textiles, medical supplies and transport equipment is being organised by the Board on the same basis as munitions. Textiles, coal, pulp and paper are the main shortages. Equally important will be the timing of reconversion if productive capacity and materials surplus to war requirements are to be distributed on an equitable basis. But the report promises no early expansion in civilian supplies in this country; it declares that

it is unlikely that present strict rationing of civilian goods in the United Kingdom can be appreciably relaxed until some time after the German war is over at the very earliest.

Europe's Coal Needs

Coal is described in the Report of the Combined Production and Resources Board as being, along with textiles, "in acutely short supply," and the Report fears that, even with the measures which the Board's Combined Coal Committee has taken or is taking to meet the situation, the probability of a deficit remains. No information is available about the estimated needs of Europe, both for military operations and for the rehabilitation of European industry after the war. Nor is there any official information about the present state of the mines in Europe, though the statement of M. Mendes-France, General de Gaulle's Minister of National Economy, that the mines in Northern France have been left intact, is extremely encouraging. It seems that the speed of the Allied advance and the activities of the Maquis deprived the Germans of the opportunity to destroy equipment or render mines unworkable. War correspondents report a similar situation in Belgium; the position in Holland is not yet known. French coal production in 1938 was about 46 million tons, and its imports 18½ million tons. In the same year, Belgium produced just under 30 million tons and the Netherlands about 13 million tons. Belgium and Holland exported 4.6 million tons and 3.6 million tons respectively, French exports were just below 1,000,000 tons. In 1938, Britain exported 6.2 million tons to France, 658,000 tons to Belgium and 890,000 to the Netherlands. But whatever the production situation in these countries, the demand for British coal will be substantial, and it is likely that productive resources will be increasingly strained in the forthcoming period. The need for increased output per miner, for the extension of mechanisation and for the reorganisation of this country's coal industry on a basis of maximum technical efficiency will correspondingly become more, and not less, urgent.

Military Currencies

The plans made for providing currency of liberated countries to the Allied troops were officially made known this week. In Belgium, notes of the National Bank have been supplied to the Supreme Command for the use of the armed forces. The notes consist in part of currency taken to London from Belgium in 1940 and in part of currency printed in London on the orders of the Belgian

Government. Arrangements have been made by which military personnel may remit all or any portion of their pay received in Belgian francs to the United States or Great Britain against payment in dollars or sterling. Soldiers leaving Belgium will also be given facilities for exchanging whatever Belgian francs they hold into their own currencies. The rate of exchange fixed is 176½ francs to the pound. In the case of the Netherlands, the arrangements, which were made long ago with the Dutch authorities in London, follow the same lines. The guilder notes and coins prepared for the Dutch authorities in Great Britain will be supplied for the requirements of the Allied forces. If, however, the required supplies of such currency cannot be made available to the troops in the initial stages of the liberation, the Dutch population in the frontier region likely to be affected have already been requested by their Government to accept the French and Belgian franc notes which the British and other Allied troops are likely to carry. The rate fixed is 10.691 guilders to the pound, this being the parity indicated by combining the guilder-Belgian franc rate incorporated in the Belgian-Dutch monetary pact of last October and the franc-sterling rate of 176½ just fixed between the Belgian and British authorities. This, incidentally, leaves the Netherlands colonial guilder rate at 7.60 guilders to the pound, which is completely out of line with the provisional rate of the metropolitan guilder. This is a maladjustment which will soon be corrected, probably by bringing the West Indies guilder rate into line with that of the Netherlands guilder.

Meanwhile, there is evidence that the rates fixed for the liberated countries are provisional, and that if they are to become permanent drastic changes will have to take place in the cost and wages structure of these countries. Reports from Holland suggest that at the rate of exchange just fixed meat would cost the equivalent of £2 a pound, eggs 10s. each, a pair of shoes £12, and a suit of clothes £120. It is significant that all adjustments hitherto made or in contemplation are towards a lower purchasing power for the currencies concerned. The French Government has authorised a general 40 per cent increase in wages to catch up with the cost of living. In Belgium the Government also intends to adjust the level of wages to the prevailing cost of living. The longer-term plans of the Governments for contracting the inflated currencies and cost structures they found on returning to their countries have not yet been applied. Judgment on the provisional rates fixed should, therefore, be suspended until these plans have come into operation.

Antwerp Re-enters Diamond Trade

Diamond sales, which earlier this year were at a record rate, have lately fallen off; the latest London "sights" held during the last few days, attracted only a limited demand. Apart from the approaching end of the war in Europe, and expectations of an increase in supplies of civilian goods, the pending revival of diamond finishing operations in Antwerp appears to have been the chief reason for the more reserved attitude of buyers. The revival of the Antwerp diamond industry may, indeed, result in far-reaching changes in the international diamond trade. Until the spring of 1940, Antwerp, with its 23,000 skilled diamond workers, prepared some four-fifths of the world's diamond supply for the market. Despite a rapid growth since 1940 of diamond cutting and polishing operations in the United States, Palestine, South Africa, Great Britain, Brazil, Cuba and some smaller centres, the number of diamond workers (including apprentices) outside the European mainland last year (according to an estimate of the US Bureau of Mines) did not exceed 10,000. Of these the majority appear to have been engaged in the preparation of industrial diamonds for the munitions industries and the remainder mainly in the processing of the larger ones. The finishing of smaller gem stones, formerly the monopoly of Antwerp, was virtually suspended. As a result, there was a disproportionate rise in the prices of small stones. Prices of cut meles under one carat in the United States (the chief market) have trebled or quadrupled since 1939; those of

one-carat stones have risen up to 100 per cent and larger stones by a smaller percentage. The war-time boom in gem diamonds was largely based on larger stones acquired for investment purposes. With the re-opening of other investment channels and the resumption of civilian production, this demand is likely to decline; but smaller gem stones are likely to gain in importance, especially as the so-called "Antwerp qualities" are the only type of rough gem diamonds of which the Diamond Trading Company (the producers' syndicate) and the mines still hold substantial stocks. The diamond syndicate appears to place high hopes on the revival of the trade in small stones. Accordingly, it is actively supporting the Belgian Government in its plans for an immediate revival of the Antwerp diamond industry. It has earmarked a large reserve of small rough stones for Antwerp, and it intends to assist in the replacement of the equipment in diamond factories which the Germans have scrapped or removed during the war.

Supplies and Prices

The prospective increase in diamond-cutting and polishing facilities and, hence, in the supply of gem diamonds may not be without effect on prices. The trade in gem diamonds is dependent on the confidence of the public in the stability of prices and the syndicate may well endeavour to stabilise them at the present level. Owing to the sale of its vast stocks in the past three years and the accumulation of large liquid funds it is in a strong financial position. But although the syndicate controls and regulates prices for rough diamonds, it has no control over the wages in the cutting and polishing industries, which are an important item in total costs and—owing to the shortage of workers—have risen to fantastic levels in the past three years. As the Belgian Government no doubt regards the Antwerp diamond industry as one of its main sources of dollar and sterling earnings, it may be anxious to export as much "diamond labour" as possible in the form of finished small stones, a development which may bring lower prices. In view of the disproportionate rise in the prices of small stones, such a reduction would be in the interests of the long-term stability of the diamond market. The revival of the Antwerp diamond industry will greatly widen the basis of the diamond market, but it remains to be seen how the probable reduction in the prices of small finished stones will affect the demand for gem diamonds as a whole. It is not impossible that it will make buyers more cautious for a time, especially if the public were to regard a fall in the prices of small stones as a threat to the stability of the diamond price level, rather than as a consequence of a readjustment in the diamond finishing industries.

Halt in Selling or Recovery

The fall in equities was arrested this week, at least temporarily; some see signs of a rather better tone, others believe there is evidence that weak holders will continue to come forward, determined to get out at almost any cost. Before the recovery in mid-week, the decline had carried the average level of British industrial equities back to that of mid-May, according to the figures of *The Financial News*, and the total fall is the most severe since the collapse of 1940, although as yet much less severe than that. A reverse was overdue, but it already seems to have been overdone. The reasons popular in the market are the great uncertainty about the character of the peace-time regime and the beginnings of search for liquidity. Further, the fact that a number of factories are beginning to curtail their activities and even to discharge staff raises doubts about the smoothness of the switch-over. If the selling is dictated mainly by a hope to "get in" lower down, it is likely to be followed by a renewed rise quite as sharp. If, however, there is a genuine search for liquidity, it is at least odd that it should be accompanied by a rise in gilt-edged stocks, which are the usual repository of funds held for future use in business. Nor is it very clear into what, other than equities, any large volume of money can be put, since it is quite certain that few holders will be prepared either to go without income, or to accept the modest return obtainable on gilt-edged for more than a very short period. Adjustments were called for. They must continue for some time, but it is difficult to see why Stewarts and Lloyds, for instance, should have fallen some 15 per cent in value in a matter of weeks.

Criticism of Film Report

In his address to shareholders of the Associated British Picture Corporation, the chairman, Sir Philip Warter, said that, in the interests of shareholders, the board of directors must oppose the recommendations for any form of control contained in the report recently submitted to the Board of Trade by the Cinematograph Films Council. The report (it was discussed in *The Economist* of August 12th, page 221) found that the industry was riddled by monopolistic practices and that the conditions of healthy growth do not exist. Its proposals can be grouped under two headings: the removal of restrictive practices which abound, and positive assistance—by way of a Film Finance Corporation—designed to promote the growth of the industry. Sir Philip was not explicit about the details in the report to which he objects. But he expressed the view that the film industry, by its very nature, must rely for its healthy development on the "strong progressive combines," and that any weakening and restricting of them would "seriously" prejudice its future. To object to the proposals of the report in the interests of the shareholders in one of the two film "empires" is one thing; but to argue that the establishment of a healthy film-producing industry is conditional on *carte blanche* being given to vast combines is quite another matter. Large-scale enterprise is no doubt necessary in the modern film industry, but mere size does not necessarily guarantee enterprise and efficiency. To deride as a "popular cry" the widespread demand for the protection of the small independent producer and exhibitor is to deny the value of their potential contribution to an industry which, more than most others, depends on individual initiative and equality of opportunity.

Grocers' Post-War Plans

The National Federation of Grocers' and Provision Dealers' Associations has published the report of its post-war plans committee. The Federation speaks for the "independent" grocer and expresses itself strongly against what it calls the "octopus" chain store and co-operative society. It urges the Government to turn its attention to the problem, and suggests limiting the number of shops which can be held by one company or group of companies. The report suggests that unless action is taken the "consumers' shopping liberties" will be curtailed. There is no doubt that the independent grocer offers his customers valuable service, but the consumer's choice exists, and some may prefer the goods and services offered by the other types of distributor. The pace at which the independent food shop has been displaced by chain stores and co-operatives during the war has not been large. Since August, 1939, the rate of displacement—as revealed by a recent Ministry of Food inquiry—has been only about 200 a year. Perhaps it is too much to expect the Federation to take the broadest view of consumers' advantage. Chain stores are able to pass on to consumers the benefits they gain from bulk buying, and they are in a better position to offer standardised articles. The independent grocer has every right to insist on equality of opportunity; and insofar as the chain store has an advantage over him in the matter of purchasing—by placing larger and regular orders—he has his own remedy in co-operative purchasing. The chain stores themselves compete vigorously with each other, and, as a group, they have been a factor in lowering prices to the consumer. Co-operatives, patently, are not harmful to the public—if they were they could not have gained the popularity they have. There is a yearly opportunity for re-registration, yet the co-operatives have been able to keep a quarter of the total butter registrations.

The Federation does not confine itself to seeking protection from "big business." It wishes also to see a halt called to the extension of markets, open or covered, and looks forward to the elimination of mobile food shops and street stalls. It is self-evident that this proposal should be strongly resisted. Some of the recommendations are useful and practical—the continuance of rationing and price control until supplies are abundant, the setting of minimum standards for manufactured foods, the standardisation of food containers and their contents, and even the continuance of the Ministry of Food. A sad omission from the report is that it contains no section dealing specifically with the problems which will arise on demobilisation. No mention

is made of the re-entry of "independent" ex-Servicemen to the trade, or of the possibility of new entrants from the ranks of ex-Servicemen.

Unified Control

After two years' negotiation, the London Stock Exchange evolved a scheme designed to secure unified control instead of the existing duality under which one body manages the finance, in the interest of the proprietors, and another regulates the action of members as brokers or jobbers. This scheme (its details were recorded on page 540 of *The Economist* of April 22nd) has now reached its final form, and is to be submitted to the proprietors for their acceptance during the coming week. If accepted, and duly confirmed at a subsequent meeting, it will come into operation on March 25, 1945. It will continue unless two-thirds of those members of the new Council, who represent either of the two existing governing bodies, agree that the old system shall be restored. This decision can be taken during the month of January, 1947, or of any second year thereafter, to become operative on the following March 25th. During the five months' interval since the outline of the scheme became public nothing has arisen which would suggest that there is any likelihood that the scheme will either be rejected or substantially amended. From the standpoint of the public, it is evident that it falls short of perfection in that, in safeguarding the rights of the proprietors, the new Property and Finance Committee, which is in fact the existing Trustees and Manager plus representatives of the Committee for General Purposes, representing the members as a profession, has still the power to damp down improvements which would be in the interest of the institution as a servant of the public. It is to be feared that this is inevitable until such times as certain existing shareholdings become more widely dispersed, but it is very widely felt that the representatives of the proprietors will take a long view, and that there is little prospect that any serious consequences will flow from this admitted possibility of divergence of interests. From all other points of view, the facts that there will be one body to speak for the Stock Exchange, and that representatives of both proprietors and members will be called upon to consider all problems affecting either, can only be beneficial to both interests.

More Municipal Conversions

The Chesterfield offer of either redemption or conversion has been followed in a matter of days by offers by four other local authorities in respect of five loans maturing in January, February and April next. The authori-

Maturing Loan	First Redemption Date	New Issue
292,725 Grimsby 4½% 1945-55	1st April, 1945	292,725
1,500,000 Leicester 4½% 1945-55	1st Jan., 1945	1,500,000
824,000 Plymouth 4½% 1945-55	1st April, 1945	394,073

- ★ Interest paid half-yearly
- ★ Interest is subject to Income Tax, but tax is not deducted at the source
- ★ May be sold quickly through your Savings Bank

Issued by the National Savings Committee, London

ties in question are Grimsby, Leicester, Plymouth and Poole. Only the last two are paying off any of the nominal amount of the debt, and the Poole repayment is very modest. The only other point of interest is that all the terms offered are the same as those of Chesterfield; a 3 per cent stock repayable 1964-69 and offered at 99. The lists close on November 11th, except that the Plymouth and Poole lists will close as soon as the total offered in conversion is covered. The technique, both of partial redemption, where funds exist, and offers at uniform terms, irrespective of credit standing, is now well established but cannot be popular with the authorities with a high standing. The accompanying table gives particulars of the old and new stocks. The saving in interest is some £67,750.

Harland and Wolff Scheme

The scheme now suggested for the alteration of capital rights in Harland and Wolff is not very different from that described on page 92 of *The Economist* on July 15th and is, in large measure, subject to similar criticisms. The existing position is that the "A" ordinary shares are entitled to a non-cumulative preferential 4 per cent and to a further 2 per cent *pari passu* with the "B" which are entitled to all remaining distributable profit. The latter have received 6 per cent in each of the past four years. It is impossible from the published accounts to determine with any degree of certainty what has, in fact, been earned on the "B" capital. It is now proposed that the "A" capital be split into equal parts of 4½ per cent cumulative preference shares and ordinary shares, and that the "B" shares be converted into ordinary. This means that the "A" surrender preferential, but non-cumulative, rights of £208,000 for cumulative preferential rights to £117,000, but that they obtain, in exchange for a limited participation of £104,000, a share—almost 60 per cent—in the equity of the company. In actual figures, apart from the cumulative rights gained which may be important, they lose in dividends if the distributable profit is between £117,000 and about £450,000. Above that figure they gain. Distributions of the past five years have averaged some £412,500. So far as it is possible to assess real earnings they appear to have been, for the same period, somewhat in excess of the critical figure of £450,000. It is to be noted that the scheme was originated by the holders of the majority of the "A" shares who recently acquired them from the original allottees. Other holders of "A" shares who have been consulted support it, but there is no mention of any approach to holders of "B" capital. The board state that they regard the proposals "as of such a nature as can be properly submitted to the members for their approval." They also state that the new securities are considered to be more marketable than the old. This may well be so, but it is easy to make both securities conform more nearly to the familiar without disturbing completely the relation between the receipts of the two classes of capital.

Bombay Bullion Slump

The rupee prices for gold and silver have fallen heavily over the past fortnight. From a silver quotation of Rs. 133/11 on August 28th, after the Bombay market emerged from the long "bear squeeze" deadlock, the price has fallen to Rs. 125/10. The rupee gold price has declined from Rs. 75/5 to Rs. 68/3. The explanation common to both movements is the war news. The news has not only been so good as to discourage the hoarding demand for precious metals which normally feeds on disasters; it has been good enough to conjure up prospects of an early peace and of at least a partial restoration of the free international movement of precious metals. If this freedom is restored, the enormous disparities between the prices for gold and silver in such markets as London, New York, Bombay and Alexandria must inevitably disappear. In Bombay the anticipation of a return of relatively free arbitrage operations have been reinforced by continued official sales of silver. Between them, these two factors have offset the impact of continued inflation and have remedied the short technical position in the market which came to a head towards the end of July. The price of gold in Alexandria and in other Middle East centres has been falling for the same reasons—that is, the expectation that with the return of peace international bullion prices will revert to a single integrated level and that this will be maintained by international movements of the metals. The parities, however, need not be

those indicated by the level of shipping costs. In India, for example, the rupee price of silver must in any case allow for the import duty, which was raised by 20 per cent in 1942 and is now equivalent to over Rs. 8 per 100 tolas. There is, moreover, some uncertainty concerning the future sterling-rupee parity, which, of course, must enter into any calculation of the prospective rupee price for silver. On current account the rupee will be an exceptionally strong currency after the war, though that position may be changed if the bulk of India's abnormal sterling claims are funded. But inflation has bitten far deeper into India's economy than into Britain's, and on this score the rupee may ultimately settle below the present parity. Such a development would also justify a higher rupee price for silver than that indicated by the present straight parity between London and Bombay.

Cheaper Farm Loans

The directors of the Agricultural Mortgage Corporation have, this week, announced the promised concession in the rate for long-term agricultural loans. All new loans will be made at 3½ per cent. The rate of interest on existing loans will not be affected, but facilities will be given to enable borrowers to convert their loans to the 3½ per cent rate on payment of a conversion fee of £5 per cent on the outstanding balance of the loan. Since 1934 the rate charged by the Corporation has been 4½ per cent. Even this rate involved the Corporation in persistent loss because its resources were raised on exceptionally expensive terms: £8,500,000 of 5 per cent debentures and £2,000,000 of 4½ per cent debentures were issued between 1929 and 1932, that is at the height of the dear money period. In order to meet the deficit of the Corporation the Government has since 1934 provided an annual subsidy of £60,000. By the Agricultural (Miscellaneous Provisions) Act which became law on July 27th this subsidy is being increased to £150,000 per annum in order to enable the Corporation to reduce its loan rate. By offering 3½ per cent long-term mortgage loans the Corporation should be able to recapture a fair volume of business which it had lost to the clearing banks after 1933. The new rate is well below the competitive market price for long-term agricultural mortgage loans; the increased subsidy placed at the disposal of the Corporation must be regarded as a further instalment in the heavy subsidy of British agriculture by the Government.

Retail Trade and Bombardment

As was expected, flying bombs were responsible for another considerable drop in retail trade in central London in July. This is clearly brought out in the accompanying table, reproduced from the retail trade report in the *Board of Trade Journal* for September 9th. Figures for North-West England are given as a standard for comparison. Trade as a whole was maintained. The index for total sales (1942 = 100) was 96, only five points below the index for June and the average for the twelve months ending in June. From the table on page 397 it can be seen that the

PERCENTAGE FALL IN SALES COMPARED WITH AVERAGE FOR JUNE, 1943, TO MAY, 1944.

Category	Central London		Suburban London		North-West England	
	June	July	June	July	June	July
Non-food merchandise	29	48	21	22	4	6
Apparel	28	50	24	18	6	7
Household goods	31	45	13	32	4	5

trade lost in London was gained in other parts of the country, especially in reception areas. Compared with July, 1943, all the provincial areas show increases in turnover with only minor exceptions. Central London sales declined in every department, and in suburban London the only rises are in what might be termed "evacuation needs"—apparel and travel goods. In the latter section the increase was as much as 85.9 per cent above a year ago. The pattern of trade will probably be repeated in the August report, but, if the current upward trend is maintained, it should show a recovery in London for September.

Anglo-Argentine Tramways

Comments by the chairmen of British owned companies operating in Argentina on the treatment meted out to them by the Argentine Government grow more and more outspoken. The recent report of Anglo-Argentine Tramways was a case in point and the thesis there outlined lost nothing in being expanded by Sir Bernard Docker at the annual meeting. The underlying cause of trouble is that, over a period of years, the local Government has refused to allow increases in charges which would permit either the full maintenance of physical equipment or a reasonable return in the capital already invested. Actually the undertaking has been absorbed into the Buenos Ayres Transport Corporation by a scheme not very dissimilar to that of London Transport and new capital is required, but there is of course no chance of raising this. Further, the money to acquire certain rivals under the grouping scheme had to be borrowed from a local financial syndicate. This loan was eventually taken over by the Government. With the advent of the new regime in June 1943 a new chapter in the process of expropriating the foreign capitalist was opened. The company's balance sheet showed, quite properly, the loan mentioned above for forty million pesos as a liability against the assets acquired. The Control Commission, acting as Government inspectors, insisted that a further sum of equal amount should be included as share capital, apparently belonging to the state, this capital representing a part of the contributions which the travelling public would in the future have to pay in the way of fares. These shares, which have no real counterpart of any sort, were given voting rights and by the use of them the authorities obtained voting control. This control was immediately used to transfer all executive posts in the Transport Corporation to state delegates. Anglo-Argentine Tramways proposes to take every legal step possible to secure the rights of the proprietors, but it has to be admitted that there would seem very little prospect of obtaining redress under a regime which engages in such fantastic procedures as that described by Sir Bernard.

PLANNING FACTORY FUEL EFFICIENCY

For your Fuel Efficiency Campaign to be fully effective, wise planning and enthusiastic execution are both needed. In the Ministry's Bulletins you will find specialised advice on how to improve the efficiency of your works. If your fuel-watching system is based on the friendly co-operation of management and workers, you will ensure that these improvements are maintained. Have you acted on the suggestions outlined in the previous advertisements of this series?

- ★ Have you tracked down and put to use all process waste by re-examining every production process with an open mind? For steam process you need *Fuel Efficiency Bulletins* Nos. 22, 25, 26 and 28.
- ★ Have you planned furnace loading and eliminated waste? There are many excellent suggestions for furnace users in *Fuel Efficiency Bulletins* Nos. 5 (gas operated), 13 (electrically operated), 24 (oil operated) and 17 (furnace insulation).
- ★ Have you overhauled the boiler house? For boiler house economy hints, you need *Fuel Efficiency Bulletins* Nos. 1, 2, 9, 10, 20 and 27.
- ★ Are you certain that your fuel-watching system is just as good as a vigorous management drive can make it? Look up *Fuel Efficiency Bulletin* No. 7 for the duties and responsibilities of your fuel watchers.

Fuel Watchers' badges and copies of the *Fuel Efficiency Bulletins* can be obtained from the Secretary of your Regional Fuel Efficiency Committee

Issued by the Ministry of Fuel & Power

Clearing Bank Returns

Heavy Treasury Deposit Receipt borrowing from the banks was again the main factor in the expansion of bank credit last month. The clearing bank returns show a rise of £27 million in the holding of TDRs and an accompanying increase of £39,505,000 in deposits. These have climbed to the new record of £4,160,888,000. The true expansion in bank credit has been even greater than the rise in deposits suggests, for during the month there was a fall of £7,189,000 in cheques in course of collection and transit items, thus reducing to that extent the element of duplication in the deposits total. The other main contribution to the rise in deposits was an expansion of £17,099,000 in the banks' short loans. This increase mainly measures the larger holding of bills by the discount market following the increase in the weekly offerings. The banks themselves are still precluded by the heavy TDR borrowing from raking their full share of the additional Treasury bills issued through the tender, and last month their discounts actually fell by £2,354,000 to £210,555,000, a total which is about £11 million lower than the figure for August, 1943. This suggests that by far the greater proportion of the additional Treasury bills issued over the past year has gone to Empire and other holders of "abnormal" sterling balances. Loans and advances continue their decline from the seasonal peak of £770,280,000 reached last June. Last month they fell by £13,324,000 to £741,712,000, a fall which has cancelled the whole of the recovery made over the first half of the year. This relapse provides fairly conclusive confirmation of the theory that the bulk of the additional loans made between January and June of this year were to finance the tax payments which are normally concentrated in the early months of the year.

Coal in the Home

The Women's Advisory Committee on Solid Fuels was formed in March last year, and a great deal of research has gone into the making of its report, *Heating, Cooking and Hot Water Supplies* (Women's Advisory Committee on Solid Fuels, 1s 3d). The Scott, Barlow and Uthwart Reports have been studied; visits were paid to collieries, carbonisation works, factories manufacturing appliances; and a prefabricated house—but not the Portal house, which was not on view in time—was inspected. General housing and housekeeping problems were also considered. The report is, however, weakened by the terms of reference implied in the committee's name. The rich field of research in the application of modern domestic appliances to poorer homes is scarcely touched upon. Emphasis is inevitably placed on the use of coal as a domestic fuel, even where, from a purely objective point of view, it cannot be justified. It is true that the running cost of coal appliances is lower than that of gas or electricity appliances, and for this reason it commends itself to the lower income groups. The use of coal has numerous disadvantages compared with other fuels, and the committee could have brought these to the attention of manufacturers with a view to the production of more appropriate apparatus. For example, one essential which is rarely found in the cheaper stoves is adequate insulation, so that too often a hot-house atmosphere is produced in the working-class home on bath night, and the lot of the housewife who has to cook on a coal stove on a hot summer day is not to be envied. There is no doubt that gas and electricity are easier to use, clean and labour-saving, and that their price should be brought within the means of the poorest home.

Wholesale Trade Index

Last April the *Board of Trade Journal* published the retail trade index on the new basis of 1942, and for the same reasons the index of wholesale textile sales has been converted from its old base of 1937 to one of 1942. This index, which appears in the *Board of Trade Journal* for September 2nd, covers sales and stocks of 87 firms, both large and small, reporting a total turnover in 1942 of about £47 million and an average stock valued at £7,000,000. Sales and stocks are reported by categories broadly similar to those in the retail trade report. The three most important are women's and children's wear, men's and boys' wear and dress materials, which accounted for 54 per cent, 17 per cent and 9½ per cent respectively of sales in 1942.

The ratios between the three categories are different from the ratios in which consumers spend their money on them because the wholesaler is not always the last link in the distribution chain before the retailer. The retail sample is composed mainly of multiples, co-operatives and department stores, whose principal source of supply is not the ordinary wholesaler, who deals mainly with the independent

* Including exports, which form only a small part of the total.

retailer. Thus the two series of wholesale and retail sales indices represent two parts of total trade, rather than the same flow at different points. The accompanying table reproduces some of the figures in the new index of wholesale textile houses.

Shorter Notes

The numbers registered at employment exchanges as unemployed on July 17th totalled 63,197, a decrease of 11,401 since April 17th. This is the lowest level the recorded unemployment figures have reached.

The owners of 180 mills, containing nearly 15 million spindles, closed when the cotton spinning industry was concentrated in 1941, are becoming restless about the prospects and the details of reopening. To deal with the problem a special committee has been formed, with Sir Raymond Streat as chairman, and containing three representatives of the stopped and three of the running mills. The committee will give its attention to the provision of raw cotton and labour for the idle mills. Some quarters urge that, of the closed mills, single unit firms should have priority over mills in the big combines. At all events, many difficulties will have to be overcome to speed up production to the level which Europe will shortly require. At the same time, the position at a later date, when abnormal demand ends and some return to concentration may, perhaps, appear desirable, must not be overlooked.

The accounts of the General Theatre Corporation group for the year ended March 31, 1944, show gross profits £14,000 higher at £518,004. Due to increased maintenance work done during the year, deferred repairs calls for only £17,000 against £43,510. Taxation, however, requires £19,000 more, although it is reduced by relief of £48,000 (against £27,000) obtained from the absorption of EPT deficiencies of previous years. Net profit of the parent company emerges £20,000 odd higher at £79,381. The preferred ordinary dividend of 9 per cent is not increased, since it is considered prudent to transfer the large sum of £55,000, against £40,000, to general reserve. The wartime boom in some sections of the entertainments industry is reflected in the groups' increased profits, but the chairman, Mr Rank, indicates that business for the current year—especially as regards music halls—has been seriously affected by the flying bomb attacks.

COMPANY MEETINGS

TIMOTHY WHITES AND TAYLORS, LIMITED

RECORD SALES

MR LOUIS NICHOLAS ON POST-WAR DEVELOPMENT

The fifteenth ordinary general meeting of Timothy Whites and Taylors, Limited, was held, on the 13th instant, at the May Fair Hotel, London, W.

Mr Louis Nicholas, the chairman, presided. The following is the statement by the chairman circulated with the report and accounts:—

Within recent weeks the company has suffered a sad loss by the death of Mr Philip E. Hill, who has been chairman of this company since its formation. We who were privileged to work with him realise how much we owe to his wise counsel, which played an important part in the establishment of the company in its present satisfactory position.

As will be seen by the directors' report, the trading profits for the year show an increase of £98,722 1s 4d, but practically the whole of this sum has been utilised in the increased provisions for taxation and deferred repairs and renewals. All proper provision has been made in the accounts of the company and its subsidiaries for depreciation of fixtures, plant and machinery and for the writing down of leases.

Your company and its subsidiaries are still operating under difficult conditions owing to shortage of staff and other restrictions caused by the war, but we are continuing to follow our usual policy of supplying our customers with the best possible assortment of goods at reasonable prices. I am pleased to say that the total sales and the dispensing of the company and its subsidiaries during the year under review have been the largest in its history. This has only been made possible by the loyal co-operation of the personnel of all ranks, to whom I am sure you will join with me in extending our thanks.

NEW ACQUISITIONS

Since December 25th last your company has acquired the whole of the ordinary shares and some of the preference shares of Mence Smiths Stores (Proprietors), Limited. This company, which retails hardware, etc., has branches throughout the south of England. In addition, your company has also acquired 37 shops in the south of England carrying on the business of retailers of grocery, hardware, etc. These shops have been transferred to, and are now being carried on by, a new company registered under the name of J. Salmon and Son, Limited, the whole of the share capital of which is owned by your company.

Both these purchases have been made in view of a post-war scheme of development of the company which has been seriously engaging the attention of your directors for some time past, and should, in my opinion, be a most useful acquisition to the company's activities and allow for considerable expansion when hostilities cease and trading conditions return to anything like normal.

THE DIRECTORATE

You will see that the directors have done me the honour of appointing me chairman of the company. Mr Espley, who has acted as your managing director for many years past, has relinquished that position and has been appointed vice-chairman and advisory director of the company and its subsidiaries, with a view to devoting his activities to the future expansion to which I have already referred. On your behalf I would like to thank Mr Espley for the loyal services he has rendered to the company during the period that he has occupied the office of managing director. Mr G. I. Rushton, M.P.S., who has acted as assistant managing

director for some years past, has been appointed managing director in the place of Mr Espley.

A large number of our staff are still serving with the forces; some of them unfortunately have lost their lives, and I should like to tender our sympathy to their relatives in their bereavement. We are, of course, continuing the financial

assistance hitherto given to members of our staff who are serving, and we are looking forward to their return to us when hostilities cease.

The trading during the current year continues satisfactory, although in the south of England conditions have been somewhat disturbed.

The report was unanimously adopted.

CROSSES AND HEATONS LIMITED, BOLTON

EFFECTS OF LABOUR SHORTAGE ON PRODUCTION

MR JOSEPH R. HEATON'S ADDRESS

The twenty-fourth annual ordinary general meeting of Crosses and Heatons, Limited, Bolton (formerly Crosses and Winkworth Consolidated Mills, Limited), was held, on the 14th instant, at the Albert Hall, Manchester.

Mr Joseph R. Heaton, the chairman and managing director, presided.

The secretary read the notice convening the meeting, the minutes of the last annual ordinary general meeting, and the directors' report.

The chairman, in the course of his address, said: The report of the directors and balance-sheet for the year ended March 29, 1944, have been in your hands for some days, and with your permission I will take them as read.

Since the last annual general meeting the name of the company has been changed from Crosses and Winkworth Consolidated Mills, Limited, to Crosses and Heatons, Limited, in accordance with a special resolution passed at the extraordinary general meeting on March 23rd last. The scheme of reconstruction has been sanctioned by the Court, and is now effective, and I am pleased to say that stockholders are to have some return on their capital. In order that stockholders should have an up-to-date summary of the company's exact position, a *pro-forma* balance-sheet showing the effect of the scheme has been circulated with the accounts.

I desire to inform you that the company is dealing expeditiously in putting the scheme of reconstruction into operation, and stockholders would assist the staff in these very difficult times if they would refrain from corresponding with the company on matters relating to the payment of dividends, the payment of fractional differences and the issue of certificates for their new holdings. It is hoped to complete all these matters, including the payment of dividends, by October 2nd next, or as soon thereafter as practicable.

YEAR'S PROFIT

The profit for the year amounts to £170,160 which compares with a profit of £169,958 for the previous year. As stated in the directors' report, it is not necessary to provide depreciation in this year's accounts in view of the recent revaluation of the company's fixed assets, but it is proposed to set aside £25,000 for deferred repairs, in addition to which we have spent £34,224 upon repairs and renewals and in upkeep of plant, as against £33,230 during the previous year.

BALANCE SHEET ITEMS

Land, Buildings and Machinery.—In the certified balance-sheet this item stands at £2,654,955, which has been written down under the reconstruction scheme to £1,562,214, as appears in the *pro-forma* balance-sheet showing the effect of the scheme.

Debtors.—The amount outstanding is £192,444 as against £67,277, the difference representing taxation repayable, wages loans to employees and a slight increase in trading.

Stock-in-trade.—The total value is £526,738 as against £442,011, the increase being due to the carrying of larger raw cotton stocks.

Cash Position.—The credit balance amounts to £144,421 as against £231,173. *Sundry Creditors* are £117,400 as against £36,781 for last year.

PROFIT AND LOSS ACCOUNT

The net amount on profit and loss account, after deducting the balance brought forward of £581,295, which has been utilised in reducing the fixed assets in accordance with the scheme of reconstruction, is £241,846. Out of this balance the directors recommend the payment of one year's dividend on the new 6 per cent. redeemable cumulative preference stock and the payment of 6 per cent. on the new ordinary stock, both less income-tax, absorbing in total £66,573. Provision for sinking fund for the redemption of the new 6 per cent. preference stock absorbs £13,962, and your directors further recommend the setting aside of £25,000 for deferred repairs, leaving £136,311 to be carried forward to the next account in accordance with the net figure shown on the profit and loss account in the *pro-forma* balance-sheet.

PRODUCTION DIFFICULTIES

Without unduly taking up your time, I would like to give a brief outline of the production difficulties that at present beset the management of the company. As you are aware, profits depend upon production no less in cotton spinning and doubling than in any other industry, and if increased production is to be obtained, it is essential that the necessary labour is made available. Under war-time conditions we are dealing with all the difficulties as effectively as we possibly can, but I must point out to you that prior to the outbreak of war in 1939 our mills were operating at approximately 75 per cent. of capacity, but since April, 1941, when the "Cut and Concentration Scheme" took effect and the shortage of juvenile labour and absenteeism amongst the female labour due to many causes became acute, our production is now only 50 per cent. of capacity.

CHANGES ON THE BOARD

I regret to inform you that Mr John Greenwood has intimated that he does not desire to seek re-election, and your directors take this opportunity of expressing their thanks to him for his services since his election to the board in 1931.

When I addressed you on March 23rd last I intimated that it was the intention of your directors to strengthen the board by co-opting three of the company's most experienced managers. This has been done, and I am sure this step will commend itself to the stockholders. The directors concerned are Messrs Frank Berry, George Hargreaves and Herbert Nelson, all of whom have given long and efficient service to the company, and I consider they will prove to be valuable additions to the board.

Once again I should like to express the board's appreciation of the fine services of the staff and workpeople in these very difficult times.

The report of the directors and statement of accounts for the year were adopted, and the retiring directors and the auditors were re-elected.

THE FINANCIAL NEWS, LIMITED

ENCOURAGING PROGRESS CONTINUED

MAJOR-GENERAL DAWNAY'S SPEECH

The forty-seventh annual general meeting of the Financial News, Limited, was held, on the 12th instant, at the registered offices of the company, 20, Bishopsgate, E.C.

Major-General G. P. Dawnay, C.B., C.M.G., D.S.O., M.V.O., chairman of the company, presided.

The chairman said:—The report and accounts are before you and there is little for me to say regarding the figures. The profit for the year amounted to £35,491, compared with £33,122 for the previous year. This is not such a marked increase as was the case last year compared with the year before, but having regard to factors to which I shall refer later I think you will agree that it shows a continuation of that encouragingly progressive tendency of which I spoke last year.

The publications owned by our subsidiary and associated companies have shown the same tendency and the profits of the subsidiary companies, with which we have again dealt conservatively, are reflected in the accounts before you. Income tax required £18,938 this year, compared with £17,264 last year, leaving a net profit after providing for income tax and National Defence Contribution of £16,553, compared with £15,858 last year.

There is no item in the balance-sheet to which I need draw your attention. Both current assets and current liabilities show increases, but you will note that there is an excess of current assets over current liabilities of £4,878 more than was the case last year. Your directors have therefore felt justified in again recommending the payment of a dividend of 20 per cent. on the Ordinary shares. The payment of the Preference dividends has absorbed £5,269 net and the Ordinary dividend now recommended will require £10,504 net, leaving a balance of £780 to be added to the carry-forward, which will then stand at £99,594.

ADVERTISING REVENUE MAINTAINED

Advertising revenue during the year has been well maintained, but against this there has been a further increase of printing charges, and other costs have shown a tendency to rise although not to a marked degree. These trends will continue, particularly when we are able to extend the service offered by our publications.

Our various publications have all increased their circulation during the past year, which indicates that we are supplying those services which our various readers require. We are prevented from doing all that we would wish in this direction by the limitations which have been imposed since early in the war upon the use of paper. This has necessitated balancing for each issue the number of pages and the number of copies printed, and also the number of pages devoted to editorial matter and advertisements. As we have been unwilling to sacrifice the goodwill of our publications by unduly restricting the reading matter,

this has resulted in some loss of advertisement revenue.

We cannot therefore look for any material increase in profits under present conditions, but on the other hand we should be able to expect them to be maintained. After the end of the war in Europe, of which the prospect is now encouraging, we hope to be able to use paper more freely. This would enable us to increase our sales and to improve upon the services we are now able to give to our various readers. This in turn will entail additional expenditure which we can expect to be more than compensated by additional revenue from advertisements as more normal business activity is resumed.

I would, however, repeat the warning I gave last year that one very important part of our revenue before the war—namely that from prospectuses—is likely to remain very small after the war for an indefinite period.

THE OUTLOOK

When we next meet, I believe, as I think you all do, that the war in Europe will have ended. While the nation's energies must then be directed to bringing the war in the Far East to a swift and victorious conclusion, some part of the resources now devoted to war may, I take it, be diverted to the urgent problems of reconstruction with which we shall be faced. We must not forget that this country must, after the war, if our living standards are to be maintained, achieve an increase in exports of the order of 50 per cent. over the pre-war level. This will require great enterprise and initiative, and in achieving it the City of London must play a leading part. It will be the aim of the *Financial News* to make its full contribution to the solution of this vital and pressing problem.

The staff has remained at the bare minimum of the last few years. We have lost one or two junior members to the Forces whom we have been obliged to replace in the present restricted labour market. The improvements to which I have referred have meant extra work for the staff as a whole, and the directors wish to pay tribute to its efficient and loyal service during the past year. We have continued to supplement the pay of those members of our pre-war staff serving with the Forces, and the present favourable course of the war gives rise to the hope that we may be welcoming some of them back in the not too distant future.

The report was adopted.

ANGLO-CYLON AND GENERAL ESTATES COMPANY, LIMITED

DIVIDEND AGAIN 7 PER CENT.

The fifty-eighth annual ordinary general meeting of the Anglo-Ceylon and General Estates Company, Limited, was held, on the 14th instant, in London, Sir Edward Rosling (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the accounts:—In Ceylon the crops of tea and rubber were good although that of tea was

slightly less than last year. The rubber crop, however, showed a gratifying increase. The cocoa crop was poor, owing mainly to drought but prices realised were somewhat better. Costs of production are again higher due principally to further increases in the cost of living allowance to labour, which incidentally is in very short supply.

In Mauritius, as I forecast last year, the crop was lower by 4,500 tons, although it was larger than expected, in view of the lands put under production of foodstuffs. The full loss of crop which might have resulted was to some extent mitigated by the skilful efforts of our estate managers in their programme of cultivation.

The vice-chairman, Mr F. W. Douse, was permitted to visit Mauritius during the early part of this year and spent the month of April there. He was thus able to discuss on the spot the many problems which have arisen since the war began. He comments:—"The estates are in a satisfactory condition considering the severe labour difficulties which for various reasons now exist."

RESULTS OF YEAR'S OPERATIONS

As to the accounts the gross profit for the year amounted to £193,165 and after providing £140,000 for taxation £53,165 is available for distribution to the members, and we again recommend a dividend of 7 per cent., free of Income Tax, leaving £11,165 to be added to the carry forward.

For the current year the gross profit will probably be detrimentally affected by the results in Mauritius owing to a severe reduction in the sugar crop, resulting from the visitation of a cyclone in April last and the cumulative effect of loss of production occasioned by the growing of foodstuffs. It is not anticipated, however, that the net profit after the deduction of Income Tax and Excess Profits Tax will be affected.

The report was adopted.

TRIBUTE TO SIR EDWARD ROSLING

In proposing the re-election of Sir Edward Rosling to the board, which was duly carried, Mr Francis W. Douse, said: This is somewhat of an event, because as Sir Edward has been either Managing Director or Joint Managing Director since he was appointed to the Board, he has not had to come up for re-election. He only does so now as he has asked to be relieved of his duties as managing director in view of his advancing years. Sir Edward has had a very distinguished career and enjoys a great reputation. Before he came back to this country he was our General Manager in Ceylon for six years and joined the board in 1913. He has thus served the company for over 37 years. He spent 27 years planting in Ceylon, and during 10 years of that time was the planning member on the Ceylon Legislative Council, and it was for this work that in 1913 he received his knighthood. I and my colleagues very much regret that he has found it necessary to give up active participation in the business of the company, but we are glad that he has consented to remain as chairman and that we shall therefore have the benefit of his advice, we hope, for some years to come.

be made otherwise than in accordance with United Kingdom style restrictions. In future, therefore, garments intended for export will not be subject under Board of Trade Orders to home style restrictions.

Goatskins.—Arrangements have been made to divide available supplies of raw goatskins between the United States and the United Kingdom in the ratio of 5 to 1, subject to a stock adjustment in America's favour. The United States has agreed not to buy tanned goatskins or tanned sheepskins for the rest of 1944 until UK purchases have reached agreed levels. Any additional quantities will be equally divided from January 1, 1945. East India tanned goatskins are to be divided in the ratio of three to USA and seven to the UK. East India tanned sheepskins will be divided in the proportion of one to five. It is expected that, as in the case of hides and calf and kip skins, the arrangements for co-ordinated purchases will continue to ensuring a steady flow of foreign supplies.

Beveridge Plus?

WHEN Mr Willink promised the Bury St. Edmunds electors last spring that the Government's social security plan would be "better than Beveridge," most people thought that this was just a piece of vote-catching. But the two White Papers on Social Insurance and Workmen's Compensation show that his claim was not altogether an exaggeration. The Government, which pays a graceful tribute to Sir William's work, has incorporated very many of his proposals in its own scheme. In some cases they have been improved upon; in others, the official plan is less satisfactory. But Sir William Beveridge might properly be described as having not only designed but pre-fabricated the Government's plan.

The two White Papers issued this week (which are summarised on page 440) contain remarkably progressive proposals. They take what is best in the old insurance system and discard the worst, cutting out a great deal of dead wood in the process. The scheme is not a revolutionary one, though some of the changes come very near it. At its lowest, it is an attempt to set social insurance on a commonsense and orderly basis. At its highest, it is a new chapter in the planning of complete social security.

The six main principles of the Beveridge plan have been closely, if not completely, followed: comprehensive-

ness, classification, unification of administrative responsibility, adequacy of benefit, flat rate of benefit and flat rate of contribution. The Government proposes a universal and complete system of social insurance, for all ages and all classes of the population. It will cover all the contingencies of normal life—birth, childhood, orphanhood, marriage, sickness, invalidity, industrial injury, unemployment, widowhood and death. Especially welcome is the emphasis laid on the family as a unit, with the provision of family allowances and marriage grants, and the recognition of the housewife as a special class. The introduction of a death grant is a long-needed reform.

The scheme for workmen's compensation, published separately, proposes particularly radical changes. The Government has agreed with Sir William Beveridge that the present system is "based on a wrong principle and has been dominated by a wrong outlook" and it proposes to sweep it right away. Compensation will be taken out of the Courts, and the individual employer's liability will be replaced by a central fund. The lump sum payment will go. The principle of compensation for loss of earning capacity has been abandoned and industrial injury insurance will be treated as a social service.

These changes are indeed revolutionary. They repre-

(Continued from page 397)

on the British farmers' war effort. During the course of their visit of two to three months, it is possible that members of the party will visit Canada also.

Oils and Oilseeds.—The liberation of Marseilles and Antwerp has led to speculation on the development there of oilseed crushing and refining, since these towns were important centres before the war. If the mills and plants can operate, supplies could be sent to them from United Nations stores. Supplies are relatively good, but will need to be regulated. The new crop of United States linseed is insufficient for domestic and lend-lease purposes, and the Argentine export surplus is only 115,000 tons compared with 693,000 at the end of August, 1943.

Clothing Exports.—The Board of Trade has issued the Clothing (Restrictions) Orders (Amendment) Order 1944 (S.R. and O. 1944, No. 1039), which comes into operation on September 15th; it enables garments intended for export to

sent a departure from the insurance principle and from the traditional linkage between earning capacity and compensation. There may be pressure for a review of the proposed rates of benefit, particularly for total disablement, which are much lower than the scale proposed by the Trades Union Congress, and may be hard on higher paid workers who become totally disabled. But whether higher rates can be granted will depend, not only on the general state of the national economy, but on the effectiveness of the more positive measures taken for accident prevention and for the rehabilitation of disabled workers.

The proposals for the administration of social insurance seem, at any rate on paper, to be wholly satisfactory. For the present hotchpotch of authorities and agencies, there will be substituted a single central Ministry of Social Insurance, with local offices; the new Minister will also be responsible for the Assistance Board, which is to take over all forms of cash relief and thus virtually complete the process of nationalising the Poor Law. This should cut out the duplication, the overlapping and many of the anomalies in the present system. All contributions will be paid on one card instead of into a variety of funds. The gain in efficiency and the economies of concentration should more than offset the danger of any possible rigidity or loss of the personal element. This danger will probably be the chief basis of the opposition of the Approved Societies, which are to be superseded and not, as was originally implied, used as Government agencies. The Societies, together with the Industrial Life Offices and (possibly, though by no means so certainly) the insurance companies dealing in workmen's compensation, will undoubtedly fight the scheme inside and outside Parliament. Many of their functions will wither away under the comprehensive state insurance scheme, even if their work in other directions expands, and any increase in voluntary insurance is hardly likely to compensate for the loss of business they suffer. These institutions have performed their duties honestly and, on the whole, efficiently. They have a legitimate interest in the maintenance of the *status quo*; but however much sympathy there will be for any displaced agents and collectors, sectional opposition should not be allowed to stand in the way of the plan. The success of the new administration will, of course, depend largely on the new Minister and on the type of staff who are recruited to the new service. There is a great opportunity for introducing men and women trained in social welfare, and to make complete the break with old Poor Law tradition.

*

There are certain respects in which the Government's scheme represents a change for the worse and not for the better when it is compared with the Beveridge proposals. One of the main principles of the Beveridge report was the need for income security, by relating benefits to subsistence needs—though its own proposals were a very imperfect application of the principle. The Government rejects this approach. The Beveridge scheme was based on the assumption that prices in 1945 would be no more than 25 per cent above 1938 prices. The White Paper makes no such assumption and does not deal at all with standards of living; it makes no mention of rents, to which Sir William Beveridge devoted so much study. It argues that the linking of benefit to subsistence rates might involve frequent variation of the former in accordance with the cost of living and that social insurance, dealing in averages, cannot take account of differences in circumstances between people or places. Presumably the reason for the Government's attitude is that to adopt a subsistence basis would add enormously to the cost, especially as subsistence rates would inevitably rise under political pressure, which it would be difficult to resist. But living costs may rise steeply in the years immediately after the war (whatever happens to the unrepresentative cost-of-living index) and the new scale of benefits may soon be entirely inadequate. The whole idea of social security would become meaningless unless it aimed at some kind of income security, and this can

only be assured if benefits are related to subsistence needs. This dilemma is likely to remain unresolved for many years, and the only ultimate solution, however remote it may be, is a scale of benefits large enough to provide for all minimum needs.

The margin between benefits and subsistence may be partially met by the provision of national assistance, which will in future be available to anyone who can prove need, and will not, as at present, be limited to a few special categories. But national assistance necessarily involves a means test and the resented visits of investigating officers. This painful problem of the 1920's and the 1930's is not, after all, to be solved. There has to be some kind of cushion to catch the few people who might escape from the social insurance net. But in a watertight social security scheme, assistance would barely be necessary.

The Government's decision to adhere to the insurance basis has also led it to reject Sir William Beveridge's recommendation that full unemployment benefit should be available indefinitely, subject to compulsory re-training after, say, six months' unemployment. Instead, benefit will be discontinued after thirty weeks, but a higher allowance will be given to workers who undertake training. This decision, whatever the reasons for it, is a great pity. There is no guarantee that the offer of a few extra shillings will induce workers to accept retraining. They might prefer to cling on to assistance in the hope that they will return to their previous jobs. A policy for full employment calls for the maximum mobility and adaptability of labour. Retraining and the acquisition of new skills is an integral feature of this policy.

The Government has also departed from the Beveridge report in that it proposes more generous treatment for old people and less generous treatment for children. Instead of retirement pensions only rising to their full rate after twenty years, the rates will come into effect at once. Family allowances are to be 5s. per week per child—omitting the first child, except where the parent is receiving benefit—instead of 8s. as proposed by Sir William Beveridge. The balance, according to the Government, will be met by increased benefits in kind. But it will be some time before a nation-wide service for children can operate effectively. This economy will save the Exchequer, which is to bear the full cost of family allowances, some £40 million, though retirement pensions and widows' benefit will amount to more than £45 million more than the Beveridge scheme. It was often said that the Beveridge proposals were somewhat hard on old people, but it is false economy and wrong policy to improve their position at the expense of children. If anybody has to be sacrificed, it should not be the children, and this policy is hard to reconcile with the urgent need of raising the birth-rate.

*

"We cannot afford it" used to be the theme of much of the criticism of the original social insurance plan. This charge can be levelled equally against the Government's scheme, for there is very little difference in the cost of the two. The Beveridge scheme would have cost £697 million in 1945 and £858 million in 1965. The Government scheme will cost £650 million in 1945 (of which £411 million would, in any case, fall to be spent under existing schemes) and £796 million in 1965. The difference between the two proposals of £47 million in 1945 is narrowed by the estimated expenditure of at least £20 million on the industrial injury scheme and the specified amounts for training benefit and children's services in kind. Of the cost of social insurance, excluding industrial injury, 54 per cent will be met by the exchequer and 44 per cent from contributions. The Government should consider, before it is too late, revising the basis of collecting contributions. Great Britain is one of the few countries which does not have varying rates of insurance contributions and benefits. The Government is probably right to adopt Sir William Beveridge's view that varying rates of benefits would be inconsistent with the aim of a national minimum. But a flat rate of contribution is a form of regressive taxation, bearing unduly heavily on the lower income groups. New Zealand's social in-

insurance scheme, though it provides flat rates of benefit, is financed by an income tax graduated according to capacity to pay. This method, though there are arguments of tradition and custom against adopting it in Britain, is undoubtedly the only equitable one.

The White Paper's rates of contribution, though lower than the Beveridge rates, may seem a large slice out of a low-paid worker's income. It is, however, only fair to point out that the average worker now pays out far more than 3s. 7d. for coverage against sickness and burial. The employers' share (£125 million in 1945) will be 50 per cent higher than at present (£83 million). This additional burden cannot be dismissed as insignificant, though it is right that employers should bear some part of the cost. In industries with high labour costs, such as coal mining, the extra charge for insurance contributions may mean further increases in selling prices. Similarly, industries producing for export will argue that they are unfavourably placed compared with domestic or sheltered industries which can pass on the extra cost to the consumer. Part at least of the insurance costs should be met out of a tax on profits, and not as a general levy on employers, which can only become a tax on employment.

The technical problem of finding £239 million a year more for social insurance should not be insoluble, especially if £147 million of it can be raised by direct contributions. The plan, in other words, can be financed without undue difficulty, at least in the early years. Later on, with the rising cost of old-age pensions—by 1965, the population of pensioners over working age will have

increased by 1,900,000—it may be difficult to find means of raising the full cost. But the nation's ability to meet the cost depends on the rate at which the national income can be increased. This in its turn depends on the trend of the population, on the increase in productive capacity, on the reconstruction of international trade, and on the extent to which consuming power can be maintained—in other words, on the whole complex of the national economy. Social security, in both the Beveridge and the Government context, rests on three major assumptions. Two of these, family allowances and a comprehensive health service, have been promised. The test will come with the third assumption, the "maintenance of employment." Social insurance, as the White Paper points out, is "but a means to achieving positive effort and abundant living." Social insurance commitments, without a positive policy for wealth, would become a millstone round the nation's neck. Given that essential, social security can become the cornerstone of economic progress.

It will take time to bring a scheme of this magnitude into effect, and no target date has been suggested for its operation. There are many intricate problems still to be sorted out, many additions to the "mosaic of detail" to be filled in, and much in the Government's scheme that needs revision, while there will be plenty of people who will seek to obstruct and delay the plan for as long as possible. The Government has shown courage—if not speed—in framing its proposals for social insurance. The need now is for equal courage, and greater speed, in translating them into law.

Terms for Germany

THE article which appeared under this same title, in *The Economist* of August 12th, has aroused considerable controversy, both in these columns and outside. It is good that the issue on which the whole peace settlement will turn should be capable of stirring minds and pens. But it is disappointing that few of the critics should have been able to understand an article which was quite clearly written. The critics have written at length about the treatment that Germany deserves; *The Economist* wrote about the sort of settlement that would work. They have expatiated on German psychology; we were concerned about British psychology. They have accused *The Economist* of wanting to be kind to the Germans; our only desire was to be truthful about the British. They have attacked us for wanting a soft peace; but the argument was for the sternest peace that had any hope of being maintained.

The maintenance of the peace is the crux of the whole problem. It is easy to write a peace treaty of the utmost severity. Everybody will be pleased—except the Germans, who will have no voice. But nothing could be worse

than a severe settlement that is not maintained. The most certain way of ensuring a short peace is first to give the German people a burning grievance and then to let them become strong. It follows that any statesman who is trying to plan more than a breathing space must ask himself whether his settlement will endure. Any peace that stops short of complete extermination has to be maintained if it is to endure. And maintenance, if there are any penal clauses, requires enforcement.

There are not many examples in modern history of settlements that have, in fact, been enforced. Those that have lasted a reasonable time—pre-eminently the settlement of Vienna in 1815, which did not undergo a general revision for a whole century—have been those that were self-maintaining—that is, those that no large country seriously desired to upset. Those that required enforcement, such as Versailles, have been short-lived. Most of the examples of terms imposed by one country on another, and enforced over a long period, concern the relations of large countries with small—and even there the histories of Ireland and Poland do not encourage a belief in the

possibilities of permanent coercion. There are few lessons to be drawn from history that are as clear as this—so much so that one writer, with a proved sense of history, was moved, only six years ago, to write that

the unending cadence of history shows that moderation and mercy in victory are no less vital than courage and skill in war.

The quotation is from Mr Winston Churchill.

But *The Economist* has not gone so far as to say that there can be no enforcement at all. Indeed, in present circumstances, a self-maintaining peace—that is, one whose terms the Germans and everybody else would freely accept—is clearly impossible. The teachings of history cannot be followed exactly. But neither should they be entirely abandoned. The path of wisdom is to conclude a peace that will require no more enforcement than will in fact be forthcoming. And how much will that be? The only possible answer, with one eye on history and the other on democratic politics, is not very much.

★

If enforcement is the key to what is possible, it must surely be obvious that the governing factor is not the impact of the peace terms on the Germans but their impact on the Allied peoples, whose attitude will determine whether, in twenty years' time, an infringement of the treaty will be countered by force. This is the very simple point that quite three-quarters of our correspondents have failed to grasp. The psychology of the German people, their history and present state, the punishment they have deserved, the anti-Prussian feelings of the Southern Germans, the shades of goodness and badness among them—all these are highly interesting questions. But they are barely relevant (if, indeed, they are relevant at all) to the question of what will be maintained and enforced ten or twenty years from now. In this paramount issue, it is the psychology and policies of the victors that matter. Nor can enforcement safely be left to some of the victors without the others, for a split in their ranks would offer the most obvious opportunity for German manoeuvres. The weakest link in the chain is the future resolution of the American and British peoples, and it is, therefore, on a correct judgment of this vital factor that the workability of the peace depends.

To estimate the mood of the British people twenty years hence is necessarily hazardous. But two things are reasonably clear. The first is that a policy of enforcement would be burdensome. It would involve constant vigilance, a willingness to accept unwelcome facts, a readiness to take unpleasant action before it could be shown to be strictly and directly necessary, an ability to see clearly through the fog of propaganda, a total immunity to the doctrines of appeasement, an ability to avoid any periods of lapse into indolence or indifference. The second thing that should be clear is that neither the British nor the American Governments or peoples demonstrated their possession of these qualities in the 1920's and 1930's. It is perfectly open to anybody to hold that, though the last peace was not enforced, the next peace—though it may be stricter, and therefore harder to enforce—will be. But the onus is surely on those who hold this view to produce some evidence for the belief, which is a necessary part of their contention, that popular psychology and governmental procedures in Britain and America will, after this war, be radically different from what they were after the last war. It is not enough to say that we may have learned a lesson or two. To sustain the argument, it is necessary to contend that, in their beliefs and actions, the democracies will be wholly different creatures. And to this contention it can only be answered, with regret, that there is no sign of conditions being very different from what they were. The indignation against the Germans was just as strong in 1918. So was the determination that it must not happen again. Are we really any wiser or any more far-sighted, or any less tired, or any less given to wishful thinking than we were then? Those who believe in the possibility of enforcing a very severe peace have to give firm affirmatives to all these questions. Where is their supporting evidence?

The possibilities of enforcement are, of course, partly

a function of time. The argument—and perhaps this should have been made more clear in the original article—relates most strongly to long-term policies. In the short run, much greater severity can be shown—and should be. For a few months, the victors will be ready to enforce almost anything. There is, very properly, to be a complete occupation of Germany; the war criminals are to be punished; and Germany cannot expect to get equal treatment in the distribution of relief. Beyond that, there is no reason why countries which have been stripped and despoiled by the Germans should not help themselves to any industrial plant they may find in Germany, or compel Germans to labour for the rehabilitation of devastated areas. Within, say, the first three years, all these things will be possible. It is when they begin to stretch themselves out into long-term policies—when the occupation becomes permanent, when the punishment is everlasting, when the Germans are told that their standard of living is to be permanently lowered, when German industry is not only transplanted for the moment but forbidden for the future—it is then that the problem of enforcement arises. It is surely axiomatic that the longer the preventive and punitive measures stretch out in time, the more difficult will it be to secure their enforcement. The mood of readiness for military action will ebb steadily from the very day of the armistice. A policy which may be reasonable on the morrow of occupation may be physically impossible ten years hence.

Of all the policies for breaking German aggression over a long period, three are most frequently discussed. The first is territorial readjustment. It takes the form either of splitting Germany up into a number of states or of handing over large areas of German territory to the sovereignty of neighbouring states. The second is economic impoverishment. The third is total disarmament. Of the three, the last is by far the most important. *The Economist's* contention is that, since the democratic peoples cannot be relied upon to enforce very much, the whole of their resolution and determination should be concentrated on this one vital policy. Germany should be wholly disarmed. There should be no German Army, however small. Germany should be permitted to make no aircraft of potentially dangerous types, no guns, no tanks, no armed or armoured ships. This disarmament should be unilateral and imposed for an indefinite period. If Germany is kept totally disarmed, then it is not necessary, for the purpose of keeping the peace, that it should also be partitioned and impoverished. Since the supply of resolution to enforce is limited, and since disarmament is the essential item, let us concentrate on that. To do so is to provide a chance that the essential will be retained.

Unfortunately, if the reports are to be believed, Mr Roosevelt and Mr Churchill, meeting at Quebec, have taken the different view. They have decided to go the whole hog and try all three policies at once—partition, impoverishment and disarmament. Territories west of the Rhine may go to France, Belgium and Holland, territories east of the Oder to Poland. German minorities may be transferred to the remaining territory in which industrial life will be more or less banned—the so-called policy of "pastoralisation." This is an unworkable policy; a settlement based upon it would not last ten years. Whether the Germans have deserved it simply does not enter into the calculation. All three policies require perpetual supervision and enforcement, not on the morrow of the treaty but thirty and fifty years after. Their effectiveness turns on the degree of enforcement put behind them. If they are not enforced, the weary history of 1933 to 1939 will be repeated and the stage set for the third world war.

Territorial changes which flout the rule of self-determination, and economic changes which condemn the Germans to live at the level of a crowded peasantry, are terms at once unessential, impossible and positively dangerous. They are not essential, for if total disarmament is enforced, the Germans will not in any case be able to make war. They are impossible because they would not be enforced. Anyone who remembers how quickly the Treaty of Versailles came to be regarded, especially in America, as the root of all evil, will find it impossible to believe that the democratic communities

could be rallied behind a policy of using force to prevent the violation of infinitely more stringent territorial and economic clauses. It will not be a question whether the terms of the settlement continue to enjoy abstract approval. It will be whether the electorates will be willing to take expensive and unpleasant action to support them. Quite certainly, they will not.

And from this fact flows the third criticism of these terms—that, by complicating the task of enforcement, they are positively dangerous. If all these onerous restrictions were placed on Germany, it need not be thought that the Germans would begin by violating the disarmament clauses. They would first attempt to restore their industrial life. They would then plead for "justice" for Pomerania or the Rhineland. In doing so, they would divide counsel, trouble conscience and bedevil all hope of action among the democracies. The rot would have set in long before the question of rearmament arose.

Yet the question of armaments is the real issue. A disarmed Germany cannot make war. A direct and undisguised plea by Germany for rearmament will be rejected—provided the issue is not confused by a lot of other points on which consciences are tender and resolution weak. But if some new Hitler can start with the easier items and work his way upwards, the ban on armaments will eventually be carried away, almost unnoticed, by the revisionist flood. However pessimistic one may legitimately be about the continuing vigilance of the Allies it must be hoped that on the issue of German rearmament, if it is simply presented, they can stand firm. If they stand firm on this, economic penalisation and territorial sanctions are unnecessary. If they cannot stand firm on disarmament, there is no hope for anything more complicated.

A peace that puts all its emphasis on disarmament is not a weak peace. It is a strong peace, for it has some hope of being enforced. It has incidentally a better hope of winning over some Germans to accept it, thus paving the way slowly to the only lasting way of peace, the way of acceptance and self-maintenance. But this is not the argument. In any foreseeable future, enforcement is the crux. A peace based primarily on disarmament may be enforced in twenty years' time. The peace of Quebec, the

A Policy for Wealth—VI

Technical Progress

HITHERTO the argument of this series of articles has mainly been concerned with the need for a rapid increase in the productive equipment of British industry and with the obstructions that lie in the way of such an increase, whether they arise on the side of labour or of management. But it is not enough to underline the need for more capital. It is also necessary to specify what sort of capital, and to ensure that it is used with the maximum skill. This is the province of the technician and the scientist and a Policy for Wealth will fail unless it enlists their help to the fullest possible extent. There is, unfortunately, good reason to believe that the British community is not only failing to provide itself with enough new capital, it has also not been acquiring capital of the right sort. Or in other words, the productive equipment of the country is both too small and too old. In recent years, we have been consistently slower than our chief competitors in exploiting technical progress.

This is a sweeping statement, and being a qualitative judgment it cannot be proved by any statistics. There are doubtless exceptions. But the general impression left on anyone who has first-hand knowledge, however slight, of British, American and German industry and their products, is that British industry, on the broad average, is rather old-fashioned. It is certainly no longer, as it used to be, in the van of technical progress. The new products, the new processes, the technical revolutions, nowadays begin elsewhere and are somewhat belatedly copied in Britain. It would be difficult to name more than two or three cases

peace of permanent economic impoverishment and permanent territorial loss, most certainly will not.

The letters that have been printed in these columns show how very difficult it is to get the thesis here expounded, simple though it is, understood at this time of excusable passion. There will be those who will misunderstand this second exposition as fully as they did the first, and who will again say that *The Economist* wants to have a soft peace, and to be kind to the Germans. This is not only not true but the reverse of the truth. There will also be those who failed to see the point of the first article but will grasp it at this second statement, and maintain that *The Economist*, under pressure from its readers, has shifted its stand. This also is untrue; every single argument in this second article was also in the first. And there will be those who, without reading either the first or the second article, will merely dismiss the whole contention as sentimentality. They may be asked who are the real sentimentalists, those who would base long-term policies on the emotions of the moment (however justified those emotions may be), or those who make an objective attempt to foresee the atmosphere in which the policies will have to be carried out?

The great majority of the very many letters received were in opposition to the view taken by *The Economist*. That was expected and is not surprising. The contention here put forward is that the peace settlement should not contain anything that cannot be enforced, and that what it does contain should be enforced. Both halves of the policy will be unpopular. But the criticism now expressed against a "soft" attitude is as nothing to the abuse that will be showered on a "hard" attitude hereafter. There is the rub. This is as near a matter of life and death as ever arises in public policy. We would ask no more than that every advocate of severity should look into his own heart and ask himself, in all seriousness, whether he really thinks that the policies he puts forward stand any chance of having great and painful efforts made to support them, not by ideal parties in an ideal country, but by Conservatives and Labour, by Republicans and Democrats, elected by the present methods, by the present electorates. Only to the extent that we can successfully predict our own future moods shall we build an enduring peace.

in the last thirty years of a new industry starting first in these islands, or of a new technique of major importance to an established industry being tried out first here. The wartime triumphs in aircraft design and in radar (to name only two) have shown that there is no inherent national inferiority in these matters. It can be done; but in peacetime, and in the context of industry, it is not being done.

The blame for this state of affairs cannot fairly be placed on the abstract scientists. Their quality is as high as ever. Relative to their numbers, they have fully as many achievements to their credit as the scientists of any other country. "Relative to their numbers"—there is the crux of the matter, for the scientific community is far smaller in this country than in either of its major competitors. Inventive genius cannot, of course, be bought for money; but the chances of a Faraday or a Rutherford emerging from ten thousand scientists is clearly much greater than from a hundred. Moreover, it would be a mistake to ascribe most technical progress to genial leaps of the human spirit. Most of it comes from the systematic teamwork of competent scientific technicians.

The first and most obvious need is thus to enlarge the scientific constituency. The country needs a very much greater flow of scientists, and the schools, the colleges and the universities need to be widened and enlarged—twofold, threefold or fourfold—for the purpose. Not only should they be enlarged, there is still something of a gap to be bridged between academic science and industrial technology. The country very urgently needs institutions

such as the Massachusetts or California Institutes of Technology or the better Technische Hochschulen in Germany—institutions of the very highest academic standing which, at one extreme, embrace the most rarified atmosphere of abstract science and, at the other, reproduce the conditions of everyday scientific work in practical industry.

*

There is thus no lack of objects for the fruitful expenditure of effort and money in the improvement of scientific education, both in quality and especially in quantity. But this is not the major need. The root of the trouble does not lie in the universities but in industry. Just as, in respect of the *quantity* of productive equipment, the difficulty is not in finding the savings, but in inducing industry to use them, so in respect of the *quality* of British investment, the difficulty lies not so much in providing the scientific advice, but in persuading industry to follow it.

By and large, British industry is not nearly as interested as it should be in being up to date. Here again, there are, of course, outstanding exceptions, individual firms and even whole industries who keep the keenest eye on the progress of their respective technologies and who maintain large scientific staffs and research establishments for the purpose. But there is also (to speak frankly) a great deal of industrial "research" which is little more than window-dressing, either testing staffs dressed up in academic titles, or else adjuncts to the publicity department designed *pour épater les bourgeois*. Spread over the whole range of British industry, the volume of genuine scientific research is very thin. Moreover, apart from fundamental research, there is a lack of willingness to bide the time, or spend the money, for a proper development stage. Most technical advances are not handed to the industrialist on a plate in a finished state. They need long, difficult and expensive development, at every step of which the scientist and the production man must work side by side. This is what is chiefly lacking in British industry. If these are thought to be extreme statements, three examples (for which we are indebted to a memorandum written by Dr George Tugendhat for private circulation) should help to establish the case.

The first is rubber. Before the war the British Empire was the largest producer of rubber in the world. Yet until recently there was virtually no research going on in this country into the structure of rubber and its possible substitutes. When synthetic rubber began to come over the horizon, basic research on a large scale was conducted in America not only by the petroleum companies, whose interest was in the raw materials of the new processes, but also by the rubber companies, whose interest was in the end-product. In this country very little research indeed has been done in synthetic rubbers and virtually none has been commercially produced.

The second example is coal, England's greatest natural resource. Quite a number of the more complicated tar derivatives and even some of the more common types, such as anthracene, had never, until the present war, been produced in this country. In the hydrogenation of coal—more important to no country on earth than this—we have been largely content to import foreign ideas. England is practically built of coal and lime, yet until the last few years we had to import every ounce of calcium carbide, and thus had no home supply of acetylene, which is essential for many welding techniques.

The third example is petroleum. In America, in Russia and in Germany, new industries are arising to exploit the derivatives of petroleum, of which synthetic rubber is only the most dramatic. On all this we know very little and are doing even less. An official committee is, it is true, now sitting on the question of petroleum as an industrial raw material, but its terms of reference have been carefully restricted to the fiscal issue.

Who, or what, is responsible for this state of affairs? The Government bears some of the blame, though only

a negative one. Both the burden and the incidence of taxation have been discouraging to technical progress. Capital expenditure on research has not been tax-free, though it is to be in the future, and the depreciation rules have, at the least, not encouraged the industrialist who wanted to keep his plant up to date. The general protectionist mentality has, in this matter as in others, been far more to blame. It has not been necessary for British industrialists to keep up to scratch. If, with their present plant and methods, a comfortable profit could be assured by rings and cartels, tariffs and quotas, why should they undertake the painful intellectual exercises and the expensive outlays that were necessary to keep up with the latest fads of the scientists? Indeed, in a surprising number of cases, the effect of the patent laws, buttressed by international cartel arrangements, has been to erect actual prohibitions against research by British firms in specified fields.

But even more important than the protectionist mentality, pervasive though it has been, has been the general quality of British industrial management. How often has one heard the complaint that "scientists are not practical men, they have never seen a factory"—but how rarely the far more valid complaint that "practical men are not scientists, they have never seen a laboratory." The painful truth is that far too many British business men are out of their depth in their own technologies. They may employ scientists, but they do not understand them, and are thus hardly in a position to be advised by them. In an American or German industrial firm, a majority of the directors will be university graduates, with a good knowledge of the branch of science with which the firm is concerned. Is there a single large British firm of which the same can be said? Yet without a full understanding of both sides of the question, the very difficult marriage of the technical and the commercial cannot be accomplished. There are, indeed, virtues in government by intelligent amateurs, but rapid technical progress is not among them. And when the amateurs are selected by heredity rather than by intelligence, the virtues are far to seek.

*

What, then, can be done to put British economic policy on a sounder scientific basis? A certain amount can be done by public policy. The money spent on higher scientific education can be multiplied. The depressing incidence of taxation can be still further modified. The Government can use all its powers of persuasion and compulsion—as, for instance, when permission for price-fixing is sought or protective tariffs are solicited—to insist on research being both initiated and applied. The whole subject of restraints upon trade, whether by the patent laws or by other means, can be reviewed. But the vital points cannot be touched by overt state action, for they are matters of psychology and custom. For this purpose, it is the public opinion of the business world that needs to be mobilised. If a day came when every Board of Directors felt itself impelled, by the pressure of opinion it respected, to spend more on research, to pay more attention to the results, and to reinforce its own numbers by men who really understood what it was all about—then the battle would be won.

This is where the argument comes back to the familiar point. No economic atmosphere will be more conducive to this happy result than one that combines competition with prosperity. Competition without prosperity, the true cut-throat competition, leads to capital consumption rather than capital growth. It is a *saute qui peut* in which no long-term policies can get a hearing. Prosperity without competition is an invitation to indifference and to fatty degeneration. But if a successful policy of Full Employment can be combined with a rebirth of competitive enterprise—if there are ample profits, but only for the efficient—then the whole tempo of scientific and technical progress would be speeded up. Competition-in-prosperity brings the practitioners of the best methods to the top. And it compels the others to follow suit. No more effective formula could well be found.

Finances of the Church—II

A New Reformation

THE Church of England is faced with an urgent need of financial reform. Its resources are still chained, in modified form, to parishes that are grossly unequal in size and income. Mobility needs to be restored. Men and money must be freed to go where they are needed now and not where the circumstances and generousities of the past have rooted them. This article will consider first, what redistribution of existing resources is necessary and desirable and, as a corollary, what administrative changes will be required.

Every benefice should have a reasonable minimum income—say £400. To secure this, an extra £887,000 is required. Part can be found by a levy on the richer benefices. A graduated system of taxation has been suggested, starting at £400 and allowing a maximum income of £800; this would yield £264,000. A much better method is the compulsory pooling of all surplus income, advocated by a recent Commission of the House of Bishops.* The Commission does not define surplus income, suggesting that each case should be judged on its merits, but the most rigorous basis possible would yield under half the required amount.

But these figures relate to *endowed* income. There is in addition the comparatively small amount (under one-tenth of the value of endowments) which incumbents receive in annual voluntary contributions from their own parishioners. The Church hopes to expand this amount. The latest scheme of the Ecclesiastical Commissioners offers to meet any *additional* money raised by each parish with an equivalent grant. The Bishops' Commission suggested that the same principle should apply to future grants from diocesan and central funds; and that, where there was insufficient voluntary support, there should be no incumbent. Such devices are simple and psychologically attractive. They may raise much new money, but the trouble is that voluntary giving, quite as much as endowment, "bloweth where it listeth." Contributions vary not only with the wealth of the parish, but with the popularity of the incumbent—which many would say is no index to his worth. On the other hand, if the unequal incidence of voluntary gifts were to be evened out by central grants, the special inducement to give more—or indeed to give anything—would disappear. A solution is to divert more voluntary contributions to central funds. Less might be raised this way than through a local and personal appeal—but pay could be fairer and the clergy more independent. Supplemental schemes of purely local assistance might be retained. The first aim should be to build up a central fund of voluntary contributions which, with the pool of surplus incomes, ought to be enough to make up the income of each benefice to a guaranteed minimum. On this basis, the suggested minimum of £400 should be realisable.

*

The first condition of equal pay is equal work. The size of parishes must be changed as well as their incomes, and clearly the two reforms must proceed closely together—to undertake one without the other would be both impractical and unjust. The Archdeacon of Croydon has suggested, in a recent pamphlet, that if the number of benefices were reduced by a fifth, the large sum of £500,000 would be freed for assisting poorer benefices. The fallacy of this argument is that his figure is reached after allowing £375,000 for the 1,000 extra curates presumed to be needed—in other words, it would involve a higher proportion of junior lower-paid clergy. Some money might certainly be found by a reduction in the number of parishes but all of it will probably be swallowed up in meeting new needs.

*Report of Commission of the House of Bishops on the Remuneration and Housing of the Clergy (and other matters), unanimously approved by the House of Bishops, 1943.

The Church has, in fact, too few and not too many clergy. Yet the clergy themselves are more unevenly distributed than their incomes. In the first place, parishes are absurdly unequal in population. About half of them contain under 500, about a quarter over 4,000; or, to take the extremes as revealed by the 1924 Commission on the Property and Revenues of the Church (now somewhat modified), 20 per cent of parishes have under 300 inhabitants, while 5 per cent have over 10,000. In the second place, assistant clergy are not spread so as to minimise this inequality, but so as to accentuate it. Thus, perhaps a thousand parishes with a population of over five thousand have no curate, while many parishes a fifth of the size can afford two clergy. In the third place, the clergy are tied to the parishes by the system of local endowments. Yet all the time and on every side, there are increasing opportunities and needs for clergy in factories, missions, hostels, and youth centres.

The country is much better served with clergy than the town. Suburbs, again, are much better served than the poorer industrial districts. An urban parish has, on the average, ten times the population of a rural one. Again, there are four times as many curates to population in the rural diocese of Guildford as in the urban diocese of Blackburn. The trouble here is not so much, as Oscar Wilde suggested, that the countryside is honeycombed with curates, as that the urban supply is woefully inadequate. Any increase in the size of rural parishes must take into account the wide and scattered nature of many areas, the strong force of local tradition and custom and, of course, the site of the church itself. The church, as the Bishops' Commission pointed out, is "where it is and not where reformers think it ought to be" while, in the countryside, "history and geography are more relevant than arithmetic." Redundant churches, both in town and country, might be closed for Services and arrangements for their upkeep made with interested architectural bodies. There is a case for perhaps three times as many clergy in the country as in the town. Such a standard would permit considerable further amalgamations of rural parishes. Moreover, there is a strong case for an all-round stepping-up in the size of parishes. Groups of clergy have successfully tried the experiment of working a large area from a communal centre. This economises manpower and helps to solve the difficult problem of the over-large parsonage house.

The obstacles to redistributing curates are largely financial. Many are earmarked to particular parishes from the beginning of their careers, through training grants made by the richer dioceses and through financial offers coming from the richer incumbents. There is some help in the suggestion that bishops should "ration" the number of curates they licence and of ordination candidates they accept according to a mutually agreed scheme. But the major solution for the supply of curates must lie in the redistribution of financial resources.

*

It is not surprising that many reformers suggest that the Church should scrap its financial past and start afresh. On this basis, all endowments would be pooled, all existing areas abolished, and a representative central authority

CORRECTION

In the first article on Finances of the Church, in *The Economist* of September 16, it was stated that Queen Anne's Bounty was responsible for annual payments to the clergy of about £270,000. This figure was intended to refer only to annual payments other than those arising from tithes, and should have read £490,000. It is in respect of income other than tithe that the Ecclesiastical Commissioners make the larger annual payments.

would reallocate spheres of work and pay a fixed scale of stipends on a planned and rational basis.

Such drastic measures are, theoretically, both just and administratively simple. Nevertheless, most of the desired results can be achieved without causing such strong antagonisms or breaks in tradition. Compulsory pooling of surplus incomes and redivision of parochial areas could best be done, as the Bishops' Commission suggested, by representative diocesan authorities. Once the principle of thoroughgoing redistribution has been accepted by clergy and parishioners, there might remain technical difficulties in readjusting rights of patronage. Although at least half the total of incumbents are now appointed by ecclesiastical authorities, the Crown and a large number of laymen still have a say in many appointments. Patronage is an anomaly; but individual patrons have been increasingly co-operative. So long as patronage does not delay reform there is a case for its further retention.

One administrative reform in Church finance is long overdue—the amalgamation and reconstruction of the Ecclesiastical Commissioners and Queen Anne's Bounty. The 1924 Commission suggested that both bodies should have the same board of governors; a special Commission, set up in 1933 to consider this point, advocated complete union, and a joint committee of the two bodies is now working out details. The administrative duplication involved in their many parallel functions is sufficient logical argument for amalgamation. A new board of governors is suggested, less cumbersome and more democratic than either of the existing boards. It would comprise 41 members, including ten each from the three House of Bishops, Clergy, and Laity.

The joint body thus constituted would act, in effect, as the trustee of the Church's inherited wealth of all kinds. It would also have an annual surplus available for welfare schemes and new grants. Economies of joint management might make this larger than the present total surplus of the two bodies of £425,000. Finally it would, under the suggestions of the Bishops' Commission, act as the central financial agency for the redistribution of resources to be carried out by the dioceses.

Social Insurance—A Summary

1. The Government's scheme for Social Insurance falls into two parts, Part I (Cmd. 6550, 6d.), dealing with Social Insurance, Part II (Cmd. 6551, 3d.) with Industrial Injury Insurance.

2. The entire population is classified in six groups, with different benefits and contributions. The categories and numbers in each group are as follow:—

Class	Numbers in thousands		
	Men	Women	Total
I Employed persons.....	13,350	4,750	18,100
II Others gainfully occupied.....	2,150	450	2,600
III Housewives, including those gainfully occupied.....		9,650	9,650
IV Other persons of working age.....	1,000	1,250	2,250
V Children under 15, or 15-16 at school.....	5,150	4,950	10,100
VI Persons above working age who have retired.....	1,200	3,600	4,800
	22,850	24,650	47,500

3. Weekly rates of contributions, including those for industrial injury insurance, are given below, with Sir William Beveridge's proposals in italics for comparison:—

Class	Class I			Class II	Class IV
	Insured Person	Employer	Total		
MEN: Aged 18 and over	s. d.	s. d.	s. d.	s. d.	s. d.
21 and over*	3 10	3 1	6 11	4 2	3 4
Between 16 and 18...	4 3	3 3	7 6	4 3	3 9
Between 16 and 18...	2 5	2 1	4 6	2 9	2 2
Between 16 and 18...	2 6	2 6	5 0	2 0	1 6
Between 16 and 18...	3 0	2 5	5 5	3 6	2 8
Between 16 and 18...	3 6	2 6	6 0	3 9	3 0
Between 16 and 18...	2 0	1 7	3 7	2 5	1 10
Between 16 and 18...	2 0	2 0	4 0	2 0	1 6

* The Beveridge Report proposed three groups—16-18; 18-21; and over 21.

4. The following is a summary of the principal benefits proposed:

The effect of all these reforms can now be briefly indicated. Administration would be simplified. It would reach at least half-way towards full centralisation and full democratic control. Financial control would be shared between the Church's own representatives and the amalgamated Commissioners and Bounty. The former would be more powerful and the latter more representative. All clergy would receive an adequate minimum stipend, which would end uncertainty and inequity of payment and, with it, the need for personal appeals. Parishes would continue to possess their own endowments up to a maximum limit, but their incumbents would be paid increasingly from central funds. The Church's control over its own clergy would thus be increased—though to no alarming extent. Finally, the clergy would be redistributed on a rational basis and some funds diverted to extra-parochial needs.

Such a programme of reform is radical but it involves no sharp break with tradition, and some of the advantages of the localised "parochial system" could be retained. It is no more than a *minimum* programme if the Church's resources are to be fairly and fully utilised. The Church of England is fortunate compared with Nonconformist bodies in the wealth of its endowments and the continuity of its tradition. It has corresponding responsibilities. Only in the last twenty-five years has it had the opportunity, through the creation of the Church Assembly, to speak with an authoritative voice on financial and administrative matters. That it also now speaks largely with one voice is encouraging and in strong contrast to secular politics. Numerous and successive commissions of the Church Assembly and its Houses have been almost unanimous in advocating widespread reforms; and many minor measures of reform have recently been passed. The voice of the Church is progressive and egalitarian but at the same time deeply sensitive to tradition and cautious of action. There is a widespread feeling that the Church's attention to moral and spiritual matters, in an era that is critical both for itself and the world, should not be distracted by financial preoccupations. Yet the Church's authority is clearly weakened if its own house is not in order. The Church of England would gain immeasurably from a new and internal reformation.

Family allowances of 5s. a week for second and subsequent children. Where the parent is in receipt of benefit, the first child will be included. Services in kind, including school meals and milk, to be extended.

Orphan's allowances of 12s. a week for each orphan.

Sickness and unemployment benefit of 40s. a week for a married couple, 24s. for a single person. After three years, sickness benefit will be replaced by an invalidity benefit at retirement pension rate. Unemployment benefit will end after 30 weeks. Special allowances at a higher rate will be given for attendance at approved training courses. An additional allowance of 16s. a week (15s. for invalidity benefit) will be added for those on single benefit who have an adult dependant. Self-employed persons will not receive sickness benefit during first four weeks of illness, and will not be eligible for unemployment benefit.

Retirement pensions at standard rate of 35s. for a married couple and 20s. for a single person. Minimum retiring age of 65 for men, and 60 for women, but joint pensions payable from date when husband qualifies. Pensions will be increased by 2s. a week (joint) and 1s. (single) for each year by which retirement is postponed beyond pensionable age.

Maternity Grant of £4. Maternity benefit of 36s. a week for gainfully occupied women for 13 weeks, provided the occupation is given up.

Attendance allowance of £1 a week for 4 weeks for married women not eligible for maternity benefit.

Widow's benefit of 36s. a week for 13 weeks, with 5s. per week added for first child, for widows under 60. Guardian's benefit of 24s. a week if there is a dependent child. Widow's pension of 20s. a week for widows of 50 or over at the time when the husband dies or children cease to be dependent, provided 10 years have elapsed since marriage.

Death grant of £20 for person over 18, £15 between 6 and 18, £10 between 3 and 6, and £6 under 3 years of age.

The main benefit rates are summarised as follows:

	Sickness Benefit	Invalidity Benefit	Unemployment Benefit	Retirement Pension
Single man or woman.....	s. d.	s. d.	s. d.	s. d.
Married man with gainfully occupied wife.....	24 0	20 0	24 0	20 0
Married man with wife not gainfully occupied.....	40 0	35 0	40 0	35 0
Married woman, gainfully occupied.....	16 0	16 0	20 0	20 0
Dependant's allowance, where payable.....	16 0	15 0	16 0	...

(The standard rates of sickness and unemployment benefit are the same as in the Beveridge plan, except that the duration was unlimited and except for the condition of compulsory attendance at training centre. Retirement pensions of 25s. for a couple and 14s. for a single person in first year rising to 40s. and 24s. respectively after 20 years.)

5. National assistance will be available to all who can prove need.

6. The administration of the scheme will be the responsibility of a Ministry of Social Insurance. The administration of Assistance will be kept separate, though the Minister of Social Insurance will be responsible to Parliament for both. Approved Societies will not be retained either as independent financial units or as agents for the administration of the scheme.

7. Financial aspects.

The estimated expenditure (excluding workmen's compensation) over the next 30 years will be as follows:

	(£ millions)			
	1945	1955	1965	1975
Social Insurance Benefits:				
Retirement pensions.....	169	203	272	324
Widows' and guardians' benefits.....	34	41	40	36
Unemployment benefit.....	87	87	85	80
Sickness and invalidity benefits.....	55	66	68	65
Maternity grant and benefits.....	9	8	8	7
Death grant.....	4	7	11	14
Cost of administration.....	16	16	16	16
Total.....	374	428	500	542
National Assistance:				
Assistance pensions.....	37	41	39	37
Unemployment assistance.....	22	22	21	20
Other assistance.....	6	6	6	6
Cost of administration.....	4	4	4	4
Total.....	69	73	70	67
Family Allowances:				
Allowances.....	57	58	54	50
Cost of administration.....	2	2	2	2
Total.....	59	60	56	52
Health Service.....	148	170	170	170
Total Expenditure.....	650	731	796	831

Estimated income over the same period will be:

	1945	1955	1965	1975
Receipts from contributions of insured persons and employers.....	283	280	275	259
Interest on existing funds.....	15	15	15	15
Balance of expenditure, to be met from Exchequer (or local rates).....	352	436	506	557
Total income.....	650	731	796	831

The total cost of the Beveridge proposals was estimated at

	Government Proposals			Workmen's Compensation Acts			Beveridge Plan	
	Injury allowance during incapacity for work (first 13 weeks)	Injury allowance after 13 weeks and pension rate for 100% disablement	Pension, if 100% disabled and unemployable	Pre-war	With war increases		Disability Benefit (first 13 weeks)	Industrial Pension (after 13 weeks)
					First 13 weeks	After 13 weeks		
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
(a) Single man or woman without dependant	s. d. 35 0	s. d. 40 0	s. d. 50 0	s. d.	s. d.	s. d.	s. d.	s. d.
(b) Single man or woman with adult dependant	43 9	50 0	60 0	earnings 30 0 max.	35 0 max. (limit of 3rd earnings)	40 0 max. (limit of 3rd earnings)	40 0	3rd earnings 60s. max. (minimum as in col. 8)
(c) Married man...	43 9	50 0	60 0		40 0 max. (limit of 3rd earnings)	50 0 max. (limit of 3rd earnings)	40 0*	
(d) Married man and first child	48 9	57 6	67 6		45 0 max. (limit of 3rd earnings)	55 0 max. (limit of 3rd earnings)	48 0*	3rd earnings + 8s. 60s. max. (Minimum as in col. 8)

* Subject to wife not being gainfully occupied.

£697 million in 1945, rising to £858 million in 1965, owing to the increase in the cost of retirement pensions from £126 million to £300 million. Under the Beveridge plan, social insurance benefits would amount in 1945 to £367 million, national assistance £47 million, family allowances £113 million, and health service to £170 million. Total costs of administration amounted to £24 million.

The total cost of the present social insurance system is £411 million, made up as follows: Pension benefits, £177 million; unemployment, £87 million; sickness, £30 million; health service, £80 million; public assistance, £15 million; children's benefits, £4 million; administration, £18 million.

A comparative statement of estimated income gives the following result:

	Under Present Social Insurance Schemes and Allied Services		Under Government Proposals	
	£ Millions	Per-centages	£ Millions	Per-centages
Receipts from contributions of insured persons and employers.....	136	32	283	44
Interest on existing funds.....	15	3	15	2
Expenditure to be met from Exchequer (or local rates).....	278	65	352	54
	429*	100	650	100

* This discrepancy between this figure and the £411 millions above is mainly due to the changes in the financial position of the unemployment scheme.

8. *Workmen's Compensation:* Industrial Injury Insurance will be treated as a social service. The scheme will be comprehensive in scope, and will apply to industrial accidents and specified industrial diseases. Liability will be placed on a central fund out of which all benefits and administrative charges will be paid.

The weekly rate of contributions will be 6d. for adult men and 4d. for women, shared equally between employer and workman, with half the amount for juveniles, with a contribution from the Exchequer. Benefits will not depend on a contribution qualification. (These contributions are included in the main Social Insurance contributions listed above.)

The scheme will be administered by the Ministry of Social Insurance, with the advice of an Advisory Council composed equally of employers' and workers' representatives.

Claims will be dealt with by a Pensions Officer, subject to appeal to local tribunals, on which employers and workers will be represented, and further right of appeal to an Industrial Injury Insurance Commissioner, whose decision will be final.

Disablement benefits will be at uniform flat rates for first 13 weeks of incapacity, to be replaced by an industrial pension, supplemented by a special allowance if the pensioner is unemployable. Allowances will be given for family responsibilities.

Industrial pension will not be based on loss of earnings, but on the degree of disablement due to the injury, which will be assessed by a medical board. No provision will be made for commutation of pension by lump sum payment.

In fatal cases, the widow will receive temporary benefit under the general scheme (36s.) for 13 weeks; this will be followed by a pension of 30s. a week if she is 50 years or over, has dependent children or is incapable of self-support, and 20s. a week for other widows, with allowances in respect of dependants.

The rates of injury allowance and disablement pension proposed, compared with existing scheme and Beveridge plan, are summarised below:

NOTES OF THE WEEK

Arnhem

The airborne invasion of Holland was an audacious plan to break the stalemate into which the Allied armies were moving along the frontiers of Holland and Germany. Had it been entirely successful, it would have turned the German defences along the length of the Rhine and would, possibly, have initiated a new battle of movement. Even with limited success, it was planned to open up Holland, trap the German armies on the Dutch coast, and lengthen the German line defending the Reich. This more limited objective has been fully achieved. General Dempsey's forces are established in a wide salient along the Maas and have forward elements in control of Nijmegen with its vital bridge across the Waal. The full success hoped for has not been achieved. After a magnificent ten-day struggle, the British First Airborne Division fighting round Arnhem had to be withdrawn across the lower Rhine to rejoin the Second Army at Nijmegen. They have lost the first round, even though it was their struggle that made the successes at Nijmegen and Eindhoven possible. But it is not likely that this is the last round in this vital area. The attempt was defeated because the weather was bad and the relieving land forces were too far away. Winter weather has not yet set in, and now the main forces are on the spot. It may not be long before Arnhem is fully avenged.

Last Lap

On Tuesday the Long Parliament reassembled after its longest wartime holiday to face the busiest and probably the most critical months of its career. This Parliament has been burdened with responsibilities as heavy as any in history. Its opportunities have been equally exceptional. Resolutely led, it has brought the nation through the storms of war to the approaches of victory; supported and encouraged by the common will it has undertaken to plan a vast scheme of social and economic reform. No parliament has ever been so rich in good intentions. But few have started so much and finished so little. The truth is that Parliament and Government have been overtaken by the march of events. There is now a real danger that in spite of every lesson and warning the nation will find itself as little prepared for the coming of peace as it was for war. In planning for peace the country is still in the pre-Dunkirk period. What have the Government to show for their years of planning? With the single exception of the Education Act no major plan of reconstruction has reached the statute book—and even in this one case full implementation is delayed. The Government's scheme of social security has at last reached the White Paper stage and joins the queue with policies for a national health service, full employment and the control of land use. Nothing is known of the Government's plans for the reform of local government and very little of their scheme of industrial reconversion. There is so much to do and so little time left to do it in. This, surely, is the moment for Parliament to reveal its strength—and the strength of the democratic principle—by pursuing as rapidly as possible, and in the true spirit of unity, the real aims of national reconstruction policy. Sectional wrangling at this stage—or even wholly high-minded, but excessive, quibbling over details—would be disastrous. The fine promise of "food, work and homes" can still be shattered by details of procedure. Parliament has entered its last lap. Only by a burst of legislative activity can it catch up with the hopes of the nation.

The Housing Crisis

The most urgent of Parliament's numerous tasks is to expedite legislation to solve the serious housing problem. The alarming cynicism with which the average citizen regards the Government's promises is not due entirely to bitter memories of the unfulfilled pledge, "Homes fit for heroes to live in," of 1918. It is due, also, to the unfortunate lack of realism that has marked the handling of the housing problem in recent months. Housing is com-

plicated by its interrelation to the wider problems of town planning and the control of land use, and there is some excuse for the patchwork nature of the Government's policy. But there is no excuse for delay in the enactment of that policy—delay that threatens to condemn a large number of people to sample peace under appalling conditions of overcrowding. Neither of the two Bills concerned with housing and now before Parliament is free from faults. The Housing (Temporary Accommodation) Bill, making provision for emergency dwellings of the Portal type in the first two years of peace, requires amendment in several matters of specification, costs and siting. The Town and Country Planning Bill, which was given its second reading on July 12th and has now entered the committee stage, is inadequate in certain of its financial proposals relating to grants and compensation. But each of them is much more than half a loaf and infinitely better than no Bill at all. Mr W. S. Morrison has been very busy during the recess trying to placate the local authorities who contend that the Planning Bill does not go far enough and that the same powers and grants afforded them in their task of developing the blitzed areas should be extended to all urban areas. Clearly the financial relations between the Exchequer and the local authorities are in need of complete overhaul. Meanwhile the debate on Wednesday showed that the Government's concessions have made the Bill much more widely acceptable. The Planning Bill can become an effective piece of legislation only if there is complete goodwill and co-operation between the Ministry and the local authorities. The amendments include a series of minor concessions concerning grants, but do not make provision for any extension of Exchequer grants in the redevelopment of blighted areas. A new category of land, open space or playing-field, is added to those which the authorities may acquire for planning purposes by compulsory purchase. Other amendments simplify the procedure of compulsory acquisition, and make compulsory purchase applicable to land required for "the relocation of population or industry or for replacement of open spaces."

On Tuesday Mr. Lyttelton announced that several types of temporary houses have been judged satisfactory and will go into production early next year. The necessary jigs and tools have already been ordered. When the three types already approved are in full production next summer about 2,500 houses will be made available each week. On Wednesday the Housing (Temporary Accommodation) Bill was given its third reading. Equally satisfactory is the news that good permanent houses can now be constructed in less than half the normal number of man-hours. This fact has been established by experiments in new construction methods conducted by the Ministry of Works. The physical specifications of post-war housing are becoming clearer. The question of how is being answered. But the where and the when and the how much are still obscure. Large-scale requisitioning of land by local authorities is still held up through uncertainties regarding terms of compensation; and this means that the first practical steps in housing policy—the planning and preparation of building sites—are as yet far too timid. The Planning Bill provides the local authorities with wide powers to tackle their housing problems—to replan and redevelop all urban areas spoliated by war or obsolescence. Nothing is more important for the future of housing than that the Bill should become law as soon as possible. Any form of obstruction, or even of delaying criticism, from any quarter, will be unforgivable. The Government's aim is the erection of some 4,000,000 permanent houses within ten or twelve years of the general resumption of building activity. For a decade at least a large number of people will be accommodated in temporary houses. But London's housing problem cannot wait for temporary houses. Mr Bevin has appealed to the building trades for a large number of volunteer workers. If the appeal is not answered, London will face the sixth winter of war better sheltered from the enemy than from the elements.

Poles Divided

On Friday last the Polish Government unanimously passed a resolution demanding the dismissal of General Sosnkowski, the Polish Commander-in-Chief. The root of this demand is the Polish Government's growing disapproval of General Sosnkowski's political activities. These are notoriously directed in the main against any policy of understanding with Russia. That a Polish military commander or a military junta should be able to obstruct the foreign policy of the Polish Government is a regrettable legacy from the Pilsudski-Beck regime. Another equally unfortunate legacy is the prerogative enjoyed by the President, by virtue of which, under the Constitution of 1935, he is empowered to veto any political decision taken by the Government. The Polish President has now made his consent to the dismissal of General Sosnkowski conditional upon a reshuffle of the Polish Government designed to bring the spokesmen of the Nationalist opposition into the Cabinet. The Nationalists are at least as much opposed as General Sosnkowski to a policy of reconciliation with Russia. Only last week they demanded that M. Mikolajczyk should declare null and void the proposals for agreement that he had shortly before addressed to Marshal Stalin. General Sosnkowski's dismissal may make it easier for the Polish Government to come to terms with Russia. But the inclusion of the extreme Nationalists would certainly offset that advantage. The Polish Government should not have accepted General Sosnkowski as Commander-in-Chief in the summer of 1943. Very late in the day they are trying to correct that mistake; but they would be utterly short-sighted if they now allowed new obstacles in the shape of the Nationalists to be placed in their path. The Western Allies are at present making a determined effort to persuade Marshal Stalin to accept M. Mikolajczyk's scheme for a Russo-Polish settlement. The Russians' excuse for refusing to deal with the legitimate Polish Government has been hitherto their alleged inability to carry out any policy in the teeth of a concerted opposition from the President, the military groups, and the irreconcilable anti-Russians. If the Polish President, by his political attitude over the Sosnkowski crisis, provides convincing evidence that Russia's suspicions are not altogether groundless, his will be the melancholy distinction of having contributed personally and irrevocably to Poland's servitude and to the weakening of the Grand Alliance.

