Work and Wealth

week's three-day debate on employment policy profoundly disappointing. This was hardly the Ministers. It is true that they added very little White Paper, but it is equally true that they sub-very little either. Mr Bevin's opening speech was live in its sincerity, and though there was nothing vel in what he had to say about the need for ty of labour, adaptability of industry and full activity, it is an advantage to have these principles ted by his authoritative voice. Sir John Anderson an effective debating speech, but its content was t very positive. Mr Pethick Lawrence had asked him answer some of the queries about the budgetary applications of the policy that were posed in these columns two weeks ago. The Chancellor's reply left the matter still very obscure. He was emphatic that Budgets must be balanced over a period, and that must be seen to be a cardinal point in Government policy." But he left the House in doubt whether the incurring of "productive debt"—whatever that may be—might not be an excep- tion to the rule.

The sense of disappointment, however, arises less from these Ministerial speeches than from those made by pri- vate members. With very few exceptions, they were far below the level of the opportunity. Here is a great new development of public policy—perhaps the most import- ant single step forward in economic matters that has ever been taken. The White Paper deliberately sketched it out

only in general terms in order to secure the maximum of agreement before proceeding to the difficulties of the details. But members preferred to quibble, to strain at gnats, and to serve notice that the cost of conquering unemployment must be paid by others than the particular interests they represent.

The Socialists were particularly unhelpful. Even Mr Shinwell, who can usually be relied upon to see to the centre of a problem, indulged in some astonishing wish-ful thinking on the possibility of disregarding foreign trade, for which he was very properly castigated by the Chancellor. Most of his colleagues insisted on dragging in the very red herring of public ownership, in spite of Mr. Bevin's clear statement that "the question of how you can give effect to decisions as to who will own industry is not prejudiced by this White Paper." There could be no greater disservice to the community than to foster completely unnecessary disunity in a matter where the greatest possible unity of purpose and method will be needed for success. To quote Mr Bevin again, "the proposals of the White Paper will operate, whatever the ownership of industry may be." To raise the cry that large-scale nationalisation is an essential preliminary to any attempt to secure full employment—a cry that will inevitably be resisted and has always hitherto been voted down by a majority of the electors—is to put the making of party capital above the abolition of mass unemployment.

Before the motion was carried without a division, several members insisted on making the point that it committed them to approval of nothing beyond the acceptance of responsibility by the Government for securing "a high and stable" level of employment. The position therefore is that Parliament is committed to the end but not to any of the suggested means of attaining it—indeed, there was hardly one of these means that did not come under criticism from some quarter. This is a ridiculous position. Everybody has known for a long time past that the Government is committed to doing its best to prevent mass unemployment; only the formal acceptance of the responsibility is new. On the other hand, the methods are the whole structure of the policy. Where the White Paper was deficient was not in principles but in practical means of attaining them. But Parliament, instead of correcting that defect, will have tended to intensify it. The effect of the debate will be to make a Government, not over-bold in any case, hang back. To approve the principle, in such circumstances, is of no help at all. The attitude of private members is to insist that the front move forward while sniping at the lines of communication.

There is another aspect of the matter, to which Sir George Schuster devoted an excellent speech on the first day. He insisted that the attainment of all economic objectives—not only those of full employment and social security but the wider objectives of a rising standard of living—depend absolutely upon the efficiency and productivity of the British national economic machinery. Nothing could be more true. What is happening at present is that everybody is busy disputing about the size of the slice of cake that each is to receive after the war. Labour's slice is not only to be large but regular. There is to be a slice for education and a slice for planning and a slice for health and a slice for housing, a much larger slice for the armed Forces and several slices for social security.

But no one is concerning themselves with the size of the cake. On the contrary, there is a universal tendency to assume that Providence will take care of that. Even the Chancellor of the Exchequer, ordinarily so cautious, tells the House of Commons that he is sure the country will be able to secure the necessary increase of its exports by 50 per cent. But how? If the Government have any idea of the means by which this very great increase can be achieved, they are keeping singularly quiet. Perhaps it can be done; but only by enlisting the utmost efforts of all concerned. It will require an enormous effort of mobilisation—which is the one thing, of all things, that cannot be done behind closed doors. Or again, learned discussions are conducted on the subject of distributing between different uses a large prospective increase in the national income. But on what are these spacious expectations based? It is true that there are certain indications of greatly increased productivity after the war. But to rely on these signs for a post-war prophecy would be most dangerous. In a comparatively narrow range of industries there have doubtless been permanent gains in productivity. In others, the statistics may be most misleading. The productivity per head of *The Economist* Newspaper Ltd. has greatly increased during the war, in the sense that the value of the output divided by the number of persons employed is very much greater than it was in 1938. But this is merely another way of saying that a much smaller staff are working very hard; it implies nothing about productivity when peace time conditions return. The present mood of the country is not merely to expect economic miracles, but to expend them before they arrive.

It cannot be too often repeated that all the rosy dreams of the present depend entirely upon the size of the national income. It can be taken for granted that the average British citizen would not take kindly to a state of affairs which did not enable him to consume, at his own wish and command, at least as much as he did before the war. But on top of this, the state is

committed to the maintenance of larger armed Forces and to a whole array of projects of "collective consumption" such as expanded plans for health, education, housing, town and country planning and the rest. If there is any deficiency, it is not likely to be either the level of popular consumption or that of Government expenditure that will suffer, but the third constituent, the provision of resources for the maintenance, replacement and increase of capital. But to cut down the allocation to capital is to reduce the rate of progress. In short, if the size of the total national income is inadequate in the years immediately after the war, it will remain inadequate, since the provision for progress will be the first to suffer. The penalty of inadequate production of wealth in the present is inadequate growth of consumption in the future. From this unrelenting logic there is no escape.

So the productivity of the national economic machine is the key to all the rest. Everything depends upon the rapidity with which the volume of real wealth produced by the average Briton in the average hour can be increased. Yet, strangely enough, this most vital of all questions is the one that is most ignored. Professor Pigou once said that there were three great tasks of economic policy: to increase the size of the national income; to make its flow more regular; and to improve its distribution. Under the heads of Full Employment and Social Security, the second and third of these questions are receiving ample attention. But the first, on which the other two are dependent, is left to shift for itself.

A policy of productivity will make its demands on all who are engaged in the process of creating wealth. From industry it demands a policy of seeking efficiency wherever it can be found. But the prevailing policy of British industry is to protect inefficiency wherever it is established. One after the other, in response to the Government's invitation, the industries are drafting their post-war policies, and it is a refreshing rarity to find one that is not based on the principle of protecting such markets as lend themselves to the process, and dividing them up among producers whose costs, in the sacred name of "security," are not to be subject to any unbearable pressure.

That industry, left to itself, should react in this way, is perhaps understandable, though none the less to be regretted. What passes understanding is the complacent attitude of the Government. The Board of Trade, to all appearance, is content with passive acceptance of these restrictionist doctrines. It is true that, according to the White Paper, it is to take steps to inform itself of what industry is up to. But if the details are obscure, the general drift of policy is already more than clear enough to have evoked a protest and a condemnation if there were any spirit for such a course. It would rather seem as if the chief result of having a Socialist at the head of the Board of Trade is to leave a clear field for all forms of anti-social action.

If this country is to achieve in peacetime the maximum production of which, in war conditions, it has shown itself capable, nothing less is needed than a complete reversal of the prevailing philosophy among British businessmen. The industrialist must realise that, in peace as in war, his chief duty to the community is to produce, and that if he fails in this, no other virtues he may possess will weigh very much in the balance. It was the great virtue of the regime of competition and free trade that it concentrated energies on this object. It may be that the same object can be secured by other means, but by one means or another secured it must be.

The demands that will be made on labour are, of course, no less. The worker's standard of living depends, not on what he can squeeze out of the capitalist, but on what he produces. But the prevailing attitude in Labour circles is shown by the fact that Sir Walter Citrine chooses this moment to advance a claim for a universal 40-hour week *without reduction in earnings* (the emphasis is his). The question of shorter hours is encumbered with any number of ambiguities and euphemisms which obstruct clear

thinking. It may be, of course, that the claim is not to reduce the actual hours worked, but simply to increase the number of hours for which overtime rates are payable—in short, to ask for a general rise in wages by the back door. If so, it would be more honest to say so quite clearly. Again, it may be that there are certain industries where the average worker would actually produce more in 40 hours than in 48. But if so they must be very few, and the employers must be quite exceptionally short-sighted if they have not already realised it. Wherever this is true, hours ought to be reduced as a matter of course. But this is certainly not typical of manufacturing industry as a whole, or of the service occupations which now make up so great a part of the whole economy. It is certainly not true in transport, for example, that the average worker could move more ton-miles or passenger-miles in 40 hours than in 48. In industry as a whole, a proposal to reduce hours is a proposal to reduce output.

It is doubtful whether the workers would really desire more leisure rather than more income if they could once be freed from the delusion that their output has nothing to do with their consumption. When it is a clear choice between more income and more leisure, the average worker chooses more income; as every employer knows, the one unforgivable sin is to deprive a worker of his fair share of overtime. But whether or not it is in the worker's interest, it is certainly not in the nation's. On the

contrary, it is a lamentable illustration of the popular approach to the economic problem that the Secretary of the Trade Union Congress can choose this moment to suggest not more hard work but less. If clear thinking and realism were the fashion, any such suggestion would be laughed out of court. There would be a case for reducing hours of work if the nation were so rich that it had no further material wants, or alternatively if the attempt to secure full employment for the available resources had decisively failed and it had become necessary to share the unemployment—and the poverty. But the first contingency is certainly not true, and we must continue to hope that the second is equally unreal.

The foregoing paragraphs have been couched in alarmist terms. That is deliberate. The position is alarming. After this war, the nation faces the necessity for economic adjustments of great magnitude and gravity. If the task were to carry them through without any fall in the standard of consumption, individual and collective, that, by itself, would be difficult enough. But the task that the nation has set itself is to make the adjustments and also to realise a substantial increase in the level of consumption, chiefly by the means of state-provided welfare schemes. This task can be accomplished, but only if everybody realises the magnitude of the effort involved and only if everybody, on either side of the party fence, is prepared to make the same sacrifices of prejudice on behalf of unity as have been made during the war.

Leadership in Europe

THE disappearance of Marshal Badoglio and the setting up of the Bonomi Government have an importance far greater than their immediate impact on the political life of Italy. They represent the first free governmental decision of a liberated people in Europe. The representatives of the Italian people decisively reject the old compromised regime. They have decided that the men who worked with Mussolini and the Fascists are not fit people to direct the destinies of post-war Italy.

There is nothing astonishing about this reaction. When one remembers what the peoples of Europe have suffered under the authoritarian regimes of the last twenty years and in what a cataclysm of disaster these regimes have broken up, the surprising thing would be if the nations were still ready to accept their old rulers. Yet, obvious and justified as their reaction is, there are disturbing signs that it is neither understood nor appreciated in this country. Instead of welcoming the choice of Signor Bonomi as a healthy expression of Italy's desire for a break with Fascism, the British Government, it appears, felt serious hesitations about accepting the new Prime Minister and did so only under the pressure of their military advisers in Italy.

This is not the only example of a policy which seems designed to favour the discredited supporters of Fascism and to alienate the Allies' friends. The Darlan episode, the preference shown in some quarters for Pétain, the "kind words" to Franco or, at another level, the slowness in arming the French *maquis* all show an unaccountable distrust of the popular forces of resistance and a preference for dealing with "the established authorities." There is only one obvious reason for this policy. Those responsible for framing British policy must have a morbid fear of social revolution and, as a consequence of it, are obsessed by the danger of "European leadership" passing from Britain to Russia. This attitude obviously has many variants and qualifications, but the basis—fear of social upheaval—is the same.

Two things must be conceded to this view. Social revolution carried through with violence by mob rule is nasty and brutish, and its consequences are long, not short. If there is any other way of solving social conflicts and tensions, it should be preferred. It is also true that post-Hitlerian Europe is in a revolutionary state. The consequences of totalitarian rule, crowned by the suffering and devastation of war, have driven thousands in the

direction of extremism and violence. All this can be admitted without in any way supporting the apostles of reaction in this country, for the argument turns not on the question whether or not it is desirable to have a violent revolution, but on whether the policy of supporting the pillars of the *ancien régime* is best calculated to avoid violent revolution.

The question answers itself. The surest way to ensure that the masses will be driven towards a dictatorship of the extreme Left will be to impose on them the discredited leaders of the system from which, in their belief, the war has set them free. Europe, on the morrow of the war, will be in a state of flux. The revolutionary ferment could take extreme forms. Equally it could be canalised into constitutional, liberal and progressive institutions. There is, after all, a third way, beside the way of dictatorship to Right or to Left, and after decades of dictatorship, the attraction of the way of constitutional democracy is strong. But if the leaders of the greatest and most stable parliamentary democracy use their influence on the continent to restore to power the tyrants, or the camp followers of the tyrants, whom the war has overthrown, there will only be one channel for popular feeling—social revolution and a dictatorship of the Left.

The same fact governs the authorities' other anxiety—the supposed passing of European leadership from Britain to Russia. Leadership is a loose term all too easily used to cover a relationship which it is difficult to define. In the first years after the war, Allied armies may still be in Europe, and leadership will take a direct physical form. Afterwards it cannot depend upon force alone. It lies in the attraction of ideas, in similarity of approach, in sympathy, in respect, in readiness for co-operation. In all these things, Russia does not enjoy all the advantages. It is a large continental Power with a great military machine and, as such, excites fear as well as respect. In their dealings with Europe so far, the Russians have not fallen behind their Allies in "realism" and expediency. Their great advantage is the Soviet myth, the belief of millions that in some way or another the Russian revolutionary record offers some solution of the pressing social and economic problems of this century.

Great Britain will not be feared for its military pre-dominance. There can never be a "British steam roller." On the contrary, its record of singlehanded resistance against tremendous odds has given it a great opportunity for building up the most fruitful kind of European leadership. The difficulty lies in the legacy of the interwar years. Mass unemployment, isolationism, appeasement, Munich—these make up a composite picture of a people whose creative epoch had run its span and who were living in the afterglow of a successful past. Leadership implies giving a lead. Nothing could do more to convince the peoples of Europe that Britain has no lead to give than if after victory the British were to restore the men who deceived and despised them before the war and fought on Hitler's side when war came. A lead

does not come from a nation that is looking backwards. If Britain's leaders hanker too obviously for the old order, the nations will look elsewhere—and hence to Russia—in their determination to build a new.

This would be a tragic outcome not only for this country but for the European peoples as well. British society offers so much that they would be so ready to adopt. It is crazy policy to identify Britain with the cause of reaction in Europe when British policy at home is liberal to the roots and offers an impressive example of the way in which liberty and order and popular rule and constitutionalism can be welded into a single system. By crying up the Badoglios and crying down the great resistance movements, the Government is reversing every precedent in British history. It is appearing reactionary abroad while being liberal at home. Often in the past it could be said of Britain that it was liberal abroad and conservative at home, but it has fallen to the leaders of to-day to create at home a community which could interest and excite and, indeed, lead opinion abroad and yet do all in their power to cover the light under a bushel of reactionary foreign politics.

It is not too late to retrieve the situation. However unwillingly, the Government has recognised Signor Bonomi. It has agreed that the Balkan Kings must depend upon popular approval. There is still time to give massive aid to the *maquis*. It will be possible for months yet to send genuinely liberal and constructive propaganda to Europe, painting a picture of the British community which is far more true and compelling than the timidities which a conservative censorship strives to impose upon the BBC's European services. The European peoples could still prove ready admirers of Britain's constitutional methods, social progress and democratic freedom, if Britain's spokesmen began at last to speak in favour of British institutions and to encourage the European nations—whether they are Italian or Czech or French or Yugoslav—to try their hand at a similar system. If there were a little more democratic enthusiasm in British foreign policy and a little less fear of anarchy, a little more confidence in liberal ways and a little less reliance on authoritarianism, a little more straight support for the popular movements of tomorrow and a little less clinging to the discredited ruling cliques of yesterday, there would be far less danger of violent revolution in Europe and a far brighter outlook for British leadership.

The Britain that Voltaire and Montesquieu admired, the Britain that spoke through Canning and Palmerston, the Britain whose moral purposes were thundered forth by Gladstone, was not the friend of tyrants and the enemy of progress. If Britain is to provide leadership for Europe after the war, it can only be leadership in the principles that are the marrow of the bones of the British people. Britain is a progressive Power or it is nothing. Once let it lend its name to the principles of legitimism and authority, and it will be left behind by the tides of history as surely and as finally as the Talleyrands and the Metternichs, the Bourbons and the Czars.

Books in Distress

EVERY literate member of the community is aware of the more obvious difficulties of the book industry. Production is handicapped so acutely by shortages of labour, transport and raw materials that supply and demand are widely divergent. Book-buying has become an unfortunate business of watching and waiting.

Under wartime conditions the demand for reading matter is seemingly insatiable. Its real volume is in no way represented by the turnover of the book publishing trade (some £18,000,000 in 1943, compared with £16,735,900 in 1942). At present, nine new books out of ten are over-subscribed before publication, and it is not uncommon for orders to exceed the numbers printed by four or five times. The demand for books in the months ahead is certain to be at least equally great. The

British book industry will have to play its part in the restocking of libraries in liberated Europe; it must regain its position in Empire and overseas markets; and it must make its own special contribution to the success of planned reforms in education, medicine and general welfare.

The book industry is unique in that it supplies not only a physical commodity but also the ideas, opinions, facts and fictions which are the instruments of knowledge and culture. For this reason its problems deserve particularly sympathetic consideration. Every effort of reconstruction at home and overseas depends very largely on books for the dissemination of its theories and principles. Twentieth century democracy would be impossible without the printed word.

The Publishers Association regards the present position of the industry with considerable apprehension. The most urgent problem is that of supply. Before the war publishers carried sufficient stocks of paper and books to meet several years' demand. These stocks are now virtually exhausted, and demand must be met entirely out of the publisher's paper quota (40 per cent of pre-war consumption) and the somewhat meagre supplies made available by the Ministry of Information. In a report submitted to the Government, the Publishers' Association recommends that the quota should be substantially increased "at the earliest practicable moment." This would make possible the printing of larger editions (with a consequent reduction in production costs per unit) and an improvement in deliveries for export.

This recommendation deserves support, even from those whose standard quota is still smaller and who are faced by a no less insistent demand. There is a severe world shortage of newsprint and of paper made from wood, for supply reasons. But this does not apply to book papers, which are largely made from esparto in peacetime and straw in war time, and it should now be possible to increase these supplies. The assimilation of technical and educational literature can be regarded as a form of capital investment, and at present books of fiction comprise only about one-tenth of the works published in Britain—though not, of course, of the volumes.

The straw paper used to-day is home-produced. In quality it is inferior to the esparto papers produced in Britain before the war, but much less so than in the last war. The esparto grasses of Algeria, Tunisia, Morocco and Spain are used locally for the making of ropes and baskets, but their main use (normally) is in the manufacture of paper in Britain. Until 1940, about 300,000 tons of the material were imported by British esparto paper-mills each year. The Publishers Association urges that immediate steps should be taken to reorganise the esparto-collecting industry in North Africa so that imports may be resumed. While the shipping tonnage required for this purpose would be very small, the more economic employment of labour and machinery in the book-paper mills and savings in fuel (approximately twice as much coal is required in the production of straw paper) would more than offset any minor diversion of the war effort.

In each of the three component parts of the book-producing industry—printing, binding, publishing—the labour shortage is acute. Many of the difficulties of the industry are common to all light industries; but there are others of particular importance and urgency. In the printing trade the age and health of the average worker and the demands of civil defence make it impossible to increase working hours. Output per unit of labour could be improved through the more efficient utilisation of the existing labour supply, but the restricted paper quota imposes upon publishers a policy of printing small editions in an attempt to supply imperative demands for as wide a range of books as possible. Such a policy is obviously wasteful of labour and machinery.

The binding trade threatens to become an even narrower bottleneck of book-production than at present. A shortage of women workers, already serious, is likely to reduce production still further in the near future. Recruitment for the Forces and the voluntary drift towards occupations thought to be more essential have supplemented the normal flow of labour from the industry. For nearly four years the number of learners entering the trade has been less than one-third of the pre-war intake. Production has been maintained at its present rate very largely through the employment of older women who are capable of performing hand operations but are unsuitable for training to machine work. It is not surprising to learn, therefore, that a considerable number of binding machines (guillotines, block-presses, folding and sewing-machines, etc.) are standing idle. The Association's report states that 1,000 women are now required each year to maintain the present

volume of production and to replace losses from normal causes.

The report proposes that the policy followed hitherto by the Ministry of Labour Book Production Advisory Committee in recommending the deferment of indispensable workers in printing, binding and publishing should continue without change; that no men over military age should be withdrawn from these trades except at the recommendation of the Book Production Industrial Transfer Panel; that workers skilled in book-printing should, when conditions permit, be transferred back from munitions as quickly as possible; and that additional women (particularly young women) should be directed into the binding trade under the Registration for Employment Order as and when circumstances allow. These proposals relate to the "pre-armistice" period and represent a sweeping request for special treatment.

One factor limiting supplies, the report says,

is the absolute priority exercised by the Government, through HM Stationery Office, upon book-printers and book-binders, particularly for the production of the apparently endless succession of official books about the fighting services, the cost of which in ordinary book-production now needs reconsideration if the evidence in the book-shops is taken into account.

If this somewhat nebulous statement is intended as a protest against the extension of public information it is invalid. The reasons which have prompted the Stationery Office to extend temporarily the range of its publications are sound. Through the mass-production and mass-distribution of its books and booklets the British point of view has been made widely available. Moreover, the high standard of these anonymous Stationery Office publications must be regarded as an adequate compensation for any minor invasion of the field of private enterprise. There is a danger, admittedly, that a general and rigid priority for such publications may operate against the public interest. Even in an open market, printers and binders may be expected to give preference to Government contracts, so that under conditions of short supply the private publication of books of real importance is likely to be held up. In other words, the priority system should be flexible enough to cover all book-production, whether private or public.

The value of the export trade in books cannot be measured in financial terms alone. Books are ambassadors of British ideas and culture. The export trade in books falls into three categories: the visible export of books wholly or partly manufactured; the invisible export created by the rights of publication in British books, including serial and film rights; and the re-export which takes place where British publishers acquire Empire and other rights in books of American origin. In each of these categories the impact of the war has proved damaging. The Association's recommendations (in addition to those already mentioned) include the lifting of the embargo on imports of books from America and Canada; a wider interpretation (both qualitative and quantitative) of the term "permissible imports"; the granting of additional supplies of paper to the industry; the reduction of book postage-rates to the United States; the offer of sterling facilities to Continental book-sellers; and "some guarantee" of stability in the exchanges.

Some of these demands are excessive and unreasonable. The financial system cannot be moulded to the specifications of separate trades. There is a touch of arrogance about the publishers' demands, an unwillingness to concede that there is even so much as a mote in their own eye, which does not advance their cause. If they are to have special help, it would be reasonable to require that they should take special steps to see that the books actually produced measure up to the high standards implicitly assumed in the report. But, on the whole, the book-publishing trade's analysis of the present situation, and its estimate and proposals for the future deserve a hearing. The return, both economic and cultural, for a small diversion of resources into book publishing, is likely to be large.

Control of Land Use

THE Town and Country Planning Bill and the accompanying White Paper, which were simultaneously released on Friday of last week, together constitute a long-awaited and important declaration of Government policy. The subject with which they deal is a difficult and complicated one. It presents almost unprecedented intellectual hazards, and it suffers from great confusion and ambiguity of language. The Government department chiefly concerned is the Ministry of Town and Country Planning; but the title, apart from being cumbersome, leads to many misapprehensions, since the word "Planning" is also used in a far wider sense than any known to the Ministry. "The Control of Land Use" is the title of the White Paper and an exact definition of the topics it covers; but to the great majority of newspaper readers the general subject will be most easily recognisable under the description of "Uthwatt and All That."

The subject has its learned devotees; but it has also attracted a vast body of opinion which has chanted the sacred names of Barlow, Uthwatt and Scott without having more than the haziest notion of what those celebrated reports contain or any idea at all of the formidable complications involved in any practical policy. It is a very great advantage that what the Government calls its "prolonged and detailed search for a solution" has at last reached the point at which the public discussion can be brought out of the clouds and down to earth.

There are two problems involved. Both of them concern the use of land, and there are some principles common to both. But they are distinct problems and the Government is rightly treating them separately. One problem is particular and urgent and is the subject of a Bill which, it is to be hoped, will be passed this session. The other problem is general and of longer term, and in this case the Government are proceeding by the method of stating general principles for discussion before attempting to draft a Bill.

The particular problem dealt with in the Bill is how local authorities can acquire land in large blocks for the purpose of planning the redevelopment of areas as units. The peculiar urgency of the problem arises from the plight of the towns that have suffered large-scale bomb damage, such as Hull and Plymouth. But the plight of slum-blighted areas is much the same, and the Bill rightly puts the two cases on substantially the same level.

The general problem is of far wider application. Put at its briefest, it is the problem of seeing that the use made of land by its owners is not contrary to the interests of the community, that values created by the community are recovered for the community and, conversely, that property acquired in good faith is not arbitrarily or discriminatorily confiscated by the actions of the state.

The Bill

The Bill, to repeat, is concerned with the smaller and more urgent issue. It is long and complicated, as any measure that strays into the tangled undergrowth of the law of property must be. But for the purpose of understanding its general purport, attention can be concentrated on five main new principles embodied in it:

1. The legal procedure by which local authorities can acquire land is to be greatly simplified in cases where the area in question has either suffered war damage or else is blighted by slums and where it requires "laying out afresh and re-developing as a whole." In the case of blitzed areas there is to be power, for five years, to schedule the whole area as a unit. In the case of blighted areas, the procedure is slightly less simple, but the five-year limitation is removed.

2. These powers are not to be limited to the areas actually blitzed or blighted. The local authority is equally to be given powers of compulsory acquisition (subject to the requirement of a public inquiry and Ministerial assent) for "overspill" areas outside its own jurisdiction.

3. The price to be paid for land so acquired is, in general, to be the value existing on March 31, 1939. Two exceptions are permitted. In the case of owner-occupiers either of agricultural land or of land used for residential houses within the limits of the Rent Restrictions Acts, the compensation is to be increased by a percentage to be fixed by the Treasury and presumably related to the rise in values since 1939.

4. It is assumed that local authorities will borrow the funds required for the purchase of land. The Treasury will make grants equal to the whole of the interest for two years. For a further eight years (or in exceptional cases thirteen years) grants will be made to the extent that the redevelopment of the land is still in progress and its income-earning capacity therefore in abeyance. After ten (or fifteen) years, however, the full burden of the loan will fall on the local authority.

5. A general power is to be conferred upon local authorities to acquire and hold land where such acquisition is an essential preliminary to a planning scheme which could not otherwise take place.

The Bill appears to give the local authorities the essential minimum of what they require. They will at least be able to escape from the paralysing uncertainty in which they now find themselves and to proceed with their plans, even if not in quite such favourable circumstances as they had hoped.

The financial provisions of the Bill will nevertheless excite some criticism, especially in relation to the fixation of 1939 values. The view of some local authorities, to judge by a statement by Lord Latham, is that where the chances of war have raised the value of a piece of land, the owner should not be able to profit, but that where the chances of war have lowered the value, he should be made to suffer the loss. This would be a case of the local authorities having it both ways with a vengeance, and they can hardly put it forward with any seriousness. The owner of land in war-damaged areas is likely to suffer quite enough under the Bill, without having this additional injustice thrust upon him.

More serious criticism is likely to attach to the provision by which the owner-occupiers of agricultural land and small dwellings, and they alone, are to have their 1939 values enhanced by a percentage designed to take account of the subsequent rise in prices. Why should not the small shopkeeper have the same benefit? As a class, he has suffered more, with less public assistance, than any other class in the state. It is true that he is not very easy to identify, but the sort of arbitrary distinctions that define the term "small house" could equally well define the "small shop."

But the argument is somewhat wider. Should it not, in equity, be provided that all compensation based on the values of 1939 should be written up by an amount that would offset the fall since that date in the general value of money? The Government "pledge" will, no doubt, be cited against any such proposal. But the fundamental equity of the insistence on 1939 values is that no piece of land should be allowed to rise in value relatively to other pieces of land, or land as a whole relatively to other forms of property, because of the war. To apply the rule rigidly will mean that a loss of real wealth will be inflicted, not on landowners in general, but on precisely those landowners who have been unlucky enough to own land in blitzed areas and who have probably already lost the income from that land for several years. An almost exactly similar point arose in connection with the War Damage Act, and the Government was induced by Parliamentary pressure to add an "escalator clause" by which value payments can be increased to compensate for any fall in the value of money. What was done in the one case can be done in the other. Moreover, if there were such

an escalator clause, the necessity for exceptions, and the jealousy that they will inevitably cause, would disappear.

Another financial point that will arouse some discussion is whether the local authorities should be left, after the first ten years, to bear the whole burden of their redevelopment schemes. As a matter of justice, it is questionable whether national funds should be spent for local purposes after the period of rebuilding. But the blitzed cities have suffered for the whole nation. Moreover, the pragmatic test will be whether, with this limitation, the re-development will be carried through on the scale and in the manner that is desired. There should at least be power for the central Government to make a longer-term grant in special cases where an argument, on national grounds, can be made out for so doing.

These are details, and important details. They do not affect the fact that the Bill, in its main structure, is a satisfactory one which should be quickly passed.

The White Paper

The wider problem of the control of land use arises from the fact that land is really two substances in a single form. Land can be used either as soil or as space. It can be tilled, in which case it has one value; or it can be built on, in which case it has another, and almost invariably higher, value. The difference between the two values is the "development" value. The basic argument is that all development value arises from the activities of society, not from the efforts of the landowner. In effect, the state now, for the first time, recognises the validity of this argument. But it also recognises the fact that, in all past ages, land has changed hands, in good faith, at prices that include development value.

The principle adopted is that nobody shall be deprived of pre-1939 development value, but that post-1939 development value shall accrue, in the main, to the state, whether or not it can be shown to arise directly out of the state's activities. The two halves of the principle give rise to the two problems of compensation (where the realisation of pre-1939 development value is prevented) and of betterment (where post-1939 development value is realised).

This is the principle; but the mechanism for attaining it is necessarily complicated. Of the two halves, betterment is the simpler. Development value is constantly arising, since the value of land depends not only on the use to which it is actually put but also on the use to which it might be put. But to levy a charge on betterment as it accrues would not only be a formidable administrative problem, but it would also cause great hardship, for the owners would have to pay the charge before they had realised the enhanced value.

The Government has therefore decided to levy the charge only when the enhanced value is encashed—that is, when the use of the land is changed or it is "developed." For this purpose, it will be provided that the consent of the local planning authority must be sought before any substantial change is made in the nature or scale of use of any land. If the proposed new use is not in conflict with a planning scheme, consent will be given. But at the same time, an assessment will be made of the value of the land before and after the change, and a Betterment Charge levied on the difference. The rate of charge is fixed at 80 per cent, rather than at 100 per cent "in order to facilitate voluntary agreements."

This is a straightforward scheme which should not be difficult to administer. In particular, the valuation problems are not difficult, since the two values to be compared are both to be assessed on the same date. Both are also actual rather than hypothetical values, since the one is the value of the land in its present use and the other its value in another actual use to which it is immediately to be put. It is true that any levying of charges on betterment reduces *pro tanto* the incentive to owners to develop their land. But this is an objection to any scheme for taxing betterment, not particularly to this one. And the assessment of rates on development value could, if need be, restore the incentive.

Compensation is more difficult. Four stages are envisaged, as follows:—

(a) The first step is to ascertain the 1939 development value. A complete valuation of all the land in the country would be an enormous task that would take too long. Land is therefore to be divided into three categories—green, white and built-up. Green land is that where there is a general presumption that no development value existed in 1939—that is, rural land not in the vicinity of towns and unlikely to be built on. In the case of built-up land, the presumption is that the 1939 development value had already been realised in that year and that no question of compensation can therefore arise. No general valuation of either green or built-up land will be attempted, but if any owner in either category claims that, for special reasons, his land had an unrealised development, or re-development, value in 1939, a valuation of that land will be made. White land, which is all that is neither green nor built-up, will have its 1939 development value ascertained by a general valuation.

(b) The second stage is to decide how much of the ascertained development value to pay in compensation in those cases where the state, for planning reasons, prohibits the development. To pay the full amount in all cases would be to ignore the existence of "floating value." Every piece of land round a town will have some development value since the town *might* spread in its direction. But to aggregate all these values would assume a far greater growth of the town than was in fact likely. The Government propose to defer this problem for five years, to take the advice of an expert committee at that time, and in the meantime, while registering claims to compensation, to make no payments.

(c) Thirdly, there is the question of when to pay compensation. In the case of green land, any compensation payable would be paid immediately after the expiry of the five-year period, so that the matter would be settled, in respect of this land, once and for all. In the other two cases, compensation would not be paid until permission to develop was actually refused.

(d) Lastly, there is the question of who is to pay. It is proposed to set up a national Land Commission with a fund at its disposal, into which all betterment charges would be paid and out of which all compensation would be issued. It is the expectation that eventually this fund would show a surplus. The finances of local authorities will, however, be completely relieved of all responsibility for compensation.

This is a very brief summary of a very complicated scheme. It lacks the simplicity of outright nationalisation of the land, which has adherents far outside the ranks of the Labour party, and which may yet ultimately prove to be the only workable solution. But nationalisation was clearly not to be expected from a coalition Government, and if there has to be a less thoroughgoing scheme, this one has much to commend it. It differs in several respects from the Uthwatt proposals, which were to apply, in their full form, only to "white" land and which proposed the acquisition of development value by the State. On the whole, the new proposals seem to be more clear cut and for that reason, to be preferred. Whether they will prove to be workable, technically or politically, remains to be seen. Almost everything depends on the skill and judgment with which the valuers do their work.

Taken together, the Bill and the White Paper are the first major advance into a region that has been much talked about but little explored. They are, of course, vastly incomplete. They do not in any way foreshadow the appearance of that national plan which has also been long promised, and the power given by the Bill to a few local authorities to start the positive planning of land use in their cities increases the urgency of the need for a national framework within which these very local essays can find their place.

For this wider conception the pressure should be maintained. But at least it can be said for these two documents that they give reasonably satisfactory answers to smaller problems and that they in no way prejudice the emergence of a grander design.

NOTES OF THE WEEK

After the Fall of Cherbourg

The liberation of Cherbourg towards the end of the third week of the invasion marks a decisive turn in the battle of Normandy. The harbour itself, though partly demolished, will soon be made usable again by the methods of repair perfected by Allied engineers in North Africa and in Italy. The flow of men and supplies to the battlefield will now become broader, steadier and quicker. In the near future the Allied forces will be able to break out from the beachhead. For the moment the centre of gravity has shifted from Cherbourg to the eastern flank of the Beachhead, where the Allies have attacked between Caen and Tilly. By Wednesday they had cut the road between Caen and Villers-Bocage, and got astride of the river Odon. The immediate object is to outflank Caen. This is no easy task, for the Germans have still at their disposal at least five major roads and four railway lines converging on Caen. But the Allied Command may soon force a decision by shifting reserves from the Cherbourg peninsula eastwards. The alternative is to use those reserves for a drive from the Contentin to the south, towards St. Lo and Constances. On the whole, the fighting in Normandy is still a struggle for elbowroom.

Blows in the East

The powerful Russian offensive between Vitebsk and Zhlobin came after a pause of many months which the Russians used to build up their striking power. The Germans estimate that the six army groups engaged in the Byelorussia offensive consist of not fewer than eighty divisions, and the Russians must have achieved a local superiority of forces exceeding the classical ratio of three to one. They were able to wrest from the enemy such strong-points as Vitebsk, Orsha, Mogilev and Zhlobin in the first four days of the fighting, and to encircle Bobruisk on the fifth. The immediate Russian objective is Minsk, the capital of Byelorussia. Minsk is the northern gate to Poland; and it can also serve as a jumping off point for an offensive against the Germans in the Baltic countries. What is perhaps more important now than the loss of territory is the losses in manpower inflicted on the enemy. Five German divisions have been encircled at Vitebsk, and another five are said to have been trapped in Bobruisk—while in the same week two or three divisions were lost in Cherbourg. If the Germans commit substantial forces to the defence of Finland, as Ribbentrop has promised in Helsinki, then their strategy will seem to have already lost coherence and logic. German propaganda has already started cautiously to prepare public opinion for the loss of Warsaw. Has Hitler really made up his mind to give up Warsaw and to hold Helsinki?

Nazis at Bay

There is probably not much to be gained at this stage by extended discussion of the theory and practice of flying bombs as evidences of Nazi-crazed tactics on the eve of Germany's certain defeat. Inevitably, the men and women who fight wars stand, in relation to grand strategy, like the dwellers in Plato's cave, who saw only the flickering fire-lit shadows of what was really going on around them. But, obviously, it was always like that, if Hitler were allowed by saner Germans to employ resources for, and then to use, his fondly-fondled "secret weapons," it would be with a desperate hope to find a bargaining counter

in the crisis of total failure, ushered in by the crushing assault from all sides upon imprisoned Europe. "I can still hurt you," he cries, with childish, frightened boast. "Why don't you make peace now, before I hurt you more?" he hints, because he is sorely hurt himself. However interpreted strategically, this is the gangster rat in the trap. Ordinary people here, put out or hurt or bereaved by this random bombardment can see this far at least. This is another battle that Hitler has surely lost. But some facts not so far given might be helpful to the people of Southern England and, still more, to their imaginative friends further north—without aiding the enemy, who of course must be kept blind. Mr Morrison has said how much less destructive of property and life these attacks are than minor bombing. A few figures, so far shown only to a selected few, would prove this point with astonishing completeness.

Soldiers of Europe

The three assaults by land against German Europe have given new momentum to the partisans and guerillas everywhere. The Supreme Allied Command has published a number of official statements on the operation of the French Forces of the Interior (FFI). From these as well as Vichy sources, it is evident that the French maquis is no longer confined to the mountains in the east and centre of France. The activities of the maquisards have spread as far to the north and west as Brittany and as far to the south as the Dordogne and the vicinity of Bordeaux. In northern Italy guerillas have been recently prominent in tying down the remnants of Mussolini's forces and some of Kesselring's reserves. Italian partisans have acted, too, as a link between Marshal Tito's men and the maquisards in the French Alps. Finally, the guerillas behind the German front in Poland are almost certainly doing much to disorganise the enemy's rear. Of all the guerillas, those who fight in eastern Poland are best organised and best armed. The Soviet High Command was first to grasp the military and political importance of these formations. A great amount of skill and imagination went into keeping these guerilla bands in existence in the forests and marshes throughout the years of Russian retreats and defeats, and into arming and organising them for the opportunity that has now come. Next come the partisans of Marshal Tito, less well equipped, but armed sufficiently for the kind of elusive mountain warfare at which they excel. In contrast, the French maquis has been, and still is, poorly armed and equipped. The greater is the gratitude the Allies owe to it for the deeds done so far. But what the maquisards expect from the Allies is not words of appreciation. It is effective and quick help in the shape of weapons, ammunition, medical supplies and instruction. Geographically, the French maquis is in a somewhat worse position than the guerillas in eastern Poland and Jugoslavia. The Russians can send supplies to their partisan allies overland, through vast and thickly wooded spaces beyond the enemy's control—though the Russian Air Force has also been very active in supplying them. Weapons can reach Marshal Tito's men by sea, along the stretches of the coast that have been freed from the enemy. The maquisards control no points on the French coast; and the land between their strongholds and the front in France is closely watched by the Germans and Vichy. Even so, the difficulty of supplying the maquisards with what they need is not insurmountable—if the importance of aiding them is realised fully and in time.

Aid for Irregulars.

The appointment of General Koenig to be Commander-in-Chief of the French Forces of the Interior is good promise for the future. It links the maquisards and the Allied armies. General Koenig's is a key position, and will be treated so by the Allied Supreme Command. The French Forces of the Interior wish to, and can, do more than auxiliary service to the Armies of Liberation. Their

ambition, understandably, is to be the nucleus of a new French Army. Adequately supplied and instructed, they may fill this rôle. General de Gaulle has spoken of their "cruel lack of weapons." It would be a grave political error if the slightest excuse were left for attributing any part of responsibility for this lack to neglect by the Allies of France. Partisans or maquisards are the most active elements in every occupied country. They are likely to play a prominent part in the political life of their nations after the war. Now, in the west, there is a great chance to make the renewal of the *Entente Cordiale*, with the Americans included, a fresh reality in the minds of Frenchmen. No political or military prejudice against the irregular character of the maquis should be permitted to waste this chance.

Far Eastern Successes

This has been a week of victories in the Far East. The Japanese threat to the Allied supply lines in North Burma, which looked at one time as though it might develop into a threat to India itself, has been decisively defeated. Fighting through "terrible monsoon conditions," British and Indian forces have opened the road from Imphal to Kohima and Manipur, and the Japanese troops in the Naga and Chin Hills are in considerable difficulties. The importance of this move will be felt in India, where a relaxation of tension and a return of confidence should strengthen the hope of preventing further famine this year. It will also greatly improve the chances of General Stilwell's men, who have captured Mogaung, and should now be able to bring up sufficient reserves to put an end to the endless siege of Myitkyina, and firmly to establish their hold on the rail-head of the North Burma railway. All these are essential preliminaries to the reopening of the Burma Road. This, in its turn, is the preliminary to the building up of really important Allied bases in China. Then only can the campaign directed against the Japanese from India and Burma begin to coalesce with the campaign in the Pacific. A shuttle service of bombers could be established from China across to the Pacific bases of Bonin and Saipan, and the projected American naval landings in South China could be supplemented by land and air activity in China itself. Both these developing strategies leave out Malaya and Singapore and the Dutch East Indies. They are part of a pincer movement to snip Japan's conquests away from the mainland.

Education in the Lords

An amendment to the Education Bill moved in the House of Lords by an ex-President of the Board of Education, Lord Stanhope, trespassed into the forbidden field of curriculum—of what will be taught in the new Butler schools. It sought to provide for the inclusion of homecraft, and cookery and technical subjects in the education of boys and girls over 16. The one proviso to Lord Stanhope's sensible suggestion is that there is a limit to the extent that the domestic arts can usefully be learnt outside the home. Whatever its merits, however, the amendment served to raise the much wider question of what is to be taught in the schools. In the Government's reply, this particular proposal was quite logically opposed on the ground that the Bill was merely creating machinery and could not therefore include as an afterthought provisions for instruction in one or two selected subjects. The fact is that the general curriculum is still undecided, in spite of the recommendations of the Norwood Committee, published last year. The sausage-machine has been all but completed, and no one yet knows what kinds of meat it is to use or whether it is to be the same old soya-soya.

Young Persons

Some discussion also arose in the Lords debate on education over the naming of the local part-time colleges for the education of boys and girls between 16 and 18. The House eventually agreed that the name of "Young People's Colleges" should be altered *pro tem.* and pending better second thoughts by the Government, to "County Colleges," which was felt to be less objectionable. "Nomenclature," as Lord Selborne remarked with uncommon shrewdness, "is always difficult." On the other hand, the original name had the obvious advantage of being clearly descriptive, and

derived from the comparable legal term of "young persons" for boys and girls of these ages. Moreover, as the same speaker pointed out, "county college" invites confusion with the existing "county school." The success of this new experiment will not, in any case, depend on their name, but on the teachers and the schooling that are provided at them.

Teachers Wanted

It is not perhaps sufficiently understood that the new Education Bill, with its provisions for longer schooling and part-time colleges for adolescents, may conceivably become a dead letter for lack of the right number and kind of teachers. The view of the Education Sub-committee of Nuffield College, as reported this week, is that even the emergency schemes for recruiting 10,000 extra teachers, mainly from the Forces, which the Government has devised, will not be sufficient to stop the gap. The Committee's calculation is that the pre-war teaching strength will require to be raised by over 60 per cent, and that this may take up to twenty years to do, even if these emergency schemes are applied and even if the pre-war annual output of trained teachers is doubled. The Committee therefore suggests a programme of recruitment and training on the same lines as those approved by the Government and recommended by the McNair Committee—but carried considerably further. It is gratifying that the best official and non-official thought is moving in the same direction on this matter, and that all the proposals which have so far been made realise that the vital need is for the quality of teaching to be raised rather than lowered in the process of expanding the army of teachers. It will be very far indeed from easy to satisfy this need.

The McNair Principles

The Nuffield College Report on the supply and training of teachers was produced quite independently of the

BUSINESS ENTERPRISE AFTER THE WAR

Small and medium-sized businesses in all branches of industry and trade must have every opportunity of contributing, by their enterprise and initiative, towards the nation's economic well-being after the war. They must be given full support in developing British trade at home or in overseas markets.

Changes due to war conditions call for a far-sighted policy concerning the financial aid they may need. This Bank, through its branch managers, will therefore be prepared to consider enquiries from promising undertakings, whether old or new, conducted under good management. It will base its consideration of each proposal as much upon the prospective borrower's integrity and business capacity as upon his material resources.

MIDLAND BANK LIMITED

INDEX TO VOLUME CXLVI

The Index to Volume CXLVI (January to June, 1944) will be available in about two weeks' time, and will be sent to all those who have asked for the Index to be regularly supplied to them. Any other readers who wish to receive the Index (post free) are invited to apply to The Publishers,

THE ECONOMIST, Brettonham House, Lancaster Place, London, W.C.2

investigations of the McNair Committee. But the chief principles which it lays down will almost certainly be known in the history of educational policy as the McNair principles. They are two: first, the importance of practical apprenticeship in the schools; and, secondly, the necessity and, equally, the desirability of drawing recruits for teaching from a much wider field of education, age and experience than hitherto. The main object of the Nuffield proposals, both for the immediate post-war period of emergency and afterwards, is to break down the present barriers to entering the teaching profession. If the teachers needed are to be found, this is in any case unavoidable. The pool of available recruits from the secondary schools is not and will not be anything like large enough. Like the Government, the Nuffield Report looks first to the Forces. Much greater use is recommended for whole or part time work, of both married women, whether teachers already or not, and persons "skilled in various crafts"; and the use, for a time at any rate, of young men and women direct from both secondary schools and universities. Here the emergency and long-term proposals touch in "the practical apprenticeship" which the Committee regards as an essential preliminary to the equally essential study, in colleges and refresher courses, of educational theory, accompanied by the setting and passing of tests. The Nuffield Report, like that of the McNair Committee, recommends a three-year period for training in place of the present two-year course, but suggests not a continuous term of teaching in the schools but a continuous year. The identity of approach in these reports is remarkable. It extends to teaching conditions as well as recruitment and training. Both reports lay an equal stress upon better school buildings and equipment, higher pay all round and the equalisation of remuneration between different kinds of schools, different areas and the sexes. Only in its somewhat stronger stress upon the imperative need for smaller classes, to make good teaching feasible, does the Nuffield Report differ, even in emphasis, from its more official counterpart. There can be few subjects on which the Government has received such unanimous guidance as in this all-important one of finding the men and women to make the Butler Bill work.

No Finnish Armistice

After the fall of Viipuri on June 20th, the Russian advance in Finland was halted for nearly a week. It is perhaps this fact, quite as much as the blandishments of Berlin, that has led to the Finns' failure to form a new Government, ready to accept a Russian armistice. There is no doubt that, so long as there seems to be even the slenderest chance of military resistance, the present Finnish Government will neither negotiate nor abdicate. The Germans, realising this, sent Ribbentrop to Helsinki with the offer of further German reinforcements, and now General Keitel has arrived to organise their entry into the fight. This, together with the short lull in Russian progress, seems to have overborne the wiser counsels of a week ago. Yet the Linkomies Government is clearly uncertain of itself. The secret session of the Finnish Diet has been cancelled; and the Conference of the Social Democrats, where Mr Tanner would have had to explain his inexplicable attitude, has been postponed from July 1st. The result of this false confidence is sheerly tragic. A new Russian advance has begun. The amount of help Germany can give will do no more than prolong the fighting. More Finnish lives will be lost and Russia's terms be stiffened.

Where to Shop

Consideration of the Plymouth Plan and other designs for urban reconstruction has given rise to doubts about some implications of these necessarily broad schemes. The notion, for instance, of planned shopping centres, where shops and stores are concentrated in attractive and dignified surroundings at single points, is an idea which, though neat and sensible enough on paper, may not be so convenient in practice. The middle way between indiscriminate development of ugly and untidy shopping streets, on the one hand, and big blocks of compound stores under the direction of local administrators, on the other, is not an easy one. Perhaps in the Plymouth Plan, it has been suggested, the balance has been weighed down somewhat too much on the side of the latter. Some concentration of

shops in the centre of any city is, of course, inevitable. The whole attraction of a town—and especially one like Plymouth, which serves a large surrounding rural and holiday-making area—would be lost without it. It is the character and extent of the concentration, and the amount of limitation which it places on the number of local and "street" shops, which have to be carefully examined. By emphasising the need for good communications to the central or sub-central shopping centre and for the control of local shops, the Plymouth Plan possibly implies a regimentation of local traders which may prove costly, both economically and financially, and difficult to effect without injustice, inconsistency and, above all, inconvenience to shoppers.

Listener Research

Techniques for the investigation of opinion were developed during the 'thirties in both this country and the United States in order to answer specific questions about public taste and to forecast public behaviour in specific circumstances. In both cases there was usually a commercial reason for the question. The comparatively recent entry into this field of Ministries and public corporations has given these inquiries a place among the social "sciences" which is probably not yet justified by improvements in the techniques employed. A lucid and interesting paper on the methods used by the BBC's Listener Research Department, which was read last week before the Royal Statistical Society by Mr R. J. E. Silvey, shows that, while the BBC has adopted the established methods of investigation, including the highly controversial "Mass Observation" and adapted them to its own uses, it has made little attempt so far to scrutinise the peculiar collection of psychological assumptions on which those techniques are based. Probably this is because "methodological" investigations are not practicable in war-time. Probably, to some extent, it is because the necessity for producing "tangible" results and justifying a department's existence is no less imperative in a great public corporation than in a private advertising agency. Obviously, if these techniques are to go on being used for attempting the precise assessment of public opinion for the formulation of public policy—or the policy of public corporations—it is necessary for a more thorough examination to be made of the degree to which the answers produced are conditioned by the questions asked; of the extent to which they present a true picture and not merely a consistent one; and of the validity of assuming that bias is automatically removed by the statistical technique adopted. The study of public opinion is as much the sphere of the psychologist and the sociologist as it is of the statistician.

What Listeners Want

Certain of the figures published by Mr Silvey to illustrate the BBC methods of Listener Research are of considerable interest, though they exclude all overseas and Forces listeners. About half of the home civilian adult population normally hear the 9 o'clock news bulletin; this can rise to 65 per cent when the King, Queen or Prime Minister speaks; it also reached this figure when the news of the Italian surrender was announced—and no doubt has touched a peak again since the invasion of Normandy. Otherwise the proportion listening varies from about 30 per cent for "ITMA" and "Music Hall" (and, surprisingly,

Type of Programme:	Percentage of the Listening Public	
	Actively Liking	Actively Disliking
Variety.....	73	11
Cinema Organ.....	58	19
Features (Documentary).....	60	13
Religious Services.....	52	25
Dance Music.....	41	35
Symphony Concerts.....	26	56
Chamber Music.....	15	69

for the Sunday night Postscript), down to 4 per cent for "Music Lovers' Calendar" (talk) and 2 per cent for "What the Poet Sees." An indication of the results of special studies of the active popularity or unpopularity among the "listening public" of specific types of programme is given below, though Mr Silvey is careful to point out that BBC programme planning, while guided by the results of this research, is in no way bound by it. In view of the imper-

fections of method, this is perhaps just as well: e.g., although it is shown that over the period October, 1941, to October, 1943, the proportion actively liking "Dance Music" fell from 53 per cent to 41 per cent and that actively disliking it rose from 25 per cent to 35 per cent, there is insufficient evidence that this is not merely a restatement of the fact that, during the interval, a larger proportion of the 19-25 age group joined the Forces and so dropped from the scope of the BBC's study.

The Murders at Görlitz

From the statements made by the German Government and from testimony given by eye-witnesses among the RAF officers repatriated from Stalag Luft III, it is possible to reconstruct the grim events which led in March this year to the massacre of fifty officers by the German authorities. The background is the state of instability and disintegration inside Germany. Nine or ten million foreign workers, displaced and bombed-out civilians and prisoners of war make up a floating population which is unpredictable, inflammable and, potentially, mortally dangerous. If the rot set in, if panic started, if the reins were thrown off, if great uncontrollable mass movements began, the overstrained superstructure of discipline and order might be overthrown with uncanny speed. This is, presumably, the Gestapo's constant nightmare. Its officials must be perpetually on the watch for agents provocateurs, for centres of disaffection, for potential leaders who might, in any area, begin to set the avalanche in motion, just as a small pebble struck from the shoe of a climber can loose a mountainside. When a few dozen young officers began to build a tunnel out of Stalag III they guessed at part of this background. They realised that, to escape, they could wear any old foreign uniform, need not speak German and had only to join the wandering groups of workers trudging about the Reich. What they could not guess was the role which in the diseased imagination of the Gestapo they would be supposed to play. The mass escapes were, presumably, pictured as attempts to insinuate into Germany's floating population groups of active agents of sabotage and opposition. How else can one explain hysterical references in the official German statements to "mass escapes numbering thousands" prepared by the Allied General Staff, involving political and military objectives and "endangering public security in Germany"? The officers left Stalag Luft III as escaping prisoners of war. They were captured as saboteurs in civilian clothes, handed over to the Gestapo and judicially murdered.

To explain the grounds for the German panic is not to offer any palliation of the crime. The killing of the officers was coldblooded, calculated murder in direct contravention of the Prisoners of War Convention. The men were not shot "resisting re-arrest." Otherwise at least one or two would have been wounded. In any case, the evidence of the repatriated officers makes it clear beyond all doubt that they were arrested and later murdered. Nor does the pretext that they were wearing civilian clothes lessen the crime. No prisoner of war is expected to escape in his regimentals. The episode illustrates once again—if further illustration were necessary—that Germany's leaders shrink from no brutality if they think it serves a military or a political purpose. Mr Eden has promised the "exemplary punishment" of those responsible, and it is important to see that the military authorities are not allowed, by shifting responsibility on to the Gestapo, to escape their share. From the officials at the War Office down to the prison commandant the German officers must take the blame.

National Publicity

The Tory Reform Committee has devoted its third Bulletin to a discussion of official publicity. While, in their view, there is no case for it at home, the need for publicising British policy, institutions and cultural achievements abroad will not end with the war, and some appropriate Government department should be set up to deal with it. The Tory Reformers reject a number of solutions: the continuance of the overseas branch of the Ministry of Information, or a small separate Ministry, or the creation of a publicity department attached to any of the three senior Ministries—the Foreign Office, the Treasury or the Board of Trade. These solutions are considered inadequate because the field to be covered

transcends the scope of any one Ministry, while a very junior Minister tends to get no hearing at all. The solution which they suggest is the creation of a National Publicity Office, having the same relation to the Cabinet as the proposed Central Statistical Office, and enjoying the same right of access. Abroad, its officers would work in special Publicity Missions, closely attached to the Ambassador, but not directly subordinate to him. The Tory Reformers have raised an important topic, even if their proposals need further examination. There can be little quarrel with their demand for a policy for national publicity, since they define publicity in the proper sense, not as propaganda, but as information—and add the rider that the first aim of the Service would be to discover what kind of information other nations want, not to thrust down their throat a "British point of view," which they have no desire to hear. It is on the side of machinery that the Report is more open to question. If the Foreign Office were organised on a rational basis with the Secretary of State for Foreign Affairs as the non-departmental head of a group of allied Ministries—overseas trade, diplomacy proper, foreign publicity and so forth—the proper place for the office would be there. It would be easier to co-ordinate its work, and it would certainly work more smoothly abroad.

War and the Daily Worker

Sir James Grigg remains adamant in his refusal to allow the *Daily Worker* to have an accredited war correspondent. At question-time on Tuesday, pressed by Members of all parties, the War Minister would not "budge an inch." He would only refer back to his original answer, six months ago. The case against the *Daily Worker*—the decision is a Cabinet one and cannot be attributed to War Office prejudice—is that Communists cannot be trusted, and that two prominent members of this party were sentenced under the Official Secrets Act for disclosing secret military information. The trouble is that the security censorship is, nominally at any rate, a voluntary one; and the Government, from experience, does not trust the *Daily*

MILK CHOCOLATE & the Nation's Milk Supply

THE contribution of the Milk Chocolate Industry in ensuring Britain's milk supply during these critical war years is not generally realised.

Before the war this industry was using 40 million gallons of milk a year. Cadburys took more than half of this vast quantity. It came from the counties of Hereford, Gloucester, Salop, Stafford, Flint and Denbigh where Cadburys have consistently encouraged dairy farming over a number of years. In these areas they have established four Milk Factories which have greatly assisted in developing milk production. Today these four factories alone collect and distribute sufficient fresh milk for well over a million people.

Cadbury means Quality

Worker. But however untrustworthy individual Communists may have proved in the past—and however unpardonable the *Daily Worker's* record in the early days of the war may have been, few would deny that it has steadily supported the war since it was allowed to reappear. Nor is it, even under the Defence Regulations, an offence to be a Communist. The *Daily Worker* is not asking for special facilities; its correspondents' stories would automatically be submitted to censorship. There are now well over 500 war correspondents accredited to Allied Supreme Headquarters. They include many foreign nationals. The Kemsley press, which, as one MP pointed out, has been fined for publishing information which would be of value to the enemy, has, quite fairly, not had its correspondents withdrawn. It is unreasonable to penalise one newspaper for an offence which it has not yet committed. It would not be taking too great a risk to allow the *Daily Worker* to have a correspondent. Any offence against security in reports from the battle-front could be prevented from being published. Meanwhile, the continued ban is creating a disproportionate grievance. Even in wartime—perhaps especially in wartime—the freedom of the press, within the agreed rules of national security, is indispensable; and it applies, or should apply, without discrimination, to "good" and "bad" papers alike. Certainly it is not for the Executive simply to pick and choose—though if Parliament, on a vote, were to agree with the Cabinet that would, of course, be that.

Art for the People

The war has given a great stimulus to the arts. People who seek much-needed relaxation and change, troops or civil defence workers browned off by the monotony of waiting or drill, have found a new pleasure and sources of entertainment in music, plays or pictures. CEMA, the Council for the Encouragement of Music and the Arts, has done much to respond to this popular interest. The Council was started in January, 1940, in the early stage of the war, with the limited object of providing entertainment in the black-out and in isolated areas, and to fill the gap caused by the collapse of most forms of organised entertainment.

Today, in its fourth year, it has reached a new stage. The pamphlet *Arts in Wartime*, a review of CEMA activities during 1942-3, gives some idea of its activities and aims. With its modest income, £100,000 from the Treasury and £50,000 from the Pilgrim Trust, the Council's record is creditable. In 1942-3 it provided some 8,000 concerts, including 4,543 in factories; a dozen theatre companies have taken plays and ballets to war workers' hostels and factories up and down the country; sixty picture exhibitions have been circulated to municipal galleries and smaller centres. CEMA has supported orchestras and theatre companies—it saved the old Theatre Royal, Bristol, in 1942. Figures are, of course, apt to be misleading, since it is quality rather than quantity that counts; but CEMA has been careful to pick the best artists and players, and to maintain a high standard of performance. There is an erroneous impression abroad that the English people are completely philistine, and resent having "highbrow" stuff thrust at them. The success of the Proms and the National Gallery concerts are evidence on the other side. CEMA's experience provides more. There is also a general feeling that art and politics are so separate that the state should not interfere. CEMA's principle—state support without state control—is not logical, but perhaps the right compromise. In Republican Germany, every city and township had its own (state or municipally supported) orchestra, opera and theatre. It may be that the same idea may eventually be realised in this country.

Law Officers

A brief but useful measure to prevent delays in the process of law received its second reading in the Commons last week. The Law Officers' Bill provides that in the absence of the Attorney-General, his deputy, the Solicitor-General, shall be able in all cases to act for him. Until now this provision had to be made separately in each Act in which it was necessary. An increasing number of Acts had not done so and some adjustment was clearly desirable. The Bill will apply to the corresponding officers in Scotland and Northern Ireland.

AMERICAN SURVEY

Nominations at Chicago

THE National Convention of the Republican Party, meeting at Chicago, has done what was universally expected of it. On the first ballot, with virtual unanimity but without any enthusiasm save of the manufactured sort in which these conventions specialise, it has nominated Mr Thomas E. Dewey, Governor of New York, as its candidate for the Presidency in this year's election.

Thus ends one of the most extraordinary pre-convention campaigns in the history of American politics. Governor Dewey was "drafted"—which is a technical term meaning that he was nominated without his candidature having ever been avowed. He was nominated unanimously on the first ballot. Candidates have been drafted before now, and candidates have been nominated on the first ballot. It may be that there are other instances of the two things happening together—though no such instance comes easily to mind. But what is the most extraordinary feature of all is that Governor Dewey is not popular among the politicians of the party. They did not want to have him, but they felt they had to. They relieved their feelings by nominating a real "machine politician" for the Vice-Presidency. The first choice was Governor Earl Warren, of California, who would have given the ticket an Atlantic-and-Pacific balance, and who had enhanced his reputation by a rousing "keynote" speech. But Mr Warren refused the honour, and it went to Governor John Bricker, of Ohio, the only avowed candidate for any office, and the politician's ideal of a politician. It is reported that this nomination was received by the delegates with a greater volume of more spontaneous applause than any for Mr Dewey.

What is the explanation of Mr Dewey's strange power over the Convention—a power greater than that normally wielded by a President after four successful years of office? At this closeness in time, and at this distance in space, it is not very easy to say. Mr Dewey's great, and perhaps only, recommendation is that he gets votes. The Republicans are not expecting any easy walkover this year; 1944 is not another 1920, when they can win with a handsome presence and a tuneful voice. If they are to win at all, it will only be by a narrow margin, and after a stiff campaign. A vote-getter is essential. With Mr Willkie out of the running, a very quick glance round the field was enough to show that none of Mr Dewey's other rivals had an outside chance against the world-renown of Mr Roosevelt. A man who could get votes, who could collect all the forces of discontent, but whose own views were so nebulous that he would offend nobody—this was the prescription. And the answer to it is Mr Dewey.

A Convention has another task beyond that of nominating candidates; it has to adopt the Party "platform." Not too much importance attaches to this sacred rite. The candidate does not always regard himself as closely committed to it, but states his own policy in his speeches. And if he should happen to be elected, he will take even less notice of it. The Democratic platform in 1932, when Mr Roosevelt was nominated, spoke, it will be remembered, of balanced budgets and of strict economy. Nevertheless, the platform is of some interest, not as a binding commitment of the possible next President, but as a reflection of the current trend of thought among the politicians of his Party.

This time the draping of the platform was in the hands of Senator Taft, an able Conservative. Its more domestic "planks" can be regarded as common form among Republicans—they talk of the restoration of Congressional authority, of the menace of bureaucracy and of "arbitrary" (that is, Presidential) rule, of the defence of states' rights and several other ways of saying that Republicans disapprove of Mr Roosevelt. Two of the planks are of wider interest. One deals with foreign trade and, along with a number of generalities, makes it clear that American tariffs must not be touched and that Secretary Hull's reciprocal agreements must be abolished.

The other is the foreign policy plank. This commits the American people to participation in "postwar co-operative organisation"—not significantly to participation in an

organisation—and to the use of "peace forces" to preserve the peace. In sharp contrast to these ambiguities is the clear statement that there must be no interference with American sovereignty. It is perhaps enough to say that this foreign policy plank has been accepted by the *Chicago Tribune* and that it has been denounced by Mr Willkie. One London newspaper professes to find in the blessing given to "postwar co-operative organisation" a significant change from 1920. This may be politeness or it may be self-deception. There is no change in the formal attitudes of the Republican Party. There may turn out to have been a real change in American public opinion, but the experienced politicians of the Party clearly prefer to wait and see.

American Notes

Preparation for Peace

Mr. Donald Nelson, chairman of the War Production Board, has announced three steps by his Board to speed up preparations for the return to peacetime production. Already the expansion of civilian production is allowed where it will not interfere with war work. Now an order is being drawn up which will authorise any manufacturer to acquire enough material and components to make and test a single working model of any product planned for the post-war period. In addition, orders have been revoked which limited the use of aluminium and magnesium, so that manufacturers may use them if manpower is available; and, beginning on July 1st, manufacturers will be allowed

THE BATTLE OF COMMUNICATIONS

OUTFLANKING THE ENEMY

Because of foresight and bold planning Cable & Wireless have developed and extended their service although cables are cut by the enemy and the ether is congested with wireless signals.

In war, as in peace, the resources of an all-embracing communications system are at the disposal of the Governments and peoples of the British Empire.

★ Since the war started wireless capacity to and from this country has increased by a half.

★ Approximately two million words pass through the central telegraph station of Cable & Wireless every day.

THE DIE IS CAST

SANKEY-SHELDON engineers and designers are planning the new steel furniture and equipment for your post-war office and home. It will reflect the modern ideals of efficiency with its smooth-running drawers and close-fitting doors, its adaptable and adjustable shelving and standardised steel partitions. ● Only the die-pressed precision of steel can give the accuracy and permanence required. But Sankey-Sheldon Steel Furniture will be as pleasing to the eye as it is efficient. New colours and coverings will enhance the beauty of its functional designs.

to buy machinery, tools and dies for civilian production, as long as this does not interfere with war production. Mr Nelson may well be right in making these provisions at a time when he emphasises that the main effort must still be directed toward winning the war, although he may be somewhat optimistic in believing that these concessions will liberate an all-out drive to finish the war first. The immediate increase in civilian production will evidently be small. It raises, however, one question which is bound to be controversial in a period when some manufacturers still have their hands tied with war orders. That is whether outsiders will be permitted to enter an industry before the established companies are free to go back to making consumption goods. An example much quoted, and which perhaps is not entirely picked out of thin air, is whether, for instance, Mr Henry Kaiser, if he could find the manpower, would be allowed to set up in the automobile industry, while Ford, General Motors and the other well-known automobile companies were still engaged on war orders. Mr Nelson's answer was strongly in the affirmative. He admitted that a certain amount of hardship was inevitable, but insisted that, in the interests of full employment, as well as of the consumer, there could be no waiting until all manufacturers were ready to resume civilian production. Plainly this is the right decision. Equally plainly, it will be fought to the last ditch. With some adroitness, Mr Nelson insisted that it was all-important to maintain a competitive economy. The big corporations which have been spending their advertising funds so liberally to popularise "free enterprise" may feel that this is being a trifle too literal.

Another Year of OPA

The Bill extending the life of the Office of Price Administration emerged from the conference between the Senate and the House in a shape not unsatisfactory to the Administration. After a lengthy struggle, a compromise was reached on the Bankhead amendment. The new version will necessitate a small rise in the price of lower-cost cotton textiles, but it will be very much less than would have followed the original amendment, designed by Senator Bankhead to raise the price of raw cotton. The Dirksen amendment, which would have allowed appeals from OPA orders to Federal Circuit Courts, was eliminated. This was opposed by the Administration on the grounds that it would produce a host of conflicting decisions, and might hold up proceedings indefinitely. OPA has, however, been deprived of one of the key weapons in its pathetically limited armoury—the right to revoke a dealer's licence to sell rationed goods; and as matters now stand, a retailer sued for price violations can obtain an injunction which may result in substantial delay. This provision undoubtedly makes the work of the agency more difficult. They are, however, minor defeats in a substantial victory for the Administration on the home front, that bitterest of all battlefields. In view of the heavy pressures brought to bear on Congress, it is evidence of growing confidence in the management of domestic controls.

Hartzel v. US

A remarkably wide interpretation of the right of free speech has been handed down by the Supreme Court this month. By a 5-4 decision, the judgment of the lower court in the case of Hartzel v. US was reversed. Mr Hartzel was charged with violation of that part of the Espionage Act of 1917 which deals with wilful attempts to cause insubordination, disloyalty, mutiny and refusal of duty in the armed forces. His specific offence was the authorship and distribution of three pamphlets, which in the chaste words of Mr Justice Murphy, writing the majority opinion,

depict the war as a gross betrayal of America, denounce our English allies and the Jews, and assail in reckless terms the integrity and patriotism of the President of the United States. They call for an abandonment of our allies and a conversion of the war into a racial conflict.

About 600 copies of these pamphlets were sent to well-known public figures, including several highly placed Army officers, as well as to organisations and publications, including a service magazine. Evidence was produced to show that the pamphlets were read by men registered under the Selective Service Act. The statute, however, requires for conviction that specific intent to cause disloyalty in the armed forces be proved beyond a reasonable doubt, and that a clear and present danger of success be present. The majority opinion conceded that

total war of the modern variety cannot be won by a doubtful, disunited nation. Crude appeals to overthrow the Govern-

ment or to discard our arms in open mutiny are seldom made. Emphasis is laid, rather, on the futility of our war aims, the vices of our allies, and the inadequacy of our leadership.

But, nevertheless, it insisted that the mere enunciation of such ideas was not enough to prove criminal intent and ordered the verdict reversed. The dissenting opinion, which was written by Mr Justice Reed, and was supported by such noted Liberals as Justices Douglas, Jackson and Frankfurter, found ample evidence of criminal intent in the pamphlets themselves and in the supporting evidence, and emphasised that in 1942, when the pamphlets were distributed, neither the military position nor public confidence in the strategy being followed were nearly as strong as they are today. The narrow construction of paragraphs 2 and 3 of the Espionage Act by the majority has been hailed in the United States as a victory for free speech, and it is difficult to think of any other country sufficiently conscious of its impregnability to allow such latitude. The decision may well put new difficulties in the way of the prosecution in the sedition trial, although the defendants are being tried under another statute.

The Unauthorised Programme

The Republican Convention may ostentatiously ignore Mr Willkie, but he remains the party's most virile figure. His gifts of intellectual leadership are manifest in a remarkable series of articles he has written at the request of six Republican newspapers. In these he comes out as strongly as Alexander Hamilton himself in favour of a strong Federal Government, inferentially rebuking those members of his party who are fervently espousing States Rights in the hope of picking up dissident Democrats. "That is not an issue, that is a relic," says Mr Willkie pungently. On the negro question, Mr Willkie demands that the party should take its stand unequivocally against the poll tax and in favour of anti-lynching statutes. He insists on more rather than less social security. He is less bold in the region of America's post-war economy, proposing only that industry, labour and government should set up "a co-operative mechanism which will act as a clearing-house for information and constructive programmes," but at least he makes it plain to his party that Utopia is not to be reached by passing resolutions in favour of free enterprise. Towards labour, Mr Willkie shows marked sympathy, urging the repeal of the "unwise and unenforceable" Smith-Connally Act, and insisting that industry should convince the workers that it is prepared permanently to accept the basic principles of collective bargaining. He asks the Republican Party to have the good sense to face the fact that tariffs are no longer a purely domestic problem, but that the economic strength of America should be used to lead the way to a general expansion of trade. In a like spirit he reminds his countrymen:

Our sovereignty is not something to be hoarded, but something to be used. The United States should use its sovereignty in co-operation with other powers to create an effective international organisation for the good of all.

Mr Willkie has not failed to follow up his unofficial programme by sharp criticism of the weakness and ambiguity of the foreign policy plank adopted at Chicago, and he has been joined by 15 Republican state governors. But already the vigour and precision of his articles has exposed the flocculence of the official platform. It may be assumed that the party's irrepressible, if disavowed, leader will similarly plague the official standard-bearer during the coming campaign.

GI Bill of Rights

President Roosevelt has signed the veterans' measure known as the "GI Bill of Rights." This law gives service men and women the opportunity of resuming their education after discharge by paying tuition up to \$500 per academic year and providing a monthly living allowance. It also provides for the federal guarantee of up to 50 per cent of loans made to ex-soldiers for the purchase and construction of homes, farms or businesses; for weekly unemployment allowances for a period not exceeding a year; and establishes improved machinery for job replacement. Where it fails to follow President Roosevelt's recommendation is in the extension of social security credits under the federal old-age and survivor's insurance law to all service men and women for the period of their service.

ABDULLA
A BLEND OF VIRGINIA & OTHER CHOICE TOBACCOS
"VIRGINIA" No. 7
20 CIGARETTES
ABDULLA & CO., LTD., 173, NEW BOND ST., W.1.

At 2/8d. for 20, Abdulla No. 7 is a cigarette* of outstanding quality with a charm of its own—a charm which comes from superb tobacco and masterly manufacture. It's larger and firmer than the ordinary cigarette, too.

P.S. In the wardrooms of H.M. Navy, they smoke literally millions of No. 7 every year—and you know what sailors are!

WHITE HORSE

was growing old when
this war was young

If you have wondered how it is that you can still get White Horse Whisky from time to time, and how it is that the quality and flavour of this famous whisky were never better than to-day in this fifth year of the war, here is the answer in one word . . . age.

All the flavour, fullness and smoothness of the White Horse you have known in the past is in the White Horse you may buy to-day. For to-day's White Horse is itself a whisky of the past. In the early days of the war it was already growing old. It has been ageing ever since.

It was the stocks of maturing whisky, laid down in years gone by with a prudent eye on the future, which provided the great blend that is White Horse to-day. And our unrelaxing, provident care of the whisky still maturing is your assurance that this famous Scotch will remain as always—whisky fine as a fine liqueur.

MAXIMUM PRICES:—Bottles 25/9d.; Half-bottles 13/6d.
as fixed by The Scotch Whisky Association.

Pure Water is Essential . . .

STILL MALVERN WATER, the purest known water, can still be supplied without restriction of area throughout Great Britain. Singularly free from mineral salts and solids, which may be harmful to the system, it is highly recommended by the medical profession.

STILL MALVERN WATER can be obtained in sealed bottles (Extra large) from any Grocer, Chemist or Wine Merchant.

THE WORLD OVERSEAS

The Polish Marches

TOWARDS the end of last winter's offensive the Russian armies entered eastern Poland to the south of the Pripiet Marshes. Their present advance from Vitebsk and Bobruisk points to the northern fringe of eastern Poland. The country behind the German lines is now commonly called by Poles "the Wild Grounds," the name by which the masterless steppes on the left bank of the Dnieper bend (Zaporozhe) used to be known in the seventeenth century. Those were the Polish marches, the "bad lands," the "Wild East" of old Poland.

Now the wild marches have spread 400-500 miles to the west. The past year in eastern Poland has seen the shifting of great masses of people, the breakdown of effective administration, the mingling of war and civil strife, and a growing chaos that threatens to engulf German communications and supply bases in the immediate rear of the front.

Already in the phase of the Russian offensive last winter, the Germans began the evacuation of their civilian administration from eastern Poland. Lwow in the south and Minsk, the capital of Soviet Byelo-Russia, in the north had been partly evacuated even earlier. During the lull in the fighting the stream of the exodus was temporarily halted. In Lwow itself civilian German authorities again took charge. In the meantime manpower from the Polish borderlands was driven westwards to forced labour camps. This gave rise to friction between the press gangs and the German military authorities who feared that the countryside, denuded of labour, would not be able to deliver the fixed quotas of food to the army. (Already towards the end of 1943 only 35-50 per cent of the food demanded was delivered in eastern Poland compared with 80-100 per cent in central Poland.)

While crowds of people were driven from eastern Poland westwards, the receding German tide brought crowds of soldiers, officials, administrators and settlers from the Soviet Ukraine and Byelo-Russia to Poland. All the towns in the provinces of Vilno, Polesie, Eastern Volhynia and Galicia became incredibly overcrowded. The newcomers were herded together with the part of the population that had stayed. With few exceptions, the towns of eastern Poland do not offer ample accommodation for swollen garrisons and offices. True, the buildings in that part of Poland had not suffered very much from war destruction. But at least one-third of the buildings—most of them primitive wooden houses—have become utterly dilapidated in the years of war. The standard "Lebensraum" allocated to the inhabitants of eastern Poland by the beginning of this year was 6-7 square yards per person.

Germans Beleaguered

This is the position in the towns that still belong to the Germans. The wooded or marshy countryside belongs to the innumerable guerillas of all sorts and all political colourings. The German occupation has been to all intents and purposes confined to strategic key positions and communications. To control communications in eastern Poland has been no easy task, for railway tracks often run through dense forests vulnerable to ambush. Throughout the last year labour battalions were engaged in rooting out woods along railway lines for 200-300 yards on each side of the track.

Even so, incessant attacks by guerillas resulted in the more or less permanent immobilisation of the railway connections behind Kovel, an area where the lack of good roads compels military traffic to rely entirely on railways. Raids by guerillas have also deprived the Germans of the benefit that they might have drawn from small-scale industries in eastern Poland. Many factories in smaller towns have been destroyed or burned. Factories evacuated by the Germans from Russia could not be put to work there, and had to be "leapfrogged" further to the west.

The political outlook of the guerillas in eastern Poland reflects the complex mosaic of the nationalities that inhabit those parts. In the north there are the Lithuanians and the

Byelo-Russians. Polesie is Byelo-Russian with a Ukrainian fringe in the south Volhynia and eastern Galicia are the stamping grounds of the Ukrainian guerillas. Poles dominate the towns. The German invaders have, not without success, tried to play off all these nationalities against one another.

Internal Divisions

Some Lithuanians have committed themselves to collaboration with the Germans. The hostility between Lithuanians and Poles has become even deeper than it used to be during the neither-war-nor-peace period which lasted for twenty years after the incorporation of Vilna into Poland. It has been aggravated by the fact that the Lithuanians, who had committed themselves to despatch a large contingent of workers to Germany, drew the contingent largely from Polish inhabitants, no doubt with the intention of weakening the Polish element in Vilna. The Byelo-Russian guerillas have been almost entirely composed of local peasants sympathising with the Soviets—only in the Novogrodek area have Polish partisans been active. But the feud between Byelo-Russians and Poles has not assumed sharp forms. A thin layer of the Byelo-Russian intelligentsia did collaborate with the Germans. But this collaboration has broken down; and the former collaborators have tended to move over to the other side, apparently seeing in the re-incorporation of Western Byelo-Russia into Poland, coupled with Byelo-Russian autonomy, a lesser evil than incorporation in the Soviet Union.

In Volhynia and in parts of eastern Galicia the pro-Soviet peasant guerillas are by far the strongest force. They combine the fight against the Germans with a *jacquerie* against Polish landowners, colonists and former officials. Besides them, however, there have been several sets of Ukrainian nationalist guerillas led by an intelligentsia disillusioned by collaboration with the Germans, uncompromisingly opposed to the Poles and bitterly anti-Soviet. A "declaration of principles" issued by one of those groups—the Ukrainian Army of Insurrection (UPA) and by the Ukrainian State Nationalists (OUN)—states:—

The Ukrainian nation will oppose all the old Bolshevik rulers as well as all its other foes no matter whether they are German, British, Polish or Russian White Guards. The same document expresses the hope, still lingering among Ukrainian nationalists, that in the future Great Britain may perhaps show some interest in assisting the fight for an independent Great Ukraine.

The utter unreality of these hopes is obvious. Like the Lithuanians in the north, these Ukrainian guerillas in the south have been bent on weakening the Polish element

and have organised mass slaughters of Poles. The advance of the Red Army spells their doom. The nationalist leaders are moving west with the intention of setting up centres of propaganda in France, and possibly also in . . . Great Britain.

The position of the Polish population in the eastern borderlands has been very difficult and sometimes tragic. The Poles, in spite of anti-Soviet feelings, have had no truck with the Germans; but socially and politically they have been unable to find a common language with the local peasantry. The abuses and follies of previous oppressive policies have now recoiled on them. The flood of hostility and wild revenge has gathered around them and struck at them from all sides. In addition, the Polish population does not know what to expect from the advance of the Red Army. The political persecutions of the first Soviet occupation of 1939-1941 are still fresh in Polish memories; the fear of their repetition has been very strong. During the Soviet advance last winter there was something like a panic flight of Poles from the Vilna area and Volhynia to the west. In the meantime the Polish Government in London has issued an appeal to its countrymen in the eastern borderlands asking them not to give way to the panic and advising them to stay where they are. Recent reports suggest that this appeal has had some reassuring effect. Poles in Vilna and Lwow are now taking more calmly the prospect of the Red Army's return. But, clearly, nothing less than the resumption of Polish-Soviet relations and a friendly agreement on controversial issues can bring back a higher measure of confidence, peace and order to the marchlands of eastern Poland.

After the Irish Election

[FROM OUR DUBLIN CORRESPONDENT]

WHILE the rest of Europe was either a battlefield or daily expecting to become one Eire experienced a crisis in her domestic politics which led to the general election a month ago. Critics of proportional representation have always maintained that PR tends to produce instability owing to its failure to give any single party a clear majority. Until the general election of last year, Eire had escaped this danger. In last year's election, however, no single party secured a clear majority. The number of deputies in the Dail is 138. The Fianna Fail Party, led by Mr de Valera, obtained 67 seats and the other parties 71. Mr de Valera, as the leader of the largest party in the Dail, consented to take office; but he made it abundantly clear that he would again appeal to the country if the united action of the opposition parties should hamper his administration. Things went well until May 9th, when the Government was defeated by a single vote on a clause of the Transport Bill. Mr de Valera immediately requested the President to dissolve the Dail and to cause a general election to be held.

The Transport Bill is a measure to bring some sort of order into the railway and road transport services. For many years the Great Southern Railway has been in great financial difficulties. It is not necessary to describe the details of the Bill here beyond saying that it proposes to establish a large statutory company, with Government guarantees, to take over the Great Southern Railway and the Dublin Transport Company. Rumours began to circulate during the spring that leakages of information regarding the provisions of the Bill had occurred, as a result of which substantial profits had been made by dealers in railway shares.

A judicial tribunal was established to inquire into these rumours. The proceedings before this tribunal were published in the press. They revealed that large dealings had taken place, and considerable profits had been made. The particular motion on which the Government was defeated was one to postpone the Bill until the report of the tribunal had been published. The objection of the opposition was not so much to the Bill itself, but to the—as they alleged—unnecessary and indecent haste with which it was being pushed forward.

From the beginning of the election campaign it was obvious that Mr de Valera, who is a supreme political tactician, would gain at the expense of his opponents. Feeling throughout the country was quite cold about the Transport Bill or the speed of its passage. All the circumstances favoured the Government. The Opposition parties had not time properly to organise their activities. The Labour party was split by internecine strife.

But the dominating thought among the electorate was the

international situation. Everybody was waiting daily for news of the invasion of Europe, which would bring the major war operations much closer to Ireland. Mr de Valera had preserved neutrality for nearly five difficult years. He had quite recently scored a diplomatic success by his attitude towards the American request that the Axis Ministers should be expelled from Dublin. The man in the street felt that this was not the time to drop the pilot who had steered the Irish ship so deftly through such troubled waters.

The result of the election was even more favourable to the Government than the political forecasters had expected. The Fianna Fail first preference votes increased from 555,249 last year to 595,691. The Fine Gael first preferences declined from 306,568 to 249,248, and Labour from 209,827 to 135,587. Fianna Fail secured 76 seats, Fine Gael 30, Labour 12, Farmers 11 and independents 9. Mr de Valera obtained his independent majority. The new Dail met on June 9th, and elected him Prime Minister by 81 votes to 37. The proceedings at this meeting were anything but harmonious, and it is clear that party and personal animosities will play an important part in politics in the immediate future.

Irish Policy in Peace

The average voter, however, having returned the Government to power, will probably be less interested in Parliamentary debates than in solving the pressing problems of his daily life which continue to grow in difficulty. Owing to the concentration of British shipping for the invasion of Europe, deliveries of coal in Eire have been stopped, just at the time when the supply of electricity is at its lowest level on account of the drought. The transport system is reduced to the barest minimum, and the use of power is restricted in every direction. It is hard to imagine what will happen if the fuel situation does not improve before the winter.

This is but one of the innumerable problems to which the Government must now turn its attention. The Ministers now enjoy such a comfortable majority that they can devote themselves uninterruptedly to planning for the post-war situation. The return of large numbers of workers from Great Britain will give rise to serious unemployment if work for them is not planned well ahead of their arrival. The stoppage of building and other types of investment during the war will provide the opportunity for an extensive programme of public works.

The limiting factor on such a programme will be the need to obtain abundant imports. This gives rise to the question of the utilisation of the sterling assets accumulated during the war. The successful realisation of these assets will be bound up with the larger question of the priorities accorded by Great Britain to its different creditors, which, in its turn, will be bound up with the still larger question of international relations after the war. When hostilities cease, Irish neutrality, which preserved the safety of the country in wartime, will no longer be in peril. Continued prosperity in peacetime may demand a high degree of co-operation with other nations. It is the newly-elected Government, which will normally hold office for six years, that will have the responsibility of deciding the part which Eire will play in the brave new post-war world.

Banking Under Nazi Control

THE tradition of specialisation in German banking has not been greatly changed during the war. There have been concentration and rationalisation, but with varying effects. The actual number of banks has been greatly reduced and, during 1943, there was a substantial reduction in the number of branches maintained by the leading banks. The profusion of banking reports and the discussion about banking reforms, which were at times an important feature in German economic papers, are deceptive. In form, the attributes of independent banking still exist, but in substance the banking industry, in its structure and in its activities, has changed fundamentally. The changes began long before the war under the totalitarian economy; were accelerated during the first years of the war; and have been completed by the measures which have become known, collectively, as Germany's "air war economy."

Generally speaking, German banks (that is to say, the combined commercial and investment banks, the mortgage banks, the savings banks and the co-operative banks) which were free agents in the financial sphere have been changed, automatically, into mere administrators of accumulated savings and capital, on the one hand, and executors of the capital expenditure and general credit plans of the state, on the other. Banks no longer play an instrumental part in floating loans, in financing industry or internal and external trade. Small savings and the excess capital which accumulate, as a result of rationing both civilian commodities and the other factors of a war economy, are flowing into the banks, and are automatically invested in Treasury bills and bonds. Treasury bonds and Government Loans now form 70 per cent of the total assets of the banks, against some 20 per cent before Hitler came to power and against 40 per cent in 1938.

Bills, and particularly bills of exchange, have almost disappeared. Under a complete system of control and clearing they are no longer necessary. In spite of an effort to re-introduce a system of bank credits to industry and trade, the trend of advances has been comparatively stable. The totalitarian economy, with its growing need for substitute industries, for abnormal stores of vast quantities of raw materials and manufactured articles in agriculture and industry, replaced the old activities of the banks by new. They had to provide the necessary money capital for these schemes. Frequently the projects were so vast that even several big banks had to combine in a co-operative effort for providing the capital over the long periods necessary for constructing new industries or for storing materials.

Financing Evacuation

During 1943 there was an additional demand for financing the evacuation of factories and for the storage of special supplies against bombing activities. In addition, the bombed-out people had to be supplied with facilities for withdrawing money from banks in the reception areas. All these activities have actually broken down the last vestiges of independence. The financing of new industries or of large orders placed by the Government no longer carries any risks. There can be no more competition between individual banks now that interest rates, dividends and profits have all been pegged. Transactions at the various bourses have been virtually prohibited. In short, the German banks have more resemblance to departments of the Treasury than to independent institutions. In the complex German economy, which has still to get raw materials and manufactured goods where they are wanted, while it maintains a rigid control on their production, sale and use, the banks must necessarily take their place as the administrators of savings and capital and as the distributors of credit.

At various times Nazi economic journalists and economists seem to have felt the acute contradiction between the complete regimentation of the economy and the relative—or, rather, deceptive—freedom of the banks. The most influential Nazi economists demanded the abolition of the bourse; but they were not so sure that the credit facilities offered by the banks could be dispensed with, even in Germany's "steered economy." Practically, the German economy could keep going without a bourse in the same way as it had kept going without commodity markets. From a political point of view, however, the abolition of the bourse or the outright nationalisation of the banks would reveal the complete dependence of the individual capital owner, entrepreneur and industrialist on the state.

No Nazi journalist so far has been able to make the choice. During the reorganisation of the economy under the heavy bombing of 1943-44, there were at times indications that the formal step of nationalisation would be taken. Each time political and technical reasons prevented it.

It is in itself an interesting indication of the fundamental change in German banking that the annual reports of the banks for 1943 were published with considerable delay in 1944. Naturally, there have been unavoidable reasons of an administrative character: the extensive damage to bank buildings by bombs, the shortages of staff, added to an increase in administrative work, have all contributed to the delay. On the other hand, the annual reports have lost their importance as a reflection of general economic activities, and the banks themselves made no particular effort to publish their reports as early as possible.

There are now six leading banks instead of the traditional Big Five. The newcomer is the "Bank der Deutschen Arbeit," which was the banking institute of the

German Labour Front. Before the war this bank was actually a kind of Nazi party bank supplying the finances for party buildings and party organisation. The most important items in the combined reports of the six leading banks, i.e., Deutsche Bank, Dresdner Bank, Commerzbank, Bank der Deutschen Arbeit, Reichskredit AG and Berliner Handelsgesellschaft were as follows:

	(In million Reichsmarks)		
	1942	1943	Increase in per cent.
Bills	2,590	2,559	—
Treasury bills and bonds	11,348	13,774	21.6
Advances	4,536	5,647	24.7
Investments	1,921	2,059	7.0
Deposits	17,037	20,037	19.5
Savings deposits	3,360	4,443	32.0
Total assets	21,940	26,020	18.6

In spite of this clear expansion, profits decreased slightly and there was a corresponding decrease in tax payments. The expansion in activities has been most marked in the report of the "Bank der Deutschen Arbeit." Contrary to general expectations in the German press, total assets increased again considerably. Neither the stop on advanced payments by the Wehrmacht nor the capitalisation of the house-rent tax could halt the general expansion, which is further reflected in the continued rise in the National Debt. The annual increase of the total debt was as follows, in million Reichsmark:

1940	34,000	1942	57,000
1941	49,000	1943	70,000

Against this increase the determined policy of skimming off excess nominal capital was bound to fail. The expectation that it would succeed is in itself an indication that control and regimentation have been clearly understood and successfully practised, whereas the ideas about finance and banking are still hopelessly interspersed with the principles and the practice left over from the free economy before Hitler.

The considerable increase, comparatively speaking, in Advances finds its explanation in the new activities of the banks in occupied countries in the East, mainly in the Baltic countries and in Poland. There a number of subsidiary banks have been established. Another reason is the extraordinary demand created by the evacuation and the dispersal of factories because of the heavy bombing. Once again the savings deposits show a more marked increase than ordinary deposits. This is a clear reflection of the disappearance of unrationed commodities and the reduction in the distribution of rationed civilian commodities, particularly clothing and household goods.

During 1943 there has been no further expansion of German banks into occupied countries in Western Europe. It has been apparent, however, that the subsidiary banks in Paris, Brussels and Amsterdam increased their activities. There has been a marked increase in the expansionist activities of all the leading banks in occupied countries in the East. In Riga, Reval, Kaunas and Cracow new banks have been established. At the same time, new banks have been founded there which can be called all-purpose banks. In accordance with the general eastward trend of Germany's industry, banking activity has also moved from western to central and eastern Germany.

THE BUSINESS WORLD

Co-operation: The Second Century

THE centenary of the Co-operative movement, which is being celebrated this month, provides an admirable opportunity for a stock-taking of the achievements and position of Co-operation, and for a consideration of its role in post-war Britain.

Consumers' co-operation is actually older than the Rochdale Pioneers. Co-operative societies, based on the teachings of Robert Owen, were started in the early 1820s. But the 28 workers who, each subscribing £1, opened their store in Toad Lane, Rochdale, for the sale of flour, soap and candles, were in essence the founders of the present movement. As well as showing considerable business acumen, the Rochdale Pioneers had social aims far beyond their immediate purpose of self-help. Their programme included house building, manufacture and agricultural production, and they hoped eventually "to arrange the powers of production, distribution, education and government." Initial progress was slow—by the end of the third year the society had only 110 members—but the principles that have guided co-operators for a hundred years were established—open membership, democratic control, distribution of trading surplus, limited interest on capital, cash trading, the promotion of education and political and religious neutrality.

After a century, the Co-operative movement has become a gigantic, prosperous and world-wide trading organisation. In Britain it employs about 300,000 workers. Its 1,148 retail distributive societies have a membership of about 9 million, and their sales, in 1942, amounted to £320 million. The combined capital of the Co-operative Wholesale Society and the Scottish C.W.S. is now £195 million, and their net sales in 1943 were over £200 million. (Some recent co-operative statistics are shown in an accompanying table.) As well as merchanting, the two wholesale societies undertake such services as manufacture, transport, insurance and banking, and a combined association—the English and Scottish Joint C.W.S.—controls the tea, coffee and cocoa business. Federal societies, controlled by the retail societies, deal with special branches, such as laundry, bakery, dairy and pharmaceutical products, and national federal societies undertake the press and printing work for the movement. *Reynolds News*, the national Sunday paper of the movement, was acquired in 1929, and now has a circulation of about half a million.

The Co-operative movement was once described by Lord Rosebery as a "state within a state." The Co-operative Union, acting as a kind of co-ordinating body, might be regarded as its civil service. Itself a registered society, the Union gives co-operators technical advice and assistance on legal, labour, production and agricultural problems; it deals with the statistical, publicity, educational and financial work. Finally there is the Co-operative political party, technically separate, but in practice barely distinguishable from the Labour party. The governing body of the whole movement is the National Co-operative Authority, representing every section, and charged broadly with the execution of policies decided at the annual congress. This is the outline picture of British co-operation. It should be added that, throughout the world, there are some 143 million co-operators, organised in 810,000 societies, whose activities are linked through the International Co-operative Alliance.

The war has had relatively few adverse effects on the

position of the British Co-operative societies, which has been well maintained, at any rate on the distributive side. Fully a quarter of the total civilian population are registered at Co-operative stores for the main rationed foodstuffs (the actual figures are: sugar and jam, 11,628,000; butter and fats, 11,382,000; bacon, 10,635,000; cheese, 11,318,000; eggs, 7,774,000; meat, 6,295,000). The Co-operatives handle about a fifth of the total trade in foods that come under the points scheme. Between 1940 and 1942, the trading surplus, out of which the dividend is paid, increased from £27.8 million to £33.1 million. The production side, however, has inevitably suffered during the war, as a result of the requisitioning or concentration of factories, or their diversion to Government orders.

The Co-operative movement, in common with other public and private bodies, is thinking now about its future. Had this year's Congress not been postponed, it would have been called upon to make highly important decisions, and in particular to consider the report of a special committee, set up in 1942, on the structure and functions of the movement and on how to strengthen its organisation, to meet the postwar situation. A majority and a minority report were submitted, which revealed sharp differences about methods and machinery, though both agreed about the need for a more modern outlook and for greater unity within the movement.

Indeed the question can pertinently be asked—why thus far and no farther? Why, in spite of its great membership and substantial capital reserves, has Co-operation not made greater headway and captured a still larger share of the market? Recent expansion has been horizontal, rather than vertical, an extension of membership rather than of business, and the average purchase of members is still only 14s. per week per head. It is still largely a food trade, to the extent of about 70 per cent of the total business. Though the Co-operatives handle about 25 per cent of the nation's milk trade, and 15 per cent of the meat trade, their proportion of drapery

* 1943 figures not yet available.

trade is only 5-6 per cent, and they have been relatively slow to enter the furnishing and household trade, although their members spend an increasing proportion of their incomes on non-food goods.

The answer lies partly in the history and structure of the movement itself. The large number of retail societies, often leading to overlapping, and their small average size have probably been deterrent factors. The process of amalgamation has been slow, the smaller societies being unwilling to merge their identity into larger groups for fear they might lose the personal and democratic touch on which co-operation is based. This makes it difficult to obtain any kind of uniform leadership, and there are many complaints that the decisions of the annual Congress or the recommendations of the National Authority are simply ignored by local societies. This parochialism is combined as often as not with underpaid society managers and with local management committees, whose members—unpaid—may have neither the time, the inclination nor the wit to handle business affairs. Recruitment to co-operative service is almost entirely from the elementary schools, and promotion tends to be more by length of service than by merit. Co-operative employees, like Civil Servants, are never dismissed except for "gross dishonesty" and the inefficient are generally pushed off to other jobs. The assurance of a safe job and the generous pension and superannuation rights provided do not necessarily encourage business enterprise.

This need not matter in areas where co-operation is safely entrenched, such as in the industrial North, or parts of Scotland and Lancashire, where people will "shop at the co-op" because they and their families have always done so, where the "divi" rather than the quality or variety of the goods is the main attraction, or where the social and educational facilities offered through the Guilds are appreciated. But in newly developed industrial areas, in the South and Midlands, where there are no strong Co-operative traditions, the societies have to face the competition of multiple shops and chain stores. The stronghold of the movement is still in the artisan classes—skilled and semi-skilled workers. Co-operation has barely touched the lowest income groups, for whom the prospect of the "divi" holds no attraction, nor has it really penetrated into the middle classes, who think they will get better service, wider choice and credit facilities elsewhere. If the Co-operatives want to raise the average purchase of their present members, to enter new areas and to extend their range of customers, they will clearly have to pay more attention to the possibly more superficial, but in modern distribution, essential factors of attracting the public. As a consumers' organisation they should, for instance, develop consumer research, and they might well follow the example of Swedish Co-operation in the design and lay-out of Co-operative buildings.

Such a policy might, of course, raise their costs, which are at present considerably lower than those of private distribution. The Co-operative Societies also enjoy advantages in the matter of taxation. Co-operative costs of administration, finance, advertising, delivery—in short the cost of "service"—are low compared with those of private retailers. Professor Carr Saunders' study of *Consumers' Co-operation in Britain* (published in 1938) estimates the costs of Co-operative grocery stores as 13.9 per cent of their sales, compared with 18.2 per cent for chain stores and independent shops. In wholesaling, his comparative estimate gave costs of 1.3 per cent of sales for Co-operatives and 9-10 per cent for private grocery firms. The report of Lord Perry's committee on Milk Distribution in 1940 showed that the Northern Co-operative Wholesale Society, Limited, handled two-thirds of Aberdeen's retail milk business at half the cost per gallon of the large London distributors. More recently, Sir William Beveridge pointed out that the Co-operative Insurance Society had the second lowest expense ratio of any industrial life office in the country.

There is thus plenty of evidence that the Co-operative

method of business is efficient and cheap—a welcome contrast to the excessive costs of retail distribution in general. But low costs may not be reflected in reduced prices, since there is a tendency on the part of certain societies, especially in the north, to concentrate on paying high dividends and keeping up prices accordingly. What is needed as well, if the Co-operatives are to play a part commensurate with their membership and resources in post-war economic rehabilitation, is a less conservative approach and broader vision. Immediately after the war, there will be an enormous demand for consumption goods, both here and in Europe; in the longer run—if a high general level of employment, with increased purchasing power and social security can be assumed—consumers' demand will become wider and more exacting.

There are signs that some Co-operative leaders are alive to the needs and possibilities ahead. Plans for an amalgamation of the English and Scottish Wholesale Societies are going forward, which would lead to greater unity of purpose and action. The CWS itself is planning a capital expenditure of £10 million, to finance increased buying of raw materials from its overseas depots, the rebuilding and modernisation of its factories, the encouragement of research and the development of goods "formerly regarded as luxuries," presumably the whole range of household equipment, vacuum cleaners, refrigerators, cosmetics, drugs, sports goods, radios, cars and motor cycles. It could improve its organisation for the sale of fruit, vegetable and fish. It might with advantage expand its catering and hotel business—for social reasons it has never gone in for the public house or brewery trade—especially if holidays with pay become universal. It might extend its book and stationery business, at present almost non-existent, and it might fulfil the original aim of the Rochdale pioneers, of building houses for its members.

The next few years therefore will provide both an opportunity and a testing time for Co-operation in Britain. It might be argued that to expand its scope and to enter into competition with multiple shops for the "neutral fringe" of consumers, or with established firms for entry into new manufacture, might involve a sacrifice of the democratic and social purpose of Co-operation. This need not be the case, though the danger is latent, and the movement must guard against any loss of interest by individual membership. The Co-operatives can help to protect the public against the artificial raising of prices, and on some occasions—notably in Scandinavia—it has acted as a brake on monopolistic practices. It is, however, important, in the national interest as well as in that of its own members, that the Co-operative movement, on the eve of its second century, should restate and reaffirm its purpose as a democratic, consumers' and Co-operative organisation.

The BRITISH MUTUAL BANKING COMPANY LIMITED

Founded 1857

The Bank provides prompt and individual service for customers in all parts of the country. In addition, it acts as a Registrar for Companies. This service includes the preparation of dividend warrants, etc.

LUDGATE CIRCUS, LONDON, E.C.4

Rubber Prospect—I

NATURAL rubber has lost its monopoly during the war. Almost overnight the United States has created a synthetic rubber industry of a capacity not far short of the world's consumption of natural rubber before the war. The sudden inflation of the industry from small beginnings, irrespective of cost, has been made necessary by the Japanese occupation of Far-Eastern countries that contributed nine-tenths of the world's crude rubber supplies before the war. Russia and Germany, too, have established the manufacture of rubber on a large scale as a means of safeguarding supplies in war.

After the war there will be two industries supplying two substances which, while not identical in quality, are physically interchangeable to a considerable extent. Inevitably, this means a complete change in rubber economics. The question is no longer whether synthetic rubber has come to stay, but in what conditions and proportions natural and synthetic rubber will meet a demand which, though growing, is unlikely to absorb the potential output of both after the war.

Much the most important, but not the only, factor that will influence the proportions in which natural and synthetic rubber will be used after the war is their relative price and convenience to the consumer. It is obviously impossible at this stage, to forecast the supply price of the two varieties of rubber. Experience in the manufacture of synthetic rubbers has been too short. Moreover, natural rubber has by no means reached a stage of technical development at which its supply price will be subject only to minor and predictable changes. The conditions of supply are very different, not only between natural and synthetic rubber, but, in natural rubber, between plantations and small native gardens, and in synthetic rubber, between the various methods of production at present in use.

Mr K. E. Knorr* has calculated that the initial capital investment required for rubber estates and synthetic plants is about equal per ton of output capacity. But the rate of depreciation favours the estate. The life of a rubber tree, though not the only item in the capital cost of the estate, is about thirty years, while the physical life expectancy of the machinery and instruments used in synthetic plants is estimated to average about twelve years. The native rubber producer, of course, has virtually no capital costs. In short, overheads per ton of output are negligible for the native, and more than twice as high for the synthetic rubber manufacturer as for the average estate. In view of the heavy fixed charges in the production of synthetic rubber, the rate of plant utilisation is an important factor in its cost per lb.

In the matter of prime costs natural rubber production costs are very different from those of synthetic rubber. The rubber estate has appreciably higher labour costs than the synthetic plant. On the other hand, synthetic rubber production involves heavy costs for raw materials, such as petroleum or alcohol, and various chemicals, as well as for power. Relative prime costs are therefore largely a matter of wages for the estate and of raw materials for the synthetic rubber manufacturer. The small native producer, in contrast, has little or no labour costs apart from what he needs for subsistence.

Before assessing the probable trend of costs after the war and their effect on the demand for natural and synthetic rubber some reference must be made to present costs—or, rather, to pre-war costs—of natural rubber and present costs of synthetic rubber.

Unfortunately, there is not sufficient evidence for precise comparison. Natural rubber costs varied considerably between the estate and the native garden, and there were high and low cost estates. Between 1931 and 1933, when the price of natural rubber in London averaged just under 3d. per lb., estate producers as a whole were operating at a loss, in spite of drastic cuts in working costs, including wages.

* "Rubber After the War," by K. E. Knorr. Food Research Institute, Stanford University, California. 46 pages. Price 25 cents.

The fall in exports added to overheads per lb., but it is unlikely that, even with a full maintenance of volume, a London price of 3d. per lb. would then have yielded a reasonable profit to the average estate producer. The fact that a number of rubber company chairmen stated in the spring of 1933 that they could produce rubber at a profit at a price of 3d. to 3½d. a lb. is a measure of the costs of the most efficient producers. Between 1934 and 1939, however, when, as a result of restriction, prices in London averaged 7½d. a lb., most estate producers made good profits. In fact, it is very probable that, in the absence of restriction a substantially lower price would have brought forward adequate supplies at a profit to efficient producers.

The cost of manufacturing synthetic rubber varies, among other things, from type to type. On Mr Knorr's calculations, the Butyl type produced by Standard Oil of New Jersey from a raw material derived from oil refinery gases

is at present the cheapest. The sum of prime costs and depreciation charges is estimated at between ten and fifteen cents (6d. and 9d.) a lb.; but with an allowance for the remuneration of the capital employed the price would be higher—Mr Knorr suggests between fifteen and twenty cents (9d. and 1s.) per lb. But this is for Butyl rubber, whose performance is not satisfactory in all respects.

At present Buna-S appears to be about the best general-purpose synthetic rubber; some seven-eighths of the American Government's production programme is devoted to this type. But even Buna-S is still held to be less satisfactory at present than natural rubber for many general purposes. Colonel Bradley Dewey, in his capacity as Rubber Director, stated last December that Buna-S was then manufactured in some of the new plants at less than fourteen cents a lb., "including reasonable management fees but before depreciation." But, with an allowance for depreciation and profit, the cost of Buna-S at present exceeds that of Butyl.

Such scanty information as is available thus suggests that the cost of natural rubber is still appreciably lower than that of synthetic "rubber-like substances." Little definite is known about costs in Germany, where large-scale manufacture has been carried on for a number of years; while it is not improbable that the trend of costs has been downwards, some of the reports of their range must be read with a measure of caution.

Nothing would be more deceptive, however, than to attempt to forecast the markets for natural and synthetic rubber on the basis of present costs, even if fuller information were available. Both the natural and synthetic rubber producing industries are essentially young industries. More than nine-tenths of the acreage under rubber in 1943 had been planted since 1909, and only between three and four per cent of the acreage had been replanted; the original tree

population, in fact, still accounts for almost the entire area planted. Again, the manufacture of synthetic rubber on a large scale is still in the stage of experimentation and rapid technical changes.

In spite of the improvements achieved in the past, the field of technical progress in the production of natural rubber remains very large, as in methods of seed selection, bud-grafting, soil management and tapping systems. Throughout the 1930s, methods of cultivation and tapping were still matters of controversy among experts. Given efficient management and intensive research, and, for the estates, an unrestricted supply of Indian workers, costs of production can be expected to show a progressive decline after the war. Moreover, there is room for improvement and greater standardisation in the processing of rubber in the early stages which can be carried out before shipment. The shipment of increasing quantities of rubber in the form of latex—a liquid, which can be handled in bulk like oil—is another promising development in that it is more convenient in this form for certain manufacturing industries.

It is not enough for efficient producers to become more efficient. If the benefits of technical progress are to accrue to the consumer through a lower market price it must be applied on a broad front. This will involve a substantial measure of reorganisation in an industry that has grown up haphazard, with estates of all shapes and sizes, varying widely in efficiency. The liberation of the rubber-growing territories now under Japanese occupation should provide an excellent opportunity for a thoroughgoing review of the pre-war organisation of the industry with the object of ensuring the conditions for a supply of cheap rubber.

The small native producer has the advantage over the estate in having virtually no overheads and labour costs. His position in the industry is of great importance, for it has been estimated that more than half of the planted area of nearly nine million acres in 1940 was in the ownership of—mainly small—native producers. As experience during the early 1930s showed, he continued to produce large quantities of rubber even at the low prices then prevailing; forecasts that he would be driven out of business proved to be erroneous, and, at one time, gave way to predictions that rubber would "go native." But that is another problem. True, he does not possess the facilities of the estate in applying the results of research, for this involves capital investment and a complete change of method. Nevertheless, there is scope for improvement in his methods, especially with technical assistance, and it would be a delusion to assume that he cannot reduce his costs still further.

The view has been expressed, by Mr Knorr, for

example, that a price of eight cents (4½d.) per lb. would make production profitable on efficient estates even if wage rates were increased. The time required to achieve the necessary overall increase in efficiency will depend, of course, on the conditions in which the estates will be found after liberation. Large-scale systematic destruction seems unlikely, if only because of the time and labour required. Large areas may have been neglected, and the damage through neglect is likely to be more serious on estates than on native holdings, though it will be partly offset by the resting of the trees.

At a price of 4d. to 5d. a lb. in New York, natural rubber would be appreciably cheaper than synthetic rubber seems likely to be for some time to come. But, while it is impossible to assess the prospects of cost reductions in synthetic rubber, they must be substantial, if only because the industry is a new one and still capable of rapid technical progress. At present, forecasts of the probable post-war cost of production of Buna-S in conditions of large-scale production, near full capacity range from fifteen to thirty cents (9d. to 1s. 6d.) a lb. Estimates for Butyl are somewhat lower. Much, of course, will depend on the treatment of the capital invested by the American Government in synthetic rubber plants during the war. If the plants were sold at a nominal price to private manufacturers this would amount to a substantial initial subsidy.

Apart from cost reductions, it is reasonable to expect progressive improvements in the quality of synthetic rubbers. These will affect the relative demand for natural and synthetic rubber for general purposes fully as much as price reductions. At a given price, natural rubber is still generally preferred to synthetic rubber. For example, processing costs are higher with synthetic than with natural rubber. On the other hand, synthetic rubber is stated to be superior to plantation rubber in resistance to petrol, oil and chemicals.

Predictions are always hazardous; but they are especially hazardous about the relative cost and quality of natural and synthetic rubber. To say that natural rubber is no dying industry is a reasonably safe guess. Its position is not analogous to that of Chile nitrate in relation to synthetic nitrate after the last war. For general purposes natural rubber will continue to be demanded in large quantities, if it is made available at low prices; but synthetic rubber would become a formidable competitor to an inefficient natural rubber industry. But apart from the physical interchangeability of crude and synthetic rubber for many general purposes, there is a growing field for synthetic rubber for special purposes. There is room for both.

Business Notes

Money Conference Opens

The international monetary conference at Bretton Woods is due to be formally opened on July 1st. Many of the delegations are led by the Finance Ministers of the countries represented. The United States has assembled a formidable team headed by Mr Morgenthau. Judged by the official ranking of its personnel the British delegation is, perhaps, the humblest in the list. Yet some American newspaper comment on the conference has already assumed that the British representatives will get the better of their American colleagues. The conference opens with none too good a send-off from the nations represented. The echoes of the grudging acceptance of the monetary fund scheme in the recent Parliamentary debates have no doubt followed the British delegation across the Atlantic. An interesting counterpoise to the prevalent criticism of the scheme in Britain, namely that it would lead this country back to the shackles of gold, is provided by some comment on the monetary fund in the current Survey of the Guaranty Trust Company of New York.

The central problem in world currency stabilisation is not to hold exchange rates in line by direct control, but to remove the causes of instability. This can be done only by inducing the individual nations—and particularly the leading commercial nations—to balance their budgets, promote stability and prosperity of their internal economies, and avoid such harmful devices as competitive currency depreciation, prohibitive tariffs and trade and exchange restrictions. . . . Whether

by agreement or individually, the nations whose stability is essential to the world's economic welfare must attain that stability by the simple but perhaps arduous course of avoiding the practices that have destroyed it. No single step would go so far toward the worldwide restoration of confidence, and the removal of the inducements to unsound practices as the return of the principal nations to the gold standard as promptly as possible after the war.

The Guaranty Survey, therefore, regards the revised monetary plan as an ineffective instrument for promoting currency stability, because "stability in any country comes not from without but from within." It finds the entire plan "a case of mistaken emphasis, an attempt to operate at the level of effect, not of cause; to treat the symptoms, not the disease."

European Views

The delegations of the continental Allied countries have gone to the international monetary conference at Bretton Woods in the United States after very detailed discussions on the currency scheme in London. The scheme has on the whole met with the approval of Allied Ministers. Their chief objection has been that the total gold and currency resources of the International Fund (\$10 billion for the whole world and \$8 billion for the United Nations) and the separate quotas for each member country may not be high enough to meet sharp fluctuations in the balances

of payment of some countries in particularly difficult years; and amendments suggesting the doubling of the quotas have been formulated. The European delegates hope that an amendment to this effect may be tabled by the British delegation, in which case it will command their support. Another amendment to the scheme, suggested by Dutch financial experts, was that the countries that contribute not 10 but 25 per cent of their quota in gold should be free to draw more than a 20 per cent instalment of their quota in any one year; this amendment, however, was eventually given up. The main interest of most European delegates to Bretton Woods, however, is not so much the currency scheme itself, the acceptance of which is taken for granted, as the project for an International Investment Bank, which is expected to figure on the agenda of the conference.

Reconstruction Loans?

The proposal of the experts for an International Monetary Fund is designed to solve short-term disturbances in the balances of payment of member countries. Most European countries, however, will be confronted after the war with heavy tasks of reconstruction, for which they will need the assistance of long-term credit. Some of the Governments concerned have made approximate calculations of their need for foreign reconstruction loans. The Polish Government, for instance, has already submitted a broad investment scheme in Washington. The scheme is based on a ten-year programme of industrialisation to be carried out with the help of a loan of \$2 billion, paid in ten annual instalments at the rate of \$200 million a year. The scheme provides an interesting contrast to Poland's financial policy before the war, which was to a large extent directed towards the elimination of foreign capital from Polish industries. Whether such ambitious schemes will find a ready response in the United States remains to be seen. The prospects will, to some extent, depend on whether the proposed International Investment Bank is organised as a strictly private concern or as an agency controlled, or supervised, by the American Administration. If the Investment Bank were a private concern, some argue, then the flow of credits would probably be strongly affected by the changing moods and calculations of the creditors. Public management might possibly provide a better guarantee for a steady rate of investment; political risks are more likely to deter the private investor than the public one. In the case of Poland, the influx of foreign credit into that country in the inter-war years was a mere trickle precisely because foreign investors were frightened by the political conditions in Poland. It is obvious that Poland's prospects of attracting foreign capital after this war will depend chiefly on whether the Polish-Russian conflict can be solved in a way that will give internal stability to the new Polish Republic. It is interesting to note that, in contrast to the Poles, the Czechoslovaks do not think that their country will need much long-term credit. Czechoslovakia will probably have suffered less from direct hostilities than any other Allied country in Europe. Its manufacturing capacity may be almost intact, and Czechoslovakia has acquired some fresh capacity in recent years, not all of which will be useless when it comes to switching over from war to peace production. The Czechs are reasonably confident that they will be able to make a fresh start with their own industrial resources.

Stock Exchange Control

Full particulars are now available of the scheme, to which reference was made on April 22nd, by which it is hoped to overcome the disabilities of the present system of management of the Stock Exchange. Originally, the finance for the provision of the House was provided by a few

persons, and it is only since 1904 that ownership of at least one or three shares in the company has been a necessary qualification for membership. Thus, for historical reasons, the financial affairs of the company, administered in the interests of the proprietors, the shareholders, have been in the hands of one body, the Trustees and Managers, while a separate body, the Committee for General Purposes, has seen to the regulation of members' activities. The point has now been reached where almost all members are shareholders and *vice versa* and where there are few holdings of as much as 200 shares, the maximum permitted. Thus, the original, apparent, conflict of interest, which went so far as to make membership of either governing body a disqualification for membership of the other, has been greatly weakened, and the point has been reached where it was hoped that a complete fusion of the two might be possible. This, however, has proved too large an objective for a single bite, and the proposal to which the proprietors are invited to give their consent is one which provides for joint action, by a new body, the Council, on all matters except those which were in the past the specific concern of the trustees and managers. On those matters the Council can act only upon the recommendation, or with the previous sanction, of another new body, the Property and Finance Committee.

The Council is to consist of the nine trustees and managers, who will continue to be elected for a period of five years, and the 30—later 27—members of the Committee for General Purposes. These, instead of holding office for one year, will be elected for three, one-third of their number retiring each year. The Property and Finance Committee will consist of the nine trustees, to be called henceforth Foundation members, and three Ordinary members, elected from the 30. These three will be appointed annually by the Council. The Council will elect three of their number, of whom one at least must be a Foundation member, to act as chairman and two deputy chairmen. Even if adopted by the proprietors, the scheme may be abrogated, on stated occasions at intervals of two years, by the vote of either class of member voting separately.

Full Unification Deferred

In its present form the scheme, by providing a joint committee with a single chairman, gets over two of the great difficulties of the old régime: the inability to secure effective co-operation between the representatives of members and proprietors, and the fact that no individual could speak to external authorities in the name of the Stock Exchange. It leaves the third, the ancient obstacle that there was always danger that the interests of the proprietors would prevail over that of the members, and that, despite the fact that they had become largely the same people. The reasons for postponing the final step, which would involve buying out the proprietors, are three: uncertainty as to what the post-war constitution of the Stock Exchange will be, the extreme difficulty of valuing the shares, and the fact that more than one-third of the proprietors are absent on service. These are reasons of weight, and the decision to stop short of full merging of interests is probably justified. The Consultative Committee, representing both bodies, which compiled the scheme, states its intention to proceed to a full merger when conditions are ripe, and its belief that the experience of joint working will prove a strong incentive to completion of the merger. If that is so—and such external evidence as exists supports the belief—the adoption of the scheme, on which a vote of the proprietors is to be taken early in September, will go far to equip the Stock Exchange for the tasks of adjustment which lie ahead. Until the post-war background emerges more clearly, it is difficult to say just what line longer-term improvements should take, beyond the generalisation that they should aim at raising the status of the institution by improving the service rendered to investors. Many schemes have been drawn up in outline by members as private individuals, but most of these depend for their realisation in some degree on the complete elimination of the proprietors' rights. The decision about this further step must rest largely with the younger men who are at present in no position to give their attention to the matter.

Limited Profits

Nothing in the latest industrial profits computations, covering the first quarter of this year, lends confirmation to the idea that the tide of ordinary share dividends has turned. In general, the absorptive power of EPT and the check of moral dividend limitation are still exerting their full effect. Some dividends have been increased this year, but when they are brought within the general focus of company reports, it is clear that these few cases have attracted quite undue publicity. Once again, the latest results show merely the slightest rise in gross profits; for the 544 companies whose results are given in Table I on page 34, the average increase is less than £700 compared with the previous year. Tables II and III show that during 1943 gross profits rose by roughly 2 per cent. This is no evidence of any failing power in EPT. It amounts probably to no more than the steady adjustment of provisions for capital charges and taxation to a now established wartime norm. A final comment on the expanding dividend myth is to be found in Table V; in the last five quarters ordinary dividends have varied from 6.2 to 6.5 per cent., with 6.3 per cent in the latest quarter. Few wartime series are so dull statistically as *The Economist's* profits analyses, and it needs more than a few occasional increases in ordinary earnings and dividends to disturb their impassivity.

Rent Control

The evidence submitted to the Inter-Departmental Committee on Rent Control by the Council of the Law Society once more draws attention to some of the anomalies of the present system of rent restriction. The Council has reviewed the present position in the light of two aims.

First, if rent control is to continue, the system should be one which operates fairly and reasonably as between landlord and tenant.

Secondly, the many anomalies in the law of rent control which exist at present and which often work great hardship, sometimes upon landlords and sometimes upon tenants, should be removed.

The Council, rightly, takes the view that the freezing of rents, coupled with the marked rise in the cost of repairs—"perhaps by between 70 and 100 per cent"—operates to the disadvantage of landlords. It has therefore recommended that, where repairs are the landlord's responsibility, the present net rents of premises controlled either under the 1939 Act or earlier Acts should be increased by 20 per cent. The figure suggested can, of course, be criticised; but there can be no doubt about the need for a formula that would ensure a measure of fairness between landlord and tenant. The rent restriction acts themselves come in for strong criticism by the Council. To quote from its evidence:

The first Rent Restriction Act was passed in 1915 as an emergency measure. A series of statutes has followed which have made numerous amendments to and extensions of the law. There are now so many statutes that it is very difficult to construe the legislation accurately, as apart from reference to decided cases it is usually necessary to consider several different Acts in dealing with each problem. But even where the law is fairly clear, the fact that there is no system of registration of standard rents often makes it impossible to determine what the standard rent is because the rent books and other necessary data have been lost.

On Tuesday the Council's views about the rent restriction acts were forcibly underlined in a judgment given by Lord Justice Mackinnon in the Court of Appeal after he had once more "groped" his way "about that chaos of verbal darkness."

Houses to Let

The need for an adequate supply of houses to let is now widely recognised; as Mr R. Bruce Wycherley, chairman of the Building Societies Association, pointed out in a review issued on June 22nd, "there should be, as far as possible, an adequate choice between houses for renting and houses for purchase." Hitherto the supply of houses to let has been quite inadequate; the absence of choice has not only compelled many persons to buy a house against their intention, but the prospect of a capital loss on re-sale has also tended to impede the geographical mobility of families which is essential to a progressive and flexible economy. For persons in the lowest income categories, a

substantial volume of construction by local authorities should gradually provide a greater margin of choice; the problem will also be mitigated by the Government's decision to retain the ownership of the large numbers of temporary houses that are to be constructed to relieve the housing shortage. But there remains a large field of construction to be carried out by private enterprise. Mr Wycherley stated that the building societies had always been prepared to advance money to owners of property for letting. He stressed the need for devising ways and means to encourage private enterprise to erect houses for letting and for creating conditions that would permit the employment of building society funds for this purpose. The devising of "ways and means" has now become a matter of urgency.

Building Society Mergers

Invitations have been sent this week to members of the Leeds Permanent Building Society and of the Woolwich Equitable Building Society for meetings to sanction the proposed merger between the two from which will emerge the British Building Society. Before waiting for the formal sanction of the scheme, negotiations have been started to attract within this group two smaller societies, the Liverpool Investment and the Dunfermline Building Society. Other absorptions are in prospect, and the new British Building Society promises to take second place in the ranking of building societies in this country. The amalgamation movement is now well under way—so well that questions were recently asked in Parliament pointing to the danger of a monopoly in this field of enterprise. The possibility of any such danger arising from recent mergers was categorically denied by the Financial Secretary to the Treasury. Mr R. Bruce Wycherley, in his review of the position, put on record the fact that the amalgamation movement owed nothing to prompting or compulsion by any Government department or the Bank of England. It would be wholly foreign to British traditions if such direction had been used. It is evident, however, that the building society movement is viewed with constant interest in certain Government departments and at the Bank of England; that in the early days of the war this interest became tinged with a certain concern; that the authorities in Whitehall and the City appreciate the need for a general tightening up of building society practice, especially for ensuring that all societies adhere to standards of liquidity maintained by the best. In so far as the amalgamation movement helps to serve these objectives, it may be said to have the fullest sympathy of the authorities.

War Damage Repairs

The publication of the War Damage Commission's explanatory pamphlet on the procedure in arranging for the repair of war damage marks a turning point in the work of that body. The Commission was brought into existence in 1941 and faced the task of dealing with well over 2,000,000 buildings in the country which had up to then suffered war damage. The primary demand at that time was that they should deal with these great arrears of work with the greatest possible speed, and the Commission was left with no option but to make the best of the situation. Its ambition was to adapt its procedure as far as possible to that of a normal building contract—that is, to inspect the damage before it was repaired, to agree on the

extent and cost of the works to be done, and, in cases where the "cost plus" procedure was inevitable, to state what it was prepared to pay. This proved impossible, for the magnitude of the problem did not permit the Commission to consider and agree tenders and competitive estimates before the work was put in hand; this had serious disadvantages—sometimes to the claimant, sometimes to the builder, and sometimes to the Commission. With the agreement of the National Federation of Building Trades Employers, the Commission has now evolved a policy which is the result of three years' experience, discussion and deliberation. Briefly summarised, it is that facilities are being provided for prior consultation on the extent of works to be undertaken in all cases of genuine doubt. For the first time the Commission is able to offer that where the cost is likely to exceed £250, the claimant can arrange with it the terms of payment. Lastly, the Commission has made clear its views on the proper charges in prime cost cases. While hoping that the bulk of the larger works will be done on the competitive tender or fixed fee basis, it is realised that practically all the smaller jobs and some of the large ones will still be undertaken on the method of prime cost plus a percentage. The Commission has therefore defined both the "cost" and the "plus" in the fullest possible detail. In this way it has provided a "yardstick" which, with the facilities for prior consultation, should go far to eliminate much of the doubt and difficulty which has arisen in the past. It is hoped to have the new system fully working by next August.

Status of Statisticians

The Royal Statistical Society, quite properly, is concerned with the need for ensuring an adequate supply of qualified statisticians to meet a growing demand for them in industry and trade. A committee appointed in July, 1943, "to consider what measures are desirable to improve and to regularise the professional and scientific status of persons engaged partly or wholly in statistical work," and to draft proposals, found the present and prospective position unsatisfactory. In the main the committee's criticism is directed against the lack of a common standard of qualification which is unsatisfactory to the employer who has to engage a statistician, and against the lack of a recognised status for the profession which is unsatisfactory to the employee. In the committee's view there is a "strong case for instituting some method of determining the professional status of statisticians." While admitting that the Universities must continue to be the main source of training in statistics, the committee is of the opinion that existing examinations are not sufficient to provide all the requisite professional qualifications, and that a new system similar to those obtaining in other professions seems to be needed. It therefore suggests that provision should be made for two grades, one of which should be below that of a University degree. Successful candidates would receive a diploma for the high proficiency task and a certificate for the lower one. In the committee's view, the Royal Statistical Society might appropriately undertake the task of operating such a scheme. The Royal Statistical Society's initiative in devising means for raising the quality of statisticians is timely; but whatever means it ultimately devises, the desire for status should not become an excuse for the adoption of restrictive practices.

British Overseas Bank

Arrangements have been made for transferring the current banking business of the British Overseas Bank and of the Anglo-International Bank to Messrs Glyn Mills and Company, and their frozen assets to the Continental Assets Realisation Trust. This marks the last chapter of ventures launched with great hopes immediately after the last war. The BOB, established in 1919, was meant to restore British banking connections with Eastern Europe. At first it centred its activities in Poland, where, in collaboration with local interests, it formed the Anglo-Polish Bank. Later its activities extended to the Baltic States, Germany, Hungary and the Balkans. Everywhere it was dogged by political instability and ultimately by financial difficulties that culminated in moratoria and standstill agreements. In 1939 the position of the bank had become sufficiently critical to call for the intervention of a guarantee syndicate formed under high auspices. The syndicate, in order to safeguard

depositors, provided a deferred deposit of £2,000,000 which ranked after all other deposits. With this backing it was hoped that the bank might survive the war. This hope was reflected in the valuation of its £1 shares. A week ago they were quoted as high as 30s.; now they are a nominal 10s. The guarantors may, however, have taken a less optimistic view of post-war political development in Eastern Europe. Another factor was that what remained of the current banking business of the bank became too small to cover overhead costs, even though these had been drastically cut. A deficit in the trading income could ultimately only be met by drafts on the guarantee fund, and, presumably, the deferred depositors in question objected to such use of their funds, though no doubt the small subsidy involved would have been readily granted had the post-war prospects been more reassuring than they would seem to be in the view of the guarantors. The current business is, therefore, being transferred to Glyn Mills. In order to hand over assets equivalent to the transferred deposit liabilities a draft of £300,000 on the deferred deposit has been required. This debt remains as a claim ranking ahead of the shareholders' interest.

Continental Assets Realisation Trust

The frozen assets on the Continent of Europe, which have a book value of about £2,000,000, have been transferred to the Continental Assets Realisation Trust, which undertakes the direction and management of the BOB for a "reasonable annual fee plus 5 per cent on realisation of frozen assets." As these assets are liquidated, the proceeds will be applied, after prior charges have been met, in distributions to the shareholders of the BOB by way of repayment of capital. The Continental Assets Realisation Trust was first heard of in 1939, when it took over the standstill claims of the London Merchant Bank, whose current business was at the same time transferred to Messrs Guinness, Mahon and Company. The trust is served by experts who, during the war, have had opportunities of keeping as close touch as is possible with developments in enemy and enemy-occupied countries. There may be a good case at a later stage for entrusting it with the task of sorting and salvaging the considerable volume of standstill claims and other frozen European assets which is to be found on the books of many London banks.

Anglo-International Bank

The arrangements made for the transfer of the current banking business and frozen assets of the Anglo-International Bank are a logical accompaniment of the British Overseas Bank arrangements because the BOB has managed the Anglo-International since January 1, 1941. They follow closely the pattern of those made by the BOB. The banking business of the Anglo-International is now negligible. Assets amounting to £50,000 in cash and gilt-edged securities have been set aside to provide for contingencies. The frozen assets, practically all of them in enemy territory, have a book value of £760,000. The Anglo-International Bank was formed in 1926 to take over the business of the Anglo-Austrian Bank and of the British Trade Corporation. Its Budapest branch was taken over by the British and Hungarian Bank in March, 1939, and a year later the two Rumanian branches were absorbed by the Banque de Credit Roumain. The process of liquidation of the business of the bank had thus made considerable progress before the final moves announced this week. In February, 1943, the paid-up capital was reduced from £1,960,008 to £1,470,000 by returning 5s. per share to holders of 1,960,008 shares of £1. Further returns of capital will take place as and when frozen assets are liquidated. Although these two parallel operations must be judged purely as business propositions, dictated by the unfavourable current trading position of the two banks concerned, it is difficult to avoid interpreting them as a gesture of abdication by British banking from Eastern Europe. Coming at this particular stage of the war, it is a development which will not be altogether welcome to Britain's friends in that part of the Continent.

The "Turn of June"

The incidence of the calendar should have made it possible for the money market to shift a great deal of the seasonal end-of-June pressure on the Treasury. The whole

Back to the battle for markets!

In the kind of world that will exist when the 'Cease Fire' sounds there will be no place for the old, narrow, economic rivalries. We believe that the success of lease-lend has proved the principle of industrial collaboration to be a working formula not only for victory but for a just and durable peace.

We, in this Company, feel convinced that the same principle, carried over into post-war reconstruction, will not only furnish ample scope for private enterprise but will help to build that stable and confident kind of world in which enterprise can thrive.

In the interests of all, including ourselves, we therefore invite support for this principle from industrialists and business men on both sides of the Atlantic who believe with us in International Industrial Collaboration for Peace.

THE MOND NICKEL COMPANY LIMITED

Never again

OF COURSE you remember, in those far-off days before the war, the glare and dazzle of on-coming car headlights. You also remember the way you closed your eyes, kept the wheel as steady as you could, and hoped for the best.

All that is over. When this war is finished, head-light glare will be a thing of the past. Polaroid will allow you to stare into approaching headlights as the eagle is said to stare unblinking into the mid-day sun.

Polaroid has made other miracles possible — for example, the projection of three-dimensional cinema pictures in full colour, anti-glare sun glasses, non-glare reading lamps and a multiplicity of optical instruments.

Polaroid is made possible by the use of iodine. It is but one instance in a great field of development. New uses for iodine are constantly being found in medicine, agriculture and industry. So many new facts have been brought to light in the last hundred years that it has been necessary to set up an organisation to disseminate this knowledge. This organisation is the IODINE EDUCATIONAL BUREAU. It was formed in 1938. The services of this Bureau are available free to any industrial or commercial undertaking with an iodine problem.

ISSUED BY GODFREY PHILLIPS LIMITED · 1844-1944

of the week's Treasury bill maturities fell in June, and in theory the market could have concentrated its payments for the bills issued this week on Saturday, July 1st. For some time past, however, the discount market syndicate has, with official encouragement, spread its applications for Treasury bills fairly evenly over the week as a whole, so as to help the even flow of Exchequer receipts. The banks had no payments to make against Treasury deposit receipts this week, but neither did they have any maturities. The market had to take up the fair allotment of 35 per cent of its quota application for the £110 million of this week's Treasury bills. At no time have conditions in the short-loan market been stringent. The banks did not buy bills until towards the end of the week, when preparations for the June 30th balance sheets had been completed. But at all times there has been an adequate supply of short loans, though most of the additional money placed at the disposal of the market in the earlier part of the week was "bad" money which the borrowers knew would be recalled on the final day of the year. The market has been preparing for the ordeal of that final day of June by selling bills to the official agents throughout the week. July and August bills have been sold through this channel. The official help has been given direct to the market and does not appear to have come through the clearing banks. The magnitude of these official operations over the first half of the week is revealed by the Bank return, which shows a rise of £33,205,000 in the holding of Government securities and of £10,499,000 in other securities. By last Wednesday the total of bankers' deposits had risen to £217,732,000, or £37,796,000 higher than on the previous Wednesday and the inflation of bank cash connected with the half-yearly window-dressing was thus proceeding at a good pace.

Cable and Wireless

The full accounts for 1943 of Cable and Wireless, the operating company show a rise of some £158,000 in receipts from messages and wayleaves to £9,924,844. Payments to oversea governments, working expenses and maintenance charges are, however, all higher on the year, and the net receipts, up to this point, show a fall from £4,729,466 to £4,544,757. Total payments to the Inland Revenue and the Treasury have risen from £2,100,000 to £2,240,000, and, despite falls in most other charges, the net revenue is some £50,000 lower at £1,228,892, of which £1,200,000 is required to maintain the dividend at 4 per cent. This means that the main income of the Holding company is unchanged, but it has suffered a small decline in miscellaneous receipts on outside investments. Its dividends, too, remain unchanged. The balance-sheets of the two companies show considerable changes, but these are largely associated with EPT adjustments, and the consolidated statement shows few alterations beyond a growth in gross liquid assets from £32,025,588 to £36,007,211 and an increase in the net amount from £16,748,362 to £17,572,324. Debtors include an amount of £8,325,000 due to the Inland Revenue and the Treasury, and of this £8,250,000 is the liability of the operating company. Some £7,500,000 represents taxation. Holdings of the group in gilt-edged and other marketable securities are included at £19,729,000 odd or very slightly above their market value. The group has, thus, much liquid capital to meet any post-war demands. Further, despite many difficul-

ties, it appears that the stations of the group have been considerably expanded during the war period. Much of this expansion must have been very expensive, but the accounts give no indication of its cost. It seems possible that some of the developments may have been subject to special arrangements with the authorities, but, if this is so, there is no hint of it in the published material.

A New Problem?

One matter which may be of very considerable importance to shareholders and others is, however, raised by Sir Edward Wilshaw in his address to the annual meeting of the operating company. This concerns the possible outcome of the Commonwealth Telegraph Conference, held in Australia towards the end of 1942. At that meeting the constitution of the Imperial Communications Advisory Committee was altered and its name changed to the Commonwealth Communications Council. The new body met in London in April and is to meet again in October. Cable and Wireless were called upon to give evidence in April, but have received no intimation about the results of the meeting. Sir Edward is not prepared, at this juncture, to make any definite statement about the position; but he evidently feels that his group, constituted by Charter as a result of the Imperial Cable and Wireless Conference of 1928, is entitled to be informed of any development of policy within the Empire. He points out that the company's duties include

the whole cost of the maintenance and development of wireless both here and throughout the Colonies, of the whole of the Empire's cable communications and of both to many foreign countries. But, he said, as I have indicated, the Company is in turn dependent on continued support for the Empire policy which it exists to implement, and if that support is withdrawn and the financial resources on which it relies are diverted into other hands, then not only Empire communications as a whole but in time many other Empire interests may suffer disastrously.

The broad outline of the inferences to be drawn from this statement seems plain. Among other things it seems that, under war conditions, a proportion of traffic for the antipodes, normally handled by the company, has been routed via New York. It remains to be seen how far this position can be remedied after the war. Stockholders will doubtless be grateful for the warning. At present, however, no information exists which would form the basis of a reasoned judgment. The price of the ordinary stock of the Holding company was unaffected by the statement. At 79½ ex dividend the stock yields £5 os. 4d. per cent.

Dock Labour

The preparations for the invasion involved a considerable amount of planning for the docks, some of the details of which were disclosed by Lord Ammon, chairman of the National Dock Labour Corporation, Limited, at the Corporation's annual general meeting this week. The Corporation's policy has always been to secure the quickest possible turn round of ships and to conserve an adequate labour force to meet requirements. In order to meet invasion needs, and to replace the high wastage (in the last three months some 1,500 men left the industry), the Corporation had to take on 6,000 additional men between March and June, bringing up its total labour strength to 42,435. Two-thirds of the entrants were new to the industry, and experienced dockers had to train many of these, as well as British and American troops for the work of unloading munitions in France. The invasion meant that ships were diverted to hitherto little used ports, and the busy ports became even more active. The daily average surplus of labour during the waiting period was 5,000, and on one day a peak of 9,500 was reached. Though the dock industry is traditionally turbulent, industrial discipline, in spite of minor disturbances, has been well maintained. Avoidable absenteeism is creditably low; in fact, for the whole of 1943 the average of "unaccounted absence" was only 3.7 per cent of normal days or shift turns for allocated workers. Financially, the Corporation has had a successful year and accumulated a surplus of £738,465, which enabled it to wipe out a deficit of £193,260 and retain a credit balance of £545,205. This was largely due to the high revenue from percentage payments (from April 29th these

(Continued on page 31)

COMPANY MEETINGS

BURMAH OIL COMPANY, LIMITED

GOOD RESULTS FROM PARTIAL OPERATIONS

DIVIDEND OF 12½ PER CENT.

MR. ROBERT L. WATSON'S STATEMENT

The forty-second annual general meeting of the Burmah Oil Company, Limited, was held, on Friday, 23rd ultimo, at Glasgow.

Mr Robert L. Watson, chairman and managing director, presided.

The following statement by the chairman was circulated with the directors' report and accounts:—

For reasons well known, those of our wholly-owned subsidiary companies which were concerned with production, pipeline transport, and refining in Burma did not operate in 1943. The balance of trading profit of £1,862,893 brought into profit and loss account is the yield from marketing and shipping operations of our two wholly-owned trading subsidiaries and of our tanker company respectively. It compares with £3,444,389 contributed to the profit and loss account in 1942 by all the wholly-owned subsidiary operating companies, and although the tonnage of 1943 sales was somewhat greater than that of 1942, this drop of £1,581,496 in profit is a sufficiently close indication of the effect of the loss of our Burmah production on our trading results. The increase in dividends and interest, welcome and substantial though it has been, makes good only £377,122 of this decline.

Fortunately, however, that is not the whole story. In 1942 we had to provide a net amount of £2,523,755 for taxation, whereas, largely because of these lower trading results, the net provision required for 1943, at £1,744,015, is £779,740 less.

DISTRIBUTABLE BALANCE STILL SUBSTANTIAL

Thus, between increased income from investments, the larger amount brought forward from 1942, and the reduced provision required for taxation, the amount available for disposal, as dividend or otherwise, is, at £2,565,169, only £338,429 down on the 1942 figure. Your board have allocated £100,000 of this disposable balance to general reserve, bringing this reserve up to £2,550,000 and have declared a second interim dividend of 10 per cent. less tax at 7s. 5d. in the £ on the ordinary stock which they recommend should be the final, making the total dividend for the year 12½ per cent., less that rate of tax. This absorbs £1,717,064 and requires a payment of £74,673 to the companies' provident funds, leaving a balance of £373,432, or £38,398 greater than the amount brought forward from 1942, which it is recommended should be carried forward.

ADVANCE PROVISION FOR TAXATION

We believe full provision has been made for all taxation, including that involved in 1943 profits. There may be something freed from this but, since EPT standards have not yet been agreed, no credit in respect of it has been taken in these accounts.

With supplies and demand so dependent as they are to-day on the fortunes and requirements of war, and therefore so much out of commercial control, it is perhaps unwise to hazard any guess at all at prospects for the current year. Given the conditions which have ruled up to date, results should not, however, be inferior to those now before you.

GRAND ALL-ROUND SERVICE

Knowing that this would be your wish I record here our appreciation of the part played by our employees and by those of Burmah-Shell in securing these results. In India, especially, these men's activities are far from confined to their peacetime duties. In many directions there, they and their companies' organisations have performed, and continue to perform unusual

services of particular value in to-day's conditions. Then, too, our subsidiary companies, the Assam Oil Co., Ltd., and the Tinplate Co. of India, Ltd. (the latter a creation of ours in conjunction with the Tata Iron and Steel Co., Ltd., after the last war and in which we hold the majority interest) have, because of the situation of their operations, been of a value in these times out of all relation to the tonnages of produce they dispose of, and have responded most creditably to the unusual calls they have been required to meet. Nor must we forget both congratulations and thanks to officers, engineers, and crews of our tankers who have kept their ships safely afloat faithfully performing their war-time duties. And, lastly, I would like to record our appreciation of the Anglo-Iranian Oil Co., Ltd.'s and the Shell Transport and Trading Co., Ltd.'s contributions to our investment income and of the useful parts the former company continues to find for a great many of our men from Burmah to play—in Iran—in the great war effort which that company is contributing.

It is with great regret, and the expression to their relatives of our very sincere sympathy, that I have to report two further fatal casualties, since our meeting last year, among our men on military service—Major J. H. L. Brownrigg and Captain D. Robinson, who were promising members of our Eastern staff. Further military honours have been gained in this period and Mr. B. J. Ellis, of our home engineering staff, has received an O.B.E. (Civil) for valuable services rendered at the Petroleum Division, to which he was loaned at the beginning of the war.

POST-WAR PLANS READY

I can once again say no more as to our return to Burmah than that our plans will be ready for application just as soon as conditions make this possible. Our claim for losses suffered by "denial" of our properties to the enemy cannot be finalised until we are in a position to determine what, if anything, can be salvaged and what the cost of rehabilitation will be.

The report and accounts were unanimously adopted.

The second interim dividend of 10 per cent. (2s. per £1 unit) paid on June 16, 1944, was confirmed as the final dividend on the ordinary stock for the year 1943.

Sir Louis J. Kershaw, K.C.S.I., C.I.E., and Mr. W. A. Gray, the directors retiring by rotation, were unanimously re-elected, and the auditors, Messrs. Brown, Fleming and Murray, were reappointed for the current year.

BRITISH ELECTRIC TRACTION COMPANY, LIMITED

DIVIDEND MAINTAINED

The forty-eighth ordinary general meeting of The British Electric Traction Company, Limited, was held on the 23rd ultimo in London.

Mr. Richard J. Howley, C.B.E. (the chairman) said that their gross revenue for the year amounted to £767,962, an increase of £7,669 over the previous year. Practically the whole of that was represented by the increased revenue from investments. The expenses showed little change and the sum remaining for appropriation was £316,441, compared with £309,915. The directors recommended the payment of the same dividends as for the previous years, leaving £56,961 to be added to undivided profits account.

The B.E.T. group of omnibus companies now owned some 8,500 omnibuses operating throughout the provinces and in addition to the normal public services, provided special transport services for many thousands of war-workers.

Their electricity supply companies continued to develop and important war-time contracts were being carried out. As in 1914-18, the importance of electricity for industrial purposes was again being emphasised in this war.

There seemed to be growing among the public a better appreciation of the dangers to the community of rushing into experiments in public ownership. That was especially appropriate in the case of road passenger transport, which was shown to be operated with great skill and consideration for the public convenience. One of the dangers of the future was the tendency to more and more uniformity in the ordering of our daily lives. In the past we had thrived on the rewards of individual enterprise and effort.

The report was adopted.

CABLE AND WIRELESS, LIMITED

(THE OPERATING COMPANY)

RECORD TRAFFIC RECEIPTS

Record traffic receipts of £9,420,000 and additional other income of more than £140,000 enabled Sir Edward Wilshaw, chairman, to announce at the annual meeting of Cable and Wireless Ltd., on the 29th ultimo, that for the first time the company's gross receipts had risen above the £10,000,000 mark. But profit was down by £50,000 owing to expenses having risen and to increased provision for E.P.T. by £100,000 to £2,000,000. He estimated that at the end of 1943 some £7,500,000 was payable for taxation, while tax reserve certificates (including £800,000 acquired since the end of the year) totalled £6,250,000. By the end of 1943 the company had in addition £11,000,000 in British Government and other securities.

Sir Edward commented that they must not cavil at high taxation; if the cost of the war were not found in this way it would have to be found in others which might impose greater burdens.

Development policy had been followed mainly in directions which might help the war effort. Costly wireless relay stations had been created to overcome "fading" difficulties; funds had been created for establishing facsimile picture transmission and telephony throughout the system; similar provision had been made for cable development.

Sir Edward attacked the "popular misconception" that cables and wireless were rivals, adding that experience since the 1929 merger had shown that they were complementary to each other, giving strength and flexibility under unified control.

Continued Empire support was essential; the company could not continue responsibility for carrying the main burden of maintaining Empire communications if Empire support were withdrawn and financial resources diverted into other hands—a disastrous policy. Yet the company had not been taken into the confidence of the Commonwealth Communications Council but had been asked only to give evidence; it had not yet been officially informed of any report or recommendations. Sir Edward announced that funds had been set aside for considerable developments throughout the Colonial Empire.

Planning ahead had been necessary to maintain communications with Advanced Army H.Q. on the various fronts. Several women operators had already gone overseas in the new uniformed Telcom organisation. The Minister of Information had accepted Sir Edward's offer to carry free of charge during the war all pictures sent to or from the Ministry.

The report was adopted.

HAWKER SIDDELEY AIRCRAFT COMPANY, LIMITED

FURTHER DEVELOPMENTS

The eighth ordinary general meeting of the Hawker Siddeley Aircraft Company, Limited, was held, on the 29th ultimo, in London, Mr Thomas O. M. Sopwith, C.B.E., F.R.Ae.S., the chairman, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts: The profits of the operating companies have been brought into the accounts to an extent sufficient to pay the same dividend as last year. We can again say that adequate provisions have been made in the accounts of the operating companies for their excess profits tax and other taxation liabilities; for their appropriate proportions of war damage contributions, and for such other purposes as their directors have considered necessary, including reserves for deferred repairs and other contingencies. Interim dividends of 15 per cent., less tax, and 17½ per cent., less tax, have already been paid, making a total for the year of 32½ per cent., less tax, the same as last year.

HIGH STANDARD OF PRODUCTS

The products of the operating companies maintain, both quantitatively and qualitatively, the same high standard of the past. There are new names—the Albemarle, a glider-towing freighter type which was in operation during the landing in Sicily, and, more recently, the invasion of Europe; the Tempest, the latest R.A.F. fighter, which in every way reflects the same superiority over other types as did the Hurricane and Typhoon. The York, to which I made passing reference last year, is now in quantity production and has proved beyond doubt one of the most reliable transport types for all purposes. I look forward with confidence to the début of the York and its sister types on the more important commercial routes under post-war conditions.

There is a further important development to which I can make reference in general terms. The arrival of the jet-propelled aircraft owes much to the pioneer work carried out by one of your operating companies. I regard this as a most important development, and whilst I do not expect spectacular changes, I forecast steady and consistent progress. These projects are only part of the development work in hand.

FUTURE OF AVIATION

I indicated last year my belief in the future of aviation. Nothing has occurred to alter those views; on the contrary, my conviction is stronger than ever. The necessity for the maintenance of a strong air force, the scope for transport and civil flying, and the need for the British Commonwealth equipment to be at least technically equal to any other, is more apparent than ever. With the experience engendered by war conditions over such a vast and varied extent, the Hawker Siddeley group is in a position to take advantage of any opportunity which occurs. Your Board have no present intention of embarking upon any venture detrimental to their established peacetime activities or of entering competitive markets with already well-established industries. They incline to the view that the wisest post-war policy will be still further to stabilise their interests in the aircraft and automobile industries, both at home and abroad.

You will have seen a reference by the Minister of Production to the total number of military aircraft delivered up to the end of December, 1943, by the aircraft industry of this country. Of this total—90,000—no less than 27 per cent. was produced by the companies in the Hawker Siddeley Group. This is a remarkable achievement and one of which all concerned can be justly proud. The report was unanimously adopted.

KONONGO GOLD MINES, LIMITED

The tenth ordinary general meeting of Konongo Gold Mines, Limited, was held, on the 28th ultimo, in London.

Mr Robert Annan, M.Inst.M.M. (the chairman), presided.

The following is an extract from the chairman's statement, which was circulated with the report and accounts for the year ended 30th September, 1943:—

As a result of lower tonnage and of a somewhat lower yield, the proceeds of bullion and the consequent charges for export tax and realisation expenses are all reduced.

A new item is the company's contribution to the cost of maintenance of mines closed down under the concentration scheme. The cost to this company for a full year is estimated at £15,000, and current expenditure is within this amount.

Your directors recommend the payment of a dividend at the same rate as the previous year, which would leave £12,958 to be carried forward as compared with £8,840 last year.

Development was still further curtailed and is now considerably below the amount necessary to maintain the ore reserve under normal operating conditions. This deficiency will have to be made good at a later date.

Total ore reserves at 362,948 tons averaging 12.06 dwt. per ton show a decrease of 38,727 tons, of which approximately 30,000 tons is the decrease in unbroken reserves underground.

Tonnage treated fell by 8,183 tons to 122,435 tons and gold output by 7,598 ounces to 45,915 ounces.

Costs, excluding development, increased by 1s. 11d. to 29s. 8d. per ton, due mainly to the higher cost of all stores, particularly Diesel oil.

The report and accounts were adopted.

LONDON ELECTRIC WIRE COMPANY, AND SMITH'S, LIMITED

The annual general meeting of this Company was held on the 22nd ultimo in London.

Mr W. J. Terry (chairman and managing director) said that the credit balance of the profit and loss account, at £97,491, was lower than last year by £2,867. The home sales had been slightly lower during 1943, but output was maintained at a high level. The export sales were still further reduced for reasons quite beyond their control. Every effort had been and would be made to maintain their overseas connexions.

The immediate future required them to continue to produce to the utmost possible extent the essential supplies for the Forces. Post-war conditions would provide many problems. It was likely that, after a short pause, there would be great demands for the products of the electrical industry. The future would demand the highest standard of efficiency from both managements and employees alike. It was essential, too, that reasonable prices should be obtained for the products of industry, so that conditions might be progressively improved.

The fixing of selling prices to-day was causing considerable difficulty owing to the attitude of some Government Departments who were still pursuing a policy of elaborate cost investigation which at times almost amounted to an inquisition, thus placing a further strain upon depleted and over-worked staffs. Surely an adequate and equitable method for the fixing of selling prices was to base them on materials, labour and reasonable establishment charges, plus a reasonable profit on cost of turnover, when E.P.T. would afford a sufficient safeguard. Relaxation of war restrictions and controls at the earliest possible moment was highly desirable. Future prospects would be largely affected by legislation yet to be enacted and by agreements with our Allies. The report was adopted.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

RECORD HARVEST

The annual general meeting of this Company was held, on the 29th ultimo, in London, Sir Harry Goschen, Bt., K.B.E. (the chairman), presiding. In the course of his review, percolated with the accounts, the chairman stated that during the past year they had granted further long-term loans of £199,628, bringing the aggregate sum advanced since the Corporation commenced business to £14,492,712 secured on first mortgage of 972,914 acres of agricultural land which had been valued at £22,697,109. Further loans totalling £116,281 had been approved by the directors. The aggregate of improvement loans completed up to March 31, 1944, was £132,547, repayable by means of rent charges under the Absolute Order of the Minister of Agriculture and Fisheries, and of £9,576 per annum secured as first charges on properties of an estimated rental value of £71,728 per annum. Once again special repayments had largely exceeded new loans granted, and the total of loans outstanding was £532,000 lower.

The farming year of 1943 had given Britain probably the greatest harvest in her history. Nearly 17 million acres were under arable cultivation, an increase of more than 45 per cent. over 1939, and bumper crops of wheat, potatoes and sugar beet were harvested. The wartime annual increase in food production was fully maintained and British farmers had produced a million tons more bread-corn and a quarter of a million tons more potatoes than in 1942. A high acreage of oats was maintained and yields were up to average. Dairy farmers had surpassed all previous records in the production of liquid milk, maintaining a larger population of dairy stock than in any previous year in spite of a reduction of over 6,000,000 acres of grassland. The report was adopted.

EASTWOOD'S CEMENT GROUP

POST-WAR RECONSTRUCTION

The ordinary general meetings of Eastwoods Cement, Ltd., Eastwoods Lewes Cement, Ltd., and Eastwoods Humber Cement, Ltd., were held, on the 28th ultimo, in London.

Mr E. S. Shrapnell-Smith, C.B.E. (the chairman), in the course of his speech, said: Despite the difficulties which beset us the ultimate demand for cement will be so great as to extend the industry to its fullest capacity. There will be, however, an intermediate stage when all industries will be striving to obtain priorities for steel and essential materials for reconditioning and extensions, in respect of which our Group has prepared its schemes to maintain and enhance its contribution to the national services.

The word "prefabrication" is being used to exemplify the interim solution in the shortest possible time of all the housing and construction problems accumulated during five years of war. This programme of emergency housing for the post-war population will be embarked upon at the cost of expenditure of public funds which will be largely uneconomic looked at in terms of rents and rateable values. The burden should be borne by the State as a whole.

Mr G. W. A. Miller, F.C.I.S. (Managing Director), in the course of his speech, said: The problem of emergency housing is too wide and too deep to permit of ready solution in whatever material and whatever type the large-scale programme of factory-built houses to be embarked upon. Even the steel houses will require good solid concrete foundations and services on site, all of which will require large quantities of cement.

The reports were adopted and dividends on the ordinary shares of each company at the rate of 7½ per cent. were confirmed.

(Continued from page 28)

have been 10 per cent of wages of allocated workers and 6½ per cent of weekly workers, compared with 20 per cent and 15 per cent before January, 1944) and to low expenditure on attendance money. The National Dock Labour Corporation came into existence as an emergency wartime measure, but its success is leading to the conclusion that it should be maintained after the war. Casual labour has always been the curse of the dock industry, and the guaranteed week's wages have undoubtedly been beneficial to dockers, even if they have sometimes resented the discipline or the transfers to other ports. The Corporation, however, is right to stress the importance of a planned return to industry of ex-dockers now in other industries (about 8,000) or in the Forces (about 8,000) and to ensure that the labour supply is not swollen beyond the industry's employment capacity.

Shorter Note

As was expected, the representations of the chairmen of the main line railways as to the need for a revision of the 1941 agreement have met with a refusal. The chairmen approached Lord Leathers as a result of meetings of the proprietors, who urged that the entry of Japan into the war, and the consequent extension of operations, had increased the user of the lines to an extent not in contemplation in 1941. The reply of the Ministry, given by Mr Noel-Baker in the House on Wednesday, was that this did not constitute a ground for revising the agreement.

Stockholders were, however, given one crumb of comfort in that Lord Leathers promised to look into the question whether conditions justified the granting of special allowances for abnormal wear and tear beyond the provisions of the agreement. With that the stockholders will, presumably, have to rest content.

† After charging one year's preference dividend. Payments were six month's in 1942 and 1943 and 18 months' in 1944. The amount earned on the ordinary in 1943-44 was rather less than 3.7 per cent.

The £1 5½ per cent preference shares at 22s. yield about 45.7. 10d. per cent. The £1 ordinary stand at 11s. 3d.

FINANCE AND BANKING

THE MONEY MARKET.—The position in the money market

prior to the turn of the half-year is discussed in a note on page 23. The Bank return, apart from the movements referred to in that note, shows an expansion of £2,152,000 in the note circulation. In recent weeks the rise in the circulation has fallen behind the comparable movement last year; although the reserve of unissued notes, at £19,375,000, is small, it may be possible to avoid a further increase in the fiduciary issue for some weeks. The movement of troops to the Continent is probably exerting an important influence on the circulation.

MONEY RATES, LONDON.—The following rates remained unchanged between June 22nd and June 29th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, ½%. Discount deposit at call, ½%; at notice, ¾%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between June 22nd and June 29th (Figures in brackets are par of exchange).

United States. \$ (4.86½) 4.02½-03½; mail transfers 4.02½-03½. **Canada.** \$ (4.86½) 4.43-47; mail transfers 4.43-47½. **Switzerland.** Francs (25.22½) 17.30-40. **French Empire.** Francs 197½-200½. **Syria.** p. 8.81-85. **Sweden.** Krona (18.159) T.T. 16.85-95. **Dutch West Indies.** Florin (12.11) 7.58-62. **Portugal.** Escudos (110) 99.80-100.20; mail transfers 99.80-100.30. **Panama.** \$ (4.02-04); mail transfers 4.02-04½. **Brazil.** 85.64½ cr. (buying); mail transfers 83.56½. **Uruguay.** 7.6597 p. (buying).

Fixed Rates for Payment at Bank of England for Clearing Offices. Spain. Pesetas 44.00. **Turkey.** Piastres 520. **Italy.** 71.25 lire.

Market Rates.—The following rates remained unchanged between June 22nd and June 29th.

Egypt. Piastres (97½) 97½-1. **India.** Rupee (18d. per rupee) 17½-18½d. **Belgian Congo.** Francs 176½-1. **China.** National 35-3½. **Iran.** Rl. 128-130. **Special Accounts** are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London. Rate for payment into Argentine special account: 16.16 pesos.

Forward Rates.—Forward rates for one month have remained unchanged as follows: **United States.** ½ cent pm-par. **Canada.** ½ cent pm-par. **Switzerland.** 3 cents pm-par. **Sweden.** 3 ore pm-par.

On June 23rd applications at £99 14s. 11d. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday, and Friday of following week were accepted as to about 35 per cent. of the amount applied for, and applications at higher prices in full. Applications at £99 15s. for bills to be paid for on Saturday of following week were accepted in full. £110 million of Treasury Bills are being offered on June 30. For the week ending July 1 the banks will be asked for no Treasury deposits.

INDUSTRY AND TRADE

United Nations Standards Committee.—A United Nations Standards Co-ordinating Committee has been established to provide a co-ordinating centre for standards in the field of communications and to develop standards for use in international trade. These will include dimensional standards as well as symbols, terms and definitions to express the properties of materials. The Committee will maintain offices in London and New York to provide the maximum possible co-ordination and unification of standards necessary for the war and immediate post-war periods. The Committee will consist of representatives of the national standards bodies organised in any of the United Nations, and it is these bodies who are responsible for promulgating the agreed standards. Approval of the scheme has already been received from Australia, Canada, South Africa and the USA, and the London office has already been opened.

Bedding and Floor-Covering Priorities.—Since June 22nd the utility furniture scheme has covered the issue of priority dockets for bedding (blankets, sheets and mattresses) and floor coverings (substitute linoleum and felt base), which guarantee the supply of these articles. Only about one-quarter of the total supplies of bedding, and about half the supplies of substitute linoleum and felt base are required to meet priority dockets. The remaining supplies can be sold to the general public in the normal way.

Fur Apparel.—The quota restriction on supplies of fur apparel by registered manufacturers will be discontinued from July 1st, since it has achieved its purpose of facilitating the withdrawal from the fur trade of labour suitable for more important work. The register of Manufacturers of Fur Apparel, however, remains in being with a view to the issue of further fur apparel Directions on a different basis. The Board of Trade is engaged in discussions with the Fur Trade Delegation on the form of the future Directions, which it is hoped to make at an early date. From to-day and until further notice, registered manufacturers of fur apparel may supply, remodel or repair fur apparel without restriction. The Board of Trade will in future call for periodical returns of labour in order that a watch may be kept on the labour position of the industry. Unregistered persons who were manufacturers of fur apparel on September 1, 1941, are still restricted to supplies of £100 in any month, but applications

for licences to supply additional amounts will be considered and they may repair fur apparel without restriction.

THE ECONOMIST PROFIT FIGURES

The defects of company accounts and the complications of income-tax make it impossible to present statistics of profits in a simple, standardised form. The following definitions may assist the reader:—

(a) **Gross and Net Profits.**—Gross profits are profits before payment of standard income-tax (but after such other taxes as EPT and NDC). Net profits are profits after tax. In many cases, figures of gross profits can be calculated only by adding back what appear to be the appropriate amounts of tax to the net figures published.

(b) **Accounting Period and Reporting Period.**—Company reports are published some time after the end of the period in which the profits were earned. The figures can be grouped by the quarter in which they are published (i.e., by the reporting period) or by the quarter in which the company's financial year ends (i.e., by the accounting period).

(c) **Old Basis and New Basis.**—On the old basis the net profit consisted of preference and ordinary dividends as published, whether gross or net, plus actual allocations to free reserves. Total profit was the largest figure of the profit and loss account, excluding capital profits and transfers from reserves. The figure was struck before depreciation if that was disclosed. On the new basis no net profit figure is provided. It can be obtained by deducting from the gross the appropriate rate of tax. The gross profit is the gross total of interest and dividends plus additions to free reserves and other savings, both grossed up at the stated rate of tax.

LONDON ACTIVE SECURITY PRICES AND YIELDS

Allowance is made for net interest accrued, and for redemption for fixed interest stocks and for changes in interim dividends for ordinary stocks.

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1858)

CAPITAL (PAID UP) - £3,000,000

RESERVE FUND - £3,000,000

Branches and Agencies throughout INDIA and the EAST
AFFILIATED BANK IN INDIATHE ALLAHABAD BANK LTD., with 15 Branches & Sub-Agencies
The Bank offers a complete Banking Service and provides
exceptional facilities for financing every description of trade with
the East.Deposits for Fixed Periods or repayable at call or at short notice
are received at rates which may be ascertained on application.
The bank also undertakes Trusteeships and Executorships.

Head Office: 38, BISHOPSGATE, LONDON, E.C.2

West End Branch:

25, CHARLES II STREET, HAYMARKET, S.W.1

Manchester Branch: 52, MOSLEY STREET

New York Agency: 65, BROADWAY, NEW YORK CITY

NATIONAL BANK OF INDIA LIMITED

Bankers to the Government in Kenya Colony and Uganda.

Head Office: 26 BISHOPSGATE, LONDON, E.C.2.

BRANCHES:

SUBSCRIBED CAPITAL ... £4,000,000

PAID-UP CAPITAL ... £2,000,000

RESERVE FUND ... £2,200,000

The Bank conducts every description of Eastern Banking business.
Trusteeships and Executorships also undertaken.

THE ENGLISH, SCOTTISH & AUSTRALIAN BANK, LTD.

Head Office: 5 Gracechurch Street, E.C.3

Subscribed Capital	£5,000,000
Paid-up Capital	3,000,000
Further Liability of Proprietors	2,000,000
Reserve Fund	1,785,000
Currency Reserve	1,585,000

Chief Office in Australia:

Collins Street, Melbourne

and many Branches and Agencies throughout Australia.

With its widespread connections, this Bank offers every facility
for the conduct of all classes of Banking and Exchange business
with Australia.

J. A. CLEZY, London Manager and Secretary.

REFUGE ASSURANCE COMPANY LTD.

Chief Office: OXFORD STREET, MANCHESTER, 1

ANNUAL INCOME EXCEEDS - £14,500,000

ASSETS EXCEED - £35,000,000

CLAIMS PAID EXCEED - £155,000,000

(1943 Accounts)

UNIVERSITY OF LONDON.—The Senate invite applications
(1) for the University Chair of Economic History tenable
at the London School of Economics and (2) for the Cassel Chair
of Economics (with special reference to Banking and currency),
tenable at the London School of Economics. Salary not less than
£1,250 a year in each case. Applications for the Chair of Economic
History must be received not later than July 17, 1944, and for
the Cassel Chair not later than August 14, 1944, by the Academic
Registrar, University of London, Richmond College, Richmond,
Surrey, from whom further particulars should be obtained.

B. Sc. (ECON.). Statistician seeks suitable post. Box 17, THE ECONOMIST,
Brettenham House, Lancaster Place, London, W.C.2.

THE HONGKONG AND SHANGHAI BANKING CORPORATION

CAPITAL ISSUED AND FULLY PAID UP \$20,000,000

RESERVE FUNDS STERLING - £7,125,000

RESERVE LIABILITY OF MEMBERS - \$20,000,000

Head Office (temporarily),

9, GRACECHURCH STREET, LONDON, E.C.3.

Chief Manager: A. MORSE, C.B.E.

BRANCHES AND AGENCIES THROUGHOUT INDIA AND
THE FAR EAST, Etc.

HONGKONG & SHANGHAI BANK (TRUSTEE) LIMITED,

9, Gracechurch Street, E.C.3, a company incorporated in England and
an affiliate of The Hongkong and Shanghai Banking Corporation, is
prepared to act as Executor and Trustee in approved cases.

Full particulars may be had on application.

COMMONWEALTH BANK OF AUSTRALIA

Guaranteed by the
Australian Government.Branches and Agencies
throughout Australia.Banking and Exchange Business of every description transacted.
Bankers to the Government of the Commonwealth of Australia, the

The Low Countries

ALL along the seaward frontiers of Holland and
Belgium the Germans have flooded the land. The
sand dunes are mined. The Belgian frontier has been
closed. Daily propaganda reminds the peoples of the Low
Countries of the "horrors" inflicted by the Allies on
Normandy. The Nazis expect invasion; or at least, they
say they are ready for it. Yet it is not certain that libera-
tion will come in that way. A rapid disintegration in
France would create a military situation in which sea-
borne invasion might be unnecessary. However, whether
liberation comes by sea or by land, or whether it comes
merely from a general collapse of the Nazis' power, it is
obvious that before very long, the Low Countries will be
free and the Allies will have to deal with the problems
of liberation.

In most of the countries of Europe, liberation is bound
up with very involved and inflamed political problems.
In Italy a long-established Fascist regime had to be
liquidated. In France, a collaborationist Government is
still in power and has received in the last four years a
measure of support. In some of the Balkan countries
there are rival centres of power, roughly coinciding with
the Government in exile and resisters on the spot. In
Italy, Yugoslavia and Greece, the problem of the dynasty
has yet to be solved. In all the eastern and south-eastern
states, as in France and Italy, the future constitutional
form of the state is still in doubt. Compared with these,
the Low Countries enjoy the advantage of an uncompli-

cated and almost serene political outlook. The ease with
which agreement was recently reached between the
British and American Governments and the Dutch and
Belgian Governments on the question of civil administra-
tion in the Low Countries reflects the straightforwardness
of their political and administrative situation. Of all the
countries in Europe, Holland and Belgium are likely to
cause the Allies the least political inconvenience in the
hour of liberation.

In neither of the two states did the Germans succeed
in setting up a quisling Government. The German mili-
tary governor is the supreme authority in Belgium, the
German Commissioner, Seyss-Inquart, in Holland. The
civil servants and the local authorities in both countries
have carried on, neither collaborating fully nor resisting.
In cases of open opposition, the Germans made changes,
introducing into office men picked from among the col-
laborationists; but, by and large, the administrative struc-
ture of both states has been neutral, under supreme
German control.

The scale of active collaboration is very small indeed.
The Dutch Nazis under Mussert are a discredited and
hated minority group, their ranks thinned by assassina-
tion. In Belgium, there are two collaborationist groups.
The French-speaking Walloons follow Degrelle and his
Rexist, the Flemings the *Vlaamsche National Verbond*.
Both movements are small. For example, Degrelle's efforts
to recruit a *Waffen SS* to fight beside the Germans pro-

duced barely 2,000 volunteers. Both movements are split between "moderates," who are ready only for collaboration, and Extremists—Degrelle himself among the Walloons and the organisation known as the *Deutsch-Vlämische Arbeitsgemeinschaft* among the Flemings—who preach the incorporation of Belgium in the Reich. Latterly, all the collaborationist movements have disintegrated and many of their members are more busy creating alibis for themselves than co-operating with their German masters. At no time have they secured anything like a popular hold.

On the other hand, although there has been resistance, it has not been on a scale such as would lead to the setting up inside each country of an underground Government whose authority could clash with the Governments in London. Effective mass resistance depends on the existence of two pre-conditions—mass organisations such as trade unions, co-operatives and political parties or a *maquis* from which partisan activity can be developed. In the Balkans, Poland, Northern Italy and parts of France the geographical conditions for a *maquis* exist. In the flat, densely populated plain of the Low Countries, they do not. Only in the Ardennes does geography favour resistance and here a small *maquis* has come into being.

The alternative—mass institutions—was destroyed by the German invaders. The Dutch and Belgians must not be thought less valiant than the Danes because they cannot organise a general strike. The Danes were allowed to keep their trade unions and political parties. The Low Countries lost theirs. Only two organisations retained anything like an independent institutional life—the Churches and the Universities, and it is significant that in both countries, but particularly in Holland, they have within the limits imposed by their function organised effective opposition—for example, the intransigence of both students and professors has compelled the Nazis to close the Dutch Universities.

One last reason for the uncomplicated political outlook in the Low Countries is the absence of any profound constitutional conflict. In both countries, the monarchy has survived the conflict with its authority undiminished. The House of Orange is the great symbol of Dutch resistance, and loyalty to the Queen is absolute from Right to Left. The Germans speak ruefully of "Orange-Communists." In Belgium, the position of the King seemed equivocal for a short period in 1940, but his bearing through the years of occupation, in which he has been a silent and uncompromising witness to the injustice of the German occupation, has restored his prestige. It is undoubtedly the connection of both monarchies with constitutional and democratic institutions which has spared them the crisis facing the authoritarian dynasties in Italy, Yugoslavia and Greece. Their popularity after the war will depend largely on their continued fidelity to these institutions.

The other great political pitfall avoided by Holland and Belgium is uncertainty over the future constitution of their countries. Both are committed to the model of western constitutional parliamentary democracy and no rival system of government has much appeal. The doubts raised in Belgium by the parliamentary deadlock which preceded this war have been stilled by the direct experience of totalitarianism. In both countries, freedom, however "bourgeois," is a thing of infinite attraction. Differences about political forms may come later. They are unlikely to bedevil the political situation in the hour of liberation.

The relative lack of political difficulties is amply compensated by the formidable task of economic reconstruction which awaits the returning Governments. In every sphere of economic life—industry, agriculture, finance, foreign trade, manpower—the German occupation has turned the Low Countries upside down and ruined them in the process. The basic reason is the same in each case. By forcibly incorporating the two countries into its European war economy, Germany has undermined the

foundations of their prosperity. Both Holland and Belgium were outward-looking. They traded with the western world and were in no way the economic prisoners of Europe. The process of fitting them into the German war economy has meant drastic reorganisation and drastic impoverishment. Holland's prosperous light industries, which processed raw materials from overseas, have been closed down. German concerns have acquired majority control in many Dutch firms. Factories have been moved from the west to the east of Holland and even over the border into Germany and have been subordinated to the rôle of subsidiaries to German industrial groups. In agriculture, the rich dairy farming industry, based on imported fodder, has been restricted to give place to cereals, hemp, flax and all kinds of oil seeds. The recent inundations, swamping agricultural land with salt water, will reduce still further the productivity of Dutch farming. In Belgium, similar processes have had the same result—basic impoverishment, amounting to severe undernourishment. Agriculture has been diverted from livestock and dairy farming to cereals and oil seeds and flax. As the German economy became less and less able to supply the raw materials needed to carry on Belgian heavy industry, output everywhere declined. For example, the greatest steel concern, SA Ougrée-Marihaye, now operates at 27 per cent of its pre-war capacity.

Finance and currency have been disrupted by the one-way traffic in goods set up by the Nazis. Raw materials, finished articles, foodstuffs were despatched to the Reich. The guilders and francs paid out for these supplies are, in theory, backed by the mark balances standing to the credit of Holland and Belgium in Berlin. In fact, there is nothing for them to be spent on. This monetary "favourable balance" has been swollen by the costs of occupation. The result in both countries has been an enormously expanded national debt which, as soon as the controls—price control, rationing and so forth—imposed by the Germans break down, will result in dangerous inflation. So far, the German controls have worked, but an enormous black market exists in both countries and the system is constantly being disrupted by the theft of ration cards, forgeries, the destruction of lists and other acts of sabotage.

Finally in the field of manpower, so drastic has the drain of labour been that some observers believe only a minority of Holland's adult men to be still living in their own country. The number of Dutchmen working abroad has been put as high as half a million. The inundations have meant further transfers of population, possibly to the Reich. In Belgium, the figure is about the same. Belgian workers have been mobilised for work in Germany, and as industrial activity declined in Belgium, more and more men were transferred to mines and plants further east.

To reverse all the trends introduced by the Germans, to unscramble the independent economic groups and interests which have been swallowed up in Germany's global economic plan; to restore agriculture on the basis of imports and by so doing to recover old markets and find new ones, to resettle a large proportion of the population—these are only a few of the problems awaiting the Governments of the Low Countries on their return. Obviously this legacy of dislocation and ruin will require from them the utmost energy, unity and activity. Though even though no grave political problems face them, it would take a very bold prophet to say that in stress of reconstruction, the political fabric of both countries will not be tested to the full. The issue may well be that of the proper use of state power and degree to which the urgency of the crisis should override the ordinary constitutional methods of democracy. There has already been a hint of this in the controversy which has arisen over the Dutch Government's decision to declare a state of martial law during the first days of liberation. It is rumoured that some members of the Queen's entourage wish to extend the period of emergency over many months to secure an "orderly" re-

to democratic government. Others see in this a threat to the whole idea of democratic government.

In Belgium before the war, there was a strong body of opinion on the Left demanding more vigorous state intervention. The splitting of the Left by the defection to the Germans of some of its leaders, such as Henri de Man, may have only a very temporary effect, and the revival of parliamentary government may soon revive the earlier *impasse* between a Right and a Left, neither possessing an effective majority.

In short, the Low Countries face a problem very similar to the problem awaiting this country. Can a democratic community use the state power in such a manner that it ensures a stable and expanding economy while retaining personal freedom and the rule of law? The degree of devastation and destitution in Holland and Belgium make the problem at once more difficult and more urgent, but on its solution depends, there as here, the continuance of political freedom, national unity and internal peace.

Five Year Plans for All?

FOR far too many years the world chose to ignore the economic achievements of the Soviet Union. When Hitler attacked in 1941, it was the almost universal belief that Russian industry was insufficient to maintain in the field an army that could resist the Nazi columns. The judgment, as all the world now knows, was about as false as it could be. In a very short span of years, it is now evident, the backward empire of the Czars has been converted into an industrial power of the very first magnitude, and when this great productive force can be turned to peaceful purposes, the Soviet state will have an opportunity to show how rapidly the standard of living of nearly two hundred million people can be raised. Russia has lifted itself by its own bootstraps.

Under the impression of these mighty events, there are signs that opinion in the outside world is now rushing to an extreme as ridiculously wrong as its previous scorn for Russian methods. The opinion is growing up that there can be Five Year Plans for all, that it is easy for any and every country to follow the Russian example and double or treble its national income in ten or fifteen years. All that is necessary is to discard capitalist prejudice, to nationalise the banks, and to recruit a planning staff. The Bombay Plan, recently reviewed in *The Economist*, is a case in point, praiseworthy in its object, but hopelessly naïve in its calculations. Some of the current talk of the speed with which China, once redeemed from the Japanese invader and free to start its Plan, is to become a strong industrial power, provides another example. To many people, it is treason and heresy to suggest that any more than, at the most, twenty years should be allowed for China to attain, in fact, the status of a Great Power which is now conferred on paper. Look at Russia. They rose in twenty years from the chaos of civil war to be a nation of Hitler-beaters. Why not China too? Or again, some of the more impatient of the colonial reformers sometimes talk as if it were only the antediluvian prejudices of the capitalist order that prevented Nigeria from becoming, overnight, another California.

That public attention should be turned to the possibility of speeding up the rate of economic progress is all to the good. But there is only disillusionment in store if

the limiting conditions are not realised. For the truth is that the conditions which made Stalin's methods a success in Russia are not very easy to reproduce elsewhere. Together with a mass of contributory circumstances, there are four primary conditions that were essential, two economic and two political. It is well worth while identifying them.

★

The essence of the Soviet Five Year Plan is the massive investment of capital. The direction of the investment may change as the plan develops—from heavy industry to light industry to social services—but at every stage, the essence of the Plan is that capital shall be invested—that is, labour and materials devoted—to dams, mines, mills, roads, railways, canals, factories, schools, hospitals and the like on a far larger scale than would happen in a free economy. If the word had not already been pre-empted for another meaning, one would be tempted to say that the Soviet economy is capitalist, since its basic premise is that the productivity of the whole economy can be most rapidly expanded by the extra-rapid and extra-large creation of capital resources.

But the labour and the materials devoted to this accretion of capital have to come from somewhere. Poor and undeveloped countries invariably have "full employment"—they have to—so that there is no margin of unused resources that can be mobilised for the purpose. Loans can be raised abroad, but they are likely to be small relatively to the size of a whole national economy. And in any event this was not the Russian method.

There is only one other source from which the labour and materials needed for the capital construction can be drawn. That is from the consumption of the people. The theory of the Five Year Plan is that, by cutting down consumption in the present and devoting the resources thus saved to a very rapid growth of capital equipment, the total output of the economy can be expanded and, in due course, the absolute level of consumption can be restored—that is, provided it is not necessary to step aside to prepare for defence against Nazi attack. In the

163/4, STRAND, LONDON, W.C.2

end, the standard of living of the people is raised to a level not only higher than it was before the Plan started, but higher than it would have been if there had been no Plan. But the first stage is one of cutting down consumption in order to liberate resources for capital formation*. This was, most decidedly, the pattern followed by the Russian experiment. It was no accident that the years of the first Five Year Plan coincided with one of the worst famines in Russian history. A reduction in the level of consumption was an essential part of the whole scheme, without which it could not proceed.

From this analysis can be deduced the first economic pre-condition of a Five Year Plan, Soviet-style. There must be a possibility of compressing the level of consumption. Whether the compression be done by an inflation of prices or by direct physical measures, it must be possible, before a Five Year Plan can start, for resources to be diverted from consumption to the building of capital. This is as much as to say that, in the poorest countries, such as India or China, or the tropical colonies, a self-supporting Plan is next to impossible. In India, despite the fabulous wealth of a handful of maharajahs and industrialists, there is no margin; in China even less. The resources that could be obtained by a compression of consumption in those countries would be so small as to have no perceptible effect on the total output. Countries such as these necessarily rely on external assistance to get their start, and external assistance—apart from such windfalls as India's war-time sterling balances—is inevitably small. Other countries, where there is a margin, can hope to implement an autonomous plan only to the extent that they do, in fact, mobilise that margin. Dams and factories can only be built by labour and materials, and no amount of paper planning or of financial manipulation will provide the labour and materials if they continue to be used for current consumption.

The second economic pre-condition is sufficiently obvious. After the resources have been provided by cutting down consumption, there must be reason to hope that their application to the formation of capital will raise the total output quickly. It may be reasonable to impose sacrifices of consumption for ten or fifteen years provided they can then be put back with interest, but if the process were spread over many more years of lowered standards of living, it might be very difficult to justify. In short, the yield on the investment, calculated in real terms, must be good. Or in technical language, the marginal productivity of capital must be high. In Russia, clearly, it has been very high. But it does not follow that it would be equally high elsewhere. It could hardly be expected to be so high in an economically mature country, already equipped with the more obvious forms of capital. Nor would it necessarily be high in an undeveloped country. Russia, after all, has enormous natural resources which other countries do not enjoy, and the Russian people are at such a stage of development that they can quickly adapt themselves to new methods. This

* The argument can be illustrated numerically. The following figures do not purport to be a representation of what naturally happened in Russia or elsewhere. They are rather a schematic representation of the theory of Five Year Planning. The figures are intended to be units of real resources, and they show the distribution of a nation's output between the three categories of consumption, of Government requirements (other than capital) and of capital formation. The year P is that in which the Plan begins:—

	P Year: minus 1	P plus 1	P plus 5	P plus 10	P plus 15
Resources devoted to:					
Consumption . . .	88	70	75	85	105
Government . . .	10	12	15	20	20
Capital	2	18	25	30	35
Total output	100	100	115	135	160

These figures assume, as is not unreasonable, that the investment in capital equipment of as much as 18 per cent. of a nation's total output would raise the total of that output by 15 per cent in the first five years. Thereafter the proportionate return, in increased output, for the investment of resources in capital, gradually declines. The essential point to notice is that the increase in total output is only achieved at the cost of a severe reduction of consumption in the early years which, in this example, is not recouped until the third five-year period.

is a subject that has been insufficiently explored, but before a country adopts a Five Year Plan it should at least enquire what the marginal productivity of capital is likely to be in its particular circumstances.

*

The two political conditions follow from these economic principles. In the first place, there must be a government willing to impose the Plan on the people. Imposition is, of course, a necessity. If the people wanted to save so large a part of their incomes—that is, to consume so small a fraction of what they produced—they would have done so and the necessity for a Plan, at least in this form, would not arise. It is the essence of the Plan that, for a period, it makes the people invest more, and consume less, than they would freely wish. The end may be approved by the people, but the means are necessarily those of compulsion. For short periods and under the manifest pressure of external danger, even democratic peoples can be persuaded to accept the compulsory reduction of their standard of living (though, in the present war, only one people, the British, can be said to have freely accepted a substantial reduction for more than a very short time). It is highly doubtful whether, over much longer periods and without the obvious compulsion of peril, a free electorate would be resolute in thinking that the end justified the means. This cannot, of course, be dogmatically asserted; but at least the Planners should realise that they must assume either a dictatorial regime or the willingness of a free electorate to put up with a substantial lowering of the standard of living for quite a long time.

The second political condition is that the Government must be not only willing, but also able, to impose a reduction in consumption. Whether or not the electorate—that is, the collectivity of individuals—approves the policy, the means must be compulsion—that is the single individual can be given no choice. This lesson has been so clearly taught by the war that it requires no further proof. But the restraint of consumption is an extremely difficult administrative operation. Not only must the limited supplies be parcelled out equitably—which means that the black market must be stamped out—but steps must also be taken to prevent a surfeit of unspendable money causing inflation—which means heavy taxation and all the paraphernalia of a savings campaign. These are tasks that can only be carried out in countries where there is a large, efficient and honest body of public servants. Once again, it is a requirement that cannot be met everywhere.

All four of the necessary conditions were present in Russia. The method of the Five Year Plan was admirably, if ruthlessly, suited to Russian conditions, and the world now admires the results. Nazi Germany is another case in point and the world, if it hardly admires the result, is nevertheless put to considerable trouble to batter down the very efficient and productive machine that was built by the Nazi planners.

But it is difficult to think of many other cases in which all the requirements could be met. The need for rapid progress is certainly greatest in countries like India and China, and it would be very pleasant to believe that there was an easy solution for their economic problems. But unfortunately it is precisely in these countries that the conditions are most difficult to create. And in those richer countries where the economic conditions can be met, the political difficulties are great. Some people will draw from an analysis of the facts the conclusion that democratic methods must go if they hamper planning on the Russian scale. Others will prefer to conclude that a democracy must be content with the slower pace of economic progress (albeit possibly faster than under *laissez faire* conditions) that is possible when the planning does not abrogate freedom of choice for the individual. Either of these positions is logical. The one illogicality is to hold that the Russian pace of economic progress (even if, on other grounds, it were possible in the country concerned) can be combined with the methods of agreement and consent.

The Trumpet Blowers

TIMES have changed since the Ministry of Information was Public Whipping Boy Number One, the butt of press, Parliament and public. To-day it is not only accepted as part of the wartime furniture, along with rationing, controls and fire-watching, but is regarded, if not with affection, at any rate with tolerance by those who come in contact with it. This is partly the result of growing up. The Ministry, as Mr Bracken said, is no longer "a nest of amateur singing birds"; it now has a song worth singing, and above all it has a Minister who knows how to deal with Fleet Street. One of the most remarkable features of last week's debate in the House of Commons—the first for two years—was the unanimity with which Members of Parliament, including the journalist MPs, showered bouquets on Mr Bracken and his staff, bouquets which the Minister, in a witty, almost Churchillian speech, acknowledged and gracefully passed on to his colleagues.

Most of the Members who had come to praise the Ministry had also come to bury it. Led by Mr Burgin, whose main theme was "We don't want to lose you, but we think you ought to go," there was a strong demand that the Ministry should disband with the cease-fire order. Wartime information has necessarily become a commodity, subject if not to rationing, at least to control. Journalists, especially news editors, while appreciating the security reasons for control, feel that official hand-outs and censorship cramp their style and are nostalgic for the days of the free-for-all scramble for news. Many of the people, including powerful sections of the press, who are most anxious for the demise of the Ministry of Information, are also in favour of a speedy lifting of all Government controls.

It seems clear, however, that some form of news control will have to be continued after the war. The war against Japan, outrunning the German war, will not only require a censorship, probably less rigid since the enemy will be farther away, but may also need "putting across" to the people, war-weary, anxious to get back to normal and, unless they have friends and relations in the Far Eastern theatre, not intimately affected. Further, and this is a more important factor, the public has already been warned that controls and rationing will have to last for some time after the war. To explain the reasons for continued restriction, for possible shortages of food and materials, in short, the need for continued discipline and ordered transition, the Government will still need its channels of publicity.

But as soon as the safety of the state is no longer in question, the censorship functions of the MOI will, and should, wither away. By far the largest proportion of the Ministry's staff is engaged in censorship, either of letters (the Postal and Telegraph Censorship employs over 12,000) or of news. The prolongation of any censorship of either kind for a day longer than was necessary would be intolerable. There is, it is true, often a tendency to exaggerate the degree of press censorship. What goes into a paper is, rightly, left to the good sense of Editors—the fact that editorial policy is often dictated by newspaper proprietors is irrelevant to this argument. The extent to which freedom of the press has in fact been preserved in wartime—freedom to print, comment, interpret and criticise—has been remarkable, but the sooner the complete freedom of the press from Government control can be restored, the better.

*

Once the Ministry of Information has been shorn of its negative, censorship functions, what would there be left for it to do? The Ministry's tasks in the field of home publicity might be described broadly as being, first, to tell the public what the Government wants it to know, and secondly, to tell the Government what the public thinks.

Into the first category fall the majority of the Ministry's Home activities; book publications, press relations, lectures and meetings, films, advertising, and the reference division. It acts, theoretically at least, as a funnel for Government information. At one stage there was a tendency to wish all types of Government publicity on to the Ministry, which would have turned the funnel into a hopeless bottleneck. But the day-to-day handling of publicity is much better left to the appropriate public relations departments of the various Ministries. These have been greatly expanded since the war and perform a very necessary function, releasing news to the press, answering enquiries, arranging conferences, providing facilities and in general maintaining liaison between their department and the public. These functions are performed with varying degrees of efficiency and courtesy. Sometimes a newspaperman is made to feel that a great favour is being conferred on him, sometimes he has information thrust upon him, often he meets a stone wall of reticence, while some PROs seem to regard it as their main mission in life to boost their Ministers. The MOI has in practice little to do with these day-to-day departmental activities, though it has to know broadly what is going on. It generally handles news of a wider or non-departmental character—the Hot Springs Conference, the Beveridge Report and the Employment White Paper are instances. On balance the various relationships involved in this rather complex system—those between the public relations departments and the press, between the PROs and MOI, and between the MOI and the press, have worked satisfactorily. But if, after the war, the Departments retain their own publicity organs, the need for a separate Ministry of Information, except for co-ordinating or reference functions, will be correspondingly smaller.

Two fields in which the Ministry of Information has been pre-eminently successful are the production of books and films, and the advantages of having a central body for this type of publicity are indisputable. The Ministry's books, commissioned by and written for different Service or Home departments, have been best sellers—over 23 million have been sold in this country alone—they are imaginatively produced, readable, often brilliantly illustrated and have done a great deal to stimulate popular interest and knowledge of the Services. The work of the Crown Film Unit rightly earned high praise in the debate. Though Mr Bracken rejected the title "documentary" as "dreary," British film producers have been the pioneers of the documentary technique. Both the books and the films should continue in peacetime, if the public is to be adequately informed of the state's activities. In particular, there is a strong case for state subvention and production of the right kind of short films, which have a far-reaching educational and social value, and should not be left entirely to commercial enterprise. But these two activities by themselves would not justify the existence of a special Ministry.

The Ministry's activities in arranging lectures and meetings, mainly through its regional offices, will hardly be necessary after the war. As and when the black-out is lifted, halls become available and political activity is revived, there will be less demand for Government-sponsored enlightenment. Such matters are best left to individual initiative and to the Workers' Educational Association, debating societies and organisations of various political complexions. The extent to which Government control should be exercised over broadcasting in peacetime is an enormous subject in itself. But if there is to be such control at all, it should be remote and indirect, through the nomination of the Governors of the BBC. This also hardly requires the existence of a Ministry.

About the other side of the Ministry's work, interpreting the public to the Government, much less is heard. After the outcry over "Cooper's Snoopers" early

in the war, the Ministry took fright, but its Wartime Social Survey does an honest and useful job for the Government. The Survey's services are available to any department, but its main investigations have been for the Board of Trade and the Ministry of Food, testing consumer reactions to food and clothes rationing, shopping difficulties, quality and supplies of goods. Its staff are all trained social science investigators. The Survey does not touch "morale" or politics. If the Government is to assume an increasing responsibility for social welfare, health, housing and employment generally, it will clearly need to pay attention to consumer research.

There are thus a number of domestic information functions which can and should be performed after the war, both centrally and regionally. They would, however, hardly justify the existence of a whole separate Ministry, which might be too like creating a permanent Ministry of Propaganda. But there is no reason why a central information department should not be set up, as a part of the Cabinet Secretariat, including on its staff competent professional journalists, publicists and social science experts, equal in status and working on similar lines to the Central Statistical Office. The question of salaries will obviously have to be reviewed, if the best men are to be attracted, but this point applies generally to Civil Service recruitment. Such a solution would give the best of both worlds. As part of the Cabinet Secretariat, the Central Information Office would speak with authority on Government policy and plans, and it would be small enough not to become bureaucratic or unwieldy.

On the foreign side, there is an even stronger case for retaining the overseas functions of the Ministry of Information. In wartime the Ministry has had to tell the world about Britain's war effort and achievements and has had to work not only in neutral countries, to counter the blast of the German propaganda machine, but in Allied countries which have only a vague idea about this country.

The British Information Service in the United States has, on the whole, worked effectively. Originally there

was a tendency to "write up" this country, which was not well received in sophisticated American newspaper offices, but latterly more effective and subtler methods have been used, and the main reliance now is on the prompt and efficient answering of requests for information. In Russia, too, the Ministry's efforts have been well rewarded. "British Ally" now sells some 50,000 copies. The building up of international understanding is important in wartime. After the war, when the bonds of fighting a common enemy have disappeared and political and economic friction may develop, it will be even more vital.

Again, it is probably not necessary to have a special Ministry to look after foreign press and propaganda, functions which fall properly within the sphere of the Foreign Office. The most logical course would be to reorganise the Foreign Office, setting up separate departments for publicity, trade and intelligence, under the general aegis of the Foreign Secretary, but allowing to each a considerable degree of executive independence.

But whatever form of machinery is evolved for stating Britain's case, the really important thing is to have a case to state, and to state it in the right way. The end of this war, to judge from the example of Italy and the French popular movement, will see a revival of liberal, left-wing, progressive—possibly intensely nationalist—Governments in Europe. Publicity aimed at the type of Government which ruled Europe after the war, or designed to interest limited aristocratic or ambassadorial circles, would not only fall flat, but would do this country untold harm. Publicity should also be truthful. A description of England in the 1930's, which failed to mention Jarrow or Merthyr Tydfil, would have been untruthful, but the real story would not have enhanced this country's reputation. Wartime social achievement has been creditable, and can be faithfully recorded, without gloss or embellishment, and, provided that the right aims and policy are pursued after the war, the national trumpets can be blown fearlessly and with pride.

NOTES OF THE WEEK

The Russian Offensive

The Soviet offensive in Byelorussia has developed into one of the most decisive campaigns of the war. The historian will probably class it with the battle of Stalingrad and the crossing of the Dnieper. A fortnight after their first attacks on Vitebsk, Orsha and Mogilev, the Russians now stand roughly two hundred miles to the west of their starting points. Minsk, the capital of Byelorussia, fell to the attackers with surprising speed; and the drive from Minsk westwards began immediately after the city's capture. There is no doubt that large German forces have been routed. This is shown by the high number of prisoners—including many German generals—taken by the Russians. The morale of the German soldiers seems to have given signs of being even below the standard of last winter. The advance from Byelorussia gives the Soviet Command the chance to strike in two main directions. One thrust southwards towards Baranowicz opens the way to Brest Litovsk, on which a second from Kowel, now evacuated by the Germans, may soon converge. These operations may be regarded as the first moves in the battle of central Poland. The other direction is from Minsk and Polotsk towards Vilna and Dvinsk, the two bases from which the Russians may attempt to drive a broad wedge between East Prussia and the German forces in the Baltic area. It has still to be seen for how long the present rate of the advance—15 miles a day—can be kept up. But there is no reason why their "conveyor belt" system of supply should not enable the Soviet armies to press forward continuously during the greater part of the summer.

"A Somewhat Lengthy Affair"

The Prime Minister told the whole story of the flying bomb on Thursday, or rather the story of a major battle that has been going on, unseen, for over a year—engaging

a large part of Allied air strength and of Germany's industrial resources—ever since it was learned that the enemy was developing a large long-range rocket. Bombing upset his preparations for the discharge of both the rockets and the smaller flying bombs; and in the event, still under bombing, he has been reduced to the discharge of about 100 to 150 of the latter every twenty-four hours. Each weighs a ton, and when it is considered that a very considerable proportion of those discharged are intercepted, the relatively light weight of this "trying and worrisome" attack is evident. Even casualties, though grievous, are not heavy. Deaths amount to one per bomb (that is, per ton) dispatched, and the ratio of deaths to hospital cases is 1:3. Mr Churchill did not underestimate either the effect or the duration of the attack. It may be "a somewhat lengthy affair." But life in London (née Southern England) will go on as it has done since the bombardment started—unless bigger missiles perhaps raise bigger problems. People with no ties in London may leave if they will; but for the most part, as Mr Churchill advised, they will carry on and make the best of it under this "harassing fire."

A Victory for the Danes

In a trial of strength between the Danish people and the German forces of occupation, the Danes have secured a remarkable victory. After a series of acts of sabotage, which grew in intensity when the news of the Allied landing in France reached Denmark, the German authorities in Copenhagen decreed a curfew, policing the streets with Germans and with Danes from the notorious *Schalburgcorps* and firing on those who evaded the curfew order. This seems to have been the last straw to a population whom the criminal activities—murder, looting, arson—of the *Schalburgcorps* had already driven to the verge of violence. Led by their trade unions, the workers began to

come out on strike. The Germans postponed the curfew from 8 until 11 p.m. on June 29th, but this small concession had no effect. The strike spread, and by June 30th it had become general, involving 400,000 people, and it was spreading to the provinces. The Germans attempted to force the people back to work by terror. A state of siege was declared; the city was cut off from the countryside; all the services—gas, water, electricity—were suspended, and fighting broke out in the streets. At the same time the German authorities tried to negotiate a return to work with the Danish leaders. By this time, although the body representing Denmark's small resistance movement, the Danish Freedom Council, had not been responsible for declaring the strike, it had started to back it and had formulated four demands as a condition of a return to work. The *Schalburgcorps* must go; the state of emergency must be lifted; Copenhagen must be free to communicate with the outside world, and the municipal services must be restored. Finally, no one should be penalised for their part in the strike. Negotiations continued between the Germans and the Danish leaders. When, on July 2nd, Dr Best agreed to call off the emergency and restore the services, the leaders of the Employers' Federations and the Trade Unions together with the Mayor of Copenhagen appealed to the people to end their strike. They preferred to follow the lead given by the Danish Freedom Council, and only when the Germans accepted all four conditions did the general strike come to an end.

The German Defeat

How can one explain so complete a local defeat for the German authorities in Denmark? They, after all, had all the advantages of overwhelming military strength on their side. The first reason is, of course, the fact that the Germans are on the verge of defeat in the war. They know it and the Danes know it, and the knowledge vitally affected the psychological atmosphere in which the strike took place. Another reason is the important rôle Denmark plays in the German economy. As the strike spread outwards from Copenhagen, it began to affect farms, co-operatives, dairies and agricultural processing plants. Had it spread further and lasted longer, it might have affected Germany's food supply. The decisive reason, however, is the fact that in Denmark the old forms of democratic society survived the German occupation. The Nazis are paying the price for trying to make Denmark into a model protectorate. They left the trade unions, they left the employers' federations and the municipal authorities. The Danes did not feel that their whole way of life had been pulverised out of existence and, with it, the power to react in the accustomed manner of free men. When the provocations offered by the occupying authorities and their Danish jackals in the *Schalburgcorps* became intolerable, the Danish workers possessed, in their trade unions, instruments through which to organise mass action. Thus their successful strike has a moral beyond the immediate issue of military occupation. One of the greatest safeguards of freedom is the existence of a plurality of institutions expressing the purposes of the citizens and independent of the state. When they disappear, the power to act independently goes with them.

To Balance or Not

The references to budgetary policy in the White Paper on Employment Policy were described in *The Economist* as the fruit of the Treasury's wrestling with its conscience. The struggle goes on and it is still difficult to tell which doctrine is on top. The White Paper, it will be recalled, stated, among a great many other things, that the policies proposed in this Paper . . . certainly do not contemplate any departure from the principle that the Budget must be balanced over a longer period.

But the effect of this was largely nullified by a succeeding paragraph suggesting that it was the relation of the debt burden to the national income that really mattered. The second round came with the Chancellor's speech in the employment debate. Once again, there was a flat-footed statement qualified by an aside. The flat-footed statement was that it was a cardinal point in Government policy that budgets must be balanced over a period, whatever happened to them from year to year. The aside was an underlining of the advantages to be derived from increasing productive

debt while dead-weight debt was being written off—which leaves in the mind the query whether the service of "productive" debt is supposed to come into the balanced budget. Another variant came when Sir John Anderson spoke on the third reading of the Finance Bill.

I developed this matter to some extent [said the Chancellor] in a speech on the Government's employment policy, and I then pointed out, and I think it is worth repeating, that we ought to look at the National Debt in relation to the growth of the national income. We ought, in turn, to consider the growth of the national income in relation to the growth of automatic burdens. Expansion of the national income might render us indifferent to a proportionate expansion of the National Debt, but we must beware, because we have to consider how far the national income may be already mortgaged. I pointed out the increasing burden which the taxpayers of this country will, inevitably, have to bear, in consequence of the increasing proportion of aged persons in the community.

Here, then, would appear to be a new doctrine: that all is well provided the sum of the debt charge plus other "automatic burdens," especially old age pensions, does not rise relatively to the national income. This variant, it is hardly necessary to point out, would permit quite a lot of deficit financing, and in the long run as well as the short. What is one to make of these various utterances? The purpose of setting them down here is not in the least to embarrass the Chancellor or to challenge him to play the futile game of verbal consistency. Somewhere in these equivocations there is embedded a principle that may well be vital to the whole policy of full employment, which (unless we are uncommonly lucky) cannot be pursued to success within a regime of balanced budgets—at least in the ordinary meaning of the words. It is very important that the public should know what the Government really means.

Resettlement

Mr Bevin announced last week, in reply to a parliamentary question, that a special service, under the control of the Ministry of Labour, was to be set up to give advice

The merry
monarch
had a bright
idea . . .

He made good the deficiencies in his budget by personal borrowing from those early bankers, the City goldsmiths, on terms which were highly satisfactory—to His Majesty! No wonder the limits of the Royal Prerogative took so much thrashing out in Charles II's days. Subsequent and more enlightened Governments have deemed it wise to encourage the Banker, with the result that today the advantages of a complete banking service are available to every citizen. The Westminster Bank with its network of branches offers you the security and convenience of a Current or Deposit Account, while its Trustee Department offers the testator the advantages of corporate executorship. Call and discuss these and other services with your local Manager.

WESTMINSTER BANK
LIMITED

on the resettlement of men and women in civil life. It has long been urged, by Lord Nathan in particular, that the question of resettlement is a matter that ought not to wait until the end of the war. Lord Nathan has asked for a Ministry of Welfare, or at least a Department of Welfare, presided over by a Minister of Cabinet rank, and has urged that the local machinery should be set up well in advance so that people would be used to it when they came to need it. It is satisfactory that something is now being done. But it is not clear from Mr Bevin's reply whether the machinery that is to be set up will be adequate to cope with the problem or whether the extent of the problem itself has been fully foreseen. He said that the function of the resettlement advice offices

will be to give advice and information to all men and women released from the Forces or from other forms of war service, and to render every possible assistance to them in dealing with their resettlement problems.

But it will not be only a question of the resettlement of ex-Service men and women. The underlying emotion of every citizen at present, whether he or she is in the forces, on war work or evacuated, is the desire to go back home. But it is essential for the Government's plans for reconstruction that this desire should not get the upper hand; otherwise even the dubious principle of "first in, first out," will be lost in "all change." The longer the war lasts, the more necessary it is to bring home to every individual citizen the fact that the order to "stay put" with the "cease fire" applies to him or her. In this atmosphere of being at school in the holidays the Government will have to contend with a host of civilian problems—the re-establishment of family life; the provision of homes and furniture for the bombed and those who have never had them; the reopening of small businesses as well as those belonging particularly to the armed Forces, including the great band of prisoners of war. Resettlement is not, therefore, simply a matter of helping those on war service to settle down in peacetime occupations. It will be a major armistice problem, affecting in one way or another the whole nation. The Minister of Labour may be the best Minister to be responsible for policy, and his Department has the advantage of having a local staff with wide experience in welfare work. But he would do well to have advising him a committee of men and women who have made social welfare a speciality. The resettlement that will be necessary is a task that no Government Department has had to undertake before, and it will require a skilled staff.

"They" and "We"

It is satisfactory to learn that the resettlement advice Officers are to be specially selected and trained for the job. They will be expected to have a good knowledge of the social sciences and economics, of central and local government, and of the range of statutory and voluntary social services (the kind of subjects in fact that are included in the London School of Economics Social Science course). Recruitment to the service, though mainly from the Ministry's present staff, will not be confined to it. People with experience of social service work may also be taken on and special consideration will be given, as Lord Nathan in fact emphasised, in his earlier welfare and resettlement proposals, to ex-Service men and women, who are likely to handle the problems of other ex-Service people with tact and sympathy. It is also especially important—and consultations are now going on with the National Council of Social Service and other voluntary organisations—that the new service should neither overlap nor compete with the work of the Citizen's Advice Bureaux. The CABs are voluntary agencies; one of their main functions in the early stages of the war was to help evacuated people find their feet in strange surroundings. Since the war, they have grown rapidly and widened their scope. They now not only act as a kind of post office between the different departments, but also deal with a great variety of questions, touching all sections of the community, many of which would never be taken to Government officials. The Citizens' Advice Bureaux will be the first to welcome the official recognition that there is need to advise the citizen; to help him find his way in the maze of Government and local departments; to understand and fill up forms; and to give advice on personal problems in a friendly and non-bureaucratic manner—in other words to bridge the gap between "They" and "We."

The Monetary Conference

The International Monetary Conference was formally opened at Bretton Woods last Saturday and this week has got down to business with commendable speed. A welcoming message from President Roosevelt set the key for the discussions by emphasising the infectious nature of economic instability in any one country and by arguing that "the economic health of every country is a proper matter for the concern of all its neighbours, near and distant." The President went on to stress the fact that any international monetary mechanism must serve a dynamic and soundly expanding world economy, for only in such a framework "can the living standards of individual nations be advanced to levels which will permit the full realisation of our hopes for the future." The opening address was made by Mr Morgenthau, who had previously been unanimously elected president of the Conference. It was, in the main, a plea for creating some ordered system of international monetary relations because there was no greater menace to world peace than monetary instability, which destroyed the basis of world trade, created unemployment and depression and led to economic aggression. After these preliminaries the Conference split itself up into three Commissions: the first to deal with the monetary proposals, taking as its agenda the proposals for setting up an International Monetary Fund; the second to discuss the proposals for setting up a United Nations bank for reconstruction and development; the third, a "remnants department," to cover any subject outside the scope of the first two commissions—for example, the place of silver in the new international monetary order.

White and Keynes Commissions

The first Commission is under the chairmanship of Mr Harry White, of the US Treasury. It has itself been split up into four committees, each of them dealing with a particular aspect of the Monetary Fund scheme. Mr Harry White, in a speech to the first plenary session of the Commission, spoke for the Fund as a permanent co-operative institution designed to promote exchange stability, to assure multilateral payment facilities, to help lessen international disequilibrium and to give confidence to member countries. The second Commission, dealing with the reconstruction bank proposals, has been put under the chairmanship of Lord Keynes. In launching his Commission on its labours Lord Keynes gave a brief summary of the reconstruction bank project which, he said, owed much to the initiative and ability of the US Treasury. It would be the duty of the proposed bank, by wise and prudent lending, to promote a policy of expansion in the world economy—but "expansion" in a sense in which that term was the exact opposite of inflation. The bank would make direct loans to member countries, but the greater part of its capital would be used to serve as a reserve fund to guarantee private loans, thus making exceptional loan risks attractive to the open market and securing reasonable terms for the borrowers. Lord Keynes emphasised that the proceeds of such loans would be available for purchases in any member country. He admitted that the United States would probably have to provide most of the actual "cash" involved in these loan operations, but added that the risk would be shared by all participating countries and pointed to this distinction between the subscribers of money and the takers of risk as one of the attractive novelties of the scheme. He was also at pains to point out that the bank would not tread on any toes. It would not compete with UNRRA because it would come into the reconstruction picture only after UNRRA had provided the first aid of relief and rehabilitation. It would not compete with private investment banks or with public financial markets, since no transaction would be undertaken without the approval of the banking authorities of all the countries concerned. Unanimous governmental consent would also be required. Indeed, it is apparent that so much attention has been paid to safeguards that it is legitimate to wonder how large a volume of capital will actually be provided. But, within the measure of the possibilities, it may be that the world bank will be even more valuable than the currency fund, since the resources it provides can be directly applied to productive purposes.

The Place of Silver

The third Commission is under the chairmanship of Señor Eduardo Suarez, the head of the Mexican delegation. If only for this reason, it is likely to be very much concerned

with the problem of silver. The Mexican delegation has tabled proposals for giving silver a recognised place in the Monetary Fund scheme. The Mexicans, on this issue, have found allies in the silver lobby of Congress. A letter sent to President Roosevelt by the chairman of the Senate Silver Committee asserts that the plan for post-war monetary stabilisation published by the US Treasury suffers from the "basic organic defect" that no place is assigned in it to silver. It is urged that parities for the currencies of member countries should be fixed in terms of silver as well as of gold. This proposal has already been opposed by the US delegation. The principal Chinese delegate, for his part, has explained that China was not particularly interested in silver as an international currency stabiliser, pointing out that China had done without silver since 1935, and that the managed currency system operated after the demonetisation of silver had worked efficiently, until it was dislocated as a result of Japanese aggression. The chances of silver emerging from the Conference with increased monetary status are less than slender; but everything suggests that it will occupy more than its fair share of the discussions.

Finland's Fatal Hour

Of all the satellites of Germany, Finland was until recently the only one that could attempt to justify its policy on the ground that it was waging a "separate war" against Russia—still remaining independent from the Reich, and even at heart hostile to the New Order. The Finns had a genuine grievance against Russia after the war of 1939-1940. Even so, their participation in Hitler's crusade was a grave and grievous error, to say the least, whatever mitigating circumstances they may hitherto have been able to plead. The new Finnish-German agreement, concluded during Ribbentrop's visit to Helsinki, and the appearance of new German troops in southern Finland have radically changed the situation. By refusing to conclude a separate armistice with Russia, the Finns have themselves entirely exploded the excuse of their separate war. With suicidal folly the Linkomies Government has chosen this moment, when the Russians threaten completely to cut off the Germans in the Baltic area, to assert their solidarity with Berlin. The double-faced role of the Finnish Social Democrats is striking. At first, they registered a verbal protest against the new commitments of the Government. Then they decided not to withdraw their Ministers from the Cabinet, which means that, in fact, they agreed to share in the responsibility for continuing the war. This decision can in no way be justified by invoking "the will of the people." Neither the people nor Parliament had been consulted by the Government about the fatal step it decided to take. The rupture of diplomatic relations between the United States and Finland may perhaps still act as a last minute warning and restraint. It may bring home to the Finns what they stand in imminent peril of losing.

Polish Citizenship

A recent decree issued by the Soviet Government declares that all Poles coming from eastern Poland (from western Ukraine and western Byelorussia), and serving with the Soviet armies, will have the right to choose Polish citizenship. This may perhaps be regarded as a step towards a Polish-Russian agreement. Wherever the new frontier between Poland and Russia may ultimately be drawn it is essential that the population of the disputed territory should be given the right to choose Polish or Soviet citizenship. The right of option is an elementary principle of justice observed in all the territorial transfers that have taken place in modern times. But the meaning of the Soviet Government's decree is not quite clear. It contains a great many qualifications. First of all, the right of choice is granted to Poles who serve with the Red Army. This may be interpreted as an inducement for Poles to join the Soviet Army or, more accurately, the Polish units under General Berling. Properly, of course, the right of choice should not be regarded as a reward for military service; either it belongs to every Pole in eastern Poland or to none. Secondly, those Poles who were Soviet citizens even before 1939, are that is, before the Soviet occupation of eastern Poland, are now to be given the right of choice. There has always been a fairly large Polish minority in the Soviet Union proper: but it is doubtful, to say the least, whether the Soviet Government really means to give those Soviet Poles the

right of exit. It is more likely, perhaps, that the measure is meant for the benefit of those Soviet officers of Polish descent who have been detailed to serve with the Polish Army in Russia. If this is so, then again the decree may be interpreted as reflecting the desire of the Russians to make the Polish-Russian army attractive to Poles. In that case, the decree might not have much to do with the more fundamental issue of the choice of citizenship. Finally, who is going to grant Polish citizenship to those who choose it? At present the Russians recognise no Polish Government; and, in any case, all that the Soviet Government can do in law is to free individuals from Soviet citizenship. Only a Polish Government can recognise them as Polish citizens. The crux is still the absence of diplomatic relations between Russia and Poland.

Brake on Planning?

Apart from complaints that the proposed procedure for acquiring sites is still not sufficiently speedy, the objection of local authorities to the new Town and Country Planning Bill is largely financial. Here their doubts fall under two heads. In the first place, there is the argument which Lord Latham has summarised by saying that the 1939 prices which were promised as a ceiling have turned out to be a floor. Some land has fallen in value since 1939, but authorities will apparently have to pay the full 1939 price for it. But on the other side of the account must be set the land which has appreciated during the war, but which is not covered by the Bill's special provisions for rises in value. The justice done by the Bill to both owners and authorities is rough, but justice none the less. The second objection of the local authorities is that the aid to be given by the Treasury is inadequate, and this is perhaps worthier of consideration. The authorities are faced with the fact that the more spacious they make their plans, the more slowly will they get a full return for their outlay—and in some cases the less return will they get. If a "blitzed" area in the centre of a town is rebuilt in a broad and ambitious way, with wide roads and plenty of open space, much of the "betterment" thereby created will accrue not merely to the "overspill" areas, where it would be automatically recovered, but to a much wider region. No doubt the White Paper's proposals on compensation and betterment, when implemented, will cover such cases. But, even under those proposals, betterment will take a long time to harvest, and the argument is that local authorities should not be cramped in their style through financial stringency. A case can also be made for extending the same amount of Treasury aid to "blighted" areas—those containing slums or obsolete housing—as to "blitzed" ones. The redevelopment of the former districts is less urgent, but still very urgent, and when undertaken will prove just as costly. The views of the local authorities deserve respect, but they will commit a most serious mistake if, as seems not unlikely, they range themselves stubbornly against a Bill which, on balance, gives them very considerable and admittedly much-needed powers.

Control of Building

In order to ensure the success of planning schemes it is necessary to have the right to prohibit changes in the use of land while the plans are being prepared. By legislation last year the whole of the land in this country was placed under "interim" control. The Ministry of Town and Country Planning has now made a new Order, setting out the types of development for which permission cannot ordinarily be refused by local authorities. This Order is to last only for the period of the war. The main classes of

INDEX TO VOLUME CXLVI

The Index to Volume CXLVI (January to June, 1944) will be available in about two weeks' time, and will be sent to all those who have asked for the Index to be regularly supplied to them. Any other readers who wish to receive the Index (post free) are invited to apply to The Publishers,

THE ECONOMIST, Brettenham House, Lancaster Place, London, W.C.2

permitted development are schemes already sanctioned by a Government department; the restoration of war-damaged property and the maintenance of existing buildings, so long as there is no change in size or in use; and essential schemes for public utilities. In special circumstances—for instance, in areas scheduled for wholesale reconstruction—control may be stricter. This measure should ensure that none but admittedly necessary works are undertaken without there being the option of refusal by the planning authorities. It is, however, to be hoped that the flexibility of these powers will not incline some local authorities, as has happened in the past, to prefer this piecemeal method of procedure to the more formal and effective method of working to a definite scheme. Control is no substitute for some set plan for the use of land in each area. The "interim" powers should be necessary for only a short interval; they should not linger on as "the pale platitude of the meantime" for the next twenty years.

An Ambassador Recalled

The American decision to recall the United States Ambassador at Buenos Aires to Washington for consultation has been followed by the recall of Sir David Kelly, the British Ambassador. Neither the American nor the British Government recognises the Farrell regime in Argentina, and the new step merely underlines that disapproval. The British Government hesitated for a week before deciding to recall Sir David. It is doubtful whether this way of expressing disapproval has any effect on an obstreperous Government other than to stiffen its intransigence. Such action would be likely to be effective only if there were in the country itself strong opposition forces which could be galvanised into action by a singular mark of disapproval from the democratic Powers. At present such an opposition exists in Argentina as little as it did in Eire last March. However, there are far too many critics in the United States, and far too many wish-fulfillers in Argentina, waiting to spread the rumour of a rift between Britain and America in their Argentine policy to make it worth while for a minor British scruple over the wisdom of the course to be allowed to play into their hands.

* * *

Herring Bill

The general decline in the fishing industry in the years before the war was most keenly felt in the herring trade. The quantity of herrings landed in the United Kingdom fell from 12 million cwts in 1913 to 5½ million cwts in 1937. Overseas markets were lost to other countries, particularly to Germany. Some Government assistance was given to the industry by the Herring Industry Acts of 1935 and 1938, and the Herring Industry Board was established. The war intervened before the effect of this assistance could be felt, and the Board ceased to function. The Government has now shown its intention of fostering the industry again, by the introduction of the Herring Industry Bill, which was given its second reading on July 5th. The Bill proposes to resuscitate the Herring Board and to enable it to make grants to assist people proposing to engage in the industry, to purchase boats and equipment, especially to those who were previously engaged and those who have served in the armed forces and the mercantile marine. In addition, the Board will itself be authorised to purchase boats and equipment for charter by fishermen, and to arrange for the refrigeration and processing of herrings. The Bill proposes to empower the Board to operate local schemes whereby, with the consent of a majority of the fishermen concerned, levies would be imposed on the first wholesale sales of the catches, with a view to obviating as far as possible any undue difference in earnings. The Bill sets up the Board to act for five years, and the amount it can spend is limited to £2,770,000, of which £2½ million may be borrowed. The majority of the provisions, together with one providing for loans in connection with exports, suggest that the Government intends to assist the industry in a full scale attempt to recapture lost markets. The proposals constitute a thorough attempt to arrest the decline of one of the most important branches of British fisheries, and one which, directly and indirectly, provides considerable employment, particularly in Scotland.

Scottish Agriculture

The Secretary of State for Scotland, introducing the Votes for the Scottish Departments of Agriculture and Education last Tuesday, gave some figures to show the great contribution Scotland has made to wartime food production. According to the Ministry of Food, Scotland produced enough to be self-sufficient, and exported nearly a million tons of oats, beef, sheep and potatoes, as well as 150,000 tons of fish in 1943. Scotland's share of agricultural produce amounts to no less than 14 per cent of the United Kingdom total of over 22 million tons. The Scottish acreage under crops in 1943 was 2,120,000, an increase of 43 per cent over the last pre-war year, and an increase of more than 21,500 acres over 1918, despite a loss since then to housing and aerodrome developments of 300,000 acres. There are more than four times as many allotments as in peace time, and twice as many as in the last war. Dairy cattle has increased by 9 per cent, and a third of the milk produced is T.T. That Scottish agriculturists are more concerned with the future than with the present was fully borne out by the debate, and Mr Johnston's speech indicated that the Government realises this. Hill sheep farming, which occupied much of his speech, has been an aggravating problem for decades—greater even than the general agricultural one. This has been recognised, and last January the Balfour of Burleigh Committee on hill sheep farming submitted its Report (Cmd. 6494). It has been discussed in detail, and its main recommendations accepted by hill sheep farming interests. The Report's proposals for the disposal of surplus store lambs has not, however, met with the same accord, and the problem is being discussed with the National Farmers' Union and those concerned. Other aspects, such as the proposal of a Wool Marketing Board and the conversion of the most depressed hill sheep farms to forestry, are being discussed with the appropriate authorities. The Scottish Department is tackling the problem of the productivity of deer forests. Already these have been stocked with 127,000 sheep and 4,000 cattle, and there is room for another 72,000 sheep and 3,000 cattle. For the future, little or no increase in the acreage under crops can be expected—indeed, there may be a decline under normal conditions, however favourable they may be to agricultural interests. But a development of livestock husbandry is desirable and urgent if Scotland is to have a full share in a general scheme of agricultural prosperity after the war.

Overseas Forces' Leave

The question of leave for soldiers who have served long periods overseas was again raised in the House this week. It is a plea which, even when headlines are devoted to other more immediate battle themes, is hard to deny. At present the maximum period of overseas service, except in the case of volunteers offering to stay abroad, is five years. It has already been reduced by stages from the seven years which was the rule for the peacetime regular army. It can be argued, however, that the circumstances for the wartime soldier are different, and, particularly in the case of married men, or those suffering from periodic breakdown in unhealthy climates, it is the sense of isolation and frustration, rather than the physical hardships of a battle area, which are hardest to bear. These factors may in the end out-balance the military advantage of troops well-trained to the type of warfare which is suited to the far-off country, whether jungle or desert. The Government has already given the assurance that every possible effort will be made to reduce the maximum period of overseas service and to extend the exchange system. Naturally, with the main war effort concentrated on the invasion of France and the conquest of Italy, exchanges are more difficult to arrange than ever; but the number of men who have been continuously abroad for four years, or even three, may not be unmanageably large. Though it may not be practicable to effect complete equality in this matter with the American overseas forces, there can be no excuse for not making every effort to follow this generous example. Moreover, this matter is, in a sense, one first practical instalment of the problems—and the psychology—of demobilisation itself.

AMERICAN SURVEY

His Own Man

It is nothing new for Presidential candidates to modify or disown the party platform, either after their election or even during the campaign. Mr Dewey's first statements make it clear that during the next few months he intends to interpret the programme adopted at Chicago, which he candidly admitted was a thing of "inevitable compromises." Already, in his first press conference, he has endorsed the reciprocal trade treaty programme of Mr Hull as a "Republican policy," although he said nothing about the platform's insistence that such treaties be approved by Congress. In both his first meeting with newspapermen and in his speech of acceptance, he made a good impression, both by his affability and the skill with which he turned aside difficult questions. The address to the Convention was a nicely calculated fusion of generalities and forthrightness. On foreign policy he had little to add to the party's plank, beyond his determination to keep the conduct of the war out of politics, and his guarantee that the Republicans would make a secure peace. But he laid about the Administration's domestic policies with shrewdness and vigour. This is good political sense. The Roosevelt regime is most vulnerable on its domestic side. Governor Dewey promised new talent in government, and that real delegation of authority which has always proved so difficult for President Roosevelt to achieve. Competent administration by experts is the foundation of Governor Dewey's reputation in New York; and this is what he will offer to the nation in the coming months, combined with reassurances to business that the problem of full employment will be solved with the accent on free enterprise rather than on Government spending and controls. There is another reason for this domestic emphasis. With the invasion of Europe there has been a revival of President Roosevelt's popularity. What Mr Dewey must hope is that by November the war takes a less prominent place in people's thinking, for in international reputation, in experience and statesmanship, he cannot hope to beat Mr Roosevelt. In his acceptance speech Governor Dewey was at great pains to point out that he had no outstanding commitments to any one; that he was, in effect, his own man. He can write his own ticket, up to the point of alienating substantial numbers of his party, for he is the G.O.P.'s main instrument for a return to power after twelve hungry years. As Mr Willkie pointedly reminded him, he has before him one of the great opportunities of history, that of developing a constructive alternative to the New Deal. Even the *Herald Tribune*, while conveying its admiration, intimated that more precise guidance on the rejuvenation of the free enterprise system would be welcome. But so far for Mr Dewey, silence has proved golden indeed. His political

adroitness is so great that he may be tempted to confine himself to variations on what he said at Chicago.

* * *

The Republican Governors

If Governor Dewey intends to take a progressive stand on foreign policy or domestic issues, there is no lack of allies in his own party. At the Convention, as at the Mackinac Conference last year, there was ample evidence of a new spirit in the fresh crop of Republican state governors. With some truth they can claim to be closer to current feeling than the old hands of the party, who have not fought and won an election for years. At Mackinac it was the efforts of a small group of progressive governors which, despite the resistance of the Old Guard, made the pronouncement less isolationist than it would otherwise have been. At the Convention there was another attempt by the younger governors to liberalise the domestic programme and put more teeth into the foreign policy plank. It was owing to their labours that the foreign trade plank paid at least lip-service to the desirability of continuing reciprocal trade treaties, though by giving way to the protectionists in the matter of Congressional approval, the liberals gave back with one hand what they had taken with the other. Even stronger words have been spoken on foreign policy. Fifteen governors backed up Mr Willkie's blast against the draft adopted, and a small group of young Republicans are reported to have written a platform of their own, although they were not prepared to force the issue. Governor Edge, of New Jersey, Governor Sewell, of Maine, and Senator Ball were all prominent in demanding a stronger wording. What these progressive Republicans need is a leader capable of taking over the management of the party from the old hands, and opening its doors to younger talent. Mr Willkie would have had no hesitation in seizing the opportunity. Governor Dewey will be more cautious, not only because of Mr Willkie's lamentable example, but because he cannot afford to imperil the unity of the party. But neither can he campaign convincingly on the issue of youth *versus* quarrelsome old age with his own party still in the hands of weary elder statesmen. If the party is to win in November, some way must be found of letting in the new blood which Governor Dewey finds so badly needed in national government. The new men are there; the problem is to find some way of persuading the Old Guard to let go.

Service Warning

Once more the Services, this time in a report from General Marshall, Admiral King and General Arnold, the

BANKERS TRUST COMPANY

INCORPORATED WITH LIMITED LIABILITY IN U.S.A.

HEAD OFFICE — NEW YORK

SIXTEEN WALL STREET

LONDON OFFICE — 26 OLD BROAD STREET, E.C.2

ALSO

BANKERS TRUSTEE AND EXECUTOR COMPANY LIMITED

three U.S. members of the Combined Chiefs of Staff, have issued a warning to the public about the urgency of war production. Noting that the recent favourable course of the fighting "seems to have persuaded some people that the war is nearly won, and that they can go back to civilian life," the military commanders pointed out that heavy losses in material are certain to be maintained, and that any slackening in production would delay victory. The War Department has followed up this warning by an announcement that the tank production in 1945 would be stepped up by 12 per cent; and by the news that in June war production was down 8 per cent from May, with the most serious deficits in lorries and radio devices. This is not entirely unexpected. In May the heavy lorry programme was dragging, principally because of lack of manpower in the foundries and forge shops; and other war industries felt the lack of specialised labour themselves or in plants producing components. It appears that Mr McNutt's priority referral system for labour has gone into effect none too soon. Both employers and employees are heartily opposed to its restrictions, and the penalties for "black marketing" of labour are so slight that it may prove a less than complete cure for the tendency to get back into civilian occupations. There are no indications, however, of any more drastic measures. A National Service Act at this stage is out of the question, and Congress has adjourned without taking any action to draft the 4-Fs into essential work.

Income for Full Employment

Some estimates and assumptions by Federal Reserve Board economists about the post-war employment problem have been made public by Mr Joseph Keenan, of the War Production Board. The basic assumption is that in the first year after the post-war transition has been completed, there will be 60 million people available for work. This is allowing for 2.5 millions still in the armed forces, and frictional unemployment of 2 million. To maintain full em-

ployment will require an unprecedented volume of production, not only because of the normal population increase, but because of expected increases in the output per worker. In terms of 1943 prices, the Federal Reserve Board estimates that a gross national income of \$170 billion will be necessary for full employment. This is \$30 billion less than the war-time peak income, which, also in 1943 prices, is put at \$200 billion. This contraction is based on the belief that hours of labour will decline, that some persons will leave the labour force, and that the average volume of output per man-hour may decline, owing to the fact that many workers will return to trade and service occupations and industries where the output is less than that in highly mechanised industries like munitions. Were production to return to the 1939 level, which in 1943 dollars was \$108 billion, unemployment of from 15 to 20 million might be expected. This is a threat comparable to the unemployment in the early thirties. The average citizen does not picture the enormity of the problem in precisely these terms, but unquestionably there is a very widespread anxiety about post-war jobs, which is not limited to what are known as the "cutback jitters," and helps to explain the restlessness of workers in war factories anxious to assure their futures.

Publicity for Reverse Lend-Lease

Some timely publicity for reverse lend-lease from the British Commonwealth is contained in a report issued by the Foreign Economic Administrator this week. The total for the first quarter of 1944 is put at \$500 million of supplies and services to American forces and shipping overseas. Figures on raw materials, commodities and food-stuffs furnished for shipment to the United States have not yet been compiled, nor are full figures available for aid furnished to American forces in India. It is pointed out that the quarterly totals have been steadily rising; for the United Kingdom alone they were \$116 million in the third quarter of 1943, \$224 million in the fourth quarter, and \$260 million in the first quarter of this year. In the first three months of this year aid from Australia and New Zealand exceeded Lend-Lease shipments to those two countries. The report stresses the contribution of Great Britain to the common pool for the liberation of Europe, citing the waterproofing of tanks and trucks, the railway transport for American troops, the jettisonable petrol tanks for Thunderbolt fighters, the 2 million pairs of woollen socks, and 25,000 miles of steel landing mats. To some extent, at least, the report compensates for the most unfortunate result of Mr Lyttelton's recent gaffe—the complete submergence of the facts on Lend-Lease which his speech was intended to convey. It may even help to discourage the belief in certain quarters that the liberation is very largely an American affair.

The Free Philippines

President Roosevelt this week signed two Congressional resolutions affecting the Philippines. The first makes it possible to give the islands their independence as soon as practicable after their liberation, instead of waiting until July 4, 1946, the date originally fixed. This measure also provides for the acquisition of adequate land and air bases, in addition to the naval bases and fueling stations already allowed. The second resolution brings into effect a Joint Economic Commission to consider the economic and financial rehabilitation of the Philippines. Of the two, the second may well be of greater importance to the Filipino than the first. The islands have, during the period of inclusion within the American tariff wall, become so dependent on the American market, particularly for the disposal of sugar, that complete independence, economic as well as political, might easily be disastrous. The Commission will have to consider, not only the reconstruction of the islands after their occupation, but modification of their economy to make them less dependent upon the American market. Most Americans will regard Filipino independence as a well-earned reward for their gallant co-operation against the Japanese; but the fact remains that independence has also been advanced as a means of freeing American beet sugar interests from a serious competitor, and it may be politically impossible to give the Philippines free access to the American market.

THE WORLD OVERSEAS

The Polish Scene

(By a Correspondent)

IN the fifth year of the war the life of the Polish people in the German-controlled "General Gouvernement," that is, in Central Poland, presents a picture of extreme physical and spiritual weariness, if not exhaustion. Five years of starvation, terror and humiliation, unknown in the rest of occupied Europe, have sapped the energies of the nation that so proudly rose to defend its independence in September, 1939. Rarely has a nation been bled so white and lost so many of its spiritual leaders and its best sons in so short a time.

It is on Polish towns that the deepest wounds have been inflicted. The "General Gouvernement"—the rump of Poland—was never economically self-sufficient. Poland's larder lay in the West in the present German-annexed "Warthegau," from which central Poland has been cut off. The agriculture of the "General Gouvernement" has had to feed not only the towns, but also numerous German garrisons. After the loss of the Ukraine the Germans have tried to replace the Ukraine as a source of foodstuffs by this part of Poland. They even claim, and have announced, that the region has now changed from a deficit area into one producing a surplus.

Polish reports do not bear out that claim. The Nazi grip on Polish agriculture has certainly been tightened since the loss of the Ukraine, and this has worsened the food position in the towns even further. Bread has become a luxury in Warsaw, and the population of the Polish capital now lives on potatoes. In 1943 the annual ration of potatoes was about 100 lb. per person. The price of one pound of potatoes on the free market was about 1s. 3d. (if the price in Polish zlotys is calculated at the nominal rate of exchange before the war). In relation to the earnings of the people the price was, in fact, much higher. According to calculations made by the agencies of the Polish Government in Poland, the index of the cost of living last winter was over 5,400 (August, 1939 = 100).

The German Terror

Copied with starvation, an incessant feeling of uncertainty is created by the sudden and indiscriminate round-ups by the Gestapo as well as by press gangs. A street or a whole district is suddenly surrounded by SS men; hundreds or thousands of people are driven straight from the pavements into lorries and carried away to prisons, labour corps or concentration camps, either in Poland or in Germany. Public executions have become a common sight not only in villages and small towns, but in the capital itself. The social fabric of life has been destroyed. All classes of society have been thrown into the melting pot of the Terror. For five years the system of education has been abolished, and the young generation has grown up wild and illiterate.

In the background are the ruins of the Jewish ghettos. For eighteen months the extermination of the Jews has been going on with a monotonous cruelty for which there is no parallel in history. In Warsaw alone the ghetto housed between 400,000-500,000 Jews in the first years of the war. Except for a handful who have been saved and hidden by the Polish population, or who have joined the partisans, not a single Jew is left in the ghetto since the tragically hopeless struggle of 30,000 survivors against the German garrison of Warsaw in the spring of last year.

What happened in Warsaw happened also in many other towns of the "General Gouvernement." The disappearance of the Jews led to a wild scramble for the remnants of their property by a minority of the Polish population. The greatest crime of the war has paradoxically given birth to the mushroom-like growth of a new Polish middle-class consisting of the most diverse elements, but mainly of a social and moral Lumpenproletariat.

In this atmosphere there could hardly develop any collaboration between Poles and Germans. Such chances of col-

laboration as might in theory have existed were wasted by the Nazis during the first years of the occupation, when the conquerors hoped for a quick victory, and saw no benefit for themselves from any concessions to the Poles or from any mitigation of the rigours of their rule.

Approaches were recently made by the Nazis to certain Polish personalities. Appeals for a common front against Russia were issued. But the gulf between conqueror and conquered was already too wide to be bridged by "anti-Bolshevism." And the Germans' own daily warfare against the Polish people went on uninterrupted, even while appeals to wage common war against the Russians were being made. The terror frustrated all chances of collaboration. People who, under different circumstances, might just possibly have become collaborators more often than not travelled from the conference tables in high German offices straight to German prisons.

The Underground State

The underground movements in Poland have been faced since the beginning of the war with the most difficult dilemma. The organisation of mass activities, strikes, and demonstrations has involved the most terrible risks for the non-political mass of the people, as well as for the active resisters. Every act of resistance has called forth the most massive reprisals. On the other hand, no movement of resistance can exist in passivity, since the penalty for passivity is internal disintegration. And passivity—because it could never be complete—could not prevent the terror from raging.

The dilemma is still unsolved. The Polish underground movement has developed a conception of its rôle which is somewhat different from the conceptions prevailing in the movements of other occupied countries. It does not regard itself as an organ of popular resistance, but as an underground state in being. Thus it is officially said that the underground state employs 30,000 officials. How correct this figure is it is difficult to say, and it is not very important. What is interesting is the emphasis laid upon the "state" aspect of the underground. The core of the movement seems, in fact, to consist of the more courageous elements of the former civil and military services, and that core is itself surrounded by the illegal organisations of the political parties.

This follows a traditional pattern inherited from past Polish experiences. But it seems to have resulted in a some-

Man about Town

Of this once-familiar type it was written: "He follows rigidly the conventions of dress and manners. Hansoms were made for him, and gold-banded cigars." To which we may add that he also favoured the delectable cigarettes made by Rothman of Pall Mall.

As an example of how good these cigarettes are, you should

try our Navy Cut Medium. Fragrant and fresh, they are modestly priced at 11/- a hundred (postage 3d. extra). We shall be happy to supply you at any Rothman shop, or direct by post from Rothmans Ltd. (Folio B.22) 5 Pall Mall, London, S.W.1. DUTY-FREE Parcels to Prisoners of War and H.M. Forces Overseas (including India and Burma). Ask for special order form containing full particulars.

what one-sided and limited form of resistance. The underground "state" tends to act in a "bureaucratic" way. It directs acts of sabotage, condemns traitors to death, and carries out sentences. It also directs the activities of quasi-professional military cadres. But it does not give the resistance a broad and popular character. There has developed a striking contrast between the intense activity of the narrow cadres of the "underground state," and the apathetic passivity of the broad masses of the people in the face of German call-ups, expulsions and mass executions.

This implies not the slightest reflection on the courage, devotion and heroism of the cadres of the Polish "underground state." The point is simply that the methods adopted do not seem to have provided any antidote against the despondency and feeling of helplessness bred among the people by the prodigious German persecution.

The next months or weeks will put the Polish "underground state" to a trying test. The Poles may see the entry of the Soviet armies into central Poland before a Polish-Soviet agreement has been reached. It is hardly necessary to explain the new and painful dilemmas which such a position is bound to create for the fighters of the Polish underground. The Polish Government, it will be remembered, has instructed them to co-operate unconditionally with the advancing Soviet armies in expelling the German invaders. To what an extent the Poles will be able to carry out these orders will now largely depend on their treatment by the Soviet authorities. The Russians will no doubt find that the Polish "underground state," whatever its limitations, is the decisive political factor in central and western Poland.

The Canadian Indian

[FROM OUR OTTAWA CORRESPONDENT]

To a greater extent than for many years, an awakening interest in the native Indian population of Canada is manifest. Examination of post-war problems over the whole field of rehabilitation has led to the discovery that a neglected problem of this kind had existed inside Canada long before the war. The handling of native peoples throughout the world will be one of the foremost problems of the post-war settlement, and it is a matter of surprise to Canadians to find that their policies with respect to the aboriginal native peoples of Canada, numbering 120,000 persons, scarcely bear comparison with progressive policies developed in other countries in recent years. In particular, the new Indian policies of the United States Government, and the modern treatment of the Maoris by the New Zealand Government, offer a striking example to Canadians.

In Canada, the Red Indian, the noble red man of the romantic novel of Canadian history and the Hollywood screen, has been segregated on reservations, bound by a policy of perpetual wardship and denied the status of citizenship and the ordinary opportunity of economic advancement. "In one law," said an Indian chief recently, "we are classed with the Eskimos and the insane. In another they tell us we are not a 'person,' a term describing an individual other than an Indian. In one law, compulsory service regulations apply, as we are held to be British subjects. In another, the electoral act, we are not British subjects, and cannot vote, hold office, drink in a tavern, and have intoxicants on the reserve." Some 3,000 Canadian Indians are serving in the armed forces, a fact which has injected the problem of Indian policy directly into the field of post-war plans.

Within the terms of traditional policy toward the Indian, the Canadian Government has fulfilled its obligations. Many tribes have had ancient treaties with the British Crown, dating from the conclusion of the Indian wars. The Government has spent several millions of dollars each year in Indian administration. But the result has been that the Indian has been walled in by a policy of paternalism. The Indian school system, operated largely on denominational lines, has been out-moded. The Indian has not risen, except in a few special cases, beyond a position of inferiority. He has been unable to secure a voice in parliament or in public life with which to press his just claims. This is the policy that has recently begun to come under scrutiny in Canada.

The war has brought, for the first time, a temporary measure of economic opportunity to the Indian. The Indian Affairs Branch recently reported:

There has been a steady decline during the year in the production of basketry, hand-loom weaving, wood carving

and other types of handicraft work. This decline took place despite the increased demand for handicraft products, particularly basketry. The decline was due wholly to the number of Indians, particularly Indian girls, who had become employed in essential war industries.

At best, the basket and beadwork type of employment has produced only a very low standard of living for Indians. On the other hand, recent developments in northern Manitoba and Saskatchewan—regions of muskrat conservation projects—have elevated and stabilised the economic situation for several hundred Indian families. Since most of the Indian men in Canada are trappers, the conservation of wild life represents a direct approach to the Indian problem.

But on the whole, conditions on Indian reservations and in villages in the northern wilderness have remained, as some members of the Parliament Committee on Reconstruction recently observed, in the category of slums. The reservations do not, indeed, support the Indian population. Medical and other services, even the provision of food in some cases, are provided by the Government. Reservation areas are generally poor land, without mineral or other resources. It is not surprising that many Indians, especially the older population, cling to the reservations which are the only prospect of security open to them. For the younger people, the failure to open up the pathway of improvement and assimilation into the economic life of Canada represents a tragedy to them and a national loss to Canada.

The root of the trouble lies in the Indian educational system. It has been called a national disgrace by students of Indian affairs. Official records showed that in 1943 there were 352 schools to which Indian children went, and enrolment was only 16,800. Fewer than a hundred of these pupils had advanced beyond elementary school stage. Higher education for talented children has not been available. Judging from the record. About half of those attending school go to residential or church mission schools. This system, followed in Canada, is being abandoned in the United States because of the inevitable reversion of Indian children back to the barren, initiative-killing life on the reservations.

To modernise Canada's Indian policy, a thorough transformation of public attitude will be required. The argument that the Indian should be treated as a free and equal citizen immediately arouses antipathy and scorn, so long has the public neglected the Indian, and so fixed has become the idea that he is an inferior person. But up to now Canadian Indian policy has done little beyond save the Indian from extinction. It has done little to open the way for his assimilation into Canadian society. The young and intelligent Indian objects that he is being forced to remain within an old and obsolete mode of living. In the wake of this war, however, the first evidences of change in Canadian attitude have appeared.

Price Control in India

[FROM A CORRESPONDENT]

EUROPEANS and Indians alike have been keenly interested in the effectiveness or otherwise of the Government's somewhat belated measures for combating inflation. There is considerable gratification, in which the large numbers of British Servicemen here share, that the steep rise in prices has been halted.

The Government has taken various measures to check the rise. Most prominent and popular in the public eye is the Profiteering and Hoarding Prevention Ordinance, the effects of which are now becoming visible in large reductions in prices over a wide range of everyday articles to conform to controlled maximums. The prices of certain categories of consumer goods have fallen substantially in Delhi, Bombay and Lahore, moderately in Calcutta, Lucknow, Nagpur and Karachi, and slightly in South India.

Sir Jeremy Raisman, Finance Member, in presenting his latest Budget, pointed out that, apart from primary items of food and clothing, there are a thousand and one other consumer goods which have been placed out of reach of the ordinary man by the anti-social practices of profiteering and hoarding, and it was to combat these that it had been necessary to frame this all-embracing enactment. The measure thus operates in a double-barrelled manner: (1) forcibly and arbitrarily reducing prices; (2) forcing supplies on to the market, thus also tending to lower prices.

Every dealer is required to maintain complete lists of

controlled prices on display in his shop, and these must be shown to customers on demand. The selling price of an article, for which Government has not fixed the maximum price, must not exceed by more than 20 per cent its cost on landing (in the case of imports) or its cost of production. The public are urged to demand cash memos., which dealers must furnish if the amount of the purchase is Rs. 10 or more, except for fruit, vegetables, fish, meat, eggs.

In late November, under the Ordinance, the Controller-General called upon all importers of a large variety of specified goods to supply the following information in respect of their transactions: licence numbers and dates of import licences; quantities arrived since January 1, 1943; quantities expected during the next six months; names of wholesalers and retailers to whom the articles imported have been sold and prices at which sold; landed cost including duties; normal profit margin before the war in 1939; and profit margin now charged, giving reasons where it exceeds 7½ per cent.

In early December this was followed up by a notification that twenty-three articles of wide consumption were subject to the provision of the Ordinance that no person other than a dealer or producer shall have in his possession at any one time more of such articles than are necessary for the reasonable needs of his family for a period of three months. Throughout December, the Controller-General toured the country contacting commercial bodies with the object of taking the trade into confidence and securing their co-operation.

The Ordinance has been amended to make it self-contained by providing, *inter alia*, for the summary trial of offenders and for the refund of excess price charged. Most of the Provincial Governments have set up advisory committees to administer the Ordinance.

The Government is to open model shops which will sell articles at controlled rates. Among the further goods which are to be controlled are silk, radios and parts, second-hand motor cars (by making them saleable only to authorised dealers) and boots and shoes (by appointing licensed dealers).

The Example of Cotton

It was the cotton cloth control which pioneered the way for the successful application of the dual principles embodied in the Ordinance. This control came into operation in June, 1943; under it maximum prices were fixed, and all cloth manufactured after August 1st had to be stamped with the controlled price and the date of manufacture (to prevent hoarding, as all cloth should be disposed of within six months of manufacture). All stocks of unstamped cloth (i.e., made before August 1st) had to be sold (to the public) before January 1, 1944 (originally October 31, 1943), or they would either be confiscated or stamped at a heavy fee, which would relieve the hoarder of any profit he hoped to get by hoarding. In August a stock declaration was called for, and its results startled the market. Merchants had accumulated eight months' supplies. As a result of the control order more than 2,500 million yards of hoarded cloth were forced on to the market. Ceiling prices (reviewed quarterly) for over 20,000 varieties of cloth have been fixed, although when the scheme was started it was thought the number would not exceed 3,000.

In mid-February the Indian Woollen Goods (Control) Order was published, providing that only recognised dealers might sell controlled woollen goods and then only at prices not exceeding the maximums fixed by Government, while other Indian woollen goods cannot be sold at more than 25 per cent above cost of production. Individual purchases of controlled woollen goods in a year are also limited. Again, with effect from March 1, coal distribution came under Government control, with fixed prices for all coal and coke.

Rationing of rice, wheat and sugar now exists in more than 50 cities and towns, and in the case of Bombay and Travancore is being extended to rural areas. By the beginning of April, however, it was hoped that all-India statutory price control over rice would have come into force. One uniform price for all-India was not envisaged; but it was intended to fix prices on a regional basis, one for South India, including Orissa and Bombay, another for Central India, and a third for Bengal and Assam.

All these measures represent the tackling of inflation from the supply side. On the demand side, Government is making powerful efforts to mop up surplus purchasing power by various means. These include: a fourth Defence

Loan issue; a small savings campaign; the Prize Bonds scheme; increased taxation; gold sales; and a proposed 25 per cent rail fare increase, which is expected to deflate currency at the rate of Rs. 1 crore a month. Market speculation has been checked by banning forward transactions, with floor and ceiling prices for raw cotton hedge contracts. Subscriptions to Defence Loans for the year to February 1, 1944, reached the record figure of Rs. 115 crores, nearly three times the figure of the previous twelve months.

This year's Budget drew the net still tighter round profits and incomes increased by the war and reduced the dividend-paying capacity of companies. Corporation tax and income-tax are expected to bring in Rs. 174 crores (including Rs. 78 crores from EPT) against Rs. 18 crores before the war. While there is no change in the 66½ EPT rate, the compulsory deposit is raised from 1-5th to 19-64ths. Agricultural incomes are also to be taxed by Provincial Governments. Because the normal 1,000 tola gold bars (worth Rs. 71,000) are beyond the reach of all but the wealthy classes, in order to absorb the purchasing power of the masses, Government Mints were ordered to make small bars for local markets. These are available in weights of one tola (worth Rs. 71) and five tolas (worth Rs. 355), the former being like a 4-anna coin and the latter rectangular.

When is an apple ripe?

If an apple is picked for storage before reaching a certain stage of ripeness it is liable to develop a disease known as bitter pit. That is why, in some countries, the apple growers prohibit the exportation of immature fruit, lest their reputation suffer abroad. In order to determine the right time to harvest, an apple is sliced in half and the exposed part treated with a solution of potassium iodide and iodine. If the apple is completely ripe, no change in colour appears. The various stages of immaturity are accurately registered by changes in the colour of the cross section.

Iodine is used by veterinary surgeons, photographers, engineers, opticians, and even by gamekeepers in the rearing of pheasants. There is hardly any commercial or industrial organization which does not, knowingly or unknowingly, employ iodine in some of its many forms. If you have an iodine problem, write for information to the IODINE EDUCATIONAL BUREAU. This Bureau exists to help you, and its advisory services are free.

WHITE HORSE was never better than it is to-day

It would be easier to buy White Horse Whisky as and when you like to-day if there were not so many people trying to do the same thing. Like so many of the comforts of peacetime, White Horse is scarcer because of the war.

It takes long years to bring this famous whisky to ripeness and maturity. It took forethought and a provident care to provide the present regulated supply. And the same care and forethought are your assurance that to-day and in the years to come the quality of White Horse will be guarded as jealously as ever.

More White Horse could not be released without broaching stocks still growing old and ripe for your future pleasure. And for no consideration will the good name of this famous blend be put in jeopardy.

MAXIMUM PRICES:—Bottles 25/9d.; Half-bottles 13/6d.
as fixed by The Scotch Whisky Association

WHEN will you get Black Magic again?

[WE GIVE YOU ONE GUESS]

All the nice things that used to be in Black Magic Chocolates — are they dead?

No.

They exist.

But they might as well be dead, for all the use they are.

The Mauritius sugar that gave the tang to the Black Magic caramel — it's in Mauritius.

The Valencia almonds that went into the Black Magic truffle-and-nougat and montelimar — they're in Valencia.

Brazil is no longer where the nuts come from. It's where the nuts stay.

Venezuela no longer sends us its peculiar fruity cocoa beans. It sends us petrol.

We didn't use petrol in Black Magic.

All the nice things are in all the nice places — except Britain.

They'll come again. When they do, so will Black Magic.

You can call that a threat or a promise, as you please.

ROWNTREES

THE BUSINESS WORLD

Rubber Prospect—II

THERE will be room after the war for both natural and synthetic rubber. Natural rubber will probably continue to hold a substantial advantage in price and quality for general purposes, at least for some years. There will be a growing outlet for synthetic rubber in special uses; as a result of further technical improvements in its quality and in ease of handling, it may also tend to encroach upon fields formerly held by natural rubber. For example, it may find a growing usefulness for duties that require a high degree of resistance to petrol, oil, chemicals and abrasion, even if it remains more expensive than crude rubber. In such uses it will command a premium measured by its qualitative superiority. Some Buna-S enthusiasts, perhaps optimistically, envisage a standard tyre with a Buna-S tread, a natural rubber base and sides, and a bead of reclaimed rubber.

But, in the calculable future, there will hardly be room for the whole potential output of crude rubber and the present productive capacity of synthetic rubber, even on the most optimistic assumptions about prospective demand.

On Mr K. E. Knorr's admittedly tentative calculations—these are reproduced in Table I—the world's combined annual productive capacity of crude and synthetic rubber is likely to reach some 2,750,000 tons after the rehabilitation of the Far Eastern plantation industry. During the first ten months of 1941, when restrictions on crude rubber shipments were virtually suspended, an average price of about 13½d. a lb. in London gave rise to exports at the rate of more than 1,500,000 tons a year. Obviously, it will not be possible to resume shipments at this rate immediately after the liberation of the territories now occupied by the Japanese. But if restoration is pressed ahead and there is no restriction, the industry's productive capacity may well regain its former level within about two years. Moreover, if restoration is accompanied by a drive for efficiency, something like the former volume of shipments might be forthcoming within a few years of the liberation at half the real cost of 1941—at a profit to producers and with wages and working conditions among the best in South-Eastern Asia. In addition to this prospect of 1,500,000 tons of natural rubber, there may be a synthetic rubber capacity of nearly 1,250,000 tons a year—though, of course, its costs will be substantially higher than those of plantation rubber, at any rate initially.

The consumption of rubber showed a steady increase during the inter-war period with the growth of motoring, which accounted for about two-thirds of the total demand. As Table II shows, the consumption of crude rubber was in 1937 amounted to 1,100,000 tons, which was a double the consumption of the middle 'twenties. A further increase in consumption is as certain as the further expansion of the world's road traffic;

moreover, there is a growing market for rubber—especially for cheap rubber—in other uses. Although greater durability may bring economies in the use of rubber—still better tyres, for example—it would not be surprising if the consumption of crude and synthetic rubber together were to approach 2,000,000 tons a year at the end of the forties. But, for a few years at any rate, it might be safer to reckon with a combined demand for crude and synthetic of about 1,600,000 tons, as suggested by Mr Knorr.

Pending the rehabilitation of the crude rubber industry, that is, for a year or two after the liberation of the Far-Eastern sources of supply, the world is likely to absorb all the rubber it can get. The replacement demand for tyres will be very great. But once the productive capacity of natural rubber is fully restored, combined crude and synthetic rubber capacity will be greatly in excess of prospective demand for a few years, perhaps by as much as one million tons a year, or about a third of the capacity.

The main problem after the war is therefore to create the conditions in which natural and synthetic rubber can both play their part to the best advantage of the consumer at prices that yield a reasonable return to efficient producers. More precisely, it is one of adjusting total supplies of rubber to demand at the lowest prices that will satisfy total demand. This involves the fullest possible equality of opportunity, not only for crude and synthetic rubber, but also between estate and native producers of crude rubber.

*

Any proposals for the solution of the problem must take account of the economic facts that the United States is by far the most important consumer of rubber—it accounted for half the world's total intake during 1937-39—and that consumers' purchases and prices have been very unstable in the past. Nor must they overlook the political facts that the bulk of the supplies of natural rubber are derived from British and Dutch territories and that the greater part of the newly created synthetic capacity is in the United States.

Neither of the two extreme solutions that command a body of followers—completely uncontrolled competition or all-embracing cartelisation—is likely to satisfy the economic criteria and to prove politically acceptable.

To the economic purists, inevitably, free competition is the perfect solution of the problem. A free market, so they say, would automatically ensure the adjustment of total supplies to demand at the lowest possible prices; it would also regulate the proportions in which natural and synthetic producers are to meet the world's needs of rubber, as well as the relative shares of estate and native producers in the

(a) Net imports.

The question "where" residential construction should take place raises few problems as between regions. In the main it should and will follow population growth, from whatever cause resulting. The only question that arises in this connection is whether the hitherto unchallenged virtue of home ownership is appropriate for a country in which mobility of population is so pronounced; the individual stands to lose much if he owns a home under such conditions.

Within metropolitan areas, however, the location of housing is important. City planners agree that the only hope for the fiscal and social structure of American cities is to reduce the density of population and business in city centres in an orderly fashion, and in such a way as to reduce the cost of living and doing business there. In addition, the area of city government must be enlarged to enable cities to assess part of their costs against dwellers on their outskirts who take advantage of their services but do not pay for them. The alternative, which is rapidly becoming reality, is depopulation of the core of cities. Since use values based on lower densities would be considerably below present land values and since condemnation at these lower values is impossible under the American constitution, cities seek a way of bringing land values down to a level where building

and rebuilding in city centres is economically feasible.

Out of this welter of controversy emerges the following rough range of prediction for American housing in the post-war period. The number of units required each year in the first ten post-war years, to house the net growth in the number of families, to meet migration and to replace worn-out housing, may run anywhere from 500,000 to 2,000,000 with most estimates in the area of 1,000,000 to 1,500,000. Most of these units will be built by private enterprise, and prefabrication, partial as well as complete, will play its part in pushing down the "floor" for private construction, which will be the "ceiling" for public enterprise. A five-room \$2,500 house (pre-war price level), complete with land and utilities, seems to be a practical possibility within five years after the war.

The same kind of houses will be built as before but more efficient methods will be used to reduce costs of constructing them. No radical change in mortgage finance is foreseen, although many would like to see reduced initial payments and monthly payments reduced by longer periods of amortisation.

Finally, since urban redevelopment plans are still in the discussion stage, building will, at least initially, proceed on the outskirts of metropolitan areas just as it has in the past.

Business Notes

Monetary Agreement with France

It was announced by Mr Eden in the House of Commons this week that negotiations had been proceeding in London between officials of the British Government and the French Committee of National Liberation on the administration of civil affairs in liberated areas and on the currency question. These negotiations have been held at the expert level, but the official approval of the agreement is likely to prove no more than a formality. When ratified, the agreement will be submitted to Washington; as this

step should coincide with General de Gaulle's visit to President Roosevelt, there is every reason to hope that it may provide the corner stone of a practical recognition of the Committee of National Liberation as the Provisional French Government by the two Allied Powers. The agreement on currency would give to the Provisional Government in Algiers the responsibility for the issue of currency in liberated France. The military franc notes would still be used, but their issue would be canalised through the French authorities, which would thus be in possession of all the facts about the monetary circulation, though not necessarily in control of it. The French authorities would thus be able to co-ordinate their policy in the matter of control of prices and wages with the relevant facts in the situation and would not suffer, as they must do in existing conditions, from divided responsibility for what are different aspects of essentially a single problem.

The issue of military currency in France has hitherto caused little dislocation. President Roosevelt has issued an appeal against excessive spending by the Allied forces, and instructions to the same effect have been given to the British troops in Normandy. The military notes are not circulating very freely. Their unimpressive appearance and the fact that they bear no signature or other proof of the authority responsible for their issue or redemption will ensure that they do not become a true part of the circulating medium. They are finding their way back to the banks much more rapidly than the old Bank of France notes which also formed part of the Allied armies' stocks of French currency. There have even been cases of current taxes being paid by Norman peasants in the military currency. That must be the nearest indication yet available that the notes in question may be standing at something less than par. Meanwhile British banks have been given instructions regarding the encashment of franc notes—both military and Bank of France—brought back from Normandy by the Forces or sent here on French account. For the former, they will be converted at the official rate of 200 francs to the £. For the latter they will be converted without limit at 202 francs to the £. The ultimate redemption of these notes will probably be left to the grand balancing of accounts that will take place after the end of the war. The mutual aid agreement between this country and the French authorities is, as far as operations in metropolitan France are concerned, working in a one-way manner. There is still no organised authority on the spot with which Allied bulk purchases of commodities such as milk, for which the Forces would normally depend on local supplies, can be transacted. In each case, the transaction has to be settled direct with the seller and paid for in cash. In such transactions it has, on the whole, been found that even when paying the controlled prices, the franc is considerably overvalued at 200 to the £. In other words, the debt being accumulated by the Allies in respect of currency issued by them in France is appreciably larger than

OVER a century's experience of sound construction is behind the making of Milners' Office and Factory Steel Equipment.

the volume of goods represented by these issues would warrant. Fortunately, the amount in question is as yet small. The main purpose of the 200 francs rate, that of keeping down the local expenditure of the troops, is being achieved, and if, in the process, abnormal sterling balances are being increased rather faster than they would otherwise be, consolation must be found in the minute proportions which the debt to France will occupy in that aggregate liability of Britain. If and when it serves French interests to change the 200 francs rate, the change will no doubt be made.

Reconstruction Equities

Despite an undoubted decline in the volume of business, the general tone of the stock market remains firm, with a quite appreciable rise in the general level of industrial equities. *The Actuaries' Investment Index*, of which some particulars are given on page 63, has risen by two and a half per cent on the month and by almost exactly 12½ per cent on the year. In detail, the improvement on the year is very close to that figure for the miscellaneous group, over 18 per cent for the distributive, and only just over 10 per cent for productive. So far as home industrials are concerned, the feature is a jump of 7.2 per cent on the month, and of 24.6 per cent on the year for stores and catering. This gives the key to the cause of the buying, namely, that the investor has made up his mind that the cessation of hostilities is not very far off and that all reconstruction shares will be permitted to reap a substantial benefit. Thus, the other groups, showing rises well above average, are building material shares, electrical manufacturing and the important miscellaneous group, which includes representatives of many of the newer industries. Exceptions to the rise are motors, home railway stocks and shipping shares, all of which had recently been the object of distinctly speculative buying. Another rise which calls for particular mention is one of 3.9 per cent on the month, and 28.5 per cent on the year, in oil shares. The index is made up to Tuesday, June 27th. Since then, the story has to be continued by the figures of *The Financial News*, whose indices are given in a chart on page 66. These show a further appreciable rise to date in equities, with a sagging tendency in fixed interest stocks. The figures of *The Actuaries' Index* suggest that the actual weakness in this section is restricted to long dated Government securities. This is, of course, the classical reaction to a promise of higher earnings for industry, but virtually the whole of the adjustment has taken place by a rise in equities. In view of the widespread belief that some further considerable rise in prices will occur, the strength of all fixed interest securities is to be considered as a tribute to the power of the authorities to keep down the rate of interest.

Unit Trust Accounting

The last few days have brought the publication of two further sets of unit trust accounts, making with those of the Municipal and General three attempts to solve a difficult new problem. The two new competitors are the Trust of Insurance Shares group and the Orthodox Unit Trust. All three are independent of the Association in which most of the trusts are grouped and, unfortunately, all three present different solutions. The Orthodox may, perhaps, be regarded as a less informative version of the M. & G. type of account and the lack of information is in part due to the fact that the managers have only one trust, so that fuller information would give the size of the trust. All managers appear to be agreed that the size must not, normally, be disclosed, but it would seem that special concessions ought not to be given to managers of a single trust merely on that account. Some details of the M & G accounts have been given in *The Economist* on various occasions—most recently on April 15th—and it has to be admitted that the figures are numerous and their meaning difficult to grasp unless one understands the inner workings of the various types of unit trust. The TIS group attempt to overcome these difficulties by presenting much simpler accounts than those of M & G. They present, as accounts of the managers, a balance sheet and profit and loss account and, as accounts of the managers disclose particulars about their financial standing and the profit earned, but it is with the accounts of the trust that the unit holder is primarily concerned. It is there that he must look to see

what is the cost of performing the various functions—creation and issue of new units, purchase and resale of units, jobbing in units and liquidation of underlying securities. Further, there should be disclosed any profit or loss from the rounding off of sub-unit prices and, last but not least, the remuneration for management. A little consideration will show that it is by no means easy to be dogmatic about the proper definition of certain items. Broadly, however, it is clear that no pronouncement can be made on the conduct of a unit trust unless something very like this information is available.

Standardisation Essential

By this criterion the accounts of the TIS fail to qualify. The fact that no units can be created in wartime removes some causes of complication, but even so there is no functional division of profits provided. A good deal of information is given outside the accounts, but that is an unsatisfactory method. The reason for rejecting the M & G method is the very natural desire to secure simplification, but the plain fact is that the matter is both complex and unfamiliar. Over-simplification merely obscures the facts, and the facts must be made clear if the unit trust movement is to gain in reputation and take the place it might in encouraging investment in equities. The TIS accounts may be an excellent statement of the managers' profit. They provide no means of saying how that profit is made and when economies are necessary. But, if it could be conceded that all three sets of accounts were excellent, there would still remain the fact that all are different—two completely different in conception. It will be sufficiently difficult for all those concerned to digest and explain one complicated set of accounts. If each group of managers is to have its own set, the task will become herculean and it is fairly safe to say that most people will not attempt it for more than one or two groups. The Prevention of Fraud (Investments) Act, which is supposed to come into force this month, makes the publication of accounts obligatory, but the relevant schedule fails to prescribe any form. The same is true of the constitution of the Unit Trusts Association. It is essential,

BENEFACTORS OF MANKIND

SIR JOSEPH WILSON SWAN (1828-1914)
The contribution of this grand old man to industrial progress and the advancement of civilization ensure for him an unfading name. His 86 years of life considerably exceeded the allotted span and added to the sum of human knowledge in due proportion.

Research

MANY branches of industry have benefited from the accomplishments of Sir Joseph Wilson Swan. But those which his research and original application have advanced most directly are chemistry, photography and electricity. To electrical engineers he is probably best known through his connection with the development of the carbon filament lamp. He invented the cellular surfaced lead plate for storage batteries and added greatly to the knowledge of electro-deposition of metals, and devised apparatus for measuring electric currents.

It is through the co-operation of designer and craftsman that Brush Electrical products have reached their present high standard after half a century of continuous progress.

if the movement is to reach its full development and provide service to a large number of investors, that a standard form of accounts should be prescribed which will give the information necessary to show that the funds are being administered with at least honesty, competence and economy. The preparation of such accounts should be entrusted to the leading firms of auditors who are familiar with unit trust accounts and they should be given specific instructions that there must be no question of concealing either the total or the details of the managers' profit. After due consultation with the managers, this form should be incorporated in the Act.

To Let or to Buy

The generally recognised need for a wider choice between houses to let and houses to buy can be met, at least in part—as was suggested on page 25 of *The Economist* of July 1—by constructing for letting a substantial proportion of the additional houses that will be required after the war. It is, of course, impossible to estimate in advance precisely the relative demand for houses to let and for houses to buy. This demand will be strongly influenced by the trend of building costs and of the price of houses. During a period of falling prices the relative demand for houses to let is likely to be greater than during one of rising prices. During the 'thirties, for example, when building costs and the price of houses tended to decline, a substantial number of people who bought houses might have preferred to rent them if they had had the choice. But even if the trend of prices is upwards after the war, it is doubtful whether the construction of a substantial proportion of houses for letting will provide a stock of houses to let commensurate with the need, measured by consumer preference. Further steps will be necessary to meet this need at all adequately. For example, it should be possible, either for local authorities or for private institutions, to buy part of the existing stock of houses and to make them available for letting. Far too little thought has yet been given to the practical measures that will have to be taken to meet the need for a wider choice between houses to let and to buy.

Survey of Post-War Markets

The Committee for Economic Development in the United States—an organisation set up by American business men—is organising a study of post-war markets, in collaboration with 581 trade associations, on a scale never attempted either across the Atlantic or in this country. The study has three aims. First, it is intended to assess the general level of business activity in 1947 (on the assumption that it would be the first full peace time year) on the basis of a consensus of industrial opinion. Secondly, the results are to be tabulated on the basis of census classifications in order to enable each manufacturer to estimate the post-war prospects of his industry as a whole, and to plan his own activities accordingly. Thirdly, the study is designed to familiarise manufacturers with the methods of appraising with some accuracy the factors likely to affect their businesses. The practical value of such an appraisal will obviously depend on its

quality. But in conception it is a reflection of a high degree of collective enterprise that should benefit not merely the individual manufacturer, but the community. It goes far beyond the kind of market research that has hitherto been undertaken. The collective organisation of such a study for this country would seem to deserve serious consideration. It would enable manufacturers to see more clearly ahead, and to plan their productive schedules for longer periods and with less uncertainty; and it would assist the Government in its aim of maintaining "a high and stable level of employment after the war."

Home and Colonial Changes

The preliminary results of the Home and Colonial, Meadow Dairy and Lipton group, given in *The Economist* of June 10th, disclosed an increase in net profit for the year 1943-44 of some £31,000. The full reports of these companies show that this rise was due solely to better results at home and that it was secured in face of declining earnings overseas and further restriction of supplies in this country. The explanation is to be found partly in actual economies and partly in the rather wider margin permitted between buying and selling prices. The decline in overseas earnings is explained by the chairman, Sir George Schuster, as being due mainly to conditions in the Indian tea trade. The inflationary set-up in India resulted in higher "dearness allowance" being paid to coolies. The Government arrangement made no provision for varying the price paid for teas, with the result that profits declined. This matter has now been remedied and current results should be better to that extent. A further trouble arose from the hoarding of domestic stocks of tea by Indian dealers. The resultant scarcity caused prices to soar and supplies were further restricted by transport difficulties arising from labour shortage. In these circumstances the group, in collaboration with another firm, decided to cut the selling price instead of raising it as the speculators had hoped. The manoeuvre was successful, and it may be hoped that it will not have to be repeated. Meanwhile, however, the policy resulted in some loss to the company.

Sir George also discloses certain changes in the assets of the whole group which may be of considerable interest to shareholders. It transpires that certain of the Lipton interests had already been sold in 1941, including some rubber plantation holdings. During the year the holding in T. J. Lipton, Inc., a company which controls the manufacture and sale of Lipton products in North America, has also been sold. It appears that the holding did not confer control and that the sale will not disturb mutual trading agreements. It results in a profit to the group of £123,000, of which £53,000 accrues in cash and the remainder represents Ceylon properties still retained. The net result of these various transactions appears to be to reduce the Lipton plantation assets to three Ceylon tea estates with an area of 3,400 acres. These sales have been effected in pursuance of a policy which considers the home retail trade as the main purpose of the group. This may well be sound, but the readiness of so many British concerns to reduce, or abandon, overseas interests is a little disturbing.

John Brown Re-financing

The latest example of a large-scale conversion of debt by British industry is that of John Brown, who are repaying on October 31st £1,939,082 to 4½ per cent debenture stock at a premium of 6 per cent. The operation calls for some £2,055,000, but the company proposes to raise only £1,800,000, finding the balance from its own resources. The money is to be raised by the issue of £550,000 3½ per cent debenture stock and 1,250,000 4½ per cent cumulative preference shares of £1 each, both at par. Holders of the existing debentures are offered the right to convert 30 per cent into the 3½ per cent debentures and 70 per cent into 4½ per cent preference shares. The latter is permanent capital and the former is repayable over a period of 20 years. Thus, the company will save some £12,839 per annum in interest and a similar sum in sinking fund provisions. Some play is made with the latter point, but it has to be observed that, if the arrangement permits the company to retain its liquid resources, the first stage of the transaction calls for the disbursement of some £255,000 net. In view of the fall in the rate of interest, the conversion was to be expected. As in other recent cases, the main interest attaches to the alternative form of security chosen. In the context of post-war uncertainties, the arrangement adopted has many advantages. The company will have £1,950,000 of preference capital of three categories, £2,153,893 of ordinary capital, and only £550,000 of debentures. It secures a sound capital structure and opens up the possibility of new borrowing on a substantial scale should conditions suggest such a course. This is a fact which those who consider taking the new securities offered will doubtless bear in mind. At the same time this arrangement preserves more of the attraction inherent in all equities than has been possible in these cases where debentures have been converted into ordinary shares. It would be interesting to learn what dictated this particular choice of capital structure. The whole question of the gearing of capital structure needs discussion, and the views of leading industrialists would be a welcome contribution.

Integration in Coal Mining

Active steps are about to be taken by the Coal Commission in the exercise of its legislative powers to extend the scope of geographical integration in the coal mining industry. It may be recalled that in May, 1939, Sir Ernest Gower, in his capacity as chairman of the Commission, addressed to the colliery owners of the country a memorandum explaining the lines on which the Commission intended to proceed in the discharge of its functions and outlining the geographical areas in each of which it contemplated the eventual establishment of one consolidated undertaking. Although it possessed compulsory powers, the Commission then shared the view of its predecessor under the 1930 Coal Mines Act that amalgamations made voluntarily were to be preferred to amalgamations prescribed and enforced by authority, and it indicated the circumstances under which integration should proceed by stages rather than by drastic single steps.

The Commission's proposals were beginning to receive the consideration of the industry when war broke out, but subsequently discussions were suspended, and the only consolidations which have taken place since 1939 have been those negotiated independently. It is understood, however, that the Commission now intends to resume its task at the point where it was left off five years ago. The most important developments during the interval have been: (a) the assumption by the Government since June, 1942, of the operational control of the collieries under the supervision of group production directors responsible exclusively to the Ministry of Fuel and Power; (b) the announcement of the Mining Association last March that it contemplated reorganisation proposals "involving far-reaching plans to cover every aspect of the industry in which organised action can improve efficiency, labour relationships and commercial arrangements"; and (c) the revival of the miners' demand for nationalisation. Each of these factors must inevitably influence the final decision by Parliament on the future of the industry, but in the regional discussions which are about to be opened between the Commission and the colliery owners the sole object would be the ascertainment of the best way of carrying out "a settled policy, prescribed by Statute" (to borrow a phrase employed by the Coal Commission in its memorandum of May, 1939), for the re-

organisation of the industry into a smaller number of productive units of greater average size, and as the Mining Association is now convinced of the urgency of the need for accelerated progress in this direction, there are reasonable prospects of agreement between the Commission and the colliery owners, at any rate on the main lines of the contemplated regional consolidations, before the time arrives for Parliament to give its final decision, within the intent of the White Paper of June, 1942.

Railwaymen and the War

The main issues at the annual conference of the National Union of Railwaymen, held in Edinburgh this week, have been wages and the future organisation of transport. The union has grown in strength and influence since the war; it has over 400,000 members, of whom about 51,000 are women, and its reserves amount to over £3,000,000. Although the NUR does not include locomotive engineers and firemen, or railway clerks, who are organised in separate unions, close relations between the three unions are maintained through a joint committee, and concerted wage claims have been put forward. Railway workers occupy a key position in the national economy, and can point with pride to their industrial and strike-free record since the war. They argue, with some reason, that their efforts and skill, though accorded public praise, are still insufficiently rewarded in monetary terms. The minimum wage of a general railway worker in rural districts is 77s. 6d. a week, made up of a base rate of 47s., with a 25s. 6d. war bonus and an additional, unspecified bonus of 4s. 6d. The base rate in industrial areas is 48s. and in London 50s. Certain increases have been granted since the war, the latest being in April, when an additional 5s. on the war wage (bringing it up to 25s. 6d.) was agreed by negotiation, though the unions had asked for an increase of 12s. a week. The union

leaders' aim is to consolidate the war advances into a minimum all-round rate, which will provide an adequate living standard and allow proportionate differentials for skill. Their claim for a fortnight's annual holiday with pay is still being discussed with the Railway Executive Committee. Mr Fred Burrows, in his Presidential address, emphasised the union's opinion that railway workers would never enjoy real economic security until the railways were publicly owned, and expressed concern lest renewed and intensified road competition after the war should lead to depressed wage standards. The conference adopted by 66 votes to 3 a motion in support of the Labour Party's Transport plan (described in the *Economist* of June 24). Nationalisation of the railways has long been the central plank of both the Labour Party and the Trade Union platform. There may be many social arguments in favour of a publicly owned transport system. But neither the Labour party nor the TUC have yet produced any good economic or technical arguments to support its case.

* * *

Hydro-Electric Power in Scotland

The North of Scotland Hydro-Electric Board, set up by the Hydro-Electric Development (Scotland) Act, 1943, for the development of Scotland's water power resources, has already published the details of "Constructional Scheme No. 1," which, if sanctioned, is to be put in hand as soon as possible. The scheme, which is estimated to involve the expenditure of £4,600,000, comprises three projects, at Loch Sloy, Loch Morar and Loch Lochalsh. The Loch Sloy project is expected to take 2½ years to complete and the others about eighteen months. In an article published in the April issue of *Water and Water Engineering*, Mr Eric Saunders expressed the view that the cost of hydro-electric power is likely to decline in relation to other forms of power, not only in Great Britain but also in other countries. Taking into account the rise in the price of coal, he estimated that, after the war, the average costs of electricity in this country are likely to be 0.30d. to 0.40d. per unit for steam plants, against 0.18d. to 0.25d. per unit for water power installations. On his calculations the difference in costs will be substantial. Unfortunately, Britain's water power resources are comparatively small and, even if fully developed, can only supply a limited proportion of its power requirements. Since power is an important cost item in a number of industries, especially some new ones, everything should be done to ensure the cheapest possible supply of energy derived from coal.

* * *

Co-operative Mail Order Business

At the July quarterly meeting of the Wholesale Co-operative Society a proposal is to be submitted to establish a mail order service in conjunction with retail societies. The Co-operative Movement has not hitherto provided its members with this type of retail service, although the idea is not new. It was first discussed at the end of the last war, but it came to nothing because of the opposition of the larger societies in the industrial areas. The idea was revived in 1936, and in 1939 the Co-operative Union surveyed the position and came to the conclusion that a federal co-operative mail order department would enable the

Society to take part in a type of retail trade which has hitherto been done exclusively by commercial mail order firms. The latest proposal provides for crediting retail societies with the amount of purchases from mail order customers living within their areas. There can be little doubt that a mail order department would provide a service appreciated by co-operators, and it is expected that turnover in dry goods would be increased by the new department. That there is scope for an increase is shown by the fact that whereas the co-operative proportion of national trade in dry goods is only about five or six per cent, co-operative sales of butter, margarine and sugar reach twenty-five per cent of the civil population. The Co-operative Society believes, therefore, that potential trade is lost to mail order organisations which they themselves could transact. The many Co-operative publications would provide first-class advertising media, and shops which do not themselves stock the goods which could be obtained by post could publicise them. The retail societies will be asked to sanction a referendum on the subject of a mail order department; if it is agreed, it is hoped to develop the scheme so that it can begin its operations as soon as possible after the war.

* * *

World's Water Power Resources

Mr Saunders gave some interesting statistics of the world's potential and developed water power resources in 1942, derived from the United States Geological Survey:—

	Horse Power		Per cent. of H.P. Developed	Per cent. of World's Potential H.P.
	Potential	Developed		
North America	77,000,000	29,610,000	42.5	11.4
South America	75,000,000	1,660,000	2.3	11.2
Europe	74,000,000	30,140,000	41.3	11.0
Asia	151,000,000	8,660,000	11.8	22.5
Africa	274,000,000	210,000	0.3	40.8
Oceania	21,000,000	1,330,000	1.8	3.1
Total	672,000,000	71,010,000	100	100

Russia's potential water power was estimated at 135,000,000 HP in 1937 and its developed HP at 30,000,000. These figures, of course, can only be regarded as rough estimates, subject to revision as a result of new surveys and technical improvements in exploitation. But they indicate not only the magnitude of the electric power already derived from water power but also the scope for further development. Compared with these figures Great Britain's potential and developed resources, estimated at about 2,000,000 HP and 641,700 HP respectively, in 1943, look puny.

COMPANY MEETINGS

HOME AND COLONIAL STORES, LIMITED

GROUP'S POSITION FURTHER STRENGTHENED

SIR GEORGE SCHUSTER'S REVIEW

The forty-ninth ordinary general meeting of the Home and Colonial Stores, Limited, will be held on Friday, the 14th instant, at 179-189, City Road, London, E.C.

The following is the annual review by the chairman (Sir George Schuster, K.C.S.I., K.C.M.G., C.B.E., M.C., M.P.), which has been circulated with the report and accounts:—

For the main retail business of our group the past year has, like preceding war years, been characterised by restrictions on our scope for enterprise and a heavy burden of taxation. Nevertheless, as will be seen from the accounts and the directors' report, we have been able to strengthen our group's financial position in preparation for the future, and to recommend repeating the modest war-time dividend of 3 per cent. on ordinary shares. So long as present conditions continue, our chief aim must be to maintain the efficiency of our organisation and to prepare for developing our full strength when normal trading becomes possible again.

It may be of interest on this occasion when nothing new can be said about our home retail business if I call attention to some other portions of our very varied and complex undertaking.

OVERSEAS BUSINESS

The overseas business of Liptons is an important enterprise, including a large tea distribution organisation in India, tea plantations in Ceylon, and depots or agencies in most parts of the world. At present the export of tea normally carried on either from this country or direct from India, Ceylon, etc., has been almost entirely supplanted by the scheme instituted in 1942, under which the British Government, through the Ministry of Food, is the sole purchaser of tea, and allocates available supplies to allied and neutral countries, based on their previous imports. This scheme, initiated when the Dutch East Indies were cut off, was doubtless necessary to ensure equitable distribution of the reduced supplies; but its result has been that the valuable trade built up by British firms in the export of proprietary teas has, at least for the present, been almost entirely lost.

We are preparing to resume an active policy in all overseas markets as soon as war restrictions are removed.

Our tea sales in India showed an increase over last year, but the profits were affected by special conditions. Late in 1942 Indian market prices had been forced up by speculation, while large stocks were hoarded by dealers. Shortage of labour, too, in the docks and public warehouses was causing delays in distribution. As these factors were seriously affecting genuine consumer business, we decided, in conjunction with another firm of distributors, to take the initiative by making a series of price reductions when everybody expected a still further rise. We believe that this action was largely responsible for bringing out hoarded stocks and establishing the more healthy conditions that have prevailed since last September.

This policy, which we are convinced was right meant a substantial cost to ourselves. At the same time our expenses in India have, as elsewhere, increased with the cost of living, while the serious food shortage created a special problem. In co-operation with other British firms we purchased essential foodstuffs in bulk and resold them to our employees at a loss. We thus prevented an inflationary rise in wage rates and kept our employees sup-

plied with food which they would otherwise have been unable to obtain.

Current results in Ceylon have also been affected by special difficulties. Costs rose owing to increased rates of "Dearness Allowance" payable to coolies, and this extra cost was not fully recovered in the prices paid under last year's contract with the Ministry of Food. The current year's contract, however, recognises this factor and provides for a variable price scale.

Another difficulty has been the serious shortage of labour, which, together with a scarcity of fertilisers, has restricted our cultivation programme, and will react unfavourably on this year's results.

In spite of all the special difficulties referred to above, the total working profits from Lipton's plantations and overseas trading business amounted for 1943 to about £70,000.

REALISATION OF OVERSEAS ASSETS

While this overseas business is of importance and has potentialities for development, our main purpose must always be our home retail business. We have therefore thought it right to take every opportunity to consolidate our strength for this main purpose. War conditions have given us opportunities to realise on favourable terms some of the less essential parts of our overseas interests. One of these was the holding of Lipton, Limited, in T. J. Lipton, Inc., which controls the manufacture and sale of Lipton products in the United States and Canada. Shareholders will remember that in 1936 Lipton, Limited, exercised an option to acquire from Sir Thomas Lipton's trustees the issued capital of T. J. Lipton, Inc. (U.S.A.), and Thomas J. Lipton, Limited (Canada), together with certain properties in Ceylon. The Ceylon properties were retained, while the other two businesses were sold to a syndicate in which Lipton, Limited, took a minor participation. One of the Ceylon estates was subsequently sold, and last year a favourable chance occurred to realise the shares in T. J. Lipton, Inc., without disturbing the mutual trading agreements between that company and Lipton, Limited. The net result of all the transactions following the exercise of the option has been that Lipton, Limited, has increased its reserves by £123,000 made up of £53,000 cash profits actually realised and £70,000 representing the book value of the Ceylon properties still retained.

Apart from the above-mentioned Ceylon properties, Lipton, Limited, has always had its own extensive tea estates. During 1941 it was decided to realise the less attractive of these, especially those including rubber plantations, which are really extraneous to our normal business. This programme (which has realised in all about £143,000) has been completed. The final result is that Liptons are now left with three first-class tea estates of approximately 3,400 acres. These it is proposed to retain.

FACTORY INTERESTS

Another important undertaking outside the main retail business is represented by the factory interests of the group. Besides our large tea blending and packing warehouse in London, and our bacon warehouse, we have two jam factories with an annual capacity of 13,000 tons; two sausage factories with a capacity of 12,000 tons, and a large modern bakery which can produce 4,000 tons of biscuits and 20,000,000 loaves of bread, as well as large quantities of slab cake and other goods. In common with the other sections of the business, these manufacturing interests have also had to meet their special problems arising out of war-time conditions; but their effi-

ciency and the quality of their products have been well maintained.

STAFF WELFARE

Before concluding my review of the past year I must once again acknowledge our indebtedness to our staff in every section of the business. It has been our policy to do all that is practicable to make service in our companies worth while. As shown in the report, £37,000 has been added last year to the benevolent funds. Besides this, £55,000 was contributed to the various pension schemes, and grants of £78,000 were made to dependants of employees serving with the Forces. We are also looking ahead to the post-war period, with the aim of improving the whole status of those engaged in the distribution of groceries and provisions. In a large concern like ours there are ample opportunities for advancement. It is our desire to see that our conditions of service are such as will attract the right type of junior, and that everyone joining our staff will feel that he has a good career in front of him.

GOVERNMENT POLICY AND THE DISTRIBUTIVE TRADES

I will not attempt any detailed prophecies about the future; but in this connection a matter of special interest has been the recent publication of the Government's White Paper on Employment Policy. This has a very direct bearing on a business such as ours which is so closely affected by the general prosperity of the country.

We welcome the declaration now given of the Government's determination to promote plans for full employment, and there is one special point to which I think it appropriate to call attention. Paragraph 82 of the White Paper, after stating that the success of the Government's policy will depend on the skill shown in putting general ideas into day-to-day practice, emphasises that it is vital for the Government "to obtain, more fully and much more quickly than they have in the past, exact quantitative information about current economic movements." The Government, therefore, "appeal with confidence to industry to join with them in a task which is essentially co-operative; for only industry can provide the statistical information required and only a central authority can classify and analyse information drawn from the country as a whole." This passage, it will be noted, refers specially to "industry"—a word which is usually interpreted to mean manufacturing industry. Distribution, however, is not only an extremely important economic activity, but an essential part of effective production. Moreover, the records of companies like ours can afford valuable information as to the course of consumer demand and general economic conditions.

I therefore take this opportunity to make two points. First, I want to put on public record that our companies will be ready (as indeed they have always been) to afford full information to the Government as to our results and to give them free access to all records. Secondly, I want to urge that in framing Government plans full account should be taken of the functions of the distributive trades. I think it is important to make these points when reviewing the policy of a company such as ours. "Big Business" is a common target to-day for popular attack. It is our belief, however, that well-organised large-scale distributive business can render a distinctive and valuable public service, and we are anxious not only to allow the Government the fullest opportunity to test this by facts, but to give them by access to our own records the opportunity to acquire information which will afford guidance to their general economic policy. To say this, implies no disparagement of other types of business. We recognise fully that there is great value in the activities of efficient undertakings of smaller size. We believe further that there is room for all types of traders and that competition between the different types is good both for the traders themselves and for the public. In this spirit we look forward with confidence to the future of our own business and of our country.

HE KNOWS THAT DENTURES CAN AND SHOULD BE KEPT AS CLEAN AS NATURAL TEETH

Kolynos Denture Powder, used in conjunction with a stiff brush, has proved a reliable medium in the effective cleansing of the dental plate of all food debris. A safe and efficient stain-remover, it is harmless to all denture-bases—whether vulcanite, metal or the new 'plastic' type. From all chemists—1/3.

KOLYNOS DENTURE POWDER

Also, where gum-shrinkage has affected the normal suction grip, KOLYNOS DENTURE FIXATIVE makes false teeth fit firmly. 1/3 & 3/4.

UNION CORPORATION, LIMITED

IMPROVED RESULTS

MR P. M. ANDERSON'S REVIEW

The ordinary general meeting of shareholders of Union Corporation, Limited, was held in Johannesburg on May 30th.

Mr P. M. Anderson presided.

The Chairman said: The profit for 1943 at £710,299 is £100,167 higher than for 1942. Out of the profit £100,000 has been set aside to exploration reserve account. The remainder of the year's profits and a modest £5,700, taken from the £121,663 which stood to the credit of profit and loss account, have been absorbed in paying an interim dividend of 2s. 6d. per share and a final dividend of 5s. 6d., making 8s. for the year. We open the new year with an unappropriated balance of £115,963 to the credit of profit and loss account.

You may remember that when I addressed you in May, 1938, I explained that in the search for profitable new business, considerable outlays are incurred on the prospecting of properties over which control is secured by option or otherwise. There is no regularity in the incidence of this expenditure. In some years there may be great activity and in other years practically none, but whatever may be the expenditure it is generally unremunerative for a considerable number of years and at the time there can, from the nature of things, be no certainty as to the ultimate value of the work. Time is required to make a fair appraisal. Accordingly, all such expenditure is charged to exploration reserve account and suitable appropriation from profit and loss account is made as and when deemed necessary. By the end of 1943 the exploration reserve account had been reduced to £76,842, so your directors decided that it should be strengthened. Accordingly, as I have already mentioned, £100,000 has been transferred out of the profits earned last year, raising the balance now available to £176,842.

The increase of the book value of our holdings, including claim and land holdings, after making precautionary provisions, amounts to about £56,000. That is, of course, a balance figure indicating that we have invested somewhat more than we have realised during the year. In that regard I can mention in particular that we have increased our interest in Ultramar Company. Our realisations have been of a miscellaneous character. The balance of ins and outs on these balance-sheet items and on profit and loss account being small, it follows that there is but little change in our liquidity. Our liabilities are fully covered by our cash and cash assets.

INCREASED DIVIDEND

Having reviewed the salient features of the Witwatersrand gold-mining industry and, in particular, the operating results of the gold-mining companies on the Witwatersrand under the administration of the corporation, the Chairman said that Bay Hall Trust paid a dividend of 7 per cent. as compared with 6½ per cent. for 1942, while the balance unappropriated on profit and loss account has been raised by £13,760 to £103,772. The trust's holdings at the end of the year had an aggregate value of £2,423,182, or some £440,595 above the book value.

San Francisco Mines of Mexico had another really good year, many records being established. In spite of increased Mexican and British taxation, a dividend of 3s. was paid, as compared with 2s. 6d. for the preceding year.

The South African Pulp and Paper Industries, Limited, has made further progress. The net profit for the year, after providing for depreciation and taxation, amounted to £103,061, which was £16,500 more than the corresponding figure for 1942. After providing for a dividend of 7½ per cent., the unappropriated balance became £75,739, or an improvement of £46,811. Price control has kept the selling price of the company's paper at a figure very substantially below the price of imported paper. The paper traders in the

Union have expressed themselves in favour of the continuance of some form of control of paper for a period of two years after the cessation of hostilities to ensure that the mill's output during that period will be absorbed.

The Chairman then referred to the death of Sir Henry Strakosch and the great loss sustained by the corporation thereby.

The Chairman paid tribute to the memory of another three members of the corporation's staff who had made the supreme sacrifice on active service, and thanked the depleted staffs in London and Johannesburg for efficient service rendered throughout the year.

The report and accounts were adopted and the auditors reappointed.

A copy of the full report of the above proceedings is available for inspection at the London office.

TUNNEL PORTLAND CEMENT COMPANY, LIMITED

POST-WAR PROSPECTS

MR N. M. JENSEN'S SPEECH

Extract from speech of chairman, Mr N. M. Jensen, to the annual general meeting to be held on the 11th instant.

The profit on trading is slightly reduced, but to offset this there is an increase in the item interest received and dividends on investments, and substantially the same total profit as for 1942 is shown.

After payment of the dividends on the two classes of preference shares and the interim dividend of 7½ per cent. on the "A" ordinary shares and "B" ordinary stock, there remained, together with the sum brought forward, a balance of £280,084. Unfortunately, it has not been possible to complete the accounts by our usual time, and your directors therefore decided to pay a second interim dividend of 12½ per cent., less tax, on the "A" ordinary shares and "B" ordinary stock, making 20 per cent., less tax, for the year. When this payment was announced it was made clear that no further dividend would be recommended. The second interim dividend absorbed £57,239 and left a carry-forward of £222,845.

DEMAND FOR CEMENT

The demand for cement in the home and the export market, although slightly lower than for the previous year, has been considerably in excess of what had been expected a year ago. It is impossible to forecast with any accuracy what the demand will be for the current year, but many signs indicate that there will be a substantial reduction, and, as I have intimated before, I am of the opinion that it will take two years after the war before the building and civil engineering industry will again reach its normal consumption of cement. There is a possibility that export may increase after the war, but this is largely dependent on the amount of shipping that will be available. Everything appears to indicate, however, that during the third post-war year and the following years cement will come into its own and the industry will be called upon to deliver larger quantities than ever before.

It is only right to assume that your company will be faced with a reduction in trading profits over a period, owing to the reduction in the demand for our product. A policy of advancing our prices in the endeavour to modify such reduction would, in my opinion, be unsound. On the contrary, I am certain that the industry will wish to do all it can to reduce prices as we gradually revert more and more to normal conditions. Fortunately, your company has built up substantial reserves, and it is in a strong financial position to meet such temporary setback. Your board hold the view that past profits remaining undistributed may, to some extent, be utilised if necessary to maintain the payment of reasonable dividends.

CABLE AND WIRELESS (HOLDING) LIMITED

LORD PENDER'S SPEECH

The annual general meeting of Cable and Wireless (Holding), Limited, was held on the 29th ultimo, in London.

The Rt. Hon. Lord Pender, who presided, said in the course of his speech:—

The profit for the year 1943 is £1,220,976 which exceeds the preference dividend already paid and the ordinary dividend of 4 per cent. now proposed, together amounting to £1,197,488, by £23,488. The undistributed balance of revenue account brought forward from 1942 was £279,126 which, when added to £23,488 just mentioned and £10,000 from excess profits tax account to be mentioned below, provides an amount of £312,608 unappropriated, to be carried forward to 1944.

THE YEAR'S REVENUE

The dividends received from subsidiary companies are the same as for the previous year, and amount to £1,263,965. The dividend received from Cables Investment Trust again amounts to £50,000, whilst the income from other investments at £41,837 shows a reduction of £13,715, due to the sale of investments in 1942 in order to finance the purchase of further shares of Marconi's Wireless Telegraph Company.

Apart from the telegraph business of the Operating Company and the profits derived from the manufacturing business of the Marconi Company, the third main source of the revenue of the group is its investments. The book value of the securities held by the group amounted to £19,729,017, and that these had a market value of £19,565,260—the depreciation of £163,757 being less than 1 per cent., compared with just over 5 per cent. a year ago.

The increase in the total investments held by the group is largely due to the substantial support given by Cable and Wireless, Limited, to the Government's new loans, the total value of British Funds now held by our companies amounting to over £10,600,000.

The income received by the group from the investments in 1943 amounted to £701,230, compared with £584,881 in 1942. While gilt-edged securities have been very stable during 1943 and average yields materially unaltered, the yield on most other securities has continued to fall. In the case of our companies the increased holdings of low-interest-bearing Government Loans have to be taken into account in attempting any comparisons of the income for the year under review with the incomes of previous years.

Apart from British Government stocks our holdings are, as I have stated on former occasions, for the most part represented by investments in undertakings within the British Empire. The prosperity of these undertakings at the present time is attributable to war consumption and may be expected to be sustained for a period after the war by a world-wide demand for goods and services.

THE FUTURE

I will make no forecast concerning the future. Nevertheless, I assure you that the difficulties which the war has produced, as well as the opportunities which the peace will afford, continue to receive the earnest attention of your directors. As you know the Prime Minister has forcefully reminded us all of late that "Although great dangers lie behind, enormous exertions are before us." So may it be that, through the glorious endeavour and unrelaxing effort of the United Nations, the goal in sight will be reached more quickly than we dare to hope. Then the great undertaking which we are connected will have the opportunity, alongside other leading forces of enterprise and initiative, to play its full directive and energetic share in the solution of the post-war problems.

The report was adopted.

VIROL LIMITED

LORD LUKE'S REVIEW

The forty-fourth Annual General Meeting of Virol, Limited was held on the 29th ultimo in London, the Right Hon. Lord Luke, the Chairman, presiding.

The following is an extract from the Chairman's statement circulated with the report and accounts:—

I am pleased to report another successful year resulting in an increase of about £15,000 in the gross profit to £129,934. Our operating expenses, however, have also increased, due mainly to increased wages, repairs and maintenance, transport charges, etc. The resulting net profit of £16,992, is after making full provision for all taxation on profits earned to the 31st March last.

The standard years for E.P.T. profits coincided with one of our worst pre-war trading periods and the increased profit from this year's trading has been absorbed by E.P.T., leaving only sufficient to pay the preference dividend and the recommended 10 per cent. on the ordinary shares, which you will be asked to approve.

The difficulties of acquiring adequate supplies of raw materials are still very acute. Nevertheless, we have managed to keep our large number of customers regularly supplied—if only with restricted quantities. The demand for our preparations is still greatly in excess of our ability to supply.

Virol provides those essential nutritive factors likely to be lacking in the other foods consumed, and it thus brings about an adequately balanced intake as a whole. It is to this "balance-restoring" power of Virol that its outstanding ability to produce proper development and positive health in the growing child has been attributed; and certainly the clinical experience of over 40 years has proved that the theory is completely borne out by the facts.

The report and accounts were unanimously adopted.

ARGENTINE ESTATES OF BOVRIL LIMITED

SATISFACTORY RESULTS

The 36th annual general meeting of the Argentine Estates of Bovril Limited was held on the 6th instant, at 160, Old Street, E.C.1.