Aid for Italy

It looks as though Mr Churchill's recent visit to Italy, during which he could acquaint himself with local conditions, has now borne fruit in decisions of great importance for the future of Italy. The President and the Prime Minister have decided to hand over a large measure of control to the Italian administration, and the Allied Control Commission will in future be known as the "Allied Commission" only. The British High Commissioner in Italy is to have the rank of Ambassador—a procedure the Americans have already adopted, and the Italians are to appoint representatives to London and Washington. The reason for this, in the words of the official statement, is that

The Italian people, freed of their Fascist and Nazi overlordship, have in these last twelve months demonstrated their will to be free, to fight on the side of the democracies, and to take a place among the United Nations, devoted to principles of peace and justice.

This is all to the good. It has been impossible in the last six months not to criticise the attitude of the Western democracies towards the Italian effort to recover a free and constitutional way of life. The Allies' lack of warmth and encouragement tended to discourage the democratic groups, and to alienate them from Britain and America. The new declaration by the President and Mr Churchill is a hopeful new start along the way of clearer understanding. Two things only warrant criticism. It must be asked why Russia was not associated with the decision. It is true that Russia took unilateral action some months ago, when it formally recognised General Badoglio's government without consulting Britain and America, but this is no reason why Russia's Allies should have adopted a procedure which belittles the form if not the substance of the Grand Alliance. The other point touches on the relations between the Western Democracies. This recognition of Italy is a reminder that the Provisional Government in Paris, which has received a clear mandate from France, has yet to be recognised in London and Washington. It is time this curious anomaly came to an end.

The statement issued by the President and the Prime Minister also covers the question of the economic restoration of Italy. Last week, at the request of Britain and America, UNRRA decided to extend immediate aid to Italy. This may help to meet the really appalling food position and the shortages of every kind of essential supplies in Italy. Britain and America are also to send technicians and industrial experts to Italy, and are to help the Italians to restore their communications and power systems. At the same time, the Trading with the Enemy Acts are now to be modified in their application to Italy. These decisions are long overdue—just how overdue can be gathered from a report published by five Trade Union delegates who toured Italy this summer. It states that the degree of dislocation, starvation and unemployment in Italy is difficult to describe to those who have not seen the situation at first hand. As the Report puts it—

The majority of the people are without normal employment. Those who have a job earn between 50 and 150 lire per day. A number of food articles are rationed, and in a general way, the rations are forthcoming, but their quantity is insufficient to maintain a minimum standard of health, especially for those who work. . . . Except for parts of Sicily and Naples, there is no means of transport or communication worth mentioning. . . . There is also considerable shortage of raw materials of all kinds, especially coal and power, most of which had to be imported before the war. The result is meagre prospects to improve employment possibilities, and, consequently, the social conditions of the workers.

The UNRRA decision and the help proposed by the President and Mr Churchill will begin to remedy the situation, but the steps proposed only cover the short-term problem of Italian reconstruction. The Fascist experiment of autarky, which was responsible for much of the lowering of Italian living standards, will, of course, be abandoned. But what kind of place is to be offered to the economy of Italy in the post-war world? Do the Allies mean to abate the economic nationalism of Europe? Do they mean to associate Italy's economic structure with the heavy industrial areas of western Europe on a basis of reasonable trading and exchange? Above all, do they mean to relax in any way the present restrictions of Italian emigration? Until these questions are answered, the pattern of Italy's final reconstruction cannot even be traced.

Belgium's New Government

On September 20th Prince Charles, brother of the King, became Regent of Belgium, and on the following day he accepted the resignation of M. Pierlot's London Government. Then followed several days of the most careful and far-reaching discussion and consultation, during the course of which M. Pierlot and his right-hand man, M. Tschoffen, held lengthy conversations with anybody who could claim to have any political influence in Belgium. All parties from Catholics to Communists were sounded. Consultations were held with all manner of social groups from the directorate of the National Bank to the Trade Unions and the Socialist Co-operatives. Finally, the Regent entrusted M. Pierlot with the task of forming a new Ministry, and after further discussions he was able on September 26th to announce the composition of his new Government. The key positions are occupied by the Ministers who already served in London. M. Pierlot himself is Prime Minister; M. Spaak continues to be Foreign Minister; M. Gutt still presides over the Ministry of Finance; M. De Vleeschauwer will carry on as Minister of Colonies. The new men are all drawn from the Resistance Movement inside Belgium, and represent all the parties, Catholics, Liberals, Socialists and Communists. There is also one representative of the non-party resistance movement, M. Demany, who is Minister without Portfolio.

THE BRITISH LINEN BANK

The composition of this new government, which in some respects so strongly resembles the new government in France, throws an interesting light on conditions in liberated territory. It is a convincing answer to all those who have believed *a priori* that no outside government could represent the real mind of an occupied country. The London Ministry apparently commands the support of the Belgian people. Not only are its leading figures retained, but prominent among the new Ministers are men who were members of the Underground Committee which remained in close contact with the Belgian Government in London, and, practically speaking, organised the Resistance Movement. For example, M. de Busscher, a Catholic and a Minister without Portfolio in the new Cabinet, was President of the Belgian Resistance Committee. M. Herman Vos, Minister of Public Works, and a Socialist Senator, was also a member of this Committee. M. Marteaux, the Communist Minister of Health, came to London after a period in the Underground. Most of the new men, too, were in politics before the war, and there seems to have been far less break with the old parliamentary tradition in Belgium than there has been in France.

However, the Government resembles the Provisional Government in France in that it illustrates very strongly the nation's desire for unity. Another feature in common is the apparent determination of the Government to proceed with caution along the road of drastic social change. In France M. Mendès-France, a Radical, and M. Lepercq, an industrialist, are in control of the country's economy. In Belgium, finance is in charge of a non-political financial expert, M. Gutt, and the new Minister of Economy, M. Delruelle, is an industrialist from Liège. This evidence of moderation may come as a surprise to those who have been tempted to speak gloomily of the "bolshévisation of Europe." It is certainly true that Communism both in France and in Belgium is stronger than it has ever been before. It may even be true that if the Communists wished to do so, they could set up Workers' and Peasants' Soviets. But the Communist Party of to-day does not indulge in such Trotskyite activities. Both in France and Belgium all its slogans are directed towards greater efforts in the war against Hitlerite Germany. In the purely political sphere, both in France and in Belgium, the Communists have accepted non-political ministries. In fact, with M. Marteaux in Belgium and M. Tillon in France, one might almost say that Public Health has become the classic Ministry of continental Communism.

Reverse Lend-Lease

The Ministry of Production has made public the details of British Army lend-lease to the United States Ground Forces in preparation for the invasion. They should enable the least imaginative of laymen to get an idea of the magnitude of the assault operations and of the immense amount of spade-work that preceded them. They show, too, how complete is the pooling of Allied resources and how intensely lend-lease in reverse has encroached upon the civilian life of Britain. By June, 1944, Britain was not merely an unsinkable aircraft-carrier, but a compact armed camp for the Americans. New buildings for the US forces to a value of almost £50 million had been erected from British materials by British labour. They covered 41 million sq. ft. of open and covered storage and workshops, 175 miles of railway track, 200 miles of roads in camps and depots, accommodation for 750,000 men and hospital space for 100,000 beds. This vast programme employed 40,000 workers for twenty-five months. In addition more than 12 million sq. ft. of British Army depot buildings and civilian premises were handed over to meet further storage and workshop requirements. The American forces were provided with great quantities of military equipment—armour plate, guns, ammunition, pontoon units, etc. They were given 19 hospital trains and five hospital carriers, two of them staffed by British personnel. The figures of reverse lend-lease on the railways are equally impressive. From January to June, 1944, 3,764 special trains (583,525 wagons) carried US army stores. Nearly 1,000 goods trains were run in June alone, while a further 1,531 trains for the US forces were run in May and June. Other items handed over included five train ferry steamers, 50 cranes for handling coal and stores, four floating docks, nine breakdown trains and eight mobile workshops.

Oiling the Wheels

One of the chief criticisms of the Government's plans for demobilisation was made even before the plans were announced. This was that, whatever the principles of the scheme, the primary need was for the plans to be known and understood by the men and women whose future lives would be affected by them. Delay in announcing the plans increased the risks of unnecessary frustration and discontent. Having at last declared their intentions, the Government apparently intend to lose no time in explaining them. A special pamphlet issued by the Army Bureau of Current Affairs will help to explain the scheme to all units not actually engaged in battle. Besides this, a booklet will be issued shortly to every member of the forces explaining, not only the system of demobilisation priorities, but plans for reinstatement, social insurance, pensions and benefits and the provisions of the Disabled Persons Act and the opportunities for industrial and university training that will be open to service veterans. The function of the Resettlement Advice Offices will also be explained, so that full use can be made of them. These offices will be attached to 400 Labour Exchanges throughout the country and will be staffed mainly by the same people who have been used to fitting men and women into essential war work. This administrative machinery, first announced by Mr Bevin three months ago, can do much to oil the wheels of reconversion. Service men and women are first concerned with the speed with which they can be released once they are no longer needed. Their greatest anxiety, however, is still whether there will be something better than temporary jobs for them in civilian life. Fundamentally, of course, this anxiety can only be relieved if Government plans for reconversion are fully successful, but at least a part of the battle can be won by good administration. There is much to be said for recruiting at least some of the resettlement advisers from among service people who will intimately understand the particular difficulties faced by the demobilised men and women in adapting their lives from an army to a civilian pattern.

The Forces' Pay

Previous increases in the pay and allowances of the armed forces have been obtained with such difficulty and have been, as a rule, so niggardly that the increases announced in last week's White Paper (Cmd. 6553) came as a welcome surprise. The Government has granted them as a war measure to compensate those who will not be demobilised when the German war is ended, and those taking part in the war against Japan. Thus, the increases are to take the form of war service increments for officers below the rank of Rear-Admiral, Major-General and Air Vice-Marshal, and for all ratings and other ranks, and of a Far East allowance and Japanese campaign pay. For men with three years' service, the war service increments will range from 7s. a week for other ranks, with an additional 3s. 6d. a week for each subsequent year's service, to 21s. a week for senior officers, with an additional 7s. a week. The Far East allowance, which will be tax free and will replace the field and colonial allowance, will range from 2s. 4d. a week for other ranks to 21s. for all officers, and the Japanese campaign pay will range from 7s. a week for other ranks to 21s. a week for junior officers and 77s. for a general. The pay of a private, Class 1, with three years' war service, will thus be raised from £1 13s. 3d. to £2 0s. 3d. if he is serving at home, and £2 9s. 7d. if he is serving in the Far East. The extent of the increases may be gauged by the estimate of their cost—£100 million a year, which is more than double the estimated cost of the considerable increases in family allowances made last April. At that time, the Government declared that no general increase in pay was required. On an earlier occasion, it had pleaded the fear of inflation. Wisely, it is now making amends. The new increases will not close the gap between the pay plus emoluments of a soldier and the earnings of a civilian, and the discrimination against women, who will only receive war service increments at two-thirds of the men's rates, cannot be defended. But the new rewards for service, especially long service, will be thankfully received.

The Supply of Skill

The war has caused the interruption of apprenticeship and training for very many young men and women who were called up to the Forces and other kinds of war service,

and it has also depleted the numbers of skilled workers available in industry. The apprenticeship scheme announced by Mr Bevin in the House of Commons on Thursday should kill two birds with one stone, for it will serve the dual purpose of enabling demobilised ex-apprentices to resume their training and of ensuring an extended supply of skilled labour to industry in the critical post-war period. A youth, called up at the age of 18 in 1940, for example, having served two years' apprenticeship, will find that, on demobilisation at the age of 22 or 23, he has lost three years of apprenticeship and the prospect which he could normally have expected, of earning a skilled journeyman's rate. The Minister of Labour proposes that on return from the Forces, a man whose apprenticeship has been interrupted should be treated as a man and paid a man's wage. But since he will be doing what is virtually a boy's job, it would be unfair to expect the employer to meet the cost, and therefore the State will make a contribution, thus recognising its responsibility towards the man whose career has been interrupted. There will be a wages' allowance of one-third of the recognised journeyman's rate for the occupation and district; a maintenance allowance to apprentices training in a technical institution or training centre; and a further allowance to cover the cost of training fees. The scheme will be open not only to indentured apprentices but to those training under less formal agreements and to recognised learners. The period of apprenticeship will be shortened in every case, and to the extent that men have been able to continue their training or pursue their trade in the Forces, it will be still further reduced. Both sides of industry have been consulted and have approved a scheme which is, after all, very much in their own interests.

Deadlock over Pakistan

The talks between Mr Gandhi and Mr Jinnah have ended in deadlock. True, they have expressed their hope that "the public will not feel embittered" and that "this is not the final end of our effort," but unless some entirely new line of advance can be discovered, it is difficult to see where a new initiative can begin. The fundamental cleavage of opinion is undoubtedly rooted in distrust. Moslem India is Minority India, and behind all Mr Jinnah's reserve and caution lies the fact that he represents people who do not feel any confidence in the intentions of the majority among which they live. Mr Gandhi's proposal—based on the formula worked out by Mr Rajagopalachari—was that Congress and the Moslem League should form a provisional government which would take over full power from the British. It would then appoint a boundary commission and proceed to the demarcation of Pakistan. Mr Jinnah would not accept this procedure. He demanded that Pakistan should be defined and established before independence. In other words, the Moslem League wishes the separation to be carried through under the aegis of Britain. Hence his violent objection to the Congress "Quit India" resolution. It was when he stated that putting independence before separation was putting the cart before the horse, that Mr Gandhi dismissed the theory of the two nations as unreal. This is probably nearer to the general view held by most Hindus. Mr Gandhi throughout has claimed to speak as an individual only. But if most Hindus do not believe in Pakistan, what would be their attitude if, by virtue of their overwhelming majority, they came to exercise supreme power in an India that Britain had "quitted"? This is the question to which Mr Gandhi gave no answer; yet it is uppermost in Moslem minds.

Transition in France

The French Provisional Government has made the first move towards the unification of the Armed Forces of France. All irregular forces are now to be united in the French Forces of the Interior. This will probably mean that the Communist controlled *Francs Tireurs et Partisans* will give up their independent existence. New recruitment for the F.F.I. has been forbidden. The unified F.F.I. is to be incorporated into the regular army and placed under normal discipline. "The men of the Maquis must understand that the story of the Maquis is over." The members of the F.F.I. have been given an informal assurance that their detachments will not be dispersed, but as far as possible left intact within the framework of the regular forces. The question whether the commanders who led

those units in the Underground will continue in their commands has not been decided so far. But the question is more or less irrelevant. Once the F.F.I. becomes part of the regular forces, the appointment of commanders necessarily comes within the province of the Supreme Command. The important fact is that General de Gaulle has apparently scored a success in his attempt to end the dualism, if not pluralism, of the French Armed Forces. In the sphere of civilian administration the tasks of unification still lie ahead. For the time being there is much overlapping between the ordinary civil services and the local Committees of Liberation, who are still the more real centres of authority. As the Prefect of one department put it to the members of the local Committee of Liberation: "*Nous serons Préfet à deux.*" Whether this state of affairs can be stabilised is very questionable, to say the least. But for some months to come the administration of France will probably continue in a state of flux, and General de Gaulle's Government will be provisional not only in name but also in fact. To what extent it can carry out any fundamental reforms during this period has already become a matter of political controversy. The Left is pressing for the immediate nationalisation of key industries. But against this demand is advanced the argument that, in view of its provisional character, the Government has no right to carry out such fundamental reforms, which can be voted only by duly elected legislative bodies. The argument is undoubtedly valid, provided it is sincerely meant. The principle that there should be no *faits accomplis* without consultation with the French people should apply to everybody, leaders and followers alike, and it should be applied as firmly in the political as in the economic field.

Controversy Over Bulgaria?

Nearly a month has passed since the Bulgarian Government asked the Allies for an armistice. Meanwhile events have moved fast in Bulgaria. Russia declared war on Bulgaria. Bulgaria declared war on Germany. The Bulgarian Government again asked for an armistice. The Muraviev Government gave place to a National Front Government under Georgiev. But nothing has been heard of the armistice negotiations. In an interview with the Press, the Bulgarian Prime Minister declared that he "lacked any information from the Allies concerning the time and place of the armistice negotiations." The reason for this delay can only be guessed at. It is a fact that the Bulgarian governments, that have replaced each other in such quick succession in the course of the last few weeks, have all upheld—in one degree or another—Bulgaria's old territorial claims. Last week the Bulgarian occupation forces in Greek Thrace and Macedonia concluded an agreement with the EAM partisans to whom they handed over the local civilian administration. The Greek Government has not endorsed that agreement, and it has renewed its demand for an immediate withdrawal of all Bulgarian forces from Greek territory. The Bulgarian Prime Minister, on the other hand, has declared that the agreement has only a provisional character, and that

the Bulgarian people naturally hope that at the Peace Conference due attention will be paid to Bulgaria's need of a free outlet to the Mediterranean.

What is the attitude of the Allied Powers towards this Bulgarian claim? It can be presumed that the British Government gives full support to the Greek demand for an immediate and unconditional withdrawal of the Bulgarian

Trusteeships and Executions Accepted.

forces. On the other hand, would the Bulgarian Premier still speak about "Bulgaria's need for a free outlet to the Mediterranean" if he had not some hopes of Russian backing, now that the Red Army is in Bulgaria? In the light of these facts, a controversy among the Allies over the frontiers of Bulgaria is not impossible, and this may have caused the delay in the armistice negotiations. It may also account for the anomalous position of a British "military mission" in Bulgaria, which the Bulgarians have asked to leave and the British apparently disown.

War in the Baltic

Until this year, the Germans have had it all their own way on the Baltic front. Their hold on Finland and the Baltic states shut in the Russian fleet and their control of Denmark and Norway shut out the British. Only a few adventurous submarines and mine-laying planes disturbed the security of these waters. The Germans could move their armies almost at will to the Baltic states, to Finland and Norway. Finnish, Swedish and German ships carried out Germany's economic purposes without very much hindrance. Above all, the iron ships could bring tens of thousands of tons of iron ore a day from northern Sweden. So complete was the Germans' control that the Swedish Government felt obliged to modify its neutrality to the extent of giving them important transit rights across northern and southern Sweden. To-day all this is changed. On September 23rd the Finnish Diet unanimously ratified the armistice terms with Russia which are to give Russians the use during the war of air bases in Finland and to give them in perpetuity a military base on the very doorstep of Helsinki. In Estonia, Tallin has fallen and the Germans have lost all the other escape ports through which they may have hoped to bring out their shattered armies. Estonia is nearly cleared and the Russians are steadily advancing on Riga. The Baltic is being opened to the Red Fleet, and at the same time its waters have been closed to Germany by the latest act in Sweden's retreat from its earlier unneutral policy. On September 23rd it was announced in Stockholm that after September 27th no foreign shipping would be allowed into its Baltic ports or its territorial waters. This means, of course, the complete stoppage of all trade between Sweden and Germany. For many months now there have been signs that the Swedes were anxious to embarrass the defeated Germans as far as lay in their power. First of all, the trade agreement signed at the beginning of the year reduced considerably the scale of Swedish-German trade. In August, the Swedish War Insurance Board ceased to insure ships trading with Germany's northern and Baltic ports. The transit of military traffic across Sweden was stopped in the autumn of 1943. At the beginning of this month, transit facilities for non-military supplies were also stopped. It seems likely now that even individual transit permits for Germans will be suspended. Thus at a time when Russian ships are at last able to make their way freely into the Baltic, all German facilities east of the Skagerrak have disappeared. It may well be that in the long perspective of history this change in the balance of power in the Baltic may prove to be one of the most lasting results of this war. One Power after another has attempted to exclude Russia from a predominant position in these northern waters. To-day it looks as though the long struggle may be at an end.

Honourable and Gallant Member

The Home Secretary announced in the House of Commons on Tuesday that Captain Ramsay, MP, has been released from internment. In the great majority of cases internment under Regulation 18B, the public knows nothing of the acts or activities which brought the person concerned within its scope. In the case of Captain Ramsay, however, his record was revealed, in part at least, in 1941, when he won his libel suit against the *New York Times*. Among his activities was the founding of the Right Club, which included among its members William Joyce, Tyler Kent and Anna Wolkoff. The Home Secretary has now decided that the state of the war justifies his release, and, though there is to be no release *en bloc* at the moment, a fresh review of the 223 persons detained on July 31st has led to release being authorised in 70 cases. Captain Ramsay has been released unconditionally, because, Mr Morrison ex-

plained, the imposition of restrictive conditions would be incompatible with the rights of an MP, and in answer to a question in the House whether action would be taken if Captain Ramsay engaged in hostile propaganda in Parliament, he very properly replied that it would be a matter for the Speaker. Moreover, the right judges on Captain Ramsay's past are the electors of Peebles and Southern, where a new Conservative candidate has been adopted. But what the public as a whole has the right to ask is whether the political machinery, which selected a man like Captain Ramsay as Conservative candidate for that constituency, will have been properly overhauled before the next General Election.

Permanent Houses

The Government's plans for the construction of permanent houses have reached the prototype stage. On its demonstration site at Northolt, Middlesex, the Ministry of Works and Buildings has erected thirteen types of dwellings which can be seen by the public and by local authorities. They were built for experimental purposes, and records have been kept of their cost and the time taken to build the various types. The full details will not be published until they are given to the House of Commons. The similarity of the general plans of the houses is probably accounted for by the need to equate relative costs. The interiors are practical, and obviously much thought and attention has been given to planning the layout and equipment. It seems that housewives' tastes and wishes have been considered. Kitchens are laid out as efficient workrooms; cupboard space is excellent and no bedroom is cupboardless; bathrooms are perhaps too small. It must be admitted that while the interiors of the houses show great advances on pre-war design, the exteriors are extremely drab. Since they are meant to last about 60 years, and will compete with later architectural developments, it is a pity that external appearance has not kept pace. Fortunately, the houses are not meant to be specifications to be copied everywhere by local authorities and builders. The *Housing Manual*, 1944 (HMSO, 2s.), published this week, has been prepared by the Ministry of Health and the Ministry of Works, with assistance from the Ministry of Fuel and the Ministry of Town and Country Planning, for the guidance of local authorities and others; it gives advice on planning, construction, installation and equipment. The need for architectural advice is stressed, and the *Manual* rightly says:

It is essential that the housing schemes promoted by local authorities should set a good standard for the country . . . The only statistical information about the demonstration houses so far released is that the "traditional" brick house cost £759 to build (labour and materials) and took 2,100 man-hours. One block at the demonstration site is "revolutionary" in family housing. It is a two-storey block of four flats, built on a steel frame. Much of the material is prefabricated, and the assembly on the site takes only 900 man-hours per flat. The roof can be put on at an early stage, so that work can proceed whatever the weather. The same construction can be used to build a block of four houses. For speed as well as for general appearance and amenities this type of house has much to commend it. The Duplex type of house is interesting in that it is designed as two small flats which can be converted into one house as the housing shortage is eased. It is clear that the demonstration houses will be of the utmost help to all concerned in the task of post-war building.

Recruitment for the Colonial Service

A statement from the Colonial Office a fortnight ago drew attention to the shortage of staff in the colonial service, both by pre-war standards and in view of the expansion needed to carry out development and welfare schemes. Even when allowance is made for a wider recruitment to the service from the colonial peoples themselves, there will still be many vacancies for Europeans, and it is intended, after the defeat of Germany, to consider candidates from the armed forces and from those employed in other forms of war work. This expansion in the colonial service would be a suitable opportunity for transferring the burden of its cost. At present, the salaries, passages and

pensions of all European members are paid out of the colonial budgets—that is, from taxes on the colonial peoples. From the analysis given in the *Economic Survey of the Colonial Empire*, which inevitably makes some arbitrary distinctions, it appears that the cost of administration and pensions in all the colonies before the war amounted to almost half their total expenditure, and a large part of this must have been paid to Europeans—and spent in Great Britain. The absolute sum—about £31 millions—was not large by United Kingdom standards, and it would surely be of far more practical value to the colonies to relieve them entirely of the cost of European salaries and pensions than to make them isolated grants for development and welfare projects which they would then be in a position to finance themselves—though loans or grants for big development schemes would certainly still be necessary. Such a step would remove one of the chief grounds of agitation in the colonial press against British policy; it would also serve a political purpose, for it would justify two scales of salaries, one for the European, which being paid by the British taxpayer would be in accordance with British standards, and one for the colonial, which would be in accordance with his country's ability to pay. The colonial peoples would know exactly what it would cost them to have their own administrators, a first lesson in responsible government.

London House

The Nuffield Foundation has made a grant of £225,000 to London House, which is a hall of residence for Empire students. Founded as long ago as 1930, the hall has been mainly used by post-graduate students, particularly by post-graduate medical students, and there was always a long waiting list for admission. The Governors are now planning to complete the buildings, which will be close to the University of London, as soon as possible, and are appealing for £500,000, in addition to the Nuffield Foundation grant, for this purpose and to provide an endowment. The new buildings will enable accommodation to be provided for 250-300 men—some day, somewhere, someone will have to provide similar facilities for women—at a moderate cost. But London House is not a charitable institution. The Nuffield Foundation, whose central offices will be accommodated in London House, intends to assist on a large scale future teachers and research workers in medicine and science and to enable Empire students to do post-graduate work in this country. London House will not only provide a social background for these students and bring them into contact with persons eminent in medicine and science; it will also help London to realise its opportunities for becoming a post-graduate centre for the world.

Shorter Notes

The following table gives the number of civilian casualties in air-raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.	22,282	28,522	50,804
Total, 1941.	20,863	21,839	42,702
Total, 1942.	3,221	4,149	7,370
Total, 1943.	2,357	3,462	5,819
Jan.-May, 1944.	1,561	2,916	4,477
June.	1,935	5,906	7,841
July.	2,441	7,107	9,548
August.	1,103	2,921	4,024
Totals to date.	57,257	78,802	136,059

Those killed in air-raids during August included 506 men, 508 women and 89 children under 16.

The Catering Wages Commission has recommended the establishment of its second Wages Board—to regulate the wages and conditions of workers in teashops and unlicensed restaurants. It will apply to about 70,000 establishments throughout the country. The Commission expects to propose Wages Boards in the near future to cover licensed catering establishments and public-houses.

Letters to the Editor

The Bombay Plan

TO THE EDITOR OF THE ECONOMIST

SIR,—Please allow me as one of the signatories of the proposals known as the Bombay Plan to offer some comments on the interesting article on the subject that appeared in your issue of June 17th last.

I notice that you have criticised the Plan on various grounds. First of all, you ask whether the Plan is practicable and charge the author with assuming "light-heartedly that the political and social conditions for over-all economic planning by the State can and will exist in India after the war." You will agree that none can be dogmatic and prophesy with regard to the future. The Government of India, however, seems to believe as we do in post-war planning, and if we have been light-hearted in making assumptions, I hope you will grant that we are in good company. Sir Ardeshtir Dalal, one of the "light-hearteds," has been appointed a Member of the Viceroy's Executive Council to deal with post-war planning.

You also criticise us for assuming "without proof or evidence that new investment in capital equipment including land and building will produce net industrial output in the ratio of 2.4:1." You emphasise that "the figures have no basis in fact" and that "it is the view of many experts, for instance, that the increase of 130 per cent contemplated in agricultural production is perhaps four times too high." Luckily for us, the experts of the Government of India in the Kharegat Committee's Report have come to almost the same conclusion as ourselves. They estimate that with an investment of 1,000 crores agricultural production could be increased in fifteen years by 100 per cent. Our estimate of an increase of 130 per cent with an expenditure of 1,240 crores does not differ substantially from the estimate of the Government.

We do not claim perfection. Yet, it would be wrong to say that we had not our feet on earth when we made the estimates. Those of us who are engaged extensively in business and industry and can speak from personal experience of the matter which is not so negligible will bear it out that the ratio of 2.4:1 is much nearer the mark than you seem to think.

You are correct when you say that if the prices in the planning period were higher than 1931-32 prices on which the whole estimate is based, the expenditure of 10,000 crores would be proportionately increased. But should we always calculate such expenditure in terms of money? Why not in terms of human labour? My estimate is that 10,000 crores, which is our estimate of the expenditure involved in the Plan, is, in terms of human labour, the same value as that obtained from the work of 5 per cent of the total population employed fully for fifteen years. In "savings," perhaps it would come to about 15 to 20 per cent of the annual savings of the people. If we kept this one fact in mind, we would cease to talk of inflation and created money. The whole problem revolves round one central fact. Is it possible for India to employ another 5 per cent of her total population for full fifteen years for the task of reconstruction? To put it in terms of money, is it possible for India to save 15 to 20 per cent of her annual wealth for reinvestment? My answer is "Yes." Other countries have done it, and I see no reason why India could not do it.

According to you, our estimate is wrong since we have forgotten to add to our total estimate of capital investment certain recurring items. May I submit that money spent on education, health and such other services is, if expenditure, also the income of those like teachers, doctors, etc., who will be the earners? The nation as a whole, therefore, does not invest any extra money in utilising its existing idle labour for the purpose of social uplift. In estimating the annual expenditure on the social services, we have only pointed out how much the State will have to spend. The money so spent on salaries and wages must immediately be reflected in the income of the services and eventually percolate to the exchequer. The recurring expenditure, therefore, does not stand on the same footing as other items of investment. There is an obvious difference between the two kinds of expenditure. When investment is made for production, the existing standard would not be affected until the industry

begins to produce consumer goods. An engineering workshop that produces capital goods cannot provide any consumable wealth to the nation until consumer goods are produced with the help of the machines produced at the workshop. Until such time as the consumer goods are received, money expended remains a blocked investment. In social service, however, expenditure and income accrue simultaneously, and there is, therefore, no blocked investment. You will thus see that there is no such mistake as the article assumes.—Yours faithfully, G. D. BIRLA

Calcutta.

A Temperate People

TO THE EDITOR OF THE ECONOMIST

SIR,—I do not think that the present facts warrant the complacent attitude to the drink problem reflected in the editorial paragraphs which appear in your current issue.

There has, in fact, been a very disturbing increase in drinking and drunkenness amongst young people during

the last two or three years and Chief Constables, magistrates and others have called public attention to this deplorable tendency, particularly in certain munition areas and seaport towns.

It is certainly a reflection on our national housekeeping that beer production in war-time has been regarded as a Priority No. 1, and that grain has been allocated to the brewers at the expense of poultry-keepers, dairy farmers and other producers whose products have been drastically curtailed.

In the fourth year of the Great War the production of beer was reduced to 14 million barrels. In the fifth year of the present war, beer production is approximately 30 million barrels and constitutes a heavy strain upon transport.

The Chairman of the Birmingham Licensing Justices publicly stated last year that the statistics of drunkenness were no longer a reliable index of national sobriety, and it could not be doubted that the reduction in the strength of the police force was a factor that must be taken into account.—Yours faithfully,

H. CECIL HEATH,

General Secretary, United Kingdom Alliance
London, S.W. 1

AMERICAN SURVEY

Limitless Promise

Governor Dewey's speeches have grown more liberal as he advances towards the West Coast. This is not merely the result of the lush Californian air. The West Coast is a key section, so far as the election is concerned; and its political climate is less conservative than that of rock-bound Maine, partly because of the great influx of war-workers. In his four speeches at Seattle, Portland, Los Angeles and San Francisco, Governor Dewey has revealed a determination to out-do the New Deal. At Seattle he made a vigorous effort to capture the Labour vote, painting the unions as the victims of New Deal politics and the wage-earner as "affronted by the reduction of his basic rights to the level of political rewards." He argued that the New Deal was exclusively responsible for most of the war-time strikes, through its policy of delay, overlapping jurisdictions and "planned confusion," and promised that under a Republican Administration Labour would get its rewards as a result of collective bargaining, instead of political loyalty. He endorsed most of the New Deal's social legislation, including the social security programme; promised an "expanding economy" through the co-operation of a liberated industry with a free labour force; and declared that there must be jobs for all, even if it necessitated limited Government intervention. Governor Dewey made a particularly good impression by his attack upon the inefficiency of Administration machinery for dealing with labour disputes, and even some pro-Administration newspapers have admitted the shrewdness of his hits. Unkind critics have suggested that Governor Dewey is "running for the Presidency on the platform of the New Deal." But it is surely to Governor Dewey's credit that he realises that the days of "the devil take the hindmost" are gone. Earlier in the year Mr Willkie tried, unsuccessfully, to bludgeon the Republican Old Guard into admitting that times change and the party must keep pace. Governor Dewey has engineered the conversion. How enduring it will prove is another matter. For the moment it is made palatable by the doctrine of the "limitless promise" of America, to which there will be an especial response in the new and ambitious industrial empire of the West Coast.

Black Record

Governor Dewey, unlike Mr Willkie, has made no attempt to foist sackcloth and ashes upon the Republican Party. But in his bland assumption that Republicans have always been New Dealers at heart he left himself open to the most crushing and telling rejoinders from President Roosevelt, who made his first campaign speech this week,

as soon as Mr Dewey's plan of attack had become clear. The President was at the very top of his political form. "Pointing with pride," the usual prerogative of the party in power, took second place to pointing with scorn at the Republican record on international affairs, on preparedness for the war, and on domestic problems. He took an evident delight in warning Governor Dewey that it was as unwise for a Republican to stir up memories of the depression as to mention rope in the house of a man who had been hanged; he poured ridicule upon Republican sincerity in endorsing the National Labour Relations Act, the Social Security Act and other New Deal social legislation. He did not spare the Republican record in war and in peace, recalling the "botching" of the last peace, the refusal of many Republicans to believe in the possibility of the United States becoming the victim of aggression, the Republican votes against Lend-Lease. He did not spare Governor Dewey's ill-advised advocacy of General MacArthur; and here he spoke with the authority of the Commander-in-Chief. There was, however, one notable exception to the diatribe, and that was the olive branch held out to Republicans who are sincere believers in international collaboration. There is no lull in the wooing of Mr Willkie's followers. The President has shown no disposition to be restrained by Governor Dewey's willingness to treat foreign policy as a non-controversial issue; and the aggressive nature of his speech will strain this fragile agreement. Even if it does not collapse, the immediate consequence of this first round must be to harden Governor Dewey's resolve to use whatever missiles come to hand. The coming election promises to be in the most vigorous American tradition.

Germania Delenda Est

A compromise appears to have been reached at Dumbarton Oaks on the problem of action to be taken if one of the Great Powers is guilty of aggression; and an agreement on the draft proposals has been reached, though not with such speed as to justify Senator Wheeler's charges that the conference was being rushed through to prevent sober second thoughts in the United States. It is assumed, indeed, that the new organisation may be called upon to meet aggression only from Germany and Japan or other Fascist governments. Senator Wheeler has also declared that knowledge of the peace terms would lead Americans to reject membership in the organisation to secure their enforcement. Unfortunately, the published details of the "hard peace" plan attributed to Secretary Morgenthau go far to support this view. Senator Ball last week made a powerful plea in the Senate for immediate American participation and for granting the President the right to

BALKAN SOBRANIE CIGARETTES & TOBACCO

NO LAMENTS . . .

It is customary in war-time to lament a decline in the public taste and to decry the judgment which eventually finds a substitute better than its original. We find no evidence in our business to support either charge. Never were Balkan Sobranie so highly priced, never were they so scarce, yet never were they in such constant and widespread demand. We take that as a compliment to public morale as well as a tribute to our private pride. And, as Balkan Sobranie have no substitute, the second charge does not arise.

"Why I read The Yorkshire Post"

"To begin with, I like the paper. It seems to me to have everything. I like its sincerity, its honesty, and its sense of fair play. I don't mind betting that business men everywhere would get a clearer vision of things by reading The Yorkshire Post regularly. Take politics. While upholding its own political viewpoint, it is also fair to the other fellow's points of view. And that's more

than you can say about many newspapers. Take finance. You'll always find full reports of local trade meetings, not summaries. And in post-war matters—amid the babel of voices planning Brave New Worlds, its realistic outlook helps a plain man like me to understand what our post-war tasks and opportunities are really likely to be."

The Yorkshire Post
Voice of the North

BEHOLD the invisible!

THE visible comprises all that can be seen by the naked eye. Within that range of vision man has learned wonderful things. But outside that range lie phenomena marvellous too. And man is now finding ways to "see" those phenomena. Here are two instances.

Rays of light in the spectrum beyond the violet and below the red, which have vibrations too fine or too coarse for the human eye to receive, are within the range of specially treated photographic plates. Hence, many things about the ultimate structure of matter, hitherto hidden from sight, are now revealed.

Engineers have long sought easy means of gauging strains and stresses. Through the use of Polaroid the strains and stresses in transparent plastic materials can actually be seen.

Both these developments require iodine. They are but two of the many recent applications of this remarkable element.

The IODINE EDUCATIONAL BUREAU was set up in 1938 to collect and collate all available information on iodine. The services of this Bureau are available free to any institution or manufacturer with an iodine problem.

G.E.C. In war or peace—at the service of the Empire

The development of switch and control gear for distributing electrical power to industry is of fundamental importance. The G.E.C.—the largest British electrical manufacturing organisation in the Empire—has designed and manufactured switchboards with the highest breaking capacities required in modern practice.

The demands of war have resulted in the entire research and technical resources of the Company, together with its vast production of electrical equipment, being directed to the war effort, and diverted from normal supply channels.

When peace comes the big technical advances made by the Company during these years of war in all applications of electricity, including the important one of electronics, will be available to all concerned with reconstruction in any part of the world.

Electrification Schemes

G.E.C. Electrification Schemes have been applied to all industries, including: Aircraft Factories; Chemical Works; Collieries; Food Factories; Gold Mines; Iron, Steel and Copper Works; Motor Car Works; Oil Refineries; Ships and Shipyards; Textile Mills, etc.

G.E.C.—always in the forefront of electrical progress

THE GENERAL ELECTRIC CO., LTD., MAGNET HOUSE, KINGSWAY, LONDON, W.C.2

ARE YOU OVER 17 YEARS OLD?

UNLESS you are over 17, there have been no Black Magic Chocolates since you were 14; and at that age (if we remember aright) chocolates were chocolates and never mind the name.

But if you are over 17, the words "Black Magic" probably strike a chord in your memory.

Let us help a little.

A very plain box—glossy black, with a few white lines on it.

Twelve different kinds of chocolates, in simple paper cups, without any fripperies.

Truffle-and-Nougat, Hazel Cluster, Liquid Cherry, Orange Cream, Strawberry Cup . . . heigh-ho. The girls loved 'em; and the boys took no poor view of them, either.

And now, you say, here it comes—"Come Peace, come Black Magic." But nothing of the sort. There will be a lot of pre-war goods back in the shops before Black Magic; for though we shall move fast, we shall take no short cuts—no half measures, no skimping.

Don't expect to buy Black Magic on Armistice Day; but when you do buy it, it will be as good as ever. We believe it will be better, but that will be for you to say.

Black Magic

ROWNTREE & CO. LTD., YORK

KODAK FILM helps anti-rickets vitamin research

But for X-rays, many young chickens would die. Those above were used by Vitamins Limited to find the Vitamin D needed to prevent rickets, so that enough can be fed to the thousands of chicks reared every year in this country. Older research methods depended on killing the chicks to examine their bones. Now they can be photographed by X-rays and their lives saved.

Such vitamin research is only one of the countless advances made possible by the use of X-rays in industry, medicine and science. Kodak special films have done much to make these advances possible . . . much to enable the even wider application of X-rays in the future.

You are going to hear a great deal more about the Philco Group when the war is over than it is possible to reveal at the present time. It is enough to say that this progressive group of industrial electrical manufacturing companies have made their plans—plans for the large-scale production of radio and television receiving and transmitting apparatus, electric motors, generators, switch-gear, refrigerators and electro-mechanical devices of every description. These plans await the signal of victory and the brilliant opportunities of peace. When the time comes, the Philco Group will play an impressive part in supplying the needs and comforts which the patient people of this country so richly deserve.

send American forces abroad without first securing the assent of the Senate. In combating Senator Wheeler's counsel of delay, Mr Ball admitted that the peace terms might be, indeed probably would be, unsatisfactory to many Americans; but he urged that a world security organisation offered the best means for the peaceful correction of mistakes. But if the intention is to reduce Germany to an agricultural economy, sober-minded men everywhere may well despair of the prospects for peace. This is no matter of detail. The scheme, according to the American Press, provides for the closing down of all German mines; for the removal of some German industrial machinery to the devastated countries and the destruction of the rest; refusal of any kind of assistance to post-war Germany; the cession of the Saar to France and parts of Eastern Germany to Poland, and the division of large estates into small farms. It is said that this plan has the President's approval, but not that of Messrs Hull and Stimson, and that the split in the Cabinet was caused by President Roosevelt's demand for the drawing up of harsher terms than those originally proposed. The decision may not have been taken, but that these are no idle rumours is proved by Mr Walter Lippmann's efforts in the past few days to explain why such an attempt must fail. In Mr Lippmann's words:

The Germans would become a sullen, festering mass of desperate human beings with whom no one could deal. It is perhaps understandable that in the United States there should not be a keen appreciation of the part German industry must play in the reconstruction of the European economy. But except on the score of distance and consequent irresponsibility, it is hard to see how this plan can appear to be anything but a guarantee of perpetual chaos. If this is the scheme which the President carried to Quebec, Senator Wheeler has unintentionally spoken for all men.

Arms for Peace

The Army, in the person of General Marshall, has already urged upon Americans the necessity of universal military training. At the convention of the American Legion this week General Arnold, of the Army Air Forces, and Secretary of the Navy Forrestal, supported this proposal and outlined the special problems of preparedness at sea and in the air. The Services are profoundly aware, in General Arnold's words, that

in this war, by the grace of God and the courage of our Allies, we were able to get the time to create new units and train them properly before sending them into battle.

By striking while the iron is hot it is hoped to secure agreement on adequate defence precautions after the war. General Arnold emphasised that an adequate air force depended not on mere numbers of planes but on the use of research to keep the United States at the head of new developments; on a progressive aviation industry capable of great expansion; on an elastic ground and air training scheme; and on the availability of far-flung air bases. Mr Forrestal spoke with equal feeling of false economy in cutting down the Navy and of the need for sustained naval research. The Legion convention responded by resolutions calling for the maintenance of the Navy at a strength sufficient to overcome any possible combination of hostile fleets; no scrapping of first-line ships; and universal military training. The Legion, however, is a unique audience, and it was being polled at a moment when the lesson of this war is at its peak. Presumably that most professional branch of the American Forces, the Navy, never again will suffer the indignities of the period between the wars. In the disposal of Government-owned war plants the Forces are to have priority of choice as to those which are to be retained as part of the permanent defence machinery of the country. The acquisition of bases, as urged by Senator Connally at the convention, is likely to have an even more enthusiastic response. But not even the most earnest representations of all the Services will make much headway against the public aversion to conscription in time of peace.

Freedom from News

Both the Senate and the House have approved a resolution favouring the international guarantee of the world-wide right of interchange of news by news gathering and news distributing agencies, whether individual or asso-

ciate, by any means, without discrimination as to sources, distribution, rates or charges.

and it has been enthusiastically and not unnaturally endorsed by the newspapers. The desirability of a free flow of news, as an essential factor in increasing world understanding, is hardly a debatable proposition; and in most countries the abolition of censorship is one of the most eagerly anticipated fruits of peace. The resolution, however, bears the marks of a more contentious origin. It would be difficult to suspect from the American press that the great American agencies suffer any heavy handicaps in providing their readers with as much news as they can comfortably assimilate, and the American press prides itself on being the freest in the world. It should be remembered, however, that the five Senators who last year undertook a world-wide tour of investigation expressed the gravest anxiety over British control of international cable facilities. It was declared monstrous that charges between British points were lower than those to the United States, and that in order to take advantage of these lower rates American correspondents must route their messages through British or Dominion centres, with the possibility of delay and of double censorship. There is an impression in the United States, which is quite wrong, that charges vary with the nationality of the sender. The fact is that British rates are lower because British cables are subsidised, while American are not; and that it is the importance of speedy and cheap communication to the Empire which has led to British predominance in cable facilities. It is fantastic to suspect in this situation a sinister communications monopoly. The resolution passed by Congress may mean nothing more than a non-controversial endorsement of a free press. It is more likely to be interpreted as a demand that the United States take a more aggressive share in developing international communications. This is a proposition to which some thought has been devoted, and it has only been put in cold storage during the war. If it is not pressed further it will be because the end of hostilities will restore international telephone facilities, in which American control exceeds the British, to the predominating position it held before the war.

Conserving the FOOD VALUE of our Milk

MILK Chocolate is a convenient medium for carrying, storing and conserving milk, but there is much more to it than that. . . Fresh dairy milk consists of two elements—water, which averages 87½%, and 'milk solids' (fats, protein and milk sugar), which contain calcium, phosphorus and Vitamin D and which constitute the whole food value of the milk. As the chart shows, Cadburys Milk Chocolate retains all the milk solids of all the milk used, and only the water is eliminated.

Cadbury means Quality

THE BUSINESS WORLD

Industrial Price-fixing

THE decision of the Board of Trade to reject the Cotton Board Committee's proposals for a regime of self-government in the cotton trade, with legally enforceable price-fixing powers and with jurisdiction over rayon, cotton's young competitor, has clarified the Government's attitude towards an important industry. But it is also of wider significance as an indication of the Government's approach to the formulation of post-war industrial policy in general. True, the cotton industry is not typical of British industry, or, rather, it falls into the category of trades that have suffered misfortune through a contraction of markets because of a fall in world trade or high costs or both. In this sense it is perhaps a pity that the cotton trade, rather than, say, the motor industry, has come up as the first test case.

Mr Dalton's resistance to the combined pressure of employers and trade unions for statutory and autonomous price-fixing powers merits a word of encouragement. His arguments, as given in a statement to the Press, deserve to be put on record.

There are grave dangers in such minimum price arrangements, which may easily lead to restriction rather than expansion of output, and to the perpetuation of insufficient and old-fashioned methods at the expense of more efficient and up-to-date firms. Moreover, for some time to come, the British cotton industry should be able to sell without difficulty, and at good prices, all it can produce. In the home market, the practical problem will be to enforce, not minimum but maximum prices, so as to prevent inflation. Likewise, in overseas markets, the need will be not for minimum prices, but for a certain discretion on the part of exporters. Our prices must not be so high as to lose in future years the goodwill of our overseas customers.

The President of the Board of Trade did not confine himself to a refusal of the industry's demands. He urged it "forthwith" to concentrate its energies upon "putting its house in order," and to work out its own salvation after the war with the assistance of the Cotton Industry (Reorganisation) Act, 1939. He asked the industry to press ahead with a programme of reforms designed to raise its productivity and to restore its prosperity. The industry should group itself into larger units, and instal the best equipment that can be had; bulk orders and continuous running should be secured by overhauling the merchandising section, and by double-shift working; the wages system should be modernised and simplified. These are the channels into which the industry's efforts should be diverted.

*

Mr Dalton was as well advised to stress the dangers of autonomous price-fixing powers as he was to emphasise the primary need for an increase in productivity by way of

technical reorganisation. Past experience has shown that price-fixing is a dangerous drug. It destroys the health of vigorous industries, and it is no substitute for technical rationalisation in industries that have run into difficulties.

This does not mean that minimum prices should be excluded altogether from the list of permissible devices. They may be beneficial in curing industries suffering from capital consumption. But these cases are exceptional, and in every case the need should be proved before price-fixing powers are conferred; and, like drugs, they must be carefully prescribed and administered.

Minimum prices, in fact, should only be granted on three conditions. The price-fixing agency should not be the industry itself, but the Government or some independent body responsible to it. Secondly, it is not sufficient to ask such an agency to conform to some vague formula, such as to ensure that the prices are reasonable or yield a fair return to efficient producers—such phrases, in practice, are meaningless. The price-fixers can only perform their task adequately if they are given definite instructions—a specific formula—about the method by which, and the level at which, prices are to be fixed. A reasonable example of such a formula would be to determine minimum prices on the basis of the total costs of the lower quartile (that is, the total costs of the firm whose costs stand one-quarter of the way up from the lowest to the highest)—or, alternatively, the minimum might be fixed at the prime costs of the average producer. It is, after all, minimum prices that are in question, and they should be fixed low; but to fix them by reference to the costs of the cheapest producer might defeat the purpose by driving too many firms out of business; to align them with the costs of the most expensive producer puts a premium on inefficiency; to base them on average total costs (i.e., including overheads and return on capital) might still amount to an endowment of the complacent. The alternative bases here suggested would either give the producer of average efficiency a guarantee of his out-of-pocket expenses, but no guarantee of a return on his capital, or else would give the producer of more than average efficiency a fair yield on his capital. As bases for minimum prices, it would be difficult to justify anything more generous. Whether or not these are exactly the right principles, with the development of modern costing, there should be no difficulty in formulating and carrying out precise instructions about price determination.

Thirdly, minimum prices as such are no guarantee of reorganisation. They merely create the conditions of reorganisation in that they provide a measure of security, and enable efficient producers to make a profit. In principle, they should only be granted to an industry when it has formulated a satisfactory plan for technical rationalisation, and, even then, safeguards are needed to ensure that this plan is, in fact, translated into practice with commendable speed.

Experience during the inter-war period has amply demonstrated the futility of seeking the reorganisation of industries in difficulties by giving them autonomous price-fixing powers without adequate safeguards. Coal and steel are two well-known examples.

The Coal Mines Act, 1930, gave the industry power to regulate production and prices. There were safeguards, of course. The Board of Trade had to give its approval to the schemes; national and district committees were to investigate complaints; the Coal Mines Reorganisation Commission was to induce reorganisation by way of amalgamations. But the result was a rise in prices and little reorganisation. The home consumer had to pay more, and the overseas consumer turned to other sources of supply. As a means of preventing the loss of exports the Government negotiated a series of bilateral trade agreements, and it initiated discussions for the formation of an export cartel—that is, British coal, for the first time in its history, was selling in overseas markets on political pressure rather than on price.

In steel, experience has been very similar. The industry promised cheap steel by way of technical reorganisation on

condition that it was given monopoly powers on the home market. On the recommendation of the Import Duties Advisory Committee—the supposed watchdog of the Import Duties Act—the industry's request was granted in 1932. But reorganisation was not started in earnest until two or three years later, and then was a policy of mending and patching rather than one of drastic technical overhaul. As in coal, prices rose substantially in the 1930's—partly, of course, because of the rise in coal prices, but by no means entirely. And in steel, as in coal, British output found itself increasingly unable to compete, in the absence of cartels and protective duties, with foreign producers.

The policy of granting industries price-fixing powers without adequate safeguards has, in fact, proved to be thoroughly vicious. In coal and steel, the measure of security provided by fixed prices has probably acted as a deterrent rather than as an incentive to the achievement of higher productivity by way of technical reorganisation. Their story might have been very different, if the granting of price-fixing powers had been conditional on the formulation and progressive fulfilment of a definite programme of technical rationalisation, if prices had been administered by an independent agency, and if this agency had been given instructions about their determination rigorous enough to prevent complacency.

The cotton industry, however, is in an exceptional position, and it may be that an exceptional case can be made out for minimum prices as one of the instruments of reorganisation. If the case is beyond reasonable doubt, there is no reason why the industry should not have recourse to this remedy, provided it is willing to conform to the conditions essential to successful application.

But the cotton industry is most unlikely to table such a request, for it has already been given somewhat more by

the Act of 1939—held in suspense—than it would be entitled to have under the suggested conditions of price-fixing. By this Act, price schemes are to be administered by boards elected by the members of the sections of the industry to which they apply; true, the Cotton Industry Board must satisfy itself that the proposed minimum prices are determined in accordance with the instructions of the Act, but only three of the fifteen members of the Board will be independent persons. The Board has definite instructions about price determination; it has to select a group of undertakings which "appear" to it to be the most efficient in each section, and it has to compute the ceiling of minimum prices by reference to the group's average prime costs and specified depreciation charges plus an allowance for a specified profit; but these instructions are far from rigorous. Moreover, the granting of price-fixing powers is not made conditional upon the fulfilment of a definite plan of reorganisation.

In view of the generous provisions of the Act of 1939, Mr Dalton had every justification for refusing further concessions. But then he had asked the industry to submit proposals; it would be against human nature for an industry to resist the temptation to ask for more. But the Minister has also every right to press the industry to prepare and carry out a drastic overhaul as speedily as possible. In cotton, as in every industry, the slogans must be Productivity, Efficiency, Rationalisation, Lowered Costs. These are the really important matters to which public policy should be unremittently directed. Price-fixing and market sharing—the favourite devices of the trade associations—are secondary questions which should not be brought into consideration until after the main issues have been tackled. As trimmings to a structure that is otherwise sound, they may occasionally be permitted, under proper safeguards. But as the main content of an industrial policy, they would be disastrous. Mr Dalton has waited far too long to make that clear. He should now proceed to make sure that his new policy is understood to apply to every industry in the country.

The Pottery Industry

THE need for flexibility and adaptability in the post-war structure of industry has been recognised by the Government. This means that the encouragement of minor industries will be a primary task of reconstruction. Wise direction and nourishment of these industries is likely to produce quick and satisfactory results, for in many cases they have reached a stage of development suitable for the introduction of new methods of production and organisation. It is once again a matter of "Give us the tools. . ."

The minor industries are capable of playing a very important part in the recovery and expansion of British exports; and this is particularly true of the pottery industry—an industry about which the public is remarkably ill-informed. That area of North Staffordshire known variously as the Potteries, the Five Towns (Arnold Bennett's sobriquet) and sometimes (though quite wrongly) as the Black Country, is a peculiarly isolated geographic region producing about 85 per cent of British pottery products. In normal times the value of the industry's output is some £18 million per annum, of which about one-quarter represents export trade. During the war the industry has experienced the varying fortunes of a semi-luxury trade: it has been encouraged and fostered, concentrated, and limited by turn. In the early part of the war the industry was given special assistance—largely because the raw materials (90 per cent of them) are obtained within the British Isles and because its finished products contain a high value relative to bulk weight and shipping space. In 1941 the value of the export trade in pottery reached £5,868,585—the highest figure since 1925. Authorities in the industry estimate that the volume of overseas trade could be doubled if the long overdue rationalisation of production and marketing were undertaken promptly.

It is clear that the demand for pottery will be very great in the immediate post-war years—not only for domestic tableware but for the products of the other three chief sections of the industry, glazed tiles, sanitary ware and electrical porcelain. The fortunes of each are closely connected with developments in housing. China is a fragile substance and has suffered heavy casualties under enemy bombardment. Moreover, there will be great eagerness to put away the drab "utility" pieces of wartime, so suggestive of short commons and plain fare, in favour of the more decorative and colourful

industry catering for domestic equipment will the demand for replacements and renewals be greater.

Abroad, the pottery industry is favoured with exceptional opportunities. Before the war competition with German, Japanese and Czechoslovakian producers was acute. Where trade was lost it was usually lost to the Japanese. In the home market Japanese wares were unimportant, though they had captured some part of the chain-store business. In the Dominions, however, Japanese pottery was ousting British very rapidly. In the decade before the war imports of Japanese china (as distinct from earthenware) increased by 50 per cent in Canada, 70 per cent in Australia and 45 per cent in South Africa. By 1940 the Japanese claimed to be the world's leading producers of domestic pottery and were making a strong bid for leadership in the production of sanitary ware, electrical porcelain and tiles. Their success was due to a highly efficient and systematic production of medium-quality goods, low labour costs and an energetic and ruthless marketing policy. In 1939 the position in the United States market was as follows:

Imports of pottery from	\$
Czechoslovakia	49,586
Denmark	57,085
France	370,386
Germany	549,334
Italy	416,591
United Kingdom	1,849,182
China	152,524
Japan	3,111,716

LUDGATE CIRCUS, LONDON, E.C.4

It is useless to speculate on the condition of the Japanese and German pottery industries after the war, but on grounds of goodwill alone it is safe to predict that British wares will be favoured with higher initial opportunities. How will the industry behave in a sellers' market? Will it be content to gather the windfalls or will it reach for the fruits that will keep? The danger facing the industry is that vitally necessary technical adjustment will be delayed in view of the certainty of short-period prosperity.

This technical readjustment began at a snail's pace after the Great War and has proceeded, fitfully, at the same rate. The industry is hampered very severely by the results of its haphazard growth from the eighteenth century era of consolidation under Josiah Wedgwood. In 1939 the earthenware and china sections of the industry were represented in Stoke-on-Trent by some 300 factories employing about 60,000 workers. The size of the manufacturing unit is extremely small—far too small, physically, to permit the general introduction of the most important and far-reaching technical development, the continuous tunnel oven. Where factories have been enlarged, the expansion has been piecemeal, with the result that methodical production is rendered impossible by obsolete lay-out. There are, of course, striking exceptions to this general picture of inefficiency. The new Wedgwood factory at Barlaston, with its electric tunnel ovens, scientific flow-production lay-out, excellent transport facilities and garden-village amenities, might well serve as a prototype for post-war developments. It is significant that in those sections of the industry that are unaffected and unhampered by tradition—notably glazed tiles and electrical porcelain—the production unit is larger and much more efficient than in the china and earthenware sections.

At first sight, the success of the few large producers—the "big five" earthenware manufacturers and the "big four" china manufacturers—might suggest that the troubles of the industry could be solved by concentrating production into identical units of optimum size. But this solution would overlook the fact that pottery markets are highly differentiated and cannot adequately be served by a narrow range of standardised products. In the market for cheap household crockery a policy of standardisation (by which is meant a severe limitation of designs and shapes, with resultant economies in production) would undoubtedly assist the manufacturers to satisfy abnormal post-war demand and to reduce costs and prices to meet the severe competition that will follow. In the markets for high-grade tableware in earthenware and china and for decorative and luxury ceramics, demand is more individual and discriminating and sets definite limits to the degree of mechanical production that can profitably be adopted. The bone china section of the industry, for example, is characterised by an extreme multiplicity of designs and expensive hand-painting methods of decoration.

Radical alterations in outlook and technique are necessary if the industry is to be made fit for its post-war tasks. First, there must be a voluntary restriction by the manufacturers of the range of their activities. In the past many manu-

facturers have been little more than large-scale studio potters—bespoke potters almost. They have prided themselves on their ability to produce anything and everything in the ceramic world—everything, that is, produced by their numerous rivals. The results, judged aesthetically or from the costing angle, have been deplorable. There are far too many enthusiastic but misguided Jacks of all trades in the industry. The fact that market conditions deprive some manufacturers of the economies of mass-production is no argument for the retention of methods of production more suitable for domestic crafts.

Second, and more important, is the urgent need for rationalising the production of "open stock" or standard pottery. This cannot be achieved without increasing the size and plant of productive units—and this costs money. It is very doubtful whether the industry as it stands—most of the units are family concerns—could find the funds necessary for this large task of reconstruction. The pottery industry has never, so far, shown spectacular profits and the most thorough "ploughing back" has failed, in most cases, to provide capital resources on the scale necessary for effective modernisation. One way out of the dilemma—indeed, the only way short of Government intervention—would be for the industry to appeal for support to the investing public. The prospectus would read very well: an ancient industry, rich in traditions and great names; assured supplies of raw materials and fuel; a balanced labour force with the inherent skill of centuries; a strong and constant domestic market; great possibilities overseas. At this moment in its history the industry would surely find willing backers. They would contribute, perhaps, not only capital but a tonic injection of enterprise and outside experience. The Potteries suffers badly from industrial inbreeding.

Concentration on the lines adopted with some success during the war would be quite ineffective under conditions of peace. The wartime scheme has, in fact, reduced the proportion of capital equipment per unit of labour throughout the industry. It has proved satisfactory only because the standards of "utility" production have been low enough to make possible the employment of second-rate labour and largely obsolete plant.

Strong criticism of the industry has been offered here; and it has appeared stronger because very little has been said of the efforts that have been and are being made to rehabilitate and redevelop the industry. But the good intentions of the many and the good example of the few, even when supported by an excellent centre for technical research, an impressive scheme of industrial education and sound internal industrial relations, are not enough at this time of opportunity.

If the scale of operations can be graduated towards technical efficiency, there will be a need for parallel improvements in design and marketing. In the pottery industry good design is of paramount importance. Durability and technical performance are quite definitely of secondary importance as selling factors. While all pottery should be useful, the success or failure of any particular line depends on its aesthetic appeal. The industry, like every British industry, needs first-class designers. This fact, no less important than the need for productive efficiency, is beginning to receive official recognition. Last week the Federation of British Industries submitted a memorandum to the Board of Trade recommending that a National Design Council should be set up. Some such body, provided that its propaganda could reach and reform the individual manufacturer, would contribute greatly to the recovery of British trade.

But even pottery that exhibits every good quality requires energetic and systematic marketing—and this the small-scale potter, operating independently, is unable to afford. Co-operative marketing, on the lines of the scheme put forward by Hambro's Bank—a scheme that would provide the potters with a selling organisation both intensive and extensive—would seem the way out of the difficulty.

Conversations are now taking place between the Government and representatives of the industry, and it is to be hoped that the liaison contrived under the exigencies of war will be maintained and strengthened. If the pottery industry can overcome the shortcomings of its sturdy but somewhat parochial independence, and can obtain wise guidance and encouragement from the Government, its future is assuredly bright.

Business Notes

Social Security and Insurance

Revolutionary as is the content of the Government White Papers on Social and Industrial Injury Insurance, it is impossible to trace any reaction on share prices outside the sphere of companies engaged in industrial life business. The lack of any general reaction would not have been surprising, even had markets been less idle than they are, for it was generally assumed that something very like the Beveridge proposals, insofar as they affect industry and the taxpayer, would be put forward and their effect had been fully discounted. For this reason also it is rather surprising that the recent weakness in the insurance shares most affected should have been followed by a further sharp marking down. Marking down is the correct expression, for the fall reflects an attempt by jobbers to avoid having to take up stock rather than any substantial selling pressure. Two proposals in the first White Paper affect the future of industrial assurance: the abolition of approved societies as administrators of sickness insurance and the introduction of a universal death grant. Both proposals are in keeping with the Government's pronouncements during the Parliamentary debates on the Beveridge scheme and are therefore not unexpected, although their effect on the industrial assurance industry will be far-reaching. The abolition of approved societies will tend to raise the cost of conducting industrial assurance, partly because it will take away a part of the collectors' incomes which the offices may find it necessary to make good in other ways and partly also by involving the spread of certain fixed expenses—such as salaries of indoor staff, office rents, etc.—over a smaller volume of transactions. A similar effect is also likely to follow the introduction of the death grant owing to the cancellation of some of the voluntary funeral benefit policies at present in force. Just how far this process will go must depend on the result of the separate examination to be conducted on the subject of insurance for indirect expenses connected with funerals. The probable adverse effect of the Government's proposals on industrial assurance expense ratios, already high, renders imperative the concentration of the industry into a small number of large but efficient units if it is to survive as an instrument of private enterprise. Given an effective rationalisation, however, the industry still possesses an enormous field for development in the provision of genuine life and endowment assurance, the prospects for which, in a nation becoming steadily more security-conscious, must be excellent. Social Security should have a beneficial effect on lapse ratios, and therefore help to remove one of the major criticisms of the past conduct of the industry.

Exit Employers' Liability

The White Paper on Industrial Injury Insurance removes employers' liability from the insurance companies altogether, except insofar as certain employers may wish to provide benefits in excess of the basic figures of the Government scheme. This is a further loss which will be felt by the general body of insurance companies doing accident business. The proportion of total accident business covered by this type is, however, only some 8 per cent, so that the effect on cost ratios will be much less severe than in the case of the industrial life business. If, as seems probable, it is reasonable to assume a secular upward trend in insurance business, due both to falling value of money and growing familiarity with the benefits of insurance, there is little need to envisage an absolute fall in earnings, even possibly of the industrial life companies, over an extended period. The shares of these concerns have never fully recovered from the weakness associated with the war and accentuated by the publication of the Beveridge Report. It is, of course, true that all insurance shares show a fall on pre-war figures. Thus the average for 1936 of *The Actuaries' Investment Index* for these securities was well over 130, whereas at the end of August it was under 120. A very rough assessment of the fall in shares of the industrial life companies alone from the mean prices of 1936 to date suggests a figure of 40 per cent.

Steel Strikes out for Markets

The steel industry is showing an encouraging interest in the speedy resumption of export business—stimulated, no doubt, by the reduction in war orders and the consequent appearance of surplus capacity. It wishes to be freed from the leading strings which prevent this country from exporting materials similar to those supplied by the United States under lend-lease. Lord Riverdale, a Sheffield industrialist, recently pointed out that the United States and Canada have become free to export the steel and tools in which that town is particularly interested. If the stage has now been reached when American lend-lease steel is no longer required, and when the value of the materials the British industry can spare for export exceeds the value of such special materials as are still needed from the United States, then there is every justification for asking for its removal from the list of lend-lease supplies. Indeed, if Britain, which more than most other countries must concentrate on the speedy resumption of exports, is not to be severely handicapped as a late starter, all the items on the lend-lease schedule that can be exported in quantities greater than those derived from the United States should be speedily deleted. This does not mean that lend-lease has now served its purpose. Far from it; on balance, the value of such supplies must for some time exceed that of possible British exports, presumably even if due allowance is made for lend-lease in reverse. But it is surely not unreasonable to ask for a procedure whereby priority is given in removals from the lend-lease list to the products which Britain can export. Steel appears to be one of these.

A Case for Inquiry

The motor industry has renewed its assault upon the heavily protected and ably defended "Steel House"—the headquarters of the British Iron and Steel Federation. It wants cheap steel to make cheap cars as a means of enlarging its sales at home and abroad. Some of the industry's spokesmen complain that its competitors overseas have in the past obtained their steel at a substantially lower price. On September 1st, Mr. George W. Lucas, President of the Motor Agents' Association, flatly asked in a public address in Manchester why the price of British steel is 50 per cent higher than world prices. His statement and his question cannot be allowed to remain unanswered. If it is true that the British motor industry is charged anything like half as much again as, say, the American motor industry for its purchases of steel materials, it will be at a serious disadvantage after the war. Since this is by no means the first time that complaints have been voiced about British domestic steel prices, the time has come when the argument should be settled by an official inquiry as a matter of urgency closely affecting the public interest. It should not be too difficult to establish the facts by ascertaining the prices paid for various steel products by British and American motor manufacturers. In its own interest, Steel House will no doubt give its whole-hearted welcome and approval to such an inquiry. If it should disclose more than minor differences, their causes should be ascertained forthwith—that is, to what extent they are due to higher raw material costs (of coal, for example), and higher conversion costs, either through out-of-date steel practice or through insufficient standardisation and the small size of orders. The results of the inquiry should be published without

delay. It is impossible for the layman to judge the issue between the steel and motor trades; and the issue is far too serious to leave it to mutual accusations of inefficiency in private and in public. Whatever the defects of the motor industry—Mr Lucas readily confessed to the “beam in the eye” of his own industry—they could not excuse defects in steel. The motor industry is a problem in its own right.

Cotton: What Next?

The rejection by Mr Dalton last week of the Cotton Board Committee's plan for a regime of industrial self-government does not appear to have caused alarm and despondency in the cotton industry. Perhaps the industry did not really expect the Government to go beyond the terms of the Cotton Industry (Reorganisation) Act, 1939, which already provides for a strong central organisation, with powers to fix minimum prices, subject to certain safeguards. The five-point programme for technical reorganisation outlined by the President of the Board of Trade has not had an unfavourable reception as a statement of aims. As Sir Raymond Streat, chairman of the war-time Cotton Board, said on September 27th:

I am certain there will be markets for the goods produced by our Lancashire industry provided we modernise our equipment and our practices.

The question now is whether the industry is willing to press ahead in translating it into practice, even if this may mean drastic changes in organisation and practice. The need for change, true, is widely recognised, but there is anything but unanimity about the degree of reorganisation that will be needed to bring the industry into line with the best modern practice in production and marketing. No doubt the mission that has recently made a study of the industry in the United States will be able to furnish valuable guidance; its report should therefore be published without delay. The setting for a drastic overhaul will not be unfavourable during the next two or three years; the industry is likely to have an assured market at profitable prices. And, given the necessary imagination, drive and initiative in overhauling the industry, it should be in a much stronger position at the end of the sellers' market than it was before the war.

Exchange Rates for Germany

The allied military High Command has fixed rates of 10 marks to the dollar and 40 marks to the pound for use in the conquered parts of Germany—the actual currency taken into Germany by the Allied armies is to be military authority reichsmark notes printed in Britain. The sterling rate compares with a pre-war official quotation of 11 marks to the pound. That rate was admittedly artificial, and was not a valid measure of the relative purchasing power of the two currencies. A truer guide was provided by the rate of the travel mark, which before the war stood at about 16½ marks to the pound. There has admittedly been greater inflation of the note circulation in Germany than in Great Britain. Whereas the Reichsbank circulation has about trebled since the outbreak of the war, that of the Bank of England has little more than doubled. Part of this disparity is, however, explained by the larger area which the German note circulation has had to serve. The evidence of price movements is little more than a testimony to the rigour and efficiency of price controls and rationing in both countries, but as a measure of inflation it cannot be altogether ignored, especially as the level of wages has tended to keep pace with official cost of living indices. By last March the German indices of wholesale prices and the cost of living, both based on the average for the first half of 1939, were 110 and 111 respectively. For Great Britain the comparable figures were 169 and 130. On this evidence the domestic purchasing power of the mark has fallen less than that of the pound during the war. An item of evidence pulling in the other direction is that the value of ordinary shares—always an anti-infla-

tionary hedge—has risen faster in Germany than here, the relative indices for the end of 1943, again based on the first half of 1939, being 157 and 115. Taking all the evidence into account, it is difficult to avoid the conclusion that the mark has been as deliberately undervalued by the military authorities as was the lira when it was given an exchange rate of 400 lire to the pound.

The exchange policy of the Allied High Command has now been tested by sufficient evidence to crystallise into recognisable form: overvalue the currency of your allies and undervalue that of your enemies. It is not a policy invented by the Allies; the Germans applied it long ago, with the difference that they did not even overvalue the currencies of their allies and satellites. The Germans are, therefore, about to get a taste of their own medicine. At anything like the new official mark prices German goods will be cheap to the invading Allied armies. The effect on the German economy of the rates fixed by the Allies will depend, of course, on the size of the expenditure of their armies, including Russia; but Russia has not yet disclosed the conditions in which its armed forces are to be supplied with currency in Germany. As the statistics show, the degree of inflation present in Germany today is a function much more of price and consumption controls than of the state of the currency. The inflationary potential, however, is substantial. It exists in the form of a greatly expanded note circulation, bank deposits and short-term Government debt. That potential has now been added to in no uncertain manner by a deliberate undervaluation of the currency in the exchange market. If the system of price control and of rationing loses its efficiency as the machine is overtaken by the Allied advance in Germany, the inflationary potential may assume threatening shape. Whether such a development would be of any real advantage to Germany or to the Allies is debatable.

French Dollar Needs

Commercial and financial relations between France and the United States are already beginning to move out of the spheres of relief, rehabilitation and lend-lease. Orders for some \$200 million of locomotives, freight and passenger cars and other railway equipment have been placed in the United States by a French purchasing commission and will be paid for in cash. The greater part of these goods is scheduled for delivery in 1945. The problem of financing these orders has had to be considered. French assets in the United States are blocked by Treasury Order and will remain immobilised at least until formal recognition of a French Government has taken place. Private banks are for the present unable to come to the assistance of the French Government because France is still technically a defaulter on her 1914-18 war debt and its Government is, therefore, deprived by the Johnson Act of all access to the US capital market. The orders for railway equipment have been placed with private firms which have, understandably, called for some financial guarantee of ultimate payment. The impasse thus created has been rounded by a US Government guarantee of the liabilities assumed by the French Government. The US Treasury has underwritten the orders placed by the French mission and has secured itself against this contingent liability out of the ample French funds blocked in the United States or, as in the case of the Martinique gold, under United States control.

Blocked Funds in USA

No official indications have been given of the amount of foreign assets in the United States temporarily immobilised by the blocking regulations. Some suggestion of their size and composition is, however, provided by the detailed statistics of international capital transactions of the United States which appeared in the *Federal Reserve Bulletin* up to December 31, 1941. The latest available statement of these transactions shows, among other things, the total amount of short-term assets accumulated by foreign countries and the dollar securities, domestic and foreign, acquired by foreign countries since the beginning of 1935. For this last item, the information is incomplete, since it excludes securities acquired prior to 1935. The magnitude of these foreign assets has, of course, been considerably changed since 1941, partly as a result of cash transactions by certain

belligerents, notably the United Kingdom and partly as a result of the considerable volume of transactions authorised by the US Treasury for such neutral countries as Switzerland and Sweden. The figures are as follows:

Dec. 31, 1941.	In million dollars.		
	Outstanding short term assets.	Securities acquired since 1935 Foreign.	Domestic.
U.K.	400.8	127.6	— 70.1
France	448.6	51.6	74.9
Netherlands	174.9	31.5	236.7
Switzerland	339.9	44.3	236.7
Belgium	117.3	*	*
Norway	65.2	*	*
Sweden	210.7	*	*
Germany	6.6	36.5	— 0.2

* Not specified.

In addition to these holdings, the immobilised assets include considerable amounts of earmarked gold of which no official details have been published.

Petsamo Nickel

While there is so far no specific statement on the point, it is fairly safe to assume that the cession to Russia of the Petsamo area, under the Soviet-Finnish Armistice Agreement, includes the Petsamo nickel fields. At the outbreak of the war, these fields were in course of development under a 40-year concession, granted in 1934 to the Mond Nickel Company. It is believed that production was about to commence in 1939 and that money spent in Finland amounted to some 7½ million US dollars. There is no likelihood that the existing concessionaires will be allowed to resume working the property and the question of compensation will necessarily arise. There should be no great difficulty in arranging full compensation for money actually spent, but whether any payment will be made in respect of loss of future profits is more doubtful. What is more important to International Nickel, of which Mond Nickel is the British branch, is the future of nickel prices. It is not known how far Russia has developed its own nickel resources during

the war, but up to April 30, 1944, lend-lease deliveries of the metal to Russia amounted to 10,500 tons or some 10 per cent of the annual pre-war world output. Peacetime demand within the Soviet may well fall and it is possible that, in the not too distant future, Russia may, with the assistance of the Petsamo deposits, become an exporter of the metal. If that were so, it is no reflection on the efficiency of International Nickel to say that the present policy of price fixing might be jeopardised. So long, however, as that company continues to base its policy on a maximisation of demand and of getting down costs of production it has probably little to fear.

Commodity Control

Two international commodity control agreements—those for sugar and coffee—have been extended for one year, the first from September 1st, and the second from October 1, 1944. The purposes of the renewal of the international sugar agreement are to provide central machinery for the adjustment of international sugar supplies in the period following immediately the end of hostilities, and to gain time for the conclusion of a wider scheme to tackle the long-term problems of the industry. The agreement was first concluded in 1937—it was based on a recommendation of the World Economic Conference of 1933—and comprised the world's sugar exporting and importing countries. Its original purpose was to regulate supplies in the “free world market for sugar,” and to prevent a further contraction of that market. On the outbreak of war the work of the International Sugar Council, the executive body of the scheme, came to an end, but a special sub-committee subsequently worked out a sugar zoning scheme on a world-wide basis through which minimum demands of the various parts of the world are to be met from the nearest source of production until the restoration of normal conditions. When the original five years' agreement terminated in August, 1942, it was provisionally extended for two years. Its further extension indicates that the main Allied Governments, all of whom were signatories of the original agreement, are anxious to retain the scheme as an instrument for future co-operation.

PLANNING FACTORY FUEL EFFICIENCY

For your Fuel Efficiency Campaign to be fully effective, wise planning and enthusiastic execution are both needed. In the Ministry's Bulletins you will find specialised advice on how to improve the efficiency of your works. If your fuel-watching system is based on the friendly co-operation of management and workers, you will ensure that these improvements are maintained. Have you acted on the suggestions outlined in the previous advertisements of this series?

- ★ Have you tracked down and put to useful work all the escaping steam that has been blowing to waste? Read *Fuel Efficiency Bulletins* 22, 25 and 28 and end these “skyline scandals.”
- ★ Have you spread steam demands evenly over the working day? Peak steam loads are extravagant and inefficient. Consult *Fuel Efficiency Bulletin* No. 26 (“Peak Steam Demands—Cause, Effect and Cure”).
- ★ Have you overhauled the boiler house? For boiler house economy hints, you need *Fuel Efficiency Bulletins* Nos. 1, 2, 9, 10, 20 and 27.
- ★ Have you cut out all process waste by re-examining every production process with an open mind? For steam process you need *Fuel Efficiency Bulletins* Nos. 22, 25, 26 and 28.
- ★ Have you planned furnace loading and eliminated waste? There are many excellent suggestions for furnace users in *Fuel Efficiency Bulletins* Nos. 5 (gas operated), 13 (electrically operated), 24 (oil operated) and 17 (furnace insulation).
- ★ Are you certain that your fuel-watching system is just as good as a vigorous management drive can make it? Look up *Fuel Efficiency Bulletin* No. 7 for the duties and responsibilities of your fuel watchers.

Fuel Watchers' badges and copies of the *Fuel Efficiency Bulletins* can be obtained from the Secretary of your Regional Fuel Efficiency Committee

The Coffee Agreement

The extension of the Pan-American coffee agreement until the end of September, 1945, is of greater immediate importance than that of the sugar agreement. The first of these agreements was concluded after the defeat of France in 1940. It was to reduce the adverse influences of the loss of the European market on coffee producers in Latin America, supplying some nine-tenths of the world's coffee. The scheme fixed special coffee import quotas for both the United States and the rest of the world, but, as the European mainland, which before the war absorbed two-fifths of world supplies, was the only large market outside the United States, the latter quotas have so far had only theoretical interest. The next twelve months will very probably witness the re-integration of Europe into the world coffee market. Owing to the heavy imports of the United States since the revocation of the country's coffee rationing system last year, and the poor Brazilian crop—the result of adverse climatic conditions—in 1943, world surpluses of coffee have shown a decline; there have lately been predictions in coffee trading circles, especially in the United States, that a coffee shortage may arise with the resumption of shipments to Europe. These forecasts have been contradicted by the Brazilian National Coffee Department, but it is obvious that with United States imports at the present yearly rate of some 5,000,000 bags—two-fifths larger than before the war—and the necessity of accumulating a normal trade reserve in Europe, international coffee supplies will require careful allocation if an unorganised and dangerous buying competition is to be avoided. In these conditions the extension of the Pan-American Coffee agreement is to be welcomed.

Rubber Study Group

British, American and Dutch Government officials who recently met in London to open exploratory conversations on rubber have found an ingenious way of postponing awkward political decisions; they have formed a rubber study group which will meet in friendly discussion, keep their Governments informed, but will refrain from making recommendations. It may be that it is still too early to reach final decisions on the future relationship between natural and synthetic rubber; and for a few years, at any rate, there may well be a market for all the rubber that can be produced. But decisions of principle—and they must be largely political decisions—cannot be postponed indefinitely; the initiative, inevitably, must come from the United States which, before the war, was the world's leading consumer of imported natural rubber and has now become the main producer and consumer of synthetic rubber.

A Central Design Council?

No single aspect of industrial efficiency is more important than that of design; and none has been more neglected in the past. Satisfactory standards of industrial design cannot be achieved without the close co-operation of technicians, artists and marketing specialists, for good design must reconcile the limitations of productive methods, the peculiarities and vagaries of local demand and the canons of functional and aesthetic art. Before the war British industry lost ground in many markets through deficiencies in the design of its products; and even where the deficiencies were recognised, corrective measures were pitifully inadequate. By contrast, the proposals now put forward by the Federation of British Industries must be considered very enlightened. In a memorandum submitted to the Board of Trade, it is recommended that the Government should establish a Central Design Council to act as a centre for information, advice and propaganda and to co-ordinate the activities of departmental bodies (Industrial Design Centres) charged with the task of improving design standards in separate industries. The functions of the proposed Council would be to organise permanent and travelling exhibitions of British manufactured goods of high quality; to advise on the furnishing, equipping and decoration of Government offices and buildings; and to co-operate with the Ministry of Education and other bodies in the promotion of art training and art appreciation. The Industrial Design Centres would undertake propaganda on behalf of particular industries, encourage and assist individual manufacturers to employ good designers and organise co-operative schemes of market and design research. These proposals are probably in line with the Government's intentions.

Higher Lever Profits

The preliminary statement of earnings of Lever Brothers and Unilever for 1943 show an improvement in results which makes the profit of the parent £6,593,239, compared with £6,028,834 for the previous year and £5,835,589 for 1941. These figures are all after tax. There is an even larger percentage rise in the net profits of the whole group to £8,079,742, from £6,913,003 and £6,299,663 respectively. In view of the fact that a year ago the Chairman, Mr Geoffrey Heyworth, expressed the opinion that gross profits were likely to fall, but that the net figure would probably be little changed, these results must be considered very satisfactory. All information available points to the conclusion that the consolidated profits figure is the more reliable guide to the fortunes of the group and that it, not the profit of the parent, should form the basis of calculations of earnings on the equity capital. On this basis, and assuming that all allocations from the latest figure are in the nature of free reserves, the cover for the ordinary dividend, maintained at 5 per cent, would appear to have risen from some 33 per cent to almost 50 per cent. This figure must be accepted with some reserve until the full accounts are available in the middle of next month. Some disappointment has been expressed in market circles because the dividend was not increased. It is true that the time is approaching when the liberation of Europe will permit a survey to be made of the position of the "NV" company. When that is done, it may prove possible to release some or all of the funds set aside by the British company to cover ordinary dividends for the period of occupation and the preference dividend for 1940 of "NV." It is, however, not certain that, should the earnings of that company suffice to meet all dividends at the rates paid by the British company, any immediate increase in dividends out of the funds released would be considered desirable. The market price of the £1 units of ordinary stock was little changed on the announcement at 43s. 3d., at which the yield is only £2 6s. 10d. per cent less tax.

Warning from Saskatchewan

If the new Premier of the Province of Saskatchewan is correctly reported, British bondholders of the Province and its municipalities will be well advised to prepare for yet another tussle with Canadian defaulters. It appears that the intention is to amend legislation

so that the decision of the Local Government Board shall be binding upon the bondholders and other creditors as well as upon the municipalities.

At present, the Premier is reported to have said, the municipalities

are bound to comply with the orders of the Board, but bondholders may vote themselves out of the operation of the order. This is not very clear, but it appears to mean that the Provincial Government is preparing to treat lenders, with whom they have entered into long-term contracts, as though they were subordinates over whom they had jurisdiction. If that is the case, London will presumably not, in the altered circumstances of today, wait for a period of over a year, as it did at the time of the Montreal default, to let its view be known. Already the price range for the three Saskatchewan issues and the single loan of the City of Saskatoon has been widened to ten points by dropping the bid quotation seven. The amount of money involved is some £3,500,000 in the case of the former and less than £500,000 for the latter borrower. The three stocks of the former carry interest at 4 or 4½ per cent, and are all repayable within a decade. The loan of the latter bears 5 per cent and is repayable 1941-61. All stood around or above par, the last having changed hands at 105½ ex dividend at the end of last week. Whatever may be the position of the very large sums borrowed in Canada and the USA, there can be no doubt but that the British bondholder has a watertight contract.

More Treasury Bills?

If the precedents of 1942 and 1943 are to be followed the weekly issue of Treasury bills by tender should be increased next week and remain at a figure higher than £110 million for four to six weeks. In the last two years the intention of this seasonal increase was to steer into the hands of the banks a larger volume of January and

(Continued on page 459)

COMPANY MEETINGS

SECOND ALLIANCE TRUST COMPANY, LIMITED

IMPROVED REVENUE

DIVIDEND OF 21 PER CENT MAINTAINED

The annual ordinary general meeting of the Second Alliance Trust Company, Limited, was held at 64, Reform Street, Dundee, on the 29th instant.

The following is the statement of Mr James Prain, LL.D. (the chairman), which was circulated with the report and accounts:—

The accounts for the past year when compared with those of the previous period show no changes of importance. Gross revenue from investments, which is somewhat greater than before, is in accordance with our expectations, and we propose to repeat last year's distribution of 21 per cent. on the ordinary stock, absorbing £44,100. This will leave a surplus for the year of £18,389, of which £15,000 is carried to contingent reserve fund and £3,389 is added to the amount to be carried forward.

Although it was possible a year ago to estimate with some confidence the maintenance of revenue at around the same level for the following twelve months, to-day a review of the outlook must take cognisance of the important change which has taken place as a result of the rapid improvement in the military situation. It would seem fairly certain that we are about to enter a period—if we have not already done so—when the demands by the state on industry for war material will tend to diminish. The relatively small fluctuations in profits and dividends which we have become accustomed to expect in the reports of industrial companies generally are the result of a steady demand for war material on the one hand and the levelling action of excess profits tax on the other. Any diminution in the volume of this demand which has had so stabilising an effect must introduce those uncertainties which are associated with a period of transition. I see no reason to expect, however, that our revenue for the current year will be other than satisfactory, but I would draw attention to the fact that we are rapidly approaching a time when we must adjust ourselves to altered conditions and reconsider our policies in the light of them.

THE INVESTMENTS

Turning to the annual report, you will observe the statement that the directors

(Continued from page 458)

early February maturities, which provide a useful means of balancing the effect on bank cash of the heavy tax payments normally concentrated in that period. The need for such strengthening of the banks' holdings of early 1945 maturities appears to be as great as ever. Last month the clearing banks held only £210,555,000 of bills, compared with £231,553,000 in August, 1943. This fall has occurred over a period during which the outstanding volume of Treasury bills issued through the tender has risen by £260 million. The contrast between these movements is largely explained by the accumulation of abnormal sterling balances in London. Some of this has been utilised by the purchase of Treasury bills from the market or by direct tenders on the part of the overseas banks in question. Part has been lent to the discount market against the security of Treasury bills. The discount market is running much larger bill cases than a year ago. Only part of the increase is measured by the increase of £50 million in the clearing banks' money at call and short notice between August, 1943, and August, 1944. Part of the increase in the market's bill holding is also being financed with non-clearing bank money. This "outside" competition for Treasury bills, whether it takes the form of outright discounting of bills or of increased money market loans secured by bills, has been more than sufficient to take up the increase in the issue of Treasury bills through the tender. This fact suggests that a further permanent increase in the tender issue of Treasury bills should follow the seasonal increase now due.

are satisfied that the value of the company's investments at July 31st was substantially in excess of the book figure. A further general improvement took place in Stock Exchange values during the year. Although not so marked as in the previous year, the movement was important and its effect, we believe, if applied to the company's list of investments, would be to show a further considerable appreciation during the year. This upward movement has brought the general average of industrial share values to a point comparable with the high points reached in 1936 and 1928. Although that does not preclude the possibility of values remaining at this level or of even moving to higher peaks—for conditions to-day are very different—we would not be justified in attaching much importance to this improvement or in drawing the conclusion that the prospects of our business are greatly affected thereby one way or another.

When we come to the end of this long war there will be in all countries a state of acute shortage of manufactured goods of all kinds. That taken by itself would suggest that after the difficulties of the transition stage, to which I have referred, have been overcome there will follow an era of full industrial activity to meet this potential demand. In the absence of information of the Government's intentions regarding taxation, however, one cannot assume that this era will of necessity be one of increasing returns for the investor.

EXPERT TRADE OUTLOOK

The importance of our export trade is now recognised if we are to maintain our standard of living and incur further larger expenditures on social security schemes. I am glad to see also a wider—if somewhat belated—appreciation of the necessity for an expansion in our exports sufficient to fill the gap caused by the loss of that part of this country's foreign investments which was sold in the early years of the war to finance the purchase of war material. In this connection I feel strongly that something could be done and should be done to increase the revenue from those foreign investments still remaining. I support those who have urged the adoption of firm official action to safeguard these investments. There have been too many cases recently of discrimination in foreign countries, particularly the Argentine, against those who have investments there, and in the case of foreign governments, notably Brazil, an attitude of bad faith towards their creditors. The investor individually has no remedy, but the Government could bring pressure to bear, and it is in the national interest that it should do so.

GOLD EXPLORATION AND FINANCE COMPANY OF AUSTRALIA, LIMITED

The tenth ordinary general meeting of this company was held, on the 26th instant, in London.

Following are extracts from the statement by Mr P. E. Marmion:—Having regard to war-time difficulties the year's results must be considered satisfactory.

The debit balance on profit and loss account has been almost eliminated. The amount of cash and Government securities, totalling £317,000 after reserving in full for our estimated liability to taxation, represents about 35 per cent. of the issued capital. Gold Mines of Kalgoorlie and Central Norseman will have a considerable lag of development work to make up when miners become available. Subject to this, they have proved themselves capable of yielding satisfactory profits. Victoria Gold Dredging has paid in dividends a total of 45s. 6d. (A) per share, and, whilst not expected to be as profitable as hitherto, still has some 8,000,000 cubic yards of payable ground to be dredged. Awaiting development we have two small properties in Western Australia, while in Victoria we have a substantial interest in the Jim Crow dredging proposition. The report was unanimously adopted.

GOLD MINES OF KALGOORLIE, LIMITED

The tenth ordinary general meeting of this Company was held, on the 26th instant, in London.

Following are extracts from Mr P. E. Marmion's statement:—The result for the year reflect the full effect of the withdrawal of labour from the gold-mining industry for Australia's war effort. There was a large reduction in the tonnage mined and treated. The ore handled by the mill amounted to only 79,709 tons, compared with 141,351 and 159,462 tons respectively in the two preceding years.

The operating profit was £18,271, and it is proposed to pay a dividend of 6d. per stock unit.

Ore reserves at March 21, 1944, were 17,000 tons lower than a year previously, the estimate of proved and probable ore being 536,670 tons. The average grade improved by 0.5 dwt. to 5.7 dwt. per ton. There has been a very promising development on No. 9 level in the Brownhill lease.

There has been an improvement in the tonnage treated in recent months and it is hoped that the increased rate will be maintained.

The report was unanimously adopted.

FINANCE AND BANKING

THE MONEY MARKET.—The discount market has this week been preparing for the task of taking up and paying for a larger weekly allotment of Treasury bills than has ever fallen to its lot. The bills tendered for last week included the end-of-year maturities and the market is normally allowed a free run for these by the authorities. The allotment on the syndicate's application, amounting to slightly over £110,000,000, amounted to 54 per cent. The bulk of these bills were being taken up in the latter part of the week, and the credit position had not felt the impact of the operation by mid-week. Although some of the banks have been making up for their September returns, the supply

of credit has been adequate. The reason is that the Government, deprived of a considerable part of Treasury payments in the earlier part of the week, has probably had to borrow heavily on Ways and Means advances from the Bank of England. These operations are suggested in the rise of £37,105,000 in Government securities shown by the last Bank return. With the customary end-month increase in other securities, amounting on this occasion to £10,121,000, bankers' deposits show a rise of £45,431,000 on the week and touched the comparatively high level of £221,489,000 on Wednesday. This figure will have been considerably reduced by the close of the week when the whole of the Treasury bill payments will have come in.

MONEY RATES, LONDON.—The following rates remained unchanged between September 21st and September 28th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, ½%. Discount deposit at call, ½%; at notice, 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between September 21st and September 28th (Figures in brackets are par of exchange).

United States. \$ (4.86) 4-02½-03½; mail transfers 4-02½-03½. **Canada** \$ (4.86) 4-43-47; mail transfers 4-43-47. **Switzerland.** Francs (25.22) 17-30-40. **French Empire.** Francs 197-200½. **Syria.** P. 8-81-85. **Sweden.** Krona (18.15) 16-85-95. **Dutch West Indies.** Florin (12.11) 7-58-62. **Portugal.** Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. **Panama.** \$4-02-04; mail transfers 4-02-04½. **Brazil.** 83-64½ cr. INDUSTRY AND TRADE

"The Economist" Sensitive Index.—There was no change in the index during the week ended September 27th. The complete index (1935 = 100) was 158.6; crops 135.6; and raw materials 185.5.

Blackout Into Sheets.—The Board of Trade has arranged for materials used to manufacture blackout curtain materials to be used instead in the making of sheets. In making this announcement last Tuesday, the President declared that the production of towels is sufficient to meet demand under rationing, but that he hoped soon to be able to reduce the coupon value of towels, or to free them from the ration.

Dehydrated Potatoes.—A limited quantity of dehydrated potatoes, the supply of which has hitherto been reserved for the use of the Services, is now available for purchase from the Ministry of Food by catering establishments and institutions in order to enable them to test this new type of food. These dehydrated potatoes have been produced in factories in the United Kingdom. They are in strip form, and only require to be reconstituted before being cooked like ordinary potatoes. Dehydrated potatoes are particularly valuable for catering during a time of labour shortage. They come out of the tin ready for reconstitution and cooking. There is no washing, peeling, eyeing or trimming; there is no waste, and no dirt is brought into the kitchen. The product is packed in tins containing 12 lb. of dehydrated potatoes, which is roughly equivalent to 84 lb. of raw potatoes (field weight). The price is 1s. 10d. per pound, delivered.

GOVERNMENT RETURNS

For the week ended Sept. 23, 1944, total ordinary revenue was £41,582,000, against ordinary expenditure of £103,072,000 and issues to sinking funds of £330,000. Thus, including sinking fund allocations £7,104,165, the deficit accrued since April 1st is £1,548,141,000 against £1,546,211,000 for the corresponding period a year ago.

THE UNIVERSITY OF LIVERPOOL

CHADDOCK CHAIR OF ECONOMICS.

The Council of the University of Liverpool invite applications for the Chaddock Chair of Economics, which is being established in addition to the Brunner Chair of Economic Science held by Professor G. C. Allen.

Salary not less than £1,200 per annum.

The University has power to grant leave of absence on the ground of work of national importance to a Professor who is unable to take up his duties upon appointment.

Candidates who are overseas may apply by cablegram, giving the names of three referees.

The last date for the receipt of applications is Friday, 29th December, 1944.

Further particulars can be obtained from the undersigned.

September, 1944.

STANLEY DUMBELL, Registrar.

SALES MANAGEMENT. We wish to arrange a preliminary interview with a highly qualified and fully experienced man, capable of taking complete charge of our National distribution organisation, entailing the control of about 35 representatives.

The product and service have a technical "atmosphere," and a man with an appreciation of Architectural principles, plus up-to-date management and marketing techniques, would be particularly suitable. The appointment could be made now, if National Service obligations permitted, or arranged for the early post-war period.

High remuneration and excellent prospects.

Applications giving full personal and business particulars will receive careful and immediate consideration. Our staff have been notified of this advertisement.—Box 309, The Economist, Brettenham House, Lancaster Place, London, W.C.2.

CORPORATION OF GLASGOW

DEPUTY MANAGER, MUNICIPAL TRANSPORT
DEPARTMENT.

Applications are invited for the appointment of Deputy Manager, Municipal Transport Department.

The salary for the appointment is £1,000 per annum, rising to £1,250 per annum by increments of £25 per annum. The war bonus on the commencing salary is at present £40 lis., subject to modification.

Applicants must not be over 45 years of age and must have had accountancy and administrative experience, not necessarily in a transport undertaking. The person appointed would be responsible to the General Manager of the Municipal Transport Department for all the administrative, accountancy and statistical work of the Department, and would take over the duties presently carried out by the Secretary and Treasurer.

The appointment is subject to the provisions of the Corporation Superannuation scheme, which is a Local Act Scheme, and the successful candidate will require to pass a medical examination.

Applications, stating age and full particulars of qualifications and experience, together with copies of not more than three recent testimonials, must be received by me in an envelope endorsed "Municipal Transport Department: Deputy Manager," not later than 18th November, 1944. Persons at present serving in H.M. Forces or engaged on war duties are invited to make application for this appointment.

WILLIAM KERR, Town Clerk.

City Chambers, Glasgow, 15th September, 1944.

RHODES-LIVINGSTONE INSTITUTE, LIVINGSTONE NORTHERN RHODESIA

RESEARCH APPOINTMENTS.

The Rhodes-Livingstone Institute invites applications for the following research posts in Northern Rhodesia and neighbouring territories:

- 4 social anthropologists or sociologists
- 1 economist.

The general terms of service are:

1. *Salary:* On Scales of £500-£700 in six years, or £450-£700 in nine years according to experience. (Persons of very senior status may be appointed at higher initial salaries.)2. *Period of Appointment:* Initial appointments will be for 3 to 3½ years, with a strong possibility of extension for a further 3 years.3. *Probation:* Experienced research workers will not have a probationary period. Inexperienced workers straight from a university will be confirmed in their appointments after 18 months' service; should an officer not be confirmed he will be required to repay his passage outward and pay his own passage home.4. *Additional Provisions:*

- (a) Free quarters;
- (b) Free medical services on the same terms and conditions as Northern Rhodesia Government servants;
- (c) Free first-class passages to and from Livingstone;
- (d) Annual local leave, in addition to leave at the expiry of the contract, the latter to amount to 5 days for each month of completed service;
- (e) The Institute will contribute £70 per annum towards insurance and endowments taken out by officers, while they are in its employ;
- (f) The Board of Trustees will grant sick leave on full pay, for a period not exceeding 12 months, to its officers who fall ill during the course of their duties or due to the tropical climate and in addition the Board will cover each officer with a £10 yearly accident-illness insurance, which will be taken out in the name of the Board; any payments under this insurance will be allotted as the Board thinks fit.

Applicants are asked to state their age, place of birth, general training, research experience, and to give a list of their publications; they should submit as many testimonials, or names of references as they can; and should send a medical certificate stating that they are fit to do field-research in tropical areas.

Men and women will be considered on equal terms; married couples, both of whom are research workers, will count as two officers if appointed as such. Men and women serving in the national forces are asked to submit their applications, and allowance will be made for the fact that it may be some time before they can take up their posts. However, where possible, applicants are asked to state when they would be free to come to Livingstone, if arrangements can be made for them to travel.

To: The Director,

Rhodes-Livingstone Institute.

P.O. Box 195, LIVINGSTONE, Northern Rhodesia.

INTERNATIONAL STUDENT SERVICE

The British I.S.S. Committee invites applications for the post of Director, at a salary of approximately £700 per annum, for a minimum period of two years. Duties will include the organisation of a National Appeal for world student relief, together with educational work in the Universities. Applicants should forward five copies of their applications, accompanied by recent testimonials or references by October 14th to The Secretary, International Student Service, 11d, Regent Street, London, S.W.1.

More Perfect Union

THE Governments of France and Belgium have returned to their countries. The Dutch will follow them soon, and now that these Allied neighbours are leaving London it is time to ask a question that could not perhaps be fully answered until their sovereignty was fully restored and they had re-established contact with their own peoples. The question is quite simply whether the bitter strategic lesson of 1940 and 1944 has been learnt, and whether the nations intend to develop a policy in accordance with that lesson. In 1940, and again in 1944, Western Europe has learnt that it has no hope of successful defence without Britain. Equally Britain knows that without the western fringe of Europe, it cannot ward off the threat of bombardment and invasion. Separate, they fall. Together, they can lay the foundations of security.

These are the simple facts from which arise the desire for closer and more permanent union between Great Britain, France, Belgium and Holland—to which might well be added Norway and Denmark. It is not only in this country that the idea has been discussed. General de Gaulle, some months ago, gave expression to a similar idea. The Dutch and Belgian Governments have concluded a currency agreement and are discussing, in

general terms, the project of a customs union. Both these are specifically designed to invite the collaboration both of France and of Britain, and a British-Belgian currency agreement has been announced this week.

This idea of a closer association on the West Coast of Europe has hitherto suffered from some of its expositors. General Smuts was one of the first to give it authoritative expression, and he did so in the clumsiest possible way. What should be a project of Mutual Aid, of Good Neighbourliness, was presented as a means for aggrandising the competitive power of Britain, and was coupled with the most offensive remarks about France. So presented, it offended American opinion, on whose ears all discussion of "power politics" still grates. It offended Russia, against whom alone the combination would be directed. Most decisively of all, it offended the potential members of the association, who were invited to see in it only a means of subordinating them to British policies and exploiting them for British ambitions. And internationalists all over the world were affronted by a proposal that seemed to smack of exclusive particularism.

It has taken a long time for even such an obviously sensible idea to recover from such sponsorship. Fundamentally, of course, there is nothing in the proposal of a

closer association in Western Europe to which anyone could reasonably object—save perhaps some future German aggressor. To American critics it can be said that the sort of association proposed is no more harmful to the outside world than the Pan-American Union—and that it would have a more real economic, cultural and strategic content. To Russian critics it can be said that the basic idea would, but for one thing, be identical with that which leads them to take an interest in Finland and the Baltic States, in Poland and Roumania—the one difference being that the Western Association would proceed only by the free consent of all parties. And to the Western Europeans themselves, whose desire for unity is qualified only by apprehensions about the restoration of their full sovereign status, it can be pointed out that there is no country on earth that has had more experience in respecting the equal status of smaller countries than the leader of the British Commonwealth of Nations.

Nor is there any reason why closer union in Western Europe should be considered to prejudice the chances of a more universal organisation. The practical possibilities along the universal line are being seen, at Dumbarton Oaks, to be very restricted. But even if that were not so, another association of free and peaceful nations should properly be regarded as a step in the right direction—as are the Pan-American Union and the British Commonwealth. Anything in the nature of an all-European union or federation is clearly not practical politics at the moment. In the East there is a Russian veto on any such projects; in the centre there will, for many years, be a German void. In the Mediterranean, Spanish ambiguity and Italy's probationary status are obstacles. There is nowhere but the Western fringe where a start can be made and where the techniques of merging sovereignty in a wider unity can be worked out.

At the moment, by a paradox, the chief step necessary to achieve closer relations is not less sovereignty, but more. The attitude of France is to a great extent the determining factor in any schemes for closer union. At the moment, the French are bewildered and upset by the fact that Britain will not afford full recognition to the Provisional Government of General de Gaulle. Until this step is taken, it will be quite impossible to stabilise the relations between the two countries, least of all to suggest closer relations, which can easily be twisted into meaning a subtle attack on French independence. It is an inflamed and sensitive point. The British Government will need all its powers of tact and friendship to make it obvious that the proposal of closer association is not a disguised attempt to strengthen Britain but a common interest of equal powers, all concerned with forwarding their own security. It was evident, however, from last week's debate that the Foreign Secretary believes progress can be made, since he gave the proposal his explicit blessing.

*

How can the project be best advanced? The only method of approach lies through particular objectives, not through formal surrenders of sovereignty. Mr Churchill's dramatic offer, in 1940, of complete union between Britain and France was one of the great gestures of history. But it is not by such means that progress can best be made now. Any proposal of a federation, or a union, would rouse the maximum opposition, outside the countries concerned as well as inside. A more helpful precedent is to be found in the close association achieved between Britain and France in the first months of the war, the outward form of which was a number of *ad hoc* bodies, each dealing jointly with a specific problem—finance, supplies, transport and so forth. With appropriate modifications, this is the best system to adopt now.

The first priority is naturally defence, since security is the impelling reason for a closer association. This war has shown how many different expedients in the way of pooling are possible, without an official abatement of sovereignty. The Combined Chiefs of Staff, who now link the American and British forces, might be reproduced in more permanent form to ensure the strategic

unity of Western Europe. The types of weapons used should be standardised and, if a further precedent is needed, it can be found in the Combined Production and Resources Board. Research into developing methods of defence could be carried out jointly, and it should be possible to see that the staff colleges and military academies of the four countries not only gave the same type of instruction but were in close touch with each other. In this manner, a common "staff mind" would be built up.

Strategy, of course, is meaningless without foreign policy. The complete co-ordination of foreign policies is perhaps too much to expect. The British spokesman at the new Geneva will not be able to "speak for" the countries of Western Europe in the sense of committing them by his words. But he can, and should, speak for them in the sense of consulting them before he takes his decision—France, of course, will always be directly represented. The British Government should cultivate the habit of consulting as regularly with Paris, Brussels, The Hague, Copenhagen and Oslo as it already does with Ottawa, Canberra, Wellington and Pretoria. And, in the one case as in the other, such consultation will almost always result in an agreed policy.

The scope for closer association in economic matters is as great as in political affairs. But the problem is more complicated. It should be possible to proceed from the clear to the less clear. Currency arrangements—at least for the transitional period—are among the most obvious objects of common policy, and it is in this direction that discussion has already proceeded furthest. The economic interdependence of these six countries is so great that they can hardly draw up Full Employment policies except in concert—and with Full Employment goes, of course, capital development and budgetary policy. Civil aviation is another matter in which there is an obvious community of interest—the greater in view of the fact that British, French, Dutch and Belgian colonies adjoin each other all over the world.

But when the proposal for closer association in the economic field is broadened out to cover the general mutual trade of the countries concerned, the matter becomes more complex. For Imperial Preference among the British nations there is—or at least is asserted to be—a special exception to the Most Favoured Nation rule. Whether any such exception would be granted to preferential arrangements among the countries of Western Europe is much more doubtful. The proposal would be likely to arouse strong opposition, in particular, from the United States. It would, therefore, seem to be a case of all or nothing—either a complete customs union or the *status quo*.

There is very little room for doubt that the creation of such a customs union—a unified market of 115 million people, not counting any of their colonial dependencies—would be an immense benefit to its members and to the world at large. But that does not mean that everyone would be in favour of it. From the British end, there would be opposition from the Dominions as well as from domestic producers. (How, for example, would the steel industry like the prospect of free imports from France, Belgium and Luxemburg, or the farmers that of unlimited Danish bacon?) And the other countries might well be as suspicious of a British proposal of customs union, as the British themselves would be of one coming from America. The possibilities will need to be very cautiously explored.

*

Another obvious field for joint effort is the development of the Western European countries' colonial empires. In Africa and the Far East, political divisions do not always conform to geographical and physical differences, and economic development on a regional basis would give far better results. This is obviously the case in West and Equatorial Africa. There could of course be no question of diluting the political administration. Such a proposal would arouse fears for sovereignty and possibly suspicions of the "imperialist" intentions of Great Britain. It would also bewilder the local peoples and retard their develop-

ment towards self-government. Yet joint technical services should be possible at once in health, agriculture, engineering, and transport. Principles of administration could be approximated over a period of years to a long-term goal set for self-government, not piecemeal, colony by colony, but on a regional scale.

Such suggestions may sound revolutionary, but the Lancaster bomber and the assault craft and the duck and the doodle are all revolutionary. The environment of peaceful living in Europe has changed drastically in the last twenty years and unless the nations are prepared to alter their habits as drastically, they will go the way of all those who have failed to adapt themselves to their environment—they will not survive. Yet while these projects are revolutionary, they are also intensely delicate.

Real Estate

HOUSING and town planning and the complex of questions connected with them have been all but monopolising the attention of Parliament since its re-assembly. The Commons have passed the "Portal Houses" Bill and have been dealing in Committee this week with the "Blitzed Areas" Bill. The Lords have had an interesting and authoritative two-day debate on Lord Balfour's motion. All this is quite natural, for the housing and planning complex interests almost every section of the public. For the practical-minded, there is the urgent need for repairs to damaged houses and for new dwellings. For those with a longer vision, there is the knowledge that the next few years provide an unparalleled opportunity—perhaps the last one—for bringing some order and beauty into the squalor that the nineteenth century left behind and the twentieth has created.

There are three main inter-related problems. The first is housing—the provision of shelter for those who have none and, thereafter, the replacement of unsatisfactory houses. The second is planning—the proper use of the land. The third is location, usually regarded as the location of industry, but equally properly considered as the location of housing. Each of these has its attendant subjects, such as the organisation of the building industry or the re-training of labour. And each of them is criss-crossed by financial difficulties. But fundamentally they make a single complex and no one of them can be fully solved in isolation from the others. All three are but different aspects of the single great subject, how the country can make the best use of its land and buildings, its real estate.

The Government is moving on all three lines. There is a large-scale mobilisation for repair work in London. Housing and planning Bills are now before Parliament, and the sections of the recent White Paper on Full Employment that dealt with the location of industry were

At every step, outraged national feeling, crusted vested interest and inveterate suspicion lie in wait to check this experiment in organised Good Neighbourliness. It is therefore essential that it should be launched at once. The enthusiasm of common victory, the good will and gratitude of shared hardship still link Britain to her eastern neighbours. In Europe, too, the unscrambling of the New Order must leave a period during which a sort of economic vacuum will prevail, before new interests and new groupings have time to come together. Therefore now, when optimism is highest and opposition is most disorganised, is the time to make the proposals, try the plans and put the whole weight of British prestige and diplomacy behind the project of a "more perfect union" between Britain, France, Scandinavia and the Low Countries.

among that document's most promising passages. With this show of activity, it might seem churlish to cavil. Yet there is a great deal of criticism. In housing it takes the form of a demand for a separate Ministry of Housing—a sure sign that public opinion recognises the existence of a problem without knowing what the solution is. In planning there is a sustained barrage of criticism both from the perfectionists and from the "interests." The location policy is not yet under fire, but that may be only because its practical shape cannot yet be discerned.

It would be impossible to deny that the steps being taken by the Government are both piecemeal and provisional, and that, even in the sixth year of war, must presumably be accounted a defect. In housing there is a scheme for temporary houses, but not yet a building programme. In planning there is a Bill to help "blitzed" and "blighted" towns, and a White Paper on betterment and compensation, but no decision on what sort of planning is to be done by whom. In location there is only the abstract statement of some admirable generalities. This is the indictment of the critics, and it is an impressive one. They clamour for comprehensive and co-ordinated policies. But what they do not seem to realise is the magnitude and difficulty of the questions that have to be answered before whole-hog policies can be adopted.

*

In point of time, the need for houses is by far the most urgent. Unless it is adequately met, proposals for improving the layout of towns will be regarded as a luxury and their claim to a share of the national resources strongly opposed. The immediate needs of the demobilised population must clearly be met, whatever the cost. Everyone must be housed somewhere. In practical terms, this

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

For particulars apply to:—

Incorporated

means a large programme of temporary, pre-fabricated houses and the quickest possible start with permanent housing to replace the temporaries, as well as to house displaced populations and to clear the slums.

So much is accepted common form. The big question mark relates to the size of the long-term programme of permanent housing. Should the building industry be swollen to an enormous size, in response to the urgency of the immediate demand, but at the cost of later unemployment? Or should a permanent industry of more moderate proportions be aimed at, with a much greater immediate emphasis on temporary housing? This depends on the probable level of demand for housing in the next thirty years, and that in turn depends on a major decision of Government policy. The ordinary wage-earner has never in history been able to afford the full economic cost of new houses—or at least of new houses that meet any reasonable standards. After the war he will be less able to do so than ever, since not only have building costs risen out of all proportion to incomes, but standards of housing are, with the best of intentions, being substantially raised. The great housing boom of the 1930s obscured this basic truth, which bedevils housing policy in other countries—even in rich America—as much as it does here. But the circumstances of the boom were exceptional, since it was nourished by the great rise in real incomes that followed from the drop in food prices in the Great Depression. And even so, the great bulk of the houses built in the 1930s were for the middle classes, who by 1939 were substantially rehoused. Precise prophecies are dangerous; but the overwhelming probability is that the continuance, after the first few years of urgent demand, of large-scale housing will only be possible if there are equally large-scale subsidies.

How much will it be reasonable for the state to find in housing subsidies, given the level of taxation and the many alternative claims for the money? This is the big question that is blocking the way to a comprehensive housing policy. And with the best will in the world, it cannot be answered lightly or quickly.

In the field of planning, the need for far-reaching decisions, and the difficulty of reaching them, is even clearer. It is impossible to get very far with planning without a solution of the compensation-and-betterment tangle. The Government has produced its proposals, but clearly anything so far-reaching and complicated must be fully discussed before it is enacted into legislation.

Another of the basic difficulties has come to the fore in the discussion of the "Blitzed Areas" Bill now before Parliament. The re-development of crowded cities along roomy and spacious lines involves a considerable outlay by local authorities upon the acquisition of land for public purposes; but it also involves a loss of a large proportion of their population—and consequently of their rateable value—to surrounding areas. The Planning Bill offers only grants to meet the cost of loan charges for redevelopment for a limited period. But to the cities concerned, the cost is permanent and the redevelopment schemes will themselves lower the cities' ability to pay. The Plymouth Plan, for example, proposes that the city should lose 40,000 of its pre-war population of 210,000, who would be rehoused over an area eight times the size of Plymouth itself. They would take £360,000 of rateable value with

them. How can ten-year grants towards loan charges meet a situation such as this?

The cities themselves suggest that their boundaries should be extended. This may meet the need in some cases, though it is difficult to believe that such large extensions could be put through quickly, whatever the law said. The wishes of the present inhabitants of the districts affected cannot be completely ignored. Nor could such a solution meet all cases—that of London, for example, where dispersal from the centre is planned over a vast area extending twenty miles and more beyond the boundaries of the County of London. More generous Exchequer grants may be another possible expedient; but they would clearly be an expedient only. It is difficult to avoid the conclusion that these practical planning problems—let alone the "comprehensive" plan to which the Government was at one time committed—cannot be solved without a fairly complete recasting of the whole system of local government. Planning must be regional rather than local; but it cannot be both regional and effective until there are not merely regional planning authorities but also regional bodies with financial powers sufficient for them to recover out of the gains of the country the taxable capacity lost by the towns. The practical politician could hardly be set a larger or more difficult task than that.

In location, too, the country is in the position of having committed itself to an end without having sufficiently examined the necessary means. The new policy is to take the work to the labour, rather than the labour to the work, and wholly admirable it is. But as a means of execution, the Government is apparently not yet prepared to go beyond the prohibition of new factories in some areas (pre-eminently London) and "inducement and persuasion" to industrialists to build their new factories in other areas, such as South Wales and Durham. It is very doubtful whether this will be enough to exercise a decisive influence over the location of new factories. They will, no doubt, be kept out of London. But they will go to Leicester and Nottingham and Bristol rather than to the black areas. If the policy is to be a reality, industry will have to be told, not only where it may not build, but where it shall. Is the country ready for that? And even such drastic compulsion may not be enough, for the annual increment of new factories is very small compared with the existing number. To take the work to the workers, it may be necessary to compel existing, established industries to move. When will the country be ready for that? Yet without it, the new location policy may turn out to limp very badly.

Here, then, are three very large questions of policy. Shall there be enormous housing subsidies? Shall the fabric of local government be taken apart and put together again? Shall compulsion be exercised over the location of future, and even of present, industries? Answers to all three are necessary if the housing and planning complex is to be comprehensively tackled. But all three are very difficult to answer. The Government will not have done its duty until it speaks its mind on all three. And the critics will not have established their claim to responsibility until they too have faced these major obstructions.

A Policy for Wealth—VII

Managers and Distributors

PREVIOUS articles in this series have discussed the major elements of a policy for speeding up the wealth-creating process in this country. The present, and penultimate, article is concerned with two further matters, unconnected with each other save for the fact that no survey of national productivity could be concluded without some mention of them. The first of these is the quality of industrial and commercial management. The second is

the efficiency of the distributive mechanism of the country. The following article will summarise the whole series.

The article that appeared last week raised, as one aspect of the subject of technical progress, the lack of adequate scientific qualifications among the managers of British industry. But the question of management is far wider than the possession of, or failure to possess, a scientific degree. The first job of the manager is to manage, and

though that cannot, in these days, be adequately performed without some technical qualifications, scientific knowledge is in itself no guarantee of efficiency in management. The wider question must be asked, Are British managements efficient?

This is another large question on which no generalisation is possible without a thousand exceptions and disproofs being immediately offered. Unquestionably, there are efficient managements in Great Britain, doubtless among the most efficient in the world. But he would be a hardy optimist who would contend that, on the average, the quality of management in productive industry in Great Britain is as good as it is in either of our two main rivals, the United States and Germany. Indeed, the proof can be found in the pervasive spread during the last two decades of the doctrines of protection and safety first, of organised restriction and subsidised stability. Efficient industrial enterprisers, who took a pride in their powers, would scorn such resorts of the inferior.

One reason for this state of affairs lies in the extent to which British business management is still dominated by the amateur. It is only in this country that the curious profession of the "director of companies" still exists. There are thousands of men in this country who make a handsome living by sitting on a large number of boards and directing the affairs of companies to no one of which they can give more than a small fraction of their time and attention. Some of them, of course, are mere guinea pigs. Even the more reputable and hard-working, though they can offer their companies a great deal of sound general advice, based on a wide knowledge of men and affairs, remain the merest amateurs in relation to each one of them. That a sprinkling of such men would be an asset to any board is beyond doubt. But that so many boards should consist entirely of such men cannot be other than a handicap to wise, energetic and far-sighted management. The description of company directors in the Liberal Yellow Book nearly twenty years ago is still all too true today:—

A director, once appointed, though nominally requiring re-election every few years, considers himself entitled to the office for life, unless he chooses to retire. . . . Sometimes there may be a chairman or a group within the board strong enough to drop a useless director. But, generally speaking, a director would consider himself greatly aggrieved if he were dropped merely because he was elderly, useless or without special qualifications for the work. It would even be considered bad form to propose such a thing. Since the duties are indefinite and the privileges agreeable, the way is open to various kinds of jobbery. The pay is often high in relation to the work done; though for directors who take their duties and responsibilities seriously, it may often be too low. Some individuals hold dozens of directorships. A director on resigning frequently expects to be succeeded by his son. A directorship is, therefore, too often considered as a pleasant semi-sinecure and a desirable vested interest, for the loss of which compensation is expected as a matter of course. Directorships are, in fact, the "pocket boroughs" of the present day.

This could hardly be written about either America or Germany. In both countries the structure of company organisation is somewhat different. In America, the institution of the President of a company, with his Vice-Presidents, some or all of whom are usually members of the board, enhances the status of the full-time expert managers and gives them a much larger voice in policies. In the majority of American corporations the outside directors are, and regard themselves as, consultants. Multiple directorships are far less common and multiple chairmanships very rare. In Germany, the distinction between the board of directors and the supervisory council has (or had) much the same effect.

Anything that would increase the expert element in the typical British board would be an improvement. Even in the most hidebound companies there are usually a few keener spirits in the ranks of the management. But if an ambitious man knows he cannot attain to the board, which is reserved for influential outsiders, he will go elsewhere. There should be a steady gradation, not a rigid barrier,

between the executive managers and the highest policy making organs. Only so can practical experience have an immediate impact on policy.

But structural changes by themselves would have little effect. The quality of personnel is all-important. Here the indictment is thrust back on the educational system of the country. British education is not at present producing good businessmen. Partly this is because business does not recognise education as a qualification, and partly because education does not recognise business management as a profession. In either case, it is a condemnation of both parties. This is not a plea for "Business Schools," though they have their value. It is a plea for recognition of the fact that the successful management of business requires the educated qualities—wide visions, discriminating judgment, intellectual self-confidence. And it is a plea that the production of wealth for the consumption of the community should be regarded as one of the worthiest professions in which educated minds can be employed.

This is clearly too wide a subject for more than mention in a single article at the end of a long series. It is, after all, only part of what should be one of the major national preoccupations, the Supply and Use of Brains. All that can be done here is to note the fact that without business management of the highest quality—be it in private or in public employment—no policy for wealth can go very far.

It is no part of the purpose of this series of articles to enter upon a discussion of the problems of individual industries. But there are three industries which cut across all forms of economic enterprise and which consequently lie very close to the centre of any policy for increasing the national efficiency. These are transport, fuel and power, and distribution. Transport has, within the last few weeks, formed the subject of a special series of articles in *The Economist* and it is not proposed to say anything further here. Fuel and power are the objects of the most familiar and constant concern, on which also everything has already been said many times. There remains distribution, in itself a fit subject for the most extensive treatment, but on which only a few general considerations can be noted here.

In the modern age, distribution, in all its various branches, is far and away the largest industry of the country. Any technical inefficiency in it must therefore have an appreciable reaction on the national income, both directly and through its effects on the efficiency of other industries. It is these latter with which we are here mainly concerned.

The merchant has always played a very large part in the structure of British industry and commerce. Possibly because of his essential services in the export trades, he has, in many industries, achieved an almost dominating position, as the entrepreneurs' entrepreneur. Structures that have worked well in the past should be tampered with only very cautiously. Nevertheless there is a case for saying that the merchanting organisation is acting as an obstruction to the technical rationalisation of a number of trades. The small scale of enterprise in the selling end imposes a small scale of operations, or at least an uneconomic variety of types of production, at the manufacturing end. This is most visible in the textile industries, but it can be seen in many others. Variety of types, with the high costs it imposes, often exists not because the ultimate consumer demands it, but because the merchant requires it to sustain his identity. Each industry, of course, has its own problems, and generalisation would be unwise. But at least it can be contended that, in any scheme of technical rationalisation, with the object of greater efficiency, distributing methods should not be left out of account.

Another and specific source of waste in distribution is to be found in advertising. Not all advertising, of course, can be dismissed as wasteful, and since the total expenditure on all forms of advertising in peacetime is only some 2 per cent of the national income, the dimensions of the problem cannot be large. Advertising may even have

a beneficial effect if it helps to build up a larger market for specific lines of goods which can be more cheaply produced in large quantities. But some types of advertising are clearly pure waste, such as the rival hoardings that shout the merits of different beers, or the advertising campaign which merely enables a branded commodity to sell for more than the identical goods without a brand. It is difficult to see how the good and the bad types of advertising can easily be distinguished, and still more difficult to see what could be done by public policy to penalise the one without the other. But the subject clearly cannot be omitted from any survey of economic efficiency.

NOTES OF THE WEEK

Events and Hopes

When Mr Churchill gave his last survey of the war, before Parliament rose for the summer recess, the American First Army had just broken through into Brittany, and the apparent stalemate in Normandy was over. It was a time when events, swift though they were, did not move fast enough for thoughts and hopes—minds jumped ahead to the liberation of France while the Allied armies still held only the north-west corner. Then, suddenly, events not only caught up with thoughts, but outpaced them. Three weeks after Mr Churchill spoke, Paris was freed; the liberation of France was completed with the advance of the French and American armies from the Mediterranean; with breathtaking swiftness another capital fell to the Allies, and Belgium was freed; within three weeks of the fall of Paris the Americans had crossed the German frontier. It is small wonder that when the Battle of London was declared over and air-raid precautions relaxed, thoughts should once more take the lead and expect a speedy end to the war. They have been disappointed. The Germans are fighting back fiercely; their garrisons in the Channel ports held out with a tenacity only rivalled by the defenders of Tobruk; the British Second Army is still held in Holland. Nor was there any encouragement to be obtained from Mr Churchill's somewhat pedestrian survey of the war last week. He gave some impressive facts about the strength of the Allied armies in north-west Europe—two to three million men,

equipped with the most perfect modern weapons and every imaginable contrivance of modern war.

and casualties have been relatively light—after 120 days' fighting, 90,000 British killed, wounded or missing and 145,000 Americans. But he gave a warning that the war might be prolonged well into 1945. Yet though hopes have been subdued in the last few weeks, and people are adapting themselves to the idea of a sixth winter of war, there is still a chance that events may recapture the speed with which they marched six weeks ago. There was no hint of drama in Mr Churchill's speech, which may well have been his last survey before the German war ends, and, indeed, he suggested that the end would not come with dramatic suddenness, but would rest on a declaration by the Allies while mopping up of Nazi guerillas continued. But events, whether they move slowly or quickly, are inexorable, and the drama is there whether the final curtain comes down in six months or in six weeks.

The Second Fall of Warsaw

On Monday, October 2nd, the last shots were fired by the Polish insurgents in Warsaw. So ended the most tragic fight of this war. It started on August 1st, when the thunder of Russian guns shook the walls of the Polish capital. The Russians were approaching Warsaw, and, as Marshal Stalin told M. Mikolajczyk, they expected to capture it by August 6th. Accusations that the rising was "premature" are therefore false. The real tragedy of the rising was that it had not been prepared in co-ordination with the Soviet Command. Only the Soviet military authorities would have been able to fit the insurrection into the general pattern of the campaign in Poland, and, while giving effective assistance to the insurgents, to draw the maximum strategic benefit from the battle. That this co-ordination was lacking was certainly not the fault of any particular Polish commander. It was the direct result of the suspended relations between the Polish and Soviet Governments. The political

The main conclusion to be reached by anyone who, with this purpose in mind, reviews the problem of distribution is that we know so little about it. There is no department of the national life of comparable importance on which there is so little information that can be relied upon as a guide to public policy. It is good news that the Board of Trade is at last bestirring itself to organise an authoritative voyage of exploration. There may be shocks as painful—and as salutary—to be derived from a comparison of distribution methods in this and other countries as are sustained by anyone who inquires into the relative efficiency of productive industry.

situation produced a military tragedy. Even so, the rising might have succeeded had the Russians not suffered a severe setback at the gates of Warsaw in the first days of August. Their reverse resulted in a Polish Armhem, which was the more tragic because it lasted not ten but sixty-three days, because it entailed unspeakable sufferings for more than a million civilians, and in the words of the communiqué from Hitler's headquarters, "it led to the total destruction of the capital." In August and September the main Russian force to the east of Warsaw was unable to link up with the Poles, who virtually acted as its vanguard in Warsaw. Only by air could any assistance be despatched to the insurgents to enable them to hold out until the Russians were ready for the final assault. From the west the assistance was given relatively early. But it was hampered by bad weather and by long distances; and it could not be adequate. From the east no help was given until the middle of September, by which time the insurgents had already lost most of their vantage points inside the city. Meanwhile an inexplicable dispute arose between the Allies over the question of landing facilities. The Americans were ready to fly substantial help to Warsaw provided they could land on Soviet airfields to the east of the capital. Inexcusably, the Russians first refused, and then, very late in the day, rescinded the first decision. All these delays cannot but have worsened the chances of the insurgents who were in any case fighting against very heavy odds. Thus at every stage the political divergences between the Allies deepened the tragedy of the Poles. This is the grave warning which must be drawn from the second fall of Warsaw in the sixth year of war.

Polish Test

The Warsaw insurrection has clearly demonstrated the extent to which the Polish political parties in the Mikolajczyk Government genuinely represent their people. It has also shown how little political influence is exercised by the Soviet-sponsored National Committee. The insurgents of Warsaw have sealed their allegiance to their Government with their own blood. The rising was not confined to small military groups. Broad masses of the people were drawn into it. The Committee, on the other hand, was so surprised by the rising that at first it even denied that fighting was taking place in Warsaw. It is surely obvious that these facts have one lesson and one only for the Russians. If they really want a genuine agreement with the Polish people, they must reconsider their attitude towards the Polish Government. But will this conclusion be drawn? During the rising a crisis among the Poles in London led to the dismissal of General Sosnkowski, the former Commander-in-Chief, notorious for his opposition to reconciliation with Russia. The Polish President at last acquiesced in the General's departure. At the same time, he has not pressed his former demand that the extreme Nationalists should enter M. Mikolajczyk's Government. Thus, on the Polish side, a serious effort has been made to remove the genuine obstacles to a policy of agreement with Russia. Yet to the surprise of everybody, these conciliatory steps met an unworthy and obstructive reply. Various members of the Soviet-sponsored Committee of Liberation chose the occasion to launch a vituperative attack upon the Polish Government and upon the newly appointed Polish Commander-in-Chief, the commander of the rising in Warsaw, General Bor-Komorowski. The General was again branded as a "criminal"; and the Chairman of the Committee, M. Morawski, threatened

him with court martial. The leaders of the Committee have apparently taken no notice of the joint British and American statement in which both Allied Governments recognised General Bor's Army as a combatant force, protected by the Allies. Does the Soviet Government endorse these threats? If so, then the result may be that an Allied Power will violate those combatant rights which the enemy has been categorically warned to respect. There is only one conclusion to this melancholy history. Either the Russians will very rightly repudiate the despicable conduct of the Committee of Liberation, or their own record will be so compromised that a dangerous wedge may be driven into Allied unity. Germany is not yet finally defeated. The war may possibly drag on for another winter. Can any Allied Power be interested in risking a deep cleavage in the Allied camp in such critical days?

Civil Aviation

Two conferences on civil air transport are to be held in the next few weeks, a British Commonwealth meeting in Montreal on October 23rd and an international conference in the United States in November. The approach of these meetings is forcing decisions—or at least a decision—from the British Government. There are four main points at issue. The first is one of administration. Mr Churchill, replying to a parliamentary question, has already stated that Lord Beaverbrook is no longer responsible for civil aviation policy and that his committee has finished its work. It is now forecast that a Minister of Civil Aviation is to be appointed. This independent status will serve to mark the importance that attaches to the problem, and will therefore please the critics, as will the definite divorce from the Air Ministry. But if there is to be a comprehensive Ministry of Transport after the war, civil aviation should be regarded as coming within its sphere. The second question to be decided, so far as domestic policy is concerned, is the degree of free competition to be allowed in British civil air transport—is there to be a chosen instrument or not? There is much less reason to believe that the Government is approaching a decision on this very much controverted question. The last hint of its attitude was Lord Beaverbrook's suggestion, some months ago, that a monopoly of subsidy did not necessarily connote a monopoly of licences.

But the basic question is, of course, the supply of aircraft. The United States Government has guaranteed to Lord Beaverbrook that transport planes built in America will be made available to Britain with the slackening of military requirements. This follows from British concentration on the production of fighters and bombers and dependence on American factories to supply aircraft suitable for military transport. But it does not altogether solve the problem of British civil aviation. It is hardly likely that America would willingly release large numbers of the newest—and, consequently, more economic—types of civil aircraft produced in its factories to be used on British routes. The bulk of American transport planes sent over here will most probably be adapted military types, with a correspondingly high cost per ton-mile. They would help to bridge an awkward gap, but will not, by themselves, set British aviation firmly on its feet. The Government will probably, and rightly, be asked before long to release many more aircraft designers and technicians to concentrate on the long process of evolving transport aircraft suitable to the needs of peace. However generous the allocation of American planes to Britain, American factories will still have every advantage of experience and organisation. A delay of months in the reconversion of the British aircraft industry may well prove a permanent handicap not only to the development of transport services, but also to the export market for British aircraft. The final question for civil aviation after the war will concern the international agreement on routes outside the frontiers of each country. After the Anglo-American talks in April, it became clear that the ideal of full internationalism had been rejected. The exact nature of the alternative is still obscure, though it will probably take the form of national sovereignty over civil aviation, with the mutual grant of the Right of Innocent Passage, but with the right to put down or take up pay load depending, in every case, on specific agreement. If this is to be the highest common factor of international

agreement, the recent suggestions of the Australian Air Minister, Mr Drakeford, probably provide the best solution so far as British interests are concerned. He proposed a Commonwealth air transport service, to be run jointly by the United Kingdom, the Dominions and India, with provision for optional cooperation by other countries wishing to join. The advantages of such a plan should recommend it not only here, but also to other countries with dispersed colonial possessions—France, Belgium or the Netherlands, for instance. Whether or not such a sharing of cabotage rights would be resented by American opinion, with its not entirely disinterested insistence on "non-discrimination," will probably become clear when the international conference meets next month.

The Bretton Woods Debate

It appears to be the intention of the Government to hold a debate in the House of Commons on the Bretton Woods Agreement within the next few weeks. A debate, regarded purely as a discussion, might be all to the good. A debate is already raging in the press and elsewhere, which seems to be entirely conducted by the fanatics on both sides, and a Parliamentary discussion, if it attained the high level of the two preceding debates, would provide an opportunity for more responsible voices to be heard. But the difficulty about a Parliamentary debate is that it has to take place on a motion, and if the motion were one which committed this country either to acceptance or to rejection of the Agreement, it might well be disastrous. Public opinion in this country on the subject of Bretton Woods can be divided into three sections. There is one small section, not very heavily represented outside official circles, which likes the Agreement for its own sake. There is another small but very vocal section which will not have it at any price, regardless of the consequences of rejection. The great majority would seem to be in the position of being very doubtful about the wisdom or practicability of the schemes for the Fund and the Bank, but conscious of the fact that they are intended to form only part of a much wider scheme of international economic reconstruction. This being so, it is only common prudence to wait and see what the rest of the structure looks like, and whether it is worth paying what may be a heavy price for it. In particular, British action must necessarily wait upon American; Congress must speak before Parliament, for the simple reason that the great unknown in the whole situation is how far the United States is prepared to go in restoring a workable international system. Therefore, let there be a debate, but let it be upon the adjournment or on some non-committal motion. If the Government are so ill-advised as to ask for a decision, they may force more of the centre party than they imagine into opposition.

Answering the Bilateralists

The Chancellor of the Exchequer fired the opening gun, if not for Bretton Woods, at least for the line of thought that underlies it, in his Mansion House speech on Wednesday at the luncheon for the bankers and merchants of the City of London. Addressing himself to the criticism of those "who appear to think that the line of safety

for us after the war is to reserve our full rights to enter into discriminatory commercial and currency agreements, not only as a temporary measure during the transitional period, but permanently," Sir John Anderson claimed that the Final Act of the Bretton Woods conference did not decisively reject such a course. Nevertheless he attacked the doctrine on wider considerations. In the first place, because it runs counter to the master agreement under which this country has received lend-lease aid from the United States and by which the United Kingdom "agreed to work for the elimination of all forms of discrimination in international commerce"—with the sole qualification of Imperial preference. "We are bound by this agreement," said Sir John, "and we are going to honour it." He also referred to our commercial agreement with the United States signed in 1938 by which we accepted a policy of non-discrimination in trade. But apart from these treaty obligations, the Chancellor found convincing practical reasons for avoiding, if we could, the road to bilateralism and trade discrimination. "If we discriminate, other people can discriminate. If we indulge in barter, other people can indulge in barter. It is a difficulty in all agreements and contracts, that one party cannot have it all his own way." All this is very true. But it does not really go to the heart of the problem or answer the question that is troubling many minds. If it were merely a question of a free choice between a multilateral world system and restrictive barter schemes, there would be no hesitation—just as little as if you asked people whether they preferred peace or war. But to say that a multilateral and universal system is desirable does not prove that it is possible. That, surely, is the point. After the last war, a very similar attempt was made to re-establish a non-discriminating, non-bartering, multilateral system. It did not work, and in its failure, did a great deal of harm. Will it work this time?

Is it the Gold Standard?

Meanwhile the popular discussion is not concerning itself with difficult words like multilateralism and discrimination. There the question is simply: Is it a return to the gold standard? The question was raised again in the House of Commons at the end of last week by Mr Craven Ellis, who asked the Chancellor why this country should change over from a "commodity standard" such as had operated since 1933, to the system proposed at Bretton Woods. This gave Sir John Anderson an opportunity for stating the official view on this aspect of the controversy:

Since 1933 the monetary policy of this country and all other parts of the British Commonwealth in the Sterling Area has been on the one hand to maintain sufficient flexibility in the rate of exchange between sterling and other currencies to avoid a deflationary restriction of credit for monetary reasons, and on the other hand to avoid unjustifiable and undesirable exchange fluctuations, and to preserve stability so far as this is consistent with the avoidance of deflation. The International Monetary Plan, as I understand it, seeks to extend very much the same principle over a wider area. . . . The Plan recognises gold as a standard of value as must be the case in any plan concerned with the regulation of relations between gold based currencies such as the dollar, and managed currencies such as our own, but that fact does not in any way justify the assertion that acceptance of the Plan would involve a return in this country to the gold standard. I endeavoured to make this point clear with respect to the plan in its earlier form in the debate on May 10th last, and I am satisfied that there is no change in this respect in the plan as it emerged from the Bretton Woods discussion.

The Chancellor is right; but he is also a little less than fully ingenuous. Certainly, the Bretton Woods scheme is not the gold standard on any definition of the term hitherto familiar. But it is also true that, of the several different possible varieties of international currency arrangements, both the Bretton Woods scheme and the gold standard are examples of the same genus, that which attempts to provide convertible and stable exchanges. The popular notion is not wholly devoid of truth. Whether the man in the street is right to be so scared of gold is, of course, an entirely different question.

Asylum for the Axis

When in 1943 the British and American governments asked the neutrals to guarantee that they would not give asylum to Axis war criminals, the general response was negative. They were not ready to suspend, at anybody's request, a right they held to be the concern of their own sovereignty. Since that time, however, the Allies' rapid victories in Western Europe and the Russian advance into

Poland have brought the end of the war in sight. The question is no longer academic. At the same time, the world, neutral and otherwise, now knows far more about the brutality and horror of the crimes committed by the Nazis and their satellites. To-day, the neutrals still wish to safeguard their right of asylum, but most of them have now decided that they will not permit Axis war criminals to take advantage of this right. On September 7th the Swedish Government announced that their frontiers were closed to Axis refugees, and since that time they have underlined their determination by refusing to allow Anthoni, the notorious Finnish police official, to remain in Sweden. Switzerland has closed its frontiers to Axis refugees. The Spanish Government has told the British Ambassador that in no circumstances will it permit the country to become a hiding-place for Axis criminals. Turkey has barred civilian and military refugees from Axis countries and has, for example, refused to permit the former Bulgarian Minister of the Interior, Gabrovski, to stay in Turkey. Even the Argentine government, whose intentions were most suspect, has announced through its ambassador to London that it will receive neither Axis refugees nor Axis capital funds. On the other hand, Eire has not yet made up its mind. And Portugal has so far not replied. Yet it is in Portugal that some of the most notorious Axis refugees are reported to have arrived.

Greek Unity

The news of the landing in Greece arrived only at the last moment before going to press, but it had already become apparent that the Greek Government was getting ready to return home. Two of its members have already arrived in liberated Greek territory; and General Spiiotopoulos has been appointed Governor of Athens and Attica. It is a good augury that on the eve of liberation complete agreement has been reached between the various Greek political parties and guerilla bands. M. Papandreou's Government, which now includes the representatives of the EAM, is carrying out the programme outlined in the Lebanon Charter. The main points were first the assurance that the Greek people will have full freedom to decide their own system of Government. The implication is that the King will not return to Greece until a plebiscite has decided the issue of monarchy or republic. Secondly, all guerilla bands were to be subordinate to the Greek Government; and EAM was to join the Government coalition. All parties in the Government are now satisfied that these conditions are being fulfilled. The King is to remain abroad with the special task of looking after the international interests of Greece. The leaders of the two rival guerilla bands, General Sarafis of ELAS and General Zervas of EDES have met in the Middle East and put an end to their inter-guerilla controversy. Finally, the leaders of the EAM have repeatedly expressed their full confidence in M. Papandreou, who has returned the compliment with great civility. The immediate aims of the Government are the establishment of order in liberated Greece without violence and revenge; the freeing of Greek territory from all and any forces of occupation, including the Bulgarian forces in Western Thrace and Macedonia; and the speedy organisation of relief for the solely tried people of Greece. Meanwhile, in the territories evacuated by the Germans, patriots are taking over the administration. As they come into the open, the prominent rôle of the EAM becomes more and more obvious, for in most places it is they who are naturally taking over control. Yet, on the whole, its members seem to be exercising their influence with moderation and to be ready to share power with the other followers of the Government. The quisling security battalions are said to be in a state of disintegration—a state of affairs that causes some displeasure to a few extremists on the Right; but they seem to be too weak to oppose effectively the *bloc* of the Centre and the Left. In effect, although Greece has undoubtedly moved strongly to the Left, there is some hope that internal upheavals and civil war will not be the legacy of liberation.

Bulgars in Thrace

The presence and the activities of the Bulgarian forces of occupation in Western Thrace and Macedonia still present something of a puzzle. Mr Eden has given the House of Commons the assurance that the three great Allied Powers are agreed in demanding the immediate withdrawal of all Bulgarian troops from Greek territory as

a preliminary condition for an armistice. M. Papandreou, the Greek Premier, has made a statement to the same effect. Yet the Bulgarian troops are still on Greek soil. Last week it was reported that their continued occupation had been accepted by the Greek EAM. Since then, the leaders of the EAM have categorically denied that report, and they have stated that no underground organisation has been authorised to parley with the Bulgars. Sofia, however, repeats the stories about an agreement. It may well be that in the confusion prevailing in Thrace and Macedonia, irresponsible groups are acting on their own account; the agreement with the Bulgars may well have been made by some such group. But whether or not an agreement was made locally, the order to retire has not yet been given from Sofia. Why this delay? Russian armies are on Bulgarian soil, and if the Russian high command is now ready to take over the Bulgarian troops, it will presumably lose no time in seeing that the pre-conditions of the armistice—unconditional withdrawal—are immediately carried out.

The Cost of Social Insurance

The Government's White Papers on Social Insurance have had a good reception so far, though critics on the Left, suspicious of the Government's motives, are accusing it of deliberately holding up the publication of the scheme until the last convenient moment before the election, while critics on the Right are concentrating on its cost and on the dangers of setting up a new bureaucracy. Already, representatives of approved societies have expressed "consternation" at the "anti-democratic" character of the Government's proposals. There is, it is true, an element of justification for all the criticisms, whether on the Left or the Right. It is, for instance, all-important that the administrators of social insurance should be humane—as Sir William Beveridge himself pointed out in his speech to the Social Security League last week-end. There must be plenty of men and women in the Forces who have acquired experience in handling individual problems with sympathy as Army welfare or education officers, who could well fit into the civilian scheme when they are demobilised. And there are many people with a training in social welfare, in the broad sense of being free from the taint of charity and the poor law, whose services could be enlisted. But the chief point of contention will undoubtedly arise over the cost of the scheme. The White Paper was much less explicit on this point than it might have been. It gave the impression that the Government scheme would cost less than the Beveridge scheme. But in fact it is likely to cost as much, or even more. The figures show a reduction of £47 million for 1945 below Sir William's estimate. But this is largely because the figure put in for the cost of the National Health Service in 1945 is £22 million less than the Beveridge figure. Both figures are "notional" guess work, since there will be no National Health Service in 1945, and nobody knows what it would cost if there were. In addition to this, the official estimate excludes the cost of the new industrial injury insurance scheme (elsewhere estimated at £20 million), and unspecified (which was misprinted last week as "the specified")* amounts for training benefit and children's services in kind. The total of £650 million is therefore obviously a minimum estimate. These formidable figures cannot be shrugged off. The burden they represent is bearable but heavy, and Parliament will be right in scrutinising every detail closely. But it will be wrong if it delays the implementation of the plan, which must involve a great deal of legislation. Acts of Parliament will be needed to set up the new Ministry, to bring in family allowances, to replace the present Workmen's Compensation system, to introduce a national health service, and to establish the social insurance scheme itself. No time should be lost in fixing the Parliamentary time-table.

The TUC's Programme

The Trade Union Congress's plan for postwar reconstruction will be one of the main items on the agenda of the forthcoming conference, and at this stage of events it is essential to know what the organised labour movement proposes. Many of the proposals will commend themselves to the general public, and there will be universal support for the unions' declared aims: the abolition of unemployment, the provision of good houses, shorter hours of labour, better

* There was another error in last week's article. The reference to "marriage grant" should have been to "maternity grant." There is no marriage grant in the official scheme.

working conditions, and progressive improvements in the general standard of living. There will also be general agreement with the statement that "the promotion of national development and national security are . . . a responsibility of the Government, which demand some measure of planning, regulation and control," and with the very sensible proposal for a Manpower Budget. But much in the report is *vieux jeu*. Nationalisation has for years been the central plank of trade union and socialist policy, without any very clear definition of what it means or what it would involve. This time, it is true, there are important differences in approach. Instead of a demand for immediate full-blooded nationalisation of all industries and services, the more practicable and realistic suggestion of "staggering" the process is made. The first industries to be taken over would be fuel and power, transport and iron and steel. While many other industries, such as cotton, should ultimately be nationalised, it is proposed that they should be subject to regulation in the meantime. The Government would also exercise control over land utilisation, the banks, investment policy, physical planning and foreign trade, while a National Investment Board would be set up to plan and direct the flow of capital into the desired channels. Another difference between the present and previous statements is that the unions favour the public corporation form of nationalisation rather than direct State control. This approach was indicated in the Labour Party's proposals for fuel and power and transport. But like the Labour Party, the unions still seem to be primarily concerned with the form and mechanism of control, and the report goes into great detail about the various industrial boards and advisory committees which would be set up to run industry. All this is, by now, very familiar and very boring. What are all these bodies to do? What policy are they to pursue? Are they to aim at greater efficiency, and, if so, by what means? Is there to be higher productivity or merely higher wages? Will the consumer be not only represented on a Council, but served any better than he is now? These are the questions that are never answered—except sometimes with a few generalisations that are as empty as they are round. But they are the vital questions, and until they are answered, all programmes for the "control of industry" will merely provoke a yawn.

Chinese horse typical of the T'ang period

FLYING MONEY

Fei-Tsien—Flying Money—the ancestor of the bill of exchange, was invented in China in the seventh century. It provided a means of transmitting money from place to place and thus assisted in developing trade and travel in China's vast territories.

The Emperor of the T'ang dynasty who originated this method of payment little knew he was sowing a seed which would grow into a highly specialized financial system enabling nation to trade with nation.

Modern international commerce calls at many stages for facilities which only a bank with wide ramifications can provide. In whatever overseas transactions you are interested and whatever the nature of your engagements, this Bank, with an extensive branch system in the home country and banking connections throughout the whole wide world, is able to offer you unrivalled services at whichever of its 1800 offices is most convenient for your purpose.

MIDLAND BANK LIMITED OVERSEAS BRANCH:

122 OLD BROAD STREET, LONDON, E.C.2

The Unions and Employment

The subject on which the TUC might be expected to have something to say is the contribution that organised labour can make to the newly-defined national objectives of Full Employment, Social Security and rising living standards. The report does not go very far. Two aims of the trade unions are defined as being, first, to establish the worker's right to work at the job he wants and at appropriate rates of wages and conditions, and, secondly, to increase the workers' influence over the policies and purpose of industry. Both are unexceptionable; but again they come under the head of Take rather than Put. Sir William Beveridge did tackle the TUC directly on one essential point where Labour co-operation is vital—that is, the mobility of labour—and the TUC's reply is printed in the report. It recognises that mobility of labour is essential to the maintenance of full employment, and admits that many unions impose negative restraints on the movement of labour, such as preventing non-members from following a trade, or preventing their own members doing work in other trades. It agrees that transfer and direction of labour have been justified in wartime, but would not agree to compulsory arbitration or direction of labour in normal conditions. In effect, it seeks a definite assurance, a *quid pro quo*, from the Government before it will commit itself to a policy which would lead to mobility of labour.

Provided the Government was able to give adequate guarantees that it was genuinely pursuing a policy of full employment, and was determined to take all necessary steps to control prices and otherwise prevent the exploitation of the situation by private interests, the trade unions would undertake to avoid wage policies and demarcation or other practices which might impede the achievement of full employment.

It is not very helpful to demand the end before agreeing to the necessary means.

The Industrial Coalition

The extent to which the trade unions have become a part of the machinery of wartime government is indicated by the General Council's report to the 1944 Trades Union Congress. There are joint advisory committees and councils, or trade union advisory committees, attached to nearly every Government department, and they deal not only with aspects of the war which affect their members, but with many wider issues involved in the transition from war to peace. The TUC has been consulted by the Government about production, labour supply, industrial health and welfare, food rationing, clothes rationing, prices, fire watching, nursing, rehabilitation, education and local government. In fact, the industrial coalition would seem to be as complete as the political coalition, and will probably outlive it. As is very natural and proper, the liaison has been most close with the Ministry of Labour, and Mr Bevin has hardly moved a step without first consulting his Joint Consultative Committee of employers and trade union representatives, which originally advised him on mobilisation. In some cases, the committee has had to approve measures which have proved to be unpopular, such as Defence Regulation IAA against strike instigators. Just how unpopular this Regulation is, is shown by the fact that several unions have put down resolutions on the conference agenda, calling for its withdrawal. In view of Mr Bevin's position, it is extremely surprising to find that the TUC was apparently not consulted about the Government's demobilisation plan. Indeed, the General Council wrote to the Prime Minister in March, calling his attention to this "violation of the principle of consultation." Another case where consultation has been theoretical rather than practical has been with the Ministry of Production. The General Council complains that the National Production Advisory Council has been brought into consultation on important matters of policy "only at the last possible moment," and that the suggestion was made, as if to add insult to injury, that the Advisory Council should meet quarterly instead of monthly. It will be very interesting to have the replies of both Mr Bevin and Mr Lyttelton to the criticisms of Sir Walter Citrine.

Balkan Turmoil

With the Red Army advancing across the Balkans, the political situation in each area tends to fall into an almost identical pattern. Everywhere in Roumania and Bulgaria (and there are signs that the same may happen in Hungary)

the people regard the approach of the Red Army as a signal to settle accounts with their compromised dictatorial rulers. Police regimes are collapsing overnight like card houses. The popular forces coalesce with any pro-Allied groups among the military leaders that have managed to survive the terror of Antonescu and the Bulgarian Regents. The new Roumanian government under General Senatescu includes, besides the representatives of Peasants, Socialists, Communists and Liberals, not less than fifteen army officers. The new Bulgarian Government is a coalition of the extreme Left with the ex-fascist Zveno group—the Military League headed by Georgiev and Velchev. (They were the chief architects of the authoritarian *coups d'état* in 1923 and 1934, and Velchev himself was responsible for the overthrow of the Radical peasant government under Stambolisky in 1923.) It is only natural that these extraordinary coalitions, brought about under the pressure of war and defeat, should show a very low degree of political coherence. In Roumania the Government of General Senatescu has already been shaken by an incipient crisis. A popular clamour arose for a more radical and speedy purge of the Roumanian administration, which still shelters many of the former adherents of Antonescu and of the Iron Guard. A demand to reduce the number of generals in the government has also been raised. In Bulgaria, the upheaval seems to have gone even deeper than in Roumania. Reports on the Bulgarian forces of occupation in Western Thrace and Macedonia vividly recall the picture of the Russian army in 1917. Soldiers' councils have been set up, officers have been degraded, red flags hoisted, and normal saluting has been abolished. M. Velchev has issued a stern order to the troops to return immediately to normal discipline, to abolish Soldiers' Councils and to hoist no more red flags. Now Sofia reports that the Bulgarian army has been placed under the supreme command of Marshal Tolbukhin. Apparently, the Soviet commander has no patience with Balkan repetitions of 1917, and he is chiefly interested in the extent to which his men can get some help from the armies of the former satellites; and this obviously depends upon fighting efficiency measured by normal military standards. The Bulgarian Left seems to be ready to accept this policy, but it may be questioned whether it would have agreed to it so easily if its author had been Colonel Velchev and not Marshal Tolbukhin.

Unemployment Benefits

The Social Security White Paper has been quickly followed by government proposals to increase unemployment benefits as an earnest of good intentions. Mr Bevin introduced the Unemployment Insurance (Increase of Benefits) Bill to the House last week, and it is expected that the debate on the second reading will be fitted into the Parliamentary programme as soon as possible. The new rates of benefit, which show increases from one to six shillings a week, are tabulated below:—

	Present Benefits	Increased Benefits	Increased Benefits Under Agricultural Scheme
Men	20s.	24s.	22s.
Single women	18s.	22s.	18s.
Married women	18s.	20s.	18s.
Do. (supporting husband)	18s.	22s.	18s.
Men 18-21 years	16s.	19s.	15s.
Women 18-21 years	14s.	17s.	10s. 6d.
Boys under 18 years	9s.	12s.	9s.
Girls under 18 years	7s. 6d.	10s.	
Adult dependant's allowance (including wife)	10s.	16s.	14s.
First two children	4s.	5s.	5s.
Subsequent children	3s.	4s.	4s.

These new rates are designed for the interim period before the social security plans are put into effect. In some cases, such as the adult dependants' allowances and the benefits for men over 21 and for married women, the new rates reach the full standard of the Social Security plans; in others, such as the allowances for third and subsequent children and the benefits for single women, the increased rates are half-way between the existing and the proposed rates under the comprehensive plan. In the latter case, as with the benefit for married women supporting their husbands, the existing inequality of benefits for men and women under similar conditions is still retained. The distinction between agricultural and other workers will also continue—although with corresponding increases in the

rates—until the inception of the Social Security scheme. Until that time, those who will receive increased benefits will do so without any increase in their contributions to the Unemployment Fund. The accumulated reserves of the fund now stand at £285 million. Unless the interim period is unduly long, or the rate of unemployment unduly high, this should provide a reserve substantial enough to meet the demands of the temporary unemployment of the transition period between war and peace.

Six Months' Finances

The chief item of interest in the revenue figures for the first half of the financial year is the effect of pay-as-you-earn on income tax collections. Income tax shows an increase of as much as £57,340,000 on the amount for the first six months of 1943-44. For the year as a whole, income tax was estimated to bring £116 million more than in 1943-44, and almost half this increase has been gained in six months, although, even with pay-as-you-earn, the greater part of the collection still takes place from January to March. The other revenue item to show a big increase is, ominously, customs and excise. In the full year they were estimated to show a decline of £5,000,000. In the first six months they have actually shown an increase of £33,466,000—a significant warning of the measures that will be necessary to prevent wholesale spending when the war with Germany ends. On the expenditure side, it is worth noting that expenditure on the war is still increasing, the amount spent on the supply services—£2,722,702,000—being £114 million higher than in the first six months of 1943-44. The following table gives the supply service expenditure, quarter by quarter, since 1942-43:

	(£ million)		
Quarter	1942-43	1943-44	1944-45
I.....	1,198	1,304 (+106)*	1,315 (+118)*
" II.....	1,229	1,305 (+76)*	1,408 (+103)*
" III.....	1,364	1,324 (-40)*	
" IV.....	1,505	1,474 (-29)*	

* Inc. + or dec. — over previous year.

It will be seen that in the last half of the financial year 1943-44, expenditure on the war seemed to have begun a steady decline, though the comparison with 1942-43 was vitiated to a certain extent by the extension of lend-lease terms to purchases from Canada. In the second quarter of this year, however, supply expenditure has jumped up again. Possibly, this may be partly due to the removal of more goods from the lend-lease list. A more ominous explanation, if the rise is taken together with the increase in customs and excise, is that there is more inflation.

Letters to the Editor

Industrial Price-fixing

TO THE EDITOR OF THE ECONOMIST

SIR,—In your issue of September 30th you discuss policy for the cotton industry in the light of the Government's response, delivered by the President of the Board of Trade, on September 19th, to the Report of the Cotton Board Post-War Committee, which was presented last January. I feel I must point out that your article misinterprets the statement made by Mr. Dalton.

Your first error is in your opening words. You write:

The decision of the Board of Trade to reject the Cotton Board Committee's proposals for a regime of self-government in the cotton trade, with legally enforceable price-fixing powers. . . .

Mr. Dalton said:

Cotton control must continue for some considerable time. The Cotton Control through its standard prices achieves, more simply and directly, the price-fixing objects of the Act [of 1939]. The cotton industry is entitled to assume that this Act will come into operation as soon as the Cotton Control disappears. The industry may wish some modifications of the 1939 Act, or for some other measures by the Government. The present Government will be prepared to consider any such requests if the industry is able to submit proposals and evidence of effective action already taken. . . . This assurance having been given by the Government regarding "price man-

agement," we expect the industry to concentrate its energies forthwith on putting its house in order.

The foregoing is an abbreviation of Mr Dalton's statement, but it embodies correctly the operative parts. After the meeting, when interviewing the press, Mr Dalton said that the Government intended the present Cotton Board to continue in existence until the date of the introduction of the 1939 Act—which, of course, prescribes a statutory Cotton Board on very similar lines.

You will see that this by no means amounts to rejection of the Cotton Board Committee's proposals for self-government and fixed or minimum prices. On the contrary, it amounts to acceptance.

It is true Mr Dalton said more than I have quoted. He urged certain reforms which the Government consider vitally important. He drew attention in grave terms to the dangers of minimum prices. Personally, I very much favour an attitude on the part of the Government in which there is no hesitancy in giving guidance and advice to industry from the standpoint of the national interest, but I am surprised to find so careful a journal as *The Economist* noting the advice to the exclusion of the operative decisions. The arrangement of the text must have misled you.—Yours faithfully,

E. RAYMOND STREET,
Chairman, Cotton Board.
Manchester.

Exit Employers' Liability

TO THE EDITOR OF THE ECONOMIST

SIR,—Your editorial note on this subject in your issue of September 30th assumes a change more sweeping than appears justified by the actual government proposals or the merits of the case.

At present the injured workman has not only a statutory right to compensation, but also a common law right to damages. The former must surely go, but need the latter?

It arises when injury results from the employer's breach of a duty owed at common law to the workman: failure to provide proper tools, or to maintain a safe system of working, are instances of this form of liability which has become increasingly important since it was restated in 1938 by the House of Lords (in *Wilson v. English*), and since the defence of "common employment" was reduced in scope by the same decision, as well as by subsequent ones.

The workman's common law right entitles him to be put into his pre-accident position as far as money payments can do so. It is confined to special circumstances. It is essentially different in purpose and result from any social service benefit. He should not, in future, be forced to elect between the two, and social service benefits should be paid independently of his action at law. (Whether or not the quantum of common law liability should take account of what he has received by way of social service benefit is a secondary question.)

The workman's common law right is of substantial value to him and to those he leaves behind, especially if he belongs to the higher paid grades. To deprive him of it is not intrinsically necessary to the planned reform; in the cases where it applies its elimination might well cause hardship and injustice.

Unless, therefore, legislation expressly takes the right away there will remain a limited but important field of employer's liability which many will wish to cover by insurance.—Yours faithfully,

H. EDWARD GUMBEL.

Terms for Germany

TO THE EDITOR OF THE ECONOMIST

SIR,—In the interesting correspondence which your able articles on Terms for Germany have elicited, I have not noticed the suggestion made by influential men in the United States and endorsed by competent friends of mine (whose views are not admitted to the London press or the BBC) that peace treaties should be negotiated with the various German States and free cities which constituted the old Bund. This would avoid dismemberment and the creation of a Police State run by foreigners, with the OGPU substituted for the Gestapo in Eastern Germany. It would also remove the objection to a dictated peace that the defeated nation is under no moral or legal obligation to observe it. There would be several other advantages to liberty and economy at home, on which I need not dilate.—Yours etc.,

FRANCIS W. HIRST.

AMERICAN SURVEY

Stock Taking in the Mountain States

(By a Correspondent in Colorado)

Denver, September

THE eight states comprising the Rocky Mountain region are acutely aware that the war economy has dispensed its favours with a very uneven hand. True, these states have reaped an increase in total income from the war effort—they were bound to share to some extent in an expansion which added \$20 billion of new facilities to the industrial plant of the United States, and raised the national gross product of goods and services from \$97 billion in 1940 to approximately \$180 billion in 1943. The total money income of the area, which was just under \$2 billion in 1939, rose to about \$3½ billion in 1943—an increase of roughly 75 per cent.

Yet, compared with the rest of the country, the Rocky Mountain region has actually fallen behind during the war period. Five of the eight states have suffered a decline in civilian population varying from six per cent in Colorado to fifteen per cent in Montana. Only the states of Arizona, Utah, and Nevada, located on the fringe of the Pacific Coast boom area, have enjoyed a temporary influx. The result for the area as a whole has been a net emigration of about 3 per cent of its 4,000,000 people during the past four years.

The place of the Rocky Mountain region in America's to-morrow commanded the sober attention of a recent conference called at Laramie by the Department of Agricul-

tural Economics of the University of Wyoming, which was attended by ranchers, businessmen of the market towns, and representatives of organised labour. The conference produced no intellectual miracles. True to the tradition of the area, the keenest interest was in the question whether present favourable prices of minerals, livestock, and the other extractive products of the region were to suffer a marked decline such as followed the cessation of hostilities after World War I. To the attending cattle breeders and wool growers, for example, the first line of attack remained that of trying to convince the members of the conference and their representatives in Congress that the market for meat products must be protected. That meant protection against the influx of livestock and animal products from Latin American and other competing countries. It also meant the assurance of support prices through federal legislation. The mining fraternity were inclined to point out their achievements in expanding the supply of war-essential metals, and renewed their plea for the stock-piling of large quantities of minerals as a security measure against future war.

Such demands for protection were highly understandable. They were expected to be voiced. But the discussion did not stop with presenting the traditional case for subsidies to Far Western cattlemen, wool growers, sugar beet producers and mine operators. The wall of protectionism and isolationism seemed to have some tiny breaches.

There was at least willingness to recognise the general truism that American agriculture can prosper only as the whole economy prospers: a respectful hearing was given to the labour representatives who pointed out that the ability of the farmers to market their crops will depend on the continuing purchasing power of the wage earners. Considering that the loss of farm labour to more lucrative jobs in war industries has been one of the chief complaints of the farm employer, this in itself was something of an accomplishment. To the dairyman, who had paid his milkers \$50 a month before Pearl Harbour, the \$14 a day offered to hired hands for driving trucks on war construction jobs was a serious menace to the farm-wage structure and cost-price relationships on farm products.

It was further seen that nothing like current production could be maintained without the aid of a foreign market as well as a high national standard of industrial production and urban consumption.

Somewhat timidly, the Government representatives presented the dilemma of price support: the post-war demand for agricultural products will fall below wartime levels, and prices will drop accordingly. If Government price support encourages the maintenance of production, the Government will have to buy up the excess. That, in turn, will call for disposal of the excess, either to low-income families (through such mechanism as the Stamp Plan) or to foreign countries. Unloading of supplies abroad raises all the vexing questions of international friction involved in dumping. If such commodities were sold at normal prices in the foreign market, import payments would have to be made by the countries purchasing them. That means accepting some measure of competition with domestic American production, and sharing in quota arrangements with other nations for commodities on the world market.

Protectionist Paradox

The paradox involved in demanding freedom of action for private enterprise and public protection to insulate one's own industry from competition—both in the same breath—became more and more patent as the sessions progressed. The authorised spokesmen for specific economic groups found it difficult to keep their respective pleas clear of con-

flicting suggestions. Thus, the demand for a drastic lowering of taxes was unsuccessfully paired with the concept of guaranteed price floors to producers. Maintenance of high production had to be reconciled with ability of consumers to purchase the supply at prices that would permit their wages to cover their purchases. Lip service to a prosperous, peaceful world economy and a stable international exchange did not couple well with the displacement, by American shipping, of foreign carrying trade which enables other countries to build up their dollar exchange through shipping services and exports.

These healthy doubts about the ability of any one region to block out the requirements of other areas from its thinking took a constructive turn in a search for new economic outlets. The pre-war economy of the Rocky Mountain region, it was felt, could not of itself sustain a growing or even a stationary population in the post-war world. Along with improvement in the efficiency of production of the established lines—wool growing, cattle raising, sugar beets, metal and coalmining—new areas of production must be explored.

On the agricultural side, the more effective use of the land (and the breeding of improved livestock which can thrive better on the arid plains) must be considered; on the side of the extractive industries the opportunities for exploitation of the shale oil, coal, and other deposits of the area must be appraised. Then there is the whole field of carrying primary products a step farther on their way to market: by establishing quick freezing and dehydration plants for agricultural products which cannot be locally marketed—particularly in connection with air transportation—and by converting other primary commodities of the area into processed goods on the spot.

The conference at Laramie at least partially recognised the fact that the post-war economy cannot fully satisfy the extremist, and that the Rocky Mountain region, in common with other sections of the nation, must be prepared for a drastic change in its economic outlook if it is to survive and grow.

American Notes

Slugging it Out

The Presidential campaign has gone into high gear. Governor Dewey, stung by President Roosevelt's speech to the Teamsters, last week abandoned his carefully planned campaign to refute the President point by point. In a speech at Oklahoma City, while insisting that he would not descend to the "mud-slinging" practised by the President, he declared the Roosevelt record "desperately bad." He chose to concentrate on three main points: the Administration's alleged intention of keeping men in the Services to avoid civilian unemployment; the responsibility of the Administration for the persistence of pre-war unemployment; and its responsibility for the lack of preparedness for war. In the first two points, Governor Dewey did little beyond repeating his charges and insisting that it was Administration hostility to the "job-producing machinery"—i.e., private industry—which was responsible for unemployment. The sting came with Governor Dewey's attack on the war-preparedness record of the Administration, an attack relying heavily on early quotations from Senator Truman, the President's running-mate. This will encourage Republican demands for investigation into Pearl Harbour. It is easy enough to show that America was ill-prepared for war. That is a little reckless—in view of the record—is to fasten responsibility for it exclusively upon Mr Roosevelt. The war evidently is now open for a first-rate slugging match, in which neither side will be unduly scrupulous. The public being offered a chance to join in, at one remove, by newspapers on both sides of the fence. PM offers prizes for "Dewies"—Dewey statements capable of easy refutation; while the Hearst papers offer similar rewards for anti-administration limericks, in which the slogan "clear it with ydney" (Sydney Hillman, the head of the CIO Political Action Committee) takes a prominent part. There are two more significant, if less colourful, developments in the campaign. One is the Republican Senator Ball's repudiation of Governor Dewey because of his "lack of strength on foreign policy," which may cut into Republican hopes in the Middle West, particularly in Senator Ball's own state of Minnesota, and will strengthen the Democratic appeal to the independent voter. The second is the Gallup poll's prophecy of a total vote of not more than 39,500,000, not including the soldier vote. This would be the smallest

poll since 1932, and would by general consent improve Republican chances of success. Most current opinions give President Roosevelt about 52 per cent of the total vote if the election were to be held now. This might easily fail to return the Democratic candidate, for a large proportion of the Democratic popular vote is concentrated in the solid southern states, instead of being spread over the more doubtful northern and western states.

The Negro Vote

The decision of the *Pittsburgh Courier*, the largest newspaper for coloured readers, to support Governor Dewey is a significant, if not decisive, pointer. The *Courier* previously supported President Roosevelt. It is an announcement calculated to alarm the Democrats, already anxious over the possible loss of negro votes in critical northern states like Illinois, New York and Pennsylvania. This drift to the Republican camp is, in part, the result of improved economic conditions, which have weakened the tie of gratitude to the New Deal; and in part the result of the new wartime grievances in which discrimination, particularly in the Armed Services, plays a major part. It is alleged by the Negro press that in spite of some improvement, Jim Crowism still dominates the Services, that negroes are given menial jobs and kept from combat duty. The Republicans, in their platform, went out of their way to meet these grievances, with specific mention of a permanent Fair Employment Practices Committee, anti-lynching legislation, a constitutional amendment against the poll tax, and a congressional inquiry into discrimination against Negroes in the army. The Democrats, in the throes of appeasing what appeared at one stage to be a serious threat of Southern revolt, offered little but pious platitudes. It would hardly be surprising if the Negro leaders determined to throw their votes to the Republicans, not necessarily as an evidence of faith, but to remind the Democrats that the Negro vote must be earned. It is worth noting that Mr Willkie has taken up the cudgels for Negro rights in recent weeks. What is not entirely certain is the degree to which the ordinary Negro will desert the Democrats to follow his leaders into the Republican camp. It remains to be seen whether the Negro press is as influential as it is vocal.

Economic Policy

There is general agreement that in his eight-point directive to the Foreign Economic Administrator, Mr Crowley, President Roosevelt in effect shelved what is known as the Morgenthau plan for rooting out German industry. In his seventh point the President urged "accelerated study" of the steps to control Germany's power to make war, under the guidance of the State Department; and this is viewed as a victory for the State Department's authority and its plan for "selective elimination" of German industry and rigid control of the remainder. If the Morgenthau plan was released as a trial balloon, it has been thoroughly punctured. The general insistence on a hard peace has not blinded the majority of commentators to the impracticability of turning Germany into a nation of farmers. There has been less attention in the United States for the even more interesting implications of the rest of the President's letter, in which he outlined what might be called the reconversion of American trade policy to follow the defeat of Germany. Mr Roosevelt stressed the importance of a high level of international trade, not only for a durable peace, but for the prospects of full production and employment in the United States; and the consequent intimate concern of the United States in the speedy repair of war devastation. In part the pace of reconstruction depends upon the availability of raw materials; and the international position will be eased by the cuts in purchases abroad of materials for the American war programme, and by the reduction of preclusive buying to follow the German collapse. In directing the relaxation of export controls, as far as is compatible with the prosecution of the Japanese war, the President suggested that the speediest expansion would be obtained by returning foreign commerce to private hands. It is significant, however, that in urging the continuation of Lend-Lease until the defeat of Japan, Mr Roosevelt noted that the amount and nature of this aid

is closely tied up with the strategic plans for the Pacific war and the programmes for reconstruction and for reconversion of

UNRAVELLING THE VITAMINS

Here is a diagram illustrating the progress made in the isolation and identification of vitamins. Roche workers in Britain have taken a prominent part in this research for many years. In the Roche plants, Vitamins B₁ and C have been synthesized on a commercial scale. Vitamin B₂ (riboflavin), Vitamin E, and a Vitamin K analogue are also made there.

ROCHE PRODUCTS LIMITED

industry to civilian needs which we and our allies work out on a basis of mutual understanding.

These hints of a link between American and British reconversion and of American aid for reconstruction abroad are reassuring; but there must be some doubt whether the use of Lend-Lease for ends not directly concerned with the war would be accepted in the United States. The rumour in Washington is that, if necessary, a substitute for Lend-Lease will be found in an expansion of the lending power of the Export-Import Bank. In this connection it is of interest to note the suggestion of Mr Harry Hopkins, the President's close adviser, that loans should be made to foreign countries to enable them to buy American goods; and that a condition of these loans should be that they are entirely spent in the United States. How these loans might be repaid is another matter.

Steel Wages

Labour's demand for an upward revision of wages is becoming more insistent. The President's Labour Advisory Committee, composed of representatives of the two labour federations, the AFL and the CIO, has publicly urged the scrapping of the "little steel formula." Other labour groups go further. The Convention of Marine and Shipbuilding Workers at Atlantic City demanded this week the withdrawal of CIO representatives from the War Labour Board as a protest against delay in proposing a new basis for wage revisions. A strike of maintenance workers in Detroit is threatened as an ultimatum to the War Labour Board to appoint a panel to study maintenance wage rates. Strikes are already in progress at two shipyards in New England and one in New Jersey. The central dispute, however, concerns wages in the steel industry, and a decision here will establish a new formula for industry at large. A hint of the Administration's hopes of resolving the problem of raising wages without increasing prices is contained in a recent report by the Office of Price Administration. This argues that the steel industry could absorb substantial wage increases without raising prices, when overtime pay is dispensed with. The report puts the increase that could be absorbed in this fashion at 8 cents an hour; and points out that down-grading of workers to lower-paid jobs would permit an additional 6 to 8 cents an hour increase. The catch in this argument, from labour's point of view, is that it would provide no increase in "take home" pay—that is, in total weekly earnings—and labour has been unanimous in insisting that the 15 per cent increase in wage rates under the "little steel" formula has not gone very far in compensating labour for the rise in the cost of living. This was a point of view borne out recently by a panel of the War Labour Board investigating the increase in the cost of living. On the other hand, the OPA solution would protect labour from any substantial loss as a result of the return to the 40-hour week; and this may be as much as the Administration is prepared to guarantee.

Aid to Veterans

Plans for special assistance to servicemen returning to civilian life are expanding with the prospect of partial demobilisation as soon as the war in Europe is over. It is worth remembering that many of these "veterans" are still in their early twenties, and the likelihood that some, at least, would prefer educational opportunities to jobs has already been recognised in the law known as the "G.I. Bill of Rights" passed early this summer, which provides for the payment of educational fees and living allowances, as well as unemployment allowances and federal guarantees of 50 per cent of loans for the purchase of homes, farms, or businesses. A further light on Servicemen's intentions was provided this week by a letter from President Roosevelt to the Secretary of Agriculture and the Administrator of Veterans' Affairs, in which he pointed out that more than a million members of the Forces intend to return to civilian life as farmers and ranchers. In this there are obvious difficulties which are to be the subject of a special study. The supply of economically sound farms is not unlimited; the prospect, indeed, is for contraction, rather than expansion of farming. In addition, some veterans will be debarred, by war disability, from most agricultural occupations; and many others may be unaware of likely difficulties, and in need of special training. It will be the job of the Veterans' Administrator and the Secretary of Agriculture to acquaint veterans with the prospects of successful farming, and in so far as it is possible, fit them into communities where they have a fair chance of making a livelihood. In industry, the War Production Board has promised special consideration to veterans establishing small businesses; this will cover priorities, material allocations and other assistance. Finally, preliminary agreements have been reached with the labour federations by which veterans who were former union members, will have their military service added to their plant seniority; and qualified veterans may become union members at rates no higher than those charged before January, 1940.

British Cables—A Correction

The statement in last week's Note on "Freedom from News," that "British rates are lower because British cables are subsidised," was misleadingly phrased, and has given rise to misapprehensions. British cable rates are not lower than American cable rates on competitive routes such as London to New York. The "British rates" that are lower are rates between British points—for example, the London-Montreal press rate is much lower than the London-New York rate. And the "subsidy" which makes this possible is not out of public funds, but out of other traffics. The sentence would have been clearer if it had read: "The rates between British points are lower because the British communications system chooses to subsidise them out of its other traffics." The argument of the Note is, of course, unaffected: that it is difficult to see how the Americans have any reasonable ground for objection.

THE WORLD OVERSEAS

Between Rhine and Oder

IT is not known whether the Allies are agreed on Germany's future frontiers. The map is to be redrawn, but precise indications of its shape are lacking. Yet there are numerous signs and portents on which to base a tentative estimate of the new configuration. If the main items in the various demands for territorial changes are unravelled and put into some order, it would appear that Germany's eastern border will follow the course of the river Goerlitzer-Neisse which enters German territory near Zittau in Saxony and joins the Oder north of Guben. From Guben the frontier would follow the Oder as far as Stettin. This new eastern frontier would measure roughly 220 miles, which is the shortest distance east of Berlin between the central European mountain ranges and the Baltic Sea. Considered purely in eighteenth century strategic terms, it is the best possible frontier in the east.

In the west the situation is more complicated. It may very well be, however, that the river Rhine will form the final western frontier. There are indications that the Rhine-Ruhr industrial area whose major part is east of the Rhine will be formed into a large industrial bridgehead under Allied or international sovereignty. The bridgehead would have to include the town of Hamm and Muenster in Westphalia as well as the small strip of territory to the west of the Dortmund-Ems Canal and the river Ems to its mouth at Emden. If this were done, the German frontier in the West would be about 510 miles long. This new Germany between the Rhine and the Oder-Neisse line would cover between 100,000 and 120,000 sq. miles and would have a population of roughly 45 million according to 1937-38 statistics. If the eight million people who live in the German provinces east of the Oder-Neisse were to be repatriated together with some 3½ million Sudeten Germans, the total population of the new Germany would number about 57 millions. In other words, Germany as it was before the incorporation of Austria in 1938 would lose roughly one-third of its territory—the major part of it in the east—but only 16 per cent of its population.

This is the bare outline of the suggested settlement. It is not possible even in approximate terms to define the economic condition of this territory after five years of war. Its entire industry is located and organised for purposes of war; the economy of the new Germany will have to be reorganised and re-sited for peace. But some idea of its natural resources and the location of its productive capacity can be obtained from the figures for 1937. At the end of that year, the totalitarian organisation of Germany's economy had been completed but there was still a large measure of peace time production. Plans for industrial self-sufficiency were started during 1937 and 1938.

At the end of 1937 German statisticians were asked to prove that Germany, as it was then, could be made self-sufficient in agriculture as well as in industry. At that time Germany produced from its own resources some 80 per cent of its food consumption and two-thirds of its industrial raw materials and semi-manufactured materials. On the

basis of the output figures for 1937, the loss of the provinces east of the Oder-Neisse (i.e., East Prussia, Silesia, parts of Pomerania and Brandenburg) would result in the loss of the following percentages of basic foodstuffs:

	Per cent		Per cent
Wheat	15	Potatoes	28
Rye	30	Sugarbeet	31
Barley	25		

These losses exceed the possible reduction in population by almost 100 per cent. This would mean that the already reduced food standards of 1937 would probably fall below the present civilian wartime rations in Germany.

On the other hand, the western provinces that would be ceded by Germany are provinces with an agricultural deficit. They produce on the average about 50 per cent of their normal food requirements. The Allied or international authorities taking over the western provinces would have to supply the deficit from overseas, if it were intended to maintain the industrial activities of the provinces.

Of the industrial resources of the country, the coal producing areas of the Ruhr and Silesia would be outside the new Germany. Out of a total production of coal, amounting to 184 million tons in 1937, Germany would retain the output of Saxony and Lower Saxony. In 1937 these two areas produced 5.7 million tons, or 3.1 per cent of the total coal output. Germany would, however, remain in possession of the Central German lignite deposits together with some of the East-Elbian districts. These produced 54 per cent of the total output of lignite, or a coal equivalent of roughly 25 million tons. Germany would be left with some 13 per cent of its output of solid fuel. This output would have to be doubled to meet the demand for household coal, for railways and for electric power stations. It is obvious that

every ton of coal for the steel and all other industries would have to be imported.

According to 1937 figures the new frontiers would contain 6.6 per cent of Germany's former pig-iron capacity, 16 per cent of its steel capacity and 20 per cent of its rolling mill capacity. The Nazis' self-sufficiency policy in iron ore led to the development of iron mining in Central Germany. Thus the new Germany would be left with an output of some 12 million tons of low grade iron ore. Disregarding costs, this output could easily be doubled; but there would be no coal for the blast furnaces which have been built in the new industrial area between Hanover and Magdeburg in the Peine and Salzgitter area. No method has yet been discovered of converting brown coal into suitable blast furnace fuel. The new Germany would, therefore, lack the basis for an iron and steel industry.

The vast aluminium plants which have been constructed in Germany have no indigenous supplies of raw materials. Bauxite would have to be imported. Among the non-ferrous metals there are very slender resources of copper and lead-zinc ores, but the potash mines would yield raw material for the production of magnesium.

The largest single supply of natural mineral resources is the potash mines of Central Germany. Their normal output would far exceed German requirements. Production would either have to be drastically curtailed or markets would have to be found outside Germany. The cession of territories in the East and the West would also mean the loss of at least one third of the total capacity of Germany's electric power stations, and more would have to be closed down because of the lack of coal. Thirty-six per cent of Germany's electricity is derived from coal, 39 per cent from brown coal.

This almost total loss of the most important raw materials of modern industry contrasts with the fact that the greater part of Germany's engineering capacity would remain within the new frontiers. The biggest centre is Berlin. Then come Hamburg, Leipzig and Frankfurt, Mannheim, Stuttgart, Nuremberg, Augsburg and Munich. Without imports of raw materials all this capacity would be useless. The result would be that the textile industry, the food processing industries and all the industries which are needed for supplying agriculture with implements and machinery could not continue production.

In addition the greater part of road transport would have to revert to horse-drawn vehicles. The output of natural oil in the Hanover region may be kept up at roughly one million tons for a short time. But this output would have to cover Germany's total demand even though it is not more than 10 per cent of the oil consumption of Great Britain before the war, and roughly one fifth of Germany's pre-war consumption. No synthetic oil could be manufactured, because of the lack of coal.

A road, rail and canal map of Germany shows that the entire system of communications would have to be reorganised. Important centres and junctions would fall into disuse and the network would be far in excess of the actual traffic that would be necessary under the new conditions. The war economy has changed the actual location of the manufacturing industries. At the moment they are dispersed

over the whole of Germany. But they all depend upon the districts which produce the raw materials.

It is obvious that this new Germany could not exist as a self-sufficient unit. This unreal settlement would destroy most of its manufacturing capacity and would turn it into an agricultural country, burdened with an enormous industrial population.

It is difficult to see what the Allies' long-term intentions can be towards a Germany reduced to such a level of economic disintegration. Presumably they would not mean this rump state to be completely self-sufficient. Perhaps if such a Germany were allowed to trade freely with Europe and the world, it would just possibly survive. But there are two reasons for supposing that adequate trading facilities are not likely to be granted. First of all, none of the European Allies has so far given up its claim on reparations. Secondly, the parallel case of Austria after the last war suggests that under modern conditions of economic nationalism, the surrounding nations would not be ready to establish the kind of commercial relationships which would be necessary to give even a very moderate standard of living to the German people. Germany might then become what Vienna was in the interwar years—a place of mass unemployment, mass undernourishment and perpetual political tension. Can this really be called a recipe for peace?

Cacao Research

[FROM OUR ACCRA CORRESPONDENT]

September 6th

THERE are signs that one of the lessons from the West Indies is being learned. Trinidad's cacao plantations, from which has come a considerable proportion of the world's high grade cacao, have suffered seriously in recent years from "Witch Broom" disease. No attempt was made, until it was too late, to organise research to combat the depredations of pests and diseases. In the Gold Coast, which has the requisite rainfall and the right type of soil, cacao cultivation was rapidly taken up by the natives, who were quick to appreciate its possibilities as a source of money income, with the result that to-day the Gold Coast is the world's chief source of second quality cacao. The rate of increase of cultivation is seen in the following figures of cacao production (in metric tons):

	Gold Coast	Nigeria
1913	51,309	3,679
1919	178,973	26,121
1930	180,764	50,209
1939	280,000	116,000

The presence of *Sahlbergella*, a bug which attacks cacao, was discovered in the Gold Coast in 1909. In sufficient numbers, these will kill a cacao tree by injection of a toxic fluid while they are feeding off the tree. To this pest has been added "Swollen Shoot," a virus transmitted by insects into the cacao trees, which causes swelling in the shoots, decay of the leaves and finally the death of the tree. Similar pests and diseases have been found in the West Indies and Belgian Congo as well as in other parts of West Africa. One authority has put the loss of cocoa in the Gold Coast

due to *Sahlbergella* as high as 20 per cent of the season's crop.

The farmer's solution to the problem has been to cut new areas for cultivation out of the "bush," but the fact that some day there would be an end to the new areas which could be opened up, and that the Gold Coast farming community were gradually adapting their crop cultivation to a cash crop which might peter out in the next generation or so, raised important economic and social questions which forced the Gold Coast Government to take action. A Central Cocoa Research Station was opened at Tafo in 1938 to conduct research, particularly into the "Swollen Shoot" disease and the *Sahlbergella*.

A Western African Basis

The findings of the Nowell Commission on cocoa marketing and, during the war, the concentration of the essential commodities supply machinery in the Resident Minister's Office have put the problem of the future of cocoa into a West African context. Cacao research is being looked upon now rather as an important factor in the post-war development of West Africa than as the tiresome child of any one colony's agricultural department.

The problem has been to create an independent organisation with an adequate qualified staff, to do research work at a central institution, to co-operate with the agricultural departments in the four colonies and French West Africa in applying this research, and also to find a method of financing the scheme which would free it from dependence on fluctuating colonial revenues and thus provide the financial stability necessary. But it is now agreed that as long as there is cacao in West Africa there will be a need for research and, therefore, of a permanent research station. The West African Cacao Research Institute has now been set up at Tafo. A permanent technical staff of 15 to 20 scientists will be required and provision will have to be made for the seconding of specialists for special investigations. Much of the staff will have to come from outside West Africa and the African staff will have to be trained. Since cacao in West Africa is a peasant farmers' crop, it has no pool of experienced European or African personnel to draw upon on the production side.

But while the staff is being trained, there is urgent need for a survey of the cacao in both Nigeria and the Gold Coast to find out where exactly it is growing, in what direction the farmers are moving as the trees die, where the disease-stricken areas are and how virulent the disease is in those areas. For instance, it is known that the cacao crops have been diminishing over recent years, though the rate of planting is not thought to be diminishing. But it is not known yet if the rate of seedling planting is at present exceeding the tree mortality rate. This information is vital, for cacao takes six to ten years to mature and the rate of planting now is a vital factor in the yields for the years 1950-54. This work will have to be done by the Government departments on the spot, and only when this vital preliminary information has been collected can a research station function properly by advising how best to control disease under given conditions.

The financial question falls naturally into two compartments—survey and research—as outlined above. The cost of the surveys could be borne in the first instance by the governments of the colonies most concerned. That would be the simple solution to an urgent problem. The research side might be financed by a grant from the Colonial Development and Welfare Fund. But since the institute may become permanent and will, therefore, require a permanent income, it may well be that a different source of funds may be tapped. The profits of the West African Produce Control Board's marketing activities were in effect a levy on producer and consumer alike and what better method of using them could there be than to put them at the disposal of an enterprise from which producer and consumer alike would benefit?

A New Development

The establishment of this research institute is important as a major contribution to the control of cacao pests and diseases, but it is also significant as a development in colonial policy. It is an experiment in setting up an organisation with a specialised staff, free from the normal routine machinery of colonial government, with a regional basis and responsible through a regional authority, the Resident Minister's Office, to the Colonial Office.

PRODUCTION FOR VICTORY

THE BUSINESS WORLD

The Future of British Shipping

THE reconstitution of an efficient merchant shipping fleet should be one of the corner stones of national reconstruction. Lord Leathers, Minister of War Transport, did well to emphasise this principle in a speech in the House of Lords on Wednesday. Shipping is not merely an important source of wealth—contributing before the war about 1.3 per cent to the national income—and, in particular, a large source of foreign exchange. It is also an essential element in national defence—the "buckle that fastens" Britain to the Commonwealth of nations and the world.

In shipping, as in civil aviation, there will be a need for a new international convention as part of the general peace settlement. Such a convention would lay down international standards on technical matters, on safety and on conditions of work for seamen. At the instigation of the International Labour Office much progress has already been made with the formulation of a seamen's charter which is discussed on page 489. But, beyond that, an international shipping convention should provide a new framework within which the various fleets are to ply for trade.

In shipping, no less than in civil aviation, there is much to be said for internationalisation as an ideal policy. Thus, the international agreement on the pooling and control of shipping fleets of the United Nations which was published last week might serve as a starting-point. The agreement provides for the setting up of a United Maritime Council which will have the task of utilising the shipping of the various countries to the best advantage until the end of the war. There is to be a uniform system of freight charges for the same or similar services, and ships are to be allocated without regard to financial considerations. Further, the contracting Governments have agreed

not to release from control any ships under their authority or permit them to be employed in any non-essential cargo unless the total overall tonnage is in excess of the total overall requirements, and then only in accordance with a mutually acceptable formula which shall not discriminate against the commercial shipping interests of any nation and shall extend to all contracting Governments an equitable opportunity for their respective tonnages to engage in commercial trades.

This agreement is a sensible one; it will prevent unnecessary confusion and the inflation of freight rates; and, as Lord Leathers pointed out, it holds out hopes of post-war collaboration. But it is highly unlikely that internationalisation would be acceptable as a permanent policy; for all practical purposes the presumption is that there will be a return to competition.

But a return to the kind of competition that governed the shipping industry before the war, with its discriminatory practices and subsidies, would be most unsatisfactory. Even those who most strongly favour competition would insist that it be fair and equal competition. British ship-owners, in point of fact, are by no means so completely, or so unqualifiedly, wedded to competition as they used to be. This is shown by a report on shipping policy published this week by the General Council of British Shipping in which a plea is made for the organisation of shipping "on the basis of private enterprise and free competition," but "subject to reasonable agreement to keep freights on an economic level and the supply of tonnage adjusted to meet demand." As examples that might be followed the Council recommends schemes such as the Liner Conferences and the Tanker Pool which were in operation before the war. Its aim is to extend the principle of these arrangements to tramp shipping, which comprises the bulk of the world's tonnage and is peculiarly subject to ups and downs in freight rates and consequently to unremunerative working and the gradual consumption of capital. The Council's

suggestion might well form the basis of discussion; but safeguards would be required to ensure that price-fixing powers will not mean excessively high freights. Hitherto, the competitive tramp market has provided some check on any tendency of the liner conferences to abuse their powers; rate-fixing for tramps also would mean a complete and tight international cartel—run, presumably, by the shipowners and in their interest. There is no reason why such arrangements should be any less noxious in shipping than in any other trade. Moreover, at the end of the war the world's shipping fleets are likely to be seriously unbalanced in relation to peace requirements. There will be a surplus of wartime utility ships—"a prodigious" one according to Lord Leathers—and a shortage of others. So far as surplus tonnage is concerned, the Council suggests that this should be divided into two categories, a strategic or break-up reserve to be taken off the market as quickly as possible, and a commercial reserve of ships which would be regarded as marginal tonnage. This would, of course, increase the possibility of a rise in freight rates.

The operation of a rate-fixing scheme would of course involve international collaboration. But, as Lord Leathers recognised, there is no need to postpone the reconstruction of the British Merchant fleet pending agreement on a new international convention. The severe restrictions which have limited new construction to standardised wartime ships are to be relaxed to permit the gradual resumption of the construction of vessels for peace. A policy of reconstruction must have three aims. The British merchant fleet must again be large enough to serve the nation's needs; secondly, it must be a balanced fleet, comprising

tramps, liners, cargo liners and specialised vessels in the right proportions; thirdly, the new fleet should be technically as efficient as possible and the new vessels should be constructed at the lowest possible cost.

It is impossible at this stage to know exactly what the total size of the fleet should be after the war; but Lord Leathers stated categorically that it should be at least as large as before the war, and as much larger as British efficiency could make it. Before the war the British fleet carried some two-fifths of the world's sea-borne trade; by coincidence, it also met, fairly exactly, one of the most reasonable criteria of necessary size—that is, it was large enough to carry the whole of the trade between British ports and half of the trade between British and foreign ports. As was suggested in an article in *The Economist* of July 24, 1943, a policy of restoring the pre-war position might be expressed on the basis of one of these two alternatives. But as the two magnitudes may diverge after the war, the best policy might be to adopt the second, that is to aim at a fleet large enough to carry all wholly British trade and half of British-foreign trade. This would avoid the necessity of making a claim (which would no doubt be contested) to a merchant fleet large enough to carry indefinitely a fixed proportion of the world's total seaborne trade.

The question of balance is equally important. A properly balanced fleet is not merely one that is balanced in relation to the demand for shipping space, but also one that yields a maximum return. Moreover, since in a competitive world Britain's position as a ship-owner will ultimately be dependent on its efficiency, it is of great importance that British ships should not be technically inferior to, or more expensive than, those of other nations. The equipment and practice of British shipyards must be brought into line with modern standards; this is also a pre-condition of a resumption of the important British export trade in ships.

The task of reconstructing the shipping fleet in accordance with these principles is a formidable one. It is probable that Britain will end the war with a fleet that is not merely unbalanced, but several million tons smaller than before the war. Reconstruction will be very costly. For example, the cost of construction of a 7,500 ton dead-weight single deck steamer of simple specifications has risen, according to *Fairplay*, from £13 6s. 8d. per ton in June, 1939, to about £22 at the end of 1943. At £20 per ton dead-weight, the cost of constructing something like five million tons dead-weight of shipping would amount to £100 millions. But the rehabilitation of the shipping fleet is not merely a matter of replacing tonnage lost during the war. Indeed, a substantial proportion of the tonnage still existing will also have to be replaced, either because it is worn out or because it no longer satisfies modern technical requirements. And costs may rise still further.

It is not surprising, therefore, that the General Council of British Shipping believes complete reconstruction to be beyond the resources of the industry. If so, the question arises how reconstruction is to be financed. Broadly, there are three possible solutions. First, the difference between the industry's financial resources and its requirements might be met by a state subsidy. In view of the importance of shipping, there is something to be said for this solution;

but the Government is likely to be very shy of any subsidy policy, partly because of the precedent it would set for other industries which are (or might think themselves to be) in a similar position. Nor does it really get round the difficulty to suggest that compensation for ships lost should be paid at replacement values rather than at insured values; this, no less than a subsidy, would be differential treatment for one industry and would not help with the replacement of surviving, but obsolete, ships. Secondly, there is the possibility that money might be made available by the Government, not as subsidies, but as cheap loans. Many of the same arguments apply here also, in addition to the consideration that the shipping industry could hardly bear a large amount of fixed debt to the Government ahead of its existing prior charges.

Moreover, to any scheme which essentially consists of putting the shipowners in sufficient funds to order new ships there is the objection that it does nothing to ensure that the total volume of orders is adequate, or that they are placed regularly enough to provide the means of existence for a healthy shipbuilding industry. If, in any event, the Government is going to have to find the funds, there is a very great deal to be said for it taking a larger hand in the business. A practical version of this third solution was suggested in the article already referred to. In brief, the proposal was that the Government itself should order the ships and continue to own them during the whole of their life, though hiring them out for long periods of several years at a time (possibly the whole life of the ship) to the shipping companies. By some such scheme as this, a number of objects would be secured. First, the shipbuilding industry could be assured a stable long-term programme of work, which would greatly assist in the reduction of costs. As Mr A. Murray Stephen pointed out on Tuesday during his presidential address to the Institution of Engineers and Shipbuilders in Scotland, the maintenance of stable employment would also be assisted by a planned programme of naval construction. Secondly, although there would naturally be the closest consultation with the prospective hirers about the design of ships—ships could, in fact, be designed to be employed by individual lines and built to their requirements—the Government could also make certain that the Merchant Navy was of the size and type that are needed in time of war. Thirdly, the question of providing additional financial resources for the industry would not arise. Fourthly, if the complete abolition of subsidies cannot be achieved, the adjustment of the hiring charges to the level of freight rates would provide a most convenient method of assisting British shipping. Fifthly, the actual operation of ships would be left in the proper place, namely, in the hands of private enterprise. And lastly, the ownership of vessels by the Government would make it possible to maintain, at all times, an unused reserve of efficient shipping—a vital requirement of national defence. A scheme such as this would not only thus solve a number of the industry's most pressing problems, it would also provide an excellent example of that working alliance between the principles of collective and private enterprise which all parties profess to be seeking.

The Government will no doubt consider such alternatives

as this to the proposals for more direct assistance that the shipping industry has, quite naturally, put forward. But whatever may be the best policy, the worst of all would clearly be to postpone decisions until the end of the war or until after a general election.

Fortunately, the speech of Lord Leathers suggests that the Government is alive to the need for, and to the problems involved in, the rehabilitation of the British merchant marine. It is anxious to collaborate with other nations in

the constitution of a new international framework for the shipping industry. Meanwhile, it is taking steps to ensure an early beginning with the work of restoring the British merchant fleet. It has asked the shipping and shipbuilding industries to draw up a programme of replacements; and the restrictions on the construction of peace-time vessels are to be gradually relaxed. This is good news; Britain cannot afford to be a late starter in one of its most essential industries.

Business Notes

Coal Black-out

Major Lloyd George has the unenviable function of having to cast a periodical gloom over the proceedings of the House of Commons. At question-time on Tuesday, he gave a renewed warning that if the present rate of coal output continues, there would be a risk of interference with the war effort as well as of serious hardship to domestic consumers. His review of the position since the wages agreement was concluded six months ago—the decline in output by 100,000 tons a week, and of output per man by 5 cwt. a week, and the increase in voluntary absenteeism of 25 per cent—has already appeared in the press. So have his reminders of the need for continued economies in consumption in order to meet requirements in Europe and at home. The public knows that the coal situation is serious, and if it does not, it is not for want of telling. The Minister called a special meeting of the miners' leaders on Thursday to discuss with them the gravity of the situation, and he is to meet the representatives of the Mining Association next week. But there are two things which the Government should do to throw more light on the situation. One is to resume the publication of the monthly production figures, and to state the estimated requirements of coal for export. There can surely now be no valid security reason against giving such information. Secondly, and more important, they should allow the report of the American mining mission to be published. So far only a brief, summarised and almost certainly expurgated version has appeared. If the report is being held up, as has been suggested, for fear of hurting the feelings of those concerned in the mining industry, such an action is against the public interest. If there are good reasons for withholding publication, they should be given. The American experts' suggestions for improving the efficiency of the industry are of too great an importance for their report to be confined to a narrow circle.

"Full Technical Efficiency"

On the same day that he gave this very depressing picture of the coal situation, Major Lloyd George announced the formation of a new committee* of mining engineers to advise him on how to bring the industry into "a state of full technical efficiency." The committee has been instructed to investigate the whole question of technical equipment and organisation of production, including mechanisation, conveyance and loading. Though the platitude "better late than never" can be applied in this case, it is fantastic that such a committee should be formed only now, after five years of war and four years of falling coal production. Its Chairman is Mr Charles C. Reid, formerly General Works Manager of the Fife Coal Company and now Production Director at the Ministry of Fuel. He represents the only "independent" element in the committee, which consists otherwise of colliery managing directors and managers. It is surprising that there should be no representative of the highly efficient Nottinghamshire collieries, such as the Bolsover Company, and it is a great pity that no outside mining experts should have been appointed. The exclusion

* The members of the committee are: Mr H. J. Crofts, joint managing director Chatterley-Whitfield Collieries, Ltd., Staffordshire (annual output 1,250,000 tons); Mr Douglas Hann, director, Powell Duffryn, Ltd. (12.5 million tons); Mr John Hunter, managing director, Doncaster Amalgamated Collieries (4½ million tons); Mr A. Kirkup, director, Lambton, Helton and Joicey Collieries, Ltd., Newcastle (5 million tons); Mr J. A. Nimmo, general manager, Workington branch United Steel Companies, Limited (2½ million tons); and Mr H. Watson-Smith, managing director, Hardwick Colliery Company, Limited (1 million tons). The secretary of the committee is Mr R. Crawford.

of any representatives of the miners from the committee is presumably to be explained by the desire to keep technical questions separate from politics. But in practice it looks as if the owners have been invited to say whether they are efficient.

Idle Markets

The volume of business in the stock market continues to decline, and there are, at last, some signs of a falling off of enquiry. While it is extremely difficult to disentangle the effects of the numerous factors influencing business, the falling off seems to have coincided with a decline in the belief that the war in Europe will be over in a matter of weeks rather than months. It also follows a considerable adjustment of values between the various groups of equity shares. It cannot be said, however, that this adjustment appears to follow any logical classification of equities according to their post-war prospects. It seems rather to have taken the form of tending to eliminate the rise of the few weeks before the setback started, which suggests that most of the selling comes from those who bought for capital appreciation. According to the figures of *The Actuaries' Investment Index* and *The Financial News*, of which particulars are shown on page 491, the general level of British industrial equities now stands between end-May and end-June for the former, and very early in June for the latter. The difference in date is what would be expected from the fact that the smaller index consists of market leaders which tends to move before the general run of shares. As the difficulties of the transition to peace become more apparent the view that the end of the war will see a fall in equity values is gaining more adherents. There is also a resurgence of the view that it is the shares in consumption goods industries which will benefit most during the post-war years, and that there may very well be opportunities before long to switch from low-yielding consumers' goods shares into high-yielding shares of concerns producing capital goods. Further, it is being argued that in the immediate post-war period the latter will have much greater problems of conversion than the former. That may be true, but it is important to bear in mind that it is the specificity of the plant, not of the final product, which is the determining factor. As to the larger argument, it seems that, in the transition period at least, there will be no lack of people who want capital goods. Whether the actual demand

for these or for consumption goods will be greater will depend in no small degree upon Government policy at home and abroad. Clearly, one of the greatest demands of all will be for durable consumption goods, ranging from houses to motor cars and household equipment. But in those countries where devastation has been great, or where the desire to increase industrialisation is strong, or where the need for modernisation of existing equipment is strongly felt, some sacrifice of current consumer needs will be made to obtain the necessary physical capital for full reconstruction.