The Deputy-Chairman, Lord Luke, in his address circulated with the report and accounts, stated that to conform with modern practice the accounts had been drawn up rather differently this year. Provision for Taxation on profits to 30th September, 1943, was shown as a separate item in the Profit and Loss Account instead of being deducted before arriving at the net profit on trading. There was an increased net profit on trading this year, for which they had to thank their estancias.

Mr. G. A. Ellison, their Chairman, had reported from the Argentine that the result of the year's estancia working results were fairly satisfactory. For the fifth year in succession they had had no locusts. Unfortunately the severe drought and extraordinary heat from December, 1942, to March, 1943, came at a time when they had many steers fattening for the St. Elena factory, and though they did well, they did not put on flesh as they would have done in better weather.

The price of cattle had continued to rise during the year. They had sold surplus stock and bulls at very satisfactory prices. Their cattle were healthy and sound. The number of calves marked was quite up to the average.

Nineteen young employees from the Company's farms in Argentina were serving with H.M. Forces. Most of them volunteered early in the war. Moreover the other employees had contributed substantially to the voluntary British Patriotic Fund.

Lord Luke expressed the Company's thanks to Mr. Ellison for his interesting report.

WIGGINS TEAPE AND COMPANY (1919) LIMITED

INCREASED PROFITS

The annual general meeting of Wiggins, Teape and Co. (1919), Limited, was held, on the 7th instant, in London, Mr F. L. T. Barlow (chairman) presiding.

The following are extracts from the chairman's statement circulated with the report:—The outputs and sales of your company and its subsidiary companies continued to be affected by the shortage of raw material supplies, with the consequent restrictions and limitations by the Government in the uses of paper.

It has again been our policy to maintain the high quality of our products as far as is possible, and we have made every endeavour to make the best use of the materials available to us.

The available profits of £364,911, including a net refund of excess profits tax of £52,658 in respect of the year 1941, show an increase of £39,846. After providing for interest on debentures and dividends on the preference and ordinary stocks, your directors have transferred the sum of £37,000 to the reserve account, bringing the reserve up to £850,000 and the sum of £74,500 to contingencies reserve. The total distribution of 8 per cent., less income-tax, on the ordinary stock for the year 1943, is 1 per cent. more than for the previous year.

The total of the surplus and specific reserves of the group of companies, according to the summary of balance sheets shows an increase of £237,566 compared with the previous year. Current liabilities show a substantial reduction due to the reduced liability to the taxation authorities. With a reduction of £108,000 in the total of the current liabilities and proposed dividends, and an increase of £180,000 in the total of the current assets, the net liquid position of the group shows a further improvement of nearly £290,000.

The report and accounts were adopted.

GOVERNMENT RETURNS

For the 13 days ended June 30, 1944, total ordinary revenue was £109,587,000, against ordinary expenditure of £199,185,000 and issues to sinking funds of £205,000. Thus, including sinking fund allocations £2,145,027, the deficit accrued since April 1st is £821,502,000 against £867,201,000. for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24 inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £248,699 to £2,601,430, the other operations for the period (no longer shown separately) raised the gross National Debt by £87,971,819 to £20,412 million.

INDUSTRY AND TRADE

Meatier Sausages.—The present supply position of manufacturing meat makes possible a temporary increase in allocations of meat to manufacturers. From July 9th manufacturers of pork sausage and pork sausage meat will be required to increase the meat content of their products from 37½ per cent.

to 50 per cent., and the Minister of Food has made an Order to that effect. There will, however, be an increase of 1½d. per lb. in the maximum wholesale and retail prices to cover the increased cost. The retail price of sausages will therefore be 2½d. per lb.

"The Economist" Sensitive Index.—There was no change in the index during the week ended July 5th. The complete index (1935=100) was 158.6; crops 135.6; and raw materials 185.5.

Planning Criticisms

THE Town and Country Planning Bill was given its second reading in the House of Commons on Wednesday by a comfortable majority. This was something of an anti-climax to an agitation against it of remarkable force and passion. The Parliamentary Labour Party had to hold four meetings before it could decide on its course of action—and the action, when decided, was the inaction of abstention.

It is very difficult to understand why the Bill should have aroused this hostility. It is by no means perfect—when it first appeared, several criticisms of it were made in these columns—but it is not the reactionary measure it is being made out to be. Indeed, the agitation against it is a depressing illustration of the way in which prejudice can be widely sown by a few fanatics. There appears to be an infinitude of people who do not understand the issues, but will nevertheless lash themselves into a passion over the "obstruction" of "vested interests." It is doubtful whether more than a fraction of those who have written heated paragraphs or drawn bitter cartoons about the Bill have understood what they were talking about.

For some reason, the Bill is believed to benefit the landowners. How this belief arose is difficult to imagine,

since it is intended to expedite the procedure by which they can be bought out and to limit the compensation they can receive. It is true that some local authorities hoped to buy land in blitzed areas at the still lower level to which values have, in some cases, been depressed by the blitz itself. In these cases, the landowners are to be given the 1939 value of their land (that is, between one-half and two-thirds of its post-war value, relative to other forms of property, the exact proportion depending on what happens to the value of money) instead of the one-third or one-quarter that would be their lot if they were bought out at the present "forced sale" prices. If to assure these landowners that they will only have half their property confiscated and not three-quarters is a reactionary protection of vested interests, then words have lost their meaning.

Mr Arthur Greenwood's case against the Bill was even harder to understand. He wished to have it withdrawn because it did not provide for the nationalisation of the land. He must have meant the nationalisation of all the land in the country, because the Bill does provide for the public ownership of land in blitzed and blighted areas—its sole purpose is to assist and expedite the buy-

ing out of private owners of this land. Mr Greenwood must therefore have been seriously contending that the reconstruction of the blitzed areas should be deferred until the whole question of the nationalisation of all the land in the country had been settled. Now *The Economist* has on several occasions expressed the view that these problems of the proper use of land will not be satisfactorily solved until the nation makes up its mind to take over the ownership of the land. But to say that nothing should be done until this vast issue is settled is to be doctrinaire to the point of absurdity.

Or again, it is made a ground of complaint by many critics that the Bill makes no provision for the "national plan" that has been promised—that is, for the unitary planning of areas much larger than existing boroughs or even counties. That the planning of land use should be tackled on a regional basis is certainly desirable. But let no one think that it can be easily contrived. If it is proposed to transfer town planning functions to authorities larger than the existing local authorities, the opposition of their associations will be far stronger and more passionate than any that they are showing to this Bill. Once again, the immediate choice is not between the present Bill and the perfect solution, but between an interim measure and nothing.

With the atmosphere of prejudice that has been created against it, the actual details of the Bill have received very little discussion. Three main criticisms were made in these columns a fortnight ago. The first was that some effort should have been made, in freezing land values, to take account of changes in the value of money. The second was that other classes of owner-occupier have as good a claim as the farmer and the small residential house-owner to exemption from the "1939 value" clause. The third was that provision should be made for giving permanent financial assistance to local authorities where the effect of re-development was permanently to reduce the money income arising from the land in a blitzed or blighted area. Mr Silkin also made a strong case out for still further

simplification of the procedure of requisition. The Minister has promised to carry out further consultations before the Committee stage—which is likely, in any event, to be both interesting and arduous.

The Bill has naturally distracted attention from the wider and even more contentious issues of compensation and betterment with which the White Paper deals. But one argument of some interest is already emerging. This is the contention that to make a levy on betterment, and particularly to do so in the way proposed in the White Paper, is to remove all incentive to the development of land.

The White Paper, it will be remembered, proposed to levy a charge of 80 per cent on the development value of land at the moment that it is developed. The alternative proposal is to assess the betterment (that is, the increase in development value) every five years and to tax it whether or not it has been realised by the actual use of the land for building. This would, indeed, provide an incentive to development, since only by that means could the funds be raised to meet the levy. But it would also lead to many cases of hardship and to hasty building, since land may have a development value and still be incapable of development at any particular moment.

The point is important, for the development of land means building, and building should make up the largest part of that steady and adequate flow of capital expenditure that is needed for full employment. The solution may be to adopt a mixture of the two plans—to put a small annual charge on development value (for example, by assessing it to local rates) but to defer the capital levy until the capital value is realised by development.

This problem is interesting in itself. But it is still more interesting as an example of the sort of delicate technical problem which cannot possibly be handled in an atmosphere of clamour, of prejudice and of ignorance. The problems of reconstruction cannot be solved by gusts of emotion; but the behaviour of the "planning" interests in the last few weeks does not suggest that they will be tackled with the necessary knowledge and realism.

Will UNRRA Work?

IN Europe the Allies are in sight of victory. They also have a clearer picture of what victory has cost the occupied nations in terms of loss and destruction. There is thus a double reason for ensuring that plans for relief and reconstruction are well ahead. UNRRA (the United Nations Relief and Rehabilitation Authority) has now been in existence for some nine months. It has opened the offices of its European Division in London. Its work has been divided into various categories—Medical Relief, Welfare, Displaced Persons. Plans for allocation and supply, on the basis of an overall calculation of Europe's needs, are ready to go into operation and the consideration of the various nations' more detailed requirements is in hand. Yet for all this, there is a general impression that UNRRA is in some way missing its opportunities and turning out to be not a vigorous experiment in the new internationalism, but another pale Genevan ghost.

It must be admitted that UNRRA faces difficulties calculated to break the back—or the heart—of the stoutest agency, national or international. Its task is, briefly, to ensure that a small and therefore inadequate surplus of raw materials, food stuffs and manufactures be so distributed among a group of hungry nations that each nation receives a minimum of relief before the richer nations—consumers and suppliers alike—weigh in with maximum demands, backed by superior purchasing power. UNRRA is quite simply an experiment in rationing, in putting need before purchasing power, and all the world knows that there are few operations more arduous than this.

One set of difficulties besets the supply end. The United States and the British Commonwealth are naturally the great suppliers. The Combined Boards represent-

ing the British and American Governments still control the Allies' pooled war chest of goods and materials. UNRRA's purchases go through the Combined Boards, but they compete there with war needs and with the semi-war needs of AMG and Civil Affairs, who are purchasing basic civilian necessities to cover their period of operation—an unspecified period, roughly presumed to be about six months.

Behind the influential service buyers jostle the ordinary civilian purchasers—the farmers and the manufacturers who have their eyes on the Governments' stockpiles and press, to some extent effectively, for a quick return to "normalcy." If UNRRA asks for wool for Holland's textile industry or machine tools for France, it is competing against the urgent demand of British and American manufacturers. Finally, UNRRA has to compete against attempts at private buying made by the European governments with assets of their own. Its own efforts to secure allocations are complicated by the fact that the money at its disposal, some \$500 million, is just about half the sum spent by Mr Hoover on relief after the last war and is quite inadequate to meet Europe's real needs.

The difficulties at the distributing end are no less formidable. Again, UNRRA is not the only agency in the field. Its relationship to Civil Affairs and AMG has not been made clear and varies in different areas. According to a statement made by Mr Herbert Lehman in Cairo, UNRRA officials are to enter the Balkans with the Allied armies and undertake immediate relief. In the West, they are to take over at some unspecified date from the Civil Affairs organisation of the Army. The transference of work calls for the closest co-ordination

of plans between UNRRA and the military. In the case of Displaced Persons this apparently has been achieved already and UNRRA is to be responsible for the work from the outset. But in other spheres, co-operation has not been achieved. The lack of it is particularly damaging and fatuous in the medical field.

Another difficult set of relations has yet to be fully worked out between UNRRA and the various national governments. The extent to which their own agencies can be made completely responsible for distribution is limited by the fact that the supplies will be mainly Anglo-American and neither Government wishes to see its resources used for anything except straight relief. The danger that the European Governments if left to themselves might indulge in discrimination and political logrolling cannot be ruled out. UNRRA must therefore act as a referee, even though it should make no attempt to set up a grandiose distributive agency of its own.

Here the Authority is up against the most intransigent of all its problems—the exasperated nationalism of the governments with which it has to deal. Again and again, plans have been delayed or have had to be changed because of the understandable but obstinate desire of a government to undertake all its own relief work, coupled with an equally obstinate desire to get as much as possible in the shape of foodstuffs and supplies out of the Combined Boards.

These obstacles would face UNRRA whatever its constitution. Only if it can secure the services of really able and commanding personalities and only if it is backed to the last degree by the Governments of the Great Powers—but particularly of the Great supplying Powers, can it possibly overcome the inhibitions and difficulties with which the task of relief is beset. Yet it is quite obvious that it lacks both these essential conditions. Apart from a few really able people, it is an open secret that UNRRA has been recruited from among those whom every other department could spare, whereas it should be an essential qualification of every official transferred to UNRRA that he cannot strictly be spared from his current work. This first disability springs from the second—lack of real government backing. It looks very much as though neither the British nor American authorities really attached very much importance to the success or failure of UNRRA and failed to see how much their own prestige and the prestige of all future international organisations is likely to suffer as a result.

This attitude is very difficult to understand. On the one hand, the job of relief must be done. On the other, UNRRA is the only possible agency. It may be that since they are to supply most of the resources, the Americans and the British are still tempted to run relief themselves. True, they have done nothing to create a substitute for UNRRA, but their lack of enthusiasm for it may spring from a prejudice of this sort, mating happily with the

instinctive uninternationalism of the Foreign Office and the State Department. Yet a moment's reflection should show that no Anglo-American agency, however powerful, influential and Government-supported, could undertake the work of rebuilding Europe. It would meet, angry and obstructing at every turn, the governments whose countries it was aiming to relieve. It would have no support from local agencies; on the contrary, it would be very likely to meet passive resistance. It would reawaken everywhere echoes of Germany's four-year propaganda that the Allies are invading Europe to make the European market safe for British and American capitalists. It would have no moral hold at all over the Allied governments with supplies or resources of their own. The attempt to secure an orderly distribution would probably degenerate into a black market on an international scale. UNRRA may be a cumbrous instrument, with its Council of 44 nations, its international staff, its mixed committees and polyglot experts, but there is no other possible instrument and the only sound policy is for London and Washington to stop crabbing it and instead to make it really effective.

★

For this, two things are necessary before all. UNRRA will fail if it cannot meet Europe's need for food and clothing and seeds and machines. The surplus is small. If the supplying countries return to their peacetime standards soon after the armistice, it will disappear altogether. The peoples of Britain and the United States and the special interests in Britain and the United States—agricultural or industrial—will have to be told squarely by their governments that the period of rationing and control will not come to an end until Europe has received its "basic minimum" and that if this entails sacrifice, it is a sacrifice as worth making for peace as were their earlier sacrifices for victory. The will to make sacrifices needs to be equally evoked in both countries, but the scope for sacrifice, though not negligible in Great Britain, is almost infinitely larger in the United States. It is there that the major battle for enlightened and self-interested unselfishness will have to be fought. The point may need some propaganda to bring it home, but by December the stress of the American presidential election will have passed and, in this country, it would be unlike Mr Churchill to shrink from an appeal that involves "toil and sweat."

The other need is an immediate and universal improvement in the standards of UNRRA's officialdom. Many war agencies are already working at reduced pressure. The Ministry of Economic Warfare and the Foreign Economic Division are obvious examples. The best men and women from these agencies should be transferred to UNRRA together with some really indispensable people from the Service Ministries, the Foreign Office and the State Department. The need is for first-class administra-

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

For particulars apply to:—

tors. The war has thrown up a number of them and some should now be spared for the first job of peace.

The old League failed in part because the governments did not place at its disposal the services of enough able and eminent men. The instrument was condemned for the ill-will and the flabby policy of the governments that wielded it. It was blamed for failure by those who had

Mother Russia

EXPERTS on population statistics and population trends in Western European countries view with unmistakable envy the population trend in the Soviet Union. Comparisons between birth-rates in Russia and in most of the other European countries provide a striking contrast.

In France, Belgium and Czechoslovakia fertility (about 1930) was from 5 to 10 per cent below the level required for the permanent maintenance of a stationary population. In England and Wales, Norway, Switzerland and Latvia it was 10 to 20 per cent below the replacement level. . . . In the USSR the net reproduction rate was over 1.60, that is, one that if maintained would result in an increase of more than 60 per cent per generation.*

Attempts to project population trends into the future more often than not lead to bewildering conclusions. They show, in the course of not more than a few decades from now, a dwarf-like and anæmic Europe overshadowed by the full-blooded Russian colossus. The uncanny fertility of the steppes seems to mock the "decaying vitality" of the West; and the demographers, having already threatened the West with the growing numbers of the black and yellow races, are now condemning it to eclipse by the uninterrupted expansion of Slavdom. Prophecies of this kind may or may not be correct. They are based on the assumption that no great and unexpected events reverse pre-war population trends; that no national catastrophes—wars, famines or revolutions—depress the birth-rate in some countries and that no favourable circumstances raise it in other countries. The statistician is, of course, right to work on these assumptions. But the economist and the sociologist should check the statistician's conclusions in the light of less automatic tendencies.

In the case of Russia, many elements in the future trend remain obscure. Some experts have questioned the accuracy of the population figures of the 1939 census in Russia. The fact is that the results of an earlier census, carried out in 1936, have never been published. The explanation then current was that the census had revealed a relative decrease in the population caused by the collectivisation and the famine in the early thirties. This may perhaps be undue cynicism. But, in any event, it will be impossible to assess the prospects of the Russian birth-rate with any certainty until the effects of the war on the balance of the Soviet population are known. That balance has undoubtedly been gravely upset through losses in manpower caused not only directly by hostilities but also by the cruelties and miseries of the German occupation.

The Soviet Government, significantly enough, does not seem to trust the optimistic conclusions of the demographers. It is not setting any hopes on the "automatic" tendencies of the birth-rate. A decree, published in Moscow on July 8, has initiated a set of measures designed to secure a massive increase in Russia's population after the war. Taken together, these measures constitute perhaps the most radical and comprehensive programme for a population policy that any Government has yet formulated; and they are unique in social legislation.

The chief feature of the decree is the increase in allowances paid to mothers of large families. A previous law, of June 27, 1936, provided allowances for mothers of large families, starting from the seventh child. Under

never given it a chance to succeed. It would be tragic indeed if the first international agency of the post-Hitlerian world should bear on it all the marks of weakness that marred Geneva of old. With UNRRA it is not only relief and rehabilitation that are at stake. The great issue is whether the Great Powers are ready to accept the responsibility of making any international agency work.

the new decree, allowances will begin with the third child. The aid is to be given in two forms: a lump sum will be paid at the birth of a child; and in addition monthly allowances are to be paid for five years. The table below compares the total sums of the allowances paid in the course of five years under the law of 1936 with those that are to be paid under the new decree.

Allowances for mothers of large families.
In roubles.

	1936.	1944.
Third child	no allowance	400
Fourth child	"	6,100
Fifth child	"	8,900
Sixth child	"	10,400
Seventh child	10,000	14,500
Eighth child	10,000	14,500
Ninth child	10,000	18,500
Tenth child	10,000	18,500
Eleventh child	12,000	23,000

Monthly allowances begin with the fourth child (the 400 roubles entered against the third child is a lump sum at birth). The average monthly wage of workers in the lower income groups is between 400 and 600 roubles, amounting to between 24,000 and 36,000 roubles in five years. The allowances are thus very large, the more so since they are apparently cumulative—the allowance of 23,000 roubles is for the eleventh child, not for eleven children.

Apart from direct allowances, large families are to be granted fifty per cent reduction on fees paid to kindergartens. The rations for mothers have been increased and the services provided for the expectant and nursing mother have been considerably improved. Pregnant women are not allowed to do overtime or night work; confinement leave has been increased from 9 to 11 weeks, and so forth. And, last but not least, the introduction of three medals—"Glory of Motherhood," "Motherhood Medal" and "The Order of the Heroic Mother"—aims at raising the moral standing of the mother of a large family. The medal in Russia also brings material advantages to its bearers. It entitles them to better food and clothing and gives them exemption from queueing for rations—a privilege that is by no means negligible in the classic country of interminable queues.

A further interesting innovation is that the state is now to take care of children born out of wedlock. Special allowances are to be paid to unmarried mothers, if they desire to bring up their children themselves. If not, they are to have the right to place them in children's homes where they will be brought up at the expense of the state. At the same time unmarried mothers have been denied the right to sue for the establishment of paternity and for payment of alimony—which might be called protection of the unmarried father. The whole measure seems to be designed to free the mother as well as the father of a natural child of all material embarrassment. After the war there will inevitably be a great surplus of women in Russia, of whose natural children the states promises in advance to take care.

The Soviet State has not only set up these material inducements to the increase of families; it is also to penalise any recalcitrant citizens who prefer small families. A prohibitive progressive tax has been imposed on small

families, bachelors and spinsters. A family with only two children is liable to pay the tax; a family with four children gets a monthly allowance. For the third child, a lump sum is payable; in the "battle for population" nobody can stay neutral. The parents of only two children—and this was in the thirties the size of most of the Russian families in the towns—have to pay for their moderation; the parents of three are rewarded. And with characteristic thoroughness and "realism" the decree also orders the establishment of new children's homes, a considerable increase in the production of children's clothing and footwear, as well as the opening of new shops selling maternity articles.

Another section of the decree introduces important reforms in the law on marriage and divorce. The guiding principle here is "the strengthening of family ties." Unregistered marriages have no longer any legal validity. The procedure of divorce has been made as uninviting as possible. Divorce cases are to be heard in public. Only a higher court, not a People's Court, can grant a divorce. In addition, the fees to be paid on obtaining a divorce have been fixed so high as to be entirely prohibitive for the working classes. Divorce has become a privilege open only to the high income classes.

In order to realise the evolution that Soviet ideas on

NOTES OF THE WEEK

Victory Week

The Allies are advancing on every front. In Normandy Caen has fallen and the Americans have taken La Haye du Puits. In Italy the advance on Arezzo continues. In Russia the Red Army's stupendous drive has reached and overrun Vilna, and a new Baltic offensive has been launched threatening Dvinsk. In the Pacific the last Japanese resistance on Saipan has been crushed. In other spheres of the war the news is good. The U-boat menace has been so effectively defeated that not a single invasion ship succumbed to submarine attack. The air offensive against Germany has been resumed with a massive attack on Munich, and Londoners have had three nights completely free of flying bombs. Yet it would be a poor return to the men who have won these victories if the grimness of their effort were underestimated—the Americans suffered 15,000 casualties on Saipan alone—or if success were used as an excuse for reducing civilian effort. The Germans are fighting toughly in the suburbs of Caen and Vilna, are contesting every yard in Italy and still have their rocket guns in reserve for London. As General Eisenhower has pointed out, a very tough fight still lies ahead.

De Gaulle and Washington

General de Gaulle's visit to Washington has been crowned with almost extravagant success. Before his departure from the United States the General spoke of "Franco-American friendship, of which he had been given a thousand touching proofs." To judge by this, General de Gaulle must have convinced himself that the prejudice against the French provisional government that was prevalent in Washington only a short time ago has now been completely dispelled. He has expressed his conviction that the negotiations in Washington will soon lead to results similar to those achieved in the negotiations between the French and the British in London. Thus an agreed policy seems at long last to emerge. The Algiers government has now been recognised as the only *de facto* authority in liberated France. General de Gaulle chose his visit to the United States as an occasion to make a number of important political statements. He declared that France had no claims on any Italian colonies, but that

in Europe, on behalf of international security, and particularly French security, and the security of her Western neighbour, certain practical measures would be necessary, and that there was territory where the flag of the French army might well have to fly.

family life have undergone one has only to recall the following words by Lenin: "The example of divorce shows that it is impossible to be a democrat and a socialist without at once demanding the full freedom of divorce, because the absence of that freedom is an additional vexation to the oppressed sex, to the woman." The present departure from that conception is not the first of the kind, but it is the most drastic one.

Whether the new policy will really produce the rapid rise in the birth-rate at which it is aimed remains to be seen. Certainly it is far more drastic than any policy specifically directed to the population has ever been before and if the state can exert an influence on the birth-rate by specific measures, these should certainly be strong enough. But it may be that, in Russia as elsewhere, the general environment of life has an effect far stronger than any special measures. For example, in Russia, bad housing conditions and the high proportion of women employed in industry (women formed about 40 per cent of industrial employees even before the war) undoubtedly played a large part. To correct these, without a population policy, might have little effect on the birth-rate. But a population policy without some improvement in these respects (of which, of course, there will presumably be some) might have equally little.

The General explained that he was thinking of a long-term occupation of the Rhineland, though he said nothing specific about its duration. There are apparently two issues here which may easily be confused. One is France's undoubted right to participate in the Allied occupation of Germany if the state of her armed forces after the armistice permits her to do so. General de Gaulle was undoubtedly also right when he said that this subject of France's uncomfortable neighbour cannot be settled in the absence of France. His speech, however, gave the vague impression that the occupation of the Rhineland which he had in mind was not necessarily meant as part of the general occupation of Germany by the Allies. Has General de Gaulle taken up the old French demand for a permanent occupation of the Rhineland? No definite reply to this question can be given; but the issue is certainly going to be one of the greatest problems of the post-armistice period.

Russia Over the Bug

The distance between the Red Army and Warsaw is diminishing daily. The Russians have already crossed the River Bug, at least at some points. The political significance of this lies in the fact that the Curzon line, proposed as the new frontier between Poland and Russia, runs for a long distance along that river. Yet, even so late in the day, there has been no real sign of a serious attempt to settle the Russo-Polish dispute. M. Molotov may perhaps soon make a political statement similar to that which he made when the Soviet Armies advanced from Bessarabia into Rumania. He may declare that Russia has no further territorial claims on Poland, and that the Red Army will not interfere with the social and political order of that country. But what was considered a satisfactory statement in the case of a satellite can not be regarded as enough in the case of an Ally which has made so great a contribution to the Allied cause. What seems particularly indefensible is the tactical game for which the Union of Polish Patriots in Moscow has been used in recent weeks. A fortnight ago the Union bluntly denied the legality of the Polish Government in London, and foreshadowed the setting up of a new Provisional Government. A week ago the Union spoke in more conciliatory terms, and demanded in effect only a reshuffle of M. Mikolajczyk's government so as to include the representatives of the Polish colony in Moscow. Soviet circles in London are reported to have stated that the attitude of the Polish Union in Moscow does not reflect the views of the

* "The future population of Europe and the Soviet Union," League of Nations, Geneva, 1944.

Soviet Government. If this is so, then it is really difficult to see what it is that still delays the resumption of Soviet-Polish relations, for which some preparatory work has already been done. It is quite possible, of course, that the Soviet Government desires first to sound the mood of the Polish people in Poland before it commits itself to the recognition of M. Mikolajczyk's Government. There are, however, great risks in such a policy. The entry of a foreign army, be it even the army of a trusted Ally, always tends to produce something of a political crisis, as the discussions between London, Washington and Algiers have demonstrated. The critical symptoms are bound to be much more acute when the entering army does not necessarily enjoy the full confidence of the people on whose soil it is going to fight; and this is the case with the Red Army in Poland. In such circumstances the lack of any relations between the command of the advancing army and the Government of that country can lead to disastrous complications, which it would be extremely difficult to undo later on. The Soviet-Polish issue concerns all the United Nations, and especially Great Britain and the United States, and this really is the last hour for effective action.

Hitler's Generals

The Wehrmacht has lost more than twenty generals in three weeks. Most of them were killed or captured in Normandy or Russia. Dietl, with two other generals, was killed in an accident. Dollmann, who was in command of the Army Corps defending the Cherbourg peninsula, died suddenly; and, lastly, the oldest active Field Marshal, von Rundstedt, Supreme Commander in the West, was replaced by Field Marshal von Kluge, who has held several commands in the East. These are the bare facts that have become known. It would be unnatural if these "mass-deaths" of generals had not given rise to speculations about the relations between the Nazi party and the generals. No doubt the loss of so many generals who were commanders in the field must present a serious problem. Efficient higher "troop leaders," as these generals are called in German military language, cannot be created from one day to another. Even if talented successors could be found at once, it takes time for new divisional and higher commanders to learn to work efficiently with their staff officers and the commanders of subordinate units. The fact that more generals have been killed in action in this war than in any other modern war is probably the result of two factors. The greater mobility and speed of this war has compelled higher commanders to be frequently in the front line of fire. In addition, the Wehrmacht, probably as a reaction to the last war, when generals were usually far behind the fighting lines, acts on the principle that generals must be seen as often as possible in the front line to get a first-hand view of the situation, and incidentally to sustain the morale of their troops. Thus it is quite unnecessary to read the machinations of Himmler and his Gestapo thugs into the recent thinning of the generals' ranks. Natural explanations cover it far more convincingly.

The rumours connected with Rundstedt's dismissal are also exaggerated. It may be that at some stage of military collapse, some responsible authority in Germany will seek an armistice, and almost by definition it can only be a General, but the Germans are still some distance from that degree of disintegration, and it is quite false to picture the Wehrmacht as a separate entity struggling against the Nazi party to secure an armistice now. The generals as representatives of a separate Junker class have long since disappeared. Their political influence ended with the formation of the High Command of the Wehrmacht in February, 1938. The Nazification of the Wehrmacht was then completed, and the old Prussian and German generals became military experts, pure and simple. Since that time they have been directed and controlled by the centralised military administration of the High Command. The leading men of the High Command, under their chief, Fieldmarshal Keitel, are not known to have been changed for more than eight years. The stability of this administration, compared with the changes in the higher commands of the armies, is striking, but it is precisely this stability that explains why Hitler has been able, during recent crises in the Wehrmacht, to replace one higher commander after the other. The modern general is completely dependent on two factors, the military administration which provides the men and the material for the armies, and to the staffs of armies, army corps and

divisions. The undeniable fact is that in Germany the military administration is one hundred per cent a Nazi institution, and it is also beyond doubt that the main body of the staff officers of all grades in the Wehrmacht are recruited from young men who have made their careers since Hitler came to power. It is certainly true that a gifted and experienced older general may make better use of his staff officers than an inexperienced young general. But it can be said at the same time that generals like Rundstedt, whose most formative years date back to the nineties of last century, have certainly lost touch with the staff officers and generals who made their careers under Hitler. Von Rundstedt's dismissal is no mystery. His age and his experience were certainly valuable for the position of supreme commander in the West so long as the invasion had not started. The defence against the invasion, however, needs a more active general, and he has been found in von Kluge.

Capital Reconstruction

The strongest incentive to industrial efficiency is full employment. Where unemployment is heavy the social and economic advantages of labour-saving and time-saving appliances are neither apparent nor altogether real. If British industry is to maintain its position during the post-war years it must utilise the manpower of the nation both fully and efficiently. The first need is for capital re-equipment. Before the war British industry was alarmingly under-capitalised. Five-sixths of the modest sum set aside each year for capital investment in plant and machinery in general industry was absorbed by maintenance and depreciation and there was little left for new development. The habits of patching-up and making-do were settling on industry like a blight. European industry, when it is re-established, will employ the most up-to-date equipment possible; and it is unlikely that American industry will abandon its traditional policy of "scrap and rebuild." Without a change in the established policy of British industry—which will require changes of mind both in industry and in the Inland Revenue—there is a serious risk of being left behind. In an address to the Engineering Industries Association, last week, Sir George Schuster indicated certain aspects of the problem of capital re-equipment that require urgent attention. Does industry possess the financial resources necessary for large-scale capital reconstruction? And could a heavy increase in capital charges be met out of the proceeds of an eight-hour day? It is possible that a higher capitalisation could, in some industries, only be carried with the retention of the shift-system—even the three eight-hour shift system. The promotion of industrial efficiency is fundamentally a matter of maximising the productivity of the worker—as an individual and as a group member. Without the assistance of adequate resources of capital maximum efficiency is impossible; but it may be that the provision of mechanical equipment is less difficult than the changes in organisation needed to make full use of it. Efficiency depends not only on capital equipment but on successful collaboration, the abolition of restrictive practices, the elimination of the worker's fear of unemployment and of reduced piece-rates. In other words, it depends on wise leadership and good industrial relations.

An Orderly Unwinding

Lord Woolton's opening speech in the debate on Employment Policy revealed more fully the Government's intentions with regard to Controls. During the "transition period"—the period after the war "when we are moving from full war employment or partial employment devoted to war purposes to the period of peace" or the period "between the two wars, if by chance one of our enemies retires from the conflict before the other"—it will be necessary to ask the country to exercise continued restraint. The reasons are obvious. Controls were imposed gradually as the necessity for them became apparent; they will be suspended gradually as their diminishing usefulness is neutralised by other factors. For some time it will be necessary to maintain control of raw materials that are in short supply; to preserve the system of rationing, specifically if not quantitatively; to discourage the production of non-essential goods for the home markets however profitable they may be; and to maintain those controls which will stabilise prices. This policy is wise economically (in the interests of the export trade and of employment policy);

it is wise socially (on grounds of equity), and it is wise politically. So much should be common ground among all schools of thought, for not even the most extreme advocate of uncontrolled private enterprise would be likely to find his cause advanced by the chaos and unfairness that would follow upon too early a relaxation. But it is the further period, beyond the transition, where there is still need for some clarity of thought. "Control" and "no control" are in danger of becoming ideological slogans. In the literal sense, control means that the business man is left with the initiative and the responsibility for action, but the Government reserves the right to impose restrictions. Control, in other words, says No and can never say Yes, and for that reason it should be kept to a minimum. "Control without responsibility is the definition of tyranny" (the quotation is from Mr Herbert Morrison). But, on the other hand, it is clear that, in many of the spheres where the Government has during the war been exercising positive direction, it will, and should, continue to do so. But this is not control, it is organisation and policy. The danger is that too many purely negative controls will be kept on because they operate in a field where a public interest is vaguely recognised but where the state is unwilling to adopt a positive policy to serve that interest. As Mr Hawtrey has pointed out, "people will shrink from the fateful step, and will yet be unwilling to give up the control which keeps the door open to it." That is the kind of control that must be avoided like the plague—and to say so is in no way to prejudge the case for collective action of a positive kind where it is appropriate.

"Entrepreneur" or "Venturer"

The economist's terminology has long been a butt of the layman—and justifiably so. Confusion arises from the specialised employment of words used variously in common parlance. The very term "capitalist" is misleading—as *The Economist* pointed out last week, "if the word had not already been pre-empted for another meaning" it would apply with particular appositeness to the Soviet economy. Has Lord Woolton provided a new and better variant of the wretched euphemism "entrepreneur"? In his speech on the Government's employment policy he asked: "Are the merchants of this country prepared once again to become 'merchant venturers'?" "Venturers," if it can avoid the suspicious connotations of "adventurer," is a happier (and more cheerful) choice than the thinly disguised "undertaker." But the word already has its critics. There are some who look wistfully over their shoulders to an age when licence was broad enough to make venturing a practical possibility—an age when Lord Woolton's advice to "go out venturing in the world overseas for trade for the benefit of Britain" meant an individual and partisan approach to international law and relations. There are others who find it difficult to reconcile the history book's colourful description of the Elizabethan merchant with the drab picture in the mirror—the poor dupe of bureaucracy with his pen flying incessantly over the official questionnaire. The term "Private Enterprise" has been condemned by those who regard present-day business as too private and lacking in enterprise. "Venturer," at the moment, is free from these defects.

Education in the Lords

The Education Bill is moving through the House of Lords with perhaps less difficulty than might have been expected. But the peers are not giving it an entirely clear passage. The effect of the general good will for the Bill appears to be that it is the minor points rather than the major principles which are debated, and on some of these minor points there will be amendments for the Commons to deal with. "Young People's Colleges" have been renamed "County Colleges," and the President of the Board of Education has been instructed to consult with the President of the Board of Trade and the Minister of Agriculture in appointing one-third of his Advisory Council—an annoying and probably quite ineffective complication. There has also been a plethora of suggestions that this, that or the other subject ought to be included in the curriculum by law. These were to be expected: the substance of education is a subject that interests the public quite as much as the framework of the educational system. The Bill is intended to deal only with the latter, but people naturally want to

talk about the former, and the Government gave them an excuse by including a provision for religious education which, for this reason if for no other, had better have been left out. But entirely apart from these questions of procedure, is it really right to clutter the curriculum with compulsory subjects? This week, for example, Lords Mottistone and Chatfield wanted to have compulsory instruction in the duties of citizenship, "including the duty of defending their native land and assisting in the maintenance of law and order." This seems to embody a wholly false idea of education. For one thing, the average boy or girl acquires a healthy suspicion of any doctrine that is taught compulsorily. And for another, the object of education is (or should be) to develop, to build up, to exercise the mind, not to stuff it with other people's preconceptions—to create the ability to think, not to destroy the wish to dissent.

The Battle of the Quotas

The international monetary conference at Bretton Woods has made good progress during the past week. Agreement on the main principles of the monetary fund scheme has been reached. The work of the second Commission, discussing the world reconstruction bank, is well under way, and official spokesmen anticipate less difficulty with this part of the conference's task than with the currency discussions. The press reports from Bretton Woods have to be searched very closely for any hint of these solid achievements. Most of the "coverage" has been concerned with the items of dispute. This is not surprising. Disagreement always makes better news than agreement. Moreover, it inevitably tends to occupy a larger share of the proceedings. The press picture of Bretton Woods has also been considerably distorted by the pronouncements of Republican Congressmen telling all prepared to take it from them that the Conference was wasting its time, and must not be taken seriously because Congress would never ratify anything in the nature of the monetary fund or the reconstruction bank proposals. The main battle within the Conference has been waged around the size and distribution of the quotas and the com-

BUSINESS ENTERPRISE AFTER THE WAR

Small and medium-sized businesses in all branches of industry and trade must have every opportunity of contributing, by their enterprise and initiative, towards the nation's economic well-being after the war. They must be given full support in developing British trade at home or in overseas markets.

Changes due to war conditions call for a far-sighted policy concerning the financial aid they may need. This Bank, through its branch managers, will therefore be prepared to consider enquiries from promising undertakings, whether old or new, conducted under good management. It will base its consideration of each proposal as much upon the prospective borrower's integrity and business capacity as upon his material resources.

MIDLAND BANK LIMITED

position of the monetary fund's executive committee. This fight was to be expected. The two issues crystallise all the competitive aspirations of the participating countries—whether in the search for position in the ranking of world powers, or in the bidding for overdraft facilities from the fund. Of the originally proposed aggregate quota of \$8 billion, the US was allocated \$2,500 million, the United Kingdom \$1,800 million, Russia \$1,000 million, China \$600 million, and India and France \$300 million each. The quotas were fixed on an elaborate formula comprising three elements: national income, foreign trade, and the extent of recent variations in annual balances of payments. This was attacked by China, which suggested that population should be given some weight; by Russia, which urged that potential rather than past foreign trade be taken into consideration; and by France, which strongly objected to being placed below China in the ranking of world Powers. Some of the objections have been met by raising the aggregate quota to \$8½ billion, and distributing the increase to certain of the objectors—mainly to Russia. The next difficulty, raised by Russia, was on the score of the gold subscriptions of the member countries. It was argued that countries which had suffered severe devastation as a result of the war should be forgiven some of this gold subscription, since the whole of their gold reserve should be retained for financing essential reconstruction. The Russian delegates were reminded that they need not pay more than one-tenth of their gold reserve in gold, but they showed considerable reluctance to disclose the size of this reserve.

The proposed Executive Committee of the monetary fund is to consist of eleven members. It is suggested that five of them should be permanent representatives of the five Great Powers, the United States, the United Kingdom, Russia, China and France, and that the remainder should be elected by the smaller Powers by a unique system of proportional representation. The main opposition to these proposals has come from the South American countries, which have staked out a claim for two permanent members to be shared by them. The nearest the conference has got to the dramatic has been the threat of the Indian delegation to pack its bags and leave if the fund was to refuse all responsibility for the realisation of India's blocked sterling assets. This claim met a united opposition from all other delegations. The debt in question—say £1 billion—is too large to be shouldered by the fund, and would by itself more than exhaust Great Britain's quota. The French delegates argued quite logically that if India's claims on Great Britain were to be handled by the fund, why not the claims of the enemy-occupied countries arising out of their clearing accounts with Germany? The best contribution the fund can make to the solution of these abnormal credits and debits arising out of the war is to help get the wheels of international trade turning again, and thus create the exchange from which these frozen assets must ultimately be liquidated.

Gandhi and Pakistan

The Cripps offer thrust back on the political leaders of India the responsibility of finding a way out of the communal deadlock between Moslem and Hindu. For two years they have shown little eagerness to accept the challenge, with the one exception of Mr. Rajagopalachari, who has continued to urge that the British offer was made in good faith, and that its proposals should be met in a constructive spirit—in other words, by seeking an understanding with the Moslems. At first this attitude cost him dismissal from the Congress party, but his prestige was undiminished, and he remained in contact with Congress leaders. So long as they were all in prison, little progress could be made, but since Mr Gandhi's release, Ma Rajagopalachari has, with Mr Gandhi's approval, been carrying on private negotiations with the Moslem leader, Mr Jinnah. The proposals have now been published, and they would seem to go far—though not perhaps quite far enough—to meet the Moslem case. The Moslems are invited to join Congress in forming a provisional government to take over full powers from the British. After the war a demarcation commission will establish contiguous areas in the East and North-West of India, where Moslems form an absolute majority, and after a period during which both Congress and the Moslems will establish contiguous areas in the East and North-West plobiscite for or against the idea of the separate Moslem state of Pakistan. If Pakistan is their choice, the Hindus will accept

it. The two states will separate, with appropriate safeguards for defence, communications and commerce. In other words, some form of loose federal link is envisaged. The whole scheme is made dependent upon the complete withdrawal of the British. This is the plan. It remains to be seen whether it will arouse a more profitable response from the Indian politicians than did the Cripps proposals. On the Hindu side, the Mahasabha is still vehemently opposed to partition, and it is remarked that Mr Gandhi has not actually put his name to the plan. On the Moslem side, two fears predominate—that the withdrawal of the British may leave the Moslem minority at the mercy of Congress in spite of the plan, and that the plan may damage Moslem unity. As in all dealings with Mr Gandhi, there is the necessity of making quite certain that he does not attach to words a meaning of his own which only emerges after the event. Mr Jinnah's hold is not unchallenged and he has, it appears, refused to accept the responsibility of backing the plan. Thus the publication of the correspondence is interpreted by some Moslems to be an attempt by Congress to drive a wedge between the Moslem League and the Moslem masses. They fear, too, that the right to free propaganda might have results unacceptable to the supporters of Pakistan. In a word, the first reception of Mr Rajagopalachari's plan proves that the crisis of confidence which kept India's leaders in a twilight of uncooperative inaction two years ago is by no means dispelled.

Balkan Feuds

The feud between Royal Governments and partisans in the Balkans has not yet been settled. The negotiations begun in the Lebanon between the various Greek parties have now ended in complete deadlock. The leaders of the Left wing (EAM and ELAS) have obviously failed to get the endorsement of their followers for the National Charter signed on behalf of the Movements at Lebanon. To M. Papandreou's demand that they should join his Government in accordance with the Lebanon agreement, the reply has been given that the EAM now demands seven instead of four seats in the Government. The guerilla army (ELAS) has refused to submit to the orders of the Royal Government and insists on its continued independent existence. Similarly, in contradiction to their previous public condemnation of the mutiny in the Greek forces in the Middle East, the Left wing leaders now protest against the trial of the Greek soldiers and sailors and demand an amnesty. M. Papandreou has bluntly denounced the conduct of the EAM leaders and refused to make any further concessions. The EAM leaders have, no doubt, hopelessly entangled themselves in their own tactical manoeuvres and they have deserved the blame. But in stating this, the Greek Prime Minister has not come any nearer the desired reconciliation. The fact still remains that the EAM is the largest and most effective guerilla force in Greece and that the alternative to reconciliation is probably civil war. In Yugoslavia the prospects look brighter for the time being. The new Prime Minister, Dr Subachitch, has succeeded in forming a small Government which consists of six Ministers only—two Serbs, two Croats and two Slovenes. Some of Dr Subachitch's colleagues have served in Yugoslav governments before the war. Dr Yuraj Sutej, the new Minister of Finance, was once a member of the Croat Peasant Party and was Minister of Finance in the last Yugoslav Government before the *coup d'état* of 1941. Dr Sava Kossanovitch, the Minister of the Interior, is a leader of the Serbs in Croatia and also served as a Minister in pre-war Yugoslav Governments. Two Ministers represent the Tito movement. General Mikhailovitch holds no office and is not represented in the new Government. The only uncertain question about Dr Subachitch's team is whether it commands sufficient support in Serbia proper.

Pressure on Argentina

Argentina's relations with the Allies continue to follow an involved and unsatisfactory course. The latest exchanges—a bellicose speech by Colonel Peron on totalitarian policy and the need to be ready for war, the publication of the speech by the State Department with opprobrious comment and the appointment, which followed immediately after, of Colonel Peron to the office of vice-President—suggest that diplomatic pressure in the shape of recognition withheld and Ambassadors withdrawn has only very limited effect, and even then, not always the effect desired. Mr Cordell Hull

may not, however, be content now with diplomatic pressure only. There is talk in Washington of economic sanctions, and some reports from Argentina state that an embargo on fuel has already been imposed. Judging by the Spanish precedent, economic pressure might have more effect, provided it were applied to specific objectives, for example, the immediate departure of the Axis diplomatic agents or co-operation in the matter of joint bases on the River Plate—if those are still thought to be necessary—or, perhaps, a large Argentine contribution to the work of UNRRA. But if pressure is applied at large simply to change the Government, then, as with diplomatic pressure, the result is likely to be a strengthening of the Government's hold on Argentine loyalty. No people cares to feel that its sovereignty is being attacked, and the Argentines, in whom national feeling is exceptionally strong, are most unlikely to change their government because the "Yanquis" and the British wish it.

War Pensions

The debate on war pensions at the end of last week showed a marked tendency to concentrate on one particular issue. In spite of some diversions, Members kept returning to the question whether or not there should be a flat rate of compensation to parents for the loss of a son or daughter in the services. There was considerable support for the Minister of Pensions, Sir Walter Womersley, who maintained the principle that State money should only be given to those in need. There was an equally vocal demand that the death of a child should not be followed by any kind of means test but that some direct "token payment" should be made as compensation for the loss. This and similar arguments were heavily backed by special pleading and the citation of particularly hard cases. At present, there is a basic limit on weekly income of £2 in the case of both parents, and 25s. if there is only one, with various adjustments according to circumstances. That this is in many cases far too low and that it does give rise to instances of genuine need, there can be little doubt. Consideration must clearly be given, as the Minister agreed, to proposals which would remove much distress. On all sides, questions relating to subjects such as pensions are bound to receive considerable and probably increasing, attention from the public. One member even suggested that it would be these minor but "human" issues which would decide the fate of parties at election time, rather than the larger issues of international policy. For this very reason it is important that the maximum of justice and consideration should be given to those in genuine need of a pension but equally that firmness against opening the door to mere sentimental largesse should be maintained. It would be disastrous if the issue of more and better pensions were to occupy the time of Parliament more than is absolutely necessary, or if it were to become the bitter bone of party contention.

Service Pay

Improvements in the rates of service pay and allowances announced by the Prime Minister this week will satisfy many of the complaints raised in the debate early in March. The general effect of the new provisions will be to widen considerably the limits beyond which no dependant's allowance could be made, and to increase the number of cases where higher rates of allowance were payable. Discrepancies between the allowances made in lieu of rations to men and women officers, where both are working under similar circumstances, are also to be adjusted. Outfit allowances and loss-of-kit compensation for officers of all services will also be increased. Officers holding temporary acting rank will no longer suffer reductions of pay during periods of transfer to new appointments, or when on leave through sickness or wounds up to a limited period. Although these concessions, and particularly those which relate to the family allowances, will be welcomed both by the services themselves and by the general public who will ultimately shoulder the cost, it cannot be said that Mr Churchill has solved the real problem of service pay. While many of the armed forces are in, or expecting soon to be in, the thick of the fighting on either battlefield, there is, it is true, little opportunity for the men to spend more than their present pay. Later on, when the duties of peaceful occupation increase and the process of demobilisation begins, there will inevitably be a clear case for increasing the pay of the country's citizen army. An all-round increase in basic pay

would be a better solution than piecemeal improvements here and there. It is unlikely that the war will end before criticism compels the Government to accept further adjustments.

Police Report

The Commissioner of the Metropolitan Police has recently issued an annual report for the year 1943, which amounts in fact to a survey of police work under wartime conditions. This is the first report to be published since that for 1939, and though necessarily and laudably compressed, it manages to bring the records and statistics of crime in London up to date since that year. Before the war it might have been imagined that the dislocation of population, the uncertainty and insecurity, and the inevitable shortages of war, might have produced a criminal problem beyond the scope of a peacetime organisation. It is undoubtedly true that the past three or four years have brought some increase in the variety of work normally undertaken by the police; air-raids have brought with them the crimes of looting, and the tasks of an information bureau; national service regulations, and the numerous defence regulations have added to the labour of investigation; and, in addition, men from the Metropolitan Police Force have been lent on occasion to the armed forces and to Amgot. With all this extra work the police have lost men—regulars and auxiliaries—to the armed forces and to industry, without being able to draw on new reserves of younger men. Fresh demands have had to be made on the unpaid time of the volunteer “specials.” In spite of this, the report shows a small decline in the total number of indictable crimes, and a marked increase in the number of crimes cleared up. Juvenile crime, considering the opportunities and the incitements presented by the conditions of war, cannot from the police point of view provide grounds for alarm. The fact that a large number of citizens are now under military discipline, on the other hand, means a transfer of police work from civil to military authorities, and it may be that war conditions will not react on the incidence of crime until the war is actually over. Nevertheless, the report can be welcomed as evidence of a battle at least half won.

Conserving the FOOD VALUE of our Milk

MILK Chocolate is a convenient medium for carrying, storing and conserving milk, but there is much more to it than that. . . Fresh dairy milk consists of two elements — water, which averages 87½%, and 'milk solids' (fats, protein and milk sugar), which contain calcium, phosphorus and Vitamin D and which constitute the whole food value of the milk. As the chart shows, Cadburys Milk Chocolate retains all the milk solids of all the milk used, and only the water is eliminated.

Cadbury means Quality

AMERICAN SURVEY

Democratic Tug-of-War

The Democratic Convention next week promises even less excitement than the Republican in the choice of a Presidential candidate. Mr Roosevelt at last has conceded his fourth candidacy, on the ground that, like a soldier in the front line, he cannot desert his post in time of war. The liveliest issue at Chicago will be the choice of a Vice-Presidential nominee. The Southern States continue their campaign against Mr Wallace. Last week Virginia joined the bloc determined to black-ball him. The conservative and anti-negro circles which dominate Southern politics have no use for Mr Wallace's passion for equality, his interest in improving the lot of the poor farmer, or his Middle Western radicalism. These qualities are not universal handicaps. Mr Wallace has his own devoted following among labour and liberal groups; and, even more important, he might be able to halt the defection of the negroes. The call of the war factories has brought them in great numbers to the key electoral states of Illinois, Pennsylvania, Ohio, and New York, in which a small number of votes may swing a whole state into line. The determination of the Republicans to woo the negro is apparent, not only in the platform adopted at Chicago, but in Mr Dewey's selection of a negro, Dr Powell, the publisher of the *NY Amsterdam News*, as his Assistant Publicity Director. This is not the first time that Governor Dewey has appointed a negro to high office, and he knows what he is doing. The war has made the negro restless and made his grievances even less durable. In most cases he has a larger income, but instead of this being a source of satisfaction, the spending of it brings him up against a host of white prejudices. Wartime improvements in the status of the negro have, however, made the rulers of

Southern Democracy even more implacable, and their feelings have been exacerbated by the Supreme Court ruling on the participation of negroes in state primary elections. The Democrats will have some difficulty in fending off a states' rights pronouncement on the platform which would be interpreted as an anti-negro plank, and they certainly will not be able to go as far as the Republican platform. In this situation it would be a substantial advantage to have a Vice-Presidential candidate whose name is identified with hatred of race prejudice. Nevertheless, Mr Wallace's chances are not considered brilliant. Mr Roosevelt is reported to have said that he would put forward his name at Chicago, but would allow the convention to decide. This has been interpreted as throwing Mr Wallace to the wolves, though the President's recommendation cannot be taken too lightly. To satisfy the Southern bloc, however, the mantle may fall on Senator Truman, Senator Barkley, or Mr Byrnes, all Southerners of distinction, who would be popular below the Mason-Dixon line without alienating liberal sentiment in the north and west.

* * *

Primary in Oregon

In Oregon the odds are heavily in favour of the election of Mr Wayne Morse as US Senator. Mr Morse is a candidate of great distinction, not the least element of which is his elimination of Senator Holman in the campaign for the Republican nomination. Senator Holman, in a final whirlwind campaign, was the author of a classic and much quoted retort:

Anti-Semitic? Now why should I be anti-Semitic? My own father was an Englishman. I have relatives in England.

On all counts Senator Holman's record seems to have been unreservedly bad—he was a pre-Pearl Harbour isolationist, anti-Semitic, anti-labour, and took a violently nationalist line in his campaign for the nomination. Mr Morse is a strong internationalist and made this the core of his attack, but he also has a very remarkable labour record. He has won the respect both of labour and management, first in his post as Pacific Coast arbitrator for the Department of Labour, and later as a member of the War Labour Board and author of the "little steel" formula for wage stabilisation. He was the outstanding supporter of the "hold the line" policy and was the only member of the Board to dissent from the Ickes-Lewis agreement which concluded the mine-workers' strike last year. As *Time* has put it, he "hewed a straight line down the middle." The bulk of his campaign funds, which were extremely limited, came from employers favourably impressed by his integrity and courage, and the bulk of his votes seems to have come from labour in the Portland area. Mr Morse's chances are excellent, not only because of his personal qualities, but because of the Republican trend in Oregon. There seems to have been a Republican revival, for twice as many Republicans as Democrats turned out for the primaries. It is interesting, and perhaps heartening, however, that Mr Morse's Democratic opponent is also avowedly internationalist, and is thought to be the best Democratic candidate in Oregon in the last ten years. The Pacific North-West has always been noted for its indigenous progressiveness, although it has not always taken a peaceful form. It is striking that, with all the strains of a speeded-up war industrialisation, there should be such unanimity in principle and so decided a revulsion from isolation.

* * *

War Priorities

Plans for a smoothly rising curve of civilian production, leading without strain into the post-German war period, are hanging in the balance. It is reported that President Roosevelt has been called upon to arbitrate between the

Services, which oppose any such increase, and the War Production Board, which has begun a gradual relaxation of controls. The demand for certain types of war goods has risen sharply as a result of battle experience in Normandy, and schedules have been revised to provide for more heavy trucks, tanks, heavy artillery, shells, and ships. Heavy duty trucks have now been accorded priority equal to that of landing craft and heavy artillery. The War Department has notified the WPB that munitions output for the Army, which totalled \$1.8 billion in May, must be raised to a monthly rate of \$2.2 billion by autumn if the 1944 goals are to be met. The military also point out that any falling off in the demand for military equipment of other kinds may be only temporary, and that to increase civilian production might disastrously speed up the move back to peacetime occupations. The new schedules mean a heavy drain on steel supplies; and the steel industry has been losing ground since May, when production stood at 99 per cent of rateable capacity. It is now 94.3 per cent of capacity. Mr Batt's announcement that Britain would export 100,000 tons of steel to the US underlines the position. The immediate need of the industry is for another 50,000 men. This will provide the acid test of the new manpower controls. These have been in force only a week, so it is too soon to say whether they will be able to solve the problem of "labour evaporation," the term for a situation in which something like 20 out of every 50 men who leave their jobs vanish into thin air so far as official records are concerned. The only conclusion is that in fact workers are seeping into civilian goods and services production. The disadvantage, of course, is that there is no guarantee that the increase of workers results in more of the goods and services really needed—more laundries, for example, rather than more night-clubs. This is probably unavoidable in the absence of tightly-knit manpower and production controls, but it is hardly a guarantee of orderly or equitable transition.

* * *

Fly-Bombing Isolation

Mr Churchill's statement and the flood of news now released about the flying bomb have once more evoked sympathy and admiration for the people of "Southern England." There have been many tributes to the steadfastness of the British people and the "indispensable barrier" they provide between the United States and the enemy. There is more than this, however, to the impact of the flying bomb on the United States. It has revived the old admiration for Britain that, so magnificently stimulated by the foreign correspondents during the blitz, smoothed the early days of Lend-Lease. But it promises to come closer home. Mr Glenn Martin, a fortnight ago, said it was perfectly possible for the flying bomb to be perfected to such an extent that it might reach the United States. Mr Louis Lochner, former head of the Foreign Press Association in Berlin has even declared that the rocket-bombing of New York from submarines was a feature of German plans before the United States entered the war. The United States is keeping calm. Mr Patterson, Under Secretary for War, doubts whether Washington will be evacuated just yet. But the *New York Post* undoubtedly is right when it refers to the flying bomb as a twentieth century weapon which has smashed up the eighteenth century doctrine of isolationism. The flying bomb is a promise of what the next war may be like if the United Nations fail to maintain the peace. It is a guarantee that the "protected people of the United States" as Mr Arthur Krock calls them, may be in the front line in another twenty years. Just as the blitz of 1940 helped to prepare the way for an effective joint war effort, the flying bomb may smash up those remnants of isolationist sentiment that lie in the way of an enduring peace settlement. It is unlikely that Mr Roosevelt will not spell out the writing on the wall for the benefit of those who have failed to grasp its significance, and Mr Dewey cannot afford to be far behind. Mr Willkie, whose behaviour during the original blitz endeared him to the London public, is certain to be heard from.

* * *

Surplus Aircraft

Plans for the disposal of surplus aircraft after the war have been drawn up by a group of Harvard professors at the request of the War Contracts Subcommittee of the

Senate Committee on Military Affairs. The report, which, it is emphasized, does not necessarily reflect the views either of the subcommittee or the War Department, takes a strong stand against the view that all such aircraft should be scrapped at the end of hostilities, and emphasises their importance as a national asset. It strongly disagrees with the contention that scrapping would stimulate post-war employment, and points out that the wide public use of surpluses would stimulate demand for replacements, at home and abroad, as improved models come on to the market, while manufacturers can be given substantial amounts of overhaul and sales work. Even more interesting is the report's insistence on the opportunity afforded for implementing national policy by the exchange of surplus combat planes for bases, landing rights, strategic materials, or other considerations from friendly Powers. These exchanges would be effected only with the approval of the Service and State Departments. Transport planes fall in another category; the report urges that the most modern should be among the first released for domestic use, and that transports conveyed to other countries under Lend-Lease should be at least nominally repossessed, so that their final distribution should not be affected by emergency conditions, but primarily by national policy and peace-time needs. Senator Murray, head of the subcommittee which requested the report, has been particularly impressed by the educational possibilities which it stresses. In addition to aircraft retained by the Air Forces for training purposes, planes suitable neither for military nor civilian duty will, it is hoped, be distributed to the schools of the country to promote civilian pilot training, aeronautical research, and education. The "air-mindedness" so generated would, it is felt, help to guarantee the maintenance of an air force adequate in size and in industrial resources and equipped with the latest models. Combat planes should not, in the committee's view, be saleable to individuals of a sporting disposition. This is reassuring. Not many weeks ago there was a great hue and cry on the West Coast when it was discovered that a number of exceedingly lethal weapons had been released to retailers, who obligingly labelled them sporting rifles and disposed of the lot in a remarkably short time to anonymous purchasers.

THE WORLD OVERSEAS

The Saskatchewan Election

(From Our Ottawa Correspondent)

THE overwhelming victory at the polls in the Saskatchewan provincial election scored by the co-operative Commonwealth Federation Party represents one of the vehement changes in Canadian politics which inevitably generate consequences on a broad scale. For the first time since the CCF was formed at a convention of minor western political groups in Calgary, Alberta, in 1932, the party will assume the responsibility of office.

The new premier of Saskatchewan is Mr T. C. Douglas, 40-year-old former Baptist preacher, whose political experience includes nine years in the House of Commons at Ottawa. The foundations of CCF policy were set forth in a manifesto adopted at the first annual convention of the party at Regina, Sask., in 1933. The manifesto is strongly socialistic in character, calling for nationalisation of key industries, including banking. But in the realities of prairie politics, the CCF secured election in Saskatchewan not through its socialist proposals so much as through the spirit of political protest that has arisen against the restraints of wartime controls. That the party had capitalised on grievances of this kind was frankly admitted by Mr Douglas in his post-election statement which ascribed the victory to resentment against federal policies in dealing with manpower, with agriculture, and the federal government's alleged failure to provide suitable post-war reconstruction policies.

The significant feature of this statement, obviously, is the emphasis upon federal issues. In the provincial field, the CCF conducted their campaign on a platform of improved health services, educational reform, higher pay for teachers, and more comprehensive debt relief for farmers. At the same time, the party had promised taxation relief, placing itself in the vulnerable position of offering more extended social services while pledging a reduction in taxation. In the face of electoral success, Mr Douglas presented a considerably more sober outlook. There would be no radical legislation immediately. Reorganisation of Government departments will be carried out in the course of a four-year plan, and a new department of industrial development will be created. The public debt will be refunded as soon as convenient.

Rival Political Programmes

The reality of Canadian politics is that fundamental economic changes must be transacted in the federal parliament. For that reason, the socialist programme of the CCF must wait, for the most part, until the party can increase its influence in federal politics. Its prospects there have increased considerably, for the party now forms the chief opposition in the legislatures of Ontario and British Columbia, although it has less standing in the legislatures of Manitoba and Alberta. Its leaders claim that its prospects now include the opportunity to obtain the largest group of seats in the next parliament. Whether their hopes are realised or disappointed, the CCF is bound to have increasing effect upon Canadian policies.

For that reason, the true nature of the CCF movement has come under closer study than before. As a party that

can capitalise on wartime grievances, it may win support. The alternative to the Mackenzie King Liberal Government, as it stands now, must be the Progressive Conservatives led by John Bracken, the CCF led nationally by M. J. Coldwell, a minority Cabinet, or a coalition government formed of two or more groups. The Progressive Conservative Party, replacing the older Conservative Party which held office under R. B. Bennett (now Viscount Bennett of the British House of Lords) suffered a crushing defeat in its efforts to win seats in Saskatchewan. Its prospects have come under heavy discount, but it is the strongest political force in Ontario at present and its supporters hope to increase its present representation of 39 members in a federal house of 245. In Quebec, the home-grown French-Canadian nationalist party, Le Bloc Populaire, could make gains only at the expense of the Liberals, and the extent to which it does so may determine the character of the next parliament.

The CCF, as the *Winnipeg Free Press* has pointed out, represents the third protest movement to arise in western Canada since the last war. The Progressives enjoyed a meteoric rise in 1919 and 1921, and held the balance of power in parliament for four years. In 1935, the Social Credit Party captured office in Alberta and has elected a small, unimportant group to the Federal Parliament since then. The Progressive movement, basically agrarian, was a liberal, free trade, anti-protectionist political force. It later merged with the Liberal Party, where it remains as the western free-trade wing of that party. The Social Credit Party, based on monetary reform ideas, was provincialist in its proposals, pursuing the concept of a controlled economy on a provincial scale. This is an impossible programme, for constitutional and other reasons.

The CCF is another State-control movement—a reaction against the liberal philosophy which has drawn its greatest strength in Canadian politics from the economic necessities of open markets for exports. Its interest in social services furnishes no point of difference between it and other parties. But its proposals for guaranteed incomes, for fixed prices, for import and export boards mark the distinction. The CCF offers the closed community, the “co-operative commonwealth.” This, according to the *Winnipeg Free Press*, “is an economic mirage, based upon domestic promises impossible of fulfilment without the existence of conditions far beyond the borders of Saskatchewan and beyond the frontiers of Canada.”

Power Shortage in Switzerland

[FROM OUR GENEVA CORRESPONDENT]

EVER since imports of coal have been drastically cut down, Switzerland has increasingly been forced to depend on her own resources of fuel. These are proving insufficient, and for the second year running the authorities have been compelled to curtail the consumption of electricity during the winter months. Production has been unable to keep up with a higher demand, and the situation has been worsened by the abnormal drought which has prevailed since 1941. According to the latest figures, the production of electricity has increased in almost geometric progression since 1900.

Kilowatts (thousands)	1900	1910	1920	1930	1940	1943
	131	420	810	1,520	2,034	...
Kilowatt-hours						
(milliards)	0.2	1.2	2.8	5.1	8.2	9.2

The recent increases in consumption have been particularly great in industry and domestic use. At present, the percentage distribution of electric power, according to official figures, is as follows:

THE ECONOMIST, July 15, 1944

Domestic use	12 per cent.
Art and craft	9
Industry	46
Railways	10
Losses and pumping	11
Export	19

In 1941, there were 6,030 electric power plants in Switzerland, 130 of them being responsible for 95 per cent of the total output, 99 per cent of which came from water power plants. Since then, two big hydro-electric plants have been put in service, the Verbois plant on the river Rhône, near Geneva, which, until its completion next year, is yielding only two-thirds of its potential production, estimated at half a million kilowatt-hours a year, and the Handeck-Innertkirchen plant, which yields 600 million kwh. a year. The latter is the most powerful plant in Europe. It consists of three composite plants fed by the river Aar and by two artificial lakes on the Grimsel Pass, containing altogether 4,236 million cubic feet of water. The two highest plants have been in production for the past three years, and the third and lowest, at Innertkirchen, began producing just over a year ago. The construction of these works involved the boring of seven miles of tunnels in the granite. The Innertkirchen plant, the first bomb-proof power-plant in Switzerland, is entirely hewn in the rock.

Even this is not sufficient, and the Government, strongly backed by industrialists and local authorities, have set up a scheme for adding another 1,000 million of kwh. to Swiss electrical production. Some of the new constructions are under way; the Ruppenswil plant, on the river Aar, which will be finished next year, will yield 100 million kwh. to the Federal railways, and to the new Bois Noir plant on the river Rhône, and the Rossens plant in Canton Fribourg. Other schemes are still being examined; among others, one for creating an artificial lake at Gletsch, on the Furka Pass, and one involving the flooding of the Upper Rhine valley, at Hinterrhein, on the Splügen Pass road. This last scheme is strongly opposed by nature lovers, as well as by the natives of the district, as the completion of the scheme would result in the transfer of 600 people from the villages of Hinterrhein, Nufenen and Medels, which would disappear under a lake containing 9,884 million cubic feet of water. The proposed plant would yield some 300 million kwh. a year.

The Middle East in 1962

[BY OUR CORRESPONDENT IN PALESTINE]

AT a moment when there is much talk about the political future of the Middle Eastern countries, a comprehensive study has been published, by Dr. A. Bonne of the Economic Research Institute of the Jewish Agency, which tackles the question from the economic angle. The author takes it for granted that all political obstacles can be removed, and the machinery can eventually be established for “collective economic planning,” embracing the whole of the Middle Eastern area—that is, Palestine and Trans-Jordan, Syria, Lebanon and Iraq, and possibly Egypt, Cyprus and Turkey. His aim is to show what planned reconstruction, freed from political impediments, could achieve towards solving the economic problems of this vast area during the next two decades or so—between now and 1962.

Of these problems there are two of outstanding import-

ance: the exceedingly low social and economic standards of the local population; and the rapid growth of population, which threatens to depress standards still more. The pre-war national income per head has been computed to be £26 a year in Palestine, £19 a year in Turkey, and £10-£13 a year in Syria, Egypt and Iraq. The average yearly income of an urban Arab family of five persons is estimated to be £33 in Palestine and £47 in Cyprus; while the cost of living of a fellaheen family of five was £37 a year in Palestine and in Cyprus, and between £25 and £26 a year in Egypt.

All these figures have, of course, been put out of date by inflation. Squalor, undernourishment and endemic diseases are widespread; the consumption of industrial goods is limited to bare necessities; technical equipment is poor; and methods of work are primitive, especially in agriculture, on which the major part of the local populations still depend for their livelihood.

The productivity of labour is very low, which is, of course, the chief cause of the present poverty. The net productivity of a male earner occupied in agriculture has been calculated (on the basis of 1934-35 crops) to be 90-98 international units (in Mr Colin Clark's statistical terminology) in Syria, Lebanon, Turkey and Egypt, 108 in Turkey, 143 in Cyprus, and 148 in Arab Palestine, against 420-580 units in Western Europe; the net output per head on cultivated land was in most regions only 40-43 international units. The high rate of mortality among the native population is much more than offset by the high birth-rate (reaching 43 per thousand in Egypt and 50 per thousand among Palestine Arabs). The annual increase of the total population of the Middle Eastern area is now over 600,000; and it is quite certain that the present population will be doubled within the next generation.

Over or Under Populated?

On the face of it, therefore, there is a real and imminent danger of over-population. This does not take into account, however, the potential capacity of the area. Quite apart from substantial mineral deposits—and the rich oil-fields, which now loom so large in world politics, are only one instance of these untapped resources—there are wide tracts of waste arable land and ample quantities of water for their irrigation, which would enable many families to settle in districts which are now a desert or sparsely inhabited by nomad tribes and primitive fellaheen. An estimate of these possibilities is given in the following table:

CLASSIFICATION OF MIDDLE EAST LAND
ACCORDING TO UTILISATION, 1939
(in sq. km.)

Country	Total Area	Cultivable Area	Cultivated Area	Irrigable Area	Irrigated Area
Egypt	1,000,000	34,000	24,000	34,000	23,000
Turkey	763,000	300,000	87,000	30,000	4,000
Iraq	453,000	92,000	13,000	51,000	7,000
Syria	202,000	61,000	16,000	12,000	2,500
Palestine	27,000	12,000	9,000	4,000	400
Transjordan	90,000	4,600	3,500	600	200
Total	2,535,000	503,600	152,500	131,600	37,100

On the average unirrigated land, which is worked under extensive cultivation, carries a population of 60 per sq. km., but the average agricultural density on irrigated land may

be 200 per sq. km. On this basis, assuming that the irrigable areas can be irrigated, the capacity of the area to support has been reckoned at 30,000,000—that is, at more than the total natural increase during the next two decades is likely to be. Such an expansion of the rural community would certainly bring about a parallel growth of secondary and tertiary occupations. Assuming that, in most of the countries in this area, agriculture will still account for between two-thirds and three-quarters of the total number of earners, the following figures may be calculated for the total population and its occupational distribution in the year 1962:

ASSUMED POPULATION AND EARNERS IN 1962
(in 1,000)

Country	Total Population as at Dec. 31, 1939	Assumed Total Population in 1962	Assumed Total Earners in 1962	THEREOF		
				In Agriculture	In Industry	In Services, Commerce, Transport, etc.
Egypt.....	16,680	24,000	8,100	5,346	1,053	1,701
Turkey.....	17,620	26,000	12,000	8,160	1,680	2,160
Syria.....	3,700	5,500	1,800	1,080	306	414
Iraq.....	3,700	4,950	1,375	1,059	179	137
Cyprus.....	380	600	200	114	44	42
Palestine—						
Total.....	1,502	3,600	1,487	402	435	650
Arabs.....	1,057	1,500	500	260	80	160
Jews.....	445	2,100	987	142	355	490
Transjordan	300	450	150	113	16	19

If it is further assumed that the net physical output of agricultural earners will increase during the next two decades by some 50 per cent, and the exchange value of the agricultural products in terms of industrial goods and services will increase by 50 per cent as well (according to the argument developed by Mr Colin Clark), then the net agricultural income of the Middle Eastern countries will treble. The income of earners in industry, trades and services may increase by more than four times, so that the total consumptive power of the Middle East countries may rise to some £1,200 million (at pre-war values), against some £330 million before the war.

But such a development would call for very large capital investments, which, on the basis of the experiences gained in recent colonisation activities, have been assessed at some £2,500 million, divided almost equally between agriculture and other trades and industries. Even assuming that a considerable part of this could be covered by internal saving, a big assumption, there would still remain very large sums to be supplied from external sources.

The Political Obstacles

All these figures are the merest conjectures. But they are based on real facts and real possibilities. The economic feasibility of such a development cannot be doubted, nor its general trend. But is the co-ordinated action which would be required politically possible? The programme outlined above is dependent on the putting into effect of large-scale reclamation and irrigation works, with power plants; national housing and building schemes; the expansion and modernisation of the present transport system; the improvement of farming by planned capital investment in agriculture and by the introduction of intensive cultivation; a supply of cheap capital to lower the rate of interest in rural credits; measures to reduce exorbitant farm rents; the systematic exploration and utilisation of the existing raw materials; the training of skilled workers and a general expansion of educational, medical and other public services; and the practical progress of these activities would be much hindered, and often rendered impossible, by lack of inter-regional understanding and international support.

So far, collaboration between Middle Eastern countries has been very limited. All talk of political and cultural unity cannot conceal the fact that there is little hope of achieving even the limited objective of a customs union in what has been called Greater Syria—that is, Syria, Lebanon, Palestine and Transjordan. Moreover, a uniform customs policy in these states, dominated as they are by autocratic landowner and primitive peasantries, would not necessarily be to the benefit of the more industrialised areas (e.g., Palestine and Lebanon). It may be that, contrary to logic, the political integration of the Middle Eastern block will have to come not as before, but after its economic development.

Letters to the Editor

The Cost of Service

TO THE EDITOR OF THE ECONOMIST

SIR,—The word "service" describes the whole function of retailing, and I endorse the plea in your issue of June 24th for much more statistical information about retailing costs so that the community can measure the cost of various items against the benefit which it derives from them. But it must not be assumed that the comparison would always be unfavourable.

Most of your examples are of department store services. Why you should consider them socially unjustifiable is not clear. Tearooms in department stores you describe as "luxurious"; this is true if you mean "comfortable," but not if you mean "voluptuous." In any case, I can assure you that in general they amply pay their way, and impose no financial burden on customers who do not patronise them. Escalators are installed by department stores because they are found to carry passengers from one floor to another more effectively and economically than lifts; I believe the LPTB has had similar experience. Exhibitions are, of course, not directly remunerative, but their cost is relatively quite small. The same is true of roof gardens, of which in any case there are only two in the whole country. I am surprised that you contrast van delivery services unfavourably with the "casual errand boy," a type of employment which progressive retailers feel it their social duty to eliminate.

If large retail businesses sought to raise retail prices in order to pay for unremunerative services, your criticism would be merited. But there is no justification for any such allegation. To suggest that they have encouraged the technique of the fixed-price branded article is directly contrary to the facts, since on the whole it is not popular among them. The initiative in branding and price-maintaining their products has been taken by manufacturers, primarily in order to obtain for these products a widespread distribution through small independent shops.—Yours, etc.,
Retail Distributors' Association. DONALD BARBER.

Co-operative Taxation

TO THE EDITOR OF THE ECONOMIST

SIR,—In the otherwise very admirable article on the Centenary of Co-operation which appears in the issue for July 1st there is a statement contained on page 21 to the effect that co-operative societies enjoy some taxation advantage. This, however, really is not so. They are subject to taxation in the same way as all other businesses. They are liable to Income Tax, Excess Profits Tax, and National Defence Contribution on trading profits, and to Income Tax on investments income. They are also liable to pay on the income derived from the ownership of land and property under Schedule D. In short, they are taxable under Schedules A, B, C and D, like all other businesses and trading organisations.

The only advantage co-operative societies enjoy, if such it can be called, as compared with limited companies, is that instead of tax being levied on the society in respect to interest on capital and loans, which in the case of companies corresponds to dividend on capital and interest on loans and debentures, it is levied directly on the individual shareholder or loanholder and not upon the society. Thus interest is paid in full before deduction of tax by the co-operative society but the individual recipient must account to the Tax Authorities if he is liable. Ultimately, therefore, the position of a shareholder or loanholder in a co-operative society in relation to taxation liability is exactly the same as that of a shareholder or loanholder in a company, for in the latter case, although interest may be deducted, if the person concerned has income below the abatement levels the tax deducted can be recovered. Otherwise the position so far as taxation liability as between co-operative societies and other trading organisations is exactly the same. There is no point of difference.—Yours faithfully,

R. A. PALMER.

General Secretary, Co-operative Union, Limited.

MODEL OF A VITAMIN

- CARBON
- NITROGEN
- SULPHUR
- OXYGEN
- CHLORINE
- HYDROGEN

The model in the photograph above might seem to be the elaborate plaything of the Twentieth Century child. But it is a structural model of

Vitamin B₁. It gives a tangible representation of the very complicated chemical structure of this vitamin. The first gramme of Vitamin B₁ is reputed to have cost £50,000. In the Roche plants in Britain, it has now been synthesized in quantities that bring it within the reach of all.

ROCHE PRODUCTS LIMITED

You are going to hear a great deal more about the Philco Group when the war is over than it is possible to reveal at the present time. It is enough to say that this progressive group of industrial electrical manufacturing companies have made their plans—plans for the large-scale production of radio and television receiving and transmitting apparatus, electric motors, generators, switch-gear, refrigerators and electro-mechanical devices of every description. These plans await the signal of victory and the brilliant opportunities of peace. When the time comes, the Philco Group will play an impressive part in supplying the needs and comforts which the patient people of this country so richly deserve.

WHITE HORSE

was growing old when
this war was young

If you have wondered how it is that you can still get White Horse Whisky from time to time, and how it is that the quality and flavour of this famous whisky were never better than to-day in this fifth year of the war, here is the answer in one word . . . age.

All the flavour, fullness and smoothness of the White Horse you have known in the past is in the White Horse you may buy to-day. For to-day's White Horse is itself a whisky of the past. In the early days of the war it was already growing old. It has been ageing ever since.

It was the stocks of maturing whisky, laid down in years gone by with a prudent eye on the future, which provided the great blend that is White Horse to-day. And our unrelaxing, provident care of the whisky still maturing is your assurance that this famous Scotch will remain as always — whisky fine as a fine liqueur.

MAXIMUM PRICES:—Bottles 25/9d.; Half-bottles 13/6d.
as fixed by The Scotch Whisky Association.

Pure Water is Essential . . .

STILL MALVERN WATER, the purest known water, can still be supplied without restriction of area throughout Great Britain. Singularly free from mineral salts and solids, which may be harmful to the system, it is highly recommended by the medical profession.

STILL MALVERN WATER can be obtained in sealed bottles (Extra large) from any Grocer, Chemist or Wine Merchant.

ST. ANNE'S WELL COLWELL SPRINGS

THE BUSINESS WORLD

Debenture or Equity?

AMONG the matters on which the opinions of industrialists have undergone a *volte face* during the past two decades must be counted their attitude towards the raising of money by the issue of debentures. Twenty years ago the argument ran, that if one could borrow money at a lower real rate than the return given by the ordinary capital at market price, it was to the advantage of the equity holder to do so. The cult of the perpetual debenture had declined, but long term issues were still fairly popular. They made it possible for the share of the equity in the business to expand over the period of repayment, even if there were no actual expansion in the total capital employed.

Last week, Lord Aberconway, sponsoring the latest instance of the exchange of debentures, in whole or in part into equity capital, expressed the views that permanent capital is preferable to terminable debt; that accumulations out of profits should be used to strengthen the business and extend the scope of operations rather than to repay debt; and, by implication, that equity capital is to be preferred to other types.

The contradiction between these two points of view is more apparent than real. If the outlook for the business in question is one of expansion and of steady and rising profits, there is everything, from the standpoint of the equity holder, to be said for raising a reasonable amount of capital by the issue of debentures, or of preference shares, or even of both. The fact that in the 20's and 30's many companies issued too great a variety of types of capital ranking in front of the equity, and issued far too much of such capital, does not invalidate the argument, provided the premises are correct. At present, however, few people would suggest that British industry can in most lines of business with confidence look forward either to expansion or to a rising level of profits without periods of recession, still less both together. It is permissible to hope that the wisdom of post-war policies, coupled with the initiative and energy of the human element in industry, will have this result. It would be rather less than prudent to count on it. In general, therefore, Lord Aberconway would seem to be right in preferring capital to debt. Indeed, it is evident that there is a crying need for a much larger share of the capital of industry to be financed on the basis that the stockholder bears a share of the risk. The only part of his thesis that can be questioned is his view that such debt as is contracted should be on a permanent rather than on a terminable basis—a view which in this particular he has not carried to the length of offering an irredeemable stock.

There have over the past two years or so been several offers to convert debentures into equity shares, and they have, on the whole, been reasonably successful. It would, however, be unduly optimistic to base any very hopeful conclusions about the financing of postwar reconstruction and expansion on this experience. The issues have been made at a time when industrial equities—and for that matter most other securities—were recovering from levels almost unprecedentedly low into which they were plunged by the events of 1940 and by the penal wartime taxation of industry. Share values are still rising, but there can, from this point, be no sure hope of a continuance of the appreciation at the rate which has prevailed since June, 1940. Moreover, the time must be close at hand when it will be a question of finding new money, not a mere conversion from one type of security to another. And the pressure of inflationary Government finance, which is now the chief influence for buoyancy in the markets, will soon, it must be hoped, be reduced, if not removed.

The context in which industry must after the war seek for new equity capital will be one in which most of the money must come from institutions or from the small man,

always rather averse to taking large risks and trained by the activities of the National Savings Campaign to believe that to play for safety is not only wise but patriotic. Add to this the facts that much of the new money must be put into ventures where the risk is considerable and that most of the potential investors have little or no experience of dealing in stock exchange securities, and it will be seen that the task of raising industrial capital will call for considerable powers of insight and management.

In theory a solution to the problem might be found by the individual continuing to take up Government stock and the Treasury finding the money for capital expenditure in approved cases. No doubt rationing of new capital will be necessary for some time, but there is not the slightest evidence that the state is likely to attempt so large a dose of socialisation as this solution would postulate or that industry would find it acceptable. Nor is there any reason to suppose that, if the Government did take to supplying capital for industry, it would make the right choice, or that the provision of a Government shock absorber between the general investor and the essential function of risk-bearing would be beneficial to the national income or, in the long run, to the individual citizen.

★

The solution must be sought on other lines, namely, by educating potential investors in the effects of their invest-

ment, by facilitating investment and by reducing to reasonable proportions the risks that they are called upon to bear. Employment policy, if it is successful, will tend to diminish, if not to remove, some of the causes of changes in the money dividend to be derived from industry as a whole. No such programme could succeed, however, which aimed at stabilising either employment or profits in any given industry. Properly used, the tax concessions already promised and others which may reasonably be expected to follow will work in the same direction. Further, a higher proportion of equity to total capital employed in industry would automatically make for smaller fluctuations—as well as a smaller maximum—in the return to be expected on equity investments.

All this, however, is scarcely likely to be sufficient, at least during the early years when the demand may be greatest, to overcome the reluctance of many people whose co-operation will be required to assume or resume the habit of risk-taking. This playing for safety is a general fault of a large section of the population. It applies to the entrepreneur and the worker no less than to the investor, and it would be well if means could be found to counteract it.

Even so, unnecessary risk-taking is to be deprecated, and the less margin the investor has the less can he be expected to risk his savings. There would appear to be two lines of approach which would make it easier to attract small savings into the ordinary capital of individual companies and two methods at least by which it might be possible to give the small man a reasonable spread over a larger number of equities than his slender resources would permit him to purchase without unduly heavy costs.

*

In order to encourage investment in individual companies it is necessary, on the one hand, to obtain and to make available to the public much more information about the activities and the earnings of industry, and, on the other, to reduce so far as is possible the cost of dealing in stock exchange securities in small amounts. Having regard to the resistance of directorates to any enquiry into the details of their operations and results and to the fact that, even at existing rates, the commission on small stock exchange

orders hardly covers the broker's costs, neither line of approach is easy. Nevertheless, both must be exploited to the full.

Of the means to spread risk the two which most readily suggest themselves are the interposition between the investor and the individual company of some institution which actually holds shares in a number of companies in which it is specially interested and issues to the public either fixed interest or equity shares, or a body, making similar issues to the public, which specialises in dealing in securities. Both investment trusts and finance houses exist in considerable numbers, but the only variant of them which has achieved any considerable popularity among quite small investors is the unit trust. The reason for this success seems to be more closely associated with advertising policy than with any outstanding merit which either the principle or the particular composition of many of the trust sub-units possesses as investments for the man of very moderate means. All three forms of organisation—the unit trust, the more orthodox investment trust and the finance company—are, however, doubtless capable of improvement.

This is not, of course, the only means by which the problem can be approached. It has already been suggested, on several occasions in these columns, that there should be tax relief for money invested, out of profits, in extensions of business, which would carry with it, as a necessary corollary, some tax relief on the profits earned, in the early years, by new capital raised in the market and used for genuine extensions of business. The purpose of these suggestions was to stimulate the volume of capital expenditure; but they would have the incidental advantage of stimulating equity investment. In one way or another, however, there is need for a bridge to be built between the desire of industry for equity finance and the desire of the public for safety in its investments. This is more than a technical problem; it is an essential part of the adjustment of institutions to a new age. The existing structure of financial institutions grew up in an age which, itself essentially stable, embraced a large number of individual risk-takers. Nowadays the economy as a whole has inherent tendencies to instability, but the individual craves security. It is in everybody's interest that the transition should be effected as smoothly and as quickly as possible.

Inquest on Coal

THE White Paper on coal statistics,* published by the Ministry of Fuel and Power, is one of the most illuminating documents of the war. It contains the complete history of the mining industry from 1938 to the end of March, 1944. Some of the information has already been published, but this is the first comprehensive summary of all the facts, and credit must be given to the Ministry for lifting the statistical black-out so completely in a vital section of war production.

The record of the four war years of coal production is one of almost unrelieved gloom. In the years before the war, the industry was beginning to recover from the depression; indeed, output in 1939, though there were fewer miners in the industry, showed a considerable improvement over 1938. But since 1939, as is shown in Table I, both output and manpower have declined progressively, the biggest drop in both being between 1940 and 1941. There has been a further decline in production during the first quarter of 1944. The gap between production and consumption in the coal year ended April 1944, amounted to 4.5 million tons, which has had to be met from stocks. The low figures for the first quarter of 1944 may, of course, be exceptional, because of the abnormal dislocation caused by the stoppages in South Wales and Yorkshire in February and March. Apart from minor local disturbances, the coal-fields have been remarkably free from strikes, ever since the wages settlement was reached in April, and after the added spur of military demands for coal. Moreover, as the year goes on, the cumulative effect of recent measures taken by the Government may be felt—the direction of youths to the mines, the grouping of pits under production directors, and the more efficient operation of new machinery. Perhaps Major Lloyd George, reviewing the work of his Ministry in the debate in the House of Commons that is to take place after this issue goes to press, will give some rather

more encouraging information about the industry's prospects than can be estimated from a study of statistical trends. But it is difficult to be optimistic about the general outlook; and in particular, the Bevin boys are not likely to have any immediate effect on production. They may have just about offset normal wastage (Table II), but are not likely to have any long-term effect on manpower. All available evidence suggests that the vast majority will not stay in the mines a day longer than they are compelled. The problem of declining juvenile entry has thus only been shelved, not solved. Whereas in 1938 there were 27,600 boys under 16 in the industry, by 1943 there were only 18,200—a drop of one-third.

The most disturbing aspect of the coal situation is undoubtedly the progressive decline in productivity (Table III). Though there may be many external reasons for the falling output per man-shift at the coal-face—the most reliable criterion of productivity—the fundamental factor, for which it is not easy to find a remedy, is that the men in the industry are getting older and have begun to feel the strain of the war. Strain is probably also the main cause of the alarming increase in the accident rate (Table IV), though here again no single factor can be held responsible. The introduction of less experienced labour, the general intensification of production, combined with a relaxation of supervision and the defects in materials—particularly the shortage of good timber for roof support—have all played their part. The reduction in the number of fatal accidents is satisfactory, though not conclusive, since an explosion in a single colliery would send the death rate up, but the increase in the number of accidents lasting for more than three days and the increase of 40 per cent since 1938 in the accident rate call for renewed efforts to improve safety provision in the pits. The fact that about one in every four miners is liable to be killed or injured every year is not conducive to recruitment. No information is given in the White Paper about the effects of industrial disease, but the

incidence of pneumoconiosis has been creating a serious manpower problem in South Wales, especially in the anthracite areas, since many miners have been claiming release as sufferers from this dust disease.

Absenteeism and indiscipline have contributed in no small measure to the troubles of the coal industry, and it would be foolish to underrate their effects. But the White Paper suggests that the importance of absenteeism in relation to other factors has perhaps been exaggerated. The national rate of absenteeism from all causes has risen from 6.4 per cent of possible shifts in 1938 to 12.4 per cent in 1943; among face workers, the rate of voluntary absenteeism in 1943 averaged 6.1 per cent, and involuntary absenteeism 9 per cent. No comparable national figures are available for workers in other industries, but recent investigations by the Medical Research Council show that in 1942, at seven different factories, the percentage of time lost averaged 8.1 per cent for men, and 15.3 for women (in 1942 the mining figure was 10.4 per cent). This indicates that though absenteeism is high among miners it is not excessively so in comparison to that of factory workers. No estimate is made in the White Paper about the quantity of coal that might have been saved had full shifts been worked, but an interesting table showing tonnage lost from causes other than absenteeism is given (Table V). In 1943, while 10.7 million tons were lost altogether, less than 10 per cent were lost as a result of disputes, and a higher proportion were lost as a result of accidents, breakdowns and machinery repairs; as many as 500,000 tons were lost through rail transport difficulties. In the first quarter of this year, however, the proportion of tonnage lost through disputes was as high as 60 per cent of all losses.

It may legitimately be asked how far the experience of Governmental control over the operational side of the industry has been justified. The answer, in terms of output, is disappointing, though it might be inferred that had there not been any control at all, the situation might have deteriorated still further. Among the measures which, according to the Government's coal plan of June 1942, would lead to increased output and should be introduced without delay, were the concentration of production on the most efficient pits and seams, and the extension of

mechanisation. Table I shows that the number of mines has hardly altered since 1942, though this does not exclude the possibility that production may have been concentrated on a seam within a pit, or even of transfers within a district. Independent evidence, however, suggests that there has been little effective concentration—some opposition has been encountered from both sides of the industry—and the mechanisation figures (Table VII) speak for themselves. Between 1938 and 1943, the proportion of coal cut and conveyed mechanically increased in both cases only by 8 per cent. While some districts, as will be seen from Table IX, are nearly 100 per cent mechanised, in others (notably South Wales and Durham) the proportion of coal either cut or conveyed mechanically is still less than 50 per cent. There may be geological difficulties in mechanising output in some of the older districts, but it would be desirable for the Ministry to state fully the limitations of the policy, and to set a target which each district could attain within a given period. The miners' leaders, since the war began, have withdrawn their opposition to mechanisation, which in the past was always associated with unemployment, and the Ministry itself has launched a considerable drive for it. But so far, the results have been disappointing.

It is impossible to enter into detail about the White Paper, or to comment on the consumption figures, the fuel efficiency campaign, and other aspects of wartime operations which it covers. But two conclusions emerge very clearly from an analysis of the statistics. One is that the pessimists and critics (among them *The Economist*) were right, and that the policy of drift was continued for far too long, and then measures were applied "too little and too late." It was promised in June 1942 that the coal industry would be placed on the basis of national service; this may now be true of manpower, but it has never been true of organisation. Nothing more than the milder degrees of "co-ordination" has, in general, been achieved—indeed, it hardly could be so long as the income of every mining company is mainly dependent on the results of its own pit.

The second conclusion to be drawn is that the need for reorganisation is as urgent as ever. It is obviously of little use to hold a post-mortem, merely for the satisfaction of

1943 (not yet available)	---	---	---

having made a correct diagnosis, unless the lessons of experience can be applied to prevent a recurrence of the disease in the future. The war will be won—in spite of coal shortage—but after the war, the need for coal will be as great, both for domestic needs, for the reconstruction of European industries and for export, to make good the loss of foreign exchange. (In the year before the war, 46.3 million tons were exported.) It is therefore certain that some form of Government direction will have to be continued for a considerable period after the war if the demand for coal is to be met and an exodus from the industry is to be prevented.

Table VIII, giving the number of mines, their output and employees in 1942, shows that nearly half the number of mines, employing less than 300 workers, produced only 5.9 per cent of the nation's coal. The total number of mines actually declined by 194 between 1938 and 1943, but—though the White Paper does not give details—the number of undertakings has remained about the same at approximately 900-1,000. In fact, the war has not touched the structure of the industry at all; an opportunity has been missed to effect the reorganisation which Commission after Commission has pronounced as necessary and inevitable.

The revision and simplification of the industry's wage structure, embodied in the national agreement of April 20th, presents the most hope for the future of the industry. If, as laid down in the agreement, peace can be kept in the coalfields for 4½ years, there will be a chance to bring about some radical changes in the industry without a violent upheaval. On the other hand, the figures contain no evidence that the mere meeting of miners' grievances will—as has so often been advocated by the "psychological" school of thought—automatically improve the industry's economic prospects. Mining wages are now higher than at any time in history. The national average wage in 1943 (Table VI)

V.—ESTIMATED QUANTITY OF SALEABLE COAL LOST FROM CAUSES OTHER THAN ABSENTEEISM

(000's omitted)

was £5, compared with £2 15s. 9d. in 1938, though the proportionate differences between the districts (as shown in Table IX) are as great as ever. The national ascertainment shows that wages costs have risen from 10s. 6d. per ton in 1938, to 20s. 1d. in 1943—in other words, wages costs have doubled—without there having been any corresponding increase in productivity—in fact, the reverse has happened. No one will say that the present level of wages is high; before the war the miner was badly paid, and probably he is still underpaid in relation to the national importance of his work. Nor will there be any opposition to the miner's claim for decent working and living standards—the wartime canteens now providing meals for 96 per cent of the men in the industry and the pithead bath programme, held up since the beginning of the war, should obviously be continued in the postwar period. But these things will have to be paid for. If these grievances are remedied without any comparable effort to increase the efficiency of the industry and the productivity of its labour, the effect will merely be—as it has been—to put up the price of coal and to lower the competitive strength not merely of the coal industry itself in its export markets but of every British industry that uses coal. The maintenance of a high level of wages must depend in the long run on the productivity of the industry, and it is through increased technical efficiency that the industry's salvation will come.

How to raise the productivity of the mining industry is outside the scope of this analysis of coal statistics. Figures cannot prove might-have-beens. The White Paper neither proves nor disproves the contention that the industry would be run more efficiently under national ownership. But it does prove that something is radically wrong. And the experience of the past five years establishes a very strong presumption that nothing less than a radical reorganisation of the structure of the industry will put it on its feet again.

Business Notes

Keynes on Gold and Sterling

Some of the more interesting items of information from the Bretton Woods conference have come from the press conferences, with which the leading delegates have been lavish. Lord Keynes has used the assembled journalists for statements on two important topics: the place of gold in the proposed international monetary order and the heaviness of the external monetary obligations which Great Britain is in course of assuming during the war. On the first of these subjects, Lord Keynes was evidently answering the main gist of American banking criticism of the proposed monetary fund, which regards the scheme as a betrayal of sound currency principles and of the gold standard in particular. Lord Keynes, therefore, went out of his way to propitiate the gold party, and in doing so used words which clash somewhat with the sentiments he expressed on the same subject in his recent House of Lords speech. "The real purpose of the Monetary Fund," he said, "is to bring back gold as a fundamental reserve money." He added that he wished to make it clear that it was not the intention of the promoters of the Fund to indulge in arbitrary and unreasonable changes in the currency price of gold. At the same time, Lord Keynes argued that the old gold standard "was so rigid that it failed to work," and implied that there would be no undue reluctance on the part of the authorities in charge of the Fund to use the elasticity of the scheme in varying exchange rates. On the question of abnormal sterling debts incurred by Britain as a result of the war, Lord Keynes was candid and informative. He stated that, apart from securities and gold sold, sterling loans repaid and Lend-Lease aid, Great Britain would by the end of this year have accumulated sterling debts amounting to £3,000 million. Sir John Anderson referred in the last Budget speech to an aggregate of £2,000 million for these debts, and his figure was based on calculations for the end of 1943. On this evidence abnormal sterling balances are now piling up at the rate of about £1,000 million a year—the most rapid rate of expansion since the beginning of the war. This acceleration is not altogether surprising, given the increasing scale of war expenditure in the Far East (much of which swells India's sterling balances) and the virtual exhaustion of realisable overseas assets, whose gradual liquidation had until recently provided a powerful brake on the expansion of these abnormal sterling balances.

Bullion Sales in the East

It was announced this week that the banks in Iraq had suspended their sales of gold on official account for an indefinite period. In the course of June official sales of gold in Egypt were suspended owing to the saturation of the market. There appears to have been little saturation in the Iraq market, where King George sovereigns were until recently quoted at the equivalent of 10s. or at the rate of about £20 per ounce. It would seem that throughout the Middle East the need to sell gold as an anti-inflationary solvent has recently diminished considerably—though this does not mean that the local demand for the metal has in any way diminished. The main factor in the position is the recent diminution in the scale of spending by the Allied Governments in these territories. Egypt has ceased to be a basis for immense military operations. The Middle East supply route to Russia no longer commands its former importance. The infusion of fresh purchasing power into these countries by external Governments is probably a small fraction to-day of what it was even a year ago. This would be sufficient explanation of the much reduced scale of gold sales in these countries. In India the situation probably calls for an increased scale of official bullion sales. The operations of SEAC are likely to expand for some time to come, and a great deal of the expenditure incurred will take place in India. There has been no evidence yet of official sales of silver in Bombay. A statement made this week by a US spokesman at Bretton Woods suggested that the 100 million ounces of silver recently Lease-Lent to India would be used exclusively for coinage. This news immediately sent the price of silver in Bombay soaring,

since the recent drop in the quotation had mainly been due to expectations of an early start of official silver sales. The Government of India later announced that, in agreement with the American Government, this silver could also be sold in the open market if this were required. Following the issue of this communiqué the Bombay price reacted.

Wages and Cost of Living

The Chancellor of the Exchequer's decision to allow the cost of living index to rise by 5 points, and the emphasis in the Employment White Paper on the need for maintaining stability in wages and prices, bring to the forefront of discussion the whole question of wage adjustments according to the cost of living index. An article in the *June Ministry of Labour Gazette* describing sliding-scale methods adopted in various industries is therefore of more than usual interest. The sliding-scale method of regulation was first introduced towards the end of the last war when prices began to rise rapidly and wage earners sought to keep pace with them. By 1922, the wages of over 3 million workers were covered by cost of living arrangements, but between the wars, a great many schemes lapsed and by 1939 there were only 1½ million workers covered. Since the beginning of the war, there has been a revival of the principle, and it is estimated that almost 2½ million workers are now affected. Three major industries which have introduced cost of living sliding-scales since 1940 are coal mining, cotton, and iron and steel. Other industries where sliding-scales operate include building and civil engineering (since 1921), boot and shoe (since 1922), pottery, and the whole range of Trade Board industries, of which the Perambulator and Invalid Carriage Trade Board was the first. The railway sliding-scale introduced in 1920 lapsed in 1940. The schemes vary considerably in the different industries. In mining, for instance, there is a uniform cost of living addition per shift (now 2s 8d) and no alteration takes place unless the index varies 5 points or more in either direction. In iron and steel, where the cost of living sliding-scale replaced the prewar selling price sliding-scale, the present addition of 2s 6d a shift for adult males, allows for variations for each point of the index. In cotton there is a percentage increase or decrease on basic wages of 2½ per cent in the weaving section for every four points variation in the index, and in the spinning section a change of 2½ per cent. The building scale provides for a four-monthly revision, and variation of 6½ points in the index produces an adjustment of ¼d per hour.

The relation of wages to the cost of living index has for some time been the subject of controversy in the trade union movement. Cost of living sliding-scales present certain definite advantages to the workers—in times of rising prices they maintain purchasing power and introduce some element of stability. But in times of falling prices, reductions in wages, as might be expected, are bitterly opposed and, if they fall low enough, may lead to industrial unrest. That is why the stronger unions have hitherto preferred to rely on their bargaining power rather than on any automatic mechanism to secure wage adjustments. The existence of a sliding-scale does not, however, preclude advances outside the scale, as was shown in mining. It is interesting to note the attitude of a union which recently adopted a sliding-scale; the Spinners Association stated in January 1940 that

a certain amount of apprehension was evidently felt by many as to the probable effect on the interests of the members generally of the application of this new method but... it would appear that some such system was necessary if a satisfactory standard of living, approximating in some measure to the pre-war standard was to be maintained.

A rise in the cost of living is invariably one of the dominant factors in demands for wage increases. But if the possibility of introducing sliding-scale generally is to be considered, it is essential that before anything else, the present cost of living index, which is still based on 1904 budgets, should be made more representative of working-class expenditure.

More Speculative Business

Although there is so far no very clear evidence of it in industrial share prices, the beginning of this week brought a large increase in the volume of stock exchange enquiry and some expansion in the volume of business. Unfortunately, the number of bargains received has a very poor index of activity since June 15th, owing to the fact that the House is, and always has been, closed during periods of "Alert." The reasons for this decision are as clear as the results are unfortunate. The House is really a lightly roofed court, lit from above by glass domes. It would be little short of a deathtrap if a blast bomb exploded sufficiently near to disturb the roof. To find alternative accommodation—even if that were possible—would be of little use unless it had telephones in adequate numbers. It is probably true that the solution of dealings between offices during periods of alert causes less disturbance to market facilities than any other. It does mean, however, that only the most conscientious "mark" bargains during such periods, and that all are too busy, when the House re-opens, to spare much time for what is, admittedly, less important than getting orders fulfilled. The published figures of the past three weeks are thus of little value. What can be said is that business kept up very well throughout, and that it has now recovered to something like the very high level ruling immediately before bombing was resumed. Unfortunately, a substantial part of the increase has occurred in the more speculative sections. The resumption of large-scale business here appears to be based on the better war news. Past experience suggests that this is not a very sound foundation for buying of this sort, since most of the shares in particular favour will remain highly speculative until such time as their future is established for good or ill. Apart from these sections, there has been a slight speeding-up in the rise of industrial equities, which has carried the index of *The Financial News* from 113.4 to 113.9 in a single week.

Union Castle Accounts

The full accounts of the Union Castle Mail Steamship Company for last year show a modest rise in the net valuation of the fleet from £5,594,372 to £5,753,115, but this is due to outlays on replacements, as can be deduced from rises of £1,428,837 to £4,684,787, and of £286,813 to £1,453,312, in the fleet replacement and the Government tonnage accounts, respectively. Under the Government agreement this necessarily results in a fall in voyage receipts, and the accounts show a drop from £1,793,772 to £1,502,893. There has, however, been a change in the treatment of insurance charges, profits on the insurance reserve now being included in the published figure. It is, therefore, necessary to reduce the 1943 figure by £107,456 to make it comparable with that for 1942. At the same time, additions to insurance reserves, not previously disclosed in the profit and loss account, have been discontinued. Other sources of revenue improved on the year and there was an offset to the lower total profit in a fall from £928,495 to £599,587 in the depreciation charged on the smaller fleet. There is also a fall from £815,000 to £700,000 in tax provision, the split up of which is not given. Again, the latter figure has been assisted in 1943 by writing back £80,213 for tax provision no longer required and claims in respect of Dominion Income Tax. As a result of these changes, the sum available for dividends is increased by almost £124,000, after providing £150,000 against nil for deferred repairs and renewals. An interesting point, to which no reference is made in the report, and little appears to have been

provided elsewhere, is the fact that the net amount of all dividends after tax is well up on the year. This is presumably to be associated with the DIT relief, but some explanation appears to be called for. In the case of the ordinary shares, although their amount and the rate of declared dividend are both unchanged, the net distribution is increased by £16,782, or virtually 24.5 per cent, making the 5 per cent distribution equivalent to £3 2s 3d per cent after deduction of tax. Without more information it cannot be assumed that the net receipt will be maintained in future, but on the rate given above the yield at the current price of 24s 3d ex dividend is £2 11s 4d tax free.

Bank Share Yields

As was to be expected, there is no change in the dividend declaration of any of the English banks, and it is assumed that there will be none, at least, for the duration of wartime taxation. Despite this, the price of bank shares, taken as a whole, has been rising steadily for the past four years. According to the figures of *The Actuaries' Investment Index*, the value of bank and discount company shares rose from 113.6 to 121.7 in the year ended June 27th, while the yield fell from 3.99 per cent to 3.73 per cent. The corresponding figures for June, 1940, when prices were at, or near, their nadir, were 74.9 and 6.12 per cent. After the preliminary adjustments to the outbreak of hostilities, dividends have been unchanged throughout the war, but the extent of the recovery of any given share has been appreciably affected by a number of factors. The following table sets out the prices and yields for each of the past two years, together with the amount of capital paid up, callable and reserve liability, on all the principal classes of shares of the seven leading English banks:—

	Paid up	Call- able	Div.	Price July, 1943	Yield July, 1943	Price July, 1944	Yield July, 1944
	£	£	%		%		%
Barclays "A"	1	...	10†	53/-xd	3.77	57/6xd	3.48
" " "B"	1	...	14	75/6xd	3.70	78/6xd	3.56
District "A"	1	4‡	18‡	90/6xd	4.05	93/6	4.00
" " "B"	1	...	10†	55/-xd	3.63	55/6	3.66
Lloyds "A"	1	4*	12	59/6xd	4.03	62/6xd	3.84
" " "B"	1	...	5†	28/6xd	3.50	30/6xd	3.28
Martins	2‡	17‡	15	187/6xd	4.00	196/3xd	3.83
" "	1	...	15	81/-xd	3.70	87/6xd	3.43
Midland	2‡	9‡	16	200/-xd	4.00	216/3xd	3.70
" "	1	...	16	211/3xd	3.78	236/3xd	3.39
" "	1	...	16	86/6xd	3.69	94/3xd	3.39
Nat. Provincial "A"	0.7	4.3†	15	51/6xd	4.07	53/6xd	3.92
" " "B"	1	4‡	15	72/6xd	4.14	76/-xd	3.95
" " "C"	1	...	15	85/6xd	3.50	91/-xd	3.30
Westminster	1	3†	18	86/6xd	4.16	91/-xd	3.95
" "	1	...	12‡	69/-xd	3.62	74/6xd	3.36

† Maximum. ‡ Of which £3 6s. 8d. reserve liability. * Of which £3 15s. reserve. § Of which £12 reserve. ¶ Of which £2 reserve. In the case of Lloyds, Martins and Westminster, there is a deferred liability on shareholders for the very small Isle of Man circulation.

It will be seen that a number of changes on the year appear to have very little logical justification. Why is it necessary to have a wider yield margin now than a year ago to compensate for the possibility—a very remote possibility—of a call on the partly paid capital of Martins and the Midland? Why, in the one case where there is a straight comparison between a maximum dividend share and one entitled to the full equity, with no liability on either, namely, Barclays, does the former yield less than the latter? Finally, why should the shares of Martins have participated to so slight an extent in the recovery?

Opencast Coal

The production of coal from opencast workings was started in this country when it became evident that there was going to be an acute coal shortage, and production has now been developed on a considerable scale. More opencast coal, as is shown in the table on page 87, was produced in the first quarter of this year than in the whole of 1942; about 70 per cent of the total is obtained from the North Midlands and Yorkshire. Opencast coal, however, though it has made a useful contribution, can only supplement coal produced from deep mines. Its annual output, at the current rates of production, still represents less than one week's output from normal methods. The Select Committee on National Expenditure, in its sixth report of the session, reviews the development and methods of opencast production and examines some of the problems involved. The Committee praises the organisation of production, now under a separate department of the Ministry of Works, and is particularly impressed with the way in

which worked-out sites are restored to agricultural uses. It urges that more adequate road and rail transport should be provided, since obviously the work of getting the coal is nullified unless it can be distributed effectively; it seems that at the present time as many as two million tons are dumped, waiting transport. The Committee also recommends an acceleration in the delivery of excavating machinery and drilling rigs ordered under the Lend-Lease agreements; some of this new plant has recently arrived and, under the supervision of trained American mechanics, is being put into operation with good results. The Committee does not give any estimate of the costs of this method of coal-getting, since these vary widely from one site to another, but it states that the prices for coal sold have so far not covered the costs. However, it hopes for a progressive lowering of costs from the use of more suitable machinery and the adoption of better planning. The Committee recommends an immediate revision of contracts, which were fixed initially when the costs of operation were very high, and points out that contractors have benefited from the Government's action in obtaining suitable machinery and from the advice of American experts. The continuation of opencast production after the war will, of course, depend on the supply and demand for mined coal, but it will also depend to a large extent on costs being brought more into relation with costs of shaft mining.

The Clothing Ration

The President of the Board of Trade announced last Tuesday that twenty-four coupons in the 1944-5 clothing ration book would come into use on August 1st, and that the next issue would not be made before February 1, 1945. The basic ration is therefore to be continued at the rate of four coupons a month, and it has been at this rate since January 1, 1942. After just over three years of the clothes ration, it is worth while recapitulating the issues of coupons. The general issues began on June 1, 1941, when 26 margarine coupons were converted into clothing coupons. On the following dates releases of 20 coupons were made: August 18, 1941; January 1, 1942; June 1, 1942; October 12, 1942; March 15, 1943; and September 1, 1943. On February 1st last the current 24 coupons were released for a period of six months. It is probable that future releases will be made at the set times of February and August, thus avoiding the irregular releases which characterised earlier years of rationing. Two special classes of persons have been granted additional coupons, and these will be continued in the new ration year. Children were given supplements on November 1, 1941, of 20 or 40 coupons, according to age and size. Other children's supplements of between 10 and 30 coupons were issued in 1942 and 1943. The other special class is composed of industrial workers in various groups. In 1942, issues were made to different groups, of 10, 15, 20, 25, 30, 35 or 45 coupons, according to the type of employment; and in 1943 a supplement of 10 coupons was granted. It is not proposed to discontinue the use of any coupons still in the hands of consumers in the 1942-43 and 1943-44 clothing books. It is a pity that the ration could not have been slightly increased, particularly for the supplementary classes, on whom clothes rationing is particularly hard. When the time comes for an increase, a beginning should be made with children and industrial workers.

Raw Cotton Trends

Shortage of farm workers and increased food production have led to a further curtailment of the United States cotton crop. According to the first estimate of the Department of Agriculture, published last week-end, 20,472,000 acres have been planted. This is 1,470,000 acres less than last year and the lowest figure since 1895. This year fertilisers have been more liberally used than usual and weather conditions have been favourable. Current field reports are encouraging and unofficial estimates of the yield are in the region of eleven million bales, which compares well with last year's yield of 11,478,000 bales. If expectations are fulfilled, the crop will be sufficient to maintain adequate supplies of American staple. United States consumption is at present below its wartime peak, although it is still above the pre-war level. It is unlikely to be much above ten million bales this season owing to scarcity of textile labour. Despite higher Lend-Lease shipments, there will be a carry-over into next

season (which begins on August 1st) of over ten million bales. Last year it was 10,657,000 bales. The carry-over provides a sufficient reserve for large-scale shipments to be made from America for relief purposes. Reserves outside the US amounted a year ago to 12,246,000 bales—the largest ever reached and nearly five million above those at the outbreak of war—which suggests that there is no likelihood of an international cotton shortage. The large quantity of cotton has, in fact, led the US Department of Agriculture to consider plans for an international postwar cotton regulation scheme, under which fixed export quotas would be allotted to each surplus country. But the attitude of producers outside the United States will be influenced by the fact that they can, in view of their large surpluses, strengthen their position in the international market. Whether any quota agreement is reached or not, the cotton market after the war is more likely to be a buyers' than a sellers'. Buyers' difficulties during the next few years will centre round the fact that the quality of the bulk of to-day's surplus—American and other—leaves much to be desired. During the war, however, manufacturers have learned to deal with lower grade materials, and the effect of the international shortage of high-grade raw cotton on manufactures should not be overestimated.

Brazilian Traction Progress

The full accounts of Brazilian Traction Light and Power Company for 1943 show a continuance of the rise in sales of electrical energy and of passengers carried by the traction services at approximately the rate of recent years. Tram services continue to benefit from the petrol shortage, but gas rationing has resulted in a fall in sales to below the 1937 level, while shortage of supplies has slowed down the expansion in telephone installations, leaving a waiting list of 22,000 at the end of the year. Water sales improved to a new high level after the decline of 1942. These developments are reflected in an accentuation of the rise in gross earnings of the Brazilian operating companies from US \$46,570,250 to US \$52,162,244, an increase of 12.01 per cent against 8.88 per cent for 1942 over 1941. There is also

Examine fuel-economy methods in your plant now to safeguard coal supplies for next winter. Peak steam loads are extravagant and inefficient. They eat deeply into the coal pile and interfere with factory output. Start to s-p-r-e-a-d the steam demands and you will get immediate savings of coal. Aim at a steady steam demand. You may find the answer in staggering your production operations—possibly a morning job could be done in the afternoon—or that an alteration in working hours will help to spread the steam demand. You may even find that there are some operations that can be eliminated altogether. See that the steam-using departments give the boilerhouse ample warning of changes in load.

LOOK UP YOUR COPY OF FUEL EFFICIENCY BULLETIN No. 26 (Peak Steam Demands—Cause, Effect and Cure). Read it again. It gives all the answers to your steam peak problems. If you've mislaid it—write TODAY to your Regional Fuel Office for a further copy.

a small improvement in the expense ratio. This, with a reduction in depreciation, results in a rise in the net revenue accruing from these companies to Brazilian Traction to \$19,432,345 from \$16,449,016 in 1942 and \$9,755,391 in 1940. After miscellaneous receipts and administrative charges and amortisation, net revenue of Brazilian Traction is \$19,152,212 against \$16,066,090 in 1942 and \$9,259,807 in 1940. No forecast is given as to the current year, but published reports already show a decline in earnings, due in part to labour decrees of November, 1943, which reduce the spread between unskilled and skilled labour wages. In addition to this effect on expenses, the company tends to suffer from labour shortage, owing to the fact that concerns whose selling prices are not controlled can bid up the price of labour. Against these disabilities are the facts that Brazil's industrial development is proceeding rapidly and that there may before long be some relaxation of shortages. The exchange position has shown little change on the year, and the minor deterioration in the excess of exports over imports is insufficient to cause any anxiety on that score. Capital outlays in 1943 were expanded to make good the short fall of 1942, and the four-year average is \$11,467,249. The prospect for the shareholders appears to depend in the main on the attitude of the Brazilian authorities, for there can be little doubt that the opportunities for development are very substantial.

Harland and Wolff Scheme

If very persistent market reports are correct, the directors of Harland and Wolff are about to suggest a scheme for the reconstruction of the company's capital. This consists of 4 per cent non-cumulative "A" shares, participating up to a further 2 per cent with the "B" shares, to which accrue all further profits after the total of 6 per cent has been paid on the "A." It is proposed that the latter should exchange their holdings for half the amount in new 4½ per cent preference capital and the remaining half in ordinary. The "B" shares would be exchanged into ordinary on a pound for pound basis. Dividends on the "B" shares have been 6 per cent for the past three years and, on this basis, both classes of share have received that amount. If the new scheme is to maintain the income of existing "A" shareholders, 7½ per cent must be paid on the new ordinary. This gives 4½ on half the existing capital and 7½ on the remainder, an average of 6 per cent. Actually it is suggested that 7 per cent will be paid in respect of 1943, but that is not known as an official fact and in any case the "A" shareholders lose on the transaction. They are in fact being asked to give up 43½ per cent of their preferential rights without, it would seem, any very adequate compensation. At present they get 4 per cent if there is £208,000 gross to be distributed, while under the new scheme total distributions have to be £270,000 gross odd before "A" shareholders are equally well off. Only if distributable profits exceed £447,000 gross do they begin to be better off under the new than under the old arrangement. Gross distributions have averaged some £385,000 per annum over the past four years. Are the prospects for this firm of shipbuilders and engineers so good as to warrant the putting forward of these suggestions?

Shell Profits and Prospects

The net profit of "Shell" Transport and Trading for 1943 is slightly higher at £2,373,301 against £2,306,908.

After meeting preference dividends, earned for equity amounts to some 5.4 per cent, free of tax, against 5.2 per cent. After repeating the tax-free dividend of 5 per cent customary since 1939, the carry forward is strengthened by £126,019. Although these results are the best since 1939, the conditions operating have been much as before and there is unlikely to be a substantial change in the company's position while the war lasts. The most interesting part of the statement by the chairman, Lord Bearsted, relates to the expanding activities of the Shell Union in the United States. The Shell Union's trading results for 1943 are said to compare very favourably with 1942. It has produced a greatly increased amount of aviation fuel. It has, as well, increased its underground reserves of crude oil. In addition, the Shell Chemical Company—which, in the interests of co-ordinating the oil and chemical sides of the business, has been made into a division of Shell Union—is operating, for the US Government, a synthetic rubber plant. Apart from these successes in the United States, the other overseas operations of the group are reported to be developing satisfactorily, and to include the extension of all concessions for associated companies in Venezuela. The return of peace will, of course, make possible a considerable expansion of the group's overseas activities, which are even now vast. It is in expectation of a post-war boom that the yield on the £1 ordinary shares, standing at 84s. 7½d., has fallen as low as £1 3s. 7d. tax free. Lord Bearsted does not wish private enterprise to be handicapped in its post-war endeavours by Government interference and, as regards controls, thinks that the sooner they are scrapped the better. But the most specific obstacle which he mentions as blocking the road to even a mild Eldorado for the ordinary shareholder lies in the heavy and mounting incidence of double taxation—since, in almost every country in which the group operates, both income tax and EPT on a mounting scale are now the rule. The solution of this problem is, optimistically perhaps, resigned into the "capable hands" of the Chancellor.

Cheques and Bills of Exchange

The details of net receipts from the various heads of stamp duties used to be given each year in the report of the Commissioners of Inland Revenue. These reports became an early war casualty. Since then information on this subject has been made available only through the efforts of members of Parliament who have put down the necessary questions to the Chancellor of the Exchequer. Last week Sir John Anderson, in answer to a question from Sir Waldron Smithers, gave half-yearly figures of receipts from the following categories of stamp duties since September 30, 1941. The yearly figures have been compiled from his answer and, for purposes of comparison, the figures for the last complete pre-war year have been added.

The number of cheques stamped in England has undergone a persistent diminution over the past three years and for 1943-44 was appreciably below the 1938-39 figure. This decline does not indicate a reduced circulation of credit. The reserve of stamped cheques may have been considerably drawn upon in the last two years. Paymaster's warrants, which now constitute a larger part of the cheque circulation, bear no stamp. But it is probable that in certain trades cash payments have tended to oust the cheque. The revenue from stamps on bills and promissory notes has declined heavily. The movement measures the virtual disappearance of the foreign bill and the very low ebb to which the

domestic bill has fallen as a method of financing trade. The increase in the receipts from bankers' bills and notes is almost wholly a reflection of the increased circulation of Scottish bank notes.

The Quarter's Debt Movements

The revenue deficit for the first quarter of the financial year amounted to £819,400,000 as compared with £867,600,000 for the corresponding quarter of last year. It was met by net subscriptions to longer-term Government issues of £400,700,000 and by an expansion of £421 million in the floating debt. In the first quarter of the financial year 1943-44 savings brought in £714,600,000 and the corresponding expansion in the floating debt total amounted to £156,100,000 only. The contrast between these figures is largely explained by the repayment of Conversion 5 per cent loan during the past quarter. This involved a net repayment of long-term debt and its replacement, in the main, by floating debt held by the Government departments which for some months previously to the date of maturity had held Conversion 5's as a short-term investment. That fact tends to explain the rise of Ways and Means advances from Public departments last quarter from £394,475,000 to a new high record figure of £437,755,000. The main element in the floating debt expansion was provided by Treasury bills, the total of which increased by £386,790,000 over the quarter. It is impossible on the basis of the published figures to split up this expansion exactly as between bills issued through the tender and those issued through the tap. The issue of bills through the tender between the last Saturdays in March and June increased by £190 million and on this

basis it will be seen that the expansion in the Treasury bill issue during the quarter has been about equally divided between tender and tap bills. The June debt return brings out two interesting points. It takes the net total of National Savings certificates issued to £1,008,150,000, the first time the £1 billion mark has been crossed by this item. It also shows the first reduction in the total of Tax Reserve Certificates outstanding in any quarter since their issue was begun in December, 1941. With the June debt return, the eighth half year of six months Treasury Deposit Receipts has been completed. This provides an opportunity for a review of the issue, pre-encashment and normal maturity of

these securities since their inception, which is given in the accompanying table. The existence of over £1,300 million of floating debt in this form obviously creates a technical problem of some magnitude for post-war Chancellors of the Exchequer. Are the TDR's to be converted into Bills? Or funded? Or are they to remain indefinitely?

Shorter Notes

The number of working days lost as a result of trade disputes in May was only 45,000, compared with 719,000 in April and 185,000 in May, 1943. The coal industry accounted for three-quarters of the total number of days lost. The great majority of disputes, which affected 21,000 people directly and over 6,000 indirectly, arose in connection with wage questions. An analysis in the Ministry of Labour June Gazette shows that in the first five months of this year 2,873,000 working days were lost, compared with 486,000 in the corresponding period of 1943, and about 80 per cent of these were lost in mining.

The resources of the building industry in London are to be concentrated on first-aid repair of houses damaged by flying bombs. Labour and materials will also be brought from the provinces, and naval ratings, marines and airmen will be called in to assist in the repair work. Workers will be housed in hostels, empty houses and with private families, and the Ministry of Labour is making a special appeal for volunteers to assist in the reception and feeding arrangements.

COMPANY MEETINGS

WHITEHEAD IRON AND STEEL COMPANY, LIMITED

BALANCE SHEET CLARIFIED

MR G. H. LATHAM'S ADDRESS

The thirty-seventh annual ordinary general meeting of The Whitehead Iron and Steel Company, Limited, was held, on the 11th inst., at the King's Head Hotel, Newport, Ion.

Mr G. H. Latham (chairman and managing director), who presided, said: "entlemen, as the report and accounts have been in your hands for some days, may I like it as your wish that they should be considered as read."

During the past three years I have, for various reasons, omitted to submit to you detailed review of the company's activities, and you will agree that it is still not expedient that I should do so. We all hope that by the time the next annual accounts are submitted I shall be allowed to give you more interesting report.

This year a further modification in the arrangement of the balance sheet has been made so as to bring it into line with modern practice. The fixed and current assets have been separated and their respective totals shown, while the amount set aside for depreciation, instead of appearing among the reserves, has been deducted from the cost of the fixed assets. The share capital, general reserve, and profit and loss account credit balance have been grouped together so as to show clearly the total amount (£1,408,198) by which the assets exceed the liabilities. This rearrangement makes the financial position of the company clearer to the shareholders.

PROFIT AND LOSS DETAILS

The profit and loss account shows that the trading profits for the year to March 31st last amounted to £444,933, a decrease of £114,529 compared with the previous year. Income from dividends and interest shows an increase of £2,073, but after making full provision for taxation liability, and setting aside the sum of £40,000 for special depreciation, the net profit of £159,610 is approximately the same as that of last year. Adding the sum of £43,136 brought forward from 1942-3, the total amount available for the year is £202,746, out of which an interim dividend of 10 per cent., absorbing £39,191 (net), has been paid, leaving a balance of £163,555. Your directors propose to transfer £75,000 to general reserve, thus increasing the balance of that account to £575,000. They also propose the payment of a final dividend of 10 per cent., less tax (making a total distribution for the year of 20 per cent., less tax), and to carry forward a balance of £49,363.

With regard to the balance sheet, you will note that during the year further investments, amounting to £60,000, were made (all in Government securities), bringing the total amount invested up to £239,037.

The value of stocks and stores has increased by £254,597, from the abnormally low figure of £280,807, at which they stood last year, to £535,404. Cash is reduced by £184,823, and sundry debtors (including accounts of subsidiary companies) by £55,716.

During the year a further sum of £7,500 was paid off the 1st mortgage debentures, leaving a balance of £31,200. The total of current liabilities (£1,263,601) exceeds the corresponding sum for last year (£1,251,989) by £11,612.

As I have already pointed out, the net results, as shown by our balance sheet, is that our total assets, which are valued on a conservative basis, exceed our current and debenture liabilities by £1,408,198. The soundness of our financial position is there-

fore obvious, and, having regard to all the circumstances, I am sure you will agree that the results are satisfactory.

A TRIBUTE TO LOYAL SERVICE

In conclusion, I should like to pay tribute to the excellent work done by all our employees, and more especially our depleted staff, all of whom again deserve your sincere thanks for their loyalty and untiring efforts in maintaining the efficiency and output of our works.

The chairman then moved: "That the directors' report and statement of accounts for the year ended March 31, 1944, duly audited and submitted to the meeting be received and adopted, and that a final dividend of 10 per cent. (actual), less income tax, for the year ended March 31, 1944, be, and the same is hereby declared payable to the shareholders on the register as at June 19, 1944."

This was seconded by Mr A. O. Whitehead, and duly carried.

Messrs George Whitehead and John Lewis were re-elected to the board, and the auditors—Messrs. Deloitte, Plender, Griffiths and Company, of London and Cardiff, were also re-appointed for the ensuing year.

Upon the motion of Mr E. T. Lyddon the board were congratulated upon maintaining a very sound financial position, and a very hearty vote of thanks was accorded to the employees and staff for their loyal services during the past year.

WELWYN GARDEN CITY, LIMITED

PLANNING NEW HOMES AND TOWNS

VIEWS OF SIR THEODORE CHAMBERS

The twenty-fourth ordinary general meeting of Welwyn Garden City, Limited, was held, on the 12th inst., at the Great Northern Hotel, King's Cross, N.

Sir Theodore G. Chambers, K.B.E., F.S.I. (the chairman), in the course of his speech, said: "The accounts for the past year confirm the stable foundation on which the affairs of your company rest. Shareholders will note an increase in the loans secured on freehold property as a result of the creation of new mortgages amounting to £74,000, the proceeds of which have been utilised in reducing the loans from bankers. Taking the associated undertakings together, their combined indebtedness to the bank, which reached a peak figure of £504,000 early in the war, has now been reduced to £201,000."

The figure for sundry creditors is increasing because we are providing annually a sum to cover the arrears of maintenance of our various properties. Shortages of material and labour have made it impossible for us to maintain our property as we would wish, but we have already provided £17,000 towards this future expenditure.

AN EXAMPLE OF MODERN TOWN CONSTRUCTION

Turning now to the more general aspects of our business, shareholders will have noted that a great deal of time and attention is being devoted to post-war planning on a comprehensive scale, in particular the planning of new homes and towns.

For our part, we look forward to the end of the war with the conviction that we shall continue to be in the future as in the past a leading example, of modern town construction. The outbreak of war found the town barely half complete in relation to the number of houses, the availability of industrial occupation and the provision of recreational facilities. So far as industry is concerned, we believe that when the war history of the town comes to be written the value of our principles will have been entirely proved. The fact that we already

have over 80 industries in the town and that many other firms are making inquiries and in some cases reserving sites are indications of the trend of opinion.

The question of housing is, of course, entirely dependent upon the availability of raw materials and labour and upon some decision by the Government as to how the disparity between pre-war and post-war building costs is to be dealt with. Given a reasoned approach to these questions, we have not the slightest doubt that the combined efforts of our local authority and your company will ensure the provision of all necessary houses of all types. We have always claimed that at any given time our standards of house building were of the highest, and we can unhesitatingly state our intention to ensure that our house-building after the war will continue to provide value for money second to none.

CULTURAL AND RECREATIONAL ELEMENTS

In regard to the town's cultural and recreational elements, the outbreak of war caught us at a bad moment, since the provision of these naturally tends to follow a short distance behind the main development. In the three or four years prior to the outbreak of war the expansion of the town showed a sharp upward trend, so that, although we had made continuous additions to our health services and the facilities for many forms of recreation, and in consequence had achieved a very high standard, we nevertheless found it necessary in the summer of 1939 to give considerable attention to important developments. As examples, I might mention a combined indoor and outdoor swimming pool in the town centre, a municipal hospital, an hotel, new blocks of shops in both the town centre and the south-eastern shopping areas, billiards hall, town football ground, large areas of new playing fields, technical school and cultural centre with small repertory theatre, a second cinema.

IMPORTANT ANCILLARIES TO CIVILISED LIFE

The absence of these features has, of course, been very noticeable under war conditions when many forms of recreation and holiday-making have been artificially restricted. Furthermore, the absence of buildings suitable for special war purposes such as A.R.P., evacuation, Home Guard, British Restaurants and many others, necessitated the appropriation of premises normally available for recreation and similar purposes. I am, however, convinced that all those responsible for the future of the town will be determined to see that the post-war standard of these essential contributions to the modern way of living will in no way fall short of the standards of our housing and industry. The extent and volume of these important ancillaries to civilised life in a town which entail considerable capital expenditure are sometimes minimised or even overlooked by planners who concentrate upon such purely physical objects as houses and factories. Many essential requirements such as places of worship, schools, public houses and refreshment rooms, hospitals, and public halls and the like may be provided by external agencies. The local authorities will play their part under their statutory powers, but it is also incumbent on the company to contribute substantially and to shoulder its appropriate share of the responsibilities, for it has to be borne in mind that, while many of these will be revenue-producing, there is a fringe which will not be self-supporting. Nevertheless, the value of the assets of the shareholders is dependent upon the ultimate growth and prosperity of the town as a whole, and is materially enhanced by the maintenance of the satisfaction and good will of the whole community. The general conditions of life in the town have their reactions upon the demand for accommodation, and it is upon this demand that the growth and development of the place ultimately depends.

The report and accounts were unanimously adopted.

THE MINING TRUST, LIMITED

EARL CASTLE STEWART'S STATEMENT

The fifteenth annual general meeting of the Mining Trust, Limited, was held, on the 11th inst., in London.

The Rt. Hon. Earl Castle Stewart, M.C. (the chairman), presided.

The following is an extract from the chairman's statement, which was circulated with the report and accounts for the year ended December 31, 1943:—

Creditors and provisions for taxation at the end of the year amounted to £26,250. Of this sum £22,733 represents the 1942 and 1943 liability for income-tax and national defence contribution, of which £13,304 has since been paid, leaving a total of £9,429 payable on January 1, 1945. Share capital is unaltered but it will be observed that the capital liability in respect of this company's guarantee of loans made by American Smelting and Refining Company to Mount Isa shows a reduction from \$1,161,125 to \$361,125 after the repayment of \$800,000 to American Smelting and Refining Company under the arrangement made between Mount Isa Mines, Britannia Lead Company and the Mining Trust Limited referred to in the chairman's statement last year. Investments at cost show an increase of £10,000 reflecting the purchase of £10,000 2½ per cent. National War Bonds 1951-53.

Revenue for the year amounted to £119,640, being a decrease of £15,855 as compared with the previous year. This decrease is mainly due to the fact that no dividend was received upon the shares of New Guinea Goldfields, Limited, and to a decline in the advisory and administration fees and commissions.

Expenses for the year show a fall of roughly £4,000 in taxation. Profit, after deduction of tax, was £44,634, which was applied to reducing the debit balance on income and expenditure account.

MOUNT ISA MINES

For the year ended June 30, 1943, Mount Isa Mines, Limited, made a profit of £A.86,133 before allowing for depreciation. Reserves of developed and prospective lead zinc ore were 7,116,740 tons and copper ore reserves were estimated at 2,442,700 tons. Since April, 1943, Mount Isa has been almost entirely engaged in the production of copper, and by arrangement with the Australian Government will continue this programme until the end of the year 1944. The production of lead silver bullion has for the time being been suspended, but the Britannia Lead Refinery will continue to be employed for some months in refining lead bullion which is afloat and in the treatment of by-products.

During the year the redemption of £402,269 8 per cent. First Mortgage "A" Debenture stock was completed and arrangements are now being made for the replacement of the 5 per cent. Five-Year Guaranteed Sterling Third Mortgage Debentures by a new issue of similar Debentures carrying a rate of 4½ per cent. and repayable by equal instalments over a period of ten years.

After reviewing the position of the trust's gold producing properties, the chairman continued:—"In view of the trend of recent monetary talks between the leading commercial and industrial nations, we may well hope that upon the resumption of full-time operations on all the above gold-producing properties we may derive considerable benefit therefrom."

Liquid resources of the company show a strong position. Cash at bankers amounted to £506,877; £40,000 has been invested in short-term Government securities; tax reserve certificates amounted to £11,000. Secured advances to a subsidiary company totalling £71,681 have been largely repaid since the date of the publication of these accounts. Total liquid resources at the present time amount to £623,000.

The report and accounts were adopted.

LUNUVA (CEYLON) TEA AND RUBBER ESTATES, LIMITED

MR. H. J. WELCH'S ADDRESS

The thirty-seventh ordinary general meeting of The Lunuva (Ceylon) Tea and Rubber Estates, Limited, was held, on the 13th inst., in London, Mr H. J. Welch (the chairman) presiding.

The following is an extract from the address of the chairman circulated with the accounts: After writing off the net amount of £18,551 expended during the year on buildings, machinery, etc.—including £5,000 from the value of the Aigburth Estate buildings, machinery and plant—and providing £38,500 for Ceylon taxation and £20,000 for excess profits tax, the net profits amounted to £107,375.

The final dividend of 6 per cent., less income tax at 6s. 4d. in the £, makes, for the year, 10 per cent., less income tax at an average of 6s. 7d. in the £. The dividends paid are equal to 13.46 per cent. for the year, if income tax had been deducted at the standard rate of 10s. in the £.

Owing to reduced supplies of manure, temporary shortage of labour and unfavourable climatic conditions, the tea crop manufactured—just over seven million pounds—was less than the high record of the previous year and averaged 710 lb. per acre. As compared with 1942 the cost of production was higher by 1.81d. per lb., the price realised was 1d. per lb. more, but the profit per acre was lower at £10 4s. 1d.

The rubber crop of 2,074,644 lbs. (about 900 tons) was also slightly lower than the record crop of 1942 and averaged 438 lbs. per acre tapped. The profit per acre was £6 19s. 8d.

Copra manufactured from our coconut crop amounted to 638 tons and yielded a profit of £2 1s. 7d. per acre.

The report was adopted.

THE NATIONAL BANK OF NEW ZEALAND LIMITED

LORD BALFOUR'S STATEMENT

The seventy-second annual general meeting of the National Bank of New Zealand, Limited, will be held, on the 27th inst., at 8 Moorgate, London, E.C.

The statement by Lord Balfour of Burleigh (the chairman), circulated with the report and accounts, refers to the increases of £1,654,000 in deposits, £1,003,000 in advances, and £2,314,000 in cash in hand and balances with bankers. The decrease of £1,098,000 in British Government securities is fully explained in two paragraphs headed "Exchange Operations" and "Reverse Lend-Lease." Under the heading "Profit and Loss," the statement says:

"Despite the fact that the trading banks are now restricting new loans which are not connected with the war effort, our advances, contrary to our expectations, have shown a fairly substantial increase. The net result of the various increases and decreases in the different items of our profit and loss account is an increase of £12,519 in our profit, which this year is £100,589. This is the best result we have been able to show since 1939, and it enables us to make an addition to the reserve which we have created for post-war contingencies. When the war is over, substantial expenditure upon our premises will undoubtedly be necessary, and we are extremely glad to have a reserve from which some of that expenditure can be provided. The interim dividend of 1½ per cent., less United Kingdom income tax, paid in January, absorbed £18,500. The depreciation written off premises is somewhat lower this year at £16,254, and the amount paid to the

pension and gratuity funds remains at £15,000. Of the balance, the directors propose that £20,000 be transferred to the post-war contingencies account, the £30,833 be paid as a final dividend of 2 per cent. less United Kingdom income tax at 7s. 8d. in the £, and that £117,889—almost exactly the same as last year—be carried forward."

The statement also refers to the step taken by the New Zealand Government to increase production, to the stabilisation programme, and to the Servicemen's Settlement and Land Sales Act.

"SHELL" TRANSPORT AND TRADING COMPANY, LIMITED

MEETING ESSENTIAL NEEDS

THE CHAIRMAN'S STATEMENT

The annual general meeting of the "Shell" Transport and Trading Company Limited, was held, on the 11th inst., in London, the Rt. Hon. Viscount Bearsted M.C. (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the accounts:

The energies of the whole oil industry have been concentrated on meeting the needs of war. Many problems of supply and transport have been faced and overcome. The completion of various pipeline projects, the effective use of all inland waterways, and the continued movement of great quantities of oil by the railways, together with the increased number of tankers available, have succeeded in meeting the essential requirements. Perhaps the most striking development in a year of record achievement in the U.S.A. has been the vast increase in aviation fuel production. No less than 16 per cent. of the total U.S.A. production of this aviation fuel came from Shell plants, and, of course, our efforts in this connection are not confined to the U.S.A. Many of the technical advances which have affected the quality and quantity of aviation fuel production are the direct result of the research and skill of the Royal Dutch-Shell Group's scientists and technicians. All such discoveries have been placed unreservedly at the disposal of the United Nations.

The trading results of Shell Union for 1943 compare very favourably with 1942. Cash resources are considerable, and the company has set aside special appropriations as provision for various wartime uncertainties and post-war contingencies. At the end of 1943 Shell Union had been able slightly to increase its underground reserves of crude oil and, in common with the industry, the company is continuing its exploration activities in the current year.

Turning to Venezuela, I mentioned last year that a new petroleum law had been passed under which the Government would grant new concessions with extended life in exchange for the existing concessions. Those companies in which we are interested applied for and have in due course received such new concessions. Our producing operations in other countries, particularly in Colombia, Egypt and Trinidad, are developing satisfactorily. I have no development to report affecting the properties of the Mexican Eagle Oil Co.

While the year's work has necessarily been concentrated on the one task of meeting the needs of the Allied war machine throughout the world, careful plans are being drawn up for the reopening of our producing, manufacturing and marketing activities in those many countries overrun by the enemy, in confident anticipation that their deliverance is at hand.

The report was adopted.

INDUSTRY AND TRADE

Attested Herds Admission.—The Ministry of Agriculture announces the re-opening of admission to the Attested Herds Scheme to all types of herd. The reopening is, however, without financial assistance towards the cost of qualifying tests and without bonus payments. Certain requirements must be met before an official test of the herd for the issue of a certificate of attestation is arranged. These are that the management of the herd and the condition in which it is kept must be suitable for the observance of the rules for attested herds and certificates must be produced of two consecutive tuberculin tests with negative reaction at intervals of not less than 60 days and not more than 12 months. In the case of a new herd being constituted by animals transferred from attested herds, the Minister will be prepared to consider the issue of a certificate of attestation at once without further test.

Sugar and Preserves.—From August 20, 1944, the preserves ration will be reduced from 2 lb. to 1 lb. per 4-weekly period and the use of the "R" coupon will be discontinued. From that date four sugar coupons and one preserves coupon (P) will be available for use during each 4-weekly period, and it will still be possible for consumers to use these coupons to obtain either sugar or preserves. Each sugar coupon will be worth ½ lb. sugar or preserves, and the P coupon will be worth 1 lb. of sugar or 1 lb. preserves. Consumers may, therefore, obtain during each 4-weekly period either 3 lb. sugar but no preserves, or 2 lb. sugar and 1 lb. preserves, or 1 lb. sugar and 2 lb. preserves, or no sugar

but 3 lb. preserves. An extra issue of 1 lb. of sugar for jam making will be available during the period July 23rd to August 19th. The changes in the sugar and preserves ration arrangements have no doubt been indicated by the poor prospects of the fruit crop this year. A full preserves ration would be difficult to meet, and no doubt the relatively plentiful supply of sugar will be welcomed.

"The Economist" Sensitive Index.—There was no change in the index during the week ended July 12th. The complete index (1935=100) was 158.6; crops 135.6; and raw materials 185.5.

FINANCE AND BANKING

THE MONEY MARKET.—With the note circulation at the new high record of £1,136,063,000, a rise of £1,953,000 on the week, the reserve of unissued notes in the banking department has fallen to £14,178,000 and a further increase in the fiduciary issue must now be a matter of days. The Bank return

(Continued on page 100)

GOVERNMENT RETURNS

For the 8 days ended July 8, 1944, total ordinary revenue was £59,022,000, against ordinary expenditure of £130,640,000 and issues to sinking funds of £265,000. Thus, including sinking fund allocations £2,410,239, the deficit accrued since April 1st is £893,385,000 against £960,709,000 for the corresponding period a year ago.

On July 7th applications at £99 14s. 11d. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday, and Friday of following week were accepted as to about 45 per cent. of the amount applied for, and applications at higher prices in full. Applications at £99 15s. for bills to be paid for on Saturday of following week were accepted in full. £110 million of Treasury Bills are being offered on July 14. For the week ending July 15 the banks will

Wilson's basic concept was of the sovereign equality of all states, great and small, ex-Allies or ex-enemies. His League was to be universal, and it was not an alliance or a confederacy of powers but a league of nations. This notion of the equality of Abyssinia and America, of Guatemala and Germany was recognised from the start—indeed was proudly claimed—as a piece of idealism. It was hoped that reality would grow up to this dream. Unhappily, it was not so. But the universalists are undaunted. In the hands of some of Wilson's disciples, his doctrine of an international league has blossomed into a new doctrine of exclusive universalism. Not only must all nations be equal members of the League, but any recognition of the special status of any member, any special grouping of members, any relations between some members closer than they will accord to all members—all these are heresies. A large section of American opinion brands as "balance of power politics"—a term which has become an accusation—any attempt on the part of any other country to concert its arrangements with its special friends. (The doctrine of American "hemisphere solidarity" is tacitly exempt.) The smaller nations, as is natural, are also unwilling to admit that there are any gradations in sovereignty.

The force of events is, indeed, inevitably driving world opinion in two conflicting directions. On the one hand the manifest facts of life among the nations are making it clear that, in all matters of wielding force, it is only the Great Powers that count. Since it is universally admitted that the new League "must have teeth in it," this is a paramount consideration. Any system that rests on power must accord a special status to those who can alone wield power. But secondly, the repeated spectacles that the world has been given of what the use of force by a Great Power can mean to small nations have made all the small nations more nervous than ever of committing their destinies to hands which may turn out to be mailed fists. The Great Powers alone can make the system work. But if it is worked by them alone it will meet with widespread suspicion and obstruction.

This dilemma can be seen as a conflict not only in the ranks of the nations, but also within the ambit of American opinion and policy. The administrators in Washington are driven by the logic of the facts to seek an agreement, at least in the first place, with their three major allies alone. But the substance of the agreement they seek, obedient to the majority voice of American opinion, is based on Wilsonian universalism. There can be little doubt what the British and Russian views will be. Russian policy is always realistic, and British policy is, for the moment, in a realistic mood. Russian policy might, indeed, be content for all time with a Great Power concept. British ideas—as is so often the case—are half-way from Moscow to Washington. There is no retreat in London from the belief that the ultimate aim of foreign policy must be to create a free union of equal states, and that nothing less will guarantee perpetual peace. But the weight of British argument is likely to be thrown on to the other leg of the thesis—that the best way to attain this objective is to build on what has already met the test of war—on the British Commonwealth, the Combined Boards, the Anglo-American pooled bases, the Canadian-American Joint Defence Board, the British-Russian and Russian-Czech alliances. Collective security can only be built upon the world as it exists at the moment of victory, not on an imaginary world of atomised nation states. Undiluted universalism would only widen the gap between the reality of the world situation and the idea of world order.

*

This could easily become an inter-Governmental quarrel. But, most fortunately, two books have appeared just in time to make it clear that there is a school of thought in America, not perhaps the majority but second to none in authority, which sees clearly the dangers of too rigid a universalist approach. One of these books is by Mr Walter Lippmann, whose "US Foreign Policy" had an enormous effect on opinion when it was published last year.* The other is by Mr Sumner Welles, who was until recently Under-Secretary of State. Both these books, though in different keys, point the impractical nature of a Wilsonian approach. Both find the solution in a regional system. Indeed, it is for their emphasis on regionalism that both books are chiefly remarkable.

The war, says Mr Lippmann, has created two regional groupings and foreshadowed two others. In the West, the Atlantic Community, made up of the United States, Canada, Latin America, Great Britain, the nations of Western Europe and their colonies, is a reality. It has been an effective unit of defence against Germany in two wars, it has itself been at peace for a hundred years, it is maritime and commercial and its deep roots lie in the tradition of Western Christendom. Unhappily, between wars, the nations forget this natural unity and have to recreate it painfully at the eleventh hour of desperate war. A first step to a functioning world order would be to formalise this unity through joint defence, common foreign policy and "organic consultation."

The other region lies in Eastern Europe and Asia—

* Mr Lippmann's new book, "U.S. War Aims," is to be published in England later in the year by Hamish Hamilton.

the Russian Orbit is Mr Lippmann's term. Here the great Eurasian land-mass is organised round the power of Moscow. It differs radically in its tradition and organisation from the Atlantic world, but it is a recognisable unity and can be a pillar of the post-war world. To these, Mr Lippmann would add in time a Chinese and a Hindu-Moslem region. These are admittedly much more hypothetical and vague, but the final concept is of a world order built not on individual sovereign states but on "the historic communities of States."

Mr. Lippmann claims that this method of regional organisation can help to solve the other crucial problem of establishing a workable relationship between the Great and the Small Powers. In each community—except the Moslem-Hindu community which Mr Lippmann does not seriously discuss—a Great Power is the nucleus of effective defence. In collaboration with its smaller neighbours, it secures peace in its region by dealing with inflamed political problems such as frontiers and minorities. Only "universal questions" come before the World Council.

To quote Mr Lippmann again:

The issues that are local within them they must settle among themselves; the issues that are general they will deal with in the world council, consulting at the higher level after they have consulted at the lower levels, deliberating not as disparate sovereign states but as communities which have in the end a common interest. In this view of things the horrid antithesis between nationalism and internationalism subsides. No one is asked to transfer his allegiance from his own country to a new cosmopolitan fatherland. As he is a good patriot so he is a good neighbour, and by being a good neighbour he is loyal to the laws, the usages and the requirements of the universal society.

*

It is most valuable that this thesis should be stated, at this moment, with such authority. America's contribution to the new world order will be all-important and something more than good intentions on America's part will be needed. Any workable system must be a compound of idealism and realism and, at the moment, it is the latter quality that is in shorter supply.