Meeting the External Debt

The Chancellor of the Exchequer, in his speech on Wednesday, made some remarks on Britain's external debt which gain in significance from the recent discussions with Empire representatives. He pointed out that though this country would emerge from the war with heavy overseas obligations it would also command high credit throughout the world. This credit, he suggested, was based on the character of the people, their courage, their determination and skill and above all, their productive efficiency. With these attributes, Britain's financial indebtedness could be translated into physical terms of production.

I tell you (said Sir John Anderson), and I speak under a sense of responsibility, that I believe we can see our way through. We can meet our obligations in a realistic way, that is by producing the goods that other countries will want. The process will take time but it depends, in the main, not upon skilful financial adjustments, but upon the willingness of our own people to recognise that, as they fought their way to freedom, so they can work their way to security and progressive improvement in all their material conditions. It depends also upon the recognition by our creditors that they have a common interest with us and must collaborate. They must be reasonable and not seek to treat war debts on the footing of ordinary commercial obligations. Practically the whole of our external obligations incurred during the war are to our allies and associates in the war. We have incurred a debt to them—but have they not also incurred some kind of debt to us which they too can pay by their confidence in us, which has stood a much sterner test, and by their practical cooperation with us?

Repair of Bomb Damage

Sir Malcolm Trustram Eve, who was appointed three weeks ago to deal with repairs to London houses damaged by flying bombs, made the first major move in his campaign last Tuesday. On that day, an Order (S.R. & O., 1944, No. 1112) came into force, reducing the limit of expenditure up to which building work—war damage or not—in the London Civil Defence Region may be carried out without licence, from £100 to £10. Applications to spend more than £100 will still be dealt with by the Ministry of Works; local authorities will authorise expenditure between £10 and £100, but work other than war damage work will not be permitted unless it is essential from, for example, a sanitary or structural point of view. The Order will have the effect of freeing a substantial number of building workers for the repair of bomb damage. It is hoped to draw as many London builders as possible into the pool of those with local authority or Ministry of Works contracts. Small builders will be organised into working parties. All will be paid on the War Damage Commission's scale of rates for war damage repairs undertaken for private customers—that is, the local authority rates have been raised; this change is retrospective to June 15th, the day when the flying bomb attacks began. A properly balanced labour force of some 100,000 men is required for some months. It is not yet known how far the new measures will fill the gap, and Sir Malcolm estimates that he "may want another 20,000 to 30,000 men." The major obstacle to employing firms from other parts of the country is said to be the lack of distribution. It is already contemplated to take the census urgency of the problem, this difficulty is surely one that can be surmounted. Winter is about to begin, and hundreds of thousands of Londoners are living in discomfort.

Census of Production

It is good news to know that the Board of Trade has begun to clear the ground for Britain's first census of distribution by soliciting the views of trade associations.

There is a widespread belief that efficiency ends with manufacture and inefficiency begins with distribution. As a generalisation, this statement is obviously untrue. Inefficiency and high costs are not confined to distribution. But what is true is that there are very few facts about the costs of distribution and yardsticks by which the public can measure its efficiency. The formation of an Institute for Scientific Distribution this week is to be welcomed if, as appears to be the intention, it will concern itself with the objective and continuous study of the problems of distribution. Fact-finding inquiries will be greatly assisted by a regular census of distribution. It is already contemplated to take the census of production each year after the war; formerly it was taken every five years. There is a strong case for taking a census of distribution at frequent intervals, perhaps every two years. Similarly, the interval between population censuses has been far too long in the past; it might well be reduced from ten to five years. But if the number of such statistical investigations is to be increased and if they are to be carried out at short intervals, the existing facilities at the disposal of the Government will have to be overhauled. It might be an advantage, for example, to follow American practice by creating an organisation analogous to the Bureau of the Census, that is by making a single organisation responsible for all censuses. The creation of a strong and permanent organisation would not merely simplify the procedure, but it should make for speed in the assembly and publication of statistics.

"Can Pac" Wages Award

After what seems considerable delay, a message from Montreal discloses the fact that the wages award of July last is estimated to cost the Canadian Pacific some \$15 million. Total working expenses for 1943 were some \$248 million. The award is retrospective to mid-September, 1943, but it cannot be assumed that its incidence is equal over the whole period. The whole of the cost, from its inception to the end of August, has been charged against the gross receipts of that month giving a net loss for that period of \$3,409,454 against a surplus on the same month of 1943 of \$3,843,887. It is impossible from these figures to determine the amount still remaining to be charged against the last four months of the current year. It is, however, presumably substantial and it will be rather surprising if most of those months do not show a decline on the net figures of 1943. Up to the end of August, the comfortable surplus of earlier months has been converted into a deficit of \$2,203,000. It seems a great pity that the amount of additional costs included in the August deduction is not disclosed, but even if it were it would still be difficult to assess the outlook for the holders of the equity. The net income from ancillary services and the cost of various charges varies greatly from year to year and is sufficiently large to affect very markedly the net profit of the whole undertaking. What is clear is that a very material increase in costs has been sanctioned. It may be possible to carry this higher cost with existing charges and traffic at a wartime level. Whether this will be possible after the war is a matter which justifies some doubts in the minds of the holders of the ordinary shares. The price of these, which has stood as high as 18 last year fell about $\frac{1}{2}$ point to 14 $\frac{1}{2}$ on the announcement. The 2 per cent dividend paid in respect of 1943, costing \$6,700,000, was covered by earnings of \$37,940,000.

Oil and Dollars

The Anglo-American oil conference held in Washington last August provided one important bone of contention. It concerned the "exchange" reservations with which the British delegates desired to hedge the fundamental provision of the agreement that international traffic in oil should be free from discrimination and unhampered by restrictions imposed by either Government or its nationals inconsistent with the purposes of the agreement. The British delegation objected that strict adherence to this principle might place an undue strain on British dollar resources in the difficult years of the immediate post-war era. The Americans resisted the introduction into the agreement of any clause tolerating discriminatory practices. This issue occupied the greater part of the conference, and at one time went very near to wrecking it. In the end a compromise was found and inserted as

an appendix to the agreement. The text of this reservation is as follows:

It was agreed by both delegations that the terms of the agreement provide for due consideration by the Commission of the foreign exchange position of each country.

The United Kingdom delegation stated that during the post-war transitional period referred to in the draft agreement for the International Monetary Fund, the United Kingdom might be obliged to take into account the exchange which it would lose or gain by the purchase or sale of petroleum in deciding the sources from which the petroleum it required should be drawn; that this situation would continue until sterling became freely convertible, and all restrictions on payments and transfers for current international transactions have been removed.

The United States delegation took note of this statement. They pointed out, however, that if the United Kingdom Government were to take unilateral action in this sense, the effect would be inconsistent with certain purposes of the agreement.

It was agreed, therefore, that before any such action was taken the matter should be placed before the International Petroleum Commission, which, after due regard to the principles of the agreement, should seek a solution acceptable to the two Governments; failing agreement on such a solution the Commission should consider the desirability of recommending to the two Governments a suspension of the agreement in whole or in part. It was agreed that should the Commission be unable to make any recommendation acceptable to the two Governments, the Government presenting the problem to the Commission would exercise its right to give notice to terminate the agreement . . . term of notice (for this purpose) should be shortened from six months to three months.

It will be noted that the Americans do not accept the reservation; they merely take note of it, and provide machinery for considering the application to depart from the basic purposes of the agreement. From the British point of view it is important to have tabled the reservation, and to have it incorporated as a footnote to the agreement. It is also significant that the International Monetary Fund draft should have been invoked as a plea for this reservation. The incident provides the first practical test of the application of its "transitional period" clauses, and the first indication of American reaction to such invocation of the monetary agreement.

US Mexican Oil Settlement

The reported ratification by the Mexican Senate of the settlement reached a year ago between the American and Mexican authorities over Mexico's expropriation of the assets of American companies in 1938 closes another chapter of an altogether disconcerting story. The Mexican Government not only expropriated American and British oil companies, but it has also consistently refused to pay adequate compensation. The American oil companies had valued their properties at between \$400 and \$500 million; the settlement provides for a compensation of \$24 million, together with interest at the rate of three per cent from the date of expropriation. The settlement, obviously, is a political one; for reasons of its own the American State Department not merely condoned the high-handed action of the Mexican Government but also accepted a mere token payment as compensation. Not unnaturally, the Royal-Dutch-Shell group refused to settle on a similar basis, and the Foreign Office has been faced with the unfortunate precedent established by the American State Department. In spite of the difficulties of enforcing restitution, or, at least, adequate compensation, there is no reason why the British Government should set its seal to a similar settlement.

Bulk Purchase

The Government has decided on purchasing in bulk, and for some years ahead, large quantities of foodstuffs. Details of the latest agreement—that between the Governments of the United Kingdom and Australia—were disclosed by the Minister of Food, Colonel Llewellyn, in the House of Commons on September 27th. The United Kingdom will buy the whole of Australia's exportable beef, mutton, lamb, butter and cheese for the next four years; it will also buy, until 1946, the whole of its surplus of eggs and pig meat. Final details about prices remain to be settled, but they are to be subject to review at the end of two years "on the grounds of substantial changes in conditions." As Colonel Llewellyn pointed out, these arrangements are being

made as part of the Government's policy of "safeguarding food supplies for the United Kingdom during the next few years." They do not mean that the Government intends to adopt the method of bulk purchase as a permanent policy or to apply it to all imports of foodstuffs and raw materials after the war. In wartime, the method of bulk purchase has a number of advantages. It is a means of making sure of supplies by guaranteeing a market to producers; it prevents an undue rise in prices in a period of scarcity; and it offers certain administrative advantages at a time when raw materials and foods have to be rationed to manufacturers and consumers. In peace, price must be the overriding consideration in the determination of policy—and the method of bulk purchase does not necessarily ensure lower prices than a free market. This does not mean that there be no room for bulk purchases after the war; equally there is no case for their universal adoption. They should be regarded as an alternative in the aim of securing imports at the lowest cost.

Wheat Supplies

The Ministry of Food has ordered a reduction in the rate of extraction of national flour from 85 to 82 $\frac{1}{2}$ per cent. The rate of extraction was raised over two years ago as a means of saving shipping space. In the meantime the United Kingdom has harvested two very good wheat crops, but between one-third and one-quarter of its wheat requirements have still to be imported, and the reduction in the flour extraction rate means more wheat imports. In terms of shipping space, however, these increased import requirements will not be heavy and they will not materially affect the international wheat supply position. Although the consumption of wheat in the 1943-44 season, due to the abnormal wheat demand for the production of industrial alcohol and for feeding purposes in the United States, has been exceedingly heavy, the combined carry-overs of the four main overseas wheat surplus countries (United States, Canada, Australia and Argentina) into this season, according to the US Department of Agriculture, amounted to 1,170 million bushels, compared with just over 625 million bushels at the outbreak of the European war in 1939. The latter figure, moreover, was high compared with normal standards and just before the war exercised a strong pressure on international wheat prices.

The large carry-over into this season, however, is not the only encouraging factor in the present international wheat position. Despite current reports of drought damage in the main wheat-producing areas of the Southern Hemisphere, this year's world wheat crop promises to be a large one. The combined United States and Canadian crops, according to the latest official estimates, may reach the record total of 1,563 million bushels, an increase of 433 million bushels on the year. In most other parts of the Northern Hemisphere the 1944 crop has also been large. Even from France, Italy and the Balkans, satisfactory crop conditions have been reported. On the demand side the United States War Food Administration has greatly reduced wheat allocations for industrial and feeding purposes and the country's combined allocations for all purposes (including lend-lease and relief shipments) this season has been limited to 1,114 million bushels, a quantity which is fully covered by this year's United States crop. It is true the next twelve months will witness the reintegration of Europe into the world market and UNRRA has tentatively estimated that some 3 million metric tons

(just over 110 million bushels) of wheat will be needed for the European relief work of the first six months after the termination of hostilities. Nevertheless, unless the southern hemisphere crops, due to be harvested towards the end of 1944, turn out to be very poor, withdrawals from stocks during the next nine months should not be large. Moreover, the majority of the large overseas wheat-producing areas are planning to increase their wheat area for the 1945 crop; in the absence of a weather catastrophe both the short and long-term prospects for the world's wheat supplies appear encouraging.

Deflation in Belgium

The Belgian Government will this week-end launch a drastic currency reform, the details of which have been worked out by the Government during the years of exile in Britain. The main objectives of the plan are to contract the volume of currency and credit from the inflated levels reached under German occupation, to preserve the purchasing power and, therefore, the exchange value of the currency, and to trace and tax illegal profits made by collaboration or black market activities during the occupation. Details of the plan must naturally be withheld until it comes into operation, but reports from Brussels suggest that a new currency, which has been printed in England, will be exchanged for the present notes on a franc for franc basis, but only up to a certain figure. Anyone who tries to change more than this into new francs will only obtain a proportion of what he tenders. Exceptions will be made for employers needing large sums for wage payments and for other institutions which normally have to maintain large cash reserves. The same will apply to bank balances, the credits over a certain maximum figure being available only for investment in long term Government securities. The combined circulation of currency and credit in Belgium at the time of the German invasion was about 51 milliard francs. The total has now risen to about 185 milliard francs, and it is the intention to bring this figure well below the present level. The effect of this drastic deflation should be to bring down the cost of living to a level approximately in keeping with the rate of exchange of 176½ to the pound given to the currency and with the structure of wage and salary rates that still prevails in Belgium. The fact that so ambitious and drastic a currency reform is being put into operation within one month of the liberation of the capital is a hopeful commentary on the effectiveness with which the Belgian Government has secured its hold on the machine of administration in Belgium and on the political stability of the country. Similar plans had been prepared for France, but there is no indication of their being put into operation because tampering with the currency and bank balances might turn the peasants and small bourgeoisie against a Government which already has its hands full dealing with the political forces to the Left of these at present docile and quiescent sectors.

More Credits for Holland

The Dutch Government is losing no time in its preparations to mobilise external resources for financing relief and reconstruction work. Following the arrangements of a credit of \$100 million with a syndicate of American

banks, it has this week signed agreements for raising credits in Switzerland and Sweden. The amounts and terms of the transactions have not yet been published, but it is known that the credit in Switzerland has been arranged with a group of Swiss banks but that in Sweden has been negotiated with the Swedish Government. A stipulation of both agreements is that the proceeds must be expended by Holland in the lending countries. The Dutch authorities have already planned their programme of purchases in both markets. From Switzerland they will, in the main, buy machinery and electrical equipment. The purchases in Sweden will consist largely of timber, wood pulp, tools and agricultural machinery.

Fife County Conversion

The process of dealing with next year's municipal loan optional maturities is proceeding apace. Last week Doncaster and Newcastle-on-Tyne announced the repayment of £491,510 of stock on April 1, 1945, and of £858,940 on January 1st respectively without mention of any offer of conversion. At the beginning of this week the Fife County Council made a more interesting offer. In giving notice of repayment of £1,168,306 of 4½ per cent stock 1945-55, the Council gives holders the option of applying, up to February 1, 1945, for 3 per cent County Council Mortgages repayable May 15, 1960. This is the first sign of reaction by the municipalities to the encouragement offered them to convert marketable securities into over-the-counter mortgages. The amount of stock involved on this occasion is comparatively large, but the County Council has behind it the guarantee of the Treasury to provide any funds, in excess of the Council's own resources, required to pay off holders who do not accept conversion. It will be interesting to test the size of the demand for such unmarketable securities and full disclosure of the terms of issue and the amounts sold ought to be made public. It is very difficult to see why anyone should accept an unmarketable security unless it carries a higher return than a marketable one.

More Industrial Conversions

The advantages to those concerns which have been formed, or have raised new capital, sufficiently recently to benefit from the power to issue redeemable preference shares are becoming apparent. The past few days have brought offers to holders of such shares in two very different concerns; Palestine Potash and Broadcast Relay Services. In the case of the former the conversion is supplemented by the redemption of notes and the issue of new capital to finance that operation. The scheme of Broadcast Relay Services is a straightforward offer to convert 5½ per cent cumulative preference shares of £1, on a share for share basis into 5s. ordinary, those accepting to receive 4s. 6d. in cash for each share converted. In both instances it is probably the desire of the management to get rid of fixed interest capital rather than to borrow more cheaply, since the savings are not large. Full particulars of the Palestine Potash scheme will be issued early next month. In the case of Broadcast Relay, arrangements have been made for any new ordinary shares not taken in conversion to be covered at 16s. 6d., less a commission of 6d. a share. The issue price of 16s. 6d., plus the 4s. 6d. cash to be given to preference holders converting raises their receipt to 21s. per share of £1, which is the figure at which redemption is to be effected. The return on the ordinary shares at the price of issue is only some 2.12 per cent, tax free, on the 7 per cent tax free dividend, whereas the preference shares carry 5½ per cent. The operation should result in material benefit to present holders of the equity, if the expected expansion in retained earnings materialises. In addition to raising the potential earnings on the ordinary, the operations place the companies in a stronger position to raise money by prior charges should the outlook appear to warrant such a step when conditions are more settled.

Cordoba and Primitiva

There has been some slight improvement in the market for Argentine securities owing to two recent announcements. In the first place, the Cordoba Central Trust is sufficiently certain that the promise of the

Argentine Government to pay off the underlying securities will be implemented to put forward a plan for the use of the funds. The original trust deed was drawn with a view to gradual liquidation, but it did provide that the first debentures might be redeemed at par out of any moneys received, but after a lapse of six months. It may be doubted whether a wholesale redemption was ever contemplated, but holders of this security are now asked to accept prompt repayment at 100½ instead of waiting six months and receiving 100. If this is accepted they will be paid off on December 1st, while holders of the second debenture will receive 65 per cent on March 1st, 1945. As the first debenture carries only 3½ per cent it is not likely to be considered a hardship that it should be repaid sooner than was expected. Other assets should suffice to pay the second debentures the further 18 per cent which the market price suggests is expected. The second development is an offer from the Argentine Government to Primitiva Gas to pay as compensation about four and a half times the amount of their original offer. This development follows the news that the Federal Court has rejected the original figure as not representing a fair valuation of the properties to be acquired. It is understood that the case is in course of being taken to the Supreme Court. No statement has been made by the company and it is improbable that the revised offer will be considered any great contribution to an agreed settlement as it is still only a fraction of the full claim.

Seamen's Charter

The officers and merchant seamen of twelve countries have adopted an International Seafarers' Charter, with the object of regulating seamen's wages, hours and conditions on an international level. The Charter, which will probably be presented to the Maritime Commission of the International Labour Office before the end of the year, represents a bold attempt to apply the principles adopted at Philadelphia to one of the most important international industries. The Charter proposes the fixing of minimum wages at £18 a month for an able seaman, with related minima for other ratings, and, for officers, minimum rates of £22 10s. a month for third mate and fourth engineer, with appropriate rates for higher grades, rising to £40 10s. for chief engineer and £45 for master. It suggests a 40-hour week for port work and a maximum 8-hour day for men on board, with 12 days annual leave with pay. In order to ensure continuity of employment, it proposes the creation of manpower pools in each country—on the lines of the wartime arrangements—which would keep registers of men employed and men available for employment. While waiting to be signed on, a man would receive 80 per cent of his sea-going wages. Entry into the shipping industry would be controlled; no boy would be allowed to go to sea before the age of 16; and proper training and certification would be required, not only for seamanship, navigation and engineering, but also for catering and stewardship. The Charter lays stress on the need for improving the standard of crews' quarters and on establishing a minimum safety code, with provision for inspection. It is perfectly true, as the Charter points out, that seamen work under entirely different conditions from factory workers; they work for a variety of employers and spend their money in different countries, and there is certainly more scope for standardisation of their conditions than for those of industrial workers. It is also true that in some countries—notably the United States and Scandinavia—conditions are far in advance of those elsewhere. But though the Charter makes it clear that the seamen's aim is a minimum, and not an equalisation of standards, it is hardly practicable to apply the same yard-stick to Chinese and US seamen, with their widely differing standards of life, as far as wages are concerned. It is clearly desirable to establish minimum international requirements for conditions of work and living on board ship, as well as for safety provision, and to embody these in a new International Convention.

Rand Wages Agreement

A wages agreement was reached last week, in the South African goldmining industry, between the Chamber of Mines and the Mine Workers' Union, who represent about a third of the industry's 45,000 European employees. An initial £25,000,

and an annual £100,000 for five years, is to be put aside out of profits to finance housing and other welfare schemes, to be mutually agreed. This will cost employers the equivalent of about 2s. 8d. extra in wages per week per worker, which is very much less than the 30 per cent increase in wages originally demanded by the Mine Workers' Union. Moreover, the extra cost will, in fact, be charged to profits and not to working costs. Attempts are now being made to reach similar settlements with the other mining unions. If all the industry's workers accept similar terms, the charge on profits will represent a little over 2 per cent of the total amount paid in dividends in 1943. This would let the employers off lightly, but at the same time the workers should benefit considerably from the welfare schemes proposed. The amounts made available for housing will enable workers to put down initial payments for the purchase of homes of their own, which is, no doubt, psychologically attractive. The agreement includes a wage truce for five years, during which time neither employers nor employees may attempt to change wage rates unless conditions alter "very materially." But, before the agreement has even become effective, its provisions have been rejected unanimously by a meeting of the shaft stewards of the Central Rand group. If this is the reception given now to proposals for a truce, what is likely to be the attitude of employees if the cost of living rises—or of employers if other mining costs increase? In the Heraclitan world of wage disputes, the agreement has done its best to give stability to the industry. But even temporary success is still in the balance.

Catering Wages Commission

The Catering Wages Commission have presented their annual report, in which the progress made during their first year is described. The extent of their work and the energy they applied to it can be judged from the fact that they met no less than 47 times during the year. It is estimated that the catering industry is now the sixth largest industry in the country, but the lack of precise statistical information has been a serious handicap. The Commission, however, are taking steps, with the assistance of the Ministries of Labour and Food, to remedy this during the coming year. Methods of regulating wages and conditions of employment have been studied, and wages boards for industrial and staff canteens, and for teashops and unlicensed restaurants have already been recommended. The grouping of the diverse sections of the industry for wages board purposes is a question on which views diverged, both in the trade and in the Commission, who are at present in favour of the establishment of a small number of boards. For two sections of the trade—the catering activities of the Crown and theatres—the Commission have reported that appropriate machinery already exists. Subjects on which the Commission hope shortly to report include the postwar rehabilitation of the catering industry, postwar equipment requirements, the development of tourist traffic insofar as the industry is affected, facilities for workers' holidays, and the training of workers for the industry. It is interesting to note, in the light of the battle which accompanied the passing of the Catering Wages Act, that the organisations which opposed it so strongly have sensibly decided to co-operate with the Commission.

Plan for a Town

Although all local authorities are concerned about post-war development in their areas in housing, education, and so on, few of them appear to be going beyond their social functions. For this reason, the report *The Development of Barrow-in-Furness*, prepared by Councillor G. D. Hastwell, the Socialist mayor and Sir Jonah Walker-Smith, the Conservative MP for Barrow-in-Furness, presents a novel view of the functions of local authorities. Their premise is that the industrial conditions prevailing in the borough are "valuable and essential parts" of their "very existence." Without a healthy industry, with its concomitant of sufficient employment, it is realised that the civic activities of the town could not flourish. The report is practical in outlook, and will form a useful basis for the deliberations of a new standing committee of the Council, to be

called the Development Committee, which Councillor Hastwell and Sir Jonah propose should be established. A long view is taken, and Barrow is expected to be the centre for a population of 200,000 in 50 years' time—the borough's present size is about 70,000. The authors of the report take an optimistic view of Barrow's future. The town depends for the major part of its employment on the shipbuilding firm of Messrs Vickers, who believe that their post-war prospects are good. In 1943, the average number they employed was 19,300, and the payroll amounted to £5,577,000. The revival and development of mining activities, the extension of the paper-making and flour-milling industries, the extension of other existing industries and the attraction of new ones, and the possibilities of an airport are among the propositions discussed. It is unusual these days to find in any post-war report a sentence such as the following:—

... we have refrained from any suggestion of State intervention and Government financial assistance.

The proposals are based on principles of self-determination, sound economy and long-term and progressive policy pursued with courage and confidence. There are, of course, limits to the degree to which Barrow's economic fortunes can be shaped by its local authorities or, indeed, by its inhabitants. But the independent outlook reflected by the proposals is most refreshing.

Odeon Theatres Expansion

The principal changes in the accounts of Odeon Theatres for the year ended June 30th last are mainly the result of the acquisition during that period of a further 27 theatres and of the incorporation in the consolidated statement of the Entertainments and General Investment Corporation, excluded from the first consolidated statement of a year ago for technical reasons. The principal effects are rises of some £3,819,000 to some £15,822,000 in theatres and equipment and of £2,380,000 in loan capital to £10,117,000 odd, due to borrowing for part finance of the purchase. There is also an adjustment of payments to shareholders outside the group and a rise from £125,516 to £635,495 in excess of purchase price of theatre investments over par value. As Mr Arthur Rank points out in his statement, this excess is moderate compared with the valuation of investments in subsidiaries which now stand at £2,828,904. The new theatres only contributed to the income of the group for just over half the year, 727 theatre-weeks against a yearly figure of 1,404, but there is a rise in total revenue of the group from £2,163,687 to £2,815,558. Loan interest increased by some £105,000, and total taxation from £1,448,993 to £1,974,860, but the parent company was able slightly to increase its dividend and appropriations. The accounts are analysed in some detail on page 490. The rise of £9,346 in the parent's profit before war damage is stated by Mr Rank to give, if anything, too favourable an impression of the gain to the proprietors out of a rise in attendances at the theatres of the group by 25 million to 180 million. Box office receipts rose from an undisclosed figure to some £16 million, of which 39 per cent, against 38 per cent for 1942-43, was absorbed by entertainments tax, while total direct

taxation took 50 per cent. In these circumstances, it is not surprising to find Mr Rank urging a reduction in entertainment tax when the war is over. This may seem desirable in view of the fact that the rate of this tax has been trebled since pre-war days, but it is doubtful whether the authorities will, or should, give this tax a high priority in the list of reductions. The first items of tax relief, when that is possible, must be such as to permit the replacement of those semi-essentials, the stocks of which have been almost exhausted during the war.

Shorter Notes

The President of the Board of Trade announced in the House of Commons on September 19th that any disabled ex-Serviceman who was formerly a retailer is to be granted a licence to open a shop in any area or line of business. The only proviso is that, if he proposes to set up in an area in which he did not trade before, a licence will only be granted if it does not prejudice the interests of other closed retailers on the Board of Trade register. The rules for the granting of licences to disabled ex-Servicemen who were not retailers before the war are the same, except that the licensing committees will consider, with Ministry of Labour advice, whether retail trade affords good prospects for each individual applicant. The British Legion has been invited to nominate a representative to serve on each of the licensing committees.

The claim of the National Union of Agricultural Workers for a weekly minimum wage of £4 10s. has been rejected by the Agricultural Wages Board. The minimum will remain at 65s. a week.

On October 3rd Captain Waterhouse, Parliamentary Secretary to the Board of Trade, informed the House of Commons that export statistics for 1943 and preceding years are to be published shortly; it is to be hoped that this will soon be followed by a resumption of the publication of monthly export and import returns.

The decision of the Government to set up a body to deal with industrial design is a welcome one. Few details are yet available, but Sir Thomas Barlow, Director of Civilian Clothing, in announcing the Government's intention last Monday, said that great importance was attached to it. The scope and powers of the new organisation will be wider than those of the present Council of Art in Industry, and it will endeavour to improve the design of articles in common use. It is probable that the proposals of the Federation of British Industries, which were discussed in these columns last week, will be closely followed.

COMPANY MEETINGS

DECCA RECORD COMPANY, LIMITED

SATISFACTORY RESULTS

The fifteenth annual general meeting of the Decca Record Company, Limited, was held, on the 29th ultimo, in London.

Sir Cyril F. Entwistle, K.C., M.C., M.P. (the chairman) said that the balance from trading account amounted to £115,766. After deducting depreciation and other charges, the profit amounted to £101,349, an increase of £16,800 on the previous year. The directors recommended a final dividend of 75 per cent., less tax, on the ordinary shares, making a total dividend

for the year of 100 per cent., less tax. The increased dividend they were able to recommend was well within the earning capacity of the company after provision for E.P.T., without the exceptional profit brought in this year and, allowing for the fact that for the current year no further relief from income tax could be anticipated.

The business carried on previously by Decca Radio and Television, Limited, had been absorbed by the company during the year. The directors were convinced that the merging of the radio with the record business would react favourably on both sections.

He felt sure shareholders would regard the results disclosed as highly satisfactory.

The continuation of the war had inevitably resulted in a progressive increase in production difficulties. They believed, however, they had now seen the worst in that connection. The demand for records had continued on a level far in excess of their Board of Trade quota, or their capacity to supply. For over 12 years they had been issuing the recordings of that great artist Bing Crosby, who had recently arrived in Europe. Immense though his sales had been to date, they were convinced that their post-war distribution of his records would eclipse anything they had seen in the past.

They viewed with great confidence the prospects of their business as soon as existing war-time restrictions were removed.

The report was adopted.

It cleans efficiently ALL types of DENTURES

The use of denture powder and brush for cleaning artificial teeth has proved completely satisfactory in practice, and should become a regular habit, especially after meals, in the interests of hygiene. KOLYNOS DENTURE POWDER is as harmless to the new 'plastic' bases as it is to metal and vulcanite, yet it effectively removes all food debris and stains. From all chemists—1/3.

KOLYNOS DENTURE POWDER

Also, where gum-shrinkage has affected the normal suction grip, KOLYNOS DENTURE FIXATIVE makes false teeth fit firmly—1/3 & 3/3.

GOVERNMENT RETURNS

For the week ended Sept. 30, 1944, total ordinary revenue was £81,551,000, against ordinary expenditure of £149,674,000 and issues to sinking funds of £130,000. Thus, including sinking fund allocations £7,234,165, the deficit accrued since April 1st is £1,616,394,000 against £1,588,235,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £363,590 to £2,513,118, the other operations for the week (no longer shown separately) raised the gross National Debt by £66,660,178 to £21,195 million.

INDUSTRY AND TRADE

Trade Disputes.—The number of working days lost in August through industrial disputes was 125,000, a rise of 61,000 on the July figure. The number of people involved was 33,800, against 20,900. In coal mining, 15,900 workers were involved in stoppages during August, and an aggregate of 31,000 working days were lost. In the metal, engineering and shipbuilding industries 15,000 people lost 88,000 days.

Film Industry Inquiry.—The Minister of Labour has appointed Sir Harold Morris, MBE, KC (chairman), Lord Terrington, CBE, and Mr A. M. Wall, JP, to constitute the Court of Enquiry which he has set up under the Industrial Courts Act, 1919, to enquire into the matters in dispute between the Film Artistes' Association and the Film Producers' Association with particular reference to the existing arrangements for the employment of crowd and small part artistes.

War Damage Business Scheme.—All policies under the business scheme which are in force on September 30, 1944, will be extended until December 31, 1944, without further payment of premium or further action on the part of the policy holders. For additional insurance under the business scheme as well as for new insurance under the scheme, the rate of premium has been reduced to 1s. 8d. per cent for the three months October 1st to December 31st, 1944, with a minimum premium of 5s.

Agricultural Loans.—Under the Agriculture (Miscellaneous Provisions) Act, 1944, the Minister of Agriculture has been enabled to increase the funds of the Agricultural Mortgage Corporation to allow of their making long-term loans on mortgages of agricultural land and for improvements at 3½ per cent per annum. The Corporation have in consequence announced a reduction to this rate of the interest on all new loans.

"The Economist" Sensitive Index.—There was no change in the index during the week ended October 3rd. The complete index (1935 = 100) was 158.6; crops 135.6; and raw materials 185.5.

1,000, 130/-. Post free. Sample flat 50 for 6/8.

CORPORATION OF GLASGOW

DEPUTY MANAGER, MUNICIPAL TRANSPORT
DEPARTMENT.Applications are invited for the appointment of Deputy
Manager, Municipal Transport Department.The salary for the appointment is £1,000 per annum, rising to
£1,250 per annum by increments of £25 per annum. The war
bonus on the commencing salary is at present £40 11s., subject to
modification.Applicants must not be over 45 years of age and must have
had accountancy and administrative experience, not necessarily
in a transport undertaking. The person appointed would be re-
sponsible to the General Manager of the Municipal Transport
Department for all the administrative, accountancy and statistical
work of the Department, and would take over the duties presently
carried out by the Secretary and Treasurer.The appointment is subject to the provisions of the Corporation
Superannuation scheme, which is a Local Act Scheme, and the
successful candidate will require to pass a medical examination.Applications, stating age and full particulars of qualifications
and experience, together with copies of not more than three
recent testimonials, must be received by me in an envelope endorsed
"Municipal Transport Department: Deputy Manager," not later
than 18th November, 1944. Persons at present serving in H.M.
Forces or engaged on war duties are invited to make application
for this appointment.

WILLIAM KERR, Town Clerk.

City Chambers, Glasgow, 15th September, 1944.

Machinery for Peace

IT is impossible to read the proposals for a new inter-
national security organisation drawn up at Dumbarton
Oaks without realising how very closely the new League
is modelled on the old. Whether it is a question of
obligations or structure or procedure the "United
Nations Organisation" is blood brother of the League
of Nations. The language of the new proposals is more
dry and sober. All the Utopian aspirations of the
Wilsonian experiment are carefully left out. Nevertheless,
the aim to provide machinery whereby fully Sovereign
states may settle their disputes by peaceful means is the
same in both documents, however much the new proposals
avoid any suggestion of a new heaven and a new earth.

The structure proposed at Dumbarton Oaks closely
follows the forecast made in *The Economist* of Sep-
tember 23. There is to be a General Assembly of all the
United Nations, to which other states may be admitted
by a two-thirds majority of the Assembly votes. This is
indistinguishable from the old League Assembly. The
range of problems which it may survey and on which it

may make recommendations is as wide. But, as with the
old League, the chief source of authority is not the
Assembly but the Council.

The new scheme proposes a Security Council which
has roughly the same powers and functions as the old
Council of the League. The four Great Powers—America,
Britain, Russia and China—have permanent seats, and
France will "in due course" also have permanent repre-
sentation. Six other states will be elected by the Assembly
and serve for two-year periods, three retiring each year.
In the old Council, very much the same expedient was
used to secure Great Power and Small Power represen-
tation. If there are any differences in the work proposed
for the Council, they lie in the greater clarity with which
the new proposals underline its overwhelming responsi-
bility in the sphere of security.

Assembly and Council will, in the new League as in
the old, be served by a permanent secretariat. An inter-
national Court will deal with justiciable disputes. The
new proposals suggest that either the old Permanent

Court be carried on or a new one established on identical lines. Finally, a new organ, an Economic and Social Council, will guide the social, economic and humanitarian work of the new League and direct the work of existing bureaux, of which the International Labour Office will presumably be one.

One entirely new feature is the place given to regional organisations. As the proposals put it

Nothing in the Charter should preclude the existence of regional arrangements or agencies for dealing with such matters relating to the maintenance of international peace and security as are appropriate for regional action.

Where it is appropriate, the Security Council may make use of regional machinery to ensure the enforcement of its decisions, but no local action may be taken without reference to the Council nor may regional agencies take to themselves the functions which can only be exercised by the Council. Thus the type of regionalism permitted is not exclusive.

*

The obligations of the new organisation are very similar to those laid down under the old. Its primary function is to ensure that the state members use pacific means in settling their disputes. Unlike the old, the new League contains no specific guarantee by each member of the territorial integrity and political independence of all the states, but since no state sacrifices either without a struggle and all struggles are the subject matter of the League's deliberations, the distinction is academic. The peaceful means proposed are the old ones—judicial settlement, arbitration, conciliation and, where everything else fails, reference of the dispute to the Security Council.

Where the aggressor refuses peaceful means, the Council may specify what sanctions, diplomatic, economic and military, should be imposed. In the old League, sanctions short of war were to follow automatically on the breaking of the Covenant by any Member. In the new proposals, the supreme authority of the Council covers all sanctions, military and non-military alike. It alone apparently defines aggression. It alone specifies the action to be taken. The difference may not seem important but it shows that the drafters have learned the lesson of this war—that only Great Powers can wage war effectively.

A new feature of the proposals against aggression is the setting up of a military staff committee, consisting of the Chiefs of Staff of the permanent Council Members, which will advise the Council on its military responsibilities. The forces at the disposal of the Council are to be composed of national contingents contributed by the different state members. Of these, however, some air contingents are to be held immediately available for the use of the Council. In both proposals, one may see a desire to "put teeth" into the new League. In parenthesis, it should be noted that much less space is devoted to disarmament in the new proposals.

In the old League, one of the most criticised provisions was the unanimity rule which covered the recommendations made by the Assembly and the war-making decisions of the Council. The Members' obligation to fulfil the Council's recommendations on sanctions was conditional upon their being reached without dissentients, other than the parties to the dispute. This ruling in fact gave the power of veto to every Member of the Council. In the new proposals, most of the votes in the Assembly may now be taken on a two-thirds majority. The voting in the Council is deferred for further consideration. It is, however, known that the difficulties which made postponement necessary also turned on the problem of a veto. The British and American drafts apparently proposed that, in determining and combating aggression, the Council should decide by a majority vote, none of the Great Powers being in the minority. In other words, the Great Powers, like the whole of the old Council, were to be unanimous. To this was added, however, the old Council proviso that any Power, Great or Small, if it were itself accused of the aggression, should not vote. The Russians wish to see this proviso deleted. In other

words, they wish to be able to veto Council action, even when they are accused of aggression.

Thus under the old form of unanimity or the new form of a veto, the same problem has come up. It underlines once again the fact that in a world of sovereign states, the power exercised by the League is the power which the Great States are ready to put at its disposal. In disputes concerning themselves, they will not permit a Council vote to override their determination to be judges in their own cause. They may indeed decide to adopt peaceful procedures; but if they do not, the League cannot coerce them. This was the naked fact underlying the old unanimity rule. It is the reality behind the Russian attitude.

*

It is not really a matter for surprise that the new structure of the international organisation so closely resembles the old or that the same problems have emerged in both. The shape of the world has not changed very much in the last twenty-five years. It is still a world of separate independent sovereign states. All that has happened is that the Great Powers have, if anything, become greater, and the gap between the great and the small has widened. In such a world, the old League is about the best structure men can contrive to express their peaceful purposes and their pious hope that all nations will abide by them. But the structure itself will not guarantee peace. It is a device of machinery, an instrument which, if the nations are bent on peace, will help them to cooperate smoothly but which, if they are not, will be of little use.

The Russian attitude over the Council voting is only a more frank admission of a reservation which every separate sovereign Great Power will make. The Russian Government no doubt feels more strongly on the matter because Russia alone of all the nations has been once ejected from the League for aggression. It is easier to understand the Russian point of view if one can answer two questions. Would Great Britain allow itself to be arraigned before Council and Assembly on the grounds of "imperialist aggression" in India? Would the United States permit China and Russia to join Mexico in a joint defence against some supposed act of aggression on the part of America? The Russians have bluntly stated a reservation which all will make.

This is not necessarily a disaster. On the contrary, if it compels statesmen and people to face the realities of international cooperation it will have done a real service. That cooperation will depend, as long as sovereignty lasts, on the will to peace of the Great Powers and not upon any structure of international security. Structures are not panaceas, covenants are not peace. Peace will be achieved, arduously, year by year, if the Great Powers in their relations with each other and with their smaller neighbours make respect, cooperation and good neighbourliness the rule of their foreign policy. Thus, while the publication of the proposals drafted at Dumbarton Oaks is undoubtedly a milestone in international order, one of its most encouraging features is the fact that it was published soon after the meeting between the President and Mr Churchill at Quebec and on the eve of the discussions between Marshal Stalin, Mr Churchill, Mr Eden and Mr Mikolajczyk in Moscow.

Covenant or no covenant, the obstacles to real post-war understanding are there. Trade problems, relations with South America, the Japanese settlement—all these may cloud understanding between the United States and its partners. The future of Germany, the independence of Poland, the post-war organisation of the Balkans—these are problems which may create friction and misunderstanding between Russia and the West. The new League can solve none of them. Rather its successful working depends upon their solution. But if Allied statesmanship can bring the Great Powers out of the war determined to work together for peace as closely and as wholeheartedly as they did for war, then the new League can be an effective and creative instrument of their common purpose.

Back to Politics

THE Liberal and Labour parties have now announced their decision, which never was in much doubt, to fight the next election as independent parties with independent programmes. The Conservative party, faced with Hobson's choice, will also fight independently. There will thus be no "coupon" election. The three parties, having put an end to a truce which has already lasted for more than four years, will open up electoral warfare.

Already the political atmosphere is heavily charged, and party organisations are beginning their election preparations. The week-end speeches of Mr Eden and Mr Attlee savoured of electioneering; both tended to claim for their respective parties the lion's share of the credit for the Government's social insurance plan, while in a fortnight's time, the Liberals will be able to produce Sir William Beveridge as their ace of trumps. The coalition in fact is beginning to wear very thin. The Labour party hopes that it will be dissolved "with dignity and good feeling, for it would be an unworthy thing for so great an adventure to end in squalid bickering." But it looks as if this is exactly what will happen. The crisis which has developed over the compensation clauses of the Planning Bill may be the first of many crises, which will make an all-party Government a mockery. The pulls and pressures of sectional interests may become so strong that not even the prestige of Mr Churchill will be able to hold the parties together.

The truth is that unity among the political parties is only practicable in time of national danger. The Dunkirk harmonies cannot be sustained by a choir whose members are singing out of tune. Now that there is a general feeling that the war in the west can safely be left to General Eisenhower and Field-marshal Montgomery, political unity has become an artificial concept. There is, indeed, a great deal of costly fighting still to be done. But the period of policy-making for war is over, and the content of politics is almost fully directed towards the years of reconstruction and recovery. These, too, will be crisis years; indeed, the economic war against want and unemployment will call for as great a national effort and as much unity as the military war against Germany. Logically, therefore, there may be good reasons for continuing the coalition, but psychologically they must break down. In war, not only is there agreement on ends but there is also agreement—or at least not party differences—on means. In peace, agreement on ends is limited to the broadest generalisations and there is fairly complete disagreement—that is, the parties feel impelled at least to create an appearance of disagreement—on means. Nothing could more clearly illustrate the impo-

tence of a coalition when faced with peacetime questions than the present deadlock over the Planning Bill. Each party by itself has a policy; the coalition has none.

The date of the election will, of course, be decided by the Prime Minister, but he will get his signal from the Labour party, whose private dilemma will be to choose the right moment to cut the painter. Its executive's statement purposely leaves this vague, though it rightly stresses the importance of giving the men and women in the Forces a chance to play their part in an election. But this is purely an administrative point, and the Conservatives are most unlikely to give the Labour leaders six months of freedom from office to conduct their election campaign. The very strong probability is that the Labour Ministers' resignation will be followed almost at once by an election. This being so, the December conference of the Labour party will have to decide whether the break and the election should come at once or later. Once again, there are, in logic, powerful arguments for postponement until the last possible moment, so as to give Mr Bevin a chance to direct at any rate the opening phases of demobilisation, to ensconce Sir William Jowitt in his new Ministry, to assist in conducting the war against Japan and to enable the joint plans for social reform to be translated from White Papers into Parliamentary Bills. But a situation in which Ministers would attend Cabinet meetings in the morning and catch the afternoon train to denounce their colleagues on the hustings would clearly be unworkable. Similar arguments can be used to support the suggestion that the coalition should be resumed after the election. But this would be regarded as political trickery, and the cry "The coalition is dead—long live the coalition" is most unlikely to be acceptable to the Labour rank and file.

It is fascinating, though obviously hazardous, to indulge in political forecasts or to try to assess the balance of parties in the next House of Commons. To judge from by-election results, there should be a swing to the left, especially if the still untested opinion of the Forces is taken into account. But the magic of Mr Churchill's name will undoubtedly influence the floating mass of the electorate, the non-political millions, who, after all, have the decisive say, who rarely vote in by-elections and who pay little attention to party labels. These voters will have so much difficulty in imagining anyone else as Prime Minister that it should not be very hard for the Tory propagandists to convict the Socialists of deserting the indispensable man. Moreover, Mr Churchill should appeal to many people on the left, as the man who has met Stalin three times. The Conservatives will probably

be able to put forward the greater number of war heroes and younger men as candidates. The Liberals may well increase their representation in Parliament, even though the existing electoral system operates against them. The Labour party may throw away its chances of appealing to the non-political electorate by its excessive rigidity. Its decision to fight Sir Stafford Cripps is evidence of suicidal tendencies, and there are other Independent Members who, though outside the Party, would nevertheless be able to promote its interests in the country if they were given the chance. Common Wealth

Colonial Constitutions

THE constitutional deadlock in India tends to obscure the progress that is being made by other parts of the dependent Empire towards responsible government. Yet it is a remarkable fact that the years of the war, so far from being a period of marking time, have seen constitutional changes, in the direction of more self-government, all over the colonial empire. Last week, the Secretary of State announced his approval in principle to a new constitution for the Gold Coast, which gives its Legislative Council a majority of unofficial members. This follows the recent announcement that a Royal Commission is to examine the proposals put forward by the Ceylon Board of Ministers; the draft order-in-council promulgating a new constitution for Jamaica; the reports of the Trinidad and British Guiana franchise commissions; and the promise that responsible government in internal affairs will be restored to Malta—all within the space of the last eighteen months.

There have been other developments, not involving constitutional changes but nevertheless helping towards responsible government. High upon the list of these should be placed the appointment of an African to the Kenya Legislative Council, the reform of local government in Cyprus prior to the re-establishment of a Legislative Council, and the setting up of provincial councils in Northern Rhodesia in which Africans, not necessarily the chiefs but the most progressive members of the native authorities, speak their minds on matters concerning their territory.

The scope and nature of all these changes vary in accordance with the political maturity of the colony concerned. But it is possible to trace, through them, the milestones on the road to Dominion status. The first is reached when a colony is given a Legislative Council. To begin with, this is merely a means of making representations to the colonial government; it is a debating assembly, but it has no powers. It is the government which initiates bills, and as there is an official majority in the Council, they are certain to be passed. The next milestone is, therefore, reached when, as will now be the case in the Gold Coast, there is an unofficial majority in the Council. Eighteen out of the thirty members will be elected to the new Legislative Council in the Gold Coast, the remaining twelve consisting of six officials and six unofficial members nominated by the Governor. But the powers allowed to the Council are still very limited. The Governor will be enabled to override its decision "in the interests of public order, public faith or good government," though his action will, in its turn, be subject to revocation by the Colonial Office.

From now on, therefore, progress towards responsible government depends on the powers and functions of the Legislative Council and, conversely, on the limitation of the Governor's power. This latter has been one of the biggest points at issue between the Secretary of State and Jamaica in the discussions on the island's new constitution. Originally, the Governor's powers of certification and veto—that is, of certifying that bills have become law even though they have been rejected by the Council and of vetoing bills that have been passed by it—were absolute. After negotiations, however, a concession was made, and it is at present proposed that

has now applied for affiliation to the Labour party. Its request will without doubt be turned down as decisively as was that of the Communists, though both parties would bring a certain amount of useful electoral grist to the mill. For the same reason, Labour will never countenance any electoral agreement with the Liberals, even though many three-cornered contests might be won by one or other party. In short, the pattern of the inter-war years will be repeated for at least one more election. The Tories are more interested in power, the Socialists in purity. The country is likely to gratify both wishes.

though absolute powers of veto should be retained, the power of certification should be exercised in accordance with the advice of the Executive Council. In the case of Ceylon, the British Government has stipulated that whatever form of constitution is eventually adopted, the Governor must have overriding powers in matters relating to defence, external affairs and currency and those likely to arouse opposition from minority communities.

Along with the extension of the powers of the Legislative Council goes an attempt to educate its members in the work of administration. There is no question of this in the new constitution proposed for the Gold Coast. But in Jamaica, under the proposals at present under discussion, the Executive Council will consist of ten members, half of whom will be selected by the elected House of Representatives and will serve as chairmen of five committees concerned with such matters as agriculture and social welfare. In Jamaica, the Legislative Council proper will become an Upper House consisting of fifteen nominated members. It will apparently have power to initiate bills, but it has been officially declared that it is the Executive Council which will be "the principal instrument of policy in Jamaica"—it will prepare budgets, approve Government Bills before they go to the House of Representatives and perform such other functions as the Secretary of State may direct.

This attempt to give the people a lesson in the departmental system was tried some years ago in Ceylon and did not, it is true, have much success. There, the Donoughmore Commission found, the divorce of power and responsibility led to a situation in which

those who have the controlling votes . . . do not bear the responsibility for their decision, those who have to bear the responsibility are without the controlling votes.

It does not follow that in the different circumstances of Jamaica, where for one thing there is no communal problem, the committee system will not work. But it is worth noting that in Ceylon it was found advisable to give the people more responsibility rather than less. The legislative and executive councils, under the Donoughmore constitution, were fused into a single State Council, and a Board of Ministers was made responsible for the various departments of government, seven out of its ten members being elected members of the Council. But the State Council only had limited control over matters of finance.

The grant of responsible government to a colony is, therefore, no simple procedure. The Secretary of State has above all two things to bear in mind. First of all, he has to remember that he is trustee for communities which might be oppressed by those to whom the reins of government would be given. Secondly, he has to be assured that self-government will not mean bad government and in particular financially unsound government. If there are to be large investments of capital in the colonies after the war, the investor, whether he is taxpayer or private capitalist, must be assured of the financial stability of the colony he is investing in—there should be no more Newfoundlands. Moreover, those who cavil at the Governor's reserved powers should take a lesson

from the present situation in the Bahamas. There, the power to legislate lies with the elected House of Assembly to which the Governor can only recommend legislation. Recently he recommended, as a result of the expressed desire of the Imperial Government, that the secret ballot should be extended to the Out Islands. The House of Assembly turned the proposal down, and there is no means of making it law.

*

Difficulties such as these—the communal problem and the recalcitrance of the Bahamas House of Assembly—could be resolved, partly at least, if government were made democratic at the same time as it is made responsible. In the Bahamas, the property qualification for an elector allows nearly 20 per cent. of the population to vote, which is far higher than in the other West Indian islands, but the property qualification for a Member of the House of Assembly is as much as £200. In recent years, therefore, the grant of new constitutions has been accompanied by a considerable extension of the franchise. Ceylon was granted more or less universal adult suffrage under the Donoughmore constitution; Jamaica is to be granted it under its new constitution. The Trinidad Franchise Committee has unanimously recommended the abolition of a property qualification for electors in that colony and the Secretary of State has gone further by abolishing the literacy qualification as well; the island will in future have universal adult suffrage, and though members of the Legislative Council will still have to fulfil a property qualification, it will be greatly reduced. The British Guiana Franchise Commission, on the other hand, has been less progressive. A majority has recommended that the property qualifications for voters should be retained, though reduced by half or more; it also recommended a literacy test in English, but the Secretary of State, while accepting the retention of the property

Confusing the Issue

ONLY the briefest comment was possible last week on the speech made by the Chancellor of the Exchequer at the Mansion House to the bankers of the City. The speech touched upon a number of topics and Sir John Anderson had much that was both cogent and encouraging to say. But the more important passages, and those that have attracted most attention, were those that dealt with some of the issues of international trade and finance involved in the Bretton Woods Agreement. These passages raise an important issue of public policy, on which it is advisable that something more should be said.

The Chancellor was careful to say that the British Government was not yet committed to acceptance of the Agreement, though he very rightly added that

if we find that the United States and other countries important in international trade and finance decide that it is acceptable to them, we must not reject it lightly.

This may perhaps be interpreted as stating the intention to wait until Congress has pronounced. Sir John also made it clear that he would have much more to say about Bretton Woods when the time comes for it to be debated in Parliament. He selected only a few points for discussion in last week's speech. But it is reasonable to suppose that he selected those that seemed to him to be the most important. And it must be recorded, with regret, that his treatment of them was more calculated to confuse the issue than to elucidate it.

The Chancellor used three arguments in favour of Bretton Woods—or, more strictly, of the general philosophy of international trade of which Bretton Woods is the first expression. One argument was that we are bound to the acceptance of this philosophy—in particular to its ban on discrimination—by Article VII of the Master Lend-Lease Agreement. The second argument was that, in any case, Britain must embrace a multilateral system of international trade and finance and eschew discrimina-

qualification, has substituted for the other recommendation a literacy test in any language.

In Africa, the question of universal suffrage has hardly yet arisen. In the Gold Coast, the municipal members are elected by ballot, for which there is a property qualification, but the provincial members are elected by the provincial councils, the members of which have a vote for every unit of ten thousand inhabitants in their divisions. In principle, this system is to be retained under the new constitution. In Northern Rhodesia, too, the system of provincial councils, from which it is hoped eventually to draw an African central council, is still something far less than direct representation. The time may come when the central council will elect a member to serve on the territory's Legislative Council, but there is a danger that this system will leave, for instance, the African on the compound unrepresented. It is an interesting and welcome means of giving African opinion a hearing, but it should not be regarded as a substitute for a wider suffrage.

For the majority of colonies universal suffrage must still remain a distant goal. So, too, must the attainment of fully responsible government. But these examples of the past few months show that there is always movement on the road from the dependent Empire to the independent Commonwealth. There are obstacles in plenty, and whereas the colonial peoples tend to ask for too much and too soon, the Colonial Office seems to grant too little and too slowly. But it is worth noting that, except where the communal problem is intense, as in Palestine, disturbances in the colonial empire in recent years have been caused by economic factors such as low wages rather than by unfulfilled political aspirations. That in itself is a testimony to the reality of the British promise to grant self-government to the colonies and also to the colonial peoples' belief that it will eventually be carried out.

tory barter. The third was that the plan provides considerable elasticity of exchange rates. On this third point, there can be little quarrel with the Chancellor; but the other two deserve a little further analysis.

Article VII of the Master Agreement pledges both the British and the American Governments to take action,

open to participation by all other countries of like mind, directed to the expansion, by appropriate international and domestic measures, of production, employment, and the exchange and consumption of goods . . . ; to the elimination of all forms of discriminatory treatment in international commerce, and to the reduction of tariffs and other trade barriers. . . .

It will be noticed that there is an obligation on both countries. It will also be noticed that a number of objectives are set up, without any indication that any one of them has priority over the others, or that one should prevail over the others if they come into conflict. Moreover, it is becoming apparent that the vital word "discriminatory" is given widely varying interpretations by different people. As usually interpreted in America, it condemns a number of British practices, such as imperial preference (for which an exception has apparently been granted, though the text of the Master Agreement bears no trace of any such qualification) and any arrangements, such as the Anglo-Argentine agreement or reciprocal bulk-purchase agreements, designed to secure that the benefit of British purchases shall accrue to the British export trade; but it conveniently omits such American discriminatory practices as insistence that American loans shall be spent in American markets. In this view, a country which puts other countries in possession of its currency by buying goods is discriminating if it tries to control the expenditure of that currency; while a country which puts another in possession of its currency by making a loan is fully entitled to control the expenditure of it. That this is the accepted American doctrine has been made clear in

the last few days by Mr Harry Hopkins, the President's confidential adviser, who advocated a policy of "tied" loans. On the other hand, the British definition of discrimination will appear just as far-fetched to American eyes as the American does to British. Apart altogether from imperial preference, which is a standing exception to the most-favoured-nation rule, Sir John Anderson stated in the House of Commons on Tuesday that some forms of "clearing and payments agreements, bulk purchase contracts and import control" come within the definition of non-discrimination. If this view is accepted by the Americans, and applied in both a commercial and a monetary context, there is really no dispute. If "non-discrimination" is so widely defined, no one would want to discriminate.

But this, after all, is no more than a matter of verbal definitions. Much more important was the Chancellor's insistence that, pledge or no pledge, a non-discriminating, multilateral system of international trade was in the interests of Great Britain. The alternative, he implied, was "what is in essence a barter system for our international trade."

If we discriminate, other people can discriminate. If we indulge in barter, other people can indulge in barter.

When the Chancellor poses the choice between an agreed multilateral system and a barter system conducted in an atmosphere of hostility, there is, of course, only one answer. But to put the choice in this way, as if what were at stake were a simple choice between the two extremes, is only to confuse the issue. It is the same sort of prejudicial irrelevance as the question that used to be put, with a similar air of finality, by Chamberlain's supporters in the Munich days: Do you prefer war or peace?

It is a matter of almost unanimous agreement that a free and universal system of international trade which works successfully is perfect. Such, broadly, was the system that prevailed before the last war. But one of the clearest lessons of the inter-war period is that a system of rigid obligations that breaks down can be very damaging. In the light of hindsight, most people now would agree that the attempt to re-create the pre-war system in the 1920's did far more harm than good, and, specifically, that Great Britain would have been better off if no attempt had been made to restore the gold standard, at the previous or at any other parity, until the political and economic relations of the world settled down to something much nearer normality. When the man in the street anxiously enquires of Bretton Woods "Is it the gold standard?" (and anyone who is in contact with the public can testify to the anxiety), he is not asking a technical question, but using a convenient shorthand for the query, "Are we getting ready to make the same mistake, or the same sort of mistake, as we did last time?"

Now in some respects—probably on balance—the Bretton Woods plan is more elastic than the gold standard. But fundamentally, its object is the same as that of the financial reconstruction of the 1920's, the re-creation of a multilateral regime of free convertibility. It would take a great deal of boldness to assert that the elasticity of the Bretton Woods plan would have been enough to carry it through the hurricane of 1929-31. At bottom, the case for Bretton Woods is that the hurricane will not recur. And that means that Bretton Woods must be judged by the available evidence on the correctness of this view.

There may well be good reasons for taking an optimistic view. But there are also good reasons why the United Kingdom should measure the risk with particular care. The real cause of a breakdown, if one were to occur, might well lie with the creditor countries of the world. Nevertheless, the breakdown would present itself in the guise of a default by the debtor. Britain is the largest prospective deficit country and has been stripped, during the war, of virtually all its reserves; on Britain would almost inevitably fall the odium of a collapse. What is in the minds of many of those who have doubts about Bretton Woods is not that the inception of the plan would be harmful to British interests, but that its

breakdown, if a breakdown should occur, would be most peculiarly damaging to Great Britain.

The real issue is, then, whether, after all the evidence has been weighed, the Bretton Woods scheme looks as if it would work. The United States can afford to take the attitude that, even if it does not work, no harm has been done; Britain cannot. The conditions for successful working of a universal system are very familiar. They are that the large countries shall avoid depressions and keep their balances of payments in equilibrium. The question, therefore, becomes whether these two conditions are likely to be met. In America, there is very little conclusive evidence yet; though if effective policies to secure these two objects are to be adopted, the time is getting short. The American answer to this double question is the most crucial. But the United Kingdom is the second largest economy, and we should be candid enough to ask the question of ourselves. So far as employment policy is concerned, there is the outline of a policy, but very little evidence to show with what energy it will be pursued. As for the balancing of the British international account, there is a great deal of talk but no sign of a policy. Indeed, to judge by the plans for high-cost restrictionism that are being drawn up by one industry after another, we shall be very fortunate to regain our 1938 volume of exports, let alone secure the necessary 50 per cent increase. The Government might be invited to explain how they reconcile their international policy, based on unaided competition in open markets, with the rampant restrictionism they encourage—or at least permit—at home.

These questions are not raised for the purpose of suggesting answers to them. On the contrary, no man can yet supply the answers. It is not intended to suggest that the answers, when they come, are more likely to be unfavourable than to be favourable. There will be a very sincere desire in almost every quarter in this country to take as optimistic a view as is reasonably possible, to stretch a point or two of realism in putting the most favourable construction possible on every piece of evidence. That will certainly be the practice in these columns. As the Chancellor said,

If we have to choose between standing out of international institutions or taking a leading part in making them work, particularly when they are institutions for economic co-operation, I have no doubt where our true interest lies.

But with the lesson of last time, when currency ambitions ran disastrously ahead of reality, so clearly in the public mind, and with the national reserves depleted, we cannot merely leap in the dark. It is only common prudence to wait as long as possible, until the growing light of evidence shows how wide is the gap that has to be leapt by courage and optimism.

It may be, then, that in the end the country will agree with the Chancellor's championing of Bretton Woods. But if so, it will not be for the reasons he gave. It is a distortion of the issue to present it as one of multilateralism *versus* barter, of Adam Smith *versus* Hjalmar Schacht, of economic peace *versus* economic war. It is nothing of the sort. The real issue is whether the Bretton Woods scheme is likely to work more successfully than a less ambitious alternative, such as might well consist, for example, partly of groupings of currencies on the analogy of the sterling bloc (within which concerted policies for full employment and balanced payments could be pursued), and partly of relations between the "key currencies" based upon the pre-war Tripartite Agreement. The issue is between two different sorts of multilateralism, two different definitions of discrimination.

It is depressing to see the Chancellor himself confusing the issues. It would be interesting to know why he thinks it necessary to do so. He is far too shrewd not to know what the real issues are. Why, then, does he ride off on debating points of doubtful relevance? The conclusion suggested is that he, too, is not sure where truth lies on the main issue. For the moment the only sound policy is to Wait and See.

A Policy for Wealth—VIII

The Policy Summarised

IN the course of this long series of articles a number of suggestions for policy have been made. Appearing week by week and related in each case to a separate variation on the main theme, they have no doubt appeared disconnected. The time has come, in this final article, to draw them together and to present the Policy for Wealth as a consistent whole. But it is necessary to emphasise that it has not been the purpose of these articles to dogmatise or to enter into the details of any particular expedient. It has rather been the intention to draw attention to a whole field of economic policy which has hitherto been taken for granted both by statesmen and by economists and to point the necessity for hard thought and effective action if the foundations of all economic wealth are not to crumble. The basic truth is that the British community does not produce nearly enough wealth, and if these articles have assisted in underlining that fact, they will have served their purpose. They are not intended to summarise or conclude a discussion but to begin it, and if, in that discussion, every single specific suggestion is rejected, they will still have served their turn provided that the basic principle is accepted and acted upon—the basic principle that means of speeding up the production of wealth must be sought wherever they are to be found.

The following twenty points, which very briefly summarise the whole series, are therefore to be regarded as no more than chapter headings for the policy:—

1. For the British community, and for many years to come, the size of the cake of the national output is certainly as important as, and probably far more important than, any questions about the size of the various slices. Neither Full Employment nor Social Security will be accounted successes unless they can be combined with a rising standard of output.

2. In past decades the average rate of increase of productivity per head has been about 1½ per cent per annum compound. The objective should be to raise this rate to 2½ per cent per annum, which is equivalent to doubling the present average productivity in a generation. This would bring productivity in Britain in 1975 to about the level reached in America today.

3. Though many things contribute to a nation's productivity, by far the most important factor is the amount and quality of its productive equipment. Horse-power per head=Wealth per head. The most important single constituent of a Policy for Wealth should therefore be a speeding up of the rate of increase of productive equipment. Before the war, the British community was investing only about 3 per cent of its income in additional productive equipment. This is not enough.

4. In the recent past, there has been no lack of savings for the volume of investment in productive equipment that industry was prepared to undertake. But this may have been because that volume was so small. If a Policy for Wealth is embarked upon, one constituent of it should be action to ensure a sufficient supply of savings to finance the increased volume of productive investment. This might necessitate a continuance of the National Savings campaign, or even taxation.

5. Unproductive forms of capital, however necessary they may be (e.g., housing), should not be allowed to absorb more than their fair share of the available supply of savings.

6. The machinery of the capital market, by which savings are made available to industry, does not work unsatisfactorily. But there is a need for means by which capital can be supplied on equity terms (i.e., on a risk-sharing and profit-sharing basis), especially to small firms.

7. The burden of taxation on industry needs to be radically reconsidered, with a view not so much to reducing its burden as to redistributing its incidence, so as to put a premium on the use of industrial income for the rapid replacement and extension of productive equipment.

8. There is no good reason to suppose that the substitution of public for private ownership would, by itself, lead

to any increased investment in productive equipment. But in a number of industries, of which coal and steel are examples, the present structure is an obstruction to rapid technical progress. The prescription is technical rationalisation with the object of producing the maximum output at the minimum labour cost; ownership is a secondary matter.

9. Restrictionism in all its forms—particularly price-fixing and quota-fixing activities—is the major enemy of efficiency. It penalises the efficient and protects the inefficient. If there is to be a rapid increase in productivity, it must be brought within bounds.

10. But competition by itself, without a reasonable rate of profits, will lead to the consumption of existing capital rather than to the production of new equipment. The aim of government policy should therefore be "Competition-in-Prosperity"—that is, a severe ban on restrictive devices coupled with an effective Full Employment policy. Neither one of these two will do much good without the other.

11. Both Labour and Capital should accept the historically demonstrable fact that good profits and high wages go together. Organised labour should realise that it is in its interest to ensure a reasonable return on the productive capital employed in the industry—an aim which is entirely compatible with hostility to large incomes for individuals. Industry should realise that its markets depend on the incomes of the wage earners. The best way of linking the two would be by industry-wide profit-sharing schemes, on the lines of the coal-mining "ascertainment."

12. In return for an official "High Wages" policy, relating wages to the national output, the Trade Union movement should formally abjure all rules, practices, demarcations and other devices which have the effect of reducing output per man-hour. Any doubtful cases should be adjudicated by a tribunal.

13. Demands for shorter hours (other than those where it can be demonstrated that a higher output per week would result) should be deferred until the national output reaches a figure specified in advance.

14. Double shift working should be regarded as the rule, rather than the exception, wherever substantial mechanical equipment is involved.

15. An effort should be made throughout the educational system to multiply the scientific community by four or five within a generation.

16. The existing gap between the Universities and industry should be closed by the foundation of Institutes of Technology.

17. The expenditure of industry on scientific research and development should be very greatly increased. The status of the scientist in industry should be improved and he should be given a much larger voice in the formation of industrial policy. Particular attention should be paid to the development, or pilot-plant, stage.

18. The quality of British industrial management should be improved. Managers need to have much more technical competence. The amateur element on boards of directors should be reduced and the expert element increased. The need for the educated mind in industry should be recognised.

19. Distributive methods should be included in the agenda for technical rationalisation. In many cases, uneconomically small-scale production is dictated by the merchandising system.

20. The wastes directly and indirectly involved in some forms of advertising should be rigorously examined.

A policy of this sort clearly calls for a major effort on the part of the Governmental machine. A very great deal of legislation would be called for, and an even greater volume of administrative decision. It affects the whole array of Government departments; indeed, it is difficult to think of more than two or three Ministries which would not have a part to play. In this it resembles the Full Employment policy to which the Government is already formally committed. Both range far too wide for the executive responsibility to be concentrated in any

one department. Yet both are articulated policies, in the sense that they have a definite aim which can only be attained by the careful balancing of complementary elements. Together, they are a task of government second only to that of war. And like war, they create an administrative dilemma which is none the less crucial for being, by now, very familiar. An Economic General Staff is, it is understood, out of favour as a phrase. But the same thing under another name is very badly needed to give the central direction and energy to a policy that will otherwise be brought to a halt by its own sheer bulk.

*

But, when all is said and done, not all the items of a Policy for Wealth lend themselves to Government action. And even in those that do, the Government will not get far without the support of public opinion. The basic requirement is, then, for a vital and urgent sense of direction on the part of the public. In economic matters, the British people must know where it is going and be determined to get there. At present, in these fundamental matters of economic policy, all is drift. Nowhere in the community is there a conscious grouping of people who have both a faith and a policy. Certainly the two major parties are equally at sea. The Labour party, in so far as it has any real ambitions beyond the particular interests of the trade unions, has nothing to offer save a doctrine that is almost wholly irrelevant to the matters that have been discussed here. The Tory party, dominated as it is by business interests, either believes in the deliberate protection of inefficiency or else takes refuge in an impolicy of purely temporary expedients, judging every case on its merits.

All those who believe themselves to be independent and disinterested servants of the common weal, all those who are more interested in the cake than in the slices, have no higher duty than to consider how they, individually or collectively, can help to bring the country to a realisation of the economic peril in which it stands. In every direction, in world strategy, in international com-

merce, in the promises that have been made to the people at home, the British community has mortgaged its wealth beyond its present power to produce. Only a radical improvement in the efficiency and productivity of the country can enable us to meet the commitments into which we have already entered. It is not enough to place eloquent reliance on the loyalty, the unity, the devotion of the British people. No one who has lived through these last five years can doubt that these qualities exist, or that, when roused and properly led, they can achieve the impossible.

It is the rousing and the leadership that are needed, for the greatest dangers are not deliberate obstruction and stupidity, but apathy, fatalism and an acceptance of inferiority. The fruit of the 1920s and 1930s is that the country is intensely slump-minded. It is taken too much for granted that the days of expansion and adventure are over. There is too much readiness to accept the superior efficiency of other countries as something that does not concern us—to deny the facts for as long as possible and to offer complacent excuses for them when they cannot be dodged any longer. There is far too much talk of protecting "rights" and defending established positions rather than of creating opportunities for advancing into fresh ground. In economics, as a nation, we are thinking in terms of Maginot lines. But in economics, more even than in strategy, a defence that does not permit any forward movement is doomed to failure.

In the last analysis, all the great economic problems are one. If Social Security and Full Employment can be achieved, both Labour and Capital can be summoned to leave their concrete emplacements and join in the free movement of competition-in-prosperity. And Social Security and Full Employment will be sterile unless they are built on a basis of rapidly expanding wealth. Nothing could be more foolish than to dispute the order of precedence. All three legs of the tripod are required for security, and the great need is for leadership strong enough to build all three at once. There has never been a greater opportunity for economic statesmanship. Where is the Pitt or the Peel to seize it?

NOTES OF THE WEEK

The Planning Storm

Deus ex machina again, Mr Churchill intervened in the Commons last week to suggest that the whole of Part II of the Planning Bill, dealing with compensation, should be dropped. The problems of compensation and betterment, which must be solved before the task of rebuilding Britain can make any satisfactory headway, have proved themselves repeatedly to be too tricky and controversial for a coalition Government. The Planning Bill formula aimed no higher than a minimum working agreement for tackling the most urgent needs of "blitz" and "blight" on a basis purposely left vague, and only reached after prolonged deliberations. But even this small corner of compromise, reached so painfully and laboriously, has given way under the stress of dissension within the Government and pressure from outside. Yet the Planning Bill cannot be put into operation until the terms on which local authorities may acquire land compulsorily have been at least provisionally settled. For this reason Mr Churchill's original proposal to deal with the whole question of compensation in a separate Bill, and meanwhile to rush through the Planning Bill in truncated form, met with strong opposition. Instead, Mr Attlee stated on Monday that it was hoped to produce new agreed clauses on compensation, to be added to the present Bill, next week. Any revision of the "1939 basis" of compensation must be expected to favour the property-owners. Revision upwards is, in this case, in the direction of justice, and might be done either by extending to other owners the percentage increase over 1939 prices already conceded to small owner-occupiers, or by granting a general increase over the 1939 level to allow for the fall in the value of money. It may be that the concession will only be given to buildings and that the unmodified 1939 price will still apply to land. The actuarially simple solution of paying current market values—still strongly urged in some quarters—is unlikely, in any

case, to find acceptance. Meanwhile, as the Government strives—according to latest reports with success—to secure a last-minute agreement, the urgent needs of the "blitzed" cities are again hamstrung.

*

Local Government Areas

The demand of the "blitzed" cities to be given a new and better start in life is accepted by the whole nation; but the hope that this could be done in isolation without settling vexed questions of national scope was further dashed by Monday's debate on the "Plymouth clause." This amendment sought to compensate "blitzed" cities for the loss of population and rateable value involved in bold replanning by setting up special boundary commissions with power to extend their areas. Mr W. S. Morrison gave a convincing reply to this particular suggestion, but every argument he adduced pointed to the need for widespread changes in local government. He pointed out that the planning schemes for the cities concerned covered, rightly, a very wide area, which allowed for a green belt around the city itself and for the dispersal of much of its surplus population to centres five or more miles outside it—and clearly no boundary extension could stretch that far. He urged that the cooperation secured between local authorities in making joint planning schemes should not be imperilled by cutting up rural districts. He argued in fact that it was "Greater Plymouth" and "Greater Sunderland" which must form the units of redevelopment; but no hint was given as to how the financial loss and gain of their constituent authorities, arising from joint planning, can be balanced. The Government did, however, promise a White Paper shortly, dealing with the whole question of the status, boundaries, and areas of local authorities, to be followed by legislation which it is

hoped will be ready by the next session. The Minister of Health claimed to have already found a high degree of unanimity in discussions with local government associations. It is rumoured that the Government's main proposal is to be the establishment of a permanent boundary commission. More drastic measures than this will be essential to solve the difficult problems of reconstruction illustrated by the Planning debate; and legislation may, in any event, come too late to help the immediate financial embarrassments of the "blitzed" cities. For these, no solution has been offered—and Mr Morrison contented himself with the rather specious suggestion that a loss of population may not necessarily involve a loss of rateable value. With the Government's policy limping so badly, it is merely ironical for local authorities to be told once more to go ahead and plan boldly.

*

New Ministers

Two new Ministers have been appointed to two new Ministries. Sir William Jowitt becomes Minister-Designate of Social Insurance—the "Designate" indicating that his Ministry awaits its legislative birth. Lord Swinton becomes Minister of Civil Aviation. There is no "Designate" in his title, and it seems to be in doubt whether he is to have a Ministry or not, since it is common ground that civil aviation must remain intimately linked with the Air Ministry for the duration of the war, and it appears to be the intention to relate it to the Ministry of Transport after the war—which would unquestionably be right, since civil aviation, though it deserves a Minister of Cabinet rank, is hardly a large enough subject for complete administrative separation. Both appointments are good. Sir William Jowitt has worked hard and long on the Government's social insurance proposals, and he is the best man to carry them forward. But as a member of the Labour Party, how long will he remain in a member of the Labour Party, how long will he remain in office? Would it not be as well to have a Tory as Minister-Designate Alternate of Social Insurance, so that there may be no discontinuity? Lord Swinton has never received as much public recognition as he deserves for the fine work he did as Secretary of State for Air in the vital years from 1935 to 1938. To him more than to any other politician—and more than to any but a very few administrators—the country owes the fact that it had an Air Force of superlative quality and of just adequate size in 1940. Before that, at the Colonial Office, though some of his policies were debatable—he was largely responsible for the commodity restriction schemes—there was no doubt of his energy or ability. He should make an excellent Minister of Civil Aviation. Neither of these appointments increases the number of Ministers of Cabinet rank, since both Sir William Jowitt and Lord Swinton were of that rank already. There are now 40 of these Ministers, or 41 when Lord Halifax is in England, and if a new Minister Resident in West Africa is appointed there will be 42 (the Portfolio which Sir William Jowitt has hitherto been without, will presumably vanish still further into the fourth constitutional dimension.) Of these 42 offices perhaps about a dozen can be expected to disappear in peacetime, though some of them—the Minister of Reconstruction, for example—will not go at once. The minimum size of the peacetime Cabinet is therefore 30. No such body can be a functioning reality.

First Fruits at Moscow?

An official communiqué from Moscow announced that on Wednesday the British, American and Russian Governments informed the Bulgarian Government that the withdrawal of all Bulgarian troops from Greek and Yugoslav territories is regarded by the Allies as an "essential prerequisite for the beginning of negotiations for an armistice." On the same day the Bulgarian Government accepted this preliminary condition and agreed to evacuate Western Thrace and Macedonia within fifteen days. A day before the Bulgars were still claiming that their troops would stay in the area of the Struma, allegedly in order to fight the retreating Germans. The fact that an agreed demand for the evacuation of Greek and Yugoslav territory was addressed to the Bulgars almost six weeks after their request for an armistice suggests that the delay must have been caused by a divergence of views among the Allies. It is probably a correct guess that agreement between the Allies on the Bulgarian issue was reached during the first days of Mr Churchill's visit to Moscow. This is perhaps the first

(and let us hope not the last) success produced by the Prime Minister's mission. There are quite a number of controversial issues on the agenda of the Moscow conference. The agreement on Bulgaria indicates that at least on this point the controversy was probably more apparent than real and that there is no disposition in Moscow to create special sources of friction between Russia and Britain in the Mediterranean.

*

Dutch Tragedy

In the liberation of Europe, the Dutch are being as unlucky as the Belgians have been fortunate. It is their misfortune that the sweeping advance of the summer months should have been arrested on their soil. What is more, the results are likely to be not only some more months of anguish, but more permanent damage. In those localities that have frequently changed hands in the recent fighting, Dutch patriots have come into the open and have thus exposed themselves to German revenge once the Allies had been compelled—however temporarily—to withdraw. The mass of transport workers, who since September 17 have been disorganising the German lines of communication by means of a general railway strike, have been exposed to similar reprisals. The prolonged fighting has turned the strike into a double-edged weapon. It has struck at the seven million Dutchmen living to the north of the Rhine delta quite as much as at the Germans' military traffic. The northern provinces of Holland are now cut off from food supplies. With winter approaching, they are also deprived of fuel, since the Limburg coal mines are in Allied hands. But worse than all this is the flooding—the flooding of cultivated land the Wehrmacht has already carried out and the threat of further flooding. On October 6th the Dutch Prime Minister, Dr Gerbrandy, revealed the fact that 17 per cent of the total arable and pasture land of Holland is already under water. Throughout the rest of the low-lying country all important dykes and locks have been mined. When these mines explode and the sea-walls collapse, half of Holland—including parts of Amsterdam and Rotterdam—may be under water, most of it under salt water. A great work of civilisation, the result of an age-old, proud and stubborn struggle of man against the sea, can be destroyed overnight. The reclaiming of the areas overrun by salt water would take years; and it would add a baffling problem to the difficulties of reconstruction. The political effect of the catastrophe would be to create a wave of enthusiasm in Holland for territorial claims on Germany—claims that would not otherwise be very popular. "A mile of German soil for every flooded mile of Dutch soil" has already become the slogan. If the Nazis persist in their destructive folly and carry out the large-scale plan of destruction, then the pressure for territorial compensation, exerted by masses of homeless Dutch farmers, will be politically irresistible. The hope, however, still exists that a quick change in the fortunes of the war may yet prevent the worst climax of the Dutch tragedy.

EXECUTORS & TRUSTEES

For more than a third of a century Martins Bank has acted as Executor and Trustee. During that time the public have realised the advantages of employing a corporate Trustee, especially in the disturbed conditions of to-day, and have increasingly availed themselves of the Bank's services.

These services include
Security Efficiency Economy
Continuity of Management

Provisional French Parliament

The demand for a return to parliamentary institutions is steadily growing in liberated France. But a real revival of parliamentary rule is hardly possible so long as so many millions of Frenchmen remain in German captivity. Any election to a Constituent Assembly held before the return of more than two million prisoners of war and deportees might be challenged on the ground that it falsified the real will of the people. Even so, the French are apparently reluctant to put themselves in the hands of an uncontrolled Government merely because so many Frenchmen are still in the hands of the Germans. Though a Constituent Assembly may be impossible for a long time to come, the Consultative Assembly may in the meantime act as a substitute for it. Since the Provisional Government's arrival in Paris little has been heard of this body. In the turmoil of liberation it was pushed off the stage and it had almost been forgotten, when it was decided last week to bring it back on to the scene, to enlarge it and to confer upon it all the status of a Provisional Parliament. Contrary to previous plans, the members of the new Consultative Assembly will not be appointed by *Conseils Généraux* to be elected in the Departments, but directly by the Resistance and the political parties. The elections to local and departmental Councils will not be held before February, 1945; whereas the new Consultative Assembly is to meet on November 7th next. Out of the total of 246 deputies, 149 will be delegates of the Resistance in Metropolitan France, 60 will be chosen from among the deputies and senators who did not vote for Pétain on July 10, 1940, and 37 members will represent *la France d'outremer*.

The members of the National Council of Resistance, the former underground "Government" of France, will become members of the Consultative Assembly; and so the Council of Resistance, which has often been driven, against its will, into the position of a virtual rival to the Provisional Government, will now be absorbed by the Assembly. At Algiers the Assembly was little more than the shadow of the Provisional Government. Now it is to aspire to a more independent rôle and one more reminiscent of a normal Parliament. The Socialists have adopted a resolution demanding powers of "real control" for the enlarged Assembly; and the demand is certain to be echoed by the other parties as well as by organisations of the Resistance. The Government—or at least some of its members—is reluctant to submit itself to the real control of a body that cannot claim any normal constitutional origin. The argument can, of course, be turned against the Provisional Government itself. Even before the Assembly has met, a brisk discussion about its prerogatives is developing in the press. The controversy is almost certain to end in a compromise. In Paris the Consultative Assembly will be less shadowy than it was at Algiers, if only because it will be reinforced by the real pressure of public opinion. But it will hardly attain the full satisfaction of its parliamentary aspirations.

Economie dirigée

National workshops were the dominant idea of 1848 in France. Nationalisation of workshops seems to be the overwhelming demand in 1944. The demand is supported by the mixed motives of socialism, patriotism and economic expediency. The French Left is putting forward its traditional programme solidly and respectably wrapped up in purely national colours. Big Business, it is said, has collaborated with the invaders. National justice, rather than social justice, demands that it should be properly punished by expropriation. Many resisters with no socialist leanings are inclined to accept this policy for the sake not of its content but of its wrapping. Believers in *étatisme* find reasons of expediency for demanding that the programme of nationalisation should be carried out at least in part. General de Gaulle himself has now spoken in favour of a state-managed economy that would leave a wide margin for private initiative and for the profit motive. The first practical steps in this direction have already been made. The coal mines of the north have been nationalised by decree. This is regarded as necessary both in the short run—in order to avert an acute fuel crisis this winter—and in the long run, because the state's control over the fuel resources of the nation is thought to be a pre-requisite of any *économie dirigée*.

On the Right there has been some strong opposition against the propriety of carrying out such sweeping reforms during a constitutional interregnum, when Government decrees can receive no valid legislative sanction. The case of the Renault factories, requisitioned by the Government but not nationalised, is entirely different, since the legal basis of this action is the plenary powers granted to M. Daladier in 1938, which allowed the Government to conscribe wealth during a national emergency. Whether the next step, from requisition to nationalisation, will be taken, depends on the outcome of the Renault trial which is soon to be opened. This will undoubtedly be a great political trial, in the French tradition. It will hold the centre of the political stage for some time, and the verdict will serve as a sort of precedent in economic policy. Another recent decree provides for the confiscation of illicitly acquired profits. The decree is retrospective, and it covers the whole period of the war from September, 1939. The political justification for this measure is obvious, though the extent to which it can be carried out is doubtful. Still another acute issue has been created by the widespread demand for workers' participation in industrial management and for profit-sharing schemes. Many of the steps that are now being taken in the economic field may be of passing interest only. But some of them will undoubtedly have a more lasting effect, and mark the transition to a state-managed economy, even if not to Socialism.

Telling Europe

Very shortly diplomatic and political correspondents are apparently to be given permission to go to Europe. It is high time, for although military correspondents have, in fact, been allowed to comment quite freely upon political events, in most cases they have not had the necessary background of past knowledge to make their comment really informative and to the point. Now that the official ban on political correspondents has been raised, it is almost as important that military censorship in completely liberated areas should be modified. It has obviously been necessary, while fighting was in progress, to impose strict limits on the amount of information given to the press, but it is at the earliest and not the latest moment that a situation should be brought to an end in which it is possible to know more about German occupied Europe than about liberated territory. It is a truism to say that, between the Western democracies, the links of information and understanding must be restored at once. But perhaps less thought has been given to the manner in which, between democracies, such links are best restored. Official propaganda cannot do a great deal. Occupied countries have had four years of propaganda full of idealised pictures of sanatoria and modern schools and sun-filled workers' dwellings—all to be realised in Hitler's New Order. If the democracies try to do the same thing—as, according to some reports, they are doing—the results will be strongly negative. There is a limit to the amount of propaganda of this sort the human mind—in a democracy—can stand. It has probably reached that limit in Western Europe. What is needed now to excite the interest and sympathy of Britain's continental neighbours is not glossy publications from the Ministry of Information, but newspapers, magazines, books and possibly Hansard—anything to show that public opinion is alive, spontaneous, creative and unfettered. Correspondents have raised the question of the lack of British papers and although the Ministry of Information sends a limited number to Europe, the supply is still quite inadequate, and the Paper Control, which until a few months ago allowed periodicals additional paper for exports, has chosen the year of liberation to stop this concession. Even more serious is the problem of books. It is true that the pressure on the publishing trade after five years of war is tremendous. The schools and universities of this country are as short of British text-books as Europe is of all types of British books. There is here a question of priorities which so far neither the authorities nor the publishing trade appear to have faced. But when the list of priorities is drawn up, books for Europe, representing in a rich and diverse way the life and thought of Britain today, should receive a very high place.

Electoral Redistribution

The Redistribution of Seats Bill was given its second reading in the House of Commons on Tuesday. Members in general welcomed this measure which, as Mr Morrison

explained, should ensure that "each member ought as far as practicable to represent an approximately equal number of constituents" and which provides permanent machinery for adjusting constituencies to population changes. The Bill closely follows the recommendations of the Speaker's Conference and the Vivian Committee on Electoral Reform. Four boundary commissions will keep the state of constituencies under constant review and will prepare redistribution schemes for submission to Parliament. The Speaker's Conference recommended that the total number of seats should be left substantially the same as at present—591, excluding University representation—but the Government has decided, in order to correct the most glaring electoral maldistribution, immediately to divide constituencies with over 100,000 population. In this way 25 new Members will be returned, mainly in boroughs on the outer London fringe which developed in the period between the two wars. A departure from mathematical principles is the decision not to change the representation of Wales and Scotland, while the City of London's representation will also not be affected. It seems unlikely that the Bill will become law in time to allow a full redistribution to take place before the next General Election—the redistribution of seats proved to be a lengthy business in 1918. It is always easier, and less painful, to add to Parliamentary representation than to subtract from it, and though the very small constituencies should clearly be abolished, there seems no reason why the number of seats in Parliament should not be made considerably more flexible, or why the figure of 615 should be regarded as sacrosanct. This point was raised by several Members, some of whom might lose their seats in a redistribution. Another point of criticism was raised by Mr Lawson, who argued that the Bill did not go far enough to remove anomalies in the present system and, rather irrelevantly but very necessarily, drew attention to the unsatisfactory state of the Service register. But the main division of opinion in the House arose over the question of proportional representation, which Mr Harvey claimed had been too lightly dismissed by the Speaker's Conference. His amendment was naturally supported by Liberals and Independents, who would gain in seats under proportional representation; but it was decisively opposed by Conservative and Labour members, who are no less naturally wedded to the two-party system.

Lord Woolton's Policy for Wealth

In a speech made on Saturday of last week, Lord Woolton showed that his eyes are open to the main chance of British industrial policy. Were it not disrespectful to say such a thing of a Minister of the Crown, one might even suggest that he had been reading the articles in *The Economist* on "A Policy for Wealth." He was clear and precise on the subject of restrictions, whether imposed by labour or by capital, which

impede the full flow of goods at low prices, and thereby endanger the standard of living that would otherwise be possible for the community, and he made the very welcome, though rather less than fully precise, statement that

the Government are not prepared to countenance in any industry arrangements by which prices may be stabilised only at the expense of output and employment.

Whose employment? Restrictions are often defended as protecting the employment of the restrictors. Where will the onus of proof lie? And what does "countenance" mean? These details need clearing up, but they do not diminish the sense of pleasure that such good sense inspires. Lord Woolton should continue in this vein—and recommend it to his colleagues.

Towards an Arab Union

The Arab Conference at Cairo which came to an end last week was only a preliminary to a full Pan-Arab Congress, to be held at a later date. Representation was not complete, and only five of the delegates—from Egypt, Iraq, Syria, Lebanon and Transjordan—signed the protocol which summed up the findings of these talks. The representatives of Saudi-Arabia and the Yemen are to refect the protocol to their Governments. Nevertheless, the proposals are more concrete and far-reaching than was expected. The core of the protocol is the recommendation that the Arabs should

establish a League of Arab States which would represent the common interests of the Arabs to the outside world, secure each against aggression and endeavour to combine the foreign policy of all the states so that the Arab States in future speak with a common voice. The proposal is not for any very close union. The structure is that of a league of nations. As such, it would carry the advantages and the defects of such systems. It would not raise awkward questions of sovereignty. None of the states is ready for any abdication of this sort. Syria and the Lebanon, for example, are unlikely to support the idea of a Great Syria including Palestine and Transjordan, because it might impinge on their sovereignty. But, like all leagues, an Arab league would depend for its effectiveness on the extent to which the major obstacles to co-operation had already been removed. It could not do much to remove them. The Cairo Conference was not empowered to deal with the issues which divide the Arab states among themselves—for instance, the vexed question of leadership which is jealously disputed between Egypt, Iraq and Saudi Arabia. Only one issue of this kind came up—Palestine, but the Conference dealt only with the political aspect. The delegates underlined their acceptance of the British Government's White Paper of 1939, limiting Jewish immigration and promising eventual independence to a Palestine with an Arab majority. The problem of fitting Palestine and indeed the other states into a workable economic system on regional lines lay outside the agenda of the Conference. Yet it is one of the keys to any Arab league, for it is the foundation for political understanding. It is to be hoped that when the full conference meets, one section at least will seek to co-ordinate all the invaluable work accomplished by a series of economic conferences at Cairo over the last eighteen months at which, under the aegis of the Middle East Supply Centre, the physical basis of Arab Union has been thoroughly discussed.

Egyptian Reshuffle

The sudden dismissal of the Egyptian Prime Minister, Nahas Pasha, and the establishment of a new Ministry under Maher Pasha has been linked by some observers with the Pan Arab Conference. In fact, the change has almost nothing to do with external affairs. Ever since Nahas Pasha became Prime Minister in the dangerous days of February, 1942, friction between King Farouk and his first Minister has been continuous. The young King's conception of government is hardly compatible with the position of Nahas as the independent leader of a great national party. The fact that the break came over the coupling of their two names on a popular poster is symbolic of the real matter at issue—the King's determination to rule and not to accept a power subordinate to that of the Egyptian Parliament. Nahas was not the King's man. He came to office in the teeth of the King's opposition, very largely because he alone could be trusted to see Egypt through the testing time of Rommel's advance and to abide loyally by the treaty with Britain. As long as the crisis lasted the British had a strong interest in maintaining his position. But interference

in Egyptian domestic politics is not the rule of British diplomacy. The external crisis is over, and the King has taken advantage of this fact to dismiss the Prime Minister who commands an overwhelming majority in Parliament. The new Ministry of Maher Pasha is made up of the opposition parties, and includes some of Nahas' most bitter enemies—for example, Marram Ebeid Pasha, who was the author of the notorious Black Book which set out to expose "the corruption and maladministration" of the Nahas regime. In the near future new elections will be held—or rather made—and it is not unlikely that Maher will obtain a majority. The reshuffle in Egypt is unlikely to infect internal policy very deeply. So intense is the poverty of the fellahin and so inattentive to these real needs are the ruling classes that nothing short of a revolutionary programme could fully cope with Egypt's economic problem. This government of King's men is very unlikely to tackle the Augean stables, in spite of the King's promises to the people of "food and clothing." Externally, the Government has pledged itself to foster Pan-Arabism and to abide loyally by the treaty with Britain. The second is more in doubt. When other aggressions threaten in the Mediterranean—as they did from Italy in 1935 and from Italy and Germany in 1942—the Egyptians come to prefer a British protector to a foreign conqueror. Once the menace passes, it cannot be said that Britain is popular with any party—Wafdist or Saadist. There may well be trouble ahead.

The Last Satellite

The rapid Russian advance on Budapest from Jugoslavia in the south and Transylvania in the east will soon seal the fate of Hungary, Hitler's last satellite. Peace-feelers have apparently come from Budapest, but so far without any practical effect. The Russians have told the Hungarians that three conditions must be fulfilled before any arrangements for an armistice can be made. The Hungarians must break with Germany, help to expel the Germans from Hungarian territory, and accept the pre-Munich frontiers as the basis of any future settlement. Apparently Budapest has not yet accepted these preliminary conditions, although the suspicion that the Lakatos Government was contemplating "treason," that is to say, an armistice, drove the members of the Arrow Cross to attempt an abortive *coup d'état*. It does not seem very likely that an internal upheaval will occur before the entry of the Russian troops into Budapest. The Left opposition is clearly re-emerging. In July last, a coalition was formed by four parties—the Smallholders, the Peace Party, the Social-Democrats, and the Communists. The new grouping—the Peace Party—has one plank only in its political platform—ending Hungary's partnership in Germany's war. It is doubtful whether this coalition of the Left will find any supporters among army officers and high civil servants—as was the case in Roumania and Bulgaria. The Russians are not likely to have the same tenderness for Horthy as for King Michael of Rumania. There are old scores to be settled with the Hungarian Regent, scores dating back to the White Terror of 1919 and 1920. The fall of Budapest may therefore be followed by an upheaval more radical than the change of regime in Bucharest and Sofia.

Education for Demobilisation

The Army and the RAF have both announced their plans for schemes of education for the forces awaiting demobilisation, and the Navy intends to follow suit. The plans are roughly similar in outline. The Army will provide six to eight hours' instruction in service time, and the RAF six hours. Both allow for part of the time to be spent in training for citizenship, on ABCA lines. The rest will be educational or vocational. On the vocational side the policies of the two services diverge. The Army's plan is a somewhat modest one compared with that of the RAF, and it does not pretend to be able to give more than pre-vocational training. The RAF plan is designed to improve existing qualifications, or to prepare for further civilian training, and training will be provided only when employment prospects are considered favourable. Obviously, the RAF will need the advice of the Ministry of Labour and other Government departments in planning this part of its programme. Both the Army and the RAF are to rely on their own resources for teaching staff. It is perhaps optimistic to hope that sufficient teachers will arise to dispense education on the scale envisaged. The main burden will fall on the already overburdened (and

not always suitably qualified) regimental officer. Inter-unit and inter-Service co-ordination would probably help to make the best use of the limited number of teachers available. The Ministry of Education might be consulted so that training courses for instructors could be arranged to assist in the provision of teachers for normal educational requirements.

Policy for Cocoa

A White Paper (Cmd 6554) issued this week by the Colonial Office gives the first official account of the operations of the cocoa control in West Africa during the war. In the absence of full knowledge, the control has been criticised, first for its price policy, which allowed it to reduce the price paid to the producer while it realised a large profit; secondly, for its destruction policy; and, thirdly, because although there was a representative of the buying firms on the control board, there was no direct representative of the producers. The report answers the first two of these criticisms in full. Behind all the control's operations was the knowledge of the serious shipping shortage. That in the event its operations only showed a deficit in 1939-40 and 1941-42, and that at the end of 1942-43 there was an accumulated surplus of £3,676,253, could not have been foreseen. As regards destruction, the report points out the difficulty of providing storage facilities in West Africa owing to the shortage of materials and also to the fact that the time during which cocoa can be stored there satisfactorily is limited. The third criticism is not answered as such, but the White Paper contains an important statement of future policy which appears to meet the critics' case. From October, 1945, organisations are to be set up in the Gold Coast and Nigeria empowered to purchase the whole cocoa crop, to prescribe the prices and to be responsible for disposal. In the Gold Coast, the organisation will have an official majority and will also include Africans and representatives of other interests. "The Government majority will represent the interests of the producers and will act as trustees for them" until their cooperative societies have developed enough to provide their own representation. Moreover, it is contemplated that "representatives of the producers should eventually constitute the majority in the proposed organisation." In Nigeria, the work is to be given to the Supply Branch of the Administration, and there is to be an advisory committee representative of the producers and other interests. Thus, the buying firms will no longer be able to determine the price at which West African cocoa is bought. The alternation between cut-throat competition and the buyers' ring, which, as the Nowell Commission of 1938 pointed out, led to disastrous fluctuations in prices, will cease, and a long-standing African grievance will be abolished. Provided that the proposed system is not used to the disadvantage of the consumer, there seems no reason why it should not be extended to the purchase of other West African produce.

Shorter Notes

According to a Parliamentary answer, the present estimated cost of subsidies is £214 million per annum, made up as follows:—

	(£ million)
Bread, flour and oatmeal	64
Meat	23
Potatoes	27
Eggs	15
Sugar	15
Milk	17
Cheese	3
Bacon	2
Other subsidies	48

The total, which represents about 1s. 9d. per head per week, has fallen by about £7 million per annum owing to a revision of the estimate of shipping losses.

Mr Dingle Foot has given some estimates of German financial exactions from occupied countries. With a number of countries omitted for lack of data, the total of occupation costs and clearing balances had amounted by the end of August to £6,600 million, while the annual rate was then running at £690 million. For the purpose of these estimates, Reichsmark figures have been converted at the rate of Rm. 13½ = £1.

Letters to the Editor

A Policy for Wealth

TO THE EDITOR OF THE ECONOMIST

SIR,—I note that in your plans for the future of business you make the suggestion that all commercial works should by law become closed shops. The Government is to give the trade unions power never granted to any body of men before. If they are not subscribed to and obeyed there is to be no hope of employment for any working man or woman. The unions then will have no need to satisfy their members since their members cannot leave them, and all discipline will be in their hands and theirs alone since not merely "the sack" from their place of employment, but from all places of employment, will be in trade union hands.

This terrible gift of power over all workers should, you suggest, be offered in exchange for a hope of a gracious willingness to "examine" such trade union practices as may impoverish the country and the world, of which you state quite truly there are not a few.

These enormously powerful organisations have no responsibility for increasing or improving output, and all risks of capital are, at any rate at first hand, a matter of indifference to them. Their task is to wait until wealth has been sufficiently increased to enable them to demand more money for less work. Does it not seem to you unnecessary to legalise enormous and irresponsible power in these hands? I give you an example of the spirit in which such power would be likely to be used: the proposal quoted in the *News Chronicle* of September 19, 1944, made by Mr Tom Lowe, Midland organiser of the National Union of Foundry Workers, to sack craftsmen with 20 or 30 years of experience rather than dilutees who had not finished their apprenticeship—non-union craftsmen of course. It would be interesting to follow the careers of militant Tory or Labour workmen if your idea were carried out.—Yours faithfully,
Mirfield.

RONALD F. WALKER.

TO THE EDITOR OF THE ECONOMIST

SIR,—It is disturbing to find *The Economist*, generally so much alive to psychological factors, arguing in the important article on "Labour and Wealth" from an assumption only valid if a whole range of such factors be ignored. This assumption is, briefly, that the satisfaction of life is to be sought by "the workers" anywhere but in their work; that it lies in fact between two alternatives, "a higher standard of material consumption" and "more leisure," between which the economist may in due course require them to make a final choice. Without going to extremes with Ruskin or William Morris one may surely object that there is a third factor which must often make it impossible to pose any such simple choice; namely, that the character of a man's work, and its capacity or incapacity to satisfy his soul by developing his powers and so giving him judgment, balance and self-respect, may be more important to his happiness (and to his value to others) than an increase in either his "standard of material consumption" or his leisure. You allow that "the Luddite passion is both very strong and very natural," but appear to overlook that it may have a firmer basis than miscalculation of interest; that in fact it may be well founded in an instinctive fear lest mechanical development, by fragmenting labour into tasks fitter for idiots than rational men, may turn self-respecting craftsmen into human cattle. I suggest that what we have to consider is a balance not merely of two factors, standard of consumption and leisure, but of these two with a third, satisfaction in work. Or are we asked to accept that, while all men may share in the first two, the last is to be a privilege confined henceforward to the professional and managerial classes.—Yours faithfully,
Chelsea

A. RICHMOND

AMERICAN SURVEY

The Willkie Influence

(By a Correspondent in Ohio)

(Editor's Note.—This article, as will be apparent, was written before Wendell Willkie's sudden death. In part it can be regarded as his epitaph.)

THE second act of America's quadrennial drama, the presidential campaign, is now in progress. The curtain rose on the Chicago conventions. It will fall on the counting of votes. The middle act is filled mainly with speech-making, but this year the candidates share honours with two actors of unknown powers. One is an individual, Wendell Willkie. The other is a group, the Political Action Committee. Only fitfully does Mr Willkie approach the centre of the stage. Indeed, the most ardent labours of the Dewey managers have failed to lure him from his position in the wings, from which he casts impartially baleful glances at the main proceedings. The PAC, on the other hand, has jostled the Democratic National Committee off the stage. Second only to Mr Roosevelt, Sidney Hillman's tireless workers are the leading feature of the Democratic campaign.

The capacity of Mr Willkie and of the PAC to influence the outcome in November is a topic of sharp debate. The shelved Republican leader has made himself the "mystery man" of the campaign by refusing to name his choice for President. He controls a considerable body of independent voters—men and women who do not make up their minds until the issues have been thrashed out. On the Democratic side, the PAC is trying to bring out a huge dormant labour

vote. Both forces will influence the result in November. But there is a question in the mind of the informed public about each: Can Mr Willkie retain his hold upon the independents? Will the PAC prove to be a boomerang to Mr Roosevelt?

Nobody knows even approximately how many votes Mr Willkie can be said to control today. Some of his journalistic admirers assert that he can swing anywhere from 3,000,000 to 6,000,000 ballots. The claim is based on his popular vote of more than 22,000,000 four years ago. That was the largest popular vote ever cast for a Republican presidential nominee. In 1932, Mr Hoover received fewer than 16,000,000 votes. However, by no means all of the difference of 6,000,000 represented independents. The total popular vote in 1940, for both candidates, was 11,000,000 larger than in 1932. It is not unreasonable to suppose that the bed-rock Republican vote is now in the neighbourhood of 20,000,000. Furthermore, in 1940 many Willkie votes were cast by anti-third-term Democrats. They can be counted on to oppose the fourth term, with or without encouragement from Mr Willkie. Nevertheless, the Willkie independents may be numerous enough to decide a close contest. They are thought to be especially strong in New York and California, which are "key states" this year. That explains why Governor Dewey sent emissaries to the Willkie camp before his September speaking tour. It

explains, too, why Mr Roosevelt invited the "mystery man" of the campaign to the White House.

In bidding for Willkie support the President runs no political risk, but Governor Dewey may be inviting trouble in the Midwest, where many Republicans regard Willkie as an extreme and even dangerous internationalist. The Midwestern states account for 155 of the 531 votes in the Electoral College. Most polls of public opinion indicate that sentiment in those states has turned against Mr Roosevelt. In this region the spirit of pre-Pearl Harbour isolationism lingers on in the shape of a new American "nationalism." Governor Dewey's quest for Willkie support may antagonise this element in Midwestern Republicanism. Perhaps in part because he feels sure of this vote, Mr Dewey is determined to keep foreign policy out of the campaign as a partisan issue. The talks at the State Department between his representative, Mr John Foster Dulles, and Secretary Hull were carried on in an atmosphere of serene harmony. In his speech at Louisville, Kentucky, Mr Dewey flatly repudiated isolationism. Nevertheless, he—like the President—still speaks the language of "national sovereignty," whereas Mr Willkie insists that we must relinquish some of our sovereignty in order to play an effective rôle in securing world peace. To adopt Mr Willkie's position in foreign policy, Mr Dewey would have to go beyond the position of the President. He is hardly likely to do that, in view of the debates in the Senate over the Dumbarton Oaks conference and the rising Republican clamour for a pre-election inquiry into "responsibility for the Pearl Harbour disaster." The old isolationists in Congress are trying to force Governor Dewey's hand in the campaign. He will need to display the political genius of a Roosevelt if, as the campaign temperature rises, he adheres to his stand that the winning of the peace, like the winning of the war, must be kept out of politics.

Recognising Mr Dewey and Mr Roosevelt as moderate internationalists, Mr Willkie has attacked both in the public prints for evading "the supreme issue of our time." The confluence of Roosevelt and Dewey ideas on foreign policy, however, tends to weaken Mr Willkie's rôle as the balance of power in the campaign. His impartial attacks, if continued, may plunge his followers into a dilemma. The value of Willkie support must decline the longer his choice is postponed.

If the Willkie war of nerves is somewhat novel in American politics, the rôle of the PAC is wholly new. The traditional strategy of American labour in politics, created by Samuel Gompers, is: Reward your friends, punish your enemies, and work for or against specific pieces of legislation; but never act as a group on either side in a national campaign. This strategy is based partly on a desire to make the two major parties compete for labour's support, and partly on a fear of reprisals should a favoured party fail to get in. The time-honoured policy was scrapped when Mr Hillman's PAC endorsed the Roosevelt-Truman ticket. Whether it be hailed as "progressive Americanism" or denounced as "labour bossism," it is a force to be reckoned with in the campaign. The best evidence of the importance of PAC is the vehemence of Republican attacks upon it.

Unfortunately for the Democrats, the committee is also stirring up dissension within the ranks of labour. Some opposition arises within the Congress of Industrial Organizations from former Republican workers who have been forced to join CIO unions, and now bitterly resent having their votes "dictated." More serious is the reaction of the American Federation of Labour. The opposition of the older labour group is founded both upon principle and upon fear. The principle is expressed by AFL Vice-President Matthew Woll: "Labour can not and must not stake its whole future upon the success or failure of any political campaign." The fear arises from the possibility that the CIO will enjoy Government favouritism if the President be re-elected. Antagonism to the PAC campaign is growing not only in the AFL ranks, but also among John L. Lewis's United Mine Workers and the 15 railroad brotherhoods, who incidentally cherish a grudge against the President for the Government's handling of their wage demands.

This is important, if true, since organised labour is the great question mark of the current campaign. Moreover, any loss of labour votes from the Roosevelt column would be a net loss. A critical question of the moment is how many new labour votes can PAC bring out to offset the defection of disgruntled oldsters? On the whole, in this

second act of the campaign drama, the uncalculated power of PAC looms much larger on the scene than the calculated indecision of Mr Willkie.

American Notes

One Man

The death of Wendell Willkie is a heavy loss on both sides of the Atlantic. This country will not soon forget the rare political courage with which, at a time when he was running for President, he endorsed Mr Roosevelt's foreign policy, and his later support, in defiance of influential groups in his own party, of the Lend-Lease Bill and the repeal of the Neutrality Act. Without his intervention American aid to Britain and American preparedness for war would have been on a much slighter scale. What is less widely appreciated in this country is the importance of the liberalising rôle Mr Willkie has played in American public life in recent months. His wartime journeys to London, Moscow, the Middle East, and Chungking reinforced an internationalism of outlook unusual in a Republican of Middle Western origins. If at times his enthusiasm for the future of the common man in Russia and China led him to underestimate the British contribution to social progress, this was a small price to pay for the healthy corrective he provided to isolationism and rampant nationalism. Even before his defeat in the Wisconsin primaries, which led to his retirement from the Presidential race, Mr Willkie showed a courageous, if rash, indifference to his immediate political interests. It was his repeated attacks on the isolationists and reactionaries of his own party which led to the fatal charge that he was only a "carbon-copy Roosevelt" and convinced the party bosses that he must be eliminated at all costs. After his snub at Chicago, Mr Willkie turned with undimmed enthusiasm to campaigning for American participation in international security plans. But his influence was even more decisive in the shaping of the Republican campaign. There can be no doubt that Governor Dewey's repudiation of isolation, and his moderately progressive domestic platform, owe much to a desire to win the support of Mr Willkie and the independent Republicans who found in him their most forthright and attractive spokesman. Mr Willkie's most telling rôle was that of goad to the elephant. Seldom has one man been a more effective guardian of the public interest. It is being said in the United States that his death will remove the main guarantee of Republican liberalism and may lose Governor Dewey the independent vote; but the Republican regulars will sleep more easily with the end of the Willkie war of nerves. Nothing has been more remarkable in recent American politics than the transportation, in four years, of the champion of the public utilities, the "barefoot boy of Wall Street" into a leader of liberal opinion and the conscience of the Republican party. There are men in the party of equal integrity and devotion. Already Senator Ball, for his outspoken criticism of Governor Dewey's foreign policy stand, is spoken of as the inheritor of the Willkie mantle. But there is no one in sight to equal Wendell Willkie's capacity for capturing the public imagination. His going is a calamity for liberal Republicans and for men of good will everywhere.

Second Round

The second round of the Presidential campaign finds both candidates mending their fences. Both parties are increasingly conscious that this will be a very close race indeed. The patently inspired suggestion that Governor Dewey, if elected, would seek to retain Mr Hull, the present Secretary of State, either in that capacity, or as advisor to Mr Dulles, has been hailed as an adroit move; but it is a play from weakness, rather than strength, implying as it does a certain diffidence on the part of Mr Dewey and Mr Dulles. It meets the charge that a new Administration would bring an inexperienced hand to the conduct of foreign affairs; and has the further advantage that Mr Hull's popularity is more solidly grounded than that of any other member of the Administration. Mr Hull has, of course, repudiated the idea at this stage, but this may not be the final word. Mr Dulles has, at the same time, injected a degree of partisanship into the foreign affairs honeymoon by intimating that Senate support would be more readily forthcoming for a Republican President than for Mr Roose-

velt. This is perhaps true; but it does not answer the question, support for what? Or dispose of the likelihood that Governor Dewey might be more amenable to the arguments of a man like Senator Vandenberg than Mr Roosevelt. In his second campaign speech the President, also, was more sober and more on the defensive. The pains he took to deny specific Republican charges suggests that they are considered damaging in the Democratic camp. Among them are the allegations that the Administration was wedded to the perpetuation of wartime controls; and that demobilisation from the Forces would be intentionally slowed down to avoid extensive unemployment. He devoted even more time, however, to repudiating the Communist label which Republican strategy is attempting to fasten on the Democrats. This is an old and familiar theme; but it is evidently expected to be doubly effective because of the activities of the Political Action Committee of the CIO. Mr Hillman acquitted himself with great verve and adroitness before a Congressional committee anxious to show him guilty of violation of the prohibition on labour union contributions to party elections. The anti-Administration press, however, continue its attacks with unparalleled ferocity; and what Mr Hillman's organisation may accomplish by delivering the labour vote may be more than offset by the opportunity the Republicans are exploiting to paint the Administration as controlled by a radical labour agitator of Lithuanian Jewish extraction. The slogan "Clear it with Sidney" may have as devastating an effect as "Rum, Romanism, and Rebellion" had on the chances of James G. Blaine. Its use, however, in no way impedes the battle for the foreign minorities, which was carried one step further this week by Governor Dewey's kind words for the Poles and Mr Roosevelt's announcement of aid for Italy.

The Right to Vote

The most revealing feature of Mr Roosevelt's speech was his urgent appeal to voters not to fail to register in order that they may vote in November. In a sense, the election may be decided when the registration booths close. (Registration in America is not automatic, but requires a deliberate application by the voter.) Mr Roosevelt had many sound observations to make on the patriotic duty of members of both parties to vote; but his appeal was patently motivated by Democratic anxieties that a light poll may ensure a Republican victory. Mr Roosevelt pointedly reminded his listeners that in the fateful election of 1920 only 49 per cent of the potential voters took part. Even in 1940 the proportion only reached 62½ per cent, although the popular vote was the highest recorded. The overwhelming of election issues by the war will bring this down; but the main factors are the absence of Servicemen (and the complexities of the soldier voting law, to which Mr Roosevelt made a bitter reference), and the numbers of war workers who have changed their state of residence too recently to be allowed to vote. The number of such migrant workers is put at 13 to 14 millions; and if even 4 or 5 millions of these are deprived of the right to vote, or do not exercise it, the lead which Mr Roosevelt enjoyed over Mr Willkie in 1940 may vanish. One result of the likelihood of a light vote is to cast some doubt on the reliability of even the best public opinion polls, for they can hardly make allowances for the fact that many of those polled may fail to show up at the booths in November. Obviously there is an increased margin of error; and it is quite likely that even the 2-3 per cent lead generally attributed to President Roosevelt is an overestimate, as the groups which are most likely to be disfranchised, through a combination of legal requirements, migration, and the difficulties of reaching the polls, are those most likely to vote for Mr Roosevelt. His lead among Servicemen is put as high as 2 to 1. In this situation, anything which arouses interest in the campaign improves Mr Roosevelt's chances; and it is said, perhaps unjustly, that Governor Dewey has deliberately pitched his campaign in a low key for this reason. It is perhaps relevant that in his last speech Governor Dewey returned to his prepared programme, and to such an uncontroversial subject as the need for lower taxes all round and simplification of the tax law. As one unfriendly paper said, all that is needed now is for him to come out for longer life and fewer toothaches. What his serious critics deplore is his failure to explain how, with such general tax reductions, sufficient revenues would be forthcoming to meet existing commitments which, because of the termination of war contracts, the maintenance of the Forces, and oldiers' discharge benefits, are likely to remain not far

below their present level for some time after the end of the war in Europe.

The Wage Issue

The burning question of whether President Roosevelt will agree to an upward adjustment of wages before the election is still unsettled; and the period of suspense has been marked by an unprecedented if belated rallying of industrial leaders in support of Mr Roosevelt's stabilisation policy. "Holding the line" is fast becoming the password of the National Association of Manufacturers. Mr Eric Johnston, president of the Chamber of Commerce, put industry's case most cogently to the War Labour Board when he expressed the fear that wage increases now would lead to a rising spiral of costs and prices, and argued that increased wage rates, to offset declining hours worked, would handicap the post-war expansion of industry. In asserting that after the war, when post-war costs were more clearly ascertainable, industry would probably wish to increase hourly rates, he was not so clearly in step with the majority; and this is a proposition to which labour will lend a very sceptical ear, conscious as it is that after the war its bargaining power will be very greatly reduced. The President's decision, even in the opinion of an outstanding labour reporter like Mr Louis Stark, is heavily weighted with politics. If Mr Roosevelt allows for an upward revision of wages before the election, he will be accused of betraying the majority to bribe the labour vote. Even within the ranks of labour—which is unanimous on the need for wage increases—there are political difficulties, for the most immediate rewards would go to the CIO, whose case for wage increases in steel, automobiles, and other mass production industries is already well advanced on the books of the War Labour Board. This might alienate voters in the AFL unions, which are by no means so unanimously behind Mr Roosevelt. This situation lends colour to reports that Mr Roosevelt may shelve the whole issue until after the election; and that he has refused to make any promises or commitments to labour leaders pressing for immediate relaxation of the wage controls.

EASE THE BURDEN

THE WORLD OVERSEAS

Into Greece

THE liberation of Greece has begun. In the first week of the campaign, the Allies have overrun the whole of the Peloponnese and entered Corinth. The liberation of central and northern Greece ought not to present very great difficulties. The Germans are not likely to put up a strong resistance, outflanked as they are by the Russian advance from the north; in any case, the major part of the country has already been freed by the Greek partisans. The Allied revenge for 1941 is more likely to be a triumphal advance than a protracted battle.

But the Greece, on which British soldiers have again set foot, is a very different place from the country where in 1941 they fought against overwhelming odds. Famine and destitution have in the meantime sapped the strength and the health of its people. The most difficult operations in Greece will fall not to the operational Staff of the Allied Expeditionary Force, but to its Civil Affairs Branch. Civil Affairs, together with the agencies of the Greek Government, will now take over the administration of the country, and on it will fall the responsibility of supplying Greece with food and other essentials.

The exceptional difficulties of this task spring from the fact that even in normal times Greece, which specialised in producing "Mediterranean" crops, tobacco, fruit, wine, olives and olive oil, was dependent for its provisioning on imported wheat and cattle. During the years of the occupation, the Greeks tried to some extent to switch over from growing tobacco to the cultivation of wheat. But the switch-over was made on an insignificant scale. Its effect has been undone by the general decay of farming. Reports from inside Greece suggest that livestock has been reduced by 60 per cent; that most of the agricultural implements are now dilapidated; that the yields of cereals per acre have fallen below the pre-war level which was, in any case, the lowest in the Balkans; and that consequently only a very small part of all essential foodstuffs can come from domestic resources. The Greek Government has laid in some stocks in Turkey, and Civil Affairs is also sending in supplies in the wake of the advancing armies. Nevertheless, Greek officials think that the stocks are quite inadequate to put an end to the famine. Bread is the chief item in the Greek diet; and the Greek Government has urgently asked the Combined Boards in Washington to increase the allocation of flour for Greece.

The next problem is distribution. Even if Greece's thin railway network is not destroyed in the course of the present campaign, it will not be able to distribute supplies over the country. In normal times the road traffic in Greece played a fairly important rôle. With 6,000 to 7,000 cars and lorries on its roads, pre-war Greece was relatively more "motorised" than any other country in the Balkans. At present the road traffic has ceased, and no lorries are available. The Civil Affairs Branch has at its disposal not more than 250 3-ton lorries to care for civilian needs. Here, too, a more generous allocation will be needed if the population of the more remote provinces of the country is not to be left starving. The traffic between the Aegean islands and between the mainland and the islands is also at a standstill. The local Aegean merchant fleet has been sunk during the war, though the remaining ships of the Greek merchant navy, which found shelter in Allied harbours, ought to be able to restore the coastal sea traffic.

Rampant Inflation

The Greek national income is now estimated to be about 40 per cent of the pre-war average. It is out of this shrunken income that the Greeks have had to meet the costs of the German occupation in their multifarious "legal" and illegal forms. The occupation forces have used the last weeks of their stay in Greece for some fantastic farewell looting. This has been strikingly reflected in the truly feverish expansion of the currency in circulation in the course of recent weeks. In August this year the circulation was 500,000 billion

drachmae compared with 10 billion drachmae before the Italian attack on Greece. In the course of one month only, from August to September, this astronomical circulation was multiplied by eight, and passed the 4,000,000 billion mark. The price of a gold sovereign, which was 1,000 drachmae before the war, stood at 3 billion in August and rose to 30 billion by the middle of September.

The burden of the inflation has fallen mainly on the towns, where wage and salary earners have had no other purchasing power than the heaps of almost valueless money. In the countryside money has virtually disappeared, and barter has become almost the only form of exchange. Under such conditions it has proved impossible for the Allied military authorities to fix any rate of exchange between the special military pound issued to the troops and the drachmae. A rate of exchange will be fixed only after the liberation of Athens, though even then the fixing of a rate can hardly have any immediate practical meaning.

Currency Problems

The question how the Greek Government is going to tackle the currency problem is of obvious interest. It is not very likely that any immediate and drastic measures can remedy the inflation. For instance, an exchange of banknotes and the blocking of accounts, similar to that decreed by the Belgian Government last week, would probably yield no significant results in Greece. First of all, the scarcity of goods, and especially of foodstuffs, available to the market is, and is likely for some time to remain, so acute that the monetary system can hardly be immediately revived. Even if the circulation of money is mechanically restricted, its value cannot be restored as long as it can buy no goods. Secondly, a distinctive feature of the Greek economic and financial situation is the extent to which Greek consumption depends upon exports. This fact rules out any effective restoration of the currency system on the basis of a merely domestic "normalisation."

Finally, after the liberation of the country the Greek Government will probably find itself compelled to cover most of its budgetary expenditure by using the printing press. The yield of taxation is certain to be insignificant as long as agriculture and industry are not at least partly rehabilitated. Before the war the yield of indirect taxation used to be nearly three times as large as that of direct taxation. If this system of taxation is to continue, any return to some sort of a budgetary equilibrium will take a very long time. In addition, the credit system, never well developed, has now been utterly destroyed. Under such conditions even the introduction of a new currency would not prevent a new inflation; and it may even be wiser to wait with a monetary reform until some of the economic pre-requisites of a stable currency have been created.

The question of how long it will take to bring the currency situation under control will be determined not only by purely economic factors, but also by psychological and political issues. How quickly can the distrust of the banknote—the unavoidable aftermath of so sweeping an inflation—be overcome? This in its turn will to a very large extent depend on the development of political conditions in Greece. How quickly will the present Greek Government be able to establish a unified and effective administration all over the country? How quickly can there be any return to normalcy against the background of the present social and political tensions in Greece? The reconciliation between the Greek Government and the Left is certainly a favourable augury, although it is hard to say how definite it is or how lasting. The fact that the EAM guerillas have submitted to the authority of the Government ought to facilitate social peace in the period of transition, until the controversy over Republic and Monarchy can be solved by the verdict of a popular plebiscite. The immediate economic and financial prospects cannot be made good by any magic; but they can be made less difficult by political stability.

But something more than this will be needed to make recovery possible. Greece illustrates more strikingly than most other liberated countries the inadequacy of the plans for immediate relief, on which Civil Affairs and UNRRA have been working. Greece shows how closely interconnected are relief, rehabilitation and reconstruction. No real relief will be brought to the Greeks unless their agriculture is rehabilitated. This in its turn cannot be achieved without some reconstruction of the technical basis of Greek farming. Now that they have lost a very high proportion of their cattle, the Greeks believe that they cannot redevelop their agricultural resources without importing two or three thousand tractors, as well as other agricultural implements. Will they be able to receive those on credit? On the other hand, the switch-over from the horse and the mule to the tractor is inconceivable without at least a partial reorganisation of small-scale farming in the direction of co-operation. Similarly, the power stations must be restored if industry is to go back to work. Incidentally, the mining of bauxite in Greece has in the meantime been strongly developed by the Germans.

In the inter-war years Greece, like the other Balkan countries, was economically drawn into the German orbit, because Germany was the chief buyer of Greek tobacco, fats, ores and so forth. Now that this dependence and its tragic sequel are receding into the past, the Greeks must ask into whose economic orbit they will now be drawn. Will the western Powers—and primarily Great Britain—have sufficient interest first to give real relief to Greece, and then to enter into close trade relations?

Switzerland's Economic Problems

THE strain on Switzerland's economy has been intensified by the liberation of France and the beginning of the end of the war against Germany. This additional strain is temporary, and will disappear as soon as the fighting ends. Public opinion in Switzerland tends to consider the present situation, with its military implications, as the reverse of the situation in 1940. Then, as now, the commander-in-chief of the Swiss army ordered more men to be mobilised. This time the Swiss authorities obviously wanted to guard themselves against a possible violation of Swiss neutrality by the belligerents, whose fighting fronts once again lean on the Swiss frontier, as was the case in 1914-18. Fears of this sort, however, seem exaggerated, although the fighting itself forces the Swiss authorities to carry the additional burden of caring for more refugees as well as for combatants who chance to enter Swiss territory.

From an economic point of view Switzerland has never been so isolated as during the present stage of the war. The liberation of France has for the time being virtually put an end to Switzerland's overseas trade. The trade with the Balkan countries and other western European countries has also ceased with the advance of the Allied armies, and Germany's increasing difficulties may even prevent it from sending supplies of coal, steel and chemicals. The immediate effect of this last stage of the war has been the piling up of manufactured articles for export orders which cannot be transported. Growing export difficulties and dwindling supplies of foreign raw materials have been the main feature of Swiss industries in 1944. Here and there production programmes have had to be reduced. During the first part of the year the increased activity in the building industry made up for the decline elsewhere, but a short time ago the shortage of coal led to a reduction in the allocation of cement. Difficulties were especially experienced in the export of machinery. The watch-making industry, which employs roughly 10 per cent of the total number of industrial workers, reports a fall in employment. Imports of cotton and wool are at a standstill, and the worsted yarn spinning mills cannot continue operations on the present level. Although two new cellwool plants have come into operation recently, not more than one-quarter of the total demand for textile fibres can be supplied, and the Swiss public is still averse to buying textile goods which contain staple fibres.

The wartime changes in Swiss industry and agriculture are as far-reaching as in any belligerent country. The countries surrounding Switzerland have all, at one time or another, been belligerents, and industry was forced to find a way of replacing imported raw materials by synthetics.

It is therefore not surprising that all the leading industries complain of increasing costs of production. Full employment has been realised for a long time. But owing to the growing costs of production, that is, the expenditure of a greater amount of labour on the same unit of manufacture, the physical volume of the national product is estimated to be 20 per cent smaller compared with the last year before the war. The money value, however, has increased over the same period by 7 per cent.

A tremendous effort had to be made to increase the production of foodstuffs. The acreage under cultivation has been doubled during the war, and exceeds the total acreage achieved at the end of the last war by 70 per cent. The mountainous character of the country and the poor soil make this a great achievement. Yet there is still a deficit in cereals, and during the coming winter bread will contain a still higher percentage of potato-flour.

The volume of Swiss imports in 1943 was reduced to 53.8 per cent of the 1938 total, whereas their value had increased to 107.5 per cent. During the same period the exports decreased to 59.8 per cent in volume, but rose to 123.6 per cent in value. The result of this, which is probably fairly common to all industrialised countries during a war, is of considerable importance to a country whose foreign trade per head of the population was among the highest in the world.

Post-War Prospects

At present, Switzerland is almost completely isolated so far as her economy is concerned, but the near end of the war has produced a lively discussion about post-war economic reconstruction. Agricultural interests tend to fight for maintaining the increased acreage under cultivation regardless of the higher costs of production. From this sector there comes, therefore, a demand for some system of "steering" the economy. The planning or "steering" in Germany's totalitarian agriculture seems to have been taken as a model by these interests. If free market conditions were restored, the greater part of the wartime increase in agricultural production would automatically disappear. Industrial circles naturally contend the demand for maintaining agricultural production on the wartime level, which would place a permanent and heavy burden on the whole community.

Swiss industry, and, indeed, the entire Swiss economy, is vitally interested in the restoration of international trade. But it is realised that at the end of the war an entirely new situation will be revealed all over the world. Industrialisation has been advanced in many predominantly agricultural countries. Germany's temporary domination of the entire continent has imposed changes on the economic structure of many countries which will not simply disappear with the end of the war. The prospect of "pastoralised" Germany finds no appeal in Switzerland, whose industry was closely linked with that of Germany. Above all, Switzerland cannot passively await the restoration of world economy and world trade. At present, the most important problem is whether industry can be kept going by working for the accumulation of stocks of manufactured articles. There are many indications that the engineering industry is accepting orders for post-war delivery, but the difficulty is that at the moment post-war orders can hardly be specified. Machine tools and machinery have changed in purpose and design. A great number of synthetic materials will probably find a permanent place in post-war industry. The demand for new machinery and new plants will change, and above all the purely military demand will abruptly cease. Swiss industrial circles are undoubtedly hesitating to make the necessary changes before the war actually ends.

BANK OF MONTREAL

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

RATIONING MAKES EXTRA VITAMIN SUPPLY ESSENTIAL

THE BODY MUST HAVE ENOUGH vitamins A and D if it is to remain healthy. Before rationing most of us got sufficient of these in our ordinary meals, but wartime diets tend to reduce the vitamin value of our food.

A daily dose of Crookes' provides sufficient 'anti-infective' vitamin A to enable you to resist colds and influenza; it provides, too, the correct amount of 'sunshine' vitamin D to keep adults healthy and to allow children to grow up with strong bones and sound teeth.

CROOKES' HALIBUT OIL

OBTAINABLE ONLY FROM CHEMISTS

Capsules—per bottle of 100—8/6 · Liquid—per phial—enough for 16 days 2/-

Conditional Surrender

LET US never forget that in waging total war we have willingly surrendered many cherished privileges and age-old liberties.

This is a long war, and some of us may be tempted to accept our present limited freedom as the measure of our liberty tomorrow. That is the line of least resistance, the way of lazy thinking.

The surrender of our personal liberties is far from unconditional. Restrictions, which the bus companies have been compelled to impose, have been accepted willingly upon the understanding that they will end with the end of their necessity. With the removal of war-time controls, British omnibus companies will again demonstrate the unrivalled value to the community of road passenger transport owned and operated by private enterprise.

the best-known tobacconist in the world

BACKGROUND TO ACHIEVEMENT

Power

FOR more than forty years BTH has been pre-eminent in the design and manufacture of power station equipment. Not only does the Company provide generators, switchgear, transformers and rectifiers for very many electricity supply undertakings throughout the British Empire, but in many cases has also been responsible for the design and installation of the complete systems. The first successful steam turbine for utilising extra high temperature steam was manufactured by BTH for an electric power company in the U.S.A.; this experience ultimately enabling BTH to make the propulsion unit for Air Commodore Whittle's jet-propelled plane.

THE BUSINESS WORLD

Dear Raw Materials

THE prosperity of British industry has been founded on cheap raw materials. Until the 1930's, the British manufacturer could buy his raw materials in the cheapest market; and he could transport them either by water or else over short distances by land. Very largely, this meant the use of imported materials, or even where the materials were home-produced, the possibility of importing kept the cost low. Until the last dozen years, British industry—unlike the industries of other countries—was not compelled to buy expensive materials merely because they were home-produced. The advantage that this traditional system conferred on the people of Great Britain was enormous beyond all measure. It has meant that British industry could pay higher wages than foreign industries and yet sell at competitive prices—and, since the system was also applied to food—a given cash wage meant more in real terms to a British worker than to a foreigner. Low raw material prices and a high standard of living are the obverse and the reverse of the same medal. The second is impossible without the first. A country can, up to a point, stand the heavy cost of converting raw materials into finished goods that a high wage policy involves, if it has an advantage in cheap raw materials. But high conversion costs and dear raw materials are a combination that make exports unsaleable and the domestic cost of living excessive.

The old principle has been increasingly disregarded ever since the last war, and especially since the triumph of protection in the early 1930's. A great part of the persistent anæmia of British export trade is the direct consequence. But conditions look like being far worse after the war. If British industry was handicapped by high costs before the war, it will be entirely weighed down after the war. At a time when a radical improvement in the country's competitive position is an urgent national need, the trend is in the precisely opposite direction. Both raw material prices and conversion costs are soaring.

During the war, with the emphasis on output rather than upon price, the terms at which British industry has been compelled to purchase home-produced materials appear to have altered further to its disadvantage. Other materials, such as aluminium and magnesium, have had to be produced at high cost as a means of safeguarding supplies to industry. It is hardly surprising that a number of industrial chemical and steel industries are beginning to get alarmed about the rise in coal prices; and that the motor industry is beginning to compare British and American steel prices.

Unfortunately, it is by no means easy to measure the difference between the prices British and foreign industries have to pay for their home-produced raw materials. International price comparisons are notoriously tricky, not only because list prices and actual purchase prices are by no means the same thing, but because of different methods of quoting prices, differing definitions, varying exchange rates and so on.

There is no doubt, however, that coal is now the most serious raw material problem of British industry. The price of coal, already rising in the 'thirties, both absolutely and relatively to prices elsewhere, has doubled since 1939, mainly as a result of the progressive advance in wages, unaccompanied by higher productivity. A year ago, on October 12, 1943, when coal was cheaper than now, the chairman of Imperial Chemical Industries, Ltd., Lord McGowan, made the astonishing statement that pithead prices in the United States were lower than in this country by the equivalent of 10s. a ton, that is by an amount little less than the total pre-war cost of coal at the pit in this country. A British pit-head price double the American will place many other industries, such as steel, chemicals and light metals, at a serious disadvantage. It is all the more disquieting since British industry, unlike American industry, does not possess an alternative source of energy in abundant water power.

Steel, another important material which consumers in

this country can no longer buy in the cheapest market, also rose substantially in price in the 'thirties and, more steeply, after the outbreak of war. The industry contends that, on the average, British steel prices were no higher than American prices in 1938 and 1939, and that the rise during the war is a reflection, not of higher costs of production or excessive profits, but of dearer coal and imported ore and scrap. On its own admission, however, British steel prices have advanced in relation to American prices since 1939; the absolute advance has been of the order of 50 per cent and the relative rise—after allowing for the depreciation of the pound—amounts to about 25 per cent. In fact, many products of the industry are now sold at prices showing an increase of well over 50 per cent above pre-war prices.

It is difficult to verify the steel industry's contention that its pre-war prices were no higher, on the average, than American prices. One of the steel industry's consumers, the motor industry, holds the contradictory view. Its contention is that the British steel industry charged a good deal more for the materials they had to produce than American steel-makers charged motor-car manufacturers across the Atlantic. According to one British motor firm, with the most excellent opportunities for knowing the exact state of affairs in both countries, the price of "auto-body extra deep drawing cold rolled sheets" at Detroit was \$3.05 per 100 lb. or \$68.32 per long ton in 1939 and \$3.30 per 100 lb. or \$73.92 per ton in 1944. Converted at \$4.85 to the pound in 1939 and at \$4.00 in 1944, these prices are equivalent to £14 per ton in 1939 and £18½ in 1944; the British prices were £21½ per ton and £29½ respectively. Other examples, relating to January, 1939, are given below:—

	American Price, c.i.f. London,* Per ton	British Price, Delivered, Per ton
	£ s. d.	£ s. d.
Cold-drawn 1% low nickel chrome bars	21 5 0	33 11 0
Cold-drawn 5% casehardening nickel bars	28 8 0	45 6 0
Hot-rolled 1% low nickel chrome bars	17 17 6	24 12 0
Hot rolled 5% casehardening nickel bars	25 0 0	34 7 0

* Excluding Duty

If these quotations represent the facts, the pre-war price differential was of the order of 50 per cent in the products quoted. (These do not, of course, cover the complete range of steel materials purchased by the motor trade.) The British steel industry, however, maintains that, in sheets for example—the biggest item—the prices in the two countries were similar for the commoner qualities, and British prices were up to 15 per cent dearer for the higher-grade ones; it suggests, moreover, that the disparity would have been removed if the Richard Thomas and Summers strip mills had then reached the stage of full production. There is thus a conflict of expert evidence.

The steel industry may feel aggrieved at being singled out, and by the motor trade, for complaints about high material prices. It can point to an excellent war record, to a highly-developed system of price control and profits equivalent to barely 10 per cent of the capital employed in its heavy and sheet sections—a low rate for such an industry in such circumstances. But steel is not the only industry that has done its duty by the country in war. Its wartime record cannot become an excuse for saddling the national economy, after the war, with steel costs higher than competing countries will have to pay; nor could it excuse avoidably high costs before the war. If the large-scale substitution of British for imported materials in the 'thirties has not brought lower prices, it has yet had one solid advantage in that Great Britain was far less dependent on imported steel supplies in 1939 than it was in 1932; in other words, the tariff and import restrictions have led, if not to the hoped-for thoroughgoing rationalisation, at least to the installation of additional capacity which has made Great Britain more self-sufficient in steel in wartime. But the industry can claim no credit for this result; it was accidental. Nor

would the country wish, or be able, to live indefinitely in conditions appropriate to a war economy.

Chemicals are another set of raw materials which form the basis of many new and growing industries, yet many of them seem to be relatively expensive in Great Britain. In a paper on "The Chemical Raw Material Potential," prepared by Mr W. D. Scott and published in *Chemistry and Industry* on July 29th, the prices of a list of basic materials in this country are expressed as percentages of the American prices. With a few exceptions the comparisons are unfavourable to this country:

BRITISH PRICES OF BASIC CHEMICALS EXPRESSED AS PERCENTAGES OF AMERICAN PRICES

	%		%
Acetic anhydride	151	Cresylic acid	93
Acetone	167	Formaldehyde	105
Alcohol, Butyl	182	Naphthalene	81
Ethyl	64	Phenol	159
Methyl	131	Phthalic anhydride	110
Benzene	272	Soda ash	149
Calcium carbide	144	Sulphur	206
Caustic soda	121	Sulphuric acid	208
Chlorine	135	Urea	152

In Mr Scott's view, dear chemicals are the result of inability to buy in the cheapest market, due to the Safeguarding Duties, and of the tax on hydro-carbon oils. The tax on hydro-carbon oils used in industrial processes is an anomaly which is now under review by an official committee. In so far as the safeguarding duties have made for high prices, this result may not be wholly unconnected with the fact that the greater part of the British chemical industry is controlled by a single concern.

Here, then, are three sets of essential raw materials of industry—coal, steel and chemicals—which are, admittedly or allegedly, substantially more expensive than in the United States. Other examples could be cited from the pre-war years. And there are still many more materials that have had to be produced in this country during the war at any cost in order to provide insurance against a breakdown of imported supplies and for whose continued production in peace-time strong claims will be made. If the war means the transformation of Great Britain from a cheap to a dear power country, if, by way of tariffs, import restrictions or cartel arrangements, British manufacturing industry has to pay more than others for its steel, its light metals and alloys, and for many of its basic chemicals, then the prospect of a really solid industrial revival—let alone a flourishing export trade—is bleak indeed. British industry is already struggling under the disadvantage of high conversion costs; it now also has high raw material costs.

*

This dangerous drift must now be arrested at all costs and by all means. The facts are not generally known because of the lack of clear data, and they have been given insufficient attention because, for five years, output has been everything and price nothing. The first step should be to ascertain the facts about comparative costs and prices in Great Britain and elsewhere. If these reveal more than minor differences to the disadvantage of British manufacturing industry, then their causes should be established and the findings published.

Monetary Reform in Belgium

THE Belgian Government has given the problems of financial reconstruction the high priority they deserve. On Thursday of last week it signed a monetary agreement with the United Kingdom, fixing the rate of exchange and providing machinery for financing trade between the franc and sterling areas. Two days later it launched a drastic deflationary programme designed primarily to rid the country of the redundant purchasing power created during the German occupation. At the same time it has instituted a new system of exchange control. The three programmes are in essence complementary. Without a drastic measure of deflation there could be little hope of maintaining the exchange value of the Belgian franc at the rate of 176½ to the pound fixed by the monetary agreement, while the efficient functioning of the clearing machinery provided by the agreement must in large measure be helped by an exchange control which will ban unwanted capital movements and, within reason, predict commercial transactions beyond mere day-to-day budgeting.

For commodities produced at home—and particularly for those which, like steel and chemicals, enjoy substantial protection—it will be necessary, first, to ascertain whether conditions of supply are less favourable than abroad. In coal this is undoubtedly one, but by no means the only, cause of relatively high production costs. If, for defence or other overriding reasons, certain materials must be produced in this country in spite of basically unfavourable conditions of supply, then the manufacturer who uses them should not have to pay the extra cost. Where there is no overriding case for protection, manufacturers should be allowed free access to the cheapest sources.

Secondly, where differences in costs and prices are not traceable, or not entirely, to unfavourable conditions of supply, it should be ascertained whether the responsibility lies with inadequate tools, equipment, faulty structure or incompetent management, whether the industries concerned are overlaid by restrictive practices on the part of employers or workers, whether the potential market is too small for the adoption of large-scale methods, whether consumers' requirements are insufficiently standardised, or whether, as in the case of the duty on hydro-carbon oils, Government policy is faulty. Once the causes of dear raw materials are clearly established, remedial action should follow without delay.

Such fact-finding inquiries, clearly, should not be entrusted to representatives of the industries concerned. To ask representatives of an industry to advise the Government on how to make it efficient—as Major Lloyd George has done in coal—is to ask for the impossible. The steel industry's advice after the last war was to impose a tariff; and every other industry which has to compete with imported materials will tender the same advice. It would be a grave error, indeed, if Major Lloyd George's example were to be made a precedent for steel or chemicals, for example. If there is reason to suspect, as there is in steel and chemicals, that protected raw material industries charge prices higher than those at which the commodities could be imported, there is an unanswerable case for an official investigation. One solution is the appointment, by the Government, of small technical committees, assisted, possibly, by first-class experts from other countries as consultants, with power to take evidence. Their terms of reference should not be narrowly defined, like those of the committee appointed by the Government to investigate the effect of the duties on hydro-carbon oils, but should be as wide as possible. And the results of these investigations should, of course, be published—not suppressed or expurgated as the recent report by American coal-mining experts has been.

If British industry is to have a solid basis for expansion and prosperity after the war, it cannot afford the luxury of dear raw materials. Yet the heritage of the nineteenth century is well on the way to being lost through the almost light-hearted, step-by-step departure from the established policy of buying materials in the cheapest market. There is a case for immediate and thorough-going investigation. Coal, steel and chemicals deserve a high degree of priority, but there should be no limitations imposed. These are not academic points; they are matters of economic life and death.

The monetary agreement follows a pattern already made familiar by the Belgian-Dutch agreement of October, 1943. The agreement is for a period of three years, but is terminable on three months' notice by either party. The rate of exchange of 176½ francs to the pound is not to be altered except after mutual consultation and is to form the basis of all transactions between the two currencies in the territories where the contracting parties have jurisdiction. The Bank of England and the National Bank of Belgium will respectively furnish the sterling and francs required for financing payments between the sterling and franc areas, but if in the course of providing such currency either party acquires more than £5 million, or its equivalent, of the other's currency, the excess is to be paid in gold at the free disposal of the creditor. This arrangement excludes the sterling balances already held on Belgian account. (Will any monetary agreement to which the United Kingdom is a party be free of this uncomfortable reminder of the problem of abnormal sterling balances?)

The sterling or francs held by either party will be freely transferable between residents of the two currency areas and "as opportunity offers" may become available for payments of a current nature to residents outside these areas. The agreement thus opens the door to the development of multilateral payments and free convertibility of the two currencies. The agreement specifically abjures the charge of bilateralism which might at first sight be levelled against it. It states that "if, during the currency of this agreement, the contracting parties adhere to a general international monetary agreement, they will review the terms of the present agreement with a view to making any amendments that may be required." The contracting parties promise one another full cooperation and exchange of information with a view to keeping capital transactions in line with their respective policies and to prevent movements of funds "which do not serve direct and useful economic or commercial purposes." This provision points the way to the new international control of capital movements and to a technique of exchange control which may do away with the need for postal censorship. The exchange of information will also apply to the whole range of monetary policy in which the mutual interests of the parties may be affected. Though each contracting Government shall be alone responsible for its monetary relations with third parties, "they shall maintain contact whenever the monetary relations of the one affect the interests of the other." This first monetary pact between the United Kingdom and a liberated country will, no doubt, provide the guiding lines for similar agreements now being negotiated by the United Kingdom with the Netherlands, France and Norway.

On Saturday last the Belgian Government issued its decrees for cleaning up the currency situation after its defeat during the German occupation. In May, 1940, the Belgian note circulation and the volume of bank credit together totalled about 65 milliard francs. When liberation came the figure had increased to about 183 milliards. This inflation of currency and credit had gone hand in hand with a reduction in the volume of consumer goods. Symptoms of price inflation had been kept in check by rigid price control and rationing, but with the eviction of the Germans these controls inevitably suffered a temporary loss of efficiency, and black markets began to reflect the true depreciation in the value of the currency. Drastic action was called for and the Belgian Government cannot be accused of having failed to rise to the urgency of the situation. During the first five days of this week all holdings of Belgian bank notes of 100 francs and over have had to be notified to the authorities. The notes of lower denomination continue to circulate, but those declared to the authorities and deposited with them have already ceased to be legal tender. New notes, printed for the purpose in Great Britain, are being exchanged for the old on a franc-for-franc basis, but only up to a maximum of 2,000 francs per head. The balance of the old notes is blocked for the time being.

At the same time all bank balances have been blocked save for 10 per cent, or the amount which stood at the credit of the account in question on May 9, 1940 (whichever is the greater). Commercial and other firms inscribed on the Belgian Register of Commerce will have their bank balances freed to the extent of 1,000 francs for each employee. After an interval of a month the Minister of Finance will decide what proportion of the old notes and of blocked bank balances he will release immediately. After the initial and subsequent releases the surplus of notes and bank credit will be treated as follows: 40 per cent will be temporarily blocked and progressively released as and when the Belgian economy can absorb it; the remaining 60 per cent will remain blocked and the greater part will probably be absorbed by a retrospective tax on war profits. Any part of this surplus not absorbed by such taxation may ultimately be converted into long-term Government securities, but no definite decision has yet been made on this point.

As far as can at present be estimated, the initial effect of the deflationary programme will be to bring the currency and credit circulation in Belgium back to approximately its pre-invasion level. Thereafter, there should be progressive expansion as reconstruction and the re-accumulation of consumer goods call for additional circulating medium. Though the plan is frankly deflationary, it is not the product of a deflationary or "hard money" philosophy. It is a drastic surgical operation which the monetary malady of Belgium—as of every country occupied by Germany—requires; but the patient will not be required to submit to continuous doses of deflation as was Great Britain in the 1920's. Once the cut has been made, the whole emphasis of Belgian

monetary policy will be in the direction of re-expansion. In congratulating Belgium on this currency operation British opinion should not be thought guilty of hypocrisy or of recommending to others a monetary policy Britain has firmly resolved not to follow itself.

One of the incidental objects of the monetary decrees is to help the Belgian Government in its investigation into war profits. The intention is to tax these heavily and retrospectively and the blocked note and credit balances will provide a useful pointer to where these profits are to be found. Admittedly they are in this respect an imperfect criterion. The farseeing collaborationist or black market operator may have chosen to salt away his gains in other ways. In the case of the more notorious of these specimens there will be abundant evidence, other than the state of their bank balances and currency holdings, on which to take retributive action. For the rest, the immobilisation of such assets will prove an extremely useful point of departure for these inquiries.

The monetary decrees should also have a rapid effect in normalising the economic life of Belgium. The blocking of the greater part of the old note circulation will at one stroke have deprived the black market of that redundant volume of purchasing power on which it lived. The issue of new notes should also stop the hoarding of agricultural produce by farmers who, since the liberation of Belgium, have been aware that some plan of note conversion was afoot and were unwilling to sell their produce against notes which might become blocked or even valueless. The decrees should, therefore, help from the currency and goods side of the price equation to bring the cost of living into closer adjustment with the external value conferred on the Belgian franc.

The Belgian system of exchange control introduced this week bears testimony to the hospitality which the National Bank of Belgium's experts and representatives have enjoyed at the Bank of England during the past four years. The Belgian system bears a close resemblance to that which has gradually evolved in this country. There is, however, one important point of difference. Though all Belgian nationals will be required to declare their foreign assets they will not be compelled to sell their existing holdings to the Government, but as additional external assets are acquired hereafter by Belgian nationals, they will have to be declared and offered for sale. Payments within the Belgian monetary area, which comprises Belgium, Luxemburg, the Belgian Congo and Ruanda Urundi, will not be subject to restrictions. It is expected that purchases of currencies of countries with which Belgium has negotiated monetary agreements,—at present the guilder and sterling—will be covered by a general license giving banks almost as much freedom as in operations between the various parts of the Belgian monetary area. Thus, the emergence of a new system of exchange control in Belgium is made compatible with an extension of the area of the world within which free multilateral convertibility of currencies operates.

Business Notes

Disposal of Government Factories

A Government pronouncement on all the matters affecting the conversion of war production to a peace-time basis is anxiously awaited. So far, White Papers have been published on only two aspects—the demobilisation of the armed forces, and the disposal of surplus stores. A Board of Trade announcement this week deals with what is, in effect, only a minor part of the whole complex of reconversion. This is the plan for the disposal of surplus Government factories. Altogether, it is expected that about one thousand modern factories will be available to private enterprise. Industrialists who require space of 10,000 square feet or more in surplus Government factories or storage premises for peace-time purposes may apply forthwith to the Controller of Factory and Storage Premises. Factories will be leased for a period of ten years, with an option to the tenant to renew. The rent will be the 1939 rental value, and there is provision for review between the end of the third and fifth years. The demand for the factories is expected to exceed their number, so that selection will have to be made. The criteria to be followed by the inter-departmental committee, which will make the selection, under the chairmanship of the Board of Trade's Controller of Factory Premises, include the following: the establishment of a balanced distribution of industry; the re-establishment and expansion of the export trade; the maintenance of a war potential; the requirements of town and country planning; the efficiency with which the applicant can use the factory; and the claims of firms whose premises have been destroyed by enemy action, or requisitioned by the Government.

The Government's decision to lease its factories, rather than to sell them by competitive tender, as was done after the last war, is satisfactory, while its desire to allocate the factories immediately, so that no delay occurs between their use for war and peace purposes, is laudable. But it is a pity that their whole intentions with regard to factories should not have been announced at the same time. Compared with the total of factory and storage premises now engaged on Government account, the thousand factories which are to be allocated are a meagre and negligible part. Since they are entirely at the disposal of the Government, it might have been wiser to leave some of them as a reserve which could be used to introduce flexibility into the complex of industry, and which could be allocated towards the end of the transition period to fit into the pattern of private enterprise. As it is, with no general plan apparently in mind, the factories will be allocated on an unavoidably arbitrary basis (which will be favourable to the tenants) before industrialists, town planners and others concerned, can know to what use the factories could best be put.

The Mark Exchange Rate

Reflection does not commend the exchange rate for the Reichsmark of 40 to the pound and 10 to the dollar which was announced a fortnight ago. It is now known that there was a distinct difference of opinion between the British and American Governments on the issue. The British Treasury would have preferred rates of about RM 25 to the £ or about RM 6 to the \$, which would probably have represented an under-valuation of the mark of between 30 and 40 per cent. The American Treasury got its way and the new rate must be regarded as the first part of the Morgenthau plan to be applied to Germany. To impose a certain degree of under-valuation on the enemy's currency is only reasonable, but to exaggerate to this extent is to make inflation in Germany quite certain—indeed, necessary if Germany is not to have a large export advantage. Inflation can, of course, be relied upon to do a great deal of miscellaneous and haphazard damage to the German economy and society, which to some people's way of thinking, is all to the good. But it will tend, on the whole, to reward the reactionary and militaristic elements (big business and the landowners) and to penalise the mass of the population. It may spread to the liberated countries, and it will certainly depreciate the value of the RM 25 billions of clearing balances in Berlin that they own. It would be interesting to know what advantages are thought to outweigh these defects.

Gold Ban in France

There is still no sign of any application of the detailed plans prepared many months ago for the exchange of the note issue, and the partial blocking of bank deposits, in liberated France. The only measure of monetary control hitherto announced from Paris is a ban on trading in gold. Another decree is in preparation for compelling all French holders of gold and of foreign assets to declare them to the authorities. The long delay which has elapsed before these first essential steps in monetary reconstruction were taken is a measure of the technical difficulties involved in such a task, and not of the unwillingness or unpreparedness of the Government to attack the problem. There are admittedly political reasons for not proceeding with the proposed exchange of notes and blocking of bank accounts. Such measures would be highly unpopular with the French peasantry, and would immediately evoke determined opposition. But the main reason why the prepared plans have not been put into operation is the absence of the required administrative machine. The breakdown of communications—even of the nationwide network of radio stations—has deprived France of a truly centralised administration. For the time being, each district governs itself without centralised directives from Paris, and, under those conditions, a wholesale rehabilitation of the currency is out of the question. The problem of distributing the supply of new notes throughout France would alone completely defeat the plan. It is extremely unfortunate that this should be so, for the bold plan of monetary deflation which French experts had prepared depended for its success on rapid execution. The delay which has already elapsed since the liberation of Paris will have stiffened the political resistance to any programme of currency rehabilitation. The absence of any reabsorption of redundant purchasing power has greatly hampered the French Government's effort to bring about a contraction in the cost of living. The development of the price situation is, on the contrary, still of an inflationary character. The price for wheat allowed to French farmers has this week been raised from 410 francs to 450 francs per 100 kilos. The latter figure is about 50 per cent higher than the price at which Canadian wheat could be imported into France. The price of bread has at the same time been raised from 3.60 to 4.90 francs per kilo. The loaf would have to be sold at 6 francs in order to correspond to the new price for wheat. The difference is being met by a Government subsidy estimated to cost 5,300 million francs annually.

Belgium Regains Gold

The French Government has made rapid restitution of the gold which the National Bank of Belgium lost to Germany through the subservience of the Vichy authorities. The amount in question is £43 million. It represents gold which was sent in November, 1939, by the National Bank of Belgium to the Bank of France for safe keeping. After the German invasion in 1940, the French authorities disregarded instructions from the National Bank of Belgium to ship the gold to the United States and sent it to Dakar. From there it was returned to Belgium in 1941 on the instructions of the Vichy Government, and ultimately made its way to Berlin. The National Bank of Belgium protested against this transaction and proceeded to sue the Bank of France before the United States courts, where it obtained an attachment on an equivalent amount of the French gold held in the United States. The Bank of France had appealed against this judgment, but the matter has now been finally settled by an agreement on the part of the Bank of France to make full restitution for this gold to the National Bank of Belgium. This friendly gesture makes a fitting opening to the reign of the new Governor of the Bank of France, M. Emanuel Monick, who, as Financial Attaché in London before the war, gained many friends who will wish him well in his new position.

Military Currency in Greece

The British forces now operating in Greece have been supplied with British Military Authority sterling notes for their currency needs. Greece is the first reoccupied country where the liberating armies have not been advised of an

official rate of exchange for the conversion of local currency into their BMA notes. Attempts to fix such a rate were made by British and Greek representatives, but they were defeated by the complete chaos into which the Greek currency position has recently been allowed to drift. The breakdown of the fiscal machine in Greece, and the weight of German exactions, have involved resort to the printing press which has not been equalled in any other German-occupied country, and which even exceeds the inflation perpetrated in China. The drachma has become virtually valueless, the velocity of its circulation is nearing infinity, and such domestic trade as goes on has reverted largely to a system of crude barter. The rates of exchange commanded by foreign currencies vary, not only from district to district, but from hour to hour. This week, reports have come of rates of 800 million drachmae being given for a BMA £1 note, while that rare bird, the gold sovereign, is said to have been exchanged at 30,000 million drachmae. These rates are not indicative of any rational exchange market, but of the complete breakdown of the Greek currency system.

Shipping Shares Recover

Investors in shipping companies cannot complain that recently there have not been plenty of prescriptions for solving their post-war difficulties. There has even been action to the extent of the international agreement on the pooling and control of shipping fleets of the United Nations, published a fortnight ago. Other developments to date were dealt with in an article on page 483 of *The Economist* of last week, which set out a scheme for the future of the industry, while on Tuesday, Mr E. H. Murrant, the new chairman of Furness, Withy, stated that the debate in the House of Lords had shown that the Government well realised the problems and difficulties ahead of the industry. The conjunction of these statements was sufficient to start modest buying of shipping shares, but the movement did not last long and was followed by a partial reverse. The shares which rose most were those in which there was recently a considerable volume of speculation, based on the expectation that the companies might be taken over on very favourable terms. According to the figures of *The Actuaries' Investment Index*, the yield on shipping shares has, since April of last year, been appreciably above that on industrial equities as a whole, whereas before that date it was usually below it, often very much below it. The explanation appears to lie in the fact that the resumption, or increase, of dividend payments which occurred last year has not been fully reflected in higher prices. Jobbers in the shipping share market remained confident as to the long term outlook throughout all the difficulties of the inter-war period and are still so to-day. Prices are still so much below the levels of the best inter-war years—the September value index was 26.3 per cent of December 1928—that there is no inducement to any but very weak holders to sell. The yield last month was 4.67 per cent against 4.27 per cent for the total index and the price may be held to discount a recession in earnings after the war. The interests of the investor, in anything but the very short run, are similar to those of the public, namely a mercantile marine of maximum size, operating at the highest pitch of efficiency. It must be kept constantly in mind that there can be no better justification for insisting upon the former requirement than the ability to demonstrate that the latter has been achieved.

Preference Share Rights

Margate Corporation and an adjacent urban district are to exercise their option to acquire the undertaking of the Isle of Thanet Electric Supply Company as from December 31, 1945. The special interest of this transaction lies in the fact that many electric supply companies have now come to the end of their period of guaranteed contract, and are liable to be acquired by local authorities; and the Thanet case has given rise to some doubt about the position of preference shares in the event of repayment. At the time that its proposed acquisition was announced, the Thanet preference shares stood at around 26s., cum some 2s. 9d. net of arrears. The repayment price can, presumably, be no higher than 22s. 9d., since the shares have no right to participation in any surplus break-up values, and it is suggested in some quarters that this certain loss of 2s. 3d. a share is unfair. There would seem, however, to be no grounds for this suggestion. There has been no doubt or secrecy about the right of local authorities to acquire electricity supply companies at

any time beyond a certain date. There is, in every case, the possibility that local authorities will not choose to exercise their right, and there is even the chance that special legislation in the interest of the private companies may be introduced into Parliament at any time. The possibility of some loss if public acquisition was decided upon represented a legitimate risk, and not a certainty, which should have been—and appears in fact to have been—discounted in the price. The high yield of some £5 3s. on the preference shares would seem a reasonable cover for both this risk and the arrears of dividend. Similarly the complaint that preference capital, which is much better placed than equity as regards current earnings, will get much worse treatment than equity at break-up, is completely irrelevant. The relative rights of the two classes of capital under different situations should have been known and allowed for. This case is not comparable even with the Powell Duffryn affair. The acquisition of any electric supply company marks the legitimate termination of its contract, and preference shareholders are entitled to no more and no less than their agreed break-up rights.

Wool Industry Reconstruction

The report issued by the Wool Industry's reconstruction committee, which comprises all sections of the industry and includes trade union representatives, is very much an interim statement of activities and objects. Although the committee recognises that "efficient distribution is complementary to efficient production" it has little to say about how the efficiency of distribution can be improved. Disappointingly few suggestions are put forward about the reorganisation of the industry's structure, though this will be a vital step if productive efficiency is to be increased. The report deals mainly with the problems of machinery and labour supply in the transition period immediately after the war. The committee has undertaken a survey of the industry's estimated needs for machinery replacements and renewals, and also for completely new equipment. In order to avoid a repetition of the "careless policy" adopted after the last war, when mills in France and Belgium stripped by the Germans, were re-equipped with up-to-date British machinery and operated in competition with British manufacturers using more or less obsolete plant, it asks for "a reasonably priority of supply" of new machinery. The industry's own plan for deconcentration has been under discussion by the Board of Trade since March and the committee hopes for an early statement of policy from the Government. The problem of reabsorbing labour may present considerable difficulties—it has been estimated independently that nearly half the prewar labour force has been released for other purposes. The report rightly stresses the importance of demobilising key men, such as overlookers and loom turners, in due proportion to operatives. It recognises that the future of the industry depends as much as anything else on its ability to attract and maintain a sufficient supply of juvenile labour, and the whole question of recruitment and training is now being examined by the Wool Textile Employers' Council. Emphasis is also laid on the importance of research, and it is satisfactory to learn that there is now general agreement in the industry that the wool industry research association should be financed by a statutory levy and not, as in the past, solely by a voluntary fund.

IMPORTANT NOTICE

This world famed Sherry (formerly called Findlater's Fino) could not be registered under that name and thereby protected from imitators. For the safeguarding therefore of our world-wide clientele we have re-named it—Findlater's Dry Fly Sherry.

FINDLATER, MACKIE TODD & CO. LTD

Wine Merchants to H.M. The King, Wigmore Street, London, W.1

Anglo-Iranian Assets

The full accounts of the Anglo-Iranian Oil Company add nothing to the information given in the preliminary statement so far as profits are concerned. The figure is arrived at after all appropriations, other than income tax and provision for dividends, including a repetition of the transfer of £500,000 to preference stock reserve. The dividends are included in the accounts gross and the rate of tax is not stated. On the assumption that the proper rate is 10s., the 20 per cent dividend is covered by earnings of some 25.4 per cent compared with 26.9 per cent for 1942 and only 8.4 per cent for 1941. In these years, however, sums of £2,000,000 and £625,000, respectively, were provided for extra depreciation before reaching the earned-for-ordinary figure against nothing in 1943. These figures are of little value in assessing real earnings and it is doubtful whether they give more than the slightest indication of their trend. The only means of assessing the value of the property is to consider the annual statements of the chairman, Sir William Fraser, in conjunction with the changes in the figures of the balance sheet.

The first point is that all assets in enemy-occupied countries are said to be fully covered by the provisions for special depreciation. As a result of these and other appropriations, net liquid assets, excluding inter-company items, have risen from just over £6,000,000 in 1939 to just under £22½ million in 1943. Over the same period, there has been a fall of some £3,250,000 in net advances to subsidiaries. This is a statement of net profit retained in liquid form. There is no means of placing a money value on capital outlays, financed out of retained profit during the period. Sir William has, however, given some indications of the work undertaken during the war period. In his latest statement he makes it clear that only recently has the pre-war plant been worked to capacity, but he also says that it has been necessary to undertake considerable new construction in order to supply high-grade aviation spirit. There has also been an increase in the capacity of the Haifa refinery of the Iraq Petroleum Company. There is in addition any small benefit which may result from the drilling of wells in this country. A year ago, reference was made to certain additions to plant, which may be those already mentioned, and to expenditure on research. There are certain minor offsets against these increases, due to a different method of presenting the accounts, but it is quite clear that the company's strength has been greatly increased during the war. The price of the £1 stock units is some 5½, which is above the best of 1938, but well below the 1937 record, and gives a yield of only some £3 8s. 11d. per cent.

Canadian Pacific Interim Dividend

The need for caution in interpreting the immediate effects in the rise in wage costs to the Canadian Pacific Railway, mentioned here last week, is emphasised by the decision of the directors to pay an interim dividend on the ordinary capital in respect of the current year of 50 cents, or 2 per cent. The payment came up for consideration in August, but action was deferred because of the heavy liability indicated by the wage awards. The decision to pay an interim this year of the same amount as the total

distribution for 1943 looks at first sight rather anomalous. It may well be, however, that the conservative nature of the 1943 payment was dictated by fears of the result of the wages award. Certainly, Mr D. C. Coleman, the chairman, told stockholders that the peak of net revenue would prove to have been passed if the rise in costs continued. As was pointed out last week, it is very difficult to say what the future holds, owing largely to doubts as to the amount of recession from the wartime peak which may occur in Canadian industrial activity. There can be little doubt that expansion will have continued its secular upward trend, but how far this may have been affected by wartime developments is impossible to say with certainty. If, in the event, the holders of ordinary stock receive a substantial increase in dividend this year, it is, in the absence of any statement of policy by the management, not possible to assert that this means more than that the 1944 results have proved rather better than was expected. The price of the \$25 units of ordinary stock recovered on the dividend announcement to 14½.

Stock Exchange Nominations

In pursuance of their policy of encouraging members to join the Forces, the Stock Exchange, London, has, from the outbreak of war, relaxed a number of its regulations. One of these limited the period during which a nomination to membership might be transferred to twelve months from the death or resignation of the member. For the war period this was extended to twelve months after the conclusion of peace. It is now evident that this is far too vague, and the Committee has decided, subject to confirmation, to substitute for it "twelve months after a date (not earlier than March 25, 1945) to be fixed by the Committee." The intention in making this adjustment appears to have been, not only to give definition to, but to shorten, the period of extension. It cannot be doubted, however, that the duty of fixing a date confers on the Committee a very considerable power to control the rate at which the substantial stock of nominations, accumulated during the war, is used up, and also their value. The stock in cold storage is 669, and, if all were taken up, the membership would be raised to 4,240, compared with 4,107 at the end of August, 1939. It seems doubtful whether so large a membership will be necessary after the war as before, but that will depend upon a complex of altered conditions of which a possible fall in turnover is only one. Incidentally, an expansion of 133 in membership, by means alternative to nomination, is probably large for a five-year period, and it is at least possible that this rate of increase will not be maintained.

North-East Coast

Industrialists, trade unionists, business interests, local authorities and individuals of the North-East coast have, on the initiative of Lord Ridley, combined to plan the industrial future of their area, so as to prevent any return to the pre-1939 depressed conditions. At a meeting last Friday, October 6th, the North-East Development Association, which will cover Northumberland, Durham and North Yorkshire, was formally constituted. The objects of the Association, which will act as a coordinating body for the various planning groups now being formed, are, broadly, to represent the needs of the region with a united voice, and to attract new enterprise, in order to arrive at a better balance of employment in an area formerly dependent on heavy industry. First the rearmament programme and then the war have kept the North-East's shipbuilding, coal, general engineering and chemical industries occupied to full capacity, and, though already the effects of programme changes and the running down of war contracts are beginning to be felt, it may be presumed that the reconstruction of Europe and the Japanese war will maintain a steady demand for the output of heavy industry, even though contraction of war-swollen capacity is necessary. But, for various reasons, the area was comparatively late and unlucky in securing new war production, such as aircraft, and it is generally feared that at the end of the war it will be difficult to absorb the workers from depleted heavy industry or the considerable numbers who were transferred to other areas. It is all to the good that local enterprise should take the initiative in facing up to these problems, and it is very creditable that so much agreement on principle should have been reached in an area where there used to be so much disunity. But nothing can be done by one area alone to ensure

full employment. It is essential that the North-East's plans should be fitted into the national framework. The same point applies to the very interesting scheme for West Cumberland, put forward in a memorandum by Colonel W. C. Devereux, and to the ambitious projects of the Medway Towns' Full Employment Council. This still remains a problem for the general economic policy of the Government—and, at the moment, particularly for the Board of Trade, whose plans for industrial location, though sound in principle, are still unclarified in practice, and for Mr Lyttelton, whose statement on the reconversion of industry is shortly to be made.

Agricultural Statistics

For the first time since the war began it is possible to get a clearer view of the changes which have taken place in British agriculture. Statistics have been published in actual figures, instead of, as formerly, in terms of percentage changes. The figures put out this week by the Ministry of Agriculture, based on the returns made on June 4th each year, are given in a wealth of detail for each of the years from 1939 to 1944. Their length forbids their reproduction in full, but some of the more important figures are summarised in the accompanying tables.

UNITED KINGDOM ACREAGE OF CROPS AND GRASS
AT JUNE 4TH
('000 acres)

Crop	1939	1940	1941	1942	1943	1944 (Pre-liminary)	% Change 1944 on 1939

Horses	1,709	1,050	1,054	1,006	957	918	- 14.9

These tables do not reveal the whole picture of British wartime farming. The Ministry of Agriculture has promised shortly to make available statistics dealing with other aspects of farming, such as labour and the use of machinery.

More Treasury Bills

The amount of Treasury bills offered for tender this week has been raised to £120 million. The offerings had remained at the previous level of £110 million for 25 consecutive weeks. They may well return to that level after a few weeks at £120 million, for the latest increase must be regarded as a seasonal movement and not as part of the long-term upward trend in the Treasury bill issue maintained since the outbreak of the war. The primary objective of the rise to £120 million is to place in the hands of the banks a larger volume of bills maturing in the early weeks of 1945, when such maturities will provide a useful offset to the heavy seasonal concentration of tax payments. The need for some reinforcement of the banks' bill portfolios is again emphasised by the September clearing bank returns, which show bills discounted to be no higher than they were in September, 1943, despite the increase of £260 million that has meanwhile occurred in the amount of Treasury bills issued through the weekly tender.

Clearing Bank Statements

Recourse to the banks for deficit financing was on a heavy scale last month and in consequence the volume of bank credit again underwent substantial expansion. The deposits of the clearing banks, according to their September statements, were £4,251.1 million, or £90.2 million more than in August. The expansion is more than accounted for by the increase of £106.5 million in the banks' holding of Treasury Deposit Receipts. The weight of TDR borrowing last month again prevented the banks from increasing their bill portfolios or their money at call and short notice. These items fell by £2.1 million and £13.5 million respectively. The holding of bills discounted should increase over the next few weeks as a result of the Treasury's decision to increase the amount of Treasury bills offered through the weekly tenders to £120 million. The banks' loans and advances fell by a further £6.5 million last month to £735.2 million and have thus reverted to approximately the level held in September 1943.

Shorter Notes

Sir Raymond Streat, on behalf of the Cotton Board, has replied to Mr Dalton's statement on the industry's future, welcoming his invitation to collaborate in order to raise competitive efficiency, provide a stable level of employment, and secure a substantial volume of export trade. The Board also expresses appreciation of the Government's concession in the "controversial question of price management." It draws attention to a number of gaps and reservations in the Government's statement, in particular the omission of reference to deconcentration, reallocation of labour and redundancy of plant, and the lack of clarification about taxation policy. The Cotton Board Committee, it is stated, will be kept in frequent session and will deal at a later stage with outstanding points in Mr Dalton's statement.

Nucleus clothing firms in certain areas are to have restored to them the labour they lost in the early part of the year when cuts were made in their "approved labour forces." This step has probably been taken because of current fears that there might be an acute shortage of clothing, particularly of infants and children's clothing. It is true that stocks of clothing have fallen steadily since March, and at the end of August, according to the Wholesale Textile Association, there was a drop of 22 per cent on the year before. Stocks in the hands of retailers showed no appreciable change in children's clothing, but in adult wear they are over 20 per cent below last year.

ROYAL BANK OF CANADA

DIVIDEND No. 229
Notice is hereby given that a DIVIDEND of 1½ per cent., being at the rate of 6 per cent. per annum, upon the paid-up Capital Stock of the Bank, has been DECLARED for the three months ending 30th November, 1944, and will be PAYABLE at the Bank and its branches on and after 1st December, 1944, to shareholders of record 31st October, 1944.
By Order of the Board,
E. B. MCINERNEY, London Manager.
6 Lothbury, London, E.C. 2. 12th October, 1944.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with limited liability).—Dividend notice.—Ordinary capital stock.—At a meeting of the Board of Directors held to-day, a dividend of Two per cent. (fifty cents per share) on the Ordinary capital stock in respect of and out of earnings for the year 1944 was declared payable in Canadian funds on December 1, 1944, to shareholders of record at 3 p.m. on November 1, 1944. By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, October 10, 1944.

COMPANY MEETINGS

CITY OF SAN PAULO
IMPROVEMENTS AND
FREEHOLD LAND COMPANY,
LIMITED

INCREASED TRADING PROFIT

SIR ARTHUR DU CROS' SPEECH

At the thirty-second ordinary general meeting of City of San Paulo Improvements and Freehold Land Company, Limited, on the 9th instant, the chairman (Sir Arthur Du Cros, Bt.) stated that the issued capital now consisted of £344,262 7 per cent. preference stock with £215,164 in 2s. 6d. units of ordinary stock. All arrears of dividend on the preference stock had been settled by the distribution of £150,614 of 5½ per cent. redeemable income stock, since reduced to £142,161, and the £423,535 of 7½ per cent. debenture stock had been replaced by £378,000 of 5½ per cent. debenture stock.

The trading profit in San Paulo amounted to £122,815 compared with £89,016. After meeting interest, sinking fund and all other charges to August 31, 1944, including 12 months' dividend on the 7 per cent. preference stock, which in future would be paid half-yearly, and the 30 per cent. dividend recommended on the ordinary stock to February last, the net result was a balance of £68,052, out of which the preference and ordinary dividends would absorb £38,299, leaving £29,603 to be carried forward. The year's accounts had been burdened with £11,500, which would not occur again.

LAND SALES

During the past three financial years sales of land had trebled at increasing prices. For the six months of the current year sales had continued at a high level. As to possible speculation, sales to any one customer were limited in amount and contracts were not transferable, so that the company held an over-riding control. To prolong life and strengthen the company the stock of land would be fully maintained as suitable opportunities occurred. The demand had increased in sympathy with the growth of San Paulo, its population and industries, and also as a consequence of the war through which internal funds and profits in Brazil had greatly increased, a proportion of which were being invested in real estate.

By the improvement in sales instalment debtors had increased during the year by £333,700, bringing this asset to over one and a half million pounds, secured by land and buildings and carrying interest at 6½ per cent. These debts were similar in nature to the loans made by building societies at home, and there were practically no arrears.

The profits in suspense, representing profit to be collected in future years in respect of sales made in past years, had increased by £283,500 to £989,456, providing a valuable buffer against future trading fluctuations should they occur. Increased sales would continue to provide a cumulative source of income, while if sales decreased the adverse effect would be averaged over from 10 to 16 years.

HOUSING SHORTAGE

The company's business lay in the provision of housing facilities, of which there was a shortage to be overtaken in San Paulo as in other places. New houses were in strong demand. It was the desire and to the interest of the municipal authorities to co-operate with the industry, and they were doing so.

Owing to the higher cost of living the

cost of constructional work and administration expenses are increasing throughout Brazil.

No one could predict the future course of exchange in any country, but Brazilian finance had greatly benefited by the war. The Minister of Finance had stated recently that "the situation in regard to the cruzeiro, with its great gold backing, is

FOLLAND AIRCRAFT LIMITED

PRODUCTION MAINTAINED

MR. A. P. GOOD ON POST-WAR DEVELOPMENTS

The ninth annual general meeting of Folland Aircraft, Limited, was held, on the 12th instant, at Terminal House, Grosvenor Gardens, London, S.W.

Mr Alan P. Good (the chairman) presided.

The secretary (Mr E. N. Egan) having read the notice convening the meeting and the auditors' report,

The chairman said: Gentlemen, under present conditions it is still not possible for me to give a detailed account of the work done, but during the year under review, ended June 30, 1944, as indicated in the directors' report, the company's production has been maintained and the position is considered satisfactory by the board. It is still the company's duty, for the present, to make the maximum contribution possible to the war effort, and I think I should be in order in telling you that during the past two years the output has surpassed all previous figures by a considerable margin and that this increase is being maintained. The accounts do not fully reflect the increases in production which have been achieved because of the policy of Government Departments in relating the profit margin to capital employed rather than to the turnover achieved.

BALANCE-SHEET FIGURES

Referring to the items on the balance-sheet before you, you will note that in pursuance of the policy which your board has enunciated on several occasions previously, the book value of plant, machinery, etc., has been reduced by a further £4,000 and now stands at the very conservative figure of £17,600, which represents less than 6 per cent. of the share capital of the company. The remaining fixed assets—namely, freehold land and buildings—have been written down by a further £4,000 to a figure of £140,000, which figure your board is quite satisfied is considerably less than their present-day worth.

Dealing with the liquid assets you will note that there is an increase in stocks, debtors and work in progress of £266,000, represented in the main by an increase in work in progress resultant on the development of new contracts which the company has undertaken during the year. These increases are partially offset by increased liabilities to trade creditors and bankers of £243,000, but the net liquid assets have now increased to £206,000, or approximately 4s. 2d. per share with the fixed assets of freehold land and buildings amounting to another 2s. 10d. per share.

IMPROVED TRADING PROFITS

The trading profit for the year—arrived at after charging depreciation and providing for excess profits tax—shows an improvement over last year's achievement, the explanation for this lying again in a more satisfactory tax settlement for the past year than had been provided for in the balance-sheet. Naturally arising out of this, however, there is a corresponding increase necessary for income-tax provision to cover liability on the increased residue of profit for the year ended June 30, 1943. Furthermore, it has been necessary to increase the income-tax provision still further beyond the normal, to allow for the attitude of the Inland Revenue authorities

one of the most solid ever existing in Brazil." The fact could not be ignored that through the war the industrialisation of San Paulo and of Brazil had been greatly accelerated.

The report and accounts were unanimously adopted, dividends approved, and the retiring directors and auditors re-elected.

towards the substantial amounts set aside in the accounts for deferred repairs; as you are probably aware, the authorities will not permit these as a deduction for income-tax, but it is permissible to hold over an equivalent amount from the excess profits tax liability.

PLANNING FOR THE FUTURE

While, as I have advised you, the company is at present devoting the whole of its activities in furtherance of the war effort, and while the work in hand at present is of high priority and will probably be required after the termination of the European war, your directors have continually in their minds the necessity for planning for the post-war period. In this connection they have already decided that the company should continue, in the main, with the object for which it was formed, that is, for the design and construction of aircraft.

It is not irrelevant at this time to draw attention to the fact that your managing director has been connected with the design and construction of aircraft from the earliest days of the industry and has a long history of successful designs during the period between the two wars. Your directors, fully alive to the great future of aircraft, have taken steps necessary to strengthen the design staff, and all possible measures are being taken to ensure that your company takes a leading part in the future development and manufacture of aircraft both for military and civil use and in both the land and amphibious classes.

SCOPE FOR DEVELOPMENT

Your directors are watching, with the greatest of interest, the proposals for a large land and sea airbase in close proximity to the company's premises, and in any case you will appreciate that the position of the company's property on Southampton Water offers great scope for potential development in the air age which we feel will follow the cessation of hostilities.

There remains to inform you that your board of directors has been considerably strengthened by the return of Mr C. L. Hill from duties overseas and that on Mr Hill's return your directors decided to retain the valuable experience of his alternate director, Mr R. J. Norton, and have, therefore, co-opted Mr Norton to the board.

TRIBUTE TO STAFF AND WORKPEOPLE

I do not think I should allow the occasion to pass without paying a well-earned tribute to the staff and workpeople of the company who have withstood with resolution the hardships and dangers of five years of war in the front line of the Home Front. From the managing director downwards all have lived and worked through an extremely difficult period, and while it is not possible for you to perceive, from the results which have been laid before you from year to year, the full extent of their strenuous efforts, they have, in no small part contributed to bringing the war to its present satisfactory state.

The report and accounts were unanimously adopted.

ODEON THEATRES,
LIMITED

INCREASED PROFITS

The seventh annual general meeting of Odeon Theatres, Limited, was held, on the 12th instant, in London, Mr J. Arthur Rank (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the accounts: The trading profits of the group amounted to £2,815,930, compared with £2,163,687, an increase of £652,243 which you will, I am sure, agree is most satisfactory even though taxation again absorbs the bulk of the increase. Taking Odeon Theatres, Limited, alone, a trading profit has been earned of £1,228,052. The directors recommend the payment of a dividend on the ordinary shares of 20 per cent., less tax.

In excess of 180,000,000 patrons were admitted to our theatres during the year, an increase of 25,000,000 upon the previous year, but in spite of this large increase, owing to the incidence of heavy taxation, our net profits have only increased by the small sum of £9,346, and we believe we have suffered because the allowance for wear and tear which we receive for taxation purposes is totally inadequate to meet the additional depreciation suffered. We have nevertheless created reserves to cover the cost of making good this exceptional depreciation as soon as we are able.

£8,000,000 IN DIRECT TAXATION

Of gross box office receipts of some £16,000,000, £8,000,000 in direct taxation has to be paid—approximately 50 per cent.; consequently it is my considered view that we must look to an alleviation in the entertainment tax after the end of the present hostilities, particularly when it is borne in mind that pre-war the approximate percentage of our box office receipts which went in entertainment tax was 13 per cent., whereas to-day it is 39 per cent.

I referred last year to the policy of your directors whereby we hope, at the cessation of hostilities, to extend our activities to various countries throughout the world. I would hasten to assure you that we propose to do that, only after careful research to ensure that such investments as we make in those countries will show a reasonable return on the capital employed. I also referred last year to the importance of a strong film production industry to this country, and particularly to a company such as this which is primarily engaged in the exhibition of films. We already have taken one step to protect the future to ensure that the control of the two leading film studios passed into friendly hands. We have made an investment in a company which, through the British and Dominion Corporation, Limited, indirectly owns the Denham and Pinewood Studios, and have done so at a figure which should ensure us a satisfactory return on our investments.

IMPORTANCE OF FREE ENTERPRISE

I look forward to the future and particularly the post-war years; if industry in this country (including the entertainment industry) is allowed to operate under conditions where enterprise receives its just reward, I am convinced that this country can maintain its great place in the commercial activities of the world, but it can only do so if the industrialists of the country, great and small, can operate freely and if their enterprise receives commensurate reward. In your own company, it is our aim to maintain the highest possible standard of service to the public both as to their material comforts in the theatres and to the entertainment we place before them, and we are sure that with such a policy we can face the future with confidence.

The report was adopted.

FURNESS, WITHY AND COMPANY,
LIMITED

POST-WAR PROBLEMS

MR. ERNEST H. MURRANT'S REVIEW

The fifty-third annual general meeting of Furness, Withy and Company, Limited, was held, on the 10th instant, in London, Mr Ernest H. Murrant, M.B.E., presiding.

The chairman, in moving the adoption of the report and accounts, after paying a tribute to the late Lord Essendon, said: After deducting £409,049 for taxation the net profit for the year is £540,668. From this amount we have paid the usual half-yearly dividends on the preference share capital; we have transferred £300,000 to depreciation; we have transferred a small amount of £9,551 to fleet replacement account, in order to round off that item in the balance-sheet; and after providing for the dividend which it is proposed to distribute on the ordinary stock there is an amount of £165,523 to be carried forward.

POST-WAR PROBLEMS

Having regard to the exhilarating successes which the Allied Armed Forces are achieving on all fronts, it is, on the one hand, reasonable to assume that the European war is approaching its climax, and, on the other hand, it brings forward the consideration of post-war problems even though our ships may not be released from requisition, and other forms of control may not be removed, until some time after the cessation of all hostilities. If I may express a personal opinion, it is that there are many grounds for gratification in the sound policy towards shipping problems which has been followed by the Minister of War Transport and his advisers. In detail, however, shipowners have much to be dissatisfied with, but, in general, many of the evils which arose out of the first world war have been avoided. In the result our ships have been permitted to earn no profit, but merely a rate of interest and depreciation, and, in common with all forms of industry, we have been subjected to unprecedented taxation.

On the other side of the picture, British shipping can properly be regarded as one of the most important instruments without which the war might well have led to a very different result, and the Government have every reason to be satisfied that they were able to call upon a large and, on the whole, well-equipped mercantile marine. Both the Government and shipowners will shortly find it necessary to deal with post-war problems, and the fundamentals (leaving apart some very important and special considerations, such as redistribution of tonnage and international collaboration) seem to me to be comparatively easy to state, although perhaps not so easy to solve.

THE GOVERNMENT AND SHIPPING

From the Government's point of view they have had the benefit of the services of our ships without profit to the owners; they will presumably be concerned to see that the industry does not languish, but must be restored to full status and vitality, bearing in mind the requirements of the Empire, the value of shipping services from the point of view of invisible exports, and also its potential value for all other purposes. Indeed, the Government is committed to recognise the necessity of maintaining the British Mercantile Marine in adequate strength and in a position of full competitive efficiency.

Our side of the problem will be to restore our fleets to the extent necessary to cover our trade requirements and in order to maintain the services which are our goodwill, but which we shall have to achieve in face of the knowledge that replacement costs will far exceed the values which have been recovered for ships lost; we shall be faced with the competition which will arise from the fact that there may possibly be more tonnage afloat at the end of the war

than at its commencement, although very differently distributed and very largely of emergency utility types, and with it all we shall be required by our stockholders to earn a reasonable return upon our invested capital, apart from depreciation, administration expenses, and so on. It is obvious, therefore, that a very broad and generous interpretation of the Government's policy towards shipping will be essential bearing in mind also that a considerable volume of merchant tonnage will in fact remain in Government ownership on the conclusion of hostilities.

LOST TONNAGE REPLACEMENT

There is no reason to doubt that the Government will realise the facts of the situation; indeed, the debate in the House of Lords last week yielded clear evidence that the problems as well as the many difficulties are well appreciated. It will be for the Government and shipowners to find a common basis of interpretation of the problems and solution of the difficulties. I suggest that broadly the common basis will be recognition of the fact that additional capital will be required in order to replace lost tonnage and to bridge the difference between receipts for ships lost and the higher level of post-war construction costs, and that, at the least, interest and depreciation must be earned on that additional capital. With good intentions to back the Government's already declared policy, it should not be impossible to crack that nut, even though the volume of post-war international trade remains an uncertain factor and that the flow of that trade may be diverted in some cases from its pre-war channels.

At the date of the current balance-sheets of our own and subsidiary shipping companies we have standing to the credit of those companies as a whole a total sum of £1,146,280 in the Government tonnage replacement account. I have found, while abroad, a great deal of misconception about these amounts, it being thought in some quarters that they represent a kind of gift from the Government to provide free capital for replacing lost ships. The truth, of course, is that the amounts are the property of shipping companies, but are only collectable if and when new ships are acquired, within a specified period of seven years. For that reason the amounts are not included with the assets shown in the balance-sheets, and it is obvious that, large as the figures may appear to be, they will not go very far towards meeting the extra costs, due to conditions directly attributable to the war, of new cargo liners or specialised ships.

BOARD'S POLICY

In accordance with our usual policy, however, we shall not fail, when circumstances permit, to build or acquire new ships for our essential services, and we welcome the indication given by the Minister of War Transport that licences for special types of ships may shortly be more readily obtainable. For this purpose the reserves which we have built up in the fleet replacement account will be needed to the full, but reinforcements will also be required in what will amount to the struggle for liberation and rehabilitation—a phrase which we are accustomed to use in another connection, but which is well adapted to the shipping industry. It is apparent, however, that even when it becomes possible to place contracts for specialised ships, a long period must elapse before such vessels will be ready for service, a period within which we shall need to protect our services with such tonnage as we may have available.

The report and accounts were unanimously adopted.

FINANCE AND BANKING

THE MONEY MARKET.—Credit has been in comparatively good supply in the money market this week. The banks have been required to pay £100,000,000 in TDRs against which effective maturities amounted to about £70,000,000. Of the new money paid in this way £4,500,000 came from "outside" sources, generally thought to be Empire central banks. The banks have been keener buyers of bills than in recent weeks, though they have up to now limited their purchases to November maturities. The Bank of England return this week shows very little movement when compared with the previous week's return. Bankers' deposits at £177,927,000 have risen by £110,000 only and reflect the prevailing ease in credit conditions. The note circulation is £1,745,000 higher at £1,160,446,000, a new record.

MONEY RATES, LONDON.—The following rates remained unchanged between October 5th and October 12th:—
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, ½%. Discount deposits at call, ½%; at notice, ¾%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between October 5th and October 12th (Figures in brackets as par of exchange).
United States. \$ (4.86½) 4-02½-03½; mail transfers 4-02½-03½. Canada. \$ (4.86½) 4-43-47; mail transfers 4-43-47½. Switzerland. Francs (25.22) 17-30-40. French Empire. Francs 197½-200½. (Continued on page 527)

GOVERNMENT RETURNS

For the week ended Oct. 7, 1944, total ordinary revenue was £52,070,000, against ordinary expenditure of £119,721,000 and issues to sinking funds of £355,243. Thus, including sinking fund allocations £7,589,408, the deficit accrued since April 1st is £1,684,400,000 against £1,691,845,000 for the corresponding period a year ago.

The Shape of Agriculture

B RITISH agriculture was set, at the beginning of the war, a single objective—to grow as much food as possible. Maximum production, irrespective of cost, became an urgent necessity if starvation was to be avoided and shipping-space freed for materials and munitions. This involved a concentration on those products which yield the highest food value per acre. How well this task has been achieved is illustrated by the comprehensive figures of output, issued for the first time by the Ministry of Agriculture, which were summarised on page 521 of *The Economist* last week. These show that the total “cultivated area,” which excludes rough grazings, has actually—due to military and industrial demands for land—declined during the war by over half a million acres. The enormous expansion of output has therefore been wholly obtained by more intense farming and by ploughing up grassland on a scale unprecedented in this country and possibly elsewhere. In the United Kingdom arable acreage has increased since 1939 by a half, and, if temporary grasses are excluded, the area that has been tilled this year for crops is higher by two-thirds. The crops

themselves have been selected so as to give the greatest food value consistent with what the public can be persuaded to eat. Thus the potato crop, which yields the greatest number of calories to the acre, shows the biggest increase of all major crops and has doubled its acreage. Wheat also covered nearly twice its pre-war acreage in the critical year of 1943, but has given way slightly this year to allow the further expansion of oats and barley. Despite the shortage of imported fertilisers, the yield per acre of most crops has slightly increased. On the other side of the balance sheet there have been considerable falls in the number of livestock. More than half of the nation's pigs, and a quarter each of its sheep and poultry, have vanished. Yet, despite a fall of 38 per cent in the area under permanent grass, there are actually more cattle than there were before the war. More important still, the number of cows and heifers in milk is slightly higher.

These results are a tribute to the success and ingenuity of British farming in expanding food production. Taken together, they amount to a change in shape and a growth in size much greater even than the achievements of the last

war. It is true that they have been accompanied by—and possibly could not have been secured without—an inflation of farming incomes entirely without parallel in any other section of the community. But nevertheless the technical achievement is large. The area under the plough in England and Wales has, in fact, returned to the high level it had reached in 1875. All-out production will need to continue for some time yet to help meet the urgent demand for food from liberated Europe. But sooner or later—and it is fast becoming sooner—British agriculture will have to readjust itself to normal world conditions. The fact that, in the case of agriculture, a siege economy and a peacetime economy pull in completely opposite directions is too well known to require much elaboration. War and blockade temporarily remove the advantages of the international division of labour, which enable a country to buy in the cheapest market and sell in the dearest. These advantages have operated over the last seventy years to make it increasingly possible for Britain to buy its food necessities—such as wheat and meat—cheaply from abroad, thus setting free purchasing power to buy more of the “protective” foods—dairy products and vegetables—whose increased consumption has given, in turn, a new and naturally-protected market for British agriculture. The history of British agriculture since 1875 is thus largely one of the transition from a large-scale and reasonably prosperous arable economy to an increased specialisation in dairying and market gardening, coupled with an all-round reduction in total acreage and in employment on the land.

That this process has been painful to the industry is unquestionable. But that it has been beneficial to the British community as a whole is even less open to doubt. Cheap food, indeed, is the foundation of Britain's wealth. Together with cheap raw materials, it has enabled this small and poorly endowed island to enjoy the second highest standard of living in the world. There is no doubt that a British worker can, in general, produce far more wealth for himself and the community in industry than in agriculture. By the process of the international exchange of goods, he can get just as much food by a fraction of a day's work as would take him all day to produce on British soil. Nor does this system make the country any weaker in wartime. A fraction of the manpower that would be needed on the land if the country were to feed itself can build ships to keep the sea lanes open. Compared with Germany, Britain's chief wartime advantage is that manpower does not have to be allocated to grow the whole of the food supply.

But this classical system, it will be said, has long ago broken down and since British agriculture has, under the uneconomic pressures of war, returned to its size and shape of 1875, many would wish to keep it there and to reverse the trends brought about by international trade. But though many queer things have happened to international trade in recent decades, there has never, in peacetime, been the slightest difficulty in buying cheap foreign food. On the contrary, the farmers' trouble has been that foreign food has got progressively cheaper. It is true that there may be some difficulty in paying for imports after the war. But to abandon the attempt to get it just because it may be difficult to pay for would be economic defeatism of the worst kind—it would bring about just what is feared, since dear food means high wages and high wages mean low exports. It may be proved necessary, if the export problem is handled very badly, to restrict imports of food and thus to abandon the key to prosperity; but if so, it should be the last position to be surrendered and after a long struggle—not the first.

The question, therefore, is not whether the wartime developments should be reversed, but how far the reversal should go, and what form it should take. It is not realistic to suggest that British agriculture should once again be left entirely unprotected against the full blast of foreign competition. That it should receive some degree of assistance is clearly the nation's wish. The grant of any assistance means that the non-agricultural community will be

just that much poorer; no fine words can dodge this obvious fact. Whether the assistance takes the form of tariffs, quotas, subsidies, guaranteed prices above the world level, “equalisation payments,” grants, cheap capital or anything else, it involves a transfer of real income to the farmers from the rest of the community. The rest of the community is willing that this should be so. But the transfer can clearly not be expected to be either unconditional or limited. It will be limited in amount: this means that British agriculture has a clear choice between being large and being prosperous, and will obviously be well-advised to choose the latter. The general aim should be to produce an industry, employing no more men than it did before the war (or even fewer), but providing each of them with a good living.

Moreover, the state clearly has the right as well as the duty to insist that its aid is used for the benefit of the consumer as well as the producer. This means, for one thing, that assistance must not be given in any way which restricts supplies or enhances prices; both quotas and tariffs should be excluded. And for another thing it means that the state must allocate its assistance so as to encourage those products which can be grown most efficiently and at cheapest cost.

The agricultural industry would also be wise to assume that the state's assistance is limited in time. An overwhelmingly urban electorate, when it discovers that its resources are not infinite, may tire very quickly of spending scores of millions on home-grown food that it could get more cheaply from abroad. The only sound permanent basis for British agriculture is to secure so rapid and so great an increase in its technical efficiency—in the output per man employed—that it can before long stand on its own feet. Here again the signpost points to the newer branches and away from arable farming. It is highly doubtful whether British agriculture could ever compete in, say, grain crops with the great open spaces; the climate and the scale of the country are all against it. But in dairy farming and in stock-raising, in fruits and in vegetables, the possibilities are much greater. It is on them that the effort should be concentrated.

*

These are the obvious major considerations. The size and the prosperity of British agriculture are linked together in an inverse relationship by the need for state assistance, which is inevitably limited. And within the determined size, every consideration—the most economical use of the assistance available, the claims of nutrition policy and the need for greater efficiency—points in the same direction. This is what renders so fantastic the proposals still being made that some or all of the vast wartime increase in the area under the plough should be preserved. The crops that are most essential during wartime are the very ones whose cost in subsidies to the Exchequer was highest before the war. Wheat, for instance, cost up to £5 million a year and sugar-beet from £5 to £6 million; and the experience of vast wartime subsidies, such as that necessitated by the trebling of the price of wheat, suggests that to grow these crops on a larger scale increases rather than diminishes their average cost. Clearly, agriculture must retrench to something approaching its pre-war pattern as well as its pre-war size. There is a strong case for saying that even that pattern was unduly biased in favour of the arable type of farming which has since expanded. Responsible critics, such as Lord Astor and Mr Seeborn Rowntree in “British Agriculture,” urged before the war that state assistance should be redistributed so as to give greater encouragement to the production of protective foods. Their case is now strengthened. The Hot Springs conference called on all nations to pursue a policy along these lines in order to improve their standard of nutrition. Measures taken towards securing social security and full employment should enable the industrial population to afford a better diet in such things as milk, eggs, vegetables and fruit, in which they are still gravely deficient, and this naturally mounting purchasing power provides by far the best promise of prosperity for British agriculture. This policy would

never, of course, be pushed to the lengths of complete specialisation. Soil fertility must be maintained—although this requires less concession to uneconomic practice than is commonly claimed.

It is natural—and inevitable—that farmers should struggle to preserve their wartime prosperity. This is bound up with a high level of arable production, and any prospect of “going back to grass” on a large scale is regarded as a disaster. The old conviction that “break a pasture, make a man,” but “make a pasture, break a man” is still very strong. Having with much effort retraced the long road of its history from 1875 to 1939, agriculture is now asked to return abruptly to its 1939 position—or further. It is felt to be harshly ironical that the better agriculture succeeds in meeting the nation's urgent wartime needs, the greater must be its loss when peace returns. But agriculture is not alone in this; other industries have also been turned topsy turvy by the war and have created new reconversion problems for them-

selves with every fresh triumph of their wartime efforts.

Agriculture is entitled to sympathetic treatment by the nation and to every assistance in making such transition as is necessary. But this does not alter the necessity for a drastic reconversion of the industry's size and shape. In the long run, too, it would not pay farmers to maintain artificial props for an uneconomic system. Costly burdens which the nation might be prepared to shoulder now in the full tide of its gratitude for agriculture's wartime achievements would only too probably be cast off in five or ten years' time by a more hard-headed public. Farmers would then be left in mid-air, unable to compete with the cheap imports of meat and grain which the nation would rightly insist on obtaining. To put off the evil day of change is not only unwise, it may be disastrous. Agriculture has now a golden opportunity to capitalise the nation's good will towards it by securing a smooth reconversion to a more limited and less costly, but by no means unprofitable, economy.

Russia and the Middle East

IN the course of this war, Russian foreign policy has been dominated by a single consideration—the search for security. Behind the moves of Soviet diplomacy in Eastern Europe lies the desire to secure strategic frontiers, bases and zones of influence behind which Soviet territory may be secure. To a great extent this pursuit of security coincides with another aim, that of recovering the patrimony of the old Czarist Empire. Indeed, the great exiled Russian historian and liberal, Miliukov, prophesied at the beginning of the struggle that Russia's aim would be “to recover the heritage of the old Russian Empire.” But the coincidence is not complete. The Baltic States, Bessarabia and Eastern Poland did form part of Czarist Russia; the Bukovina and Eastern Galicia did not; while the Soviets lay no claim to Central Poland and Finland, formerly under Russian rule. The extent to which the two policies—the pursuit of security and the recovery of the Empire—coincide, springs from the fact that in the Czar's policy, strategic frontiers and zones of influence were also dominant motives.

If the old historical patterns of Russian diplomacy have re-emerged in Europe, one may well ask whether they will not re-appear in other areas in which Russia was traditionally interested. At present, the German menace and the advance of the Red Army concentrate Russian interest on Europe. But historically Europe was not the only object of Russian interest although it did enjoy privacy. For years the world of the nineteenth century held its breath over “the Eastern question”—a question which turned upon Russia's influence in the Black Sea, the Danube Basin and the Straits. Persia and Afghanistan were storm centres of fear and interest. If history is to repeat itself, may it not do so in the Middle East?

There are two obvious reasons why Russia's historical

interest in the Middle East should revive. The first is that the facts of geography do not change. The search for security behind stable strategic frontiers can be as urgent today as it was a hundred years ago. Baku and Batum still lie exposed on the very fringe of Soviet territory. The Caspian Sea still stretches into the heart of Soviet Asia. Indeed, the long-range bomber has made the problem rather more acute. There was a tremor of uneasiness in Russia when in 1939 during the Russo-Finnish war General Weygand's army, half a million strong, was massed in Syria. Impressions such as these can leave an abiding mark. The last decade has, moreover, heightened Russia's concern in the Middle East. For ten years now the centre of Russian industrial gravity has been moving eastwards. The war has given tremendous impetus to the movement. In Soviet Central Asia a great new industrial area has been opened up for whose safety Russia must be at least as much concerned as it has been in the past for the Ukraine.

These are the reasons for Russian interest. Nor are the means of influence lacking. The ideological principles which dictated Russia's dramatic withdrawal from the Middle East in the twenties no longer determine policy. This has now been demonstrated by the Russian demand for oil-concessions in northern Persia. The demand has so far been refused by the Persian Government, at least for the duration of the war. But the Russian reaction to the refusal—it has taken the form of an appeal to Persian public opinion against the Persian Government—leaves no doubt about the determination with which the Russian Government will follow up its new move in Persia. Such a step, which would make Russia a foreign oil concessionary alongside other capitalist, imperialist Powers, would have been unthinkable in the revolutionary phase.

HEAD OFFICE TEMPORARILY AT KIDBROOKE PARK, FOREST ROW, SUSSEX.

It is a striking illustration of the extent to which post-revolutionary policies are now spreading from Russian internal politics to the foreign field. The change is not only ideological. It is a departure from the earlier policy of autarky. Russia is ready to depart from self-sufficiency at least sufficiently to claim a lien on the world's oil reserves. The emergence from autarky may not be very immediate nor very rapid, but the direction is set and there can be little doubt that in the next twenty years Russian influence in the Middle East will have an economic basis. The industrial areas of Transcaucasia, Kazakstan and the other border republics will be the nearest, if not the most efficient, workshops of the Middle East.

Revolutionary inhibitions have been cast away in other spheres. The revival of the Orthodox Church had made it possible for Russia's diplomatic representatives in the Levant to take on once more the rôle of protectors to the various Orthodox monasteries. Similarly in Persia, the entry of Soviet troops in the North restored "religious and cultural freedom" to the Armenian minority. There has also been a revival in Russia of the Moslem religious community. The Moslem Soviet republics can speak to their brother Moslems in a common idiom. At the same time, in the political sphere, Russia is still profiting from its revolutionary tradition. Unlike the British and the French, the Soviet Government has no political liabilities in the Middle East. Unlike the Americans, it has no record of oil imperialism—so far. In a word, the political record is "clean." Although in recent years, Russian propaganda has soft-pedalled the Arab nationalist *motif*, the Arabs themselves still remember with gratitude the support they received from local Communist groups in the twenties and thirties. It is significant that in their newly-won independence, both the Syrian and the Lebanese Governments requested the Russians to enter into diplomatic relations with them, a request to which the Soviet Government acceded at once. The Lebanese request specifically referred to Russia's generous treatment of all nationalities and to the Soviet's rôle as the revolutionary champion of the oppressed nations.