Nevertheless, when all this is said, it is still legitimate to ask whether Mr Lippmann and Mr Welles, in their reaction against universalism, have not gone too far to the other extreme. The regional solution is admirable where it works; but it does not work everywhere. Mr Lippmann has perhaps been over-impressed by the Atlantic Community, Mr Welles by Pan-America. But the essence of both examples is that they are voluntary associations of free nations. In the Atlantic Community, no nation fears either Britain or America. What chance is there of a similarly voluntary and free association in the Russian orbit, which includes Poland, or in the Hindu-Moslem region, or even in the Far East? But if this free association does not exist, then the instruction to each region to settle its own local issues is an invitation to the strongest power in the region to impose its will. Regionalism, when it ceases to be free and voluntary, becomes imperialism. So long as, within a region, small nations are afraid of large nations, the rest of the world cannot escape its responsibility for intervention. Peace is indivisible, and the World Council must necessarily concern itself with every threat to peace.

The truth surely is that, in a problem of such complexity, all simple formulae are suspect. If the system is to be workable, it must take account of the special status of the Great Powers, and it must not pretend, in the name of collective security, to diffuse the responsibility for questions of war and peace on to those who could not execute their decisions. But if the system is to engage the idealism of mankind, it must be designed to solve the great majority of questions by free agreement and without the use of force. Clearly the solution is a different organisation for different purposes. Where force is needed, let the responsibility for using it be plain. But let it be used only in times of international martial law. And let it be hoped that, as the years pass, the need for it will vanish.

Government and Industry

THE Fabian Society has always been the practical and realistic branch of the Socialist movement in this country. During the war, many of the most active Fabians have been brought very closely into contact with economic reality by playing individual parts in the national effort of economic mobilisation, and this has tended to reinforce the Fabian bent towards practical proposals rather than utopian dreaming. The latest report on "Government and Industry: A Framework for the Future," is an excellent example. In part, the report consists of a description of the relations between industry and Government; permission has been secured to reprint this section on page 118 of this issue of *The Economist*. But the report also contains proposals for post-war policy. There will be few industrialists who will agree with these proposals, but they will find them reasonable and moderate. There is, for example, no assumption of inherent virtue on the part of the critics or of inherent vice on the part of all who live by profit. On the contrary, there is a willingness to admit that private enterprise can be both public-spirited and effective. In describing the industrial structure of wartime, for example, the report says that

to a large extent, whole sections of industry have become without any great change of personnel, virtually units of the wartime Government machine acting under its direction in all respects. At the worst, there has been a certain mingling of private interest with public policy. At the best—and not infrequently—there has been practical and successful collaboration between the more competent technical and managerial personnel in industry and the more competent and enterprising civil servants, temporary or even permanent.

Or again, the report recognises that there is no case for the nationalisation of the whole of British industry within any period worth troubling about at present, and that it is only in a few of the more vital industries that early changes in ownership are required. As Mr Morrison says in his Preface, the people would not agree to anything more "and, even if they did, speaking as one with some experience of administration, I do not believe it possible that their wishes could be carried out."

But perhaps the greatest gain for clarity of thinking in this report is its acknowledgment that it is not the ownership of industry but the policy it pursues that is of major importance to the community. Though the nationalisation of certain key industries is looked for, public ownership is admitted, on economic grounds, to be "not the essential point" and the objective of this neo-Socialist thought is to secure "the drawing up of a code of principles for the guidance of the price and production policy

of large-scale economic units." This is an immense gain. For two generations now, British public opinion, under the impulse of Socialist thought, has been mightily concerned about who should own British industry and about the membership and constitution of the Boards, Committees, Councils or the like that were to administer the public ownership. It is like a breath of fresh air to have an avowedly Socialist body at last admitting that it is the quality of the management and the policy pursued in such matters as prices and production that matter, not the names on the share register.

The specific proposals of the pamphlet are simple. In the first place, there is to be a permanent Buying Ministry, to organise the whole of the Government's purchases from, and orders to, industry. Secondly, there is to be "a central Department for industrial control," whose primary functions should be to prevent monopolistic restriction and to administer the policy for the location of industry. This central Department would need to employ a great deal of industrial and managerial skill. And thirdly, though trade associations have legitimate functions to perform, they should not be allowed to exercise restrictive powers.

The Government must have an organisation which should be separate from the trade association through which to control the development of an industry, and to ensure that essential tasks such as research, standardisation, reorganisation, export marketing and so forth, are adequately performed.

These Industrial Boards would presumably be appointed by the Government and be responsible to it, though the report is somewhat ambiguous on the point.

*

It is obvious that if any consistent long-term industrial policy is to be possible in Britain, it must be such as will be at least broadly acceptable to the two main parties of the state. The difficulty hitherto is that neither side has put forward any proposals that are worthy of consideration by the other. The only platform on which the two sides have shown any willingness to meet is the growing tendency of employers and trade unions in specific industries to unite for the purpose of pushing up prices and "stabilising" both profits and wages—that is, to secure special privileges for themselves at the expense of the consumers.

If, then, the intellectual leaders of the Left change their tune and advance a policy embracing so many victories for moderation and clear thinking as are shown by this

CREATE AN ESTATE

Every man who effects a Life Assurance Policy immediately creates for those dependent upon him a personal Estate of known amount free from the risk of depreciation

EQUITY & LAW LIFE ASSURANCE SOCIETY
LINCOLN'S INN FIELDS

Temporarily removed to
163/4, STRAND, LONDON, W.C.2

pamphlet, it behoves other sections of thought to examine how far they can go to meet such a promising initiative. Do the ideas embodied in this Fabian pamphlet present a basis upon which an industrial policy could be built up that could be supported by all those whose concern is with the public welfare rather than with special interests either of labour or of capital?

It is very difficult to deny the basic assertions of the pamphlet. The vision of a completely untrammelled industry achieving new prodigies of enterprise by the method of free competition is nowadays merely a vision. For one thing, comparatively few British industries are competitive. The practices of controlling prices and production and of protecting profit margins have gone so far that a "market price" is becoming a rare phenomenon. Whether or not, as a hypothetical proposition, competitive private enterprise should be left free of all government interference, it is quite impossible for any community to permit the powers of monopoly and restriction to be wielded by those whose main motive must necessarily be private profit. And even if the question of "imperfect competition" never arose, purposive direction by the organs of the state would be necessary to secure the two objectives of adequate employment and of a balanced location of industry. It is quite impossible to deny that the Government will have to intervene for at least these three purposes; that its intervention may lead it a long way; and that, if there is to be intervention, it should be sensibly planned at the centre. If it is now conceded from the Left that these necessities do not require sweeping changes in the present ownership of industry, a broad range of agreement should be possible.

*

And yet there must still be certain reservations. To the Fabians, control still seems to be an end in itself. In their description of wartime arrangements, they are ready to admit that there has been a fruitful partnership between the state and industry. But in their prescription for the future, all the discussion is of the checks and balances that the Government is to impose on the activities of industry; very little is said of the need for helping industry. "Control without responsibility is the definition of tyranny" says Mr Morrison in his preface, but the authors of the pamphlet do not listen. Or if they do, they take it for granted that the state is necessarily responsible. But nothing could be farther from the truth. Responsibility in the sense of concern for the general interest the state ought to have, but often does not. Responsibility in the sense of being answerable for the consequences of its actions, the state certainly does not possess when it is controlling private enterprise.

It is most essential that there should be clear thought on this issue. Negative control of industry by the state is a vicious principle and should be kept to a minimum.

The Missing Technician

IT is neither surprising nor undesirable that the recent acceleration in the rate of progress towards final victory should have encouraged the expression of very optimistic views on the future of British exports. Optimism can be a valuable stimulant; and industry will need every stimulant if it is to achieve the target set for it by the Government and the hosts of planners. British industry may or may not be capable of sufficient expansion to meet a fifty per cent increase in exports—but a mere statement of the aim will not produce any such spectacular result. If hopes are to be implemented they must be supported by a policy that makes full and efficient use of the nation's resources.

The concept of industrial efficiency has undergone many changes since the principles of the division of labour were first formulated. With the opening of the machine-age, specialisation and the sub-division of occupations became the accepted pattern for all large-scale

Some degree of it is necessary for full employment, to prevent monopoly, to foster a balanced distribution of industry, to advance the export trades and the like. But it is essential, first, that in every case the limits of control should be clearly set; secondly, that its purposes should be no less clearly realised; and thirdly, that to match every negative control the state should try to provide a positive assistance. It is not necessary to have an admiration in principle for private enterprise to justify these requirements. They are not based on preference for private as against public ownership, but on a preference for the positive principle of activity as against the negative principle of restriction.

The need, then, is for more thought to be given to the principles that should limit and inspire the Government's intervention in industry. The Fabian Report is a very great and welcome advance in its recognition that it is policy and not structure that chiefly matters. The Fabians should advance still further and say what the policy should be. In what circumstances is price fixing permissible and at what level, relative to the average costs of an industry, should minimum prices be set? In what circumstances, if any, should maximum quotas of production be determined, or entry to an industry controlled? Is there agreement that the industrialist's primary duty is to produce, not to seek a sectional "stability"? Is it accepted that capital, whether public or private, will not freely flow into an industry unless it is allowed to be adequately remunerated? Is it clear that the worker's real interest is always to increase his net output, with the aid of as much machinery as can be provided for him, and never to restrict production, or to obstruct technical improvement? Is it accepted that, for this purpose, British industry needs substantial re-equipment and that the state should assist in the process? Is it right that profits ploughed back into industry should be taxed as heavily as they are? Is it conceded that wages and profits are likely to be high together and low together and that they are partners in producing the output of industry, not competitors in consuming it?

If the right answers can be given to these questions and if an industrial policy can be built upon them, then a structure of organisation such as that suggested by the Fabians would work admirably. But the same structure could work equally badly if it were animated either by a spirit of repressive hostility to all forms of private enterprise or, conversely, by the mere desire to buttress an economy in which "self-governing" confederacies of employers and trade unions strove each to stabilise its own prosperity. If the Fabians can divert public attention to the content of industrial policy, as opposed to the shape and colour of the rooms in which it is to be discussed, they will be continuing their record of service to the community through intellectual leadership.

operations. But the increasing size of the business unit and the intensification of national and international competition revealed serious flaws in the system. The attempts to repair the structure of industry produced new methods of co-ordination and new principles of collaboration. Scientific management became the order of the day. Through time and motion study, cost accountancy, industrial and scientific research and the study of industrial relations, welfare and fatigue, methods were sought to check and abolish the waste inherent in rigid specialisation and departmentalism and to neutralise the dangers to which power-mechanisation had subjected the minds and bodies of the workers. The industrial system began to approach the ideal of corporate activity.

The moment is ripe for a further step forward. Pioneering work during the past twenty years has demonstrated the need for a new functionary in industry—the specialist industrial designer. In 1937 the Council for

Art and Industry reported:

Modern developments of popular education, and the rapid changes, here and abroad, in fashions and in the habits of the people, are making good design a matter of ever-increasing importance. In order that British industry may profit to the full from these changing conditions and that Great Britain may be secured her rightful place as a creator of taste and fashion ranking high in international trade, every possible step should be taken to improve the artistic quality of British products. . . .

If the old belief that "British goods sell themselves" (through the agency of a goodwill inherited from Victorian times and subject to depreciation) is persisted in, then the objective of expanding exports will be unattainable. Improvements in technical efficiency and in marketing and sales organisation are not enough; they must be backed by improvements in the functional and aesthetic qualities of the goods produced. Mr John Gloag, who has written wisely and bravely on this vital need of industry, has called the industrial designer "the missing technician"—a title that is a powerful corrective to the conventional view of the designer as the long-haired Bohemian nit-wit of fiction. Industrial design has been neglected for so long that first-class performers are scarce, but there are enough of them to form the nucleus of a strong team to serve post-war industry.

*

After the war, British industrial capacity will probably be greater than ever before. The inventions and discoveries of war will be available for translation into the goods of peace-time commerce, and a large and exciting range of new materials will be at industry's disposal. There is considerable danger that these opportunities will be abused. In a sellers' market (such as may be expected for several years in most trades) there will be strong temptations to misuse new materials and processes. Conditions will be favourable for the growth of mushroom enterprises which, by their unskilled handling of these rare opportunities, may bring new materials into discredit and thus hinder the development of more reputable firms and industry in general. The plastics industry is well aware of this danger and is trying, through its advertisements, to correct the potentially damaging and irresponsible view that plastics can do anything and everything.

Before industrial design can serve British industry as well as it has served industry abroad (notably in Sweden and America) there must be a complete change of heart in the average business man. Industry suffers, at one and the same time, from a surfeit of designs and a deficiency of design. The distinction is all-important. Unable to identify the qualitative reason for a declining export trade, the manufacturer (in many industries) has struggled gamely but ineffectively by increasing the variety of his products. For this purpose he has usually employed the services of a decorative artist, whose work has proved quite abortive. The result has been to extend the range and complexity of the manufacturing process and to increase costs of production disproportionately. Reference to the pottery industry provides a clear and factual example. Total exports of pottery in the years before the war were in the region of £3,000,000 per annum. The industry was then represented by more than 350 firms—most of them producers of domestic earthenware and china. Each of these firms produced a large variety of "body" shapes and a larger variety of patterns with which to decorate them. According to Miss Moira Forsyth, "A medium-sized firm employing 400 to 500 people was in the habit of carrying about 300 stock patterns, all of which had to be available in tea, dinner, breakfast and coffee sets, so that orders for replacements and matchings could be met." Under these conditions it was not surprising that the industry, as a whole, was unable to compete in an open market with the potters of the Continent and Japan. Professor Sargent Florence has described the effects of design rationalisation in American industry. He has shown that improvements in the functional qualities of such common articles as grocers' paper bags, milk bottles and saucepans have increased demand and cheapened production very markedly.

To quote such evidence is not to plead for stan-

dardisation. The employment of competent designers in industry would automatically result in a limitation of designs through voluntary discrimination and improved demand. Not a little of the public's apparent liking for variety is really attributable to its restless pursuit of articles combining functional and aesthetic qualities at a reasonable price. Where such articles are marketed—and there are, of course, notable examples of successful design in Britain—demand becomes canalised to a remarkable degree.

In the sphere of industrial design British industry has much to learn from America. Mr John Gloag has written:

In America, the man who can design a streamlined tram, a motor-car body, a gas-cooker, a trailer-caravan, an electric iron or a radio set is now regularly consulted as a technician—as a qualified engineer, a chemist, an electrical expert or an architect is consulted.

The results of this policy have been very encouraging. Mr Raymond Loewy, the American industrial designer, estimated in 1941 that \$850 millions worth of goods manufactured to his design specifications would appear during the year. Between 1938 and 1940 the sales of the Studebaker corporation (employing Loewy as designer) increased by more than 125 per cent. In 1940 Loewy's designs for General Motors ("Frigidaire" products) contributed to increased sales amounting to 100,000 units (or a 25 per cent increase over the previous year). These are hard facts and they could be matched by designing successes in Britain. But examples are all too rare.

*

There is, however, a growing awareness of the vital importance of industrial design and various independent and public bodies are already at work endeavouring, by precept and example, to educate the business man to a full and effective appreciation of its market value. Much can be done by skilful propaganda as was proved, from 1917 onwards, by the *Svenska Slöjdföreningen* in Sweden. It is too soon yet to say whether the Board of Trade's Utility designs will have a permanent and purist influence on public taste or will produce violent reactions. The Council for Art and Industry was established by the Board in 1934. Its influence has been very considerable. In 1937, on the Council's recommendation, the Board of Trade established the National Register of Industrial Art Designers. The existence of this register enables the manufacturer to select an industrial designer with confidence. Qualifications for registration rest on proof of genuine creative ability. Registered designers have been responsible exclusively for the designs of Utility furniture. Another wise step has been the setting up of a Sub-Committee of the Department of Overseas Trade to consider design in relation to overseas markets. Industrial design cannot flourish under a strict paternalism (in Nazi Germany and Soviet Russia it has become a matter of bureaucratic *clichés*) but before the desired marriage between art and industry can take place both parties will need much prodding and coaxing. The Central Institute of Art and Design, a federation of numerous national organisations covering the whole field of graphic and plastic arts, was formed in 1939. Its services to industry and Government departments have been available in time of war. As the merits of industrial design achieve wider recognition the Institute's work should gain in effectiveness.

An ideal example of the planned use of industrial design in the service of industry is afforded by developments in the cotton industry. The industry now has its own Centre to advise on all problems of design, colour and style. This Centre has embarked upon a policy which should remove a main cause of the overseas decline in the cotton trade before the war—the mediocrity of its woven and printed design. In the long run everything depends on the business man's recognition of the value of the new industrial resource at his command. If his conversion can be speedily effected the future of British exports will be incomparably more bright.

NOTES OF THE WEEK

Bretton Woods

The battle of the quotas at Bretton Woods ended in the inevitable compromise last week-end, and with this major obstacle to agreement overcome, Mr Morgenthau could announce that "the International Monetary Fund has been born." The redistribution of quotas was made easier for the losers by increasing the aggregate contributions from \$8 billion to \$8,800 million. This is how that total was ultimately distributed:

(In \$ millions)		
U.S.A.	2,750	Mexico 90
U.K.	1,300	Yugoslavia 60
U.S.S.R.	1,200	New Zealand ... 50
China	550	Norway 50
France	450	Chile 50
India	400	Colombia 50
Canada	300	Cuba 50
Netherlands ..	275	Egypt 45
Belgium	225	Greece 40
Australia	200	Iran 25
Brazil 150		Peru 25
Czechoslovakia ..	125	Philippines ... 15
Poland 125		Venezuela 15
South Africa ...	100	Uruguay 15
		Bolivia 10
		Luxembourg 10
		Iraq 8
		Ethiopia 6
		Costa Rica 5
		Dominica 5
		Ecuador 5
		Guatemala 5
		Haiti 5
		Salvador 2½
		Honduras 2½
		Nicaragua 2
		Paraguay 2
		Iceland 1
		Panama ½
		Liberia ½

The distribution is at places incongruous. The significance of the quotas can only be derived from the foreign trade of each member country, and to give to the USSR virtually the same allocation as to the UK appears more than slightly absurd. Equally difficult to justify is the grant of a higher quota to China than to France. These incongruities are the price paid for agreement on the wider aspects of the scheme, and the more glaring discrepancies will no doubt be remedied in the light of actual experience. The dispute on the constitution of the executive committee of the Fund has been settled by increasing the number of directors to twelve, five being appointed by the "big five," and two by the Latin American nations, leaving five to represent "the rest." The South Americans thus won their fight, showing as much aptitude in capitalising their newly won creditor status as they have done in other directions in wielding the power of an international debtor. There was some dignified argument about the location of the Monetary Fund and world bank headquarters between the British and US delegations. The Americans won, and it is to New York that the delegates will have to travel in order to attend meetings of the boards. In order to complete the discussions of the second commission, concerned with the reconstruction bank scheme, the conference, which was due to close last Wednesday, was extended to the end of the week. The main argument on this commission has been concerned with the ratio of the bank's guarantees to its capital resources, the proportion of capital that should be made available for rehabilitation and for development (the Latin-American countries fearing that too much would go to the war-devastated countries), and finally, the inevitable fight over representation on the board of the bank. These relatively minor hurdles are being satisfactorily surmounted. One of the most satisfactory features of the whole conference has been the excellent cooperation between the American and British delegations, a tribute not only to the wisdom of the delegates, but to the thoroughness of the preparatory work.

Abnormal Sterling Balances

The problem of abnormal sterling balances has overshadowed a good deal of the proceedings at Bretton Woods. Hardly an issue arose which the Indian delegates could not interpret in terms of their frozen sterling balances. The pressure to get the conference to deal with this and related problems was successfully resisted, and the matter was referred to bilateral discussions between the debtors and creditors. The spokesman of the British delegation at Bretton Woods announced this week that invitations have been sent out to Empire countries with sterling balance problems to meet in London after the International Monetary Conference and discuss the whole question. The Indian delegates have estimated the ultimate size of their abnormal sterling at £1,000 million. The Egyptians have placed the size of their sterling balances at £250 million. The question of abnormal sterling was raised in Parliament this week

during the debate on the new £1,000 million vote of credit. The Chancellor of the Exchequer did not disguise the fact that "we are here presented with a formidable problem of which we have not hitherto in history had any comparable experience."

Houses Under Private Enterprise

The publication of two reports by the Ministry of Health's Central Housing Advisory Committee, together with the second reading of the Housing (Temporary Provisions) Bill on Wednesday make this week a landmark in housing policy. The Private Enterprise Housing report (Stationery Office, 1s.) is a particularly valuable document. Between the wars, private enterprise provided more than 3 million of the 4.2 million houses built in England and Wales, and was subsidised in respect of only 433,000 of these. If the Government's aim of building more than twice as many houses after the war (the target is 10 million in 10-12 years) is to be achieved, both public and private enterprise will be fully occupied. But if both agencies are to be used to meet the same needs, it is only fair that they should be treated on a par. The Government have accepted the committee's recommendation that the Exchequer should subsidise houses built under private enterprise during the early post-war period, subject to conditions about size, construction, rents and selling prices. This is commonsense. No suggestion is made about the form or period of the subsidy, which must vary according to the area and the type of house built, but the Committee thinks that it should be withdrawn as soon as practicable since "given favourable conditions, housing needs can be met without assistance from public funds." The most essential condition is, of course, that the present swollen level of building costs should be reduced and kept in line with the general cost of living. The Committee heard conflicting estimates of post-war costs, but seemed inclined to favour the view of the National Federation of Registered House Builders that houses could sell at 20-25 per cent above prewar prices. Perhaps insufficient account is taken in the report of the reductions in cost which should result from technical improvements, such as standardisation, prefabrication and the economies of large-scale site preparation—but on the other hand, the estimates of labour costs may be too optimistic. In the uncertainties of the transition period, people will tend to rent houses rather than buy them, and the Committee considers that private builders, with financial assistance from building societies, should be prepared to build more houses for letting than for sale. It is a pity, perhaps, that the Committee has rejected the idea of compulsory control over building standards, in favour of a voluntary scheme, and that the Government has accepted this view. Two important recommendations are that the local authorities should provide financial assistance to housing associations, and that a permanent body should be set up to review building costs periodically. One notable omission is the subject of rents, which must wait for the report of the Interdepartmental Committee on Rent Control.

Houses Under Public Enterprise

The ground covered by the Design of Dwellings report (Stationery Office, 1s.) is more limited and specialist. It deals exclusively with the standards of houses built by local authorities, and its recommendations, many of which have already been incorporated in a Housing Manual now being prepared by the Ministry of Health for the guidance of local authorities, do not involve legislation. The report lays down a number of unexceptionable principles: design and construction should keep pace with progress in other fields; local authorities should aim at making their housing estates pleasing to the eye; the standard of rural housing should not be lower than that of urban housing. It suggests a healthy balance between flats and houses; separate accommodation on estates for old people and better provision for single people. Local authorities have already been asked to co-opt housewives on to their housing committees, to em-

ploy trained architects and to appoint more trained housing managers. Flats, it is suggested, should provide more communal facilities and present a less barrack-like appearance than they usually do. The standard proposed for a 3-bed-roomed dwelling, consists of two ground-floor rooms, one for meals and the other for general purposes (or else a dining recess off the living room) a "utility" laundry room, separate bath and lavatory, and adequate outbuildings. Many improvements on prewar lay-out and equipment are proposed, especially for cooking, heating, laundry and cupboard facilities. The report does not lay enough emphasis on the provision of constant hot water, which should probably be included as a minimum compulsory requirement; nor, surprisingly, is there any mention of refrigerators. But, on the whole, its recommendations are attractive and sensible, and the estimated selling price of £467—an increase of 16½ per cent over the better type of pre-war Council house—is not unreasonable, if it can be attained. The question, however, is what control there will be, beyond exercise of persuasion, to secure that local authorities adopt the proposed standards.

Coal and the Commons

Last week's debate on coal in the House of Commons was singularly inconclusive. Members seemed to be so overwhelmed by the weight of statistics in the Ministry of Fuel's White Paper that they were unable to offer any constructive suggestions for improving the coal situation. Major Lloyd George added little to the general picture of the industry presented in the Statistical Digest, and he failed to correct the very gloomy impression created by the declining output figures. His estimate that an increased output of one hundredweight per manshift would result in an annual increase of 10 million tons points to the need for raising productivity and makes all the more disappointing his admission that no large increase in production can be expected before the end of the coal year (i.e., April, 1945) from the use of American machinery. The most encouraging parts of his speech were his statements that eight out of ten "Bevin boys" are proving satisfactory and that a higher proportion of pit production committees are working effectively. It is also satisfactory to know that much-needed surveys of the coal resources of the various coalfields are now being undertaken. Perhaps the most effective speech of the debate was that of Mr David Grenfell, ex-Secretary for the Mines, who described very vividly how miners in the Kent coalfield had stuck to their posts under the invasion threat of June, 1940. Speakers on both sides of the House—who seemed mainly to be either ex-colliers or colliery directors—were in complete agreement about the need for a drastic reorganisation of the industry, though not about the methods. The Labour spokesmen concentrated on nationalisation, using principally the psychological arguments, while the Conservatives favoured rapid amalgamation as an alternative. Both were concerned primarily with production and scarcely any reference was made to distribution though, as will be seen from a table on p. 121, the need for reorganisation of distributive methods is urgent. By and large, it cannot be said that the coal position is any forrader as a result of the debate, and since Parliament will sooner or later have to decide whether or not to nationalise the mines, it seems a pity that MPs should have had so little to contribute to the discussion.

Back to Rome

The Government of Signor Bonomi has transferred its seat from Salerno to Rome. Allied hesitations whether to recognise the Government of Marshal Badoglio's successor have apparently come to an end; and as the fighting lines move towards the north, the new Government will soon be master of the whole of southern and central Italy. Signor Bonomi is now confronted with economic and political problems which it would be difficult to overrate. According to Press reports, the Italians have been notified that after this year's harvest, they will no longer be supplied with food by the Allied relief agencies. It is not clear, however, whether relief is going to be withheld from the whole of Italy or only from those areas in southern and central Italy where this year's crop will be more or less normally harvested. The Lombardy plain is no less important as a food producing area than as an industrial area. If the harvest there is not gathered in this summer, or if a high proportion

of the crop is requisitioned by the Germans, a substantial gap is bound to appear in Italy's larder. In southern and central Italy, the crops ought to cover the demand for the coming year, provided the Government succeeds in buying up sufficient quantities of grain from the peasants. At present the farmers are rather reluctant to sell their produce, because of the chaotic condition of the Italian currency, the wide differences in prices which vary from place to place and—last, but not least—because their money is unable to buy consumers' goods. What is now needed in order to feed Italy is probably not so much to import food as to import shoes, clothing and agricultural implements which would induce the farmers to sell food. Politically, the Italians hope that, owing to its anti-fascist record, the new Government will be able to secure some undefined mitigation of the Allies' still unpublished armistice terms. Signor Bonomi's Government has cautioned the people against unduly optimistic and light minded expectations, and Signor Ercoli, the Communist Minister of State, has warned them that they cannot hope to be painlessly redeemed from their part in the war. Italy, he pointed out, can mitigate the consequences of its defeat only by the most active war effort on the side of the Allies. A mobilisation of some classes and a recruiting campaign of volunteers for the Italian Army are to start soon. The Italian partisans, who fight in Northern Italy, have been formally incorporated in the Army organisation in order to protect them against German reprisals. Even so, the political situation of the Bonomi Government is in some respects awkward. It rather resembles the situation of the democratic Weimar Government in Germany in 1919, which had to bear the odium of supporting the Versailles Treaty which to many Germans appeared unbearably harsh. The difference between Germany and Italy is that, unlike the German Liberals and Socialists, the Italian democratic parties were always genuinely opposed to the military adventures of their predecessors. Even so, Signor Bonomi will need much political wisdom to carry on a regime so loaded with liabilities from the Fascist era.

Vilna and Lwow

The capture of Vilna by the Russians has revived the old controversy over the fate of that town. The Russians in their official communiqué have described Vilna as the capital of the Soviet Lithuanian Republic, for this it was proclaimed to be after the setting up of the Republic in 1940. The Polish Government has protested against this description in a restrained but categorical form, pointing out that it has been the common view of the United Nations that no territorial changes take place during the war can be recognised without the consent of the interested parties. Both Governments, the Russian and the Polish, stick to a formal viewpoint. Until they reach a new frontier agreement the Poles still regard the Riga Treaty as valid. The Russians, on the contrary, think that the *status quo* of 1941 remains in force. Apart from this, the Russians have not shown themselves ready in their recent territorial proposals to envisage the return of Vilna to Poland. This presumably explains their somewhat demonstrative insistence on the "Soviet" and "Lithuanian" character of Vilna. A similar controversy is likely to arise over Lwow now that the Red Army is advancing towards the city. The Russians have often indicated that under certain conditions they would be prepared to return Lwow to the Poles. The proposal of the Curzon Line has not prejudged to whom that town ought to belong. There are two versions of the Line. Under one, Lwow remains on the Polish side, under the other it goes to Russia. Informal negotiations about the resumption of

Polish-Soviet relations seem to have broken down completely for the time being. And the line which the Russians take about Lwow will be an important indication of their further intentions towards Poland. If Lwow, like Vilna, is claimed as a Soviet town, then the prospects of Russo-Polish agreement are very remote.

After Saipan

The defeat at Saipan has been followed by the resignation of General Tojo's Government. Tojo came to power in October, 1941, and presided over Japan's first sweeping victories. Now the pendulum has swung so steadily towards defeat that the Emperor's advisers have counselled a change in the leadership of the nation's war effort. Marquis Kido, the former Home Secretary, is to be Prime Minister. Other details of the reshuffle are not yet available, and Tojo may or may not retain the post of War Minister. He has managed to identify himself in a special way with the Saipan disaster, for it is the first major engagement to follow his centralisation, five months ago, of all power in his own hands. Until then, at the apex of the military and naval hierarchy, there had been a War Minister and a Navy Minister responsible for the administration of the armed forces and an Army Chief of Staff and a Navy Chief of Staff who were in charge of operations. In February these four offices were fused into two. General Tojo, who was already Prime Minister and War Minister, became Army Chief of Staff as well. At the same time the Navy Minister, Admiral Shimada, became Navy Chief of Staff. Now, apart from the change of Prime Minister, General Yoshijiro Umezu, the former Commander of the Kwantung Army, now becomes Chief of Staff. Admiral Shimada is to remain as Navy Chief of Staff, but a new Navy Minister has been appointed, Admiral Naokuni Nomura.

The loss of Saipan has obviously been a shrewd blow at Japan's military power and at its self-confidence. There are some signs of tension in Japan, of which the readjustments in the High Command are the chief example. Nevertheless, it would be very foolish to over-estimate the effect of this defeat, since it has been countered by a substantial Japanese advance in China. The Japanese Army is making a determined effort to link up its zone of occupation in Central China with the occupied zone round Canton. Changsha has in the past been a frequent scene of battle and this is not the first attempt that the Japanese have made. This time, however, the thrust seems heavier and it is uncertain whether the Chinese can hold it. The effect of a complete junction would be disadvantageous to Allied strategy. It would cut off the American air fields in South-East China and it might strengthen Japan in an area where, according to some reports, Admiral Nimitz finally intends to make a massive landing.

The New Evacuation

The third big evacuation of the war is now taking place. From July 2nd, when the Government announced that the official scheme would be reopened for priority classes in London and other areas of southern England, up to July 14th there had been 207,468 registrations and 152,652 departures, according to a statement by the Minister of Health at the week-end. As usual, the transport arrangements are working smoothly, which is a considerable achievement in view of the present congestion on the railways. But also as usual, difficulties over billeting are being met with in the reception areas. The unwillingness of householders there to receive evacuees has possibly been exaggerated, but there is no use denying that a hard core of resistance exists now as it did in 1939 and 1940-41. In fact, it has probably grown since the blitz days, when the sense of imminent danger united people as never before or since, and invigorated them. To-day, though there are fewer justifiable complaints for the reception householder to make than in 1939—the children are medically examined before departure and deloused where necessary—people are everywhere cross and tired enough to make unwanted guests a resented burden. Moreover, if tempers are frayed, supplies are short. Since 1940, towels have been rationed, other household goods are scarce and dear, and domestic help is difficult or impossible to come by. On a household toiling along on bottom gear, the imposition of another household is thus more than an

inconvenience, and it is ludicrous to pretend, as the billeting authorities claim, that the evacuees do not have to be done for, but need only be provided with facilities for doing for themselves. It is well-nigh impossible for two housewives to share a kitchen and precious pots and pans and maintain good relations, with the result that, as before, it is not the school children, but the mothers with small children whom it is difficult to place. Another grievance lies in the shortage of food, especially milk. Most of the evacuees are in the priority classes for milk, and for the first few days at any rate their priority rations can often only be met at the expense of the residents. This is not to say that householders should not be expected to take in evacuees if they do not want them. To do so is a national duty which they must tolerate with good sense if not with good will, and at the very least with thankfulness that they have not had to experience the flying bomb. But the unpleasantness of their obligation should be recognised. What is wanted is not un-called-for denunciation of the reception areas by London journalists who have never had evacuees billeted upon them, but co-operation from the guests, tolerance from their hosts and all possible facilities and help from the authorities concerned.

Emergency Powers

The Home Secretary had no difficulty last week in persuading the House of Commons to renew the Emergency Powers (Defence) Act for another year; but the debate made abundantly clear that exceptional limitations of individual freedom will not be tolerated for one moment that is not strictly necessary. Mr Morrison pledged the Government to review the emergency powers when hostilities in Europe come to an end. Some of these powers have been earmarked for abolition before that time; some will be swept away with the Nazis; but others will be necessary for continuing the war against Japan and "in relation to the economic problems and equitable distribution of supplies during the transition." Members were content generally to proclaim the orthodox libertarian principles, but Mr W. J. Brown used the occasion to denounce "the unholy alliance between the employers' federations and the trade unions"—an "alliance" which he thought as repressive of personal liberties as any emergency powers. There can be no two opinions about the intrinsic viciousness of the emergency powers and it is natural enough that they should be suspected, in some quarters, of covering the machinations of sectional interests. It is for this reason that the House of Commons, while authorising such powers for the duration of the war, will withhold them, in their present form, when party politics are resumed. The fact that the Home Secretary's licence to employ emergency powers is subject to annual renewal provides opportunities for regular scrutiny and revision.

Peace Terms in Parliament

The end of the war is coming so obviously in sight that Members of Parliament can be excused their anxiety to know what the Government intends to do, once the German collapse begins. That anxiety underlay a series of questions asked in the Commons on July 18th. First of all, there were several smart exchanges on the old topic of the "Two Germanys." Mr Eden had a passage of arms with Mr Stokes and Mr Bevan, the Foreign Secretary maintaining that Hitler was "symptomatic of the dominant sentiments and tradition of the German people," while Mr Stokes and other Socialist Members argued that Nazism was the product of defeat, despair and unemployment. Mr Rhys Davies obviously had the same question in mind when he asked Mr Churchill whether

the Allied Powers, in deciding on the policy of unconditional surrender for the enemy, envisaged the possibility that the workers in Germany might overthrow the present Nazi Government and establish a Communist régime instead, and whether the Allies were prepared for such an eventuality.

From the answers given by the Ministers it must be assumed that the Government does not share the view that there is a non-Nazi Germany to which an appeal can be made. This naturally throws light on its attitude towards the second problem raised in the Commons—could the war be shortened by a statement of the Allied armistice terms, coupled with an appeal to surrender? Many Members were

obviously disquieted by the depth of official silence on this question. They received no comfort. The armistice terms are not yet to be announced. This being so, it is hardly surprising that Mr Stokes got no satisfaction on his final question, in which he tried to discover whether the Allies had decided to detach East Prussia from Germany. Mr Churchill said that there was no secret agreement made at Teheran over East Prussia, but as the armistice terms themselves are still secret, it would be perfectly possible for them to include a clause on East Prussia which, if not secret in the strict technical sense, would nevertheless be completely secret to the House of Commons—or to anyone else who happens to be perturbed over the extent to which the British people may be committed to peace terms which none of their representatives have had any opportunity of discussing.

Turkish Non-Belligerency?

It begins to look as though the dismissal of Mr Menemajoglu will make a decisive difference to the trend of Turkish foreign policy. Talks with the Allies have been renewed, and Von Papen is reported to be taking a very gloomy view of the probable future of Turkish-German relations. It is not likely that the Turks will actively enter the war at this stage, though it is a possibility not to be excluded altogether. It is more likely that they will show their solidarity with the Allied cause by breaking off relations with Germany, a step which might perhaps be accompanied by the concession of some bases and other "non-belligerent" aids. The risk of German reprisals cannot be completely dismissed, and as long as this is so, more direct intervention is unlikely. On the other hand, the Turks were deeply perturbed by their isolation in the Spring. The absolute balance between safety without influence and responsibility with risk is difficult to find. Mr Menemajoglu leant over too far in the direction of neutrality. A lean in the direction of cordial non- or pre-belligerency may now correct the bias.

Dual Power in Yugoslavia

After the formation of the Yugoslav Government, under Dr Subachitch, it was generally assumed that the new arrangement meant reconciliation between King and Partisans. The dismissal of General Mikhailovitch, the former Minister of War, seemed to bear out that interpretation. It was also assumed that two of Dr Subachitch's ministers were direct representatives of the Partisans. A recent statement from Marshal Tito's headquarters shows that these assumptions have probably been somewhat hasty and inaccurate. Marshal Tito has declared his confidence in the two ministers who were said to represent the Partisans, but he denied the report that they spoke for his movement. The attitude of the Partisans' leader towards the new Government appears to be one of friendly expectancy, but not of complete solidarity. Nor does Marshal Tito seem to have accepted the new Government as the sole Yugoslav authority. While he recognises it as the legal representative of Yugoslavia abroad, he reasserts the claim of the National Committee of Liberation to act as the competent authority in Yugoslavia itself. The dualism of power is to end at some later stage, when the two Governments merge into one. As in Greece, reconciliation with the dynasty seems to arouse opposition among the radical groups of the Partisans. But unlike the leaders of the EAM at the Lebanon Conference, Marshal Tito has been more cautious in framing the terms of the compromise. He has probably thought it expedient to agree only to terms which would be more or less acceptable to his followers. Given his great prestige with the Partisans, he may perhaps succeed in making the reconciliation effective by stages, since reconciliation "at a stroke" seems to be impossible. The incident illustrates rather clearly the social and political tensions prevailing in Yugoslavia. In addition, the representative character of Dr Subachitch's Government continues to be emphatically questioned by many Serb politicians, who claim that the peasants in Serbia proper are still firmly behind General Mikhailovitch. Whatever the truth, there seems to be no possibility for the time being of forming any Government that would suit the political tastes of all the national and social groupings in Yugoslavia. In the absence of any better

alternative, Dr Subachitch's Government may possibly be the best political combination that meets the needs of the moment; but its limitations ought not to be overlooked.

Workmen's Compensation

The British system of workmen's compensation is moribund. Most of its numerous defects spring from the faulty principle on which the pioneer scheme of 1897 was based—that the employer is legally liable "to compensate any employee for loss of earning capacity due to accident or industrial disease arising out of and in the course of his employment," irrespective of any direct or indirect negligence on the part of the employer, and in spite of negligence by the employee. Long adherence to this principle has produced a system that rests, in the last resort, on the threat or practice of litigation, and, for that reason, necessarily has some elements of suspicion and grievance. The scheme fails in its main purpose of providing adequately for all industrial casualties; it does not promote the conditions necessary for the successful rehabilitation of those temporarily or partially disabled; and its administration is piecemeal and costly. The Government are committed to a policy of reform. The elements of a reformed system are not hard to state. It should guarantee the worker an adequate income should he become, for any reason, an industrial casualty; it should enable the worker to recover damages for injury caused by the direct or indirect negligence of his employer or fellow workers; and it should remove the employer's liability to compensate for injuries and accidents for which he cannot reasonably be held responsible. Whatever the system of financing the Government's scheme it is certain to prove controversial. The monetary burden of industrial disability should be shared by as many shoulders as possible, but separate firms and industries with so-called "clean" records in industrial health would not easily be persuaded that a pooling of responsibility is necessary.

A report on "The Law and Employer's Liability" issued this week by Mr Quintin Hogg and six other Conservative MPs, puts forward somewhat vague proposals as alternatives to those contained in the Beveridge Plan. The report is so loosely worded that comment upon it can be based only on an estimate of the authors' intentions. The first recourse it is proposed should be to National Health Insurance, to which both employee and employer have contributed and on which they have a justified claim. But in addition to these subsistence benefits the employer should be liable to make up an injured employee's income to two-thirds of his earnings before the accident. It is suggested that the principle of compulsory insurance should be extended to all employers, and that the State should underwrite the solvency of insurers. This "doubledecker" proposal of a private liability, compulsorily insured, on top of an orthodox social insurance scheme is an interesting variant. Certain statements in Mr Hogg's report suggest, however, that he has not fully appreciated some of the real disadvantages of the existing system. Thus there is little recognition of the need to reduce administrative costs, or of the need to remove the control of the rates of industrial disability benefits from the jurisdiction of courts of law and the atmosphere of litigation. On the question of commutation the report suggests the abolition of the employer's right to insist on composition, but finds it "a doubtful move to abolish the ability to commute altogether."

Schools for Londoners

With the Education Bill well on the way to the Statute Book, the time has now come for local authorities to consider the reorganisation of their schools within the new framework. The London County Council is among the first to tackle the problem. Its Education Committee is to study various recommendations and plans, and it has already accepted the suggestion that London should be provided with "comprehensive high schools," each with about 2,000 pupils. The idea, apparently, is to avoid the differentiation in status, as unfortunate as it is undeniable, that is commonly drawn between the grammar and technical school and the "modern" or senior elementary school. The motive for the

change is a laudable one. There can be few things so demoralising or hampering in development, as for a school to feel itself inferior and a home for dullards. To counteract this tendency, which is bound to persist so long as the pupils of one school are due to leave at 15 or 16 and those of the other at 17 or 18, everything must be done to prevent the standard premises, staff, equipment and amenities of the "modern" school from sinking below that of other post-primary schools. The proposed solution, largely based on the urban American high schools, is one which it would take many years to establish. The general sub-committee of the LCC which has submitted it admits as much, since 90 sites of 8 or 9 acres each have to be found in place of the existing premises which, before the war, housed 963 separate post-primary schools. The re-organisation would inevitably be slow and difficult and it should be firmly established that the ultimate goal is desirable before it is begun. It has not yet been satisfactorily proved, for instance, that the weight of such large numbers of children in one school does not bear heavily on the administration, the headmaster or headmistress and finally on the children themselves. Secondly, it should be realised that the new schools would necessitate much longer journeys—twice a day and probably at rush-hour periods. The LCC should consider whether as much could not possibly be accomplished by a more complete integration of school activities rather than of school buildings, so that exchanges of staff and special amenities and other administrative measures might foster a feeling of greater unity between all types of local schools.

Durham's View

The proposal of the North-Eastern Electric Supply Company to erect a large generating plant at Durham has caused heated opposition, and has led to an appeal for a public inquiry made to the Minister of Town and Country Planning by the Bishop, the Dean, the University, and others. It is the threat to the celebrated view of cathedral and castle from the railway which has aroused the strongest protests. Many of them have clearly been made without any knowledge of the actual site chosen, which lies, in fact, on the northern outskirts of the city, and would not affect the foreground of this view. It is true, however, that the two high chimneys and three high cooling towers of the plant would preside over the city jointly with the cathedral, and, however well designed—and the opportunity for good architecture certainly exists—they would be bound to clash sadly with the medieval atmosphere of the city. The City Council have decided not to oppose the proposal, provided that no alternative site is available. It is hard to believe that there is not an equally suitable or more suitable site to the north of Durham itself along the river Wear. Here lies a depressed industrial area, where the arguments of bringing work and prosperity, used by the scheme's supporters, have surely still greater justification. It would be short-sighted of Durham to concentrate on its own prosperity rather than on that of the area as a whole. There may be good economic reasons for choosing a site within the city's boundaries. But, until they are stated, the man in the Durham street as well as the man on the Flying Scotsman is likely to be more swayed by aesthetic considerations.

Future Doctors

In the long run, the success of a national health service depends, not on its organisation—on whether it is administered by central authority, local authority or the medical profession—but on the quality and quantity of doctors. The White Paper on the health services admitted this by implication, but the supply of doctors was left undiscussed until the findings of the Inter-Departmental Committee on Medical Schools (the Goodenough Committee) had been made known. This committee's report has now been published. For improving the quality of doctors it makes many valuable recommendations. The committee was not concerned with the details of medical curriculum, but its conclusions on the outline of a student's training are very much in line with those of the sub-committee of the Royal College of Physicians published in May. It recognises, that is, that the medical student to-day is so overloaded with facts that he loses all sight of principle and method. Further, he spends his clinical training under different specialists

who very rarely see their specialty in relation to medicine as a whole. He thus becomes a jack of all specialties and anything but a master of general medicine. When he comes to practise it, he tends to rely more and more on the removal of symptoms, in which he is helped by the great advance in therapy in recent years, instead of concentrating on the diagnosis of disease. The Goodenough Committee emphasises that potentially good doctors must be found by drawing students from all sections of the community, which will involve a larger and better system of grants, including adequate maintenance grants and family allowances where the student would otherwise be expected to contribute to the support of his or her family. Like the Royal College of Physicians, the committee is also in favour of a system of selection, as well as examination, in admitting students to medical schools. Secondly, it emphasises that the student should be a person with a good general education, that early specialisation in vocational subjects is to be avoided and that "there is no better background to a medical training than a university course of study in some other faculty"—in, for instance, the classics, history, languages or pure science. But even good students have to be well taught. At present, very few clinical teachers hold whole-time appointments. Most of them are consultants and specialists who earn their living through private practice and can, therefore, spare only a few hours a week to their unpaid teaching work. The Committee recommends that every medical school should be an integral part of a university—as is already the case with one exception in England and three in Scotland—and that the staff of every medical school should include a whole-time professor in each of the departments of general medicine, general surgery, and obstetrics and gynaecology. There should be many more whole-time appointments, senior, intermediate and junior, and though specialists who are part-time teachers are recognised as having an essential contribution to make to the training of students, the Committee realises that clinical teaching is a specialty of its own and that the best doctors are frequently the worst teachers.

But though there will probably be general approval of the Committee's recommendation for improving the quality of doctors, the question of their supply, and particularly of their distribution, is dealt with less satisfactorily. The Committee "assumes that more doctors will be needed." At the beginning of this year, those in active practice, including those temporarily serving with the Forces, numbered 45,413, which is roughly equal to 1 per 1,000 of the population. (The number of general practitioners is roughly taken as 1 per 2,000 of the population.) The Committee takes "a cautious" view of the increases that will be needed to implement the new health service, and comes to the conclusion that if the existing medical schools enlarge their entries to admit a total entry of 2,500-2,600 students a year, the supply of doctors in civilian practice in Great Britain may be expected to have grown to 50,000 by 1953 and 55,000 by 1958. But, from the point of view of the public, it is the distribution of doctors as much as their total supply that is important, particularly the distribution of consultants and specialists. At present, the chief drawbacks of the medical schools are the concentration of schools and students in London and the absence of schools in certain areas such as East Anglia and the south-west. Yet the Committee recommends no big dispersal or amalgamation. It disapproves the LCC's plan to found another medical school, based on an LCC hospital, and it recommends that Charing Cross Hospital be moved into Middlesex and St. George's to a site in south London. The Committee also recommends that the West London Hospital school, founded solely for women students, should close, since it comes down firmly and rightly for co-education in the other schools. It is also recommended that every medical school should have access to 1,000 hospital beds, which will mean the association of other hospitals, including local authority hospitals, with the teaching hospital. From the point of view of medical education, these recommendations may go far enough. But if the Government were relying on this Committee to produce a scheme which would involve a dispersal of consultants and specialists it will be disappointed. There will be a better organisation of their services within the present framework, but hardly a better distribution of their services to the country as a whole. Thus, the organisation of a consultant service, one of the worst omissions of the White Paper, is still left in the air.

AMERICAN SURVEY

Presidential Priorities

(From Our Washington Correspondent)

THREE separate strands have to be woven into the strategy for the election in November. One will be woven by the generals and by the course of military events. The other two are largely a matter of choice for the President.

Parallels between the country's other war-time election, in 1864, and the present, are many and pertinent, but none is more likely to hold true than the influence that the course of military events will exercise on the contents of the ballot box. If the impression is general that the war, while not over, is being well fought, support for the Administration responsible for its direction can be predicted. In this very cynical war, it is hard to say how much the public will assess ideological victory along with military victory. Probably the country will be more interested in square miles recaptured, rate of casualties, signs of developing German and Japanese weakness, than in the name and spirit in which such gains are won. Yet the political record that was an integral part of military operations in North Africa and Italy, and the civil and military responsibility that was placed as a double burden upon General Eisenhower when he embarked for France, do confuse and disturb a proportion of the electorate; the results of these policies,

besides the purely military progress achieved, will have a certain effect on the enthusiasm of the Roosevelt vote.

Obviously, the President has little say in the military victory. Unconditional surrender, first of Germany, then of Japan, is a formula which permits of variations only in military strategy. But when it comes to the transition to peace, now occurring before fighting has reached its climax, and to the post-war problems which are preceding the end of the war, not only strategy, but priorities, remain to be established. And these priorities are election agenda of a prime order.

In determining those priorities and in picking the issues for his election campaign, the President has to have two distinct objectives in mind: to win in November, 1944; and to win in circumstances which will also permit him to win in Congress in 1945. Unless all the effort that he has spent in avoiding a repetition of the Wilson story is to be in vain, he must rate the second objective as equal to the first. Nevertheless, he must address himself to different audiences for each. For re-election, he most badly needs the help of the left-of-centre groups, of which the CIO Political Action Committee is typical. For successful relations with Congress, he must woo the Conservatives, led by the Southern

Democrats. The right of his party can be disregarded in the elections but is strong in Congress; the left has few representatives in Congress, but can command votes in the crucial states. To attain both his objectives, the President must carry both wings with him. If he cannot do that, he must make a choice.

The South is beginning to realise that its bargaining power at election times is low, because of its traditionally solid adherence to one party. This realisation is currently witnessed by the move to allow to the electoral college—that is, the body of 531 delegates from the States who do the final electing (the election on November 7th is, formally, to choose the electoral college, not to elect the President)—a discretion which that body has rarely exercised since the appearance of parties on the American political scene. During the New Deal honeymoon, the Democratic National Convention abandoned its former two-thirds rule for the nomination of candidates; now, with selection on the basis of a simple majority, the South's delegates no longer hold a veto power. But in the electoral college, if the 148 votes represented by the Southern states (it takes 266 to elect a president) were not committed to the party's choice, the election could either be decided in the college, without reference to the popular mandate, or be thrown into the House of Representatives, as the Constitution prescribes when the electoral college does not show a majority. The official Democratic organisations in Texas, Mississippi, and South Carolina are already toying with this possibility. Their candidate might be Senator Byrd, who also has some support in Louisiana and in his own state of Virginia.

Meanwhile, the pro-Roosevelt forces are considering the possibility of an appeal to the courts, in which they would hope to establish the force of precedent as binding the electoral college to the people's choice. They are aware that the South can outsmart itself by short-circuiting the popular majority; constitutional abolition of the electoral college, stimulated by such tactics, might be coupled with abolition of the poll tax as a condition of voting in federal elections. So far as November is concerned, the conservative Democratic efforts may not amount to much. As long as the South reliably adheres to a one-party system, it will have to strain hard to get political consideration at election time. But in Congress next year? That is another story.

The Left Wing

The CIO Political Action Committee is currently being given great credit, particularly by Conservatives, for its effect on the recent primaries—Liberal successes in Alabama, Florida, California, Oregon are credited to its organisation, and its registration record is thought to have contributed to the ill-health of Mr Dies in Texas. The homely precinct touch of its local committees is an asset that politicians understand.

Moreover, an issue congenial alike to left-of-centre groups and broader populations through the country was dumped on to the front pages and into political laps by the sit-down strike at the Brewster plant, which until recently produced planes for the Navy.

The Brewster incident was an impressive post-war preview. The plant has been a focus of difficulty from the beginning of war production. Conspicuous inefficiency of management, reflected in both costs and delivery schedules, led the Government to insist on changes last fall, when Henry Kaiser was brought in to straighten out the kinks. The company operates two plants, one in New York that makes parts, and one in Johnsville, Pennsylvania, that assembles the planes. At the end of May, the Navy terminated its contract with the company as from July 1. That constituted a month's notice as far as assemblies were concerned but practically no notice for the manufacture of parts further back up the production line. Dismissals at the New York plant were therefore made immediately. A "stay-in" strike was staged by the workers in protest; it was called off by the union (United Auto Workers, CIO) when Government investigation of possible new contracts or alternative placements was promised.

For practically all of the Brewster employees who had been dismissed getting new jobs meant dislocation, moving families, finding new ways to get to work, etc. Some of them are being hired for war-work elsewhere at their top skills and at the rates they got at Brewster. Others, who are returning to their pre-war jobs, are taking a cut from about \$1.06 an hour to about 67-70 cents, with a correspond-

ing effect on total earnings. A certain number are still looking.

The importance of the incident is that a case involving only a few thousand people has shown the country a sample of what will happen when setbacks of 30-40 per cent of entire war-production programme follow the defeat of Germany, perhaps within the year. It takes little political perspicacity to grasp the relevance of the resulting question: What is going to happen to me? From the left-of-centre standpoint, therefore, nothing would be more desirable than for the President to base his election appeal on a satisfactory answer to that question. But what will be the effect, after the election, if the answer embraces policy that the conservatives do not like?

The Republican groundswell about which much was said some months back may have considerably less than the tidal proportions given it by earlier estimates; the Political Action Committee may be able to widen, at the election, its success at some of the recent primaries. But even if both these assumptions were fulfilled, the present nearly-equal division of the House would need to be remembered, including the number of right-wing members who will be without significant opposition in November. In the Senate, a move toward the left is even less visible. What about votes on foreign affairs in 1945?

The present probability is that the President-candidate will give the campaign minimum attention; an overseas trip in the midst of it might have the character of a political gesture. It is also not impossible that Congressional voting on foreign affairs, as military victory comes in sight, will likewise be kept at a minimum with a fluid series of executive agreements taking the place of peace conference and peace treaty.

But some votes there will be, in November and later, and therefore also some Presidential choices on how best to win, both times. The old choice between Henry Wallace and Jesse Jones keeps on presenting itself.

American Notes

The Vice-President Reports

Mr. Wallace has a keen and imaginative eye for new frontiers. He has perceived one in Asia, an opportunity for American economic leadership to confer great benefits and reap both material and spiritual gains by raising the standards of living of the Pacific peoples. In his first report last week he subscribed to what might be called the new Pacific School and to a belief in what he called the "manifest destiny of the West of America and the East of Asia" and their potentialities for new trade, new investment and new accomplishments. He urged that vigorous trade with China and Asia would greatly increase the population and prosperity of the American north-west; and that in China there was an opening for almost unlimited American technical and material assistance, "given on a businesslike basis." While agreeing that China would and must be industrialised, Mr. Wallace, with a farmer's eye, insisted that this must be preceded and accompanied by agrarian reform—a "New Deal for the Chinese farmer." This reform would require technicians, information, agricultural implements, fertilisers and insecticides. Machines for transport, by sea, air and land, as well as machine tools, and materials, will be needed.

Mr. Wallace's speech was interesting, but nothing in it was sufficiently startling or out of character to affect his political future, being decided this week at Chicago. Normally, the nomination to the Vice-Presidency is not a great issue. It is characteristic of the extraordinary nature of this year's election that the main drama should centre about Mr. Wallace rather than about the unprecedented spectacle of any man running for a fourth term. In part this may be due to the belief that this time Mr. Roosevelt's Vice-President stands a good chance of succeeding to higher things, should Mr. Roosevelt be translated to some more cosmic post or should his health prove unequal to the full four-year strain. In part it is also due to the fact that through force of personality and circumstance the Presidential nomination is outside controversy, and the only expression of the stresses in the Democratic Party is to be found in the vice-presidential selection. The choice this week may cast an interesting light on the relative weight pulled by the party's Conservatives and New Dealers. Mr. Roose-

velt has expressed his personal preference for Mr. Wallace, but not with the emphasis of a command, and the nomination may go to one of the other contenders, of whom Senator Truman of Missouri seems to be emerging as the main challenger. But such speculation pales into insignificance compared with the fashion in which the country, which found a third term hard to swallow, has become so inured to the idea of a fourth term that it has to turn to the vice-presidency to find a real issue.

OPA and Cotton Prices

The compromise on the Bankhead amendment to the Price Control Renewal Act will increase prices at cotton mills by about \$150 millions a year, according to an estimate by the Price Administrator. The extent of individual increases still is being worked out, but according to the provisions of the Act they will be effective from June 30. The Act provided that each major textile item should be considered separately, to determine whether its ceiling price reflected parity prices to the cotton grower. This provision was contested by industry representatives in meetings with OPA representatives. They proposed instead that there should be an all-round temporary increase, equal to the rise in the cotton parity price since May 31, 1942, plus all increases in labour costs. According to Mr. Bowles, the Price Administrator, this would have meant a general increase in mill prices of more than 10 per cent, equal to more than \$200 million a year. He insisted that such an interpretation of the Act would shock both Congress and the country, and that Congress could justifiably resent being saddled with the responsibility for the resulting increase in prices to the consumer. Instead, OPA has determined to authorise increases on only the following items: combed and carded cotton yarns, sheets and pillow-cases, denims, chambrays, combed yarn fabrics, and grey print cloths, the categories in which it might reasonably be charged that the price ceilings were too restrictive. Mr. Bowles has not retreated from OPA's often repeated assertion that, in general, textile ceilings permit the payment of parity prices to the grower as well as fair margins to the manufacturer; and he has nimbly assumed the support of Congress in beating off the second frontal assault by the industry. The modified victory won by the cotton manufacturers and growers is not the major difficulty presented by the renewal of the Act. In signing the Bill, President Roosevelt remarked that if the relaxation of penalties for non-wilful violation of rationing regulations (and who violates an act wilfully?) proved an insuperable obstacle to efficient enforcement, he would return the Bill to Congress for reform. That the amendments weaken enforcement there is no doubt; how seriously will be shown by the experience of the next few months. It is doubtful, however, no matter how injudicious the relaxation of penalties is proven to be, that Congress will be willing to tighten controls at a time when the war will, presumably, be close to a successful conclusion, and the campaign against restrictions more vigorous than ever.

Economic Charter

Plans for an Economic Charter, to create a world of expanding trade and equal trading opportunities, have been submitted by a group of economists to the recently established Committee on International Economic Policy, headed by Mr. Winthrop Aldrich, of the Chase National Bank. The theme of the report is the great contribution which can be made by freer international trade to stable employment and high living standards, and the unique opportunity offered by a moment when the "established patterns of costs and prices have been dissolved by the pressures of war." It is proposed that the United Nations should establish an International Economic Organisation to supervise the carrying out of the principles of the Charter. These principles follow fairly closely the acknowledged characteristics of official American economic policy, and include the barring of discrimination against alien traders and the "most favoured nation" policy; the modification of regional arrangements such as Imperial Preference in return for the reduction of the American tariff; the prohibition of exchange control used as a trade barrier; elimination of export subsidies to commodities in world surplus, and abolition of excessive export prohibitions and taxes, and of import restrictions and

quotas. There is evidence of a growing interest in post-war trade outlets for American goods, and the distinguished businessmen who constitute the membership of the Committee on International Economic Policy no doubt share the belief that foreign trade may help to solve the employment problem of the fifties, as well as hoping that advantage may be taken of the opportunities to lower trade barriers. They are more certain of a sympathetic reception in the United States for the first proposition. The need of searching every avenue for solutions to the problems of employment is widely appreciated. But it is more doubtful that they will make a lasting impression on the resurgent economic nationalism of the United States. Understanding of the political requirements of stability has gone much further than appreciation of the economic underpinnings. The question might also be raised whether too much emphasis on the American stake in foreign trade does not tend to put the cart before the horse. Foreign trade may well constitute the "crucial 10 per cent" of American business. But if after the war the American national income can be maintained,—not, indeed, at the war levels, but at a level high enough to keep unemployment at a minimum—foreign trade will be correspondingly stimulated. If the domestic problem cannot be solved, no amount of agreement to reduce trade barriers or clutching at export markets will suffice.

Detroit Dream

The dispute between the War Production Board and the Services over the advisability of allowing men's minds to turn, to a limited extent, to the problems of peace-time production has been postponed rather than decided. Part of Mr. Nelson's programme is to go into effect at once; the rest is to be delayed for a month in deference to the Services. It appears that one phase of the programme has aroused dissension within the WPB itself. This is the provision that regional directors of the Board be allowed to release manufacturers from war restrictions on an individual basis. The opposition comes from the automobile industry. Representatives of the industry have refused the Board's offer to let them plan for the resumption of civilian production, on the grounds, apparently, that they want a guarantee that they will all start together. The Board has issued what is called a "dream sheet" to guide industry back from war-work into the manufacture of everything from cars to bobby pins. The prospect for the automobile industry is for immediate production of 2 million cars a year as soon as hostilities with Germany are over. Prices, it is thought, will be about 25 per cent higher than those before the war. One Detroit headache is the intentions of Henry Ford. Mr. Ford has prophesied that his company will be producing cars within a month of victory; and he sees no reason why prices should be higher than they were before the war. It is not clear how seriously this threat is taken. Detroit is full of rumours of the imminent disintegration of the Ford company. Resignations among high Ford executives are not new, but they have been plentiful recently. Willow Run was hardly proof of the supremacy of Ford organisation. Henry Ford himself is 81, and his grandsons are too young to take over control of the business. But the fact remains that Ford has always been a maverick, unwilling to make agreements with other companies; and he has the resources and the plant to make the Detroit dream a rather uncomfortable nightmare. The determination of the rest of the automobile industry to hang together may hinge as much on what Ford may do as on their fear of outsiders breaking into the business. There is also a certain alarm—not felt in Detroit alone—that public expectation may have to be taken down a peg or two. The advertising profession has gone so far in prophecies that the "age of alchemy" is just around the peace that some wholesome debunking is needed.

THE WORLD OVERSEAS

Algiers at Work

GENERAL DE GAULLE has returned from Washington to Algiers with the assurance that the sovereignty of France and the integrity of its Empire will now be scrupulously respected by the Allied forces in France, and that the Americans, as well as the British, have recognised the Provisional Government of Algiers as the sole *de facto* authority over all liberated French territories. This puts an end to the anxieties and suspicions that were rife among Frenchmen until recently. The fear of a new version of Darlanism has been effectively allayed. General de Gaulle's personal prestige has grown; to many Frenchmen he now appears not only as the champion of France in its struggle against Germany, but also as the man who reasserted the rôle of France among the Allies. On the other hand, the clarification of the Allied attitude towards France and its provisional Government has undoubtedly served to increase the confidence of the French people in their allies; and it has done something to prevent the French from drifting into a mood of morbid national ego-centricity. The new position ought also to stimulate serious political discussion among Frenchmen who have until quite recently avoided raising controversial issues of domestic policy in the fear that internal controversy might be used abroad as a reason for not recognising the Provisional Government.

The Provisional Government has in the meantime speeded up the building of a new French administration. It has invalidated all laws and decrees of a political character passed by the Vichy Government since the conclusion of the Armistice—such as the constitutional laws, the laws on racial discrimination, and the decrees designed to promote collaboration with the invader.

A new decree issued on July 8th defines the status of the regional Commissioners, appointed by the Provisional Government to administer the liberated areas. The Commissioners form, according to that decree, the "provisional administrative body" in those zones in which civilian administration is devolved upon them by the Allied Supreme Command. They will be responsible for military security behind the Allied lines, for the re-establishment of Republican law and for the economic needs of the civilian population. They are to be directly responsible to the Provisional Government. Only when they are unable to communicate with the Provisional Government, and only for so long as the interruption of communications lasts, are they endowed with wide emergency powers. The regional Commissariats replace the Prefectures appointed by Vichy.

The Commissioners are also entrusted with the task of ordering and supervising the elections of new French legislative bodies in accordance with the ordinance of April 21st last. This ordinance, it will be remembered, provided for elections in three stages. Immediately after the liberation of any department there were to be municipal elections followed by the formation of a General Council in each department. In the second stage the General Council were to choose delegates to the Consultative Assembly; and only in the last stage, not earlier than a year after the complete liberation of Metropolitan France, were General Elections to the Constituent Assembly to take place.

In the light of experience in areas liberated so far it seems that this scheme will have to undergo some modifications. For various reasons, municipal elections have had to be postponed in all freed territories. In Corsica the delay has been due to the fact that the island has been a military zone. In Algeria some groups of Moslems are being enfranchised; and until this is finished there can be no complete voters' register. Similarly in France, the municipal elections and the formation of the General Councils will be delayed not only by military considerations, but also by the need to draw up a new electoral register in connection with the recent enfranchisement of women.

For some time, therefore, the Consultative Assembly will remain what it is now, a relatively small body with little effective control over the activities of the Provisional Government. How that Government will use its extremely

strong position is a question to which no reassuring answer can be given on the basis of recent experience. The authoritarian tendency in the Provisional Government has now found a fresh expression in the new press law which has created a legal framework for bringing the whole French press under the strict control of the Government. Ostensibly, the press law is directed against the Vichy press only; it provides for the closing down of all newspapers published under Vichy, and for the requisition of their printing shops and facilities for distribution. A "syndicate of the clandestine press" will transform the clandestine papers into large and openly published dailies and periodicals. The authors of the press law are not satisfied with this. In future the publication of newspapers will require special licences to be granted by regional Commissariats of Press and Information. The Commissariat of Information will have the right to suspend every publication, and to deny journalists the right to work in their profession. All broadcast and information services, as well as film productions, have also been subjected to the Government's control.

In so far as the new press law aims at the closing down of the collaborationist press, it is difficult to criticise it. But the closing down of the collaborationist press ought to be a single measure which the Provisional Government would carry out under special powers over a strictly limited period of time. The new law, however, makes the Government permanent master over the life and death of the French press. In the history of French press laws it can only be compared with the despotic Bonapartist press law of 1852, of which it is almost a replica. The new press law has been supported by some Algiers papers as an indispensable remedy for the corruption of the French press under the Third Republic and for its dependence on sectional interests. No doubt the press of the Third Republic suffered largely from these evils; but it is difficult to avoid the impression that the remedy now devised is more likely to kill than to cure. For the old dependence of the press on financial interests, which was not, in any case, very complete, there is now substituted total dependence on the single control of the State.

The press law is only one example of the difficulties created by the undoubted necessity of some sort of purge in France. The Augean stables of Vichy must obviously be cleaned. But it would be disastrous if in the process the Gaullist administration were to acquire "iron brooms" with which to sweep away any independent groupings or tendencies. Decrees covering the purge continue to multiply. A new and interesting addition to them has been the "law of national unworthiness"—*indignité nationale*. Unlike the other decrees covering the punishment of traitors, this decree is apparently directed not against outright traitors and collaborators, but against a rather undefined category of Frenchmen who have been lacking in "national dignity." Citizens in this category will be deprived of their civil rights for not less than five years. If rightly and justly applied, this law might help to eliminate the "guilty men's" influence from French political life. But if used in a partisan spirit the same law could be employed to disfranchise the "intractable" men belonging to any opposition.

This fixation on the purge tends at times to tragi-comedy. This week the Consultative Assembly at Algiers excluded one of its members, M. Serda, former deputy for Bone, on the ground of his association with Pucheu. At the same time, the boomerang of the purge turned against a member of the Government itself. M. Frenay, the Commissar for Prisoners of War and Deportees, has also been attacked in the Consultative Assembly as a friend of Pucheu. It can be seen from these two incidents that the aftermath of the Pucheu trial can still be felt at Algiers. The busy production of quasi-authoritarian decrees, and the regular witch-hunting in Cabinet and Assembly, provide a strange and melancholy contrast to the great drama of liberation in France itself, in which the French people are playing so active and heroic a part.

Canadian Mutual Aid

[FROM OUR OTTAWA CORRESPONDENT]

THE first report of the Mutual Aid Board contained an effort to present items in terms of material rather than of dollar values, so as to reflect the scale of assistance furnished by Canada in non-financial terms. The same device, of course, would place the commercial trading relations among nations in a different light than the usual one of a settlement of cash values.

The cost, nevertheless, is met in dollars and cents, though they are furnished by the Canadian Treasury. In the ten-month period to March 31, 1944, covered by the report, the Mutual Aid Board expended \$912,603,000. The new appropriation for 1944-45 was \$800 million, of which \$67 million was earmarked for UNRRA. This vote unexpectedly faced less opposition than did the corresponding billion dollar appropriation the year before. It was carried by 122 votes to 8, the nays all being French-Canadian nationalists. Their arguments are mainly that Canada is over-exerting itself in the war, a plea which becomes understandable when one examines the disruptive effect of the war upon the old social fabric of French Canada.

Mutual aid represents an important sector of the Canadian war effort; and Government supporters pointed out to the dissenters that substantially less war employment would exist without mutual aid. Out of a war expenditure of some \$15 million, mutual aid and its earlier counterparts accounted for the following items:

Aid to Britain, 1942	1,000,000,000
Repatriation of British-held debt	700,000,000
Interest-free loan to United Kingdom	700,000,000
Purchase of U.K. assets in Canadian plants	200,000,000
Private repatriation of debt	100,000,000
Mutual aid, 1943	1,000,000,000
Mutual aid, 1944	800,000,000
Total	\$4,500,000,000

Somewhat less than one-third of the Canadian budget costs for war, therefore, represents assistance to Allied countries at Canadian expense. The chief recipient has been the United Kingdom.

War Exports

The mutual air report makes it abundantly clear that British ability to buy in the Canadian market has been by no means exhausted. Britain has bought and paid for more war supplies in the past year than Canada has furnished free of charge. Over the same period, mutual aid to Britain was \$723,753,000 and British purchases in Canada were \$1,149 million. The report made by Mr Howe, as chairman of the Mutual Aid Board, gave both the actual goods furnished and the cost of them to Canada. The list included 42 Lancaster bombers; 102 Mosquito bombers; more than 600 other planes, mostly trainers; 551,900,000 rounds of ammunition; 2,014 universal carriers; 92,648,000 lb. of chemicals; 17,536,000 lb. of explosives; 39,149 Bren guns; 78,585 transport vehicles; 16,183 wireless sets; 534 landing craft; 90 vessels of 10,000 tons each, and so on. The list includes military clothing and food supplies.

To other countries, mutual aid included \$23,282,000 to Russia, \$20,959,000 to Australia and \$4,101,587 to China. Other destinations were \$874,000 to the West Indies, representing flour only, and \$482,000 to India, representing wheat only. The flow of war goods on a mutual aid basis to Russia, Australia and China is increasing, and these countries are now receiving a larger share than they did last year. Substantial mutual aid orders are being filled for the French Committee of National Liberation, which will be shown in the accounts for the current year.

Mr Howe's report provided the first outline of the extensive consultation that takes place before it is decided where Canadian mutual aid shipments shall go. Consultations with British and American officials at the strategic and economic planning levels permit close correlation with war supply originating in the United Kingdom and the United States. To allow for co-ordination with needs of Canadian armed forces, the Canadian chiefs of staff consider, and decide upon, requests for mutual aid.

Britain's Dollar Resources

An accounting of the British Government's resources of Canadian dollars, by which purchases of \$1,149 million

were financed in the year to March 31, 1944, was contained in the mutual aid report. The chief source, by far, was payments made by Canadian forces in the United Kingdom. A tabulation of funds showed:

	\$
From British exports to Canada	101,000,000
From receipts for freight services	38,000,000
From interest and dividends	59,000,000
From other current receipts	38,000,000
From capital receipts, less capital payments not shown elsewhere	27,000,000
From payments by Canadian forces overseas	534,000,000
From adjustments of intergovernmental transactions, sales of non-sterling exchange and changes in official balances (net)	40,000,000
From the sale of U.K. equity in Canadian war plants to the Canadian Government	165,000,000
From cash withdrawals from working capital funds formerly advanced to Department of Munitions and Supply and contractors	190,000,000
Deduct: Net balance of Canadian dollars required by sterling area other than the United Kingdom and furnished from United Kingdom dollar pool	-61,000,000
Total	\$1,131,000,000
Add: Apparent errors and omissions	18,000,000

Total

The figure of \$61 million did not include amounts paid by other parts of the sterling area to the United Kingdom for military supplies purchased in Canada. In addition, the United Kingdom drew upon a working capital fund used to finance war production in Canada and this item is estimated to be about \$90 million.

The mutual aid report showed that Canada had not received any items under the reciprocal clauses contained in its agreement with other countries. That this would be a substantial item, if strictly taken into account, is suggested in the fact that payments made by Canadian forces overseas amounted to \$534 million.

WHEN will you get Black Magic again?

[WE GIVE YOU ONE GUESS]

All the nice things that used to be in Black Magic Chocolates — are they dead?

No.

They exist.

But they might as well be dead, for all the use they are.

The Mauritius sugar that gave the tang to the Black Magic caramel — it's in Mauritius.

The Valencia almonds that went into the Black Magic truffle-and-nougat and montelimar — they're in Valencia.

Brazil is no longer where the nuts come from. It's where the nuts stay.

Venezuela no longer sends us its peculiar fruity cocoa beans. It sends us petrol.

We didn't use petrol in Black Magic.

All the nice things are in all the nice places—except Britain.

They'll come again. When they do, so will Black Magic.

You can call that a threat or a promise, as you please.

ROWNTREES

Germany at War

Falling Efficiency

LABOUR efficiency, "just" wages and "just" profits are subjects of perennial discussion in Nazi Germany. The abolition of free markets before the war, rationing and the almost complete freezing of money wages and money profits have produced problems which have not been solved. Productivity—output per worker and per machine—has become a grave problem. The spur of competition to individual efficiency has been replaced by "efficiency comparisons" between different factories.

Wages are paid according to individual or group efficiency on the basis of wage schedules drawn up by time-study engineers. The German Labour Front is responsible for most of this work. Between 1933 to 1943 the Front trained 50,000 of these time-study engineers. But the result has not been an increase in productivity or individual efficiency. There has been a gradual loss in efficiency only partly compensated by longer working hours, the employment, where possible, of more workers and the utmost simplification of production processes and working methods.

The loss of efficiency has been a steady and cumulative process. Recently the German press published the results of a long-period inquiry into working hours (at one factory). The results are shown in the following table:

	Working Hours 48-Hour Week (Peacetime)	60-Hour Week (Wartime)
Effective hours lost	16	30
Cause of lost time:—		
(a) Illness, holiday, etc.	4	11
(b) Bad use of time	3	5½
(c) Idling, etc.	5	8
(d) Shoddy work	3	5

Generalisations cannot be made from these figures. It is not even possible to say whether these can be taken as average. The object in this particular factory was apparently to achieve an increase in output of 25 per cent by a simple extension of working hours by 25 per cent. The table shows that the actual increase was only 5 per cent.

Wartime Shortcomings

The idea that a war-economy increases productivity is, in general, an uncritical one. It is usually overlooked that the extreme standardisation and rationalisation which make it possible to dispense with the high percentages of very skilled workers do not result in an actually higher output per manhour—though they do, of course, result in considerable increases in output per unskilled manhour. Rationalisation and standardisation are devices which enable industry to employ unskilled labour.

There is in all countries at war a considerable increase in faulty material and rejects. The cause may be bad raw material, unskilful use of machinery, inexperience, carelessness in checking or the wrong assembly of parts. And the absence of competition tends to prevent this increase in faulty material from reducing profits; the incentive to good work and good organisation is reduced.

In Germany there are a number of additional causes for the very considerable fall in efficiency. Foreign workers are employed in great numbers. So, too, are very many unskilled women under the Compulsory Work Order. Longer working hours and the general strain of wartime conditions are reflected in the fact that this particular German factory reveals an increase in the incidence of sickness from 3.67 per cent in 1938 to 6.37 per cent in 1942. Innumerable attempts have been made in Germany to stem the steady decline in efficiency. The purely technical method of measuring the output at each stage of a particular working process by comparative time studies has been familiar for decades. The only addition made by the Nazi engineers is that the standard times so carefully worked have been made the basis for official wage schedules.

Crude psychological methods are employed to stimulate production. To counter absenteeism, blackboards are set up

on which every absentee is named. "Efficiency competitions," medals, decorations and special facilities for holidays are employed to replace the normal incentive of better wages. Foreign workers are given the opportunity of attending special classes, after which they may become foremen or skilled workers. For young workers efficiency competitions are held on a large scale all over Germany, rather in the manner of sports competitions. The prizewinners are offered places at technical colleges or schools for foremen.

These methods are not very effective. Other devices are provided by the Institutes for Labour Physiology. These Institutes have been busy for at least two decades studying the relations between working hours, fatigue and individual output. The fact that individual efficiency varies in degree during the day and during the week has been rediscovered by Nazis. The most recent "discovery" is that longer working hours produce greater fatigue if there are only one or two long breaks. Consequently the normal ten-hour day has now been broken up by a greater number of short breaks. It is asserted that after the introduction of more and shorter breaks output increases considerably.

Hot meals provided by works canteens are also said to have had a good effect. Not much headway has been made, however, with the improvements that have long been recognised everywhere as making for greater efficiency—better lighting, properly designed benches with seating accommodation, and so on. This suggests that neither the material nor the labour is available to carry them out. Safety first measures were already fairly well developed in pre-Hitler Germany.

Automata

The most interesting item, perhaps, is the concentration of the Nazis on semi-automatic and automatic machines. The gulf between the small number of highly skilled engineers and the great mass of unskilled and semi-skilled labour has grown tremendously during the war. The automatic machine which superficially reduces the machinist to a feeder-arm is matched by an attempt to make the skilled worker, too, into a "one-track" or "one-purpose" worker, particularly in the metal-working industries. This has already gone so far that young workers are being trained in a very short time for one single measuring operation or for minding one particular part of a machine tool. It has been observed that the introduction of a new and technical simplification or a new psychological or physiological approach usually increases output at first. But the success is always short-lived, and, in fact, most of the Nazis' difficulties have been overcome—where it has been possible to overcome them—by the simple expedient of increasing the number of workers.

There is now no possibility of increasing the number of workers further. This explains the frantic efforts of the Nazis to get at the causes of falling efficiency. An overriding condition, in present circumstances, is that there should be uniform standards all over Germany. The "air-war economy," with its extreme dispersal of factories, requires that machines and their parts should be wholly interchangeable. From blast furnaces to spades, standard models have been developed instead of the wide variety of designs in use before the war.

All this makes for mobility of labour. In the most important industries workers can be switched readily from one part of Germany to another. This is another reason for the official schedules which set out uniform working times for all working processes and make them valid for all parts of Germany. The wages paid for these working processes are then only variable by special regional allowances in accordance with traditional differences in standards and conditions of living.

The trend is clearly towards uniform mechanical efficiency, with workers tied to the machines by uniformly applied psychological and physiological principles. All technical initiative is confined to a small number of scientists and engineers who display more and more a purely technocratic outlook. And all the time both productivity and total output go down and down.

THE BUSINESS WORLD

Bank Assets and Profits

THE aggregate balance sheet figures of the London clearing banks for June 30 do not disturb the well established trends in the growth and distribution of bank assets since the outbreak of the war. These are brought out in the following table, which gives the June 30 figures for each year since 1939 and expresses each of the main assets item as a percentage of the relative total of deposits.

	(In £ million)											
June 30	1939	1940	1941	1942	1943	1944						
	£	%	£	%	£	%	£	%	£	%	£	%
Cash	235	10.8	270	10.9	311	10.5	354	10.8	387	10.7	427	10.4
Short Loans	150	6.9	166	6.7	143	4.9	147	4.5	165	4.5	184	4.5
Bills	249	11.5	384	15.6	193	6.6	292	8.9	236	6.5	202	4.9
T.D.R.'s	...	...	...	...	482	16.3	543	16.6	859	23.6	1,246	30.4
Investments	600	27.7	636	25.8	880	29.9	1,058	32.4	1,159	31.9	1,169	28.5
Advances	988	45.5	962	39.0	859	29.2	800	24.5	744	20.5	770	18.8
Deposits ...	2,167	...	2,469	...	2,946	...	3,263	...	3,630	...	4,100	...

* Of Deposits.

* Of Deposits.

Within the framework set by a continuous expansion of bank credit, the tendency has been towards an ever increasing dominance of Government paper in the balance sheets. By June, 1941, investments had ousted advances from their pre-eminence among the assets. By June of last year advances had been pushed back to third place by that new form of short-term bank investment, the Treasury Deposit Receipt. By June, 1944, the upstart had taken first place. Since short loans are now almost wholly secured by Treasury bills and since the banks' bill portfolio is just as exclusively made up of Treasury bills, the proportion of deposits covered on the other side of the balance sheet by Government paper had by June 30 last risen to 68.3 per cent. To this might be added the 10.4 per cent ratio of cash which, in effect, is an interest-free loan to the Government. It will thus be seen that what is left of the genuine commercial business of the banks is extremely small beer. The ratio of advances to deposits, which was 45.5 per cent in the last balance sheets to be published before the outbreak of the war, had by June 30 last fallen to 18.8 per cent—probably the lowest figure in the history of joint-stock banking.

Of the movements for the twelve months to June 30 last perhaps the most interesting is the fall, both absolutely and relatively to deposits, in the holding of bills. It is not the banks' fault that their bill portfolios should have fallen so drastically, since it is the Treasury, through the Bank of England, which fixes the weekly amount of TDRs that the banks must take and which thus determines the amount of bills for which there is room in their portfolios. The progressive decline in bills discounted is now in process of being remedied with the increase of the weekly tender offering of bills to £110 million, but it is evident that the TDR has established its pre-eminence as the most important means of Government borrowing from the banks and it is difficult to see how this new bank asset can be dispensed with in the immediate post-war years.

The virtual stability of investments over the past year is gratifying. The ratio of this item to deposits has actually fallen and the absolute increase of no more than £10 million is the smallest for any comparable period since the beginning of the war and shows how little the large subscriptions to Government loans during the past year have owed to direct applications by the banks. The other interesting movement shown by the bank figures for the past year is the first check in the absolute decline of bank advances since the beginning of the war. Loans for the "small man" may have played some part in the modest recovery in this item. A more important factor is probably the positive encouragement to borrowing from the banks for effecting tax payments which is provided by the Excess Profits Tax law. The main recovery in the banks' advances occurred in the early months of 1944, i.e., at the season when tax loans would normally be at their peak and though some of the ground

then gained has been held, it is still too early to claim that a new trend in the demand for bank loans has begun to manifest itself and that this item is now set for a long-term recovery.

Since the growth in banking credit has been comparatively even over the past five years, these mid-year figures provide a reasonably accurate basis for comparing the gross earnings of the past four years and the prospective earnings for 1944. Estimates of the yields on the main categories of assets are made in the following table and the gross earnings for 1939 and 1944 are calculated on that basis.

	1939	%	1944	%
Call Money ..	150	at 1½	184	at 1
Bills	249	at 1½	202	at 1
Investments ..	600	at 3½	1,246	at 1½
Advances	988	at 4	770	at 3½
Gross Earnings	67.1		84.1	

It will be seen that the loss of income on advances—due not merely to the fall in advances, but to the lower rate for the business still transacted—is rather more than offset by the increased income from investments. Looking at the picture of gross earnings in its broadest outlines, it appears as though the main difference between the years 1939 and 1944 were provided by the new item of Treasury Deposit Receipts, on which the banks this year should earn a gross figure of about £14 million.

These figures of gross yield of assets are, however, a most misleading measure of the changes in the banks' earnings. The increase in deposits has meant a heavier outlay on interest paid to depositors—though this item is probably small owing to the banks' limitation of their special deposit rates to a maximum of 1 per cent. Moreover, the bulk of the increase in deposits has taken the form of current accounts and not of fixed deposits. More important has been the loss to the banks of earnings from foreign exchange business, new issues, foreign acceptance and other sources of income which were considerably reduced and in some cases completely dammed up on the outbreak of war.

General charges have, moreover, increased considerably. The salary bill has risen owing to cost-of-living bonuses and to the general practice of the banks of making up the pay of their employees serving in the forces. Additional staff has had to be recruited. ARP work has involved considerable expenditure. Not only was constructional work put in hand, but such precautionary measures as the duplication of records and the reorganisation and decentralisation of Head Office control meant heavy outlays. If generous allowances are made for these items, it would seem that the clearing banks' net profits were now running at a figure about £5 million in excess of that for 1939.

*

In the light of these estimates it may once more be asked why in these circumstances the banks are still not paying EPT. There are many answers to this question. The first is that the banks were, on the whole, able to claim good standards owing to the special profits on realisation of investments which fell during the EPT standard period. Another reason is that the clearing banks have been allowed to write off the whole of their German standstill commitments as a set-off against taxable profits. For the clearing banks alone these commitments amounted to £11 million on the outbreak of the war and even by spreading the set-off over a number of years, the annual impact of this factor on the figure of taxable profits has been considerable, but must by now have largely disappeared. Another factor explaining the absence of

EPT payments by the banks must be sought in the sudden fall in taxable profits during the early war years. In the years 1939 to 1941, inclusive, the banks had hardly begun to feel the effect of increasing credit. On the other hand, certain items making for lower net earnings made their impact felt immediately. Among them were the loss of foreign exchange and new issue earnings, the higher staff costs and ARP expenditure. It is more than probable therefore, that

in those years the profits fell appreciably below the EPT standards and that in this period the banks accumulated a deficit which they have since been working off. Since the beginning of 1942 the taxable profits have probably ruled higher than the standard and in due course—perhaps this year for certain banks, and perhaps in 1945 for others—the deficiency will have been used up and the banks will start paying EPT.

Wartime Control of Industry

An article on page 103 of this issue discusses some of the issues raised in the Fabian Society's pamphlet "Government and Industry; A Framework for the Future" (Fabian Society; 6d. net.) The section of the pamphlet entitled "Wartime Machinery" gives a succinct and accurate account of the machinery of control that has been built up during the war, and is, by permission, reprinted here.

BEFORE attempting to design the layout of a peacetime organisation, it is worth examining the actual details of what has come to prevail during the war, particularly as certain peacetime functions of Government—e.g. housing, will be not dissimilar in principle from munition production. Many of the facts of wartime production have to be kept secret for security reasons; but the general lines of the organisation are available for public knowledge. Probably what bulks largest in the public eye—though not in the eye of the business world—is the system of "controls":—the Iron and Steel Control, Non-Ferrous Control, Timber Control, etc. These have been the subject of intermittent public controversy since the beginning of the war. Yet they are in fact only one section, and probably not the most important, of the Government's wartime machine for supervising industry.

This machine can really be divided into two main sections:

- (a) The buying departments, and
- (b) the supervising departments.

The most important function is probably that of the buying departments, though to some extent the two have naturally been intermixed, and the same Ministries (notably the Ministry of Supply) have undertaken both. Besides controlling the direct contractors, the buying departments also administered the inner ring of Government factories. The Ministry of Supply, as is well known, following the example of the last war, evolved a very large group of Royal Ordnance Factories, based on the peacetime Woolwich Arsenal. These were Government factories in the full sense and every worker in them (the number of whom was very great) was a direct employee of the State. There is no doubt that the great success of these production units rested on the fact, not merely that their location and working conditions were better and more intelligently planned than most private business factories, but that the labour force felt themselves to be working directly for the State, without any profit-making "entrepreneur" intervening—just as if they were in the Forces.

★

Intermediate between these ROFs and the ordinary private firm stood the "agency" factories. In these the Government were the owners of the factories, but an important firm managed them and employed the labour force for a fixed management fee. They were thus also non-profit-making, but the workers were employees of a business firm—e.g., ICI, Bristol Aircraft Company or whatever the case might be. Undoubtedly despite the absence of the normal profit-making set-up, the psychological atmosphere was very different in these agency factories (which were regarded by the workers as ICI or Bristol Aircraft Company rather than Ministry of Supply or MAP) than in the ROFs. The Ministry of Supply built a large number of agency factories, outside the inner ring of ROFs, and the MAP depended on them almost entirely and set up virtually no direct Government factories. Though the agency system had obvious practical advantages from both the Civil Service and business point of view, being in fact the line of least resistance, the predominance of it in the aircraft industry—as against the predominance of

real Government factories in the last war—probably had far-reaching effects on the war effort.

It is worth considering the function of the Buying and Supervising Departments in separate detail:

Buying Departments

The kernel of these has been the straight production departments of the Ministry of Supply, MAP and Admiralty, which have had the job of buying, and securing the production of, all the munitions and equipment required for fighting the war by the Services—from aircraft and tanks to boots and shoes and petrol cans. Whereas in old-fashioned peacetime deflationary conditions this could largely be done by mere Contracts Departments, because in conditions of general unemployment there was only a buying problem and not a production problem, in wartime conditions of full employment and later hyper-employment, the production part of the job became much the most important. The kernel of the Supply Departments therefore became a series of production directorates, each concerned with a given article of equipment. In the Ministry of Supply, for instance, there would be such a directorate for weapons, another for tanks and vehicles, another for ammunition, another for general stores, and so forth. In the MAP there would be one for aero-engines, another for aircraft equipment, and so forth. In the Admiralty, there would be similar branches covering, of course, merchant ships as well as war ships.

From these directorates, which provided the central drive of the war production effort, a variety of subsidiary organisations covering the necessary services sprang up as the intensity of the war effort and the resulting labour scarcity or hyper-employment deepened. The Supply Departments required branches of this kind to ensure that, for instance, premises, labour and capacity in general, should be available, and that clashes between the production directorates which sprang from these needs should be reduced to the minimum. The business firm producing for one of these directorates, therefore, found itself dependent on the Government not merely for orders, but for labour, premises, plant, finance and materials. Since the provision of these depended on the authorisation of the central production directorate, the firm found itself in fact subordinated to the will of this directorate to a more or less absolute degree, whatever the legal position might be. Without political agitation it was hardly possible to escape from its grip. One could say that virtually the whole of the enormously expanded engineering and many attendant industries were themselves under Government control more complete than had ever been contemplated by the most drastic "planners" of peacetime. Indeed, it was sometimes asked just what function a managing director performed when the Government supplied him with orders, finance, labour, machinery, premises and materials. The answer was, of course, that he supplied (or did not, as the case might be), the essential function of management, i.e., of combining all these together in an economical fashion.

Supervising Departments

The essential function of what might be called the supervising departments was to ensure supplies of articles not bought directly by the Government, but required for the life of the community, either by the public as a whole or by firms in Government factories working directly for the Government.

It was to meet this need that the "controls," so familiar in public discussion, grew up. These controls covered three main areas of industry:

- (1) materials required for munitions,
- (2) food for the community,
- (3) other necessities such as clothing.

The great bulk of the control over supplies of materials for munitions, etc., was administered by the controls of the Ministry of Supply, leaving a few to MAP in the case of specific aircraft materials. As is well known, the general type of Ministry of Supply control was a converted trade association supervised—in a greater or lesser degree—by the Raw Material Department of the Ministry. The Ministry of Supply controls and Raw Material Department thus became responsible for the whole of the iron and steel, chemicals, non-ferrous, timber, cotton, wool, jute and a host of subsidiary industries. The machine tool control of the Ministry of Supply also became responsible for ensuring supplies of machine tools for all war purposes, and therefore for supervising the machine tool industry. MAP confined its "control" activities to certain special materials. The Ministry of Food naturally performed the same function in the case of the food industries, and the Board of Trade in the case of other civilian necessities such as clothing, boots and shoes, and retail trade. The Ministry of Works (which also acted to a considerable extent as an agency for building to the orders of the other departments) administered controls for certain building materials.

★

The essential function of the supervising, as opposed to the buying departments, was to settle the volume of production, to allocate it between firms, to allocate materials, supplies and orders at various stages, and to fix prices. The supervising departments usually did not actually buy products at any stage, though in certain cases—e.g., food or non-ferrous metals—it might be a buyer or an importer on a very large scale for subsequent resale to the public or other departments. In practice, therefore, the success of the control organisations necessarily came to be judged by the extent to which they delivered the goods at reasonable prices. Inevitably, from the crisis of 1940 onwards, this became the main criterion of success; and we must probably allow that, despite the theoretical defects in the forms of organisation and the prevalence of trade association personnel, the controls, judged by this test, largely achieved their purpose. This is not to say that their success might not have been more complete if the organisation had been somewhat nearer the ideal. For instance, those which were run by business men from other industries turned Civil Servants, were probably the most successful.

Business Notes

Disposal of Surplus Stocks

The Government's plan for the disposal of surplus stocks (Cmd. 6539) is necessarily tentative and provisional, and it may have to be revised as a result of international discussion or in the light of changing circumstances. The White Paper does not deal with the disposal of fixed assets, such as land, buildings and factories, or of machine tools, which will be considered separately, as will the problems raised by the disposal of surplus aircraft supplies. It concentrates on the disposal of manufactured stores suitable for civilian uses. The disposal of raw materials will be governed by the appropriate controls, while surplus munitions will be broken up for scrap or spare parts. Some surplus stores will be earmarked for the relief of liberated countries, and others may be needed for the Japanese war. The three main principles which the Government proposes to follow are first, that while the rate of release should be such as to satisfy the most urgent consumer requirements, and to relieve pressure on storage and production space, it should avoid flooding the market; secondly, that stocks should be distributed through the normal channels; and, thirdly, that "fair and reasonable" prices should be secured, if necessary by statutory price control, while the number of intermediaries should be minimised and profiteering prevented. In every case, the representatives of the industries and trades concerned will be consulted. Disposal arrangements will vary according to the nature of the goods, the state of the market, and other factors. While the appropriate departments will handle the collection and classification of surplus goods, the Board of Trade will be generally responsible for the arrangements for their disposal.

It seems, from the very sketchy outline of the plan, that

The actual type and degree of control over price, supplies, allocation, etc., naturally varied greatly from industry to industry and depended on circumstances. The controls, in fact, worked independently, and tightened their grip over the firms in their own industry in so far as appeared necessary to maintain essential supplies. The average business man came to see that if within reason he delivered the goods, he would not be interfered with further. But if he did not deliver them, more drastic control would be exerted. In the last resort his business might be taken over altogether. No doubt very few businesses actually were; but it has to be remembered—both for wartime and peacetime policy—that for obvious inescapable reasons of manpower, the Government must as to 95 per cent or so work through the existing managerial personnel of industry. The supplies of such personnel are just not great enough either in quantity or quality for it to be easy to set them aside in very many cases in conditions of full employment.

To complete the picture of the war production set-up, one should mention two other types of authority:

- (a) the Co-ordinating Authorities,
- (b) the Allocating Authorities.

As hyper-employment began to be reached, the need for co-ordinating authorities was felt more and more keenly in order to referee any major clashes between the active production departments, and even perhaps occasionally to avoid such clashes by planning in advance. The Ministry of Production was set up for this purpose, and is generally admitted to have achieved a certain amount of co-ordinating work both at HQ and through the Regional Organisation, which was thus provided with a referee on the spot in the case of local clashes. The chief Allocating Authorities were, of course, the Ministry of Labour for manpower, a special committee for materials, the Machine Tool Control for machinery, and the Factory and Storage Control of the Board of Trade for premises. The Ministry of Production and Ministry of Labour attempted to plan jointly the location of new factories and Government orders in such a way as to direct these into those parts of the country where there was still manpower, labour and capacity. No new factory could be set up without the recommendation of the production directorate and the approval of the Ministry of Labour and Ministry of Production.

the Government is thinking along the right lines, but there are certain principles which must be observed if the aim of a "fair and orderly" disposal of surplus stocks is to be secured. It is above all essential that the methods used after the last war should be avoided, and that the Government should not act as a commercial entrepreneur, interested primarily in securing the maximum yield from the sale of goods in the minimum space of time. Policy should be

A TOWER of STRENGTH SOLID • SAFE • SECURE

All classes of

guided by wider issues, and by consideration of the effect of disposal on production, prices and the market generally. In most cases, the supply of goods available for release is likely to fall short of demand, both from industrial and civilian users. The criterion in such cases should be to release the goods as rapidly as possible, provided that reasonable prices can be preserved. The question of what constitutes "fair and reasonable" prices is left vague in the White Paper. There will almost certainly be a tendency for the trade associations, who are to be consulted, to press for a slower disposal and for higher prices than would be reasonable or desirable. The Government must, at all costs, resist this tendency; it must maintain sufficient control over the whole process and machinery of the disposal of surplus stocks to ensure that there is no "breaking the market." The danger of "breaking the market" will, of course, be greater where the supply of goods exceeds the immediate demand, as in the case of machine-tools. In such cases the Government would be justified in holding the stocks, and only releasing them when it is assured that the market can take them. It is right that the market should not be "broken." But there are two possible definitions of a broken market. One—the correct one—is that a market is broken when even a fully efficient producer cannot compete. The other—which will be that advanced by the average trade association—is that the market is broken when the least efficient producer is deprived of his full margin of profit. "Fair and reasonable prices" should be defined with an eye to the first definition not to the second.

Form of Accounts

The latest recommendations of the Institute of Chartered Accountants concern the form in which the balance sheet and profit and loss account should be presented. Although adopted by the Council, these recommendations emanate from the special committee set up to study the problem and it is to be noted that they differ appreciably from the evidence which the Institute tendered to the Cohen Committee. The full value of the latest recommendations can only be assessed by considering them in relation to the previous statements from this source, but there are certain definite points which can be considered in isolation. In the first place, while continuing to state that standard forms are neither practicable nor desirable, the Council stress the fact that a proper view of the trend of events can only be obtained if certain principles are consistently applied. These principles appear to be the separation of all figures into sub-groups, so that each of these contains only items similar to one another, and the arrangement of sub-groups into groups. It is possible to quarrel with some of the details of the arrangement suggested, but there is no doubt that the principle is correct. The only question is whether it goes far enough for there is nowhere any statement that there should be agreement among accountants as to definitions. It is, perhaps, assumed that this exists to the necessary degree, but, if that is so, there are excellent reasons for doubting whether the assumption is justified.

Important Notice to our Sherry Customers

FINDLATER'S FINE, well-known to Sherry drinkers all over the World, will in future be known as

FINDLATER'S DRY FLY SHERRY

The reason: Findlater's Fine cannot be registered and protected from imitations under that name. FINDLATER'S DRY FLY is registered, ensuring protection for our customers throughout the World.

FINDLATER, MACKIN TODD & CO. LTD.
Wholesale & Retail, 11, Abchurch Lane, London, E.C. 4

Much of the practice recommended is in accordance with that already adopted in the case of a small fraction of the best accounts presented in the past year or two. Two excellent suggestions appear, however, to have received virtually no acceptance so far, namely, that commitments of material amount for capital expenditure should be dealt with in a note to the balance sheet, and that both debts and credits not expected to mature for over a twelvemonth should be stated in a separate category. Further points which are of particular importance are the recommendations that, where the previous year's figures are given—and their inclusion should be obligatory—they must be prepared on the same basis as the figures of the year under review, and that the word subsidiary should be considered to include sub-subsidiary. There have been recent cases where the former principle was certainly not observed and at least one recently where in addition no mention was made of the lack of comparability. The recommendations as to profit and loss accounts are reasonably sufficient so far as they go, but they suggest only proper disclosure of "the amount available for appropriation." That is to say, there is to be no statement even of administrative costs, let alone factory or comparable costs. It cannot be too frequently stated that, until information is available which enables those concerned to obtain a wide view of the functioning of these institutions, there is no means of combating the dissatisfaction which results from the concentration of power in the hands of a few people who are, in existing circumstances, protected from criticism—favourable or otherwise—by a lack of information which ought to be made available.

Motor Taxation

It would be hard to find a more complete contrast than exists between the suggestions laid before the Chancellor of the Exchequer for the revision of motor taxation by the Society of Motor Manufacturers and Traders, on the one hand, and the Motor Agents' Association, on the other. The former advocated, in the main, the mere substitution of cubic capacity of the cylinder for diameter as the basis of taxation. The latter ask for a complete scrapping of any taxation which would tend to influence design and the substitution of a graded tax on initial value for both private cars and commercial vehicles. They advocate this only as a *pis aller*, for the whole basis of their case is that the motor, as a tool of production, should be exempt from all taxation. Except insofar as private cars and some other passenger vehicles are to be regarded as contributing to entertainment rather than to production, this is certainly sound, and the great merit of the solutions advanced by the MAA is that it is possible to switch from one to the other, or indeed to any interpolated position, without any more inconvenience to makers and distributors than is necessarily involved in a variation in prices. The arguments in favour of some such system of taxation were set out in some detail in an article in *The Economist* of May 13th, and they are very similar to those now advanced by the MAA, except that two of the alternative schemes of that body call for a marked reduction in total tax on motors, starting with total abolition of all taxes, including the Fuel Tax. The first step away from this principle is to retain the Fuel Tax and impose a registration fee of £1 per vehicle; the second adds a comparatively low scale of *ad valorem* taxes, based on original list prices; whilst the third and last suggests the stepping up of this scale to a point where the present tax yield is provided. While it is certainly very desirable that transport costs, which enter into all goods in greater or less degree, should be kept as low as possible, the vital matter which the Chancellor is now called upon to consider is what type of tax will produce a large, flourishing motor industry in this country, capable of taking its full part as an exporter to world markets. As has already been stated more than once, *The Economist* believes that for this purpose the *ad valorem* tax combined with a fuel tax is the most useful instrument so far suggested and that any tax which cramps design is deleterious.

The Distribution of Coal

Lack of space prevented more than a cursory reference last week to the very interesting information about coal distribution provided in the Ministry of Fuel's statistical White Paper. Table I, in page 121, shows how the total out-

put of coal has been distributed between various users between 1938 and 1943. Out of a greatly reduced supply available, the needs of home consumers increased both absolutely and relatively—the greatest proportionate increases being recorded for manufacturing industry and electricity undertakings, whose percentage of the total was doubled. Increased home consumption was offset by the virtual cessation of exports, the fall in which was not very much greater than the decline in output, although its share of total output fell during the six years from 20 per cent to 3.6 per cent. After the war, coal exports will have to be resumed on a considerable scale. To meet both foreign and home demand it will therefore be necessary not only to step up production but to effect further economies in utilisation, and possibly to maintain some restrictions on domestic and industrial users. Since the fuel efficiency campaign was started at the end of 1942, Fuel Efficiency Committees have visited some 25,000 factories and nearly 20,000 people have been trained in special Fuel Efficiency courses and centres. These developments are of great importance from the point of view of securing efficient coal utilisation after the war. Table II shows in more detail the different industrial users of coal.

Coal Merchants

The census of coal merchants in April, 1943 (Table III), indicates the need for an overhaul of the distributive system. The number of merchants, 27,000, nearly half of whom dispose of less than 20 tons a week, is altogether

excessive, and leads to considerable overlapping and duplication of service. Distribution is not a simple operation, owing to the need for dealing with a variety of different grades which do not readily lend themselves to standardisation, but costs could undoubtedly be lowered by such measures as an amalgamation of merchants, the increased introduction of machinery and the delimitation of areas. In this connection, the proposals of the Tory Reform Committee for "a more orderly structure of the trade" merit consideration. Its recommendations include controlled entry to the trade and the appointment of area committees with powers to fix selling prices, by adding fixed margins to the pithead prices—these margins to include a "service charge" from which a Distributive Charges Account could be created. The White Paper does not give any information about present costs of distribution; an example of a typical area in the *Times* (July 13th) gives a pre-war average retailer's margin of 13s. 1½d. in winter and 12s. 11½d. in summer. It is clear that the cost to the consumer may become prohibitive if the upward trend of production costs revealed in the national ascertainment is continued. Total net costs rose from 16s. per ton in 1938 to 27s. 6d. in 1943.

Absenteeism Among Miners

Table IV gives the results of an interesting survey of absenteeism during three separate weeks. It shows that in a normal working week, over 76 per cent of the men lost no shifts at all, voluntarily, while 17 per cent lost only one shift, and only about 7 per cent lost two or more. The survey shows a definite correlation between voluntary absenteeism

and holidays, and between different days of the week. Thus, whereas face workers' absenteeism was as high as 24.5 per cent on the Tuesday after a holiday, it was as low as 3.5 per cent on the Friday before a holiday. Involuntary absenteeism was not subject to the same fluctuations. Major Lloyd George told the House of Commons that the voluntary rate had decreased recently; in the first quarter of this year it was 4.7 compared with 5 per cent in the first quarter of 1943. He attributed this reduction in part to the success of the system of voluntary fines, which was started in Durham and has now been adopted in a few coalfields. Under this system, a maximum fine of £1 can be imposed on the spot by a Regional Investigation Officer of the Ministry, accompanied by two assessors from the management and workers' side; if the offender makes good the fine is refunded. In Durham, 12,600 cases have been dealt with in ten months, and only 34 per cent. of the fines have been forfeited. Durham's rate of avoidable absenteeism, 2.4 per cent for all workers, is far below the national average of 4.9 per cent, and, to judge from this experience, the extension of the scheme to all other regions would undoubtedly be beneficial.

Australian Loan Repayments

No surprise can be felt at the announcement of the Australian High Commissioner that the £8,125,000 of debentures and registered stock of the 3 per cent Commonwealth loan, repayable October 1st this year is to be redeemed without re-borrowing. It is also the intention to pay off the Melbourne and Metropolitan Tramway 5 per cent loan of £1,000,000 on that date, while notice had already been given to redeem twice that amount of Brisbane Tramways 5½ per cent stock. The two last are optional maturities which are being tackled on account of the high nominal rate of interest. There exist a number of other optional maturities of the Commonwealth and State Governments, repayable at any time on due notice, mostly costing around 4 per cent. A January figure of sterling holdings of the Commonwealth showed a total of £74 million which is, according to some authorities, an understatement even for that date. It would seem possible to repay some of these optional maturities forthwith, but it is extremely probable that the Commonwealth authorities are holding their fire for a larger operation which ought to be undertaken some time next year. At various dates, starting on July 1st next, there occur the first optional maturities of the 5 per cent loans of the Commonwealth and States repayable 1945-75. If one adds in a New South Wales loan with maturity dates of 1945-65, the total to be dealt with is well over £100 million; on which the potential savings are really substantial. It is extremely probable that Australia will wish to deal with this operation next year. No one suggests that sterling holdings, surplus to requirements, will suffice to repay the whole of this sum, but the Commonwealth should be in a very strong position to approach a partial conversion. By announcing its intention to make a partial repayment, it will be able to exact the most favourable terms possible and will, probably, be able to re-borrow a portion at long term at a very low rate. The market, with this possibility in view, has already reduced the official minima for these loans to par so that the disappearance of existing premiums, which are already much reduced, will cause no disturbance to dealings. It need hardly be said that investors will be unable to obtain 5 per cent elsewhere and the prospective operation is likely to stimulate demand for lower interest securities.

POST OFFICE & TRUSTEE SAVINGS BANKS ISSUE

A Profitable Liquidation

According to a statement made last week-end by the board of the Hyderabad (Deccan) Company, the Nizam's Government has made an offer of £708,000 for the principal asset of the concern, the Singareni Collieries Company. The shares of the Hyderabad Company are of £3 denomination. They have rarely stood as high as 35s. in recent years until a few weeks ago, and on the eve of the announcement they were quoted at 38s. If the offer is accepted, the board expect to make a distribution of the order of 68s. per share. Over the past decade, the average dividend on the capital has been about 3½ per cent and there is no apparent reason to expect an early improvement in earnings from the colliery company. What, in these circumstances, suggests to the Nizam that he should bid almost double the best price recently quoted for the shares? The answer, presumably, lies in the quite abnormal exchange position. On the one hand, India, and presumably the Nizam's Government, holds a huge and growing accumulation of sterling which it will be by no means easy to convert into goods, except over an extended period. On the other, there is no certainty as to the purchasing power of either sterling or rupees over that period. The local Government may feel that it can get more out of the property than the Hyderabad Company has done, but it is, in all probability, also taking into account the fact that it may be worth paying a very high premium to be certain of getting real assets now for its sterling holdings. It may be worth while looking into the prospects of other companies in India and in other areas, such as Egypt, where holdings of sterling balances are large, with a view to seeing whether there is any chance of similar transactions.

Labelling Food

The Minister of Food has made an Order which implements the policy set out in the White Paper, "The Labelling and Advertising of Foods" (Cmd. 6482), published last November. With certain minor exceptions, the Order provides that pre-packed foods shall be labelled to show the name and address of the packer, the name of the food, the names of the ingredients in the order of the proportions in which they were used, and the minimum quantity of food in the package. Special rules apply to labels and advertisements when claims are made about the presence of vitamins or minerals in a food. Claims are only permitted when specified vitamins or minerals are present, and the proportion has to be stated. The Order comes into force on January 1, 1945, to give manufacturers time to amend their labels. The Order will provide a necessary safeguard to the public. It is particularly important when so many foods are pre-packed, and at present when, owing to zoning, shoppers are confronted with unfamiliar trade names. Although the need for such control is enhanced by the war, the provisions of the Order deserve a permanent place in the marketing of food. For this reason it is a pity that the regulations were not laid down by Act of Parliament rather than by Defence Regulation which might be too hastily set aside when the war is over.

Argentine Investments

Whatever the true position may be with regard to the question of economic sanctions against Argentina, there is some evidence of a change of attitude by those responsible for running British enterprises in that country. In the past, it has always been their policy to stress the good relations existing between them and the Argentine Government. But in the past few months there has been a change. It is true that the policy of discrimination against foreign capital has been carried further than hitherto, but, until recently, the change was one of degree rather than of kind. Some of the aspects of the treatment of Argentine Tramways, the projected expropriation of Primitiva Gas and, one may gather, the impression created on the railway managers in their negotiations in Argentina, seem to mark a new departure; an intention not only to reduce earnings to a level where even depreciation cannot be adequately covered, but also to assume complete control with a minimum of compensation. In these circumstances, the comments of the boards of several Argentine enterprises have been much more outspoken than was at all usual, and the matter has been brought to something of a climax by the statement last week of Mr J. A. Goudge, chairman of the Buenos Ayres and Pacific Railway. All Mr Goudge said was that there was

little prospect that the British stockholders would be allowed to derive any benefit from the recovery in Argentine prosperity and that there had been a change in the Argentine Government's attitude. In the past the statements of railway chairmen have been so consistently mild that even this modest amount of criticism marks a decided change in policy. It is not fanciful to see in it the dawning of a belief that the policy of appeasement in matters of investment is as little likely to succeed as such policies usually are. What is required, in this connection as in other matters, is that this country and the USA, at least, should concert a policy which will hold out hopes of development for backward countries, among which Argentina must now be counted, and make it abundantly clear that only those who are prepared to observe the rules will receive the benefits.

Hudson's Bay Successes

The preliminary results of Hudson's Bay Company for the year ended January 31, 1944, show a net profit of £124,874 against £114,138. This favourable result is reached despite an increase of over £275,000 in the amount required for taxation, which is £1,533,948. This makes possible the payment of a 5 per cent ordinary dividend, one point higher than last year and the highest distribution made in the last ten years. Far more profitable to the ordinary shareholder, however, is the tax-free payment from receipts of land sales of 5 per cent, which compares with a total of 8.5 per cent previously distributed under this head since payments were recommenced in 1938. Altogether it is a bumper year for the ordinary shareholder. Figures for the land account for 1943-44 are not yet available, making comment difficult, but it must be remembered that profits from land receipts represent in effect, not current earnings, but the repayment of a capital asset. The difficulty is to know what is the real value of the very large land assets held by the company, which would help to indicate the break-up value of the ordinary shares. In the long run the proposed repayment of £600,000, the remainder of the preference capital (£200,000 having been repaid last year and £600,000 in both 1942 and in 1936), is of more permanent value for equity prospects. The elimination of the preference shares will leave ordinary as the only class of capital, a factor which should greatly help an enterprising postwar policy. In view of these facts, it is not surprising that the ordinary shares have risen by 14s. 1½d. to 78s. 9d., cum dividend, in the week following the preliminary announcement. Assuming that tax relief on the ordinary dividend is at the same rate as last year, namely 7s., and including the payment out of land receipts, the yield on ordinary shares amounts to £2 2s. 4d. per cent tax free.

Public Departments' Investments

This is the season of the year when Sir Waldron Smithers MP is seized with his annual hunger for information on the more obscure details of the national debt position. This year he has improved on his previous performances and has extracted from the Chancellor of the Exchequer a considerable amount of information for which the statistician should be duly grateful. The following table gives the average outstanding amounts of the main constituents of the floating debt and is chiefly remarkable for its revelation of the extent to which the Treasury is now in debt to the Bank of England in the day-to-day course of business.

Quarter Ending	Average Amounts Outstanding during Each Quarter (£000)			
	Treasury Bills	Ways and Means Advances by		Treasury Deposit Receipts
		Bank of Eng.	Public Depts.	
1943				
31 March	2,770,796	25,922	261,896	986,328
30 June	2,907,118	2,619	265,300	999,786
30 September	3,044,500	3,163	320,515	1,022,315
31 December	3,055,614	17,076	369,107	1,282,832
1944				
31 March	3,096,732	15,132	379,982	1,406,412
30 June	3,365,226	9,088	442,302	1,408,456

The rate of interest paid on advances from the Bank of England varied throughout between ½ per cent and 1 per

cent. Rather less than half the advances from public departments were interest free. The balance bore interest at 15/16 and 1 per cent. The following information was given showing how many TDRs were encashed prior to maturity in each of the last four years and the loans into which the proceeds of such encashments were invested.

TREASURY DEPOSIT RECEIPTS (£ millions)

Year to	Loans Into Which Proceeds of Encashments have been Applied				Total Encashed
	3% Savings Bonds	National War Bonds	Tax Reserve Certificates	Post Office Issues	
30 June, 1941	28	113	—	—	141
30 June, 1942	77	200	136	10	423
30 June, 1943	110	210	177	10	507
30 June, 1944	105	248	281	14	648
	320	771	594	34	1,719

The debt charge in 1943-44 on certain items of the debt was as follows:

	in £000's
Treasury Bills	27,733
Ways and Means Advances	1,818
Treasury Deposits by Banks	12,121
National Savings Certificates	7,900
Tax Reserve Certificates	3,289

During the year to June 30, 1944, the Tax Reserve Certificates redeemed in payment of taxes amounted to £658,683,000 as against £11,834,000 repaid in cash. The Chancellor also stated in answer to a later question that the national debt held by Government departments on March 31, 1939, was £630 million and on March 31, 1943, £1,927 million. These figures do not include the holdings of the Issue Department of the Bank of England (which can readily be ascertained), of the Exchange Equalisation Account, and of a number of smaller departments such as the Crown Agents, the Treasury Solicitor and the Ecclesiastical Commissioners.

Cocoa Supplies

At Messrs Rowntree and Co., Ltd.'s last annual meeting some months ago, Mr G. J. Harris, the chairman of the company, suggested that there was a distinct threat of a cocoa shortage after the war. He gave two reasons for his opinion; these are: the apathy of West African native planters as a result of the low cocoa prices paid by the Government since the outbreak of war, and the menace of cocoa diseases, especially the "swollen shoot disease," in some of the West African cocoa regions. The cause of the first of these difficulties has since been removed. The Colonial Office has recently extended its West African Cocoa Control scheme, in force since the outbreak of war, until the end of the 1945/46 season, and it has raised its buying prices with immediate effect. Thus in the Gold Coast, the world's most important cocoa supplying area, native farmers received 11s. per load of 60 lbs for their recently harvested mid-crop, which compares with 7s. 6d. originally fixed for purchases during this season. From the beginning of the next season on October 1, 1944, the price will be raised to 12s. 6d. per load, and this should go a long way in overcoming the apathy of farmers, especially as the Government is pledged that any surpluses it derives from its cocoa transactions will be handed back to the producers or used in their favour. The fight against the cocoa diseases, which have made considerable headway during the war, is more difficult and requires time. Following the visit of Dr. H. A. Tempny, Agricultural Adviser to the Colonial Office, to the West African cocoa regions last winter, however, the problem has engaged considerable attention and measures to meet it have been taken by the Government in co-operation with the Wartime Association of the British cocoa and chocolate industry. While full details of the extent of the damage by disease have not yet been published, the latest data about current crops do not suggest that current supplies have been decisively reduced. Meanwhile, it is encouraging that through the improvement of the shipping position, losses of West African cocoa supplies through inadequate storing in the Tropics have been reduced to a negligible level and that at least some surpluses from present shipments may be available to supplement supplies for relief and immediate post-war requirements. As Brazil, the world's second largest cocoa producing area, too, has lately reported a prospective recovery in its cocoa production and exports, the danger of a cocoa shortage appears to be receding, although a skilful handling of available supplies and of the campaign against the cocoa diseases in West Africa remains essential. The extension of the West African cocoa scheme for another two seasons has postponed, but not removed, the need for reorganising the West African cocoa marketing system and of coordinating world cocoa supplies.

Shorter Note

A conference is to be held towards the end of the month between representatives of the British, United States and the Netherlands Governments to discuss the probable nature of post-war problems in rubber, both crude and synthetic. It is proposed to draft a tentative programme of studies to be made by the three Governments as a basis for further discussions. They will discuss the desirability of establishing a committee to survey the crude and synthetic situation with a view to the consideration of post-war problems. The British delegation will be led by Mr O. S. Franks, Ministry of supply, and Mr P. H. Wjstermann, will lead the Netherlands delegation.

REPORT OF THE AUDITORS TO THE MEMBERS

We have audited the above Balance Sheet. We have obtained all the information and explanations we have required. In our opinion such Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Company's affairs according to the best of our information and the explanations given to us and as shown by the books of the Company.

COOPER BROTHERS & CO.,
CHARTERED ACCOUNTANTS. } *Auditors.*

LONDON, 12TH JULY, 1944.

SIR PERCY E. BATES, BART., G.B.E.

A comparison of the profit and loss account for 1943 with that of 1942 shows a reduction of £228,000 in operating profit and interest after providing for deferred repairs, an increase of £111,000 in the interest on investments, a reduction of £156,000 in the depreciation, and an increase in the net profit of £40,000.

This straight comparison is perhaps rather crude, as the net result arises from the interplay of very many factors. In both years the charge for depreciation is on the same basis as that arranged last year with the Ministry of War Transport, namely, not less than 5 per cent. on the values which are the basis of the Company's remuneration. The charge for deferred repairs is also the same in both years. In round figures receipts from voyages are lower by £100,000 and voyage disbursements £100,000 higher mainly in wages. Victualling receipts have barely covered the cost of provisions. If we have succeeded in saving money on office and dock establishments, the benefit has been passed on to the Ministry and we have, therefore, recovered less in organisation expenses. In fact, no single short explanation will cover the situation; there have been swings in the figures in both directions.

In the balance sheet, on the assets side the Fleet at £10,417,485 shows the effect of the depreciation for the year. Investments in government stocks rose during the year by £1,395,000; the other items call for no special comment.

On the liabilities side, the main feature is the increase in the reserves, which have been increased by £400,000.

It is far too soon to say in what manner or for what purposes these reserves will be required, but it is not too much to say that the remoter future of the Company will depend on the degree of skill and prudence with which they are put to their proper employment. The responsibilities of the Company if it is to play a role in future trans-Atlantic traffic in keeping with its past history and background, are very great. To emphasise the importance attached to these reserves the item has been brought higher in the balance sheet, where it now stands next to the share capital.

The final dividend, if approved by the shareholders, will bring the total distribution to rather less than one-third of all the sums which during the year the directors have dedicated to the future.

As regards 1944, I see no reason to anticipate results very different from those of 1943. Half the year is already past—though in war anything is possible.

As regards the post-war future, it will be most important from the Government's point of view, as well as the Company's, that our ships should be withdrawn as soon as possible from troop service. There is a vast amount of restoration work to be done on all of them and this will be carried out far more quickly and cheaply if performed while there is an ample supply of labour available in the shipyards.

Of course, cash cannot be the sole criterion for the release of our ships, but when early release, Government money and the Company's interest are all in line, it is surely right to remark on the fact.

Not for very long can the Atlantic differ from the rest of the world, and it may well be that our post-war future will be exciting, but if we are in the least desirous of postponing our trial of it we will not be fit to live in it.

PERCY E. BATES,

Chairman.

12th July, 1944.

BLEACHERS' ASSOCIATION, LIMITED

COTTON EXPORTS' RECOVERY VITAL TO "FULL EMPLOYMENT" PLANS

SIR ALAN SYKES, BART., ON SOME POST-WAR DANGERS

The forty-fifth ordinary general meeting of Bleachers' Association, Limited, was held at the Houldsworth Hall, Deansgate, Manchester, on Friday, the 14th instant. Sir Alan Sykes, Bart. (the chairman), presided.

The Chairman, in the course of his speech, said: I am sure that you will share the satisfaction which your directors feel in being able to place before you a balance-sheet which shows a better result than anything we have had within the past twelve years. Before dealing with other changes in the balance-sheet, I should like to refer briefly to the reasons for the improvement in our profits. This can be attributed almost entirely to an increase in turnover, that is, in the value of the work which we have done, and this increase in turnover has arisen from three distinct causes.

In the first place there has been a small but appreciable increase in the volume of our ordinary work, and by that I mean the usual types of finishes that are required for Utility cloth and for a large range of Government orders, as well as for the small export trade which is now done. In the second place, we have had the benefit during the past financial year of receiving the full increment of increases in prices which we were authorised to make early last year to cover increased costs of production which had become fully effective in the previous financial year. I am afraid that this is one of the disadvantages which is inseparable from the control which is now exercised over the prices we may charge. We may not vary our prices without authority from the Board of Trade and we cannot obtain that authority until we can justify the proposed variation. Therefore, we must experience the full effect of increased costs of production before we can apply for permission to raise our prices, and then a certain amount of time is required for investigation in order that the Board of Trade may be satisfied that our proposals are warranted. Even when we receive the necessary authority, some time must elapse before we obtain the full benefit from the increase, because our customers have entered into forward commitments on the basis of current prices and these must be honoured.

It seems probable that we shall have a somewhat similar experience in the present financial year, since our costs have recently been increased by higher wage rates and the extension of paid holidays, as well as by increases in the prices of certain commodities. I make no apology for dealing with this subject at some length, because it is essential that those who exercise authority over us should realise the strain that they will impose on industry and the injustice which they will do to shareholders if their methods result in a prolonged time-lag between the incidence of increased costs and the consequential adjustment of selling prices.

ASSOCIATION'S WAR WORK

The third contribution to the increase in our turnover has come from a substantial increase in the volume of special types of work which we have undertaken for various Government Departments, and by this I mean work which is quite distinct from the ordinary processes of bleaching and finishing which normally constitute the bulk of our trade. But although this work has added substantially to our turnover, it has not resulted in a proportionate increase in our profits, since, as I told you on previous occasions, the prices we are allowed to charge and the margin of profit we are allowed to make on Government orders is very strictly limited by an efficient system of costing. Of this we make no complaint, since it is of the highest importance that the Government ex-

penditure on war production should be kept at the lowest possible level, but I think I should add that the extension of these methods to the general control of prices in peace-time would very soon ruin an industry that could not maintain the rate of turnover of its capital which is assumed for the margin of profit allowed on Government contracts. At the best it would preclude any possibility of providing for those reserves which are essential if industrial plant is to be maintained in an up-to-date and efficient state. I should, however, like to take this opportunity of recording our appreciation of the invariable courtesy and fairness with which, in our experience, the Government Cost Accountants handle what must sometimes seem to be a somewhat thankless task.

The improvement in our turnover and profits is also due, in a large measure, to the untiring efforts of our branch managers and our technical staff in maintaining production under extremely difficult conditions of labour shortage, and by their ingenuity and resource in producing specialised finishes to meet the requirements of Government Departments.

HIGHER NET PROFITS

If you will refer to the directors' report you will see that the trading profit amounts to £471,131—an increase of £105,000 over the corresponding figure for the previous year. After deducting directors' fees, depreciation and debenture interest, which are the same as last year, the balance of net profit is £227,271 compared with £122,030 for 1942-43. The amount brought forward from the previous year's accounts was £94,485, making the available balance of profits £321,757. The directors recommend the payment of a dividend on the preference stock for one and a half years in respect of arrears to March 31, 1937, which will absorb £205,218, and, after providing £20,000 for war damage insurance premiums, they propose that the balance of £96,538 should be carried forward to the next accounts.

In submitting this recommendation to you I should like to remind you of the reasons which I gave in my speech last year which influenced your directors to limit their recommendation to the distribution of the profits earned in the year and to avoid diminishing the company's liquid resources. The position to-day is the same as it was last year, and for the same reasons our recommendation does not go beyond the distribution of the available balance of the year's profits.

FULL EMPLOYMENT

After dealing with various items in the balance-sheet, the chairman continued:

This concludes my review of the balance-sheet, and I earnestly hope that when we meet next year I may be able to tell you that we are concentrating our energies less upon war-time production and more upon perfecting the plans, for which the Government has already announced its policy, for maintaining full employment in industry. There is much to be done in the cotton industry if that ideal is to be achieved and maintained beyond the immediate post-war period. The Government has had before it for some months certain proposals upon the principles of which its views must be made known before the cotton industry can get to work on practical measures. The goal of Government policy is an ambitious one and it will not be reached by timidity and procrastination. Unrestricted competition and full employment are incompatible and a policy, the success of which depends upon the control of economic forces, cannot be put into practice by hampering industry with restraints founded upon nineteenth century economic theories.

The internal organisation of the cotton industry, however, is not the only question, nor indeed the most important question, upon which we need assurances as to the Government's future policy. A substantial increase in the export trade of this country is as essential to the maintenance of our world position as it is to the maintenance of the standard of life of our people. And one of the most important contributions to that increase should come from the recovery of our export trade in cotton goods.

POST-WAR EXPORTS

It will be worth while, for a moment, to consider the position in which we find ourselves to-day in relation to our overseas markets. Owing to the exigencies of war, some other nations have greatly expanded, not only the area of their export markets, but also the total volume of their trade, whilst we in this country have been compelled to cut down the volume of our output to little more than one-half, and have also been subject to a system of licences for every market to which we normally export—in some cases to the total exclusion of our goods, in others to but a fraction of our former trade. This is a serious handicap with which to start but it may not be the only one. We have reason to believe that the arrangements made with other Governments for the supply of materials for war purposes include conditions which, until they are revoked, would prevent us trading with certain markets even if otherwise we were able to do so. Such conditions can be justified whilst there is any danger that the materials supplied on special terms for war purposes might be used as the basis of export trade, but those conditions and those terms should not be continued for one moment longer than is necessary to maintain our united war effort.

A "PLANNING" DANGER

There is another danger which may emerge from the wealth of plans which are being devised. It may be that when we are in a position to produce increased quantities of cotton goods for export, such exports will—unless steps are taken to prevent it—be directed through inter-Governmental arrangements for relief to markets of a purely temporary character without regard to the long-term interests of our trade. There is every justification for directing all surplus war stocks to the relief of European countries, but to the extent that relief is to be provided from current production, it should come first from those countries which under war-time conditions have been able to expand their output. It would be manifestly unfair that the increased productive capacity of such countries should be used to meet the needs of our former markets whilst an undue share of our production is directed to fill the temporary demand from Europe. Unless our position in this respect is preserved during the first twelve or eighteen months after the end of the European war, the opportunity to recover our lost export trade may be permanently lost.

CONFIDENCE IN FUTURE

Although I have drawn your attention to one or two obstacles that may be encountered in the path that lies ahead, I do not want to leave you with the impression that the future does not hold some promise of an improvement in our trade provided the necessary action is taken by the Government to avoid the difficulties to which I have referred. We shall, of course, be limited in our activity by the available supply of labour and particularly by the extent to which that problem will affect the production of yarn and cloth, but, given freedom of access to our overseas markets, without Government interference as to direction, I think we can look forward with confidence to the post-war period when our productive capacity is restored.

The resolution approving the report and accounts was moved by the chairman, seconded by Sir William Clare Lees, Bt., and carried.

BIRMID INDUSTRIES, LIMITED

FACTORIES FULLY EMPLOYED

The adjourned ordinary general meeting of Birmid Industries, Limited, was held at Birmingham on the 14th instant.

Mr Cyril C. Maudslay (chairman and joint managing director) presided.

The following is an extract from the chairman's statement circulated with the report and accounts:—Turning to the combined statement of assets and liabilities, I would make the following comments:—The fixed assets show an increase of approximately £43,000, which is accounted for by additions, less depreciation. The liquid assets of stock, debtors, and cash taken together show an increase of £502,000 over last year's figure; likewise, Tax Reserve Certificates, in the sum of £333,375, show an increase of approximately £97,000 over the corresponding figure last year.

On the opposite side of the account sundry creditors and reserves for taxation show an increase of £473,726 as compared with the corresponding figure last year, which reflects a substantial increase in turnover achieved by the group as a whole. The reserve for war contingencies, including deferred repairs, stands at £100,000, as against £50,000 last year. It will be noted that the surplus of liquid assets over liabilities shows an increase of £125,000 whilst the surplus of assets over liabilities has risen by £111,564.

The whole of our factories have been fully employed during the period under review, and we have every reason to believe that the various Government Departments for whom we have worked have appreciated the great efforts we have put forth to meet the demands made upon us.

POST-WAR PROBLEMS

It would be optimistic to suppose that when the war ceases we shall be able to pick up the threads of our normal peacetime activities without a break for general rehabilitation, but the directors have constantly before them the question of post-war problems, and how to use our increased facilities to the best advantage.

A large proportion of the company's normal manufacturing activities was linked with the motor-car and automotive transport trades. With the expected early resumption of the manufacture of cars and lorries in the post-war period, it is to be assumed that these portions of the various factories supplying this trade will find a fairly immediate opportunity for employment. In this connection the period for change-over of manufacture will be reasonably short and certainly in ample time to satisfy the requirements of customers. It is also hoped that whilst there will be a very heavy reduction in the requirements of light alloys for the aircraft industry there will remain a considerable amount of business in this connection.

WIDER APPLICATION OF LIGHT ALLOYS

Apart from this, however, there is reason to believe that the enormously increased amount of light metals available from the big expansion on production facilities, and the improvement in the manufacturing and fabricating technique resulting from the war programme, will cause a much wider application of light alloys for all kinds of purposes for which they have not hitherto been used, ranging from shipbuilding to household appliances. It is also expected that this will be further intensified by a reduction in final cost of articles made in light metals.

The directors have all these possible outlets for light metals regularly in review, and considerable exploratory work is being done in this direction. The continued expansion, coupled with the dearth of skilled labour, has entailed a large amount of dilution, which throws an additional burden on the nucleus of skilled personnel. I think that both the country and the shareholders should be especially grateful for the way in which all concerned have cheerfully carried on under the additional strain and stress of these four long years.

The report and accounts were adopted.

BEECHAMS PILLS LIMITED

LARGER PROFIT

The sixteenth ordinary general meeting of Beechams Pills, Limited, was held, on the 19th instant, in London.

Mr. Louis Nicholas, J.P. (Vice-chairman), presided and read the statement of the chairman, Mr Philip E. Hill, of which the following is an extract:—

The trading profit for the year ended March 31st last, earned by the companies of the group operating in the British Empire and in almost all parts of the world other than Europe, amounted to £1,471,560 as compared with £1,269,334 in the previous year. The overseas trade was most satisfactory and provides encouraging hope for the post-war periods.

Our group of companies has contributed to the National Exchequer £1,079,152 in excess profits tax and national defence contributions and £395,885 in income-tax, a total of £1,675,037.

The group as a whole has a reserve set aside for future taxation amounting to approximately £300,000. Nothing has been included in the accounts in respect of the post-war refund of excess profits tax, which is estimated to amount to £269,000 after allowing for income-tax thereon at 10s. in the £. The Chancellor of the Exchequer in his Budget speech in April last gave satisfactory assurances with regard to this refund.

This business commenced over 100 years ago by the sale of the proprietary medicine which gives its name to the company, but at the present time many goods other than proprietary medicines are sold, and your directors are year by year extending beyond proprietary medicines the variety of the group's products.

During the past four years much time and thought have been devoted to the development of overseas trade, and the company is confident of making a considerable contribution to the export trade of this country which will be so necessary after the war.

The report and accounts were unanimously adopted.

MANLEY AND REGULUS LIMITED

10 PER CENT. DIVIDEND

The twenty-fifth ordinary annual general meeting of Manley and Regulus and Regulus, Limited, was held, on the 19th instant, at Wolverhampton, Mr. P. J. Jemmett (chairman and joint managing director) presiding.

The following is an extract from the chairman's review circulated with the accounts:—We have provided for maintenance and/or depreciation of buildings, plant and machinery the sum of £18,716. Owing to the present heavy cost of repairs both of plant and buildings, we have made a transfer from profits for deferred repairs of £15,000. As I have previously mentioned the statutory amount allowed for depreciation is nothing like sufficient to cover the war-time wastage due to excessive wear and tear. During the year we have paid in taxation the sum of £84,000, and as provision for future payments we hold tax reserve certificates for the sum of £93,000.

The subsidiary companies have all made reasonable profits, the whole of which has been retained as additional working capital. I told you last year that due to the change-over in Government requirements the production this year would probably be considerably lower, but all the same we have managed to keep up a very high production record.

It is impossible for me to venture any prediction as to the future, but there is every reason up-to-date to expect that our next balance-sheet will be quite satisfactory.

The report was adopted and a final dividend of 5 per cent., making 10 per cent. for the year ended April 30, 1944, was approved.

VENEZUELAN OIL CONCESSIONS, LIMITED

THE NEW TERMS

The twenty-eighth ordinary general meeting of the Venezuelan Oil Concessions, Limited, was held, on the 17th instant, in London.

Sir Andrew Agnew, C.B.E., the chairman, in the course of his previously circulated statement, said that the profit of the year 1943 was £1,099,540, as compared with £1,256,668 for 1942. The difficulties in offtake which had occurred in 1942 and restricted the output in that year had not been experienced to the same extent in 1943. On the other hand, they had been operating for most of 1943 under the terms of the new Venezuelan Law of Hydrocarbons, with consequent increased surface and production taxes. Those increased taxes would have a continuing effect on operating costs; against that they had received from the Venezuelan Government the renewed concessions which gave them security of tenure over an extended period.

Although the revised terms of the concessions became applicable as from March 13, 1943, their new concessions ran for a period of 40 years from December 24, 1943, with the right of renewal on terms to be negotiated. They would, he knew, share the board's feeling that that was an important step in the company's history in that they had obtained security of tenure on terms which they had been assured by the Venezuelan Government would ensure a stable partnership between the Government and the company.

The increased surface taxes, which were now at a rate per hectare of five times that formerly applicable, would naturally increase their incentive to keep the prospects of their undeveloped holdings under constant investigation so as to ensure that their surface tax payments were incurred to the best advantage by periodic surrender of territories found to have little prospect and, as opportunity offered, to acquire new promising areas in place of those surrendered.

From that point of view and looking to the long-term producing life of their concessions as a whole, it was of interest that the attention which had recently been focused upon the Caribbean area generally as a source of crude oil production had made it possible for them to resume exploratory drilling on an increased scale. When circumstances permitted full information would, of course, be given of the results of their efforts to enlarge certain of their present producing fields and to locate new ones.

The report was adopted.

WM. CORY AND SON, LIMITED

Sir Arthur Cory-Wright, Bt. (the chairman), who presided, on the 13th instant, at the forty-eighth annual general meeting of Wm. Cory and Son, Limited, said that the net profit amounted to £706,850. Earnings from ships showed an increase. Although they had been able to add to their fleet, it was still a long way from its pre-war proportions.

The market value of their holdings in marketable securities at the date of the balance sheet was over £700,000 in excess of their book value. The resources of the Cory group had been still further augmented, and the new presentation of the balance sheet emphasised a position of considerable financial strength, which would enable them to look forward with confidence to post-war developments.

The board recommend a final dividend of 15 per cent., subject to income tax, on the ordinary and employees' stock, making 20 per cent. for the year.

The report was adopted.

INDUSTRY AND TRADE

Cotton Cloth Exports Cut.—The export cotton allocations for the third period of the year show a reduction of about 10 per cent in the yardage compared with the previous quarter. This has been due partly to the supply position and partly to the fact that there has been a marked tendency recently for exporters to claim production in heavier and better cloths, with the result that the weight of yarn required to meet the yardage allocated has exceeded the provision made. In recent periods, the allocations have amounted to about 80,000,000 square yards, and the total has been cut to about 72,000,000 square yards. As before, 20 per cent. of the yardage will be held in reserve for free production at a later date. All contracts under these allocations have to be arranged by July 28th.

Unregistered Veterinary Practitioners.—In accordance with the recommendation made by the Loveday Committee on Veterinary Education in Great Britain, the Minister of Agriculture and the Secretary of State for Scotland have appointed a committee to inquire into the extent and effect of veterinary practice in Great Britain by persons who are not registered veterinary surgeons and to recommend any measures which may be desirable to limit or regulate such practice. The chairman of the committee is Lt.-Col. Sir John Chancellor.

"The Economist" Sensitive Index.—There was no change in the index during the week ended July 19th. The complete index (1935=100) was 158.6; crops 135.6; and raw materials 185.5.

The Bacon Ration.—For eight weeks from July 23rd, the bacon ration will be raised from the present 4 ozs. to 6 ozs. a week. This is the first increase for three years. Bacon was first rationed on January 6, 1940, when the allowance was 4 ozs. a week. It was raised to 8 ozs. on January 25, 1940, and reduced again to 4 ozs. on June 10, 1940, since when it has been unchanged.

FINANCE AND BANKING

THE MONEY MARKET.—The securities bought by the Bank of England during the final days of June to help the market over the turn of the half year are maturing and concurrently the temporary expansion in bank cash is disappearing. During the week to last Wednesday Government securities of the Bank of England fell by £14,750,000 and bankers' deposits accompanied this decline with a fall of £19,889,000. The difference between the two movements is wholly accounted for by an increase of £6,413,000 in Public deposits. This reflects the heavy transfers of tax and war damage contribution money made to Exchequer accounts this week. These payments have played a conspicuous part in draining surplus cash from the money market and though credit has been in adequate supply, all previous evidence of abundance has disappeared. This week the Treasury bill maturities rose to £100,000,000 and next week they will be £110,000,000, thus equalling the current weekly offerings by tender. The banks were called upon to pay £70,000,000 against T.D.R.'s this week against effective maturities of about £30,000,000.

MONEY RATES, LONDON.—The following rates remained unchanged between July 13th and July 20th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, 1%. Discount deposit at call, 1%; at notice, 1½%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between July 13th and July 20th (Figures in brackets are par of exchange).

United States. \$ (4.86) 4.024-03; mail transfers 4.021-03. Canada. \$ (4.86) 4.43-47; mail transfers 4.43-47. Switzerland. Francs (25.24) 17-30-40. French Empire. Francs 1971-2004. GOVERNMENT RETURNS

For the week ended July 15, 1944, total ordinary revenue was £49,015,000, against ordinary expenditure of £109,562,000 and issues to sinking funds of £360,000. Thus, including sinking fund allocations £277,239, the deficit accrued since April 1st is £954,292,000 against £1,024,759,000 for the corresponding period a year ago.

No Policy for Germany.

THE Nazis have thrown a smokescreen of censorship
and counter-propaganda over the crisis that shook
the régime last week and any attempt to assess the reasons
for the revolt or to gauge its extent can only be pro-
visional. Yet some facts seem clear enough. The funda-
mental issue was whether or not to continue this desperate
war. The Nazis are committed to it and have, in the last
few weeks apparently planned a last drastic reorganisation
of the Reich to meet the threat of actual invasion. The
decrees published on July 25th were probably discussed
and prepared before. Their aim is a sort of totalitarian
levée-en-masse, a throwing into the front line of
Germany's defences of every man and woman who can
be combed out of the administration, out of industry,
out of the army's own reserves. The new "General Com-
missioner for total mobilisation," Goebbels, will

have to re-examine the whole State administration,
including the Reich railways, Reich postal services, and
all public establishments, institutions, and undertakings
with the purpose of freeing a maximum of manpower.
To do this, men and material must be used rationally
and to the last, tasks of lesser war importance stopped
or reduced, organisation and procedure simplified.

This is the challenge thrown by the Nazis to destiny.
With the Russians advancing with gigantic strides in the
East and the Allies massing for further blows in the West,

they have planned the defence of Germany literally to
the last ditch. Their attitude must have made it clear
to military and civilian leaders alike that so long as the
Nazis are in power, the course is set for a fight to the
bitter end, and, obviously, a certain number of the
military leaders opposed the plans—General Dittmar in
his commentary on the conspiracy revealed the fact that
defeatism had overtaken many officers and that some of
them had tried to sabotage the new measures.

The Nazis' leaders realised that a core of effective
opposition had begun to form. Their only course was to
repeat the manoeuvre of June, 1934, and smoke the rebels
out. Himmler appears to have moved SS units into the
War Ministry before the attack on Hitler. The attack
itself may have been staged by the Nazis, or it may have
been the last desperate throw of the rebels when they
realised that they were discovered. What does seem
certain is that the effect of the news on sections of the
Germany army was far greater than the Nazis feared.
Some units were in revolt. Many hours after the attack
Hitler, Goering and Doenitz had to come to the micro-
phone to appeal for loyalty, and to forbid the Germans to
obey the rival Government which the insurgents had, pre-
sumably, tried to set up. Himmler was given complete
control of the *Heimatheer*; a new chief of staff, General
Guderian, was appointed; and it was also necessary to

appoint a new chief of staff, General Stumpf, to the air force. These changes show clearly that the army was the storm centre of the crisis and that the Nazis are now in the desperate position of being able to trust least the instrument they need most.

Thus the first rift has appeared in the Nazis' "monolithic" state. Himmler may still be able to hold the state together, but the sentence of the watchers has gone out on Hitler's empire. The crisis will recur. The Berchtesgaden bomb set a fuse alight which must sooner or later blast the Nazi regime from power. It is obviously in the Allies' interests that it should be sooner, not later. Since revolt and unrest will break out again, is there nothing the Allies can do to accelerate the process and match the pounding of the enemy on the battle fronts by his disintegration at home? To undermine the enemy has always been the accepted target of the Fourth Arm of political warfare. Now, surely, a supreme opportunity lies ahead. Yet British and American propaganda was not ready for the crisis of July 20th, and there is at present little sign that its occurrence is going to make one jot of difference to the high political strategy of the war.

The reason for this paralysis lies chiefly in the determination of Allied statesmen not to be duped by Germany. The argument runs that last time a lenient peace was made with a supposedly democratic Germany, but the democrats were wolves in disguise. The German General Staff remained intact. Stresemann helped to rearm them and, when the day was ripe, Weimar disappeared, and with the full concurrence of the German people, Hitler replaced it and embarked on the policy of total war. It follows, the argument continues, that it is false and sentimental to believe in two Germanys, a good and a bad, a good one to which we can appeal with fair terms and promises so that it shall throw out the bad. The Nazis, the Generals and the masses are all indistinguishable in guilt; so the only policy is unconditional surrender.

*

Hitherto, the apparent unity of Germany under Hitler has lent colour to this theory. Now, however, the Germans have proved conclusively that there are two Germanys. The division is not between a good Germany and a bad. Neither are good. The distinction has nothing to do with morals or principles; it is a simple one—between some Germans who want peace and some who do not; and some of the Germans who do are apparently ready to take steps against those who do not. That, in the simplest terms, is the meaning of July 20th.

The most effective assistance the Allies can bring to the would-be peacemakers is to give them some idea of the conditions awaiting Germany in the event of a surrender, and the benefits, if any, they might gain from overturning the Nazi regime. So far nothing of the kind has been done. No joint Allied statement has been made. Some time ago Mr Churchill told the Germans that the Atlantic Charter did not apply, as of right, to Germany. More recently, it has been admitted that armistice terms exist, but they are not to be announced. From the three Allied leaders, speaking jointly, has come only one definite policy—unconditional surrender, with whatever consequences it may entail. This is the policy vacuum which Goebbels in Germany and unofficial Allied propagandists have eagerly filled in. Goebbels has not chastened his imagination for the task. Germany divided between the Powers, German men castrated, German women sold into slavery or worse, the economic life of the Reich destroyed—this has been the constant refrain of the last two years. Against it the Allies set official silence and unofficial confirmation—for example, Lord Vansittart's recent article in the *Sunday Dispatch* in which he proposes, among other things, that German workers should spend "a period of celibacy in foreign labour camps."

If all these things were in fact going to be done to Germany, there would be a cynical reason for disguising the fact. The foolishness of the present position is that most of these horrors are not even contemplated. The

enemy is being stiffened in his resistance by a picture of policy which the Allies have no intention of carrying out. In our anxiety not to have any bargaining with the Germans, we are making it incredibly difficult for anyone in Germany to think of surrender.

Official and unofficial hints have given some idea of the conditions which the Allies do not intend to impose on Germany. The Reich is not to be permanently partitioned. The German people's economic life is not to be permanently crippled. There will be no organised massacres and mutilations. The guilty men will be punished, but the whole nation is not to be treated as war criminals. All this being so, why cannot the Allies say it in unequivocal terms and their propaganda service repeat it day in, day out, so that the alternative to war and Hitler does not look as despairing as it must to-day? The Allied leaders could gain the political initiative in Germany simply by stating the things they do not intend to do.

Such a policy would be hotly disputed in this country. It would be denounced as weakness or sentimentalism. Nothing could be further from the truth. No one would accuse Marshal Stalin of sentimentalism or leniency. Yet the Russians, unlike their Western Allies, have an official Free German Committee, and ever since it was set up, a constant propaganda appeal has been going out, not indeed primarily to the German masses, but to German generals and officers. Again and again, the Free German station has assured the German generals of decent treatment provided only they will revolt against the regime. On one occasion Marshal Stalin even stated that some sort of German army would of course remain. The Russians, it appears, are not committed to the oneness of all Germans. If it is weakness to try to divide the enemy, and to use promises as weapons, then Russian policy towards Germany is weak.