All these means of influence—economic, religious, political—will undoubtedly be exploited by Russia to ensure that its neighbours to the South are friendly and are not used by a hostile third Power as a base for aggression. If, however, this first-line of defence were to fail, it is obvious that there are other weapons in Russia's armoury. If a real threat arose, then the Russians would undoubtedly seek to reinsure their territory by intervening actively in Middle Eastern politics. The most convenient instruments for such an intervention are the frontier Soviet Asiatic Republics—Armenia, Azerbaijan, Tadzhikistan, Kirghizia and Kazakstan. Like the Ukraine and White Russia, each has now its separate Commissariat of

Foreign Affairs, and the Commissars could, if necessary, raise a number of awkward frontier issues—an unsettled legacy from Czarist days. Since the October Revolution, there have been virtually no eruptions, but the conflict this summer between Sinkiang and the Kirghiz and Kazak republics is a reminder that the frontiers are not finally fixed. In the west, the Tadjiiks are closely related to the people of Afghanistan. Might they not press for "re-union"? Persian Azerbaijan may one day be the seat of an irredentist movement, demanding union with Soviet Azerbaijan. Finally Soviet Armenia might demand the revision of the Treaty of Kars, signed in 1921 by Turkey and Russia, under which the Armenian towns of Erzerum and Trebizond remained with Turkey. There are now few Armenian inhabitants in Turkey's eastern vilayets, but a Soviet move in this area might well take the shape of protective action against pan-Turanianism, a movement of Turkish origin, which aims at unity among the Moslem states of Western Asia, and which might some day try to detach the Soviet Moslem provinces from Russia. It is, after all, only this summer that the Turkish Government had to take strong steps to suppress a German-backed pan-Turanian agitation in Turkey. All irredentist movements along Russia's southern frontiers would be greatly helped by the fact that the way of life of the Soviet Asian peoples is on an incomparably higher level—materially and culturally—than that of their neighbours to the south.

In the post-war world, there is every likelihood that the Russians intend to do no more in the Middle East than exercise the peaceful influence that their power and proximity make inevitable. Europe is likely to remain their chief strategic interest, and if peace and security are assured in Europe, this will probably be the decisive factor in the Middle East as well. There was always a sense in which, in the days of the Czar, the Russians' policy in the Middle East was derivative. They exercised pressure on the dominant Power in the Middle East, Britain, in order to influence British policy in the vital European arena. As the Russian statesman, Skobelev, bluntly put it: "The stronger Russia is in Central Asia, the weaker is England in India and the more will she be conciliatory in Europe." To-day, the same policy is likely to work in a reverse order. Britain and, to some extent, America are the dominant Powers in the Middle East. The better their relations with Russia in Europe, the less likely is Russia to fear for its security in the Middle East. In this question, as in so many others, the secret of peaceful relations lies in Washington, London and Moscow. If they are agreed, particularly in the vital sphere of Europe, there is no reason why stability and progress should not be the Middle Eastern background for a generation.

Ministers of the Crown

PRESSURE is being put upon the Government, from both the Conservative and the Labour sides, for the appointment of a single Minister to have oversight over all matters relating to housing. The demand for the appointment of a new Minister is too often an excuse for laziness in thought; those who cannot think out the solution for a problem demand that someone should be appointed to do the thinking for them. Moreover, the appointment of a new Minister often retards, instead of advancing, the solution of a problem. If he is a Minister without a Ministry, a supervisor or co-ordinator, he may be almost helpless, a convenient receptacle for the responsibility of the Departments without effective power (what-ever may be written on paper) to direct their policies. And if there is a new Ministry, as well as a new Minister, it suffers from the enormous handicap of having to find a new home and recruit a brand-new staff at a time when competent civil servants are at a very high premium. Such a Ministry will be lucky if it does not have all the incompetents of Whitehall wished upon it. It will be still luckier if it can hold its own in the fierce inter-departmental struggle for priorities—priorities for personnel, for money, for the Cabinet's attention or for Parliamentary time. In a very true sense, the time when a question is urgent is precisely the time when a new Ministry should not be created to deal with it.

"There ought to be a separate Ministry," is, in general, a clamour that is as ill-advised as it is fashionable. It may be, nevertheless, that a case can be made out for some administrative reorganisation in the sphere of housing. It is certainly anomalous that land should be the concern of one Ministry, housing of a second and building of a third. But if anything is to be done about it, the obvious remedy would be, not the creation of a fourth Ministry, but the concentration of all these matters in one. Logically, the solution would be to transfer the housing functions of the Ministry of Health (and of the Scottish Department of Health) to the Ministry of Works, and possibly to re-merge in that parent the Ministry of Town and Country Planning.

This would have the advantage of reducing the number of departments by one. For their number is growing alarmingly large. As was pointed out in a Note last week, there are now 41 posts of Cabinet rank (one being vacant). This does not include the Law Officers, on the one hand, nor, on the other hand, does it include Lord Halifax, who also enjoys the personal status of a member of the War Cabinet when he is in this country. In 1937, before the approach of war began creating offices, there were 21 members of the Cabinet.

The present total is, of course, partly inflated by purely temporary offices, which can be expected to disappear. There are, for example, four Ministers Resident, in the Middle East, in the Mediterranean, in West Africa and (for Supply) in Washington. These will go—though there is a very strong case for keeping the Ambassador in Washington in the Cabinet. Then there are the war-time Ministries—Production, Reconstruction, Supply, Aircraft Production, Food, Information, Economic Warfare. Some of these will certainly go, though the Ministry of Food should be retained, and a Minister of Reconstruction may well remain for many years. In addition, there is a strong case (though there would also be strong opposition) for a permanent Ministry of Supply, to organise the ordering of supplies of all kinds for the Government. Out of the seven wartime Ministries, it may be that there will be a net loss of only four.

What may be called the "natural" shrinkage of the swollen wartime Cabinet might therefore amount to no more than a very few members. Moreover, there may well be pressure for further creations. It is not yet apparently decided whether all forms of transport are to remain under one Ministry; if not, there will be pressure for a Ministry

of Merchant Marine. This is not an argument that would generally commend itself; but there is much more to be said for a division of the powers of the Board of Trade. That department is at present one of the weakest in the whole structure of government, and the prospect of the functions in respect of industry and materials now exercised by the Ministries of Supply and Aircraft Production being handed back to its nerveless hands is a most unattractive one. The Board of Trade might well confine itself to the external trade of the country, as in some measure a counterpart to the Foreign Economic Administration in Washington, while a new Ministry of Industry was created to evolve and to administer the Government's industrial policy. Another proposal for splitting up an existing Ministry which would have some support would be to separate the oversight of the National Health Service from the local government functions of the present, misleadingly titled, Ministry of Health. The combination in one Ministry of these two functions is largely accidental and may well be becoming positively harmful. Lastly, there is a demand, which has been voiced in the House of Commons this week, for a Secretary, or Secretary of State, for Wales, on the lines of the Secretaryship of State for Scotland.

Not all, or even perhaps any, of these proposals will be adopted, but it would clearly be rash to assume that the post-war Cabinet, even after the immediate inflation of wartime has disappeared, will be much smaller than 35 in number. And indeed the pressure of circumstances makes a large number of Ministries inevitable. It is an essential part of the British system of government that a Parliamentary Minister must take responsibility for all departmental acts. That means that all important—and many unimportant—matters must at least be mentioned to him and receive his signature. In a large Ministry, either the Minister becomes an overworked automaton or else his desk becomes a bottleneck. The system cannot work unless the Minister can understand and follow all that is done in his name.

But at the same time a Cabinet of 35 Members is clearly unworkable. It is not merely the number of individuals who have to find seats round the table at 10 Downing Street—indeed that is the smaller part of the problem. The real difficulty is a more mechanical one. Every department is under the obligation to consult, and has the right to be consulted by, every other department on whom its interests even remotely impinge. The time and effort that have to go into this process of consultation necessarily vary pretty nearly as the square of the number of departments. As it is, a civil servant often spends more time in telling others what he is doing, and in finding out what others are doing, than he spends in getting on with his job.

Here, then, is a dilemma. A large number of departments is inevitable and in some ways an advantage. But a Cabinet of 35 is unworkable. It cannot be said that the expedients devised to overcome this dilemma during the war provide much guidance for the future. The largest spheres of policy have been dominated by the Prime Minister and, in all matters, there has been a very much greater common desire to get on with the job than can be relied upon when the objectives are less

clear and the perils less menacing. There has been a structure of standing Cabinet Committees—the Defence Committee, the Lord President's Committee, the Reconstruction Committee. But these Committees have been attended by almost the whole Cabinet—and even so any contentious matter has gone up to the Cabinet itself. Nor is the small War Cabinet a reality. Contrary to the popular belief, there has probably not been a single occasion when these eight Ministers, and these eight alone, have sat down to reach decisions; the other Ministers concerned are almost invariably there. Membership of the War Cabinet is a largely honorific rank.

*

The political scientist's solution is what has come to be known as the Haldane Plan—that is, a Cabinet exclusively composed of non-departmental Ministers, each responsible for a group of departments. Something of this sort is clearly necessary and inevitable. But nobody should delude himself with the belief that it would be an easy system to work. One variant of the plan, which is often put forward, would create super-Ministries as well as super-Ministers. But this is clearly impossible to work. If the super-Ministry has powers over its subordinate Ministries—if the super-Minister is responsible to Parliament for what is done in his sphere—then it will become a gigantic bottleneck. But if the subordinate Ministers retain their responsibility, the super-Ministry is powerless, since it has no executive control.

NOTES OF THE WEEK

Progress Report from Moscow

The talks in Moscow between the British and Soviet Governments are lengthening to the duration of three ordinary Conferences. This is not surprising, for the times, the urgency and the size of the agenda are all extraordinary. Many of the most pressing political problems are now at their eleventh hour. Either they will be settled this autumn or they may never be settled at all. The three most urgent are the Balkans, Poland and Germany. The evidence suggests that on the first issue good progress has been made. The awkward issues between Greece and Bulgaria have been shelved by the Allied armistice being made conditional upon a Bulgarian withdrawal from Greek territory. Thus the Moscow Conference has reinforced a lot of solid, unsensational co-operation already accomplished. For example, the British representative on the Allied Control Commission in Roumania has started work in Bucharest. The relief of Greece, Yugoslavia and Albania is to be UNRRA's responsibility under Sir George Matthews as Balkan Regional Commissioner. There is little suggestion here of exclusive spheres or of exceptionally difficult inter-Allied adjustments. The last issue, Germany, has apparently not yet been discussed. This may well be due to the frontier question. The whole issue of territorial change at the expense of Germany was raised in the first instance almost as a by-product of the Polish dispute. By far the largest modifications are suggested in Eastern Germany to the "benefit" of Poland as compensation for the territory beyond the Curzon Line. The Polish question is thus antecedent to any settlement of terms for Germany. It is not surprising that Poland has so far held the centre of the stage.

* * *

Polish Tangle

So far, little headway seems to have been made in the difficult negotiations concerning Poland. The conversations between the British delegation and M. Mikolajczyk have been almost continuous, interspersed with Anglo-Russian discussions. On one occasion, a tripartite conference took place in Marshal Stalin's presence. But no decisive point has been reached. Of the two obstacles to understanding—the existence of two Governments and the conflicting territorial claims—territory is apparently proving far more troublesome. The Russians seem to be ready to accept M. Mikolajczyk's proposal that a new Polish Government be formed, based on the three parties in his coalition, together with the Communists on an equal basis. In these conditions, the National Committee would quietly

The way out of this *impasse* is probably to regard the non-departmental members of the Cabinet not at all as super-Ministers issuing instructions to subordinates but as so many Prime-Ministers-in-commission. Each of them should preside over a Cabinet Committee of Ministers, using only such devices to secure agreement as a Prime Minister uses in Cabinet. It would be a necessary corollary that a new version of the doctrine of collective responsibility would have to be built up, and that decisions of such a Committee, once reached, should be binding upon all the Ministers concerned and be supported by them. Appeal to the full Cabinet might, for example, be allowed only with the consent of the presiding Minister. But two further conditions would be necessary for such a system to work at all well. One would be that each Cabinet Minister was assisted by a staff of expert advisers—that is, the existence of several Prime Ministers would require several Cabinet offices. This would be supremely necessary in the case of economic policy, which requires, in a high degree, both central planning and widely diffused extension. And the other condition would be that enough statesmen of the requisite calibre should be available. This is perhaps the hardest requirement of all. The Cabinet Minister of these days, unless he is a man of extraordinary personality, tends to become an overworked departmental figurehead, with hardly a thought or a moment that he can call his own. The broad view and the large vision will have to be restored to the politicians before they can be restored to statecraft.

disappear. It has not been able to rally much Polish support. Andrej Witos, the Committee's vice-chairman and Commissioner for Agriculture, has been dismissed on the grounds that he has failed to carry through the land reform. If a regime fails to give land to a land-hungry peasantry there must be some very strong reason for the failure. The Polish peasant is, apparently, a legalist. He does not want land under a false title. If he has not cooperated in the land reform, it is probably because he distrusts the authority of the distributing government. Realism as well as Allied solidarity might thus dictate a flexible Russian attitude on the question of the rival governments. But it appears that the territorial compromise suggested by M. Mikolajczyk is not so acceptable. He is ready to fix a temporary line of demarcation roughly following the Curzon Line, but asks that the final territorial settlement should be postponed until after the war—both in Western and Eastern Poland. The Russians agreed to this in 1941. Today they have reversed their attitude and demand a final settlement now. M. Mikolajczyk has no power to agree to such a solution. There at the moment the question rests. It is to be hoped that British and American diplomacy can help to break this potential deadlock.

Compensation for Land

The Government is still in trouble over the Town and Country Planning Bill. The Prime Minister's suggestion of a separate Compensation Bill was manifestly unwelcome to the House of Commons when it was made a fortnight ago, and the Cabinet accordingly made an effort to produce a compromise which could be embodied in the present Bill. The new clauses remove some of the extraordinary vagueness which might have rendered the original proposals unworkable, and they make a number of other valuable changes of detail. But no major concession is included. Departure from the 1939 price is now to be permitted only for building and not for land, only for owner-occupiers and only up to 30 per cent above the 1939 level (unless this proportion is raised by Order.) This is not satisfactory to the Tory critics, from whom came threats in Thursday's heated debate to vote against the Bill. The hope of getting it through this week is fading, and the proposal of a separate compensation Bill is being heard again. The Bill is, of course, very urgently needed, and the temptation is strong to say that anything that approximates to justice would be better than further delay. But the critics have a quite unanswerable case. The new clauses concede that the 1939 price would be unjust to the owner-occupier,

who could not find alternative accommodation for anything like the same amount of money—who would, in other words, be partially expropriated. But if the 1939 price is an expropriation of owner-occupiers, why is it any less expropriation of other owners? And if the 1939 price is fair for buildings, why is it unfair for land? And since the value of money has fallen by more than 30 per cent, why should justice be limited to this arbitrary figure? The whole episode is an example of the growing tendency to argue that robbery is not robbery if the victim is rich. Indeed, it is a particularly bad example, since it is not the whole class of property-owners who are to be expropriated, but only those members of the class who are unfortunate enough to own property in blitzed areas. There has been a great outcry about "speculators." But if speculation has been rife (of which no evidence has been adduced) it could be dealt with directly by a separate clause prescribing special treatment for property that has changed hands during the war. Another principle that has been forgotten during the outcry is that it is better that a few should get more than justice than that any citizen should get less. What makes the whole business more puzzling and provoking is that there is an obvious and easy way out of the difficulty, which was suggested by *The Economist* when the Bill was first published months ago. This is to base compensation on 1939 prices, and to write all these prices up by a uniform percentage to allow for the fall in the value of money. This is what was done in the War Damage Act. It would secure 1939 values, which, as those rare individuals who have read the Uthwatt Report know, is what that body recommended, carefully distinguishing it from 1939 prices. It is, of course, true that the more money is paid out in compensation the greater becomes the need of the local authorities for more generous assistance—but that is an argument for more assistance, not for less fairness. The responsibility for the muddle and the delay and for the present emergency rests squarely on the Government. And the Minister has not improved his standing by accepting a number of amendments on matters other than compensation, all of which will be restrictive and obstructive in their effect.

* * *

International Air Transport

A White Paper (Cmd. 6561) sets forth the general principles whose acceptance Lord Swinton, the Minister of Civil Aviation, will propose as the basis of a new air convention at the international conference which is to be opened in the United States on November 1st. These concern the international rather than the domestic policy of the British Government. Lord Swinton is to be guided by two main principles. First, he will not ask for the complete internationalisation of air transport—which is impracticable at this stage—but he will propose a fairly wide definition of the freedom of the air. This freedom is not to be confined to the right of innocent passage through the air space of individual states and to the right to land for non-traffic purposes; it would include the right to set down passengers, mail and freight in any country from the country of the origin of the service, and to take on traffic in any country destined for the country of the origin of the aircraft. Trading between intermediate countries and the right to engage in the cabotage of another country would be a matter for separate negotiation. This would mean, for example, that a British air line could carry traffic between this and any other country, but that it could not, without special arrangements, take on traffic in Belgium on its way to Hungary, or, on the way back, from Hungary to Belgium. Secondly, Lord Swinton will propose that the world's air transport capacity should be adjusted to the volume of traffic on international routes; that the traffic should be shared by the members of the convention by determining the frequency of each nation's services; that fares should be internationally controlled in relation to standards of speed and accommodation; and that wasteful competitive practices should be avoided, especially by the control of subsidies. (In addition, there are a number of technical matters, such as safety regulations, which must obviously be embodied in any air convention.) These proposals would be translated into practice by an International Air Authority, working through an Operational Executive, with regional panels.

* * *

Principles and Practice

These principles constitute an approach, or an attitude, to the problem rather than a detailed plan. Hence the anxiety expressed by some Members of Parliament in the

House of Commons on Wednesday. Everything will depend on how the principles are to be applied. The International Air Authority, for example, would wield very great powers through its control over the allocation of frequencies to member countries and over the rates of carriage on international routes. While it would consist of representatives of the member countries, nothing is said in the White Paper about the method by which voting power is to be determined, except that it should be on an "equitable basis." Again, the basis on which frequencies are to be distributed by the Authority among the various countries wishing to take part in any given service are not defined; it is merely proposed that the Authority should ensure "equitable participation." Nor is there any definition of what should constitute an international route and, hence, of the field over which the International Air Authority is to hold sway. Further, the principles governing the freedom of the air can have little meaning in the absence of a precise definition of what constitutes the territory of a state. On a narrow definition of a "state," this country's right to reserve cabotage would be confined to the United Kingdom. And on the method by which participation is to be determined will depend the attitude of some of the smaller countries. These are some of the crucial points. They are not raised by way of criticism of the Government's proposals, but merely as an indication of the complex problems that await solution at the Conference. It would have been impracticable for the Government to fill in the details of its proposals; they have been purposely left undefined, and there will be hard bargaining at the Conference. It is by no means certain, for example, that the United States will agree to the principle of the international allocation of frequencies *cum* rate-fixing, although individual countries would have the choice to operate the services allocated to them by chosen instruments or by several concerns in competition. Nor is it likely that the smaller countries will readily abandon the bargaining power that their present right to refuse traffic landing facilities confers.

Battle for Hungary

The battle for Hungary is nearing a decisive stage. On the eastern fringe of the Hungarian plain a heavy tank battle still seems to be raging round Debrecen, where the Germans are delaying the Russian advance towards Budapest. The Russians have now suddenly emerged in strength from all the passes through the eastern and central Carpathians, have taken the Carpatho Ukraine and joined hands with the Slovak insurgents. The German positions in eastern Hungary have thus been virtually outflanked, and the Russians are now certain to invade Hungary from the north. In the south their advance by now must have gone considerably north of Szeged in the direction of Budapest. The battle for the Hungarian capital, however, has not yet begun. This may well be a difficult and protracted battle. Budapest, like Warsaw, presents the attacker with the task of a difficult river crossing; and the city can be made into a fortress by the Germans. The Russian Command will probably prefer to encircle Budapest by crossing the Danube on the flanks rather than storm it from the east only. Meanwhile recent political events have upset every German calculation. The

request for an armistice made public by Horthy, the *coup d'état* which succeeded in deposing the Regent and substituting for him the leader of the Arrow Cross, Szalasy, the disintegration of the Hungarian Army, and the surrender of its Commander-in-Chief General Miklos to the Russians amount, in fact, to the actual desertion of Hungary. The Wehrmacht has had to foot the bill. New divisions had to be sent to Budapest to help Szalasy into power, and to keep the capital safe for the Wehrmacht. The Germans will try to make the battle for Budapest a great delaying action to cover the approaches to Vienna. Beyond Budapest, up the Danube, the flat land is again favourable to tank warfare, and only the Bratislava gap, not too formidable a barrier, will stand between the Russians and Vienna. The repercussions of the battle of Hungary on the situation on the Polish front is probably less direct than some military writers have suggested. The threat that the Russians might outflank the German positions in central Poland from Hungary or Austria and Czechoslovakia is pretty remote. So far there has been no close connection between the fighting in the two countries. However, the conclusion of the battle of Hungary may certainly speed up an all-out Russian offensive in Poland, and make the defence of Silesia by the Germans extremely difficult, if not impossible.

The TUC and the Press

A dispute has arisen between the Trades Union Congress and most of the press. Last year the TUC passed a resolution to the effect that, in future, only journalists belonging to an affiliated trade union (that is, to the National Union of Journalists and not to the Institute of Journalists) would be admitted to report its proceedings. The same action was recommended to the constituent unions. This year the press tickets for the Conference were made subject to the condition that the holder must also hold an NUJ card. Beyond question almost all of the journalists concerned are members of the NUJ, but there is a point of principle involved—namely, that no body should be allowed to dictate who should be sent by the press to report its proceedings. It is perhaps a little grandiloquent to dress this up in the somewhat overworn toga of the freedom of the press, but it is an essential principle nevertheless. Most of the papers have declined to be represented at the Congress, though the agencies are there and the papers are printing their reports. This, of course, is a very weak gesture which will be wholly ineffective. The Congress, after listening to some very silly ranting by Sir Walter Citrine, has refused to budge. It has, indeed, nothing to lose so long as the papers are so pusillanimous. If they really believe in their principle, they should boycott the Congress completely, agencies and all. Labour leaders, especially the secretary of the TUC, are not notably averse to publicity, and really forthright action would bring them to their senses. As it is, they have been given the opportunity of a cheap victory over the "Press lords." Sir Walter Citrine was quite wrong in supposing that the presence of a representative of *The Economist* at Blackpool implied any approval of the TUC's position. We would have joined in an effective protest; but half-measures are pointless.

Control of Labour

For the past year, the General Council of the TUC has been examining the structure of its affiliated unions and considering how to consolidate and modernise their organisation. This was one of the most debated issues at the 1942 and the 1943 Congresses, and it was therefore disappointing that the General Council interim report on "Trade Union Structure and Closer Unity," which may have far-reaching effects on industrial organisation, should have been accepted with virtually no discussion. The General Council, recognising that "the trade union movement in a changing world cannot retain its pre-war conception of organisation if it is to prosper and efficiently fulfil its ideological and practical function," has put forward proposals for encouraging amalgamation and bringing about closer unity. This is consistent with recent trends in the trade union movement, but the process of consolidation may take a long time. Trade union membership is now close on 7,000,000. If the union catering for Civil Servants were affiliated it would increase the total membership by 700,000. Their exclusion under the Trade Disputes Act is still a very sore point, and the General Council has been instructed to renew its efforts to secure a repeal of the prohibitive clauses. The trade unions' view is that the claim should be conceded in return for their

having given up many traditional practices and rights in wartime. Foremost of these is, of course, the right to strike—though practice has fallen far short of principle. The need to minimise strikes will be as necessary in the immediate post-war years as it is now. The threatened strike in the Yorkshire coalfield over what seems a comparatively minor issue is a bad augury for future industrial peace. Regulation 1AA, aimed against instigators of strikes, came to the fore at the Congress, and a resolution calling for its withdrawal was defeated by a narrow majority. The General Council insists that the unions will not tolerate the retention of compulsory arbitration after the war. But the unions have not so far committed themselves about the extent to which they will accept control over labour in other respects after the war.

Grave Words from France

General de Gaulle's speech on October 14th contained two grave warnings. One was addressed to the French people, the other to the Allies of France. In both, General de Gaulle stated many sound and necessary things; and in both he tended to overstate his case. Describing the present situation of France, he said:

We are just emerging from the abyss. It is now for us to grasp the rope and hoist ourselves up the slope by the sheer strength of our wrists.

Nothing could describe more graphically France's present plight and the tasks ahead of the nation; and perhaps no other words could reflect more adequately the amount of will-power that General de Gaulle himself can be expected to put into the job of rebuilding France. In domestic affairs the chief task of the moment, as he sees quite correctly, is to put an end to the pluralism of power. This can only be done by achieving a unified and stable administration, army and judicial system. All these are elementary tasks, but they probably cannot be accomplished at a stroke. The old Vichy administration has broken down. What little remains is inevitably challenged by the Committees of Liberation. The old army, too, has broken down, and the irregular Forces of the Interior have come into the open. A new administration and a new army can probably be set up only by the merging of the old and the new elements. The process is admittedly a difficult one, and—for its peaceful conclusion—it requires time, patience and good will on all sides. The cleavages between Frenchmen are deep, and they can be overcome only gradually. General de Gaulle has undoubtedly been right in insisting on the urgency of establishing "national order." But the timing of the process is delicate. If it is done too brusquely, there may well be internal convulsions and civil strife, which would bedevil the politics of the Fourth Republic for many years to come.

Entente Cordiale

General de Gaulle's second warning was addressed to his Allies. He protested against their apparent "relegation of France to the background." His indignation at this neglect has been understood and echoed by public opinion both in France and in this country. Whatever may be the motives of the British Government in refusing formally to recognise the French Provisional Government, Parliament and press have left no doubt about their attitude. A situation in which China is to be present in the councils of the Great Allied Powers and France absent is frankly ludicrous. Similarly, the absence of France from the European Advisory Council is an inexcusable political scandal, especially now that the problems of Germany's immediate future are being discussed and settled. But here again General de Gaulle has gone too far in airing an undoubted and justifiable grievance; he even seems to have added one or two imaginary grievances of his own. It was grossly unfair to suggest that the selfishness of the Allied Powers is responsible for the present economic difficulties in France, especially when the General himself pointed to "the belligerents' primary obligation to feed the devouring battle." Such acts of economic policy as the striking over-valuation of the French franc or the speedy despatch of supplies to the freed areas of France immediately after their liberation make nonsense of the accusation. It ought to be obvious to General de Gaulle that by making such baseless insinuations he is likely to antagonise Allied opinion which is otherwise so willing to support his just demands. He is also lending some colour to the criticism of those who suggest that he is more interested in creating a mood of

self-centred nationalism in France than in promoting a full revival of the Entente Cordiale.

Pacific Strategy

The massed fleets of the United States in Pacific waters have opened a new phase in the struggle against Japan. Hitherto they have been attacking the outer ring of the Japanese defence system, the Mandated Islands—Marianas and Carolines—the island of Palau and Halmahera in the Moluccas. Each operation, though costly, has been successful, and the outer line is now completely broken. Indeed, American aircraft can now operate from reconquered territory. The phase which is opening now is, however, much more formidable. A new island shield protects Japan's

sea-lanes in the East China and South China seas—the Riukiu Islands, Formosa, the Philippines and Celebes. Of these, only the Riukiu group are on the scale of Saipan and Guam. The others are all large territories, supporting strong land garrisons; and the Riukiu Islands, though smaller, are very near to the main Japanese bases. The problem facing Admiral Nimitz is therefore to land forces on these islands in sufficient strength to master the large Japanese garrisons, and to do it in what are virtually Japanese home waters. Against him are the garrisons, the land-based aircraft and, somewhere in the background, waiting for its own moment to strike, the main Japanese fleet. That the moment, in the opinion of the Naval Command, has not yet come is illustrated by the evasive tactics of the Japanese naval elements off Formosa. In Admiral Nimitz's favour is the fact that the American fleet is larger, more up to date and more flexible, and also that American superiority in the air is overwhelming. These two factors have made possible a revolutionary development in air-sea tactics. The recent heavy air attacks on Formosa have been launched from aircraft carriers in such strength that ground based aircraft could not ward off the blow. In the main, the Americans are bombing airfields to ensure that any Japanese counter-offensive from the air is impossible when the day for invasion dawns.

Stake in Formosa

The loss of Formosa would be primarily a military disaster for the Japanese. The island has important air and naval bases to guard the entrance into the East China Sea and to reinforce the Japanese hold on the Chinese coasts between Shanghai and Canton. Incidentally, the recent occupation of Foochow by Japanese troops shows the importance the Japanese High Command sets upon con-

trol in this area. But other interests, principally economic, would be involved in a Formosan campaign. The island of Taiwan—the Chinese and Japanese name for Formosa—has been for many years a very important source of food for Japan. Just before the war, over 90 per cent of Formosa's foreign trade was with Japan and Japanese-occupied China. Nearly 50 per cent of its gross value of production was exported, and in 1939 about 65 per cent of these exports were made up of rice and sugar. Imports were on a smaller scale than exports—about 69 per cent in 1939—and even so were made up to a great extent of equipment for the military installations and harbours, railway lines and other producer goods which were of little benefit to the inhabitants. Some critics reckon that, in spite of a very great increase in Formosa's agricultural output during the years of Japanese occupation, it is likely that the standard of living of the five or six million Chinese inhabitants has actually fallen. In short, the Formosan economy is an exaggerated example of colonial exploitation. The economic deficit was not offset by any political or social advantages. The Japanese conquered the island in 1895, but it was not fully pacified until 1902. There were rebellions against the conquerors in 1907, 1912 and again in 1915. Between the wars, the Formosans had a brief period of semi-liberalism. The Chinese petitioned the Japanese Diet in 1921 for autonomy and a parliament. No notice was taken of this petition, but in the twenties, at least, the Japanese school policy was for a time more generous and two movements grew up, the moderate conservative Taiwan Cultural Society and a Marxist movement which was strong among young people and the agricultural co-operatives. In 1928, however, the "liberal" era came to an end. The Taiwan Proletarian Youth League was suppressed in 1931 and the Cultural Society in 1937. They have continued to exist underground, but probably in a fairly weak and vestigial form. An American landing might, however, be able to count on something of a Fifth Column.

The Spanish Facade

The impact of the Allied victories in western Europe on the internal situation in Spain has been strong, but so far

A NATIONAL HEALTH SERVICE

Lord Dawson

ON OUR VOLUNTARY HOSPITALS

• The voluntary hospitals have certain qualities, due to their history and traditions, that cannot be erected *de novo*. Experience and authority have gathered round the teaching hospitals. There is something in their tradition which cannot be reproduced. As well try to copy Westminster Abbey without its spirit. •

Following Lord Dawson's tribute the Minister of Health says, "The Voluntary Hospitals... are a typical and successful product of this country's methods." There is now in view a bold forward step—a Health Service for everybody—and the Voluntary Hospitals, as always in the past, are eager to play their full part.

In the centuries of their existence the Voluntary Hospitals, now numbering over 1,000, have had a single mission—the welfare of the patient, nothing else. Every part of their service to the people—the training of all doctors, and more than half the nurses; the long, inspiring story of research, discovery, improved treatment, healing, more hospitals, better hospitals, freedom of choice of hospital—each has had its source in that one ideal passionately and com-

passionately pursued. The Voluntary Hospitals are run for human beings by human beings. This is why, perhaps, the Voluntary Hospitals have gained the affection, loyalty and support—which they will certainly need in the future as much as in the past—of so many millions of people. It is always 'our hospital.'

As their contribution to the war effort, the great resources of the Voluntary Hospitals in staff, buildings and equipment have been made available to the Government. Thousands of their doctors and nurses are in the Forces.

In the future, the Voluntary Hospitals look forward to making their own unique contribution to the building of a healthier Britain, as partners in the plans for the Nation's Health Service.

ISSUED BY THE BRITISH HOSPITALS ASSOCIATION
12 GROSVENOR CRESCENT S.W.1

not strong enough to upset the façade of stability which the Franco regime shows to the world. But it is only a façade. The Monarchists have in the past been more discreet in their expressions of sympathy with the Axis. As a result, they are gaining influence while the camp followers of the Falange are falling away. But both ruling factions have been unable to reconcile the people to the régime. There are still more than a million Spaniards in prisons and concentration camps, a sure proof that the victors of 1939 still fear their vanquished opponents. The victories of the democracies have increased that fear. Allied statesmen may claim that the war has lost much of its ideological character; but Franco's opponents look on the Civil War as the first round in the world war, and expect to share in the Allies' victory. However, the opposition is stronger in numbers than in leaders. It lacks above all any real capacity for action. True, unrest has increased recently. The various maquis in Spain itself have become more active. Catalonia is growing restive. The exiles, who have played a prominent role in the F.F.I. in southern France, thunder against Franco from Radio Toulouse, and some of their guerilla bands have even crossed the French-Spanish frontiers and fought skirmishes with Franco's police and army. But so far these activities have failed to break the inertia of the Spanish people. Indeed, against the background of inexorable repression, they look very quixotic. Far from becoming a real challenge to Franco, they have tended to demonstrate the weakness of the opposition.

No force inside Spain can break the political deadlock—at least for the time being. Franco cannot hope to win popular support; nor can the opposition be carried back to power by its own momentum. Both sides are looking abroad hopefully or uneasily for the political stimulus or support they need. Both sides in Spain are looking anxiously across the frontier into France. Meanwhile, Franco is playing upon the fear of Communism both inside and outside Spain, and underlining his "mission" to maintain law and order. At the same time, his new Foreign Minister, Lequerica, is assiduously working the regime's "passage home." Spanish airports have been put at the disposal of American air companies. Freedom of movement for German agents has been restricted. The columns of the controlled Press overflow with pro-Allied sentiment. These efforts have had some success. Mr Churchill has spoken kind words to General Franco. Friendly statements were recently made by Mr Hayes, the United States Ambassador. These pointers restore somewhat the waning self-confidence of the rulers; and they bewilder and confuse the opposition. Franco can console himself that the Nemesis of history is, after all, less frightening than he may have feared. And the Republicans are perplexed by the prospect that the Caudillo may stay when Führer and Duce have gone.

Insurance and Assistance

When the Unemployment Insurance (Increase of Benefits) Bill was before the House of Commons last week Mr Bevin stated quite flatly that neither he nor any member of the Government has accepted the principle that subsistence can be satisfied by insurance. The new rates of benefit, which in some cases bring the sums payable up to the level of those proposed under the social security scheme, are not to be regarded as providing adequate amounts for subsistence.

Insurance has always been regarded, not as subsistence, but as a contribution towards it. That is the whole basis of the Insurance Acts.

It follows, therefore, that the term social security, as applied in Great Britain, is a misnomer. The scheme will provide a national minimum, but a minimum that is below the subsistence level. Subsistence is, in fact, to consist of insurance plus assistance, the only difference between the new system and the old, from this point of view, being that the insurance element will be larger. It also follows that the cost of full social security is unknown because it is impossible to ascertain how many people will apply for assistance to bring them up to the subsistence level. It will be remembered that in 1940, when supplementary pensions were introduced, the number of old-age pensioners who applied for them, and were accepted, vastly exceeded official estimates, which were presumably based on the number who were being given poor law relief. Under the social

security scheme the great body of the sick will also have the right to apply for national assistance instead of "going on the rates," and it can be taken for granted that their numbers will be correspondingly large. What, then, becomes of the social security budget when there are two large unknown factors in it—the level of prices, which determines the cost of subsistence, and the number of applicants who will satisfy the conditions for assistance?

Trade Unions and the Peace

The Trade Union Council has adopted by 5,560,000 votes to 1,350,000 the report of the Anglo-Soviet Trade Union Committee dealing with the post-war treatment of Germany. This committee's resolution states categorically that "the German people cannot be absolved from all responsibility" for the crimes of the Nazis, and condemns "the appeasement policy of those who are endeavouring to mitigate the punishment of the Hitlerite criminals." Thus the Trade Union Council seems to have turned a somersault. Last year, without even a card vote being taken, it passed an amendment deleting a passage in a resolution which fixed the war guilt on the whole German people, and instead affirmed the Nazi regime's responsibility for war crimes. The industrial wing of the Labour movement has now adopted the views of the political wing expressed in the Labour Party's resolution at its 1943 conference and its recent statement of foreign policy. Opinion among the Trade Unions, however, is divided on the issue. The debate was most heated and showed not only division of opinion, but a great deal of confused thinking. One section is worried by the fear of a repetition of the events of 1918 and 1919, and is anxious to help democratic opinion in Germany to assert itself. This view was expressed by the Chairman, Mr Ebby Edwards, in his opening speech, and supported by such unions as the National Union of Distributive Workers, the Amalgamated Engineers' Union and the Transport and General Workers' Union. But the miners, the railwaymen and the general and municipal workers were strongly in favour of the report. The Trade Union Council has further committed itself to the principle of reparations and the view that Germany should make good the material damage caused by its armies. The British side of the joint Trade Union committee, however, proposes that there should be an inter-Allied commission to fix the distribution of labour between the different countries and the period for which it should be used, to lay down hours, wages and conditions of labour, and to prevent any degeneration into slave labour. The fear that German labour might be used in competition with British labour, and that German goods, like coal, would be sent to this country as reparations was uppermost in the minds of those who, remembering the effects of reparations after the last war, opposed their exaction this time.

NHI in Retrospect

Professor Hermann Levy points out, in his latest study of British social insurance,* that full social insurance exists nowhere to-day because in no country can a person, for instance, obtain full compensation for loss of earnings during sickness. It has been quite impossible to obtain adequate contributions from employers and employed or, through the state, from the taxpayer. But other countries do attempt to retain the insurance element by basing compensation upon earnings. The flat rate system, as practised in Britain, is only intended to secure a minimum standard of living—now officially recognised as below the subsistence level—during incapacity. Professor Levy devotes his arduous researches into the history of National Health Insurance in this country to proving how much better is the Continental system of compensation in proportion to earnings. He certainly makes out a very strong case for it. But he has lost his case, for the new social insurance, like the old NHI, but unlike the old workmen's compensation, will be based on flat-rate benefits. Only war pensioners will continue to have any graduation of benefits, it being based in this case on the amount of the disability.

Professor Levy would agree that it is permissible to regard cash benefits, which do not give full compensation for loss

*National Health Insurance. By Hermann Levy. National Institute of Economic and Social Research. Cambridge University Press. 366 pages. 7s. 6d.

of earnings, as reasonable, provided that they bear some relation to earnings. But he states, rightly, that partial medical benefit cannot be accepted.

Medical benefit which is only partly effective is wholly inadequate.

A large part of his book is taken up with exposing the inadequacy of health benefits under NHI. All that an insured person can count on is treatment by a general practitioner and a supply of drugs. But the former, largely because of the conditions under which a panel doctor is compelled to work, falls short of the standard of treatment given to a private patient, and the prescription of a drug—or even of cotton wool, as appears from one of Professor Levy's illustrations—may be queried on the grounds of expense. Thus, even these limited medical benefits are, in Professor Levy's opinion, only partial. Yet there is no provision under NHI for hospital and specialist treatment, nursing, surgical appliances, or dental and ophthalmic treatment, except by way of additional benefits, the distribution of which depends on the financial position of the approved societies; and the extent to which they are granted can be gauged from the fact that the total expenditure on them in 1938 amounted to only £2,580,000, against the £10,535,000 which was spent on ordinary medical benefit. Most of the defects exposed in Professor Levy's valuable study are common knowledge; in any case, NHI is dying, and is to be replaced by social insurance and a national medical service. But those responsible for framing the new schemes will find many an object lesson in his book.

Magistrates' Courts

For good or for evil, the rôle of the amateur in public affairs is getting smaller, and the emphasis is now on experts, technicians and professionals. But the system of lay justice still prevails in magistrates' courts, which, as the Home Secretary pointed out in a speech to the Magistrates' Association last week, in addition to dealing with all the minor delinquencies, deal with nine out of ten of the indictable offences and have a large volume of work of a quasi-civil character, such as affiliation orders and matrimonial cases. A year ago, the Hereford case showed how lay magistrates need, in their turn, to be assisted by the expert, and Mr Morrison emphasised the growing importance of the work of the magistrates' clerk. A Departmental Committee on Justices' Clerks, under the chairmanship of Lord Roche, has reported in favour of an extension of the system of whole-time clerks, which is at present confined to only about a hundred of the thousand magistrates' courts in England and Wales. The other expert who, Mr Morrison said, is essential to help the lay magistrates is the probation officer, whose work is closely related to that of the clerk. In cases of juvenile delinquents, in particular, the probation officer is an essential link between the Bench and the accused. All too often the Bench is composed of magistrates living in an entirely different social sphere from those whose cases they are dealing with. They thus have no idea of the social conditions which affect the life of the young offender. Nor, although they are now asking for the power to impose severer punishments, do most of them trouble to find out the effects of the punishments they can already inflict on the lives and outlook of those they sentence.

Terrorism in Palestine

After five years of more or less outward calm, Palestine has once again come to the fore as a scene of revolt against British rule. The official announcement last week from the Officer Administering the Government of Palestine and the C-in-C, Middle Eastern Forces, stated that since early this year

Palestine . . . has been the scene of a series of outrages, crimes of violence by Jewish terrorists acting with the deliberate intention of bringing about by force developments favourable to the realisation of their political aims. . . .

The crimes include the assassination of members of the security services, the destruction of Government buildings valued at "scores of thousands of pounds," and an unsuccessful attempt to assassinate the High Commissioner. It is probably not a coincidence that this announcement was made so soon after the decision to agree to the formation of a Jewish brigade. The latter was refused for so long—and is unwanted by the majority of Jews, who prefer to fight side by side with their own compatriots—that the

consent at this stage of the war is possibly a concession calculated to win the co-operation of Jews who have extreme political ambitions, but deplore the methods of the terrorists. If this is so, it is unfortunate that the wording of the announcement on terrorism reads as if the Palestine administration held the whole Jewish people, in whatever country, responsible for it. There is a universal tendency to regard the "good" Jew as the exception and the "bad" Jew as the rule, and it is sad to see an administration which claims to be impartial between Jew and Arab fostering the fallacy. It is hardly the way to win the collaboration of the Jewish community in Palestine in putting an end to the terrorism of the few.

Equal Pay

The Royal Commission on Equal Pay held its first meeting in London this week. The members were announced in the House of Commons by Mr Attlee last Thursday and the commission's terms of reference summarised as follows:—

To examine the existing relationship between the remuneration of men and women in the public services, in industry and in other forms of employment; to consider the social, economic and financial implications of the claim for equal pay for equal work.

The selection of members for this subject presented the difficult problem of combining impartiality in the commission with representation of two diametrically opposed approaches to the problem—that which stressed the justice of the claim and that which stressed its practical disadvantages. The list of commissioners satisfies both needs. The chairman, Mr Justice Asquith, will ensure that the question of altering the law of responsibility for the family, should the claim for equal pay be allowed, will be fully considered. At present, the father of a family is fully responsible, by law and convention, for providing food, shelter and clothing for his wife and children. If equal pay for equal work were to become the general rule, this would be a good opportunity to match the new economic rights of women with some increase in their financial responsibilities before the law. In discussing the economic problems of enforcing equal pay, the Commission will have both the advice of a seasoned economist, Professor Dennis Robertson, and of a representative, the Hon. Jasper Ridley, of the two categories of employers, the banks and the insurance offices, which are most widely known for paying their women staff at a lower rate. In addition, the Commission includes Dame Anne Loughlin, first woman chairman of the TUC; Dr Janet Vaughan, for the professions; Mr John Brown, heavy industries trade unionist; Miss Nettlefold, woman company director; Mr C. S. Robinson, representing the government in its rôle of employer; and Lady Limerick, member of the LCC for South Kensington and of the Ministry of Labour's Women's Consultative Committee.

Freedom of Comment

The Economist of August 5th contained an article entitled "Britain and Argentina," in which comments were made on the policy of the United Kingdom and of the United States towards Argentina. Some of these comments were critical of American policy, and therefore distasteful to Americans. What is of relevance to the rest of the story is not whether the views expressed were correct, but that they were the honest views of *The Economist*, arrived at after some study and thought and reflecting (as has since become apparent) the opinions of a large section of the informed British public. Reuters cabled the article to its clients overseas, among them the newspapers of Argentina, who printed extracts from it. For this action Reuters received a protest from the American Chamber of Commerce in Buenos Aires, not on the ground that the text was inaccurate but that it was objectionable to them. And, to cap all, the Buenos Aires manager of one of the American news agencies has undertaken that his news service to Argentina shall no longer be polluted with extracts from *The Economist*. No further comment need be made upon this remarkable episode than to hope that it is not a typical example of what the American Congress meant by its demand (usually thought to be directed against the British) for an international guarantee of the "world-wide right of interchange of news by news-gathering and news-distributing agencies, . . . by any means, without discrimination as to sources, distribution, rates or charges."

AMERICAN SURVEY

The Public and Foreign Trade

(From a Correspondent in North Carolina)

AT the moment when American post-war policy in international trade is in process of determination, public opinion is in a somewhat curious state. There has never been so much general enthusiasm for the removal of trade barriers and the expansion of world trade. There has never been less apparent popular support for the protective tariff, and its proponents have never been less vocal. There is even an exaggerated recognition of the rôles played by the U.S. protective tariff in the development of trade barriers throughout the world.

There is, however, not much realisation of the basic changes which have taken place in the nature of international trade since 1914. The extent to which international trade is no longer between the private individuals or corporations of one country and those of another, but is also between governments and their agencies, which may deal either with their opposite numbers or with private individuals and corporations, is pretty generally overlooked. American public opinion, likewise, has not recognised the necessity for confronting the dilemma posed by the attempt to free international trade from national controls while national governments continue to control domestic price levels and to carry out their own particular domestic economic programmes.

The decline in public support for the protective tariff is due in part to the growing importance of that sector of American industry which has convinced itself by decades of successful experience that it can compete in world markets without benefit of either tariffs or subsidies. This is particularly true of the producers of automotive equipment and of machinery of all sorts. These industrialists are quite aware that increased sales of goods by foreigners in the United States would increase foreign purchasing power for their products. Consequently, manufacturers of products in this category are increasingly becoming supporters of free trade.

Not the least curious aspect of public opinion in the United States is the evidence which it offers that the earnest indoctrination of generations of college students by their professors is at last bearing fruit of sorts. American professors of economics have taught with reflected missionary zeal the British classical doctrine of free trade. On a people living in a continental economy this doctrinal garment has not hitherto rested easily. The case is different now. It is no longer considered quite respectable, even in industrial circles, to advocate the protective tariff. It is ironical that the achievement of this pedagogical triumph of the acceptance of the principles of free trade by the more literate public should come at a time when these doctrines in their simplest nineteenth-century form have been pretty generally emasculated in fact and repudiated in principle by the rest of the world.

Thus there is in the United States, at least momentarily, wide enthusiasm for the benefits to be derived from foreign trade. These benefits are rarely thought of in terms of the receipt of larger quantities of imports. Americans instinctively are inclined to think of world trade as a means of getting rid of surpluses. Everybody is concerned with the disposal of forthcoming agricultural surpluses as well as with the disposal of the already vastly expanded production of airplanes, machine tools, aluminium and magnesium. Foreign trade is often offered as a sovereign remedy for unemployment through getting rid of "these burdensome surpluses." Foreign trade is supposed to solve, in some vaguely magical way, "the problem of over-production." The effect of domestic full employment in increasing both imports and exports is, however, as yet an intellectual novelty.

Few are willing to spend much time on the question of what specific imports the United States should accept in increased quantities when it comes actually to lowering

tariffs. There is likewise little apparent concern about what goods and services should be received in payment for these "surpluses" of which foreign trade is to rid the country. There is, indeed, a quaint nation professed by a good many enthusiasts for international trade that there is no need to worry about that if arrangements are made to lend or invest enough, indefinitely, to supply as many dollars as foreigners might wish to use for the purchase of American goods and services.

Exchange controls, import quotas, bulk purchases by government, bilateral agreements and cartels (but not commodity agreements!) are pretty generally discussed as though they were invented by Hitler. It follows that all nations are expected, upon the defeat of Hitler, to remove these controls with the same enthusiasm which the French Forces of the Interior demonstrated in rising against the German forces occupying Paris. Little consideration is given to the argument that these national controls of foreign trade originated, in part, because of fundamental difficulties in the maintenance of equilibrium in the international balance of payments. There is little realisation that these controls in various countries were part of the effort by national governments to maintain domestic employment and that the effort often met with a considerable degree of success, even aside from the "export of unemployment" to other countries.

In this state of public opinion it is not easy for American bankers, for example, when they try to make up their minds whether to support or oppose ratification of the International Monetary Fund, to understand why any country would wish to retain some features of exchange control or wish to abolish them only gradually. It is likewise not apparent to them why it is at all necessary to allow a country, once its currency is stabilised at a "sound ratio," to devalue that currency in order to remedy a fundamental disequilibrium. This state of mind in financial circles adds up to the nostalgic conviction that "The way to remove trade barriers is to remove them and not to create a lot of new and complicated institutions which would merely substitute international controls of trade for national controls."

There is undoubtedly widespread willingness in the United States to make what is somewhat sentimentally expressed as "sacrifices and contributions for the promotion of international peace and prosperity." This willingness is substantial enough to furnish at least the minimum popular support necessary for UNRRA, the International Monetary Fund and the International Bank for Reconstruction and Development if these are presented to the public as prerequisites for the resumption of normal international economic activity.

This willingness has, however, sometimes been interpreted and publicised to mean that the American public, convinced of American capacity to produce more than can be domestically consumed, is prepared to extend Lend-Lease or to make other loans available indefinitely to other countries. In this way, so the story goes, there need never be any shortage of United States dollars to hamper the self-expression of mankind in international trade.

There is little ground upon which to base expectancy for the fulfilment of any such hope. As soon as public opinion realised that this unlimited supply of United States dollars would have to be furnished by the American taxpayers or through the issue of purchasing power by the Treasury which would otherwise be available for domestic uses, the political reaction would be virulent.

This reaction would be strengthened by general public realisation of how low the standard of living among a large section of the American people really is. The sooner it is understood in all countries that the provision of adequate domestic purchasing power for the products of industry must be the corner stone of national economic policy and that real equilibrium in the international balance of payments must be based thereon, the brighter the prospects for an expanded world trade will be.

American Notes

Foreign Policy in Politics

The importance of the decision of the *New York Times* to support Mr Roosevelt for a fourth term—though it deserted him for Mr Willkie in 1940—and the arguments which have prompted that decision can hardly be over-estimated. This is not only because of the influence of the *Times*, though this is more nearly national than that of any other newspaper, but because of the key it provides to the "hard thinking" which must now be engaging many independent voters. The issue of foreign policy is the touchstone by which the *Times* has tested the claims of Mr Dewey and Mr Roosevelt; and it has been led to support the President by its conviction that, on foreign issues, the Republican party is still so deeply divided that Governor Dewey, if he were elected, would find

that his mandate was obscure, his purposes were questioned and his authority was inadequate to the great demands which history would make upon it.

On the other hand, the world-wide prestige and the long experience of Mr Roosevelt might prove to be one of the most important cohesive forces

in binding together the new world organisation in its first experimental years.

It can hardly be a coincidence that such frank doubts of Mr Dewey's ability to carry his party with him on the pre-eminent issues of foreign policy follow so closely upon the removal of Mr Willkie from his accepted position as guardian of Republican internationalism. In the minds of many voters Mr Willkie must have been regarded as the main guarantee against the ascendancy of its isolationists and nationalists in the Republican party. With this safeguard removed, many of Mr Willkie's friends and followers may, reluctantly, conclude, like the *Times*, that Mr Roosevelt will prove a more effective executor of responsible American participation in world affairs than Mr Dewey. In California, Mr Crum, the leader of the "Willkie Republicans," already has announced his intention of voting for Mr Roosevelt. Governor Dewey has, with great pains, endeavoured to establish the contention that in the field of foreign affairs there is such a basis of agreement and co-operation between the two parties that no issue exists. His endorsement of the Dumbarton Oaks plan followed within a few hours of its publication. It now looks as though this thesis may have received a mortal blow. In his foreign policy speech this week Governor Dewey will probably attempt to re-establish his claim to be very whit as enlightened on foreign issues as the President; but it may be too late to halt the exodus of Willkie Republicans.

The Last Lap

Prophecies of a small Presidential poll have been jolted this week by registration figures running in many cases not far behind those of 1940, and in some cases actually ahead. In New York City, the key city in a key state, registrations, which are now closed, totalled 3,216,000, only 174,000 below

those of 1940. This did not include 335,000 applications for soldiers' ballots which, if they are returned in time, will bring the total above that of 1940. Reports suggest, indeed, that despite the awkwardness of the state laws, soldier participation may be on a heavy, if not a decisive, scale. For this credit must go to the efficiency of the Services in distributing the more than 4 million ballots which have been requested. At home, the responsibility for getting out the registrations seems to have been borne largely by voluntary workers; and they in turn have been stimulated by a growing bitterness of feeling which has been particularly noticeable in the Democratic camp. In families which have been respectable Republicans for generations there are new splits between the younger and older members; and there are picturesque accounts of a taxi-drivers' unofficial campaign, which includes the refusal to carry passengers who look as though they might vote for Mr Dewey. The Gallup poll suggests that the race will be even closer than it looked last month. The popular vote now divides 51 per cent to Mr Roosevelt and 49 per cent to Governor Dewey; but it also reports a significant gain of 20 electoral votes for the Republicans and a loss of 41 for Mr Roosevelt since September. The tally by states now gives Mr Roosevelt 243 electoral votes against 228 for Mr Dewey, with 268 necessary for election. This prospect of something like a dead heat no doubt is responsible for the vigour with which both parties have been cultivating the foreign minority groups. In this process Governor Dewey has a freer hand than the President, and in the past week he has denounced the "unfair treatment of Poland by her Allies," demanded unrestricted immigration into Palestine for the Jews, and warmly endorsed Italy as "friend and ally." This policy of easy promise is not without its dangers, suggesting as it does the irresponsibility of opposition; and it may lose as well as gain votes. In his recent speeches Governor Dewey has returned to his rôle of prosecuting attorney; and has made a part of his arraignment the accusation of Communism which other Republicans have found so profitable a line of attack. This is a charge easier to sustain than might be thought, for in the American political vocabulary Communism is often synonymous with Government ownership; and it exploits the growing hostility to Russia so evident in the United States. Mr Roosevelt has been keeping himself in reserve, but with his speech on foreign policy scheduled for next week he is expected to lift the campaign from the rather dreary level of accusation and denial which has characterised it so far.

Cutting the Knot

There is rather less confidence to-day than existed in the early summer that the Senate will accept the ideas embodied in the Dumbarton Oaks draft. This is implicit in President Roosevelt's caustic remark that some people prefer to stir up dissension over such details as whether silk hats or low-neck dresses would be worn rather than concentrating on major objectives. The objections are not quite as trivial as that. The unfinished business of Dumbarton Oaks—the right of a Great Power to sit in judgment in its own dispute—bulks larger in some minds than

BANKERS TRUSTEE AND EXECUTOR COMPANY LIMITED

the area of agreement already won; and as Senator Ball has pointed out, the line that America must know the details of the peace before it agrees to support it is the foundation of the isolationist strategists, who do not dare to launch a direct attack. It is said that in order to circumvent those who would like to limit the extent of American participation, the Administration may submit the proposals piecemeal. In this connection the suggestions of Senator Connally and Senator Austin in the October bulletin of the Peace Society are receiving serious attention. They proposed that while American participation in the new league should be made the subject of a treaty to be ratified by the Senate, the authority of the American member of the Council should later be the subject of a statute which would require only a majority vote of both Houses. Senator Connally is the Administration spokesman on foreign policy, Senator Austin one of the most far-sighted members on the Republican side. Any plan which bears their name cannot lightly be dismissed; and there is undeniable ingenuity in their scheme for getting around the need of Senate ratification for the most controversial aspect of the Dumbarton Oaks plan. At the same time it is sometimes easier to get an unpalatable dose down at one gulp; and a policy of little by little may offer prolonged opportunities for obstruction. It is by no means certain that it would not be as easy to obtain a two-thirds majority in the Senate now as a majority in both Houses in six months' time, when the opposition has had time to organise.

Escape Me Never

A great crowd surging and swaying in Times Square; mounted policemen on parade; traffic lanes choked; ecstatic cries, frustrated groans, and periodic shouts of "Give her

air—she's fainted again" might lead an intelligent Polynesian to suppose that election fever had reached its height. But the scenes of mass enthusiasm daily staged in the heart of New York have nothing to do with either candidate or either party; neither with the war in Europe nor the war in the Pacific. These public raptures are excited by the "personal appearances" at stated hours each day of Mr Frank Sinatra, a singer of sentimental ballads. Being a modest young man, Mr Sinatra would probably concede that Mr Roosevelt has greater charm, that Mr Dewey has a richer voice, that Governor Bricker cuts a finer figure of a man, and that Senator Truman is far more folksy. Yet every hour young women are swooning at the very sight of Mr Sinatra—and none of the national candidates has yet achieved that result. His wizardry mainly affects 'teen-age girls, the bobby sockers or soxers, as they are called on the front page of every American newspaper. Innumerable young American males angrily demand, "What has he got that we haven't?" and professors of psychology interviewed by the press obligingly grapple with the problem. Their theory that Mr Sinatra appeals to the mothering instinct is coldly received by older matrons, who point out that young men of slight build, commonplace looks and a talent for warbling can be found to mother in any city block or village Main Street, and it is not necessary to pay to see them. The Sinatra cult will always be worth a footnote in social histories of the Greatest War. There was an agitated buzz at Republican Party Headquarters the other day when Mr Sinatra called at the White House to give the President assurance of his support in the election. The alarm was short-lived, for it was realised that Mr Sinatra's political influence can hardly be effective at least until 1948, when his army of delirious admirers reach voting age. By that time they presumably will be thinking of some other heart-breaker.

THE WORLD OVERSEAS

Germany's Food Situation

GERMANY'S harvest is almost in, but the distribution of cereals and root crops in preparation for the winter is still in full swing. Once again, the country is almost cut off from foreign food supplies. There are no longer any additional foodstuffs available from Russia, the Balkan countries and western Europe, and the surpluses from Western Poland, Czechoslovakia and Denmark have no appreciable effect at a time when at least eight million prisoners of war and foreign workers have to be fed from German supplies. In fact, the military and political situation has forced the authorities to give foreign workers employed in German agriculture and industry the same rations as German workers.

What has been harvested in Germany this autumn will have to last for human consumption and for feeding livestock until the new harvest begins in 1945. The question arises, therefore, whether Germany will be able to carry on the war this winter with the foodstuffs available.

Germany began the new agricultural season with a reduction in the weekly bread ration for normal consumers from 5½ pounds to 4.9 pounds. The potato ration, which was severely cut last year, has been fixed preliminarily at 7.7 pounds per week. The fat and meat rations have so far remained unchanged. Since the food situation must be judged by the changes in rations rather than by official crop announcements, the new bread ration indicates clearly that this year's cereal harvest is smaller than in 1943 when the potato crop was almost catastrophically low—barely sufficient for the needs of human consumption. During the 1943-44 season, the shortage of potatoes and vegetables was compensated by larger bread rations. In 1944-45, potatoes will again replace bread. It looks as if there will be no change in the supply of calories if adequate supplies of vegetables, meat and fats can be maintained.

The real difficulty, which will be apparent in the agricultural industry rather than in consumers' supplies, is, however, beginning. Cereals, root crops and vegetables and even fats and meat rations will probably be maintained on the present basis for the whole winter. But this is only

possible by sacrificing more of the pig population because of the shortage of feeding stuffs. In 1943 and 1944 there was a steady decline in the production and supplies of feeding stuffs. Almost one-half of the pig population had to be slaughtered last year, and in 1944 the milk yield has tended to fall, although the number of dairy cows increased. This is the result of dwindling supplies from foreign countries and of concentrating on the cultivation of oilseeds and vegetables for human consumption.

During 1943-44, the acreage under oilseeds was extended by 25 per cent to 1,500,000 acres, but the harvest will be no larger than in 1943 because of reduced yields. The cultivation of oilseeds demands very intensive work. Additional labour had to be used and other crops had to be neglected. This one example shows the peculiar difficulties of Germany's agriculture—even if the weather is ignored. During the whole war there has never been any possibility of increasing the overall agricultural output. The steadily growing difficulties in the supply of machinery, tractors, fuel and fertilisers have made the employment of more labour necessary. For years prisoners of war and foreign workers have replaced peasants and agricultural workers who were called up. Yet it was only possible to maintain pre-war cultivation.

Now, even in Germany, the available land is being reduced in the frontier regions of the east and the west and by the big dispersal of war factories all over the country. The full impact of German defeats and withdrawals is not yet shown in the accounts of this year's harvest. In East Prussia, as well as in the western provinces, the harvest was not only delayed by unfavourable weather conditions, but also by the call-up of every available man and woman for digging trenches.

The statement that medium cereal and potato crops have been harvested may be quite true if they are measured in tons, but there is reason to believe that the quality of the crops is rather below average. The evacuation of frontier regions and the heavy burden placed on the railways by war transport have, in addition, undoubtedly affected the

very complicated storage system which has been changed almost every year. One year additional storage capacity was needed for cereals and in another year for potatoes, according to the changes of the weather and the harvests.

German agriculture and the food processing industries have revealed during these five war years more changes than during a whole generation in peace-time. In 1943-44 the potato-processing industry, manufacturing alcohol, potato-flakes and flour, starches and so on, was almost at a standstill. The potatoes were used for human consumption. A considerable part of the sugar-beet crop had to be diverted to the production of alcohol, which was badly needed as motor fuel and for a great number of industries. New processes had also to be found for making sugar-beet suitable as fodder for pigs. A year earlier the baking industry had to learn to make bread from a mixture of rye, wheat and barley. It was relatively easy to expand the acreage under oilseeds, but the hardening of some of the vegetable oils so that they can be used as substitutes for butter, margarine or lard has not been solved satisfactorily.

Similar problems had to be solved with almost all other foodstuffs. Mass feeding is being practised on a very large scale. New cooking facilities had to be manufactured, some of them mobile to meet the requirements of bombed-out people. For a long time Germans have been eating potatoes in their jackets, and in large kitchens the potatoes are sometimes peeled by flames in order to save as much as possible of the potato. It is clear from all these more or less elaborate processes that the utmost economy in foodstuffs has been necessary during the whole war. With each new season the percentage of bulky foodstuffs, like vegetables, cereals and potatoes, in the diet has increased. All foodstuffs, particularly bread, fats and meat, are, however, distributed in a very complicated system of differential rations, which even today allow adequate rations for the Wehrmacht and for certain important categories of workers. The overall supply situation suggests that there will be no sudden deterioration in rations if it is assumed that the fighting remains more or less static.

This Year's Plan

The first stages of the agricultural plan for 1944-45 are now being carried out under extreme difficulties. There is first of all, because of military retreats, a reduction in the area to be sown and planted. Next, the fertilizer quotas, especially nitrogen and phosphates, have again been reduced. No relief is expected and indeed possible in the labour shortage. The peasants are overworked but are still under effective control, which is partly mitigated by a system of privileges and premiums. Allotment gardening and the breeding of backyard poultry and rabbits by townspeople have either declined, because of bomb damage and overwork at factories, or have been restricted in order to save feeding stuffs. Generally speaking, there is little possibility of eking out rations by buying in the black market or by allotment gardening. The fact is that the Germans have almost nothing beyond their rations, which have become increasingly monotonous. Fruit, tobacco and alcohol are rare commodities. The cigarette ration, for example, has been reduced to two cigarettes per day. Citrus fruit, raisins, olives from Spain, Italy and the Balkans have disappeared.

The present distribution of supplies depends on a very complicated system of control and zoning. If the administrative machinery is disrupted, the system of delivery and the supplies for the towns will at once be affected. Local stocks are soon exhausted as bombing has shown. Each new advance of the Allied armies enforces changes in this system. A shortage of railway trucks may undo the careful plan for the distribution of potatoes and other foodstuffs.

At the moment of defeat Germany should be supplied with foodstuffs sufficient for continuing the present rations, but it is very doubtful whether the distributive machinery would still be in working order. Severe shortages, mostly of a local character, will be unavoidable, and the mass movements of foreign workers and of Germans trying to get back to their former places of residence will make any adequate distribution of available supplies impossible. The harvest of 1945 will certainly be smaller than in 1944 even if the weather should be favourable. It cannot be doubted that the agricultural administration will kill off a considerable part of the livestock in order to maintain the meat ration during the winter. The soil will show signs of exhaustion, because of the shortage of fertilizers and machinery, and for some years yields will be low. In fact, German agriculture will probably experience even greater difficulties than after 1918 when for more than four years production remained at a very low level.

Japan's War Economy

[BY A CORRESPONDENT]

A GERMAN newspaper correspondent, writing from Tokyo, has called the attacks on the Mariana islands, with which this year's American offensive started, the "Stalingrad" of the Japanese people. Early this year, an "austerity" campaign was opened in Japan which can certainly be compared with the German anti-complacency measures after the first serious reverses of the Wehrmacht. The Japanese tea-houses and theatres, as well as all "luxury" shops, have been closed; no railway tickets may be sold for pleasure trips; students are liable to do labour service; the evacuation of children and others who have no business in the big towns is recommended by the authorities. More significant still is the mobilisation of the country's woman power which began only a few months ago. At least 60 per cent of all employees in banks, insurance houses, catering establishments and post offices have to be women or girls; the minimum quota for the motor, rubber and oil industries is 30 per cent; and for other engineering and shipbuilding establishments 10 per cent. Last year's programme for telescoping all unessential industries seems to have been carried through by June this year; and a survey which was published towards the end of 1943 shows that at that time as many as two-thirds of all textile factories had already either been closed or put at the disposal of other factories or industries. The number of clothing coupons, which were barely sufficient in 1943, have now again been cut by 50 per cent for all persons up to 30 years of age, and by 60 per cent for the older generation, whose members are supposed to have larger pre-war stocks. Clothing habits have already been greatly affected by these new measures. Kimonoes are out of fashion as they require too much material; the Japanese girl, 1944 edition, wears a utility suit with trousers.

The industrial strategy of Japan is best illustrated by the list of "key industries" which have first priority with regard to the supply of labour and raw materials; among these are the aircraft industry including the manufacture of all accessories and of auxiliary machinery, and those producing light metals, iron and steel, aircraft fuel and lubrication oil, as well as coal mining, munition production and shipbuilding. The first place among "essential" industries was formerly taken by shipbuilding, but, to-day, aircraft production is by far the most vital industry. The Japanese claimed early this year that the volume of aircraft production had doubled during the preceding twelve months; more recently, a spokesman of the Ministry for Production boasted that the output of aircraft is now larger in Japan than in any other country with the exception of the USA. Considerable attention is also given to mining activities, particularly in Japan itself and in the Chinese and Manchurian territories near the Japanese islands. Recent production programmes provide for an increase by 60 per cent in the output of iron ores, and by 30 per cent in the output of copper ores, although some of the new ores will probably be low grade. The mining company of the Mitsui Trust has recently doubled its share capital, largely in order to expand its coal mining.

A new industrial hierarchy is being built up, under the control of the Ministry for Production, itself a fairly new Government department, but with the active collaboration of the big industrialists, whose economic and social power is bound to be further increased by these new measures. The general managers or other leading employees of certain big establishments in a number of "key" industries have been nominated as Government trustees for production; Government orders are given directly to these "trustees," who are responsible not only for the output in their own works, but also for a number of companion factories which are being combined with the big works for the purpose of war production.

Various technical reforms have recently been introduced. It was claimed a few months ago that a simplification and rationalisation of the types used in the machine-tool industry had led to savings of raw materials ranging from 30 to 50 per cent, within the preceding six months. Shift work is being introduced in an increasing number of key factories, often against considerable technical obstacles. The rigid price-control measures which sometimes acted as a brake on output, even though they could not stop an increase in wholesale prices by some 40 per cent between 1939 and 1943, have now been considerably loosened; the control of prices has been decentralised; the prices of light metals and other essential products have been increased; and, most significant, a system of special premiums has been introduced which are being awarded to industrial establishments for any outstanding successes in production. These new concessions may, of course, further endanger the price-mechanism; and it is perhaps significant that, according to a recent report, the Japanese now also contemplate a general increase in wage-rates.

Price-premiums for special achievements are also among the measures designed to raise the agricultural output, particularly the output of rice and other staple foodstuffs. The Japanese Government has completely stopped the importation of rice, mainly in view of the shortage of shipping space. Minimum quotas of rice have been fixed for every peasant, for the first time this year, which have to be delivered to the marketing authorities. In addition, peasants have been urged to cultivate wheat, barley or oats during those months of the year when their rice-fields would otherwise be unused; this year's harvest of grains other than rice has been as high as 27 million koku (one koku equals 4.96 bushels), compared with a harvest goal of 70 million koku of rice; consequently the "rice" ration of the town population now consists of a mixture of rice and other cereals. Potatoes are also cultivated in larger quantities than before; but otherwise vegetable-growing in the villages is to be discontinued or to be very considerably reduced. The cultivation of green vegetables is stimulated, however, in the form of allotment-gardening by the townspeople themselves, so that valuable peasant labour and transport may be saved for more essential purposes. More important from the point of view of the farming population is the fact that fruit-growing and silkworm cultivation are also discouraged by the Government.

Mexican Development

[FROM A CORRESPONDENT IN CALIFORNIA]

THE war has advanced Mexico's industries greatly. For the first time the country has its own blast furnaces, tin-plate and sheet mills. The steel industry has doubled. Chemicals are made in more than 100 factories, large and small, established since 1942. Wool, leather and textiles are being exported. Dehydration plants multiply. Recently, manufacturing has been contributing some 1½ million pesos to Mexico's yearly production as compared with about 700 million pesos from agriculture and another 700 million from mining.

New foreign capital has gone into these industries. A year ago it was arriving at the rate of some \$600,000 weekly; between October, 1940, and February, 1943, it totalled some \$100 million. Commercial deposits nearly trebled in three years. Investments have centred mostly in the industrial areas, including Monterrey, Guadalajara, Tampico, Veracruz, Cordoba, Merida, Puebla, and, of course, booming Mexico City. The new money has been helping to finance lumber, mining, shoe manufacturing, construction companies, swanky night clubs, magazines and business papers, homes, apartments, and expansion and improvements in previously established Mexican firms.

But since the Mexican Government's decree of July, 1944, placing most foreign investment under Government control, many foreign businessmen feel uneasy. Recently, North American bankers have been pooling funds for Mexican ventures. Yet Mexicans say they welcome foreign money seeking enterprises in partnership with Mexican capital and Mexican participation in administration.

To-morrow's investments will concentrate on Mexico's two greatest needs; better land-use and transportation. Industries now rest on a crumbling agriculture. The land and its use are the country's greatest weakness and greatest potential strength. If Mexico masters her Good Earth, she may move far toward self-sufficiency. If she fails, she faces only trouble. Her two major post-war tasks are greatly to

increase acreage yields, and to get supplies and labour to the farms and take crops out—which means roads and railways. In some states 64 per cent of all communities can to-day be reached only by mule trails unfit even for ox carts. Though Mexico is larger than Germany, France, Spain, and Italy combined, she will never till more than one-eighth of her total area. And even this will require millions in investment for reservoirs, hydroelectric dams and plants, irrigation canals, drainage ditches and the clearing of immense jungles. In 1930, only some 56,000 square miles of the country was fit for ploughing, and of this only 3.6 per cent was tilled—an area a little larger than Eire, some 17½ million acres. This cropland might support Mexico's people fairly well, were the peasants not bound to Stone Age methods of farming. But their primitive techniques have combined with the land's ill-distributed rainfall and depleted soils to create what may easily become a major land crisis.

The peon, a notorious soil robber, has for generations used the crudest tools of his ancestors to plant tiny patches of corn and beans year after year. Soil conservation and machinery are new and strange to him. Mexican farmers have mostly worked the pleasant central plateau, to which they are biologically adapted. To-day the central states hold about 45 per cent of all Mexico's farmers, but only 15 per cent of the total available cropland. Bad farming on exhausted land has led to steadily dwindling crop yields.

To-day Mexico's yields are among the world's lowest. Each year about as much acreage is planted to maize, the country's greatest diet staple, as to all other crops combined. Yet out of 45 maize-growing countries, Mexico ranks 38th in yield. Bean yields average from a quarter to a fifth of those obtained in the United States. Mexico has been ranking 59th out of 62 countries in yield of wheat land. Cotton yields have been low, though the acreage has increased.

Inadequate financing and equipment, small holdings that cannot be profitably mechanized, and primitive farming have combined to perpetuate agricultural decay. To offset some of these disadvantages the Government has recently been redistributing acreage formerly controlled by large land owners under the "ejidal" system which provides grants of land to villages for family or collective use. The Government has been hoping to bring much irrigable land under cultivation. Late in 1943 about 10 per cent of cultivated land was irrigated. By 1946 Mexicans hope to have 2½ million acres irrigated, thus bringing closer to reality the hopes expressed by President Camacho: "The future of our agriculture lies in the fertile land along the coasts. The displacement of our population toward the coasts will relieve the congestion of the central plateau, which has been exhausted by the colonial policy of abandonment to the traditional maize farming of the Indians."

To this end, the Government has in view some of the best lands on the West Coast. To-day this area's only important irrigation system is around the Angostura Dam in northern Sonora, which can irrigate some 140,000 hectares, chiefly benefiting the important Yaqui Valley. Other projects are planned to irrigate cotton land in Lower California, a valley along the Rio Fuerte which is potentially capable of rivaling the Imperial Valley over the border, and the rich Laguna Valley.

All this will help. But land reclamation must be accompanied by a revolution in transportation, which has all but broken down. Since the time of Diaz, who built 18,640 kilometres of railroad during his 30-year reign, Mexico has added only some 700-odd kilometres to her main lines. The potential wealth of some of her richest states lies untouched and almost unknown for lack of rails. Mexican experts estimate that for every peso invested in the railroad industry up to 1900, some 13 pesos were added to the total public wealth. To bring every spot within 40 kilometres of a railway, the country must have at least 50,000 kilometres of main line tracks. Rehabilitation has begun, but on an insignificant scale—recently the Federal Government provided some 350,000 pesos to recondition rights of way and rolling stock on its Kansas City, Mexico and Orient Railway, connecting Chihuahua and Sonora, and linking with American railroads at the border.

The Government—and only the Government—can make headway in Mexico's two great post-war problems. But can it find the money for such vast rehabilitation? If not, the last hope is barter. The brilliant and busy Constantine Oumansky has recently opened Soviet headquarters for the Western Hemisphere in Mexico City. It may be that Russia will help.

SEE WHAT YOU SAVE WITH FUEL WATCHING

A fuel watching system is as good as management makes it. Backed by *personal* interest and enthusiasm it will pay and pay handsomely. Without managerial drive it may be a failure. *The choice is yours.* A well-directed fuel watching system is, in many instances, the only real answer to the factory fuel supply problem. Economically, it is a sound business proposition.

PRACTICAL SUGGESTIONS. See that every point of usage of heat, light, and power is a Fuel Watcher's responsibility to prevent waste. Make sure that your system covers each department. Post in each department practical directions for the economical usage of steam and water, gas, electricity, oil, and compressed air *in that department.* Encourage suggestions and schemes from all your Fuel Watchers for even greater savings of coal, steam, hot water, gas or electricity, oil, and compressed air. Give every suggestion *personal consideration.*

Together, a good Fuel Watching System and the intelligent use of your Fuel Efficiency Bulletins cannot fail to yield immediate and very welcome economies of coal gas, and electricity.

Look up Fuel Efficiency Bulletin No. 7 without delay for further information. If you've mislaid your Bulletins send to your Regional Fuel Efficiency Secretary for further copies.

KODAK FILM helps engineers to measure stresses

Here is a picture of the internal stresses in the "chair" of a railway line under load. Such pictures, obtained by photographing transparent models in polarised light, enable engineers to see where extra strength is needed and where economies in material can be made. The work of science and industry, for peace-time needs as well as for the needs of today, owes much to photography and 'Kodak' Film.

Kodak Limited, Kodak House, Kingsway, London, W.C.2.

THE BUSINESS WORLD

Unilever Accounts

THE publication of a consolidated balance sheet by Lever Brothers and Unilever, Limited, marks another milestone on the road towards informative accounts. The company controls concerns covering every stage of operation from raw material production to final retail selling. These concerns carry on business in a number of different currency areas, and the consolidation of accounts expressed in currencies which may vary in value against one another obviously presents problems and may call for considerable discretion in interpretation of the result.

If, realising these limitations, as they do, the board of Lever Brothers and Unilever, Limited, think it worth while, even under some pressure from public opinion, to publish a consolidated balance sheet, the arguments against the publication of similar figures by less complex groups are reduced to vanishing point—that is unless they are frankly based on a belief in obscurity for its own sake. It may be of significance that the chairman of the company is a member of the Cohen Committee. In view of the considerations stated, the directors point out that the balance sheet can only be taken as a general guide. Its value is further weakened by the absence of similar accounts—or, indeed, any—for the Dutch associate (usually known as “Unilever NV”) to distinguish it from the British company “Unilever, Limited”) and by the fact that the figures of the United Africa group are partly estimated, since their accounts are made up to end-August. These are mainly matters over which the board have little control. It is more interesting to consider how far they have gone in those where they are free to act.

As will be seen from the accounts, set out in detail on page 555, the general presentation of the balance sheet is in accordance with the main lines of the recommendations of the Institute of Chartered Accountants. Reserves are properly grouped and separated from provisions. The latter, however, are mainly included under a general heading with current liabilities. For the most part all the items under this main head fall to be dealt with during the current year. But two of them, replacement of ships and exchange differences, are of a completely different character. Their meaning is clearly explained in the body of the report, as it should be, but it is arguable that it is over-conservative to deduct them from liquid assets in calculating net working capital. The former is depreciation in suspense, to be used to write down new ships to pre-war valuations as and when they come into service. The latter is a reserve against exchange fluctuations.

The remaining items of the accounts are more or less self-explanatory, except for fixed assets, which, perforce, raise a problem of some complexity. Not only is there no subdivision of tangible assets, but these are lumped into one figure with goodwill and, according to the rubric, “premiums less discounts and capital reserves” of the consolidated companies. Included in these deductions is £1,669,161, representing a reserve of the parent company resulting from a valuation of shares in subsidiary and allied concerns in 1937.

(It may be remarked, parenthetically, that the parent company appears to have changed its practice about the treatment of share premiums—or at least their presentation in the accounts. The balance-sheet shows, as a capital reserve, premiums on shares issued. Some of these were issued in exchange for holdings in subsidiaries. But during last year, when Batchelor's Peas was taken over, largely, by such an exchange, there was no increase in premiums disclosed. Had an issue for cash been made and the cash used to buy shares in Batchelor's Peas, the inclusion of the premium would have been obligatory. The effect of either procedure is the same. Should not its reflection in the accounts be identical?)

On the composite basis of valuation set out above, the fixed assets of “Unilever, Ltd.” stand at £82,939,273. This is neither what they cost originally, nor what they cost “Unilever, Ltd.” to acquire. Nor has it any relation to replacement cost or earning power. It contains elements of each, except replacement cost, but it would be a puzzle to give a single definition of its meaning. A certain amount of standardisation of practice is believed to exist within the group, but it seems that this starts from basic figures arrived at by a variety of different practices. If it is conceded that a complete revaluation is too large a task, that strengthens the argument for a much greater uniformity of practice in the future. It is easy to believe that the publication of values of groups of assets might be misleading if the individual accounts are so variously compiled. It is also true, as the report states, that the prime consideration is earning power. It is, however, still the case that it would be a valuable addition to economic knowledge to know the nature of the assets which form the physical foundation of the earning power.

Similar considerations apply, *mutatis mutandis*, to the composition of the deduction shown for “depreciation and obsolescence.” It will be noted that the balance-sheet figure shows a rise of £2,526,000 on the year, whereas the total depreciation provided in the consolidated profit-and-loss account of the group is only £1,977,633. The difference between these figures arises from the inclusion of the depreciation reserves of Batchelor's Peas and Frosted Fruits, from the consolidation of the accounts of the North African interests, from transfers to write down the value of ships completed during the year out of insurance received in excess of book values, and possibly from other sources. The net effect is that total long-term assets, even before deducting the depreciation provided from 1943 profits, show a small fall in spite of the acquisition of the two companies mentioned and of capital expenditure of £586,597.

The conclusion is that the consolidated balance sheet is less informative and satisfactory than the consolidated profit and loss account—which need not, and does not—inherently inherit troubles from the past. The board has, however, made clear its limitations and the meaning of some of its items, and that is itself a big step forward.

The aggregate profits of the group, before charging a slightly larger sum than in 1942 for repairs and renewals, show a fall of over £1 million to £191 million odd in 1943. There is, however, a profit of about £1 million derived from the revaluation of the French franc. The amount of NDC, EPT and income-tax provided for the current year is slightly lower, but the additional tax provision, including adjustments in respect of earlier years, is much lower. Thanks to this, to somewhat smaller costs for war damage and to the saving in interest resulting from debenture conversions, the net amount available for the ordinary capital and co-partnership certificates is up by almost 50 per cent.

The 49.1 per cent earned for ordinary, shown on page 555, is a measure of earning power, not necessarily of the amount accruing to the benefit of the equity. If the comparison is carried back rather earlier, the figure, on this basis, was 54.8 per cent for 1939 and 49.5 per cent for 1940. Thus earning power is still below the level of the first 15 months of the war. In these two years appropriations for the purpose of funding staff pensions reduced the amount accruing directly to the ordinary to 36.6 and 28.4 per cent respectively. Further, all these calculations are based on figures prior to the provisions made against the contingency that “Limited” may have to provide dividends on the ordinary capital of “NV” for the period of the occupation. What the profits attributable to that group have been is not yet known. Nor is it possible to say how far they may be regarded as necessary to cover damage and other losses. All that can be said is that taxed reserves exceeding 26 per

cent of “Limited” ordinary capital may conceivably be drawn away for this purpose.

As to the future, there is prospect of small further reductions in cost from the disappearance of War Damage contributions and, in due time, from reductions in debenture interest and taxation. Each recent year has brought a reduction in the contribution of home trading profit to the total. Mr Geoffrey Heyworth, chairman of the parent company, puts the overseas figure at 44 per cent for 1943 against 37 per cent for 1942 and 30 per cent for 1941. Evidently a recovery towards pre-war conditions at home would have a great effect on earnings.

Tourism in Britain

UNTIL recently, to mention tourists or tourist traffic was to recall to British minds visits to the Continent, drinking in French cafés, winter sports in Switzerland, walking in Germany, tzigane music in Hungary, and similar delights. On the Continent, the word tourist connoted a profitable livelihood for hotel and café keepers, for luxury shopkeepers and for all the other participants in a flourishing industry. But few people in this country ever thought of tourism as an industry or realised that Great Britain was itself a tourist market, in which the services comprising the tourist trade were bought and sold.

There were two reasons for this state of affairs, the most important being the lack of information. Every component of export trade is measured with some degree of precision. But in the balance of payments, tourist traffic appears only as a net (unfavourable) balance, and even then it is concealed in a miscellaneous item, aggregated with such very different things as the sale of second-hand ships. The other reason is the general offhand British attitude to the foreigner. That people speaking a foreign tongue should be regarded as oddities is perhaps hardly to be wondered at in a country where a resident of ten years' duration in a village is still graded a “foreigner,” and the term is used with some disparagement. Casualness towards visitors from other countries is noticeable in small ways. Compared with European countries, few shops exhibit notices like *ici on parle Français*, or *hier spricht man Deutsch*, and certain common notices are never displayed in other languages, even in the centre of London, as is the case abroad. The Publicity Bureaux in several of the resort towns are pale reflections of the *syndicats d'initiative* which, on the Continent, cater for the well-being and entertainment of the visitor.

It has lately been realised that Britain's tourist industry was in fact a considerable source of income. The cinderella among exports is at last receiving some recognition. Its post-war prospects are being discussed in the light of the uncertain future of this country's balance of payments, the need for maintaining every existing foreign market, for developing new ones, and for acquiring foreign exchange.

Among recent discussions on the importance of the tourist trade, Mr R. G. Pinney's study, *Britain—Destination of Tourists*,* is the most detailed. His task has been difficult because of the lack of statistics, but his estimates reveal the remarkable fact that Britain's tourist industry before the war was

of first-class proportions, comparable in value with that of the USA and nearly half as large as that of France—the country “with the largest credit estimate” from tourism. It compared in value with the exports of the United Kingdom's woollen industry or of her coal.

The estimates made by Mr Pinney, who follows Sir F. W. Ogilvie's methods, show that the expenditure of visitors to the United Kingdom between 1926 and 1938 fluctuated between some £24 and £33 million per annum. In 1937, coronation year, tourist expenditure reached a peak of £33,299,455, which compared with the following receipts from other exports in the same year: cotton yarn and manufactures, £68,509,000; machinery, £49,741,000; iron and steel and manufactures, £48,370,000; vehicles of all kind, £39,924,000; coal, £39,654,000; woollen and worsted yarns

* *Britain—Destination of Tourists*. R. G. Pinney. Travel and Industrial Development Association. 106 pp. 2s.

There will, however, be many problems to be faced and a great accumulation of arrears of capital outlays to be met. Final decisions cannot be reached until it is possible to plan on a world wide scale in conjunction with “NV,” but preliminary plans are under consideration. Only one specific new development is mentioned, namely the establishment of a plywood industry in Nigeria, as one item in a plan for the industrialisation of the Colonies. While the outlook would seem to be for a material recovery in retained earnings, the shareholder will do well to remember that “Limited”, more perhaps than any other large British concern, not only draws its profit from the sale of necessities to the public, but has also a moral responsibility for the development of some of the territories in which it operates.

and manufactures, £35,503,000; and chemicals, drugs and dyes, £24,653,000. The importance of the tourist industry can be judged from these figures of visible exports.

A remarkable fact is that the tourist industry does compare so favourably with the main visible exports, when the effort made to sell those goods is measured against the passive attitude of the trades concerned towards the revenue derived from its customers from overseas. But it compares unfavourably with the income derived from tourists by other countries; in France, for example, it amounted to some £100 million in a good year. This difference, perhaps, is the measure of lost opportunities. Before the war there was insufficient impetus behind the diverse interests which stood to gain from a larger tourist trade for action to be concerted, and the extra business for each would have been only a small part of their total receipts.

Although there was no encouragement to them to come, and no very warm hand of welcome greeted them when they arrived, foreign visitors came in fairly stable numbers (the average before the war was about three-quarters of a million). This augurs well for the future. If so much has been got with so little effort, it is not unreasonable to suppose that a greater effort will produce a much larger revenue.

A firm which sells goods has the advantage that it can show samples of them. The product can be looked at and handled by the prospective customer before he buys it. He can even order an article which is different from the sample and more to his own taste. There are no samples which the man who proposes to sell Britain can take abroad to the prospective customer. His task is not to be envied. He has to sell a personality, a tradition, a way of life—and he has to try to sell a climate. To say these things is not to imply that Britain has a limited appeal as a holiday centre. It has its own beauties, historic buildings and charm, as well as what may be termed the usual “holiday attractions.” Happily, large tracts of the countryside have been preserved and made available to the public by the activities of the National Trust. The language is widely spoken and understood by foreigners, so that the lack of disposition of the Englishmen to speak foreign languages is not a real barrier, as the English tourist in Europe has discovered. In any case, a considerable part of the market must be among the English-speaking peoples of the Dominions and the United States. There can be something in every aspect of Britain which can be made to appeal to the potential visitor.

Some agency or organisation is required to do the selling, because, as experience shows, the task cannot be left to individual enterprise. The range of trades which share the money the tourist spends is wide. Transport services, hotels, restaurants, entertainments, shops and consumer services will all gain directly, and indirectly the additional income brought in by visitors is like a stone thrown into a pool. The goods they buy and take home to be admired by friends can assist visible exports indirectly by increasing the demand for British goods. Tourism also provides employment. In 1931, hotels, restaurants, inns, lodging and boarding houses employed 264,578 men and 365,446 women—of whom a sizeable proportion must have owed their living to the foreign tourist. Since so many will gain from the attraction of tourists, there is a strong case for the acceptance by the Government of the responsibility for a body established to undertake the work of presenting

the attractions of this country as a field for the holiday-maker from overseas. Such a body could be organised on the lines of the British Council or the Council for the Encouragement of Music and the Arts.

While the Travel Association offers itself for the job of official national tourist organisation, it recognises that it needs to be reorganised to fulfil this task. In the past it has derived by far the greater part of its income from commercial sources. It was not therefore able to be impartial. For example, its hotel guide contained only the names of subscribers. As in certain other countries, the new tourist body ought to be granted sufficient money from public funds to make it independent of the need for such bias, although it might expect to receive donations from the industries which will gain most from its activities—transport services, hotels and restaurants.

*

A national tourist organisation can draw on the experience of other countries in planning its activities. It could maintain a statistical and research department, co-ordinate the component parts of the tourist industry, maintain offices overseas, and publicity would bulk large in its work. It could co-operate with such voluntary bodies as the Workers' Travel Association, and the travel department of the National Union of Students, to their mutual benefit.

It is not enough to set up administrative machinery to deal with any problem, least of all in the case of the tourist industry. The best salesman cannot sell unattractive goods. However well the publicity is done, there are a number of factors which tend to lessen Britain's appeal to the foreign tourist, and action should be taken to modify or remove them. Visa charges and petty restrictions could

be removed. The improvement of hotels is widely quoted as an essential prerequisite. The Catering Commission has the development of the tourist trade in mind in its work, and its report on this subject is expected shortly. The implementations of its recommendations for the rehabilitation of hotels will benefit the tourist as much as the home traveller. The quality of the service provided by trained, adequately paid staffs will raise the general standards in hotels—provided the need for the training is taken as seriously as the need for adequate payment. There seems little doubt that the austere licensing laws are a powerful deterrent to visitors from countries free of them, as the Royal Commission on Licensing realised. Probably the weather is a deterrent to a visitor from a more clement climate, but this cannot be changed either for his benefit or for ours. There may, nonetheless, be a charm even in an old-fashioned London fog, which could be glamourised. The Travel Association should adopt the Duke of Wellington's attitude to the English climate: "In summer it's perfect; and in winter no country has a better."

In all the discussions on how to increase tourist traffic, it should be remembered that Britain will not derive much advantage from aping what other successful tourist markets have to offer. It is the differences from the traveller's own country which should be brought to his notice, and for which, presumably, he makes his journey. He should be encouraged to make his visit to England an adventure. He can watch a new way of life, eat new food and drink unfamiliar drinks. The insularity of the average European could be overcome by the proper publicity approach. In his travels in Europe he has encountered a good deal of "sameness." The difference between England and any other European country is greater than the difference between any two continental ones. If this idea can be sold successfully, Britain's tourist industry will flourish.

Business Notes

More Belgian Decrees

The immediate results of the Belgian deflationary plan have been far more favourable than could have been expected. The exchange of notes and the somewhat arbitrary limitation of new notes made immediately available were bound to have a profound effect on the everyday economic life of the country. They brought the volume of current transactions down to a mere trickle; during the five days of last week when the old notes still retained their fully legal tender attribute, inevitable confusion prevailed. All this, however, was a five-day wonder during which the new notes circulated with the old, but at highly differential rates of exchange. By the beginning of this week the new notes provided the only valid circulating medium and the drastic reduction in the volume of currency had already struck a death blow at the Belgian black market and was providing strong inducement to the farmer to disband the foodstuffs which he had been holding back owing to his distrust of the old notes. The Belgian Government have kept a weather eye open for the inevitable attempts of the population to discover every legal (and some illegal) evasions of the decrees. One of the main loopholes was found to be the purchase of postage and revenue stamps. The latter are widely used for tax payments and are available in large denominations. Their sale has been stopped and all holdings of revenue stamps have now to be declared and justified to the authorities. The plan for investigating and taxing war profits has been furthered by a decree making it compulsory to declare to the Government all security holdings. Since all dealings in real property have to be registered in Belgium, that register, together with the declaration of securities, the deposit of old notes and the blocking of bank accounts will provide the authorities with most of the relevant data they require for pursuing their investigations.

* * *

Flight From the Franc

The application of the Belgian monetary decrees has been watched with great interest in France. There has been an appreciable movement out of notes into other types of property. The most evident reflection of this movement has been the sudden rally in the Paris bourse which followed a persistent decline that began with the reopening

of the market after the liberation of the city. With a note circulation of about 600 milliard francs, or approximately four times the pre-war figure, this movement out of the currency is having appreciable effect on prices and renders the rate of exchange of 200 francs to the £ increasingly artificial. Evidence of this artificiality is provided by the valuation in Paris of securities also quoted on foreign security markets. Old Consols are currently quoted in Paris at 42,500 francs per £100 bond, or £212½ as compared with the London quotation of £80. In other words, the true rate of exchange on this basis of the relative valuation of Consols would be about 530 francs to the £. Central Mining bearer shares are quoted in Paris at 7,500 francs, or £37½ (at the official rate of exchange) as compared with a quotation of £20 in London. In the black market gold has risen by 10 to 15 per cent since the publication of the Government's decree requiring the declaration of all privately-held metal to the authorities. This flight from notes, however, does not necessarily—or only—reflect a belief that the French authorities will follow the lead of Belgium. Rather on the contrary, it is becoming increasingly clear that the present state of the French administrative machine, never over-strong in financial matters, would not permit a compulsory conversion of the currency. This is most unfortunate, for it greatly complicates the task of avoiding inflation, and it is fear of inflation that is the chief explanation of the rise on the Bourse. Already a "scissors crisis" is developing—wages and material prices are higher than the controlled prices of finished goods—and if the authorities cannot bring the former down, they will sooner or later be compelled to let the latter rise. Thus all the old familiar problems are rising again. Some experts are believed to be considering an enforced limitation of expenditure—a sort of universal points ration—but it is very doubtful whether this would be any easier to enforce than a conversion of the currency.

* * *

Business and Transport

The Joint Committee of the Association of British Chambers of Commerce and of the Federation of British Industries which has been examining the future of inland goods transport advocates a solution in terms of price competition on the basis of equal opportunity between

financially independent means of transport. Its report, published on October 13th, emphasises the need for efficient and economical transport after the war. In its view these objectives can best be attained by the observance of these main principles. First, there should be "as great a degree of co-ordination as possible among the various forms of transport" as means of "avoiding unnecessary overlapping of services and uneconomic competition." Secondly, co-ordination should be achieved by "securing for traders adequate alternative facilities, care being taken that the resultant competition is on fair terms." Thirdly, the trader should have an "unfettered right to select the form of transport which he approves." The Committee insists that all forms of transport—not merely the railways—should publish their rates and that there should be a tribunal—similar to that created by the Railways Act, 1921—with jurisdiction over all forms of transport. To give effect to its proposals the Committee recommends that a public inquiry should be held, "either by a Parliamentary Committee or some other appropriate body, into the existing regulations governing all forms of transport."

*

If the choice were between the ideal form of price competition and either a private monopoly and outright nationalisation, price competition would be the best solution. But, in the peculiar conditions of British inland transport, price competition is a doubtful remedy, not merely because of the very great difficulties in the way of creating the conditions of competition on equal terms, but also because this might give rise to cut-throat competition in the strict sense—that is, to services so cheap that they do not maintain or replace—still less improve—the existing capital equipment of the industry. Capital consumption of this sort is not, in the long run, in the interest either of the consumer or of the community. In the event, of course, this type of competition would lead to a private cartel before it had gone very far. It is easy to understand the reluctance of British business to depart from the principle of competition; but it is difficult to see how the objective of the lowest possible total real transport costs can be attained on the basis of the Committee's proposals. It asks for "co-ordination" and the elimination of unnecessary overlapping of services; but how can this be squared with the maintenance of adequate alternative facilities and of the freedom of choice of the traders? In the matter of both capital and operational expenditure the lowest total transport costs can only be secured by technical integration. But this is excluded from the terms of reference of the proposed committee of inquiry. Technical integration, as was suggested in a series of articles in *The Economist* on September 2nd, 9th and 16th, would involve a departure from the principle of price competition as defined by the Committee; but it need not involve either the creation of a private monopoly or outright nationalisation. The urgent need is for a small independent expert committee to examine the technical conditions of integration; without the facts, expertly analysed, the formulation of rational transport policy is impossible.

* * *

Railways Plan for Air Transport

While the Government has now stated its attitude on the international aspect of civil aviation in a White Paper, discussed on page 535, its domestic policy is still unclear. True, one of the outstanding problems—that of the Departmental control of civil aviation after the war—has been settled, at least partially, by the appointment of Lord Swinton as Minister of Civil Aviation. Civil aviation is not to be administered by the Air Ministry after the war, though it is not yet clear whether it will be given independent status or, what is perhaps more logical, whether it is to be administered by an all-embracing Ministry of Transport. The fact that Lord Swinton has equality of access to the Ministry of Aircraft Production with the Secretary of State for Air will presumably mean that his demands will not have to pass the scrutiny of a jealous air-marshal and should allay fears—hitherto, perhaps, not without justification—that inadequate attention is being given to the production of civil aircraft. On the other outstanding problem—that of participation—the Government has not yet stated its policy. In spite of this uncertainty, however, private enterprise is formulating its plans. The railway companies have completed their plans for a network of services for Great Britain and Europe. They propose to form a new company to operate the network; to offer participation to other air

operators and to the short sea shipping interests who operated regular surface routes before the war similar to the railways' own cross Channel services; to give the public "complete interavailability" of tickets on their land, sea and air network; and to buy British equipment as soon as this is available. Moreover, the railway companies propose to operate their main and subsidiary routes without subsidy, on the assumption that, by agreement between Governments, no subsidies will be granted to other operators in the European field. These plans have evidently reached an advanced stage; they emphasise the urgency of a decision by the Government on the conditions of participation in the development of British air transport.

* * *

Preliminary Statements

The confusion into which some expert commentators fell, on reading the first "preliminary statement" of profits and dividend, released by Electric and Musical Industries last week, has raised again the question of what the ideal premonitory company announcement ought to contain. In this particular instance, a latent ambiguity in wording caused many commentators to confuse group profits with parent company profits and to diagnose a fall when, actually, a rise had occurred, as compared with the preceding year. The matter was put right by a supplementary statement on the company's behalf, but not before dealings had taken place in the market on the basis of the original, and erroneous, impression. The entire position and status of "preliminary statements" would, indeed, be all the better for some measure of regularisation aiming, if not at uniformity, at least at comparability. Unlike the formal annual reports and balance-sheets, of which they are the precursors, preliminary statements are not official documents carrying the direct authority of boards of directors. Presumably, the latter authorise their publication in every case, but the precise form they assume appears to be determined largely by company secretaries, acting frequently in co-operation with some advertising or other agency, through which the information is transmitted to the press and the "translux"

Consolidated Main Reef Mines and Estate, Limited.

(Incorporated in the Union of South Africa.)

Extracted from the Annual Report for the Year ended 30th June, 1944

Capital £1,247,602 in £1 Shares, all issued, fully paid.

DIRECTORATE.

DR. H. PIROW (Chairman). A. A. AURET
MAJOR C. S. GOLDMAN. G. CARLETON JONES
W. H. A. LAWRENCE. A. G. PETYT. R. S. G. STOKES

Tonnage Milled, 2,343,000.

		Per ton milled.
Total Working Revenue	£2,646,142 16 6	£1 2 7
Total Working Expenditure	2,288,415 12 1	0 19 6
Working Profit	£357,727 4 5	£0 3 1
Total Profit for the Year	£369,523 6 1	
Balance unappropriated at 30th June, 1943	418,232 17 3	
Forfeited Dividends Account	1,080 17 0	
	£788,837 0 4	

This amount has been dealt with as follows:—

Expenditure on Capital Account for the year	£5,973 14 11
Miners' Pensions — Provision on account of Outstanding Liability as at 31st July, 1943	13,151 16 1
Transferred to Contingency Reserve	2,100 0 0
Taxation	131,348 15 9
	152,574 0 9

	£636,262 13 7
--	----------------------

Dividends declared during the year:—	
No. 68 of 8½ per cent., and No. 69 of 8½ per cent.	218,330 7 0
Leaving a balance unappropriated of	£417,932 6 7

Available Ore Reserve re-estimated as at 30th June, 1944:—			
	Tons.	Value, Dwt.	Width, Inches.
Main Reef	861,000	3.5	56.2
Main Reef Leader	2,336,000	4.3	53.5
South Reef	1,859,000	3.8	48.7
Bird Reef	2,433,000	2.7	69.8
Total	7,489,000	3.6	56.7

There are in addition 1,076,000 tons of payable ore valued at 4.4 dwt. per ton contained in shaft and safety pillars not at present available for stoping.

Compared with the previous year, the available reserve shows a decrease of 1,386,100 tons, the estimated stoping width is 0.7 inch less, and the average value is unaltered.

The full Report and Accounts may be obtained from the London Secretaries, A. MOIR & Co., No. 4 London-wall-buildings, London, E.C.2.

service of the Stock Exchange. Traditionally, they are a species of advance intimation of the figures which investors are most anxious to learn from the forthcoming report—the rate of dividend and, frequently, the amount of the year's profit. In practice, they have come to be the force which moves market prices, subject to only a relatively small margin of adjustment when the finer points in a company's position—e.g., its liquidity or the view of its prospects taken in the official directors' statement—become public knowledge on publication of the complete accounts. Someone always loses, consequently, if the impression given by the preliminary statement is not, in fact, the right one—since, between the statement and the report, fairly extensive dealings may take place at prices which are too high or too low. The opportunities for "rigging the market" by unprincipled persons are sufficiently obvious to have induced the Stock Exchange, some years ago, to issue an official appeal to all companies to ensure the publication of preliminary statements giving, as a minimum, comparable profits and dividend figures for a couple of years. The initial response was gratifying, but good intentions have not always been maintained, and the purely technical difficulties of ensuring comparability, it must be admitted, have increased since the war. Uncertainty over the taxation position of individual companies has been a frequent source of difficulty. The tendency, again, to furnish consolidated figures for holding companies, progressive and praiseworthy though it is, has introduced another complicating factor; for the "financial area" covered by "profits" may vary between one year and another. Even dividend rates can be a source of confusion if an "interim" in one year is wrongly contrasted with a "final" in another. Obviously, there can be no set form for preliminary statements, but it might serve a useful purpose if the Stock Exchange authorities were to repeat their former request and make it clear that comparability, whatever basis is chosen for calculation, is the prime and essential virtue.

Electrical and Musical Industries

The corrected preliminary statement of Electrical and Musical Industries shows that while the parent company's profit is £22,000 higher at £149,230, the group's profit is only slightly up at £182,024, against £174,357. The ordinary dividend is to be maintained at 8 per cent. Despite the trouble and embarrassment caused by the ambiguous way in which these figures were first presented, they cannot—in any case—be regarded as a very valuable source of information about the company's prospects. Electrical and Musical Industries, as a big concern dealing largely in conventional amenities, has undergone a large-scale conversion to war-time products. For this reason, its present position is an uncertain pointer to future prospects. The difficulties of reconversion will be correspondingly great. But there can be little doubt that post-war demand for its normal products will be very high. These consist largely of gramophone and radio equipment, in which the company supplies a large share of the domestic market as well as possessing valuable foreign interests and connections. Demand for these goods is not so likely to slacken—though there may be increased competition—when restocking has been completed, as for those of most other industries. The company's business in electrical household appliances also has good prospects; while its considerable accumulated experience in the supply of television apparatus opens up new possibilities of production. The low yield of £2 6s. 10d. per cent, cum dividend, on ordinary shares is a reflection of the high hopes of investors of the company's chances.

Russian Oil Mission in Teheran

The arrival of a Russian oil mission to Teheran in September marked an important new phase in Russia's

trade policy and—generally—in her economic relations with her Middle Eastern neighbour. The mission, headed by M. Kavtaradze, an under-secretary of the Soviet Foreign Office, applied to the Teheran Government for a concession in the Kevirkhurian area in northern Persia. At the same time, a commission of Russian experts submitted a scheme for prospecting the oil reserves in the whole of northern Persia with a view to future exploitation by Russia. So far the Russian request has met with a blunt refusal from the Teheran Government, but the refusal has been qualified by the phrase: "For the duration of the war." The reluctance of the Persian Government, and even more so of Persian nationalist opinion, to admit foreign concessionaires is well known; but this reluctance has on some occasions been overcome, both by economic need and diplomatic pressure. That the Russians will not shrink from bringing strong diplomatic pressure to bear upon Teheran can be taken for granted, and M. Kavtaradze has been emphatic in pointing out to the Persians that at any rate they themselves would not be able to exploit their oil reserves and that the Russian concession would help in the industrialisation of northern Persia and in freeing its people from the fear of post-war unemployment and poverty. These arguments may, of course, carry more conviction with the Persians after the war than they have carried so far.

Russia as Oil Exporter?

The Russian keenness on acquiring oil concessions in Persia has probably come as a surprise to the world. It will be remembered that in 1921 Russia annulled her Treaty with Persia of 1907 under which northern Persia became Russia's exclusive sphere of interest. The roads, railways, power stations, harbour installations and land property owned by the Russian Government and by Russian nationals were then declared to be the "property of the Persian people" and were renounced by the Russians without compensation. Even the Russo-Persian Bank in Teheran became Persian property. The present Russian move in Persia seems to foreshadow some return to the economic policy of 1907. The question will be asked, what has impelled the Russians to go back to that policy? It is certainly not any shortage of oil reserves inside Russia. The Russian oil industry has not been affected by any war-time devastations, except perhaps for the minor oilfields of Grozny, which were under German occupation for a few weeks in 1942. The Transcaucasian industry has worked to full capacity in the years of the war, and new oil centres have been greatly developed in the "second Baku" (between the Urals and the Volga), in the subarctic Pechora basin, as well as in some areas of Asiatic Russia. (The only war-time shortage has been in high-octane fuel, which has been imported from the United States.) Immediately after the war the Russian domestic oil output will almost certainly greatly exceed the domestic demand, because the mechanical equipment of Russian agriculture (the largest oil consumer in the country) has been severely depleted. Presumably the Russians' interest in Persian oil is due to their desire to be among the world's great oil exporters. Apart from the political advantages that go with such a rôle, the export of oil would assist Russia in overcoming the pressure on her balance of payments that is bound to arise in connection with her projected imports of machinery in the years of post-war reconstruction.

Welsh Day

For the first time, the House of Commons devoted a whole day, last Tuesday, to a debate on Welsh affairs. The main burden of the day was that Wales needs special consideration, and only one voice—that of Mr. Aneurin Bevan—was raised to point out that Welsh problems cannot be isolated from the general ones of, for example, coal mining, or agriculture. If there is any industrial distinction between Wales and England, it is that industry in South Wales before the war was mainly basic and heavy, so that the population suffered particularly when these became depressed. South Wales has been scheduled as a development area (they used to be called special areas) and its prospects are as good as those of any other area similarly placed. During the war the Government has built six factories in South Wales and one in the North. Wales has shared the general industrial prosperity and diversity of industry. The Government factories in Wales will be leased on the terms already announced for the disposal of

Government factories in general, and will be used to create a better industrial balance in the area. The President of the Board of Trade, in winding up the debate, announced that the Government plan for South Wales was to increase factory space, to extend the range of industry, and to provide special opportunities for light industries. He declared that the plan was already being implemented. Improved communications are vital to these industries and plans are now being worked out by the Ministry of War Transport. They include the improvement of facilities in South Wales, the extension of the navigability of the River Severn, the building of the Severn Bridge, and better communications between South Wales and the Midlands. Mr Dalton's speech probably foreshadowed the outlines of the Government policy for all the development areas. It is proposed to seek legislative powers for the Board of Trade similar to those formerly exercised by the Commissioners for the Special Areas, and a Bill is to be introduced to this effect. With additional powers the Board will be able to exercise strong influence to direct new factories and new industries where they are most needed.

Recording Industrial Health

The value of the Industrial Health Research Board's eighty-fifth report, *The Recording of Sickness Absence in Industry* (HMSO, 4d.), which was reviewed in *The Economist* of September 9th, has been emphasised by *Healthy Industry*, a memorandum prepared by the Automatic Telephones and Electric Co., Ltd., with the object of describing the firm's experience in recording absence from work, and in running a health department. The report is intended to assist other firms, and it contains valuable practical and detailed advice on recording. The two publications should be read in conjunction. It is interesting to note how closely the Automatic Telephone system follows that advocated by the IHRB. *Healthy Industry* adds considerable weight to the Board's report, since it points out, from a business standpoint, the advantages to be gained from a factory health service. The survey declares that concern with employees' health is

... in reality a matter of good management, and not a charitable or paternalistic gratuity.

A year's working of the department is described in detail. Particularly interesting is the work done by the medical officer on minor industrial disease; in specific instances his advice minimised their occurrence, or even prevented them entirely. In industry generally sickness records would assist research in revealing industrial diseases hitherto unrecognised. The author of *Healthy Industry* makes the point that it is unlikely that sickness records will be kept for their own sake or for that of an outside statistical body. Automatic Telephones have made a valuable contribution to industrial health in drawing attention to the use and usefulness of recording sickness, and to the need for more industrial health services.

Goldmining Problems

The annual reports of a number of Rand goldmining companies have followed close on the heels of the confused news regarding labour agreements and renewed disputes. In present conditions, working costs are rising and profits falling. Consolidated Main Reef Mines and Estate managed to maintain its output by using low-grade ore from old development dumps; nevertheless, costs only fell by 7d. per ton, against a fall of 2s. 1d. in revenue—thus reducing the operating profit by a third. The most encouraging report has come from "Blyvoors," who are said to possess the technically ideal mine, which, if the high payability of the ore is maintained, should be able to mill 200,000 tons monthly at low cost. But it is not, in any case, technical problems which are giving most trouble to the industry. It is the shortage of labour, which is keenly felt by all the mines. Development of new ore reserves has been reduced or postponed for several years, due to the need for economy in both stores and labour. Now it can be put off no longer. But even the return of peace will not bring with it a sufficient supply of native labour. The development of the Rhodesian copper industry, among other factors, is a handicap to recruiting outside the Union. Within the Union, a greater variety of alternative occupations may pro-

gressively become available to native labour; and a higher level of education and of political consciousness will make its attitude less pliable than in the past. Counting in the cost of housing and welfare schemes in terms of which their wages are chiefly paid, natives working in the mines receive one-tenth the remuneration of European employees. The latter may be expected to receive before long a large part of the wage increases they are now demanding. In these circumstances, the case for a considerable increase in the native mineworkers' low standard of living is very strong in itself—and it may prove to be the only way to secure sufficient labour. A large part of the cost would necessarily fall on the Union Government's share of gold-mining profits—but the cost of even a large rise in native wages would be by no means prohibitive, and part of it might be indirectly found by intensifying efforts to secure a more balanced economy in the Union. Meanwhile, the goldmining industry's headache—where to find the labour for essential developments—looks like continuing unrelieved.

Warrants to Bearer

The possibility of the restoration to British companies, after the war, of the power to issue share warrants to bearer, appears to be receding. The consensus of opinion among witnesses before the Cohen Committee has been that the utmost publicity of the identity of a company's members is necessary both on financial and social grounds, though views have varied widely as to the degree of disclosure which is desirable and practicable. Imperial and Chemical Industries is the latest of many interests which have testified before the Committee to maintain that there should be compulsory disclosure of the beneficial ownership of shares and debentures, "provided a reasonably convenient and workable scheme can be devised." As the largest joint stock concern registered under the Companies Act, with 200,000 Ordinary shareholdings, the ICI should be in a position to speak with some authority on the point,

NEW MODDERFONTEIN GOLD MINING COMPANY, LIMITED.

(Incorporated in the Union of South Africa.)

and it is significant that its recommendation envisages the application of the principle of disclosure of nominee holdings to private as well as public companies. What is even more important, however, is the way in which the ICI's memorandum definitely ties up nominee disclosure with the suggested permanent prohibition of the issue of share warrants to bearer. The coupling of the two is strictly logical. Nominee holdings are, of course, a method of securing, under a system of registration of shareholders' identity (which does not, under English law, permit the entry of a trust on the register), that anonymity which the issue of share warrants to bearer automatically confers. The whole idea of hiding beneficial ownership runs counter to the evolution of popular conceptions on disclosure, and the restoration of facilities for the issue of bearer warrants, after the war, would render nugatory any steps in the direction of freer publicity which the Company Law Committee, and, subsequently, Parliament, might contemplate. Admittedly, however, some price would have to be paid by way of reduced negotiability of the documents of title in which the Stock Exchange deals. Warrants to bearer are much more popular in overseas centres than in Britain, and if London aspires to regain, in due course, some part of its former status as an international market, the question may assume additional importance. Whether any compromise is possible—under which, for example, the identity of beneficial holders may have to be furnished, on challenge, when a coupon is being cashed—is a matter which it might be worth while exploring further.

Harrisons and Crosfield

Harrisons and Crosfield accounts for the year ending June 30, 1944, show results which, considering the wartime limitations on a merchanting concern much of whose business is in the East, must be judged highly successful. Profits are £17,000 higher at £258,932. They are struck after providing for all expenses including depreciation and taxation, which are—unfortunately—still not shown; but there is the assurance of the chairman, Mr Eric Miller, that taxation has been very heavy in every country of operation, and that in some cases it has been duplicated, in others levied with retrospective effect. The same distributions are made as last year, the deferred ordinary dividend being maintained at the rate of 10 per cent, which compares with distributions of from 20 to 25 per cent in the pre-war decade. At its current price of 90s., deferred ordinary stock yields only £2 4s. 5d. ex dividend, an indication of the high hopes that are set on the company's post-war prospects. Such hopes need certainly not be discouraged by the company's handling of its wartime difficulties. The needs of total war production have doubtless enabled a firm with interests and centres all over the world, and handling the export and import of a wide variety of products, to regain in other spheres much of the loss caused by its reduced function as rubber and tea agents. Liquid resources were sufficient to set aside in 1942 a reserve of £350,000, enough to cover the whole value of investments in Japanese-occupied territory. Clearly, these investments are not now likely to prove a total loss. To any sum that may be freed from this reserve for the purpose of rebuilding business in occupied countries, there has been added this year a special provision of £50,000 earmarked for this purpose. The prudence of making this allocation instead of raising the dividend cannot be doubted. Harrison's and Crosfield are now strongly armed for a post-war expansion of business. The company is keenly

interested in the future demand for natural rubber. Mr Miller re-emphasised its indispensability for motor car tyres and hoped greatly to increase its use as a road-surfacing medium. He also stressed the need, in all types of post-war development for increased partnership and co-operation between merchant and manufacturer.

Australia's Sterling

The report of the Commonwealth Bank of Australia for the year to June 30, 1944, points out that over this period the sterling reserves and money at short call in London increased (in terms of Australian pounds) from £78.5 million to £168.8 million. Unlike certain other accumulators of abnormal sterling balances, Australia appears to be observing the phenomenon with equanimity. This is indicated by the Commonwealth Bank's comments on the proposals for an International Monetary Fund:

In any post-war reorganisation dominated by the larger industrial nations there is the possibility that the special requirements of primary producing countries will not be fully safeguarded, Australia, because the major part of her export income is provided by commodities which are sensitive to seasonal changes and liable to considerable fluctuations in world prices, is in a relatively vulnerable position. She must, therefore, always endeavour to maintain an external reserve which is high in comparison with her total volume of trade in order to protect her internal price and income structure against the full impact of external influences.

In its comments on Australian public finances the report criticises the relatively poor support for Government loans by the public, "whose incomes and cash resources are now very substantial." The criticism gains point from the announcement made last week by the Commonwealth Treasurer that only £85,000,000 has so far been subscribed to the £160,000,000 Second Victory Loan and that this progress is "very much short of expectations."

Premium Bonds for Palestine

The fight against inflation in Palestine is to be waged with the help of a premium bond issue, following the precedent for such a course set by India and Cyprus last year. An initial issue of £1,000,000, consisting of 100,000 bonds of £10 each, is proposed. The bonds will carry interest at the rate of 1 per cent. Premia will be paid quarterly, the first bond drawn each quarter being redeemed for £1,000, while 158 other bonds will carry prizes for smaller amounts. The Colonial Secretary, announcing the issue in the House of Commons last week, stated that "after the most careful consideration of all methods to raise in Palestine as much money as possible by local borrowing, it was decided that premium bonds would make the strongest appeal to the population of Palestine." The premium bond issue in India has not fulfilled the expectations of some of its more hopeful sponsors. The precious metals are still providing a more attractive magnet for the hoarded savings of the people than any piece of paper issued by the Government.

Shift-working in Cotton Industry

The Legislative Council of the United Textile Trades' Unions, in a statement prepared after discussion of Mr Hugh Dalton's five-point plan for the cotton industry, has "recognised that changes are taking place in the mechanisation of the cotton industry." The statement adds that whenever the industry is in a position to instal the modern type of machinery, the operatives' representatives will give the fullest consideration to the question of shift-working unions. The importance of this announcement lies in the fact that strong opposition against shift-working has been put forward in the past by the textile trades unions at conferences. The Legislative Council says further that "it will be realised that the cotton operatives have a right to express themselves on this matter." This suggests that the Council is prepared to let the operatives have the final say, whether there shall be shift-working or not, whatever the view taken by the operatives' representatives as a whole. Does this mean that cotton operatives have recognised that shift-working is an essential prerequisite of the effective utilisation of expensive machinery?

COMPANY MEETINGS

LEVER BROTHERS & UNILEVER LIMITED

HOME AND OVERSEAS TRADING

MR GEOFFREY HEYWORTH'S REVIEW

The annual general meeting of Lever Brothers & Unilever, Limited, will be held, on the 24th instant, at Lever House, Blackfriars, E.C.

The following is the review of Mr Geoffrey Heyworth (the chairman), which, at the meeting, it is proposed will be taken as read:

Much of the company's activities are still bound up with Governmental war requirements, and for that reason the information given in this review, to enliven the bare figures of the published accounts, can only be on general lines.

TRADING—HOME

Soap Trade.—Rationing of domestic and toilet soaps has continued in Great Britain and Northern Ireland, raw materials being limited to 80 per cent. of pre-war consumption. Supplies of packing materials continued to be scarce, necessitating considerable effort in collecting empty containers for re-use.

Margarine Trade.—The margarine industry of the country continues to be carried on under the control of the Ministry of Food, and there have been no material changes during the year. The company continues to play an important part in the provision of vitamins for this product.

Seed Crushing.—This industry also continues under the control of the Ministry of Food. The total crushing in the country was somewhat less than in 1942; our companies maintained their share of it. The same has been the case with oils refined and hardened. Deliveries of animal feeding compounds were greater than in the previous year.

Other Foods.—The most important event was the purchase of Batchelor's Peas, Limited, with the object of broadening the company's interest in the canning industry.

The operations of the food companies generally continued to be governed by the various controls. The volume was less than in the previous year. Dehydration of vegetables was undertaken for Government account.

TRADING—OVERSEAS

The contribution of overseas interests to the combined trading profits was 44 per cent. (37 per cent.).

Availability of supplies and restrictions on output were the main determinants of the volume of our overseas manufacturing businesses, which are located in eleven different Empire countries. Each presented new problems of its own, which were solved satisfactorily by the management on the spot. In total, soap sales were slightly less and edible sales slightly more than in 1942.

An interest in a soap and edible business has been acquired in Rhodesia which will permit the supply of specialties to this market on more favourable terms.

The United Africa Company by its activities in common with other traders on the West Coast has ensured the supply of West African products essential for war purposes, with results which have earned the commendation of the Governments concerned. Subsidiary companies in East Africa, Iraq and Syria have played a correspondingly important role. The United Africa Company and its subsidiaries look forward to taking part in any industrialisation of the colonies which may receive the

approval of the Government and appear to be economically sound; amongst the projects under consideration is the establishment of a plywood industry in Nigeria. In British West Africa the company's pension arrangements have been extended to the permanent African staff at an annual cost of £40,000.

CAPITAL EXPENDITURE

This has been virtually at a standstill except for essential renewals. An urgent programme of renewals, modernisation and extensions involving very large capital outlay at home and overseas is accumulating for attention after the war.

STAFF

Although the flow of staff to the Armed and Civil Defence Forces lessened during the year, it averaged nonetheless 180 a month. Of our regular peace-time employees in the United Kingdom, 11,600 were in the Forces or full-time National Service on June 30, 1944, as were 5,400 of the war-time staff. 327 had been killed or had died on Service; 230 were prisoners of war; 80 had earned decorations apart from Mentions in Despatches. The scheme which was instituted at the beginning of the war of paying allowances to staff on National Service has been continued.

The total personnel employed by the company and its subsidiary and allied companies in Great Britain and Northern Ireland at the end of the year was over 43,000, exclusive of those on National Service, and about the same number were employed overseas.

The capital accumulated in the pension and provident funds increased during the year to £13,485,000. Except for £797,000, this capital is invested outside the business.

In view of the importance which the board attaches to all matters affecting the well-being of the employees in both works and offices, they have appointed a director, Mr H. H. Bagnall, to be in charge of a new personnel department.

MEMBERS

The number of stockholders at December 31, 1943, was 196,438 and of debenture holders 5,044.

POST-WAR PROBLEMS

Progress has been made in determining the general lines of the company's organisation for ensuring expeditious handling of post-war problems at home and overseas.

Discussions with Lever Brothers and Unilever N.V. will be necessary before final decisions can be reached, but the time may be fast approaching when these will be possible. The more detailed study and planning that is required cannot be adequately tackled by the senior personnel remaining with the business; it is therefore hoped that the release of key personnel at present on National Service will soon be feasible.

THE CURRENT YEAR

Sufficient is known of the trend of earnings during the current year to show that they will not differ materially from those of 1943.

GREAT UNIVERSAL STORES, LIMITED

YEAR OF FURTHER PROGRESS

The twenty-sixth ordinary general meeting of the Great Universal Stores, Limited, was held, on the 12th instant, in London.

Sir Archibald Mitchelson, Bt. (the chairman), presided, and in the course of his speech said: "The combined trading profit for the year amounts to £889,754, compared with £722,648 in the previous year. Your directors are pleased to recommend a final dividend of 8 per cent., free of tax, making a total for the year of 11 per cent., free of tax, which compared with 10 per cent., free of tax, last year."

It is a matter of much satisfaction to me, after a connection with your company extending over some ten years, to be able to place on record that its success has been mainly due to a policy of giving the greatest possible value in price and quality to our many hundreds of thousands of customers. Our rising earnings resulted, and continue to result, from a narrow margin of profit secured on a very large turnover; this is an undeniable boon to the vast body which buys our goods.

Our trading profit has once more shown an increase, and if in future we add to this figure the profits we expect from our Jays and Campbells group, you will arrive at a sum in excess of a million pounds, a great achievement for your company and its subsidiaries. It will be even more satisfactory to you to learn that this upward progress of our business has been well maintained during the first half of our current financial year, which gives me every reason to say that, all being well, the results of the year ending next March should equal, if not exceed, those of the year under review.

We see no need and we have no present intention to make any share issue. If at some later stage a new share issue were to become desirable, the board would naturally only decide upon it at such a time and upon such terms as would be as advantageous as possible to Great Universal Stores stockholders.

THE JAYS AND CAMPBELLS' ACQUISITION

In reference to the acquisition of the Jays and Campbells group, the new share capital of £1,000,000 to be submitted to to-day's extraordinary meeting includes £68,750, or 275,000 ss. shares, upon which the vendors of all the ordinary shares of Jays and Campbells were given an option, as part of the purchase consideration payable by Great Universal Stores. None of the 275,000 shares, upon which these vendors hold the option, can be issued to them without the permission of the Treasury.

The average profit of Jays and Campbells for the past eight years, before providing for taxation and depreciation, was approximately £400,000; for 1942-43 it was returned at about £300,000, a reduction which was due to the fact that the company made drastic cuts in the value of stock-in-trade in connection with the introduction of utility furniture.

The reason we purchased Jays and Campbells was that we considered that this undertaking, with almost 200 depots assisted by the merchandising experience of the G.U.S. group, should play an important and profitable part in helping to furnish some of the four million new homes that it is proposed to build to meet the present housing shortage. On the basis of current earnings this investment should add approximately £200,000 to the group's annual gross trading profit without making any further increase in the ordinary share capital of G.U.S. We are of the definite opinion that this acquisition is one of the best and most promising carried through by Great Universal Stores.

The report was adopted, and at a subsequent extraordinary general meeting a resolution was passed increasing the capital by a further £1,000,000, divided into 4,000,000 ordinary shares of 5s. each

RANSOME AND MARLES BEARING COMPANY, LIMITED

SIR ALBERT BENNETT'S STATEMENT

The twenty-eighth ordinary general meeting of Ransome and Marles Bearing Company, Limited, was held, on the 12th instant, at the registered office of the company, Newark, Notts, Sir Albert Bennett, Bt., the chairman, presiding.

The directors' report showed that the net profit for the year, after providing for all revenue charges, including taxation and depreciation, £62,205, amounted to £123,134, which, with the balance of £79,928 brought forward from the previous year, made a total of £202,062.

The following is the statement by the chairman circulated with the report and accounts: Our various plants have been fully occupied during the past year. I am glad to say that there is a great improvement in the liquidity of the balance sheet as compared with that of a year ago. As the time for a return to normal trading draws nearer, this becomes of great importance. While we have no great change-over in production to face, there will be a considerable amount of readjustment to be done. There will also be a transition period before industrial programmes generally can get into their stride, and it is at present impossible to estimate how long this period will last.

You will observe that the board recommend a further transfer to contingencies reserve which will bring this up to £100,000. This should be adequate to meet the cost of the change-over and avoid the necessity of charging such expenses against post-war trading.

THE FUTURE

With regard to future prospects, there is nothing I can add to the remarks which I made last year and which I want to emphasise. I said then that our industry is dependent on the whole field of industrial activity as our products are mainly required for incorporation in capital goods, such as new factories, ships, machine tools, machinery, aircraft, and motor vehicles. There is little doubt that the need for such products in all parts of the world will be very great, but the fulfilment of the need will depend on the financial resources available to industry, and also upon international financial arrangements which will enable a free exchange of goods. It may well be found that the finances of many British industries have been seriously affected by the drastic curtailment of retainable profits during the war.

I also said last year that I hoped that if the war ended suddenly, industry would not find itself with no definite guidance as to Government policy. I may be unduly pessimistic but I am afraid this is exactly what will happen. There is a multiplicity of White Papers and theoretical plans, but I fail to see anything concrete emerging from them. If this is so, the consequences will be serious.

TRIBUTE TO STAFF

I have again to express our thanks to our staff and workpeople for their efforts during the year. I am sure that we would like to extend our congratulations to all those members of the company who are serving in the Forces on the magnificent victories which have been achieved and to express our hope for their safe and speedy return, and our sympathy to the relatives of those who have fallen.

The report and accounts were adopted and a final dividend of 11 per cent., making with the interim dividend of 9 per cent. a total of 20 per cent. for the year, less tax, was approved.

The retiring director, Mr F. W. Baker, was re-elected, and the auditors, Messrs Tansley Witt and Company, reappointed.

DEBENHAMS, LIMITED

FINANCIAL POSITION STRENGTHENED

SIR FREDERICK RICHMOND'S STATEMENT

The ordinary general meeting of Debenhams, Limited, will be held at Wigmore Hall, Wigmore Street, London, W., on the 26th instant.

The following is the statement by the chairman, Sir Frederick Richmond, Bt., circulated with the report and accounts:—

The statement of accounts now presented shows that the balance of the profit and loss account is £780,231, and that after charging debenture interest, trustees' fees and directors' fees, there is a surplus of £692,074, an increase of £64,469, a substantial portion of which is due to a saving of £50,915 in debenture interest in consequence of the conversion scheme which was carried through last year. After adding £305,961 brought forward and providing £379,000 for the preference dividends, there is an available sum of £619,035, which the directors recommend be allocated as follows:—To reserve for taxation £125,000, to reserve fund £50,000, to pay a dividend of 25 per cent. on the ordinary shares £125,000, to carry forward £319,035.

The period covered by the accounts was a difficult one for distributing businesses. All the familiar war-time restrictions—scarcity of merchandise, coupon rationing, price control regulations, loss of staff, etc., etc.—were again present, and they do not become any easier as time goes on. The results are better than I had anticipated in my statement last year, and I trust you have found them satisfactory. Speaking for myself, I think it is a matter for congratulation that, after five years of the most devastating war in history, we have been able to maintain and even to strengthen our financial position.

SUCCESS OF ALLIED COMPANIES

Our three principal London establishments (Debenhams and Freebody, Marshall and Snelgrove and Harvey Nichols and Company Limited) all recorded an increase in sales during the period under review, i.e., the twelve months ended on July 31st last. This increase was almost entirely achieved in the first half of the trading year, because in the second half the turnover was adversely affected by the flying bomb menace. Fortunately, we have been able to keep expenses well under control, and the net results show an improvement over the preceding year. Having regard to the fact that these businesses are prevented from trading in many classes of goods on a pre-war profit basis and that a higher proportion of utility merchandise has been handled, we have good reason to view the results with satisfaction. There can be no doubt that the shopping public have become much more discriminating than they were owing to the necessity of obtaining the fullest possible value for their coupons, and it is not unreasonable to suppose that the preference for quality thus engendered will in very many cases outlast the war, to the permanent advantage of businesses like the three I have just mentioned, which have a world-wide reputation for high-class merchandise. Personally, I have little doubt that our West End businesses will always have a useful and, in all probability, an indispensable function to fulfil, and that they may look to the future with confidence.

PROVINCIAL BUSINESSES

Turning to the subsidiary and allied businesses in London and the provinces, we find their experiences varied considerably, as was only to be expected. While the higher-grade establishments were successful for the most part in increasing their turnover, the more popular businesses, speaking generally, failed to maintain their sales figures of the previous year. Such, indeed, appears to have been the general

experience of retail drapery businesses throughout the country in the year 1943, and this is not surprising in view of restricted supplies and in particular the limitation of coupons, a factor which was accentuated in the case of the provincial businesses by the large-scale return of evacuees to London during that period. Notwithstanding these handicaps, the net results were not unsatisfactory, and with very few exceptions each of these businesses contributed its quota to the profits of the parent company, after making such reserves as prudence demands in these uncertain times.

Shareholders will realise that problems of the first magnitude confront the directors of many of our businesses after the war. I refer to the rebuilding and reconstruction of bombed premises. Nothing definite is known as to the policy of the Government in regard to rebuilding, but while we all realise that the housing of the population must have first priority, it is earnestly to be hoped that the needs of industry, which are also of the first importance if full employment is to be maintained, will receive due consideration.

FURTHER ACQUISITION

Since our last meeting we have acquired the important high-grade business of Griffin and Spalding, Limited, of Nottingham, founded in 1846, and occupying one of the best positions in that city, where we were not previously represented. The policy of your board in acquiring control of suitable businesses in the provinces as the opportunity occurs has hitherto proved successful, and our experience of this particular business since we became associated with it fully bears out the anticipations we had formed of its potentialities for expansion. The directors of Plummer Roddis, Limited, have also extended their footing in Weymouth by the acquisition of V. H. Bennett, Limited, a business which we have reason to believe is capable of considerable development.

I think a study of the balance-sheet will be sufficient to convince anyone that the financial position of the company is very strong. Current assets (stocks, debtors, current accounts, investments and cash) total £3,939,520, against current liabilities of £2,520,685, a surplus of £1,418,835. It will be seen, therefore, that the liquid position is satisfactory.

THE OUTLOOK

In the unprecedented circumstances of to-day, I trust you will not expect me to venture on a forecast of the future. Although we are looking forward with thankful expectation to an early termination of hostilities in Europe, we cannot shut our eyes to the fact that the transition period from war to peace may be protracted, and that the tasks of reconstruction may present problems just as difficult as any we have had to face during the war. The only thing one can predict with certainty is that unsettled conditions will prevail for some time to come. I can, however, assure you that whatsoever the future has in store for us, your directors will spare no effort to safeguard your interests to the best of their ability. If we could feel certain of obtaining some relaxation of the war-time restrictions to which we are now subjected, it would help us enormously and nothing would be more welcome. With regard to the current trading year to date, the results as a whole compare favourably with those of the corresponding period of 1943, and I am hopeful that in the absence of any unforeseen developments of an adverse nature we shall be able a year hence to put before you not less satisfactory results than we have been considering to-day.

CALCUTTA TRAMWAYS COMPANY, LIMITED

INCREASED PROFIT

At the annual meeting of shareholders on the 10th instant, the chairman, Sir Geoffrey R. Clarke, C.S.I., O.B.E., said that conditions in Calcutta had been abnormal, throwing a heavy strain on the tramway service in coping with the additional demand for traffic facilities. The result had been an increase in receipts amounting to £299,902, against an increase in working expenses of £190,915, due mainly to higher wages, allowances to meet increased cost of living, and the supply of food to the employees at normal rates. The severe famine in Bengal particularly affected Calcutta, and the company bought food and supplied it at lower prices, as otherwise they could not have kept the staff together.

(Continued from page 552)

Industrial Relations

The Ministry of Labour is to be congratulated on having produced a guide to industrial relations in Britain. (H.M. Stationery Office; 3s. 6d.) It deals not only with the machinery, both voluntary and statutory, governing industrial relations in different industries, such as joint industrial councils, joint production committees, trade boards, and the arrangements for settling disputes, but acts as a guide through the intricate—too intricate—maze of collective bargaining and wage-fixing arrangements. One section describes the various employers' and trade union organisations; another deals with the International Labour Office; the chapter on the cost of living illustrates the unrepresentative character of the present index. There is an interesting historical section, beginning with the Combination Acts of 1799-1800, but the real story of modern industrial relations might be said to begin with the efforts of the Whitley Committee in the last war to set up permanent joint machinery throughout industry. Whitleyism, though it was established in a number of industries and became especially strong in Government employment, broke down in the largest and most strongly organised industries, largely because it seemed to be imposed from on top and never became sufficiently rooted to resist the troubled state of industry in the years following the Armistice. This time, the machinery for industrial consultation should be better suited to stand up to the stresses of the post-war period, and as Mr Bevin himself has emphasised, should be instrumental in smoothing many difficulties. Whether this machinery will ever operate effectively in the mining industry seems more in doubt, and the threatened strike of the Yorkshire coalfield is a pointer to the trouble that lies ahead. The Handbook shows the real progress that has been made since the outbreak of war. The decasualisation of dock labour is one example, while the extension of statutory wage regulating machinery to the nursing profession and catering trades, and the schemes now under consideration for domestic service, should bring the pockets of hitherto unorganised labour into line, thus completing the process begun in the Trade Boards Act. It will indeed be interesting to see which of the wartime schemes survive; the joint production committee machinery, which has on balance been an important factor in improving industrial relations, is likely to be retained and extended.

Shorter Note

A White Paper is to be issued in the near future to bring up to date some of the figures which were published last July in the *Statistical Digest* from 1938 (Cmd. 6538), relating to the coal industry. Meanwhile a summary of the statistics for the April-June, 1944, quarter has been published in the *Board of Trade Journal* for October 17th. A selection of these will be found on page 557, together with 1939 figures and those for previous quarters, for comparison. It may not be practicable to publish all these statistics at monthly intervals; but the issue of monthly production figures is both possible and desirable in the national interest.

HARRISONS AND CROSFIELD, LIMITED

The thirty-sixth ordinary general meeting of Harrison and Crosfield, Limited, will be held in London on the 24th instant.

In his review of the company's financial year ended June 30, 1944, Mr H. Eric Miller says the financial condition remains strong and liquid. The profit of £258,932 is no mean achievement.

Reviewing the rubber industry, Mr Miller pays tribute to the virtual miracle performed by the U.S.A. in producing huge supplies of synthetic substitutes, thus saving the situation for the United Nations. He reports that exploratory conversations on post-war rubber problems have been held recently in London, by officials of the British, United States and Netherland Governments. The plantation side of the industry is studying the practical problems that will arise on the liberation of territories now occupied by the Japanese.

INDUSTRY AND TRADE

Cloth Exports.—There are no major alterations in cotton textile allocations for export in the last quarter of 1944 compared with the previous period. A small allocation has been made for French North Africa, where the need for goods is extremely urgent. The embargo on exports of wool textiles to the United States and Latin America has been to some extent lifted, and firms will be able to export at the rate of just over half their shipments in the year 1940-41.

Co-operative Trading.—Co-operative Wholesale Society sales for the six months ended July 8th totalled £86,713,513, an increase of 10 per cent. on the corresponding period of 1943. Of this, £64,478,279 was in grocery and provisions, an advance of over 11 per cent. There was an increase of 4 per cent in drapery and men's wear, the sales of these sections reaching £3,852,681, while an increase of 25 per cent in furnishing and hardware raised the turnover in those departments to nearly £2,000,000. Sales to the Ministry of Food were £2,530,856, a decrease of £1,025,493 compared with the corresponding period of 1943. From their productive works, CWS supplies rose 6 per cent to £25,663,116, more than half of which was contributed by the flour mills (£5,730,456), creameries (£3,832,424), preserve works (£1,762,259), tobacco (£1,626,753) and soap works (£1,377,934). Profits have been well maintained, and £1,885,000 is to be distributed to society members at the rate of 5d. in the £ plus a special bonus of 1d. in the £. Deposits and withdrawals in the CWS Bank amounted to £574,346,494 in the half-year, an increase of 7 per cent on the corresponding period of 1943. The bank now operates 49,895 current accounts, compared with 42,336 at the beginning of the war. Since January,

1940, 38 co-operative society accounts have been closed owing to amalgamations, leaving 830 accounts open. Trade union accounts have increased during the war by 1,413 to 10,821; clubs by 30 to 846, and other mutual organisations by 1,876 to 9,710. Three new Co-operative Chemists' Societies (Oldham, Woolwich and York) are applying for membership of the CWS. The directors recommend a donation of £10,500 to the Co-operative College, for which the Co-operative Union is appealing for funds. Negotiations for the amalgamation of the two wholesale societies are proceeding to a harmonious conclusion. Both the English and the Scottish CWS have a director now in Russia making contact with the Soviet co-operative societies for the development of closer relations. Plans being reviewed for the opening of new productive ventures by the English CWS will involve an expenditure of several million pounds after the war.

"The Economist" Sensitive Index.—There was no change in the index during the week ended October 17th. The complete index (1935 = 100) was 158.6; crops 135.6; and raw materials 185.5.

FINANCE AND BANKING

THE MONEY MARKET.—Floating debt borrowing has been on an exceptionally heavy scale this week. The Treasury bills to be taken up amounted, for the first time, to £120,000,000, which went against maturities of £110,000,000. Despite this increase in Treasury Bill borrowing, the Treasury Deposit Receipt call in Treasury Bill borrowing, the Treasury Deposit Receipt call on the banks was heavy, £120,000,000 being required of them as compared with effective maturities of about £76,000,000. The discount market's applications for the higher volume of Treasury bills on offer was understood to have covered the issue, though it required no actual increase in the amount applied for. In other words, the syndicate's quota had already risen to about £120,000,000 in the previous week, though only £110,000,000 of bills were then on offer. The magnitude of the past week's floating debt borrowing has done no more than keep pace with the heavy net supply expenditure, and the credit position in the money market has been kept very comfortable during the week. The banks have been keen buyers of bills, and on most days balances from non-clearing lenders have been available to the market at $\frac{1}{2}$ per cent.

MONEY RATES, LONDON.—The following rates remained unchanged between October 12th and October 19th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, $\frac{1}{16}$ %; 3 months, $\frac{1}{16}$ %; 4 months, $\frac{1}{16}$ %; 6 months, $\frac{1}{16}$ – $\frac{1}{8}$ %. Treasury Bills: 2 months, $\frac{1}{16}$ %; 3 months, $\frac{1}{16}$ – $\frac{1}{8}$ %. Day-to-day money, $\frac{1}{16}$ – $\frac{1}{8}$ %. Short Loans, $\frac{1}{16}$ – $\frac{1}{8}$ %. Bank deposit rates, $\frac{1}{16}$ – $\frac{1}{8}$ %. Discount deposit at call, $\frac{1}{16}$ %; at notice, $\frac{1}{16}$ %.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between October 12th and October 19th (Figures in brackets are par of exchange).

Statistical Summary of the Costs of Production, Proceeds and Profits of the Coal Mining Industry
The particulars included in this statement relate to undertakings which produced about 97 per cent of the total quantity of saleable coal raised during the period. They are based partly upon the returns made for the purpose of wages ascertainties for certain districts, and partly upon other returns supplied by individual colliery owners.

	1939		Last Quarter, 1943		First Quarter, 1944	
	Amount	Per Ton Disposable Commercially	Amount	Per Ton Disposable Commercially	Amount	Per Ton Disposable Commercially

* The Coal Charges Levy was 5s. per ton of coal supplied in the month of January and 8s. per ton in February and March, or about 7s. per ton spread over the quarter. If this amount is deducted from the gross figure of "Other costs," the result will give the approximate net amount of "Other costs" on a comparable basis with figures previously published in the Annual Reports of the Secretary for Mines.

GOVERNMENT RETURNS

For the week ended Oct. 14, 1944, total ordinary revenue was £39,928,000, against ordinary expenditure of £103,954,000 and issues to sinking funds of £360,000. Thus, including sinking fund allocations £7,949,408, the deficit accrued since April 1st is £1,748,746,000 against £1,751,436,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £279,598 to £2,594,687, the other operations for the week (no longer shown separately) raised the gross National Debt by £66,050,346 to £21,332 million.

On Oct. 13 applications at £99 14s. 11d. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday and Friday of following week were accepted as to about 35 per cent. of the amount applied for, and applications at higher prices in full. Applications at £99 15s. for bills to be paid for on Saturday were accepted in full. £120 millions of Treasury Bills are being offered on Oct. 20. For the week ending Oct. 21, the banks will be asked for Treasury deposits to the maximum amount of £120 million.

PMH

PMH stands for Production per Man-Hour. The abbreviation—though not, of course, the concept—has been invented by Sir Frank Platt's Cotton Textile Mission, whose report on their visit to the United States was issued last week. The Mission was despatched across the Atlantic to see whether Lancashire had any lessons to learn from the American cotton textile industry in the way of increasing its technical efficiency and making the scarce supply of labour go further. The report (which is summarised in a Note on page 581) minces no words. It is not content with personal opinions, which are fallible, however well qualified the observer. The Mission collected a large volume of hard facts on output and efficiency in the United States, which are set alongside comparable British practice. The results are both convincing and startling. "With normal staffing," the Mission reports, "British PMH... is less than the American by approximately 18 to 49 per cent in spinning, by 80 to 85 per cent in winding, by 79 to 89 per cent in beaming, and by 56 to 57 per cent in weaving." In other words, the average American worker produces from one and a quarter to ten times as much in an hour as the average English

worker. The main reason for the higher American output the Mission finds to be the use of more modern machinery; one of the most eloquent comparisons in the whole report is between the 95 per cent of automatic looms in America and the 5 per cent in England. But machinery is not the whole story; other reasons for high productivity are the application of scientific methods to the utilisation of labour, the greater standardisation of product and multiple shift working. These are the mechanical factors; but on the personal side the Report adds two significant comments: the average age of the American labour force is much lower; and "American mill managers, generally, are young and analytical and progressive in their outlook."

Here, then, is precise and authoritative confirmation for one of the basic industries of the country, of the thesis that has been argued in these columns in recent weeks.

The resources in manpower and materials still in reserve in the Inner Zone are not negligible. The population of Japan is about 74 millions. For workers and second-line troops, the Japanese High Command can draw on Korea with 23 million inhabitants and Manchuria with 43 million. So far, there have been no disastrous losses in manpower. The outposts of the Pacific conquests are lightly held, though the garrisons are well supplied and can, as is the case at Rabaul, fight on long after they have been by-passed and cut off. The pick of the army is concentrated in Manchuria and North China. The forces in China are not first class troops and so far the fighting in Hunan has been carried out without reinforcements from

outside China. There is, of course, a substantial army in Burma. Even so, Japan has ample manpower and each year new age groups are being trained for war under officers of the Reservist Association.

The weapons at the disposal of the armies are plentiful and the stocks are large, but technically they are completely outclassed by Allied weapons. Shipbuilding is the greatest bottleneck. The Japanese yards can produce about 800,000 tons of steel shipping a year. Even when this figure is supplemented by wooden ships, it is inadequate to cover Japan's losses. However, if the fighting draws back to the Inner Zone, the pressure on shipping will relax. In the air, the Japanese are concentrating—like the Germans, since they lost the struggle for air supremacy—on fighters. The bombing force is slight.

The factor of distance upsets the calculations of comparative strength between Japan and its enemies. The Japanese only produce one-eighth of the United States steel output, but steel is very heavy freight and the industrial centres of Osaka and Nagasaki are nearer the battle fronts than Pittsburgh, Birmingham and Chicago. If, in spite of the difficulties of the calculation, some comparison can be made between the relative strength of Japan and the Allies, it seems that on the sea complete superiority has been established. In the air, too, the Allies enjoy superiority, but in spite of the enormous development of carrier-borne aircraft, they still lack bases from which to strike a decisive blow against the Inner Zone. The Japanese are attempting to overrun the bases in Eastern China. And even if they are saved and others established, the weight of a blow delivered from makeshift bases in unindustrialised China can hardly compare with the offensive launched against Germany from the vast, up-to-date airfields of Britain. The complete Allied superiority on sea and in the air leaves no doubt about the final issue. It is only the time factor—how long will victory take?—that is in doubt. Here land fighting is decisive. It is unlikely that a mass landing on Japan from bases in the Philippines and the Marianas will be the pattern of the attack. The mainland must be conquered first. This would give a broad and nearby land

base for a mass assault. It would also in itself break the backbone of the Japanese industrial effort. China is therefore the key. The landings on the Philippines show that the conquest of the coasts of China is a practicable operation, especially when British fleets and air forces have reinforced the American. But the operation may not be very quick. The Chinese armies are in no state to act as front-line troops. They would only be able to play a subsidiary part. To land enough Allied troops in Southern China—the only stretch of coast relatively open to the Allies—will certainly require another D-Day, with all the planning and building up of reserves that such an action requires.

There is, however, no reason to suppose that the Prime Minister and the President at Quebec underestimated the task ahead or found their resources inadequate. It is the scale of the Allies' economic and military power that makes their victory certain, even though the way to it may be longer and more costly than is sometimes realised. Moreover, the strategic situation in the Far East is not static. Just as the European war was altered at a stroke by Hitler's attack on Russia, so a Russian intervention in the Far East could revolutionise the military situation overnight by opening the back door into Japan's Inner Zone.

Recently articles in *War and the Working Classes* have adopted an unfriendly tone to the Japanese. Even more recently *Pravda* reviewed a novel, *Port Arthur*, on the Russo-Japanese war of 1904 and referred to Port Arthur as part of the Russian patrimony. One cannot build up a policy on allusions and literary articles, but the change of tone is significant. But more important is the inescapable fact that Russia has old scores with Japan and the time to settle them is the time of Japan's greatest involvement with other Powers. Thus a Russian intervention may well change the whole pattern of Far Eastern strategy. It would not make victory more certain; the sentence of the watchers has already gone forth on Japan's brief empire. But it would make victory more rapid and less costly and could pave the way to a more lasting Far Eastern settlement.

A Plan for Broadcasting—I

BROADCASTING is less than twenty-five years old. This is difficult to remember. So familiar has the habit of listening become, so quickly has it taken its place among the conventional necessities of life that it is easy to forget how recent an arrival it is. In the last war there was no broadcasting in any country; neither news nor propaganda could use the air, and "morale-building" had to employ more pedestrian channels. It is only about twenty years since an official Committee, set up by the British Government, reported that the broadcasting of news and entertainment by wireless telephony would never be more than a plaything for the few.

In these twenty years there has been rapid progress in the technique of broadcasting, both in the technique of radio diffusion and in the technique of presentation. A considerable volume of experience has been built up. Yet all is still, in the truest sense, experimental. The time has been far too short for any but the most direct effects of this new social phenomenon to make their appearance. All conclusions must necessarily be provisional in the extreme.

It is the more surprising that, in one respect, broadcasting, young though it is, is already tending to ossify. This is in its main administrative structure. The view is very widely held that there are only two ways in which broadcasting can be organised and financed. One is the way practised in Great Britain and in practically all European countries—that of a state-owned monopoly financed out of the proceeds of licence duties on receiving sets. The other is the American way—of commercial broadcasting companies financing themselves, in competition, by "selling time" to advertisers. Some countries, such as Australia and Canada, have mixtures of the two

systems, but even in these cases, the ingredients are limited to the two of monopoly financed by tax and of competition financed by advertising.

The organisation of British broadcasting is now under review, with the probability that whatever decisions are reached in the near future will be permanent, or at least very hard to upset. There is a very real prospect that the choice of method of organising broadcasting will be regarded as limited to these two, and that the only matters to be considered will be thought to be their respective merits, with a judgment passed, at the end of the argument, for the one or the other. But there is really no reason why the choice should be so limited. Human ingenuity is not so barren nor the technique of social organisation so confined.

This article and those that will follow (all of which are entirely concerned with domestic broadcasting and omit the largely separate question of foreign broadcasts) are a plea for further and bolder experiment. Both of the existing systems have manifest defects. The state monopoly has all the faults to be expected from a monopoly—timidity, conservativeness, greyness, dullness. The advertising system's defects are equally obvious—mercenary, tawdriness, social irresponsibility. Must we really commit ourselves beyond recall to one or the other? Why cannot we exercise our minds in trying to evolve a system that is better adapted than either to serve the purpose for which broadcasting exists?

What are "the purposes for which broadcasting exists"? We have all heard a great deal about the educational and cultural opportunities that are open to the broadcaster and of the corresponding responsibilities for national taste that rest upon him. We have all heard

of the deadly political use that can be made of radio's power to influence the minds of men, and of the necessity for the guardian of this power to be pure and spotless. We have all heard rather too much of broadcasting as a weapon of war.

Now all these, in their various ways, are didactic purposes. They are all issues that worry the intelligentsia. And they all tend to underrate the basic fact about broadcasting. Either it is interesting or it is nothing. Either it commands the listener's attention or else it is wasted on the desert air. Listening is a voluntary act. Even in Germany, Goebbels has never succeeded in compelling the people to listen, but only to have their sets switched on (which is an entirely different matter). It follows that the didactic purposes must necessarily be secondary to the need to be interesting. Broadcasting is not like a school, where the presence of the subjects can be commanded. It is far more like a theatre, to which the audience has to be attracted.

The basic requirement for anything to be interesting is variety. Human beings, fortunately, are not all alike, nor is any one human being always in the same mood. Any broadcasting service that tries to be interesting must seek variety before all things. There is, of course, a great deal of variety within any broadcasting programme. Even in wartime Britain, where there are only two general programmes to choose from, the range of material presented is enormous. But that is not quite the real meaning of variety. It is not enough that there should be a sermon on Sunday morning and music hall on Saturday evening. There is variety in sermons and variety in music halls. Interest is a relative matter, and it is quite impossible to tell whether a programme is really gripping the interest of the listener unless there is something with which it can be compared. There cannot be real variety without choice.

An interesting broadcasting service must, then, offer a wide range of choice—of simultaneous choice. There must, in short, be more than one, or two, programmes on offer to the same listener at the same time. Only so can he be reasonably sure of finding something that will interest him. The argument can be carried further. When soberly analysed, the general programme is an absurdity. Even the most "general" newspaper has no ambition beyond that of entering one household out of three, and if a periodical interests one in ten of the reading public it has been a phenomenal success. Variety, properly interpreted, requires not merely a number of programmes, but a number of different sorts of programmes—one for the highbrow, one for the lowbrow, one for the mezzo-brow, one for the earnest seeker after instruction, one for the no less earnest seeker after escape from instruction. A country will have the perfect broadcasting system if it arouses the greatest aggregate volume of interest; and that requires variety of programmes in range and in depth—several different examples each of several different sorts of programme.

Moreover, this fits in admirably with the chief political requirement of broadcasting—that it should not pollute the democratic process. It is wholly right that the fullest advantage should be taken of the opportunities offered by radio for intellectual cultivation and for moral leadership—opportunities at least as great as have ever been presented by any other medium. But that this enormous power should be placed in the hands of a monopoly, however high-minded and public-spirited, is so obviously and disastrously dangerous that it could only have happened, in a freedom-loving community, in the way that it has happened—that is, by inadvertence and in absence of mind. If the public can only be made to stop and think about the position it has got itself into, its collective hair will stand on end at the prospect. The only event in human history at all comparable with the invention of radio, from the social point of view, is that of printing. What would have happened to our liberties—indeed, to our intelligence—if the printing press had, from the start, been monopolised by a public corporation, be it never so well-intentioned and devoted to its duty? For centuries now, it has been common form among the western democratic peoples to look down upon any benighted country which reserved the power of the press to Authority, and to pity it not only for its political captivity but also for its ignorance, the intellectual backwardness and the technical poverty that are the inevitable consequences of a censorship. So firmly is this doctrine held, that the smallest infraction of it, if it relates to printed matter, will be hotly resented and condemned. Yet a complete breach of the same doctrine, relating to an instrument that may yet prove to be still mightier than the pen, is looked upon with complete indifference.

There is still time—but probably only just time—to remedy this disastrous mistake. If radio is to be the servant of a free society, and not its assassin, it must follow in the printers' footsteps; it must regard itself as a free medium and be prepared to put out to the world virtually everything that is offered to it—subject, of course, to the laws against libel and indecency. Only so can radio avoid becoming a prison for the human spirit. Let there, indeed, be cultural influence and intellectual leadership. But let everyone who has these commodities to purvey, or thinks he has, be given his chance. Let there be no need for an *imprimatur* on any broadcast. Let no question be asked but whether it is likely to interest enough of the customers. These are categorical imperatives. And they can only be met by having a wide choice of programmes independently conducted.

This means that there should not be a single Broadcasting Corporation. Variety is essential to interest, and competition is the necessary mechanism of variety. Whatever plan be chosen for the ownership and financing of broadcasting (with which the remainder of these articles will be concerned), the main essential is that there should be no monopoly.

(To be continued)

Have you heard of—

A CAPITAL ANNUITY

Part capital, part interest . . . £315 per annum guaranteed for twelve years . . . of which, on average, £271 is capital repayment and £44 is taxable interest . . . and, after the twelve years, an annuity of £472.10s. (subject to tax) continuing for life . . . this can all be secured by a male life aged sixty for a present investment of £5,000

NOTES OF THE WEEK

Limited Results at Moscow

The Moscow Conference is at an end with some solid achievement to its credit. The scope of the discussions were, of course, limited by the fact that no American leader was present and this fact more than any other dictated the course of the proceedings. Matters of direct interest between Britain and Russia had pride of place and no decisions appear to have been taken on matters which required the full concurrence of the United States. For instance, the conferences did not carry on the unfinished business of Dumbarton Oaks. Nor were any new decisions taken about Germany. It is widely assumed that Mr Churchill and Marshal Stalin will meet the new American President as soon as possible after his election, and to a certain extent the Moscow Conference has simply prepared the way for further discussions later on. This is fortunate, because on one of the major issues of the peace—the Polish issue—the discussions ended very nearly in deadlock. The existence of the National Committee at Lublin would almost certainly have proved no obstacle to a settlement, had it not been for the Russian insistence that the Curzon Line must be accepted as the eastern frontier of Poland now. Mr Mikolajczyk had no power to accede to this demand and he has returned to London without a settlement. Thus there will be another interregnum in which the existence of two rival authorities will week by week and day by day embitter the issue and make final agreement more unlikely. The National Committee are bitterly attacking Mr Mikolajczyk and laying on him the blame for their failure to achieve land reform. For their part the London Government are very naturally protesting against the arrest in Poland of Poles who support the London Government and their mass deportation to Russia—steps which inevitably recall Russia's bitterly resented policy in 1939 and 1940. The situation is thus little short of civil war, with the Great Powers ranged on opposite sides behind the contending Governments.

Balkan Agreement

Eighteen months ago it looked as though Allied disensions in the Balkans might be as acute as the Polish dispute itself. Happily wiser counsels have prevailed and the latest Moscow Conference has reached a very large measure of agreement between the British and the Russian Governments in their policy towards the Balkan States. The Bulgarian armistice has been mutually determined, though its terms have not yet been published. In Yugoslavia there is to be no clash of governments, for the Royal government in London and Marshal Tito's National Committee are now to act together in a single administration. This satisfactory settlement reflects the realities of the Balkan situation. Russia enjoys enormous popularity as a Slav power, as the principal liberating force and as a revolutionary. On the other hand, the desperate economic needs of the poverty-stricken Balkans, particularly in the matter of food, can only be met from the West. The Russian armies bring liberation but they do not bring supplies, and the handing over of civil supplies to UNRRA in Greece, Yugoslavia and Albania underlines this fact. It is upon this point of economic assistance that the British Government would do well to concentrate. It has far more political significance than the question of the monarchy, which has seemed at times to preoccupy British policy in the Balkans almost to the exclusion of everything else. The crisis which has arisen in the far more politically mature country of Belgium shows that nothing so quickly undermines the authority of a government of national union than failure to meet the popular desire for better and quicker supplies. It is a fundamental British interest that governments of national union should guide their countries over the difficult period of transition. The only alternative is Left Wing extremism or a return of the old figures discredited by collaboration with the enemy. Neither type of government could offer any possibility of stable and prolonged collaboration with this country. Mr Eden is in the Middle East. Admittedly there are many pressing local problems with which he must deal—Turkish

"pre-belligerency" the new Egyptian government, the problem of French relations with Syria and Lebanon, the progress of Arab union—but for the time being, Balkan problems are the most urgent of all. If as a result of his observations he can persuade the military authorities and the Combined Boards to increase their quotas for the Balkans, he will have secured not only a military but a diplomatic and political success.

Towards Unity in Yugoslavia

After prolonged fighting Belgrade has been freed by Marshal Tolbukhin's forces and by Marshal Tito's partisans. The liberation of the capital raises the immediate problem of a new Yugoslav Administration. The issue was discussed at the Moscow Conference, and the Yugoslav Prime Minister, Dr Subasich, has now gone to his country in order to reach a working agreement with Marshal Tito on the type of Administration that is to be set up. The arrangement which was made a few months ago, when Dr Subasich became the Yugoslav Prime Minister, has now outlived its time. It was entirely provisional and temporary. No real fusion or integration between the National Committee of Liberation in Yugoslavia and the Yugoslav Government in exile was even attempted. The agreement merely committed both sides to a sort of political truce and divided between them the spheres of Governmental activity. The Government in exile assumed representative functions abroad, but it obtained no real control over domestic affairs. Inside the country, the National Committee of Liberation exerted—and still exerts—exclusive power, at least in those areas which the partisans have managed to free from the Germans. This division of function, in which the Government in exile obviously played a role more symbolical than real, will now in all probability be revised. In what way the fusion of the two bodies will be brought about cannot yet be said. But the difficulties in the path of unification should not be underrated. The administrative agencies of the Committee of Liberation have done well enough as the local agents of the fighting partisans. They are probably less suited to peacetime government of the country. Dr Subasich and Marshal Tito will now have to try to set up a more normal Administration. In this they have the backing of Russia and Great Britain, since both countries have undertaken not to pursue conflicting policies in this part of the Balkans. The other puzzling problem which will soon be cleared up in Yugoslavia itself is the extent to which the National Committee really enjoys the support of the Serb population. Still another important question bears on the future structure of Yugoslavia. Marshal Tito favours a loose Yugoslav federation; and only this week the formation of an autonomous Macedonian Republic within the framework of Yugoslavia has been announced from Tito's Headquarters. The gesture towards Macedonia will certainly not be received with unanimous approval by the Serb nationalists. They believe in a centralised Yugoslavia in which parts of Macedonia would continue to belong to Greater Serbia for administrative and political purposes. If the Southern Slav nationalities can now agree on the future structure of their state they will perhaps have made a step towards the obliteration of the internal feuds that shook Yugoslavia in the inter-war years and ended in the appalling slaughters of 1941.

Planning Bill to Harbour

The Government made a mistake in attempting to justify the new compensation clauses in the Town and Country Planning Bill on a strictly logical basis. Mr W. S. Morrison reiterated several times during the debate that there was no desire to depart from the principle of a fair market price; but that, since current prices were capricious, the only thing to do was to go back to 1939. But the logical corollary to this argument is to say that any general increase in the price of land and buildings since 1939 should be

taken into account. Whether this was the sense of Mr Hore-Belisha's amendment, or whether it intended to compensate each individual block of land for its rise in value, is not clear. Again, Mr Morrison went back to the much-scarred body of the Uthwatt report to point out that the Government were proposing a standard where Uthwatt proposed a ceiling. But which would be fairer? To take the Uthwatt 1939 values, and to adjust downwards where current market price is lower? Or to take the Government's 1939 prices, and adjust upwards on an invidious basis? The former course would, incidentally, catch the speculation, about whom there was again much talk, but no action. Mr Morrison made clear that the concession that has been made to the owner-occupier was given him solely as occupier, to compensate for disturbance. But the sum offered him is too large for mere inconvenience—and, if it is intended to be that, the whole principle of compensation, instead of the discrimination in paying it, falls open to attack. Mr Hore-Belisha's amendment was eventually defeated by 324 to 58, the great majority of the Conservatives voting with the Government. Some were influenced by Mr Morrison's disingenuous plea, which gave away much of his case, that this method of compensation would be confined to this particular wartime measure. But much more cogent, perhaps, was the argument of the Tory Reformers that to allow for the fall in the value of money in compensating for land would lay the House open to the same principle when social security came to be discussed. This attitude is quite indefensible. If money values steadily and considerably fall, as during the war, it is only fair to increase the state's payments, whether for property or unemployment insurance, in the same way as purchases and wages are automatically adjusted in the open market; otherwise an inflationary spiral will be a fruitful source of haphazard injustice. It is probable that the Commons will finish with the Bill this week. The Government have thus got through the first instalment of a legislative programme accepted three years ago. It can only be repeated that if they had not lingered so very long on the way, much of the present toil, sweat and tears would have been avoided, and a more satisfactory piece of legislation would have emerged. The compensation clauses as they stand will plague the Government for many years to come. To cite only one example of the effects, will the building of houses for letting, so urgently needed, be encouraged by the treatment now accorded to the owner-investor?

Recognition by Halves

The simultaneous recognition of the French Provisional Government by the British, American and Russian Governments has been welcomed with satisfaction in France and in all Allied countries. The act has redressed a genuine grievance which was strongly, naturally and vocally resented by the French. It has also been a remarkable demonstration of unity and co-ordination among the three great Allied Powers. Russia had actually already recognised the French Provisional Government, and the renewal of the recognition on Russia's part underlines the harmony of Allied policy in its relation to France. The act of recognition will not entail any practical changes inside France, where nobody has disputed the right of the Provisional Government to represent the country, although as an article on page 573 points out, there are for the time being serious obstacles to the effective extension of the Provisional Government's authority over the whole country. Recognition ought to have immediate political and diplomatic consequences. France should now be invited to confer with the other great Allied Powers on international security and to join the European Advisory Council. President Roosevelt's statement on Tuesday last that no such invitation will for the time being be addressed to the French must bewilder public opinion in France as well as in the other Allied countries. There is surely no logic in a policy that has at long last recognised the representative character of the Provisional Government and yet does not recognise its title to speak on behalf of France in the inner councils of the Grand Alliance. The French are bound to regard this as a new affront to France's national prestige and as an attempt to deprive it of any say in matters that vitally concern its own future. It need hardly be added that such contradictory policies do not induce Frenchmen to think better of their Allies. Non-recognition was bad policy; half-recognition is no better. Nothing less than full recognition—with all its implications—can do justice to France.

Storm Over Teheran

In last week's issue, there appeared an account of the steps taken by Russia to acquire oil concessions in Northern Persia and the refusal of the Persian Government to consider any concessions before the end of the war. In the course of the last few days, a genuine storm over Persia oil has blown up. The Persian Prime Minister has made a special statement announcing that not only Russian concessions, but also British and American schemes for the exploitation of oil reserves have been rejected; and that the previous Persian Government had been overthrown by Parliament because of its over-favourable attitude towards foreign concessionaires. This statement suggests that nationalism in the Teheran Parliament was strong enough to compel the Government to adopt a negative policy on concessions. The Russians have replied to the refusal at once and with their customary vigour. The accusation has now been levelled at the Teheran Government that it has sabotaged the transport of Lend-Lease supplies en route from the United States to Russia. The gravity of such an accusation is obvious. If the charge were to be taken literally, it would mean nothing less than that the present Persian Government has violated the Treaty of 1942 under which it guaranteed to Russia all facilities needed for the smooth flow of American goods and weapons across Persian territory. In return for this undertaking Russia (as well as Great Britain) agreed not to interfere in Persia's internal affairs and to withdraw the Soviet forces from the zone of occupation in northern Persia after the end of hostilities. It remains to be seen whether Moscow will be disposed to reconsider its commitment of non-interference in the light of the alleged Persian sabotage. Meanwhile it is supplementing its direct diplomatic pressure by giving press and radio publicity to those Persian newspapers which are demanding the dismissal of the Government, not this time for being too kind to foreign concessionaires, Russian or otherwise, but on the contrary, for not being kind enough to the Russians. It seems that the Soviets have little to learn from their capitalist predecessors in the same field.

THE WISDOM OF MAKING A WILL

Unless you make a will the provision for your dependents may be different from that which you had intended. Several reasons, including unwillingness to place the responsibility of executorship upon the shoulders of an intimate friend or relative, who may pre-decease you, may have caused you to defer completing plans for the future.

No need exists for further delay, since you can appoint this Company as executor and/or trustee, either solely or jointly with your wife or husband, a relative, or a friend, and thus be assured of continuity of administration and of security. You are invited to ask any branch manager of the Bank for particulars of this service. Alternatively, you may apply to one of the Company's own offices at the following points:

Head Office: Poultry, London, E.C. 2.
Branches: 70 Pall Mall, London, S.W. 1,
and in Bangor, Birmingham, Bournemouth, Brighton, Bristol, Carlisle, Hull, Leeds, Leicester, Liverpool, Manchester, Newcastle-on-Tyne, Nottingham, Oswestry, Sheffield, Swansea and Torquay.

MIDLAND BANK
EXECUTOR & TRUSTEE COMPANY
LIMITED

Production Planning

The immediate problem of reconversion arises from the difficulty of reconciling three urgent calls on the productive capacity of the country—calls for the maintenance of the maximum effort of war until the moment of victory, for the earliest possible alleviation of the shortage of civilian consumer goods, and for the speedy revival and expansion of the export trades. These desiderata cannot be treated satisfactorily by any hard and fast system of priorities. Neither the war effort nor the export drive should be considered or treated in complete isolation: each depends for its success on the co-operation and the physical and mental well-being of the workers. Without in any way reducing the impact of armed force on the enemy, it should now be possible to relax, in some degree, the principle of total mobilisation for war. In the House of Commons, last week, Mr Dalton was able to throw a little more light on the Government's intentions with regard to reconversion. The Government's war factories will not be sold in the open market. They will be let and their lessees will not be those who can offer most but those most likely to satisfy the various needs of national economic policy. These thousand or more factories, most of them completely up to date and well equipped, are valuable additions to national capital of which the earliest and maximum use must be made by peacetime industry. The Government insist that their activities should, in general, (1) contribute usefully to the employment policy of the region, especially in relation to the creation of a balanced and diversified economy; (2) be suitable for participation in the export drive; (3) be capable of swift conversion—that is, without large structural alterations. These qualifications, if all are fulfilled, are onerous enough: they need not, surely, be supplemented by the further requirement that the factories should be maintained at the ready for an emergency switch-over back to war production. Mr Dalton announced that industrialists have responded well to the Government's invitation of last November, and that there seems to be no difficulty in finding good tenants among the applicants. In the planning and provision of post-war industrial accommodation the Board of Trade is very much at the mercy of the Supply Departments. It is a matter of great importance that these latter should give adequate notice of their intention to quit.

A wise condition governing the tenancy of the Government's war factories is that the goods to be produced should be of high utility standards whether for home or export trade. The technical advantages of utility production are obvious enough. The functional advantages of the products themselves are gaining steadily in appreciation. But an even more important merit of utility standards, under conditions of economic scarcity, is that they greatly facilitate the adoption and enforcement of fixed prices. Post-war shortages will make price control imperative if inflation and its injustices are to be avoided. Utility standards need not be unduly austere. Both in variety and quality their ranges can be extended. During the war, producers of standardised goods—other than the arsenals and war factories—have had to make do with inadequate resources and, to some extent, the benefits of standardised products have been masked (for

the consumer) by inferior materials and poor handiwork. The Government's scheme to encourage the production of utility goods, even when the normal resources of industry are available, should prove beneficial to the domestic consumer and greatly improve the prospects of the export trade.

The Cost of the War

In the House of Commons last week Mr Ascheton advised members to "steel themselves" before he announced that up to September 2nd the war had cost the country £23,893 million. His advice was unnecessary. Although the financial records of war are far from being the "meaningless symbols" they are sometimes supposed to be, their very magnitude stupifies layman and politician alike. Annual Government expenditure has now reached £5,000 million—nearly double the figure of £2,700 million in 1918. American estimates put the total direct cost of the last war at \$330 billion, of which \$200 billion were spent by the Allies. Such figures have very little meaning unless they are related to the real wealth of the community and expressed as proportions of national income. In 1918 the British Government spent about half the community's total income of £5,500 million. Today it is spending a larger fraction—nearly 60 per cent. Not all of the figure of almost £24,000 million is, of course, dead loss. Some part of it represents capital equipment and stocks acquired during the war that will be of service in peace. Much more represents consumer goods that would have been needed war or no war. An accurate measure of the economic cost of the war would involve a comparison of what has been consumed with what would have been consumed. And even if this could be done it would still fail to measure the real cost of the war to the British people. It is not possible by any method of accounting to set a value on physical inconvenience, hardship and suffering, on mental anguish and bereavement.

Greek Claims

One of M. Papandreou's first official speeches since the return of the Greek Government to Athens was devoted to sweeping territorial claims, against Bulgaria in Thrace and Macedonia, against Albania in the Epirus. He also claimed the return of the Dodecanese Islands. There is something infinitely discouraging in this spectacle of the war ending as it began, in a flurry of conflicting frontier claims, the Great Powers claiming territories from the lesser Powers and the lesser Powers from the still smaller Powers. And so the tragi-comedy goes on with no more hope of permanent solution now than at any time in the last century. The war might have taught the lesson that all strategic frontiers have disappeared, and that the only way to deal satisfactorily with a frontier is to make it unimportant. But this lesson has not been learnt. It applies especially to the Balkans. The whole area is so poverty-stricken and its resources are so meagre that the only way in which decent life could be guaranteed to its peasants and workers—across whatever frontier they may live—would be to pool the economic wealth of the entire peninsula and develop its agriculture and its industry in relation to river valleys and mineral reserves irrespective of the frontiers which may happen to cross them. A regional organisation would also be the only solution for small communities such as Macedonia and Albania. The frontiers claimed by Greece in either region would only lead to counter-claims and, once the balance of power in Europe had changed, to new struggles and the drawing of new frontiers. After the last war the southern frontier of Albania was certainly drawn at the Greeks' expense, for the Italians at that time wished to aggrandise their Albanian satellite. There is thus a case for some revision, but it would no doubt lead to Yugoslav claims against Albania and possibly to the disappearance of any autonomy for the Albanians. Similarly, as long as Macedonia is divided between Greeks, Bulgars and Serbs, its frontiers will be a source of perpetual friction. However, it does seem that there is here an opportunity for British statesmanship. The question of sovereignty over islands is less troublesome than the redrawing of land frontiers. There is a strong case for giving the Dodecanese to Greece, and a less strong case, but still a considerable one on grounds of nationality, for placing Cyprus under Greek sovereignty. In return for these sub-

stantial gains, the Greeks should be urged to provide the British with air and sea bases in the Aegean and in Cyprus and to subordinate their frontier claims in the North to a wider Balkan settlement.

Government in Central Africa

In a long and important statement in the House of Commons last week the Secretary of State for the Colonies gave a clear decision on the question of the amalgamation of the two Rhodesias and Nyasaland. What may frequently be an obstacle to colonial regionalism—a difference in native policy between the territories concerned—has in this case been recognised as insuperable, as the Royal Commission under the chairmanship of Lord Bledisloe found in 1938. On almost every ground, historical, geographical and economic, there is a great deal to be said in favour of amalgamation. But even were it conceded that it would lead to a higher standard of living and increased material prosperity, it would still be impossible to reconcile the two fundamentally opposed native policies. In the European areas of Southern Rhodesia, said Sir Godfrey Huggins, the Prime Minister, in 1938,

the black man will be welcomed, when, tempted by wages, he offers his services as a labourer; but it will be on the understanding that he shall merely assist and not compete with the white man.

But in the dependent territories of Northern Rhodesia and Nyasaland the native is regarded as a future partner, and though this principle can at present only be very theoretical, the natives themselves appreciate the distinction between the two conceptions. At a meeting of an African Provincial Council in Northern Rhodesia last year, an African said that his people would only agree to amalgamation if it were clear that the native policy of Northern Rhodesia would not be altered. But the practical advantages of regionalism are not to be abandoned because of the obstacle to amalgamation. A Standing Central African Council is to be set up with a permanent inter-territorial secretariat. It will be consultative and its general function will be to promote co-operation between the three Governments and their staffs. All matters relating to development and welfare, such as communications, health and education, are to come within its sphere. *Ad hoc* conferences will be held under the aegis of the Council to deal with technical and special subjects.

The Council should enable planning for development and welfare to take place on a regional basis and should prove as useful as the Anglo-American Caribbean Commission in the West Indies. Moreover, just as West Indians are associated with the work of the Commission through a system of West Indian Conferences, it is intended to associate unofficial members of the legislative councils of Northern Rhodesia and Nyasaland with the work of the Council and the possibility of direct African association in the future is envisaged. But the Council's work will be unavailing if its plans and advice cannot be carried out for lack of funds. It will be exasperating for Southern Rhodesia, which has made far more progress in these matters than the dependent territories, if improvements are held up on its borders. It is up to the Colonial Office to back up its political theories of partnership for the Africans with practical help in raising their standard of living.

New Constitution for Northern Rhodesia

Colonel Stanley made an announcement at the same time on constitutional development in Northern Rhodesia. The unofficial membership of the Legislative Council will be increased, not however by adding to the number of elected members, but by increasing the number of nominated unofficial members from one to five. The Council will thus consist of nine officials, five nominated unofficial members and eight elected unofficial members; Northern Rhodesia, though it will have an unofficial majority, will therefore still be one stage behind the Gold Coast, where, under the proposed new constitution, there will be an elected majority in the Legislative Council. Of the four new members, two will represent African interests, which, since the original nominated unofficial member was appointed to represent the Africans, will bring their representation up to three—the Africans' request for more representation is

thus granted. Direct African representation in the Council is envisaged when the provincial African Councils, described in an article in *The Economist* of October 14, 1944 (page 500), have had more experience. It is intended that delegates from these should form an African Central Council (not to be confused with the Central African Council for the two Rhodesias and Nyasaland), which should send members to the Legislative Council. In the meantime the members nominated to represent African interests will be Europeans, though on a vacancy occurring it will be open to the Governor to select an African to fill it.

The Italians in England

One of the most serious defects of the section of the British press that feeds its readers on sensations and "revelations" is the inconsistency of its argument. In recent weeks it has tried to champion the cause of homeless Londoners. It has done a useful service in stressing the urgency of repair work and has called for drastic action to mobilise the necessary labour. But at the same time it has thought fit to conduct a violent campaign and vendetta against the Italian prisoners-of-war drafted to London to assist in that same urgent task. The campaign has taken the form of a petulant (though possibly justifiable) grouse against the billeting of prisoners-of-war in houses more suitable for bombed-out citizens. The vendetta, which has taken the form of a vicious racialism, seems to have led the authorities to take the Italian workers off repair work. In return for the doubtful satisfaction of venting racial spite, many Londoners are to continue to live in leaking and roofless houses. Oddly enough, these same voices are loudest in the demand that the physical restitution of Britain shall be assisted by German labour after the war.

What Next in India?

The breakdown of the Gandhi-Jinnah talks at the end of last month has created an unhealthy vacuum in Hindu-Moslem relations. The succeeding weeks have been occupied with mutual recriminations and mud-slinging, quite different in tone from the discreet courtesies which preceded the talks. This *post mortem* period possesses only one advantage, which applies less to Indians than to the foreigners concerned that no solution to India's problem can apparently be found. It has stimulated on both sides statements of Hindu and Moslem ambitions as clear as anything that can be hoped for. Mr Gandhi, backed by Congress, but not officially representing it, has offered a provisional Hindu-Moslem government—in which the Moslems would be a one-in-three minority—to which the responsibility of fixing the boundaries of Pakistan would be given. The principles of demarcation, according to Mr Gandhi's formula, would be that independent Moslem provinces could be formed where (if at all) Moslems could show by plebiscite something like a 75 per cent majority. If and when separate Hindustan and Pakistan states were established, Mr Gandhi would reserve to a central government, in the interests of Indian security and economic development, all matters of foreign affairs, defence, communications, customs and so on. Mr Jinnah, in the more delicate position of a minority leader, is suspicious of the proposal, and demands that the principle of separate independent Pakistan should be accepted first and the details of the scheme formulated afterwards. Two separate constitution-making bodies could then

bargain for the final settlement. Even if the Moslems could get the Hindus to accept this, there would be no guarantee of ultimate agreement, since they would still be the weaker bargaining party. The real problem resolves itself into whether the Hindus will depart sufficiently far from their principle of Indian unity and the Moslems sufficiently far from their principle of Moslem independence for a compromise to be possible and for freedom from British control—which Hindu, Moslem and Briton alike desire—to be attainable. The real choice lies with the minority. Which is preferable, freedom for India or sovereignty for Pakistan? The choice can be made easier by a more accommodating attitude from Hindu leaders than has been shown by Mr Gandhi. It has been suggested that some sort of lawyer's committee of all parties might find it easier to reach a compromise settlement of Hindu-Moslem differences than the more rigidly ideological minds of Mr Gandhi and Mr Jinnah. If the leaders could, when the heat of recrimination has cooled, accept such a delegation of authority, a more hopeful prospect might come into view. No doubt should be left where the British Government stands. It has often been a complaint against British policy that it has deliberately fostered Moslem separatism as an obstacle to Dominion status. The charge is untrue, or at least unproven. Now is the opportunity to prove that it is untrue. The Moslems must not be coerced into a solution of which they are genuinely afraid. But they might be persuaded and their fears might be allayed. In both tasks the British have a positive rôle to play.

Mobilising the Last Ditch

The fall of Aachen and the Russian advance into East Prussia have brought the war firmly on to German soil. The Nazis' reaction to the Allied advance has been to create a new military organisation, the so-called *Volkssturm*, into which will be sent all men from 16 to 60 who are not already in the armed forces. Its task, romantically put, is "to defend the Reich to the last man." Its duties will probably be more sober—to guard dumps, patrol bridges and protect lines of communication, and thus free soldiers for the front line. This is its military significance. In fact, it will not seriously impede the Allied advance. For one thing, it will only have light arms. Its true significance is political. It is not to be organised by the Wehrmacht but by the Party, and in a sense it is a last-minute improvisation to tighten the Party hold on the masses in these ultimate days of despair and apathy. Hitler and Himmler, as party leaders, have tried to give the *Volkssturm* a little historical glamour. It is the *levée en masse* of 1813 and so forth. But it is neither a people's rising nor an incipient maquis. There is no *élan* behind it. Even at this stage it is being arranged through the card indexes at Party headquarters. It will almost certainly dissolve in any area occupied by the Allies. Yet it poses one urgent problem. It signifies the Nazis' continued will to resist. The Wehrmacht and the *Volkssturm* are fighting "delaying actions," though nobody, not even the Nazis, knows what the delay will gain. It may be time for the Allies to fall out. Or time for the Nazis to organise an underground army. But one thing is certain, however. Sporadic resistance—by Himmler's "werewolves"—will continue. To overcome these pockets, the Allies will need the active help of the non-Nazi German people. If the occupying forces show in their tackling of the problems of AMG that they can distinguish a Nazi from a non-Nazi, punish the one and protect the other, there will be some hope of defeating the apathy and desperation which are Himmler's best allies among the German masses. Then it will be possible to secure the active collaboration of German men and women in smoking the "werewolves" out.

* * *

Office Workers on the Move

If the congestion of large cities is to be relieved and their ever-widening sprawl halted, attention must be paid to the possibilities of re-locating offices as well as factories. This is especially true of London, where the need for dispersal is greatest. A committee of the National Council of Social Service, which has examined the possibilities, finds the wartime experiences of evacuated office staffs discouraging. This is largely due to the makeshift conditions in which

they have had to live and work. But even under the best of conditions, many employers would be unable, and most would be highly unwilling, to leave central London. The majority of their staffs are equally hostile to the idea. The attractions of metropolitan life are, apparently, very great. Apart from sentiment and prejudice, apart from domestic and housing ties, London has at present advantages in secondary and higher education and in hospital treatment which count for much among office workers. If firms could be persuaded to move, their best destinations—from their own and the reception areas' viewpoint, as well as from planning and administrative considerations—would be the existing medium-sized towns with good communications with London. Here, office staffs would find strong compensating advantages, such as the avoidance of long daily journeys, easy access to the countryside, lower rents, and a more integrated if less varied society. There are fifty towns of 20,000 to 100,000 population within eighty miles of London, most of them to the south. From these towns, many thousands of City workers travel daily a hundred miles and more. Traffic congestion would also be eased by some decentralisation of offices to the outer suburbs of London, but with the cautionary proviso that these cannot be allowed to spread much further. Only a very limited and partial dispersal of offices is practical. The Government, which is far and away the largest employer of office labour, was considering before the war the advisability of dispersing some of its departments. The lesson is that a policy of office dispersal can only begin to be successful if the Government give the lead.

* * *

How Many Shopkeepers?

To run a small shop was the aim of many ex-Servicemen after the last war; and the many failures then have not deterred the same idea from gaining great popularity among the Forces now. The prospect of a return to fierce competition is naturally distasteful to retailers, whose trade associations have set up a number of panels to give advice to prospective post-war entrants. These panels have already received the blessing of the British Legion. Sweet and tobacco shops, being the smallest and cheapest to buy, may be especially sought after, and for this reason the Confectionery Trade Council has given close attention to its advisory scheme. The advice given by the trade to each applicant will be based on his previous experience, his financial standing, the suitability of the proposed premises, and the "consumer need" of the locality in question. The trade association's own bias in favour of a qualification test for entrants and a limitation on the number of shops in each locality is bound to find its way into their recommendations. An advisory panel cannot of itself restrict new entry; but, administered by a body believing in restriction, it can strongly discourage it. There is every reason for ex-Servicemen and women to exercise caution and gain advice before setting up shop. But are the representatives of existing vested interests the best persons to advise them? "Consumer need," for instance, will be interpreted very differently by the consumer himself, who clearly gains from there being a great number and variety of shops, and by the shopkeeper who equally clearly loses.

* * *

Misprints Supplement

The term *errata* is always something of a euphemism: it would be patently inadequate as a notice of the misprints that appeared in *The Economist* last week. It is a characteristic of misprints that they tend to "creep" into the pages of respectable journals: last week they marched in shamelessly and captured column after column. On page 530 they rebutted the popular lyric "There'll Always be an England" and advised the agricultural industry that "the state's existence is limited in time." On page 531 they hinted darkly at the "privacy" of Russian interests in Europe. On page 538 they raised their eyebrows at the price of "National Health Insurance" by Professor Hermann Levy. On page 540 they referred to a "quaint nation" but, mercifully, failed to identify it. They did so many strange things that further selection would perhaps be invidious. It might be said in self-defence and by way of apology that owing to the peculiar difficulties inseparable from wartime publishing. . . . But there is just a possibility that readers find enjoyment in the *lapsus calami*. If so, last week's effort is a matter for considerable pride.

Shorter Notes

The following table gives the number of civilian casualties in air-raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.....	22,282	28,522	50,804
Total, 1941.....	20,863	21,839	42,702
Total, 1942.....	3,221	4,149	7,370
Total, 1943.....	2,357	3,462	5,819
Jan.-May, 1944.....	1,561	2,916	4,477
June-Aug., 1944.....	5,479	15,934	21,413
September.....	170	360	530
Totals to date.....	57,427	79,162	136,589

Those killed in air-raids during September included 63 men, 80 women and 27 children under 16.

Letters to the Editor

A Policy for Wealth

TO THE EDITOR OF THE ECONOMIST

SIR,—Point number eight of your twenty points enumerated in your final article indicates that in your opinion the question of public or private ownership of an industry is a matter for secondary consideration.

I would agree with you regarding industry in general, but not as regards the mining industry, where, for psychological reasons, it is of primary importance. Here, inheritance of wealth is more closely associated with control than in any other industry in the country, with the consequence that the controllers of this industry inherit not only their shares but a fixed attitude towards the industry and its workpeople. As the miner inherits his job and a similar fixed attitude towards the mineowner, then it is small wonder that strife is never absent from the collieries.

For some generations now sons have succeeded fathers in the mining industry, and with inheritance they assume control. This has a very frustrating effect on the colliery officials, who for the most part can never hope to control policy. Compare this system with the board-room of a modern progressive business where the directors have won their seat at the board-table by sheer merit. There is, moreover, a probability that such a system breeds a natural hesitancy to accept new ideas and improvements, as there is a tendency to rely on systems which have proved successful in the past.

It is my considered opinion that the changes necessary to rationalise the mining industry can only be effected by the nation taking over the ownership of the mines. I speak subject to correction after a mere three years' experience in the industry, but with experience of several other types of industry.—Yours faithfully,

CHARLES A. LIDBURY

Nottingham

TO THE EDITOR OF THE ECONOMIST

SIR,—In his letter published in your October 14th issue, Mr Richmond is hardly fair when he suggests that you were ignorant of any other "worker-satisfaction" factors than a "higher standard of material consumption" on one hand and "more leisure" on the other.

The problem is essentially one of "output per man hour," and within the range of reasonable working hours it has yet to be proved that a reduction in working hours per week will enable the same weekly output to be maintained. It has certainly been proved that a reduction in excessive hours involves no loss of output, indeed may lead to an increase, but, as shown by a recent Medical Health Research Report, this is an argument for reasonable hours, and output does not continue to maintain itself with a progressive decrease in hours from this reasonable standard.

All this does not, however, diminish the force of Mr Richmond's argument, which is the necessity for the worker to obtain satisfaction from his work. Many managers have still not realised this fundamental necessity, and, whether there is a working week of 50 hours or 40 hours, whether looked at from the basis of technical efficiency or of social satisfaction (and there is a close connection), it is necessary for each worker, from top to bottom, to regard his gainful

The rising trend of the wartime birth-rate was maintained in the second quarter of 1944, and reached the new high level of 19.3 per thousand. This compares with 16.2 and 17.5 per thousand in the corresponding periods of 1942 and 1943, and 17.9 in the first quarter of this year. It is the highest birth-rate of any second quarter since 1925. The lowest rate of infant mortality for this period of the year was also recorded. Only 43 children in every thousand lost their lives in the first year of life, compared with 46 in the June quarter of 1943 and an average of 54 in the same period over the last ten years. The death-rate for the whole population, however, increased from 10.9 per thousand in the second quarter of 1943 to 11.2, but was still lower than the average of 12 per thousand for the years 1938-42. The number of marriages recorded, although slightly higher than in the second quarter of 1943, was lower by 23,460 than the average for 1938-42.

employment not merely as a dull necessary economic interlude sandwiched between two periods of delight, but a period in which every effort is encouraged to provide a satisfactory outlet for his abilities and self-respect.

May I, in conclusion, congratulate *The Economist* on the excellence of this series of articles. In depth of analysis and clarity of presentation they have reached a very high level, and should form the basis for many discussions on this topical and all-important matter.—Yours sincerely,

W. PUCKEY,

Director and General Works Manager, Hoover Limited
Perivale

The Shape of Agriculture

TO THE EDITOR OF THE ECONOMIST

SIR,—You write "The grant of any assistance (i.e., subsidy from taxation) means that the non-agricultural community will be just that much poorer." Is that true? Surely it would only be true if (a) we can achieve full employment without a large and prosperous agriculture, (b) we can pay for all the imported goods we cannot grow or produce here in any circumstances, and in addition can pay for what we could grow here only at greater money cost than the foreigner is willing to sell, and (c) the engineering trade would not in fact be able to lower the cost of exports just because it enjoyed the steady bread-and-butter business which a prosperous home market among British farmers would bring?

Once we have proved that we can maintain a high and stable level of employment, then the international division of labour will not only be good theory, it will become practical politics. But until that happy time comes, are you really prepared to spend public money on unemployment benefit rather than on maintaining a high level of food production at home?—Yours faithfully,

DAVID ECCLES
House of Commons

The Bretton Woods Agreement

TO THE EDITOR OF THE ECONOMIST

SIR,—In your article called "Confusing the Issue" in your issue dated October 14th you write this sentence:

Now in some respects—probably on balance—the Bretton Woods plan is more elastic than the gold standard.

In the Bretton Woods plan there is a variation of 10 per cent allowed, whereas if a state is either on or off the gold standard they can alter the ratio of their currency to gold to whatever extent they wish and when they wish. Surely that is more elastic than allowed under the Bretton Woods final act. But please do not take this as a point in favour of gold—it is not.

The internal value of a state's currency in relation to its external value and the management of the former is vastly more important. Gold changes in value, and if it is allowed to drag the external value of our currency up or down with it, then the internal value of our currency should be rectified from time to time to keep level with such changes.—Yours faithfully,

J. W. L. KEMP

AMERICAN SURVEY

Presidential Personalities

With less than a fortnight to go to election day, the Presidential campaign has reached the stage of personalities. Both candidates have an interest in being something less than fully frank about their policies. Mr Dewey has to make himself out to be a much more fervent internationalist than he really is. Mr Roosevelt will lose votes if he reminds the country that he has ever been in any way critical of the once-more-sacred principle of free private enterprise. If the isolationists are the skeletons in the Republican cupboard, the New Dealers and the Communists can always, with suitable expressions of horror, be rediscovered lurking behind Mr Roosevelt. So personalities take the place of policies, and it is almost becoming a contest between Mr Roosevelt's alleged ill-health and Mr Dewey's alleged inexperience. Mr Roosevelt is compelled to parade through New York in the rain to prove that he is hardy. Mr Dewey, in his speeches, has to be so statesman-like that he conveys almost no meaning at all other than that he does not like Mr Roosevelt. In a contest of personalities, the President could hardly help but win, and this is Mr Dewey's weakness. For the last week or so the news has been bad for him. The Willkieites seem to be going over to the President. This is, at least, true of their articulate leaders, such as the *New York Times* and Senator Ball of Minnesota, formally a Republican and a very close associate of ex-Governor Stassen of that state, whom many regard as the coming man of the Republican Party. Whether the rank-and-file Willkieites, who are very heavily drawn from professional and business circles, will follow their leaders is much more doubtful. It is, in any case, likely to be a very close election. In the public opinion polls, Mr Roosevelt has only the narrowest lead, and many of the technical factors are against him. But he still has a number of speeches to make, and the old magic is still very potent. He has already forced Mr Dewey to cancel a speech that was to be devoted to the farm problem and instead attempt to defend the Republican record on foreign policy. In other words, a campaign which started as a bold Republican offensive against the President is now on the defensive. Perhaps the most interesting feature of the whole campaign is the way in which foreign policy resists all Republican efforts to move it off the centre of the stage.

Sticky Flying

The British White Paper on international air transport has had the reverse of a favourable reception in America. So far as can be gathered from the cabled reports, not a single voice has been raised in its favour. The American civil aviation interests, scenting in the references to control of routes and frequency an attempt to limit their freedom to fly anywhere, denounce the British plan as cartellism. Most of them, in addition, fear the impetus that a regulated system would give to the "chosen instrument" notion, which, in America, receives the blessing only of Pan-American (leading candidate for the choice) and of United Airlines. Considerable glee has been expressed in the American Press over the prospect that the Russians and the Chinese will, at the Chicago conference, like the British plan as little as the Americans. This is doubtless true, and was known to the British Government before the White Paper was published. But there is still very little sign that the Americans appreciate the true realities of the position. The papers are still full of announcements of applications for licences to fly from New York to Newfoundland, Eire, London, Paris, Rome, Cairo, and Calcutta, and other such globe-girdling routes. Compared with these empyrean dreams, the White Paper seems pedestrian. What the Americans do not seem to realise is that there is very little prospect indeed of getting the assembled nations to concede such freedom to American aviation—and certainly no prospect at all without the reciprocal grant of equal freedom to foreign aviation in the United States. What would happen to a foreign line proposing to fly from London to Shanghai by way of New York, Chicago, San Francisco and Honolulu, picking up and setting down traffic all the way? As

a practical matter, the alternative is between some such system as is sketched in the British White Paper and the system which existed before the war, in which every traffic stop was the product of separate bargaining. The American operators may yet come round to the British proposal as being likely to give them much more freedom than they can get in any other way.

Liberation in Asia

General MacArthur has redeemed his pledge, given after the Americans' heroic and unsuccessful resistance at Bataan and Corregidor. As he promised then, American troops have returned to the Philippines to free the islands from the Japanese. It may be a long and hard struggle, but, if the campaign goes well, the United States Army will be able to redeem another promise, made by the Government over eight years ago. In 1936 the final date of Philippine independence was fixed for ten years ahead. That prospect, darkened by the Japanese invasion, comes nearer and clearer with the American counter-invasion. Cordial messages have now been exchanged between President Roosevelt and President Osmena, who landed with General MacArthur's troops on the island of Leyte. Until the invasion the Filipino President had been with his Government in Washington, where full recognition as the *de jure* representatives of the Philippines enabled them to maintain constitutional continuity. President Osmena has called on all Filipinos to give their complete and determined support to American troops, and there is the hope that the first pro-Allied fifth column in Asia will soon make itself felt. This call to resistance has been taken by some sections of American opinion as an opportunity to reiterate the need for a Pacific Charter. By this means, it has been urged Far Eastern peoples can be induced to welcome and assist the Allied march to Tokyo. The situation, however, is more complex. Until Allied policy, collectively and individually, has been more fully defined, no vague declaration of pious ideals will serve to instil an unreserved enthusiasm into the mixed peoples of South-Eastern Asia. The liberation of the Philippines now begun will nonetheless be of political as well as military significance. If American-Filipino co-operation can be developed to the full, and can achieve good results, the effect, not only on Oriental peoples, but on future colonial policy in the Far East may be far-reaching. But with the approach of 1946 the question is inevitably being asked whether the Act of 1936 can be applied in its entirety. What is the meaning of "independence" for a country which, in the ten years between promise and fulfilment, will have been conquered by the Japanese and reconquered by the Americans? It is unlikely that any simple formula will work in such a complex situation. But the fashionable American doctrine of hostility to "imperialism" allows of none but the simplest formulas.

Shorter Notes

Stronger economic controls than those of 1914-19 have prevented a repetition of the wild boom in commodity and land prices which took place during and after the last war. But even the smaller rises of the last four years have left American farmers comparatively well off. Real estate values are up by 36 per cent, livestock by 86 per cent, machines and equipment by 34 per cent. Not surprisingly, farmers' currency holdings are up by 140 per cent and holdings of Government bonds by 939 per cent. As a result of this relative prosperity farmers have been able to pay off 14 per cent of real estate mortgages, incurred during the long lean years of depression.

Wartime prosperity is also demonstrated by low figures of business failures. Only 980 concerns failed over the whole of the US in the month of September. The total for 1943, 3,221, was less than one-fourth the number recorded in 1940, and compared well with an average of 17,000 for the 1930s.

THE WORLD OVERSEAS

Tensions in France

SINCE the French Provisional Government installed itself in Paris four major problems of domestic policy have absorbed French public opinion: the setting up of a new Administration; the unification of the regular and irregular armed forces; the purge of former collaborators; and the definition of the Government's social policy. All these problems are interconnected. All reflect different cleavages in the country; a solution for all of them is being demanded, more and more vocally; and none of them has been decisively tackled. These, in brief, are the reasons why social and political tensions are beginning to appear in France.

The Provisional Government has not yet been able to set up an effective administrative machine, functioning under unified direction from the centre. In his speech of October 15th, General de Gaulle openly pointed to the physical and political reasons why this task has so far proved impossible. Physically, the departments cannot be effectively governed from Paris as long as communications between the capital and the provinces are disrupted. Politically, the authority of the Provisional Government has not yet asserted itself in some places against the local and departmental authority of the Committees of Liberation which control the situation on the spot. This is particularly true of Southern France, of towns like Marseilles and Toulouse, where the bodies of local Resistance exercise quasi-independent power. It was to these bodies that General de Gaulle addressed his grave warning that administrative functions can be carried out only by organs and persons appointed by the Government. But the North, too, has its dualism of power. Indeed, in one form or another, it exists in every town in France. The rôle of the Committees will continue to be a crucial issue in French politics for some time to come. The Committees were originally formed as organs of the Resistance. As such, they were naturally opposed to the administrative bodies which acted under the orders of Vichy. They were their clandestine rivals. After the disappearance of Vichy and the collapse of the old Administration, they automatically emerged as the centres of authority. But their authority has been purely political. Their leadership more often than not is Communist or vaguely Left, a reflection of the predominant rôle that the Left played in the Resistance. With the ending of Resistance the Committees have tended to change from the organs of Resistance into organs of the new Power.

French Soviets?

This dualism tends to emerge in any community undergoing a transition full of revolutionary possibilities. After the last war it appeared in every country in which the old political system was breaking down. In Russia, the conflict between the Central Government and the Councils of Workers, Peasants and Soldiers—the Soviets—was for a time the dominant political problem. This was also the case in Germany, Austria, Poland and other countries. In each, attempts to perpetuate dual power were made and failed. Everywhere, except in Russia, the Soviets disintegrated and gave place to an ordinary Administration.

Are the Committees of Liberation the French version of the Soviets? The analogy is in some respects fairly close. But there are some important differences. The Soviets were elected bodies, though they were based on class-exclusiveness; they were elected only in factories, villages and barracks. The Committees of Liberation are not elected bodies. They are self-appointed groups of former resisters. This fact diminishes the weight of their political claims. On the other hand, they have not adopted the principle of class-exclusiveness. More important still, no French party or tendency, not even the Communists, has raised the slogan: "All power to the Committees of Liberation." Nor have

the Committees of Liberation seriously attempted to co-ordinate their activities on the national plane. Their activities have been on a local or departmental scale. But without national unity of action, a revolutionary movement cannot seize power.