Even if Russia shared the timidity of Britain and America in the question of terms for Germany, it would still be possible to show that unconditional surrender, if it is taken literally, does not add up to a policy. To offer terms to a group—be it made up of generals or ex-party leaders or workers' councils—does not entail a bargain. Surrender does not cease to be unconditional because its terms are made public. The Allies are not going to bargain with any group. That is obvious. But at present they give no German the opportunity of judging whether their terms are not preferable to continued war—which they undoubtedly are. The Becks and Stauffenbergs and the others that may come after them have no assurance that the Allied peace will not be rather worse than Himmler's rule. Until they have, an inhibition must lie on all German attempts to bring the war to an immediate end.

*

It is possible that an Allied statement would not have a decisive effect. Himmler's resources are not exhausted. Yet Allied terms and Allied inducements might be effective and the mere possibility is worth the effort. The danger of the present attitude of unconditional surrender is that it is rapidly developing into a paralysis rather than a policy. By their silence the Allies renounce all attempt to shape events and guide them towards a desired goal. Unconditional surrender is becoming a policy of drift, of wait and see, of reliance on what may turn up. But the drift of events may carry Germany, Europe and the Grand Alliance itself to a very different conclusion from the one the Allies desire. It may carry them to military stalemate or prolonged fighting and then to divided counsels and Allied disputes. No policy for Germany means, in fact, no policy for peace.

To ask for a statement of policy is not to advocate bargaining with the Germans. It is simply a plea made in the name of common sense (now re-christened political warfare) that some political weapons should be placed in the hands of any Germans who will rebel against Hitler. It is a plea that the means should be given them to convince their fellows that surrender at discretion is infinitely to be preferred to the government of a paranoiac gang.

The Public Schools

THE Fleming Committee were appointed just two years ago "to consider means whereby the association between the Public Schools and the general educational system of the country could be developed and extended." Their Report, which is issued this week, will inevitably give rise to much discussion and, almost as inevitably, heated controversy. It would be a pity if, in the heat of the fray, the expository parts of the Report were overlooked. They contain a brief but most learned and interesting account of the growth of the ancient schools of England to which someone on the Committee or its secretariat has devoted great scholarship and industry.

The recommendations are, however, what the public will naturally seize upon. The Committee have rejected both of the extreme approaches to their subject. They reject, as do their terms of reference, the view that there is nothing wrong with the place of the Public Schools in the educational system of the nation. On the other hand, they equally reject the view that the Public Schools should be abolished. As the Report points out, "association" is a very vague word, which might denote "anything from juxtaposition to almost complete absorption." The Committee have chosen to interpret it to mean the admission of a certain number of boys and girls from the state system into the Public Schools, which are otherwise to be left much as they are today.

Two schemes are put forward for this purpose. The distinction is necessary because the Committee's terms of reference defined the Public Schools as "schools which are in membership of the Governing Bodies' Association or Headmasters' Conference." Both bodies embrace two fairly distinct types of school. First, there are the independent schools which are not in receipt of any public funds at all and are what is generally meant by "the Public Schools." Secondly, there are the schools of independent foundation which receive grants from public funds—most of them by direct grant from the Board of Education rather than from Local Education Authorities. The nucleus of these are the ancient local grammar schools. Very nearly all of the Independent Schools are boarding schools; the majority of the second category of school are, in the main, day schools. The total number of schools involved is 184 boys' schools and 136 girls' schools, divided in rough equality between the two categories. The total number of boys and girls is rather more or less than 100,000.

The Committee's Scheme A is mainly intended for the schools that already receive grants—that is, typically, the old Grammar Schools. The proposal is that all places in these schools, however filled, should be equally accessible to all pupils—that is, fees should either be completely abolished or else graduated, in accordance with the

parents' means, from nil to the full amount. The Local Education Authority should have the right to reserve a certain number of places, for which it would pay the school in full, recovering from the parents such part of the boarding fees (if any) as they could afford, but no part of the tuition fees, since these places would be regarded as part of the national system of free secondary education. In the case of other places, the difference between the cost of tuition and boarding and the amount (if any) charged to the parent would be made good by the Board of Education. The Report is not explicit about the method by which these other places would be filled.

Scheme B is proposed for the Public Schools in the usually accepted sense of the word—that is, for the independent boarding schools. These schools should be invited to provide not less than 25 per cent of their total places for boys or girls holding bursaries to be granted by the Board of Education to "qualified pupils who have been previously educated for at least two years at a grant-aided Primary School." These bursaries would be awarded either at the age of 11 or at 13; in the former case the bursar would go for two years either to a Junior School or to an approved Preparatory School (not including any that are conducted for private profit). For all these bursars, the state would pay the whole cost of education, including pocket-money, cost of outfit, etc. It is intended that the original proportion of 25 per cent shall later be increased "with a view to the progressive application of the principle that school should be equally accessible to all pupils and that no child otherwise qualified shall be excluded solely owing to lack of means."

The practical difficulty in any such scheme is, of course, the method of selection of the bursars. Applications, it is suggested, should be made through the Local Education Authorities to the Board. Selection would be made by Regional Interviewing Boards, and the final distribution of selected candidates to the schools should be made by the Board. The schools would not select the candidates they were to admit. The Committee rightly reject the suggestion of a competitive examination or any other purely intellectual test. The selection is to be on interview and previous record.

*

This is an honest attempt to solve a difficult problem, the more impressive for being the unanimous report of a very widely representative Committee. If it really succeeds in getting 25 per cent of State-selected bursars into all of the Public Schools, that will be an achievement that would hardly have been conceivable twenty years ago. As the Committee point out, any solution must necessarily be a voluntary one, and it is so likely as to be

virtually certain that this is quite as much as will be freely accepted. Indeed, it may well be too much, and it is easy to predict that the Public Schools will want at least to select their own bursars. Only the impractical will criticise the Committee for not having gone further.

And yet it is very doubtful whether their proposals will have very much effect on the real problem. That problem is not educational at all, but social. It does not arise because poor children are denied access to education of the highest intellectual calibre. In some subjects the standards are higher in the State secondary schools than in the Public Schools. The problem arises because the existence of two educational systems divides the English people into two nations. The division is not intellectual, but psychological and social. The distinction is not that one is better educated than the other, but that one has a higher social prestige than the other. It is typified and deepened by the phenomenon that exists in this country almost uniquely in the world—the social importance of accent in speech, as distinct altogether from correctness or incorrectness of speech.

*

The effects of this cleavage are unfortunate—indeed disastrous. But just how and why they are disastrous is almost always misunderstood. It is not that the Public Schools turn out the wrong type of man—quite on the contrary. By and large, they are the best schools in the world. Nor is it that the Public Schools deliberately foster snobbery or class-consciousness. On the contrary, as Mr Muff and his peripatetic colleagues of the Parliamentary Labour Party somewhat ingenuously discovered, they are at great pains to inculcate the opposite. Indeed, the "Public School problem" does not arise at all from the advantages conferred on their pupils by the Public Schools, but from the social disadvantages which, by contrast, are imposed on all the rest. The trouble is not that the Public Schools are schools of leadership, but that their exclusive social standing inevitably forces all other schools to be, in greater or less degree, schools of followership.

This danger has been getting greater in the last twenty-five years with the spread of the Public School habit. The dividing line in society has become much sharper than it ever was before. There are more Public School boys to maintain the ascendancy of their class. And there are more boys conscious of equal intellectual attainments but of unequal social status. The cleavage is beginning to affect every part of the national life. To anyone who is acquainted with education in America or the Dominions, the contrast is most striking. The intellectual attainments of the English schoolboy are far higher; but the inferiority complex, the social *gaucherie*, the maladjustment to society, the lack of self-confidence, which are so common here are almost unknown there. The danger is not so much inequity as inefficiency.

A Dangerous Divide

THE long-feared crisis in Polish-Soviet relations has come—at the moment when the conquering Red Army is coming near to Warsaw. The deadlock between M. Mikolajczyk's Government in London and Marshal Stalin's Government in Moscow has become a breach. Early this week it was announced from Moscow that a Polish Committee of National Liberation had been set up, claiming the executive authority of a provisional government. A statement was issued by the Soviet Government declaring its intention to enter into an agreement with this Committee on the relations between the Russian military authorities and the civil administration in Poland. The Polish Committee had already put out a denial of the legality of M. Mikolajczyk's Government, and the Russian recognition of the Committee, even though for a limited and provisional purpose, could only be interpreted in one way.

The situation produced by these developments is ex-

remely serious. The Polish Government in London directs the underground resistance to the Germans in the greater part of Poland, and is recognised by the Governments of both this country and the United States. The Russians again emphasise the Soviet wish to see Poland an independent state, based upon the will of its people, and denies any Russian desire to interfere with Polish sovereignty; but the existence of the legal Polish Government in London is deliberately ignored. The attitude of the British and American Governments hardly needs exposition. Their recognition of M. Mikolajczyk's Government is full and firm, and they must reject out of hand the new Committee's claim to governmental status, however provisional. It is impossible to conceal that a contradiction of the first importance has appeared in Allied policy; or that the crisis is of Soviet making.

It would only make matters worse, however, to oversimplify the issue and present it merely as a matter of

Moreover, how are these 1,500 bursars to be chosen out of a much larger number of applicants? The Committee rejects intellectual tests and devotes considerable space to defining the qualities needed to take advantage of boarding-school education. But there are likely soon to be many boarding schools which are not Public Schools. How to distinguish between those boys who are to go to boarding schools and those who are to go to Public Schools? The Committee, in substance, abandon this problem to the uninstructed judgment of the Interviewing Boards. Is it not likely that, in the complete absence of any other criteria, the Interviewing Boards will choose boys of the "Public School type"? Then the argument will indeed have come full circle.

The only possible line of solution is not by getting a few poor boys into the rich boys' schools, but by getting the rich boys into the state schools—which would destroy at one blow the social exclusiveness of the Public Schools and leave them to develop their manifold excellences free of this social incubus. It is not 25 per cent or 50 per cent of bursaries, but 100 per cent that is wanted; not *la carrière ouverte aux talents* but *la carrière fermée à la manque de talents*—however talent may be defined or ascertained. Or as Archbishop Cranmer told the Commissioners for the Grammar School of Canterbury four hundred years ago "if the gentleman's son be apt to learning let him be admitted; if not apt, let the poor man's child being apt enter in his room."

To urge this now is admittedly to urge what cannot be had. The Committee are to be commended for having gone as far as they could. But it is as well that it should be realised that their proposals are not the end of "the Public School problem." They are only just a beginning.

Polish right and Russian wrong. The rights of nations, for which we stand, are crucially involved in this crisis. But it must be added that there have been grievous faults on both sides. The Russian pretext for recognising the new Committee is presumably that there must be some local authority with which to deal in Poland, and that every Soviet effort to reach a new agreement with the Government in London has been rebuffed. It is in fact true that there has been an intransigent refusal on the part of a minority in that Government to accept any proposal to meet the Russians in the smallest degree. The removal or overriding of this Right rearguard, the broadening of M. Mikolajczyk's already widely representative Government by the inclusion of some spokesmen of the minority of Soviet-disposed Poles, and above all perhaps the production of some progressive programme for the social and economic future of an independent Polish community—these steps would not have impaired M. Mikolajczyk's authority, and they would have left neither the Russians nor the dissident Poles with any genuine ground for grievance. But, in spite of the desire of the moderates in the Polish Government to show good will and wisdom, no such steps were taken. Instead, a policy of drift, which mixes the attitudes of King Canute and Mr Micawber, has been pursued.

But how real have the Russian efforts towards agreement been? How acceptable is the explanation that this new Committee is necessary for the civil administration of territories freed by the Red Army? The Soviet Government, ever since the breaking off of diplomatic relations, has refused to negotiate or discuss. The Curzon frontier was offered to the Poles with a "take it or leave it." A separate Polish army was established in Russia. The Union of Polish Patriots was sponsored as an unofficial rival to the London Government. "Agreement" in this context has served to mean little more than the acceptance of Soviet terms. There exists in Poland an entire "underground state" owing allegiance to London and capable of co-operating with the advancing Red Army in administration; but the Russians will not recognise its existence because the Government in London will not accept their terms.

*

Neither retrospects nor recriminations can be very helpful at this stage. If it is true that Marshal Stalin has decided to close the door to M. Mikolajczyk's Government, it will not be possible for the British and American Governments to follow his example. They will have no option but to make this plain to their Russian ally. But if they can, and should, deal only with the legitimate Government of Poland, they can, and should, do everything in their power to persuade that Government to face the facts of the new situation produced by the appearance—and, still more by the proclaimed policy—of the Russian-recognised Committee. Everything possible must be attempted to bring the Government and the Committee together.

It is in the truest interests of the Polish Government itself that this attempt should be made. Judged by all pre-war standards the Government in London is as representative of its people as any exiled Government can be. The Committee of National Liberation, judged by the same standards, is altogether unrepresentative. It is composed of Polish Communists and of a number of Right and Left wing non-Communist politicians most of whom have been until lately interned by the Russians. If the issue were to be left to the free play of internal political forces in Poland, the coalition of the four Polish parties which form M. Mikolajczyk's Government would almost certainly have a substantial majority. The chief strength of the Committee is, in fact, that it enjoys the full support of the Soviet Government and the triumphant Red Army; these assets do not support a claim to speak on behalf of the Polish people.

But this is by no means all that is involved. There are certain social and political facts in the present situation in Poland itself that must be faced; and, with these in view, the new Committee has begun its career shrewdly.

On the first day of its existence, it proclaimed a series of important social reforms, chief among them being a land reform which is to be carried out at once in liberated Polish territory. At a stroke the long-strained social structure of Poland is to be altered. "Estates hitherto held by Germans or by traitors, as well as the estates of great landowners possessing more than 50 hectares (125 acres)" are to be confiscated and shared among the small peasants. "In the provinces incorporated in the Reich" the maximum of land which can be retained by the landowners has in principle been fixed at 100 hectares (250 acres). The confiscated land will be distributed to holders who possess less than twelve and a half acres of land.

There can be no doubt that this measure, if applied, will set on foot a genuine and popular agrarian revolution in Poland—even though it may also reduce Poland's potential power to produce food. According to the 1931 census, there were 14,700 estates in Poland larger than 125 acres. About 5,500 of these were in Eastern Poland and were distributed among smallholders when the Soviet Armies entered Poland for the first time in September 1939. The present reform would therefore affect 9,000 estates in Western Poland. The area made up of estates of over 125 acres was, in the whole of Poland, about 22 million acres, roughly one quarter of the total arable land. Some 1,900,000 holdings, that is, 64 per cent of the total, were smaller than twelve and a half acres; and of these a high proportion were tiny plots of less than five acres.

The peasant's hunger for land is, as it always has been, the crucial problem in Polish social policy, and it is to this hunger that the Committee has made its first appeal. True, an agricultural reform was carried out in Poland in the inter-war years. Between 1919 and 1938 more than 6,000,000 acres were bought by the state from the great landowners and distributed among the peasants. But the pace of the transfer was too slow compared with the amount of incredible poverty that was accumulating in the countryside. The landlords' obstruction of the reform only sharpened the peasants' hunger for land. Unfortunately—and, as it may now prove, disastrously—the Polish Government in London, though dominated by the Peasant Party, has shown an astonishing timidity even in discussing schemes for any further land reform. The pressure of the landlords has proved too strong even in exile.

It is by means of this trump card that the Committee hopes—at least among the peasantry—to win the majority which it conspicuously lacks. The beneficiaries of land reform will be all holders of less than twelve and a half acres; in 1931 they still numbered nearly two-thirds of the agricultural population, and the proportion was not much smaller in 1939. In other words, the Committee offers two-thirds of the peasants a vested interest in up-holding the regime which it intends to set up. Any Government or group of politicians which opposes this reform or flouts this interest will be dubbed reactionary and lose the support of the peasant majority.

The Committee's programme combines curiously the appeals of social reform, nationalism and territorial expansion. It speaks of the incorporation into Poland of East Prussia, Pomerania and the whole of Upper Silesia, and of Polish frontiers on the Oder. It holds out to the peasants the promise of a mass colonisation by Poles of the provinces acquired from Germany. It promises also the restoration of property to the Catholic Church and to all Poles who have been expropriated by the German invaders. Wages, too, are to be substantially raised.

The proclamation of such sweeping changes by a *soi-disant* "provisional executive authority" is unprecedented. The great merits of some of the reforms are evident; the grave demerits of the proposed annexations and "*Drang nach Westen*" are equally so. But these are not now, at this moment, the immediately important points. What are crucial are the divergence in Allied policy and the prospect of actual civil conflict in Poland between the supporters of Government and Committee.

There is only too much reason to fear that the new Soviet-sponsored regime may mean the ruthless prosecution of those who maintain their allegiance to London. There is only one question to-day. What can M. Mikolajczyk and his Government, with the advice and sustenance of their Allies, do to avoid disaster?

The full force of British and American persuasion in Moscow to prevent the road to reconciliation from being irreparably blocked is an essential first step. On the side of the Polish Government, for its own sake and that of Poland, it is equally essential—without waiving any atom of its legal claim—to endorse those social reforms that meet Poland's and the peasants' needs; and to look frankly for some means of combination, on a constitutional basis, with the Polish elements whom the Committee represents.

It has been an error on the part of this Polish Government not to recognise fully the implications of the fact that, for all its undoubted legality, it too—like all Governments in exile—is provisional in character. Ultimately,

the people of Poland must choose for themselves what rulers they want after their long agony, and they will make their choice according to the deeds and the policies of the candidates. On doubt it has been the consistent intention of M. Mikolajczyk's Government, which has fought so stoutly against the German foe, to give them that choice—freely. Probably, if the Committee prevails, they will not be given the same freedom to choose. But they will be offered, it seems, a policy in part at least of popular and fundamental reform.

Thus, while it is unquestionably necessary for the Western Allies to stand up for the legal Government's rights, it is no less necessary for that Government to make good and justify those rights by steps which, in wisdom and realism, should have been taken much earlier. This is not, it should be repeated, simply a question of justice—though it is that. It is a matter of hard facts. The Polish Government has been most unfairly treated, but to save itself—if, indeed, that is still possible—it must act in a positive way, and act quickly.

Bretton Woods

THE Monetary Conference at Bretton Woods closed its session at the end of last week with the unanimous agreement of all the participants to the text of two documents, one of them setting up an International Monetary Fund, the other setting up an International Bank for Reconstruction and Development. (The terminology is confusing, since the Fund will conduct a banking business—that is, will deal in currencies—while the Bank is, in the main, a guarantee fund.) The Agreements now go to the Governments for ratification, and it has been made clear that no Government is committed by the vote of its delegation at Bretton Woods. What has been decided is the form that these two institutions will assume when (or if) they come to birth.

These two documents represent a very substantial achievement. The subject matter was technical and contentious, but 44 delegations have agreed. It is true that the Conference presented the unedifying spectacle of a technical gathering being jockeyed by purely political considerations, and the determination of the quotas resembled the process of political chaffering more than an objective attempt to achieve equity. Some of the results are ludicrous. Populous and powerful though the Soviet Union is, and immense as its services to the common wartime cause are, it is fantastic to suppose that its part in the financial transactions of the world either is, or for a very long time will be, at all comparable with that of the United Kingdom—yet the Russian quota is \$1,200 million against the British \$1,300 million. Or again, nothing save the fashionable political myths of the moment could justify a quota for China larger than that for France or double that for Holland—both of which presumably cover those countries' colonial possessions. The management of the Fund and the Bank will have to rise above this sort of petty huckstering.

On the whole, however, these can be accepted as surface blemishes and they are offset by many reasons for solid satisfaction with the results of the Conference. Not the least of these has been the harmonious co-operation of the American and British delegations. In the main, of course, this was due to the ironing-out of differences beforehand. But it has been demonstrated that solutions worked out in advance by the American and British Governments will be accepted by the United Nations as a whole with a minimum of amendment and—so far as can be judged—an absence of resentment or of charges of dictation. This is an omen of great promise.

So far as can be judged from the summaries so far available, of which the substance is given on page 156, the two schemes have, in fact, been very little altered from the form in which they emerged from the American-British negotiations. There are, nevertheless, some altera-

tions in the Fund that should be noticed, and it must be said, in candour, that they are not improvements. The item in the joint proposal of last April which was most generally applauded in this country was that which provided for the rationing of a scarce currency and allowed for the possibility of discrimination against a country which persistently failed to make its currency available in sufficient volume. In British eyes, this proposal provided a way out of a dilemma which is greatly feared in this country—the dilemma of being limited in our purchases from sterling countries because we are short of dollars. In the final version, it would appear that this proposal has been dropped. All that is now provided for is that, when a currency is in short supply, the Fund may issue a report "setting forth the cause of the scarcity and containing recommendations designed to bring it to an end." Furthermore, in addition to the omission of this proposal for putting pressure on the chronic surplus country, there are some new provisions for putting increased pressure on the chronic deficit country by taxing it upon the use that it makes of the Fund, in excess of its quota. These two pro-creditor and anti-debtor shifts have altered the balance of the Fund since the April proposals—not by any means fatally, but to an extent of which notice will have to be taken.

It is not possible from the summaries to determine exactly how far the Fund would interfere with the working of the sterling area. It appears that "discriminatory currency practices" are to be eschewed, but this might mean almost anything. British opinion will want to know whether the Conference agreed with the view expressed by Lord Keynes in the House of Lords last May, that this did not exclude voluntary agreements between, say the United Kingdom and New Zealand to stabilise the expenditure of each in the other's country. Another matter which needs scrutinising with great care is the time-table proposed. It appears to be contemplated that the Fund shall be in operation within eighteen months from now; but there is also to be an interim period during which exchange controls are still to be permitted. What is not quite clear is whether exchange rates have to be fixed before the end of 1945. If this is the proposal, it is hardly practicable.

The scheme for a Bank for Reconstruction and Development has had less public discussion, but it would appear to raise less contentious issues. Of its total capital of \$10 billion (of which \$9,100 million has been allotted), only one-fifth is to be called up in the first place and used as a fund for the Bank's own lending operations.

The rest is a contingent guarantee fund, by which the Bank can guarantee issues made on the public market either by itself or by other public or private bodies. As Lord Keynes frankly indicated in his inaugural speech to the Second Commission, it will be the American market (or the American Government) which will have to find the money; the other countries will bear their share of the risk. Since the guarantees will relate only to interest and service, very large sums could be guaranteed in this way, at a cost to the borrower of only 1 to 1½ per cent above the market cost. This is, in substance, an extension of the League Loan method of the 1920's. And the memory calls up the one great unknown in the Bank's prospects—how many loans are there likely to be which are safe enough to meet the Bank's standards and yet not safe enough to float on their own merits? But whether the scale of its operations proves to be large or small, the Bank will clearly, *pro tanto*, be rendering a service. It will be a most useful long-term adjunct to the short-term functions of the Fund.

The Agreements now come back to the Governments for consideration—among others, to the British Government. Should they be ratified? Before the question can be answered, it is as well to make a distinction between the content of the Agreements and the assumptions on which they are based. From the technical point of view, though they have blemishes, the Agreements should be acceptable. That is to say, if the sort of world for which they are designed comes to pass, then those arrangements are probably better, on the whole, than any others to which 44 nations could be brought to agree.

But the assumptions need the most careful examination. The whole structure is based on the assumption that the post-war world will be a place in which the nations will be able to balance their incomings and outgoings within a small margin, without exchange controls on current transactions, without "discriminatory currency practices" and without more than a very limited power to change the gold values of their currencies. The margin is smaller than might be thought at first sight, for, in practice, it will be the available amount of dollars and gold that will set the limit. The United States quota is \$2,750 million, that of Canada (the other probable "hard" currency is \$300 million; and the Fund will probably start with about \$1,000 million, at most, of gold (other than that subscribed by the United States and Canada). The total of gold and dollars may be about \$4,000 million. Moreover, these are not annual figures, but totals. There was originally a suggestion (not referred to in the summaries) that no country should draw more than a quarter of its quota in any one year. If this provision has been incorporated, the basic assumption is that the balances of payments of the world will, every year, be within \$1,000 million—or £250 million—of balance. If the provision has not been incorporated, the condition cannot be stated with such precision, but will not be substantially different.

Now this is a very large assumption. It is not an impossible one. But before it can be said to be a probable one, all sorts of other conditions will have to be established. This has, of course, been recognised from the start. The sort of world in which the Fund would work would be one in which at least the major countries were successful in avoiding unemployment crises, in which there was a substantial lowering of tariffs and other trade barriers, in which creditors behaved as creditors should, in which debtors did not default—in short, in which balances of payments were naturally brought into equilibrium by expansion, not forced into it by contraction. To ask the question whether these Agreements should be ratified is in reality, to ask what prospect there is of a reasonably close approach to such conditions.

The answer must be largely sought in the United States. Not only is America now by far and away the most powerful country in the world, exercising a dominant influence on the world's economy, but America is also the country that is the least persuaded of the necessity of taking positive action to control the economic environ-

ment of human activities. The fate of the Bretton Woods Agreements when they are submitted for Congressional approval will, in itself, be one indication of what can be expected—and it goes without saying that British ratification should, in any case, await the action of Congress. But even if the Agreements survive the Congressional test, there will still be many other matters on which the British Government will need to hazard a guess. What are the prospects of an effective employment policy in the United States? What are the prospects of America so greatly increasing its purchases from, or lendings to, other countries as to bring its balance of payments into equilibrium? To ask these questions is not to suggest the answers to them, still less to suggest that the answers will necessarily be unfavourable. But they will need to be answered before the British Government can afford to take the risk of ratifying the Bretton Woods Agreements.

"The risk of ratifying"—for the essential difference between the American and British positions is that there is virtually no risk for the United States in ratification. Let us suppose that the worst happens, and that the post-war world is not one of balance and expansion, but of distortion and depression. America risks, indeed, the loss of a sum in dollars and gold equal to the cost of carrying on the war for ten days—and "loss" means, of course, that this sum will have been spent in the United States by other countries. But all the other provisions of the Fund would, in such circumstances, be more in America's interest than in any other country's. As in the depression of the 1930's the American interest would be to prevent other countries from imposing exchange controls (which the strong dollar would not require), from depreciating their currencies, and from discriminating against purchase of American goods because they were shorter of dollars than of other currencies. The closer the approach to the gold standard—which, in these days, is a dollar standard—the better American interests are served, in prosperity and depression.

But Britain is in different case. Even in deepest crisis, Schachtism will never pay this country. But it is in the British interest to be free to make the best of a bad job if a bad job is what has to be faced. And the circumstances of the United Kingdom dictate other methods of making the best of a bad job from the American. If the circumstances of 1931 were to recur, Britain would wish to be able to allow the pound sterling to find its level and to concert measures for stabilising trade within a group to which all countries that would abide by the rules should have access. A Bretton Woods system would not be in the British interest in times of crisis.

British policy is thus faced with a dilemma. Here are proposals which will confer benefits on the world if certain optimistic assumptions are fulfilled, but which may be a dangerous tying of hands if the hopes are not realised. On the other hand, to reject them is to surrender once and for all the chance of realising the hopes on which they are founded. It is the same dilemma that was faced, though less consciously, over the return to the gold standard twenty years ago—for the new proposals are, if not a version of the gold standard, at least based on the same fundamental conceptions. It would be easier to have faith that faith alone will suffice if there were not so recent a proof to the contrary.

He is a fortunate man who can reach a definite conclusion in so difficult a dilemma. Two things should, however, be reasonably clear. The first is that every effort should be made, as speedily as possible, to fit together the other parts of the jigsaw—particularly the important sections labelled "commercial policy" and "employment policy" in order to build up the assurance of a reasonable world economy. The second is that, pending this effort, there can be no question of rejecting the Bretton Woods Agreements. But whether they should be unconditionally accepted, for immediate application, is a matter which must necessarily await further evidence of the trends that are to be expected. That evidence will have to be sought, above all, in the results of the American election and in the temper of the American public and Congress in the months that are to come.

NOTES OF THE WEEK

Continental Front

For the last few weeks the military situation in Europe has been completely dominated by the unparalleled speed of the Russian advance. The great pace of the war in the east has strikingly contrasted with the slow progress of the advance in the west. The question is inevitably asked why this contrast should be. What is it that has enabled the Russians to attain so stupendous a mobility? What is it that has reduced the Allied forces in Normandy to almost stationary warfare? The chief advantage that the Soviet High Command enjoys is the enormous length of the front which now stretches over a distance of more than one thousand miles. When the attacker's striking power is superior to that of the defender, and when his initiative shows no sign of slackening, then his ability to spring surprises on the enemy, to manoeuvre and to co-ordinate blows grows in progressive proportion to the length of the front. Conversely, the shorter the front, the greater the chance of the defender to saturate his lines with men and material, and the smaller the opportunity for the attacker to achieve mobility. The Soviet High Command has partly to thank Hitler's "intuition" for the operational advantages on which it can now count. In the course of the whole war, Hitler has proved himself incapable of ordering a single large-scale withdrawal calculated to shorten his lines. Even now, when the Russians are already within striking distance of the Riga-Tilsit railway, the last route of retreat from the Baltic lands, the German armies there are ordered to "stay put." This enables the Russians in the Baltic area not only to conquer territory, but also to annihilate the enemy's armies in the best Clausewitzian manner. But it is not only Hitler's folly that lengthens the front. Russian strategy deliberately does the same, to splendid purpose. Within a few days the Russian lines in southern Poland has turned in a semi-circle from Rovno and Brody, east of Lwow, right to Przemyśl, which lies half-way between Lwow and Cracow. This single advance brought the Russians appreciably nearer to Upper Silesia and it lengthened the front by more than a hundred miles. In the centre, wedges have been driven almost to the gates of Warsaw, at Lukow and Deblin; and the cumulative effect of such "wedges" and "salients" is also to lengthen the front. The question of how the Russians manage to keep their supply services running at the pace at which their armies advance is at least partly answered by the fact that it is the very speed of the advance that saves communication lines and potential supply bases from destruction by the Germans, and leaves them available for the Russians.

Close Quarters

Allied strategy in Normandy has clearly been fettered by the shortness of the front. The full superiority of the Allied forces cannot be brought to bear on the enemy as long as he is not compelled to disperse or spread his forces to face a wider threat. When the invasion of the Continent began, it was generally assumed by the layman that the Allied Command would try to establish more than one beachhead. It cannot yet be said whether that assumption was wrong or not. But the German Command is apparently no longer acting on it. The enemy has seemingly taken it for granted that the Allies have for the time being chosen to use the Norman beachhead as their only jumping-off ground. Consequently the bulk of the German reserves have been thrown into Normandy. This, no doubt, leaves correspondingly greater opportunities for the Allies elsewhere. But General Montgomery's forces have in a sense become imprisoned in the beachhead. His recent attacks to the south and east of Caen were formidable but ineffective attempts at breaking the prison gates; and, at least outwardly, they were reminiscent of the stationary war of material which France saw in the last war. Even so, it cannot be said that this type of warfare holds out no promise of a more or less quick transition to mobile warfare. If General Montgomery does succeed in breaking through and crushing the hard crust of the enemy's defences in Normandy, he will perhaps have won the decisive battle before advancing inland. Experience in Italy points to this possibility, though it should not be forgotten that, at the decisive stage of the fighting in Southern Italy, the enemy was actually forced to disperse his forces between the Liri front and the Anzio beachhead.

Economic Diplomacy

When Lord Beaverbrook rejoined the Government last year, as Lord Privy Seal, there was much speculation on what his functions would be—apart of course from sitting on the left hand of the Prime Minister as consultant-in-general. It has since become clear, from his appointment to conduct successive negotiations of varying informality with the United States Government on civil aviation and oil, what one at least of his rôles is; and a most important job it is, too. Broadly, Lord Beaverbrook seems to have been set the task of exploring the possibilities of an accommodation after the war between the policies of this island and the continental United States on a number of matters of the highest commercial significance. In a sense, considerably more can be learned about the likely attitude of the Americans in business affairs from *ad hoc* talks of this sort than from the more formal and more technical proceedings of conferences of the kind that has just been concluded at Bretton Woods—despite the political and nationalistic prepossessions that tended to dog the experts' discussions even there. Flying and oil and rubber arrangements are specific instances by which to test post-war intentions, and it is only by thus getting down to cases that the real aspirations of American (and British) politicians and business men can be discovered. This is not to say, or even to suggest in the slightest, that secret diplomacy conducted on a purely empirical basis is preferable to the settlement of international policy in open conference. Quite the contrary is the case. But when critics claim, quite rightly, that the worth of such steps as the setting up of an international investment bank or exchange fund cannot be calculated until it is known what commercial policy the United States will in fact pursue, they are more likely to find the answers to their questions in what transpires during Lord Beaverbrook's talks than in the formal acts of the full-dress conferences. It is for this reason that some little concern has been felt at the manner in which these negotiations were becoming, as it were, a separate department of policy, divorced in the person of the Lord Privy Seal—whose economic qualifications are not perhaps among his most outstanding—from the regular conduct of economic diplomacy by the Treasury, the Foreign Office and the economic departments. For this reason it is reassuring to learn that Mr Law, Minister of State at the Foreign Office, and Mr Lloyd, Parliamentary Under-Secretary of the Ministry of Fuel and Power, head the powerful inter-departmental delegation which is assisting Lord Beaverbrook in the oil talks.

Continent, Island and Empire

The results of Lord Beaverbrook's tour of missions on civil aviation and oil have not, and will not, be published, apart from the most general forms of words about the degree of agreement reached. But it is already quite plain that one central problem of policy has been found to be common to these topics, and to the question of rubber which is also under discussion between the American and British Governments. This problem is the difficulty which arises when the attempt is made to work out agreed principles that will be equally applicable to the policies of the United States (or Russia) whose home resources and markets are on a continental scale and to Great Britain whose resources and markets lie so largely outside her frontiers. Because of this difference in size and situation the simple formula that each Power should cultivate its own garden in its own way, while policies outside their frontiers should only be decided by mutual agreement, cannot be relied upon to produce an even-handed result. It is this difficulty that causes the principle of "non-discrimination" in general trade policy, for instance, to be regarded rather differently from the British and the American angles—even though, in a world of countries all as willing to buy as to sell, it would be equally desired by both. It is this difficulty that causes the Americans with their own home continental air routes to approach the international issues of civil aviation rather differently from the British, whose home routes are negligible and whose Imperial and European routes are vital. It is this difficulty, finally, that causes the British, whose oil and rubber resources are all overseas, to view proposals for the international control of extra-

territorial supplies of oil and rubber rather differently from the Americans, a large part of whose oil and rubber (synthetic) resources are inside the United States. In most of these respects Russia comes into the same category as the United States. One conclusion is obvious; there must be a good deal of give and take in any agreement on these topics to ensure that no country will be unfairly handicapped by arrangements to tie all countries' hands abroad while leaving them quite free at home.

Mr Gandhi's Pronouncements

In some ways Mr Gandhi bears a surprising resemblance to the late Mr Gladstone. He has the same conviction of the moral rightness of his every political manoeuvre, and he has the same capacity for making the most important pronouncements of policy in what always seem to others ambiguous and equivocal terms. This month Mr Gandhi has set out in an oddly circuitous way, by a series of interviews, letters and speeches, to explain where he now stands in comparison with 1942 at the time of the Cripps offer. The upshot, however, has been that confusion has become worse confounded. At first high hopes were raised of an end to the Indian deadlock by the apparent admission by Mr Gandhi that he now favoured, broadly, the principles of the Cripps offer of independence, and was willing to concede autonomy to Moslem areas. Then followed a number of glosses, riders and interpretations—some of them, to the lay and Western mind, simply contradictions—from which must emerge the reluctant conclusion that not even Mr Gandhi knows what he really does mean. He says that he would be satisfied with a National Government limited in its functions during the war by "the exigencies of war"; he would advise Congress to participate. Then he adds that he still adheres to the "Quit India" resolution of two years ago, and denies that his proposals can be identified with those of Sir Stafford Cripps. He offers to the Moslem League what in the plain interpretation of plain language would appear to be partition. Then he denounces the Cripps offer for having suggested "vivisection." He pronounces what is apparently intended to be a programme. Then, in effect, he declares that he no longer has any responsibility for policy and speaks only as an individual with a moral obligation.

What Next?

To outward seeming the chief mark of Mr Gandhi's recent proceedings would appear to be irresponsibility. In effect, Mr Gandhi, by this series of unclear and contradictory statements, is making a calculated attempt to throw the responsibility for the deadlock upon the British Government and Mr Jinnah. In addition, half-hidden in the mass of abstractions and generalisations, there is an equally calculated and very significant demand for the inclusion of the Indian States in any independence plan—though Mr Gandhi is "no enemy of princes." The Viceroy and the British Government are no doubt right to feel that, when all has been said, there is still little or nothing upon which to go further forward. Nevertheless, it is an important fact that a considerable section of responsible opinion both in India and this country believes that at least a new opportunity for discussion has been provided. Obviously, the line could be taken that the test of Mr Gandhi's overtures will be his success in arriving at an agreed formula with the Moslems, and that nothing further should be done until this has been provided to begin with. On the other hand, it is desperately important not to miss any chance. Probably no policy can be decided until Mr Jinnah has spoken his mind, which may be before this issue of *The Economist* has been printed. But it would be quite wrong for the British Government or the Viceroy to decide out of hand to stand pat. Possibly no better way could be discovered of throwing the responsibility back where it belongs—that is, upon Mr Gandhi and his colleagues—than to propose a conference on the basis of his suggestions, whatever they may be, at which all sections of Indian political opinion (including the imprisoned Congress leaders) might be invited to attend.

General Tojo's Successors

After a long period of unparalleled victory and expansion, the Japanese are now in an equal series of defeats. The loss of Saipan is all the more depressing after the other losses that preceded it. In Japan material conditions have been growing worse in the last year. There are shortages and restrictions, and the masses are feeling the weight of total war. This is the background of General Tojo's dismissal. It is not a major change, nothing comparable to the dismissal, say, of Mussolini, but it does mark a change of policy in Japan. Under Tojo, practically all the power was concentrated in the hands of the military leaders. The system worked well enough as long as victory followed victory. Now that the phase of defeat and retreat has begun and the actual physical defence of the Japanese homeland may be necessary before many months are out, a military government without roots in the people, without a mass movement to back it or even normal political contacts, cannot ensure enough popular support to tide the country over the coming difficulties and dangers. The Emperor has therefore found a scapegoat in Tojo, and ordered General Koiso and Admiral Yonai to construct a more popular and more broadly based government. Incidentally, the statement published in last week's *Economist* that Marquis Kido had been entrusted with the formation of a new Ministry was taken from an incorrect report from the news agencies. According to Japanese constitutional practice, the Emperor called Marquis Kido into consultation and entrusted him with the task of finding a new Prime Minister.

In the new Koiso-Yonai Government, the military are reinforced by the inclusion of representatives of the old political parties and the old parliamentary life of Japan. Mr Machida is included, who at 83 is the Grand Old Man of Japanese politics. The Minister of Transport, Mr Shimada, and the Minister of Agriculture and Commerce, Mr Maeda, are former members of the Seiyukai. The Foreign Minister, Mr Shigemitsu, was a member of the Tojo Government; but he, too, has connections with Japan's "Liberal" past in the foreign field. Admiral Yonai

BUSINESS ENTERPRISE AFTER THE WAR

Small and medium-sized businesses in all branches of industry and trade must have every opportunity of contributing, by their enterprise and initiative, towards the nation's economic well-being after the war. They must be given full support in developing British trade at home or in overseas markets.

Changes due to war conditions call for a far-sighted policy concerning the financial aid they may need. This Bank, through its branch managers, will therefore be prepared to consider enquiries from promising undertakings, whether old or new, conducted under good management. It will base its consideration of each proposal as much upon the prospective borrower's integrity and business capacity as upon his material resources.

MIDLAND BANK LIMITED

is the link between these men and the military representatives. As was reported last week, the offices of War Minister and Chief of Staff and Navy Minister and Naval Chief of Staff, fused under Tojo, have been separated again. To mark the complete break with Tojo, the Chief of Staff he dismissed, Field-Marshal Sugiyama, is the new Minister of War and General Umez, commander of the Kwangtung army, is Chief of Staff. Altogether, the new Government may be called a government of national concentration. It is a coalition between the military and the old political groups. It will be the job of the army and navy to put an end to the series of defeats. The politicians will be expected to rally the people to active support and defence, and to prepare them for the much greater ordeals which lie ahead. This is not a "peace government" whatever individual rôles some of its members may play on some future and more desperate occasion.

From Algiers to France

On Tuesday the Consultative Assembly at Algiers passed a motion of confidence in General de Gaulle's Government. The vote reflected the growth of General de Gaulle's prestige after the striking diplomatic successes which he scored during his recent visits to London and Washington. In backing his foreign policy the Assembly was virtually unanimous. But the debate has revealed the uneasiness caused among Frenchmen by the trend of French domestic policy. A Radical member of the Consultative Assembly declared that

with a concentration of power in the Government's hands unknown in the history of democracy, it seemed that all the conditions were present for the establishment of personal power.

The fear of personal power has been newly stirred by the establishment of a virtual monopoly of news services in liberated France under the control of the Provisional Government. M. Bonnet, the Commissar for Information, has declared that the monopoly is to remain in force only provisionally, during a period of six months after the liberation of the country. His statement, however, has hardly

removed apprehension. The six months during which the monopoly will be in operation will be those of the electoral campaign in France, during which the French people will be more than ever in need of uncontrolled and unmanipulated information. General de Gaulle's successes in foreign policy have enabled him to obtain from the Assembly an "over all" vote of confidence covering foreign as well as domestic policy. Only four voices were raised in the Assembly against the vote. But indications are that, if the Provisional Government insists on its present quasi-authoritarian line, it will provoke deep disunity in France after liberation. The session of the Consultative Assembly that was closed on Tuesday last was presumably the last meeting of the Assembly on North African soil. The Assembly is now to be transferred to Metropolitan France. It is a pity that, before this happens, its message to the French people was not one that encourages the hope for the full revival of France's great democratic tradition.

More Men for the Army

Members of Parliament on Tuesday pressed Sir James Grigg for more information about the conditions under which men are being transferred from the Royal Air Force and the Navy to the Army. One suggestion was that the men so transferred should be formed into separate brigades, so as to preserve their links with the Services in which they had originally enlisted. Sir James Grigg explained that to organise them separately would defeat the purpose of the transfer, which was to maintain the fighting strength of existing units and formations in the Army. But he said that the men would be posted in small groups rather than individually and, as far as possible, would be allowed to express preferences for particular arms and regiments. At this stage of the war it is inevitable that the Army should receive the highest priority in manpower, and for some time past the authorities have been concerned about how to find more soldiers without depleting the labour strength of essential industries and services. The Cabinet's decision to transfer men from other fighting Services is a gratifying reflection of the mounting strength of the Allied air and naval forces, and of the low rate of casualties inflicted by the Luftwaffe or the U-boats. RAF men are also being used on the railways, where the pressure of war transport has been aggravated by the strain of holiday-makers and evacuees. Airmen, sailors and marines have now been brought in to help repair bomb-damaged houses in Southern England. All this shows that although a manpower budget has to be planned well in advance, the allocations made between the various fighting services and home industries, it has to be highly flexible and rapidly adaptable to meet the needs of the moment.

Billeting in Private Houses

The most important point to be made immediately about the evacuation (official and unofficial) of some 250,000 persons, mostly children and women, from the bombarded London area is that it has been very successful. Some sort of billet has been found for all but an infinitesimal few of the official refugees. Moreover, in spite of the publicity given to some hard cases and bad feeling, the welcome given to them by their hosts has on the whole been gratifyingly good. What has undoubtedly been shown again, however, is that the centuries-old dislike of the British people for billeting in private houses, embodied in some of the key documents of the "unwritten" British Constitution, has not grown weaker with the passage of time, and is now much stronger in the case of billeted civilians (especially families) than of troops, whose unwelcome presence it was that gave rise to the traditional complaints. In part this war's expressions of this dislike have been due to a sense of inequitable treatment: to the feeling that the large houses of the better-to-do are not always called upon to give their proportionate share of accommodation; and, in several recent instances, to the fact that, in some holiday resorts, lodging-house keepers were in effect called upon to ply their trade—that is, to take in guests—at cut rates. In addition, there are other real grievances arising from the present shortages of household equipment. Mostly, however, it is the same general disinclination to share homes—especially with "foreigners" from another part of the country—that has been in evidence this year as four years ago;

and it is surprising that the lessons of the first evacuation did not lead the Government to explore more thoroughly all possible alternative ways and means of housing refugees: in Butlinesque camps (so popular among holidaying families before the war) or in requisitioned houses. Certainly this seemed at the time (in 1940) to be the chief moral of that great dispersal; housed in this way the migrants would have taken up less room, not more, than in private houses; and a considerable amount of this sort of accommodation must have come, or be coming, available with the exodus of troops. However, the best is being made of what is not a very good job.

The Future of the ILO

On Wednesday the Commons debated the International Labour Organisation. Members of Parliament congratulated the British delegation on its work at Philadelphia; they expressed general agreement that the ILO was a good thing; hopes that the Philadelphia Charter would be translated into practice, and not remain an academic document; and regrets at the absence of Russia from the counsels of international labour. Mr Bevin, after losing his temper with Conservative back-benchers—a sign perhaps that the Coalition as well as nerves are beginning to fray—repeated what in his view, and presumably that of the Government, should be the role of the ILO in reconstruction: "the precursor of an international parliament in the wider field." Mr Bevin has, of course, always been a champion of the ILO, and a believer in the tripartite, Government-employer-worker, relation on which it is based. There is now no question, as there was perhaps a year ago, about the continuation of the ILO or about its value as an international agency. The Philadelphia Conference, committing the representatives of over forty nations to a broad programme of social reform, firmly re-established the ILO's position, and Parliament has now fully endorsed the actions of the British delegation at the Conference. There is, however, still question—and neither the Philadelphia meeting nor Wednesday's debate succeeded in classifying the issue—about the methods of implementing ILO recommendations, and about its functions in relation to any future world economic organisation. The ILO is only an advisory body—it cannot enforce its decisions or apply sanctions to members who fail to comply. For its effectiveness it must depend on the goodwill of Governments, and more particularly on the strength of national and international trade union movements which are always the most concerned to see its principles adopted. Moreover, to be really effective, as *The Economist* has consistently argued, the ILO should concentrate on the social and labour problems, and should not dissipate its energies over the whole field of economic problems, as some of its more enthusiastic supporters would like to see.

The City

The report of the Improvements and Town Planning Committee of the Court of Common Council of the City of London, which was presented on Wednesday, is a mine of historical and graphical information about the affairs and problems of the City's layout. It is not, however, in any sense a plan to make that layout in the future either worthy of the area's unique position or appreciably more workable, in terms of transport, traffic and accommodation, than it was in the years between the wars. It is as an Improvements Committee rather than as a Town Planning Committee that its authors have approached their task. It is significant that they begin their report by denying, on the best of authority, that a great opportunity was lost at the time of the Great Fire nearly three hundred years ago. Their exposure of "the legend of the so-called rejection of Wren's plan" is a fitting preface to the proposals for street widening and land-use zoning that follow. In most essentials the report could, and should, have been written before the bombing of the City and the official acceptance of the principles of area planning made more ambitious projects possible. In the conclusion of the report, it is stated that "we have not dealt with the financial problems of reconstruction." In fact, however, the report is dominated by financial fears. In effect, it is taken for granted that there will be nothing commensurate by way of betterment or

other financial assistance to offset the very high cost of compensation if radical reconstruction is attempted. It is recognised that the matter is still open, but the worst is assumed. The basic formula, therefore, is "safety first"—and the restoration of rateable value. The City of London is not to be planned as a great single national precinct. Instead, it is to be improved piecemeal—in a number of no doubt necessary and important directions. St. Pauls may be given a little more space to stand in and to look out from. There may be an eastward extension of the Embankment and a ring-road (made up of existing routes). But the real aim is to restore at least the old amount of City activity—indeed, if possible, to get in eight workers (by the use of higher buildings) where there were five before. The vision some have had of a city worthy of the Greater Britain of which it is the centre will remain visionary. It may indeed be that, by the failure to solve problems of finance which cannot be disregarded, this will prove to be the only feasible method of mitigating the problem of city congestion; and the City is characteristically made up of hard-headed business men. It is not now the habit of the City to take bulls by the horns. But if there is a case anywhere for the over-riding of purely financial considerations, it exists in the City of London because of its historic national and international importance and because of the opportunity that has been given to refrain from undue rebuilding by the action of the enemy and by the evacuation for several years of many firms. It is of course true that the congestion of the City, the high site values involved and the multiplicity of landed interests concerned make the task of restraint and redesign peculiarly difficult. But the authors of this report show no appreciation at all of the fact that it is the crowding of business in the City that is a central and direct cause of the living and travelling problems of the entire Greater London area. There could be no better example of the necessity for an effective and early solution of the problems of unitary local replanning and compensation. The Committee has stated the City's dilemma; it has made no real attempt to resolve it.

Making the most of the NATION'S MILK

THE demand for liquid milk is constant, but the supply is less in winter than in summer when there is a surplus. This surplus can be conserved in a number of ways, one of which is to make Milk Chocolate. Cadbury's Milk Chocolate retains the valuable milk solids (fat, protein and lactose) which contain calcium, phosphorus and vitamin D. Only the water which comprises roughly 87½ per cent. of the milk bulk is eliminated. Milk Chocolate is a compact and highly concentrated food, easily kept and transported and requiring no elaborate packaging. It retains the full food value of the milk almost indefinitely without special storage or canning.

Cadbury means Quality

DOES A MAN WHO EATS THE RIGHT FOOD NEED VITAMINS?

IT'S a catch question: "Does a man who eats the right food need vitamins?"

The answer, of course, is: No. Or, rather: Yes, he does need vitamins—but he gets them.

The governing word in the question is "right."

But eating the right food presupposes an ideal world of plenty, where the right food is available and where education and economics encourage the proper feeding of all sections of the population.

Consider the position in Britain today, after five years of war. The *per capita* intake of vitamins in the diet is almost certainly higher now than before the war. The Government have taken measures to fortify all margarine with Vitamins A and D, so that it has a vitamin content equal to summer butter. Children under five, and pregnant women, are given an allocation of Vitamin C in orange juice, and Vitamins A and D in cod liver oil.

Our fighting men in the Western Desert received synthesized Vitamin C tablets.

It is interesting to remember that as recently as six years ago the mass production of vitamins, necessary to apply this knowledge, would not have been possible. But today, at the Roche plants in Britain, synthesized vitamins are made by the ton. It is this mass production of vitamins that has

made them available on an economic scale.

It is certain that synthesized vitamins have played a very important role in keeping Britain at war in good health. The ideal world where the right food will be available to all may take some time to evolve, but no one in Britain, or in the countries of Europe awaiting liberation, need fear any shortage of these protective factors.

In a recent report in "The Practitioner" on the Medical Aspects of Axis Prison Camps, it was stated: "Before being taken prisoner most of the British and South African troops had been receiving a routine dose of ascorbic acid (Vitamin C) in tablet form while campaigning in the desert. This, coupled with the fact that on one or two rare occasions we were able to obtain for the men a few fresh tomatoes and onions (at extortionate prices), apparently served as sufficient protection against the development of any clinical scurvy in the camp during the first five months after capture."

The Geese are Dying

The debate in the House of Lords last week on the sources of national expenditure on social services gave Lord Woolton an opportunity to lay a number of persistent economic bogys. The extension and expansion of social services are to be regarded not only as an expression of humanitarian ideals but as a sound business proposition. Lord Woolton estimates that current absenteeism due to sickness is costing the country £280 million a year. Even when abnormal conditions due to war no longer exist sickness absenteeism will impoverish the nation by about £180 million a year unless the general standard of health is improved. Every pound spent wisely on social services reduces in some measure the overhead charges (losses from strikes, sickness, absenteeism and unemployment) which must be met out of the nation's resources. Lord Glasgow's lament, "the tax-paying geese are dying," drew from Lord Woolton the corrective, "We no longer depend on the geese that lay the golden eggs." The burden of cost which social progress entails cannot be shouldered by the few; it must rest on the broad back of the entire community. "The root of the matter," said Lord Woolton, "is to be found in the amount of business that we can do and not in the amount of money we can avoid spending." And the argument might continue: "The amount of business that we can do depends on the amount (and the quality) of the work that we do." The recent upheaval in economic thought is clearly demonstrated by Lord Woolton's definition of wealth as something produced by work—a definition that he called "modernist." If the definition is new, it is because it has been newly rediscovered. Britain's social and economic objectives can only be attained by the full use of her manpower. This means full employment. It must not merely mean hard labour for those who manage to avoid unemployment.

Whose Body?

The Goodenough Committee on the medical schools urged that in the interests of medical progress everybody, "whatever their wealth or status," should be willing to be taught upon when ill. At present, freedom from being

taught upon is one of the privileges which is bought by a private patient in a hospital; it is one of the most cherished privileges, and if it is to be taken away one of the chief reasons for becoming a private patient will disappear. There is a certain class distinction in this squeamishness. There are, it is true, many people in all walks of life who object to being used for demonstration, and many who have no objection at all. But, generally speaking, the "poor," who are normally taught upon, are free from squeamishness and even welcome the interest shown in their symptoms, whereas the "rich" have a rooted objection to public display of their disease. When the patient becomes a corpse, however, the squeamishness is on the other side. Again generally speaking, the "rich" would not mind if their bodies were sent to the dissecting rooms of the medical schools. The "poor," on the other hand, must have their decent funeral. Moreover, the state respects their wish. No corpse can be sent to the dissecting room if the next of kin objects, and the result is that unless there are bequests of bodies, the medical schools rely on unclaimed bodies in public institutions and on the co-operation of local authorities to hand them over. But, as Dr Neville Goodman pointed out in a recent lecture to the Royal College of Surgeons, the supply of bodies—subjects, to give them their technical term—is mainly perilously low. The effect of social legislation is that there are fewer casualties and fewer unclaimed bodies. Consequently, whereas formerly the maximum number of students per body was 16, in 1941-42, according to Dr Goodman, there were 12,582 students—including dental students—and 608 subjects, giving an average of 20 students per subject, or 3.2 per part instead of 2. When, therefore, new social legislation brings a further decline in pauperism and the demand from doctors brings an increase in the number of medical students, the supply of subjects relatively to the demand will fall to a level which may endanger the future of medical education and thereby the quality of the new generation of doctors. Social legislation may thus defeat its own ends.

The Goodenough Committee recognised this danger and commended it for the Government's consideration. The probable solution, as Dr. Goodman pointed out, is an increase in the number of bequests which in 1941-42 only accounted for 3 per cent of the supply of subjects. But, according to the present law, this is not so simple a procedure as it sounds. A would-be subject has to be reassured that his next of kin will raise no objection; forms have to be applied for. Red tape thus deters the "rich" from compensating for their refusal to be object lessons when they are alive by their willingness to be subjects for dissection after death. The Goodenough Committee suggests that the difficulties may be mitigated by administrative action which would not involve any change in the law. But, whether this takes place or not, propaganda is needed to convince rich and poor alike that their willingness to place their bodies, alive or dead, at the disposal of the medical schools is a direct contribution to the progress of medicine.

Shorter Notes

To fit in with the Government's plans for training men and women released from war service for civilian jobs (the details were given in *The Economist* of April 15th) the Army is working out its own scheme for the vocational guidance of soldiers and ATS. Sir James Grigg told the House of Commons on Tuesday that, as far as the war situation permits, regular periods in working or training time will be allotted each week for vocational education. The courses will cover a wide variety of trades and provide for practical work; they will be related to the wider post-war training which will be given by the Ministry of Labour.

In an article entitled "Which Way to World Order?" in last week's issue, Mr Sumner Welles's new book was described as supporting the thesis of a regional organisation of world security. This was based on a cabled review of Mr Welles's book which concentrated on its concessions to regionalism. It is now clear that Mr Welles, in the main, is a Wilsonian, a universalist, a believer in giving the Great Powers only a minority vote in the World Council—that is, an advocate of just the opposite views to those ascribed to him last week. This misunderstanding of Mr Welles's position is to be regretted—it is one more example of the difficulties with which international discussion has to contend in present conditions. The argument of the article is not affected.

AMERICAN SURVEY

After the Conventions

WITH the close of the Democratic Convention, the stage is set for the election campaign. The cast is settled; even the issues on which they will fight—or decline to fight—are moderately clear. So far there have been no major surprises. The nominations of Mr Roosevelt and Mr Dewey were foregone conclusions. The party platforms contain nothing unexpected. Even the dropping of Mr Wallace might have been predicted from the vigour with which the Southern Democrats have been outgunning for him. Senator Truman is what might be called a border-line Southerner, conservative enough to placate Texas and Louisiana, but with a record of service as chairman of the Senate Committee investigating the war effort which commends him to the East and to the AFL. This is not to say that the Democratic Convention was as carefully controlled as the Republican or that there were no fireworks. One element in particular caught the party managers, the bosses and the hacks unawares, and has left them a little perturbed. This is the surprising strength and energy shown by the Political Action Committee of the CIO. Even before the convention this body had scored some notable triumphs in defeating reactionary Senators and Congressmen in the primaries and in assuring the return of some hard-pressed Liberals. It very nearly saved Henry Wallace. The party bosses, alarmed by the demonstration staged on the Vice-President's behalf, accused the CIO of packing the galleries, and the CIO retorted by accusing Mr Hannegan, the chairman, of "bad faith" in pushing Senator Truman's candidacy. There is no doubt that the strength of the demonstration led to the sudden concentration of the most diverse elements behind Senator Truman. All the regulars were alarmed at this new manifestation of political influence and sunk their differences in what was almost a stampede to Mr Truman.

Conservative or Liberal?

In the event, the CIO failed to bring off the re-nomination of Mr Wallace, handicapped as they were by the cool and careful phrasing of Mr Roosevelt's letter, and Mr Hannegan's assertion that the President would welcome Senator Truman as running mate. The Liberals also failed to swamp the Southern group over the "equal rights" plank in the platform, and what has emerged is an evasive compromise which will hardly be satisfactory to the negro voter. For the moment the Conservative wing of the party appears to have triumphed, and even Mr Roosevelt seems to have estimated that the party's chances would be better if the Conservatives were not openly antagonised. Nevertheless, Mr Wallace, whose disinterested loyalty to the President was never better displayed, may not have been far wrong in suggesting that a new Liberal movement was born at Chicago. The CIO contains most that is freshest and most vigorous in the Labour leadership in America; it may provide a motor power to replace the expiring dynamo of the New Deal. Some commentators already are predicting the dissolution of the Democratic party if the breach between its Conservatives and Liberals is not healed. But the imminent collapse of the Democratic party has been confidently prophesied for a century.

Other speculations concern the future of Mr Wallace. Although he has been eliminated from the party ticket, it is certain that he will be found some new function. President Roosevelt is notoriously reluctant to lose an old friend if he can be shifted to a new job; and Chicago has shown that although the bosses of the party machine in New York, Illinois and Pennsylvania may dislike Mr Wallace, he has other friends as well. It has been suggested that Mr Wallace's role may be that of "thinker and prophet," the conscience of the Administration and the party. This

is very likely true, but Mr Wallace is too active to be content with dreaming New Deals.

In his acceptance speech Mr Roosevelt made it clear that he does not intend to fight on the ground so carefully prepared by Mr Dewey. The Republican candidate insisted that the conduct of the war and the fashioning of the peace really were outside party politics, and that they constituted no issues. Not so Mr Roosevelt, who insisted that the people of the United States must decide this November whether they turn over the job of winning the war and the peace to an

inexperienced and immature hand, to those who opposed Lend-Lease and international co-operation against the forces of aggression and tyranny, until they could read the polls of popular sentiment; or whether they wish to leave it to those who saw the danger from abroad, who have met it head on, and now have seized the offensive and carried the war to its present stages of success, to those who, by international conferences and united actions have begun to build that kind of common understanding and co-operative experience which will be so necessary in the world to come. They will also decide whether they will entrust the task of post-war reconstruction to those who offered the veterans of the last war bread-lines and apple-selling and who finally led the American people down to the abyss of 1932. . . .

Mr Roosevelt intimated that he would not wage a campaign in the usual sense. This quotation may, indeed, be Mr Roosevelt's version of how not to fight an election, but

THE DIE IS CAST

SANKEY-SHELDON engineers and designers are planning the new steel furniture and equipment for your post-war office and home. It will reflect the modern ideals of efficiency with its smooth-running drawers and close-fitting doors, its adaptable and adjustable shelving and standardised steel partitions. ● Only the die-pressed precision of steel can give the accuracy and permanence required. But Sankey-Sheldon Steel Furniture will be as pleasing to the eye as it is efficient. New colours and coverings will enhance the beauty of its functional designs.

WHITE HORSE

was growing old when
this war was young

If you have wondered how it is that you can still get White Horse Whisky from time to time, and how it is that the quality and flavour of this famous whisky were never better than to-day in this fifth year of the war, here is the answer in one word . . . age.

All the flavour, fullness and smoothness of the White Horse you have known in the past is in the White Horse you may buy to-day. For to-day's White Horse is itself a whisky of the past. In the early days of the war it was already growing old. It has been ageing ever since.

It was the stocks of maturing whisky, laid down in years gone by with a prudent eye on the future, which provided the great blend that is White Horse to-day. And our unrelaxing, provident care of the whisky still maturing is your assurance that this famous Scotch will remain as always — whisky fine as a fine liqueur.

it is not likely to be Mr Dewey's. It is already becoming clear that by bearing down so heavily on the issue of age *versus* youth, Mr Dewey may have been the architect of his own undoing. This will be particularly true if Mr Roosevelt's contention that the emergency is still upon the American people is accepted instead of Mr Dewey's implication that the real issues lie in postwar reconversion.

Mr Roosevelt did not fail to remind his listeners of his position as Commander-in-Chief. In Republican circles this is referred to as exploiting the war; but it is part of the determination not to allow the Republicans to assume that they would conduct the war as well as the Roosevelt Administration does. Nor will the Democrats fail to hit out all the time at the isolationist record of many prominent Republicans. This can hardly fail to bring into the open the unhealed breach in the Republican party, which was so elaborately and painstakingly camouflaged at Chicago. There are too many men in the inner circles of the party with pre-Pearl Harbour isolationist records for this to pass unchallenged; and if Mr Dewey chooses to defend them, he will inflame the Republican interventionists, of whom Mr Willkie is the best known, but not the only, member.

Mr Willkie's intentions are also the subject of a host of speculation. There is said to be great pressure being put upon him to declare himself for "Dewey and the straight ticket," but to date he has preserved a Sibylline silence. There is ample testimony that a good many Republicans share his dislike for the Republican platform's lukewarm attitude to international collaboration. An article in the current issue of *Harper's Magazine* contends that the Republicans have already sustained a heavy loss through their too summary dismissal of the man who piled up such a huge vote in 1940. The author believes that the repudiation of Mr Willkie guarantees that the Mugwump—or Independent—vote will go Democratic, in the realisation that there is nothing else for it to do. There are stories that Mr Dewey is in reality the prisoner of Governor Bricker and the Old Guard; that he will provide the figurehead and the speeches, and the boys in the backroom the policy. Mr Dewey's position, caught between Mr Willkie and Governor Bricker, is none too comfortable, and, as a practised tenor, he might well croon "How happy could I be with either, were t'other dear charmer away."

American Notes

Hemispheric Prices

Mr Leon Henderson, the originator and stormy petrel of the office of Price Administration, was immediately and happily consigned to limbo by Congress after he was forced out. But Mr Henderson is still interested in prices and controls; and at the first Conference of Inter-American Development he made a strong plea for hemispheric scheduling of orders after the peace in order to minimise the dangers of inflation and scarcity in all the Americas. Mr Henderson pointed out that every country represented at the Conference was shadowed by the same ugly ghost, in greater or less degree. Of the South American countries, only three, Argentina, Colombia, and Uruguay, have kept the increases in the cost of living since 1939 within moderate limits. In one, the cost of living has more than doubled, and three others show increases between 50 and 60 per cent. In the United States, Mr Henderson argued, there is a great unbalance of supply and demand underneath the war controls, and if at the end of the war the controls are relaxed there will emerge a wide unbalance of prices similar to that which followed the last war. Speaking from the records of the last war, Mr Henderson traced the story through the speedy elimination of controls to the collapse of 1921; and he expressed some alarm lest this time the natural desire for an end to controls might bring about an even greater and almost unmanageable load of unemployment. Another 9,000,000 peacetime jobs and a 35-50 per cent increase in production over the par-war peak are his estimates of the requirements for stable employment. While urging that some schedule of priorities for post-war orders was necessary, Mr Henderson disavowed any bureaucratic hankering after the extension of wartime controls, insisting that they were insufficient, even if suited, for quick

economic recovery. But he did insist that no nation could act alone and be saved.

1945 Model

Predictions that the first post-Hitler automobiles would be the 1942 models which manufacturers have been talking about are now being discounted. The War Production Board has agreed that when production is resumed the industry will be free to make new models rather than return to the pre-war types. Permission was granted this month for the construction of experimental models and the acquisition of machine tools. The four orders designed to prepare industry for limited reconversion are hedged about with so many conditions that it is difficult to believe that they will make any inroads upon materials or manpower needed for war production, whatever their effect on morale. The freer supply of aluminium and magnesium, dating from July 15th, is not to be used to increase the total of end products; they are only to be used as substitutes for less satisfactory metals. The construction of experimental models, permitted from July 22nd, is not to be construed as permission to construct samples for sales promotion, and if the expenditure is greater than \$5,000 monthly, specific approval is necessary. One third step, the permission to place unrated orders for machine tools and equipment, becomes effective on July 29th; but such orders will only be filled if they do not interfere with rated orders and available manpower and facilities. The fourth order will not be issued until August 15th, which suggests that it was the most controversial. This will set up machinery by which manufacturers who have unused labour and plant may get permission to make civilian articles not now allowed, or to exceed present limits as to quantity. In their wording, and in the care with which the Departments concerned have supervised their issue, there appears to be a reasonably good guarantee that no such interference will take place, and that preparation for peace will tread on the heels, not the toes, of war production.

Letter to the Editor

The Cost of Service

TO THE EDITOR OF THE ECONOMIST

SIR,—Mr Barber's defence of what some people consider the extravagant services of department stores is that "in general they amply pay their way." Even if this dictum were accepted (in spite of the very complex and debatable calculations involved) it would not affect the main argument. For the contention is that such services represent additional cost of distribution which the department stores must make good by maintaining higher prices than would otherwise be necessary. This does not mean that such services are always unprofitable to the stores; but that they are unprofitable to a public requiring cheaper goods. Many of these services are devised (as Mr. Lawrence E. Neal has written, with admirable objectivity, in his famous book) simply "to attract customers to some central location by every inducement open to the store proprietor." Small shops do not need to offer these sometimes very costly "inducements." Writing in 1938 about the costs of retail distribution, Prof Arnold Plant and Mr R. F. Fowler came to the conclusion that it costs the larger stores "a good deal to reach their larger public as witnessed by the higher cost of Despatch and Publicity." It is, however, a hopeful sign for post-war developments that at least one trade, the furnishing trade, has lately stressed the necessity for simplicity of service.

Mr Barber seems to suggest that the large stores do not particularly favour the system of price-fixed branded articles—which, as he will agree, tends to restrict the power of shops to reduce price-levels. Unfortunately the Board of Trade's Report on Restraint of Trade (1931) does not support Mr Barber's contention; for the Report expressly states that "some evidence was laid before us to the effect that large retailers exert pressure upon the manufacturers in order to compel them virtually to treat the goods as price-maintained and to withhold supplies from retailers who sell the goods at prices considered unduly low."—Yours faithfully,

Richmond, Surrey.

HERMANN LEVY.

BANK OF ENGLAND

Two Hundred-and-Fifty Years

ON Thursday of this week, July 27th, the Bank of England completed the first quarter of its millennium. A week previously it passed the centenary of the Bank Charter Act of 1844. This double event has been fittingly celebrated by the publication of a history of the Bank, the work of the eminent economic historian, Sir John Clapham.*

These two volumes were written at the request of the Bank but Sir John hastens to point out that they are not an official history and that "nothing whatever has been imposed." Official or unofficial, the work is that of an extremely privileged historian. All the material in the Bank was thrown open to Sir John—that is, up to 1914, when the curtain of anonymity and secrecy comes down with abrupt finality, and compels Sir John to end his history with a final chapter of hazy and wholly impersonal impressionism covering the last thirty years.

The sealing of the first Charter of the Bank on July 27, 1694, was the culmination of long drawn out negotiations between a group of city company promoters, for whom William Paterson, "a pedlar turned merchant," acted as spokesman, and the Government of the day. William III was waging the War of the Grand Alliance against France, the Exchequer was running low and in 1693 a Committee of the Commons was appointed to report on schemes for raising money. It was before this Committee that William Paterson appeared with his group's proposals to raise £1,000,000 "upon a fund of perpetual interest" at a cost to the State of £65,000 a year in perpetuity, namely 6 per cent on the capital plus £5,000 for "management." This amount would be raised by the creation of a bank whose capital issued to the public would immediately be re-lent to the State. In return the Bank would receive certain privileges, including that of issuing notes, which, it was hoped by the promoters, would be given the attribute of legal tender.

The scheme was accepted, but with modifications. There was to be no legal tender for the notes, the original capital to be raised and re-lent to the Government was £1,200,000, the rate of interest being a generous 8 per cent, plus a yearly fee of £4,000 for management. The Bank was created by the Ways and Means Act of 1694. The first issue of capital of £1,200,000, 25 per cent paid up, was made in June, 1694, and subscribed within twelve days. The first instalment of £112,000 was paid to the Exchequer on August 2, 1694, against the Government's promise to pay in the form of interest-bearing tallies.

Soon after this first and basic operation, the Bank began looking for current banking business. By September, 1694, the Governor was explaining to the General Court (the general body of proprietors) that the directors kept their "running cash" with the Bank. Would not all proprietors do the same? The Bank soon began issuing notes and discounting bills. Before long, it was keeping the accounts of a number of Government Departments, though by no means all of them, and was handling the "remises," i.e., the business of remitting funds, to Flanders and other foreign parts for the war against Louis XIV.

The early years were difficult. The orgy of "projection" amidst which the Bank had been born left its inevitable aftermath of losses, suspicion and shaken credit.

In addition, the Bank suffered from the recoinage of silver in 1695, which left it with a considerable amount of clipped coins that had been accepted at par and had then lost their currency. Moreover, the Bank in those early months had fallen to the temptation of over-issuing its notes. It had to meet its first serious run in May, 1696, and could not surmount the test. The first suspension of cash payments occurred.

Government Agent

Within the first few years of its existence, the Bank had become the agent for the issue of the Government's Exchequer bills, the Court undertaking to subscribe directly to a substantial part of the issue. This first participation in Government Loans had to be submitted to the approval of the General Court, which, on first being confronted with the proposal, turned it down. By 1709 the Bank had obtained statutory assurance that no Exchequer Bills were ever to be issued without its consent. That assurance was given by the Act "for enlarging the capital stock of the Bank of England and for raising further supply," which raised the capital to £4,402,343, increased the advance to the Government to £1,600,000, but left the remuneration at £100,000 a year, i.e., 6 per cent and £4,000 management.

At a very early stage in the history of the Bank there came into existence the Committee of the Treasury—that select number of the directors who to this day constitute the real source of power and authority and the initiator of policy at the Bank. The Committee's function is more precisely defined in a title it bore for some years after, "The Committee to Attend the Lord Treasurer." In other words, it was the spokesman for the Bank with the Government of the day and thus became the normal source of authority. Unfortunately for the historian, no minutes of the proceedings of this Committee were made or at least survived, before 1779. The Committee was made up of the leading members of the Court, including those who had "passed the chair," that is to say, the ex-Governors and Deputy-Governors.

It had been suggested in the draft laws that the Governor and Deputy-Governor should not serve for more than two years and that not more than two-thirds of the directors should be eligible for re-election. Although this clause was rejected by the General Court, the two-year term of office for Governor and Deputy became normal in practice. It was only rarely that the Deputy-Governor failed to become Governor. It became normal for a man to serve his four years in the two offices in succession and then to serve for a spell, often a very long one, as a director and as a member of the Committee of the Treasury. This led to great continuity and ultimately to great conservatism in the direction of the Bank's policy.

*

The Bank's business began to take recognisable shape in the first half of the eighteenth century. It made loans on commodities, plate and bullion and occasionally on its own stock. It became a constant lender to the East India Company. Its private discount business was rapidly built up. No client was to have more than £3,000 of inland bills or notes running at any one time. Only a London resident could have a discount account (in its early days

* "The Bank of England." A History by Sir John Clapham in Two Vols. 278 and 460 pages. Cambridge University Press. £2 2s.

the Bank was nicknamed the Bank of London); and even in 1793, when the Corporation of Liverpool asked for a loan on its sealed bonds, it received a curt refusal, the Committee of the Treasury intimating that, following its invariable practice, it would only consider two-month notes of "respectable gentlemen in London." The Bank also began to transact an important business in bullion. For its dealings in silver it began at a very early date to employ the specialist house of Mocatta's, which to this day remains the Bank's silver broker. By the second decade of the eighteenth century, the Bank had become the main supplier of gold to the Mint.

Towards Central Banking

The growth of any consciousness of central banking responsibility is difficult to discern in the early history of the Bank. Almost from the start it acted as the principal banker to the Government, the manager of the National Debt and official agent for making foreign remittances and procuring bullion. In this respect the Bank, from its very earliest years, assumed one of the essential functions of a central bank. But many decades were to elapse before the Bank developed any feeling of responsibility for the adequacy of the supply of domestic credit and cash in times of crisis. In the panic of 1772, which was largely the result of infection from Amsterdam, where there had been much kite-flying and speculation, the Bank of England was discounting liberally and supporting houses in difficulties. Again, in the crisis of 1793, which followed the outbreak of war with France, the Bank went out of its way to help banking houses in difficulties, and, though it still showed its preference for London names, it made a significant advance of £40,000 to banks in Liverpool. It was not until 1817 that the Court, declining a motion to reduce the discount rate below the traditional figure of 5 per cent, formulated the classic doctrine (to be propounded more fully fifteen years later by the then Governor, John Horsley Palmer) that discount activities should be confined to "times of discredit." It was not until 1833 that an Act was passed putting dealings in bills and notes of less than three months outside the scope of the Usury Laws with their upper limit of 5 per cent. Six years later the Bank first tried 6 per cent as a cure for a crisis.

Renewals of the Bank's Charter took place at regular intervals. They were usually made the occasion for extracting an additional loan from the Bank to the Government, more often than not free of interest. Each occasion was also marked by some Parliamentary opposition to the extension of the Bank's privileges, usually based on some variant of the argument that the Government would do better for itself if it kept itself free to "apply to other shops."

*

With the suspension of cash payments in 1797 there began that conscious concern with the problems of monetary policy, as viewed from the angle of the foreign exchanges, which was later to become almost the sole determinant of credit policy. How far had there been any over issue of notes by the Bank? How far was such over issue responsible for the rise in commodity prices, for the premium on gold, for the depreciation of sterling exchange? Those were the kind of questions which stimulated the pamphleteers of the suspension period and which were thrashed out before the Bullion Committee of 1810. The Bank's evidence before the Committee was a prototype of much that was to emerge from it on later occasions. The Bank's spokesmen showed a flair for hitting on the right measures, but for advancing the wrong theoretical explanation of their actions. The Governor, John Whitmore, defended the Bank against the accusation of over issue by arguing that it "never forced a note into circulation."

He agreed that the Bank had limited its discount facilities in 1796, but that this had "no bearing upon the

price of bullion" although later he admitted that, with the Bank working on a free gold basis, he would restrict discounts so as to check a foreign drain of gold. Both the Governor and his Deputy clung to the view that there could be no excessive discounting provided the bills in question were good. Another director, Jeremiah Harman, argued that the curtailment of discounts in the past had done more harm than good and that it had had no connection with the state of the exchanges.

Whatever may have been thought of their economics, the directors stumbled by instinct and sound common sense on something resembling true central banking. In the difficulties of 1816 the Bank discounted generously and, breaking with the precedent which had earned it the nickname of the "Bank of London," it agreed in that year to accept "country securities of undoubted respectability." Industrial development was beginning to stir in the country and the Bank was slowly coming into touch with such remote new-style industries as the iron works of Hawks & Stanley of Newcastle.

One of the earliest evidences of open market policy is to be found in 1824/25, a period of exceptional over-issue by private banks. At that time the Bank sold Exchequer Bills on a substantial and continuous scale "to contract the circulation." Up to the suspension period it had been the declared policy of the Bank of England to take gold without restriction but also without going out of its way to acquire it. From the resumption of cash payments, however, there is hardly a period of crisis and strain on the reserves when the Bank does not initiate bullion operations which are not justified by the exchange position.

By 1827, moreover, an exchange policy had definitely crystallised. By that time the Bank dealt with any threat of unfavourable exchanges by "shortening the currency," selling Exchequer Bills to take capital off the market and selling silver for gold in Paris, where a bimetallic system made such operations relatively easy.

*

Soon after the close of the Napoleonic Wars, therefore, the unconscious growth of the Bank of England into the stature of a central bank had proceeded a very long way. From its earliest years it had acted as principal banker to the Government and as manager of the National Debt; but by the early decades of the nineteenth century it had evolved a sense of responsibility for the exchange value of the currency and had learnt that this responsibility could not be divorced from its domestic credit policy. In its bullion operations in times of crisis the Bank had begun to dissociate its responsibilities to the wider interests of the nation from the immediate interests of its proprietors: it was ready to import gold at a loss. The Bank, it is true, remained competitive in its discount business, though even in this aspect of its activities the conception of a lender of last resort was growing. By 1832 John Horsley Palmer had propounded the doctrine that in normal times the Bank should not discount extensively because then others would do the work, but that it should confine such activity to "times of discredit." It was the same outstanding Governor of the Bank who a year previously was telling the Governor of the Bank of Ireland that he wished to get the law altered so as to concentrate the note issue for each country in its own central bank. This represented rapid progress towards the central banking ideal.

There were, however, some setbacks to this progress. The first came with the renewal of the Charter in 1833, when it was intimated to the Bank that its privileges could not exclude joint stock banks from London, provided such banks did not issue notes. There was vehement opposition to this suggestion by the General Court, and the directors pointed out that to permit joint stock banking in or near London would "have the effect of destroying the present character of the Bank of England and forming it into a bank of competition." On this fateful issue the Bank lost the day and the joint stock banks came.

The Bank of England's branch policy also led it along the path of competition. The question of opening branches was first considered in 1826 by a committee of the Court, which found that such a course would be highly expedient. By 1830 eleven branches had been established, doing in that year £5,500,000 of discounting for nearly 1,000 clients. This was really competitive banking and much later it became increasingly competitive under the guidance of an eager Principal of the Branch Bank Office, who put new life and competitive vigour into his department in the 1890s. He only left the Bank in 1910. His reign was the last kick of the "competitive banking school."

The Act of 1844

The Bank Act of 1844 must in some respects also be regarded as a setback to the central banking ideal—not so much for what it enacted as for the prevailing atmosphere of free trade and free banking in which it was debated and created.

Peel's Act, with its victory for the principle of ultimate centralisation of the country's note issue, and its apparent triumph of the "currency school," which demanded automatic variations in the issue of notes with variations in the holding of gold, was greeted by many critics at the time as a monster of rigidity. A test came in 1847, when crisis followed disastrous crops, speculation in railway promotions and somewhat excessive discounting by the Bank of England.

The drain on the Bank's reserve led to the first suspension of the Act of 1844. The Bank was promised a Bill of Indemnity if it infringed the law in the course of expanding its discounts and advances (at not less than 8 per cent) to meet the prevailing distrust. The mere publication of the Chancellor's letter helped to stem the panic, and in fact the Act was never infringed. Another suspension of the Act—a genuine one this time—was to occur in 1857, during the commercial crisis in which all the feverish and gold-dazzled activities of the mid-fifties ended—the first really world-wide crisis in history.

*

The Overend Gurney crisis of 1866 must be regarded as an important chapter in the history of the Bank, if only because it brought to a head the war long waged between the Bank and the discount market and established the subsequent relations between the two parties on a footing that was to prove mutually so satisfactory and to provide so important a part of the credit mechanism in this country. The Bank had regarded the arrival of the bill broker in the early years of the nineteenth century with scarcely veiled animosity. The charge against them was that these houses competed directly with the Bank in discount business, that they failed to take the normal precautions of maintaining adequate cash reserves, and that therefore in times of crises they had to throw themselves on the mercy of the Bank with which they normally competed.

Whatever may be said of the merits of these charges there was more than enough justification for the Bank's suspicions in the activities of the firm of Overend Gurney, which dominated the market for many decades. This firm had become the second financial power in the City and had had a trial of strength with the Bank in 1860, when it withdrew notes on a large scale with the obvious intention of embarrassing the Bank. When Overend Gurney, as a result of mismanagement and unwise speculation, crashed in 1866, the panic and disbursements were without precedent in this country. The Bank of England, by pushing up its rate of discount to 10 per cent and keeping it there for three months, avoided an infringement of the Act of 1844. The remedy was cruel, but it worked.

At the General Court which followed the crisis, the Governor, Lancelot Holland, prided himself on the part the Bank had taken. "We did not flinch from our post, we made advances which would hardly have been credited. . . . Before the Chancellor of the Exchequer was out of

his bed we had advanced one-half of our reserves. . . . I am not aware that any legitimate application for assistance made to this house was refused." Walter Bagehot, taking these remarks as his text, preached the famous sermon in *The Economist* in which he argued that the Governor's speech was an admission that the Bank held and was responsible for holding "the sole banking reserve of the country."

That doctrine did not go unchallenged, and from within the Court itself, one Thomas Hankey, a former Governor, repudiated it as "the most mischievous ever broached," since it tended to absolve all other banks from the duty of maintaining proper reserves. Out of this vehement debate there grew the final acknowledgment by the Bank of its responsibility as a lender of last resort and as holder of the ultimate (not "the only") cash reserve of the country.

A Public Institution

By 1870 the fundamentals of Bank of England policy had been hammered out, and the subsequent history up to 1914 is rather devoid of sensation. The technique of credit policy improves steadily. The higgling of Bank Rate develops into a fine art; the efficacy of that rate in attracting gold becomes a source of perennial wonder—until one appreciates the extent to which the whole world had by then become a debtor of Britain. Open market policy evolves into a finely tempered instrument. Sir John Clapham's volumes, by giving details of the amounts paid out by the Bank for money borrowed from the market through the official brokers, Messrs Mullens, Marshall and Company, provides impressive evidence of the scale on which open market operations were transacted to render the Bank Rate effective. The Bank was perfecting its technique, but still continued to shrink from any attempt to relate it to a cohesive theoretical framework. When other and younger central banks ask it for its rules or its statutes, they are told that there is no book of the rules, that its Charter would be of very little use to them and that its relations with the Exchequer have never been codified from the relevant Act of Parliament.

The Baring crisis of 1890 cut a new facet to the Bank's technique—that of moral leadership of the City. The initiative was taken by a great Governor, William Lidderdale, to raise a guarantee fund sufficient to underpin the precarious position of the house of Baring. It was thought that £6,500,000 would be needed for this purpose. In fact over £17,000,000 was subscribed. Perhaps the most significant feature of the operations is that the joint stock banks had been called in to the inner councils of the Bank and played their full part in subscribing the guarantee fund.

Sir John Clapham arrests his narrative abruptly at the year 1914. He points out that the history of the Bank during the war of 1914-18 could be written now, but as it is only a preface to the story of the years between the wars, "which cannot be written yet," it is deferred to a later occasion.

*

In an epilogue Sir John sketches the developments which have made the Bank of 1944 almost as different from that of 1914 as that of 1914 was from the Bank of 1844 or even of 1714.

It began life as an experimental bank in a small but already rich island. Its object was to finance what its enemies regarded as a Whig War and to make profit for its proprietors. After exactly a century and a half of life it was urged by the greatest of early Victorian finance ministers to compete freely with other banks and presumably to make as much profit as they, if it could. After two centuries and a half it was a non-competitive public institution with world-wide connections and influence, not eager for profit but anxious—in the adapted words of what was once the oath and is now the declaration made by all its directors—"faithfully and honestly to demean itself according to the best of its skill and understanding and to be indifferent and equal to all manner of persons."

Peel's Act in Retrospect

THE Bank Charter Act, the centenary of which the Bank of England also commemorates this week, is by common consent one of the great landmarks of British banking history. It is also one of the very few legal landmarks. In the nineteenth century, Governments and Parliaments indulged in a great orgy of enquiries and commissions into monetary topics, but only rarely were they moved to the point at which they dared legislate. The Bank Act of 1844 stands almost alone as an Act which limited the Bank's freedom to manage its affairs as it chose. In importance, it certainly dwarfs all others.

Its real significance did not, however, flow from the letter of the law, but rather from the conclusions that men drew from it. A modern judgment, differing sharply from those of the nineteenth century, might say that its most important direct effect was to consolidate the Bank's exclusive note-issue privilege by prohibiting new private issues and limiting existing ones. It would argue that this guaranteed the eventual ascendancy of the Bank by making it, inevitably, the only bank of last recourse. But even so cautious a judgment would be disputable. Given the relatively minor part which note-issues later played in the whole credit structure, it is arguable that the Old Lady would have triumphed without this aid.

Apart from its consolidation of the virtual monopoly of issue, the Act's contribution was a purely negative one. It laid down the principle of the fixed fiduciary issue, requiring all Bank issues beyond an initial £14 million to be backed pound-for-pound by bullion, yet omitted both a "relaxing power" for use in emergency and any provision for the natural growth of currency needs. And, while thus rigidly controlling all note issues, it was wholly silent on all questions of credit control and reserve policy. Thus it is that Britain, the home and nursery of central banks, has never had a central banking code. The very term "central bank" is even now unknown to the law. And the Act which, irrevocably, set the final seal upon the exclusive privileges of a private corporation imposed upon it neither obligations nor restrictions in what thereafter was bound to be its sphere of greatest influence. Indeed, the initial effect was to loosen the Bank's hesitant grip upon central banking principles.

Several of the characteristic features of a central bank had, in fact, become clearly discernible in the fifty years before 1844. The Bank had in its first century or so become the principal manager of the public debt, and virtually the sole custodian of official balances. After 1825, it became important as the holder of the cash reserves of the London banks. By 1827 it was evolving a technique for equalising the money supply in the market. It was, moreover, working out a reserve policy which made no real distinction between its liabilities on notes and those on deposits, and which at last acknowledged the significance of fluctuations in the exchanges. It believed that, as "the only body issuing money *ad libitum*," it ought to avoid competing with the discount market.

The "Principles" of 1844

These principles were in striking contrast to those which emerged from the system of 1844. The troubles of the thirties, and especially the crisis of 1839, were widely attributed to excessive issues of notes. The "Currency" School believed that, if notes could be made to fluctuate precisely as a metallic circulation would have done, the currency system would automatically provide its own stabiliser. Hence notes should be mere bullion certificates, and the 1844 restrictions which were to make them so were really intended to restore the supposedly natural or "free" correctives. It was a logical consequence of this theory that banking business, as distinct from note-issuing, should also be free. Moreover, if notes, allegedly the cause of all the trouble, had

been safeguarded against mismanagement, how could credit, which was not money at all, do any damage?

Given the rigid control of the Bank's note-issue on "bullionist" principles, it was, as Peel declared when introducing the Bank Charter Bill, "important that the public should be enabled to obtain the use of that issue on as favourable terms as possible . . . banking business, as distinguished from issue, is a matter in respect to which there cannot be too unlimited or unrestricted a competition." The separation of the issue and banking departments of the Bank was therefore far more than a formality; it enshrined the unwritten law which at first was more important than the law itself. "The issue department," explained the Governor, James Morris, in 1848, "might be in Whitehall, and the banking department in Threadneedle Street." As late as 1857, Overstone was still declaring that people had to accustom themselves to looking at the Bank "as they would look at the bank of Messrs Smith, Payne or Messrs Jones, Loyd."

The first consequence of the Act of 1844 was, therefore, to produce a flat reversal of the rule that the Bank should stand apart from the market. Immediately the Act became operative, Bank rate, then standing at 4 per cent, the lowest rate ever previously fixed, was promptly reduced to 2½ per cent, and the rules for discounts and advances were liberalised. Thus were the outside banks and discount houses encouraged and enabled to extend credit to support the rising wave of speculation in railway stocks and projects, in raw materials and food.

Sir John Clapham's researches reveal that virtually the whole framework of the Bank Act was evolved within the Bank, though it is not clear whether the unwritten "principle" was an integral part of the Bank's plan. But if the Bank directors were not themselves the authors of the "principle," their market and lending policy in 1844-47 showed them to be faithful disciples.

Thus it was that the system of 1844 destroyed both lessons which, it was thought, had been learnt from the crisis of 1825. First, that the Bank had a clear duty to shorten sail, and thus to induce or impel others to do likewise, upon the very first sign of gathering storm-clouds. Secondly, that if and when the storm did break, the only way of avoiding panic and catastrophe was for the Bank to give maximum aid to all who needed it. The Bank Act formula, with its legal sterilisation of a large part of the bullion reserve as backing for the note-issue, and with its refusal of a relaxing power, made it difficult, if not impossible, for the Bank to pursue the second policy without breaking the law. And the "principle" of the Act effectively ruled out the first policy, virtually denying that it was even necessary.

This was the Act which, its promoters and supporters believed, was to prevent crises and, in Peel's phrase, would be wholly "delusive" if it failed to do so. It did fail. The Bank rode confidently into the very teeth of the gathering storm with every inch of available canvas exposed to the fury of the gale. And, whether or not its short-sightedness increased the rashness and the extent of the speculations of the times, it is certain that its convulsive efforts to reverse its policy at the last moment substantially intensified the eventual alarm. That was relieved only by the first "suspension" of the Act, by the issue, on October 25th, 1847, of the Treasury letter requesting the Bank to increase the scale of its assistance and undertaking to sponsor a bill of indemnity for any resultant breach of the law.

The crisis, and the manner of its relief, inflamed the controversy over the Bank Act to white-heat. But it was a barren controversy, principally because most of the major disputants were quite unable to separate the

"principle" of the Act from the Act itself. It was not generally perceived that the real solution was a wise policy and technique of credit control, which could not be prescribed by law, could be evolved only from long experience, and would always call for nice discrimination.

Solvitur Ambulando

The Bank, however, despite its efforts to justify itself before the Parliamentary enquiries of 1848, did thereafter modify its market policy. Its lending and discount policy became less competitive, and there was gradually evolved the principle that Bank rate should "follow," and not lead, market rate. Leadership was, however, needed—not competitive leadership, but leadership in the public interest. But the principle of 1844 had made so deep an impression that it was many years before the board of the Bank finally eradicated the notion that statutory control of note-issue had not put it in the position "of a commercial bank upon a large-scale." After the 1857 crisis, which also required a suspension of the Act, the Bank, unaware of the inadequacies of its own policy, blamed the excesses in the discount market, and, in all sincerity, turned upon the discount houses as a dog will turn upon the stick with which it has been beaten.

It was not until the Overend Gurney crisis of 1866, when the third and last "Treasury letter" was issued, that the Bank openly admitted a public duty to give aid as a bank of last recourse; and the abandonment of the rule of "following the market," some years later, was dictated less by considerations of principle than by the practical fact that the rule was necessitating spasmodic and absurdly frequent alterations in Bank rate. The rate then became persistently ineffective. For a brief period it even seemed that the Bank might give up the struggle for ascendancy over the market. But the battle on issues

of principle was already won, and the ghost of 1844 had been laid. Thereafter the problem was to find a technique to fit the policy, to devise ways and means of guiding and controlling the money market and credit structure, and thus to achieve the objective which the promoters of the Act mistakenly believed could be achieved by a narrow rule of note-issue control. That technique was found, especially after the Baring crisis of 1890, in direct action upon the money supply, thereby enabling the Bank to make its own rate effective; and in the development of conventional relationships between Bank rate and commercial bank lending rates, relationships which were supported and sustained by conventionalised cash ratios.

*

The story of the Act of 1844 really ends here, in the early years of the twentieth century. There is an epilogue, but it concerns only the bare bones of the Act, and not the principle which shed so much blood and sweat and tears. In 1928 the old rigid framework was widened so as to embrace not only the fiduciary issue of the Bank but also the much larger one of the Treasury, making a total of £260 million. And there was also added the long overdue elasticity clause by virtue of which the structure has been successively stretched to permit the enormous fiduciary issue required by the present war. More important still, there was introduced in 1939 the principle of weekly gold revaluations. The prescribed formula can be worked in such a way as to reverse the traditional rule that the amount of gold held determines the amount of the note-issue. In the brief interval before the war it was not possible to discern how the authorities would normally use this new toy. But after the war it may well be found that the skeleton of a famous Act has in fact disintegrated into dry dust scattered through the pages of history.

The Bank and The Economist

THE great occasion which the Bank of England celebrates this month is, in quite an intimate sense, a red-letter day for *The Economist* itself. Tradition, and the reputation of its most famous editor, have uniquely entwined the history of *The Economist* with that of the Bank. Bagehot, as Mr Montagu Norman graciously acknowledged at the paper's own centenary festivities last year, "did more than any other single individual to promote and direct" the transformation of the Bank from a commercial institution to a central bank, and "did it as editor of *The Economist*." But the relationship extends a good deal farther back than 1859, when Bagehot's reign began. Born on the eve of the greatest controversy that has ever raged around the Bank, *The Economist* had barely left its cradle before it presumed to give the Old Lady advice—and, in the eyes of history, it was good advice. The writings of James Wilson, founder and first editor of *The Economist*, have never been immortalised by a "Lombard Street," but they created the tradition which Bagehot deepened, yet never needed to re-shape.

Speaking of the unheeded warnings of his predecessor, Bagehot once claimed that the paper had resisted "almost singlehanded" the extravagant contentions of the sponsors of the Act of 1844. It was a reasonable claim, for the main factions in that classic struggle were so absorbed in the problem of control of note-issue, and so bemused by the question whether credit was or was not "money," as to be quite unable to see the real issues. It was left to *The Economist* to explain that safety of the banking system depended upon wise management of the whole monetary structure, credit as well as "currency"; that such management could never be achieved by rule of law, or even of thumb (because the "right" reserve and the "right" policy depended upon widely varying circumstances); and that if the Act, by regulating note-issues automatically, meant that the Bank could assume that it was relieved of all responsibility for "management," it was bound to produce the wrong policy. Hence

Wilson was pointing out, even before the Act was passed, that reliance upon Peel's assurance, that here was the sure preventer of speculative excesses and recurrent crises, would merely produce "a false and dangerous confidence."

Sound Banking Policy

The causes of crises, the paper explained, went far deeper than banking policy; the basic cause was usually an excessive investment of resources in capital projects. But a sound banking policy, which would evolve naturally from the self-interest of good bankers if only they were left free, could do much to prevent crises or mitigate their severity. In their effects, note-issues were of secondary importance compared with cheques, so that if the Government felt impelled to control bank reserves by law, it was absurd to limit that control to note-reserves while leaving deposit-reserves free. Moreover, the doctrine of Peel and his supporters, that this freedom enabled the Bank of England to conduct its banking business just as any other bank would do, and even imposed upon it a duty to do so, was most mischievous. Such a doctrine *The Economist* argued, would intensify instability, not mitigate it; and, in conjunction with the rigid control of the note issue, would aggravate the crisis when it came.

*

Sir John Clapham, in his excellent history, has rallied to the defence of the Bank on these matters. He believes that the Act of 1844 did not at first "make the Bank less of a central bank than it was before"—or, at all events, "not much less"; and he minimises the effects of Bank policy as contributing to the crisis of 1847. But is hard to believe that Wilson's repeated criticisms and warnings were unjustified. It is true that the 4 per cent Bank rate in 1843 and 1844 was wholly ineffective. But market rate rose steeply in the few weeks before the Act took effect; the immediate reduction in Bank rate to 2½ per cent

brought the two rates to parity, and ignored the fact that the Bank, for various technical reasons, could always compete effectively when its rate was somewhat *above* market rate. Hence the Bank's action not only checked the rising trend of the market, but actually forced the discount houses to reduce their rates to protect their business.

In view of this artificial depression of interest rates it is surely fallacious to measure the Bank's contribution to the support of rising speculative activity by the extent of the increase in its own discounts. This increase was admittedly tiny by present standards, and was not vast by the standards of 1844-7, but it was larger than Sir John implies, because he measures it by changes in the income therefrom. Moreover, the increase in the "private" securities as a whole, as *The Economist* pointed out in a considered review after the dust of battle had subsided, was very large—from £5.8 million in February, 1844, to £15.1 million in February, 1847. The central reserve system was still in its infancy, but, even so, lending on such a scale had important "multiplier" effects; and there were also powerful psychological effects.

Throughout this period, therefore, we find *The Economist* repeatedly attacking the Bank for its blindness to the danger signals in the commercial markets—the price of bar iron, for example, was doubled in the six months to March, 1845—and for its failure to take any steps to protect its declining reserve. When, in the spring of 1847, catastrophe seemed imminent, the Bank put an absolute limit on the amount of its discounts, and thus denied the cardinal precept of crisis policy—that the only way to stop panic was to lend freely at high rates. The directors did, indeed, specifically reject this policy: a year later the Governor revealed that an alternative resolution, for the raising of Bank rate to 7 per cent with no quantitative restrictions, had been thrown out by a majority vote. Moreover, he even sought to justify the Bank's competitive policy by contending that the public attached too much importance to changes in Bank rate. Speaking of the crisis measures, he declared in 1848 that "persons were absurd enough to suppose that the Bank was to assist anyone who required it, provided the Securities offered were good." A more complete denial of the responsibilities of a bank which was inevitably the bank of last resort, it would be hard to find, as *The Economist* emphatically pointed out.

Bagehot's Criticisms

This was the situation with which Bagehot had to contend when, shortly after the crisis of 1857, he assumed the editorial chair. Well might he argue, as he did in "Lombard Street," that the significance of the Bank Act had been exaggerated. But the greatest obstacle against which he battled so determinedly was in fact a direct legacy from 1844—the belief that the Bank had no special responsibilities, and no public duty. The danger in this view had, moreover, been accentuated by the "suspension" of the Act in 1847 and 1857, because that had convinced the public that the Government would always stand by the Bank in extremities.

In the fifties, indeed, the situation differed in only one major respect from that of 1847—in the cessation of the Bank's competitive discounting. But the rule that Bank rate should "follow" market rate, was, as Bagehot argued in an important series of articles in 1864, simply a "recipe for making panics." Until 1857, a "more miserable history" could hardly be found than the so-called attempts of the Bank to keep a proper reserve. After 1857 a better reserve was kept, but not because the directors acknowledged any responsibility to the public. And if, in times of emergency, the Bank was beginning to perform its duty to lend, it did so reluctantly and with misgiving, and thereby minimised or destroyed the benefit of the aid it gave. Moreover, the rule of "following" the market entirely prevented it from taking precautionary measures and enforcing caution upon the market, at the very beginning of an unfavourable exchange.

Throughout the sixties and early seventies, *The Economist* kept up a fusillade of criticism of the Bank on these

issues, supporting its week-to-week snipings with frequent heavy broadsides of reasoned analysis; it was these articles which, with relatively little change, later found their way into "Lombard Street." The paper criticised, too, the Bank's false diagnosis of its problem in 1857. The directors thought that, because the discount market had leant heavily upon them in the fifties, and in the crisis had been the main channel through which the reserve was drained, they could protect themselves by prohibiting discount market borrowings (other than the customary "quarterly advances"). *The Economist* considered this discrimination as a measure "which every sound principle . . . would point to as being as doubtful in its policy as it is novel in itself . . . it is still to the directors [of the Bank] that we must look to maintain permanently, and at all times, a larger reserve than hitherto to meet the pressure of a crisis." "However much the Bank may dislike to aid their rivals," Bagehot later declared, "yet they must aid them."

*

In intention, however, the Bank was beginning to move towards Bagehot's objective. The directors, he said, could not be blamed for the panic of 1866—although they must have known, as *The Economist* certainly did know, that Overend Gurney was rotten at the time of its conversion to a limited company in 1865. But at the moment of crisis the Bank acquitted itself tolerably well; and *The Economist* hailed as "a matter of the gravest import" the Governor's explanation (to the proprietors at the next meeting) that "we would not flinch from the duty which we conceived was imposed upon us of supporting the banking community."

This, however, was almost the last occasion upon which the basic issue was debated in public. After the middle seventies, when the objectionable rule of "following" the market was dropped, *The Economist's* criticisms were mainly criticisms of technique. If the Bank had realised by the early seventies that it had a duty to regulate and control the market with the object of safeguarding the reserve and mitigating credit fluctuations, it was only some twenty years later that it evolved a satisfactory method of doing so. In this evolution, *The Economist*—especially through the writings of Palgrave—certainly played its part. The solution did not, and could not, lie wholly within the Bank. Bagehot and Palgrave campaigned strongly for the abolition of commercial-bank interest allowances on current accounts and moderation of allowances on deposit accounts, for excessive allowances were a major cause of the ineffectiveness of a Bank rate which no longer followed the market. As the Bank itself, it gradually developed an "open market" technique of supporting Bank rate, and while *The Economist* sometimes criticised the timing of these measures, it warmly approved the measures themselves. It applauded, too, the Bank's strikingly competent handling of the Baring crisis in 1890, when the Bank's activities signalled the final triumph of the Bagehot school.

After the Battle

From then until 1914, there was no need for *The Economist* to play the schoolmaster. It became a recorder and, from time to time, a friendly counsellor. On the great issues of policy in the last thirty years—on the restriction of issues in 1920, on the return to the gold standard in 1925, on the financial reconstruction of Europe in the later twenties, on the reluctance to depart from gold in 1931 and the refusal to return to it thereafter, on the careful, gradual evolution of exchange control in 1940-41—the Bank and the journal have seen eye to eye. They have been right together and wrong together.

"No other country," said Mr Montagu Norman last year, "has a journal like *The Economist*; and no other country has a bank quite like the Bank of England." We take the honour of the juxtaposition as final forgiveness for any past quarrels—and perhaps as licence for further friendly disagreements in the future.

THE BUSINESS WORLD

Housing Costs and Subsidies

THE Government has shown a lively appreciation of the need for providing every family that wants one with a separate home as soon as possible after the war and for raising the general standard of working-class housing by an adequate long-term replacement programme. Nevertheless, there is a very real danger that, in spite of much preparatory work by the Government, performance may again fall far short of its praiseworthy aims. The danger lies in the piecemeal approach to the problem, in the neglect of the central economic proposition that the new houses must be within the means of those for whom they are intended. Unless the implications of this proposition are fully realised, the ambitious construction programme that is envisaged by the Government and has raised great expectations among the people stands little chance of fulfilment.

Fundamentally, the problem is one of the relation between working-class incomes and the cost of housing—whether in the form of rents or purchase instalments. The real reason why many working-class families were poorly housed before the war is simply that they did not possess the resources to command better accommodation or, more precisely, that they could only have spent more on housing by stinting themselves of food, clothing and other necessities and amenities. According to the inquiry into working-class budgets carried out by the Ministry of Labour in 1937 and 1938, the weekly income of £4 6s. 3d. then at the disposal of the average household was spent in these proportions:

	%
Food	39.6
Rent	12.5
Clothing	10.8
Fuel and light	7.4
Other items*	29.7
TOTAL	100

*Including items such as household equipment, soap, laundry, medical expenses, newspapers, travelling and entertainment.

The argument that the working-classes would have been better housed if they had been disposed to spend a bigger proportion of their incomes on housing merely begs the question. It is the consensus of medical opinion that the consumption of food and, to a lesser extent, of clothing was also below modern minimum standards. In any case, consumers have the choice in allocating their incomes; if the resources of the working-classes had permitted them to create an effective demand for adequate housing—either to buy or to rent—it would have been met as much as a bigger demand for food, clothing and other things.

*

The only sure way to a higher standard of living is through an increase in productivity which will raise real incomes and enable consumers to spend more on food, housing and other things. In housing specifically the solution of the problem is a reduction in costs to a level that will bring adequate homes within the limits of the resources of the working-classes. The definition of an adequate house, moreover, has changed in recent years. Houses that were regarded as adequate by local authorities before the war are no longer considered to satisfy modern standards. This is shown, with a wealth of detail, by the report of the Design of Dwellings Sub-Committee of the Central Housing Advisory Committee. The three-bedroom house of an average superficial area of 900 square feet recommended

by the Committee would have cost £467 in March, 1939; that is 39½ per cent more than the cost of the cheaper type of three-bedroom house constructed before the war by local authorities and 16½ per cent more than that of the better type. If costs could be brought down to a level at which families with limited means could rent or buy houses up to modern standards without increasing the proportion of their budgets allocated to housing before the war the problem would be solved. In this sense, houses are no different from, say, motor-cars; the secret of the rapid growth of motoring in America is to be found largely in the reduction in the cost of cars.

Unfortunately, the relation between working-class incomes and the cost of new houses at the end of the war is likely to be less, rather than more, favourable to the poorer section of the community. In other words, costs of construction have risen faster than incomes and much faster than wage rates. Although the virtual suspension of dwelling-house construction renders impossible a precise comparison of present with pre-war costs, such facts as are available suggest that the increase has been of the order of about 100 per cent. For example, the House Builders' Association informed the Private Enterprise Sub-Committee of the Central Housing Advisory Committee of the Ministry of Health that

a house which cost £340 (excluding land, roads and other site works) in 1939, would on prices current in November, 1943, cost £677 10s., an increase of approximately 99 per cent, without making any allowance for additional costs arising from payments for a guaranteed week or otherwise under the Essential Work Order or the Uniformity Agreement.

The Design of Dwellings Sub-Committee quotes a similar increase in its report. True, average weekly earnings in a large number of industries, as ascertained by the Ministry of Labour, rose by 76 per cent between October, 1938, and July, 1943, but it must be remembered that earnings during the war have been inflated by overtime, nightwork and other special non-permanent factors. Actual rates of wages for a normal working week rose by only 30 per cent in the industries included in the official inquiry, and by 37 per cent in all industries, including coal mining, agriculture, railways and merchant shipping. It is impossible, at this

The BRITISH MUTUAL BANKING COMPANY LIMITED

The Bank provides prompt and individual service for customers in all parts of the country. In addition, it acts as a Registrar for Companies. This service includes the preparation of dividend warrants, etc.

LUDGATE CIRCUS, LONDON, E.C.4

stage, to estimate with any degree of precision how far the rise in building costs will be out of line with that of working-class incomes at the end of the war. But such evidence as exists suggests that costs will be substantially higher in relation to incomes than they were before the war. In the view of the Private Enterprise Sub-Committee there is every indication that they will be "inordinately high" during the early post-war years. This is the dilemma. The post-war problem is not merely one of improving upon the pre-war relationship between incomes and buildings costs, but, first of all, of restoring the pre-war position. It is a dilemma that must be faced squarely if housing aims are to be matched by achievement. Its solution is by no means easy.

*

Above all, therefore, there should be a concerted drive to secure a steady fall in the real cost of building. The Ministry of Works, commendably, has already initiated and encouraged research and experiment on methods of construction. But it is doubtful whether the full magnitude and urgency of the task is even now sufficiently appreciated, not only by the Government, but by the building industry, its many ancillary trades and by the trade unions.

Fortunately, the scope for reductions in real costs of construction is substantial, not so much in the "shell" of the house as in fittings that lend themselves to standardisation and mass-production. An efficiency drive, to be successful, should embrace all the stages of production, from the raw material to the finished product. Raw materials must be obtained as cheaply as possible, components should be designed for mass-production wherever possible, assembly methods should be organised to secure more speed and economy. All this will involve a complete re-orientation in the building and ancillary industries; it will also involve a substantial measure of Government initiative and guidance and, in the case of the inevitable tendency to monopolistic practices, of Government control.

The Government's decision to build, and retain the ownership of large numbers of temporary dwellings, will not only assist in relieving the immediate housing shortage; it should also provide an excellent opportunity, a kind of spear-head, for speeding reorganisation in the building industry in that the Government will be a large purchaser of materials, components and fittings. The Housing (Temporary Accommodation) Bill, presented to the House of Commons last week, authorises the Treasury to issue up to £150 million for the construction of such houses by October, 1947; it is estimated that this sum would cover the cost of approximately 250,000 dwellings, equivalent to £600 a unit, inclusive of fittings.

But however efficiently the problem of costs is tackled, the double task of bringing them down not merely to the pre-war level in relation to working-class incomes but substantially below that level cannot be accomplished in a year or two. If new houses of adequate standards are to be brought within the reach of families with limited means, subsidies will be necessary, at least as a temporary expedient.

Disposal of Surplus Stocks

TUESDAY'S debate in the Commons on the Government's plans for the disposal of the great quantity of stores that it will have on hand when the war is over attracted only slight attention. But the problem is of tremendous general importance. The end of hostilities will find the Government in control of large stocks of goods and materials which the State has acquired for purposes of war. It is not possible to predict with any hope of accuracy what the size of these stocks (in most categories) is likely to be; but it is inevitable that they will be found excessive for the normal requirements of Government departments. Some part of the residue is earmarked for the relief and rehabilitation of liberated territories; part may be diverted to the export trade; but there will be surpluses, over and above these allocations, available for distribution in the home market. The disposal of these surpluses presents certain problems which must be resolutely tackled if the mistakes of the policy pursued after the last war are to be avoided. Then the Government's aim was two-fold—to recover as much of the taxpayers' war expenditure as

Broadly, a subsidy can be applied in two ways. It can be given in respect of approved types of houses or it can be given direct to needy consumers in the form of cash grants to raise their incomes to a level at which they can afford adequate homes. The former has at least two defects. First, past experience has shown that a general building subsidy does not always percolate to the consumer; secondly, a subsidy in respect of houses benefits those who can afford the full rent or purchase price as well as the needy. Both defects can be avoided by the direct subsidy to needy consumers. Moreover, it could be administered by local authorities without great difficulty. Obviously, applicants would have to pass a needs test; those that qualify might then be given a grant that would enable them to rent accommodation.

Far too little thought has hitherto been given to the vexed problem of housing subsidies. In fact, it appears that the Government intends to rely mainly on the general subsidy for approved types of building. The Housing (Temporary Provisions) Bill provides that the subsidy granted by Section I of the Housing (Financial Provisions) Act, 1938, mainly in respect of slum clearance and the abatement of overcrowding, shall in future be given for "any new house or flat provided by a local authority . . . before October 1, 1947." This form of subsidy may be justified as a stop-gap, but hardly as a long-term feature. There is probably a stronger case for another type of general subsidy, that is the financing of the construction of approved types of dwelling at gilt-edged rates. If, as it now seems, the general subsidy is to be employed as a means of bringing new houses within the means of the poor after the war, two principles should be established. First, such subsidies should be available on equal terms to local authorities and private enterprise. The principle of equality as between different local authorities was conceded in the Government's decision, announced on Tuesday by Sir John Anderson, to canalise all their borrowings through the Local Loans Fund. Secondly, as the Private Enterprise Sub-Committee rightly observed, "the grant of a subsidy to private enterprise must be subject to some measure of control of selling price or rents and of standards of size and construction."

Even a perfect subsidy, however, cannot solve the real problem of the post-war building programme, the problem of high construction costs. It can only mitigate it, and only within limits. In the absence of a substantial reduction in the real cost of new houses of modern standards, the subsidy that would be needed for a working-class building programme on the scale projected would be so high that it would stand little chance of fulfilment. On the other hand, a really drastic reduction in costs would not merely enable the poor to enjoy the amenities of new and modern homes; but it would also bring down the price and the rents of the whole of the existing stock of houses—some of which are now arbitrarily and artificially lowered by the Rent Restriction Act. It would enable the wage-earner to move upwards into existing houses of a type now occupied by the middle classes, complete with the garage for the new cheap motor-car.

possible, and to recover it as quickly as possible. This time the consensus of opinion is against any unseemly rush in the supposed direction of "normalcy." This time, too, the merits of financial recoupment are seen in proper perspective.

Intelligent guessing has put the probable value of American postwar surpluses at \$50 billion—a figure ten times greater than the corresponding figure for November, 1918. Presumably the British surpluses, adjusted to accord with relative industrial capacity, will bear some relation to the American: that being so, some idea of the magnitude of the disposals problem may be seen from the fact that the estimate given above is equivalent to a quantity of consumers' goods equal in value to the annual retail purchases of the entire population of the United States. It is clear that the surpluses under consideration will be sufficiently large to ease considerably conditions of short supply in the home market. It is equally clear that they are large enough, injudiciously disposed, to cause serious dislocation and disequilibrium in employment, commerce and industry.

The White Paper on plans for the disposal of Government Surplus Stores (Cmd. 6539) is to be welcomed as a timely recognition of the serious issues involved. There are three general principles which will guide the Government in the disposal of surplus stocks:

(a) To release the stocks at a rate which, while fast enough to get the goods into the hands of the consumers when they are most required and to clear badly needed storage and production space, aims at avoiding adverse effects on production through flooding the market;

(b) Unless there is good reason to the contrary, to distribute the goods through those traders or manufacturers who would normally handle or use them, and to secure that ultimate consumers in all parts of the country have a fair opportunity to buy them;

(c) To ensure, if necessary by statutory price control, that the prices charged to the ultimate consumer are fair and reasonable in relation to the current prices of similar articles, to prevent profiteering on the part of dealers handling the goods and to keep down the number of intermediaries to the minimum compatible with a proper distribution.

If these principles are unexceptionable, it is because they are indefinite enough to allow for numerous interpretations. They can be made to serve the most varied interests. It will not be clear whether the Government's plans are likely to make a maximum contribution to public welfare until their specific details have been formulated and announced. Clearly the entire problem of disposals cannot be solved by a simple formula. Each commodity surplus offers particular and peculiar difficulties that must be a subject for separate consideration and treatment. Goods for disposal fall into two categories. In the first, immediate post-war demand will fall short of supply; in the second, demand will exceed supply. Where the former conditions obtain it is legitimate to make the producers' and dealers' interests a primary consideration. Release of stocks should be sufficiently gradual to ensure that prices are maintained at a level which will not hamper the restoration of industrial and trading activity. The method of disposal should be one which preserves the market for the particular commodity while ensuring that the market price is as low as is consistent with that policy. It may be that even a moderate and controlled flow of surplus stocks would act as a deterrent to the early resumption of commercial enterprise. In such a case it might possibly be necessary to withhold surplus stocks completely until conditions for disposal were more favourable. But the decision, whether to release or to withhold, must rest with the Government. Markets should be restored to health, but there should be no malingering. If the market price is such that it enables the least efficient producer to maintain a full margin of profit there is everything to be said for a policy which allows surplus stocks to make their presence felt. The injection of fresh supplies into a restricted market would stimulate enterprise and put a premium on efficient production. A danger of breakdown in a market does not normally exist until the efficient producer is deprived of the incentive to compete.

*

It may be, however, that conditions under which demand falls short of supply should be regarded as a temporary advantage. It might well be profitable to unload the surpluses rapidly enough to meet the full extent of demand and to employ the resources set free (the normal producers of the goods concerned) on other work—in the export trade, for example. There can be no hard and fast rule in the matter. If the producers could be assured that they would lose nothing by the partial diversion of their activities and that they would be able to recover their normal trade when the surpluses had been used up, they would probably agree with a policy which would strengthen, at least temporarily and perhaps permanently, this arm of British industry.

The need for a firm control of prices will be most urgent in cases where supply falls short of demand. Stocks should be moved as quickly as is practicable to the consumers who can derive most satisfaction from them. On grounds of equity the distribution of such goods (both territorial and social) should be as wide as possible—and prices should be low enough, where goods classed as civilian necessities are concerned, to ensure this. In the case of luxury commodities (necessities in war, luxuries in peace) there would seem to be no reason why they should not be sold to the

highest bidder in an open market. Such disposals would absorb funds that might otherwise help to promote inflationary tendencies in the markets for the more important necessities.

By what machinery are these varied desiderata to be achieved? It is very necessary that there should be the utmost clarity in the Government's intentions. Mr Dalton's speech in the House of Commons on Tuesday added very little to the White Paper's vague proposals with regard to the organisation and administration of disposals. It is to be hoped that there will be no delay in devising this machinery, in prescribing the channels of distribution and in deciding on the extent of the necessary statutory control of margins and prices.

*

There is more than a hint in the White Paper that the Board of Trade intends to utilise the services of the trade associations as a matter of course and even of principle. Thus it is repeatedly asserted that the disposal of various classes of surplus goods will be decided "after consultation with representatives of the industries and trades concerned." It is also stated that where the principle of disposal by tender appears inappropriate, it may be desirable to operate through "a non-profit-making corporation or association, membership of which would be open to all traders normally handling the goods in question." Consultation with the trade associations is both necessary and desirable, but there is every reason to suppose that disposal by a free competitive tender system is preferable, wherever it is possible, to disposal through the narrower channels of the trade associations. The special interests of the associations would almost certainly induce them to press for a policy which would be inimical to the real interests of the consumer. This policy would include the maintenance of prices and profit margins at artificial levels and would necessitate a restrictionist policy of distribution. In the disposal of capital goods (surpluses that may properly be regarded as producers' goods) the associations would tend to allocate supplies only to existing members ("all traders normally handling the goods in question") in order to preserve the very imperfect competition which they represent. Such discrimination would strike a hard blow at the ex-Serviceman's right to obtain useful employment through his own enterprise. Where such stocks as will exist can help to re-establish industrial or trading units that may properly be regarded as war casualties, it is in the public interest that they should be made widely available for the purpose. In the long run a leaven of genuine competition would, of course, prove a real benefit to the trade associations, but their recent history does not suggest that they will readily accept this argument.

*

If Government control could prove effective in preventing the abuses (the "muscling-in" of speculators, for example) to which the system of disposal by tender is susceptible, there would be no need, except in the instances cited, to employ other methods of allocation. But as wartime experience has demonstrated, it cannot always be guaranteed that maximum price orders will be observed. If there is a real danger that the open release of a particular commodity is likely to engender black-market conditions, then disposal through the trade associations is probably the best procedure—but always under close Government control.

The disposal of surplus war stocks will mark the halfway house between the economics of war and the economics of peace. If it can be achieved successfully—with a new emphasis on the interests of the consumer—the new programme will be off with a flying start.

NATIONAL PROVIDENT INSTITUTION
FOR MUTUAL LIFE ASSURANCE

Founded 1835

48 Gracechurch Street, London, E.C.3

The Bretton Woods Agreements

The final draft of the United Nations monetary agreements is summarized below. The first concerns the Monetary Fund and the second the International Bank for Reconstruction and Development.

The Monetary Fund

Article One sets out its purposes. These are:—

(1) To promote international monetary co-operation through a permanent institution which provides the machinery for consultation and collaboration on international monetary problems.

(2) To facilitate the expansion and balanced growth of international trade, and to contribute thereby to the promotion and maintenance of high levels of employment and real income and to the development of the resources of all members as primary objectives of economic policy.

(3) To promote exchange stability, to maintain orderly exchange stability and exchange arrangements among members, and to avoid competitive exchange depreciation.

(4) To assist in the establishment of a multilateral system of payments in respect of current transactions between members, and in the elimination of foreign exchange restrictions which hamper the growth of world trade.

(5) To give confidence to members to make the Fund's resources available to them under adequate safeguards, thus providing them with the opportunity to correct maladjustments in their balance of payments without resorting to measures destructive of national or international prosperity.

(6) To shorten the duration and lessen the degree of disequilibrium in the balances of payment of members.

Article Two sets conditions of membership. It provides that the "original members shall be those countries represented at the Conference whose governments accept membership before December 31, 1945, and that membership shall be open to the governments of other countries at such times and in accordance with such terms as may be prescribed by the Fund." The proposal drafted by the Conference will be submitted to the legislative bodies of the countries represented for legal ratification. Agreement of delegates at the Conference to the proposal does not bind their governments.

Article Three of the text deals with quotas and subscriptions to the \$8,800,000,000 Fund. Quotas for countries represented at the Bretton Woods Conference have been set, and are part of the final Fund document. The plan provides further that the "quotas of other members shall be determined by the Fund . . . at intervals of five years' review and, if it deems appropriate, propose an adjustment of the quotas. It may also . . . consider at any other time the adjustment of any quota at the request of the member concerned. A four-fifths majority of the total voting power shall be required for any change in quotas and no quota shall be changed without the consent of the member concerned." The article further provides that "each member shall pay in gold, as a minimum, the smaller of (1) 25 per cent of its quota, or (2) 10 per cent of its net official holdings of gold and dollars as at the date . . . the Fund notifies members . . . it will shortly be in a position to begin exchange transactions."

"Each member shall furnish to the Fund the data necessary to determine its net official holdings of gold and US dollars. . . ."

"Each member shall pay the balance of its quota in its own currency." The text contains a clause providing for an alternative gold figure agreed to by the Fund in the case of countries which, by reason of enemy occupation, cannot determine gold holdings accurately.

Article Four of the plan provides that "the par value of the currency of each member shall be expressed in terms of gold as a common denominator, or in terms of the United States dollar of the weight and fineness in effect on July 1, 1944."

"Each member undertakes to collaborate with the Fund to promote exchange stability, to maintain orderly exchange arrangements with other members, and to avoid competitive exchange alterations." The Fund plan provides machinery for changing the par value of a member's currency "only on the proposal of the member and only after con-

sultation with the Fund." The plan allows for an initial 10 per cent increase in par value to which the Fund shall raise no objection.

Section five of Article Four provides for further increases in this manner; in the case of "(an increase which) does not exceed a further 10 per cent of the initial par value the Fund may either concur or object, but shall declare its attitude within 72 hours if the member so requests."

"(On changes not within these groups) the Fund may either concur or object, but shall be entitled to a longer period of time to declare its attitude." The plan also provides that members can make such changes in par value as do not affect the international transactions of members of the Fund, without concurrence.

Article Four also outlines penalties for unauthorised changes in par value by a member. The sanctions which can be evoked are ineligibility to use the resources of the Fund, or in certain cases expulsion from membership. In the matter of uniform changes in par value the plan provides: ". . . the Fund, by a majority of the total voting power, may make uniform proportionate changes in the par value of the currencies of all members provided each such change is approved by every member which has a 10 per cent or more total of the quotas. The par value . . . shall, however, not be changed under this provision if, within 72 hours, the member informs the Fund that it does not wish the par value of its currency to be changed by such action."

Article Five sets methods for conducting transactions with the Fund. It says (in part): "Each member shall deal with the Fund only through its Treasury, Central Bank, Stabilisation Fund, or other similar fiscal agency, and the Fund shall deal only with or through the same agencies."

Article Five also sets up a system of sliding scale charges which the Fund may levy against members based on the average daily balance of its currency held by the Fund in excess of the member's quota.

This system of fees is an important part of the Fund's operation, since the amounts involved are sizeable and are designed to discourage continuing unbalanced trends of currencies flowing into the Fund.

Article Six makes it impossible for a member to use the Fund "to meet a large or sustained outflow of capital."

Article Seven is devoted to the control of scarce currencies in the Fund. It says (in fact): "If the Fund finds that a general scarcity of a particular currency is developing, it may so inform members and may issue a report setting forth the cause of the scarcity and containing recommendations designed to bring it to an end. A representative of the member whose currency is involved shall participate in the preparation of the report."

"The Fund may, if it deems such action appropriate to replenish its holdings of any member's currency, take either or both of the following steps:—

(1) Propose to the member that . . . the latter lend its currency to the Fund or that, with the approval of the member, the Fund borrow such currency from some other [source which is prepared to] . . . make such loans to the Fund or to approve the borrowing of its currency by the Fund from any other source. (2) Require the member to sell its currency to the Fund for gold."

Article Eight sets forth the general obligations of Fund members to avoid restrictions on currency payments, to avoid discriminatory currency practices, and to agree to the furnishing of whatever information "the fund may require . . . for its operations, including, as the minimum necessary" . . . official holdings at home and abroad by banking and financial agencies, other than official agencies, of (1) gold, (2) foreign exchange; production of gold; gold exports and imports; total exports and imports of merchandise; international balance of payments, including (1) trade in goods and services, (2) gold transactions, and (3) known capital transactions; international investment position; national income; . . . buying and selling rates for foreign currencies; exchange controls; details of amounts awaiting clearance in respect of commercial and financial transactions.

Article Nine established the status, immunities, and privileges of the Fund. It shall be immune from judicial process; and from all taxation and Customs duties.

Article Ten provides for "co-operation with . . . other international organisations."

Article Eleven requires member nations not to engage in any transactions with non-member nations which would be contrary to "the provision of this agreement or the purposes of the Fund."

Article Twelve provides that the Fund "shall have a board of governors, executive directors, managing directors, and a staff . . . there shall be not less than 12 directors, who need not be governors . . . five shall be appointed by the five members with the largest quotas . . . two shall be elected by the American Republics not entitled to appoint directors . . . five shall be elected by other members not entitled to appoint directors." Election is to be by proportional representation. The executive directors shall function in continuous session. They shall select a managing director who shall not be a governor or an executive director. Each member shall have 250 votes, plus one additional vote for each part of its "equivalent to 100,000 United States dollars."

Article Thirteen establishes that "the principal office of the Fund shall be located in the territory of the member having the largest quota, and agencies or branch offices may be established in the territories of the other members."

Article Fourteen is devoted to the Fund's status in the transitional period, and establishes that "the Fund is not intended to provide facilities for relief or reconstruction, or to deal with international indebtedness growing out of the war." It also provides for members' withdrawing exchange restrictions "as soon as they are satisfied that they will be able in the absence of such restrictions to settle their balance of payments in a manner which will not unduly encumber their access to the resources of the Fund."

Article Fifteen recognises the right of members to withdraw from the Fund "at any time by transmitting a notice in writing to the Fund at its principal office." This section also traces in technical detail the settlement of accounts with members withdrawing, "with reasonable dispatch, and by agreement between (the member) and the fund."

Article Sixteen is devoted to emergency provisions, the most important of which is "the executive directors by unanimous vote may suspend for a period of not more than 120 days the operation of (the main functions) of the fund."

Article Seventeen sets a method for amending the Fund plan "when three-fifths of the members, having four-fifths of the total voting power have accepted an amendment. . ."

Articles Eighteen and Nineteen are devoted to the interpretation and explanation of terms.

Article Twenty establishes that "this agreement shall enter into force when it has been signed on behalf of governments having 65 per cent of the total quotas . . . but in no event . . . before May 1, 1945."

The Reconstruction Bank

The articles of the International Bank for Reconstruction and Development provide that the agreement shall enter into force when it has been signed on behalf of governments whose minimum subscriptions comprise not less than 65 per cent of the total subscriptions of the nations at the Conference.

Municipal Borrowing

Very little surprise has been occasioned by the Treasury's announcement that, for an unspecified period after the end of hostilities, virtually all the longer-term loan requirements of local authorities will be met not by individual issues, but by advances by the Government. For a substantial period before the war, the principle that the terms upon which a municipality could borrow should be determined by its credit status had gone by the board. Terms of issue, as well as dates, were fixed by the authorities, and the terms were unchanged over substantial periods irrespective of the actual borrower. It is only one step further, and in the context of an energetic cheap money

The first article sets out its purposes. These are:—

(1) To assist in the reconstruction and development of territories of members by facilitating the investment of capital for productive purposes, including the restoration of economies destroyed or disrupted by war, the reconstruction of productive facilities to peacetime needs and the encouragement of the development of productive facilities and resources in less developed countries.

(2) To promote private foreign investment by means of guarantees or participations in loans and to supplement private investment when private capital is not available on reasonable terms.

(3) To promote the long-range balanced growth of international trade and encourage international investment for the development of the productive resources of members, thereby assisting in raising productivity, the standard of living and conditions of labour in their territories.

(4) To arrange loans made or guaranteed so that the more useful and urgent projects, large and small alike, will be dealt with first.

(5) To conduct its operations so as to bring about a smooth transition from a war-time to peace-time economy.

The guaranteeing in whole or in part of loans made by private investors through the usual investment channels is to constitute the major operation of the Bank, accounting for 80 per cent of its resources. Twenty per cent, or £2,000 million, plus earned surpluses, is to be the extent of direct loans by the Bank.

The original members of the Bank shall be those members of the International Monetary Fund which accept membership in the Bank before 31st December, 1945.

The authorised capital stock of the Bank shall be 10,000 million U.S. dollars divided into 100,000 shares available for subscription only by members. Capital stock can be increased when voted by a three-quarters majority of the total voting power.

Twenty per cent of the subscription shall be paid or subject to call as needed by the Bank for its operation, the remaining 80 per cent being subject to call by the Bank or when required to meet the obligations of the Bank.

Two per cent of the subscriptions shall be payable in gold or U.S. dollars provided that any original member whose metropolitan territory has suffered from enemy occupations or hostilities during the present war shall be granted the right to postpone payment in gold of one-half per cent (a quarter of the payment) for five years. An original member whose gold reserves are still seized or immobilised as a result of the war may postpone all payments until such date as the Bank shall decide.

For the Bank to make loans to members it must be satisfied that the borrowers would be unable to obtain the loan otherwise under reasonable conditions and due regard must also be paid to the prospects that the borrower or the guarantor will be in a position to meet his obligations. In guaranteeing a loan made by other investors the Bank shall receive suitable compensation.

All the powers of the bank shall be vested in the Board of Governors. When a Government ceases to be a member it shall remain liable for its direct obligations to the Bank and contingent liabilities with respect to loans and guarantees entered into thereafter by the Bank.

Amendments may be made to the bank agreement when three-fifths of the members having four-fifths of the total voting power have accepted the proposed amendment.

Business Notes

policy, a very obvious one, to raise all the money required by the issue of a single type of security. To do that solely on the credit of the local authorities would have been resisted by those with a high credit standing, but a Government backing for the whole sum means cheaper money for all. The actual means to be adopted were still a matter of guesswork. In fact, the Treasury proposes to take power to make issues direct to the Local Loans Fund from the Consolidated Fund and out of the proceeds of general borrowing. It already has the power, not so far used, to issue any security other than Local Loans stock to supply the Local Loans Fund. In future the Local Loans Fund will be open to all local authorities, whereas hitherto it was accessible

only to the smaller. The local authorities will retain certain rights of borrowing, mainly for comparatively short periods. Thus, they may borrow from other authorities and from sinking and similar funds. They may borrow on mortgage to replace existing mortgages, but not apparently to increase their amount. They may borrow on bank overdraft and, where permission already exists, by the issue of bills, but only in anticipation of revenue or as temporary finance of expenditure ultimately to be met out of a loan. The measure constitutes a considerable extension of the Treasury's grip on the market in that it removes an interesting alternative to the Government's own securities. The effect is likely to be to reduce still further the yield margin between gilt-edged and other fixed-interest stocks, at the cost of making rather less easy the task of keeping down the rate paid on the Government's new borrowings.

Britain's Overseas Debts

Some of the confusion created by recent official estimates of the growth of abnormal sterling balances has been cleared by an answer which the Chancellor of the Exchequer made in the House of Commons at the end of last week. Sir John Anderson recalled his statement during the Budget speech that Britain had parted with overseas assets to the extent of £1,000 million and had incurred undischarged overseas liabilities amounting to £2,000 million. He added that these figures indicated the position at the end of 1943. In fact, the figure given by the Chancellor appears to have been no more than a rounding off to the nearest tenth figure of the aggregate four years overseas disinvestment of £2,843 million given in the latest White Paper on the sources of war finance. In other words, the Chancellor's estimate of "overseas liabilities" did not include the pre-war liabilities, i.e., normal sterling balances maintained either as currency reserves or as working balances. These may probably be placed at between £300 million and £400 million. On the other hand, when Lord Keynes recently announced at Bretton Woods that the sterling indebtedness of this country amounted to £3,000 million, his figures referred to the probable total at the end of 1944 and included the pre-war balances. In other words, the comparison of Lord Keynes' and Sir John Anderson's figures would suggest a rate of disinvestment, on this count alone, of between £600 million and £700 million for the current year.

A New Role for the Bank

It became known last week that the controlling interest in Continental Assets Realisation Trust is held by the Bank of England. Of the Trust's 104,922 shares, 70,600 are held by two nominees of the Bank, the chief cashier and the secretary. CART was registered as a private company in December, 1938. It first came into the news in the following May, when it acquired the London Merchant Bank's frozen credits covered by the German and Hungarian standstill agreement. More recently it has undertaken the direction and management of the British Overseas Bank and of the Anglo-International Bank, after what remained of the active banking business of these institutions had been transferred. As a result of these various operations CART now holds or controls frozen European assets amounting to about £3,500,000. In due time that figure will no doubt increase. There is a great deal to be said in favour of centralising these frozen assets and thus presenting a united front to the debtors. There is also a great deal to be said in favour of allowing that strength to be exerted by an offshoot of that well-known private institution, the Bank of England. With the support at its disposal, CART should be in a much stronger position than the individual banking creditors who were left with standstill credits on the outbreak of the war. German standstill credits alone were owing to British banks on the outbreak of the war to the amount of £34 million. Of this total the clearing banks held about £11 million, and these holdings would in no circum-

stances be transferred to CART. But of the balance of £23 million, held in the main by the acceptance houses, a substantial further portion may ultimately come under this semi-official control. At the beginning of the war the Bank of England offered to help acceptors who were then compelled to take up their standstill bills from the market—but made this accommodation available at the stiff price of 6 per cent. The help then given has been almost wholly repaid.

Dearer Coal

The price of coal is going up with a regularity that is tending to lull criticism rather than to cause alarm. After a rise of 3s. a ton on February 1st there is to be a new advance of 4s. a ton on August 1st. Like previous increases the new one is the direct result of higher wages granted by the latest award of the mining industry's wage tribunal in the award to end awards. Even if there are no further increases for some time, British industry will be faced with a substantially higher fuel bill after the war than before, for the rise in coal prices has outstripped that of many other essential industries. Industries, such as steel, cement, chemicals and some of the newer trades, will be handicapped at a time when Britain will have to make a special effort to increase its productivity. Moreover, unlike other industrialised countries, such as the United States, Canada and Russia, this country does not possess large reserves of water power that can be developed as an alternative to coal. The need for an increase in the productivity of the coal-mining industry and, of course, for greater efficiency in distribution and consumption—has been stressed so often as to become mere commonplace. But it deserves to be stated once more.

Larger Units in Cotton Trade

The Cotton Board Committee's main recommendation in its report on the post-war problems of the cotton industry—the report was discussed in *The Economist* of January 29th—was for a strong statutory central organisation, coming close to the pattern of industrial self-government, buttressed by an enforceable system of price control. Criticism of the lack of detailed suggestions about the concentration of the industry into bigger units has prompted the Committee to make known its views on this subject in a supplementary statement issued this week. At present the position is as follows in the various sections of the industry:

Spinning.—More than half the capacity is controlled by 31 firms, each owning more than 200,000 spindles.

Weaving.—The degree of concentration is much smaller than in spinning and the proportion of small firms much larger.

Finishing.—In this section there are a large number of small concerns side by side with a small number of relatively large ones.

Merchant Converting.—About 15 per cent of the total trade is in the hands of the ten largest firms.

Export Trade.—About 25 per cent of the total trade is in the hands of the ten largest firms, but this section also contains a large number of small firms.

Vertical Units.—These are not common in the cotton industry: 18 per cent of spindles and looms are controlled by verticle combines.

In the Committee's view the industry is in the hands of units that are "technically of a size fully compatible with maximum efficiency." Nevertheless,

the Committee was satisfied that in post-war years large concerns will possess weighty advantages in the field of research; that the concentration of a section of the industry in a few hands would facilitate the execution of a single and effective trade policy within that section; and that a few large groupings in any section could more readily arrange with similar groupings in other sections of the industry to carry through a co-ordinated policy.

The Committee, therefore, reached the conclusion that there are strong grounds for encouraging voluntary amalgamations wherever possible. These would be particularly desirable in the spinning section. As a step towards the vertical type of organisation, the Committee suggests that individual manufacturers and finishers should enter into forms of mutual agreement with individual merchants which, varying in detail, would have the common feature of establishing close and permanent links and interdependence between units of production and units of distribution.

The Prospect of the Trade

There can be no doubt that, if the cotton industry is to prosper when stocks of cotton goods have been replenished after the war, it will have to avail itself of all the means at its disposal to sell its output. One of these means, as the Committee has recognised, is the concentration of the industry into fewer and larger units. But more concentration will do little unless every effort is made to reap the economies it promises; and it might even be harmful if it were to pave the way to monopolistic practices. One of the Committee's most promising suggestions is that manufacturers and finishers should enter into forms of mutual arrangement with individual merchants. An efficient merchanting organisation, with adequate knowledge of consumer needs, could do much to canalise trade into the most productive channels and could exercise a strong influence in the re-organisation of the industry. The Committee itself is under no illusion about the industry's problems. In its first Report it had this to say:

It is clear that if the very low labour cost countries are going to enjoy equal terms of access to markets; if they are going to expand their production; and if their wages and conditions are going to remain where they are whilst our conditions improve as we intend them to, only a limited export trade in specialities will remain to the British cotton industry after the world shortage is overcome.

It is clear that the Committee is not optimistic about the prospect of the trade in bulk cottons; its hope lies with a growing demand for quality goods, and one of its tasks is to encourage this demand by all the modern devices of market and quality research, coupled with the most efficient methods of production.

A Select Committee's First Report

The Select Committee on Statutory Rules and Orders was set up about a month ago with wide terms of reference intended to surmount some of the dangers of delegated legislation. One of its duties is to draw attention to regulations which are believed to go against the intention of Parliament or whose meaning is unclear. On these grounds, the first report of the Select Committee has been laid on the Table. It runs as follows:—

The Committee have considered the Utility Apparel and Utility Cloth Orders (Amendment) Order, 1944 (SR and O, 1944, No. 703), dated June 20, 1944, which was presented to the House on July 5, 1944, and are of the opinion that the attention of the House should be drawn to it on the grounds that it appears to make some unusual or unexpected use of the powers conferred by the Statute under which it is made and that its form calls for elucidation. The Report to lie on the Table.

There can be scarcely one among the thousands of Statutory Rules and Orders passed since the war that cannot be said to "call for elucidation." It may be that the Committee's objection lies in the fact that, since it is an amending Order, the understanding of its provisions requires reference to seven previous Orders. But this is not unusual. The explanatory note which accompanies the Order is quite clear. It declares that the Order fixes wholesalers' and retailers' ceiling prices for certain items of utility clothing and that it amends wholesalers' and retailers' ceiling prices for certain utility cloths in accordance with changes in the manufacturers' prices. It is a pity that the Select Committee's terms of reference do not permit it to be somewhat more explicit in its report. If an MP wishes to table a motion on the Order he will have to give it the same detailed study it received from the Committee, and his task will be more difficult because no record of its discussion is made. While criticism might be made of the Committee's choice of an example, its function is nonetheless a vital one. Vigilance must be exercised to ensure that powers granted by Parliament are in no way exceeded. And the regular scrutiny of regulations is a powerful safeguard. The results in this particular case will be watched with interest. A motion has been tabled. Members have three months in which to discuss the matter. Meanwhile, the Order has been in force since July 10th.

Science and Industry

The importance of developing and applying scientific research in British industry is now unanimously recognised, and to the spate of pronouncements on this subject Nuffield

College recently added a weighty memorandum. The statement on "Problems of scientific and industrial research," signed by 92 different representatives of science, industry, trade unions, economics and the universities, covers a great deal of ground that is now familiar. Its chief defects are those of any document drawn up on the basis of the agreement of the greatest possible number; as well as the absence of any summary of its recommendations, and of any estimate of the cost of some of its proposals. Broad goodwill seldom gets down to details. But this memorandum does restate the most important problems and it does make a number of positive recommendations. One of the most important proposals is that "industry" should collectively maintain some 25 research associations, employing 4-5,000 scientists and technicians, at a cost of about £4 million a year to run and £2-3 million to develop. A section of the Nuffield statement is devoted to consideration of the state's relation to scientific research. The suggestion that the Government, as well as increasing its direct grants for research, should hold a watching brief for new developments which might benefit the consuming public if properly and openly used, and should have power to review industrial costs and margins, where necessary, and to promote standardisation, has much to commend it. So, obviously, has the support given to a revision of the patent laws which at present "may operate to check rather than to stimulate invention." Other proposals are that the pay and status of industrial scientists should be raised; closer links established between the universities and industry; that more attention should be paid to design and development; that the numbers of workers in both fundamental and applied research should be increased and building and equipment extensively modernised. Fundamentally, the statement urges, the promotion of scientific research depends upon a new approach, a new conception of teaching in the schools and the recognition that science cannot stand apart from "culture." It is now for those who have responsibility for the development and application of science—many of whom signed the statement—to see that these very excellent expressions of opinion do not remain pious hopes, but are translated into practice.

ICI Research Fellowships

A prompt and practical answer to the challenge has been given by the directors of ICI, who have offered to finance 80 fellowships in physics and chemistry at nine British universities. The fellowships will be of the average value of £600 a year and will operate for an initial period of seven years. ICI recognises that—to quote Lord McGowan—"academic and industrial research are interdependent and complementary." Only the broadcast conditions have been laid down for the fellowships: that fellows should undertake some teaching, and that the fellowships should provide additional facilities, and not relieve the universities of any present costs. Administration will rest wholly with the university concerned. The universities chosen by ICI, apart from London, Oxford and Cambridge, each of which is given 12 fellowships, are those near the main centres of the company's production—Glasgow, Edinburgh, Manchester, Birmingham and Liver-

pool, each with eight, and Durham, with four. ICI does not pretend that its generosity will not, in the long run, and at any rate indirectly, be of benefit to the company, though the purpose of the offer is to assist industry as a whole. It is obviously of the highest importance that the universities should be given full autonomy and independence in the administration of the scheme, which can make a vital contribution to scientific advance. ICI's example might well be followed by other industries and extended to other subjects.

Graduates in Shipbuilding

The success or failure of the British drive for exports in the post-war years will depend very largely on progress in the engineering industries. In this group shipbuilding occupies a position of great importance. Over the centuries British shipyards have achieved and maintained a record for sound workmanship that is a reason for national pride. In the world's markets, British shipbuilding enjoys a considerable goodwill by reason of the fine traditions and achievements of the Royal and Merchant Navies. Recently Mr Dalton said in the House of Commons: "We aim at a large and stable shipbuilding programme after the war." Despite the enormous expansion in American shipbuilding capacity during this war and the possibility, therefore, of keener competition, it is likely that efficiently conducted British shipyards will be fully employed for many years to come. The future rests with the degree of efficiency attained, and this, in turn, depends on the quality of the shipyard workers and managements. In 1943 the future position with regard to the supply of trained research-workers and key-workers was held to be so unsatisfactory that the North-East Coast Institute of Engineers and Shipbuilders appointed a committee to examine the situation, and to propose methods by which more university-trained men might be attracted to the industry. The committee's report, which was published recently, puts forward two reasons to explain the long-standing unpopularity of shipbuilding as a profession—cyclical slumps and poor standards of remuneration. It is suggested that salaries in the industry should be made comparable with those in other branches of engineering; and that this might be facilitated by the appointment of young men of university standard to junior managerial posts carrying opportunities of promotion to senior executive posts. It is suggested, too, that all shipbuilding and ship-repairing firms in Great Britain and Northern Ireland should give an undertaking to offer definite encouragement to the entry of graduate engineers, and should "seriously consider augmenting their technical staffs by such means as the inclusion of a greater number of assistants, to senior officials." Training schemes, already in force, should be expanded, and deserving apprentices should be given opportunities and financial assistance (by their employers) to pursue their studies at the universities. The relative long-term efficiency of the university graduate and the "man of practical experience" is a subject of acute controversy; but, in general, and for most purposes, the benefits of further education cannot be denied. To-day an efficient technical education pre-supposes practical as well as academic knowledge. The committee's views on the matter should therefore be welcomed, and its conclusion—that shipbuilding has suffered from a shortage of men of high technical training and general education, and that post-war progress will require their more numerous recruitment—deserves the closest attention.

Resumption of Distilling

The main point of Lord Forteviot's address to the shareholders of the Distillers Company was his suggestion

that the time is ripe for a resumption of whisky distilling. It is, of course, natural that all producers who have had their output rigidly curtailed by the exigencies of war should now assert claims for relaxation. In many cases these cannot be granted, but in the case of whisky distilling there is much to be said for very serious consideration. Lord Forteviot stated

that any further curtailment of supplies for abroad may endanger the continuance of that great national asset, the export of a commodity which, in pre-war years, amounted to many millions of pounds.

Actual exports of whisky averaged some £11,500,000 per annum in the quinquennium 1935-39. That is by no means a negligible contribution, and it is reasonable to assume that, at post-war prices, the same quantity would produce a larger money total. In existing circumstances, the only alternative to progressive curtailment of supplies to overseas customers appears to be an undue exhaustion of stocks. That means either a mere delay in the time when the cut must come, or else a scaling down of quality by using less mature spirit. Either of these can only be harmful to the post-war market. It may be true to say that, in the matter of whisky, there is nothing like Scotch. But it is not the fact that there are no substitutes. What whisky a country drinks is largely a matter of taste and tradition. If the alternatives set out are the only ones available, there is much to be said for releasing the very moderate quantities of men and materials necessary to permit Britain to retain its share in the overseas market, if not to permit some relaxation at home. This country has already waged total war for at least four years, irrespective not only of the current cost, but of the future liabilities this has involved. There must come a time when some resources can be spared for the rebuilding of the post-war position and the liquidation of our new debts. On the question of fact whether resources can be spared at any given moment, only those with the full facts can decide, but there is at least a *prima facie* ground for action in those cases where time and skill make a large contribution to the final value of exports and the immediate sacrifice of resources involved is comparatively modest.

Boots Earnings

The directors of Boots Pure Drug Company are to be congratulated upon a material improvement in the accounts presented for the year ended March 31, 1944. These include, for the first time, a consolidated statement of assets and liabilities of the five retail subsidiaries, the district "Cash Chemist" companies, and also some particulars as to their earnings. In the past it has sometimes been revealed that only the very modest preference dividends have been brought into the accounts of the parent, while at others it has been stated that all dividends have been included, but their amount has not been disclosed. This year £95,550 of ordinary dividends have been brought in, and it appears, from a note to the consolidated statement, there is a further sum of about £100,000 available for additions to reserves or for provisions. It is a great pity that the directors have halted at this stage. It would have been far more satisfactory to have included a real consolidation of the profits of the group. A further change in the accounts is the inclusion of all dividends net. It would have been particularly helpful, in view of these changes, if comparative figures for at least one earlier year had been given, but the company adheres to its practice of giving no comparative figures. In the accounts of the parent, holdings in and advances to the retail subsidiaries stand at some £2,316,000. The consolidated statement shows that this interest is represented by £5,000,000 of net assets before deducting depreciation reserves of £2,245,000. From the revenue standpoint it would appear that, after meeting all charges, including preference and preferred dividends, there was available from the whole group a tax-free profit of not much short of £600,000 as earnings of the ordinary capital of the parent of £1,600,000, or something well over 70 per cent subject to tax. On the basis of the previous, partial information, earnings averaged 45.5 per cent for the decade 1934-43 and were only 30 per cent in 1942-43. No comparison can be made for those years, but there is no evident reason why total earnings should have improved sharply in the period just ended. The effect of the disclosures on the value of the shares has been to raise the price from around 49s. 6d. a month ago to 60s. 9d. ex-dividend, at which price the yield is some £2 9s. 4d. per cent.

Another SPS Scheme

The board of Suburban and Provincial Stores considers the time ripe to suggest a further stage in the reconstruction of the company's capital. It may be recalled that towards the end of 1942 the then existing ordinary shares, carrying a 7 per cent dividend with further participation in profits, were converted into 3 per cent preference shares and the three million 2s deferred shares became ordinary. It is now proposed to write off the latter entirely, giving holders the right to put up an equal amount of new money in payment for capital carrying the same rights. This offer is, however, contingent upon Treasury permission being obtained, and, as a first step, it is proposed to issue only one new share for each thirty old, ignoring fractions. It is not clear what rights, if any, the holders of fractions will have in respect of any subsequent issue of the remaining twenty-nine-thirtieths. In view of the fact that 89 per cent of this class of capital is held by John Lewis and Co. or the Partnership company, this point is of some importance. The reasons given for this measure are that £1,600,000 of the original capital must be regarded as lost, and that to find some fresh money now will facilitate the raising after the war of essential further capital by the issue of debentures or preference shares. While there can be no doubt that the modicum of new money which it is proposed to raise is very desirable, there is no apparent reason for the complete cancellation of the ordinary shares. It cannot be too often insisted that, in such matters, earning power is the sole criterion. Although nothing has been paid on this class of capital, earnings on it amounted to 3.8 per cent in the year to January 31st last. Although the scheme leaves the major part of the capital loss still on the books, it is apparently contemplated that the new ordinary capital should receive a dividend in the near future; indeed, it would be difficult to raise the money on any other supposition. In these circumstances it is impossible to maintain that the equity, which belongs solely to the ordinary shares, has no value. The market was so convinced of this that, prior to the announcement, the shares stood at a premium of some 125 per cent. Even now they are still above par. No doubt a substantial writing down would be justified, but their complete elimination would be a substantial injustice. Any scheme should also make it clear that the appreciable minority of shares held by the public will not be placed in an inferior position merely because the individual holdings are small. In presenting the scheme, the board already admit, that the position is less bad than seemed probable twenty months ago.

Hudson's Bay Outlook

The Hudson's Bay ordinary shares have now lost the rise which followed the publication of the full accounts for the year ending January 31, 1944. These indicate that, despite the virtual suspension of fur sales to the United Kingdom, the company's retail trade has achieved record sales and profits. But the payment of the 5 per cent tax-free distribution to ordinary shareholders out of the land capital account, which has caused such jubilation, is now set in its proper and soberer context. It is true that the price received per acre of land sold is £1 5s. 6d., which compares with only 19s. 1d. for the previous year; but, on the other hand, the average price received per acre over the last three pre-war years, ending January 31, 1940, was £1 9s. 1d., or 3s. 7d. higher than current earnings. The reason for the high return on land account is simply that advantage has been taken of the increased prosperity of farming in Western Canada to dispose of a greater quantity of land. Unsold lands not valued in the balance-sheet now amount to 1,311,143 acres, compared with 1,918,443 acres ten years ago, and represent, as the governor, Sir Patrick Ashley Cooper, points out, a wasting asset of which the best has been sold—and which, at the same rate of disposal, would be entirely liquidated in 20 odd years' time. Farming prosperity again has enabled land revenue in the profit and loss account to rise by £100,000 to £170,016, the best result since 1939. This is due to the payment into it of substantial arrears of principal and interest, which are, of course, non-recurring items. The outstanding instalments owed to the company in respect of lands sold amount now to £1,123,562, which is lower by £160,000 than last year and by £900,000 than ten years ago. It is clear that the present good profits from land carry no promises for the future,

but rather the opposite. As regards the company's other assets, it is pointed out that Turner Valley Field, where all its oil and gas wells are situated, shows signs of reduced output. Trading prospects for the future are an unknown quantity, although there is likely to be an initial post-war boom. Hudson's Bay has certainly the capacity to yield a fair return in the long run as well as the short, but it is possible that the market has been too much swayed by its immediate gains. The £1 ordinary shares at 77s. ex-dividend yield some £2 2s. 10d. per cent, tax free.

Essential Work Order

A minor, but sensible, amendment to the Essential Work Order came into force on Monday. In the past a worker who appealed successfully against dismissal was entitled to wages for the period between his dismissal and his appeal only if his reinstatement was directed. If for practical reasons it was not possible to reinstate him, the appellant had no right to the guaranteed wage during the period. This anomaly has now been corrected by the Minister of Labour, and the amended Order gives a dismissed worker the right to wages up to the date when the Appeal Board finds the dismissal was not justified on the ground of serious misconduct, even though it does not order reinstatement. A frequent source of criticism is the absence of any definition in the Essential Work Order of what constitutes "serious misconduct," for which a worker can be dismissed, and the trade unions have long been pressing for a clarification of this term. Recently the case occurred of a shop steward in a London engineering factory who was dismissed because he was alleged to have been playing darts in the lunch break, against the firm's instructions. The worker lost his case on appeal, but Members of Parliament who raised the matter in the House of Commons contended that the Appeal Board had not heard evidence in his defence. Mr Bevin stated that he had no authority to interfere in the Board's decision, but he agreed to investigate the matter further. On the face of it,

POST-WAR INDUSTRY

There will be no place for booms and slumps in a post-war world where millions will be homeless and whole nations short of the basic necessities of life.

This Company believes that the giant task of reconstruction will provide full employment and a rising tide of prosperity for all . . . provided that international trade is freed of its old economic rivalries and placed on the stable basis of mutual benefit. In the interests of our own Company, as well as of industry as a whole, we therefore urge business leaders on both sides of the Atlantic to think and plan for the future in terms of *International Industrial Collaboration* as the only sure basis for world peace and prosperity.

THE MOND NICKEL COMPANY LIMITED

Grosvenor House, Park Lane, London, W.1

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of One Dollar (\$1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable September 15, 1944, to shareholders of record at the close of business, August 15, 1944.

By Order of the Board,
Toronto, J. R. BRADFIELD, Secretary.
July 20, 1944.

is difficult to believe that dart-throwing, unless with intent to murder or to damage property, would constitute serious misconduct" or justify the extreme penalty of dismissal. But whatever the rights or wrongs of this particular case, it does seem to indicate the need for an interpretation of the words "serious misconduct."

Engineering Apprentices

The problems of juvenile recruitment and training in the engineering industry are being discussed at the Amalgamated Engineering Union's special youth conference at Southport this week. This conference, which is the first of its kind, is a reflection of the importance now attached to the needs of young workers. The engineering employers and trade unions are about to conclude a national agreement, which will lay down the basis for apprenticeship and training in the industry, on the lines of a joint memorandum submitted to the Ministry of Labour's juvenile recruitment and training committee. They recommend that an apprenticeship system should be worked on a local basis, through special joint industrial juvenile advisory panels. These panels, which would consist of equal numbers of employers and unions representatives would be charged, broadly, with the control of supply of juvenile entrants, with vocational guidance, and with conditions of service and standards of instruction. They would maintain contact with the local education authorities. The main recommendations are that juveniles should remain in full-time education until employment is available; that pre-apprenticeship training of a general character such as is now given at junior technical colleges should be available before leaving school; that apprentices should be systematically released for a whole day a week during normal working hours for continued education, with additional attendance up to the age of 18 at a young people's college. Voluntary attendance at evening classes would be encouraged, but should not be made a condition of apprenticeship. Stress is laid on the need for a more general education and for interchangeability—for instance, pattern-maker apprentices should learn about foundry work and *vice versa*. This scheme should help to raise the general level of education and to promote flexibility, which is so essential to the maintenance of a high general level of employment.

Women Engineers' Wages

The National Arbitration Tribunal has awarded an increase of 4s. a week to women employed in the engineering industry according to the National Women's Schedule, that is, on work "commonly performed by women." A similar increase was awarded in May to adult males in the industry. This award will thus bring up the national minimum wage rates for women to 54s. for a plain time worker and 51s. for a piece worker. It is estimated that about three-quarters of a million women are affected by the increase. The Tribunal recommends in addition that the method of determining piece rates should be worked out by both sides of the industry. The unions catering for women engineers (Transport and General Workers' Union, National Union of General and Municipal Workers and Amalgamated

Engineering Union) had referred the claim to arbitration, after turning down the employers' offer, which is understood to have been for an increase of 3s. a week. They made it plain at the time that their claim was only an interim measure, pending an overhaul of the whole wages structure of the industry.

Second-Hand Furniture Price Control

The Board of Trade has accomplished what, perhaps, has been its most difficult task, apart from clothes rationing, in its control of the civilian market. Ceiling prices for second-hand furniture have been laid down to come into force on August 28th. The schedules divide furniture into three classes, A, B and C, according to the type of wood in which it is made, and prices are laid down in relation to the size and fittings of the pieces concerned. Thus prices laid down for wardrobes range from £6 10s. to £57 10s., and there are fifty-four classifications. There are twenty-four classifications for sideboards, with prices ranging from £6 to £40. Bedsteads vary from £1 5s. to £12 and bed-springs from £1 5s. to £6. The Board of Trade has had the assistance of the furniture trade in working out the schedules. The new Orders have come because earlier attempts to control furniture prices proved impossible to enforce in the absence of detailed ceiling prices. Consequently, prices rose considerably and steadily. The main object of the new Orders is not so much to achieve a "spectacular" reduction in prices—although a substantial reduction is evident from the schedules—as to arrest the steady rise and to prevent excessive prices from being charged. A too drastic reduction might have the effect of drying up the sources of second-hand furniture, and clearly there should be a reasonable inducement to the disposal of surplus furniture in private homes. As before, sales between individuals are not controlled, but advertisements must state the name of the owner and the address at which the furniture can be inspected. Another provision, regrettable though necessary for enforcement, is that the trader must enter in his records the details of the identity card of those who sell to him or buy from him. Control is extended for the first time to sales by auction, to which the ceiling prices apply. All furniture offered for sale by traders must be labelled with its price and its number on the schedule. The ceiling prices apply to new furniture (other than utility furniture), of which there is still a small quantity on the market. They do not apply to antiques, and for especially fine pieces of furniture which are not antiques application can be made to the Price Regulation Committee for permission to charge more than the scheduled price.

Nitrate Developments

The announcement made in the House of Commons on July 5th that Germany is erecting synthetic nitrogen works in Spain is of interest for the future of international trade in nitrates. Spain is a major consumer of nitrogen fertilisers and, before the war, imported the bulk of its requirements. The closing of this market will be a serious loss to the Chilean nitrate industry and European exporters of synthetic nitrogen alike, who have lost other trade opportunities during this war. Large deposits of natural nitrate have been discovered in China and are now being developed. The United States, which before the war used to import over a quarter of its nitrogen requirements, has vastly expanded its manufacturing facilities and, according to a recent report of the US Bureau of Mines, is now capable of producing nitrogen compounds in excess of the domestic post-war demand. The United States was the only large national market excluded from the quota regulations of the pre-war international nitrogen agreements, so that it was utilised as a kind of dumping ground for surpluses. Without this outlet it would have been difficult in the past to reach any agreement between the various nitrogen producers, who, even before the war, could produce twice as much nitrogen as was needed. The wartime increase in output of natural and synthetic nitrates, and the closing of some of the largest pre-war markets, is likely to result after the war in heavy surpluses. These may be partly utilised, if an ambitious policy of international nutrition standard is followed. But, in view of the importance of nitrates for peace and war, supplies and markets may well call for international governmental regulation.

COMPANY MEETINGS

THE DISTILLERS COMPANY, LIMITED

SATISFACTORY RESULTS

LORD FORTEVIOT'S STATEMENT

The sixty-seventh ordinary general meeting of the Distillers Company, Limited, was held in Edinburgh on the 21st instant. The report and accounts were adopted.

The following is the statement by the chairman, Lord Forteviot, circulated with the directors' report and statement of accounts for the year ended May 15, 1944.

The profit from trading and revenue from investments for the year ended May 15, 1944, arrived at after charging depreciation on the company's fixed assets, placing a further sum to reserve for investments, and provision for deferred repairs, taxation and contingencies, amounts to £2,039,346. This compares with the figure of £1,947,221 for the previous year.

The Board have agreed to appropriate and to apply the following sums:—

To reserve fund £500,000, making the fund £3,500,000.

To war contingencies reserve £50,000, bringing it up to £250,000, leaving available, with the amount brought forward and after deducting the interim dividends, the sum of £1,502,950, as against last year's figure of £1,295,701.

Over past years it has been possible to build up, out of earned profits, substantial reserves in some of our larger subsidiary companies, in addition to those in the accounts of the principal company, and this policy has been continued in the year under review. The stage has been reached, however, when, in the opinion of the board, advantage may be taken to some extent of this prudent and conservative policy, and the appropriations to reserves in the principal company, already mentioned, have been reduced, as compared with the previous year, by £125,000. By using the increase in profit of £92,125, and the saving from the said appropriations to reserve, the board is in a position to make the following proposals:—

(1) To increase the dividend on ordinary stock by 1½ per cent. to 16½ per cent., that is, a final dividend of 10 per cent.; and (2) To increase the bonus on ordinary stock from 1½ per cent. to 2½ per cent., thus leaving a carry forward of £534,491, or £20,157 larger than the amount brought in.

BALANCE SHEET ITEMS

With regard to the balance sheet, I have to report the following features of interest:—

(1) During the year under review the company extended their investments in National War Bonds, etc., by nearly £2,500,000, so that, at May 15, 1944, the company's holdings in gilt edged securities, largely short term, amounted to just under £15,500,000.

(2) The company purchased the whole issued capital of that well-known whisky blending company, A. and A. Crawford, Limited, Leith, and is carrying it on as a subsidiary company, and

(3) The entire issued capital of Mawson, Swan and Carter, Limited, Yeast Distributors, etc., Newcastle-upon-Tyne, was purchased during the year, and this company also is being carried on as a subsidiary company.

NECESSITY FOR DISTILLING

In my statement last year I said there was no prospect of distilling—either grain or malt—during the year 1943-44, and, in fact, there was none. It is not yet known whether the Ministry of Food will be able to release material for a resumption of distilling this year. I appreciate the difficulties of the Government, yet I cannot too strongly press for permission to start distilling as soon as possible. The necessity for conservation of stocks, and the obvious duty to supply, as fully as possible, the Armed Forces, have entailed further ration-

ing of supplies both at home and abroad. The situation at home has been borne by the public with admirable restraint, and our great export markets fully realise that we are supplying them as generously as we can. I must, however, point out that any further curtailment of supplies for abroad may endanger the continuance of that great National asset, the export of a commodity which, in pre-war years, amounted to many millions of pounds sterling. In the post-war world this would be of great value to the United Kingdom in the International situation, and it cannot much longer be guaranteed unless distilling is permitted.

There was no change in the duty on whisky in the Finance Act, 1944, so that the price of 25s. 9d. per bottle, of which no less than 18s. 4½d. represents duty, continues in operation.

The company's yeast factories have been on full production throughout the year, and there has been an ever-increasing demand for all our yeast products. At the request of the Ministry of Food, the company equipped premises suitable for additional production, and in the early part of 1944 one of these plants was successfully brought into operation.

PROGRESS IN CHEMICAL AND PLASTIC SPHERES

While present conditions do not permit me to enlarge upon the subject, I am able to say that our progress in the chemical and plastic spheres continues, and, in addition to the substantial contribution to the National effort which our company is making, in the supply of essential war materials, we are now giving careful consideration to the problems of post-war developments as affecting the industries in which we are engaged.

I have also to inform our stockholders of the proposed fusion between Gyproc Products, Limited, one of our subsidiary companies, engaged in the manufacture of plasterboard, and the British Plaster Board, Limited, whereby the Distillers Company, Limited, receives shares of the British Plaster Board, Limited, in exchange for those of Gyproc Products, Limited. After full consideration of all the factors, your board considers this to be an extremely satisfactory arrangement, which should tend to consolidate and broaden our interest in the building industry.

I do not propose to give any indication of the prospects for the current financial year, but I should like our stockholders to appreciate that the company is in an extremely strong position financially, with ample reserves, and that, so far as it is possible to do so, our plants are being kept in a full state of efficiency. Our interests are varied and well spread, and, as I have indicated, the directors have very much in mind the problems that will arise in the post-war period.

MANAGEMENT COMMITTEE

It is with deep regret that I have to record the death of Mr. William Dargie, which took place on February 15, 1944. Mr. Dargie had spent almost the whole of his business life with the company, rising, through the office of secretary, to a seat on the board, and, in 1940, to the management committee. He rendered great service to the company, and we miss his genial and kindly personality.

I have also to record the resignation of Mr. P. M. Dewar from the management committee, but I am happy to say that he consented to retain his seat on the board, where his valuable advice, gained from a lifelong connection with the whisky industry, is still available to us.

The board appointed Mr. J. M. Connell and Mr. L. A. Elgood to fill these vacancies

on the management committee. The past services and qualifications of these two gentlemen fully merit these appointments.

STAFFS

The directors again acknowledge the loyal service rendered to the company by all members of our staffs—both office and works—who remain to carry on the work of our company, in some places under trying and testing conditions. I should like to mention particularly the work of the fire guards at certain premises, who, on a number of occasions, have rendered very valuable services.

I am very sorry to report that more of our employees have been killed in action, and I tender to their relatives the sincere sympathy of all in the company's employment.

ANGLO-DUTCH PLANTATIONS OF JAVA, LIMITED

The thirty-fourth ordinary general meeting of the Anglo-Dutch Plantations of Java, Limited, was held on the 18th instant in London, Mr. W. H. Daukes (chairman and managing director) presiding.

The following is an extract from the chairman's statement circulated with the report: As regards the properties, we have no reliable information. We hear of tea being uprooted and substituted by ramie, a type of fibre. It is also rumoured that the Japanese are maintaining the sisal plantations in order to use this product for making sacks. A great deal is also heard in these times of "ersatz" tea and "ersatz" coffee, also of synthetic rubber, and still more recently of synthetic quinine. Personally I am very confident that when the estates are once again in working order agriculture in the East will be able to hold its own against all substitute products.

The report was adopted.

TRUSTEES CORPORATION, LIMITED

INCREASE IN REVENUE

The fifty-sixth ordinary general meeting of the Trustees Corporation, Limited, was held, on the 26th instant, in London.

Mr. Harold G. Brown (deputy chairman), who presided, said that Winchester House had been severely damaged by bomb blast. It was too early to assess the full extent of the damage. All branches of their business, however, were able to carry on, the Safe Deposit remaining quite unaffected and most of the public halls being usable.

At May 31, 1944, a valuation of their investments showed an appreciation amounting to fully 30 per cent. over the balance-sheet figure. On that basis, their issued capital of £1,750,000 and their free reserves and carry-forward, aggregating over £600,000, remained intact with an appreciable margin. The Trustees Department had provided a revenue of £7,451 and the total revenue at £209,345 compared with £201,615 for the previous year. They proposed a final dividend of 7 per cent., less tax, making once again 10 per cent. for the year on the ordinary stock.

Many problems which would arise after the war might, if injudiciously handled, have unpleasant repercussions on investment portfolios. It was consoling that the Chancellor of the Exchequer had held out some hope that the rules hitherto applied in arriving at profits for taxation might be reconsidered and discussed. What was bearable, although unreasonable, with tax at one or two shillings in the £, became unbearable and ruinous when taxation attained the proportions that appeared probable for many years to come. It was bad enough when our Government only had to be satisfied, but in the case of foreign trade other Governments also made claims as heavy as those of our own Government.

The report was adopted.

IMPERIAL BANK OF IRAN

GREAT RISE IN DEPOSITS

INCREASED PROFIT

SIR A. HENRY McMAHON'S STATEMENT

The fifty-fifth ordinary general meeting of the Imperial Bank of Iran will be held, on the 9th proximo, at the Institute of Chartered Accountants, Moorgate Place, London, E.C.

The following is the statement of the chairman, Colonel Sir A. Henry McMahon, G.C.M.G., G.C.V.O., K.C.I.E., C.S.I., circulated with the report and accounts for the year ended March 20, 1944:—

The outstanding feature of our balance-sheet this year is again the increase in deposits, which have risen by over £3,500,000. A large part of this increase has taken place at our Iraq branches, where, as in Iran, funds awaiting employment continue to accumulate in the hands of our customers. The item bills payable shows a moderate increase in outstanding commitments, including tax liabilities which have since been settled. Acceptances show a reduction of over £950,000, which is mainly accounted for by the decline in documentary credits opened by us in respect of imports to Iran. Much of this business has passed through departmental hands without our intermediary, and the private importer has been less active.

While our deposits have increased, discounts, loans and advances show a reduction of £1,000,000. Our advances have been substantially reduced, but our short-term discounts, which reflect internal trading activity, show an increase on the previous year. Bills receivable show little change. Investments also are about the same as last year. The cash item is accordingly increased by over £5,000,000, and it will be observed that we hold 70 per cent. of our deposit liabilities in cash and money at call or short notice, as against 55 per cent. last year.

THE YEAR'S PROFIT

Our profit shows a slight increase, and we are again able to propose the same dividend as we paid for the preceding five years, and to add £50,000 to the reserve, leaving the carry-forward increased by £1,334.

The rates for sterling and dollars in Iran have been maintained without change since May, 1942, and transactions in foreign exchange over the past year have been admirably free from local impediment or restriction. With the tendency of Allied expenditure in Iran to diminish, the demand for Iranian currency should increasingly be met by the demand of the Iranian public for foreign exchange, mainly in payment for imports from abroad. The expansion of the note issue, in so far as Allied expenditure is the cause of it, is in any case fully covered by gold and by sterling and dollar balances.

The American Financial Mission, headed by Dr. Millsbaugh, has now completed over a year's work in discharge of the extensive responsibilities entrusted to it. Public response to an issue of Treasury bonds has not been overwhelming, but such innovations require time to establish themselves. Essentially Iranian finances are in a sounder condition than those of many more prominent Powers. The external debt, in the form of the sterling loan of 1911, amounts to £885,000 only. The total of internal debt, mainly to the Bank Melli and covered to a considerable extent by stocks of commodities, works out at about £2 per head of the population—a low figure and roughly equal to the amount spent in the past out of revenue on the construction of the Transiranian Railway alone. The Bank Melli is conservatively administered, grows in strength from year to year, and has a full sense of its responsibilities.

TRANSPORT DIFFICULTIES

The premium on important necessities, created by difficulties of supply and trans-

port, has continued to increase, notably in the case of tea and textiles. The rise in the cost of living, which had been a disturbing feature up till the spring of last year, has happily lost much of its impetus. The efforts of the Government to this end were aided by the good harvests of 1943 and by the course of the war. The index figure, which was over 900 (1936-37 = 100) in April, 1943, had nevertheless reached about 1,100 by April, 1944. The incidence of this burden on our general charges abroad is one of our problems for the future.

A fairly good harvest is expected in Northern Iran this year, but in the south the prospect is poor, as the crops dependent on direct rainfall have suffered severely from drought. Iranian industrial enterprises continue their prosperous course, notably the spinning and weaving factories. It is an outstanding sign of changed conditions that Iran is now an anxious importer of raw cotton, which was formerly exported on a large scale. A corollary of this industrial growth and prosperity is the recent indication of labour organisation for betterment in Isfahan.

Sailing craft have now become the accepted means of transport for ordinary merchandise between India and the Persian Gulf. Commercial traffic by rail and road in Iran, which had been impeded by Allied requirements for supplies to Russia, is being provided for in increasing quantities. India has again been the main source of imports, and the greater part of Iranian exports has been taken by Russia. The rise in the price of tea, textiles, etc., has been accentuated by contraband export to Iraq. A feature of the year's trading in Iran has been the absorption of large amounts of gold and silver coin and bullion for industrial use or for hoarding or export.

IRAQ

In Iraq the plethora of money and the strengthening of control over exports from India coupled with rationing and price fixing, have been the outstanding features of the trading year. The 1943 barley crop was a record one, and the date crop was good. Much of the export of the well-known Basra dates is now in the form of small packets for the use of the Allied Forces.

Iraq is in the happy state of being able to budget for a surplus, though the tax burden is not excessive by western standards. Control and bulk import of commodities, however, have curtailed the activities of the private trader.

Both Iran and Iraq, like many other countries, have accumulated substantial sterling balances which they will expect to utilise for much-needed imports from Britain and elsewhere when the war ends.

Our Kuwait branch has had to cope with an unprecedented passage of pilgrims from Iran and elsewhere travelling to Mecca across Saudi Arabia by car. Such transport as could be made available was utterly inadequate to meet the demand for it, and many thousands of these good people had to return home minus their savings and disappointed of their long-cherished ambition.

As the war continues, our British staff abroad are hard put to it not to grow stale for lack of the home leave that stopped in 1939. Their case is a general one in Eastern services, but we shall all be glad when we are able to relieve them. To them, and to the much larger company of our Eastern staff, we extend our thanks and good wishes for their welfare. We are happy to record our gratification at the well-merited honour of C.B.E. recently awarded to our chief manager in Teheran, Mr L. Walter.

POWELL DUFFRYN, LIMITED

NEW CAPITAL STRUCTURE

The annual general meeting of Powell Duffryn, Limited, was held, on the 19th instant, in London, Mr Edmund L. Hann (chairman and managing director) presiding.

The following is an extract from the chairman's statement circulated with the accounts: As a result of the adoption of the Powell Duffryn amalgamation scheme members now receive the accounts in a new form. Those who previously held interests in the Powell Duffryn Steam Coal Company, Limited, and Welsh Associated Collieries, Limited, and elected to exchange their priority shares for ordinary shares in this company, together with the ex-ordinary stockholders in the Powell Duffryn Steam Coal Company, Limited, now hold ordinary stock in this company, the name of which has been changed to Powell Duffryn, Limited. The advantage of the new capital structure, particularly in the simplification of the accounts, is obvious. The result of the amalgamation is reflected in the increase in the capital of the company and a decrease in the capital reserve account. The profit and loss account includes the first dividend from Cory Brothers and Company, Limited, since the share capital was purchased towards the end of 1942.

DIVIDEND OF 8 PER CENT

The dividend of 6½ per cent. recommended on the ordinary stock of Powell Duffryn, Limited, makes (together with the interim dividend of 1½ per cent. paid on the ordinary stock of the Powell Duffryn Steam Coal Company, Limited) an aggregate dividend of 8 per cent. for the year under review.

Every effort has been made to keep the collieries and works of the company in the highest possible state of efficiency, but in present circumstances it is not practicable to maintain the properties, plant and equipment at the standard that had been attained when the war commenced. Heavy expenditure will be needed in post-war years. The industry is controlled by the Government under powers conferred by the Defence Regulations and both the production and sales of coal continue to be under direction from the Ministry of Fuel and Power. The officials and the staff of 100, who are responsible for the management of the company's affairs, are collaborating with representatives of the Ministry in furtherance of the Government's plans for maximum outputs.

IMPORTANCE OF RESEARCH

Space does not permit even a general outline of the fundamental problems of the industry or the lines of approach to their solution. The coal-mining industry for some time has recognised that the best results in research can only be achieved through co-operative effort. To this end the industry set up the British Coal Utilization Research Association. The Association has in recent years carried out important work in many directions and has in preparation a programme for comprehensive research into the production of hydrocarbons from coal, a field which has great possibilities.

The report was adopted. Stockholders who have not yet done so are requested to lodge their ordinary stock certificates of the Powell Duffryn Steam Coal Company, Limited (in voluntary liquidation) for exchange. It is regretted that circumstances beyond the company's control have delayed the issue of certificates of Powell Duffryn, Limited, but these are now being despatched as quickly as possible and all stockholders who comply, or have already complied, with the foregoing request will receive their new certificates at an early date, if these have not already been received by them.

ANGLO-PORTUGUESE TELEPHONE COMPANY, LIMITED

THE AZORES AGREEMENT

SIR ALEXANDER ROGER'S REVIEW

The fifty-seventh ordinary general meeting of the Anglo-Portuguese Telephone Company, Limited, was held at Maidenhead on the 25th instant.

The following is the statement of Sir Alexander Roger, K.C.I.E. (chairman and joint managing director), which was circulated with the report and accounts:—

The sterling/escudo exchange rate of 100 escudos to the £ has not varied since July, 1940, and the currency accounts have again been converted at that figure. Remittances continue to be satisfactory.

Revenue and expenses have increased almost in proportion, with the result that net profit at £52,126 compares with £52,627. After providing for the customary dividends of 8 per cent., less income-tax, on the ordinary stock and "A" ordinary shares, the amount carried forward is £39,237, against £39,086.

The reserve for renewals has increased from £541,069 to £620,642.

Cash on deposit with Telephone and General Trust amounted to £27,438. Your company continues in close association financially and technically with the trust and its services are appreciated both here and in Portugal.

SUPPLY PROBLEMS

The addition to fixed assets of £37,680, making the total £2,541,153, is abnormally small and is directly attributable to world shortage of telephone equipment supplies.

We have only managed to meet the more urgent priority demands, and this solely by ingenious improvisations and readjustment. The management has been able to maintain the system and service at a high level, and we continue to leave nothing undone to secure supplies in any and every direction. The number of stations in service at the end of 1943 was 63,176.

We work in happy harmony with the State Telephone Administration, whose problems are akin to our own, and we gladly pay tribute to the mutual advantages which this co-operation affords to the public whom we serve.

PORTUGUESE ECONOMY—BRITISH CO-OPERATION

The Azores agreement between the British and Portuguese Governments of October last is of the widest importance to both countries. It is true that it is a war measure only, but obviously it springs from a deep desire to cement the commercial, political and cultural relationships of the two countries for years to come.

On the one hand, the Azores Agreement enables Britain to protect merchant shipping and save valuable lives, and on the other—without in any sense putting a literal value on the Agreement—it has enabled Britain to send and continue to send Portugal much-needed material and other supplies indispensable to the Portuguese army and to maintenance of national economy. These objects are being achieved to the great advantage of Portugal and Great Britain.

If further proof were needed of the firm friendship embedded in our age-long alliance, Dr Salazar has shown it in his willingness to forgo the export of wolfram to the Nazi countries. I do not think it is sufficiently realised here that this gesture on behalf of Portugal represents a real sacrifice.

In May of this year a Bill has been submitted by the Prime Minister to the Corporative Chamber envisaging an eight-year plan for re-equipping and reorganising certain essential industries and establishing new industries capable of producing or substituting certain imported products.

Dr Salazar has not hesitated to acknowledge Portugal's debt to foreign capital, technique and enterprise, and has placed

emphasis on Britain's contribution in these directions. It is pleasing to note that in the establishment of new fundamental industries the introduction of foreign capital and technique will be sought.

A Project of Law has also recently been published envisaging a comprehensive scheme for electrification on a country-wide scale which when completed will have an immensely beneficial effect on the economy of the country.

These plans for industrial expansion are in line with those being prepared in many other countries, and Portugal can be assured that this company and the other companies with which I am associated will collaborate in every possible direction to ensure success.

In the field of communications our programme in furtherance of the national economy of Portugal involves the expenditure of at least £1,000,000 on the telephone service in the immediate post-war years.

PORTUGAL'S COLONIAL EMPIRE

Portugal has a vast colonial empire with enormous potentialities for development and expansion. The great territories of Portuguese East and West Africa are largely contiguous to the Dominion of South Africa, the Rhodesias and Tanganyika. All these countries are now and will be still more so jointly interested in inter-communication by radio, telephone, telegraph, air, roads and railways, and there is ample room for collaboration between Portugal and Britain, both financially and technically, to the great advantage of both.

The cultural and friendly intercourse of the two countries is considerably forward by the British Institute in Portugal and the Anglo-Portuguese Society in London. These organisations, in spite of war conditions, are equally alive and vigorous and all those associated with Portugal are indebted to them. H.E. the Duke of Palmella, who was warmly welcomed to London in October last as his country's Ambassador, has accepted the presidency of the Anglo-Portuguese Society, and has already shown cordial support and encouragement of the society's activities.

PERSONNEL

Personal contacts between representatives of your London and Portugal boards have been maintained in both countries. We were particularly happy to welcome here two colleagues of Portuguese nationality, not alone for the extremely valuable ality, but because in the conferences which were held, but because in addition they were able to observe some-thing of war-time conditions here, and the magnitude of the British contribution to the Allied cause. We are all ambassadors to a greater or lesser degree of the country of our birth when travelling abroad, and of our birth when travelling abroad, and these visits are of importance in the relationships between peoples. The responsibilities and duties of the board in Portugal, of the company's general manager—Mr H. A. Hincks—and the management and staff increase with the difficulties of the times and the development of the company, and I feel you will desire me to thank everyone in Lisbon and Oporto for their work in a trying year.

Of the 2,000 employees of the company in Lisbon and Oporto over 99 per cent. are of Portuguese nationality, and the scale of wages and the conditions of service have always compared favourably with any other business in Portugal.

As in most countries, there has been a steady rise in the cost of essential commodities and the Portuguese Government has recognised this by a temporary increase in salaries and wages to those in Government service. Your company has voluntarily followed this lead.

THOMAS DE LA RUE AND COMPANY, LIMITED

CONTINUED EXPANSION

The forty-seventh ordinary general meeting of Thomas de la Rue and Company, Limited, will be held in London on the 2nd proximo.

The following is an extract from the statement by Mr B. C. Westall (chairman and managing director) circulated with the accounts:—

I am very glad to be able to report continued expansion in every sphere of the company's activities. The major part of the total profits (£311,629) derive from the parent company's manufacturing activities, which are now confined to security printing. The process of re-equipment of plant destroyed at the end of 1940 has continued and the additional machinery brought into operation during the year has enabled us to undertake an increased volume of business. The volume of business in hand compares favourably with that of a year ago, and the prospects for the year ended March, 1945, are encouraging.

THE MORE DISTANT FUTURE

With regard to the more distant future, it does not seem unreasonable to hope that many countries of the world will look to Great Britain for their bank and currency notes, and we do not anticipate that we shall fail to get a fair share of such business.

The policy of transferring the plastics and stationery business to separate subsidiary companies has been fully justified. We have received many letters from members of the Forces praising the manner in which the Onoto Pen has stood up successfully to very severe conditions in many parts of the world. Such tributes are encouraging signs for the future of our pen business when restrictions are removed. It has been a source of regret that we have not been able to supply the trade with a greater quantity of our playing cards.

DEVELOPMENT OF PLASTICS

The process of reorganisation and consolidation of our subsidiary, De La Rue Plastics, Limited, has been continued. The directors found it desirable to form a separate company, Scottish Plastics, Limited, for the operation of the Scottish factory and business. This new company will continue to manufacture the Onoto Pens. Its main objective, however, will be the development of plastics in Scotland.

The output of De La Rue Plastics, Limited, has continued at a high level. A very high percentage of the work has been for the Fighting Services. While a certain amount of dislocation is bound to occur in the change-over from war-time to peace-time production, we are fortunate in that a considerable number of moulds is available for immediate use.

The policy of enlarging the research and development departments has been continued. During the war our activities have been restricted to finding new applications of plastics to war purposes. Even more could have been done had we been able to obtain sufficient technical staff with the necessary qualifications for carrying out research. It is to be hoped that the Government will bear in mind the desirability of making available for industrial concerns at the earliest moment possible experts in chemistry and engineering, so that the ground work for industrial expansion may be prepared in good time. In a comparatively new industry such as plastics, research and development are even more important than in the case of the older established industries. In our own case, the board of De La Rue Plastics have many projects in view which must await the engagement of technicians. Speaking generally, the future expansion of our plastics business will depend upon the speedy relaxation of the system of controls.

FORESTAL LAND, TIMBER AND RAILWAYS COMPANY, LIMITED

GROUND FOR SOLID SATISFACTION

MR LOUIS H. KIEK'S STATEMENT

The thirty-eighth ordinary general meeting of the Forestal Land, Timber and Railways Company, Limited, was held, on the 27th instant, in London.

Mr Louis H. Kiek, the vice-chairman, presided.

The following is an extract from the vice-chairman's statement circulated with the report and accounts: The net profit for the year has been £615,176, or approximately the same as last year, and this in spite of a decrease by some £6,500 in income from investments, etc., the natural result of the reinvestment in British Government loans of a substantial part of the proceeds of realisation of certain overseas holdings which had produced a higher return. On the other hand, these realisations, for which we had, you need not be assured, the best of reasons, have in 1943, as in 1942, yielded us a capital profit of over £50,000. After full provision for taxation in respect of the year under review and an appropriation of £100,000 to general reserve, which is thereby increased to £1,650,000, and after adding £158,879 brought in from the preceding year, there remains available £404,626, out of which the 6 per cent. preference dividend (less tax) has required £55,976 and an interim dividend of 3 per cent. (less tax) already paid on the ordinary stock £55,633.

We now recommend a final dividend on the ordinary stock of 3 per cent. (less tax) and a cash bonus of 3 per cent. (less tax), which would leave a balance of £181,752 to be carried forward to the accounts for the current year. Stockholders will again receive the benefit of the amounts of dominion tax relief set out in the detailed profit and loss account.

I trust you will agree that these results give ground for solid satisfaction. Our cordial thanks are due to all concerned for the energy and ability displayed in facing them.

BALANCE-SHEET CHANGES

The only changes of importance in the balance sheet compared with that of the preceding year result from certain modifications, contemplated several years ago but only recently practicable, in the capital structure of La Forestal Argentina. In the first place, that company's share capital, hitherto expressed in Argentine gold pesos, has been converted into the equivalent at the ratio prescribed by law of "moneda legal" or "paper" pesos, which, needless to say, have ample gold backing. La Forestal Argentina has thereby brought its capitalisation and accounting in line with the practice now generally adopted by public companies in the Argentine. In the second place you will have observed that the £800,000 of that company's sterling debentures which we owned have been converted into a corresponding number of shares, so that the extensive properties of La Forestal Argentina are now entirely unencumbered.

It is hardly necessary to refer in detail to the further evidence of strength disclosed by our balance sheet as reflected in available liquid resources. Our current assets at the end of the year, including £673,632 cash at bank, £886,766 British Government securities, and £726,500 Tax Reserve Certificates, exceeded our current liabilities by over £1,902,726.

It may perhaps have come to the notice of stockholders that there has during the past year been some criticism of this company, not, I am glad to say, in this country, on the grounds that it has been instrumental in unreasonably raising the price of quebracho extract. These allegations have obviously been founded on incorrect information, and I would like to take this opportunity of laying the actual facts before stockholders.

I have taken for this purpose the prices of materials, free on board ship at port of origin, since otherwise there would be complicating factors over which manufacturers cannot exercise any control, such as rates of exchange, war risk insurance and freights. I have examined the prices charged for all the principal tanning extracts on this basis in the period immediately preceding the war, that is July and August, 1939, and have compared them with the prices charged to-day, or, in the case of some materials that are not to-day obtainable, the prices charged at the last period during the war at which they were obtainable.

COMPARISON WITH PRE-WAR FIGURES

Material	Increase in price during the war expressed as a percentage on the price immediately before the war
Argentine Ordinary Quebracho Extract	13.46
South African Wattle Extract	15.49
North American Liquid Chestnut Extract	56.29*
Myrabolam Extract from India	131.5
Italian Chestnut Extract (last price available)	172.2
Turkish Valonea Extract (last price available)	64.4
Australian Eucalyptus (Redunca wood) Extract	45.16

* In the printed copies circulated to the stockholders this figure, through a typographical error, appeared as 115.38 per cent. instead of the percentage of 56.29 quoted.

I think you will find this table instructive and we are quite prepared to stand by our record in this matter.

The report and accounts were adopted.

BARRY AND STAINES LINOLEUM, LIMITED

IMPROVED RESULTS

The ordinary general meeting of Barry and Staines Linoleum, Limited, was held, on the 26th instant, in London, Sir John N. Barran, Bt. (the chairman) presiding.

The following is an extract from the statement by the chairman circulated with the accounts: Your directors present this year's results in circumstances which happily show a further advance on those of our last annual meeting. In the wider sphere the dawn of the day of victory broadens unmistakably. On the business side the figures which we put before you show that we have passed the financially bleak period of conversion of our works to the war tasks, in which they are now so largely absorbed.

Our net profit has risen, and has been arrived at after prudent allowances for the needs and risks of the future, a policy which is certain to have your approval. This has been achieved in spite of a drop in our dividend from Canada. It enables us to return to a dividend of 7½ per cent., a result not to be ashamed of. Again I must refrain from details of our many manufacturing activities; I will merely say that of them also we need not be ashamed. The total of our reserves and profit and loss balances, the final index of our company's standing, has risen slightly.

The needs and responsibilities of the period which will follow on the end of fighting are not being lost sight of. Planning and research are receiving their share of the attention, so far as the limitations of these days allow, which their importance demands for both the nearer and longer view. Meanwhile, the company's servants away on war service continue to gather credit—and I grieve to say that since last year there are gaps in their ranks.

The report was adopted.

THE BRITISH PLASTER BOARD LIMITED

FACTORS AFFECTING PROFITS

LORD BELPER ON PROPOSED AMALGAMATION

The twenty-seventh ordinary general meeting of The British Plaster Board, Limited, was held, on the 25th instant, in Derby, Lord Belper (the chairman) presiding.

The following is an extract from the chairman's statement issued with the report and accounts: You will observe, on referring to the profit and loss account, that the net profit after taxation amounts to £161,028, compared with £250,633 for the previous year.

The decrease in profit is due to a marked falling off in Government business during the period under review and also to a further contraction in business generally.

MAINTENANCE OF DIVIDEND JUSTIFIED

For the first time in our history as a public company, the amount recommended to be distributed by way of dividend is in excess of the amount earned. The carry-forward, however, remains at a substantial sum—namely, £266,574 15s., equivalent to about one and a-quarter year's dividend at the rate of 25 per cent. per annum. In all the circumstances, your directors feel justified in recommending the maintenance of the dividend.

I need not remind you that our average profits for many years before the war—profits earned in world-wide competition—were greatly in excess of the average profits earned since the outbreak of war. As a result of this, we have not been able to build up an E.P.T. cushion against possible future losses and, in this respect, we are in a worse position than firms less efficient in pre-war days. The fall in earnings since the war is due not so much to a reduction in turnover, as to lower profit margins imposed under the Government's Costing Clause.

AGREEMENT WITH GYPROC PRODUCTS

As you will have learned from the press, we have recently completed negotiations for an amalgamation with Gyproc Products, Limited, a wholly owned subsidiary of the Distillers Company, Limited. I regret that, owing to certain formalities having yet to be completed, I am not in a position to give you full details of the terms of the amalgamation. I can, however, inform you that the number of new shares to be issued by this company to the Distillers Company, Limited, has been arrived at by comparing the respective earnings of the two companies and ascertaining the ratio of one to the other when applied to the issued ordinary capital of the British Plaster Board, Limited. The result is that, subject to your confirmation, we propose to issue 660,000 fully paid ordinary shares of 5s. each in exchange for the shares of Gyproc Products, Limited. A cash payment to be made by the Distillers Company, Limited, is to make up the surplus liquid assets of Gyproc Products, Limited, to a total bearing the appropriate ratio to the surplus liquid assets of the British Plaster Board, Limited.

The Distillers Company, Limited, undertake not to dispose of the shares to be issued to them, or to require that an application be made to deal in these shares, within a period of two years.

EXTRA-ORDINARY GENERAL MEETING TO BE CALLED

When the formalities to which I have referred are completed, an extra-ordinary general meeting of this company will be called for the purpose of placing the proposals before you and to transact other business incidental thereto.

Your directors are confident that the

amalgamation with Gyproc Products, Limited, will place your company in a stronger position to meet present and potential competition, both within the gypsum industry and also in the wider field of competition with other types of plastering and sheet lining materials.

Since the close of the financial year sales have been fairly well maintained, but you will appreciate the difficulty of making prophecies under existing conditions.

Before closing, I have pleasure in recording our appreciation and thanks to all concerned with the management and operation of our business.

The report and accounts were unanimously adopted.

GUEST KEEN AND NETTLEFOLDS, LIMITED

FUTURE OF BRITISH INDUSTRY

The ordinary general meeting of Guest Keen and Nettlefolds, Limited, was held, on the 26th instant, at the Queen's Hotel, Birmingham.

Mr J. H. Jolly, deputy-chairman and managing director, presided in the absence, through temporary indisposition, of Sir Samuel R. Beale, K.B.E.

The secretary (Mr E. C. Drake) read the notice convening the meeting and the report of the auditors.

The following is the statement by the chairman, which has been circulated with the report and accounts for the year ended March 31, 1944, and was taken as read:—

I hope that next year I may be enabled to give you a more detailed account of the activities of our company. The appended

accounts show little change in the final results for the year under review as is inevitable under existing circumstances, but it has been possible to make progress in settling taxation liabilities up to March 31, 1943.

Mr Maurice Tollit, who has been associated with the management in Birmingham for many years, has been appointed a director of the company, and you will be asked to confirm his appointment.

RESEARCH PLANS

The board have been giving much thought to problems of organisation and efficiency as they affect our company. Plans have been made for further development of our research departments, and also for provision of the best equipment to meet post-war conditions when the present necessity for concentration on production for war purposes is relaxed. The proposals of the Chancellor of the Exchequer for these purposes are welcome as an instalment of fairer terms for British industry in its approaching struggle for export trade.

I feel that it needs reiterating that the considerable national expenditure contemplated for the improvement of social conditions in this country cannot be forthcoming unless British industries are efficient and prosperous, which presupposes the encouragement of initiative and the relaxation of control, by Government as quickly as may be.

It is with great pleasure that I again record our appreciation of the very fine contribution to national production by the management, staff and workpeople.

The report and accounts were adopted.

The retiring directors (the Right Honourable the Lord Hyndley of Meads, Sir Maurice E. Denny, Bart., C.B.E., and Mr M. H. Tollit) were re-elected, and the

auditors (Messrs Carter and Company) were reappointed.

A vote of thanks to the chairman, directors and staff concluded the proceedings.

UNITED PREMIER OIL AND CAKE COMPANY, LIMITED

CURRENT YEAR'S SATISFACTORY RESULTS

The twenty-fifth ordinary general meeting of the United Premier Oil and Cake Company, Limited, was held, on the 26th instant, at the Registered Office in London, Sir Frank B. Sanderson, Bt., M.P., presiding.

The chairman made reference to the loss the company had suffered by the death of Mr M. S. Myers, who had been a member of the board since 1919. In dealing with the report and accounts for the year ended December 31, 1943, the chairman stated that the seed-crushing and oil-extracting mills continued to operate under Government control, and although it would be unwise to attempt to forecast the future he was happy to state that the results for the past nine months of the current year had been satisfactory.

The final dividend of 5d. per share, less tax, as recommended, making with the interim dividend 9d. per share (or 15 per cent.) less tax, for the year was declared.

The directors retiring were re-elected and the auditors reappointed. After an allusion had been made to the valuable services of the general manager, Mr W. E. Waterhouse, and the continued loyal co-operation of the management, staff and operatives throughout a difficult period, the proceedings terminated with a vote of thanks to the chairman.

FINANCE AND BANKING

THE MONEY MARKET.—There has been no floating debt borrowing this week. The £110,000,000 weekly issue of Treasury bills has, for the first time, been equalled by the maturities. The banks have not been called upon to make any payments against Treasury Deposit Receipts and there were no TDR maturities. On this score, therefore, the position was left balanced. This absence of floating debt borrowing is due to the high concentration of tax payments from the banks to the Exchequer. Transfers of income tax and war damage contribution money have been particularly heavy. Despite this fact and the making up by the banks for their July statements, credit supplies in the money market have been ample. The reasons for this abundance are provided by the latest Bank return which shows an expansion of £25,107,000 in Government securities and a release of £8,987,000 from Public deposits. The effect of these two movements is cushioned to the extent of £3,232,000 by a rise in the note circulation, but enough remains to increase bankers' deposits by £29,413,000 to the comparatively high level of £199,806,000. The latest increase in the circulation has reduced the reserve of unissued notes to £13,438,000 and in view of the imminence of the August bank holiday another expansion in the fiduciary issue seems bound to occur next week.

MONEY RATES, LONDON.—The following rates remained unchanged between July 20th and July 27th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1½%; 3 months, 1½%; Day-to-day money, 1½%. Short Loans, 1½%. Bank deposit rates, ½%. Discount deposit at call, ½%; at notice, ¾%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between July 20th and July 27th (Figures in brackets are par of exchange).

United States. \$ (4-38) 4-02½-03½; mail transfers 4-02½-03½. Canada. \$ (4-38) 4-43-47; mail transfers 4-43-47. Switzerland. Francs (25-22) 17-50-40. French Empire. Francs 1971-2001. Syria. P. 8-81-85. Sweden. Krona (18-169) T.T. 16-85-95. Dutch West Indies. Florin (12-11) 7-58-62. Portugal. Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. Panama. 4-02-04; mail transfers 4-02-04. Brazil. 83-64½ cr. (buying); mail transfers 83-56½. Uruguay. 7-6597 p. (buying).

Fixed Rates for Payment at Bank of England for Clearing Offices. Spain. Pesetas 44-00. Turkey. Piastres 520. Italy. 71-25 lire.

Market Rates.—The following rates remained unchanged between July 20th and July 27th.

Egypt. Piastres (97½) 97½-1. India. Rupee (18d. per rupee) 17½-18½ d. Belgian Congo. Francs 176½-1. China. National 33-3½. Iran. RI 128-130.

Special Accounts are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London. Rate for payment into Argentine special account: 16-28 pesos.

Forward Rates.—Forward rates for one month have remained unchanged as follows: United States. ½ cent pm-par. Canada. ½ cent pm-par. Switzerland. 3 cents pm-par. Sweden. 3 ore pm-par.

INDUSTRY AND TRADE

Utility Furniture.—The output of utility furniture is increasing and consequently the basic allowance to an unmarried couple eligible for utility furniture is to be restored to the original 60 units instead of the current 30. The increase is to be made in stages. Those who received permits between September 1st and December 31, 1943, may apply for their extra units from August 1st. Those who received permits during the early part of this year will be able to apply later. Permits issued after August 1st will be at the new rate, but holders may not be able to use all the units immediately. The period of validity of permits is extended from three to six months.

Clothing Coupon Changes.—A number of minor adjustments in the coupon rates for various articles of clothing will come into force on August 1st, when the new clothing book comes into use. Most of the changes are reductions in coupon value. The most important of these brings down the coupon value of furs—no doubt a result of discussions which took place recently between fur trade interests and the Board of Trade.

Agricultural Wages Claim.—At a meeting of the Agricultural Wages Board early in July the workers' representatives gave notice of a motion for an increase in the national minimum wage to £4 10s. per week. The Board decided that the motion should be considered at the next meeting to be held on September 6th.

Stopped Cotton Looms.—The weekly payment to cotton weavers whose looms have been stopped under concentration schemes, is to be raised from the rate of 2s. 3½d. per 40-inch loom space to 2s. 6½d., with effect from June 1, 1943. It is understood that this increased allowance will not involve any additional levy upon manufacturers with running looms.

Hosiery and Footwear Control.—Two controls which are at present divided between the Ministry of Supply and the Board of Trade are shortly to be merged. From August 1st the hosiery production branch of the Ministry of Supply will be merged with the civilian Hosiery Control of the Board of Trade. It will be part of the Board of Trade, and be known as the Hosiery Control. The two branches controlling footwear, the Control of Civilian Footwear, Board of Trade and the Directorate of Service Footwear and Leather Equipment, Ministry of Supply, will also be unified shortly.

Canadian Timber Purchases.—Ministry of Supply officials, including members of the Timber Control, have recently visited Canada to discuss with representatives of the lumber industry the purchases of timber for delivery during the two years following the cessation of hostilities in Europe. Terms of purchase were agreed covering the sale of British Columbian softwoods, Eastern Canadian spruce, and Canadian hardwoods. A similar agreement is under negotiation for constructional plywood. Formal contracts with individual shippers are about to be negotiated.

Agricultural Improvement Council.—The Minister of Agriculture has decided to establish the Agricultural Improvement

(Continued on page 172)

GOVERNMENT RETURNS

For the week ended July 22, 1944, total ordinary revenue was £56,236,000, against ordinary expenditure of £109,200,000 and issues to sinking funds of £90,000. Thus, including sinking fund allocations £2,860,239, the deficit accrued since April 1st is £1,007,346,000 against £1,060,646,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £91,146 to £3,019,884, the other operations for the week (no longer shown separately) raised the gross National Debt by £9,755,428 to £20,590 million.

Council for England and Wales on a more permanent basis, with a larger membership and wider terms of reference. The Council was set up on June 12, 1941, the members being appointed in the first instance for three years. Its object was to promote closer contact between the farmer and the scientist with a view to ensuring the greatest possible application of the results of scientific research and new technical methods in ordinary farming. The expanded terms of reference include the following: "to advise . . . concerning agricultural and horticultural problems which appear to require scientific investigation; and to advise generally . . . lines on which a policy designed to raise the technical standard of agricultural and horticultural production can best be implemented."

SENSE AND A SENSITIVE PALATE. As you possess both, you should try T.T.T. Magnums Cigarettes made by WHITMORE & BAYLEY, 92, Wigmore Street, W.1. Established 1823. 100, 13/4; 500, 65/6; 1,000, 130/-. Post Free. Sample flat 50 for 6/8.

ASHANTI GOLDFIELDS CORPORATION, LIMITED

NOTICE IS HEREBY GIVEN that an Interim Dividend (No. 96) of 32 per cent. has this day been DECLARED on the issued capital of the Corporation in respect of the year ending 30th September, 1944. This Dividend is payable, less Income Tax, at 6s. in the £, on and after the 19th September, 1944, to all Stockholders on the Registers on the 20th July, 1944.

Although the gross amount of this Interim Dividend is 32 per cent. compared with 45 per cent. paid this time last year, the net amount is unchanged as Tax will be deducted at the rate of 6s. in the £. This will give Stockholders Dominion Income Tax relief in respect of the Income Tax imposed by the Gold Coast Government, and for the purpose of this Dividend such relief has been estimated at 4s. in the £ on the divisible profit.

THE TRANSFER BOOKS will be closed from the 21st to the 28th July, 1944, both dates inclusive, for the preparation of Dividend Lists.

By Order of the Board,
H. E. ASHBY, Manager and Secretary.Temporary Registered Address:
St. Hilda's, Bushey, Herts. 20th July, 1944.

BIBIANI (1927) LIMITED

NOTICE IS HEREBY GIVEN that an Interim Dividend (No. 14) of 5 per cent. has this day been DECLARED on the capital of the company in respect of the year ending 30th September, 1944. This Dividend is payable, less Income Tax, at 5s. in the £, on and after the 19th September, 1944, to all Stockholders on the Registers on the 20th July, 1944.

Although the gross amount of this Interim Dividend is 5 per cent. compared with 7½ per cent. paid this time last year, the net amount is almost unchanged as Tax will be deducted at the rate of 5s. in the £. This will give Stockholders Dominion Income Tax relief in respect of the Income Tax imposed by the Gold Coast Government, and for the purpose of this Dividend such relief has been estimated at 5s. in the £ on the divisible profit.

THE TRANSFER BOOKS will be closed from the 21st to the 28th July, 1944, both dates inclusive, for the preparation of Dividend Lists.

By Order of the Board,
H. E. ASHBY, Secretary.Temporary Registered Address:
St. Hilda's, Bushey, Herts. 20th July, 1944.

An Interim Report

"THE Churchill," the Prime Minister pointed out in his speech on Wednesday, when talking of tanks, "can be either defensive or offensive." The speech itself came somewhat in the former direction. Against the background of brilliantly good news from the battlefronts, which was its chief occasion, it seemed by contrast almost cautious and non-committal.

No doubt deliberately, there was only a slight reflection in the speech of the growing sense that the last grand climax is already at hand. Beyond repeating his belief that victory may perhaps come more quickly than was expected, Mr Churchill attempted no analysis of the next phase or the duration of the war, still less of the peace. Beyond declaring the necessity for a Poland friendly to Russia, and for a friendly France to be included among the World Council of major Powers, in discussing the problem of Germany, he made no statement of policy for Europe or elsewhere. Beyond a reference to Corporal Hitler's odd conduct of strategy in the East, and a single sentence about mutual shooting, he paid no attention at all to the critical state of Germany.

It was in fact a routine news review. It was lit up as always by Mr Churchill's power of pointed phrase. It was put into relief by his skilful knack of understatement;

but it contained nothing new or revealing—except for the expected announcement of Turkey's circumspect break with the Axis. It was an interim report, and declared no dividend yet. Presumably, the Prime Minister made no promises or prophecies because he does not know himself what may happen next. In the drawer of his desk there is no doubt the Victory Speech all ready, but he dare not even quote from it until he is sure of the way.

This is Mr Churchill's habit and so far, through every ordeal, it has served the country well. Now, simultaneously with the striding forward of victory and peace, there is another ordeal. While bombardment with flying bombs (and possibly with rocket shells) goes on, it is not possible for those under fire, and for their friends, to be fully comforted by even the best of news. Mr Churchill knows this. Possibly he argues that, so long as he cannot offer any prompt remission, 4,737 people killed in seven weeks, 14,000 seriously injured, 17,000 houses destroyed and 200,000 made uninhabitable, with another 600,000 damaged, do not provide the best context in which he can readily say "Rejoice, for the war is being won." Possibly he fears a relaxation of effort. Nevertheless, the war is being won. The bombardment may threaten very grievous happenings. But it has not altered the course of the war,

which is now set. Nor will it do so. This is a race in which we are now too far ahead to be caught, not a boxing match in which the fighter behind on points can win with a knock-out in the last round.

It would be impossible for whatever the sobriety of his intentions, for any practised speaker or writer, or for any historian—and Mr Churchill is all three in the very highest degree—to fail to make a great and exciting story of irresistible success out of the mere facts of recent events. Everywhere and in every element, all our enemies are being progressively and decisively defeated: in the Far East where the downfall of “that presumptuous Power” is being hurried on; in Normandy where the “great adventure” of invasion, superbly mounted and now pressed on, is going well; in Italy where an army of almost all the United Nations is “cleansing” the Italian soil; above all, on the Eastern European front where the Russian forces have “torn the guts out of the German army” and are about to tear the Reich itself.

So true and so significant, indeed, is the tale of triumphs that Mr Churchill was able to sketch out on Wednesday that it is impossible not to wonder whether so much caution is still necessary. To offer blood, tears, toil and sweat, with an assurance of survival, when the only alternative was utter disaster, was bold and heartening. To offer much the same mixture, four years later, when the most staggering successes are being won by the Allies, must seem disappointing. It is peculiarly Mr Churchill's own achievement that 1944 is very different from 1940.

If Mr Churchill believes that the war in Europe (and

Britain and Argentina

IN recent weeks the relations between the United States and Argentina have taken a turn for the worse. Ambassadors have been recalled, and formal statements of indictment and rebuttal have been issued in Washington and Buenos Aires. There, for the moment, the official exchanges rest, but indignation is rising on both sides, and a school of thought that is strongly represented both in Washington and in the American Press is urging economic sanctions, in which Great Britain would undoubtedly be pressed to join.

Hitherto the British Government has closely followed the lead of the United States, Sir David Kelly, the British Ambassador, was recalled soon after Mr Armour. As the Prime Minister made clear on Wednesday, London deplores the political trends of the Farrell Government no less keenly than Washington. Indeed, the British have special reasons of their own for disliking the Farrell regime which, ever since its seizure of power in January, has adopted a hostile and provocative attitude towards British-owned enterprises in Argentina. On the score both of its domestic and of its international policies, the Farrell Government has made itself obnoxious. There is no cause for surprise in the fact that economic counter-measures have come up for discussion.

But the desirability of such measures cannot be judged simply by the merits or defects of General Farrell and his crew of colonels. There are a number of other reasons which should give pause. The simplest and most compelling argument is that economic measures would be far more likely to confirm the Farrell regime in power than to remove it. There is quite enough evidence already to show that overt pressure from foreign countries has given General Farrell a popularity that he would probably otherwise not enjoy. Indeed, this would be the natural reaction in any country and national pride is certainly no less in Argentina than elsewhere.

Moreover, it is very probable that economic war would, at this stage, damage the United Nations more than it would hurt Argentina. Argentine meat and leather, not to mention such minor items as quebracho and linseed, are vital for Great Britain. On the other hand, Argentina could hardly be brought to its knees by restrictions either on imports or exports. Argentine exports are, admittedly,

the bombardment) may still continue for a long time, it is his right and his duty to say so. But, in that case, it is probably needful also to say more, in order to explain doubts and reservations which seem to conflict so much with the burden of every day's news. Without such an explanation, and confronted with the continuance and perhaps the stepping-up of bombardment, many people on the threshold of their sixth year of war will understandably be puzzled. They want to know where they stand. Frustration and fatigue can be close companions.

The time has come, in fact, to ask two questions, which go to the roots. The first is whether the Government is really prepared, mentally, politically and diplomatically, for a possible quick end to the war. Are Mr Churchill and his Ministers and the Allies ready to cope, if need be, with the biggest "windfall" of all? Are they agreed on means to shake the tree, if possible to bring the windfall down?

The second question is whether, if too much reiterated, the exhortation to "hold on until the end comes" goes on being the best guidance for people who have now all but won a most terrible war. It is after all the slogan that Corporal Hitler addresses to his own helpless and hopeless dependants. It may, of course, be that the Victory Speech itself will run: "We have gained the day. I think I can say, without boasting, that we have not acquitted ourselves without honour. But the hardest tasks and the longest trials are still before us." Yet for us now, even with the echo of our earlier endurance again in our ears, may not this be a time for boasting to balance the new bombardment?

vulnerable, but there are already complaints that they are paid for only in pounds and dollars that cannot be spent. Imports are already greatly reduced ; domestic industries have been developed to meet many of the most urgent needs ; and other South American countries—not all of which could be induced effectively to join in the embargo—already supply more of Argentina's imports than either the British Empire or the United States. Argentina has reserves and can wait until the not too distant end of the war in Europe, when all the hungry nations of that shattered continent will look to its vast stocks of food.

Furthermore, there is the political objection that far-reaching economic sanctions against Argentina would be a flagrant departure from the practice of Britain and America in their dealings with other non-belligerents. No economic war has been declared on Sweden, Switzerland, Eire, Portugal or Turkey, and only a specific ban on one item, imposed for a special purpose, on Spain. The United States has only very late in the day made even a diplomatic move against Finland, which is actually at war with America's allies. If so striking a discrimination were to be made against Argentina, the nationalist reaction in favour of General Farrell would be all the stronger.

Thus on an analysis of strictly immediate considerations, any proposal for coercive measures, if it were to be made, should be rejected. But it would be idle to deny that there are more far-reaching arguments. There is no reason why anybody in Great Britain should hesitate to admit that British long-term trading interests enter into the matter. No other country in the world has freely sacrificed its commercial and financial interests on the altar of war as lavishly or as unconcernedly as Great Britain, and no commercial interests would be allowed to stand in the way of economic pressure at this stage of the war if it had any chance of success and was essential for the triumph of the common cause. But if the purpose of exerting pressure on Argentina is not only to aid the war but also to attain some other doubtless desirable, but hardly imperative, object such as "hemispheric solidarity," then the sacrifice, on top of so many others already made, may seem too great. For decades, Argentina has

been one of the main suppliers of cheap food for Britain's industrial population. In return, it has been a valuable market for British goods, and a fertile ground for British capital—to the great benefit of both countries. Stable trading and investment relations are generally admitted to be an important factor in world peace. It is not in the interest of either Britain, Argentina or the larger Atlantic community that one of the most successful partnerships in economic history should be broken up. Britain is no longer one of those rich nations that can afford fits of uncalculated ill temper. The gain must be counted against the loss; and in this case there would be an enormous loss for a very questionable gain.

All this should be said, and said firmly. But, admittedly, it is at this point that the Americans tend to see the cloven hoof. Argentina is one of the tenderest spots in Anglo-American relations. To put the matter bluntly, each country finds it difficult to avoid suspecting the other's motives. In American eyes, the British influence in Argentina is suspected of being reactionary and anti-democratic, and British policy of being designed to exclude American trade, not by fair competition, but by bilateral discriminations. In British eyes, American policy in Argentina is suspected of being moved less by the desire to defeat Hitler than by the desire to extend the influence of Washington from the northern half of South America to Cape Horn—in short, by a doubtless beneficent but none the less real imperialism.

These British suspicions would no doubt, and no doubt correctly, be resented and disproved in Washington. But it is no less important that the American suspicions, some outspoken and some implied, should be brought into the open and dispelled. It may be that the social contacts of the British colony in Buenos Aires have been too exclusively with the landed and conservative interests—if so, it is British trade that has probably suffered most. There is certainly no ground for suspecting any British intervention in Argentine politics, and the conservative General Farrell is assuredly no lover of Britain.

The more serious charge is that British policy forces Argentina to discriminate against American goods; it is chiefly based on the Runciman-Roca Agreement of 1933. But the circumstances of that Agreement should be remembered. It was made at the bottom of the Great Depression, in the same year that the dollar was arbitrarily devalued and that Mr Roosevelt broke the World Economic Conference. It is to be hoped that such circumstances will not recur and that such strong-arm methods will not again be necessary. But it would be the height of illusion to ignore manifest facts such as that Argentina is dependent on the British market, that Britain cannot buy without selling, and that Argentina, if it wishes to keep its markets, must play its part in making it possible for Britain to pay. The more valid criticism of the Runciman-Roca Agreement is not that it took such steps as were necessary in those desperate times to underline this simple

logic, but that it put Britain's bargaining position to unprogressive ends—for example, to the limiting of road competition with British-owned railways and to the pushing of goods without much regard to their competitive merits. It is right that the plain argument of the facts should be brought home—although, let us hope, by gentler methods; it is wrong that it should be used for the protection of inefficiency.

In any case, if the charge is discrimination, let it lie against both sides. The President of the American Import-Export Bank has explained the terms on which loans are made to South American countries in these words:

When technical assistance is required, it is a normal condition of our credits that the borrower shall first make satisfactory arrangements for the employment of American engineers or other technicians qualified to see that the work is properly carried out. Our credits also provide that all machinery and materials not available in the country of the borrower shall be purchased or leased in the United States, and that such machinery and materials shall be transported in American ships.

When Britain makes pounds available by the purchase of goods and claims a voice in the spending of those pounds, that is bilateralism and discrimination. When the United States makes dollars available by giving credits and claims a voice in the spending of those dollars, that is legitimate.

This is the heart of the matter. The British are no enemies to the Pan-American idea. On the contrary, they were midwives to the Monroe Doctrine and, until recent decades, its main material support. It is only to the exclusive perversions of the Pan-American ideal which sometimes emerge that the British—and incidentally the Argentines—object. Pan-America is, like the British Commonwealth of Nations, a co-operative association resting on consent. Within the Commonwealth, Canada resists the desire of other members to tighten the machinery of association, partly because it wishes to preserve untrammelled its special relation to the United States. Similarly, Argentina is not a complete adherent of Pan-America, partly because it wishes to preserve its special relationship with Europe and with Britain. (There is not, of course, any other parallel between the positions of Canada and Argentina.) Nobody in Great Britain would argue that the United States should be asked to put pressure on Canada in the interests of Commonwealth solidarity. Similarly, it would be unprofitable to expect Great Britain to join in compelling Argentina to take a different view of its Pan-American obligations.

Special security arrangements and regionalisms of all kinds exist, in a democratic world, only if they are voluntary. Of their nature, they cannot be exclusive and will tend to be untidy. It would be a tragedy if the "untidiness" of Argentina were to inhibit cordial Anglo-American relations, or of joint attempts to tidy up the situation were to result in Argentina's violent self-exclusion from the general community of Atlantic states or to delay its return to a democratic and liberal form of government.

The Health Controversy

THE Government's appeal for a full public discussion of its proposals for a National Health Service has produced gratifying results. Not all of the six months' discussion has been relevant. The acute personal interest which everyone has in matters of health has stimulated the expression of views on much wider issues than those raised in the White Paper. Health policy has been the starting-point for numerous rambles in political theory.

But the discussions have already done positive good. They have established beyond all doubt that the principle of a national health service will have the support of all political parties. It is clear, too, now that the dust raised by a reactionary and rough-riding section of the medical profession has settled, that the objectives at any rate of a National Health Service are approved by the doctors; this, side by side with a multitude of objections in detail to the Government's actual proposals, has been ascertained by the inquiry of the British Medical Association into doctors' views. From the welter of opinion and comment it is now possible to pin-point the main items of dispute.

Many interests are involved in the present jerry-built structure of the nation's health services. They arise from a division of responsibility among numerous organisations—the medical profession, the voluntary hospitals, the local authorities and Whitehall. But the interests of all but the consumer of medical care and attention (that is, the ordinary citizen) are ancillary. The aim of the White Paper is clear—to establish a National Health Service which will provide for everyone all the medical advice, treatment and care they may require. Many critics have overlooked this primary aim. They have imagined that the White Paper is designed either to reform the medical profession or to make the first sallies in the tremendous task of recasting local government.

The chief critics of the Government's scheme have been found in the ranks of the doctors. They are not opposed to the aims of the White Paper—only to some of the means; and it is essential that their arguments should be carefully weighed, since the full co-operation of the medical profession is indispensable to the success of the scheme. The public's attention to these arguments has been distracted by the persistent sniping attacks of those who see in the White Paper the work of political extremists and a challenge to their vested interests. Provided that the doctors confine their criticism to "the question of how and in what form" (for, as Mr Willink has said, "there is no question of whether"), the public would be advised to give it as much attention as they would to advice at the bed-side.

A leading article in the *British Medical Journal* (July 8th) puts the doctors' fear in this way:

At the risk of distorting the position by summarising it briefly, we would say this fear is for the loss of professional freedom and the recasting of the medical services according to political dictate.

Is this fear justified? The doctor's conception of freedom is composite. In public discussion he has, so far, been preoccupied with three aspects of it—the scientific, professional and administrative. Very little has been said, apart from vague generalities, about the doctors' future economic position. But this is a matter of real, perhaps dominant, importance; the uneasiness of the general practitioner is due very largely to doubts about his future earnings and status.

This is not to suggest that the doctor is activated solely or primarily by motives of self-interest. No profession is richer in examples of selfless devotion to the cause of social welfare. But the doctor is human. It is true that under the present system his freedom is largely illusory. Nominally his own master, he is nevertheless, even in his hard-earned leisure, at the command of anyone who has

twopence for a telephone call. It is claimed that he is free to buy a practice of the kind and in the place that he chooses: but the heavy initial expenses of establishment set definite limits to this freedom. From the first, in probably an appreciable majority of cases, he is over-worked because, through indebtedness, he is driven to increase "turnover" of patients to a figure with which he must find it hard to cope efficiently. His hours are, generally, long and irregular. He must always provide his own old age pension. Moreover, as Professor Mackintosh has pointed out,

the general practitioner may be the servant of a number of different authorities, with varying responsibilities to each. He may receive instructions from a local authority, an insurance committee, the Ministry of Health and other voluntary or statutory bodies, according to the nature of his appointments.

That is the extent of the doctor's present freedom; and it is certain that the White Paper proposals could greatly improve his working conditions. But would they bring him in sufficient money to enable him to live at the necessary and accustomed standard? This is at the bottom of his anxiety about future status. G.P. or consultant, he wants to know, very reasonably, what he will be paid. Until he knows this, he cannot tell whether conditions in the National Service will really be better than his present somewhat unreal and very onerous freedom.

There is, however, another reason for the doctor's uneasiness about his status. He fears that employment under a salaried State service would be accompanied by loss of prestige. It is a regrettable fact that salaried public service does not, in this country, always command the respect or reward that it deserves. The doctor's status, like that of most professional men, is partly real and partly fictitious. The real element is the public's respect for his skill and humanitarian labours: the fictitious element is the conventional halo with which the public seems to invest all who are paid by fee. In the future the doctor's prestige will reflect the degree of success attained by the new Health Services.

But, on balance, a clear statement by the Government of the probable scale of salaries under the White Paper scheme would do more than anything else to allay the fears of the medical profession. There is an element of unreality about a controversy which is confined solely to matters of high principle and ideals. It would be diplomatic to discuss brass tacks for a while.

The doctors' second cause for alarm (according to the *British Medical Journal*) is that the health services will be recast "according to political dictate." The phrase covers a multitude of complaints—that the doctors will be subjected to control by local authorities; that they will be caught up in the trammels of officialdom, and will suffer unwarranted interference in scientific and professional matters. Some of these fears are groundless, and there will be little sympathy for the doctors if they protest too vehemently: but, as the PEP broadsheet, "Medical Care for Citizens," has indicated, the doctors' suspicions are not without substance:

Inflexible and pettifogging lay control of doctors, out-of-date methods of appointing and promoting hospital medical staffs, narrow-mindedness and lack of imagination are still far too prevalent among local health authorities. The doctors practising in municipal hospitals are still usually denied the full measure of freedom in their professional work which is the rule in voluntary hospitals, chiefly because local authorities like one man—in this case the medical superintendent—to be clearly responsible for all that happens in one of their institutions, whether hospitals, workhouses or schools. Local authorities still commonly expect their doctors to seek their

Council's permission before publishing papers even of a purely medical character, and they do not often invite expert technical advice from practising doctors.

The airing of such grievances, which are legitimate, should quicken the demand for a radical overhaul of the machinery of local government. But the new medical service cannot be held up until such reform is instituted, and in the meantime, some compromise, some "make do and mend," is inevitable. It does not follow that the precise compromise suggested in the White Paper—that is, administration by Joint Boards formed from local authorities and advised by Local Health Service Councils—will be acceptable. The doctors reject by an enormous majority the principle of local authority control; and it has also been suggested in *The Economist* that, for financial reasons quite unconnected with medical matters, it may be necessary to relieve the local authorities of the burden they now carry in respect of health services. For these two reasons, the scheme will inevitably have to be revised in the direction of more national control and less local authority control. A completely national solution is the ideal. But opposition from the local authority is likely to be as effective in blocking it as opposition from the doctors would be in blocking a completely local scheme. If action is to be taken quickly, it can only be by some form of compromise.

The doctors hold that medicine should be free from politics, but it is obvious that unless the state intends to abrogate all responsibility for the nation's health, politics—in the broad sense of the word—must enter into medicine. At present social justice in the field of health does not exist. The new medical service is a natural corollary of progressive action in the fields of housing, education and insurance. As such it is very obviously a political issue. When the *British Medical Journal* confesses that the profession as a whole feels apprehensive about any project that has the blessing of a particular political party; when it says that the change of heart at the Ministry of Health is a serious prognosis "if the change is an enlarge-

ment to the left"—then it is entering the political lists with a vengeance. If the doctors want to concentrate on medical science they should be glad to be relieved of administrative burdens. But their proposals that members of the Central Advisory Council should be elected by the BMA instead of being appointed by the Minister "in consultation with the profession," and that the powers of the regional joint boards should be advisory and not executive, might mean that health services would be controlled from Tavistock House rather than from Whitehall.

But when the doctors stress the fact that "housing, nutrition and satisfactory employment on a living wage with special safeguards against economic disaster" have more to do with public health than the framing of new medical services, they are right; they are admitting that the health services are matters of social policy which concern the layman as deeply as the medical profession. The White Paper offers the doctors full opportunity to co-operate in the provision of a national health service. In their professional and advisory capacities they remain the king-pins of the service. But the consumer's supremacy "in all business arrangements" is a democratic principle that cannot be challenged.

It is natural enough that a profession that has suffered in the past from "inflexible and pettifogging lay control" should view an extension of state control with some alarm. But the health services are not the only sufferers in this respect. Their administrative defects are repeated in every department of social organisation. They are the growing pains of true democracy. The answer is not to be found in a departure from the democratic principle in favour of some form of syndicalist or technocratic government, but in fuller co-operation and the rational integration of existing services. The problem is to provide equal access for all regardless of means to the country's resources of medical skill and equipment. It is essential that this skill should be properly rewarded and properly used in its new national duties. But this is only part of the solution, and the crucial necessity is to see that the problem itself is not lost sight of.

Land Reform in Poland

TWENTY-FOUR years ago, in the summer of 1920, when the Red Army was advancing on Warsaw, a provisional Polish Soviet Government was set up at Bialystok, with Felix Dzerzhynski and Karl Radek at its head. In Warsaw a Government of National Unity was formed, headed by the leader of the Peasant Party, Witos, and by the Socialist leader Daszynski.

The fate of the newly born Polish Republic was at stake. Both claimants realised that the antagonism between the semi-feudal landlords and the mass of landless peasants and smallholders was the central issue in Poland's social and political life. Both sued for the support of the peasantry. From Bialystok, Dzerzhynski and Radek issued a manifesto in which they announced the expropriation of the Polish landlords; but, at the same time, they appealed to the peasants not to touch the landlords' property and land and not to share them out among themselves; they announced that the large estates would be transferred to state ownership and managed as socialised property.

In Warsaw the Prime Minister, Witos, made a solemn promise to the peasants that, immediately after the conclusion of the Polish-Soviet war, the large estates would be split up and distributed among smallholders. At the most critical stage of the war, both sides were anxious to appear as the friends of the peasantry. But while the provisional Communist Government spoke with the language of collectivism which was incomprehensible to the mass of smallholders in the countryside, the leader of the Polish Peasant Party appealed to peasant individualism. Of the two the individualist appeal was the more effective. The overwhelming majority of the Polish peasantry rallied to the defence of Poland's parliamentary democracy. The Polish Committee of National Liberation which

has now been established under Soviet auspices at Chelm has not repeated the collectivist appeal made by the would-be Soviet Government of 1920. Its first step has been to initiate a radical land reform under which large estates over 50 or in some provinces 100 hectares (125 and 250 acres, respectively) are to be distributed to holders of less than five hectares of land. A few days after the Committee's proclamation, the Vice-Premier and acting Prime Minister of the Polish Government in London, M. Kwapinski, stated in a broadcast to Poland that the Polish Government here had prepared an identical scheme.

The significance of these appeals to the Polish peasantry will best be understood in the light of the history of land reform in Poland in the inter-war years. The promise of a radical reform made in the middle of the Polish Soviet war in 1920 was only very partially kept. The opposition of the great landowning interests in the Polish Diet proved a formidable obstacle in the early twenties.

Two basic Acts on Land Reform were passed, one in 1921 and the other in 1925. The former provided for the distribution among the peasants of estates of more than 100 hectares. The latter raised the maximum to 300 hectares. Both Acts provided for relatively high compensation to the landowners. Because of this the reform failed to achieve its main objective. It could not satisfy the "hunger for land" of the landless peasants and smallholders who were unable to pay for it. The main beneficiaries of the reform were well-to-do peasants.

Between 1920 and 1925 the peasant movement became utterly split over this issue. Three peasant parties fought each other with the utmost bitterness: the Conservative Piast Party (named after Poland's first peasant dynasty); the left Party of Liberation; and the radical Peasant

Party. Later on a strong extreme Left peasant party emerged called the Independent Peasant Party.

The disappointment of the countryside with the slow tempo and the wrong application of the land reforms was perhaps the chief cause of the early disintegration of parliamentary democracy in Poland. The multitude of peasant parties in the Diet allowed no Government to count on a stable parliamentary majority. For a time the peasants blamed parliamentary rule itself for the failure of the land reforms.

When Pilsudski staged his anti-parliamentary *coup d'état* in 1926 he was supported by the most influential and radical peasant party of the time—the Party of Liberation. Though Pilsudski did not commit himself to any specific promises about land, his thunderings against the “moral corruption” of the parliamentary government undoubtedly led the peasants to expect that he would speed up the reform. But shortly after he had gained power, Pilsudski concluded his famous Nieswicz Agreement with the landed aristocracy, with the result that, in the years of his dictatorship, the pace of land reform became even slower than before. The great landlords were heavily subsidised and protected by the state. In 1930 the various peasant movements reunited into a single peasant party, the party that is now headed by M. Mikolajczyk.

In the course of nearly two decades the total area transferred to small and medium size holdings was 2,500,000 hectares; that is, not much less than a quarter of the area that poor peasants in the whole of Poland would now receive under the schemes announced by both the Polish Committee of National Liberation and the Polish Government in London. The large estates in Eastern and Central Poland could not even claim for themselves the economic merits which large estates can elsewhere. Except in Western Poland, their agricultural technique is usually almost as primitive as the technique of the small peasant economy. This can

be seen from a comparison of the yields per hectare of the main cereals in the Polish grain-producing rural economy. The differences between average yields and the yields on holdings below 50 hectares were almost negligible.

YIELDS PER HECTARE IN 1937 IN QUINTALS

	Average	Holdings of less than 50 Hectares
Wheat	11.4	11.1
Rye	9.9	9.6
Barley	11.1	10.4
Oats	10.2	9.9
Potatoes	135	132
Sugar Beet	221	199

In the course of a quarter of a century the yield per hectare remained on the whole stationary and the area cultivated increased only very little. The important exception was Western Poland. There the large estate was a factor of technical progress in agriculture, and there, too, the peasants’ “hunger for land” was at any rate not acute, since there were only few tiny and independent holdings in those parts of Poland. Significantly, the scheme of reform proclaimed by the Polish Committee of Liberation puts the maximum size of a landed estate in those provinces at 100 hectares, instead of the 50 hectares set for the rest of Poland.

Though both the Polish Government in London and the Polish National Committee have now formally committed themselves to almost the same land policy, there can be no doubt that the Committee has gained an important start, apart from other, chiefly military, advantages it enjoys. No doubt the mass of Polish peasants would feel that their acquisitions would be more secure if they were obtained in a legally irrefragable way—that is through the authority of the legitimate Polish Government. But, on the other hand, there is a difference between the promise of a reform to be carried out in the future and an actual reform which is to be carried out without delay in liberated areas. The experience of the inter-war years has made the Polish peasantry suspicious of general promises and benevolent assurances.

The present situation in Poland is to some extent reminiscent of the position in Russia in 1917. In Russia, too, it was the democratic peasant party of the Social Revolutionaries that conceived schemes for the distribution of large estates among the peasants, while the Bolshevik Party propagated a collectivist system of farming. But, in 1917, the Social Revolutionaries were unable to carry out their own schemes, and the Bolsheviks stole their thunder and distributed the land among the peasants. Chernov, the author of the programme for distributing land, went into exile, while Lenin executed his ideas.

In the various stages of Polish history, social and the national issues have tragically clashed. Most of the progressive reforms in Poland, because of the weakness of Poland’s own progressive forces, were carried out by foreign invaders. Napoleon, Austrian Emperors, Prussian Kings, and Russian Tsars abolished chattel slavery and serfdom in various parts of Poland, while the Polish nobility, always late with internal reforms, fought heroically for their country’s independence. It was Poland’s tragedy that, in those struggles for independence, the peasantry remained either apathetic or hostile to the patriotic leaders. The great Polish insurrection of 1863 and 1864 was decisively defeated when in 1864 Alexander II decided to extend the Act of Emancipation to the Polish peasantry. The freed Polish peasants then delivered the fighters for Poland into the hands of their Russian benefactors.

Is Marshal Stalin, perhaps following in the footsteps of his Imperial predecessor? It would be a mistake to overlook the fact that the Polish peasantry is now incomparably more conscious—politically and nationally—than it was eighty years ago when it had just been emancipated from serfdom. Its hunger for land is certainly genuine; but so probably is its thirst for political freedom and national independence.

NOTES OF THE WEEK

Turkey Breaks with Germany

The Turkish decision to break off political and economic relations with Germany, announced by Mr Churchill to Parliament on Wednesday, will not at this stage have very much direct effect on the war. The area of operations has moved away from the Aegean and, in any case, the Turkish break is “not a decision for war.” For some time past, the Germans have been able to get only a trickle of supplies across the disrupted Balkan railways and the mined waters of the Black Sea. The trade break will be only a trifling embarrassment. The Turkish decision will have important consequences only if it helps to spur on Germany’s Balkan satellites to an attempt to get out of the war. Then, indeed, Turkey’s action might be the signal for a quick political and military collapse of Germany’s Balkan power. Another possibility would be a German or Bulgarian attack. Yet this is unlikely in view of Bulgaria’s record and Germany’s weakness. The question remains why, when their refusal to break with Germany was so determined in the early part of this year, the Turks have so quickly passed to a radical and opposite decision. The answer lies partly with the pressure of external events—the vast Russian advances, the Second Front, the first signs of internal disintegration in Germany. All these point to the Nazis’ imminent defeat. And these portents have in their turn worked a revolution in Turkey’s internal affairs. Until June, M. Menemenjoglu had powerful support in the Cabinet and the High Command for a policy of caution and wait-and-see. The anxiety of the President to take a more active Allied line was overridden. Events have forced M. Menemenjoglu from office, and with him went the last resistance to open support to the United Nations.

President Ryti Resigns

It was President Ryti who, late in June, pledged the Germans that Finland would make no separate peace with Russia without German consent. Thus, so long as he remained President, it could be argued that, constitutionally, nothing could be done to alter the pledge. Now the first public reaction in Finland to the attempt on Hitler’s life and to the complete German military débâcle in the Baltic is the resignation of President Ryti, and Marshal Mannerheim’s acceptance of the office in his stead. It is significant that the Finnish Diet, which was not consulted over the deal with Germany, considered the new situation, and as a result of these deliberations called on the Marshal. In June he was numbered among those in favour of peace with Russia, and it was also widely believed that he would be acceptable to the Kremlin. Mr Linkomies’ Government will, it appears, resign, and his successor is likely to be drawn from the Socialist and trade union circles who have most violently criticised the Ryti pledge. Thus the way at last seems clear to separate negotiations between Russia and Finland. It is believed that on the Russian side the Soviet Government will still offer approximately the same terms as it did in March and June, although the indemnity may be heavier. The reports from Sweden of extensive German troop withdrawals from Finland suggest that one of the chief physical obstacles to a Finnish armistice may now be removed.

The People’s Representatives

The Speaker’s Conference on Electoral Reform, with its Conservative majority (in accordance with the composition of the House of Commons), has in effect passed a vote of censure on (mainly) the Conservative Party. This is the implication of the letter sent to Mr Churchill by the Conference last week. Two points are made:

1. It is to be deprecated “that a prospective or adopted Parliamentary candidate or a Member of Parliament should give any substantial donation or contribution to any charitable, social or sporting organisation in the constituency or to any charitable fund specifically benefiting the constituents.”
2. The Conference regards with disapproval “the direct or indirect payment or promise of payment of substantial contributions or annual subscriptions to party organisations

(including local party organisations) designed to influence the action of such organisations in selecting any particular individual as a Parliamentary candidate.”

The translation of these principles into practice would be revolutionary, and most beneficial. Inevitably in the British two-party system, electors vote not for men or measures, but in the main for parties and leaders: they vote for this possible Prime Minister and Government, and against that Prime Minister and Government. The quality of both candidates and Mps is almost wholly in the hands of party administrators—who, as things are, signally fail even to attempt to select the best men (and women) for the job.

Advice or Instructions?

In the case of the Conservative party, candidates for Parliament must usually be able to pay for their electoral organisation and their election expenses, as well as making donations to charities and local activities. It has been calculated that the qualifying payment to be a candidate may run from £1,500 a year to as much as £3,000. These proposals of the conference are only the expression of an opinion—unlike the recommendation that the legal maximum scale of candidates’ expenses (including all fees to agents) should be reduced to £450, plus 1d. per elector in boroughs and 1½d. per elector in counties. Unless the Conservative party chooses to find another source of finance, such as the collection of weekly pennies from supporters, these views will be ignored. If this happens, the next Parliaments will be no better in quality than their predecessors—for the Labour party’s preference for senior trade unionists in all their “safe” seats is as hostile to talent and energy as the Conservative money test. It is of the gravest importance that the Prime Minister, after having received this very striking recommendation from the spokesmen of Parliament itself, should ask whether these principles, too, can not be made, in part at least, a matter of law and legal enforcement. After all, these proposed limitations on interested spending simply reflect a healthy broadening of view, with time, about what is tantamount to bribery and what is not. And Mr Churchill is leader of the Conservative party.

Indian Meeting

It is a step forward that Mr Jinnah, with the approval of the Moslem League of which he is the leader, should have agreed to meet Mr Gandhi for discussions on the political future of India. Too much should not be expected from the meeting of these two most agile politicians; but at least the position should be made somewhat clearer. At present the chances of an agreement between the Congress and the Moslem League, the two chief Indian parties, are extremely obscure. With one breath, Mr Gandhi

WHEN will you get Black Magic again?

[WE GIVE YOU ONE GUESS]

All the nice things that used to be in Black Magic Chocolates — are they dead?

No.

They exist.

But they might as well be dead, for all the use they are.

The Mauritius sugar that gave the tang to the Black Magic caramel — it’s in Mauritius.

The Valencia almonds that went into the Black Magic truffle-and-nougat and montelimar — they’re in Valencia.

Brazil is no longer where the nuts come from. It’s where the nuts stay.

Venezuela no longer sends us its peculiar fruity cocoa beans. It sends us petrol.

We didn’t use petrol in Black Magic.

All the nice things are in all the nice places—except Britain.

They’ll come again. When they do, so will Black Magic.

You can call that a threat or a promise, as you please.

has seemed to accept Pakistan, or the separate and independent government of Moslem provinces; with another he has appeared to condemn it, as he always did in the past. Mr Jinnah, too, has given little guide to his real intentions. In a speech a week ago, though he had agreed to talk with Mr Gandhi (in mid-August), he severely criticised Mr Gandhi's latest "proposals." Nevertheless, there are hopeful signs in the uncertain scene. There can be little doubt that the two politicians have decided that they must meet and talk partly, at any rate, because they are afraid of their thunder being stolen. Events, both economic and political, were threatening to leave them behind.

The British Role

The Viceroy and British Government have wisely sponsored the starting of plans for economic reconstruction. They have the big industrialists, who really dominate the Congress party, with them on this line of policy. They are addressing themselves to India's most obvious and most pressing need. There is, moreover, a widespread desire among moderate Indian opinion—represented chiefly by Mr Rajagopalachari, whose triumph it will be to have brought Mr Gandhi and Mr Jinnah together at last—to undo the failure of two years ago, when the collapse of the Cripps Mission left all the Indian politicians on the wrong foot. All this seems to have caused both Mr Gandhi and Mr Jinnah to think again; and it was this sense of a new opportunity that caused Parliament in last week's debate to press for every help from the British authorities towards an agreement among the Indian leaders. The Government was no doubt right to say in reply that there is very little more that Ministers or the Viceroy can do, on the political side, until at least the germ of an Indian agreement is shown to exist. After all, the Cripps offer of progressive independence still stands. But it is also true that the pursuit of economic advancement without an advance towards political independence would almost certainly prove a false trail, essential though the former is. Mr Birla, of the Congress industrialists, has pointed this out. At least, it is necessary for the British authorities to make plain that they are placing no obstacles in the way of the widest possible discussions.

Post-War Wealth

The fifth Bulletin of the Tory Reform Committee, the authors of which are Sir Alfred Beit and Mr Hugh Molson, sets out to tread the delicate middle path between those who say that the country cannot afford schemes of social reform and those who say that it can afford the sun, the moon and the stars. This task the authors accomplish by the fashionable, and wholly correct, method of national income estimates. Their figures can be summarised in the following table, of which the first column is the official estimates for 1938, the second is *The Economist's* estimates for 1943 at 1938 prices, and the third is the authors' estimates of minimum expenditure in a post-war year, also at 1938 prices:

	1938 (£ million)	1943 (millions of 1938 pounds)	Post-war
Government expenditure ..	837	3,840	1,250
Private expenditure on consumption	4,138	3,270	4,100
Private net investment at home	305	—95	550
Public and private net investment abroad	—55	—485	150
National expenditure	5,225	6,530	6,050

The third column seems to be on the low side. The figure for government expenditure covers, of course, only government expenditure on goods and services, and therefore excludes transfer payments such as interest on the national debt or social services. Even so, an increase of £400 millions is small in view of all the commitments already accepted. The authors are certainly right in holding that it will be politically impossible to depress the rate of consumption below the pre-war level; possibly they are over-optimistic in thinking that it can be held at that level. The increase in domestic investment is certainly necessary, and since "net investment abroad" includes any steps taken to reduce war-indebtedness, as well as to replenish depleted reserves, the figure of £150 million is also not excessive. The question is whether the post-war national income will be large enough to provide any margin over this minimum expenditure of £6,050 million. The authors estimate that the post-war national income may be £11,000

million more than that of 1938. This would bring it to £6,225 million. The margin is small, particularly since the expenditure is under-estimated. But, even so, the figure suggested for income requires some optimistic assumptions. It is 19 per cent above the pre-war figure and only 5 per cent above the war-time peak. It assumes an increase in average individual productivity since 1938 of about 10 per cent, combined with a reduction of unemployment to 5 per cent of the insured population. The immediate prospect is thus certainly no rosier, and possibly less favourable, than the authors make out.

The pamphlet also gives some figures bearing upon the post-war Budget. The first approach to the expenditure side is as follows:—

	£ mn.
1938 expenditure	1,068
Inc. in cost of national debt	285
„ in war pensions	100
„ cost of fighting services	250
„ cost of education	102
„ cost of health	80
„ cost of social insurance	86
Total	1,971

These estimates are, again, possibly on the low side. Moreover, the total does not include any allowance for increases in other expenditure consequent upon the general increase in the price-level. On the revenue side, the authors say that "it seems unlikely that the Chancellor of the Exchequer will dispose of a revenue of more than £2,000 millions after the war," but since they do not state what change in the level of prices they envisage, it is not easy to check the figure. It is certain, however, that the post-war budgetary problem will be a severe headache to the country. It is not easy to strike the exact mean between irresponsible profligacy and defeatism in these matters. There will be some margin of resources; but it may well be that the margin is already more than fully mortgaged.

Accomplished Facts in Moscow

The Polish Prime Minister is making a last minute attempt to reach an agreement with Russia. He has gone to Moscow to negotiate with Marshal Stalin personally, and to tell him that the Polish Government accepts the Curzon line as a temporary boundary between Poland and Russia, with the proviso that the final drawing of the frontier should be postponed until after the war. On the territorial issue, Moscow has demanded from the Poles nothing more than this; and had the conflict been confined to this point only, agreement would have been an accomplished fact by now. But the field of controversy has disastrously widened. The Soviet Government has recognised the Polish Committee of National Liberation as the temporary administration in Poland. The question must be asked whether, under the circumstances, Marshal Stalin is still prepared to deal with M. Mikolajczyk, not merely as the leader of the Polish Peasant Party, but as the head of the legitimate Polish Government recognised by the other Allies. The Polish Government is ready to return to Warsaw as soon as possible and to reconstruct itself so as to include some members of the Committee. What the Committee is probably prepared to do is to include some members of the Polish Government, but to retain its position as the recognised authority in Poland. The conflict goes deeper than it might perhaps appear, because it now involves nothing less than Poland's sovereignty and independence. When M. Mikolajczyk arrived in Moscow on Monday last, he found the auguries there not at all promising. The Soviet press greeted him with polemical salvoes against his "Government of usurpers"; and on the same day the Soviet Government and the Polish Committee of Liberation exchanged diplomatic envoys. (The Committee's diplomatic envoy with the Soviet Government is M. Rzymowski, a prominent Pilsudskist publicist who, ten years ago, had the dubious merit of being first to demand concentration camps for the democratic opposition in Poland.) The accomplished facts seem to be piling up in Moscow into a formidable obstacle to reconciliation.

"Trotskyite" Ghost in the Epirus?

The conflict between the Greek Government of Papandreou and the Left Wing guerillas in Greece is not yet solved. The leaders of the EAM are still refusing to merge their

army, the ELAS, with the other partisan forces. They also refuse to join the Greek Government on the conditions laid down by the Lebanon Conference last May. It is interesting to note that a Russian military mission has now arrived in the Greek mountains. A report from Cairo says that its

most probable objective is to draw into line the recalcitrant communists who now rule the EAM detachments.

Whether this is really so cannot yet be ascertained, though it is known that M. Papandreou has had some support in the Middle East from Soviet representatives. "Recalcitrant Communism" used to be pretty strong in Greece some years ago. Its spokesmen, who labelled themselves curiously as "Archivo-Marxists," gave many headaches to the leaders of the Communist International in Moscow. Under the Metaxas regime the "Archivo-Marxists" were wiped out by police repression; and it seems somewhat doubtful whether the same movement has now been able to re-emerge and to sway the Greek guerillas. But it is quite possible that some such unorthodox Communist tendency may have established itself among the "men of the mountains" firmly enough to oppose the Lebanon Agreement and to reject any conciliation with the dynasty. If so, then the Russian military mission in Greece will be confronted with a task which may be as much political as military. The Mission has come to Greece with an increased moral and political prestige derived from the victories of Russian armies. This will probably strengthen its hands in laying the "Trotskyite" ghost in the Epirus.

The Maquis Again

The latest communiqué on the activities of the French Forces of the Interior issued from Supreme Allied Headquarters states that

The activities of the Maquis, who have provided a constant threat to the enemy's rear, are now forcing the Germans to employ considerable strength in repressive measures.

In the Vercors area, the Germans were compelled to use artillery, aircraft and paratroops in a fifty-six hour battle against the French guerillas. Heavy fighting continues in Central France and the steady offensive against all the German lines and methods of communication has been maintained. All this costs the Maquis a heavy price in lives and equipment, and the evidence reaching Algiers points to serious deficiencies in weapons and reserves. M. Grenier, the Commissar for Air, thrust the issue of supplies to the fore in a speech to the Assembly in which he called the under-equipment of the Maquis "a veritable crime against France" and laid the blame squarely on Allied Supreme Headquarters.

In vain have I attempted to obtain . . . an authorisation for French aircraft to operate against the Germans in support of French patriots attacked by German armoured cars. Today I publicly refuse to bear any responsibility in the matter.

This is a serious statement. If the Allies' air superiority rested on a very narrow margin, the decision to withhold aircraft might be justified. But their superiority is absolute and overwhelming. Guerilla fighting is, much more than regular fighting, a matter of morale. A few aircraft over the Maquis means far more than the same number circling the "official" battlefield. And their absence will rankle for long among the Allies' best friends in France as a betrayal in the hour of need.

Accidents Will Happen

The regrettable oversight of the Home Secretary's department in failing to lay the National Fire Service Regulations before Parliament has now been formally repaired. Mr Morrison followed up last week's expressions of regret and apology by placing the Indemnity Bill before the House of Commons on Tuesday. The Bill merely provided that the regulations should operate in the same way as if they had been through the proper procedure. This act of constitutional reparation is more, however, than a mere formality. Obviously, there was never any doubt that Parliament would do what the Cabinet wished. Nor does it seem likely that any real objection would have been raised against these Regulations if they had been duly produced at the right time. But, if Parliament is to retain effectively its power (and duty) to scrutinise administrative actions, in the interests of the community at large and of individuals in particular, the form of law is of great importance in these many unavoidable instances of executive law-making. The

question to be settled now is how best to avoid any recurrence of this oversight in other Government departments. It is conceivable that, in some circumstances, the harm done by such unconstitutional practice might be considerable. No Minister or civil servant should be in a position simply to depend on automatic indemnification because of his Government's majority, and so to slacken in his attention to the likely reaction of vigilant Members of Parliament. The requirements of modern administration, in peacetime as well as wartime, make it quite impracticable to bring more than a fraction of the Executive's decisions before Parliament for prior debate and acceptance. But if Regulations can pass permanently into force when they have not received at least the tacit and implied consent of Parliament, after Members have had a chance to see for themselves what is being done, the risk of arbitrary action and possible injustice is patent. In this case, there was not the slightest justified suspicion of any deliberate intention to deceive. But there must be adequate safeguards to protect the House and those it represents against less scrupulous, or less responsible behaviour. A Conservative amendment proposing that regulations of this nature shall cease to be valid if they are not laid before the House within three weeks, was forestalled by a promise from the Home Secretary that the Government would consider some new statutory provision to this end. It is in any case remarkable that, as one member observed, this is the first occasion for complaint in five years of war.

Bomb Damage Repairs

It is now three weeks since the Government announced its decision to concentrate the labour and material resources of the building industry on the repair of houses damaged by flying bombs. The whole of London's resources have been engaged; some thousands of building workers have been brought from the provinces, and contractors from other areas, complete with equipment, have moved in. In addition, numbers of marines, naval ratings and RAF men have been drafted to help in the work of emergency first-aid repairs. Latterly the labour force has been further augmented by carpenters and joiners, builders' handymen, slaters and tilers from industrial establishments outside the building industry, and district manpower boards are now carrying out a survey of all undertakings which might employ such workers, though the emergency medical service hospitals, the railways and water undertakings will not be depleted. The mobilisation of building resources on this scale necessarily raises many difficulties, but the Ministries concerned claim that the arrangements are working well. The appeals both for building volunteers and domestic workers to help accommodate and feed them have met with a good response. In view of the urgency of the work, the builders have agreed not to take their Bank Holiday, and will work throughout the week-end. On July 13th, Lord Portal expressed the hope that the repair work would keep pace with the damage inflicted, and that houses not seriously damaged would speedily be rendered habitable. The number of houses totally destroyed, according to the Prime Minister's statement on Wednesday, is 17,000, while about 800,000 houses (of which a quarter have not yet been made habitable) have been damaged. Since continued bombing, possibly with heavier explosives, may be expected, the work of repairing damaged houses will necessarily remain a high priority in building resources. In the meantime, the local authorities are using their powers to requisition empty houses for the homeless, and when the available accommodation is exhausted, they will resort to billeting. In any

EVERY DESCRIPTION OF BANKING BUSINESS TRANSACTED.

Trusteeships and Executorships Accepted.

case, rest centres will not be used for more than a couple of days, and the Minister of Health is satisfied that they are being cleared as fast as possible; it is claimed that since the flying bombs started, the number of people in rest centres has never been as high as 50 per cent of the maximum during the 1940-1 blitz.

Strike a New Note

The flying bomb has added a new note to the cacophony of London's streets, and the proposed "imminent danger" signal of three two-second blasts on a klaxon will add yet another. In the absence of any official system Londoners have for some time been experimenting with a variety of warnings—visual and aural—and the results have been more than a little confused and confusing. Standard instruments are now being manufactured. Until they have been installed the most suitable instruments at present available will continue to give the signal to duck or take cover. The normal life and work of London has gone on remarkably in spite of these aerial hazards, which are very disturbing. The new warning within a warning, if it can be made to operate satisfactorily, will help Londoners to carry on in this way with somewhat less apprehension. The Government has decided that visible signals are not desirable. In spite of the Luftwaffe's worst efforts the Londoner's field of vision is still severely restricted. Moreover visible warnings would increase the risk of traffic accidents "caused by the diversion of drivers' attention from the road." There will still be very many people, however, who for good or ill will continue to make the visible or audible appearance of the flying bomb itself their call to evasive action. Mr Morrison paid deserved tribute to the officers responsible for operating the warning system (the familiar sirens, which are of course to continue to sound the general "alert" and "raiders passed") since the enemy's first secret weapon made its spectacular descent.

Help for the Tuberculous

An investigation carried out during the second half of 1942 by the National Association for the Prevention of Tuberculosis and the social medicine committee of the Medical Research Council found that, of 1,346 families containing a tuberculous patient, 69 per cent had an income sufficient to buy an adequate diet measured by the League of Nations standard. The remaining 31 per cent had incomes below the level needed. The League of Nations nutritional standard, however, is based on the diet regarded as adequate for healthy persons, whereas tuberculous persons require extra food and particularly extra expensive food, such as milk, eggs, butter and green vegetables. It does not follow, therefore, that even in the 69 per cent of comparatively well-off households the tuberculous member could receive the food needed, even if no allowance is made for wartime shortages. Those in the 31 per cent could have no chance of building up a healthy resistance to the disease. Since 1942, as the investigations point out, the financial position of tuberculous persons has been greatly improved by the special allowances which have now been in operation for over a year. These aim at encouraging a tuberculous patient to stop working and undertake treatment until he is cured, and they are fairly generous—there are children's allowances, maintenance allowances without any means test, discretionary allowances to meet standing charges, such as rent and rates, and special payments in individual cases needing extra help. But though in many cases the allowances relieve immediate financial anxiety and encourage the tuberculous to stop working, it is not certain that they can also enable them to buy the extra diet they need. It is not enough merely to maintain the former standard of living. In many cases, as the investigation shows, a higher standard of living is necessary. This might be achieved, not necessarily by increasing the financial allowances, but by arranging for tuberculous persons to have their extra milk—the main supplementary food needed—free or at a cheap rate, according to means, as is now arranged for expectant mothers and children. The investigations also call attention to the most patent defect of the new system of allowances, which has already been commented upon in *The Economist*. They only apply to patients with pulmonary tuberculosis who are considered to have a prospect of returning to work. Chronic cases, who ought to go on receiving regular treatment and care, are excluded from this special financial help. Thus, they may have to choose between living on public assistance, which certainly

will not improve their standard of living, or of finding employment, which by definition they are not fitted to do. And since many of these chronic cases have positive sputum, there is a danger that they may spread the disease among their fellow workers. This attitude on the part of the Ministry of Health is not only inhuman; it is also short-sighted.

Bank Fellowships

The Bank of England, on its 250th anniversary, has made a handsome gift to the nation. This birthday present in reverse takes the form of a trust fund for the promotion of economic research, and will be known as the Houblon-Norman Fund. The title will commemorate two of the Bank's most notable Governors—Sir John Houblon, the Governor of 1694, and Mr Montagu Norman, who retired recently after holding the office for twenty-four years. It is expected that the income from the fund of £100,000 will provide (handsomely) for three fellowships each year and for additional grants towards the expenses of existing economic research. The fellowships are intended

for the promotion of research into the working and function of financial and business institutions in Great Britain and elsewhere and the economic conditions affecting them.

Wisely, the Court of Directors have decided that the management of the fund shall be independent of the Bank, and Mr B. G. Catterns (the Deputy Governor), Lord Eustace Percy and Mr Samuel Courtauld will be its first trustees. They will be assisted by an expert committee consisting of Mr Henry Clay, Sir Hubert Henderson and Mr A. M. Carr-Saunders. This charitable gesture is, naturally enough, approved and welcomed by *The Economist*. Facilities for economic research are a necessary element in the long-term reconstruction of British finance and industry. Carefully administered and allotted, the fund cannot fail to prove money well spent. In establishing this fund the Bank is following the good example of other national corporations and business houses. Only recently the name of ICI has been added to the list headed by Nuffield, and education and research need many more such benefactors. It is fitting that the big profits of big business, where they exist, should be so employed. In the House of Lords, on Tuesday, Lord Barnby suggested that, since voluntary subscriptions had proved inadequate, the Government should impose a statutory levy on any industry which asked for research in its own sphere. It is reasonable that industry should be asked to share in the cost of a service which affects its welfare so vitally: but it would be impolitic to segregate industrial research units and their finances to serve narrowly the needs of particular interests. The poorer industries are those least able to afford the research facilities which they need so greatly.

Shorter Note

The following table gives the number of civilian casualties in air-raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940	1,494	1,980	3,474
Sept.-Dec., 1940	22,282	28,522	50,804
Total, 1941	20,863	21,839	42,702
Total, 1942	3,221	4,149	7,370
Total, 1943	2,357	3,462	5,819
1944—			
January	107	270	377
February	961	1,712	2,673
March	279	633	912
April	146	226	372
May	68	75	143
June	1,935	5,906	7,841
Totals to date	53,713	68,774	122,487

Those killed during air-raids in June included 716 men, 988 women, and 231 children under 16.

Fatal casualties from flying-bomb attacks up to the beginning of this week amounted to 4,735.

By comparison, road deaths during the month of May totalled 632, compared with 401 in May, 1943. In addition, 11,512 people were injured (3,222 seriously), compared with 8,972 in May, 1943.

AMERICAN SURVEY

Midwestern Steel Town

(From a Correspondent in Indiana)

THE 36,000 steel workers of Gary, Indiana, are producing and partially or wholly processing more than 80 per cent as much steel as the whole of Japan. For several years the Gary steel mills have been producing more than their rated capacity, despite the findings of Brookings Institution some years ago that 85 per cent of steel capacity might be regarded as a maximum for production.

There is no intimation that this ability to produce can be continued indefinitely. Indeed, there can be little doubt that this is a forced rate and that eventually payment must be rendered in the form of extensive repairs. Inasmuch as all steel companies appear to be setting aside large depletion reserves, repair jobs for thousands of workers can be foreseen when industrial reconversion sets in. However, there seems to be no question of the ability to carry on as long as needed at the present rate. In steel, as elsewhere, the war has set new base marks.

Gary's steel production to-day is estimated to be about 75 per cent greater than during the first World War. However, double the number of employees are required, while incomes have mounted to over three times what they were 25 years ago.

To get the proper perspective on Gary it should be recalled that the city was founded by the United States Steel Corporation in 1906 in the sandy swamp land at the foot of Lake Michigan, and that when the first World War started in 1914 the steel mills were only beginning to hit their stride. Unions were unthought of and the hours swung from 10 to 14 in alternate periods of two weeks; it was only later that the Corporation led the steel industry to the 8-hour day.

To-day all the mills are completely organised by the CIO. The basic wage rate is \$31.20 for a 40-hour week, although the average work week now is 50½ hours. The extra 10½ hours at time-and-a-half brings in \$12.28 more, or \$43.48 for the average week. This is average pay and thousands get more.

This large increase in income has had the results that could have been expected. Savings funds show astonishing growth, but equally astonishing is evidence of foolish spending. All the stores and taverns have felt the impact of a new demand. Particularly is this true of the better women's stores. The sale of cheap things has fallen off, while the demand for high priced apparel can hardly be met. Dresses at \$100 to \$150 are snapped up almost before they can be priced. Indeed, shop assistants comment on the hesitation of old customers before paying present prices, while the new customers sweep everything before them. Jewellery stores are selling amazing quantities of costume jewellery.

Doubtless this impetuosity is more apparent than real. However, there is no question about the demand created by the new incomes. Business was never like this, not even in the silk shirt era of the last war. Much of it comes from people getting things they have long wanted but never before could afford. This kind of buying is represented by the negro woman who had worked hard at a comparatively low wage and yet had educated her two children. Their education completed and the children out on their own, the mother secured a war job that brought her an incredible sum. She used it all to buy sheets and blankets for her beds, household furnishings she had never possessed.

This story came out at a discussion of the need for saving some of this new war income for the day of unemployment which may be coming. "That's all right," said the negro business man who told the story, "but I don't blame that old lady for splurging as she did. Those sheets and blankets represent a new day in her life and a new standard of living."

Despite spending, a great savings fund is being built up. How large it is one can only guess, but the guess is based

on some facts. Gary pay-rolls, to 36,000 steel workers and some 7,000 others, representing a Gary area population of 175,000, reach close to \$100 million a year. Present savings of individuals, including war bonds, must be approaching \$50 million. There are 30,000 savings depositors in the Gary banks, almost all of them mill workers.

But the most fantastic phase of savings is the hoarding of cash in safety deposit boxes and in many unknown spots. It is estimated that millions are hoarded in Gary. This is not a local but a national phenomenon. Unprecedented deals for cash are told of. The sale of a building is arranged and the buyer pulls out a roll of bills, counts off 20 or 30 thousand dollars in full payment. Such deals are the exception, to be sure, but they occur with surprising frequency.

All kinds of curious reasons are given for hoarding. One of the most common is fear of the Government. The Government may tax their money or seize it or make it worthless. How or why, apparently, does not enter into the consideration. The money must be protected, so it is hidden. Here, undoubtedly, is one explanation for the unprecedented tripling of currency in circulation since 1939. There seems to be no doubt that several billions of paper dollars are hoarded to-day throughout the nation.

Five thousand Gary steel workers are women. Neatly dressed in slacks, they are noticeable everywhere. They have doubled the income of many families and have won a new status for themselves. But if their status has developed new stresses and strains in the community it will become evident only with their separation from pay-rolls as employment declines. Their number is still growing, inasmuch as women represent the only unemployment pool still available, as the male workers continue to flow to the Army.

Recently the steel workers' union opened its newly-acquired and renovated headquarters building with a three days' celebration. Invitations for its dinner were sent to Phil Murray and other national officers, to managers of the steel mills and many members of the Gary Chamber of Commerce. While the mingling of these diverse elements need not be too highly appraised for its future good, it is yet true that little of the old antagonism towards organised labour exists in the community. Certainly a dinner of the kind mentioned would have been unthought of a few years ago. Business men have learned that well-paid contented workers make a good community—and also good business.

The chief local criticism of unionism voiced by employers is the tendency of the union organisation to think in terms of the organisation rather than the good of the individual worker, but there is nothing new in that. However, this tendency does keep the worker-management committees from getting the results that are latent in them.

Management appears to regard these committees as a helpful adjunct to the production of steel, but thinks they would be much more beneficial if the employee members did not need to bother with instructions from the unions or union policies. A start has been made towards a relationship which contains high potential values, but those values can be developed only over a considerable time. Progress calls for a degree of real labour statesmanship.

One of labour's problems which has a distinct community bearing is the changing status of the negro. Though it is a national problem, its impact on Gary is probably stronger than on any northern community, for Gary has a higher percentage of negroes than any city in the north; 20 per cent of Gary's industrial workers are negroes. They belong to the unions, which ask equal recognition for them.

Following the Detroit riots, rumours were flying in Gary and the Chamber of Commerce named a racial committee to study the situation. Many meetings were held with negro groups, and a mutual understanding of joint problems was reached. Finally a number of representative negroes were invited to join the committee with the hope that an inter-racial body may grow out of its activities. The committee has sought to ameliorate recognised inequalities, but negroes themselves realise progress in some instances can be made only with disconcerting slowness. Nevertheless community forces are keenly alive to this problem.

One block to improvement is the large group of southern whites who came north with negroes. Another is some new economic antagonism between negroes and foreign-born elements resulting from the movement of the former into the neighbourhoods of the latter. This antagonism has shown up particularly in one mixed school (Gary has every possible kind of mixed and segregated schools) over the use of a swimming pool. Apparently there is little, if any, feeling between the children in the school, but a lot on the part of white parents who are getting negro neighbours. When a Negro buys a house in a white neighbourhood, there is a feeling that values have been depreciated.

Another source of some community concern arises directly out of the war. Yugoslav supporters of Marshal Tito arranged for a speech by Louis Adamic in the largest auditorium in the city owned by the schools; that brought a demand from Yugoslav supporters of General Mihailovich that controversial problems should not be discussed in a school building, along with predictions of certain rioting. The school board hastily revoked the lease, but after due consideration permitted the meeting to be held. There was no trouble; and then the Mihailovich supporters held a similar meeting in the same building.

Gary has groups from all the nations of the world, one of the largest being Polish. They have shown great feeling over Russia's treatment of Poland, but no local difficulties have come out of such national problems. Indeed, the most surprising effect of the worldwide disturbance of the war is the failure of centripetal forces to separate Gary's many nationalities and create hatred between them.

"Well, first of all because The Yorkshire Post gives me full reports of all local trade meetings, instead of merely summarised reports—and that's valuable to me. Although there's something more than that, really."

"I think the days are gone when we can just divide ourselves up into 'north' and 'south'. Modern communications have annihilated distance, and what goes on in one part of the country is now of greater significance to business people in another."

"The Yorkshire Post is the leading paper in an important area and must obviously lead in interpreting that area everywhere else. Its leading articles are interesting. Its regular contributions include writers on all subjects; it gives all the news and gives it straight."

"The Yorkshire Post certainly helps me to get a sharper focus on national events, and I recommend it to my city colleagues."

American Notes

The New South

Southern voters continue to show remarkable discrimination in the primary elections. In Arkansas, Representative Fulbright, who made an international reputation in one term in the House of Representatives, has headed the poll in the Democratic primary for the Senate. Mrs. Hartie Carraway, the strongly-backed incumbent, and incidentally, the only woman member of the Senate, was badly beaten. There were four candidates in all, and as Mr. Fulbright did not win a clear majority of the votes cast there is to be a run-off election on August 8, but his chances are thought to be very bright. It will be a great asset to the Democrats to have so able a young man, who has made himself a leader of liberal internationalism, in the Senate to wrestle with the Old Guard of both parties. At the same time, one of the most picturesque and reactionary figures from a bygone age, Senator Ellison Smith, known universally as "Cotton Ed," has been defeated in the South Carolina primary by Governor Johnston. "Cotton Ed" was the embodiment of the narrowest kind of regionalism. He was a child of the grudges and prejudices of that unhappy time when the South seemed stricken by a pernicious anæmia, unable to rise above its economic distresses and its spiritual despondencies. A number of other illiberal Southern Congressmen have been sent back to private life by the primaries, and outstanding progressive characters like Senators Hill and Pepper have been triumphantly vindicated despite bitter opposition. The demonstrations against Mr. Roosevelt staged by part of Texas, Louisiana, and Mississippi and the drive against Mr. Henry Wallace are only part of the truth. The selectiveness of the primary voter points to an awakening political consciousness in the South. The tendency of many commentators to dismiss the South as merely the conservative wing of the Democratic party, as a constant brake on progress, does not fit all the facts. It must be admitted that in recent decades the quality of Southern representation in the two houses of Congress sadly declined and that a tradition of the most blatant demagoguery, of which Huey Long was the prize example, was established. The tide, however, has perceptibly turned. The South seems to be rallying against its own wilder elements, against those who sought power through mischief, the men who exploited the economic discontents and the race prejudices of the most ill-used section of the North American continent.

A Challenge to Youth

This is a revival that is of interest to the outside world as well as to the United States. The able young men beginning to make their mark in Southern politics are all distinguished by a devotion to the principles of collaboration for peace, and are greatly concerned with making the Rule of Law a reality. This is an attitude traditionally characteristic of the best of Southern thinking. The South has always had an international-mindedness of its own, which was shown not to have died out when in 1940 and 1941 so many young Southerners flooded into the Canadian Air Force that it was suggested it should be called the Royal Texas Air Force. In part this may conceivably be due, as the cynics emphasise, to the narrower opportunities open to young men of spirit in the South than in the West and East, but that was not all. It is to be devoutly hoped that an equally high order of courage will be forthcoming on Southern domestic issues. The war has brought a temporary prosperity—in many towns even a hectic prosperity—but it has superimposed new problems on old sores. Nearly 2 million people have moved into the South since 1940. The low standard of public health, of housing, and of education has not been lifted by the war; the sharecropper remains; race feeling has been sharpened rather than smoothed over; the discriminatory freight-rates, which handicap Southern industry, have not been abolished. The old problem of the absentee landlord, in regard to industry and commerce, is still unresolved. There has been a gloss over these old grievances during the war, with the young men in the forces, and work for all who would crowd into the factories from the farms and the hills. But what is to happen when the war factories fold up, the soldiers return, and state revenues fall? The die-hards who rejoice at the going of Mr. Wallace, and are determined to fight to the last ditch for the poll tax, anti-negro dis-

crimination, and states' rights will not provide the answer. The war has immensely speeded up the process of industrialisation in the South. It has provided an outlet for almost every crop, a job for every human being. It is of the greatest urgency that with the end of hostilities the South should be enabled to use both its new and its old resources, its human beings as well as its new synthetic rubber plants, if it is not to become a breeding-ground for despair and reaction. The emergence of young, able, and unembittered politicians in the South is a sign of hope.

Republican Purge

Representative Hamilton Fish, of the 26th Congressional District of New York State, which includes President Roosevelt's home at Hyde Park, started his campaign for re-election this week with the curse of both Governor Dewey and Mr. Willkie upon him. Governor Dewey's blast was occasioned by a sneering reference of Mr. Fish to the effect that the "Jews, unfortunately, were more or less for the Roosevelt Administration." The Republican candidate very properly proclaimed that the injection of a religious or racial issue into the campaign was a disgraceful, un-American act. Mr. Willkie, in a characteristically generous gesture, has gone even further. Enemies of Mr. Fish's candidacy have been buying space in newspapers to accuse him of being pro-Nazi. Mr. Willkie has offered his legal services to Mr. Maxwell Anderson, the playwright, should Mr. Fish sue him for his part in the advertisements, and called his attack "a public service." Mr. Fish is firmly connected in the public mind with the most bigoted forms of isolationism. There can be few Republicans of any standing who would not breathe easier with Representative Fish removed from the Congressional scene, and Mr. Dewey's statement has been widely applauded. However little Governor Dewey and Mr. Willkie have in common, they could hardly have failed to agree in regarding Mr. Fish as a liability to the party. It is not, of course, certain that even these big guns of the party will blast "Ham" Fish out of his concrete emplacements in Dutchess County. He has this week won the endorsement of his party in the primary election, though with a much reduced majority, which will encourage his Democratic opponent. Mr. Roosevelt once had a little difficulty over a purge of his own—admittedly on a larger scale—which suggested that local elections are seldom decided on national politics alone, and that high-powered adjurations to voters sometimes work the opposite of what is intended. Past attacks on Mr. Fish by national figures have been resented in his constituency, and have helped him to secure re-election. His constituents are no more isolationist than any other group of voters, but in the past twenty years they have found in Mr. Fish a friend and neighbour attentive to their local interests. It will be surprising if he is defeated, but the attempt to do so reflects credit on Governor Dewey and will hardly go unnoticed in New York City, with its large Jewish vote. Perhaps it will encourage the Presidential candidate to turn his attention to other equally undesirable personalities on the fringe of the party. There is no doubt that Mr. Willkie's support would be available for an extension of the Republican purge.

The Coal Deficit

There have been rumblings about an approaching coal shortage for some time. Mr. Ickes, the Solid Fuels Administrator, now puts the expected deficit for the coal year beginning April 1, 1944, at 21 million tons, made up of 16 million tons of bituminous and 5,000,000 of anthracite. Production of bituminous is expected to be about 610 million tons, against requirements for 626 million tons, and anthracite production about 60 million tons against a demand for 65 million tons. The estimate for bituminous is slightly above last year's production, and already the prospective soft coal deficit has been cut from 30 million tons at the beginning of the year to 16 million tons. The preponderance of the deficit, however, is in Southern Appalachian coal, which is essential to steel production and is favoured for residential heating in the eastern half of the United States. Stock-piles are said to be below minimum reserves, in part owing to the failure to apply consumer restrictions sufficiently early last year and to the loss of 40 million tons because of work stoppages, mainly the coal strikes of last year. The crux of the matter again is manpower. The soft coal industry has lost 50,000 men since January, 1943, and anthracite employment in the same period fell from 76,000 to 73,000. Approximately 62,000 miners have entered the Services since 1940; 20,000 of these were withdrawn last

year. Less than a quarter of the men aged 22-25 in the mines have been deferred as essential to coal production. There have also been substantial transfers to other industries; early this year the "outmigration" figure was as high as 5,000 a month. The men left in the mines are older; in 1942 the average age was 32, whereas to-day it is over 45, with obvious effects upon the superannuation and absenteeism rates. Absenteeism among older miners is reported to be as high as 80 per cent on Saturdays in some Kentucky mines. It is, consequently, a tribute to the efficiency and patriotism of the miner, or the efficiency of management, that bituminous coal produced last year reached 1,500 tons per man, as against 1,270 per man in 1942. With expected production at about 670 million tons, requirements at 691 millions, and stockpiles of over 60 millions, the situation is hardly desperate, although the margin is narrow, and no interruption to coal production can be allowed. Domestic consumers already have been cut down somewhat—to nine-tenths or seven-eighths of their normal consumption, depending upon their location and the type of fuel they require. No real rationing is expected, but should an unexpectedly severe shortage of industrial fuel occur, it should be possible further to reduce these allotments without causing extensive hardship. Domestic uses account for about a quarter of the soft coal consumed, so that substantial savings might be obtained.

Geared to Rubber

The end of the rubber crisis has been underlined this week by the resignation of Mr. Bradley Dewey, the Rubber Director, who declared it was time to liquidate the special agency created two years ago to "bull through" the synthetic rubber programme. At that time the Baruch Committee insisted that

If we fail to secure quickly a large new rubber supply, our war effort and our domestic economy both will collapse. . . . The rubber situation thus gives rise to our most critical problem.

That problem has been solved. Early this month Mr. Dewey set the production of synthetic rubber for the second quarter of 1944 at 209,000 long tons, or at the rate of 836,000 long tons a year. During the first half of the year the figure was 376,000. The programme has been so successfully completed that some facilities have even been lent to provide extra quantities of high octane petrol required for the invasion. Unfortunately the transfer of the functions of the Rubber agency to the War Production Board does not mean an unlimited supply of tyres. The goal for passenger tyres, which is 22 million this year, probably will be met, but this is hardly plenty in view of the state to which the public's tyres have been reduced in the last two years. The serious shortage, however, is in heavy duty truck and bus, airplane and tractor tyres, for which female labour is not suited. The bottleneck here is one of manpower in the manufacturing plants; and in a report issued on July 25th by the Rubber Director's Office a somewhat acid reference is made to the fact that less than 6,000 additional workers—only half needing to be "strong husky men"—stand between the present shortage of essential civilian tyres and the ability to meet all real needs. The reader is pointedly reminded that, by Presidential directive, the responsibility lies with the War Manpower Commission.

250th Birthday of the BANK OF ENGLAND

SIR JOHN CLAPHAM

has written, at the request of the Bank, for its 250th birthday,

The Bank of England, 1694-1914
A History

All its surviving books and papers were thrown open to the author and he has had full supporting help from the whole staff. The history of the Bank during 1914-18 cannot be written just yet but an Epilogue—"The Bank as it is"—rounds off the book for the time being.

THE WORLD OVERSEAS

Secondary Industries in West Africa

(From Our Accra Correspondent)

Accra, July 1st

THE four West African colonies are dependent for the purchase of imports on the export of a few crops. They are economically backward and by themselves, without a long-term policy of assistance and preferential treatment from outside they cannot hope to be more than a source of supply for cocoa and the fats for making soap, margarine and so on for the wealthier communities of the world.

The fortunes of cocoa, on which the Gold Coast export market is almost entirely, and Nigeria partially, dependent, have emphasised in the inter-war years the economic and social instability of dependence on one or two export crops. The gradual political awakening and natural desire in the African people for a measure of economic independence has, particularly since the Nowell Commission's report on cocoa in 1937, come into alignment with the view of the colonial governments that a balanced economy is worth striving for on fiscal and political grounds—and with the view of the large commercial firms trading on "The Coast" that West Africa yields a larger profit margin as a market than as a source of supplies for Europe and America.

Hence, perhaps for the first time, African opinion, the Government and big business are all agreed on a major point of economic policy—the need to increase purchasing power in West Africa. One of the means to this end is again agreed in principle—the establishment of secondary industries.

It is perhaps unfortunate that the realisation of this mutual agreement has coincided with the growth of ephemeral industries during wartime. Shipping has been rationed and the volume of imports drastically limited. With a shortage of consumer and capital goods there has, at the same time, been a great increase in demand, owing to the presence of troops in large numbers. Small firms and village groups making soap, perfumes, preparing fruit juices, marketing garden vegetables, and reconditioning machines have sprung up. Some are efficient firms, many are not. All have benefited from the protected market which war conditions have brought, but many are destined to become uneconomic as soon as normal conditions return.

The Conditions of Progress

It will therefore be against a background of disillusionment, and perhaps even of distrust in certain areas, that West Africa's industrial development must take place. While it is true that small industries can only be developed if there are the raw materials and a policy which takes location into careful consideration the claims of these factors and of the nearness of markets, this is not the whole of the problem. There has to be considered the African himself; the capital outlay involved in tropical industrial development; and the implications of policy in Britain after the war.

CANADA

The remarkable development of Canada presents opportunity for post-war trade extension. Explore now. Canada's oldest bank welcomes enquiries.

Main London Office:

BANK OF MONTREAL

47 Threadneedle St., E.C.2

Assets exceed - \$1,300,000,000

Incorporated in Canada in 1817 with Limited Liability

African labour is not cheap. The wage rate for an unskilled labourer in an urban area of the Gold Coast is 1s. 10d. per day (1s. 6d. plus 4d. cost of living bonus). Skilled workers, such as masons, carpenters and blacksmiths in the same areas, will earn from 4s. 6d. to 6s. per day. Although wages, particularly for unskilled workers, are low the labour costs of production are high, by reason of the low productivity per head. From what limited statistics are available, it would appear that this could be offset by the use of machinery only in the long period. In the unskilled category labour is mobile, but takes a long time to learn even an unskilled repetitive job.

Stamina of body and concentration of mind are both weakened by bad diet, low real wages and prevalence of disease among workers. Labourers work hard only under supervision, and initiative is uncommon. The effect of all this is to raise labour costs above the corresponding costs in Europe. For this reason, costs in small local industries will probably be high at the start and firms will rely for their market on local patriotism, novelty and on improved simple marketing methods in many cases organised on co-operative lines. Costs will fall as the unskilled labour becomes accustomed to the job over a period of anything up to four years (given adequate supervision by Europeans). In larger industries where machinery can be introduced, costs may fall fairly quickly (again under European supervision) to a level which is economic for the local market, thanks to the shipping costs from Britain and South Africa. It should be one of the points of post-war development policy to conduct experiments into the effect of the introduction of machinery on costs and the effect it may have on the degree of European supervision necessary to establish industries capable of competing at home and abroad. Generalisations based on experience in East and South Africa should not be taken unreservedly without a careful scrutiny of local conditions.

The establishment of an industrial unit on "The Coast," especially if it has to be near its raw materials (such as with bricks, tiles and other branches of the heavy clay industry which has possibilities in these colonies) involves much more than setting up plant. Roads may have to be built, swamps drained, water piped for miles. Road maintenance alone is a costly item. Even a modest programme of industrial development is therefore to be undertaken only as a long-term policy. It is not a question of thousands of pounds, but of millions.

The absence as yet of any considerable African managerial class in West Africa and lack of foreknowledge of the vagaries of African capital investment make it appear likely that development will be started by European or Government capital and supervision. In this way, in time, local business men can be taught the importance of maintained standards of quality, business efficiency and a brand of commercial ethics somewhat removed from the traditional "ethic" of "The Coast," which dies hard among the Africans. But unless machinery is quickly created which can foster the coming-of-age of the African entrepreneur, the cry will inevitably go up that our colonial "trusteeship" aims still at keeping the African as a hewer of wood and a drawer of water.

Colonial Policy

In view of all these problems it would appear that industrialisation will come first in those branches where there is only little competition with imported articles. Costs are likely to be much too high in the early stages of development for local enterprise to compete with the highly specialised industries of Europe and America. But if this is so, then there is great urgency to develop this narrower field quickly. A beginning has been made in the Gold Coast by the West African Institute with the production of bricks,

tiles and pottery, and the Governments of the four colonies are said to be interested in applying the lessons learned there in the light and heavy clay industries to their own local conditions.

The expansion in the consumer goods market in the large towns on the coastal fringe, because of the presence of troops and the unskilled workmen attracted there by the labour requirements of Service contracts, has already passed the peak. But it has lasted long enough for the people in these towns to have become accustomed to boom conditions. They are the politically vocal section. They will judge a policy of industrial expansion and interpret the motives of those responsible according to two criteria: the employment given by the industries developed; and the openings made available in responsible positions for educated Africans.

Any programme of expansion which goes beyond fostering purely localised cottage industries and crafts will require financial aid (say, from the Colonial Development and Welfare Fund) as a long period economic and social investment. Where it may meet the competition of imported articles, especially in textiles, it will have to be fitted in with the post-war economic policy of the Empire as a whole. Such are some of the ramifications of "trusteeship."

Canadian Oil and US Policy

MR CRERAR, Canada's Minister of Mines and Resources, has informed the Canadian House of Commons that the United States Government has modified its original plans for the search for and development of oil resources in North-Western Canada. The Canol Project, completed in May after two years of construction, will be kept on; but the US Government has disinterested itself from the search for an additional 15,000 to 20,000 barrels of oil daily from deposits in Yukon and in the Canadian North-West Territories.

The Canol Project, which included the development of oilfields near Fort Norman, the construction of a pipe-line from the Norman Wells to Whitehorse, and the erection of a refinery at Whitehorse, is providing 3,000 barrels of crude oil per day, or, rather, their equivalent in refined products—for the Alaskan Highway services. This quantity, however, meets only a minor part of local requirements, and it was not unreasonable for the Canol Project to be supplemented by a wider plan designed to secure additional oil supplies from local sources amounting to five to seven times the capacity of the Canol installations.

There are two important reasons why the United States Government has dropped this supplementary scheme. First, the strategic position in the North Pacific has changed. There is no longer the menace of a Japanese invasion of the North West corner of the American mainland; and, the tanker shipping route from the United States to North-West Canada and Alaska has become much safer. Secondly, the cost of developing the oil resources of North-West Canada at this stage of the war is from every point of view—finance, manpower and materials—too high.

The discontinuance of the US plans does not mean that the undeveloped oil resources of North-West Canada are not worth attention. In fact, the Canadian Government has already prepared plans for the development, after the war, of the natural resources of the newly opened territories of North-West Canada in which the oil resources play a very prominent part.

Military v. Civilian Views

The American Government's withdrawal from the additional Canadian oil development plans, however, is of far greater than regional importance. This is the first indication that US military oil policy has suffered a reverse. The Canol Project was designed exclusively by the Service departments without consultation with the Government's civilian oil authorities and experts. As the investigation of the Truman Committee into the project at the turn of last year revealed, the United States Petroleum Administration for War and other interested US Government agencies heard of the initiation of the scheme only through outside gossip.

As late as last December, when the construction of Canol was approaching completion, the Petroleum Administrator for War, the chairman of the War Production Board and the Secretary for the Navy demanded its stoppage because

the value of the scheme would not be worth the additional cost. Even General Somervell, who had given the order for the execution of the scheme, testified before the Truman Committee late last year that he would not have given his order if he had foreseen the difficulties of the project and especially the time its completion would require.

On the basis of its Canol investigation the Truman Committee recommended in its report that, in future, all United States oil projects in foreign countries, including purely military ones, should be carried out after consultation with, and at the direction of the Petroleum Administrator for War, a civilian authority. The discontinuance of the additional US oil development scheme in north-west Canada appears to be the first practical result of this recommendation. The experience gained in connection with the Canol Project will probably ensure that economic and practical considerations will henceforth play a greater part in the development of US military oil projects and plans.

Germany at War

Last Ditch

THE conspiracy of German generals and officers was officially ended a few hours after it began. No really convincing explanation has come from official Nazi sources. On the face of it, the crisis and the source of the plot were confined to military circles; but the results will affect the entire Nazi regime and its administration.

The totalitarian Nazi regime presents at the moment a paradoxical situation. The military situation is extremely fluid and dangerous. Economic resources and manufacturing capacities are hopelessly inferior. But the regime itself is striving to move an even greater concentration of all the resources and human energies of Germany and the occupied countries.

The conspiracy of the generals and officers was obviously ill-conceived and badly prepared. It was met with strong counter measures, which seemed to reveal the curious strength of a totalitarian administration, mainly based on the political *apathy* of the great masses of the people including the once all-powerful industrialists and financiers.

Faced by certain military defeat, prolonged destruction and unending sacrifices, the German people show no signs yet of being able (or willing) to take the road to rebellion. The mass of the soldiers go on fighting, in spite of the obvious crisis of the military machine.

Two facts are outstanding at the end of the fifth year of the war. Germany's economic and manpower resources have been stretched to their utmost limits. In the East, almost all the conquests have been lost. Italy has practically been out of the war for nearly twelve months. In the West, Allied armies are again on French soil. By all ordinary reckoning, the end is not only inevitable but near. Under these conditions the regime attempts yet again a "total mobilisation." Where are these later-than-last reserves to come from?

Unfortunately very little is known about ordinary life in Germany. The actual extent of agricultural and industrial activity can no longer be even guessed at—except that it has greatly declined. Total losses in human life during five years of war are a complete secret. Large towns are in ruins. The industrial population, including millions of foreign workers and prisoners of war, has become, perhaps, the most mobile population in the whole world.

As each new stage in the war forced the regime to exact a greater effort from the German people and from the people of the occupied countries, some new bureaucratic department grew up—and some parts of the population were withdrawn from work connected with the war effort. It has been apparent for some time that the growing bureaucracy, and the fact that people could withdraw with some ease from war work because of bombing, were the greatest sources of anxiety for the leading Nazis. If this process were to go on unchecked, it would have produced utter exhaustion. Political apathy would produce complete apathy in agricultural and industrial activity as well, which mean

an early defeat of the regime. This was the situation when the invasion began.

After the abortive conspiracy within the Wehrmacht, it can be said in retrospect, that the leading Nazis in a confused manner realised this danger and its opportunities. The danger was of complete apathy. The chance was to make use of these reserves accumulated by the swollen bureaucracy and by withdrawals from work for a new drive for total mobilisation.

The problem can be stated, from the Nazi point of view, in simple terms. Sufficient numbers of men must be found for the fighting fronts. These, fully or partly trained, can be found among the home establishments of the Wehrmacht. But the empty depots and training establishments must be filled up with new men. All this must be done, not in months, but in weeks. So the second or third "total mobilisation" begins.

The greatest single source of new manpower for the Wehrmacht and for war factories is the civil, the economic and the military administration, the number of civil servants in central, regional and local administrations, totalling several millions. In addition, those who have wandered away from work can, in part, be brought back to duty. A drastic comb-out of the bureaucracy announced by Dr Goebbels, and officially termed "the reduction of public services to the barest minimum," may yield appreciable numbers of soldiers and war workers. To do this is obviously to run a great risk. It will endanger, perhaps at once, but certainly in the long run, the complex system of public health services and the running of the rationing system, as well as local and regional administration. So far the totalitarian regime has been bound up with a large and privileged administration. The present total mobilisation will only achieve some measure of success if the numbers of bureaucrats are reduced and their privileges taken away.

The war material and equipment of the home establishments of the Army are now to be sent to the fronts. The ruthless depletion of depots and warehouses will yield results for a time. But the certainty of being short of materials in the winter may have caused serious dissension among the generals and the politicians.

There is no doubt that this risk is now being taken by the Nazis in order to stave off military defeat this summer and autumn. After this supreme effort, the Nazis will still be faced with continuing the war. Their second hope is that by a systematic reduction of the entire population to the standard of the bombed-out people, new resources may be secured for maintaining war production during the winter.

From an industrial point of view, Germany's war industry, under the pressure of large-scale bombing, has by now been extremely simplified. The "meccano" system has been widely applied, not only in building, but also in manufacturing. Factory plants and halls are entirely prefabricated. The piece of work that is to be machined is kept in a standardised fixture and is moved in this fixture from one machine tool to another. Large numbers of unskilled workers can be employed. Factories and machine tools have been made highly mobile.

Most important, and most grim, the working population is now no longer bound by the ties of a secure home. An extremely large number of homes have been destroyed. Families have been separated for years. Women have been relieved of the care of their children. There is practically no obstacle to moving large numbers of workers at a moment's notice. If figures published in Germany still have any meaning it can be said that the great majority of the German and foreign workers employed in industries are fed by central kitchens and works canteens, and that a very high percentage are housed in huts arranged in large camps close to gigantic factories constructed in the open country.

The extractive industries cannot be moved. The mining and steel industries are still at their former places. Here is, perhaps, the greatest danger to Germany's war industry, particularly in the East, where Russian armies are only 150 miles away from the Upper Silesian coal and steel and chemical industries.

This is the situation that confronts the Nazi regime at this moment. The future capacity to make war is being risked in order to stabilise the front in the East and to prevent an Allied break-through in France.

PRODUCTION FOR VICTORY

Daimler Armoured Cars—with their famous Fluid Flywheel Transmission—which helped to chase the Hun from Alamein to Cape Bon, from Sicily to Rome, are now in the thick of the Normandy fighting. What a testing for the peacetime Daimler to come!

THE BUSINESS WORLD

Electricity Shares

BEFORE the war, a good electricity share ranked in the investment scale only a little lower than a bank share. Both "industries" were "utilities" and both were proverbial for their conservative internal finance and the rock-like stability of their dividends. Parallelism went even further; for in the 1930s the continuous expansion in the national currency and credit which found expression in the banks' figures was matched, in the electricity companies' accounts, by the results of the rapid electrification of Great Britain, in which the completion of the grid system of bulk transmission played a considerable part. Between 1932 and 1939 the current generated by British supply undertakings was doubled, but as the industry adopted a policy of passing on the resulting economies to consumers, and as statutory control of charges and dividends was in force over a large part of the retail selling side, payments to shareholders increased only slowly, if at all. In fact, the industry's earning power had the ideal "backing" of a constantly expanding market rather than the lure of increasing dividends, and the low characteristic yield on electricity shares attested their established popularity with the most conservative type of equity investor.

On the outbreak of war—indeed, for some months earlier—the market for electricity shares proved vulnerable to vague but widely held fears of the physical effects of enemy air bombardment on the companies' properties. Although, in fact, the more vulnerable plants were geographically better spread over the country than their counterparts in many other industries, the whole trend of the preceding twenty years was towards increasing concentration of electricity generation on a relatively limited number of large and efficient plants which, on the face of things, seemed to offer excellent enemy targets. As the war went on, however—and particularly after the fall of France and the Battle of Britain—it was seen that, for a large number of companies, these fears were exaggerated, and electricity shares have joined in the strong recovery movement which has now carried ordinary share prices as a whole, not merely above immediate pre-war levels, but near the highest point reached in the active markets of 1936/37.

To this general statement, however, there are two exceptions to make, both of which have direct significance for investors at the present time. In the first place, while electricity holding companies have been allowed to publish regular annual accounts throughout the war, an official Egyptian darkness has descended on the results of all operating companies, which, for security reasons, have been unable to publish any profit and loss or balance-sheet figures since 1939/40. Interested shareholders, it is true, have been able to consult contemporary records at their companies'

offices, but that facility has not been open to intending purchasers, who have merely had to try to put two and two together and form their own opinion, from general indications, of what has been happening. In the second place, the general impression that the enemy has tended, throughout the war, to single out the London area as a Number 1 target for Luftwaffe and V1 bombing, has produced a disposition among investors to discriminate between the London companies (and possibly those of the Home Counties) and all the others. In the absence of firm facts and figures, it has been impossible to obtain any check on the accuracy or otherwise of the conclusions on which this tendency is founded. Today, however, when the war appears to have reached a point at which post-war recovery considerations are the only really relevant factor in a revaluation of electricity shares, it seems worth while pausing to ask how far the present differentiation in prices, to the disadvantage of the equities of companies in the Greater London area, is really justifiable.

The table at the foot of this page shows clearly the extent of the differential and epitomises some of the ostensible evidence for its existence. The companies included in the table are a representative group of supply, distribution and holding companies in the London area and some of the largest and best known concerns in the more important provincial areas. In every case, the present market price of the ordinary shares is contrasted with the highest and lowest prices recorded during the three years, 1937 to 1939. Without exception, there has been an impressive and gratifying recovery from the levels to which prices were driven down by exaggerated doubts and fears in the first few months of the war, before any enemy bombing had actually taken place. When comparison is made, however, between share prices today and at the highest levels of the three years before the war, a striking discrepancy is revealed between the experience of shareholders of the London and provincial concerns. Broadly speaking, "London" shares are still standing at only 70 to 80 per cent of their best pre-war level. The "provincial" shares are, however, very nearly back at their 1937 peak prices; the proportions run from 90 per cent to over 100 per cent of the pre-war "highs," apart from Edmundsons, where comparison is vitiated by a 50 per cent share bonus made in 1938. Allowing for that, Edmundsons shares are not slightly above their pre-war highest price.

Now, it is clear that investors have not been discouraged from buying and holding any electricity shares owing to

THE ECONOMIST, August 5, 1944

the absence of regular published figures of wartime financial progress. Of the seven "provincial" companies shown in the table, four have not been allowed to issue accounts since 1940, but their shares to-day command virtually as high a price as ever they did in time of peace. They have, in fact, exactly followed the trend of equity prices as a whole. The "London" shares, equally clearly, have not done so. To bring them into line, in that respect, would require a further rise, from current price levels, of 25 per cent to 33 per cent—which is quite a significant quantity.

What is the explanation? It is not really hard to perceive. The "provincial" companies have fully maintained their pre-war rates of dividend; the "London" companies, with one exception, have not. In default of the usual balance-sheet evidence, the market has been content to take dividend policy as the best available index of actual earning power. On this, the evidence seems conclusive. At current prices, and on current dividends, yields on "London" and "provincial" shares are virtually identical at $3\frac{1}{2}$ to 4 per cent, with a very slight bias, possibly, in favour of the "London" shares. The only exception to the rule occurs in the case of a company which has stated that its current dividends are being paid in part from reserve.