Thus it seems highly doubtful whether the Committees, even if they so desired, could challenge the authority of the Provisional Government. What they can do—and what they have apparently been doing here and there—is to obstruct the formation of the normal machinery of Government. Far from constituting a real revolutionary menace to the newly born Fourth Republic, they are by way of becoming a political nuisance. But they can also serve as a useful reserve of personnel on which the Provisional Government can draw to fill the gaps in its own administrative apparatus, now that at long last it is beginning to set one up. Even so, the activities of the Committees, especially in southern France, have aroused the fear of revolution, to which the middle classes are naturally prone, and has helped to revive the old fatal bogey of "bolshivism."

Towards a United Army

The position of the French Forces of the Interior reflects the dualism of power in the military sphere. The antagonism between General de Gaulle's small regular army and the partisans has its explosive possibilities. At first it was suggested that the partisan bands should be disbanded once they had done their job. Politically and psychologically the suggestion was unreal. The men of the Forces of the Interior are far too conscious of their rôle in liberating France to be ready to disappear from the stage. Their ambition is to become the regular army of France in place of the discredited army of 1940. But irregular bands, whatever their merits in guerrilla warfare, cannot be easily transformed into a regular army. After much controversy (and some friction between the Provisional Government and the National Council of Resistance) it has been decided that the regular and irregular forces shall be fused into one army. However, the method of fusion gave rise to a new dispute. The forces of the Interior agreed to their incorporation in the army on condition that they should remain in close formations under their own officers. General de Gaulle, as chief of the armed forces, insisted on his exclusive right to decide such matters as the organisation of the army and the filling of military commands. The controversy has still to be settled; and the incorporation of the partisans into the regular forces has been held up by the shortage of equipment and uniforms. Both sides have shown fear and suspicion and the situation is still tense.

NATIONAL HEALTH INSURANCE

A Critical Study by Hermann Levy

The purpose of Professor Levy's investigation is to analyse how far the structure and administration of the National Health Insurance Act of 1911, which still remains the foundation of sickness insurance in this country, was evolved from a well thought out plan and how far from amendments to meet the wishes of interests outside the sphere of its originators. There is a postscript dealing with the Beveridge Report and sickness insurance.

18s. net

(National Institute of Economic and Social Research: Studies No. IV).

Cambridge University Press

The purge has also proved a thorough problem. In the first weeks after liberation there were outbursts of popular anger and violence, especially in southern France. Popular courts tried and condemned to death a considerable number of ex-collaborators. The proceedings of those courts caused protests from professional judges who sometimes refused to take part in them. Until recently, the excesses of popular revenge made an odd contrast to the apparent inactivity of the Provisional Government. The newspapers of the Left and of the Resistance criticised the Government for its slowness in starting the purge, while groups of resisters reacted by taking justice into their own hands. Recently, however, a legal procedure for the purge was fixed; and this week the purge has started in Paris with the trial of Georges Suarez, the notorious collaborator and editor of *Aujourd'hui*. He has been condemned to death.

Finally, the problem of the purge also has some bearing on the wider issues of the Government's economic policy. The demand for the nationalisation of key industries has been widespread and insistent ever since the first days of liberation; and it has been doubly insistent in the case of industrial establishments whose owners collaborated with the Germans. The Left now very rarely propagates socialisation. Together with many spokesmen of the Resistance, it demands instead that the purge should consistently be applied to the "two hundred families" who own the key industries of France. In the nineteenth century, the formula of French socialism was Proudhon's aphorism, "*La propriété, c'est le vol.*" This has now, as it were, been paraphrased as "*La propriété, c'est la collaboration.*"

All these new controversies over the Administration, the army, and the purge are powerful enough to strain France's national unity and the symptoms of strain and stress are unmistakable. The Left enjoys a strong ascendancy. The ranks of the Right are decimated and scattered in confusion. Yet the Left has not yet won any definite social or political victory; and the Right may still hope that the present storm, like the storm of the Popular Front, is more noisy than dangerous. But the Right is no longer sure of this; and, with fear stimulating its energies, it can probably still close its ranks and strike back. The great question facing the French Government is whether it will be able to steer a peaceful course between futile revolutionary disturbances and violent counter-revolution.

Sweden's Peace Preparations

THE suspension and interruption of Sweden's foreign trade with Germany and most of the countries formerly occupied by Germany will seriously affect Sweden's economic conditions if the end of the war does not come soon. German supplies of coal and coke, iron and steel and chemicals, including fertilisers, cannot be replaced. By the use of timber and peat, imported fuels were cut down during 1943-44 to 40 per cent of the total consumption of solid fuels, against 83 per cent before the war. During the first seven months of this year, Germany had already delivered roughly 3,000,000 tons of coal or two-thirds of the tonnage promised for the whole year. Supplies of steel and chemicals had also been increased. Swedish industry was thus able to accumulate some stocks which will enable production to continue for some time at the present level. Before the suspension of the war risk insurance for ships on Baltic routes, practically the whole of Sweden's coal imports were carried in Swedish ships. Sixty per cent of Swedish iron ore exports, on the other hand, were transported in German ships. It is clear that Sweden's economic position would seriously deteriorate, so far as industrial and agricultural production is concerned, if foreign trade with the Continent and Germany should be at a complete standstill for any length of time. The War Insurance Board of the Government has already reintroduced the insurance of Swedish ships importing from Germany drugs, chemicals, fertilisers, seeds, rubber goods, yarn and semi-manufactures like steel plates and other rolled steel materials.

The latest figures of Sweden's foreign trade show an interesting increase in imports and a heavy fall in exports:

(In million kronor)

	Imports	Exports
1942	1,770	1,313
1943	1,818	1,151
1943 (Jan. to June)	883	589.5
1944 (" ")	931.5	398.5

The increase in imports during the first six months of 1944

is mainly the result of more imports being carried by safe-conduct ships from Latin America, Africa, Spain and Portugal. Exports during the same period decreased by 32 per cent compared with the same period in 1943. Exports of minerals and metals alone dropped by Kr. 100 millions. The latest reduction in exports of iron ore to Germany has made it necessary to reduce the working time in the most important iron ore mines to a five-day week from January, 1945, onwards.

During the spring and summer, industrial activity showed hardly any change. The number of unemployed was slightly above the 1943 figures. But there was a decided trend to peacetime production, residential building showing the most striking increase. The number of flats built increased from 23,000 in 1942 to 33,000 in 1943, and will probably reach 44,000 in 1944.

During the last three years Sweden's index of industrial activity has remained almost stable at some 12 per cent below the pre-war index. Unemployment has almost disappeared, which shows that a considerable labour force was needed for the production of substitutes and for the working of mineral and other natural resources at high costs. This is not surprising in a country which depended to a very large extent on its foreign trade, on the export of minerals, timber, timber products and specialised manufactures, and on imports of foodstuffs.

The Alien Population

The last phase of the war has placed a great responsibility on the Swedes who have promised to supply Finland with as much food as possible. Whether Sweden will be able to replace Finnish imports of grain from Germany, which amounted before the Finnish-Russian armistice to 17,000 tons a month, will soon be apparent. In addition, Sweden has absorbed, from the beginning of the war until the end of last September, roughly 160,000 aliens, mostly refugees—among them 30,000 Norwegians, 16,000 Danes, 5,500 Germans and Austrians, a considerable number of Swedes from Estonia and people from Latvia and Lithuania. Since the Finnish-Russian armistice, the number of Finnish refugees is reported to have reached roughly 28,000 persons on October 11. This does not include 40,000 Finnish children who have been given refuge in Sweden. At present, the number of aliens amount to almost 3½ per cent of the total population.

As long as the war lasts, and as long as Germany is able to control the Western Baltic, Sweden cannot continue its present production without German or German-controlled imports. It is very unlikely that Sweden will end its neutrality and drive the Germans out of Norway, which would give it access to Allied resources. Instead, active preparations are being made to anticipate a speedy end to the war. A short time ago the Swedish Parliament accepted a government proposal for a so-called "Preparedness Budget" in addition to the current budget for 1944-45. This "Preparedness Budget" amounts to a total expenditure of Kr. 1,275 millions for the immediate post-war period. These credits are to be used for the financing of emergency public works during the period of economic change and disruption after the end of the war. Parliament gave the Government powers to dispose of a first instalment of Kr. 342 millions as soon as the economic situation should begin to deteriorate. This is not, however, conceived as comprehensive reconstruction planning. The measure is rather modelled after the "public works creation" schemes which were tried out on the Continent before the war. Its main aim is the prevention of unemployment which might be caused by the disruption of economic relations at the end of the war.

At the same time, Swedish industry has been actively securing industrial orders from liberated countries. The Dutch Government is reported to have placed with Swedish firms a large order for locomotives and other manufactures. Negotiations with the British Paper Controller for large immediate post-war deliveries of cellulose and wood pulp have also been reported. There is no doubt that Swedish specialised manufactures could find ready markets after the war. The subsidiaries of large Swedish concerns in almost all countries of the world will, however, need to be reorganised, and Swedish industry itself will have to be changed before export demands can again be fulfilled. Swedish public opinion has accepted, during the war, a large measure of Government control over industry, but it is emphatically in favour of restoring international trade, without which Sweden's standard of living could not be maintained.

Irish Agriculture

[FROM OUR DUBLIN CORRESPONDENT]

THE *Irish Trade Journal* contains a detailed statistical retrospect of agriculture in Eire between 1926-27 and 1942-43. During this period many events occurred at home and abroad that had effects on the volume and value of Irish agricultural production. At the beginning of the period the gold standard had recently been restored in Great Britain and hopes were still entertained that world trade would return to "normal," defined in terms of pre-war conditions. In 1929 the great depression began, but Ireland did not experience its full impact until 1931. In 1932 a change of Government in Eire led to a new policy of self-sufficiency and in the same year began the "economic war" with Great Britain that injured the export trade for four years. One year after the settlement of this dispute the European war broke out with serious effects on the supply of imports of fertilisers and other raw materials. The many adjustments to changing conditions which Irish farmers had to make are revealed in the following table:

ESTIMATED VALUE OF AGRICULTURAL OUTPUT IN £'000

Year	Live Stock and Live Stock Products	Crops and Timber	Turf	Total Agricultural Output
1926-27	47,067	7,807	3,317	58,191
1929-30	52,204	6,640	3,317	62,161
1934-35	28,415	7,675	2,815	38,903
1935-36	30,977	8,467	3,109	42,553
1936-37	34,266	9,655	3,397	47,318
1937-38	37,271	8,936	3,455	49,662
1938-39	40,465	9,329	3,687	53,481
1939-40	46,914	10,164	3,846	60,924
1940-41	48,653	14,297	5,293	68,243
1941-42	52,349	16,730	7,630	76,709
1942-43	57,584	20,413	8,206	86,203

Many of the changes in the aggregates above are the result of changes in prices. No bulk figure showing changes in physical volume of output is available. The fall in output that occurred between 1929-30 and 1934-35 was less than the fall in value since prices declined during this period. On the other hand, in the last five years physical output fell in spite of the great rise in value. The agricultural price index has doubled during the war. Great variations have taken place in the output of particular products. The number of pigs and the production of eggs have fallen greatly on account of feeding-stuff difficulties. The acreage under wheat increased from 111,000 in 1929-30 to 2,035,000 in 1938-39, and to 6,231,000 in 1942-3. The increase in 1938-39 reflects the Government's long-term wheat policy, and emergency production during the war is responsible for the later rise. The areas under oats and barley, which showed a declining trend in the pre-war years, have risen only slightly during the war. Beet and potatoes have maintained a rising trend. The output of turf rose from 3,339,000 tons in 1938-9 to 4,522,000 tons in 1941-2, but declined to 4,245,000 tons in 1942-3. Intensive efforts have been made to increase the production of turf as a substitute for coal and other imported fuel.

The following figures of the disposal of the agricultural output show clearly the important problems of adjustment which farmers had to solve:

PERCENTAGE OF VALUE OF TOTAL OUTPUT

Year	Consumed by Persons on farms	Other Home consumption	Exported	
1926-27	29.9	21.4	48.7	100
1929-30	27.1	21.5	51.4	100
1934-35	35.7	31.2	33.1	100
1935-36	34.2	30.8	35.0	100
1936-37	33.7	30.3	36.0	100
1937-38	33.6	31.4	35.0	100
1938-39	33.0	29.2	37.8	100
1939-40	32.7	29.9	37.4	100
1940-41	36.0	33.1	30.9	100
1941-42	38.3	33.1	28.6	100
1942-43	40.8	37.0	22.2	100

During the 'twenties roughly one-half of the Irish agricultural output was exported. In the 'thirties, under the influence of the world depression and the economic war, this sank to about one-third and during the war to about one-fifth. Meanwhile, farmers and their families have become more self-supporting in the sense that they are consuming more of their own produce, and the Irish urban consumer has relied in an increasing degree on home-produced food. It is safe to predict that these trends will be reversed after the war, but it is unlikely that exports

will ever absorb as large a proportion of total output as in the pre-depression period.

Statistics of the estimated values of farm materials purchased by farmers show that a great reduction has taken place. In pre-war years the average annual amount was about £7,000,000. It rose from £8,698,000 in 1938-9 to £9,412,000 in 1939-40 and to £12,872,000 in 1940-41. In the following year it fell to £5,633,000 and in 1942-43 to £2,596,000. The volume of materials purchased declined even more since prices rose steeply. During the war more has been taken out of the land than has been put into it. This is the sense in which Eire has been living on capital. No permanent damage has yet been done to the soil, which is naturally very rich and possesses great recuperative power. When peace is restored Eire will require large quantities of imports of all sorts of agricultural equipment and raw materials. It is to be hoped that part of the sterling balances accumulated in the last five years will prove capable of procuring these essential imports.

No. 1—CYPRUS

CYPRUS, the legendary birthplace of Aphrodite, is one of the most beautiful islands in the Mediterranean. In its long story, records of which go back to the earliest historical times, Cyprus has been ruled by many races. It was in the XIIIth Century that England first became interested in the island when Richard Coeur de Lion ruled it for a time during the period of the Crusades. It was not until 1878 that it was again administered by Britain, when Disraeli secured this concession by agreement with the Turks.

Cyprus has a mixed population of some 385,000 people those of Greek descent predominating. The products of the island are mainly agricultural, of which carobs, wheat, barley, oats, potatoes, citrus fruit and tobacco, are the principal crops. There are also mineral resources and it is the Greek word for copper from which the island may derive its name.

The average annual value of the external trade of Cyprus 1935/39 was £3,700,000.

The Bank has branches at Nicosia, Famagusta, Limassol and Ammoudia. Those concerned with trade in the Mediterranean, Africa or the West Indies are invited to communicate with:—

ABDULLA No. 7

WHITE HORSE was never better than it is to-day

It would be easier to buy White Horse Whisky as and when you like to-day if there were not so many people trying to do the same thing. Like so many of the comforts of peacetime, White Horse is scarcer because of the war.

It takes long years to bring this famous whisky to ripeness and maturity. It took forethought and a provident care to provide the present regulated supply. And the same care and forethought are your assurance that to-day and in the years to come the quality of White Horse will be guarded as jealously as ever.

More White Horse could not be released without broaching stocks still growing old and ripe for your future pleasure. And for no consideration will the good name of this famous blend be put in jeopardy.

MAXIMUM PRICES:—Bottles 25/9d.; Half-bottles 13/6d.
as fixed by The Scotch Whisky Association

**WANTED
alive and dead**

THIS is no moonlight chickenstealer. He does not fear the hunter's shot. He is reared not to provide men with sport but women with furs. On certain silver fox farms, cubs were dying at an alarming rate. Intratracheal injections of iodine reduced the mortality in young foxes from 51 per cent. to 12.3. Even dead foxes benefit from iodine, or at least their pelts do. Iodine is used in the lustring of furs.

These are just two of the many uses for this fascinating element. Perhaps you have thought of iodine only as an antiseptic. There are fields besides medicine in which iodine plays an increasingly important part: photography, agriculture, engineering and optics, to mention a few.

It is possible that iodine is used or needed in some way in your business. If so, you can obtain full information—free—from the IODINE EDUCATIONAL BUREAU. This organization was founded for the purpose of helping any institution or manufacturer with an iodine problem.

THE BUSINESS WORLD

British Exports, 1938—43

THE British export statistics for 1942-43,* published last Saturday, are summarised in the accompanying tables; they exclude shipments of munitions and are therefore directly comparable with the figures for 1938, the last full peacetime year. These statistics do not make cheerful reading, for the British export trade has been cut to ribbons. The four main facts emerging are these:—

The volume of exports in 1943 was less than one-third of what it was in 1938, itself not a good year.

The average price of British exports rose by two-thirds, as the result of higher raw material prices and manufacturing costs.

The total value of British exports, in spite of the rise in prices, has been halved.

Exports of goods in 1943 were equal to only 2.8 per cent of the net national income, instead of 10.2 per cent in 1938.

These facts are a reflection of the extent to which British commercial interests have been sacrificed to the overriding needs of the war; they also emphasise the tremendous task of raising the volume of exports 50 per cent above the 1938 level after the war. If this is to be accomplished, exports will have to be five times their 1943 level. The Board of Trade has done well in lifting the black-out on the facts about the export trade and in making known these unpalatable figures in good time.

Only partial answers can be given to the inevitable questions whether British exports suffered more in 1939-43 than they did in 1914-18, and how this decline compares with the experience of other countries.

Unfortunately, there are no figures for 1914-18 comparable to the indices of the average prices and the volume of trade given in Table I. The declared value of British exports showed a smaller decline during the last war; it fell from £525 million in 1913 to £385 million in 1915, but rose again to £506 million in 1916 and amounted to £501 million in 1918. But the figures for 1915 and 1916 include private purchases of Allied Governments and that for 1918 also includes exports of stores in public ownership. Average export prices, moreover, seem to have risen faster in 1914-18 than in 1939-43; in 1919—the first year for which price and volume indices are available—the average price of exports was 177 per cent above the 1913 level (1943 prices were 71 per cent above 1938). The volume of commercial exports undoubtedly suffered a much more severe contraction than is indicated by the statistics of declared values. Even in 1919, it was only 55 per cent of the 1913 figure. In sum, such evidence as is available suggests that though the volume of commercial exports was probably more than halved in 1913-18, the shrinkage was not quite so great as it has been in 1938-43.

Nor is it possible, with any degree of accuracy, to compare British experience with that of other countries. The total volume of commercial world trade may have fallen fully as much as British exports. France, Belgium and Holland, for example, have fared a good deal worse than Britain in that their trade with the world has been almost completely suspended. The United States, on the other hand, has done much better than this country; in his sixteenth Lend-Lease report to Congress President Roosevelt pointed out that the value of the cash exports of the United States during the first six months of 1944, at the annual rate of \$2,800 million, was somewhat above the average annual rate of shipments during the four years from 1934 to 1938. In many individual commodities, such

* "Accounts Relating to the Export Trade of the United Kingdom for the Years 1938, 1942 and 1943." HM Stationery Office. Is. net. Exports for 1939-41, given in Table I, include munitions supplied to Governments of other countries, but not munitions shipped for the use of United Kingdom forces; figures for 1939-41, comparable to those for 1942-43, are to be published shortly. A detailed definition of the statistics is given at the head of Table I.

as cotton goods, a marked decline in British exports has been accompanied by an increase in American.

Examined in detail, the export figures reflect the adjustment of the British economy to changes in the nature and geographical incidence of the war and to the ever-growing demands of the war machine.

On a month-to-month view, the declared value of exports show, an initial dip in September and October, 1939, followed by a strong recovery, reinforced in the spring of 1940 by the export drive designed to yield foreign exchange. The spreading of the war in the early summer caused a renewed downward movement which continued throughout the year. During the first nine months of 1941 the value of shipments was running well below those for 1940; the substitution of Lend-Lease for Cash and Carry early in the year had relieved the pressure on foreign exchange at a time when it was beginning to be difficult to find enough manpower and materials for the war machine and for export. The sharp spurt in exports in the last quarter of 1941 was due mainly to the dispatch of stores to Russia. From January, 1942, when the figures are given exclusive of Government shipments, exports show a steady decline which has continued during the present year. Until 1941 the country had to export as much as possible; since then the policy has been to ship as little as possible.

Not all of these reduced shipments reached their destination. Between the middle of 1940 and the middle of 1942

He made good the deficiencies in his budget by personal borrowing from those early bankers, the City goldsmiths, on terms which were highly satisfactory—to His Majesty! No wonder the limits of the Royal Prerogative took so much thrashing out in Charles II's days. Subsequent and more enlightened Governments have deemed it wise to encourage the Banker, with the result that today the advantages of a complete banking service are available to every citizen. The Westminster Bank with its network of branches offers you the security and convenience of a Current or Deposit Account, while its Trustee Department offers the testator the advantages of corporate executorship. Call and discuss these and other services with your local Manager.

WESTMINSTER BANK
LIMITED

TABLE I.—VALUE OF EXPORTS OF PRODUCE AND MANUFACTURES OF THE UNITED KINGDOM DURING 1938, 1939, 1940, 1941, 1942 AND 1943

Stores owned by the Government which are shipped for the use of United Kingdom Forces abroad have always been excluded from the Accounts. Exports of munitions to the Governments of other countries, including supplies for the use of British Government Forces in the Dominions and India were, however, included in the pre-war Accounts, and have also been included in the figures for the years 1939, 1940 and 1941, with the exception of military stores sent to India for use by United Kingdom Forces as well as by the Indian Army. From January, 1942, however, the export figures exclude shipments by Government Departments of aircraft and other vehicles (except tyres and tubes for road vehicles) and arms, ammunition and military and naval stores, which may be referred to shortly as "munitions." The figures for 1938 are essentially comparable with those in 1942 and 1943 as before the war these goods were mostly exported direct by manufacturers or by representatives of the Government concerned; any such goods now exported in this way would be included in the current Account. The value of parcels despatched to prisoners of war is excluded. Goods other than "munitions" which are supplied to any Government are recorded throughout as exports whether exported by a Government Department or not. The export figures for 1942 and 1943 accordingly include, for example, exports to Russia of military goods other than "munitions" and of machinery and other supplies not purely commercial, and exports to the United States under Reciprocal Aid. Stores for the Navy, Army and Air Force Institutes, the Y.M.C.A. and other similar organisations are included, unless these are consigned to a Military Control Officer.

1924	1,277	155	107	801	189	—

(a) From April 1, 1923, figures include exports to Eire.

the disparity between shipments and safe arrivals must at many times have been considerable. Arrivals in 1943, when shipping losses had declined, probably were not much smaller than those in 1941, in spite of the sharp fall in shipments.

The changes in the geographical distribution of shipments, shown in Table II, are significant. About half the total loss of trade (by value) between 1938 and 1943—equivalent to a quarter of total exports in 1938—is due to the suspension of shipments to countries occupied by the enemy. The value of exports to British countries fell by over a third, or, if enemy-occupied countries are excluded, by just under a third. Exports to foreign countries fell by nearly two-thirds; but if enemy-occupied countries are again excluded, they declined in the same proportion as exports to free British countries, that is by a little less than a third. Shipments to the United States and Canada—and to Egypt until 1942—were exceptionally well maintained. In 1942 the value of goods consigned to these three countries exceeded that for 1938; in the past year shipments to Canada were still higher than in 1938, but those to the United States were slightly, and those to Egypt substantially, lower. All these comparisons, it should be repeated, are in terms of value figures, which are inflated by the rise in prices. The decline of about 30 per cent by value, which applies both to free British countries and to free foreign countries, is a decline of well over 50 per cent by volume.

How exports of individual commodities have fared is shown by broad categories in Table I, and for specific items in greater detail in Table IV. Among manufactures—the biggest category—the fall came earliest and has been most marked in metal goods; the metal industries, as a group, were the first to be turned into arsenals. Shipments of iron and steel and of non-military vehicles were cut to a tenth in volume between 1938 and 1943; those of rubber and timber manufactures were cut drastically. Exports of textiles could be maintained at a somewhat higher level; those of cotton goods were cut by about two-thirds in volume, and those of woollen goods by three-fifths. The category headed silk and artificial silk (it mainly covers rayon) is the only one to show an increase in both the value and volume of exports. Shipments of coal were reduced to a tenth in quantity; but for this reduction the shortage of domestic supplies would have been even more marked. Whisky has been one of the mainstays in trade with the United States; it represented more than a quarter of total exports to that country in 1942 and nearly a third in 1943.

Careful examination of the changes in the volume and destination of the exports of individual commodities shows how ruthless has been the pruning, how vigorously the needs test has been applied, and how meticulously the terms of Lend-Lease trade have been observed.

The restoration of the volume of exports to the pre-war level will be no mean task, and its expansion to anything like 50 per cent above that level can only be achieved after years of strenuous effort designed to improve the productivity of British industry and trade and the efficiency of marketing.

The immediate problem will be to raise exports as quickly as possible to the level which, together with the reduced income from overseas investments, shipping and other "invisible" exports, will provide sufficient foreign exchange to pay for absolutely essential imports of food and raw materials. This task will be assisted by the world's hunger

Table IV.—Quantities and Values of Certain Exports, by Category and Destination, in the years 1938, 1942 and 1943.

aim at increasing output and productivity. This again is an aim which can only be realised through the cooperation of the workers in each industry. Far too little has hitherto been said on the union side about productivity. Indeed, methods of raising productivity, such as accelerated mechanisation, have in the past been identified with speed-up and the unpopular Bedaux system, and, in some industries such as mining, with increased accidents; while rationalisation, as in the shipyards, has been associated with unemployment. Little enough, it is true, was said about productivity at Blackpool this year. But enough has been said to indicate that a new trend of thought is emerging.

*

One example was the speech of Mr James Bowman, the Vice-President of the Miners, who have hitherto been so concerned with wages and conditions that they have paid little attention to the efficiency of their industry. Mr Bowman pointed to the low degree of mechanisation, and the obsolete structure of the coal industry, and called for a thorough technical reorganisation under public ownership. This is, of course, only a new variant on an old demand—but the fact that a new variant is now appearing is itself significant. Then, the fact that two cotton union representatives signed the report of the Textile Mission to the United States is an encouraging sign. Mr Andrew Naesmith, general secretary of the Amalgamated Weavers' Association, has emphasised the need for raising productivity of cotton operatives, and it remains for the unions to withdraw their traditional opposition to double shift working, without which the introduction of high-speed automatic looms would just be a waste of money. The same kind of problems face the building industry. Here, again, Mr Luke Fawcett, general secretary of the Amalgamated Union of Building Trade Workers, declared that his union was not opposed to new methods of house construction; all they wanted was an assurance that housing standards would not be lowered, and that the building industry would retain control over the processes of assembling factory-made sections or components. Conservatism dies hard among craftsmen, who hate to see long-established methods and practices superseded, and there will still be pockets of resistance to new techniques, whether in mining, cotton, building or any other industry. But it does seem that the realisation that such changes must be accepted if British industry is to become more efficient, is beginning to dawn in the unions.

This year's Congress has also thrown light on a subject which has hitherto been somewhat obscure—the unions' attitude towards the re-training of the unemployed. The General Council, commenting on the Government's Social Insurance White Paper, rejected the proposal that unemployment benefit should cease after 30 weeks. It proposed instead that benefit should be unlimited in duration, with suitable provision for attendance at a training centre. This acceptance of the principle is satisfactory, since the retraining of unemployed workers in new occupations will be an essential factor in securing the mobility of labour, which the unions themselves admit is a necessary condition of full employment. It remains, of course, to be seen how far acceptance of the principle will carry with it acceptance of a workable system of rules and regulations for ensuring that the re-training is effective.

*

Many of the trade union demands in both the short-term and the long-term period are set out in the plan for the post-war reconstruction of industry which Congress unanimously adopted. This scheme, which has been reported and discussed in the press, amounts to a blue-print for a planned economy, with state ownership of the basic industries of coal and power, transport, and iron and steel, and state control over the entire economic life of the nation. The report also sets out the three main objectives of the trade union movement. To the traditional aim of maintaining and improving wages, hours and conditions of labour are added those of securing full employment and extending the workers' influence over "the policies and purposes of industry." Congress amplified these aims by passing resolutions calling for the 40-hour week as soon as practicable and holidays with pay throughout industry; for equal pay for equal work; for the legal enforcement of minimum wages and the extension of Trade Board powers to improve the working conditions as well as the wages of the lower-paid sections; for the extension of industrial health provision and welfare; as well as a series of resolutions on social security, health and housing. It called for

the retention of joint production committees in peacetime industry, and urged full support for the International Labour Office.

The unions are insistent on the need for retaining controls in the transition period. How far these would include control over labour is still not very clear. Mr Bevin has frequently reminded the labour movement that there can be no rights without obligations; Sir Walter Citrine has indicated that labour as well as capital must accept control if the transition to peace is to be smoothly effected; and this year's Chairman, Mr Ebby Edwards, specifically stated that the unions must be ready with their reply. Nobody in his senses would advocate the prolongation of controls which had outlived their usefulness or could not be enforced. But though it is likely that continued direction of labour would not be acceptable (even if a limited form will apply to men demobilised under Class B), some form of Essential Work Order with a guaranteed working week (though modifications and improvements on the present system would be necessary) may have to be continued. The TUC has now definitely rejected any retention of compulsory arbitration after the war. Instead it prefers to rely on voluntary arbitration machinery and considers that the authority of the trade unions over their members will be sufficient without legal enforcement. This was the reason why there was such a large vote against Defence Regulation IAA, which is regarded by many unions as an unnecessary and dangerous addition to wartime controls. In short, there is a tendency to advocate maximum controls for other people and minimum controls for themselves, but this very natural tendency is not being driven to excess.

*

The trade union movement has certainly begun to be conscious of its powers. With seven million members of the TUC, labour is probably more strongly organised and influential than at any time since 1921, and it is now more experienced and unified than it was then. It also seems to be realising that membership alone does not constitute a movement's strength, and that if the unions are to play a part commensurate with their numerical size and to undertake the responsibilities which they intend to acquire, they must pay more attention to internal organisation and education than in the past. The General Council's proposals for encouraging closer unity between individual unions and securing a more compact organisation of the workers in various industries have already been discussed in *The Economist*. The General Council is also planning to run training courses for trade union officials and to arrange for special courses through the London School of Economics, so that union officials will acquire some form of instruction in economic and industrial subjects, as well as the practical experience of workshop and branch organisation. Most of the present leaders of the labour movement left school when they were 13 and acquired their education at night-schools, by scholarships to Ruskin College or by picking up what knowledge they could. The TUC scheme, in conjunction with facilities for adult education provided by the Workers' Education Association, the raising of the school-leaving age and the introduction of County Colleges under the Butler Act, should all help to raise the standard of workers' education in future generations.

Mr Jack Benstead, general secretary of the National Union of Railwaymen, perhaps hit the nail on the head when he appealed to trade unionists to get rid of their "inferiority complex," which frequently shows itself in negotiation and in contact with the employers. This applies even more strongly to the Labour Party, where a curiously inverted form of inferiority complex is often found. Too many leaders of the Labour Party seem to have a fear of taking responsibility. Yet the trade unions' full plans for industry will never be achieved unless and until a Socialist Government is in power. Miss Ellen Wilkinson's plea to the unions not to treat the Labour Party as a "poor relation," to look upon their M.P.s as representatives of constituencies and not of a sectional interest, and to allow more seats to be filled by younger men and women, and not necessarily trade unionists, was an attempt to infuse a new note in Labour politics. As she pointed out, Labour has got to consider its appeal to the "middle of the road" electors as well as to preach to the converted. The TUC has given evidence that it is realising its responsibilities in the industrial field. The Labour Party conference in December will show whether these responsibilities can be translated into the sphere of politics.

Business Notes

Business Relations with France

Since a large part of France, including Paris, has been freed from military control, everything possible should be done, on both sides of the Channel, to prepare for the speedy resumption of business relations between the two countries. The restoration of postal facilities is, obviously, the first step and that of adequate travel facilities the next. True, some postal facilities have already been granted, and the reopening of a regular air service foreshadows some easing of travel restrictions. But present facilities are still severely limited, and, in fact, totally inadequate. There are many business firms in this country anxious to re-establish their former contacts; and there are French firms anxious to resume contacts in this country. A resumption of personal contacts would do much to pave the way to an early revival of trade between the two countries to the advantage of both. The future of Anglo-French economic collaboration depends, of course, on much more than the mere opening of communications. It will depend, apart from British policy, on the economic policy that France decides to pursue, in its domestic as well as in its international aspects. Full discussion of those wider problems—and early decisions in both countries—are no less urgent than the resumption of business contacts.

* * *

Unblocking French Assets

The formal recognition of the French Government should be followed without undue delay by the freeing of French assets at present frozen in Allied countries. These are in the main to be found in the United States, where their total is officially put at \$1,594 million. Of this sum \$900 million is in gold. The bulk of the French assets in the United States is held on Government account; the holdings of private individuals or firms amount to \$500 million only. In Great Britain the volume of French assets is much more modest. There is no French gold here, though some was sent to Canada in the early months of the war. The balance of the inter-Treasury account set up under the Reynaud-Simon agreement is thought to have been very small when the armistice of July, 1940, put an end to further operations on the account. The bulk of the French sterling funds is held on private account and is for the moment under the control of the Custodian for Enemy Property. That control should be waived speedily; its removal would be another important step towards the resumption of free financial and commercial intercourse between France and Great Britain subject only to the controls of exchange and foreign trade operated by both countries. When French assets have been freed the moment will presumably have arrived for France to resume the transfer of the service of the Government guaranteed sterling debt. In anticipation of this development the prices of French railway sterling bonds have risen sharply this week.

Reconversion

On Monday the Board of Trade announced the appointment of Sir Charles Bruce-Gardner to the position of Chief Executive for Industrial Reconversion. Sir Charles is a well-known industrialist and before his new appointment he held a number of key positions at the Ministry of Aircraft Production. The broad principles of reconversion are gradually taking shape. During a debate in the House of Commons on October 20th, the President of the Board of Trade, Mr Dalton, said that premises and labour released from war production will be transferred as quickly as possible to peace-time employment, "whether for the home market or for export trade." But little has as yet been done to translate those principles into policy, and even less to provide industrialists with the signposts they need to make their individual plans. Business men and industrialists are faced with so many uncertainties—some but not all of them unavoidable—that many of them find it impossible to attempt any detailed planning of capital expenditure, production and marketing. The complete removal of controls,

as after the last war, is inconceivable; but unnecessary delay in reconversion, due to absence of decisions upon the new conditions in which business will have to operate, might have disastrous consequences. Sir Charles will have a tough job; the guidance he will be able to offer to industry will be conditioned by the guidance that he will himself be able to secure from the Government.

* * *

Report on Cotton

The report of the mission that investigated building methods in the United States showed that the industry is operating at lower real costs in that country than in Great Britain. Similarly, the Mission—headed by the Cotton Controller, Sir Frank Platt—that went to the United States earlier this year to report on the cotton textile industry in that country, had "no hesitation in saying that the United States industry is very far ahead of the Lancashire industry in production per man hour." It is impossible to do justice to the detailed and technical report in a few words. Briefly, the Mission found that, with normal staffing, the British output per man-hour is less than the American by about 18 to 49 per cent in spinning, by 80 to 85 per cent in winding, by 79 to 89 per cent in beaming, and by 56 to 67 per cent in weaving. These are disturbing facts. What is the explanation? The main reasons given by the Mission are:—

The use of high-draft, high-speed and automatic machinery wherever possible; the use of up-to-date plant (large sums of money being expended for this purpose); the application of scientific methods to the utilisation of labour, which permits a relatively large number of units or machines to be supervised by the machine operatives; the policy of concentrating on high operative machinery (in terms of output), in many cases at the expense of machine efficiency; and the lower age of the operatives.

In contrast to the industry in this country, the cotton trade in the United States is thoroughly organised for bulk production; this makes possible the use of high-speed machinery, which, in turn, requires shift-working to be economical. American mill managers, moreover, are generally young, analytical and progressive; workers are alive to the advantages of scientific methods and are not strait-jacketed by long-standing practices and conventions. The Mission is refreshingly outspoken.

* * *

Remedies

The Mission has not merely reported the facts; it has also formulated a policy designed to secure an increase in production per man-hour, which, in turn, would permit the payment of higher wages. If production per man-hour in Great Britain is to catch up with that in the United States, the Mission considers that—

(a) A higher degree of standardisation and specialisation in British production is needed to allow the introduction of uninterrupted bulk production methods. This will necessitate changes not only in the producing section of the industry but also in the methods of distribution and, in addition, a much closer understanding between producers and distributors.

(b) The general standard of technical equipment in British mills needs raising, and re-equipment on a large scale is necessary to meet the required adjustment to standardised bulk production methods.

(c) Working conditions in British mills must be considerably improved from the point of view of future labour requirements.

(d) A greater degree of co-operation is needed between British spinners and manufacturers in order to effect the maximum rise in the level of production efficiency in both sections.

(e) The level of scientific training of the managerial staff of British mills needs raising.

(f) There should be greater economy in the utilisation of labour.

The Mission demonstrates conclusively that the production of bulk lines must be organised on a mass-production basis if output per man-hour is to be substantially increased. This means a complete reorientation of practice: heavy capital expenditure, multiple (or at least double) shift working,

a progressive outlook on the part of managers and workers, and consequential changes in the relations between producers and distributors. There is no reason why the Lancashire cotton industry could not be as efficient as the industry in America. The organisation of mass-production methods in bulk lines does not mean, of course, that the cotton industry should concentrate on those to the exclusion of others. On the contrary, there should be a growing market for special products which yield a higher return per unit of output than bulk lines. There is room for both if they are produced efficiently.

Belgian Monetary Area

The Treasury has issued two Orders (S R & O 1184 and 1185) as a result of the Anglo-Belgian Monetary Agreement of October 5th. These Orders remove the Belgian Congo and the mandated territory of Ruanda Urundi from the sterling area. These territories together with Belgium and Luxemburg now form the Belgian Monetary Area. Any payment to a resident of the area requires Treasury sanction. It is also provided that a resident in the Belgian monetary area may make payments to another resident as well as to a resident of the sterling area from his sterling account in the UK, subject to any restrictions under the Trading with the Enemy legislation. Goods exported to any part of the Belgian monetary area from the UK must be paid for in Belgian, Luxemburg or Congolese francs or in sterling from the account of a person resident in the area. A further sequel to the Anglo-Belgian Monetary Agreement has been the addition of the Belgian, Luxemburg and Congolese francs to the list of "specified" currencies which, under the Defence Regulation, must be offered for sale to the Treasury.

Dutch Currency Declaration

France is not the only country of Western Europe where the Belgian currency experiments have been watched with interest and some apprehension by the population. The plans of a country with which there is now a monetary alliance have, quite naturally, tended to be studied and regarded by the Dutch as the pattern of the currency plans to be applied to their own country when it is liberated. The result was an immediate rush from guilder notes of larger denominations and a demand for small notes and coins such as those excused from compulsory exchange in the Belgian currency plans. The Dutch Government have now appealed to the population over the fighting line not to engage in these precautionary tactics. An announcement from the Dutch High Command, broadcast to the people of the Netherlands, has made it clear that the Netherlands Government do not intend to discriminate now or in the future between new Treasury notes issued by them and old bank notes or silver coins issued before and during enemy occupation. Nor will any distinction be made between notes of large and small denominations except for bank notes of 1,000 and 500 guilders, which have, for some time past, been declared invalid. The Government has appealed to the people to carry as little currency on them as possible and to deposit all their surplus cash in the savings bank. This declaration is in line with what had already become known of the Dutch Government's currency plans for the post-liberation period. These envisage the minimum resort to compulsory measures of deflation and maximum dependence on the voluntary co-operation of the population in a policy designed to underpin the guilder by funding and reconstruction loans that would absorb redundant purchasing power accumulated during the occupation. The prospects for carrying such a policy to a successful conclusion in the Netherlands are perhaps more promising than in other European countries, partly because the tradition of confidence in the currency is greater than in countries where the currency has been repeatedly devalued. It is also evident that, until recently, the measure of currency inflation and the disturbance to the structure of wages and prices during the occupation had been rather smaller than in other occupied countries. The reaction to the Belgian currency plans in France and the Netherlands shows that a plan of this kind is one whose success depends largely on the element of surprise and unexpectedness.

Financial Control for Germany

The detailed regulations announced this week for the civil administration of Germany include stringent control of the financial relations between Germany and other countries. The main intention of the regulations is to prevent the export of capital by war criminals and owners of property looted from countries occupied by Germany. The Military Government will prohibit any transaction in foreign exchange assets owned by persons in Germany, including property located outside Germany, gold or silver coin or bullion, wherever located, foreign banknotes and debts. All kind of foreign exchange and property situated outside Germany will have to be reported to the Military authorities within three days of the effective passing of the laws, and certain types of assets will have to be delivered to the nearest bank, Reichsbank office or other institution designated by the military government. Since Germany has been subjected to a rigorous control of foreign exchange operations for more than 13 years, the compulsory demand for declaration of foreign assets is unlikely to unearth substantial holdings of such assets other than those accumulated by party officials and with the connivance of the party machine. The chief problem of German external assets will be that represented by the interlocking of German industry with that of the occupied countries. There is no hint in the statement of the Chief of Staff for Civil Affairs of the manner in which this problem will be tackled.

Placing Technique

It is understood that the Committee of the Stock Exchange has made substantial progress in its deliberations with regard to the issue of securities by placing or introduction. The merit claimed for this method, as against an issue by prospectus, is that it is cheaper, and this appears to be the case, at least for issues of moderate size—say, £500,000 and under. But it is cheaper largely because it avoids the expenses of newspaper advertising and of dealing with a resultant mass of applications, often far in excess of the amount of stock offered. That is to say, the information of the impending issue is, usually, much less widely spread, and the investor may justly claim that, from his standpoint, that is a disadvantage. (It is, however, not established that there is any obligation upon a concern, desiring to raise money, to advertise the offer more widely than is necessary to achieve a full subscription.) It is, therefore, not surprising that it is alleged against the method of introduction that it confers undue advantages upon those in the inner circles of the investment market, and, in particular, that these circles secure an undue advantage by being able to deal in the new security before permission to deal has been granted and subject to such permission. It would appear that the Committee has in contemplation action along two lines; first, a ban on dealings subject to permission, and, second, an intimation to the jobbers concerned that they should assume responsibility for some system of rationing, among all would-be buyers, the amount of shares available at the opening price. Some of these shares are, of course, placed with the jobbers at a lower price to enable them to get the market going. It is not clear that either of these suggestions will make any substantial difference to the actual procedure, except to the extent that they influence the outlook of the jobbers concerned. The fundamental disadvantage of the placing method is that it does not ensure wide publicity. This would not matter if the original opening price were a really good estimate of what the investor will pay for the shares. Experience shows, however, that there is nothing more difficult than to assess this figure with any certainty. One may make a good guess in four cases out of five. In the fifth, one is hopelessly astray. Nonetheless, it is along these lines that a solution must be sought, for there seems little possibility of combining the advantages of wide publicity with those of the introduction. A step towards that end would be to give to the Press a statement in reasonable detail of every offer in the hope that they would comment upon it. It is, however, in the nature of the case that comment would be restricted in those cases where the issue was small—that is to say, in all those where the economies of introduction are greatest.

Directors' Compensation

A further instance of what appears to be exaggerated compensation to directors for loss of office is provided by the resolutions for the liquidation of the Hyderabad

(Deccan) Company. The directors propose compensation to the staff which reaches a total of £17,400, while a member of the company is to table a resolution that the directors receive £30,000. The directors are four in number, including one appointed by the Hyderabad Government, who is, presumably, not eligible for compensation from the company. Of the remaining three, one, the chairman, has been on the board only since the autumn of 1941; one is managing director. Directors' and managing directors' fees appear not to have exceeded £1,200 in any recent year, and were usually well below that figure. There can be no doubt that the management of the company has been efficient, but there is no indication as to how much, in excess of directors' fees, it has cost the company, and there is no apparent reason why compensation of £30,000, very possibly paid out of taxed profits, should be given to the directors at the expense of either the proprietors or the staff. This instance serves to strengthen the case for the publication of the total remuneration of directors, which is a necessary preliminary to an informed discussion of the whole matter of the adequacy of the present system to secure either the efficient direction of the affairs of the company or the effective representation of the proprietors. On the information at present available, in this as in more than one other recent example, compensation is excessive and the proposal ought not to be entertained.

Brazilian Bonds

Brazilian bonds, which have been rising with only very slight halts and reverses almost ever since the scheme was put into force, have in the past few days suffered a collapse of six or seven points. The fall has been indiscriminate, just as was the preceding rise. It is no secret that, having secured a very advantageous arrangement, the Brazilian Government has been continuously using some of its accumulated sterling to accelerate sinking fund buying. On Friday of last week it became known that this buying had been suspended, and, when it was not resumed on Monday, a slump occurred. This was accentuated by two factors, namely, sales by bull speculators and the fact that the jobbers concerned have consistently refused to take large amounts of stock on their books. It is, of course, very easy to blame the jobbers for lack of initiative in this matter. It may very well be the case that the halt in sinking fund buying is purely temporary; that Brazil can find no more attractive way of spending sterling, and that the jobbers would do very well out of taking up stock on a fall of only two or three points. But, if that is so, then one has also to blame the speculator and the genuine investor as well for not taking advantage of this opportunity. The plain fact is that, whatever the true facts may be as to the reasonableness of the settlement reached, there is scarcely anybody who trusts the Brazilian Government, there is scarcely any broker or banker who would advise Brazilian bonds as a long-term investment, and there are many who regard the Brazilian Government as the only final buyer of the stocks at current levels. Where, as in this case, the confidence of the investor has been undermined, fluctuations of 10 per cent in value cannot be regarded as extraordinary.

Rehabilitation in Malaya

The acceleration of the American advance in the Pacific adds point to recent demands for real plans for the rehabilitation of areas at present occupied by Japan. One of these comes from the board of London Tin, who want the early setting up of an international consultative body, fully representative of producing and consuming countries, and some assurance of priority for essential materials. Meanwhile, they are pursuing internal discussions within the group with a view to submitting preliminary plans for gradual rehabilitation. They mention the need for a limited number of new dredges, but they give little indication of what their plans may be or that they have given any general guidance to their associate concerns. The recent report of the Malayan Chamber of Mines, which also touched on this subject, was slightly more constructive in that it not only urged the preparation of plans, but also suggested the greatest possible standardisation of equipment. This would no doubt help to reduce the time necessary to re-equip the industry as well as lowering costs to some extent. Since the period suggested for bringing a new dredge from the drawing board to full operation is three years, the need for action is evident.

This, however, is only one side of the question. During the lengthy period of Government-maintained price-fixing very little was done either by the tin mining industry or by rubber plantations to reduce costs to a minimum. It is essential in the interests of all concerned that, whatever post-war schemes are evolved for the control of raw material prices, two things should be demanded of the industries concerned; they must be expected to concentrate output in the hands of the low-cost producers and they must eliminate all unnecessary expenses. So far as the tin industry is concerned, it has yet to be shown that the formation of such groups as London Tin has produced the economies which are the principal justification for such groupings. In rubber there is still a mass of small companies. Whatever may be the optimum size of estate in this industry, there can be little doubt that financial integration would greatly reduce administrative costs. Although the best accounts of rubber plantation companies are more informative than those of many other industries, the drive for uniformity has failed, while the fact that proceeds of rubber sales are shown net makes it impossible to assess the level of certain costs. In tin the accounts are generally uninformative. Until these defects are remedied, only a special investigation can reveal the extent and exact nature of the troubles. That ought to be undertaken, for there can be no justification for granting assistance to an industry which has not done its best to achieve efficiency. It has too often been proved that, if the assistance comes first, the improvement is likely to be indefinitely deferred.

Future of United Steel

United Steel Companies' accounts for the year ended June 30, 1944, show a rise in profits, after EPT and depreciation, of £260,000 to £2,465,186, and a much greater rise in earned for ordinary from 8.5 to 11.4 per cent. The dividend is kept at 8 per cent to enable a transfer to general reserve—the first in the last three years—of £150,000. The accounts are analysed in full on page 588. The rise in profits is implied by the chairman, Sir Walter Benton Jones, to be mainly due to the intricacies of assessing wartime taxation. Of more significance, therefore, is the increase in the group's net liquid assets by £600,000 to nearly £5½ million. The group's fixed assets, valued at £21½ million, are covered by various depreciation reserves totalling £10 million. Against this, issued ordinary shares—the only class of capital—also amount to £10 million odd. The fact that, in the case of United Steel, a strong liquid position and ample reserves are coupled with a high yield of £6 4s. 3d. per cent shows the market's scepticism about the prospects of heavy industry. This pessimism is not altogether shared by Sir Walter Benton Jones, who anticipates that, in the post-war period, maximum production will be needed of the group's many primary products and raw materials, as well as of its heavy finished steel products, although he seems less certain about demand for its light products. United Steel is, of course, a vast vertical combine, and its self-sufficiency has been lately increased by the acquisition in 1942-43 of St. Helens Colliery, enabling it to work the whole of the undersea coalfield on the Cumberland coast, and during this year, by an exchange of shares, of an interest in the Kiveton Park Coal Company, near Worksop. In addition, its interest in John Summers, acquired in 1939, will give it access to one of the two continuous strip mills of modern design and capacity. The group has not, however, aimed to date at operating as a self-contained unit, preferring to engage in open-market deals at many stages of manufac-

ture. The width and variety of the group's interests give some protection against the possibilities of renewed depression. Some at least of the group's plant is fully modernised, and to this extent it gives a lead on the only sure road to prosperity for the iron and steel industry, which is to secure a real increase in efficiency and in output per man-hour by such means as further rationalisation and concentration of production and much greater modernisation of machinery. If the industry will employ its large reserves in facing up to this task, there is no reason why the market's conservative view of its prospects should not be disproved.

* * *

Motor Cars

The high post-war expectations of past and prospective motorists are likely to be somewhat disappointed by the prospect of a temporary shortage of cars. The expansion in the production of new cars—and, especially, the production of new models—will take time. Moreover, if the British motor industry is to secure a permanently larger share of the market in foreign countries a substantial proportion of production will have to be earmarked for export. (And if the motor industry is to work largely for the export market, it will have an opportunity of designing a proportion of its new cars in accordance with the requirements of motorists in foreign countries.) Since the supply of new cars available for the home market is likely to fall short of demand for some time, British motorists will have to rely mainly on the existing stock of cars until new ones become available in adequate numbers. Before the war there were some 2,000,000 cars in this country; it is difficult to estimate how many of these are still serviceable, though the proportion is likely to be well over half. But whatever the precise proportion, the total number of cars—old and new—available to the public will, for several years after the defeat of Germany, be smaller than before the war. This—and the rise in the volume of purchasing power in the hands of the public—explains the inflation in the prices of second-hand cars to which the forthright chairman of the Price Regulation Committee (North Midland Region) has recently drawn attention. Here are some of his examples:—

	Second-hand List Price.	Current Price April, 1939.	Current second-hand price.
Rover 10 h.p. (1939) ...	£ 275	£ 240	£ 600
Austin 10 h.p. " ...	175	155	250
Morris 10 h.p. " ...	185	155	300
Vauxhall 14 h.p. " ...	230	195	400
Buick 30.6 h.p. " ...	615	500	1,000

The rise in prices, which may well go further, will have the effect of making means rather than needs the test of ownership. But it may have another—and scarcely less undesirable—effect in that it may delay the urgent need for an increase in the productivity of the motor industry. In a sellers' market there is little incentive to an efficiency drive.

* * *

Price Control

The question, therefore, arises whether the Government should control the prices of second-hand cars. There is much to be said for price control in principle, but it is likely to meet with serious administrative difficulties. If ceiling prices at which second-hand cars are to be sold by dealers are fixed too low, their sources of supply will dry up and a black market emerge. For this reason the Board of Trade took great care, in its second-hand furniture control scheme, not to fix prices too far below free-market prices. Some such compromise solution might possibly be applied to motor-cars, though price control can never be fully effective unless the Government takes the drastic step of prohibiting sales except through dealers. New cars present less formidable difficulties. Ever since 1940 new cars could only be bought on licence from the Ministry of War Transport; moreover, a licence carried the condition that the car should not be resold by its first owner in the open market. This scheme has had the effect of limiting the sale of new cars—and of those of them that have since become second-hand—to those who really need them and of keeping their prices, both new and second-hand, at a reasonable level. There is everything to be said for maintaining this system of control until the shortage is alleviated by adequate new supplies. It will make it possible, once production can be resumed on a large scale, to meet the most urgent needs and to meet them at reasonable prices, for it would then not be necessary to maintain the purchase tax as a deterrent to purchases.

No Deflation, No Devaluation

The French Government's understandable reluctance to put into operation the plans that had been prepared for converting the note circulation and partially blocking the volume of bank credit has now found its official apologist, in the person of M. André Istel, who represented France at the Bretton Woods Conference. M. Istel has asserted this week that the rates of exchange of 200 francs to the pound and 50 francs to the dollar "correspond in the main to the real comparative purchasing power of the Anglo Saxon and French currencies." In the same statement he expressed opposition to "any over-hasty measures of deflation." The note circulation, he added, was now over 600,000 million francs as compared with 125,000 million francs before the war, but the depreciation in the franc from 176 to 200 to the pound "sufficiently allows for the deterioration of the value of the franc." M. Istel argued that France's malady was due rather to the contraction in production than to the inflation of the currency and that the principal remedy should be "gradually to restore the wealth-producing machinery" and not to proceed with deflationary measures. What M. Istel appears to forget, or ignore, is that the restoration of French productivity and reaccumulation of consumer goods will take a considerable time, that prices and wages will immediately tend to adjust themselves to the existing relation between the volume of production and the supply of purchasing power (evidence of this adjustment comes to hand day by day) and that future expansion in economic activity will call for still more currency and still more credit. The kind of equivocation in which the French experts are now indulging suggests that, however much political wisdom the past five years may have taught the French nation, the framing of a sound financial policy is still outside their grasp.

* * *

Poultry

The agricultural statistics which were published this month revealed the extent to which the poultry population was reduced by the feeding-stuffs policy. From the figures in brackets in the accompanying table, it can be seen that the reduction in England and Wales was more severe than in the United Kingdom as a whole. The drastic reduction was prompted by the fact that other livestock convert feeding-stuffs into human food more efficiently than poultry. In addition, food for poultry competes with food which can be directly consumed. Accordingly, when animal food-

stuffs were rationed in February, 1941, the egg farmer found that he was more affected than other farmers. Indeed, Mr J. J. MacGregor, in his recently published *Poultry Industry Control in the United Kingdom* (Harper Adams Agricultural College, 50 pp., 2s. 6d.) goes so far as to say that it may have put some of the specialist egg farmers out of business. The ration was sufficient to support about one-third of their 1939 population. Breeders found a profitable outlet when the backyard hen was given official recognition and a balancer meal ration. Although it is believed that egg yields of laying hens are lower, owing to food and war conditions (the blackout, for example, cuts short their feeding time) the health of breeding stocks is considered better than before the war. The size of the poultry stock has begun to increase this year, but future prospects of egg farming do not depend only on numbers, or even on an

COMPANY MEETINGS

OTTOMAN BANK

INCREASED RATE OF EXPANSION

CONDITIONS IN TURKEY AND NEAR EAST

MR. A. G. A. JAMIESON ON POST-WAR RECOVERY

The seventy-seventh annual general meeting of the Ottoman Bank was held, on the 25th instant, at Winchester House, Old Broad Street, London, E.C.

Mr A. G. A. Jamieson, the chairman, presided.

Mr W. Stewart McKim (secretary to the London committee) having read the notice convening the meeting,

The Chairman said:—Ladies and gentlemen,—The balance-sheet we submit to you this year shows an even greater expansion than that of the past two or three years; the total is £60,027,054, as against £42,360,012 at the end of 1942. Liquidity has again been maintained and we have no less than £31,660,000 in cash and money at call and notice, £11,705,000 in Treasury bills and bills receivable, while British Government securities amount to £2,128,000.

We have continued to include our French assets and liabilities at the exchange rate of 176.50 and, as regards Greece, the figures are those of December 31, 1940, no later details being yet available. The profit and loss account, containing no profits which could not be made effectively available in sterling, shows a balance of £127,938 os. 6d., which, added to the amount brought forward, makes a total of £463,116 4s. 9d., which will be carried forward.

LARGER DEPOSITS

On the liabilities side of our balance sheet there is an increase in the deposits of some £17,500,000. On the assets side cash has been increased by £6,600,000, money at call and notice by over £7,000,000, and bills receivable by £3,400,000. Our investments are greater by £400,000, all the increase being in British Government securities.

Thus you will see the whole of the new deposits in the year have been utilised in a readily accessible form, a condition which your committee regard as essential in view of the factors which have led to the great increase in deposits in the various countries where the bank is established. I think I have now dealt with all the points of interest in the balance sheet, and I will pass to a brief review of conditions during 1943 in the countries in which we operate.

In Turkey weather conditions were favourable for agriculture and crops were accordingly abundant. The volume of notes in circulation, after falling in the early part of the year, again rose, and in December was 805 million Turkish pounds, against 745 millions the previous year.

The gold held by the Central Bank, increased to nearly two hundred and two million Turkish pounds, as against one hundred and forty-three million Turkish pounds in December, 1942.

Wholesale prices continued to rise during the first part of the year, and, although they dropped in the latter part of the year, the wholesale prices index being 473½ as against 521 in 1942, the cost of living continued to increase, the figure in Istanbul being 347 in 1943 as against 232 in 1942. Our relations with the Turkish Government, its various departments, and with the other banks remain satisfactory.

SITUATION IN EGYPT

In Egypt the expenditure of the British and Allied Governments has brought great apparent prosperity to the country, and has given rise to a heavy increase in the cost of living. Efforts at price control have had little effect, and the poorer classes have not benefited from the national prosperity and are suffering from high prices for the necessities of life. Currency in circulation increased to £E104,000,000 in December, 1943, compared with £E82,000,000 in December, 1942, and

£E54,000,000 in 1941. Local industries, aided by the strict limitation of imports, had a prosperous year, and this was reflected in rises in Stock Exchange prices, which have also been influenced by the plethora of money.

Egypt's trade with Cyprus, Palestine and East Africa showed increases, and there were indications of development with Australia, but with the United Kingdom and the remainder of the British Empire trade decreased considerably.

Owing mainly to cotton exports at high prices, the money value of exports increased to £E25,000,000 in 1943 compared with about £E19,000,000 in 1942. The cotton crop for 1943-44 amounted to 3,600,000 cantars, compared with 4,500,000 cantars in the previous season, arising from a deliberate reduction in the cotton acreage. Quality, on the other hand, was much superior. The Government Cotton Buying Commission continued to operate, and increased its buying prices by 20 per cent. compared with the previous year. Comparatively little cotton was offered to the Commission, however, as the short supply and keen demand caused the market price to exceed the official buying price.

The cereal market was good. The Government requisitioned the whole of the wheat crop and part of the barley and rice crops, the banks acting as agents for purchase of cereals for delivery to the United Kingdom Commercial Corporation. Our branches took a substantial share in this business. Heavy local taxation has had an adverse effect upon our divisible profits.

PALESTINE'S INDUSTRIES

In Palestine war conditions continued to rule the economic and financial situation throughout 1943. Military expenditure increased the liquid resources of the community, and there was a continual rise in the cost of living. In an attempt to check this the authorities introduced war savings schemes, permitted gold to be sold, and imposed higher taxation and more rigid price control. Currency in circulation reached a new high level of £P37,000,000, compared with over £P24,000,000 at the end of 1942, and bank deposits continued to rise throughout the year.

Owing to lack of shipping space, the citrus trade was stagnant, and essential loans were made by the banks under the Government scheme, in order to keep the citrus industry alive. Local manufacturing industries continued to develop during the year, with a large demand both locally and in neighbouring countries.

In Iraq similar conditions to those in other Middle Eastern countries prevailed as regards currency and prices. The circulation reached over 35,000,000 Iraq dinars, an increase of over 13,000,000 Iraq dinars during the year. Committees were set up to control imports and prices, and rationing was introduced in respect of a limited number of articles. Though imports were decreasing by the end of the year, the total for the year of nearly 16,000,000 Iraq dinars constituted a record figure, exceeding that of 1942 by some 3,500,000 dinars. Over half the imports came from India, while the United Kingdom ranked second with 1,708,000 Iraq dinars.

Exports totalled 4,936,000 Iraq dinars, over half going to Syria and Iran. The year's grain crop was heavy, estimates being 390,000 tons of wheat and 580,000 tons of barley, compared with pre-war averages of 200,000 tons and 400,000 tons respectively. Barley prices worked out at

about 27 Iraq dinars per ton, f.o.b., compared with 3½ Iraq dinars before the war. Date exports were well maintained, and prices were about four times those ruling in 1938.

IRAN AND CYPRUS

In Iran money was in great demand until the last quarter. The market for local products was very active, though exports were curtailed by lack of transport. Imports continued to be on a restricted scale, and merchants who secured goods from the United Kingdom, the United States and India made large profits. The official cost of living index increased during the year from 547 to 993, compared with 100 in 1937 and 162 in 1941.

The Government re-engaged an American financial expert to advise upon the financial reorganisation of the country. Crops were good and cereals were in better supply. While the law on foreign exchange was not abolished, restrictions on the purchase of exchange were virtually removed.

In Cyprus, despite indifferent crops, there was moderate prosperity resulting from better prices for exports; caroubs went mainly to other Middle East countries, but small quantities came to the United Kingdom. There were no surplus potatoes for export after meeting the requirements of the military authorities. The demand for raisins and wines was good, and substantial profits were made by growers and merchants.

During the year, to combat inflation, the Government successfully issued Premium Bonds to the extent of £500,000, and Savings Certificates and Bonds were also put on sale. During the year we opened a new office at the seaside resort of Kyrenia, for the convenience of customers and visitors.

PEACE-TIME PROBLEMS

The war has now reached a phase when we can discern dimly the extent of the damage that has been done to the economic life of the occupied countries, and we can also turn over in our minds the problems which will arise in those countries which have escaped German occupation, but whose economic structure has been distorted by immense military expenditure and lack of communications.

Every country in which this bank has interests has either suffered the martyrdom of German occupation or is faced by the problem of readjustment of its economic life. The process of recovery and readjustment will be slow and painful, and no doubt many mistakes will be made in the process.

BANK'S STRONG POSITION

But the Ottoman Bank is in a strong and solid position to face these problems and to take its part in rebuilding the commercial life of the countries which constitute its territory. I am confident it will continue the service which it has rendered for so many years in lands which are of great historic, sentimental and economic importance to Turkey, Britain and France. In the solution of these problems we trust that we may shortly have the active collaboration of our colleagues in Paris.

Meanwhile, as communication with France is not yet restored, we repeat our procedure of last year by showing in the report the list of names of the Paris Committee as it was constituted in 1940, when communications were interrupted. Three of their number, Monsieur Charles Rist, Monsieur René Bechmann and Monsieur Emile Oudot, are due to retire this year under the terms of our statutes, and their formal re-election is proposed.

The place left vacant in the committee by the death of Sir Guy Granet has been filled by the election of the Hon. T. B. Money-Coutts, and Mr R. W. M. Arbuthnot has been elected to succeed Sir Gordon Nairne. I shall shortly submit their election for your confirmation.

The report and accounts were unanimously adopted.

ANGLO-IRANIAN OIL COMPANY, LIMITED

SIR WILLIAM FRASER'S STATEMENT

The thirty-fifth ordinary general meeting of Anglo-Iranian Oil Company, Limited, was held, on the 17th instant, at Britannic House, London, E.C., Sir William Fraser, CBE (the chairman), presiding.

The following are extracts from the chairman's statement, circulated with the report and accounts:

I informed stockholders last year that indications were that gross profits might not be far short, if at all, of those for 1942, but that our Excess Profits Tax standard would govern the net profits. This forecast has proved to be correct. The gross profits for 1943 were higher than those for 1942, and the decrease in the balance of profit from trading account brought into the profit and loss account is entirely due to Excess Profits Tax, which has been deducted before arriving at the figure shown in the account.

We have again increased the preference stock reserve by £500,000.

There has been no need to make any special reserve in the profit and loss account for extra depreciation as was done last year, but a small provision of £225,000, which is likely to be recurrent, has been charged to trading account. The balance of profit remaining enables us again to recommend a final dividend of 15 per cent. on the ordinary stock, making 20 per cent. for the year. The carry forward is increased by £40,388.

With regard to the probable outcome of the current year's trading, it appears that net profits will again be governed by our Excess Profits Tax standard.

CONTRIBUTION TO WAR EFFORT

The company's operations have proceeded smoothly and on an expanding scale during the past year. Our production of crude oil has been increased to enable us to meet the greater demands which we have experienced for practically all our products. In one particular respect, however—the supply of high-grade aviation spirit—we have had to undertake considerable new construction to enable us to make our contribution to the enormous needs of the Allied Air Forces. Plant of great magnitude was required, and stockholders can well imagine that its provision, transport and erection have been by no means easy of accomplishment under ruling conditions.

In addition to the company's activities on land, our tanker fleet has continued to render a vital service to the Allied cause. Since our last meeting, losses and other casualties have fortunately been on a diminishing scale in comparison with former periods. Our fleet, however, is considerably below the strength which will be needed for peace-time operations. We have some new ships under construction, but more will be required to satisfy our anticipated needs.

Thanks to the successes of the Allied Forces on all fronts, the time must be near when we can hope for a resumption of more normal conditions for the production of oil and for the transport and distribution of products. Our plans for future activities must necessarily depend to a large extent on the conditions which will prevail in the immediate post-war period. It is, however, satisfactory to know that our producing facilities and our principal refineries are in as good shape as is possible after five years of war, with its inevitable accompaniment of stringency in the supply of man-power and materials. Within to-day's limitations, we are doing everything possible by means of scientific research and its application to ensure that we shall obtain from our supplies of crude whatever products of whatever qualities may be required to maintain and improve upon our position as marketers of all petroleum derivatives.

The report and accounts were unanimously adopted.

RAPHAEL TUCK AND SONS, LIMITED

PREVIOUS RECORDS SURPASSED

The forty-third annual general meeting of Raphael Tuck and Sons, Limited, was held on the 17th instant, in London.

Mr Desmond Tuck (chairman and joint managing director), in the course of his speech, said: Ladies and gentlemen, our profit for the year has broken all previous records. The forecast I made at our last annual meeting, that we should again find ourselves in the E.P.T. category, has proved itself correct. The large provision we have had to make for this tax is indicated on the balance-sheet before you, and the Inland Revenue is once again sharing very well in the results of our year's work.

The remarkable rise in your company's fortunes up the ladder of progress these last two or three years is to a large extent due to the fact that under its present direction and management it is unfettered by out-of-date outlook or outlived methods.

DEMAND UNSATISFIED

Our various departments, apart, of course, from those which under war-time regulations have been closed down, continue in a healthy condition. Indeed, we have been unable to satisfy the appetite of the trade and of the public for our publications, owing to the restricted supplies of raw materials available to us, and the shortage of labour at our disposal.

I could have wished that a more generous allocation of paper had, for instance, been granted to the industry as a whole for the production of greeting cards, for the tonnage granted for this purpose has proved itself wholly inadequate.

During these years of war the contribution which the greeting card has made and is making to morale, preserving ancient and hallowed customs in times of adversity as well as prosperity, and promoting the bonds of friendship and good fellowship, is a noteworthy one. It has been bringing its welcome message of cherished remembrance both to and from members of those many families scattered far and wide, our gallant soldiers, sailors and airmen, and all those engaged upon National Service.

Our picture department has, among its other activities, been responsible for the publication on behalf of the Royal Air Force Benevolent Fund of two important pictures by Mr. Herbert A. Olivier, exhibited in this year's Royal Academy, the one depicting "Operations Room Conference, Bomber Command," and the other "Laying on the Target, Bomber Command Headquarters."

Faithfully reproduced in the full colours of the originals, these pictures are an historic record of this magnificent and vital Command, and provide a worthy ornamentation to the walls not only of private houses but of business firms and offices.

A RECENT PURCHASE

Our acquisition which I reported to you last year, of printing works in the Midlands, has already more than justified itself. This in its turn has been added to by the recent purchase of a business, complete with plant and working staff, specialising in the printing of viscose wrappings for food and other commodities, and the printing and embossing of aluminium, tin and kindred foils. We have visualised important possibilities and developments for this class of work in the post-war period, and we feel that our entry into this new field is a farseeing move.

Before concluding, may I thank all the members of our executive and staff who have served the company so faithfully during this past year. As Londoners they have neither escaped nor evaded their trying times both in their homes and at their work.

The report was unanimously adopted.

ASPRO, LIMITED

DEMAND GREATER THAN EVER

The ninth annual general meeting of Aspro, Limited, was held, on the 19th instant, at Winchester House, Old Broad Street, London, E.C., Mr H. F. Middleton (the chairman) presiding.

The following is an extract from the chairman's statement, which was circulated with the report and accounts and taken as read:

It is a matter of great satisfaction to your board, and, I am sure, to all stockholders, that notwithstanding the great difficulties of the past twelve months we are again able to recommend the declaration of a final dividend on the ordinary stock of 15 per cent., less tax, thus maintaining the total distribution for the year to 25 per cent., less tax.

The profit on trading and other income, after providing for excess profits tax, is £292,912.

COUNTRY PREMISES ACQUIRED

At the outset of hostilities your directors took the precaution of leasing a country property, standing in several acres of land, some distance from the main factory, as an insurance against stoppage or curtailment, owing to war conditions, of our full working facilities there. Certain alterations and works were carried out on this property, subject to an undertaking to make full reinstatement at the end of the war, including the erection of temporary buildings capable of dealing with a proportion of the company's output. These buildings were equipped with emergency plant, and constituted, with the staff accommodation, canteen, offices, etc., a complete independent manufacturing and distributing unit. These steps proved to be fully justified by events. Portions of our main factory were diverted to other urgent Government war work, partly carried out by us and partly by other manufacturers, and in answer to a call to undertake further work of this character, a part of our manufacturing space at the country premises had to be used. It has now become necessary to devote the whole of these premises to such purposes, but we have, fortunately, been able to make arrangements as a result of which no serious curtailment of the manufacture of our own product is anticipated.

Having regard to the expenditure upon the country premises and the waste and expense which reinstatement would involve your directors decided that the purchase of the freehold would be a sound commercial economy. Negotiations were accordingly opened with the owner, and the freehold was acquired at the pre-war figure. This explains the increase in the item "Freehold land and buildings" in the balance-sheet.

The demand for our product in the home market continues as strong as ever. Although at times we have experienced difficulty in meeting the requirements of the public to the full in these strenuous days, "Aspro" maintains its reputation and favourable position, and the indications augur well for the future.

EXPORT DIFFICULTIES

Last year I stressed the difficulties governing our export trade. During the past twelve months there has been little relaxation of the restrictions, and we have not made such advancement as we anticipated. All the same, we have missed no opportunity of supplying our customers' requirements when it has been possible, and our organisation at home and abroad has been maintained efficiently in readiness to take full advantage of all facilities immediately they are made available, with a view to recovery and further development of the markets to which we gave so much attention in the past.

The report and accounts were unanimously adopted and the dividend recommended was declared.

SOUTH AFRICAN DISTILLERIES AND WINES, LIMITED

IMPROVED RESULTS

The tenth annual general meeting of South African Distilleries and Wines, Limited, was held, on the 24th instant, in London, Mr H. R. Mosenthal, the chairman, presiding.

The following is an extract from the statement by the chairman, circulated with the report:

The consolidated net profits of the operating companies amount to £641,254 South African currency, before providing for taxation, and this compares with £561,043 last year. With sales prices controlled, you will appreciate that this increase of profits has been achieved through increased turnover; but it has, of course, attracted the full burden of excess profits duty and, together with normal, provincial, trade profits special levy and the non-resident shareholders' tax, the total of South African taxation has risen to £398,770, as against £324,830 last year, so that, against the increase in the net profit of £80,211, no less than £73,940 additional has to be paid over to the taxation authorities, leaving our operating companies with a net increase of £6,271 at £242,484.

The heavy liability for taxation has caused the local boards to maintain their policy of conserving their resources, and they have therefore only declared dividends sufficient to enable the directors of this company to propose the distribution of a final dividend on the ordinary stock at the same rate as last year, viz., 6 per cent., less income-tax. As a result, however, there remain undistributed profits in the hands of subsidiary companies of £253,883 S.A. currency as compared with the balance brought forward of £175,718.

SALES CONTINUE GOOD

The sales position of our operating companies has continued extremely good, and for the first six months of their new year, viz., March-August, 1944, their sales again show a substantial increase over the corresponding period of what has been a record year, but, as I pointed out last year, this is partly due to the increase in Excise Duty, on which increase nothing by way of profit is permissible.

I have on more than one occasion pointed out from the chair that our subsidiaries concentrate nearly 100 per cent. on their home market and have exported practically nothing either before or during the war, so their yearly increased sales are not due to any fortuitous war demand in this country and elsewhere through the cutting off of supplies of wines and brandy from Germany and France; it is therefore clear that the resumption of exports from those sources should not adversely affect us, and if demand arises again in the Union for these and for Scotch whisky,

(Continued from page 584)

adequate supply of feeding-stuffs. Many of the egg industry's prewar difficulties, some of which might have been overcome had the passing of the Poultry Industry Bill of 1939 not been postponed, still remain. The health of poultry stock and the whole question of marketing and distribution will occupy the industry in the future. So far there is no indication of what Government policy will be.

UKCC

In answer to a question in the House of Commons on October 17th, Sir John Anderson gave some fresh hints about the future of the United Kingdom Commercial Corporation—the Government's trading organisation. He could not name the precise winding-up date of the Corporation, but thought that its services would be needed for at least 18 months after the defeat of Germany. Sir John Anderson

BRITISH LION FILM CORPORATION LIMITED

RECORD PROFITS

The sixteenth annual general meeting of British Lion Film Corporation, Limited, was held, on the 26th instant, in London, Mr S. W. Smith chairman and managing director) presiding.

The following is an extract from the statement by the chairman circulated with the accounts: The gross profit on trading amounts to £205,322 compared with last year's figure of £157,003, and our net profit is £101,270 against £56,636 last year, which constitutes a new record. While I hope that when next I have to report to you our figures will be satisfactory, I should tell you that during the year under review we have been favoured by exceptionally good product as well as the general prosperity of the cinematograph industry.

The directors recommend the same dividends as were declared last year—namely, a maximum dividend of 10 per cent. on the 7½ per cent. participating preference shares and 50 per cent. on the ordinary shares; the carry forward of £27,076 being an increase of £1,472 over last year. I am gratified to be able for the fourth year in succession to recommend the continuation of the dividends on both classes of shares.

At the cessation of hostilities we can expect to have our studios de-requisitioned, which are still in the occupation of the Government. It is equally necessary that we produce and distribute British pictures, but owing to the dearth of available studio space during the year under review we have not been able to make the number of British pictures which we would have liked. We have acquired a 50 per cent. interest in the Worton Hall Studios, which should greatly help us in this direction. The report was adopted.

GENERAL CEYLON RUBBER AND TEA ESTATES, LIMITED

The forty-sixth and forty-seventh annual ordinary general meetings of this company were held, on the 18th instant, in London, Mr J. Gilroy Annan (the chairman) presiding.

The following is an extract from the chairman's address, which was circulated to shareholders:

For 1944, the estimates are framed to deal with 2,440,000 lb. tea and 2,209,000 lb. rubber. To the end of June, the present season has been favourable for tea, the crop harvested being 1,357,000 lb., compared with 1,302,011 lb. for the corresponding period of 1943 and 1,399,866 lb. in 1942, while rubber at 772,000 lb. compares with 916,933 lb. and 720,547 lb.

The report was adopted, and the dividends of 5 per cent. for 1942 and 1943 approved.

added, however, that its future is intimately linked up with the still unknown pattern of international trade in the early post-war years, and he said "it may well be that tasks will emerge in which we should like to be able to rely on the help of the Corporation." But he gave the assurance—and this is of particular interest to traders—that the Corporation will maintain its policy of not undertaking transactions which can properly be handled by traders and that, on the contrary, it will assist British traders wherever possible. Sir John Anderson's statement should allay the fears of those who saw in the UKCC a threat to private enterprise.

Research in India

An Indian Scientific Mission is paying visits to Britain and America. This is a first step towards realising the high aims of a great increase in India's real wealth and

standard of living, set out by the authors of the "Bombay Plan" and other prominent Indians. These aims require, firstly, a vast outlay in capital investment. But almost equally important is the application of new scientific techniques to industry and agriculture, and—if Indian life is to be made more tolerable as well as more prosperous—to health and nutrition. Industrial research in India has hardly kept pace even with the recent growth of large-scale industrialism, although they suffered together in the depression of the 'thirties. It has attracted little expenditure from either public or private sources. A number of officially-sponsored bodies have accomplished useful, if limited, pioneer work. The Indian Central Cotton Committee, with an annual budget of £75,000, has been instrumental in raising the yield of the cotton crop by 14 per cent over ten years and raising the area under improved types of cotton to 35 per cent of the total. This body is concerned with seed production and marketing schemes as well as with technological research; and both it and the Indian Central Jute Committee are, in fact, supervising bodies, watching over and advising on all stages of production from the field to the factory. A more specifically research body, paying attention to questions of engineering and chemistry, is the Imperial Institute of Sugar Technology. The Indian Research Fund Association carries on a relentless, if pitifully small, struggle to trace the origins and spread of India's virulent diseases, and owns a single reasonably equipped nutrition laboratory. The sum total of both money and facilities for industrial and scientific research remains absurdly small compared with the vast need. The Government has taken the lead by setting up a Board of Scientific and Industrial Research to co-ordinate activities and to plan long-term investigations into problems of both theoretic and applied science. This department cannot be effective unless it can draw into its service both money and brains, which will repay such investment a hundredfold in terms of increased prosperity and health. The shortage of experts either to undertake research or to apply its results is, of course, a severely limiting factor. Adequate training schemes are the first need. In

the meantime, foreign ability should be drawn upon. The possibility of opening offices in London and Washington to gain up-to-date scientific information deserves to be investigated. The increased prosperity of India, brought about by such developments, can be nothing but a boon to Britain. It may well produce a difference in the composition of British exports to India, but the great increase in Indian purchasing power will make unlikely a fall in the total demand.

Company Result

FINANCE AND BANKING

THE MONEY MARKET.—Floating debt borrowing has been on a smaller scale this week than last. Treasury bills to be taken up amounted again to £120,000,000 and were £10,000,000 in excess of the maturities. Treasury Deposit Receipt payments were scaled down to £60,000,000, which exceeded the effective maturities by slightly more than £20,000,000. Most of the clearing banks have been making up this week for their October statements and the turnover of funds in the money market has been considerable. Easy conditions prevailed in the earlier part of the week, the market being helped by substantial amounts of American money. This was taken off the market on Wednesday, and conditions became sufficiently patchy to require some assistance from the authorities. The Bank return shows that on the day in question bankers' deposits stood at £203,783,000, a figure which, even allowing for the effect of window dressing, should have been sufficient to preclude the need for such help.

MONEY RATES, LONDON.—The following rates remained unchanged between October 19th and October 26th:—
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%. Treasury Bills: 2 months, 1-1¼%; 3 months, 1-1¼%. Day-to-day money, 1-1¼%. Short Loans, 1-1¼%. Bank deposit rates, ½%. Discount deposit at call, ½%; at notice, ¾%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between October 19th and October 26th (Figures in brackets are par of exchange).

GOVERNMENT RETURNS

For the week ended Oct. 21, 1944, total ordinary revenue was £47,972,000, against ordinary expenditure of £120,984,000 and issues to sinking funds of £180,000. Thus, including sinking fund allocations £8,129,408, the deficit accrued since April 1st is £1,821,938,000 against £1,797,425,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £430,701 to £3,025,388, the other operations for the week (no longer shown separately) raised the gross National Debt by £74,435,792 to £21,407 million.

Extended Lease

REAT expectations of a sudden German collapse have now been replaced, for most people, by more er estimates of the date of final victory; and the nge has been accompanied, in Britain, by a lower-of political temperatures. In recent weeks the prosts of a return to party politics early in the new year e receded before a flood of speculation concerning the ntions of the parties represented in the coalition vernment. Mr Churchill's speech on the second read-of the Prolongation of Parliament Bill has put an l to all uncertainty. The coalition will be maintained il "the German war is effectively and finally finished." Then—and only then, for all parties are agreed on this vill Parliament and the coalition be dissolved; and it l fall to Mr Churchill to form a new Government n the ranks of the Conservatives so that the country's irs may be administered during the interregnum. ere will be no "coupon" election; the notion of a lition Government continuing while the parties fight h other at the hustings is dismissed as impossible;

and there is, presumably, to be no return to the principle of coalition once an election on party lines has been fought. The timing of the election depends, then, on the speed with which victory is attained and the length of the interregnum. Mr Churchill has predicted, in a cautiously phrased circumlocution, that the German war will end by the spring or early summer and has assessed the duration of the period between the end of the war and the election at from two to three months. This time must elapse between dissolution and election since the new electoral arrangements, which come into force on December 1st, impose a minimum interval of eight weeks between the issue of writs and polling. It seems unlikely, therefore, that the election will be held until well into next year, and possibly not before August or September. It will be more distant than most people had expected and many had hoped.

The arguments in favour of the prolongation of the coalition are certainly very strong. It is important that the jobs for which the coalition Government was

appointed, four and a half years ago, should be brought to finality. It is equally important that Allied plans for the final blows against Japan should not be hindered by domestic preoccupations in Britain. At the same time it is very necessary that the many schemes of social and economic reform, which, even in their present embryonic form, reflect much credit on their originators, should be translated into effective legislation.

It seemed probable until a few weeks ago that this Parliament would be distinguished by the number of good things it had left unfinished. It has now been granted a reprieve and has an opportunity to save its reputation. Failure to give effect to the reforms it has initiated would bring discredit to Labour and Conservative Ministers alike. No electoral favour could be won for either party by withholding what has been promised. The public is quite determined to have its "Beveridge" and will make short work, at the earliest opportunity, of those who delay its enactment.

But if there is much to be said for a continued coalition—so much, indeed, that it becomes inevitable—there is also much to be said against it. There is no real parallel, as some would have it drawn, between military conditions in 1918 and conditions in 1944. The present war has reached a stage of maturity that the last war never attained. However much fighting there is still to be done, the planning and the policy making and the legislating for the war are over. Parliamentary time (though the Minister of Defence, perhaps naturally, does not seem to realise it) is increasingly pre-empted by post-war matters. In other words, so far as Parliament is concerned, the coalition of 1940 has come very close to the end of its task. Today, the business before Parliament deals almost entirely with conditions in a Britain and a world at peace. The Government are called upon to reconstruct and repair the face of Britain, the structure of industry and trade, the social services—even the system of government itself; and these are tasks about which there are wide differences of opinion.

Mr Churchill has described his team as

a highly efficient Government, which has waged the war with unsurpassed success, and has shaped, or carried out, within the last two years a programme of reform

and social progress which might well have occupied the whole Parliament in the ordinary conditions of peace.

That praise, interpreted literally, is perfectly valid. But it can and should be qualified. It is not so much the inherent merit or the statesmanlike exertions of the coalition Government that have "shaped or carried out" the impressive programme of reform; it is the fact that the coalition has been in office under the extraordinary conditions of total war. The demand for reforms arose insistently in the British people as the war gave urgency to the hopes and aspirations of many decades. The truth is that these reforms, more shaped than carried out, were and are considerably overdue; and it would be a sorry business if their implementation were delayed still further.

There is thus ample reason for regarding the prolongation of the coalition, unavoidable though it may well be, with serious misgiving. The picture of Parliament pressing home in an atmosphere of unity (which means in an atmosphere of mutual conciliation) the many excellent reforms that have been drafted is an attractive one. But it is not true to life. The issues that are now coming up, like those in the Town and Country Planning Bill, are not covered by the parties' wartime agreement. They are contentious issues on which a coalition Government, by definition, cannot agree. The risk attaching to the prolongation of the coalition is that it may become increasingly impotent. There was never a time when clear decisions were more urgently needed. But the coalition, unlike each of its members, has no policy from which such decisions can be drawn. The whole is less decisive than its parts.

In this dilemma any solution must be a makeshift of compromise. Instead of decisions there can only be concessions and painful sacrifice of principle. Mr Churchill's immensely strong powers of leadership will be required over and over again to compel acceptance of one unsatisfactory compromise after another. For the moment, it seems to be agreed that even this is not too high a price to pay for the benefits that a coalition Government can bring in the fields of strategy and of war production. But the price will rise month by month and if the end of the war is much longer delayed it will eventually become intolerable.

Polish Guarantee

IN the Commons on October 28, Mr Churchill was asked whether the British Government would join Russia and America in guaranteeing Poland's sovereignty and independence. He replied that he believed the Soviet Government would give such a guarantee and that

I have not hesitated to say that His Majesty's Government will certainly conform to and themselves join in such a guarantee.

This clearly is a statement of primary importance for British foreign policy. The guarantee given to Poland in 1939 ended a twenty-year tradition that frontiers in Eastern Europe were no concern of this country. It marked the end of appeasement and the first decisive step towards war with Germany. In the post-war world this guarantee is apparently to be maintained. It is vital to know exactly what commitment it entails for this country. The weakness of the 1939 guarantee lay in the fact that it was not concerted with Russia. Russia was the only Power that could have made the immediate defence of Poland against Germany effective. A guarantee which is not concerted with Russia or is even directed against Russia is not one that this country can physically honour.

It seems clear from Mr Churchill's statement, however, that only a joint guarantee is envisaged. He spoke of the British Government's readiness "to conform to and themselves join in such a guarantee"—the guarantee being Russia's in the first place. Thus the commitment underlying the proposed guarantee is presumably that Britain would undertake to resist a German invasion of Poland, provided Russia were a party to the defence.

A joint guarantee of this kind would obviously be a

gain for Poland. Had it existed before the war, and been honoured by all the parties to it, the course of the conflict might have been wholly different—if indeed it had ever begun. But it would have been the Russian guarantee, not the British, which, in those circumstances, would have saved Poland. The giving of British guarantees—even joint and contingent guarantees—to countries in Eastern Europe which cannot be effectively defended by British forces is a highly questionable policy. What is more immediately relevant is that it does not touch the core of the present Polish crisis. The guarantee is proposed for an independent and sovereign Poland. Antecedent to any guarantee is therefore the question whether Poland is to be genuinely independent and sovereign.

It was hoped that the Moscow Conference would give a clear answer to the question of Polish independence. Unhappily it only emphasised how difficult and bitter are the issues which still stand in the way of a settlement. It became clear in the course of the Conference that both Mr Churchill and President Roosevelt had already accepted the Curzon Line as Poland's eastern frontier. The decision was taken at Teheran. If this is the case, one may well ask whether the Poles have been fairly treated by their western Allies. On their return from Teheran, did the Prime Minister and the President inform the Polish Government of their decision? There is no evidence to suggest that Mr Roosevelt took this step. Mr Churchill, it is true, in his speech on February 22nd, said that in his opinion the Curzon Line was a suitable basis for the future frontier, but added that he himself thought

the issue ought to be postponed until after the war. There is thus little evidence to suggest that the Poles were specifically told of the Teheran decision, unless Mr Churchill was referring to some such advice when in his speech last week he blamed the Polish Government for not taking "the advice tendered to them at the beginning of the year." If the advice was not given, the Poles have been most unfairly used.

Since the British and American Governments have committed themselves to the Curzon Line, it is obviously in the Poles' best interest that Mr Mikolajczyk should be ready to accept it. This does not condone the earlier Allied decision. To accept the Curzon Line at Teheran without concessions or modifications was weak, inconsistent and premature. It would certainly have been more just and reasonable if the President and the Prime Minister had continued to support the Russo-Polish agreement of 1941, according to which frontier issues were to be postponed until after the war. But they have not done so. The question at issue now is therefore not the rightness or wrongness of the Line nor even the manifest inequity of Russia's procedure, but the question whether there is to be no *quid pro quo* for this tremendous concession.

It should be said at once that sweeping frontier concessions in the west are no real compensation. Adjustments in Silesia and East Prussia are practicable. The Oder Line is not, and the Polish Government are not particularly anxious to annex large undisputedly German territories. It would be fatal if the British Government's bad conscience were to lead to pressure being put on the Poles to take "compensation" in a form they were unwilling to accept. Whether in the East or in the West, the real issue is not territory, but genuine independence. A small independent Poland would be far better than a large

Europeans and Russians 1940-70

SOME few weeks ago Mr Churchill warned the House of Commons and the "far wider circles involved" against pressing for speedy decisions on the reconstruction of a peaceful world. "There are many factors," he said, "at present unknowable which will make themselves manifest on the morrow of the destruction of the Nazi regime." When the time comes for recasting the frame of an international society there will be at least as much to fear for future peace from the disregarded factors as the "unknowable" ones. It was so in 1919, and will be the more unforgivable this time. Not the least of these factors will be the changes in the relative numbers of the peoples involved. In 1919, the momentum of the nineteenth century still gave weight to political assumptions of all-round increases in population. This time, the settlement will have a new factor of declining populations to be fitted into the pattern of peace. Whatever its provisions, it will determine the international foundations of Europe for several decades. If it should be based on the assumption of European populations as they were in the thirties, or as they are to-day, such a settlement would have created a dangerously wide margin of error by 1970. Even vigorous population policies—whose latest advocates in this country are the Tory Reform Committee*—cannot entirely reverse the powerful trends already in existence or alter the number of potential mothers twenty-five years hence. Not only will absolute numbers have changed by then, but the proportion of old people, of young men of military age and of women likely to produce children will also have altered in each country. Under such strains, a 25-year-old settlement would be lucky to survive.

This factor of changing populations may be disregarded to our cost, but it is not altogether one of Mr Churchill's "unknowables." A valuable estimate has recently been published by the Economic, Financial and Transit Department of the League of Nations.† With the academic

puppet. The Poles can live a fully sovereign life behind the Curzon Line and newly adjusted frontiers in the West. They cannot live in independence if their freedom to choose their own rulers—the essence of independence—is to be open to such mischievous meddling as Russia's backing of the Lublin Committee.

When, at Teheran, the Prime Minister and the President agreed to the Curzon Line, they made, for themselves and ultimately for the Poles as well, a very great concession to the Russian point of view. The three heads of state are shortly to meet again. It is now Marshal Stalin's turn to show that he is prepared to put something into the common pool of Allied concession and good will. Let him dismiss once and for all the Lublin Committee, which has not even served his limited purpose of providing an administration, since in Russian-occupied Poland it is the Russian military and police who in fact have to exercise all authority.

Since the British and Americans have already conceded the frontier issue, it is on the question of a Government for Poland that they must now concentrate their attention. They must not for an instant relax their determination to support Mr Mikolajczyk and they must bring all their influence to bear on Russia to secure the disappearance of the discreditable Lublin experiment. It is high time in the Russo-Polish dispute that the one-sidedness of the concessions were balanced by a gesture of genuine good will from the Russian side. Mr Churchill was able to report to the Commons that Anglo-Russian relations have "never been more close, intimate and cordial than at the present time." While one may seriously rejoice that this is so, it must be asked how it is that the closeness, intimacy and cordiality have not led the Russians to a better understanding of the Polish issue on which all hopes of a peaceful and stable settlement in Europe ultimately turn.

carefulness and welcome modesty that characterise the best of the League publications, it sets out the best available estimates or "projections" of populations for the European countries and for the USSR for two and a half decades ahead. It makes no unwarranted claim to complete accuracy in its predictions, and the even development of its projections may well be disturbed by the erratic conditions of the war years and those which follow. But twenty-five years is a short period in population matters and errors should be small. An error of a million here or there will detract little from the significance of these figures.

The most impressive of the conclusions emerging is the contrast drawn between the USSR and the rest of Europe as a whole—or, even more striking, between the USSR and the countries of North-western and Central Europe. Not even the grave losses since June, 1941, can alter the fact that the Russian population is likely to increase very greatly and very rapidly in the coming decades. If these losses are disregarded, and the assumption made that there is no change in the rates of mortality and fertility, the population of Russia by 1970 is forecast at 250 millions. Such a population will be 25 millions greater than the combined populations of all the countries of North-western and Central Europe (i.e., Great Britain, Ireland, France, Switzerland, Germany, the Low Countries, Scandinavia, Austria, Czechoslovakia, Hungary, Estonia and Latvia). Compared with the position in 1940 when the Russian population was not greater, but less by about 40 millions, the significance of these projections for the future of European politics can no longer be doubted. Moreover, the prediction appears more plausible if it is remembered that the resiliency of a growing Russian population was able to emerge in 1939 from war, revolution and economic chaos with a net increase of 55 per cent since 1900. Of the 1939 total of 170 millions, 23 millions had been added in the short but disturbed period since 1926.

By contrast, Europe is becoming a continent of demographic maturity. The years of expansion are over.

Economic development, bringing first the means of support for larger families and then the means to limit them, has come full circle, and declining fertility presages in almost every country of Europe a return to population stability. From the time when one-fourth of mankind lived in Europe, and a further twelfth were Europeans living overseas (so that one man in three was of Euro-

pean race) the population of the continent is now returning to the mid-eighteenth century ratio of one in five.

Of the constituent countries of Europe, one only had already begun to decline before the war. In 1935, the population of France started on the slow decline that will reduce its numbers from 41.2 millions in 1940 to 36.9 millions by 1970. The decline of England and Wales which would normally have started about 1945 is likely to be, like past growth, more rapid. The whole United Kingdom will have decreased in numbers according to the projections from 47½ millions in 1940 to a little over 43½ millions in 1970. By comparison, the German population (within the political boundaries of 1937) will stand at 70 millions. This is on the assumption that the relatively high fertility levels of 1937-8 are maintained and that the probable post-war emigration of foreign and German labour exactly balances the immigration of 5 per cent of the population that has taken place during the war. Even this decrease (from a "normal" projection of a 72.2 millions peak in

1955) will leave Germany the most populous country of Europe outside Russia. Next highest will be Italy with 50 millions, reflecting the gradual but steady growth projected for the countries of Southern and Eastern Europe. This trend is also demonstrated by the growth of the Polish population (again, within the political boundaries of 1937) to 41 millions.

Possibly more important than absolute changes in

numbers are the projected changes in the composition of the various national populations. Rapid declines in fertility in Western Europe mean that the large numbers born 30 and 40 years ago will increasingly outbalance the younger—and smaller—age-groups. By 1970 Western European populations begin to be heavily overweighted by old men and women. The 20 million old people (65+) of North-western and Central Europe in 1940 will have increased by 1970 to 33 millions. The corresponding increase in the USSR will only be from 7 to 16 millions, an increase of only 3 per cent of the total population at each date.

Similarly, the proportion of young males in the industrially and militarily important ages of 15-34, though likely to decrease in every country—Russia not excepted—will still be considerably smaller by 1970 in North-western and Central Europe (39 per cent) than in the USSR (51 per cent). In absolute numbers, this represents 43.3 million young men in Russia, compared with the 10 millions of Germany, under 5 million each in France and

Number of men aged 15-34.

in England and Wales, 7½ million in Italy and 6½ million in Poland.

Similarly the number of men in the productive ages of 15-64 in Russia will far exceed those in other European countries. By 1970 an increase from 49 to 84 millions in the USSR will exceed the combined numbers of productive males in France, Germany, the United Kingdom, Italy and the Low Countries. Even Roumania, Poland and Yugoslavia will have so benefited from their later growth that their combined men in these ages will exceed by 2 million the 28 million of Britain and France together.

From the economic point of view the number of dependants in each country will also be an important new factor. In England and Wales the proportion of dependants, young as well as old, is likely to remain at 30 per cent, the increase of 9 to 16 per cent of people aged 65 and over being balanced by a decreasing proportion of children. The burden of dependency in the Russian population, however, will fall. In spite of an absolute increase in the number of children under 15, the proportion to the rest of the population falls by 7 per

cent. Balanced against a 3 per cent increase in the aged, the 1970 dependency ratio will stand at 37 per cent.

It should be remembered that such projected ratios are based on levels of fertility and mortality in each country which do not vary from the pre-war figures. Either a lower mortality or a population policy resulting in a higher net reproduction rate, or a combination of both, will tend to magnify increases in an expanding population and to lessen decreases in a contracting one. In either case, the relative burden of dependants would be increased. The projections are also based on assumptions of steady development, uninterrupted by the casualties or birth-losses of war or post-war epidemics, or the adult losses of emigration. So far as these reduce populations and disturb the remarkable persistence of demographic trends, such scars will be more easily healed in "young" populations such as the Russian, rather than in ageing populations. Moreover, the new population policy of the USSR.

embodied in recent decrees giving large family allowances, is of such a nature that it may well counteract any population-reducing effect that war and invasion may have had.

To state these facts, however, is not to conjure up the bogey of another yellow peril on the eastern marches of Europe. The influence of Europeans on the political, economic and cultural development of the rest of the world has never been one purely of the weight of numbers. Even on the most pessimistic prognosis for the future of international relations, population changes of this kind under modern conditions do not necessarily spell the eclipse of the continent. What the actual results will be it is impossible to tell. But this much at least can be said. Europe's interest in constructing for itself and for the world a stable and cooperative international society is, in the light of these population trends, even greater than in 1919. The imminence of declining numbers brings with it the threat of comparative military and industrial weakness. It also brings the challenge to adapt conditions and ideas to a new ratio of men and resources.

A Plan for Broadcasting—II

THE preceding article was mainly devoted to two points. First, broadcasting is less than 25 years old and still in an experimental stage. It would be an abdication of judgment to decide, on the basis of such short experience, that there are only two possible ways of organising it, either the British method of a monopoly financed by a licence on receiving sets or the American method of private enterprise "selling time" to advertisers. The period of experimentation should be continued, with the object of finding a system that would avoid the manifest defects of these two. Secondly, whatever system is adopted, there should be no monopoly, which is liable to be just as dangerous as a monopoly of the printing press—and just as dull.

The major reason for this doctrine, be it noted, is not that monopoly is dangerously strong. Monopoly, in matters that concern the human intelligence, has both strengths and weaknesses, but on the whole it is the weaknesses that are the most conclusive. Monopoly is strong towards the wrong people, and weak towards the wrong people. For example, a monopolistic broadcasting corporation can take an immensely strong line with its listeners. If it decides that Social Credit, or atheism, or the music of Bela Bartok, or talks on sex education, should not have access to the air, then they are banned. Listeners can grumble, they can protest, they can write letters, they can switch to Athlone or Luxemburg. But they cannot affect the monopoly's policy or refuse to contribute to its support, so long as they want to own a set at all. Anyone

who considers this statement exaggerated is invited to reflect for how many years the BBC adhered to Lord Reith's ideas about Sunday broadcasts. A monopoly can rule its listeners with a rod of iron.

On the other hand, a monopoly, if it is subject to any public control at all, is weak towards "the interests"—that is, towards those who want to influence the programmes that other people are to listen to. Any corporation in the BBC's position is inevitably the universal butt of anybody who can bring public pressure to bear—that is to say, of almost everybody but the listener. From every axe-grinder it will receive advice and admonition, to all of which it must listen—for the penalty of inattention is Parliamentary criticism. From every direction it will be the object of pressure, to which it must yield. It may struggle to keep before its eyes the golden rule of broadcasting, that the programme must be interesting or it will not be listened to. But the pressure groups and the busybodies are not concerned with whether the programmes are interesting. Indeed, the Tory MP is chiefly concerned to see that his Socialist opponent shall *not* be allowed to be interesting, even if, as a gesture of impartiality, he has to be allowed on the air. The monopolist broadcaster cannot concentrate on his proper business of pleasing the greatest number of people; he is compelled to do the direct opposite—to concentrate on offending the smallest number of people. He is forced to be timid, and mediocre, and dull. Since every bright colour is displeasing to some raucous interest, he can use only grey. Since heat and cold

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.