The implications of all this appear to go some way to suggest that "London" electricity company shares, as a group, may well offer one of the few examples of serious under-valuation of recovery possibilities remaining in the under-valuation of equity share market today. Admittedly, investors do not know how far the dividend reductions made by these companies have been due to the direct effect of enemy bombardment of their properties and how far to the falling off in general demand for electricity following the wartime shift of population from London. The distinction is important in one sense at least; for the industry itself will have to bear one-half of the cost of war damage, and how the incidence of the burden will fall on individual companies is not quite clear. In any case, the more extensive the physical reconstruction necessary after the war, the longer the rehabilitation of earning power will be delayed. But it is generally believed that knowledge of the extent of physical loss which the industry has suffered through hostile action would comfort investors a great deal more than the enemy. Is it, then, suggested that, after the war, the London area will be appreciably less well populated or prosperous than before the war, or that its future demand for electricity is likely to grow at a lower rate than that of Great Britain generally? The answer is

certainly in the negative. Wise planning may help to limit any sprawling, formless growth of Greater London, on lines which many criticised but no one could stop before the war. But it seems entirely safe to say that there will be few areas of the country where electricity companies can be expected to work in a more favourable environment than in Greater London.

Politically, of course, electricity may rank high in the list of public utilities likely to come under a closer measure of state control after the war. The industry itself has not provided an altogether impressive example of internal unity in approaching the problem of its own future organisation. But political risks, as such, apply to the industry generally, not to specified geographical areas of operation. The differentiation, if any, is between, say, the efficient and relatively well-organised generating side and the distribution side, or, alternatively, between companies whose rights may be liable to fall in and be taken over by municipalities and those whose tenure is more assured. In the latter respect, the position of the "London" concerns is more rather than less favourable than that of many others. Under an Act of 1925, their tenure has been assured until 1971, and although the "life" of their shares, in their present form, is thus limited, their legal position is, *pro tanto*, all the stronger if the worst (from the shareholders' point of view) should happen. With approximately two-thirds of the industry already under municipal control, the "London" concerns account for the larger part of the capital and sales of all companies in the country, which makes the anomaly in their present market capitalisation all the more striking.

All in all, it is difficult to discover any rational explanation why "London" electricity shares should be the only group of "recovery" equities, enjoying high pre-war investment status, which can now be bought to offer a yield approaching 5 per cent on pre-war dividends which have more than a reasonable prospect of restoration when the war is over. If the "provincial" shares are rightly priced, the "London" shares are too low. If the present valuation of the "London" issues is justified, then the "provincials" are standing about 20 per cent too high. But acceptance of the latter view would challenge the entire current basis of ordinary share prices. The present average yield on all the ordinary shares in the *Financial News* Index, at 3.61 per cent, is actually lower than the average of 3.89 per cent for the seven "provincial" electricity shares shown in the table attached to this article. The conclusion seems self-evident.

The Entry into Industry

ONE of the greatest tragedies of British industry during the period between the two wars was the existence of an army of unemployed young workers. Boys and girls, who went out to earn their living at fourteen, often found themselves "too old at eighteen," and discarded in favour of a new and cheaper generation of school-leavers. In 1931, as many as 215,000 young people between 18 and 20 were out of work. The International Labour Office in a report on the problems of vocational guidance (1935) condemned the pernicious effects of placing juveniles in employment which, by its nature, cannot last for more than 2-3 years at the most, and then leaves the young person stranded with no training for any adult occupation.

It is a very encouraging sign for the future that there should to-day be a complete unanimity of opinion between Government industrialists, trade unionists and educationists that blind-alley work must be eliminated and opportunities for training and advancement provided for young entrants to industry. The Ministry of Labour's committee on juvenile recruitment and training, set up in 1942 as a sub-committee of its Joint Consultative Committee of employers and trade unionists, has circulated a questionnaire to over 150 different industries, in order to find out the views of employers and trade unions on the subject. Many industries have already prepared their plans for juvenile recruitment and training. The scheme for training building labour, produced by the Central Council for Works and Buildings in March, 1943, provides an admirable pattern for other industries. The Forster Committee's recommendations for training youths in the mines have been put into operation (as described in an article in *The Economist* of February 12th). The cotton industry has launched a scheme for attracting young workers. The flour milling, boot and shoe, pottery and printing in-

dustries have already replied to the Ministry of Labour circular. And last week a special conference of engineering apprentices was called by the Amalgamated Engineering Union, in order to find out the views of the young workers themselves.

The widespread concern now felt about the problems of juvenile recruitment is not altogether disinterested. It is, if anything, a case of self-preservation. With the decline in the birth-rate, juvenile labour may before long become scarce, and not superfluous. Every industry may, to a certain extent, compete with others for a share of the shrinking supply. In 1937 there were over 3½ million adolescents between 14 and 18. To-day the number is only 2½ million. By 1956, it is estimated, it will be 2½ million. If the school-leaving age has by then been raised to sixteen, the number of juveniles available for employment will be approximately half the

present number. These are not very palatable facts, but industry must face them. It will have to use juvenile labour more economically and not regard it as a source of "cheap labour." It may mean that many jobs formerly assigned to boys will have to be done at the other end of the age scale, by older men and women. Already, newspaper selling provides an example of this trend. The "nipper" in the London streets has disappeared and papers are sold by old men.

Nationally, the problem in the future may be one of distributing the available supply of young labour between competing occupations. Industries, such as mining and cotton, would seem to stand a poor chance, other things being equal, against the more attractive employment offered by aircraft and motor manufacture, or general engineering, since most boys, given a free field, would probably choose to be mechanics. The older industries, which suffered so acutely from shortage of juvenile recruitment in recent years, will have to make their conditions of work and welfare more attractive, and to offer prospects of stable employment and advancement before young workers will, of their own volition, enter them.

It may, therefore, be necessary to devise some form of controlling entry into industry, so long as this can be done without infringing the essential right of an individual to select an occupation or career. Guidance could probably be exercised in a negative way, such as is proposed for the location of industry. Thus if an occupation, like an area, became too congested, the Government might have to say that entry, for the time being, was restricted. In any case, it is essential that the Ministry of Labour should have full knowledge of the jobs and prospects in any given occupation, in any given area. Such a survey, which should be continuous, could feature in the national man-power budget.

Positive influence over recruitment could be exercised through the development of vocational guidance. At present, this is done either through the Ministry of Labour's Juvenile Advisory Committees or the Juvenile Employment Committees under the local education authorities. Before the war, only about one child in three was placed by the committees, the remainder more or less drifted into industry without any form of advice or guidance. The use of psychology in vocational guidance could well be developed. Though Britain was a pioneer in evolving a juvenile employment service, it has lagged behind other countries, notably the United States, in applying psychological and aptitude tests. It is also essential that the committees should keep in close touch with the juveniles they place, and give them an opportunity, at 17 or 18, of reviewing their position and, if they wish, changing their jobs.

Once the occupation has been selected, the question of training and continued education becomes all-important and the juvenile advisory committees should satisfy themselves that adequate training facilities are provided before placing juveniles in employment. It is generally agreed that the existing provisions for technical education and training in Britain are inadequate. Before the war, less than a third of the adolescent working population was engaged in organised education of one form or another. This state of affairs will, of course, be remedied under the Education Bill, which provides for compulsory continued education during normal working hours, up to the age of eighteen. The White Paper on Educational Reconstruction acknowledged that

despite what many local education authorities have done,

technical education has not hitherto made that advance which the needs of a highly industrialised community demand.

The standard of buildings and equipment has often been, as the White Paper admitted, "deplorably low"; the size of classes too big—and the quality of instruction, owing to the shortage of competent instructors, not always high. There has, moreover, been a certain element of snobbery in the approach towards technical education, and a widespread impression that the white-collar office worker was inherently superior to the worker at the factory bench.

Many improvements have been made during the war. Training has been provided at Government Training Centres as well as at Technical Colleges and institutions. The number of Junior Technical Schools alone has increased from 230 in 1938 to 379 at the present time. The bulk of training, however, is still given in industry. Many individual firms have long operated excellent training schemes, such as those run in conjunction with the local authorities at Birmingham, Coventry and at Rugby, where attendance at day continuation schools is compulsory. Other firms, faced with an influx of dilutees, have had to evolve training schemes. But as a whole, the training for industry, provided by industry, is defective. A letter from representative employers and trade unionists in the *Times* of April 12th went so far as to say that

In our public provision for training craftsmen, England is now definitely a backward country.

This, of course, refers to the training of skilled workers. But training of one kind or another can also be given to unskilled or semi-skilled workers. Even traditional blind-alley jobs, combined with continued education, can be regarded as short cut jobs, which come to an end when the youth is old enough to take up an adult occupation. To give a list of firms providing training systems would merely be tedious, but from the experience of such firms as Messrs Cadburys, Sainsburys, Fords, and Dunlops and the Gas, Light and Coke Company, which operate schemes, it appears that even menial or repetitive jobs, combined with education, need not lead to a deadening of the individual.

For the more skilled jobs, requiring apprenticeship, the engineering industry is now considering a joint scheme (mentioned in *The Economist* last week, p. 162), though no final agreement has been reached. It is proposed that the present apprenticeship period of five years, from 16 to 21, should be continued, but that instead of a boy being indentured to a particular employer, the placing of apprentices should be controlled by local joint industrial juvenile advisory panels, which would supervise standards of employment and training. Boys would not be apprenticed to employers who did not conform with the requisite standards. Apprentices, it is suggested, should learn a wider range of processes, and the boys would not become too specialist. For example, pattern maker apprentices would learn about foundry work and vice versa, while fitters should acquire drawing office experience and so on. Technical training would be integrated with general education on the lines proposed in the Education Bill.

The emphasis on the need for an all-round training is very welcome. It should go far to break down some of the older craft demarcations, which hamper flexibility of labour and may well impede the realisation of a policy for full employment. Indeed, if mass production methods are widely developed, as for instance in shipbuilding, many of the processes requiring most specialist craftsmanship will disappear. As to the quality of training provided in the workshop, it is essential that it should be given in adequately equipped workshops, under competent instructors and that the apprentices should as far as possible be engaged on actual production work. A further necessary condition is that opportunities should be provided for training for foremanship grades or positions of responsibility in the works. The suggestion of Mr George Wansbrough in the *Times* of May 15th that the present Ordinary National Certificate and the courses leading up to them should be scrapped in favour of a simplified and more general grounding in all the aspects of engineering, deserves careful consideration.

The whole field of technical education and training is too vast for treatment in a single article. But the issue is of such overwhelming importance for the future of British industry that the time is surely ripe, to adopt the suggestion that has been put forward that a special Commission should be appointed forthwith to examine the whole question.

Business Notes

Portal Bungalows

The Portal bungalow came in for considerable criticism on the occasion of the second reading of the Housing (Temporary Accommodation) Bill in the House of Commons on Tuesday. The criticism impressed the Government so much that the debate was adjourned until after the coming recess. One objection was that the bungalow is not good enough, that it is small and unsightly. There may well be room for further improvements in detail and, possibly, a case for its construction in, say, two sizes—a three-bedroom type as well as a two-bedroom type, with precisely the same components. But to make several different kinds of houses would sacrifice much of the advantage of speed in mass production; and the fact that the Portal model is not as good and attractive as a normal house evades the issue. It is designed as a stop-gap to relieve a pressing housing shortage in the shortest possible time. It is not meant to be the equivalent of an ordinary house, the point being that it will not be possible to produce ordinary houses anything like quickly enough. Mr Willink, Minister of Health, was able to show conclusively that the choice was not between factory-made bungalows and an equal number of ordinary houses, but between a given number of new houses—about 300,000 ordinary houses and 250,000 factory-made ones in two years—and a very much smaller number of houses than 550,000. Neither the labour nor the materials are likely to be available for the construction of anything like that number of ordinary houses within two years of the end of the war.

The second criticism concerned the cost of the Portal bungalow and the system of contracting to be adopted. The bungalows are estimated to cost about £600 a unit. Trans-bungalows are estimated to cost about £100, the kitchen unit is port and erection will cost about £100, the kitchen unit is likely to cost an equal amount, and the remaining £400 will be for the "shell," roof, ceilings, partitions, lining materials, floors, insulation material and other fittings. At least five firms will take part in the construction of the bungalow. Briggs Motor Bodies and the Pressed Steel Company are to provide the bulk of the "shells" and the partitions; Fisher and Ludlow, Sankey-Sheldon, and Rubery Owen will be among the main contractors for fittings. All these firms are large ones, capable of handling big orders; moreover, all of them are Government contractors and possess efficient costing systems. The Government will be able to deal with them on the same basis as it places munition contracts. Nevertheless, members of the House of Commons were right in insisting on the need for securing the lowest possible costs at all stages of production, from the raw material to final assembly—where possible, by tender. To secure this, it is not enough for the Government to have access to the costs of its contractors; it should also provide the incentives that will induce contractors to adopt the most economical methods. The Portal bungalow will provide the Government with an opportunity of leading a drive for the reduction of the cost of a commodity that is in universal consumption and absorbs a high proportion of the incomes of the working classes. Mr Eden was probably wise not to press the House for a decision on Tuesday.

Equities after the War

The latter part of last week witnessed the first real relapse in British industrial equities since early June. Slight setbacks prior to that date had occurred on Fridays and had been followed by an immediate resumption of the rise, but on this occasion markets have appeared definitely hesitant for some days and it seems possible that the upward movement, which has been running steadily since around Easter, has more or less exhausted itself. The figures of *The Actuaries' Investment Index*, of which some particulars are given on page 200, show an average for all industrial equities of 86.7 per cent of the level at the end of 1928. The range in the items making up this total is from 171.9 for electrical equipment and 156.1 for breweries and distilleries to 53.9 for cotton and only 29.0 for shipping. The index suffers from a substantial weakness in that it is based on

the prices of one date only and that not a particularly representative one. It is, perhaps, more useful to take a rather more recent computation. In August, 1936, the total index was the same as it now is, but for a rather different selection of shares. Further, the value was about or rather above that figure for the ensuing eight months. Is it reasonable that the general level of securities should be the same on the eve of the post-war period as it was in 1936-37? Trade was admittedly brisk then, but unemployment was still of the order of 1,660,000, while the wholesale price index of the Board of Trade shows a rise of some 78 per cent since 1936-37. In other words, granted a successful policy of employment and an absence of restrictionist finance, the outlook is for a very much higher money national income in, say, 1945-50 than there was any reason to expect in 1936-37. It is also the fact that the authorities appear, at last, to be alive to the necessity of a fiscal policy which will encourage efficiency in industry and they have already made concessions in the matter of research and replacement costs. There will certainly be further pressure for relief from taxation, both on retained profits made at home and on foreign-earned profits already subjected to tax. Against this, there is the fear felt in some quarters that some limitation of dividends has come to stay. The extent of this limitation is, probably, the decisive factor for the near future.

Eight Year Changes

It is possible to conclude from these changes in the situation that post-war earnings of British industry, in terms of money, will be very much higher than those expected in 1936-37; that there should be a substantial increase in real terms, but that equity holders will reap the advantages only in part in larger dividends in the near future. Some part may well not accrue to them at all and some will accrue in the form of greater stability of earnings and prices. It is difficult to say just how these facts will influence prices and the yields expected. At the end of last month, while the price index was the same as some eight years before, the average yield given was 4.08 per cent compared with 3.64 per cent in August 1936. Of this rise about half may be regarded as the counterpart of a rise in the yield on 2½ Consols from 2.96 to 3.16 per cent. A substantial part of the remainder may be due to changes in the composition of the index, a part is certainly due to the ridiculously low yield given at that time by home railway stocks and shipping shares, namely 1.51 and 0.77 per cent respectively. There remains, however, a margin, possibly considerable, which would only be justified if the outlook now is less certain than it was then. Returning to the price index, of the fourteen classes which then existed, ten show rises, but only four of these are really substantial; shipping 61.8 per cent, cotton 26.5, oil shares—not strictly British industry—22.3, and electrical equipment 15.7 per cent. The least of the four falls is 7.5 per cent for motors, while iron and steel and electrical distribution are slightly worse, and gas stocks have lost 21.5 per cent of their August 1936 value. It is interesting that the very important miscellaneous group, stores and catering and home railways, all show only very minor improvements on the period of almost eight years. In the case of building materials, the rise is only 10.8 per cent since 1928 and 5.8 per cent since 1936; while the figures for coal are only a trifle less in each case. These facts suggest that, subject to a reasonably happy solution of Britain's internal problems and a recognition that the reward of risk bearing must be considerable, there is room both for further adjustments between the different classes of security in this index and for a continuance of the upward movement, after a pause for such adjustments.

New Savings Bond Issue

After a lapse of some 27 months, during which £966,450,000 odd have been issued, the Chancellor of the Exchequer has decided to suspend the offer of 3 per cent Savings Bonds, 1960-70, from August 5th. On Tuesday, a new issue of bonds, 1965-75, with a final maturity date of

**BUY 3%
SAVINGS
BONDS** 1960

- ★ May be sold quickly through your Savings Bank

August 15, 1975, will be on offer at par. As the Chancellor rightly pointed out, these new terms are even more favourable to the borrower than the old ones. The maximum life of the 1955-65 issue, when it was first made at the end of December, 1940, was some 25 years 7½ months; that of the 1960-70 in April, 1942, 28 years 4 months, and the life of the new series is just over 31 years to final redemption. It is interesting to observe that the yield on 2½ per cent Consols fell from 3.26 per cent in December, 1940, to 3.04 per cent in April, 1942, but has since risen to 3.16 per cent. That the authorities should be able to borrow at the same rate for a longer period now than in April, 1942, is due mainly to the fact that TDRs are encashable in advance only by conversion into one or other of the tap issues. If proof were needed of this, it is provided by the fact that the old 1960-70 series, recently quoted ex dividend, was frozen hard at the minimum price of par. If previous experience is any guide, the minimum for this will be dropped to 98 on Tuesday and an effort will be made to get business going at close under par. The fact that the 1955-65 issue, also recently ex dividend, stands at par indicates that some official assistance is likely to be necessary before conditions are such as to render the new issue attractive to any but holders of redundant TDRs. The belief that such assistance will inevitably be forthcoming explains the modest rise in some prices in the gilt-edged market on the announcement. The opportunity will arise in the next few weeks of dealing with the 1952-54 issue of National War Bonds, of which two series have now been issued. The two combined raise the total to a figure at which it may be considered that a change of date is desirable, but it is still far short of the total reached by the 1949-51 series.

Responsibility for Civil Aviation

In its proposals for civil aviation, the Tory Reform Committee presses for two decisions that could be taken without prejudice to international negotiations to give this country a flying start at the end of the war. The Committee, in common with other critics of pre-war and present arrangements, does not wish civil aviation to share the same roof with military aviation at the Air Ministry. It would like it to be placed, together with other means of transport, in an all-embracing Ministry of Transport with the status of a major department of state. Failing this solution, it would like civil aviation to go wherever shipping will go, possibly even to the Board of Trade. There are good arguments for and against the present regime of combining responsibility for both military and civil aviation in a single department. In wartime those for single control are probably unanswerable; almost all current traffic is military. Even after the war military aviation and air transport will remain much more closely associated than the Navy and merchant shipping; quantitatively, it is on the military demand that the aircraft industry, which supplies both, has depended, and will depend, for its existence. Nevertheless, it has been proved in the past that single control has serious disadvantages in peacetime. The primary concern of the Air Ministry must be in the military and strategic aspect of aviation, not with the rapid development of commercial air transport. The best solution might be, not to relieve the Air Ministry of responsibility for all air transport, but only of the responsibility for purely commercial air transport. The armed Forces of the future will include a growing air transport establishment for rapid movement, just as a modern army requires a huge fleet of lorries. Military control is as essential over military air transport as it is over military road transport. Subject to this qualification, purely commercial air transport might best be administered by an all-embracing Ministry of Transport after the war, with provision for rapid mobilisation in an emergency.

Participation in Air Transport

Even more urgent than the question of departmental responsibility is a decision on the conditions of participation in British civil aviation. Who is to run the air services? The choice is not merely between public and private enterprise ; there is room for both. At present, overseas air transport is in the hands of the British Overseas Airways Corporation, while domestic air transport is largely controlled by the railways. Hitherto the Government has been studiously

vague in its pronouncements on this subject. Careful examination of official statements suggests that the Government is either deliberately delaying a decision or is still in two minds. It has carefully refrained from discouraging shipping, railway and other interests from making preparations for participation; there is, for example, the neat phrase of Lord Beaverbrook that BOAC has no monopoly of air transport, but merely of subsidy. But there is nothing in the Government's statements that would preclude it from establishing a regime of public operation if it ultimately decided to do so; it has given no definite promises. So long as the complete internationalisation of the world's trunk lines was not definitely ruled out, the Government could hardly commit itself. This is not known to be unacceptable to the United States. But indecision at this stage may well be harmful, in that it will cause delay in the expansion of civil aviation after the war. In the sphere of inter-Empire traffic the Government's decision will inevitably be influenced by the views of the Dominions, but this again is no reason for continued procrastination. The Tory Reform Committee suggests a mixture of public and private enterprise, and, in particular, that no "chosen instrument," such as BOAC, should operate more than one trunk route. Moreover, in its view, all operators, whether public or private, should derive their authority from a public board similar to the Civil Aeronautics Board of the United States. In principle, there is much to be said for the creation of a central public authority of this kind, functioning under the department responsible for commercial air transport. Equally, major trunk routes might often best be operated by single, and preferably public, concerns that would be given the mail contract for their respective routes. Feeder lines might well be left to private enterprise, subject to policy control by the Government. In practice, it may not always be possible to draw a clear distinction between feeder and trunk lines, as in the traffic between Britain and the Continent, for example. But such difficulties need not stand in the way of a statement of policy. What matters most is not so much the precise form of British post-war civil aviation as the formulation of policy designed to enable this country to participate as early, as fully and with as much enterprise as possible in the world's air transport.

Freedom of the Screen

Public criticism of the rapid consolidation of the British film industry under the leadership of Mr J. A. Rank came to a head last year. Criticism in Parliament and the press encouraged the Board of Trade to try to arrest the process of consolidation by *ad hoc* measures; and it led to the appointment of a committee of inquiry. This committee's report to the Cinematograph Films Council has now been submitted to the Board of Trade. Not unexpectedly, the members of the committee—Mr A. Palache (chairman), Sir Walter Citrine and Professor A. Plant—discovered a definite trend towards monopoly in the industry in recent years. Its signs are:

- (i) The rapid growth of the vertically integrated combines and the control that they are able to exercise at the various stages from production to exhibition ;
- (ii) The introduction and extension of undesirable practices in restraint of trade, partly by producers, partly by distributors, partly by exhibitors.

The recommendations of the Committee are designed to ensure the freedom of the screen from monopolistic practices, whether by vertical or horizontal combines, and to avoid American financial control. Legislation is suggested as a remedy, together with an ingenious scheme—"a trustee arrangement comparable to that of *The Times* or *The Economist*"—to prevent control from passing either into foreign hands or those of "undesirable" groups or persons. The "small" man in the industry is to be encouraged by the creation, under Government sponsorship, of a film finance corporation; this organisation would not only finance "qualified" producers on reasonable terms, but it would be empowered to establish a renting organisation and, eventually, to extend its activities into the field of overseas marketing. In sum, the wings of combinations are to be clipped and talent given greater scope to flourish independently. This is not the occasion for commenting in detail on the committee's suggestions. No doubt their adoption would make for greater independence; but a code of behaviour does not necessarily guarantee growth. It is efficient and successful enterprise that the film industry most requires.

Re-equipment of Industry

In the House of Lords on July 26th, Lord Barnby drew attention to the need for a speedy re-equipment of British industry to enable it to resume its peacetime activities without unnecessary delay. By way of example, he quoted from the Cotton Board Committee's Report, which suggests that textile machinery makers should be given a measure of relief from part of their munitions obligation in order to be able to produce equipment that will be urgently needed after the war. (A similar plan to allow the aircraft industry to speed up its preparations for the production of civil aircraft is made by the Tory Reform Committee in a Report discussed on page 194.) Lord Templemore pointed out that the problem of arranging the cancellation of existing contracts to free first the manufacturing capacity that will be most urgently required is one on which the Board of Trade and the Supply Departments have been "working for some time." He emphasised that the speed at which a given industry or factory can be released from war contracts does not only depend on the importance of its peacetime products, but also on the extent to which it may be required for the production of war stores that cannot be made elsewhere. In other words, capacity can only be released in so far as it is surplus to war production. This proposition, clearly, cannot be challenged. Nevertheless, it is legitimate to question—as Lord Winstone did—whether the Government is in fact allowing preparations for re-equipment to proceed as rapidly as it might within the limits of the resources that can be spared. Lord Winstone suggested, moreover, that the United States was going ahead more rapidly than this country in its preparations for peace. True, Britain, unlike the United States, is a base for military operations. Nevertheless, there is a strong case, in so far as this is practicable, for allocating any manufacturing capacity that can be released from war production on a basis that does not place this country at a serious disadvantage. A Britain short of foreign exchange will have to expand its exports with all possible speed in order to finance essential imports of food and materials.

Government Factories

As a supplement to the White Paper on the Disposal of Government Stores, Mr Dalton last week outlined the Government's policy with regard to factories and producing plant. Their allocation will be controlled to harmonise with declared aims in town and country planning, the distribution of industry, the export trade and local employment. The normal procedure, though there is to be no hard and fast rule, will be for the Government to lease these factories (in the short period) rather than to sell them by auction. This policy will not be received with unanimous approval. Disposal by auction would suit the interests of those with adequate capital resources whether their businesses are sound or highly speculative; but such a method would restrict competition unduly and might well deprive industry of the new blood it needs so urgently. After the last war, Government factories, although their disposal was very imperfectly conducted, became the nuclei of new and successful trading estates dealing primarily in the light industries. After this war there will be a shortage of modern factory premises at a time when industry will need every inch of elbow-room if its declared objectives of expanding exports and full employment are to be realised. The White Paper on Employment Policy has emphasised the imperative need for flexibility in the exporting industries. It is essential that the nation's limited resources should not be frozen into a rigid pattern. Because the state and nature of the export markets are uncertain and unpredictable, industry will be compelled to conduct itself empirically. It follows that a system whereby factory space can be acquired cheaply and adapted speedily and without costly major reconstruction for peacetime production will have many advantages. It would be a mistake, on grounds of equity, to limit the acquisition of the factories to those with the necessary purchasing power. The only argument in favour of disposal by auction would be that such a method would make for speed in adaptation and utilisation. The Government's scheme, which is as yet only an outline of a policy, has much to recommend it. Any system of allocation of factory space should deal sympathetically with those industrial units which have been put out of commission by enemy action—especially where the organisation of such units is still intact.

Oil Duties Committee

It appears that, as was indicated in the Budget speech, some action is to be taken with regard to the absence in this country of an industry based on the chemical refining of oil. In reply to a question in the House of Tuesday, the Chancellor of the Exchequer announced that he and the Minister of Fuel and Power had appointed a Committee—

To consider and report upon:—

- (a) the effect of the hydro-carbon oil duties on the supply of raw materials to, and the development of, the chemical industry in this country so far as the use of hydro-carbons and their derivatives is concerned.
- (b) the extent to which any change in those duties would affect industries engaged in the production of similar products from coal.

The chairman of the Committee will be Sir Amos Ayre and the other members, Sir John Fox, Mr. A. S. Nacharg and Sir Robert Robinson. There has been considerable controversy in recent years concerning the whole question of oil refining in this country, but it seems that a whole complex of new products is in process of evolution from the full chemical refining of oil and coal. While there is an element of competition between these two raw materials in this field, as in others, there appears to be a case for considering the two, in large measure, complementary. To this question, at least, the new Committee should be able to provide an adequate answer. For the rest, it seems a pity that the terms of reference are not sufficiently wide to include an enquiry as to any other impediments to the full participation of any interests which so wish in the development of this new group of industries in Britain. It is precisely in fields such as this, where the amount of skill, research and ingenuity in the final product is large compared with the value of the raw material, that Britain must look in future for the increase or even the maintenance of its standard of living at home and its power to meet overseas commitments. But if success is to be achieved there must be adequate supplies of crude oil available to this country, and freedom of access to these supplies.

FIGHT FUEL WASTE WITH FEWER FURNACES

IN ONE SHOP THE WORK PREVIOUSLY DONE
IN SIX FURNACES IS **NOW**
CONCENTRATED INTO
FIVE!

Many firms are meeting the 25% cut in gas supply largely as a result of better furnace loading. Such savings were planned by management and secured by the keen watchfulness of the operatives.

that the economies in gas and electricity should be maintained; and this will follow where the management, workers and fuel watchers are in close co-operation.

PRACTICAL HELP IN FUEL EFFICIENCY BULLETINS

There are many excellent suggestions, for furnace users in Fuel Efficiency Bulletins Nos. 5 (gas operated), 13 (electrically operated), 24 (oil operated), and 17 (furnace insulation). Everyone should study them—managements, fuel watchers and operatives. Extra copies can be obtained from the Secretary of your Regional Fuel Efficiency Committee.

ISSUED BY THE MINISTRY OF FUEL & POWER

Two Years of Fuel Efficiency

The Report of the Ministry of Fuel and Power on the progress of its fuel efficiency campaign, now two years old, is in many respects encouraging. Although a quantitative estimate of the economies made by industry is impossible, it is calculated that, if the recommendations of the inspection engineers who have visited factories consuming an aggregate of 39 million tons a year were adopted, the saving would be in the order of 10 per cent, or nearly 4,000,000 tons a year. Although the scope for economy is limited in the case of major fuel-using industries, such as gas, electricity, coke ovens, collieries and iron and steel, it is reported that these have organised methods of more efficient utilisation. For instance, the railways' fuel efficiency committee has arranged special courses of instruction, with particular emphasis on the saving of locomotive coal by the adoption of improved standards of driving and firing. A mere record of the number of inspections carried out—over 11,000 factories have been visited, and 5,000 revisited, by 700 engineers—though impressive, is not necessarily conclusive. In some cases economies may be just an indication of past extravagance. It might also be argued that if the 10 per cent cut imposed by the Ministry of Fuel in December had been imposed earlier, the same results would have been achieved more rapidly. Nevertheless, there can be no doubt that the campaign has been of value. Since the need for economy in fuel consumption may well be greater and not less great after the war; with the present downward trend in production, it seems that the fuel efficiency campaign is one of the wartime experiments that might, with advantage, be retained in the post-war period.

Britain's Roads

The post-war proposals of the British Road Federation, issued this week, are designed primarily to ensure the improvement of Britain's road system and to encourage all forms of road transport, private and public. There can be no doubt about the need for road improvement after the war and, even, for testing the merits of motorways. But the nature and scale of road expenditure will necessarily have to be determined in relation to transport facilities as a whole and in the control of the resources that are likely to be available. The roads, in other words, must queue up with all other claimants for capital expenditure. In its aim to encourage the expansion of road transport, the proposals are inevitably critical of monopolistic practices. To quote from the Report:

As soon as circumstances permit, subject to overriding conditions of national policy, unfettered freedom of choice of the means of transport he employs should be restored to the individual, be he trader, farmer, industrialist or private citizen. This is a fundamental liberty and is essential, from the point of view of the general welfare of the community, as a means of improving the efficiency of transport services, because the individual is in the best position to know which form of transport is most suited to his needs, and so will enable him to make his fullest contribution to the general well-being.

Perhaps unavoidably, the Report does not deal with transport as a whole.

Home Railway Half-Year

Seldom has the home railway half-year passed with so little general interest as this year. The announcements, limited in recent years to dividend declarations, had not been expected to provide any new feature. Having regard to the extreme activity of 1943, there was little possibility that revenue outside the agreement would show an appreciable increase, while the War Damage position, if changed at all, was more likely to be altered adversely than in favour of the stockholder. In these circumstances, the general sagging tendency in prices of all but the prior charge stocks is to be attributed to causes other than the fact that all the dividends to be paid are the same as those of a year ago. No doubt the adverse factor is the complete failure—foreseen by all but the constitutionally optimistic—of the campaign for a revision of the agreement which would permit of larger payments. The extent of the movement is moderate. As shown by *The Actuaries' Investment Index*, there is a fall from the May high of 80.3 per cent of December, 1928, to 77.7 on July 25th. The fall has continued almost daily since then, but is still not large. The case for a revision is still being pressed in Parliament but, as Mr Noel-Baker was not slow to point out, those who complain omit to consider that it was the duty of the Government to make the best

bargain the railways would accept. He also gave an assurance that the agreement was reached voluntarily. It is on this point that sincere doubts still exist, the more so that it is very hard to believe—irrespective of the equity of the actual terms—that conditions could have arisen in which the railways would not have reaped large benefits from a very heavy concentration of traffic, coupled with a reduction in services rendered, other than the mere carriage of goods and passengers.

Co-ops in the West End

After the war, the Oxford Street, London, shopping area will have a new department store, owned by the London Co-operative Society. The Society has bought from Peter Robinson, Ltd., its eastern block, a 16-year-old building of seven stories with a frontage in Oxford Street close to Oxford Circus, for the sum of £425,000 on a 999-year lease. This is the first time that the "Co-op" has appeared in what might be called the central shopping area of Great Britain, and it is a fitting celebration of the centenary of the Co-operative Movement. It forms part of the large policy of expansion which the co-operators are following. During the last two years they have acquired department stores in the suburbs, and the latest of these was the purchase of Marshall Roberts, Ltd., in Camden Town. The new West End store will not be open for some time after the war. At the moment the building is requisitioned by the Government. Although the store will primarily serve members, it will be open to the public. It will be interesting to observe its effect on neighbouring department stores. Lessons can be learned from the co-operative store, whose distribution costs are often lower than those of commercial firms. On the other hand, the co-operative store might well learn much itself from its close proximity to stores a great part of whose efforts are expended in providing services. The interplay of competition between the two types of store can be of benefit to both.

Good News for Bondholders

Holders of overseas bonds have had more than one piece of good news during the current week. In the first place, the month-old rumour that the Government of Guatemala proposed to repay at par the whole of the debt corresponding to the original issues of 1895, 1913 and 1928 has been confirmed. The first instalment of cash is actually in this country, and holders have until January 15, 1945, to accept the offer. Repayment will include interest to date, and, although redemption is, properly, by sinking fund, holders will be well advised to accept the offer, which covers the whole sterling debt. This was followed on Tuesday by news that the new Argentine authorities propose to repay the 4 per cent State Railway Sterling bonds on November 1st. These form the collateral for the issues of the Cordoba Central Trust, whose position has been in doubt ever since the earlier announcements of a general policy of redemption of external debt. These are the best bits of news out of South America for a very long period, and, although neither was really unexpected, they have done something to offset the ill-effects of the Argentine Government's general attitude. It is also satisfactory that settlements have been reached in respect of the debenture issues of the Sorocabana and Southern San Paulo railways whose assets were sequestered in 1940. The Brazilian Government has now agreed to terms which permit cash distributions of about 36 per cent on the £1,425,940 Sorocabana stock and of 80 per cent approximately on £506,634 of the Southern San Paulo issue. Both these are substantially above what appears to have been expected, for the stocks stood at about 29 and 60 respectively.

Tax Reserve Certificates

The Chancellor of the Exchequer has given information in the House of Commons about the total Tax Reserve Certificates tendered quarterly in payment of taxes and the distribution of these totals between the various categories of taxes. In the table at the foot of this page these figures are combined with the quarterly receipts under these heads of taxation to show the cash and TRC payments for taxes since the beginning of 1941. The interesting feature brought out by this table is the relatively high ratio of TRC payments in the case of Excess Profits and Sur-Tax. This tends to confirm other evidence of the attractions of TRCs for these two classes of taxpayers.

The Fiduciary Issue

After a see-saw movement lasting several weeks, the forces making for expansion in the note issue have won the day, and a new landmark has been reached by the addition of a further £50 million to the fiduciary issue, raising it to £1,200 million, or four times the pre-war figure. Apart from the closing of "Salute" weeks, the reason for the recent slowing-down in the expansion of the note issue—it stood at £1,146,019,264 on Wednesday of this week—is probably the departure of large forces overseas, just as a year or so ago it was the recalling of large notes

CHANGES IN FIDUCIARY ISSUE SINCE 1939
(£ million)

	From	To	No. of Weeks' Interval Between Changes
1939—September 5	300	580	40
1940—June 12	580	630	46
1941—April 30	630	680	18
August 30	680	730	13
December 3	730	780	20
1942—April 22	780	830	14
July 28	830	880	18
December 3	880	950	19
1943—April 14	950	1,000	25
October 6	1,000	1,050	9
December 7	1,050	1,100	13
1944—March 7	1,100	1,150	21
August 2	1,150	1,200	

from circulation. On that occasion the effect was largely an economy in cash reserves; on this it is, in part, a substitution of an overseas issue for a domestic one. The full list of changes in the fiduciary portion of the issue since the outbreak of war is given in the accompanying table.

Scientific Farming

The future of agriculture is one of the important reconstruction problems which has to be faced. The Parliamentary and Scientific Committee—an unofficial group of members of both Houses of Parliament and representatives of certain scientific and technical institutions—has examined the question and published its conclusions in its report, *A Scientific Policy for British Agriculture*. The Committee's solution to the problem is given in the word "science." There is an unfortunate tendency to overwork the word, as though it were an inevitable panacea. One aspect of farming which the Committee does not submit to scientific scrutiny is the one which, perhaps, looms largest in the minds of most farmers: the market. True, the report submits that "economic stability for British agriculture can only be secured by price guarantees." In this sentence the whole question is begged, since the real problem is how far British agriculture can be organised to stand on its own feet. Clearly, if high enough prices are guaranteed, agriculture can be shaped in any form desired—of this the wartime record of farming is proof enough. On other questions the report provides a valuable underlining of principles which cannot too often be repeated. Among these is the urgent

need for improving agricultural and veterinary education and research—they recommend that at least £3,000,000 a year should be devoted to the latter. They also urge the completion of soil and geological surveys, and the extension of plans for veterinary aid. Less scientific is the insistence on a system of farming described as rotational, mixed and balanced. The respect, amounting almost to reverence, which has been paid to the plough, is a keynote of the report. Security considerations may demand the post-war production of crops such as wheat and sugar-beet, but to farm these in England is not economic. Mechanisation has reached the stage where agriculture can be converted from a peacetime to a war basis reasonably quickly. This means that security need not be stressed in plans for post-war agriculture, and that its relation to the national economy as a whole should be the guiding principle for the future.

Shorter Note

Regrettably, a premature and inaccurate press report of the National Arbitration Tribunal's decision on women's wages in engineering was quoted in last week's issue of *The Economist*. The Tribunal, it has now been stated, has not made any definite award in the case. It has, however, made certain recommendations to both parties which will be discussed at a meeting next week, and which, it is hoped, will result in agreement. Failing a settlement by further negotiation, the matter would, of course, be referred back to the Tribunal.

COMPANY MEETINGS

ANGLO-NEWFOUNDLAND
DEVELOPMENT COMPANY,
LIMITED

MR FRANK HUMPHREY'S REVIEW

The annual meeting of Anglo-Newfoundland Development Company, Limited, was held, on the 1st instant, at Grand Falls, Newfoundland.

Mr Frank Humphrey, the president, in the course of his speech, said: The profit of the company for the year to December 31, 1943, after providing for depreciation and depletion, amounted to \$838,165.07 which includes dividends from Terra Nova Properties, Limited, of \$349,090. After charging debenture interest and directors' fees, and making provision for debenture stock redemption and reserve for contingencies, there remained a profit of \$81,990.07, which had been added to the balance of profit brought forward from the previous year.

During the early months of the year 1943 the mills operated at a reduced capacity, with some improvement during the second half of the year, because of an increase in United Kingdom requirements. The overall operations for the year averaged approximately 80 per cent., as against 85 per cent. the previous year.

DIVIDEND DECISION

Newsprint prices in North America continued under strict Government control, but the price per ton—which had remained constant from 1938—was increased on March 1st by \$4.40, and again on September 1st by a like amount. This, it will be appreciated, was of material assistance to us, but the additional revenue only in part covered the high delivery costs on our sales for North American delivery.

War conditions, which adversely affect our earnings, are still with us, and the slight improvement over last year is accounted for by, firstly, the exchange of tonnage with the Canadian industry; secondly, increased shipments to the United Kingdom, and, of course, the increase in the price of newsprint and United Kingdom pulps during the year. In view of all the circumstances surrounding the industry at this time, it is still considered wise to omit the payment of a dividend.

BALANCE SHEET

The reduction in our various fixed assets has been brought about through the operation of the usual annual depreciation write-off.

In the case of pulpwood, of which we have some \$570,000 less value than at the end of December, 1942, we have been unable to obtain the necessary woods labour up to this time to enable us to keep our wood piles up to normal requirements. However, in this respect the outlook for the future seems brighter, and we hope it will not be long before we are again fully stocked with this essential raw material.

The increase in cash for the year was approximately \$1,190,000. Looking to the future, it was deemed wise to strengthen our structure by the retirement of our fixed debt; which took place on July 1, 1944. This we were able to accomplish without weakening our current position, which continues to be ample for our purposes.

GASPESIA SULPHATE COMPANY

This company again operated throughout the year at full capacity. The selling price of unbleached sulphite pulp remained unchanged during the year. On the other hand, costs of production materially increased, due principally to rises in wood and labour costs. The installation of the new steam plant proceeded satisfactorily during the year and should be completed during the present year.

The net profits of this company, after charging ordinary depreciation and depletion, were \$332,172.44. Out of these profits there was set aside as provision for Income and Excess Profits Taxes the sum of \$175,000, and for special depreciation and partial write-off of the old steam plant the sum of \$53,677.62.

This company's raw materials supply was

strengthened when within the past few weeks the Government of the Province of Quebec authorised the granting of an additional 600 square miles of timber limits containing high quality pulp wood.

BUCHAN'S MINE

Despite the acute shortage of skilled labour, Buchans mined and milled 36,000 tons more ore in 1943 than in 1942, and the profits for the year were substantially better than in 1942. A higher price for part of the zinc concentrate shipments also contributed to this better result, and a further improvement in the zinc concentrate price will prevail in 1944. No new ore was discovered during 1943, and the ore reserves were recalculated conservatively, with the result that the reserves at December 31, 1943 were 488,200 tons less than at the end of 1942.

The net income of Terra Nova Properties, Limited, from its share in the Buchans Mine and from its other mining interests, after providing for taxation and other expenses, amounted to \$666,023.72, out of which dividends were paid during the year of \$350,000.

The report and accounts were unanimously adopted.

AMALGAMATED DENTAL
COMPANY, LIMITED

The thirty-ninth annual general meeting of the Amalgamated Dental Company, Limited, was held, on the 28th ultimo, at 26, Broadwick Street, W. Mr E. Russell Polden (the chairman) presided.

The chairman, in his statement which was circulated with the report, after referring to the accounts, stated:

In the sphere of specialised technical research much has been achieved which should well serve the interests of the company.

Dealing with the current position, there exists a state of efficiency which makes it possible, with certain exceptions beyond the company's immediate control, effectively to meet the call upon the company's services in the supply of essential dental products for national and civilian requirements.

The report was adopted.

HARLAND AND WOLFF,
LIMITED

ANNUAL GENERAL MEETING

The fifty-ninth annual general meeting of Harland and Wolff, Limited, was held, on the 27th ultimo, at the Grand Central Hotel, Royal Avenue, Belfast.

Mr Charles J. G. Palmour (chairman of the company) presided.

The Secretary, Mr A. T. Marshall, read the notice convening the meeting and the report of the auditors.

The Chairman referred briefly to the large programme of work being carried out at the company's various establishments, but said he was still unable under existing conditions to make any general review of the company's activities. He therefore formally moved the adoption of the report and accounts.

Sir Frederick Rebbeck seconded the resolution, which was carried unanimously.

The Chairman said that in view of the statements which had appeared in the Press he thought it right he should inform members that suggestions for the reorganisation of the company's capital had been submitted to the board by a majority of the present holders of "A" shares.

Particulars of these proposals will shortly be communicated to the holders of "A" shares and "B" stock and meetings will subsequently be convened for their consideration.

Thanks were again due to all the work-people and staffs at the various establishments for the manner in which they have carried out their duties.

The retiring directors, Mr William Strachan, Jr., Mr Atholl Blair and Mr L. V. Dunlop, were re-elected; and the auditors, Messrs Price Waterhouse and Co., were reappointed.

GENERAL ELECTRIC
COMPANY, LIMITED

IMPROVED RESULTS

SIR HARRY RAILING'S
STATEMENT

The annual general meeting of this Company was held, on the 27th ultimo, in London. Sir Harry Railing (the chairman) presided.

The following is an extract from the chairman's statement which was circulated with the report:—The profit after providing for taxation and for contingencies amounts to £1,812,409, as compared with £1,748,917 last year, an increase of £63,492. After providing £460,699, against £459,619, for depreciation and £106,645, against £89,276, for our pension fund, we are left with a net profit for the year of £1,240,730, against £1,195,741 last year. We recommend that a dividend of 10 per cent. per annum and a bonus of 7½ per cent. on the ordinary stock, both less income-tax, should be paid as last year, and the sum of £865,134, against £817,762, should be carried forward. Apart from our large carry-forward, our general reserve stands at £4,700,000.

THE STATE AND INDUSTRY

Since for certain raw materials and food we are dependent on other countries, we are vitally interested on the one hand that where a lower standard of education and living exists it should approach more closely to our own, and thereby foster an expansion of world demand. On the other hand, it is vital for us by choosing the right kind of goods and producing them at the right price to increase our exports at least to such a figure that we are able to obtain these necessities in return.

No individual, community or State, without exhausting its capital, can go on living, much less advance its standard of living, unless they produce goods at a competitive value which others are willing to accept in exchange for their own. The co-operation of labour for this purpose is as essential as that of the management of industry. In the end the fulfilment of all the hopes we have for improvements depends upon our ability to create this expansion and to share in it to the greatest possible extent. This is true, whether the State or so-called private enterprise supplies capital and management. That a measure of State direction on policy at the highest level may for some time be necessary to safeguard the community's interests can hardly be denied. That the State should not be the operating mechanism of productive industry equally cannot be denied by anyone who has had any experience in the administration of large or small undertakings, or of Government enterprises.

The post-war world will demand more than ever from industry, and especially from export industry, imagination, initiative, pioneer spirit, the courage to run risks and to make quick decisions, or as the Report of the Minister of Reconstruction puts it, "resiliency and flexibility." All these qualities are, according to the laws of nature, much more likely to be obtained from individuals than from the State.

Life is much too complex to be cast in one mould. The individual, or the unit, must give way wherever its interests clash with clearly established overriding national considerations, but within these limits the greatest possible freedom must be given not only to thought, but also to the action of individuals and of functional bodies within the State.

RESEARCH WORK

Our company, for a great many years, has carried out activities which are now being hailed in some quarters as new discoveries. Our research laboratories have celebrated their twenty-first birthday. We have always paid the greatest attention to export and have a full-scale overseas organisation which, in spite of the difficulties of war, we have maintained intact to meet the post-war need.

The report and accounts were unanimously adopted.

AMALGAMATED PRESS,
LIMITEDINCREASED PROFIT AND
DIVIDEND

LORD CAMROSE'S SPEECH

The seventeenth annual general meeting of The Amalgamated Press, Limited, was held, on the 28th ultimo, in London.

The Viscount Camrose (the chairman), in the course of his speech, said: Profit for the year shows an increase of £30,989. Most of this is absorbed in an increased tax provision of £586,000, as against £562,000. We have decided to recommend, as the report shows you, an extra one per cent. in the final dividend. If this is approved, the dividend for the year will total 12 per cent., against 11 per cent. last year. The increase is not a large one, and only requires an extra £6,000 net. As I have just pointed out, the profits, after tax, are not materially increased, but we have every justification for believing that this very cautious increase in the dividend is one which we can maintain without strain.

As the directors' report shows you, we have again placed £100,000 to the reserve account, making that account £1,650,000, and the carry-forward is increased by £4,403.

KELLY'S DIRECTORIES

A year before the war, as you will remember, we acquired a controlling interest in Kelly's Directories, Limited. That company, with its subsidiaries, did very badly in the early war days. Now it has regained its strength and prosperity and in the balance-sheet and report published a few days ago you will see that the directors recommend that the dividend for the year on the Ordinary capital should be raised from 15 per cent. to 20 per cent., while the reserve allocation in the parent company has been increased from £25,000 to £50,000. The post-war outlook for the group of publications and directories owned and controlled by the Kelly Company and its subsidiaries would appear to be very satisfactory indeed.

Other of our interests outside the main business of the Amalgamated Press itself are shaping well and justify us in a measure of optimism with regard to the results they are likely to yield when peace returns.

It is dangerous to make any prophecy to-day, but I think I can tell our 22,000 shareholders that the parent business and its outside interests are in an excellent position to take full advantage of the opportunities which will offer themselves when the war has become a thing of the past.

SUPPLY OF NEWSPRINT

The year we are reviewing to-day has had no particular high lights in the publishing field, and a general survey of our periodicals would not, therefore, be of any interest. So long as the supply of newsprint is severely rationed and the starting of new publications is prohibited the enterprise of peace-days must remain non-existent. What we strive to do is to make as good a job of our periodicals as the circumstances of the day permit, and, above all, to second and support the national effort in every possible way. I drew your attention last year to the fact that publications such as ours devote a great deal of space to the printing of information and advice on matters directly connected with the war effort. They give vital information and advice on food, cooking, fuel and other questions of consequence in the home life of our people. Right from the beginning of the present struggle our editors have maintained close and almost daily connection with the Government departments concerned, and we have had many messages of appreciation of the way in which we assisted in the solution of different problems.

The report was unanimously adopted.

THE METAL BOX COMPANY,
LIMITEDDISTRIBUTION OF 17½ PER CENT
SIR ROBERT BARLOW'S REVIEW

The twenty-third annual ordinary general meeting of The Metal Box Company, Limited, was held, on the 27th ultimo, in London.

Sir Robert Barlow (chairman of the company) presided.

The secretary (Mr John Cartner) read the notice convening the meeting and the report of the auditors.

The chairman's review, which had been circulated with the report and accounts, and was taken as read, was as follows:—

The pressure of work during the year has continued at a very high level, and the board again wishes me to express its appreciation of the sustained effort made by executives, staff and workers. The staffs of the overseas companies have met exceptional demands, despite the strain imposed by long periods abroad without home leave.

The balance of profit available—£229,579—is an improvement over last year. Due to increased income tax, it is however below that of pre-war years.

Certain of the subsidiary companies were liquidated at the end of the year and will be consolidated in next year's accounts. This will facilitate administration and reorganisation after the war. Considerable progress has been made in our planning for the post-war period.

The board has appropriated a further £50,000 to the development and reorganisation reserve, bringing this reserve up to £250,000. As will be seen from the consolidated balance-sheet, the total of undivided profits and reserves now exceeds £2,000,000.

The increases in amounts owing to subsidiary companies, and in debtors and creditors arise in the normal course of business and have no special significance.

An interim dividend of 5 per cent. was paid on the ordinary stock on January 1, 1944, and your directors recommend for the seventh year in succession a final dividend of 10 per cent. and a bonus of 2½ per cent.

We send our greetings and good wishes to the large number of our employees who are serving with the Forces, and we look forward to their early return to us.

The report and accounts were unanimously adopted.

A final ordinary dividend of 10 per cent. (making 15 per cent. for the year), together with a bonus of 2½ per cent., both less income-tax, was declared.

Mr R. Beverley, Mr J. Cartner and Mr C. C. Conway were re-elected directors of the company, and the auditors (Messrs. Hodgson, Harris and Co.) were re-appointed.

HENDERSON'S TRANSVAAL
ESTATES, LIMITED

The 32nd ordinary general meeting of this Company was held, on the 2nd instant, in London.

Mr W. L. Castleden (chairman and managing director), who presided, said: During the year we made considerable changes in our investments, increasing our holdings in Other Securities (mainly Gold Mining Stocks) by £33,100 and reducing Government Securities by £20,200, with a resulting profit of £5,289.

Sundry Debtors, which consist almost entirely of dividends outstanding, are lower by £7,100, due to reduced dividends. Temporary advances to Subsidiary Companies are increased by £8,100 while the cash position is stronger by £18,700.

Revenue shows a small decline, but is amply sufficient or justifying recommending the payment of a dividend of 10 per cent. and allow a substantial balance to be carried forward.

The report was adopted and resolutions were passed for the conversion of the fully paid shares of the company into stock.

CENTRAL COMMERCIAL
PROPERTIES, LIMITED

IMPROVED POSITION

The 16th annual general meeting of Central Commercial Properties, Limited, was held, on the 1st instant, in London.

Mr W. Stanley Edgson, F.S.I., F.A.I., the chairman, said that like its four predecessors the year to June 30, 1944, had proved difficult, but without doubt had shown more promise for the future. The hope he had expressed last year that they had turned the corner from the effects of the war had so far proved justified. Although they had sold properties producing approximately £2,600 per annum, the gross rental revenue showed a further increase at £97,530 with a net revenue of £77,876, and the current gross rent roll now stood at only slightly below £100,000 a year.

The Town and Country Planning Bill and the White Paper on the Control of the Use of Land led one to the conclusion that the Government's policy, while seeking to be reasonably fair to the landowner, was very vague and uncertain as to when or how they would be able to rebuild or alternatively receive compensation for the demolished properties, and left one with an impression that they would be much handicapped by the deadening hand of delay and sterilisation. Need he emphasise how impossible it was to carry on a progressive business of creating investments under such uncertain conditions, and might he ask what inducement there was under the present proposals to private enterprise? Why should they rebuild some of their older properties when they were to be robbed of a high proportion of their legitimate improvement value, when by merely reconditioning worn-out property such a tax could be avoided?

The report was unanimously adopted and the proposed payment of one year's dividend on the cumulative preference shares to June 3, 1942, was approved.

GLOBE TELEGRAPH AND
TRUST COMPANY, LIMITED

The seventy-first ordinary general meeting was held, on the 1st instant, the Right Hon. Lord Fender presiding.

The following is an extract from the chairman's statement circulated with the report—The income amounted to £196,942, after deduction of income-tax. The appreciation in the company's investments amounted to £2,395,491.

During the past year we considered it prudent to realise a considerable portion of our preference shareholdings, which realised a sum of £149,000. The proceeds have been reinvested and show a small reduction in income, but as the reinvestment includes a line of £75,000 2½ per Cent. National War Bonds, such reduction in income is of little moment.

We have once more been able to maintain our dividend at 5 per cent., tax free.

The report was adopted.

MILLAR'S TIMBER AND
TRADING COMPANY,
LIMITED

The annual general meeting of this Company was held, on the 27th ultimo, in London, Major A. W. Bird, D.S.O. (managing director), presiding.

The following is an extract from the directors' statement circulated with the report and accounts: The liquid position of the company and its subsidiaries continues to be satisfactory.

A not unimportant part of the burden of taxation is due to the failure of the United Kingdom taxation laws to give adequate relief to British companies who trade in foreign countries and the dominions, and who have to pay tax both at home and abroad on the same income.

The report and accounts were unanimously adopted.

Financial News Indices of 20 fixed-interest securities and 30 ordinary shares (July 1, 1935=100) with corrected yield on the latter and return on Old Consols.

(Logarithmic Scale)

Insurance Share Index.—This index has up to the present been based on an investment of £1,000 in each of 24 securities in 1913. Owing to the recent acquisition of the shares of the *Gresham Fire* by the *Legal and General*, and the consequent lack of a market quotation, the number of securities composing the index at June 30th, 1944, is reduced to 23; the index has been re-calculated for each of the four earlier dates shown in the table. For the past six months there is a gain of 6.7 per cent, a rather smaller percentage than that for industrial shares in the aggregate. The index now stands at approximately the level at the end of 1938. Offices whose shares have not yet recovered to their immediate pre-war values—the *Equity and Law*, *Legal and General*, *Life Association of Scotland*, *Prudential*, *Scottish Life* and *Sun Life*—are all primarily or exclusively interested in life assurance; in the case of the *Prudential* the prevailing uncertainty concerning the future of industrial life business has an obvious bearing on the market valuation of the shares.

GOVERNMENT RETURNS

For the week ended July 29, 1944, total ordinary revenue was £74,323,000, against ordinary expenditure of £123,692,000 and issues to sinking funds of £320,000. Thus, including sinking fund allocations £3,180,239, the deficit accrued since April 1st is £1,057,035,000 against £1,102,994,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £193,571 to £2,826,313, the other operations for the week (no longer shown separately) raised the gross National Debt by £48,800,596 to £20,639 million.

(Continued from page 200.)

depleted bill portfolios and the discount houses, with a reduced amount of bills to take up, found conditions distinctly easy. The Treasury, however, repaid the bulk of the loan from the Bank outstanding from the half-year and total market resources were slightly reduced. The only other changes of importance in the weekly bank return reflect the £50 million increase in the fiduciary issue.

MONEY RATES, LONDON.—The following rates remained unchanged between July 27th and August 3rd:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½%; 6 months, 1½%; 12 months, 1½%. Treasury Bills: 2 months, 1½%; 3 months, 1½%; Day-to-day money, 1½%. Short Loans, 1½%. Bank deposit rates, ½%. Discount deposit at call, ½%; at notice, ½%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between July 27th and August 3rd (Figures in brackets are par of exchange).

United States. \$ (4.86) 4.024-034; mail transfers 4.024-034. Canada. \$ (4.86) 4.43-47; mail transfers 4.43-47. Switzerland. Francs (25.23) 17.30-40. French Empire. Francs 1971-2004. Syria. p. 8.81-85. Sweden. Krona (18.159) T.T. 16.85-95. Dutch West Indies. Florin (12.71) 7.58-62. Portugal. Escudos (110) 99.80-100.20; mail transfers 99.80-100.30. 		Bank of England Adv.	1,250
		Treasury Deposits	28,500
		Miscellaneous Receipts	8,876
	£ 2,218,534		£ 2,218,534

INDUSTRY AND TRADE

Trade Disputes.—There was a large drop in the number of working days lost as a result of trade disputes between April and May from 719,000 to 46,000. The figure for June is even lower, at 44,000. The number of disputes in progress fell from 160 in May to 120 in June, and the number of workpeople involved from 28,100 to 24,300, which compares with 42,500 in June, 1943, when 116,000 working days were lost. An analysis for the first six months of the year shows that there were 1,182 stoppages, involving 601,100 people for 2,918,000 days. The comparative figures for the same period of 1943 are 832,222.800 and 584,000. The industries mainly responsible for the increase were coalmining, engineering and shipbuilding.

"The Economist" Sensitive Index.—There was no change in the index during the week ended August 2nd. The complete index (1935=100) was 158.6; crops 135.6; and raw materials 185.5.

Cost of Living.—The Ministry of Labour's cost of living index (1914=100) stood at 201 on June 1st. This is higher than it has been for over 20 years, except in December, 1941, and August, 1942, when it reached 201. The reason for the figure on June 1st is the partial replacement of old potatoes by the new crop at higher prices. This was sufficient to raise the index by one point from the level of 200 which has been maintained since last February.

after which date the Stock will be transferred ex-dividend.
For the Bank of Montreal, Financial Agents of the Government
of the Dominion of Canada in London.

EDWARD POPE, Manager.

47, Threadneedle Street, E.C.3. 1st August, 1944.

UNIVERSITY OF CAMBRIDGE

The Appointments Committee of the Faculty of Economics and
Politics give notice that they intend to appoint in the course of
the Michaelmas Term, 1944, two University Lecturers in Eco-
nomics. Full particulars can be obtained from the Secretary
of the Faculty Board (Mr. M. H. Dobb), at the Marshall Library,
Downing Street, Cambridge, and candidates should communicate
with him before October 15th next. If either of the candidates
appointed is prevented by national service or by the special
circumstances of the present time from discharging the duties
of the office, dispensation from the statutory obligations of the
office will be granted, subject to such conditions, financial or
other, as may be approved.

27th July, 1944.

APPLICATIONS are invited for posts as Temporary Assistant
Commissioners with the National Savings Committee. Uni-
versity training and knowledge of economics, public speaking
and organisation of meetings desirable. Salary range, £350-£600
for men and £280-£480 for women—plus War Bonus, the entry
point varying according to age. Applicants should not be liable
under the National Service Acts or more than 55 years of age.
Service in any part of England or Wales may be required.Applications in writing (no interviews), stating date of birth,
full details of qualifications and experience (including a list in
chronological order of posts held) and quoting Reference No.
P.P.333, should be addressed to the Ministry of Labour and
National Service, Appointments Department, Sardinia Street,
Kingsway, London, W.C.2.APPOINTMENT. Robson, Morrow and Co. are seeking an
outstanding man, a Chartered Accountant with wide commer-
cial experience, who could be trained in modern management
and accounting methods for work of national importance; four-
figure salary and exceptional post-war prospects. Mark envelope
"Application." Full particulars to Robson, Morrow and Co.,
Victoria Station House, Victoria Street, London, S.W.1.

PERSONAL

IT'S NONSENSICAL to think all cigarettes are
the same. T.T.T. Magnums are specially made for
the sensitive palate. Obtainable from
WHITMORE & BAYLEY, 92, Wigmore Street,
W.1. Established 1823. 100, 13/4; 500, 65/6;
1,000, £30/6. Post free. Sample flat 50 for 6/8.

concentrating everything on disarmament, would stand a chance of securing the full and, if need be, armed support of the Western peoples even after twenty years of peace. If the German campaign for revision has to begin with a naked demand for bombers and tanks, it stands a good chance of being resisted by even the crassest isolationist or the blindest idealist. But if there is a whole series of earlier demands, which appear just, or at least not worth fighting about, if the sapping and mining at the treaty is encouraged by the fact that it has too many indefensible outer works, then eventually the citadel will be surrendered, as in the 1930s, without a shot being fired. To plead for a "moderate" peace is not to plead for leniency for the Germans, but for the direct opposite, for a peace that will be enforced upon them.

Such, incidentally, was the settlement outlined by Mr Churchill and Mr Roosevelt in 1941, when they signed the Atlantic Charter. Since that time, Russian diplomacy, clumsily mismanaging the Polish issue, has introduced the fatal principle of territorial compensation. Since that time, the Nazis have by their abominable massacres and uprootings created precedents which can now be used against them. Defeated themselves, they may yet leave behind victory for their ideas. Yet the kind of peace proposed in 1941 was wiser and saner than the proposals made in 1944. It was a peace that carried within it the promise of further peace, whereas, of the settlement that is being proposed today, this unhappy prophecy must, with all solemnity, be made. Not only will it fail to preserve the peace. Inevitable war is being built into its very foundations.

The Monetary Agreements

AN apology may perhaps be needed for returning once again to the agreements reached at the Monetary and Financial Conference at Bretton Woods. If so, the apology is due from the authors of the misleading official summary of the agreements rather than from those who were misled by it into false conclusions. Some comment is made in a Note on page 213 on the general subject of the reporting of conferences. In this article some amendments are made to the judgment expressed on the agreements in *The Economist* of two weeks ago.

The proposed International Monetary Fund should be judged from two angles. There is the main issue whether, in the post-war world, any universal, multilateral, stable-exchange currency system will be possible and desirable. And there is the detailed question whether the particular system now proposed is technically the best that can be obtained. All through the discussion, it is the second and minor question that has been most widely canvassed while the major question has been either taken for granted or else discussed in terms of desires rather than of realistic probabilities.

Nevertheless, the details of the arrangements can conveniently be disposed of first. Without rehearsing once again the main outlines of the Fund, the following would seem to be the chief points of interest:

1. *Scarce Currencies.*—The official summary mentioned only that, when a currency became scarce, the Fund should make a report upon the circumstances, and it was assumed that this was all that was left of the "scarce currency" proposals of the Joint Experts' Plan of last April. This is not so; the provisions for rationing supplies of a scarce currency, and permitting members to impose restrictions on payments in that currency, are retained. They are even strengthened by a clause providing that no previous agreements (such as

commercial treaties, etc.) shall be valid against these new provisions. This is satisfactory; but at the same time the importance of this Article is reduced by a provision that a member threatened with the application of these scarce currency provisions can either lend its currency to the Fund or even use it to buy capital assets (the nature of which is unspecified) from other members, although the Fund is not normally to be used for capital transactions. To point this out is not to argue that it is wrong for a surplus country to lend its currency or to export capital. But these provisions do make it considerably less likely that the "scarce currency" provisions could ever be used.

2. *Rates of Exchange.*—The provisions for varying rates of exchange, once fixed, are as satisfactory as could reasonably be expected. Changes up to 10 per cent can be made without permission; a further 10 per cent with permission to be given within 72 hours; and further changes with the permission of the Fund, which must concur "if it is satisfied that the change is necessary to correct a fundamental disequilibrium." Moreover, the Fund is to take no account of "domestic social or political policies." On the other hand, the initial parties are, in most cases, to be those "prevailing on the sixtieth day before the entry into force of this Agreement"—that is, at latest, on November 1, 1945. After the last war, the parity of sterling was not fixed until 64 years after the Armistice, and even then proved to be widely incorrect. Is it reasonable to suppose that it will be possible to determine proper parities in 1945, which will correspond to 1919?

3. *Sterling Area.*—The currencies of metropolitan countries and their dependent colonies are treated, for all practical purposes, as a unit. But the sterling area is, of course, much larger than the British Colonial Empire, and for the wider purposes the only relevant section is that forbidding "any discriminatory currency arrangements or multiple currency practices." These terms are not defined, and it is clear

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

that they could be interpreted in a way that would obstruct the working of the sterling area. For example, members of the Fund are to be allowed to impose restrictions on capital movements; would it be considered a "discriminating currency arrangement" if the United Kingdom freed capital movements within the sterling area, while retaining restrictions on capital movements to other countries? The assurances which the Chancellor of the Exchequer told the House of Commons had been given by the Americans are not embodied in the Agreement, and all questions of interpretation are to be decided (presumably by a majority) by the Executive Directors, who would not be bound by any outside undertakings.

4. *Debtor-Creditor Relationships.*—It is under this head that the most significant changes have been made since the Joint Experts' Plan. A system of charges, payable in gold, is to be levied against members who make use of the Fund. It should be realised that the Fund does not make loans. If Britain, for example, is short of dollars, the Fund does not lend them, but sells them in return for pounds. A non-recurring service charge of $\frac{1}{2}$ per cent is to be levied, and in addition a system of recurring charges, analogous to interest, varying both with the amount and with the duration of the accommodation provided. These charges rise gradually from $\frac{1}{4}$ per cent to 5 per cent, after which they can be made penal. In the case of the United Kingdom, accommodation of up to £81½ million would attract penal rates after 10 years, up to £162½ million after 5 years, and up to £243½ million after a little more than three years. These charges go into the general income of the Fund, and if any distribution is made the first slice is to pay 2 per cent per annum to the surplus countries on the amounts of their currencies provided to the deficit countries. Thus, although the deficit countries are paying full value in their own currencies for the accommodation they receive, they are to pay interest as if they were borrowing. In addition, on some crucial issues, voting power is to be taken away from deficit countries and given to surplus countries. These provisions give the Fund a heavy pro-creditor and anti-debtor bias which was missing from the earlier proposals. Whether or not it is right to penalise countries with a chronic adverse balance of payments, it is surely quite wrong to reward countries with a persistent excess of exports over imports.

5. *Exchange Restrictions.*—It is made clear that the Fund is not to be used for the liquidation of indebtedness arising out of the war. Members are also to be free to "exercise such controls as are necessary to regulate international capital movements," but it is added that "no member may exercise these controls in a manner which will restrict payments for current transactions." In another clause "current transactions" are defined (in part) as including "without limitation, all payments due in connection with foreign trade." It needs to be enquired whether a control of capital transactions will be possible if the proceeds of exports may never be restricted.

6. *Transitional Period.*—The Fund will come into being before the end of 1945 and the transitional period will last for five years from then—that is to say, after five years the Fund may require a member, without its consent being necessary, to abandon such restrictions on current transactions as are allowed in the interim. Last time, the "transitional period" between the Armistice and the British return to the gold standard was about 6½ years; it may be rather shorter this time.

No particular comment seems to be called for on the details of the Agreement relating to the International Bank for Reconstruction and Development, save to point to the

scrupulous care that has been taken to ensure that funds raised in any country can be spent in any country.

Each of these points is doubtless small, but taken together they add up to quite a significant change in the nature of the document since last April, and a change that cannot be regarded as being for the better. There would obviously be the very greatest unwillingness to reject an Agreement of this kind on technicalities, irrespective of the major issues involved. Drafting is a matter of bargaining, and concessions must doubtless be made. But it looks rather as if the British Delegation at Bretton Woods had conceded several fresh points and won none.

★

The deciding issue, however, must be the wider question whether any system of this kind, technically perfect or imperfect, can be expected to be appropriate to the conditions of the post-war world. It is quite inevitable, not least in this country, that the question should be answered in the light of history, for the dilemma with which the country is now faced is very similar indeed to that from which an escape was sought by the return to gold in 1925. It is not quite right to say, as some are saying, that the Fund is only a subtler version of the gold standard. But it is true that the gold standard and the Fund are different species of the same genus. In the gold standard, the links between the currencies are entirely rigid. In the Fund they have some elasticity—both in the provisions for alterations in rates and in the provision of (limited and temporary) accommodation for countries with adverse balances of payments—but the object is the same as that of the gold standard, to secure universal convertibility and the maximum stability of currencies.

Different individuals' judgments on the desirability and workability of the Fund are therefore likely to vary with their opinion, considered in the light of subsequent events, on the return to gold in 1925. Of the theoretical desirability of a universal system, few will have any doubt. But equally few will deny that the gold standard system failed rather disastrously after the last war. If this new system is to work, one of two conditions must be met. Either the new system must be such an improvement, in its internal arrangements, over the rigid gold standard that it would have worked in the years of the Great Depression, or else there must be sound reason for believing that another Great Depression is entirely impossible. On the first point, it is difficult to believe that the elasticities in the new scheme, welcome though they are, would have been nearly enough to save it when the hurricane blew. And on the second point, the only sound judgment is that it is far too soon to tell—and that it will remain so for quite a long time.

Two anxieties of equal strength appear to be in opposition to each other. On the one hand, no opportunity must be missed to build a free and co-operative system of world trade. On the other hand, the mistake of 1925 must not be made again. The first anxiety would counsel an acceptance of the Bretton Woods Agreements. The second, unless there are very great achievements in other departments of economic policy, would counsel their rejection. The only possible course is, for as long as possible, neither to accept nor to reject.

The Administration of Policy

WHEN the Beveridge Report on Social Insurance and Allied Services came out, the group of Tory reformers made it a test of the Government's good will that the suggestion of a Ministry of Social Security should be accepted. Until very recently it seemed probable that the Government would continue to resist this demand; and that its own White Paper on these subjects, which is to appear shortly, would contain instead a proposal for the establishment of a Social Security Board. Now it seems, however, that there have been second thoughts. Apparently the resistance of established Ministers with responsibilities

in neighbouring fields of administration (especially in labour matters) has been overcome, in part at least; and, at any rate according to report, there is to be a Ministry after all.

This decision, if it has been made, is not unimportant. It represents the very sensible recognition, no doubt, that social insurance and the rest cannot after all be taken "out of politics"; Board or Ministry, there must be responsibility, through a Minister, to Parliament; as a protective device, the non-Ministerial Board (except in purely technical matters) is both erroneous and unwork-

able. As an administrative device, however, in certain fields, there is much to be said for the Board (with Ministerial responsibility).

This is an instance of the problem that has arisen with every extension of public responsibility since at least the Elizabethan Poor Law. What kind of agencies, central and local, can best combine efficient administration with popular control? Broadly speaking, after many trials and errors, two conclusions seemed, until lately, to have emerged from past experience, and are embodied in present practice. The first is that, in the system of Cabinet and Parliamentary government, some Minister of the Crown (and, in most cases, some Ministry or Civil Service department) must be responsible, and be held responsible, for any central or national administrative activity which involves the receipt or expenditure of public funds. The second conclusion is that, similarly, local administration involving expenditure from rates must be the responsibility of committees of locally elected councillors acting through appointed officers.

The old question that arises sharply again at the present time is whether this machinery, despite the unexceptionable principles upon which it rests, is sufficiently flexible to permit the efficient performance of all the increasing number of complicated technical tasks that have to be carried out by public authorities. There have been periodic doubts about this during the past hundred years.

★

Repeatedly, the suggestion has been made that certain tasks would be best performed, centrally or locally, by bodies of experts, sufficiently secure in office to ensure continuity of policy. Repeatedly, notably in public health and the administration of the poor law, "boards" of experts have been set up. Always, as Bagehot once pointed out, "the experiment of conducting the administration of a public department by an independent unsheltered authority" has failed: "Parliament always poked at it, till it made it impossible." Only in the case of public utilities, which, in addition to the technical nature of their operation, are also self-financing, and mostly non-controversial, has it been possible (as PEP pointed out in their recent broadsheet on the Health Services*) to set up public corporations "as an alternative to direct Ministerial control."

There can be no doubt that this stubborn resistance to government by experts has sprung from the soundest of instincts. It would be a grave matter if authority over persons and property or access to the public purse were to pass from the responsibility of Ministers or to escape the surveillance of Parliament. But many main branches of public policy are becoming as highly technical in their operation as the public utilities themselves. In a sense matters such as public health and social security are public utilities. What was once, for the most part, a problem of constitutional and political practice has become a serious technical dilemma. Except in special cases, such as the Treasury, the established administrative agencies of the Civil Service lack the personnel and expertness to do this technical work; and the programme of reconstruction that the Government is now producing stage by stage has brought these issues to a head.

The problem has arisen in the case of the proposed National Health Service. Rightly, the demand of the British Medical Association that this Service should be conducted by a corporate body of doctors is rejected. But need the responsible department be "of the traditional type"? The Government's answer in the White Paper, it will be remembered, is Yes and No. That is to say, the Ministry of Health will still exercise responsibility over the whole field of the health services, but between the Ministry and the public service of general practitioners there will be a Central Medical Board. This Board will be made up mainly of practising doctors, though it will also include some full-time and lay members. It will be appointed by the Minister after consultation with the medical profession, and will be subject to the Minister's

* Medical Care for Citizens. Planning No. 222. 16, Queen Anne's Gate, London, S.W.1.

general instructions. But the Government's intention is that the Board should have considerable latitude in its administrative work and even, within limits set by the Minister, in the spending of public money.

★

It may therefore be asked what future there may be for "semi-detached" administrative organs of this kind? It should be noted that a Central Medical Board, if it is set up, will not be the first instance of this development. There already exists the Assistance Board. The members of the Assistance Board are public servants, but do not belong to the regular Civil Service. They are drawn from persons with experience and knowledge of unemployment, pensions, allowances and social payments of all kinds. They work, as the CMB will, under Ministerial direction, mainly that of the Minister of Labour—though several other Government departments are concerned. But from day to day they work on lines which they themselves lay down, and they have undoubtedly carried out their functions efficiently—though, it should be admitted, they have not worked without collisions with the officials of the departments (chiefly the Ministry of Labour) to which they are half-attached. The forthcoming White Paper on Social Insurance and kindred topics, then, is likely to carry an important discussion a stage further. The statement of reasons why the Government has after all preferred a Ministry to a Board—if this is so—should be illuminating.

This problem is not really one of principle, because, as experience proves, government can never be taken "out of politics." Is it a problem of practice calling no doubt for different empirical solutions in different instances. Present trends suggest that two possible complementary solutions may be emerging. One is the increasing attachment to Ministries, at one stage removed and with a considerable degree of autonomy, of bodies of experts. The other, which is even more essential, is the recruitment for the Government departments themselves of men and women with knowledge and experience of technical affairs.

These two tendencies really amount to the same thing. They illustrate the obvious need for an extension of the Public Service to include what, in the broadest sense, may be called "technicians." Whether these men and women with training in technical matters can best be used as Civil Servants proper or as the staffs of "semi-detached" bodies, and whether they should be full-time officers or part-time *ad hoc* appointments—these are matters to be decided according to the requirements of each particular case. The point is that the democratic administration of technical tasks cannot be carried out without their recruitment and assistance.

There are already a number of instances of this need in the reconstruction programme. The Board of Trade will be unable to carry out its functions under the proposed Employment Policy unless it is provided, not only with the assistance of the Central Statistical Office to collate and interpret the figures of industrial activity, but also with officers—or attached Boards—capable of, say, understanding and advising the course of industrial production and location. This is true whatever division of functions may be made between the Board of Trade, the Ministry of Labour, and a possible new Ministry of Industry. One obvious example of a requirement which will almost certainly arise in the maintenance of employment is that of a National Investment Board, capable by its terms of reference and by its staffing, not simply of passing investment projects through a sieve—which might well be detrimental and delaying—but of helping to set on foot fresh activity when economic prospects require it. A Ministry or Ministerial department would hardly do here.

★

Another example is that of land policy. Here it is not simply necessary to staff the Ministry of Town and Country Planning with "technicians" capable of seeing the problems of land development in a positive and expert light. There is also to be a National Land Commission—another "semi-detached" board—which will be centrally concerned with the balancing of compensation expenditure

and betterment receipts, and therefore with the pace of land development; it will plainly need its experts—and, at some stage removed, its responsible Minister.

These instances will no doubt be multiplied as the Four Year Plan unfolds. They have their local parallel. Much of the difficulty of finding local authorities suitable to carry out each of the added tasks of reconstruction arises, admittedly, from the wide divergences among local authorities in size and wealth. But, even if these differences can be remedied by regrouping, and even if the undue burden to be laid upon the rates were remedied by the transfer of some services to central funds, there would still be an acute administrative problem. Already this problem has arisen in the case of the Health Services. Here it has been found necessary to propose joint regional authorities for those hospital and specialist services which must cover a wide area to be efficient and economical. It is important that such bodies should be equipped with competent personnel; and that the existing local authori-

ties themselves should be provided in their committees; as well as in their local offices, with competent men and women in specialised matters. There is a case, while not abating in any way democratic control by elected councillors, for the co-option of many more "technicians" to many more local committees, as well as for their appointment to local departments.

There may be fears in face of these arguments that the trend is, in effect, towards technocratic control; that these suggestions are intended to bring in government by experts by the side door. But the reverse is the case. There is a choice before us between democratic and technocratic control. The need is that the former, to survive, should be rendered efficient in all the complicated aspects of modern administration. It is to secure this efficiency, without abating democratic responsibility, that proposals of the kind outlined above must be made. If they cannot be applied, and if efficiency cannot be secured, then popular government may indeed give way to the experts' rule.

East Prussian Bastion

THE Russians' advance towards East Prussia has brought them for the first time into direct contact with German territory. Reports from East Prussia suggest that the Nazis are preparing to make a grim effort to hold the province. Reserves have been brought up from Germany, and for some weeks now the local authorities have been making feverish attempts to build up a defence line. The Gauleiter has mobilised thousands of men and women to work on trenches and strong points; and, in a belt of 18 to 25 miles running from the east of Tilsit through Rastenburg and Allenstein, reports speak of the evacuation of the entire civil population and the transformation of the area into a strongly mined and fortified line. These reports suggest a hard fight to the finish.

The military reason for preparing a long defence is inherent in the Germans' whole position on their Eastern front. East Prussia and Warsaw are two pivots of an indivisible line. If the one falls, the other must fall as well. To lose at a blow East Prussia and Central Poland would be an incalculable military setback. Neither point will be abandoned without grim and determined resistance.

The Germans have other reasons for attempting the defence of the province. None is so compelling as the strategic reason, yet each reinforces the military decision. East Prussia stands for much in the "myth" of Germanism and the Reich. As one of the factors in the building of the Prussian state, it was a forebear of the Reich itself. As one of the homes of the Junker class, the landowning backbone first of the Prussian and then of the German army, its history is woven into every page of Germany's expansion. It was the first province to revolt against Napoleon, and this act gave it the moral leadership of Prussia and hence, for a time, of the United Germany created by Prussia. In the last war so strong was East Prussia's weight in the counsels of the General Staff that troops were withdrawn from the Western Front to defend the province against the advancing Russians—a defence which culminated in the victory of Tannenberg but which may, however, have been achieved at the cost of defeat on the Marne. In 1920, the province won a new place in German esteem when the southern and western districts voted by an overwhelming majority to remain with Germany. Only the Soldau district opted for Poland.

The coming of Nazism has made no difference to East Prussia's political reliability or to its place in the "myth." The agricultural ruin which faced the large landowners in the 1930s and the attempt to reform, in the teeth of their opposition, the whole basis of land ownership and of the Reich's agrarian policy was one of the most influential factors in hastening the downfall of Dr Brüning and of the Weimar Republic and in securing Hindenburg's support for the advent of Hitler. Between 1928 and 1933, East Prussia became something of a Nazi

stronghold. The Nazi vote sprang from 0.8 per cent. of the votes cast in 1928 to 47.1 per cent. in 1932. In 1933, after the Reichstag fire, the Nazis received 56.5 of the East Prussian vote, the highest percentage of any district in Germany.

Since that time, at the price of preserving intact their social position as great landowners, the Junkers have had to abandon all control over their economic policy. They have sown and grown and marketed to the orders of the Nazi administration. But it would be a great mistake to assume from this that the war has seriously undermined the political conservatism and fervent nationalism of East Prussia. In the latest military crisis, no single East Prussian conspirator has so far been named among the senior officers.

A total withdrawal from East Prussia would cause the Nazis some economic embarrassment. Hitherto the province has produced a surplus of rye, potatoes, livestock and dairy products. Central Poland has also been transformed, by means of starving the Poles, into an export area. The loss of both would create a serious deficit. Under the Nazis, East Prussia has been steadily industrialised. To give a significant index, the generation of electric power increased by 70 per cent between 1932 and 1939. Since the beginning of the war, the general policy of dispersing armament production has brought many new undertakings to East Prussia. Elbing, for instance, has motor car works and aircraft factories. The province's timber has been the basis of an expanded output of chemicals and cellulose. The Nazis probably hoped to make Königsberg a big commercial and industrial centre for the Baltic States. The annual Fair has been held on a very much larger scale during the war. There can be little doubt that to abandon the province would lead to a real measure of economic dislocation.

Finally, evacuation would entail the return of a certain number of people to Germany. Hitherto, East Prussia has been a reception area for the blitzed cities of the Reich. The effect of sending a new stream of refugees back into Germany might, at this critical moment, have a disastrous effect on morale. "The Russians have broken in." This would be the tale, reported by hundreds of eye witnesses, that might create a wave of panic in the already shaken Reich. This may, after the strategic reasons, be the most compelling argument for a policy of resistance at all costs.

Its chances of success seem very doubtful. The Russians may possibly be compelled to pause and reorganise before they return to the advance. This pause may enable the Germans to stabilise some sort of line. Yet nothing in the Russian advance and the German retreat so far suggests that such an outcome is likely. Like Normandy, like Southern Poland, like Tuscany, East Prussia is one of the crumbling bastions of the Reich.

NOTES OF THE WEEK

The Battle of France

The last week has seen a significant change on the battlefields of Europe. The sweeping Russian advances to the Vistula, to East Prussia and towards Upper Silesia have temporarily halted, while the stationary fighting in Normandy has been superseded by mobile warfare that matches all the precedents of blitzkrieg. The lightning American thrust from Normandy across the neck of the Peninsula of Brittany was an operational masterpiece similar to the German drive to the Channel in 1940. This stroke not only gave the Allied Command room for sweeping manoeuvre; it also made it possible to strike at once at an open and vulnerable flank of the German defences, and so to upset all the enemy's operational plans. Within a few days American columns have covered half the distance between Rennes and Paris; approaching the Loire Valley at Angers they now head towards Paris through lightly held and ideal tank country. The German reaction to the threat was an attempt to cut Normandy from Brittany at the vulnerable joint of the two fronts in the area of Avranches. The German blow, heavy though it was, was too weak to achieve its purpose, and it was strong enough to bring about a further dispersal of the German forces in Normandy. The concentration of four Panzer divisions in the Avranches area weakened the German defences on the Caen and Orne sectors sufficiently to allow the Canadians to break out in strength towards Falaise. If this advance from Normandy gains speed and momentum, then the next phase may well be a drive towards the Seine valley parallel to the American advance in the south. If this happens, the transition from stationary to mobile warfare will have been summated; and the whole strategical outlook in Western Europe will be radically changed. The Battle of France is speedily mounting towards a climax at the moment when a new climax in the Battle of Poland cannot be delayed for long. On all fronts the Germans are still fighting stubborn delaying battles, among which the Battle of the Baltic Lands has been the biggest so far. But everywhere these delaying actions now seem to have only tactical significance; they no longer fall into any coherent strategical pattern.

Plot and Purge

A People's Court has already condemned eight German officers to death by hanging and five more await trial. Its procedure was remarkable, for not only is this the first trial of German officers by a civilian court in the first trial of German officers by a civilian court in wartime, but it seemed to repeat with nightmare precision the methods, language and atmosphere of the trials in other totalitarian purges. The trial itself and the various proclamations and speeches made since the discovery of the conspiracy throw some light on the extent of the crisis through which Germany is passing. It is clear that the plot itself was very widespread among the old commanders and their staff officers. The presence of von Rundstedt and Keitel on the Army Court of Honour which expelled the guilty officers from the Army, and handed them over to the People's Court, should not be taken as a conclusive proof of their own innocence. To compel men under suspicion to condemn those with whom they may have conspired is a well-known way of breaking down the solidarity of a rebellious class and of ensuring against a forming of new coalitions. Of wider ramifications, beyond the influential officer corps, there are some unsubstantiated reports, but they do not make much sense. Hellendorf, head of the Criminal Police of Berlin, has had connections elsewhere in the Reich, and this is the nearest report comes to suggesting widespread disloyalty among civilian officials. The only sign of connivance among the old industrialist interests is the mention of Goerdeler, who apparently had connections with Krupp—and possibly with Schacht—and is said to have been sacked by the Nazis in 1936 for criticising the economics of autarky and total war. It must be concluded that only the officers were really involved in the plot and were alone ready to give it leadership.

The very striking fact which emerges from all the varying and contradictory reports of the plot is that it was to a very large extent non-political. The leaders of the conspiracy seem to have concentrated on the fact that under Hitler's leadership the Army was being destroyed and that to save the Army the Fuehrer would have to be eliminated. This idea has already appeared from time to time in the propaganda made by the generals in Russia, and it suggests a surprisingly innocent ignorance among the officers of the strength and organisation of the Nazi Party. Only once in their plotting is there any evidence of embryonic political ideas. Among the orders which the Nazis accused them of preparing was an instruction to local commanders to occupy the concentration camps, free the prisoners and intern their guards. Apart from this, there was apparently no attempt to appeal to the masses, no attempt to forecast a new and better social system, not even an absolutely unequivocal call for peace. Thus the officers set out with the rather small lever of their own personal influence to shift the massive apathy of the weary, frightened and dragooned German people. The Nazis' method of liquidating the plot is to consummate the Party's control over the Army, but no amount of artificial plastering can mend the breach that has appeared in the Army's leadership, and in the next few weeks of desperate fighting it is on the Army that the Nazis will have to rely. With new defeats, new fissures will appear. This is in reality the beginning not the end of the German plot.

The Pace of Parliament

The present session of Parliament, like the war, has reached a late and critical stage. The two are closely connected for, if the best happens in Normandy and on the Eastern Front, the end of fighting in Europe will find the country still unprepared for the rush of new and urgent tasks. This is not because of any lack of preparations. White Papers on Employment Policy, Monetary Policy and National Health (to be followed very soon by one on Social Insurance) have given proofs of hard labour in the departments and the Cabinet—and a chance for Parliament to show its paces, with mixed results, in deliberation. It is legislation, however, that counts and it is legislation that is still perilously lacking. This is not due to shortage of Parliamentary time, as was feared, but to the scarcity of Bills. The war is moving faster than the Coalition Cabinet, whose infinite capacity for taking pains—so much to be welcomed and praised—is not accompanied by a corresponding capacity for reaching final decisions. There are preparations, in abundance, but still insufficient preparedness. Only four Bills of major importance for the outbreak of peace have come forward during the session. Two—Mr Butler's Education Bill, which has been a triumph for all parties and sects, and the Housing (Temporary Provisions) Bill, to speed up the building of permanent houses—have become Acts.

Government and Opposition

Responsibility for the scantiness of post-war legislation cannot be put entirely upon the Government. The two major Bills which are still held up are the Town and Country Planning Bill and the Housing (Temporary Accommodation) Bill, to provide emergency factory-made dwellings in the first two peace-time years. In each case there are faults of detail in the Government's proposals which require putting right. The failure in the former Bill to allow for changes in the value of money for the compulsory purchase of land at "1939 values" may be cited. So, too, can the failure in the latter Bill to settle satisfactorily crucial questions of design, cost, contracting and siting. In both much wider problems of planning policy are involved and require solutions. But these and other larger, and less relevant, issues—such as that of nationalisation—have been much magnified by a cantankerous opposition, in which neither the associations of local authorities nor the Labour Party have shown up well. This kind of wrecking, which comes mainly from groups who call most loudly for the utmost speed in reconstruction, illuminates

the difficulties confronting the most conscientious Coalition in making progress, even in matters where there is general agreement—especially when, as at present, the various parties are casting an interested eye towards an early General Election. Such opposition would probably be the reason given by the Government—with not a little disingenuousness, no doubt, for some of its firmest supporters, too, are jockeying for electoral position—to account for its cautious and tentative advance. But the nation's requirements remain unaltered by any of these political considerations; and the possibility that, for instance, the war may end without the vital housing programme having been put properly in train may prove a discredit to all concerned.

Planning Bill

The Planning Bill has gone into a tunnel, in which criticisms are being worked out which will emerge into the light—and heat—of day when the committee stage is taken in the autumn. The Bill's critics come under two heads: those who question the fairness of its financial proposals, and will be satisfied with adjustments of these details, and those who threaten to wreck the whole Bill because it does not go far enough in principle. In the first category are the Tory Reform Committee who have tabled a number of amendments relating to 1939 land values. In the first place, they do not see why only the small house-owner and farmer should be compensated for the expense of obtaining alternative accommodation, and urge that this concession should be extended to all owner-occupiers. They also urge that owners of agricultural land should be able to recoup all capital expenditure upon their land made since 1939, much of which has been laid out at the request of War Agricultural Executive Committees. In the second place, the Tory reformers wish to deprive speculators of gains they would otherwise make out of the purchase of land at less than 1939 values—a laudable aim but one difficult to achieve in administrative practice.

The National Setting

The second body of the Planning Bill's critics, who include a large section of the Labour party, object on principle to a measure which starts with local and not national planning. They do not necessarily want a close and rigid national plan, which would be politically impracticable and probably undesirable. But they point to the inadequate basis it provides for local decisions. Since good planning creates betterment not only locally but in outside areas, local authorities cannot bear the cost of spacious redevelopment until they are positively assured that they will be able to recoup some part of their outlay from a common fund. Further, if the Government's principle of loosening up overcrowded areas is to be satisfactorily worked out, many "overspill" areas will need to be placed at a good distance away and within the districts of other local authorities. This means a transfer of rateable values and requires, in addition to some compensatory device to balance one area's loss and another's gain, better machinery for central guidance, and regional consultation—a point which applies equally to the selection of emergency housing sites under the Temporary Housing Bills. Since, finally, any local programme of redevelopment or decentralisation needs to march in the closest step with the movement of industry, local authorities cannot begin to plan properly without receiving some central guidance on industrial location. The moral to be drawn from these various objections is not that the Government should shelve the Planning Bill and start again. It is rather that the Government should give assurances about—and hasten on—its other planning measures which should provide the national setting against which local authorities can rebuild with confidence and boldness.

Story of a Rising

On August 1st an armed insurrection broke out in Warsaw; and on August 10th the insurgents were still heroically fighting in the streets and squares of Poland's capital. They captured several districts and a number of important key-points; but the latest reports from Warsaw suggest that the position of the insurgents may now have become untenable in the face of overwhelming German armour and aircraft thrown into the battle. When the rising started the Polish insurgents could hear the sound of Russian guns in Warsaw's suburbs. But as the struggle reached its critical climax an uncanny silence settled on the Russian front, only a few miles distant from the scene

of the fighting. Directed by people who take their orders from the Polish Government in London, the rising was clearly not fitted in with the moves of the Soviet Command. When it started General Rokossovsky apparently decided to outflank Warsaw after a tentative and unsuccessful attempt to storm the city in a frontal attack. It may well be that his armies, engaged in outflanking manœuvres, were not in a position to take advantage of the "windfall" in Warsaw and to switch over to a new frontal attack. The tragic lack of co-ordination between the Polish insurgents and the Soviet armies has been a direct result of the political rift between Russia and Poland; and, in this sense, the Polish Government may perhaps be partly to blame for the avoidable tribulations of its Underground army. But the matter does not rest here. The Poles, recalling the pledges of 1939, have asked their western Allies for help. There again it is difficult to say whether effective British help could have been given to Warsaw under the present circumstances, when the fronts in France and Italy must have an obvious priority in demands on Allied resources. But there are in this country Polish squadrons in the RAF and units of Polish parachutists which have been trained precisely for such tasks as assisting risings inside Poland. Those forces are now serving under Allied operational command. Why then have Polish airmen and parachutists not been detailed to help the insurgents in Warsaw? True, Warsaw has now come within the sphere of the Russian Supreme Command. But that surely does not mean that the Polish Government, recognised by Great Britain and the United States, ought to be denied the chance of sending Polish forces to aid their fighting countrymen. Or are the Poles perhaps to lose the right to struggle on their own soil for their own liberation?

Provincial Elections in Canada

This week's two Provincial elections, in Quebec and Alberta, were chiefly interesting to the outside world for the light they shed on the Federal election, which must be held within the next nine months. In Alberta, the question was whether the Co-operative Commonwealth Federation would carry another prairie province. The answer appears to be No, though the Federal Liberals cannot derive much comfort from the fact that the election was won by Alberta's own indigenous Social Credit Party, which might well co-operate with the CCF at Ottawa. In Quebec the question was whether or not the Liberals can count, in the Federal election, on the traditional support of French Canada, which has played perhaps the chief part in keeping them in power, and Mr Mackenzie King in the office of Prime Minister, for 18 out of the last 25 years. If not, then they will almost certainly be put out. But if they can carry Quebec, they still have a chance, with scattered support from the Maritime Provinces and elsewhere, to emerge as the largest party in the next House of Commons. No very clear answer was given on Tuesday. Mr Godbout, the Liberal Premier of the Province, was defeated, but not by a large margin, since he won 38 out of 91 seats, with two results still in doubt. The victors were Mr Duplessis, Union Nationale, which will have from 45 to 47 of the seats. Mr Duplessis has some links with the Federal Conservatives, but they are not very close, and it is quite possible that the Liberals will carry Quebec in the Federal election. They will certainly win quite a number of seats there. Thus, though omens are certainly not favourable to Mr Mackenzie King, they are by no means so decisively unfavourable, particularly when taken with the splitting of the Opposition between the CCF and the Progressive-Conservatives, to make the result a foregone conclusion. On the Provincial stage, the result of the Quebec election can only be deplored. Mr Godbout's administration was able and progressive; Mr Duplessis, to judge by his past record, will be narrow and sectarian.

The Doctors' Verdict

The doctors' replies to the British Medical Association's questionnaire on the Government proposals for a National Health Service have dispelled the fears, raised by a voluble and reactionary minority, that professional opinion would prove mainly obstructionist. While the results of the inquiry (conducted for the Association by the British Institute of Public Opinion) are inconclusive and often contradictory, it is quite clear that the doctors are in sympathy with the aims of the White Paper and

will support most of its programme of reform in general terms. A very important discovery is that 60 per cent of all doctors accept the proposal that medical services and hospital facilities should be available to all citizens without exception or means test. This decision automatically revokes the one taken at a representative meeting of the BMA last September in favour of the exclusion from the scheme of 10 per cent of the population (an "unsubmerged" tenth) in the higher-income group. The replies show further that a majority of doctors support the White Paper proposals concerning health centres, the purchase and sale of general practices and the Central Medical Board's control over the location of new practices. Two out of every three doctors approve of the principle of the health centres—the most constructive and perhaps the most radical proposal in the White Paper. Moreover, the majority favour the form of health centre suggested by the Government—

a centre where both preventive and curative work is done, including, for example, maternity and child welfare and school medical treatment.

But there is another side to the picture. In spite of so much common agreement the question, "... do you consider that the quality of the country's medical service (on the lines proposed) will be enhanced or will suffer," elicits pessimistic replies from every appointment-group other than Service doctors and salaried doctors. The general reaction of the medical profession to the White Paper is unfavourable in the proportion of four to three. A majority of doctors regard the future of the profession as "unattractive." A majority—57 per cent—do not think that it will be possible for a general practitioner to continue in private practice under a national health service.

The root cause of professional dissatisfaction with the Government's scheme, apart from uncertainty about the remuneration to be paid, is distrust of the proposed administrative machinery. There is decisive opposition to the exclusion from the regional joint boards of doctors and representatives of voluntary hospitals and university medical faculties—though the principle of joint board planning and administration is widely approved. In other words, the profession would abhor any proposal for the control of medical services by local authorities "as at present constituted," and feels that such a proposal is contained in the White Paper. The doctors find the proposed central administrative structure equally objectionable, and suggest a more direct representation of medical opinion. The doctors cannot now be accused of apathy (25,435 out of 53,728 replied to the detailed questionnaire) or a lack of social consciousness, and the layman will be ready to support any reasonable modifications and concessions. In the planning and administration of the nation's health services professional experience and wisdom should be used to the full, and medical representation on central and local bodies should be sufficient for this technical purpose. But responsibility must rest firmly and unexceptionally with Whitehall—and, finally, with Westminster.

Conference Reporting

A letter to the Editor from Lord Keynes, which appears on page 215, reveals that his press conference at Bretton Woods was badly misreported in the British press, upon which, of course, *The Economist's* comment was based. It is a serious matter when the head of the British delegation is at an important international conference is represented as saying the opposite of what he actually did say. Nor was this the only defect in the reporting of Bretton Woods. The British papers could not, in present circumstances, find room for very much; but they might have tried to make their brief accounts relevant and intelligible. Anyone in London who tried to inform himself about what was happening by following the daily summary of the American press was in no better state, for the American reporters, with their constant search for the melodramatic and their love for surface details such as personalities, and for external forms such as votes and quotas, gave a wholly distorted picture of the conference, not untainted by their proprietors' political views. It might have been thought that

the official summary of the Agreements, prepared by the United States Office of War Information, and distributed by the United Nations Information Office, would be accurate. But it proved to be so full of ambiguities and omissions as to be of less than no use at all to those who wished to discover how far the draft plans had been modified. It led opinion in this country to believe that the "scarce currency" clause had been dropped, which is not so; and it was entirely silent about some important changes that have been made, and are discussed in an article on page 207. In short, the whole business of informing public opinion in this country of what was afoot was bungled about as badly as it could be.

On whom the blame for this state of affairs should fall—on Reuter's, on individual newspapers, or on the Government—is not easy to determine. It would be grossly unfair to blame the British correspondents in the United States, who are understaffed in any case, and quite unable to cover a technical conference in an inaccessible place hundreds of miles away from their normal locations. But it is to be hoped that the lesson will be learned for the future—that is, if there are to be any more conferences in American health resorts. It is no good relying, in these matters, on the American journalists, whose telegrams read, to an Englishman, more like crime reports than serious accounts of what is going on. It is apparently no good relying on the official information agencies of any one Government, which will, perhaps, naturally, omit from their summaries the parts that do not strike them as important—but which may be vital to other countries. Nor is it any use relying on the general-purpose reporter. What should have been done at Bretton Woods was to see that at least one competent British financial journalist was present who, without being given any special facilities, would at least have known the difference between an exchange rate and a balance of payments. If neither the agencies nor the newspapers will make such an arrangement on their own initiative, it is to the Government's interest to stimulate them into doing so.

*The merry
monarch
had a bright
idea...*

He made good the deficiencies in his budget by personal borrowing from those early bankers, the City goldsmiths, on terms which were highly satisfactory—to His Majesty! No wonder the limits of the Royal Prerogative took so much thrashing out in Charles II's days. Subsequent and more enlightened Governments have deemed it wise to encourage the Banker, with the result that today the advantages of a complete banking service are available to every citizen. The Westminster Bank with its network of branches offers you the security and convenience of a Current or Deposit Account, while its Trustee Department offers the testator the advantages of corporate executorship. Call and discuss these and other services with your local Manager.

American and British War Efforts

After a long delay, copies of the April issue of the *Survey of Current Business* containing the annual article by Mr Milton Gilbert and Mr George Jaszi on the National Income of the United States, have become available. The salient figures are as follows:—

	(In \$ billion)	
	Net National Income	Gross National Product*
	Current	Current
	Dollars	Dollars
1939	70.8	88.6
1940	77.6	97.1
1941	96.9	119.6
1942	121.6	152.1
1943	147.9†	186.5‡

* Gross National Product = Net National Income + indirect taxes + allowances for depreciation, etc. † Net National Income in the 4th quarter of 1943 was running at the annual rate of \$153.5 billions. ‡ Gross National Product was running, in the four quarters of 1943, at the annual rate of \$179.8, \$185.0, \$189.3 and \$191.7 billion respectively; the rate of increase was thus slowing down.

For the United Kingdom, Net National Income in 1943 was £8.17 billion and Gross National Product £9.80 billion, both figures at current prices; the latter figure was estimated by *The Economist* to be the equivalent of £6.79 billion at 1938 prices, compared with an actual GNP in 1938 of £5.57 billion. It is tempting to try to compare the absolute magnitudes of the two national outputs by converting dollars into pounds. Unfortunately, there is no reason to suppose that the official rate of \$4=£1 is an accurate reflection of economic realities. All that can be said is that, if the official rate did chance to be a correct conversion factor, then the American net national income in 1943 would be £37 billion. This would be 4.7 times the British figure in absolute amount and 1.65 times on a *per capita* basis.

What can be done with rather greater accuracy is to compare the wartime growth of output in the two countries. The Gross National Product of the United States is esti-

mated to have increased between 1939 and 1943 by no less than 75 per cent in real terms—that is, after allowance for the fall in the value of money. *The Economist's* estimate of the increase in the British GNP between 1938 and 1943 (i.e., over five years, not four) was 22½ per cent (May 6, 1944, page 607). The reasons for the discrepancy are obvious enough—they lie in the disabilities imposed on Britain by blockade, blackout and bombing and by more intensive call-up of labour, and they are also to be found, in part, in the larger margins of unemployed resources that existed before the war in the United States. But the magnitude of the American increase is nevertheless one of the economic miracles of the age. It has enabled the American people to meet the whole of their gigantic war output without curtailing consumption, which has in fact risen every year. The following figures, all of which are reduced to the basis of pre-war prices, point the contrast:—

	United States		United Kingdom	
	1939	1943	1938	1943
	\$ bn.	\$ bn.	£ bn.	£ bn.
Government expenditure ..	16.0	82.7	0.84	3.84
Consumption	61.7	70.8	4.14	3.27
Private net investment	10.9	1.8	0.59	-0.33
Gross National Product ...	88.6	155.3	5.57	6.78

(The U.K. figures are, in part, estimated by *The Economist*.)

It is possible from these figures to derive an interesting comparison of the way in which real resources have been found in the two countries for the war effort (defined as the increase since the pre-war year in Government expenditure):—

	United States		United Kingdom	
	(\$ bn.)	%	(£ bn.)	%
Resources derived from:—				
Increased production	66.7	100.0	1.21	40.3
Reduced consumption	-9.1	-13.6	0.87	29.0
Reduced provision for, and drafts on, capital	9.1	13.6	0.92	30.7
Cost of War	66.7	100.0	3.00	100.0

It will be noticed that the increase in the American Gross National Product exactly equals the increase in government expenditure; provision for capital has had to be reduced only because consumption has increased. In Britain, on the other hand, higher total output, reduced consumption and drafts on capital have been called upon in roughly equal proportions to contribute to the war effort. On this very different experience will hang many post-war tales.

Target for Tomorrow

An article in the May issue of the *Federal Reserve Bulletin* by Dr E. A. Goldenweiser and Mr E. E. Hagen, tries to give precise form to one of these post-war tales. How large must the American national income be after the war to achieve full employment? Gross national income in 1940, valued at the 1943 price-level, was \$119 billion; but in that year, out of 54 million persons seeking work, less than 46 millions found it. At present, gross national product is approaching the \$200 billion mark. In the post-war year "V plus 2," identified as 1947, it will not need to be quite as large as at the peak of the war, but it will have to be as much larger than the pre-war figure as is necessary to provide for (a) the increase in population, (b) the absorption of the unemployed (save for an irreducible minimum estimated at 2,000,000), and, (c) the growth in output per man-hour, moderately estimated at 10 per cent. The answer, according to the authors' calculations, is \$170 billion. In other words, in order to secure full employment, a volume of demand will have to be created 43 per cent greater than in 1940, when the volume of production was already higher than it had ever been before. Put in another way, if the total volume of demand falls after the war to the 1940 level, there will be about 17½ million unemployed. This figure of a 43 per cent needed increase in total demand to secure full employment is the key to the whole of economic policy in the United States. (A comparable figure in the United Kingdom, after allowance for the loss of overseas income, would probably not be more than one-third as large). The authors calculate that, on the basis of probable individual incomes, consumption demand might amount to \$113 billion. Government demand they put at \$30 billion, leaving the very large sum of \$27 billion to be made up in demand for private capital goods.

It is worthy of note that, in estimating how this \$27 billion might be composed, they allow \$ billion for a favourable balance of trade. This may be a realistic estimate, but it will not help other countries to solve their employment problem. Two billions out of 170 may not sound very much, but it is quite enough to point the moral that other countries are concerned not only with the results but also with the methods of American employment policy.

Inquest on Irish Exports

For some time now sporadic doubts have been cast on the effectiveness of Ministry of Food policy in obtaining the maximum supplies of food from Eire. The general contention has been that the prices paid to Irish producers have been so low as to choke Irish exports to a mere trickle. The whole matter was raised a year ago by Lord Strabolgi in the House of Lords. The official view, stated by Lord Templemore, was that the undisputed decline in Anglo-Irish trade was due to factors outside the control of the British Government. The Government itself had "placed no obstacle in the way of the importation of food-stuffs from Ireland." The Battle of the Atlantic had forced Ireland to depend almost entirely on home-produced food; pastures had been ploughed up to produce food, and livestock, which normally supplied the bulk of exports, were drastically cut down. The situation had been made worse by shortage of fertilisers, machinery and fuel. "We have no evidence," said Lord Templemore, "that prices paid for Eire produce have had any limiting effect on the imports from that country." This declaration might almost have been interpreted as a challenge, since the attack was renewed this spring, when the case against the Ministry was re-stated by Captain Henry Harrison in a pamphlet published by the Commonwealth Irish Association. Statistics were given to show that prices offered by the British Ministry were not only below the controlled prices for comparable commodities in the United Kingdom (which is only a reflection of the normal peacetime relationship of prices), but below both pre-war and current prices in the local Irish markets. Placed side by side with the decline in exports, the implication of cause and effect was strongly emphasised. The Ministry's reply to this latest allegation was a complete denial of price discrimination. The Government price policy, on the contrary, had been to maintain a relationship between Irish prices and Dominion prices comparable to that which had existed before the war. The Ministry further disagreed with Captain Harrison that the diversion of a small shipment of foodstuffs to Ireland might have averted the decline in exports. The inquest has now reached the point of deadlock where, each side having stated its case, neither has been proved wrong, and suspicions raised have not been satisfactorily allayed.

The primary suspicion, clearly, is that the British consumer's rations have been placed second in importance to the satisfaction of national prejudice and the habits of an out-dated economic warfare. If this were true, the complaint must rest squarely on the grounds that rations have been lower than they need have been, not on the possible effects of policy on political and economic relations after the war. The criterion of the Ministry of Food's actions must be its efficiency in obtaining and distributing food; it cannot in the circumstances adapt its policy to the expansion of post-war trade or to the economic bribery of a frigid neighbour. On this basis alone the rights and wrongs of the case must be decided. As far as the conflicting arguments themselves are concerned, some comment on the Ministry's defence can be made. The principle of maintaining the pre-war relationship between Irish and Dominion prices, as paid to producers, appears to be somewhat artificial. The real cost to Britain of food obtained from across the Irish Channel is clearly very much less than that of food conveyed across thousands of miles of ocean. Not even the excuse that an alternative policy would have favoured Irish farmers over Dominion farmers can hold good, since the Dominions have already had to control domestic demand in order to divert supplies to Britain. The conclusion is unavoidable that, whatever the difficulties in obtaining an increase, or even a maintenance, of the volume of imports from Ireland, the Ministry of Food have not assisted the situation by their price policy. It is conceivable that, in the circumstances, a policy of higher prices would not have resulted in a very much larger volume of exports, but this has not yet been satisfactorily proved. The

fact remains that the Irish Exchequer has been obliged to subsidise sales to the British Government in order to maintain even the present low level of exports. It is to be hoped that some more detailed account might be published of the prices paid and their relation to market prices, with other factors which influenced British policy. As it is, rightly or wrongly, the impression remains that Government policy may have suffered from a mixture of motives. From the point of view of both the British public and the Irish farmers the impression is a dangerous one.

Shorter Note

THE report of the Mental Nurses Sub-committee of the Nurses Salaries Committee under Lord Rushcliffe has now been published (Cmd. 6542). It recommends a national scale of salaries and emoluments for nurses in mental institutions on the same lines as the full committee recommended for nurses as a whole. For the less senior posts, the scale is somewhat higher for this type of nursing, since it is "less popular and perhaps less congenial than other branches of the profession. . . ." For instance, a female staff nurse would have a salary of £120, exclusive of emoluments, rising by annual increments of £5 to £160, whereas a staff nurse in a general hospital obtains under the Rushcliffe scales a salary rising from £100 to £140.

Letter to the Editor

Bretton Woods

TO THE EDITOR OF THE ECONOMIST.

SIR,—In your issue of July 15th, which has just come to my notice, you report me as having said in a press conference at Bretton Woods that "the real purpose of the Monetary Fund is to bring back gold as a fundamental reserve money." In fact I said nothing of the kind.

In case the matter is of any interest, the following is an extract from the report of the press conference in question, published in *The New York Times*:—

Lord Keynes said the modified form of gold standard being considered here was not inconsistent with his denunciation of the old gold standard in 1933 as "a barbarous relic." The old standard was so "rigid," he explained, that it could not stand the strain of crisis, and finally broke. Under the proposed standard, all currencies would have a "link" with gold, but it would be "flexible" enough to permit orderly changes in exchange rates when necessary to avert the breakdown of monetary systems, competitive currency depreciation and similar measures of economic warfare.

British sentiment is strongly opposed to a return to the "rigid" gold standard, he went on, adding that the present "scheme," as he called it, was "quite different" in its flexibility. "It retains the link with gold, but it can be adapted to changing circumstances from time to time," said Lord Keynes. "It provides the machinery of consultation and agreement by which orderly changes can be made. I have never argued that gold was 'a barbarous relic' in this sense. When I was criticising the old gold standard, I made various proposals for retaining the link with gold. I proposed that gold be made a 'constitutional monarch,' so to speak, which would be subject to the constitution of the people and not able to exercise tyrannical power over the nations of the world."

He said it would be very "foolish" to propose "departure from the gold link." With the United States and certain Western European countries holding large quantities of gold, and with the British Commonwealth and Russia producing large quantities of the precious metal every year, he went on, "no one in his senses would want to make the gold resources of the world useless or throw the gold miners of the world out of employment."

Yours, etc.,

KEYNES.

MILK CHOCOLATE & the Nation's Milk Supply

THE contribution of the Milk Chocolate Industry in ensuring Britain's milk supply during these critical war years is not generally realised.

Before the war this industry was using 40 million gallons of milk a year. Cadburys took more than half of this vast quantity. It came from the counties of Hereford, Gloucester, Salop, Stafford, Flint and Denbigh where Cadburys have consistently encouraged dairy farming over a number of years. In these areas they have established four Milk Factories which have greatly assisted in developing milk production. Today these four factories alone collect and distribute sufficient fresh milk for well over a million people.

Cadbury means Quality

AMERICAN SURVEY

Post-War Rubber Supplies

(By an Industrial Correspondent)

Akron, Ohio, July

IF natural rubber were to be made available in large quantity this year the American rubber industry would without question revert to it for most purposes. But the industry actually expects to be using synthetic rubber for a number of years after the end of the war with Japan. By that time, some technicians say, the arts of its manufacture and use will have so improved that it will compete in price with tree rubber from the Far East. At any rate, the United States will come out of the war with plants capable of making 1,075,000 tons of synthetic rubber a year; this rubber will have a number of special uses, mostly new ones; and it will in effect place a ceiling on the price of natural rubber no higher than 20 to 25 cents a pound.

The industry purchased additional tyre-making equipment when it was found impossible to build tyres from synthetic rubber anything like as fast as from the natural product. Even if the companies should return to the use of plantation rubber for the bulk of their tyres, they expect to need the new machinery because of the very large orders they anticipate both from the makers of automobiles and the present owners of tyres. "Original equipment" is expected to be required by Michigan's automobile manufacturers for 6,000,000 cars and trucks annually for three or four years after reconversion.

The new set-up for the tyre industry, made necessary in part by the demands of war transport, in part by the problems of working with synthetic, and in part by labour shortage, required an outlay of \$75 million. It will not be entirely completed until next year. Except for the greater length of time required, difficulties in working up synthetic rubber appear to have been solved completely in tyres of eight plies and under, those used for passenger cars. In casings of larger size the troubles result from the tendency of the synthetic material to heat up in use at high speeds. The greatest care in manufacture has not achieved a complete solution of the difficulty on the largest sizes. The losses of time in manufacture, running up to 20 per cent, occur in both the compounding and curing operations.

The belief that synthetic, in the course of time, will completely take the place of natural rubber is based upon three assumptions: that technical improvements will continue; that they will be paralleled by developments of enough new uses to keep the largest plants operating; and that the price of petroleum, the raw material, will remain level.

Before the war synthetic rubber was costing 70 cents a pound and up. As the tonnage produced mounted, the price came down, and is to-day averaging between 40 and 50 cents a pound. Government-owned plants using the petroleum process, however, are delivering GRS (Government Rubber, Styrene) at just under 20 cents a pound. Dr R. P. Dinsmore, vice-president of the Goodyear Tire and Rubber Company, estimates that with plant values adjusted to post-war replacement costs it could be produced for 15½ cents. This is an all-in figure—one or two estimates have been made of 12½ cents, but these do not include depreciation, inasmuch as the plants are Government-owned.

Two of Akron's larger companies, Goodyear and Firestone Tire and Rubber, are themselves important owners of rubber plantations, Goodyear in Sumatra, the Philippines and Costa Rica, Firestone in Liberia. Dr Dinsmore recently said that the efficient large estate with high-yielding trees could lay down rubber in New York before the war for about 11 cents a pound and make a profit of 1 cent a pound, but that there were many estates which could not do so well. Small native estates, on the other hand, had little fixed investment and small labour costs. He believed labour rates would probably increase by 50 per cent or more on the estates after the war, and that prices of natural rubber would have to increase accordingly, by 2 to 4 cents a pound. This would bring the cost of natural rubber on the bulk of the

acreage in the Far East to a parity with the figure for which many in the industry believe synthetic can be manufactured.

John L. Collyer, formerly president of Dunlop and now president of the B. F. Goodrich Company in Akron, is one of those who hold that some production of synthetic rubber should be carried on permanently after the war, regardless of economic factors. He recommends a minimum of 200,000 or more tons of the general-purpose product as a measure of national protection against another severance of supply. A few have proposed that the entire investment in synthetic rubber be preserved, but apparently without response from the rubber-using industries.

All manufacturers appear to assume a permanently much larger use of rubber after the war than before. Mr Collyer thinks the American requirement may be 900,000 tons a year, or nearly 50 per cent more than the 1940 consumption. Dr Dinsmore thinks the US will need 1,010,000 tons a year after military demands have ceased. The latter figure is based on the supposition that civilian automobiles and lorries will be taking upward of 90 million tyres a year and that civilian requirements for "mechanical" goods will be greatly increased by new developments in the use of rubber for cushioning, both for furniture and machinery. The use of rubber tyres on farm machinery is also likely to develop rapidly.

As for the rest of the world, Collyer and Dinsmore both estimate it will require 500,000 tons a year from three to six years after the war's end, Dinsmore on the nearer side. They arrive at a total of 1,600,000 tons a year as the prospective world consumption in the same period. Potential supply by that time will be very large. American synthetic capacity, as stated, will be 1,075,000 tons or thereabouts. Plantation capacity at one time was 1,600,000 tons, but the estates became accustomed to approximately 1,000,000 tons. They are not now expected to ship over 400,000 tons in the year following the end of the war (including the assumed "float" of 200,000 tons), nor over 700,000 tons in the second year.

The statistical picture becomes pretty involved with assumptions as the years stretch out beyond the end of the war, but Dinsmore concludes that a small world surplus of 148,000 tons might be piled up at the end of the first full year of plantation shipments with two more years required to bring it to 300,000 tons. The world, he says, may be facing a tight rubber situation for nearly four years after the war.

American Notes

The Philadelphia Story

The Army's announcement of extreme penalties has brought an early end to the Philadelphia Transport strike. The men were warned that if they did not return to work, they would be dismissed, their places taken by soldiers, and that, as long as the war might last, the Manpower Commission would see that they did not obtain jobs elsewhere. Over and above all this, they would have become ineligible for unemployment compensation, and might have been drafted for military service. This was the big stick with a vengeance. Certainly the situation called for drastic measures. Philadelphia is the second war production centre of the country, and when 6,000 transport workers struck early this week, two million persons were left entirely without transportation, including among them 900,000 war workers. Many of these were unable to get to their jobs, and there was substantial damage to war production. In addition, although lurid accounts of race riots may be discounted, there was tension over the race issue involved. The course of events leading up to the strike was as follows: in December, 1943, the Fair Employment

Practices Committee, an executive agency, ordered the Philadelphia Transportation Company to cease discriminating against Negroes in regard to employment and promotion. On July 1, 1944, the War Manpower Commission announced that under its priority scheme for labour no men would be sent to employers guilty of racial discrimination. On July 8th, the company announced that it would accept applications from Negroes to act as operators of cars and buses on the same terms as white men, although previously they had been employed only in the company's shops, and a training programme for Negroes was organised. By August 1st, eight Negroes were ready for trial runs. At the time the Negroes were due to take out their cars, the white operators struck. According to the War Labour Board, the ringleaders were insurgents not identified with the Transport Workers Union (CIO); and as there was no quarrel between the union and the company, the War Labour Board felt it had no jurisdiction, and therefore passed the matter on to the President. Both local and national union figures, including Mr Philip Murray, President of the CIO, appealed to the strikers without success. Appeals from the War Labour Board, the Army, the Navy, and the War Production Board also fell on deaf ears. The confusion created by the strike was an open invitation to hooliganism, but special police were called in to deal with it, and damage to life and property does not appear to have been great, nor were there many cases of race violence. Under President Roosevelt's orders, 5,000 soldiers were moved in the city to restore order and keep transport moving.

The Race Issue

Philadelphia, which was founded by William Penn, is traditionally described as the "City of Brotherly Love." Why it should have departed so far from its historic description is not entirely clear. As a great war production centre it may be that large numbers of southern whites have been drawn into the war plants, although this should hardly affect the staff of an established transportation company to any great degree. What is more likely is that the men's fears for their post-war jobs were suddenly stimulated by the new and unwelcome prospect of coloured competition. The Fair Employment Practices Committee was created by the President, in the interests of the war effort, to end employment discrimination on account of race, colour or creed. The question of principle involved was intentionally soft-pedalled. On the moral issue of equal rights, there can be no debate. But in war-time there may be some honest doubt as to the expediency of forcing Negroes into jobs where the feeling is so bitter against them. It will be remembered that the Southern railways, when ordered to promote Negroes, refused on the grounds that their white employees would not stand for it, and that war transport would be irreparably held up. The revelation that the Manpower Commission forced the hiring of Negroes, on pain of withholding labour from the company, may raise a storm among those who are convinced that the President persistently uses the war effort as an excuse for attaining social changes otherwise impossible. The Fair Employment Practices Committee has no standing except as a product of the Presidents' war-time powers. Congress may well resent the use of such sanctions; and it is difficult to believe that either Congress or the public would condone to believe that either Congress or the public would condone a strike on such an issue. The firmness with which the strike was taken in hand no doubt will impress the Negro voter, and will provide a not unwelcome offset to the equally drastic ejection of Mr Sewell Avery, the Montgomery Ward chairman, from his office several months ago, though these are minor considerations. What is more important is the proof afforded by Philadelphia that hostility to Negro competition is by no means confined to the South. It may, indeed, be even more violent in the North, because in the Southern states the Negro in fact provides little real competition for the white man, whatever the law may say. It is only too clear that the industrial advances made by the Negro during the war may receive heavy set-backs when peace returns.

Peace President

Mr Dewey has as yet done little campaigning, but he has made it even clearer than he did at Chicago that he regards himself as a candidate for a peace presidency.

Thus the Conference of twenty-six Republican Governors at St. Louis was a war council only so far as the election is concerned. In musical terms, the conference was a cantata for tenor voice and male chorus, with Mr Dewey sustaining the solo part. The interesting thing is that the singing throughout seems to have been not merely dulcet, but pianissimo. The series of policy statements in which (to quote a delightful phrase) the Governors "achieved unity of thought" with their brother from New York are mild indeed. They virtually concede the social advances of the past twelve years; while deploring, for example, "Federal usurpation," they recognised, at the same time, the need for changes in the Federal Social Security Act which will give protection to more citizens, instead of fewer. So in agriculture the responsibility of the Government is fully accepted, although a finger of rebuke is lifted at "whimsical restraints." Those who expected the Governors to emit a choral blast in favour of states' rights were sadly disappointed. The Governors reached the sensible conclusion that in this age the well-being of the American people can only be achieved by the exercise of Federal power in partnership with progressively-minded state governments. If the twenty-two Democratic Governors met together next week they would probably accept the same broad principles. The somewhat jejune efforts made to entice the Republicans into raising the tattered banner of States' Rights seemed to have failed almost as completely as the Southern Democratic revolt in the same direction. There is a growing consciousness in America, more often tacit than expressed, that modern economic problems are forcing a strengthening of the powers of the central Government. A nostalgia for a happier past and a loyalty to old traditions will often make Americans reluctant to put this in words, but the course of action plotted by both parties shows a keener awareness of how the world has changed than do their manifestoes. In both parties it is the defenders of vested interests and old privileges who most frequently take refuge in a devotion to states' rights. Neither Mr Dewey nor most of his fellow-Governors fall into this category. Indeed, many of the Republican Governors are conspicuous in the party for their progressiveness. Mr Dewey has a particularly strong interest in seeing that the authority of the Federal Government is not too wantonly attacked. He is reliably reported to believe that, whoever is elected, the next four years will prove one of the most difficult faced by any President. Mr Dewey may have drawn the picture on too small a scale in arguing that the principal issue is that of reconversion; but there is no doubt that this will be the major domestic problem, and one which for its solution will require the utmost in skill and authority from the central planning machine.

The Last Round-up

A last round-up of manpower for the war factories has been announced by Mr Byrnes, the Director of War Mobilisation. This closer and more effective control over manpower is primarily designed to direct labour into crucial areas of the war effort, where production is lagging; but it is also felt that it will be useful in providing means for rapid transfers of labour to civilian jobs at the appropriate time.

FINANCIAL POLICY IN WARS AND SLUMPS

by H. HOUSTON, M.A., B.Com.

This book sets out to forecast the financial situation in which Great Britain will find herself at the end of the present war and to determine the proper monetary and fiscal policy for the reconstruction period.

Boards and dust jacket. 144 pp. Demy 8vo. 10s. 6d. net.

(P. S. KING & STAPLES LIMITED).

14 Great Smith Street, Westminster, S.W.1.

Mr Byrnes made it emphatically clear that he does not consider the present an appropriate moment for increased civilian production, and bore down heavily against the War Production Board's hope for immediate limited reconversion. Some war plants are still badly short of manpower. He mentioned those making heavy guns and ammunition, trucks, tyres, tanks, bombs, radar and construction equipment and tentage fabric. In the main these are materials needed for the rapid land advances in Europe. The problem, however, is not only one of stepping up labour in the war plants; it is equally that of halting the flow out. Mr Nelson is reported to have said last week that men were leaving the war plants at the rate of 100,000 a month for jobs promising post-war security. The main new technique of recruitment proposed by Mr Byrnes is the imposition of "labour ceilings" on the less essential civilian industries. The idea of labour ceilings is not new. It has already been applied to war plants to prevent excessive hoarding of manpower. It is now to be used to pry loose men from civilian employment. This is an extension of the 1943 "Baruch" plan to solve the tight labour situation on the Pacific Coast. Committees within local labour areas will determine priorities for manpower; set employment ceilings in both war and civilian industries; and direct transfers of labour. The present regulations are directed toward employers, and the sanctions set up may include the withholding of materials, of fuel, power, or transportation, and any other lawful method of forcing compliance. The other end of the net—that is, the guarantee that the men released will go into the desired war jobs—presumably is covered by the War Manpower Commission's order of this spring requiring that no man may change his job without permission from the US Employment Service. The responsibility for the new controls is local, rather than the scheme of the Draft Boards, and probably, like the Draft Boards, the Area Committees will vary in their interpretation of the national urgency and of local hardship. Mr Byrnes threatened, however, that if the communities did not discharge this responsibility, there was no chance of finishing the war without a universal service law. Bluntly, this is nonsense. The chances of national service legislation are rather worse than those of a snowman in Africa. But the needs

of the war factories are, though critical, so small relative to the American manpower pool that the new regulations, if enforced with reasonable firmness, may do the trick.

They Want to be Shown

The Junior Senator from Missouri, Mr Truman, has become Mr Roosevelt's running-mate. The Senior Senator from Missouri, Mr Bennett Champ Clark, has just been eliminated in one of the most surprising primary results in a season filled with primary surprises. In Missouri Champ Clark has been a name of power for over half a century. The Senator's father was the redoubtable Speaker of the House who was Wilson's most formidable competitor for the Democratic nomination in 1912. Bennett Clark has been a dominant figure in the state and in Washington for some years. A man of considerable force, he represented both the disillusioned generation that served in France in the last war, and the suspicion of European entanglements which has marked the traditionally suspicious state of Missouri. "I'm from Missouri, and I want to be shown," is the catch-phrase that sums up this habit of mind. Senator Clark was defeated by Mr Roy McKittrick, the State Attorney General, who based his campaign on loyalty to Mr Roosevelt and attacked his rival's isolationist record. It is significant that toward the end of the campaign Senator Clark belatedly disavowed his own earlier anti-Rooseveltism. He now ascribes his defeat to "war hysteria" and to the activities of the "Communist-controlled CIO." There is no doubt that the CIO's Political Action Committee was in part responsible for getting out the vote that defeated Mr Clark, who was supported by Mr Truman, and Mr Hannegan, the Democratic national chairman. New fuel has been provided for the bitter campaign being waged against the PAC by the Hearst and McCormick newspapers and Dies Committee, which has demanded that Attorney-General Biddle investigate what it calls the "political arm of the New Deal." Some observers are inclined to see in Senator Clark's elimination a change of heart which the war has brought about in the Middle West and South West. The desire of the American people to play a part in outlawing aggression and establishing the rule of law is being manifested in a remarkable way in states that were the very citadels of isolation between the wars. It looks as if the realists of Missouri, having been "shown" the fruits of isolation and "little Americanism," have decided to be done with it. But the Missouri result, like those in other states, also suggests that the President's personal hold over his party has never been so strong, despite the southern defections.

Wartime Migration

The latest figures on wartime population movements show a heavy exodus from the North East, and North Central States, and very large gains in the South and West. While the North-Eastern states lost over a million inhabitants from 1940 to 1943, and the North Central states almost as many, the South and West gained more than 4 millions. During this period the population of the United States as a whole increased by more than 2½ millions. Four states, Arizona, California, Florida, and Nevada, and the district of Columbia, raised their population by more than 20 per cent. California had the largest numerical increase, with 1.6 million newcomers. This new migration makes the days of the old adoration, "Go West, young man, go west" look like very small beer.

THE INDEX TO VOLUME CLXVI OF "THE ECONOMIST"

(January to June, 1944) is now ready. The Index has been compiled on a more comprehensive basis than hitherto.

Copies will be sent without further application being necessary, to subscribers whose request is already on record. Other subscribers may, so long as the limited supplies last, obtain a copy of the Index (free and post free) by applying to The Publisher,

THE ECONOMIST, Brettenham House, Lancaster Place, London, W.C.2.

Duplicate your staff!

Have them in two places at the same time—at their work and in your office to confer with you when necessary.

WHITE HORSE

still as fine as a fine liqueur

Suppose that good fortune has brought you a bottle of White Horse, as sometimes it may, even in this fifth year of war.

You pour out a modest measure of this genial spirit into your glass. What is your immediate reaction? First you recognise the delicate and distinctive aroma of the White Horse you have known in times of peace. You raise the glass to your lips and at once your palate confirms your first impressions—that White Horse Whisky was never better than it is to-day.

This is quite true, and here is the reason. The White Horse Whisky in your glass is a whisky of the past and was growing old when this war was young. Stocks laid down long ago, matured and maturing, provide the White Horse supplies for to-morrow as well as to-day. Whisky as great as the White Horse you knew in time of peace, whisky which will always be 'fine as a fine liqueur.'

The present system of regulated supply is an essential provision to ensure for you the enjoyment of really good whisky both to-day, and in the years to come.

MAXIMUM PRICES:—Bottles 25/9d.; Half-bottles 13/6d.
as fixed by The Scotch Whisky Association.

THREE NUNS SAVES MONEY

—because of its
SLOW-BURNING CUT

There are two special reasons why 'Three Nuns' Empire Blend Tobacco saves the smoker money. It is scientifically cut to burn slowly, each ounce lasts longer, you smoke fewer ounces a week. It is made from fine leaf which is favoured by the lower duty on Empire Tobacco. To enjoy the fullest pleasure of smoking at a moderate cost, take to 'Three Nuns' Empire Blend.

Year to 31st July, 1942, and 31st July, 1943

Dividends per annum:		
PREFERRED ORDINARY	20%	
ORDINARY AND "A" ORDINARY	10%	
	Year ending	Year ending
	31st July, 1942	31st July, 1943
Gross Trading Profit	£2,342,792	£2,164,530
Add Amount brought forward	311,595	378,964
	£2,654,387	£2,543,494
Less Maintenance and Depreciation	1,169,805	1,188,809
Leaving a Credit Balance of	£1,484,582	£1,354,685
From this amount there has been appropriated:—		
Debt Service and		
Dividends	£235,618	£235,618
Special Depreciation of Plant and Equipment	100,000	100,000
Reserve for Deferred Repairs	200,000	200,000
Provision for Income Tax	570,000	500,000
	1,105,618	1,035,618
Balance carried forward	£378,964	£319,067

As in past years, provision has been made for the estimated liability for all taxation on Profits earned up to the date of the Balance Sheet. Up to the 31st July, 1941, the Company's Profits were less than its E.P.T. Standard. The increased trading profits for the two years have absorbed past deficiencies and the Company becomes liable to E.P.T. for the first time in the year to 31st July, 1943. As a result the net Profits of that year show some contraction and the Profits of future War Years will be subject to the limitations imposed by E.P.T.

Owing to exceptionally heavy taxation which depletes the Company's cash position, it is not possible to build up adequate resources during the period of the War for the purpose of changing over to peace-time work and for the replacement of Plant and Equipment which has suffered exceptional wear and tear during the past five years.

*Is your
drinking water
above suspicion?*

IF there is any doubt about the matter, **STILL MALVERN WATER**, the purest natural spring water known, can still be supplied without restriction of area throughout Great Britain.

STILL MALVERN WATER is singularly free from mineral salts which may be harmful, and its medicinal value lies in its essential purity.

JOHN STUART MILL

On Liberty

"Every function super added to those already exercised by the government causes its influence over hopes and fears to be more widely diffused, and converts, more and more, the active and ambitious part of the public into hangers-on of the government, or of some party which aims at becoming the government. If the roads, the railways, the banks, the insurance offices, the great joint-stock companies, the universities, and the public charities, were all of them branches of the government; if, in addition, the municipal corporations and local boards, with all that now devolves on them, became departments of the central administration; if the employees of all these different enterprises were appointed and paid by the government, and looked to the government for every rise in life; not all the freedom of the press and popular constitution of the legislature would make this or any other country free otherwise than in name. And the evil would be greater, the more efficiently and scientifically the administrative machinery was constructed—the more skilful the arrangements for obtaining the best qualified hands and heads with which to work it."

THE BUSINESS WORLD

Freedom of the Screen

THOUGH film production is by no means the only one, it is certainly one of the most important of the twentieth century industries that has not yet struck deep roots in Great Britain. A large and flourishing British film industry is desirable not merely for the economic benefits it confers—its highly skilled personnel commands incomes among the highest in the whole field of industry—but also perhaps even more because of the cultural and political influence of the film over the minds of the people; its propaganda value, reported the Moyne Committee in 1936, "is rivalled only by that of broadcasting and the press."

Unfortunately, in spite of protection, film production in Great Britain is not only small in scale and of precarious existence—it supplies barely a fifth of the footage of feature films exhibited on British screens and only manages to sell an occasional film abroad—but the whole industry is over-laid by monopolistic growths and strongly "tainted" by foreign influence. Public anxiety, brought to a head last year mainly by the spectacular growth of the Rank film empire, prompted the President of the Board of Trade to call a halt to the process of absorption. It also encouraged him to invite the Cinematograph Films Council to submit his advice on what further practical measures, if any, are necessary to check the development of monopoly in the film industry." The report prepared by a small committee of the Council—including Mr A. Palache (chairman), Sir Walter Citrine and Professor A. Plant—fully confirms the public's anxiety. The trend towards monopoly is reflected in:—

- (i) The rapid growth of vertically integrated combines and the control that they are able to exercise at the various stages, from production to exhibition; and
- (ii) The introduction and extension of undesirable practices in restraint of trade, partly by producers, partly by distributors, partly by exhibitors.

The Committee found, in fact, that the conditions of healthy growth do not exist. To begin with, studio space is inadequate and there is ample evidence that would-be producers are unable to secure accommodation. Less than half of the space that existed at the outbreak of war is at present available for the commercial production of British films; the other half is used for war purposes, including the production of Government films. Moreover, of the thirty stages now in operation, thirteen are controlled by Mr J. Arthur Rank's companies, two by Two City Films, Ltd.—a company over whose production activities Mr Rank also has control—and five by the Warner-Associated British Picture Corporation group. Some two-thirds of the available stages are in fact controlled by the two big vertical combines. Independent British producing units, as well as some American concerns desirous of producing films in this country to satisfy the quota provisions, have had no alternative but to make application to Mr Rank's organisation for studio space and to accept the terms that might be imposed, such as distribution through General Film Distributors, Ltd., and release to one or other of the Rank controlled circuits.

Peace is unlikely to bring immediate relief. In the view of the Committee, the studios suitable for the production of "feature" films that are now used for other purposes are not likely to be vacated quickly; in any case, their re-equipment would take considerable time. Moreover, if and when all existing studios are eventually restored to the work of producing "feature" films—and if there is no further change in the balance of control—the Rank organisation would control about 40 per cent of the available stages and the two combines together about 60 per cent. The Committee suggests that it would be unwise to place too many hopes on new construction in the near future because of the many competing claims for labour and materials that are likely to arise immediately after the war.

Would-be producers, the Committee finds, do not possess adequate access to finance. At present the mainstays of

finance are the renting branches of the combines, supported by the revenue flowing back from their exhibition organisations. Outside the vertically integrated groups, finance is available only in the form of guarantees by rich individual backers for specific films, or in an even less desirable form linked with distribution. The Committee holds that a state of affairs whereby independently produced films have to be financed and distributed through renting organisations, which may be concerned with competing producers, gives too much power to the interests controlling those organisations and places the small producer in too weak a bargaining position.

Nor has the independent producer any freedom of access to the screen. At present two alternative methods of distribution are open to him. He can either make a contract with one of the established renters to handle his film or, if he contemplates producing a series of pictures, he can set up his own distributing organisation.

At present both alternatives suffer from serious disadvantages. The Committee has found that the established renter may, indeed, welcome the business of distributing an occasionally good feature from an independent producer, but he is almost invariably associated with a competing producing company, or he may have a standing arrangement to distribute features for an American producer. The independent producer will tend to assume that the renter will be inclined to give preferential treatment to the pictures made by associated producers or by other regular clients, and that he will try to secure for them the best dates in the best located cinemas. He may fear that, if his picture is especially attractive, it will be used as a "sweetener" to assist in the distribution of less successful films. Again, the charges made by renters to producers—these may vary from 20 per cent to 30 per cent—are high in relation to those made for comparable services by house agents, brokers or the like. Hence, producers of a series of films generally prefer to incur the high annual expense of establishing their own distributing organisation.

The independent producer, moreover, does not have free access to the three major circuits—Gaumont-British, Odeon and Associated British Picture Corporation—which, save in exceptional cases, is held to be indispensable for the successful exploitation of a feature film in this country. If the two combines controlling the three circuits chose not to book a film, or if in booking it they decided to allot to it the least remunerative playing dates and houses in their circuits, the picture may well be a failure and the producer ruined.

Independent exhibitors, on their side, are handicapped by the monopolistic powers of renters. The Committee is particularly critical of a practice known as conditional booking. It is not suggested that the exhibitor who is prepared, for a suitable concession, to take the rough with the smooth should be prevented from doing so. But it is quite another thing for a distributor to require an exhibitor to book particular films as a necessary condition for securing the right to exhibit the picture that he desires to rent.

The monopolistic practices, in the detail in which they are disclosed in the Committee's report, are disquieting. Clearly, things cannot be left as they are if there is to be an opportunity for the growth of a healthy and independent film-producing industry in this country. Any approach to the problem must be guided by two considerations. First, it will be necessary to remove the obstacles to healthy growth; secondly, it is desirable, if possible, to assist growth by suitable Government action.

Under the first heading, the Committee made these suggestions:

- (i) There should be some form of control over the allocation of studio space until such time as the release of studios

from other uses or the construction of additional studios can afford adequate relief. First place should be given to the production of a large volume of medium cost feature pictures that are in demand throughout this country rather than to a small number of highly speculative luxury products.

(ii) The existing undertaking between the President of the Board of Trade and the controllers of the three existing major circuits, putting a ceiling on the number of cinemas that they may own or control, should be confirmed by legislation.

(iii) In order to prevent the physical control of the existing combines from being transferred either into foreign hands or those of "undesirable" groups of persons, they might be invited to consider the introduction of a domestic arrangement, on lines comparable to those of the *Times* or *The Economist*.

(iv) A booking of a feature film to a circuit for any region, and in particular for the London release area, should be divorced from all obligations on the producer or renter to book the picture to the same circuit in any other region of the country.

(v) In order to prevent the building-up of additional circuits, legislation should be introduced instituting a strict control over changes in the ownership of cinemas.

(vi) Consideration should be given by the Board of Trade to the possibility of securing for independent exhibitors, either by agreement with the integrated producers and distributors, or by legislation, a reasonable share of the feature pictures that they handle.

(vii) A tribunal might be set up to arbitrate in case of differences between members of the trade.

Under the second heading—the provision of positive assistance to the industry—the Committee's chief proposal is for

the establishment of a film Finance Corporation, to be "financed by the Government and run as a commercial corporation under a mixed board." Its functions would be to provide finance on reasonable terms to qualified producers, to establish a renting organisation and, eventually, to extend its activities into the field of overseas marketing. Moreover, the proposed Arbitration Tribunal is to be constituted from a limited number of its members.

*

There is, of course, everything to be said for the elimination of undesirable monopolistic practices, if need be by legislation. Would-be producers must have access to studio space, to finance and to the screen. The ideal solution would be to restore effective competition at each stage from production to distribution—that is to prohibit horizontal

combinations—as well as between the various stages—which would involve splitting up the two existing vertical combines. In practice, however, the restoration of perfect competition is hardly a practicable proposition. The Committee's own suggestions amount to a compromise. Horizontal combinations in restraint of trade are to be prohibited by legislation and the vertical combines are to have their wings clipped.

If independent producers can be given access to studio space—this might be ensured by the Government by making stages available to independent producers in conjunction with its own production activities in educational and propaganda films—and if, by legislation or agreement, they can be given ready access to the screen on reasonable terms, many of their difficulties will be solved. On the other hand, the merit of the suggestion that during the period of studio shortage preference should be given through the operation of an allocation system to medium cost rather than expensive films is highly questionable. What is required are good films, not discrimination between cheap and expensive ones; every unsuccessful film is expensive, whether it has been produced cheaply or at high cost. Perhaps equally questionable is the proposal that the Arbitration Tribunal should be constituted from the members of the proposed Film Finance Corporation.

The Committee is alive to the difference between removing restrictive practices and a policy of Government assistance designed to promote the growth of the industry. The achievement of the former is difficult enough; but to legislate a film industry into existence is much more so. If, as the Committee seems to believe, it could be done by a Government-financed film corporation, there would be a strong case for its establishment. But this, the most controversial proposal in the Report, is likely to meet serious criticism, since it would involve direct competition between the Government and private enterprise and would require the use of the taxpayer's money in a variety of enterprise that is usually regarded as highly speculative. There is a strong case for Government assistance in the promotion of exports. This might be achieved by way of reciprocal trade agreements; but their success, as that of the growth of the industry, will ultimately depend on the quality of its films. A good film needs no special ambassador.

When all is said and done, the future of the British film industry rests with the industry. The Government can do much in clearing away obstacles to healthy growth; but beyond that it can do very little.

The Future of Fish

SINCE the time when Queen Elizabeth instituted a "secular Lent" to safeguard the interests of the fishing industry by providing a guaranteed market, the Government has found occasion to make the industry its concern. The problem has always been the same fundamentally strategic one of preserving intact in times of peace a body of men whose seamanship and experience can be of value to the Royal Navy and the Mercantile Marine in times of war. In these days, so great is the part played by the "little ships," particularly in mine-sweeping and patrolling, that the fishing vessels, as well as the men, can be regarded and are used with great effect as a vital naval reserve.

In the years before this war, the fishing industry fell into an unhealthy state. Despite attempts at voluntary control, both in the herring fishing and the white fish branches of the industry, ships were being scrapped or sold abroad. The size of the fishing fleet declined from 348,106 tons in 1913 to 261,868 in 1937, while the estimated number of fishermen, both regular and occasional, declined over the same period from 98,900 to 51,550.

On the one hand, fishing methods had gone ahead of the market, and on the other the market was itself diminishing. The effect was felt most keenly in the herring fisheries (and, therefore, particularly in Scotland), and the quantity taken declined from 12,183,366 cwts. in 1913 to 5,563,327 cwts. in 1937. The herring industry depended mainly on its export trade, and it fell victim to the policy of self-sufficiency pursued in Russia and Germany. The German fishing fleet was encouraged to expand, and the following figures

show how it prospered, while the British herring industry declined.

	HERRING CATCH ('000 kilos)					
	1930	1931	1932	1933	1934	1935
United Kingdom	380,601	291,973	268,720	243,409	245,182	291,643
Germany	92,401	114,310	129,617	162,890	170,601	192,428

In an attempt to arrest the decay, the Herring Industry Acts of 1935 and 1938 were passed, but the war intervened before their full effect was felt. The work of the Herring Industry Board, which was set up in 1935, virtually ceased on the outbreak of the war.

The high prices paid for fish in the early days of the war before control was established illustrate, as also do the present-day queues, how readily people turn to fish as a substitute for meat. There is no reason to suppose that the supply of meat will quickly return to the level of the prospective post-war demand. There is, in addition, the problem of feeding a starving Europe, which may well find a partial solution in increased supplies of fish. It may, therefore, be anticipated that in the immediate post-war years the strong demand for fish will continue.

In considering the supply aspect, there are two separate problems, short and long term. In the short term, post-war fish supplies must depend to a great extent on the speed at which personnel and ships at present serving with the Royal Navy can be demobilised. In this regard it is not

without point to refer to the history of the industry in the years immediately after the last war. Demobilisation and re-equipment were speedy, and in 1919 trawler tonnage occupied in fishing rose steadily, reaching a peak in 1920.

This time demobilisation may be delayed, or take place in two stages, if it becomes necessary to send men and ships to the Far East when the European war is over.

A further short-term consideration is the effect on fish stocks of the great diminution of fishing during the war years. Again referring to the parallel period after the last war, the figures of landings per day's absence by British trawlers in the North Seas show a very striking rise from the comparable pre-1914 figures. In the short run, therefore (if 1919-1920 conditions are reproduced at the end of this war) fish will be in good supply. It should find a ready market, and consequently a return of prosperity to the fishing industry can be expected. The necessity for feeding Europe makes it desirable that all possible speed should be made to get the fish.

*

In the long run, however, the prospect is by no means so encouraging. While, on the one hand, the introduction of more modern methods of refrigeration, canning and curing may do much to stabilise the supply side of the market, there is no guarantee that the return of a normal supply of meat may not lead to a very sharp diminution in the demand for fish. It is easy to understand that unless a change in people's basic eating habits takes place or is induced to take place, the pleasures of fish eating will be quickly forgotten. If fish is to compete with meat as the *pièce de résistance* of a meal in the ordinary home, the fish industry will have to invent methods of processing which make it easier to prepare. It is the greater difficulty of preparation compared with meat which makes so many of housewives reject fish, apart from considerations of its perishability. In addition, the eating habits of the ordinary household have tended to place fish in the category of "something tasty for your tea," an occasional breakfast dish, or something which precedes meat or poultry on the occasion of a dinner party. The eating habits of this country have undergone a series of changes, not merely in the hours of meals, but also in their content. It is perhaps not too much to expect that further changes might remove a prevailing impression that fish is not an adequate main course for a main meal.

An important deterrent to the widespread consumption of fish has been the doubt in the mind of so many housewives of the freshness of the fish on the fishmonger's slab. Even down to the smallest village fishmonger, the fish trades must endeavour to set up and impose certain standards of freshness below which fish may not be sold. Only a widespread development of refrigeration, in the fishing vessels, in transport and in shops, can make it possible for the highest standard to be maintained so that fish can be purchased with as little hesitation as milk.

The fishing industry should remember that its decline after the 1920 level of prosperity proceeded surely and steadily, and great efforts will have to be made after the initial post-war boom if it is to keep its markets, both at home and abroad. If the housewife were educated in the proper selection of fish, in its preparation for the table, and in how to recognise its freshness, the market might well expand.

*

The great advances in fishing technique which were made at the end of the last and in the early years of the present century led to a steady depletion of the nearer fishing grounds and forced fishermen to go further for their catches. So marked was this depletion that in 1933 the Government abandoned free fishing and introduced mesh regulations and size limits to reduce the destruction of small fish. The 1933 regulations were extended in application by an international convention signed in 1937 by most of the European countries concerned in the Atlantic and North Sea fisheries. The war began before all the countries concerned had ratified the convention, which prevented the regulation from getting a fair trial. It is, nonetheless, necessary in the short-term period of boom that the long-term considerations of adequately safeguarding future stocks be not forgotten.

The Government has already given thought to the post-war problems of the fishing industry. The Herring Industry Act, based on the recommendations of the Elliott Committee (which reported in January, 1944, Cmd. 6503), was given the Royal Assent on August 3rd. It was in the herring

branch of fishing that the decline was most strongly marked. It is no doubt with this in mind that the Government is concentrating on its resuscitation. The Act, with its provisions for grants to enable fishermen to set up, received a warm welcome from the House.

In addition to making grants of money the Board has been empowered to participate in the industry more fully than before. It will be able to purchase boats and equipment for charter and to arrange for the refrigeration and processing of herrings. Conditions and standards of refrigeration may be regulated, and lastly, schemes may be operated by which levies on the first sales of herrings would be used to obviate as far as possible undue differences in earnings. These differences arise because the first arrivals at the ports get what is known as the "cream of the market" prices. Sometimes enormous differences occur. Mr Johnston, in introducing the Bill, quoted an example from Fraserburgh, where the first boats to arrive with their catch were able to get 46s. a cran, and the last only 26s. Various voluntary attempts have been made from time to time to form a pool by levy, so that returns could be more even. But it is obvious that any such measures, to be effective and equitable, must be compulsory.

*

The white fish branch of the fishing industry suffered during the interwar years, but unlike the herring branch, it was not because of the loss of foreign markets. The main trouble arose in the late twenties and early thirties, when large shoals of fish, mainly cod, were discovered in the more distant northern waters. These were fished in a somewhat greedy fashion, which resulted in the flooding of the home market with fish which was not always in its prime. The results were two-fold. The price fell sharply, and dragged down with it prices of fresher fish from the nearer grounds. And, confronted by so much inferior fish, demand tended to diminish.

The White Fish Commission was set up to administer assistance to the fishing industry, but as in the case of the Herring Industry Board, it ceased to function on the outbreak of war. The Government is considering the problems of this branch of the industry, but, whether it will be re-established in its previous form or whether it will require additional powers in order to get white fishing off to a good start after the war, must depend very largely on the state of the industry at that time.

The Government's plans for the future of the fishing industry must not be based on the sentimental conception of—to quote Mr Johnston—

... a splendid and hardy population asking neither for charity nor for the dole, but only an opportunity to pursue their avocation and their calling on the seas in return for nothing but a modest and honourable recompense. (*Hansard*, July 5, 1944, col. 1173.)

Instead, any plan for the rehabilitation of the fishing industry must have its foundation in a complete understanding of its place in the national economy and in national strategy.

MARTINS BANK
LIMITED

OVERSEAS BUSINESS

Martins Bank is fully equipped to help traders and others in transacting all classes of Home and Overseas business, and to act as correspondents in the United Kingdom for banks abroad.

London District Head Office: 68 LOMBARD ST., E.C.3
Head Office: WATER ST., LIVERPOOL 2

Total Assets £199,000,000

Business Notes

No Policy for Civil Aviation

On August 3rd Members of the House of Commons once again pressed the Government for a statement of policy on the domestic aspect of post-war civil aviation. In particular, they demanded answers to four main questions: Which Government department is to be responsible for civil aviation? Who is to run the services? Is the design of civilian aircraft being pushed ahead as quickly as possible? How are Britain's airports to be organised and operated? Mr Tree, taking as his brief the proposals published by the Tory Reform Committee—these were discussed in *The Economist* of August 5th—stressed the need for quick decisions and active preparation; otherwise, he remarked—in an effort to drive home his point—peace “will catch us not with our trousers down, but with no trousers at all.” Captain H. Balfour, Joint Under-secretary of State for Air, was not frightened by this prospect on a hot summer day. He replied calmly that the Government had not made up its mind. It has reached no decision, either on the subject of departmental responsibility or on the conditions of participation in air transport. Preparations for the manufacture of suitable aircraft were going ahead, but not as rapidly as he would like. Perhaps Mr Tree will be able to use his metaphor to greater effect in the autumn.

British Airfields

Group-Captain Wright was particularly concerned with airports. How can anyone plan air routes, he said, unless they know there are going to be some airports on which they can land and from which they can operate? Group-Captain Wright can hardly be accused of not seeing the wood for the trees. Military airports are one thing; civilian ones are another. They have to be suitably located and organised, and this requires time, even at the pace set by the Americans. He suggested three types of airport. There will have to be the large airport—Captain Balfour suggested one or two—for dealing with trans-oceanic services; these should be the responsibility of the Government. Next, airports will be needed for the British Isles-Continental and internal main services; these, Group-Captain Wright suggested, might be the responsibility of the municipal authorities. Finally, small airports will be required to deal with feeder services, charter services and with private flying; in principle these, too, might be the responsibility of municipal authorities, but where municipalities are not prepared to provide them, private enterprise might be permitted to do so. Group-Captain Wright's approach to the problem of domestic airport policy seems sensible. Captain Balfour went so far as to voice agreement. But he had nothing to say about preparations.

Markets and Normandy

Holidays notwithstanding, the Stock Exchange responded vigorously to the excellent news from Normandy and Brittany. Bargains marked on Tuesday and Wednesday numbered 7,279 and 5,808 respectively, high totals for August Bank Holiday week. The most specific reaction to the news was the obvious one—a marked rise in French Railway sterling bonds. Nord 6's and Midi and Orleans 4's all rose by about 5 points, and there was a similar jump in the 4½ per cent bonds of the Seine Department, whose liberation looks to lie so close ahead. A roughly equal rise in Chinese Government loans echoes Mr Churchill's growing confidence that the interval between the ends of the western and eastern wars will be short. German and Japanese bonds responded less than they sometimes do to United Nation's victories, but Polish 4½ per cent put on 3 points, and Austrian, Hungarian, and Greek bonds made lesser gains. Amongst British securities there was general firmness, but with few outstanding features. Following the reduction of the minimum permissible dealing price in the 3 per cent Savings Bonds 1960-70 issue, just withdrawn, a free and firm market developed in these bonds at about 99½. A last-minute rush for the bonds before the turning off of the “tap” brought in subscriptions of over £10,000,000,

raising the total of this series in issue to £976,000,000. The demand for these bonds infused a certain firmness into the whole gilt-edged market. Among industrials, textile shares have been a bright market, on export trade hopes, Listers being prominent with a gain of 2s. to 22s. 3d. Oil shares responded with modest gains to the news of the Anglo-American Oil Agreement. The biggest movement in this market, that of Attock Oil, now at the record price of 72½, was independent of this factor, and was due to repatriation buying from India, stimulated by promising reports of impending developments on the company's Punjab fields.

Unit Trust Code

There is an inconsequent touch in the appearance at the Bank Holiday week-end of the Board of Trade's requirements which must be satisfied before they grant authorisation to a unit trust. Five years of war have passed since the Sharepushing Act became law; for most of this time unit trusts have been prohibited, by a rather dubious extension of the capital issues ban, from constituting new units, and when they resume sales to the public, market conditions will hardly be more favourable than those of the last two years. Meanwhile, the trusts will need to supplement their existing trust deeds to cover the board's requirements under six heads. These cover three outstanding points; control of adventitious profits; restriction on undesirable publicity; and publication of managers' profit and loss accounts. Perfect solutions may not have been reached in all these questions, but the new requirements will rule out the possibility that the worst excesses of pre-war days will be repeated. Selling prices of units will be determined by a formula containing the principal provision that underlying securities of the trust must be valued on the lowest market dealing offered price on a recognised Stock Exchange “at the time of the quotation or sale.” “Rounding off”—the process by which the selling price of a unit was blandly raised to the nearest multiple of sixpence or three pence—is to be limited to the latter amount, or alternatively one per cent of the price—evidently to cover the case of the 5s. unit. Control of pricing, incidentally, extends only to selling prices, for the Schedule to the Act does not refer to the regulation of bid prices—the Act, it has been well said, covers sharepushing, but not the reverse process of “share-pulling.” Publicity is in future to be subject to the trustee's veto, if, as is usual, it refers to prices or yields. Further, it is required that yields must be calculated after deducting the periodical service charge from income, even if the charge may, in fact, be levied on the capital of the trust. Some of the grosser forms of “milking” capital to provide income—such as the sale of rights or capital bonuses—must be excluded from yield calculations, though other forms such as “cum” and “ex” dividend dealings, and the judicious admixture of wasting assets without provision for amortisation, are not frowned upon, and will be revealed, if at all, only indirectly in the accounts. Again, the polite fiction by which yields were sometimes calculated by reference to the opening price of the unit when the trust was formed is to give place to a percentage based on the current price.

Much argument has been heard on the form which managers' accounts should take. The Board of Trade seems to have decided that there is virtue in both schools of thought. It requires as a minimum a financial statement, in the nature of a units trading account, and also a net revenue account, showing the gross and net profits derived from the management of the trust. The first of these accounts incorporates a number of scarcely comparable items from which it would be difficult to derive accurate information on the three main sources of profit; from the sale of new units, from sales from the revolving fund, and from the unwinding of liquidated units. The Board have, very wisely, required that the amounts and percentages of these gross profits shall be separately stated and certified, before any deductions. For the unit holder's purpose, the ac-

counts and statement should be quite adequate. Doubtless, more refined percentage calculations could be devised, but a rate of profit requires checking against the amount of profit involved. Conversely, a figure of total profit might look modest and yet conceal an extortionate rate of return on one or more of the sources described above. Adequate publicity will certainly be guaranteed by these accounts, provided that they are passed to the Board of Trade and also to the press, as well as to unit holders. The Board has traditionally shown a marked reluctance to assume control over trading activities, and the unit trust rules represent its first experiment in detailed administration in this sphere. In their supervision of the movement, the Board will be assisted by all responsible unit trust managements, by trustees, and by those sections of the press which, in criticising some undesirable features of its youth, have recognised in it much that is good—in particular, the important rediscovery of the unit principle.

Banking Policy and EPT

In a survey, last month, of the impact of war upon the banking position, the conclusion was reached that, in the course of this year or next, the expansion of the banks' gross earnings may so far outstrip the increase in costs and special charges as to bring some, at least, of the big banks to the point at which they will begin to pay EPT. This, of course, was a tentative and necessarily uncertain conclusion, not only because the “true” or taxable earnings of the banks have never been disclosed, but also because the relationship between current earnings and those of the EPT standard period may vary substantially from bank to bank. But if the hypothesis is sound, some quite unexpected results may follow. It is well known that before the war the equilibrium point between the need for absolute security of the banking structure, on the one hand, and the desire for additional earnings on the other, was determined by so conventionalised a set of rules that banking policy was unlikely to be significantly or rapidly responsive to short-term changes in profit opportunities. Since the war, however, as *The Economist's* analysis of the end-June balance-sheets demonstrated afresh, the traditional disposition of bank assets has been distorted out of all recognition. When established rules become inoperative, policy can hardly fail to become more elastic, and, because it must be moulded to changing circumstances, it may also become more opportunist—if such a term can ever be used in the context of anything so steady and conservative as the principles which emerge from the board-rooms of British banks. It would not be surprising, therefore, if, once the EPT point has been reached, the banks were to put liquidity considerations well above considerations of additional profit. Some bank chairmen, with perhaps an undue respect for the precedent of post-1920 deflation, have indeed referred to their additional wartime deposits as a temporary growth; to those who argue thus, exceptional liquidity may become a positive objective. But, in any case, the gilt-edged market cannot be free from uncertainties, and the banks' stake in it is larger than ever before. It is certainly no accident that the past year is the first since the war in which bank investment portfolios have shown no more than a fractional increase, despite the effects of the local savings weeks. The EPT factor, if indeed it is not making itself felt already, is likely to accentuate this change in emphasis.

Repercussions on Short Loan Market

Another, and less obvious, direction in which comparable tendencies may develop is the short-loan market. If EPT begins to scoop up additional earnings, there will be no real incentive to take pains to ensure that floating balances are always fully employed in call loans. In the absence of a “directive” or informal hint from on high, the “money” men at the banks will no doubt continue to do their job with their customary efficiency, profit or no profit. But is it certain that no such hint would be given? To go easy on the employment of marginal surpluses would be one way of raising cash ratios. As yet, despite some suggestions in the market that the banks, already, have at times seemed to be less keen lenders than usual, the trend of bank call money (which has been upwards) does not suggest that any such policy has been followed, while published cash ratios in May and June were fractionally

below their comparable 1943 levels. If, however, the banks were eventually to keep the short loan market on short rations, one curious result would follow. The presumption would be that the discount houses would have recourse to the special buyer, whose dealing profits, presumably, accrue to the Banking Department of the Bank and not to the Issue Department, which works for account of the Treasury. That would mean that the banks' action in depriving the Exchequer of EPT (by refraining from making as much extra profit as could have been made) would have the effect of putting extra earnings in the coffers of the Bank of England. The point is, perhaps, an academic one, but it is at least an intriguing consequence of the anomalies of the legal framework of monetary control.

Oil Agreement

On the basis of cabled Press reports, the interim oil agreement signed in Washington between the US and British Governments is, as might have been expected, couched in the most general and non-committal terms, and until more detailed information is available, comment would be ill-judged. The agreement lays down certain unexceptionable principles governing the international trade in petroleum: assuring the extension to all peaceable countries of adequate petroleum supplies at fair prices and on a non-discriminatory basis; the development of petroleum resources with a view to the sound economic advancement of producing countries; recognition of the principle of equal opportunity in the acquisition of concessions; respect for valid concession contracts, and the freeing of production and distribution from unnecessary restrictions. More concretely, the agreement provides for the setting up of an International Petroleum Commission, representing the two Governments, which would make recommendations about meeting the estimated world demand for petroleum, and about the efficient and orderly operation of the international petroleum trade. The functions of the Commission would thus be purely advisory, and the agreement is terminable on three months' notice by either Government. The agreement, it is pointed out, is preliminary to the negotiation of a multilateral petroleum agreement by all producing and consuming countries, and steps are being taken to convene a world petroleum conference. It is obviously desirable that countries such as Russia and the Netherlands, which are intimately concerned, should be drawn into the discussions at the earliest opportunity.

LEGAL & GENERAL WHOLE LIFE AND ENDOWMENT POLICIES

West African Gold Mines EPT

After four years of negotiation the West African gold producers have obtained an important Excess Profits Tax concession in the decision of the Board of Referees that the statutory percentage under Section 13 of the Finance (No. 2) Act, 1940, shall be increased by 4 per cent in respect of the mining of gold from quartz lode and crush zone deposits in the Gold Coast Colony. For the companies concerned this will be a welcome piece of news, especially as the award will be retrospective to the beginning of the EPT period. Nevertheless, its scope is limited and would not seem to justify the indiscriminate rise in West African gold shares that followed the announcement. In the first place, the increase in the statutory percentage is, of course, of interest only to those companies which are in a position to claim it, that is, companies which started production after July 1, 1936; for these it means the liberty to retain profits up to 12 per cent instead of 8 per cent on the capital employed. (For established companies like Ashanti the concession will be of small importance, since it will merely apply to any increases in capital employed.) Secondly it will not affect the companies whose production is shut down for the duration of the war—which is the majority. Thirdly, it does not apply to the blanket producers, which so far apparently have made no application; most of these are, however, closed down under the concentration scheme.

Austin Motor Accounts

The Austin Motor Company has now issued its accounts for the two years ended July 31, 1942 and 1943. Increased trading profits in these two years absorbed past deficiencies as calculable for EPT purposes and the company became liable to this tax for the first time in the latter of the two years. The effect of this was a fall of some £178,000 in gross profit. However, the gross profit of £2,342,792 for the year to July, 1942, stands as a record in the history of the company. Full figures for three years are given on page 229. In both 1942 and 1943 £100,000 was set aside for special depreciation of plant and £200,000 for deferred repairs. The chairman, Mr Payton, nevertheless, evidently feels that the company's resources are not adequate for the big task of changing back from wartime to peacetime work, for he makes pointed reference in his statement to shareholders to "the exceptionally heavy taxation which depletes our cash position" and to the "exceptional wear and tear" suffered by the plant and equipment in the five years of war. In this complaint he is, of course, only one amongst many chairmen of companies engaged on munitions work. Meanwhile for Austin the problem of post-war financing has been somewhat eased by the replacement this year of £944,280 of 5 per cent First Mortgage Debenture Stock by a corresponding amount of 4½ per cent Redeemable Preference Stock and the consequent freeing of the assets charged to secure the former.

Reprieve for Primitiva

The news that the Argentine Federal Court has reversed its own previous decision to take possession of the property of the Primitiva Gas Company, on the Government's original terms, welcome as it is, is in some respects surprising. It is certain that the Argentine Government has not changed its intention, announced in April, of taking over the gas supply of Buenos Aires, and the Argentine Expropriation Law allows this to be done, as the Court originally decided, immediately, but without prejudice to compensation claims. The real issue at stake was, and remains, the amount of compensation to be paid. The Government's offer of £230,000 was calculated on the basis of the value of the property less the cost of removing installations, which they put at 80 per cent of the price offered. The absurdity of this method of calculation lay in the fact that the installations, far from needing to be removed, are essential to the continuance of the city's gas supply. That the Federal Court should now change its mind because of the unreasonable nature of the compensation offered, seems to indicate that the Government may now suggest a more

UNIVERSITY OF LONDON

The Senate invite applications for the University Chair of Statistics tenable at the London School of Economics (salary not less than £1,250 a year). Applications must be received, not later than first post on 4th September, 1944, by the Academic Registrar, University of London, S.W. 7, from whom further particulars should be obtained.

satisfactory basis of valuation. It is to be hoped that, in the absence of private agreement, compensation will be settled by the Supreme Court, according to Argentine law, which provides for the appointment of experts by both parties to decide the valuation.

Protection by Price Control

Cotton spinning employers in Lancashire and adjacent counties have decided to adopt price management after the war, as recommended in the report of the Special Committee of the Cotton Board, issued earlier this year. Before the war, voluntary yarn price agreements were in operation; in 1940 the system was taken over by the Government, and has since remained in force. On August 16th there will be a mass meeting in Manchester of spinners producing Egyptian type yarns, attended by representatives of 100 firms, owning 150 mills, containing about 15,000,000 spindles. Arrangements are now being made for special meetings of the three yarn price agreement committees in the American yarn section. It is expected that after further conferences a special committee will be appointed, consisting of representatives of all the old yarn price-fixing committees. This organisation would deal not only with price control, but also with commercial and trade policies. It is estimated that when the full programme is announced, this movement will have the support of virtually all the firms concerned. In the years immediately before the war there was severe competition amongst spinners for orders, yarn prices were cut, and in many instances orders accepted at a loss. There is determination throughout the industry to prevent this state of affairs in the future. The belief is held that if a united policy can be adopted the industry will be fully protected should unfavourable conditions arise. It is difficult to see how price control—which, to be effective, requires Government support—can protect the industry from a fall in export sales. Efficiency in production and marketing are the best and, ultimately, the only effective methods of protection.

Expenditure on Food

For the first time, details of the expenditure during the war on different classes of food have been given. Total expenditure on food has been shown in the White Papers entitled "An analysis of the sources of war finance and estimates of the national income," which have been published every April since 1941. The accompanying table is a breakdown of the figures in the latest White Paper (Cmd. 6520). Household expenditure is based on retail prices, and

(£ million)					
Commodity Group	1938	1940	1941	1942	1943
Household Expenditure:					
Bread and cereals, etc.	165	220	244	246	225
Meat, bacon, etc.	275	256	241	275	273
Fish, fresh and canned	43	39	46	36	36
Oils and fats	98	65	59	57	57
Sugar, preserves, confectionery	108	128	112	110	105
Dairy products	189	183	194	213	203
Fruit, fresh, canned and dried	79	62	32	41	35
Potatoes and vegetables	84	85	119	125	126
Beverages	54	52	51	50	46
Other manufactured foods	33	57	51	44	37
Total	1,128	1,147	1,149	1,197	1,142
PERSONAL EXPENDITURE ON FOOD OTHER THAN HOUSEHOLD EXPENDITURE	70	88	111	123	122
Totals, as in Cmd. 6520	1,198	1,235	1,260	1,320	1,264

Source: Hansard, August 3, 1944.

non-household expenditure on prices at which food is purchased by canteens, restaurants and hotels, so the two are not strictly comparable. All the figures are estimates, and may be subject to a margin of error, particularly in the case of fruit and vegetables. The figures for 1938 and 1940 are not so reliable as the later ones, because many of the statistical series were not then available. The increase in household expenditure in 1942 is due largely to lend-lease foods, such as "spam" and dried eggs, which became available in that year. Another contributory factor was the excellence of the fruit crop. The drop in expenditure in bread between 1942 and 1943 is due to the fact that supplies of biscuits and cake were reduced. The fall in the amount

spent in dairy products is surprising in view of the parallel rise in milk consumption, but it is explained by the reduced cheese ration. The large rise in expenditure in potatoes and vegetables between 1940 and 1943 is due to two factors: the increase in the consumption of potatoes, and the rise in prices of vegetables. Catering establishments have increased in number during the war: more factory canteens have been opened, and British restaurants set up. Although more money was spent in 1943 than in 1938, the volume of food purchased was considerably smaller.

Food in Occupied Countries

The League of Nations has continued its study of rationing and supply in its recently published *Food Rationing and Supply 1943/44*. Food rationing in Europe is treated in considerable detail, with tables on comparative rationing, and there is a section on production and supply. In general the food situation in Europe improved in 1943. In German-occupied Europe grain harvest reached, according to estimates, 90 per cent of the pre-war average. This tendency cannot, however, be maintained in face of shortages of fertilisers and manpower and the inevitable deterioration of machines. Nevertheless, the 1943 improvement is borne out by declines in some countries in death rates—although they increased in Germany itself. One of the many tables compares "normal consumer" rations in calories in the autumn of 1943, in countries where all foods are rationed. The order in which the countries are placed is interesting. Bulgaria heads the list with just over 2,000 calories a day. Germany, Finland, Bohemia and Moravia, the Netherlands and Belgium follow, with between 1,500 and 2,000 calories, and the countries receiving between 1,000 and 1,500 calories are Norway, the Baltic States, Slovakia, Poland, France and Italy. On the whole, the theoretical calories intake appears to be up to pre-war levels in Denmark, Germany, Bulgaria, and Roumania. In Bohemia and Moravia, Belgium, Finland, the Netherlands and Norway, although it is not high enough, the calorie intake is not, on the whole, seriously short. The average rations in the Baltic States, Slovakia, France and Italy are too low for full working efficiency. In Poland, Greece, parts of Yugoslavia and occupied Russia, famine

has been a frequent occurrence. By contrast, Great Britain is adequately served in respect of calories. The report says of Great Britain that "average intake is at or above the standard of 3,000 calories per consumption unit a day." In drawing comparisons between Great Britain and German-occupied countries it should be remembered, however, that differential rationing is highly developed on the continent. For example, although the "normal consumer" in Germany has a calorie intake of 1,930, the "very heavy worker's" intake is 3,435 calories a day. Calories cannot provide an entirely satisfactory means of comparing average consumption in different countries, since they do not indicate the nutritional value of the diet except as a source of energy, but they do provide the most convenient yardstick.

Women Engineers' Wage Increase

Agreement has been reached between the engineering employers and the three unions catering for women engineers to adopt the recommendations of the National Arbitration Tribunal. As from August 1st, women paid according to the National Women's Schedule—that is, engaged on work normally performed by women—will get increases ranging from 6s to 7s 11d a week. Women of 21 and over will get a new time-rate, including bonuses, of 56s a week, in place of the existing 50s, and the rates for younger women will be correspondingly increased. This change is brought about by transferring 12s from the present national bonus (22s) to the basic rate, bringing it up to 37s instead of the present 25s, and by adding 4s to the remaining bonus of 10s. The time-worker's bonus is fixed at 5s for all ages, instead of the present 3s for a woman of 21 and over. For piece-workers, who are in the majority, the rates will be improved. Piece rates are to be such as to yield at least 27½ per cent over the new basic rate instead of the former 25 per cent over the old basic rate. Thus a woman of 21 and over should now have a minimum of 61s 2d—an increase of 7s 11d over the previous minimum—made up of 37s base rate plus 10s 2d plus 14s national bonus. These increases are not as much as the unions asked for, but it is

(Continued on page 229)

ISSUE OF 3% SAVINGS BONDS, 1965-1975.

Interest payable half-yearly on the 15th February and 15th August. A first interest payment will be made on the 15th February, 1945.

PRICE OF ISSUE £100 PER CENT.
PAYABLE IN FULL ON SUBSCRIPTION.

Bonds of this issue are an investment authorised by The Trustee Act, 1925, and The Trusts (Scotland) Act, 1921.

THE GOVERNOR AND COMPANY OF THE BANK OF ENGLAND, by authority of the Lords Commissioners of His Majesty's Treasury, offer the above Bonds for subscription. Subscriptions will be received on Tuesday, 8th August, 1944, and thereafter until further notice in the "London Gazette." Subscriptions may be lodged at any office of the Banks hereafter mentioned.

Subscriptions will be accepted in any amount not being less than £50. Subscriptions must be accompanied by the full amount payable in respect thereof. The Principal of and Interest on the Bonds will be a charge on the Consolidated Fund of the United Kingdom.

If not previously redeemed, the Bonds will be repaid at par on the 15th August, 1975, but His Majesty's Treasury reserve to themselves the right to redeem the Bonds in whole or in part, by drawings or otherwise, at par on, or at any time after, the 15th August, 1965, on giving three calendar months' notice in the *London Gazette*.

The Bonds will be registered at the Bank of England or at the Bank of Ireland, Belfast, and will be transferable by instrument in writing in any usual or common form in accordance with the provisions of the Government Stock Regulations, 1943.

Bonds will be transferable in sums which are multiples of one penny. Transfers will be free of Stamp Duty.

A first interest payment, calculated from the date on which the subscription accompanied by payment is lodged to the 15th February, 1945, will be made on the 15th February, 1945; thereafter interest will be payable half-yearly on the 15th February and 15th August. Interest will be paid by warrants transmitted by post and Income Tax will be deducted from payments of more than £5 per annum. The first interest payment will in all cases be payable to the original subscribers or to their nominees.

The Bonds and the interest payable from time to time in respect thereof will be exempt from all United Kingdom Taxation, present or future, so long as it is shown in the manner directed by the Treasury that they are in the beneficial ownership of persons who are neither domiciled nor ordinarily resident in the United Kingdom of Great Britain and Northern Ireland. Further the interest payable from time to time will be exempt from United Kingdom Income Tax present or future, so long as it is shown in the manner directed by the Treasury that the Bonds are in the beneficial ownership of persons not ordinarily resident in the United Kingdom of Great Britain and Northern Ireland.

These exemptions will not apply so as to exclude the interest from any computation for taxation purposes of the profits of any trade or business carried on in the United Kingdom. Moreover the allowance of the exemptions is subject to the provisions of any law, present or future, of the United Kingdom directed to preventing avoidance of taxation by persons domiciled, resident, or ordinarily resident in the United Kingdom, and, in particular, the interest will not be exempt from Income Tax where, under any such provision, it falls to be treated for the

purpose of the Income Tax Acts as income of any person resident or ordinarily resident in the United Kingdom.

Subscriptions, which must be accompanied by payment for the full amount of Bonds subscribed, may be lodged at the Bank of England Loans Office, E.C.2, or at any office of the following Banks:—

IN GREAT BRITAIN:
Bank of England, Lloyds Bank, Ltd.
Bank of Scotland, Martins Bank, Ltd.
Barclays Bank, Ltd., Midland Bank, Ltd.
British Linen Bank, National Bank, Ltd.
Clydesdale Bank, Ltd., National Bank of Scotland, Ltd.
Commercial Bank of Scotland, Ltd., National Provincial Bank, Ltd.
Co-operative Wholesale Society, Ltd., North of Scotland Bank, Ltd.
Coutts & Co., Provincial Bank of Ireland, Ltd.
District Bank, Ltd., Royal Bank of Scotland.
Glyn Mills & Co., Union Bank of Scotland, Ltd.
Grindlay & Co., Ltd., Westminster Bank, Ltd.
C. Hoare & Co., Williams Deacon's Bank, Ltd.
Isle of Man Bank, Ltd., Yorkshire Penny Bank, Ltd.

IN NORTHERN IRELAND:
Bank of Ireland, National Bank, Ltd.
Belfast Banking Co., Ltd., Northern Bank, Ltd.
Hibernian Bank, Ltd., Provincial Bank of Ireland, Ltd.
Munster & Leinster Bank, Ltd., Ulster Bank, Ltd.

A commission at the rate of 2s. 6d. per £100 nominal subscription will be paid to Bankers or Stockbrokers on subscriptions bearing their stamp.

Subscriptions must be made on the printed forms which may be obtained, together with copies of this Prospectus, at the Bank of England Loans Office, London, E.C.2, or at any of the Branches of the Bank; at the Bank of Ireland, Belfast; of Messrs. Mullens & Co., 13, George Street, Mansion House, E.C.4; or at any Bank or Stock Exchange in the United Kingdom.

BANK OF ENGLAND, LONDON.
5th August, 1944.

N.B.—Separate Prospectuses relating to 3% Savings Bonds, 1965-1975, to be held on the Post Office Register will be issued by His Majesty's Postmaster-General (and may be obtained at any Savings Bank Post Office or Bank), and by the National Debt Commissioners on behalf of Trustee Savings Banks. The amount subscribed by any person under the Prospectuses issued by His Majesty's Postmaster-General and by the National Debt Commissioners must not exceed £1,000.

W. J. BUSH AND COMPANY, LIMITED

SATISFACTORY RESULTS DESPITE DIFFICULTIES

DR P. C. C. ISHERWOOD'S STATEMENT

The forty-seventh annual general meeting of W. J. Bush and Company, Limited, was held, on the 10th instant, at the Great Eastern Hotel, Liverpool Street, London, E.C., Dr P. C. C. Isherwood, O.B.E., Ph.D. F.R.I.C. (chairman and managing director), presiding.

The report of the directors submitted to the meeting was as follows:—

Your directors beg to submit their report and statement of accounts for the year ended December 31, 1943.

After charging excess profits tax, the accounts show a net profit of £128,887. Adding to this the sum of £190,767, being the amount brought forward from the previous year, and deducting the amount required for dividends on the preference shares and provision for income-tax there remains a balance of £258,829.

Your directors recommend that this balance be dealt with as follows:—

By the payment of a final dividend of 6 per cent. on the ordinary shares, making (with the interim dividend already paid) 10 per cent. for the year	25,000
By allocation to pension fund.....	20,000
By carrying forward the balance	213,829
	£258,829

The buildings and plant at Hackney, Mitcham, Widnes, Melbourne and elsewhere have been maintained.

CHAIRMAN'S STATEMENT

The statement by the chairman issued with the report and accounts was as follows:—

My address to the shareholders accompanying the directors' report and statement of accounts for the year under review must under present circumstances be in general terms.

In spite of the world-wide nature of the conflict with its adverse effects on our export trade and supply of many important raw materials, and also the many difficulties inherent in war conditions the company has in the opinion of your directors again been able to achieve satisfactory results.

The whole of the company's equipment is working practically continuously, and although maintained to the fullest possible extent within the limits of available material and labour, its life under such circumstances is reduced. Your directors have therefore deemed it prudent to increase the provision for depreciation of plant, etc. and also to make a further addition to the reserve against buildings, to both of which effect has been given in the accounts.

ALLOCATION OF £20,000 TO PENSION FUND

Although the company, since its incorporation in 1897 and even before, has paid and still is paying pensions to its retired employees, your directors have under consideration schemes for the payment of pensions on a more modern basis. With this object in view, as indicated in the directors' report, we propose, with your approval, to allocate a sum of £20,000 to a pension fund.

I am pleased to report that our branches and subsidiaries throughout the world have, in spite of many difficulties, maintained a satisfactory position.

The results which have been achieved have only been possible by reason of the progressive policy which has been pursued for many years. Our products are many and varied, and, in addition to our flourishing business in food flavours and aromatics, we are important chemical manufacturers producing a wide range of pharmaceuticals, synthetic drugs and technical chemicals, including dye-stuff intermediates.

IMPORTANCE OF RESEARCH

Much has been written lately on the importance of research and a layman might be pardoned for thinking that research with a big "R" is a new invention. As a matter of fact, your company, in common with all other progressive concerns, has for very many years devoted much time to this side of the business, and much of our success has been due to this activity. I can assure you that we have always got this important matter very much in mind.

I am strongly of the opinion that, if our country is to raise or even maintain its pre-war standard of living, export trade is of paramount importance and in this connection private enterprise must be given full scope and encouragement with a minimum of Government interference. While control is a necessary evil in war and is being in the main sympathetically and efficiently administered, in my view as a long-term policy all the Government needs to do is "to hold the ring" so as to ensure fair trading conditions. Given these, individual effort will provide continued and increasing prosperity, and the earlier that war-time control is relaxed and ultimately withdrawn, so much the sooner will general trading prosperity be achieved.

Trade associations, in the work of which your company has always taken an active part, are of inestimable benefit in preserving contact between manufacturers for discussion of matters of common interest for the good of all.

TRIBUTE TO STAFF

I cannot close these few remarks without paying a tribute to our staff for their efforts under increasingly difficult conditions. This applies not only to those at home in all three of our works, but also to the managers and staff of our many affiliated companies and branches overseas. Owing to travel difficulties, they have had to rely to an increasing extent on their own initiative, and the results they have obtained speak volumes for their hard work and efficiency.

The report and accounts were unanimously adopted and the dividend as recommended was approved.

The retiring directors, Mr C. F. Bush, Mr A. J. McIntyre, Mr M. St. Alphonse, were re-elected; and the auditors, Messrs Furquand, Youngs, McAuliffe and Co., having been reappointed, the proceedings terminated.

MCDUGALLS TRUST, LIMITED

SERVICE TO THE COMMUNITY

The eleventh annual general meeting of McDougalls Trust, Limited, was held, on the 4th instant, in London.

Mr Kenneth A. E. Moore, the chairman, presided.

The following is the statement by the chairman circulated with the report and accounts:—

You will see from the annexed accounts that the operating company—McDougalls, Limited—has again had a successful year, and that, after providing for excess profits tax and contingencies and adding £20,000 to the advertising reserve, the same dividends have been paid to the holding company—McDougalls Trust, Limited—so enabling it to maintain, for the eighth year in succession, a distribution of 10 per cent.

This laconic summary of the financial results shows how the business has done, but not what it has done. It seems, therefore, not inappropriate, particularly at this stage of the war, to interpret the accounts in terms of service to the community and from the human angle.

RECORD SALES OF MCDUGALLS FLOUR

From the fact that the business has earned profits substantially in excess of its pre-war standard you will be correct in inferring that it has produced, packed, sold, and distributed more McDougalls self-raising flour than ever, but since dividends are limited to the pre-war level by the incidence of taxation and Government control, these increased services to the community have brought no financial reward to the proprietors. In other words, the profit on the extra work done by the mills, plant, and organisation provided by the shareholders has been or will be handed over to the community in the shape of E.P.T. or by way of adjustment of remuneration under Government control agreements.

On the human side the managers, staff, and workpeople, whose ranks have been much thinned by the calls of the Services, have had to cope not only with all the usual war-time production difficulties, accentuated by much increased output, but also, both in their private and business lives, with the blitz and more recently the flying bomb, you will, I am sure, wish to join with the directors in expressing our most sincere thanks to them for duty well done.

To return to financial matters, you will see that the accounts of McDougalls, Limited, are still subject to adjustment by reference to the terms of the remuneration agreements concluded or to be concluded with HM Government in relation to the control of flour milling activities as from September 3, 1939.

DIVIDEND MAINTAINED AT PRE-WAR LEVEL

In the meantime our policy, after making modest additions to trading reserves, is to maintain dividends at the pre-war level of £202,000 per annum and to transfer the remaining profits to "excess profits tax and contingencies" account. The balance on this account, after meeting the computed liability to excess profits tax down to March 31, 1943, amounts to £280,000, and this figure should amply cover any adjustment referred to in the preceding paragraph. The financial position remains strong and liquid, and the general and advertising reserves, aggregating £250,000, are invested outside the business in British Government securities.

In addition, there are our human reserves in the shape of many trained and experienced employees serving with the forces to whom suitable allowances are being made in augmentation of their Service pay. Some have, unfortunately, fallen in action and will never return. To the others we send our best wishes and look forward to their return in the not far distant future.

The report and accounts were adopted.

HUDSON'S BAY COMPANY

RECORD TRADING PROFIT

The two hundred and seventy-fifth annual general court of the Governor and Company of Adventurers of England trading into Hudson's Bay was held, on the 8th instant, in London, Sir Patrick Ashley Cooper, the governor, presiding.

The following is the governor's statement circulated with the report and accounts: The company's accounts again disclose a record trading profit, the bulk of which is absorbed by taxation.

Receipts of the land department, both on account of revenue and capital, are the best since 1929.

Record sales and profits were achieved by the retail stores, but to do this the management had to overcome many difficulties, including those arising from a depleted staff. In the North Land we continue to do everything possible to look after our fur trade. Fur business in the United Kingdom is still restricted to small proportions. In New York, Lampson, Fraser and Huth, Incorporated, are selling substantial quantities of furs both for the Hudson's Bay Company and for many other customers. In Montreal our fur sales department disposed of steadily increasing quantities.

At the close of the year there were 15 producing wells on the Hudson's Bay Oil and Gas Company's holdings. The sixteenth well was abandoned after completion and the seventeenth is being drilled. All these wells are situated in the Turner Valley Field, which is still the only major proven Canadian field on which the Hudson's Bay Company has mineral rights. I ought, therefore, to stress that the production of the Turner Valley Field shows signs of reduction.

Resolutions were passed approving the payment of a dividend of 5 per cent. on the ordinary shares and a distribution from land sales receipts of 5 per cent., and also the repayment of the whole of the preference share capital totalling £600,000.

(Continued from page 227)

satisfactory that they should have been agreed without further reference to arbitration, and they represent a considerable improvement in the very low level of women's engineering wages, especially necessary in the case of younger women. It now rests with the unions to frame a more permanent long-term structure of wages in the industry, which will fix rates according to the job and not according to sex.

Retail Food Shops

The accompanying table shows the changes which have taken place in the number of retail food shops operated by multiple stores and by co-operative societies. The figures provide a useful guide to the extent to which the industry has changed since 1939.

	Multiple	Co-op. Societies	Total
1. SHOPS OPENED:			
(a) Total	857	692	1,549
(b) No. of cases included in (a) in which the business has been purchased from, or opened in premises last occupied by, an independent food retailer	581	495	1,076
2. SHOPS CLOSED:			
(a) Total	1,322	380	1,702
(b) No. of cases included in (a) in which the business has been sold to, or was carried on in premises next occupied by, an independent food retailer	69	4	73
3. NET CHANGE:			
(a) Total (1(a)—2(a))	—465	+312	—153
(b) Net nos. of independent businesses "displaced" (1(b)—2(b))	512	491	1,003
4. Total nos. of shops operated on May 15, 1944	22,630	18,055	38,685

Source: Hansard, August 1, 1944.

* Firms with ten or more branches in the United Kingdom.

pendent trader is being displaced by multiples and co-operatives. In a period of four years and nine months the total number displaced is only 1,003, and this figure

OHLSSON'S CAPE BREWERIES, LIMITED

INCREASED TRADING PROFIT

The annual general meeting of Ohlsson's Cape Breweries, Limited, was held, on the 10th instant, in London.

Mr Geoffrey Dent (the chairman) said that once again the profit on trading and rentals, after providing for depreciations, showed a substantial increase of £78,959 over the previous year. The demand for their beers had again exceeded their capacity to supply, and rationing had been necessary over a considerable period of the year. Supplies to Rhodesia from the Union, in particular, had been limited to the quota agreed upon between the authorities of the Dominion and the Colony, and many of their customers, particularly in Northern Rhodesia, had consequently been short of their usual supplies of the company's products. With regard to brewing materials, the cost of all ingredients used had increased, but the South African authorities had been most helpful in procuring the import of essential supplies of malt and hops from the United States, Canada and South America, and the present position might be regarded as satisfactory.

The profit on trading and rentals for the year, after making adequate provision for depreciation of all plant, machinery, motor vehicles, hotel furniture and fittings, amounted to £767,682. It was proposed to pay a final dividend of 10 per cent. on the ordinary shares, making a total distribution of 15 per cent. for the year. This year it had been necessary to provide £565,000 to cover the total estimated tax liabilities on the year's profits. That was £70,000 more than was required last year. It might interest shareholders to know that the company's contribution, by way of taxes, to the Government of South Africa and this country in respect of trading for the year 1943-44 totalled £1,243,689. The report was adopted.

OZALID COMPANY, LIMITED

DIVIDEND MAINTAINED

The annual general meeting of the Ozalid Company, Limited, was held in London on the 9th instant.

Mr. C. A. G. Hewson, F.S.A.A., presided.

The following is a summary of the chairman's statement:—

It is with pleasure that your directors recommend the payment of a final dividend of 15 per cent., less income-tax, on the "A" and "B" ordinary shares, thus providing a total dividend of 25 per cent. for the year. The main product manufactured by the company is a dry developed sensitized paper known as "Ozalid," which is used for plan reproduction and photo-printing. The process furnishes dark lines on a white ground, as distinct from the blue-printing process which provides white lines on a blue background. I should like to mention the valuable services afforded to the company during the past year by the technical director, Mr H. D. Murray, M.A., F.I.C.

The turnover for the past year has been influenced by the increasing demand for the company's products, occasioned by the present emergency. As I mentioned last year, this company, in common with others in the drawing office trade, should be fully occupied for some years in the post-war period and, provided reasonable profit margins are maintained, the immediate post-war prospects are satisfactory. The industry should also be able to increase its export trade, which in the past has been limited.

Again, the company's executive staff and labour have shown their willingness to co-operate in a period of increasing difficulties, and I should not discharge my duty were I not to mention their loyalty and work.

The report and accounts were adopted and the auditors, Messrs Peat, Marwick, Mitchell and Co., re-elected.

includes, as well as businesses sold, those whose premises next occupied by multiples or co-operatives. Probably war-time conditions have tended to accelerate the rate at which the small man is displaced, but the acquisition of about 200 a year cannot be considered serious. The figures bring out clearly the extent to which the co-operative societies are expanding, compared with multiple stores. The net increase in co-operative food shops was 312, but the multiple stores decreased by 465. On the other hand, both types acquired independent business in almost the same numbers.

Paper Salvage.—During the past twelve months, 675,000 tons of paper salvage have been collected, out of which eleven million books have been provided for the Services and damaged libraries, and 575,000 tons of paper-making and board-making material obtained.

Herring Industry Board.—Mr Frederick A. Bell, who was a member of the Departmental Committee on the Herring Industry, has been appointed chairman of the Herring Industry Board. The other members are Sir Evan Gibbs and Sir T. George Wilson.

Fleeting Opportunity

AT the beginning of this week of tremendous happenings, General Eisenhower called upon Allied soldiers, sailors and airmen to grasp a "fleeting, but definite opportunity" of victory. On Tuesday, General Maitland Wilson told the troops assaulting the Riviera to "Remember 1918." Now, many Allied divisions are moving from West and South to do their utmost. The immediate stake is the liberation of France, the ultimate prize, Germany, while the mighty Russian effort in the East is poised to press forward again. The outcome is still in the balance; but the difference is not between victory and defeat, for victory is sure. The difference is between a quick end or one drawn-out, with added suffering.

Meanwhile, the news spells another order of the day, this time to civilians, to politicians and statesmen and to the citizens who nourish their power and sustain their policies. Will a peace be made that will match the price which has been and is being paid for it? There is an opportunity as definite and almost as fleeting as the chances of this week's battles. It is a second chance; the first came twenty-six years ago. Then we, and our friends, sought military security with muddled minds and divided loyalties, and came upon aggression and war. Then we sought economic security by "safety first" and separate ways,

and found depression and crisis. This time we should know better. But do we?

Three or four years ago, there would have been little doubt about the answer. Then, when defeat was possible and disappointments constant, our view was clear. Crudely, maybe, it was expressed in the Atlantic Charter and in the many words of confidence in the future of the nation and the world that then contrasted so strangely with the sombre scene of war. We knew, or said we knew, the essentials of a peace that would work, one which we and our children could enforce and keep. In the new bright light of victory, however, that vision is far less clear. It is, in fact, possible to wonder greatly whether the same tragic mistakes may not be made again; and time is short.

What were those mistakes? This war did not happen because of the Treaty of Versailles; it happened because the peace made at Versailles was one which, for all its evident merits, we and the French and the Americans were not prepared, as the years passed, to enforce. The Great Depression which ushered in Nazism and the war did not happen merely because we and other nations made a vain attempt to reinstate the Gold Standard and the old-style methods of world investment; or even because, in this framework, we sought to levy large reparations and

discharge large war debts. It happened because we failed, in economics as in politics, to put first things first, we failed to establish the conditions of employment, production and trade, without which no regular system or machinery of international economic relationships, whether old or new, could work. The blunder of Versailles was that, as well as whittling away the principles which the settlement first set out to apply, we also failed to ask the question whether the terms settled were ones which free peoples would be willing to fight for, in order to keep the peace. The blunder of the twenties in economic arrangements was not the preference for one piece of international machinery or set of rules before another, but the failure to see that no piece of international machinery or set of rules, whether economic or political, can work unless the conditions for its working are forthcoming. Our blunder, for instance, in 1925 was not the return to a gold standard, but rather the return at a parity which involved imposing upon the employment and industrial activity of this country an arbitrary and cruel constraint—because of the superstitious belief that, whatever the conditions of employment and world trade, the old gold standard (at the old parity) was, in itself, a good thing. In other words, the mistake of last time in both politics and economics, was the sacrifice of ends to means, the setting-up of machinery without the settlement of workable policies for the achievement of clear-cut aims. The fatal flaw in both the Versailles Peace and the reconstructed system of international exchange and investment was that they were not, and could not, be worked.

Oddly enough, this was plain enough in 1940 and 1941, while now the flash of insight that danger then brought seems to be fading. It is true, and it is welcome, that the three Great Allies are now to work out in Washington the details of an international security organisation with force to keep the peace—as the League did not. The special responsibility of Great Powers to act together against peace-breakers must be made as plain as possible. But such a security organisation, however necessary, is in itself no more than machinery. There were sanctions in the Covenant of the League. It was not because of the small states that the Great Powers did not act; it was because they (and their peoples) did not choose to do so. It was because they were not prepared to use their force to keep that particular peace settlement.

The crucial question again is "What is the peace to be?" The diplomatic studies and the history books tell us that the Versailles settlement foundered because too much had already been settled and arranged among the Allies beforehand, according to the narrow and opportunist exigencies of war. Now, in the same field of territorial adjustment, the same process is running its course. The reason why the denial of aggrandisement that marked the Atlantic Charter is now being forgotten is a simple historical one. First, in the bargaining of the Allies, a one-sided settlement of Poland's eastern frontiers was proposed, and in effect, accepted; that this

adjustment in favour of the Soviet Union can be largely excused is beside the point. From it follows "compensation" for the Poles far into German territory. From this, in turn, follows a general programme of annexation and territorial revisions, which is now proceeding. This is the brief into which the Big Three discussions at Washington are trying to put teeth.

So, too, is it in the economic field. There we knew three and four years ago what the realities were, that the aim of work and trade is the best use of all resources and the maximum of goods. Our own war effort and the logic of Lend-Lease were evidence of this awareness on both sides of the Atlantic. The ends were plain, the means the best that could be improvised to serve them. But what has happened now? The nations meet at Bretton Woods solemnly and expertly, to devise a mechanism for replacing the international exchanges and investment upon a world footing; and they do not ask themselves whether they are also either willing or able, severally and jointly, to provide the conditions of employment and trade, in which alone these mechanisms can work.

So, too, is it—though much less gravely yet—at home. To make "the world safe for democracy" was only one of the last war's aims which failed. Another was "homes for heroes." Since 1918, it is true, both slogans have been scoffed at by a disillusioned generation. But they remain, inescapably, our aims. Why else should we make mortal war, and see so many millions suffer or be slain? We have before us, indeed, a set aim—"Food, Homes and Work." Plans are being busily laid to implement it. But the fear is that they are still being laid too slowly and too half-heartedly. There is admittedly a sharp material limit to what can be honestly promised, and it may have been nearly reached already. But what has been, and can be, promised must be performed at top speed; the alternative is the bitterness and disillusionment of post-1918. It should not have been possible, for instance, for Ministers and MPs to permit the Housing and Planning Bills upon which the postwar shelter of the nation wholly depends to drag on uncompleted through this crucial summer. Again the technical and indispensable machinery of reconstruction, so carefully under review, is by itself insufficient. There is needed also a policy—and a faith—to provide the conditions of success before it is too late.

The opportunity, at home and abroad alike, is fleeting indeed. It is a mere matter of months, but months big with fateful prospects. If we are content during this brief slice of history to fix our eyes only on the mechanical groundwork of peacetime organisation, without ever asking whether it will be possible to make and keep and compel the kind of political and economic order that we are taking for granted, then we shall surely fail for a second—and perhaps final—time. The deeds of those who have died will once more be frustrated, and the victory in sight will not be real.

Le Pays Réel

THE most striking feature of the Great Allied advances in Western and Southern France is the speed with which huge areas are being liberated. District after district is falling into Allied hands with barely a shot fired. The picture of slow devastation spreading step by step across France in the process of a desperate slogging war is happily being falsified in the event, except on a very local scale. Caen is to be the exception, not the rule. However fiercely the battle may still be waged in the north, the classic act of liberation for great areas of France will be the freeing of Rennes, into which the American columns swept only to sweep on; the break in normal civil life was almost nominal.

This speed is likely to have profound consequences. None of the problems of liberation will prove as intractable as at one time it was legitimate to fear. The danger

that widespread and prolonged fighting would destroy the harvest is now less acute. M. Le Troquer, French Commissioner for the Liberated Territories, has stated that this year's harvest is expected to be exceptionally good. It is still too early to be entirely confident about the safety of the food supply, for the northern areas of France are the chief grain producers, and they may still suffer severe damage. It is also true that the situation varies enormously from district to district. The towns are on the whole very near to starvation already. There are wide differences in the countryside. Normandy and Brittany are rich surplus areas, but are very short of bread, and rely at the moment on Allied supplies of biscuit. The vine-growing south is short of meat, grain and fats. Nevertheless, provided there is no catastrophic turn for the worse in the fighting, it is true to say that the distri-

bution of food and not its supply will cause the real difficulties.

The transport situation is acute. All means of communication have been hammered from outside by Allied bombers, and from within by the Maquis. Bridges are down, stretches of railway no longer exist. The Germans try to take all motor transport with them as they go, and to fire all petrol dumps. The situation is particularly dangerous around Paris. For example, the Parisian postal services have had recently to be maintained by bicycle. The Allies are preparing to help as far as they can. Shipping is still short, although it is hoped to release barges for use on the French waterways. The British are sending over lorries solely for food distribution, and Allied ships are also to bring in grain, meat and fats. M. Le Troquer mentioned that clothing and shoes had already arrived; more consignments are to follow.

In Italy it was an unhappy fact that the Allies often complicated the food situation by the competition of the soldiers for local supplies. These mistakes are not being repeated. There was some understandable confusion at first, but now, it seems, a rationing system is beginning to function, the most satisfactory feature of which, both economically and politically, is the fact that, since Allied soldiers are not given the food coupons which are required for meals in restaurants, they cannot eat the inhabitants' provisions. The German soldiers were provided with coupons by Vichy, and the contrast is strikingly in the Allies' favour.

The most difficult problem connected with distribution may be the equalisation of wages and the cost of living. A stop on wages was introduced at the time of the Armistice in 1940 and has on the whole been maintained. Meanwhile the cost of living has risen steeply. Workers' meetings in liberated territory have already started to pass resolutions calling for an increase in their wages; and the size of the gap between prices and wages will make these claims to a point irresistible. But if there were now to be a very large wage increase, without a corresponding increase in supplies or the enforcement of strict all-round rationing, the danger of increasing the inflationary situation would obviously be great. The evidence is that the Provisional Government of General de Gaulle is determined to meet the danger first from the end of prices, not wages—though it is only from the angle of supplies that the problem can be finally solved. A vigorous policy of price-fixing is needed to bring down the cost of living and stabilise it. If this is done, it ought to be possible to deal with yet another problem of distribution, the black market—which is the gaping hole in the essential rationing system. The prospects of a good harvest will also help by increasing supplies. But in the last analysis, until more normal conditions return, it is a question of good political morale. The reports suggest that it is very good—steady and responsible. In this case, the black

market, with the profiteers, can probably be largely abolished.

This evidence that the French situation is not so desperate as was expected must not be interpreted to read as though all France's economic difficulties were solved. On the contrary, the most severe problems all lie ahead. The damaged state of French industry, supplies of raw materials, the loss of skilled labour—these are long-term difficulties on which the success of French reconstruction will turn.

The two factors which promise to ease the economic situation are likely to be equally effective in the political sphere. Speedy liberation, without great material and moral damage, simplifies the immediate task of administration and in many areas will make the work of the Army's Civil Affairs branch almost at once subordinate to the local French authorities. At the same time, the steadiness of temper which liberation has revealed is apparently making it very much simpler to transfer power from suspect or openly collaborationist officials to new men.

The problem of collaboration is already beginning to fall into perspective. The evidence suggests that, in almost every area the really guilty men were only a handful, and in many cases, as M. Coulet pointed out, "left with the Germans." The great mass of French officials are loyal enough. General de Gaulle recognised this fact in his last speech to the Assembly in Algiers when he said that the great majority of French civil servants would be allowed to keep their positions. Some changes have, of course, been necessary but, again, they appear to have been made without any blowing of ideological trumpets and, which is more important, in close agreement with the resistance movements on the spot.

M. d'Astier, Commissioner of the Interior, promised on June 15th that the Regional Commissioners appointed by Algiers "would act within the democratic framework." They appear to be doing so. M. Coulet, who will finally be responsible for Seine-Inférieure, Eure, Orne, Calvados and Manche, has proceeded with good sense and restraint. In Bayeux, he suspended the sub-Prefect, M. Rochat, but did not arrest him, for he was satisfied that M. Rochat was an honest man and could be given a post elsewhere. The new sub-Prefect is a member of the resistance movement. In Cherbourg, M. Coulet arrested the sub-Prefect and put in his place M. Levivandier, a man of typically Norman conservatism but also a member of the resistance movement. Caen was the first departmental capital to be liberated. Its Vichy Prefect, M. Cacaud, and its Secretary General were arrested, and M. Coulet, following the advice of the National Council of Resistance and the departmental Committee of Liberation, appointed as the new Prefect of Calvados a prominent leader of the resistance movement. These are the major changes. Some petty officials and notable collaborators have been placed under arrest but the minor scale of the "purge" is illustrated by a statement in the new Bayeux *Renaissance de Bessin* announcing the internment of 23 persons.

A CAPITAL ANNUITY

Part capital, part interest . . . £315 per annum guaranteed for twelve years . . . of which, on average, £271 is capital repayment and £44 is taxable interest . . . and, after the twelve years, an annuity of £472 10s. (subject to tax) continuing for life . . . this can all be secured by a male life aged sixty for a present investment of £5 000

Have you heard of—

EQUITY & LAW LIFE ASSURANCE SOCIETY
LINCOLN'S INN FIELDS

Temporarily removed to
163/4, STRAND, LONDON, W.C.2

There is other evidence to suggest that the purge may figure less prominently among the ordinary people of France than in the political circles of Algiers. When, for instance, M. Coulet dismissed the manager of the old *Cherbourg-Eclair*, the workers on the paper protested that he was not a collaborator and insisted on his reinstatement in the new *Presse Cherbourgeoise*. An even more striking example comes from Rennes. *Defence de la France*, the first newspaper to be published by the Resistance Movement in Rennes, contained the order "*Aucune vengeance personnelle ne sera tolérée*"—no personal vengeance will be tolerated. All arrests must be authorised by the local military authorities and men guilty of "personal" arrest will be tried before the military tribunal. There is, perhaps, no clearer image of the unvindictive spirit of the French than the fact that the tribunals set up by Algiers to try collaborationists are to be used to try men who attempt any witch hunting on their own account.

These examples may not be typical. In some areas, there will be more fighting than at Rennes. In some areas, there may prove to have been more traitors than in Calvados. But at least it can be said that the first lifting of the veil from the true face of France shows a picture of dignity, temperateness and remarkable independence. There is thus some ground for hoping that a functioning system of local authority will be maintained without too much difficulty and the transfer from the regime of servitude to the regime of liberation will be effected in an atmosphere free from the taint of partisanship and fratricidal war.

The Provisional Government may thus face a far less formidable task than it has so far envisaged. The day of its establishment in Paris may not be long delayed and the process of grafting the Government from without on to the structure of resistance within will obviously be far easier as a result of the steadiness and stability of the internal situation. The procedure for this process was laid down in decrees passed in Algiers last April. The Regional Commissioners were first to hold municipal elections. Each department would then form a General Council and send delegates to the Consultative Assembly—it may be noted, in parenthesis, that M. Gouin, President of the Assembly, is already in France. Finally, not earlier than a year after liberation, elections to a Constituent Assembly would be held. So far it has not proved possible, for one reason or another, to hold municipal elections in liberated territory—neither in Algiers nor Corsica. It may prove impossible in France. The old Councils, strengthened by delegates from the resistance movement, may carry on. They can, of course, send delegates to a General Council and to the Consultative Assembly. Yet it is clear that for some time

to come the Provisional Government will exercise all the authority in Metropolitan France.

Doubts have been expressed, both in Algiers and in this country, about the democratic intentions of General de Gaulle and the Government he dominates. Now, happily, all the conjecture and suspicion can be brought to the test by the unescapable witness of fact. The Provisional Government has a clear field in which to prove its fidelity to the great republican and democratic traditions of France. So much of the authoritarian and personalist legislation at Algiers was excused by the supposed need in France for military discipline in the first anarchy of deliverance. But there is little anarchy. On the contrary, there is, apparently, discipline, self reliance, and common sense. The Provisional Government can therefore prove the extent to which it trusts its people by modifying many of the emergency decrees, by restoring the normal processes of justice, by abandoning close censorship and rescinding the clumsy and limiting press laws. Again, it can reflect the mood of its people by giving the purge a secondary place in its deliberations. There must be justice but it would be disastrous if the political recrimination and personal vilification which have been present at Algiers were brought in to drown the temperate note sounded in Caen and Rennes.

Again, all suspicion of personal ambitions on the part of General de Gaulle can be dispelled by the broadness with which he throws his net in recruiting new men for the Provisional Government and in appointing new men to the administration of regions and departments. Loyalty and efficiency are qualifications all Frenchmen will recognise—they and not personal allegiance should be the test of office.

Finally, the Provisional Government can prove its loyalty to its own freedom-loving people by preserving with every effort of its authority, leadership and propaganda the steadiness and solidity of the home front. Calm and dignity at a time of great national crisis can make all the difference between the retention or abandonment of democratic procedures and habits of mind. There is explosive material in France—in the Maquis, in the hungry towns, among the prisoners of war and the exiled workers. Exploited by irresponsible leadership, it could quickly undermine the present relatively even temper of the liberated French. The great test of General de Gaulle's statesmanship in this critical hour is his desire and his ability to preserve in France the steadiness, the justice, the good temper and the common sense which are in every age and country the worst enemies of tyranny and personal rule.

A Policy for Wealth—I

THE British nation, as it approaches the post-war period, is faced with four supreme problems of economic policy, into one or other of which virtually every topic of controversy can be fitted. The first of these (the order is not one of priority) arises out of the determination to prevent a recurrence of mass unemployment—it is the problem known by the possibly misleading catch title of Full Employment. This must be put first, for it is in this direction that the most compelling popular pressures are exerted. The attainment of what the recent White Paper called "a high and stable level of employment" has become a categorical imperative for whatever Government, or form of government, is in power after the war. Expressed in economic terms, it is the problem of ensuring that, whatever the size of the national income, its flow is regular from year to year.

The second problem, also arising quite naturally from the pressures of a democratic electorate, is that which was dramatised by the Beveridge Report, and has been christened Social Security. In point of fact, it goes rather beyond what that title would strictly imply; more accurately, it is the problem of the National Minimum, of seeing that no citizen is allowed, for any reason, to fall below a standard of welfare defined, in the main, in terms of food, housing, education and health and, for the

rest, in terms of cash income. This is a matter which primarily concerns the distribution of the national income rather than its size or the regularity of its flow; it is to be accomplished by various methods of transferring the command over wealth from the well-to-do, the healthy and the fortunate, to the poor, the ill and the unlucky.

The third great problem is that of the size of the national income, of ensuring that the quantum of wealth produced and consumed is as large as possible. Logically, the problem of size is entirely distinct from that of regularity or that of distribution. For example, on the evidence of recent decades, the United States is a country where the national income is larger, but less regular, than in Great Britain. Even the attainment of perfect regularity—the complete solution of the Full Employment problem—would not make the British national income, on the average of years, as large, relatively to the population of the two countries, as the average American income in the last two decades, for all its ups and downs. Similarly, as a matter of theory, this country could be considerably poorer than it was just before this war, and yet so alter the distribution of the reduced income as to secure a National Minimum. Nevertheless, although the three problems are logically distinct, they are practically bound together. As a matter of practical politics, neither

Full Employment nor the National Minimum can be attained unless the size of the national income is, at the very least, maintained. This has been made quite clear in both of the authoritative pronouncements that have appeared. The White Paper on Employment Policy stated that "to maintain and improve our standard of living there must be steady progress in the efficiency of our industry as a whole," and it was one of the basic assumptions of the Beveridge Report that the productivity of British industry would be maintained and increased. Indeed, it is obviously so, for steady employment that was bought at the cost of a high standard of living would give little satisfaction, and the difficulty of arranging such a re-distribution of the national income as will guarantee Social Security will be very great if it has to be provided, not out of an increment of prosperity, but out of the present standards of the bulk of the people.

This third problem can be called that of Productivity or, more simply, that of Wealth. Past ages have regarded it as being, in itself, the whole of the Economic Problem. Our own more complex age has raised the other two almost to an equality—almost, but not quite, for Wealth is the essential prerequisite for either Full Employment or the National Minimum.

The fourth problem, running across all the other three, is that of reorganising the system of international commerce on which Britain's wealth was founded and on which its safety depends.

Of these four problems, three have by now been amply discussed in the public forum. They have also, over the last two years, been very amply canvassed in *The Economist*. To Full Employment, two connected series of articles, as well as many individual contributions, have been devoted. Eight articles on the principles of International Trade appeared in January and February of the present year. The policy of the National Minimum has been fully discussed before and since the appearance of the Beveridge Report in December, 1942.

The problem of the National Wealth, however, though its importance has consistently been emphasised, has never received a systematic discussion in these columns. The series of which this is the first article is an attempt to remedy the omission.

★

It is not only in *The Economist* that this most important of all economic topics has been strangely ignored. In the discussion both of publicists and of professional economists it has also been left aside. On the trade cycle, on poverty and the need for a redistribution of income, on international trade—on all these there is a mountain of literature, popular and scientific, polemical and objective. But on "The Nature and Causes of the Wealth of Nations" disproportionately little has been written since 1776. Even the vast literature of Socialism has, until very recently indeed, left the subject alone. The Socialist has discussed *ad nauseam* how to redistribute the output of the community, and he has had plenty to say about how to make it regular. But as for what determines the size of the output, and why it is larger in some countries than in others, and what can be done to control it, he has had almost nothing to say. He has either contented himself with the belief that a mere change in the ownership of the means of production would, by some unexplained magic, release hidden powers of production, or else, in company with the liberal economist, he has assumed that the size of the communal output and its rate of growth were acts of God beyond the possibility of human control. The rate of growth could be measured—it was about 1½ per cent per annum compound—but its springs were mysterious and out of reach.

It is only very recently that these assumptions have come to be questioned—indeed, it is only during the war years that the desirability of subjecting the rate of growth of the national income to the same "purposive direction" as its fluctuations and its distribution has come under serious discussion. There are three main reasons for the revival of interest. The first, and perhaps the largest, is the realisation that the Soviet experiment has succeeded. Ever since the Battle of Stalingrad it has been impossible

for even the most inveterate sceptic to deny that Russia, under Communist leadership, has succeeded in breaking the secular trend, in vastly speeding up the increase of its national wealth and power, in asserting human control over the processes that determine the wealth of nations. Even those who most recoil from the methods of Soviet "direction" must accept the achievement; and it is a natural step to ask whether something of the same sort could not be done elsewhere by less oppressive means.

A second influence has been the great improvement in recent years in the statistical technique of measuring differences in national wealths, from which their magnitude has become apparent. And the third reason has been the startling conclusion to be drawn from the figures—that Britain is a long way behind the leaders, and losing its place to others who were regarded not so long ago as its followers.

One of the clearest examples of the use of this statistical technique is the article contributed by Dr Leon Rostas to the April 1943 issue of the *Economic Journal*, as the first fruit of a large project of work undertaken by the National Institute of Economic and Social Research. The conclusions of this article can be epitomised in the statement that "industrial efficiency, as measured by production per head, was roughly similar in Great Britain and Germany, while in the United States it was more than twice as great as in the two other countries." The calculations on which this conclusion is based are admittedly subject to criticism in detail, but the conclusion itself is unassailable. It agrees with other studies on the same subject, and it can be confirmed by the latest figures of national income in the United Kingdom and the United States. In 1943, when there was full employment in both countries, the output of wealth per head of the population was from 1½ to 2½ times as large in America as in Britain (the exact ratio depending on the figure assumed as a fair purchasing power parity between the two currencies)—and this in spite of the fact that a much higher proportion of the American labour force is in agriculture, with its below-average productivity, and in spite of the shorter hours worked in the richer country. Whatever the exact figure may be, and whatever allowance it may be proper to make for the abnormal conditions of war-time, there is very little room for doubt that the average American worker produces in an hour from one and a half to two and a half times as much wealth as the average British worker. There is equally little room to doubt the other conclusion that the German industrial worker, before the war, produced in an hour as much as, or possibly slightly more than, the British industrial worker.

These are startling facts, and they reveal the delicacy of Britain's economic position. Hitherto, it has been possible to maintain a higher standard of living in this country than in Germany, in spite of the fact that industrial productivity was no greater, by two means: partly by importing food cheaply from abroad instead of growing it expensively at home (that is, at great expense of manpower) as Germany did; and partly because of the reinforcement to the British national income provided by dividends and interest on overseas investments. Both these props are getting very rickety. The overseas investment income has largely disappeared and—either from choice or by compulsion—the dependence on cheap imported food may be less in the future than in the past. Indeed, there is likely to be a cumulative effect. We can continue to import cheap food only if we can pay for it, and we shall be able to pay for it only if our exports are competitive, and they will be competitive only if our high standard of wages is matched by a high productivity. Thus if we increase our productivity, we shall not only be able to consume more of our own domestic output, but we shall also be able to raise the standard of living still higher by enjoying cheap food. But if we are inefficient producers, then we shall have less of our own output to consume, and the standard of living will be still further depressed by the difficulty of organising international exchanges and by the consequent necessity of relying on the inevitably more expensive domestic production of food.

To the nation that hath productive efficiency shall be given; and from the nation that hath not shall be taken away even that which it hath.

To a very much greater extent than hitherto, the British standard of living will depend on the British standard of production. We cannot any longer expect to enjoy a cushion of unearned income on top of our earned income. Every year more inexorably we shall be faced with the dilemma: either we take steps to raise our productivity per head towards the American level, or else our standard of living falls towards the German. We cannot any longer expect to be Europeans in our standards of production but in an upper class for consumption. We have the choice between producing and consuming as much as the English-speaking communities overseas or as little as the nations of Continental Europe.

To the question thus posed there can, of course, be only one answer. And it is reinforced by a further consideration. The British population is no longer reproducing itself. On the average of the last eleven years, the net reproduction rate is about 0.80. If this continues—and it is as likely to fall as to rise—the number of workers will eventually fall by 20 per cent each generation, or by roughly two-thirds of one per cent per annum. Much of the smooth working of the economic mechanism—to say nothing of the structure of national power—depends on there being a continuous increase, not only in income per head, but also in the absolute total of the national income, which is of course a compound of the number of workers and of their average individual productivity. If the number of workers is falling by two-thirds per cent per annum, then individual productivity needs to increase by 2½ per cent per annum if it is to achieve the same

increase in the total national income as, with a stable population, is given by 1½ per cent.

To the two existing slogans of "Full Employment" and "Social Security" there therefore needs to be added a third, "Productivity," on which the first two depend. And as a practical definition of aim, the attempt should be to raise the average annual increase in productivity per man-hour from the 1½ per cent which has prevailed for many decades to 2½ per cent. A rate of 2½ per cent per annum compound is an increase of two-thirds in twenty years, or a doubling in 28 years. To double the standard of living within a generation may look like fast going; but when it is looked at through the other end of the telescope, as the intention of arriving by 1972 at the level of productivity reached by the United States today, it does not seem so very ambitious.

"Double the production per man-hour, and therefore double the consumption per man-hour, within a generation." This should be the slogan, and around it should be organised a raging, blaring campaign of propaganda until the general public accepts it as being of equal importance with Full Employment and Social Security—indeed, as being of greater importance, since both these two depend upon it. The importance of production has been dramatised by the war, and there are many lessons to be learnt about the means of securing it, as well as many examples of what can be done when all efforts are bent to that end. This war experience should be used as a base on which a wider campaign and a more permanent policy can be built.

It is the purpose of this series of articles to examine the lines on which such a policy should proceed.

Towards Industrial Unionism

THE discussions of the miners' delegate conference at Nottingham this week (the results of which will be known by the time this issue of *The Economist* appears) on the shape and constitution of their National Union of Mineworkers should have far-reaching effects, not only on the miners' own organisation, but on the whole trade union movement. In recent years, there has been a growing trend towards the consolidation of trade union structure in the direction of industrial unionism—that is, the organisation of all the workers in whole industries, rather than those in separate crafts or different districts. After the Conference the scheme will be submitted to a ballot of the Federation's membership, and if the miners succeed in overcoming the difficulties involved in creating "one big union," parallel developments in other sections of the trade union movement may well be hastened.

For the miners, it is not now, as it was two years ago, a question whether, but of how, and in what form. The miners committed themselves to the principle of a single union at their 1942 conference, and the only reason why the project has not yet materialised has been the continued coal crisis and the wage negotiations, which have absorbed all the attention of the miners' Executive.

The Mineworkers' Federation of Great Britain, formed in 1889, is a loose association of some twenty district unions, which vary widely in size, tradition, funds and influence. The movement towards unification after the end of the last war was repressed after the General Strike when district agreements were imposed. Since then, there have been bitter rivalries between the districts, especially during the depression, when the export areas, such as Durham and South Wales, suffered unemployment and wage reductions, while the position of the more prosperous inland areas, such as Nottingham, was relatively well maintained, and competition between the various coal-producing areas became acute. The ascertainment system, designed originally to provide labour with a fair share, with profits, of the proceeds of the industry, became not only meaningless, as the industry produced no profits, but, because it was organised on a district basis, a recurrent source of inter-union friction.

The events of the war have, however, produced a radically different situation. With the need to maintain output and conserve manpower, district divisions have had to be modified. Central and regional machinery has been set up under the Ministry of Fuel and Power; there is now national arbitration and conciliation machinery, and a national minimum wage has been established. The 4½ years' breathing-space provided under the Coal Wages Agreement, during which both sides are pledged to maintain industrial peace, gives the miners an opportunity to put their own house in order, and if they are sincere in their desire for a nationalised fuel industry, it is only logical that they should first nationalise their own union.

"The Mineworkers' Federation, as it is constituted today, is not fitted to meet the responsibilities which face it in the immediate future," stated James Bowman, the Federation's Vice-President in 1942. It has no power over its constituent bodies, most of whom resent its intervention and jealously guard their autonomy. The Federation itself is inadequately staffed and short of funds; its gloomy cramped quarters in Russell Square contrast unfavourably with, say, the palatial offices of the Durham Miners' Association.

The plan for a National Mineworkers' Union stipulates that there shall be "no more interference with local procedure and custom than is absolutely necessary for the sound working of the scheme." The Union would be responsible for matters of general industrial policy—output, wages, manpower, safety, hours and conditions—while the districts would continue to deal with purely local matters and continue their friendly society activities. District associations would become area councils, and their officers area officials, a change of status which may well be resented. Inevitably, the battery of district agents and staffs would have to be reduced, and the question of compensating displaced officials may prove a stumbling-block. Another problem is raised by the position of colliery deputies, who in some districts are organised in the

Federation and in others are outside it. Again, some of the skilled craftsmen are catered for by engineering unions, and the unskilled workers by general workers' unions. The term "mineworkers" is intended to cover all workers in and around a colliery, and only when these are all included, can the Mineworkers' Union justifiably claim to be a complete industrial union.

It would, of course, be foolish to expect too much from the formation of a single miners' union. It cannot solve the problems of the coal industry, but it is likely that had there been a central body, with over-riding authority, much of the sorry history of muddle and delay in the war years might have been avoided. With a national union, it should be easier to pursue a policy of maximising technical efficiency. Concentration on the most efficient seams and collieries, closing down the inefficient ones and transferring miners might be less opposed if the union were organised on a national and not a district basis. The planning and development of the industry would be rendered more practicable if the miners could speak with a single voice. All this depends on whether the union becomes a reality, and not simply a paper scheme. Apathy and indifference on the part of dissident districts would wreck the newly-found unity. On the other side, the miners' leaders will need, in the larger and more remote units, to show greater responsibility towards their members than many have done in the past.

The miners' problems in forming a single union are fundamentally the same as those involved in any form of trade union merger. Personal jealousies, fear of losing identities and of being swamped by a bigger unit, conservatism and the objections of redundant officials will always be met. Yet it is encouraging that, in spite of these inherent difficulties, considerable progress towards closer union working should have been made since the war began. A few examples will suffice to illustrate the trend: the three railway unions have set up a joint working committee to discuss matters of common interest; the Amalgamated Engineering Union has decided to seek affiliation to the Confederation of Shipbuilding and Engineering Unions; the unions catering for women engineers have an agreement not to "poach" each others' women members and have acted collectively on women's wages; the Transport Workers and General and Municipal Workers unions have a joint committee on organisation. Many unions have entered into agreements about dilution or the delimitation of spheres of influence; or have made arrangements for the mutual recognition of union cards, or set up machinery for settling inter-union differences. There has also been an increase in federations and in the responsibilities of the federal bodies. The National Federation of Building Trade Operatives now determines the industrial policy for its affiliated unions, and the Federation of Furniture Trades Workers has put forward a postwar reconstruction scheme on behalf of all its members.

But it is still true that trade union structure, which grew up piecemeal and reflects the various phases of industrial development, has not kept pace with the march of events. It is still lop-sided and in many respects archaic. It is only necessary to look at the picture provided in the Registrar-General's Report in 1942, when 57 per cent of the total number of unions had a membership of under 500, or accounted for only one per cent of total membership, while 16 unions, with 100,000 or more members, covered 60 per cent of the total membership. Of the total union membership of 7.8 millions, over 6 million were in unions affiliated to the Trades Union Congress. Among them there is often bitter competition for members—no fewer than six unions organise tobacco workers; the same number cater for insurance workers. Two rival unions recruit for shop assistants. There are no fewer than 52 unions in the cotton trade, while in the wool textile trade, the National Association of Unions in the Textile Trades is a very loose form of federation, with no power over its constituent unions, the average membership of each of which is only 1,500. Building and shipbuilding are the outstanding examples of unions which need to adapt themselves to technical changes,

and where a single union to cover all those engaged in the industry might seem advantageous.

The General Council of the Trades Union Congress has for some time past been seeking to modernise trade union structure. It spent three years after the last war reviewing the position and encouraging amalgamations, but it had to acknowledge defeat. Indeed, Sir Walter Citrine felt so rebuffed that, when urged by Congress in 1942 to make a fresh attempt, he refused on the grounds of impracticability. At Southport in 1943, however, a resolution was passed, calling upon the General Council to review trade union structure in order to determine where there was "uneconomic competition and overlapping, what amalgamations were desirable and what structural or other changes were necessary to ensure maximum trade union efficiency in the future." Such a review has now been undertaken, and the question of trade union structure will be one of the major issues at the forthcoming Congress.

Hitherto, the functions of the trade unions have, necessarily, been defensive—they have been primarily concerned with collective bargaining about wages, hours and conditions, with friendly society activities and with the general protection of their members. But during the war, in addition to these functions, the unions have acquired new responsibilities at every stage of production, and have indeed come to be regarded as an integral part of wartime machinery. Their participation in industry will inevitably be extended in the future, and if they are to have greater responsibility for the formulation or execution of policies—above all for industrial efficiency, an aspect which, in the defensive phase, the unions have obstructed rather than furthered—it is essential that the unions should be adequately organised and equipped. It is significant that only a few of the larger unions have research or economic departments, or sponsor educational activities. The TUC itself, though it has the supreme advantage of unchallenged authority (a position which contrasts with the divided allegiance of American trade unionists), does not co-ordinate union activities to the extent that it might, and there is clearly room for closer and more regular liaison between individual unions and the General Council. It also seems necessary that the General Council should become more representative. It is, for instance, ludicrous that the AEU, with nearly a million members, should only elect one representative to the General Council.

With a more unified and firmer structure, the trade union movement would make a more positive contribution to the affairs of the nation. Indeed, unless they do make such a contribution, their *raison d'être* in a community where the state's own responsibilities for welfare will be so wide, will largely have disappeared. The present structure, suitable enough in the days of *laissez-faire*, is inappropriate in modern conditions. Changing industrial techniques, and the introduction of new materials and processes have rendered many of the old craft demarcations obsolete. It seems inevitable that the future pattern of trade unionism will be much more on the lines of horizontal organisation, industry by industry, rather than by vertical organisation of craft by craft, with the general unions catering for the mass of non-skilled workers. But the corollary of the organisation of all or most of the workers in large industrial unions is that these bodies should put first in their policy the interest of the community in the highest possible output per worker.

A policy of full employment requires the maximum mobility and flexibility of labour, a condition which cannot be achieved so long as unions cling jealously to their old privileges and restrictive practices. The policy of productivity outlined in an article on page 236 can only succeed with the aid of organised labour, and can be wrecked by the unions if they stick to old ways. The new trend is to be welcomed, but it has its dangers. Industrial unionism, with greater centralisation, must not lead to bureaucratic control; it must not weaken the democratic basis of the movement; it must pull its weight in increasing the power of the nation to produce and so to keep up the standard of living.

NOTES OF THE WEEK

The Northern Battle

The outcome of the present phase of the fighting in Northern France cannot yet be definitely assessed. Further sweeping Allied advances and victories can be confidently expected. The odds are so heavy against the Germans that they cannot reasonably hope to stave off fresh defeats. What is not clear is whether they will still be able to fight large-scale delaying battles in France. Public opinion has once more been warned not to set its hopes too high and not to expect the end of the campaign within weeks. The warning—from General Eisenhower—may have been inspired by the course of the fighting in the Normandy pocket. The American drive from Le Mans northwards towards Argentan was one of the major master-strokes of the war, and the German army in the Norman "pocket" has been badly mauled. But it has obviously not been destroyed, and is still in being. It managed to keep open the precarious escape route between Argentan and Falaise for longer than might have been expected. Whether it will now be able to make a new stand elsewhere cannot yet be said. A retreat over the now bridgeless Seine would expose these battered forces to new and crippling blows; but strong remnants may still cross the river by pontoons and barges and be reinforced by fresh divisions in the rear.

Invasion from the South

Such respite as the Germans may have gained by dogged defence in Normandy has been more than offset by their remarkable impotence in face of the Allied landings in Southern France. It is enough to compare this landing with the landings at Anzio or even in Normandy to have a clear picture of the shrinking spiral of German strength. General Maitland Wilson will obviously advance along the Rhone Valley to link up with the Allied forces in the north as quickly as possible. In this he will be decisively assisted by the French partisans, who now for the first time go into action with artillery. He may also be able to strike, again with the inestimable help of the irregulars, across the Maritime Alps into Northern Italy and so out-flank Kesselring from the north and force him to abandon the Po Valley much sooner than he would otherwise be prepared to do. The extraordinary opportunities now opened before the Allies in the West and in the South have partly been due to Hitler's evident decision to throw the bulk of his last reserves against the Russian advance. All along the Eastern Front, from Lake Peipus to the River San, the Germans are now counter-attacking heavily. The Russians seem to be waiting until the enemy has spent his striking power in those vain and costly efforts before they themselves resume, as they soon will resume, their victorious drive westwards.

Hostages for Hitler

There is unhappily very little evidence to suggest that the prospect of defeat has lent moderation to the plans of the Nazi High Command. On the contrary, from every side come reports of war to the last man, and an attempt to fulfil the old threat that, if Nazi Germany were to fall, it would drag down with it the dead body of Europe. This grim pursuit of the holocaust is difficult to understand—as difficult as the Nazi mentality. The only likely explanation is that by compelling the German army to fight a series of senseless yet heroic rearguard actions—for example, the continued resistance of the Brest and Lorient garrisons—the Nazis hope to perpetuate a Wagnerian myth of heroic defeat, for use in the future writing of German history. This is only a hazard, and it may be doubted whether all the Nazi leaders intend to share the *Götterdämmerung* which they are decreeing for their followers. There has always been an incredibly sordid underside to the life-story of the Viennese housepainter. The plans for the inner clique may well include sanctuary in neutral countries, or, if that should prove impossible, a bargain with the Allies

according to the oldest of all gangster patterns—the holding of hostages. Hostages there are in plenty—the prisoners of war, the millions of foreign workers. In fact, there are too many. A sudden rising or a sudden collapse of authority might turn the hostages into Greeks in the wooden horse. It is therefore not surprising that the Nazis seem to be looking for more manageable hostages. The aged Pétain may be one. Whatever his record since 1939, he is still the "victor of Verdun." The reported transfer of King Leopold of Belgium, his consort and the royal children to Germany, is much more significant. Is this Hitler's price for another Doorn?

At Bay

It is probable that Hitler, in the last desperate stage of his struggle, also regards the people of this country, in a sense, as hostages, because they are close enough to be the targets for the terror-weapons upon which he has staked his last bid. His vain hope seems to be that, faced with fresh threats, these "hostages" may call a truce before the very worst has happened to the Germans in the field. For this reason General Eisenhower did well to point out on Tuesday that the establishment of sure military supremacy need not mean a prompt end to the fight. The bigger the victories and the quicker the advance in France, the more likely is the enemy (if he has solved the technical problems of their projection) to turn to instruments of indiscriminate bombardment with a longer range than the flying bombs, and of a different character; and at least until they, too, have proved militarily irrelevant—despite the grievous harm they may do to persons and property—the more likely it is that the Germans, and especially the Nazis, will go on doggedly, hoping against hope for a miraculous change in their fortunes. But none of this alters the fact that it is now quite certain that the worst will happen to the German armies in no very long time—though even then, with nothing more to lose, the Nazis may well attempt to fight on underground.

Economic Negotiations

The important discussions which are going on between this country and the United States on economic topics conform to the pattern of informal and mainly exploratory talks rather than to that of the formal international conference. It should not be supposed, however, that there is any fundamental difference in the binding character of the results achieved between, say, the Bretton Woods Conference on the exchanges and international investment, at which the representatives of more than forty other nations attended, and the *tête-à-tête* which Lord Beaverbrook has been holding on civil aviation and oil with American spokesmen. Indeed, the oil agreement, which was reported last week, is probably more binding, as it stands, than the draft monetary agreements which the Bretton Woods Conference reached. Whether these separate agreements are made in conference or in conversations, they are equally binding acts of policy. From this, two principles would seem to follow. The first is that there should be a constant collation of the decisions made in specific instances, such as oil or rubber or civil aviation, so that they shall add up to a consistent economic policy which is consonant with the interests and the opinion of this country. The best link for bringing and holding together the tentative policies decided is probably not any single individual, even Lord Beaverbrook. Almost certainly, if an individual Minister were picked out, it should be either the Chancellor of the Exchequer or, since it is chiefly trade policy that is being fashioned in this manner, the President of the Board of Trade. But, obviously, the most important need is that economic policy, however piecemeal the way in which it must be determined, should be consciously decided by the Cabinet itself. Certainly it is quite illogical, and likely to be very dangerous, that formal decisions should be taken at conferences, such as that held at Bretton Woods, on questions of international machinery without corresponding decisions being made,

either in this country or in the United States, on the issues of economic policy upon which the working of this machinery will entirely depend. The alternative to present procedure is neither an omnibus international economic conference nor a prior announcement by the Government of its general economic programme over all the international field. The necessity is rather that, at every stage, it should be guaranteed that the right hand of policy knows what the left hand is doing.

Trade Policy

The second requisite, which goes to the heart of our present procedure in international economic affairs, is that, by whatever means decisions on international economic policy are made, it should be ensured that they are kept in step with British opinion—and British interests. Both international conferences and Anglo-American conversations involve this country in commitments. At least it should be known whether Parliament and the people are prepared to accept and honour these obligations—it is probably even more vital, of course, that it should be known whether or not the United States Congress will be prepared to honour them. The draft agreements which have resulted from the conference at Bretton Woods are remarkable in that they run counter, in a number of important respects, to the views which were expressed in Parliament when the opportunity was afforded to debate the basis of the Bretton Woods discussions. The position at present is that, so far as the separate topics of Anglo-American discussion are concerned, Parliament's views are not, for the most part, taken; and that when, as in the case of international monetary matters, those views are taken, they are not apparently heeded. It is true that, in the British system of government, there is very little chance that, if the Government's decisions are pressed, they will be repudiated; Ministers can rely upon their majority. On the other hand, the efficiency of the system depends, over a period, upon its sensitiveness to public opinion which, for all its inevitable errors, has a steady eye both to practicability and to national interest. It is not this Government or this Parliament that will have to administer the policy which is now being somewhat haphazardly made. It is, therefore, most necessary that the Government should not only give every opportunity for a discussion of the general economic principles and expectations upon which the present negotiations and decisions, in whatever form, are based, but also that it should take very careful notice of the opinions expressed. The unspoken and undiscussed premise of all these international and economic negotiations and tentative agreements is the picture which the British Government (and the American Congress) have of the appropriate trade policy to be pursued after the war. Until this picture has been made very much clearer, there will inevitably be an air of considerable unreality about the talks and settlements which are now being made in so many various ways.

Polish Dilemma

M. Mikolajczyk, the Polish Prime Minister, has come back from Moscow with proposals for a Polish settlement. Details of the proposals are not yet known; and they are now being discussed by the Polish Government. It is fairly obvious that the scheme conceived in Moscow is based on a rigid recognition of the Polish Committee of Liberation. M. Mikolajczyk has been asked to relinquish his post of Prime Minister and to become the Chairman of the Committee. He has also been asked to induce some of his colleagues in London to join that body. The possibility of the Polish Government agreeing to those suggestions seems very remote indeed. More important still, even if the Government in London agreed, the underground movements in Poland itself would almost certainly refuse to endorse the agreement. This has now been made clear by M. Arciszewski, the Chairman of the Polish Socialist Party and the new President Designate of Poland, who left Warsaw in July. M. Arciszewski has declared that the Polish underground movements desires an honourable and straight understanding with Russia. They have assisted the Soviet Armies advancing into Poland, wherever that has been possible. They are also willing to accept the representatives of the Communist Party in the governmental Coalition on an equal footing with the spokesmen of the other political tendencies. But this is, according to the President Designate, the limit of the concessions which the Polish underground is ready to make. In no cir-

cumstances would it consent to the self-effacement of a Government to which it has remained faithful during five tragic years of German occupation. In theory, the only way out still left open is that the Government and the Committee should both give place to a Provisional Government to be set up in Warsaw immediately after liberation. Such a scheme would formally overcome the difficulties which spring from the conflicting claims of the Government and the Committee. Whether a similar scheme would satisfy the Russians remains to be seen. If the new Provisional Government created in Warsaw is to be really representative of the Polish people it would of necessity be almost a political replica of the London Government, supplemented by Communists, however much its personnel might be changed. The rift between Poland and Russia has already produced lamentable results inside Poland where extreme anti-Soviet and Fascist organisations have started something like a civil war, not only against Communists, but also against all who preach conciliation with Russia or any territorial cessions. The Polish Government has decided to put those organisations beyond the pale. It is strange, to say the least, that in view of these facts accusations of Fascism and so forth should still be flung at that Government.

"Free Generals" in Moscow

The Free German Committee in Moscow is coming more and more to the front of the stage. After eighteen months of silence in captivity, Marshal von Paulus, the German Commander at Stalingrad, and the one-time hero of a quasi-Wagnerian legend spun by Dr Goebbels, has now joined the group of twenty German generals who have denounced Hitler and called the German people to turn their weapons against him. To be quite accurate, the appeals of the Generals have been addressed, not so much to the German people, as to their own colleagues, who, under Hitler's orders, still lead the *Wehrmacht*. Significantly, General Seidlitz, the chief spokesman of the "free Generals" in Moscow, has paid an extremely warm and unstinted tribute to the men who took part in the July

Chinese horse typical of the T'ang period

FLYING MONEY

Fei-Tsien—Flying Money—the ancestor of the bill of exchange, was invented in China in the seventh century. It provided a means of transmitting money from place to place and thus assisted in developing trade and travel in China's vast territories.

The Emperor of the T'ang dynasty who originated this method of payment little knew he was sowing a seed which would grow into a highly specialized financial system enabling nation to trade with nation.

Modern international commerce calls at many stages for facilities which only a bank with wide ramifications can provide. In whatever overseas transactions you are interested and whatever the nature of your engagements, this Bank, with an extensive branch system in the home country and banking connections throughout the whole wide world, is able to offer you unrivalled services at whichever of its 1800 offices is most convenient for your purpose.

conspiracy. Their names, he said, will be honoured by posterity as the names of great fighters for German freedom. It is difficult to overlook the striking contrast between the tenor of Russian and British propaganda to Germany. In this country the authorities are very reluctant to allow direct appeals to the German officers' corps. On the morrow of the attempt on Hitler's life the whole British press—Right and Left—repeated, correctly, that the Generals were as much the foes of the Allies as the Nazis. No similar scruples inhibited propaganda from Moscow. This is not to say that the British and Americans should imitate Russia's tendency to appeal primarily to the officer corps. But it does underline the foolish rigidity of appealing to nobody for fear of being fooled by everybody.

Circular I

One of the major criticisms of the Education Bill already shows signs of being substantiated. This referred to the sketchiness of the timetable of action laid down in the Bill. On the basis of past experience of the Board (now Ministry) of Education, it was suggested that the procedure of practical reform under the Bill did not offer the maximum possible safeguard against departmental procrastination. The Minister has now issued to local authorities a circular in which he announces that the school-leaving age will be kept at 14 after April 1, 1945, when the rest of Part II of the Bill is scheduled to come into force. In view of the "impossibility" of securing the necessary teachers and school accommodation, he says, it is not likely that the order will be revoked earlier than April 1, 1946. The difficulties of teaching the extra teachers and of building the extra classrooms cannot be minimised. But why, then, was this date ever written into the Bill? Why was Mr Butler not more frank about the gravity of the position? If this first step cannot be taken—and probably it cannot—why has not the Minister already made his apologies and explanations to Parliament? To start off with an indefinite postponement of the one first vital step is very serious indeed. The timetable sketched out—the words are used advisedly—in the Education Act could not even under present conditions be called a rigid one.

What's to be Taught?

The plans for the new order in education are excellent, but the same gaps in policy which were apparent when the White Paper appeared well over a year ago still remain. The publication of the Norwood, McNair and Fleming reports took the first step towards filling them. Of the three, the McNair report on the supply of teachers and the Fleming report on the public schools have only recently appeared, and some time must clearly elapse before the Ministry can be expected to formulate a decision on their findings. The Norwood Report on curriculum, on the other hand, was published fully nine months before the other two, and it is, in many ways, the most urgent. No indication has yet been given, however, that its valuable and constructive work is bearing fruit in the Ministry. The local authorities are now engaged in preparing their development plans in the educational field. By the very nature of this work it is essential that they should know as much as possible of the Government's detailed intentions. In particular, the outlines of what the Government intend should be taught in the schools should not still remain wrapped in mystery. It is a matter which will affect each and every school in the kingdom, and which is of immense importance in planning the physical construction of new and adapted schools. Nor, more fundamentally, can the likely future level and quality of our democratic schooling be even guessed at. Nothing but a full and thoughtful declaration, preferably following closely the lines of the Norwood Report, can allay concern.

Breathing Space for Farmers

"We shall need to go on growing all the food we can in this country for many years to come." In his speech at Belfast on Wednesday Mr Hudson used this argument to spur on farmers to greater efforts. He emphasised again that the chief aim now, with arable production at

or near its peak, must be to expand the quantity and quality of livestock and livestock products, of which the world shortage is likely to be particularly severe. For some years yet, foreign feeding stuffs will remain scarce, but home crops may become increasingly available for feeding to livestock. He could point out that livestock represents a branch of farming which is economically best suited to the United Kingdom, by reason of its soil and climate, and of the perishability and costliness of its products. Thus the argument is that to make full use of the country's rich resources of grassland is the way to a prosperous peacetime agriculture and a solution of the present emergency. Great official emphasis is being put upon improving the quality of breeding and the standard of milk; the Government's acceptance of milk as "priority number one" is as economically sound as it is nutritionally wise. Thus far there is no clash between the artificial needs of an emergency economy and the long-term interests of peacetime efficiency. But there is another side to the picture, to which Mr Hudson referred only obliquely. He called the remaining years of all-out production a "breathing-space in which to build even firmer foundations for future prosperity." When this breathing-space is over, agriculture will have to take in its belt—to an extent which is illustrated, partly at any rate, by Mr Hudson's own estimate that since 1939 arable acreage has risen by nearly 50 per cent at the expense of the area under permanent grass. The Minister gave the following figures of pre-war and war-time averages in England, Wales and Scotland:

	1939	1944
Total permanent grass acreage	19,000,000	12,000,000*
Total arable acreage	13,000,000*	19,200,000
Wheat acreage	1,800,000	3,200,000
Potato acreage	700,000	1,400,000

* Just under.

An economic and not over-costly agriculture after this war will probably be appreciably bigger than it was before the war; but, to remain economic and not over-costly, it will certainly have to be appreciably smaller than it is during the war. A drive to improve livestock production, welcome as it is, will not secure the transition that must eventually take place, however "many years" ahead it may lie. The transition will be big and—unless Mr Hudson warns and plans ahead—painful.

Health Centres

Very few of the answers to the British Medical Association's questionnaire on the White Paper (A National Health Service) found the doctors—grouped according to appointments held—in general agreement. But two in every three doctors (83 per cent of Service doctors and 84 per cent of salaried doctors) approve of health centres in principle, and have clear ideas of the type they would like to see established. A majority favours the type

where both preventive and curative work is done, including for example, maternity and child welfare and school medical treatment.

Proposals on these lines were put forward originally, not by the Government, as was stated in *The Economist* last week, but by individual doctors and the BMA's Planning Commission. The health centre envisaged in the White Paper—one which would provide

for individual consulting-rooms, for reception and waiting rooms, for simple laboratory work, for nursing and secretarial staff, telephone services, and other accessories—recovery and rest rooms, dark rooms, facilities for minor surgery, and other ancillaries.

—is supported by only 15 per cent of the doctors who approve the principle of the health centre. It is perhaps surprising that, in this instance, the Government should have rejected the bolder and more comprehensive scheme put forward by the doctors—though it is almost certain that the decisive reason was the great administrative (and political) difficulty of taking maternity, child welfare and school work away from the particular local authorities which are at present responsible. It is a difficulty that must be admitted; but, since the health centres will themselves be under the administration of some local health authority, at least it should have been possible to arrange the transfer of these services, or most of them, by stages to the real health centres that the doctors and others want. On the face of it, at any rate, the courage of the doctors is in contrast to the caution of the Government.

Medical Students and the White Paper

The views of medical students on the health services White Paper do not differ widely from those of practising doctors as elicited by the British Medical Association's questionnaire. A smaller percentage of students replied to the questionnaire of their own association, which ran on much the same lines, but this is put down to such factors as holidays rather than to lack of interest; even so, it seems strange that only 30 per cent should have replied on a matter that concerns their own future so nearly. Of those who did reply, 51 per cent were favourable to the White Paper as a whole and 40 per cent were unfavourable, whereas the doctors' vote on this question showed an almost exactly opposite result—53 per cent being unfavourable and 39 per cent favourable. On another general question—whether the quality of the medical services would be enhanced or suffer by the introduction of a national service—the students differed from the doctors, 49 per cent saying that it would be enhanced and 36 per cent that it would suffer. But, in spite of this general blessing, 43 per cent of the students replied "No" to the question whether they would enter the national health service as described in the White Paper, against 41 per cent who replied "Yes" and 15 per cent of "don't knows." A large majority—72 per cent—agreed that complete medical services, including hospital and specialist services, should be available to all, free of charge; 89 per cent expressed themselves in favour of health centres; and 50 per cent were in favour of abandoning the sale and purchase of general practices. Thus, in so far as any judgment can be formed on the replies received from a minority—albeit a large one—of the medical profession, it would appear that both the present and the future generation of doctors are broadly in favour of the objectives and basic principles of a national health service. But, as in all matters of reconstruction, there is decided and widespread disagreement about means and methods.

Liberating Holland

The publication by the Dutch Government of a royal decree covering the principles of administration in Liberated Holland is a reminder that no government in exile, however representative and stable, can escape certain common problems now that the time for homegoing is at hand. They have to devise ways and means of tidying over the first weeks of fighting and dislocation—though the experience of France suggests this phase may not be as difficult as the various authorities feared. They have to get rid of collaborators while keeping the administrative machine running. They have to deal with tremendous economic confusion. Finally—and this may prove the most awkward political bundle to clear—they have to merge the exiled Government with the local resistance at a time when a great variety of factors—the chief of them, the absence in Germany of large numbers of their citizens—make immediate elections impossible. The Dutch Government in London is in perhaps the most fortunate position of all the Governments in exile. Its asset is the prestige of the House of Orange. Queen Wilhelmina apparently enjoys the complete confidence of practically every brand of political opinion from Left to Right both in Holland and in the Dutch emigration. Her policy has remained firmly constitutional, and it is quite clear that in her hands will rest most of the major decisions on policy in the immediate period of liberation. On her return she will be free to change, extend, reorientate her administration at will. The Queen, as the chief element of political continuity, solves a host of difficulties which may await, say, the Belgians whose King was first a prisoner and is now a hostage. Other factors making for stability in the Dutch situation are the relatively small number of active quislings, the extent of loyalty among the officials in Holland, and the habitual steadiness of the Dutch temper. On the other hand, economic difficulties will be acute. There may also be some immediate political difficulty in giving expression to the new political trends and ideas apparent in the resistance movement. The men who have recently left Holland testify to the strong desire of all sections of the resisters to reconstruct their parliamentary system in the direction of energy, youth and social progress.

The Government in London is naturally out of touch with these new trends. The Dutch emigration is one of the smallest, possibly not greater than some 2,000 men and

women. The Government has had of necessity to be chosen from among the business community, whose officials form the bulk of the emigration. These men, directors and employees of the great Dutch concerns—Shell and Unilevers—were brought in to direct Ministries, and to keep up a framework of government not only for Holland, but for the Dutch East Indies. In recent months, a new call on this limited manpower has come from the Allied military authorities. The Dutch have set up a Civil Affairs branch, into which again businessmen have been called with temporary military rank. Even so, it is said to be seriously understaffed. These are the men whom the Queen will take back with her to Holland. Their business background has led some critics to doubt their capacity to "merge" with liberated Holland. Such criticism overlooks the fact that Holland itself is to a great extent a "business community." In any case, the new decree makes it clear that there will be no change in Holland's constitutional and democratic system. The decree lays it down that

The States General, the provincial states and the communal councils will be re-established immediately after liberation.

Elections will be held when the exiled Dutchmen have returned. Meanwhile, the Queen's attitude is a sure guarantee that in the interim period new men from the resistance will be everywhere brought in to supplement the old politicians and the men of the emigration, many of whom will return to their normal business activities. This decree underlines the great political stability of Holland. Economic problems will be acute, but at least the Dutch Government will escape those deep and dividing political and social issues which make the future of other exiled governments and dynasties so dark.

Too Many Wholesalers?

Mr T. W. Caves, the secretary of the Wholesale Textile Trade Association, has laboured for many years to explain the useful functions of the wholesale trader. His latest observations, made to the British Hosiery Manufacturers' Association, deserve close attention. The wholesale trade

To MEMBERS of the Scottish Widows' Fund

Your "S.W.F." life assurance must be a great comfort to your mind in these uncertain days but you are perhaps sorry you did not take a larger policy.

You can still do something about this. Just ask us, or your agent, whether it is possible to have the present amount of your assurance extended.

In most cases new with-profit policies cover CIVILIAN WAR RISKS WITHOUT EXTRA CHARGE.

distributed £33 million worth of hosiery and underwear in 1942—a figure which does not include the turnover of firms combining the duties of manufacturer and wholesaler or wholesaler and retailer. This huge task of distribution was performed by no more than 7,300 workers. Mr Caves uses this statistical evidence to support his view that direct trading between manufacturer and retailer is unpractical and uneconomic. Had these goods been delivered direct from the factories to the retail stores

many thousands more (workers) would have been required by reason of the duplication of the various operations involved in distribution.

In Mr Caves' opinion it is not possible greatly to reduce the costs

entailed in the distribution of manufactured products in small quantities to every town, village or hamlet throughout the country.

This argument may well apply to the textile trade in which demand is highly differentiated by the regional and social vagaries of taste and fashion. The intermediary functions of the wholesaler, who carries a large stock of patterns and fabrics, may be more justifiable than those of the wholesaler of standardised products, such as motor-cars and household appliances. But overlapping still occurs in almost every branch of distribution, and manufacturers will continue their attempts to eliminate excessive wholesale costs by direct trading, or by themselves taking over the functions of wholesaling. The view that the multiplicity of wholesalers in the textile trade is in the interest of the independent retail unit is not without substance. It follows logically upon the need for a multiplicity of retail outlets in the textile trade to prevent an exaggerated and dangerous standardisation.

Vital Statistics

The birth-rate is still rising. Since the trough of 1941, when the yearly average was only 14.2 live births per thousand, the number of births has been steadily increasing to an average of 16.5 per thousand for 1943. In the first quarter of 1944, there were 184,145 live births, giving a rate of 17.9, compared with 16.9 for the corresponding quarter of 1943. This is the highest rate for a first quarter since 1926. Comparison with the experience of the last war, when the birth-rate dropped steadily from 22 to 18 per thousand, is surprising. But it may well be that the present boom in births is only an earlier counterpart of the boom of the early 1920's. The steady decline in the marriage rate which has been continued in the first quarter of 1944 foreshadows a corresponding decline in births and is thus presumptive that a repetition of the 1920-22 boom is unlikely in the immediate post-war period. The fewer marriages of the last two years or so are likely to result in a smaller number of first births than were produced by the more numerous marriages of the early war years. On the other hand, although the marriage rate for the first quarter of 1944 is the second lowest of the war years, it shows an increase of over 8,000 marriages on the average for 1934-9. Other things being equal (which of course they may not be), this points to a future decline in births from the present rate, but to a point not quite so low as in 1941. A more encouraging sign is the steady decline in infant mortality. The first year of life still shows much the largest percentage wastage of all, and any reduction in this relatively high mortality will be some contribution to the stability of the future population.

Road Casualties.

Lord Samuel's statement in the Lords that not only more but many more had been killed and injured on the roads than in all the Services during the war has caused considerable comment. Little of the discussion, however, has attempted to sift the statistical basis of his statement. The figures he quoted were 588,000 road casualties against under 370,000 Service casualties. The monthly road casualty figures of the Ministry of War Transport for the three years ending March, 1944 (no figures for the early wartime period are available), show 22,518 killed and 433,366 injured, which bears out its rough accuracy. But the proportion of killed to injured is roughly 1 to 20, compared with about 1 to 3 in the Services. Only just over a third of those injured on the road come in the seriously injured (meaning, detained in hospital) category, the rest being casualties which were re-

ported to the police but sustained only minor injuries. Lord Samuel's statement gives an exaggerated impression; but all the same the situation to which he drew attention is bad enough. Since the war, the number of killed has risen—the figure of 22,518 for the three years to March, 1944, compares with 19,842 for the last complete three pre-war years (1936-38)—but the number of injured has fallen considerably—433,366 against 680,926. Leaving aside the special circumstances of wartime driving, and considering instead the three pre-war years quoted, it is possible to get an idea of the sort of hazards that will be run on the roads in the future, assuming pre-war conditions neither improve nor deteriorate (both of which are possibilities). Taking the 1939 population of the United Kingdom as roughly 48 million, and assuming an average expectation of life at birth of 60 years, it follows that one out of every 120 persons born must expect to meet death on the roads, and every third one born must expect to be injured on them (leaving out of account the fact that some persons will sustain several injuries in their lifetime).

What! No Beer?

Beer production in the second quarter of 1944 was 8,117,814 bulk barrels—a new wartime record, but one which will leave the record-loving British public singularly unimpressed. The published figures create an exasperating mirage, and tongues will protrude to new (and record) lengths. Only Tantalus has suffered in comparable degree. London is taking more than its share of punishment these days; to the perils of the flying bombs are now added the horrors of unslaked thirst. The beer shortage is due to an unfortunate coincidence and concentration of forces—all tending to drain the capital of its liquid resources. The evacuation of children, and the influx of building operatives has made London's population more adult and less teetotal. Many "reputed" quarts have followed the invaders into northern France. The weather in the Straits has been uncommonly dry and hot. Moreover, beer has been in great demand for semi-medicinal purposes. Drink seems to repair very effectively the minor damage done to the nervous system by sporadic bombing. In the blitz of 1940-41 tea was the universal soother; but the latest missiles fly by day—and in summer sunshine. London has gone "dry" not through the shortcomings of the brewers, nor (despite murmurings from the trade) through any excessive limitation of the trade by Mr Bevin's firm control of man-power; apparently the Catering Bill so strained relations between the Minister of Labour and the brewers that Mr Bevin now tends to be blamed somewhat too readily. The probable shortage of hop-pickers may carry the drought a stage further, but hopes can be good that the fates will conspire to ease the situation in time for V-day. On Tuesday Mr Mabane hinted that the problem of how to make beer "keep" might be solved by pasteurisation.

Letter to the Editor

Terms for Germany

TO THE EDITOR OF THE ECONOMIST

SIR,—May I be allowed to make the following observations on your "Terms for Germany"?

You say that "the aim of a peace treaty is above all to avoid the recurrence of war." Agreed. But the only road leading to it is to keep Germany so weak that she should not be able to go to war again.

The Economist quotes Mr Churchill's speech of August 2nd, applying it to Germany. But is Germany to-day a "great civilised country"? The latest record of Germany's civilisation is the "doodle-bug," or the "death factory" at the Maidanek camp, near Lublin.

Of course, peace will have to be maintained by force, because the only guarantee of a peace for our century is to keep Germany sufficiently weak to prevent her from becoming again aggressive. Of course, Germany should not regain sufficient strength in ten or fifteen years to open a campaign for recovering her territorial losses. The argument, however, that the Germans can repeat the Ruhr crisis of 1923 is baseless because the Ruhr crisis was the result of the assistance which the Spartacus movement received from the Third International. (Sic: Editor.) This position has changed radically. For the same reason it simply does not make sense to maintain to-day that Russia is apt to accuse the Western Powers of such a "conspiracy" that she would make her own terms with Germany.

The Economist insists that this is not a question of being kind to the Germans. But what else is it?

The Economist accepts it as a fact that Allied opinion in the West will not be willing "to lift a finger to enforce the kind of settlement" which would keep Germany weak. This would be a very poor testimony of the public opinion of the Western Allies if it would be at all true. But there is still an Allied opinion of the East which as far as Germany is concerned is not less interested, not less important, and not less authoritative than the Allied opinion in the West.

A way of moderation has never been and never will be applicable to Germany. Every peace treaty based on Germany's defeat in war will be opposed by the Germans if we leave them strong enough to impose such views on the public opinion of the German people. As far as the Germans are concerned, there is no difference between "moderation" and "leniency," though *The Economist* would like to believe in it. If it really does believe in it, it only proves that its knowledge of the German psychology is not very well founded.

And if *The Economist* considers as moderate a peace treaty which would include "the punishment of war criminals, a period of physical reparation, some frontier rectification in the East, where exchanges, as opposed to transfers of population, would be possible," and last, not least, "absolute disarmament of Germany," well, I would like to meet the German who would genuinely accept such a treaty as "moderate."

And a last question. Why does *The Economist* envisage that only the Americans and the British will accept the burdens of enforcing the absolute disarmament of Germany? What about the Russians? What about the French? What about the Poles and the Czechs? Are they less interested to keep Germany disarmed? Or do they simply not count?—Yours sincerely,

STEFAN LITAUER.

Dorset House, London, N.W. 1.

[Mr Litauer raises two principal points. The first is that the only way of preventing war is "to keep Germany so weak that she should not be able to go to war again," and that, since *The Economist* proposes a "moderate" peace, it is, in fact, advocating a wrong policy. The second is that the Powers of Eastern Europe, including Russia, are prepared, if necessary without the aid of Britain and America, to enforce a strong settlement.

On the first point, *The Economist* argued that the essence of a strong treaty is that the victors should be ready to enforce it, say, fifteen years after victory, if necessary by war. We believe that the British and the Americans, as well as the Russians and the others whom Mr Litauer mentions—apparently in order to give the impression, which he knows to be demonstrably false, that *The Economist* is both anti-Soviet and anti-European—would be ready to enforce total disarmament and some other provisions. We do not believe the Western Powers would show any readiness to apply force over a violation of the territorial settlement now being proposed. Therefore, the inclusion of these "strong" territorial terms would ultimately and disastrously weaken the settlement.

On the second point, it may be that Russia and the other European Powers would be ready without British and American military aid to enforce a settlement which the Germans were attempting to reverse. Against this possibility *The Economist* records its opinion that any weakening of the present Allied Coalition would strengthen Germany's position, and repeats its view that Russia would be unlikely to adopt a benevolent and unsuspicious attitude towards any defection by the Western Powers.—EDITOR.]

AMERICAN SURVEY

American Notes

Return to Pearl Harbour

At this stage Mr Roosevelt can hardly blow his nose without having a deep political significance read into the act; and his trip to Hawaii, the Aleutians, and Alaska, has been no exception to this general rule. This may have been due to the fact that there was, perhaps, less ground than usual for speculation in Mr Roosevelt's impressions of the growth of Pearl Harbour, his commendation of the efficiency of the men in the Aleutians, his denunciation of Japan, and his expectation of great commercial developments in the Pacific. These were hardly news in dramatic form. His most interesting suggestion concerned the joint use of the South Pacific Islands, chiefly British and French possessions, as forward bases against any future Japanese aggression. But it was not so much what Mr Roosevelt said as the very fact of his going to the Pacific area, which set the tongues wagging. In the past the Administration has been bitterly condemned for underestimating the war in the

Pacific, and even for starving General MacArthur of men and supplies in the interest of the European war. There is little doubt that Mr Roosevelt relished the opportunity of turning the tables on his critics, and of hailing General MacArthur as his "old friend"—and even less that he thoroughly appreciated the political advantages of identifying himself so directly with the war in the Pacific. But the picture that his extreme critics have drawn this week is of a man so besotted with political ambition that he arranged his trip "purely as a painfully absurd setting of the stage for opening of a fourth term campaign," to perpetuate himself before the voters as Commander-in-Chief, even in the event of a German collapse, and to ingratiate himself with the soldier voters in the Pacific area. It is Mr Dewey's misfortune, but hardly Mr Roosevelt's responsibility, that the President is in a position to drive home by such expeditions his own interpretation of a world still in crisis. If Mr Dewey has chosen a slighter rôle, it was because it suited his own talents. Nor can there be any question that there were real advantages to be obtained from the President's obtaining a first-hand view of the Pacific area and meeting

General MacArthur and Admiral Nimitz face to face. What is mortifying to the Republicans in the trip is the admittedly irritating combination of business with pleasure, patriotic duty with political adroitness.

Wooing Mr Willkie

The President's invitation to Mr Willkie to visit the White House has been rightly regarded as a political rather than a social event. Mr Roosevelt would welcome, it is said, an opportunity to discuss foreign policy with Mr Willkie in an atmosphere completely divorced from the election campaign. It will be remembered that Governor Kerr, of Oklahoma, keynoting at the Democratic Convention, noted with pious regret that "when

the Republicans snubbed and side-tracked Wendell Willkie, the last vestige of liberal leadership of the Republican party was buried under an avalanche of reactionary sentiment from which it cannot soon emerge.

The Republicans did not fail to take similar advantage of Mr Wallace's elimination at the Democratic convention a month later. There have been crocodile tears on both sides of the political fence. But it is Mr Roosevelt who has taken the initiative in wooing back both these influential spokesmen for the common man. Mr Wallace has been offered an important but unnamed post in the new Roosevelt Administration. Mr Willkie is being tempted by an appeal to his immense interest in foreign policy, and his well-known discontent with both the Republican plank and its official interpreter. These overtures to the great dissident of the GOP will increase Republican anxieties. Governor Dewey is said to have begun his own courtship by suggesting that Mr Willkie might care to have the Republican nomination for the senatorship from New York. This was a gift horse to be examined with care. Senator Wagner, the Democratic candidate, is the most strongly entrenched Senator New York has had for many years. Mr Willkie might well have replied tartly, "Thank you for nothing." What is certain is that he has remained unmoved. Like Queen Elizabeth when similarly beset by suitors, Mr Willkie shows a politic disinclination either to play or to pledge his hand. It is doubtful, indeed, whether Mr Willkie would do more than promise his neutrality. There can be little love lost either between Mr Willkie and Mr Roosevelt, or Mr Willkie and Mr Dewey, and neither side can very easily produce a plum sufficiently tempting to lead Mr Willkie to compromise his hopes for the 1948 Republican nomination.

Reconversion in Congress

Prompted by the pace of events in Europe, and impatience at home, Congress has turned with a haste almost amounting to panic to the further problems of reconverting the structure of production to peace purposes. With the War Contracts Termination Bill safely embodied in law, the most urgent problem obviously concerns what is called "human demobilisation," that is, employment and unemployment policy for the members of the Forces, and some 20 million war workers who will have to find peacetime jobs. The Senate has given an unmistakable clue to the temper in which it approaches this problem by defeating the Administration's Bill by 49-25, and substituting for it Senator George's draft. Both dealt with the reforms necessary if the unemployment insurance system is to be capable of dealing with the vast upheaval in an orderly and equitable manner. The Kilgore Bill provided for Federal payments to ex-Servicemen, Government and war workers on the basis of 75 per cent of previous earnings, up to a maximum of \$35 a week. This was in addition to mustering-out pay for the Forces. It would have allowed transportation expenses, and maintenance allowances of rather conspicuous liberality for dependants during the period of retraining. The George Bill is a very much more modest proposal. It amends the Social Security Act to add Government and war workers in Government-owned plants to the beneficiaries, but it leaves the rates of compensation, and the machinery, to the States, the Federal Government agreeing to reimburse the States, and standing ready to make non-interest-bearing loans to State Governments if their funds became inadequate. It is not difficult to understand why the Senate rallied a bipartisan majority to defeat the Administration Bill, which,

incidentally, was solidly supported by Labour. It was charged that it would lead to regimentation and an unholy concentration of power in Washington; that it was a "lazy man's dream," and would make idleness as profitable as work, thereby defeating the end of reconversion; and that it was part of the attempt of the Congress of Industrial Organisations to capture the Government. While it is true that living costs vary considerably from State to State, and that there is something to be said for regional standards, it is also pertinent that State control of unemployment insurance has been the most unsatisfactory feature of the whole social security programme, and that differences in rates between the States have been far greater than could be defended on the score of living costs. There must be grave doubts whether the more backward and poorer States have the public officials or the resources to deal with an unemployment problem of a size unprecedented in their experience. The whole question is complicated by the heavy migrations of war workers to the south and west. These new citizens may change overnight from an asset to a liability; and, in addition, there will be the problem of the migrant worker, difficult of solution even before the war, under State administration. Senator Kilgore, who sponsored the Administration's Bill, may have set his scales too high; but under Senator George's plan there is no certainty of uniform justice. There are grounds for broader criticism. The Kilgore Bill, in addition to unemployment compensation provisions, would have created over-all direction for the reconversion process and the agencies carrying it out, along the lines of the present Office of War Mobilisation. It included plans for a National Production Employment Board to be made up of representatives of industry, agriculture, and labour. This body would presumably have been charged with the duty of formulating a national employment policy. The discarded Bill also made arrangements for planning public works and putting them in train, and stipulated Federal loans to the States for this purpose. The George Bill may, as Senator Barkley prophesied, undergo expansion and amendment. But as it stands, it seems, by its omissions, to place the entire responsibility for income maintenance on private industry. This may quite easily be what Congress desires.

The Right to Read

No mother has ever exercised more anxious discrimination over the books in her children's library than the American Army over the magazines, books, and even films which it sponsors. In Great Britain, British newspapers have been banned from American camps—"failed of selection" is the politer term in use. Mr Sumner Welles' "A Time for Decision," former Ambassador Grew's book on Japan, histories by Charles and Mary Beard, the collected columns of the late Raymond Clapper, have all been judged and found dangerous. For a time it was even reported that "Wilson," the most expensive film in all history, was to be banned. This has since been denied. The climax of absurdity was reached when among the banned books appeared the Official Guide to the Army Air Force, on the ground that it contained a photograph of President Roosevelt, with the chaste reminder that he was Commander-in-Chief of the Army and Navy. These excesses of solicitude are hardly of the Army's own choosing; indeed, they have been carried so far that one almost suspects a subtle scheme to discredit the whole idea by bringing it down to the comedy level. Whether this was the intention or not, that is precisely what has occurred, and the censorship of ideas seems about to dissolve in uproarious laughter. The Republicans suffer from acute anxiety lest the Administration should gain any electoral advantage through being the party in power. In some cases this has mounted to what can only be described as an obsession. Nowhere is this *idée fixe* more strongly held than in relation to the young voters in the Forces, whom it is feared may be unduly influenced by the fact that Franklin D. Roosevelt is their Commander-in-Chief. It was this which was mainly at the back of the mangling of the plan for a Federal ballot; and it is this which is at the bottom of the Army's determination to insulate the American soldier so completely from the stream of events and thought that not the slightest charge of undue influence can be brought. Fortunately, even Senator Taft, originator of the amendment banning political influence, has seen the light and agreed that the fundamental right of citizens of a democracy to obtain the facts should not be abridged in time of war.

THE WORLD OVERSEAS

A Soviet Kingdom of Poland?

"RUSSIA cannot have security without a good military frontier, and it is of great importance to her to put an end to the unrest of the Poles. Under all these considerations it is not possible to object to Russia making an aggrandisement that is demanded by justice."

These words have not been taken from any contemporary document. They come from a memorandum sent by Tsar Alexander I to Castlereagh in 1814. Like many things said or written during the Congress of Vienna, they have now suddenly acquired a new topicality. The problem then discussed by the diplomats of the Great Alliance was the project put forward by the Russian Emperor for a Kingdom of Poland. That the Russian Emperor desired "a strong and independent Poland" might have been said as often then as it is written now—of Marshal Stalin.

In 1815 the Kingdom of Poland was born; in 1831 it was brought to the grave; Poland was incorporated in Russia. Yet in his own way Tsar Alexander was absolutely sincere in the desire for "a strong and independent Poland," just as, in his own way, is Marshal Stalin. That the Russian Emperor stood for a strong Poland—strong in both area and population—can be seen from the fact that he originally intended to unite all the Polish lands held by Austria, Prussia and Russia in a single Polish kingdom. His scheme met with strong opposition from Liverpool and Castlereagh, who could not agree to a Polish settlement at the expense of their Austrian and Prussian Allies.

But the Emperor's attempt to persuade the Poles to look for a favourable frontier in the West did not fail to meet with a response from the Poles themselves. True, the Kingdom of Poland was linked to Russia by a dynastic union. The Emperor of All the Russias crowned himself as King of Poland. Yet in an era when monarchies by God's grace had just regained stability and self-confidence, dynastic ties between two countries did not necessarily involve the loss of independence for either. In the early years after the Congress of Vienna, the Kingdom of Poland enjoyed much more than nominal independence.

As to Marshal Stalin to-day, so to Tsar Alexander, the strategic motive was uppermost. He took care to see there was a unity in the foreign policy of his Russian Empire and his Polish Kingdom. But otherwise he tried not to encroach on Polish independence, and not to allow any Russian interference in Polish domestic affairs. Nor was he willing to extend the Russian system of government to Poland. In St. Petersburg, Alexander I was an absolute autocrat; in Warsaw he was a constitutional monarch. His Polish Government, consisting of great and devoted Polish patriots, was controlled by a Diet of two Chambers. Only Poles could hold jobs in the civil services. Polish was the only official language in Warsaw. A Polish army was created which was independent of the Russian.

The Polish Constitution—drafted by the great Polish leader Prince Adam Czartoryski—guaranteed to the citizens of the Kingdom personal liberties, freedom of religion and freedom of the press. In the judgment of Polish nationalist historians a century later that Constitution was "in some respects the most progressive and liberal constitution in Europe." In the view of the same historians, the electoral system introduced by the Emperor in Poland "was far superior to the English electoral system before the Reform Bill."

Progress Under Russian Rule

The first years of the Kingdom saw intensive social progress. The educational system was enlarged and modernised. Mining industries were started under the direction of Staszic, one of the greatest patriots and spokesmen of the Polish enlightenment. A modern system of finance, culminating in the foundation of the Bank of Poland, was introduced by the able Polish Minister of Finance, Lubecki. The exclusiveness of the nobility was broken; and the hardships of peasant serfdom were partly mitigated. Nothing

could perhaps better characterise this period of progress than the fact that it was under the rule of Alexander I that a University was founded in Poland's capital. When the Tsar, addressing the first Diet of the Kingdom in 1818, said to the Poles: "Your hopes and my wishes are being realised," the truth of his words could hardly have been denied. One of Poland's most solemn national anthems, still sung to-day, was written in honour of this same Russian Emperor and Polish King.

From this record it might almost seem that in Polish-Russian relations, the Kingdom of Poland might be regarded as the best model to be imitated; and, indeed, a similar union between Russia and Poland, with the same freedoms and flexibility, might result again in a new period of intensive social progress. The Russian assurances that there is no intention to transplant the Soviet system of government into Poland can be accepted. The political dualism—autocracy in Russia and constitutionalism in Poland—which Alexander I found possible, should not be beyond the political wit of Marshal Stalin. It might, therefore, be argued that the Poles' present fears of losing their national freedom and political liberties may be exaggerated. Nor can it be doubted that the slogans of a westward expansion are likely to appeal to Poles now as much as they did 130 years ago. Marshal Stalin, too, could probably find collaborators among genuine Polish patriots; and lovers of historical analogies may almost be tempted to compare General Rola-Zymierski, the newly appointed pro-Soviet Commander-in-Chief of the Polish Forces with General Zayonczek, Alexander's Viceroy in Poland. Before he became

WHEN will you get *Black Magic* again?

[WE GIVE YOU ONE GUESS]

All the nice things that used to be in Black Magic Chocolates — are they dead?

No.

They exist.

But they might as well be dead, for all the use they are.

The Mauritius sugar that gave the tang to the Black Magic caramel — it's in Mauritius.

The Valencia almonds that went into the Black Magic truffle-and-nougat and montelimar — they're in Valencia.

Brazil is no longer where the nuts come from. It's where the nuts stay.

Venezuela no longer sends us its peculiar fruity cocoa beans. It sends us petrol.

We didn't use petrol in Black Magic.

All the nice things are in all the nice places—except Britain.

They'll come again. When they do, so will Black Magic.

You can call that a threat or a promise, as you please.

ROWNTREES

Viceroy General Zayonczek—"a man of great courage and a weak character"—had fought against Russia in the Polish Legion under Napoleon. General Rola-Zymierski was one of Pilsudski's first legionaries; in the last war he received twenty-one wounds in the first skirmish between the Polish Legion and the Russians.

The Breakdown of the Union

But this is only half the lesson of history. The experience of the Kingdom of Poland contained more sombre features. Some are grave warnings. After fifteen years of existence the Kingdom was blown up in the Russo-Polish war of 1830-1831. Two conflicts accounted for this sad end. Under the Constitution of the Kingdom, the Poles had just enough freedom to demand more complete independence. The Tsar possessed just enough power to obliterate Poland's independence when Polish opinion became "intractable." Secret patriotic societies sprang up all over the country. At first they were not at all hostile to the monarch. Later on, unconstitutional methods of repression drove them into an extreme anti-Russian attitude. The working of the Constitution was obstructed equally by irreconcilable elements among both Russians and Poles. Polish secret societies established contact with the secret societies in Russia itself, who, ten years after the Congress of Vienna, organised the Decembrist insurrection.

The other cause of contention between the King and his Polish subjects was Poland's eastern borderlands. In the first years of his constitutional rule in Poland, Alexander I promised the Poles to reincorporate into the Kingdom several Lithuanian districts, previously annexed to Russia, including Vilna, Grodno and Bialystok. The Poles demanded also the inclusion of the Ukrainian lands in the south-east, including Kiev. This last demand was rejected from the beginning by the Emperor. But he also failed to honour his promise about Vilna, Grodno and Bialystok.

These two issues, the constitutional and the territorial, merged into one insoluble tangle of conflict. The head of the secret societies, Lukasinski, was unlawfully imprisoned in the Schlussemburg fortress, where he was to spend forty years. The censorship of newspapers, periodicals and books was re-introduced. The liberal Constitution gradually became a dead letter. The Diet could in the end debate only in the shadow of Russian bayonets. The Tsar's good and liberal intentions were frustrated because they were not liberal or good enough to make him really respect the aspirations of an old and proud nation. Looking exclusively for Russia's security, he took insufficient care to make Poland feel secure from Russia.

In the words of Byron the Tsar was
Now half dissolving to a liberal thaw,
But hardened back when'er the morning's raw

How nobly gave he back to Poles their Diet,
Then told pugnacious Poland to be quiet.

But in 1830, under the impact of the July Revolution in France, Poland was no longer quiet. The coat of arms of the Kingdom—the Polish White Eagle on the breast of the Russian double-headed Black Eagle—was torn asunder.

Public Opinion and Polish Independence

Critics may view with justifiable distaste the streak of romanticism that runs through Polish history. But realists must draw their lessons from history and pay attention to the peculiarities of nations. The analogy with 1814 and after hardly needs further elaboration. Russian diplomacy—which now seems to take its cue from history much more carefully than it did some years ago—would probably be well advised to balance prudently its intentions towards Poland against the historical logic of the relations between the two countries. It ought not to overlook how much the Tsarist policy towards Poland did to dig the gulf that in the nineteenth century separated the liberal and progressive West from Russia.

The Polish issue was one of the centres of Allied disputes during the Congress of Vienna. The Poles could then lay no claims; and their appeals could have little effect on the decisions of Allied statesmen; in the Napoleonic wars they had fought on Napoleon's side. At the Peace Conference the three Powers that had already partitioned Poland were the victors. Even so, British opinion then was neither indifferent nor silent on the fate of Poland. In a letter to Castlereagh, Liverpool wrote in November, 1814:

of any arrangement of which the independence of Poland does not now form a part.

At the next Peace Conference Poland will appear with the weighty titles of its seniority in the Alliance, its sufferings since 1814, and its manifold contribution to the Allied war effort. Can it be doubted that "any arrangement of which the real independence of Poland does not now form a part" would this time provoke a "battle against public opinion" much more strenuous and exacting than that of which Liverpool wrote?

Respite in Roumania

OUTWARDLY Roumania has been quiet since the Russian advance into Bessarabia and the Bucovina came to a halt in May. During a few months of fighting early in 1944, Roumania lost its conquest in Russia, the province of Transnistria. At present more than half of Bessarabia and the Bucovina, which was ceded to the Soviet Union in 1940, have been re-occupied by Russian troops, as well as a small strip of Roumania proper, between the rivers Pruth and Siret to the north of Jassy.

The total population under the control of the Antonescu Government numbers at present roughly 12 millions. The territory and the population are again what they were after the so-called Vienna Award in 1940, when Roumania lost Northern Transylvania to Hungary, Bessarabia and the Bucovina to the Soviet Union, and the southern Dobruja to Bulgaria.

During the retreat of the German and Roumanian armies from Russia to Roumania, the military and political administration was severely taxed by the influx of refugees, which made adjustments necessary in finance, agriculture, industry and, particularly, in the transport system. No definite peace movement emerged during these days, and reported peace feelers may have been nothing more than rumours.

Roumania now appears to be almost hermetically sealed off from the outside world. The Antonescu Government, unlike the Nazi regime, lacks the backing of a mass party. Yet no liberal or peasant opposition has been able so far to find an organised form. The worsening military situation has now led the Antonescu Government to make a renewed effort to tighten political and economic control. In common with other satellite countries, Antonescu's main objective in trying to stabilise political conditions is the adolescent population of the country. Out of some 3 million boys and girls between the ages from 12 to 20 years, more than a million have been registered by the state for special unions under the direction of a Secretary of State. Boys between the ages 17 to 20 years have been organised on semi-military lines in a compulsory labour service. They are directed to help with the harvest, to serve in special anti-aircraft defences, or to guard bridges. Above all, they are employed in building roads and military installations.

One main reason for the absence of an effective political opposition is the strong German hold. Roumania is for Nazi Germany a key position in South Eastern Europe. German troops are not only at the fighting front, but at all important points. Political opposition or a peace movement would mean incurring the risk of absolute German occupation. The threat of a complete dismemberment to the advantage of Hungary and Bulgaria seems to have been effective, apart from the fact that Horia Sima is still available for a full totalitarian coup under German direction.

Industrial Mobilisation

In contrast with the veil drawn over the political situation current information on the economic situation is still available. Naturally, much of this information is published by German sources for the purpose of showing Roumania's important part in Germany's war economy. In form and in fact, the nationalisation of Roumanian industry has been carried to greater lengths. Foreign capital in the oil industry has almost completely been "Roumanised." The steel and iron industries, which were in Jewish hands, have been expropriated and are now working exclusively to support the war. German concerns are in direct control of the leading industries, but German and Austrian capital interests have been repaid to a very large extent out of the huge

has been reduced by almost one-third of its pre-war volume, but only at the price of direct German control and complete dependence on German manufactured articles, and especially war material.

Under the threat of advancing Russian armies the Government re-introduced in April the rationing of bread, flour, sugar, fats and soap. Last autumn the favourable harvest made it possible to suspend rationing. During the spring local shortages of foodstuffs, largely caused by transport difficulties, became apparent. Rationing is again in force, but only in the towns, where three meatless days per week have also been introduced. From last year's harvest Germany received appreciable quantities, which amounted to roughly 500,000 tons of wheat, barley, maize and pulse. Germany had to pay for one-third of these imports with Swiss francs; some 20,000 tons of wheat have probably been exported to Finland; but there is no indication that any appreciable quantities of foodstuffs have been exported to other countries.

This year's harvest will be considerably smaller because of the loss of Bessarabia and the Bucovina. In normal times the province of Bessarabia produced almost 80 per cent of the entire oilseeds. The greater part of these crops will be lost. The area under cereals is also smaller this year. Industrial crops (mainly hemp, flax and cotton, which covered roughly 113,000 hectares in 1943) can certainly not be extended as originally planned in face of the Russian advance. As a precautionary measure a national reserve of vegetable oils and wheat is now being accumulated.

Oil and Bombs

There is no doubt that German influence has been hard at work to overcome the difficulties of a backward peasant agriculture, but apart from the more thorough collection of crops German industry has not been able to supply the peasant with much-needed industrial articles. Germany has delivered during the war roughly 4,000 tractors and 6,000 tractor ploughs. Simple ploughs and other agricultural implements needed by the peasants are now to be manufactured by Roumanian industry under a new plan. The much-discussed reorganisation of the peasant villages into some kind of production unit was a failure. Subse-

quently the Government reaffirmed that private ownership of the land would be maintained; but a new scheme aims at some kind of mixed societies for the productive combination of large and medium estates using peasant labour.

Roumania's industries, particularly the oil industry, have been under effective bombing range for some time. Oil refineries, rail junctions and harbours have been repeatedly bombed. Considerable damage has been reported each time. The raids during 1943 had no large effect (according to German claims) on the output of crude oil, which was reported to be the same, at some 5.6 million tons, as it was in 1942. Refinery capacity, however, was only partly employed. It is certain that the transport of crude oil and refinery products met with very considerable difficulties. The output figures for oil and metal ores, still published largely for their propaganda effect, are, in fact, contradictory in many respects.

The impression has been growing recently that the totalitarian organisation of agriculture and industry after the German model has become more elaborate. The particular Roumanian problem, however, is that the administration is incapable of making this new organisation work. An imposing number of organisations has been set up, but recent military events forced the administration to adopt makeshift arrangements, particularly in repairing bomb damage, in overcoming transport difficulties, and in accommodating refugees from eastern provinces. The budget for 1944-45, made before the Russian advance, had to be revised. Part of the estimated large deficit is to be covered by a new defence loan, which is actually a compulsory loan levied on industry, agriculture, and even on wage and salary earners.

There is no doubt that the Antonescu administration wanted to impress the people with the necessity of something in the nature of total mobilisation for Roumania's "second war" against Russia, which propaganda turned into a war for the liberation of Bessarabia and the Bucovina. At present Roumania enjoys a respite from large-scale fighting at the front, but increasing bombing raids have created great industrial insecurity, which cannot be countered, in present technical and administrative conditions, by any large-scale movement or evacuation.

POST-WAR EMPLOYMENT

Every nation
to its own
devices, or...

No fighting man wants to come back to peace on the dole. But unemployment is a world problem, and even with full agreement between Government, employer and worker no single employment plan can succeed without whole-hearted international collaboration.

Given this kind of collaboration... that is, if Nation "A" will co-operate with Nation "B" for the benefit not only of Nations "A" and "B" but of Nation "C"... this Company believes that the huge industrial energies developed by the war and adapted to the needs of peace will provide full employment and prosperity for all.

We therefore urge business leaders on both sides of the Atlantic to think and plan for the future in terms of *International Industrial Collaboration* as the only sure basis for full employment throughout the world, peace and prosperity.

THE MOND NICKEL COMPANY LIMITED

Grosvener House, Park Lane, London, W.1

LOOK TO THESE LEAKAGES!

Your winter production may well depend on the savings of fuel you make in your factory now. Apply the following suggestions for cutting out process waste.

Perhaps an 80-lb. steam pressure is being used where a 60-lb. one would do as well. Perhaps a liquid is heated to boiling-point when a lower temperature would do. Or your furnaces may habitually be used for small batches; concentrate the work so that they are fully loaded.

PRACTICAL HELP IN THE FUEL EFFICIENCY BULLETINS.

Most wasteful process habits can easily be turned into economical habits. For steam processes you need Bulletins Nos. 22, 25, 26 and 28. Refer to them again. If you've mislaid them send TODAY to your Regional Fuel Officer for further copies.

Issued by the Ministry of Fuel & Power

THE BUSINESS WORLD

The Federal Reserve Ratio

(From Our New York Correspondent)

ON December 31, 1941, the ratio of the reserves of the Federal Reserve Banks to their deposit and note liabilities stood at 90.8 per cent. On May 31, 1944, the ratio was 72 per cent. Although the legal minimum is considerably lower, being a compound of the statutory requirements, the law requires a reserve of 40 per cent in gold certificates (formerly in gold) to be kept against the Federal Reserve banks' note issues and also a reserve of 35 per cent in "lawful money" to be kept against their deposits. The present ratio is thus well above the minimum, but the decline has been precipitous and is causing considerable comment and some concern. The spectre of the collapse of the Government bond market, which, in 1920-21, followed up the drop of the ratio to a level of 40 per cent and less is being raised.

The declining ratio has resulted from the burden of war on the Reserve System. Since December, 1940, currency in circulation has risen from \$8,732 million to \$22,112 million (May 31); Federal Reserve notes, the chief component of this total, have furnished 90 per cent of the expansion, increasing from \$5,883 million to \$18,532 million (May 31). Until the end of 1942 the chief explanation of this expansion of circulating currency appears to have been the increase in wage payments and living costs. More recently, the growth of black market and tax evasion activities conducted on a cash basis seem to have been increasingly important. Other considerations are additional currency requirements resulting from shifts in population and greater use of cash for savings by the lower and middle income groups.

The reserve supply from which the commercial banks must meet this demand for currency was replenished until the end of 1940 by a gold inflow adequate both to meet the need for currency and to provide considerable additional increase in member bank reserve balances to cover the swelling volume of deposits. During 1941, however, the gold influx tapered off; member bank reserves dropped toward the end of the year in the face of a continued rise in deposits and currency in circulation. Excess reserves (over those legally required against deposits) on December 31, 1941, had fallen to less than half of the \$6.8 billion at which they had stood in June, 1940.

At the beginning of 1942, therefore, the Reserve System had to shoulder the burden of providing funds for the commercial banks and has carried it ever since. The larger

part of the support has been given by purchase of government securities in the open market on the instance of the Reserve Board. The System's firm and unlimited offer to buy and sell Treasury bills at three-eighths per cent, which in effect puts the initiative in the hands of the member banks, is widely used, and about 30 per cent of the System's holdings of Government securities at the end of April were carried with options for repurchase by the member banks. In addition, member bank borrowings have been rising in recent months and now total nearly a quarter of a billion dollars, the highest in over a decade. Reserve Bank credit outstanding is now \$14,759 million; at the end of 1941 it was \$2,369 million.

This increase of \$12 billion has been largely dissipated in a \$10,937 million increase in the money in circulation, but has also served to compensate for a \$1,483 million decrease in the monetary gold stock, which might otherwise have made a serious dent in member bank reserves. As it was, member bank reserves increased by only \$119 million during this period (January 31, 1942—May 31, 1944). The issue of reserves in excess of legal requirements dropped to about 10 per cent of the June, 1940, level, with actual deficits in reserves recurring in New York and Chicago. This was a result of disproportionately heavy sales of Treasury obligations which now constitute the primary reserves of member banks because the Reserve System stands ready to buy them at a fixed three-eighths per cent rate; to this extent the literal reserve definition has lost its meaning.

Several ways are open by which the apparent problem of the falling Federal Reserve ratio could be alleviated. These would either help to satisfy the demand for currency from sources outside the banking system, or would assist the member banks to meet the need without resort to the Federal Reserve Banks, or would facilitate the operations of the Reserve Banks in furnishing member banks with funds.

The Treasury could provide a limited amount of currency without recourse to the banks by issuing silver certificates against its bullion holdings at full legal monetary value (\$1.29 per ounce); thus far certificates have been issued only against the cost price of silver bought—about 50 cents an ounce. This measure would be of limited efficacy, however, for it would fill currency needs at the present rate for only a few months. The silver holdings could be revalued, and certificates issued against the higher value, but this would serve for only a few months more.

Following the second alternative the Board of Governors could reduce member bank reserve requirements to the statutory minima for demand deposits of 13 per cent for New York and Chicago banks, 10 per cent for reserve city banks, and 7 per cent for "country" banks and 3 per cent for time deposits. (Present levels are 20 per cent, 20 per cent, and 14 per cent respectively for demand deposits and 6 per cent for time deposits.)

The third line would make a more direct frontal attack on the declining Federal Reserve ratio. The Treasury might use the \$1.8 billion Stabilisation Fund to replenish Reserve Bank reserves. Or the Reserve Banks might resume the issue of Federal Reserve Bank notes, which were raised for emergency periods and require a reserve of only 5 per cent (the balance may be Government securities) as compared with 40 per cent for the Federal Reserve notes. Unfortunately, Federal Reserve Bank notes are currently under a cloud, since several hundred millions printed years ago were issued a few months ago in an unorthodox manner: the Reserve Banks deposited Government securities with the Treasury to provide for "retirement" of the notes at the same time they were issued, the Reserve

thus avoiding putting up any reserves or paying the tax which it must pay when such notes are outstanding. This evoked much criticism and the Senate passed a Bill, now pending in the House, to forbid the use of Reserve Bank notes.

These three broad methods are not the only ones available. There are a number even less orthodox, and in addition Congress might authorise any number of steps by statutory changes.

Furthermore, the problem may never become acute. At the time of writing the Fifth War Loan is about to open, and by converting sizeable private deposits into Government deposits requiring no reserves, it will alleviate the condition temporarily. At some time the currency expansion is likely to end and a return flow occur. And some believe it not inconceivable that this country's gold stock may increase again.

Therefore, the high degree of concern which is sometimes expressed is probably overdone. In any event, neither the Treasury nor the Reserve authorities seem perturbed by the problem. In line with the statements of the British Chancellor of the Exchequer and the Governor of the Bank of Canada, American officials have declared for a post-war cheap-money policy, which implies that they have confidence in their ability to maintain it. In a speech at Worcester, Massachusetts, on December 16, 1943, Mr Daniel W. Bell, Under-Secretary of the Treasury, declared:

Interest rates have remained stable during the wartime period, and confidence in the continuation of this stability has been and is widespread and well justified, and has caused investors to subscribe to new issues of Government securities in successive war loans without any sign of holding back in anticipation of higher rates.

Business Notes

Sanctions against Argentina

The United States Treasury has this week fired the first live shot in the economic war against Argentina. It has decreed an embargo on the export of gold to that country. The gold in question is that which is earmarked on Argentine account in the United States. Since 1941 the balance of payments between the United States and Argentina has been heavily favourable to the latter. Argentina has, therefore, accumulated large holdings of dollars. These have been converted into gold and the gold gradually transferred from the United States to Argentina. It is these exports that, until further notice, will be prohibited. There is no question of blocking the Argentine gold held in the United States. It will still be freely convertible into dollars, and the dollars in question will be available for such Argentine purchases as can be made in the United States. The embargo, in fact, brings the position of Argentine funds in the United States roughly into line with that of Argentine sterling accumulations. In the case of sterling these funds cannot be freely converted into other currencies and cannot be taken out in the form of gold, but are protected by a gold guarantee. Nevertheless, the American move is clearly one of offensive character and amounts to discrimination against Argentina. Fortunately, it is a decision which, owing to the weak position of sterling, the United Kingdom had been compelled to anticipate and which, therefore, requires no corresponding and answering gesture from our side.

Egypt's Sterling

The leader of the Egyptian delegation at the Bretton Woods Monetary Conference, Sany Sackany Bey, has stated that, after the end of the Conference, one of the members of the delegation was sent to Canada to discuss trade relations between the two countries "as one of the means for liquidating sterling balances." There can only be one interpretation of this remark. Egypt, disappointed of its hopes of getting the problem of abnormal sterling balances discussed and, perhaps, solved at Bretton Woods, is now endeavouring to get this sterling freely convertible in at least one of the "hard" currencies, namely Canadian dollars. In an earlier statement made while the Bretton Woods Conference

I think it can be fairly said of the United States, as the late Chancellor of the Exchequer, Sir Kingsley Wood, recently said of Great Britain, that "... we have revolutionised public opinion as to what are fair rates for Government war borrowing." I believe that this revolution in opinion has a sound basis in underlying economic realities, and is applicable to the coming times of peace also. I hope that the policies of the Government will be directed to this end.

In its Annual Report for 1943 the Board of Governors of the Federal Reserve System expressed the same view:

Public policy with regard to long-term interest rates should be part of a programme to achieve continuous full utilisation of the country's material and human resources. It should be formed with reference to the fact that after the war this country will be the greatest creditor nation in the world, and that in creditor countries, according to past experience, the interest rate on long-term capital is likely to be low.

Over the years a low cost of money to borrowers on long-term should tend to promote increased employment by encouraging capital outlays in both old and new enterprises. It would facilitate the task of refunding the public debt and safeguard the value of Government security holdings of the millions of individuals, educational institutions, trusts, banks, insurance companies, and other investors, who have placed tens of billions of dollars in Government bonds to help finance the war.

However, the decline in the Reserve Banks' ratio to the present level evidences a major landmark in American monetary development: war finance by this time has absorbed most of the "fat" accumulated during the latter 1930's. The almost incredible plethora of monetary reserve funds which has prevailed for several years past is no more. Conditions may change so as to re-establish great ease; if they do not, and if the heavy burden of large deficits continues for any considerable time, monetary management in this country is likely some time hence to be compelled to resort to measures heretofore used little or not at all.

was in progress, Sany Sackany Bey remarked that Egypt's sterling assets amounted to £250 million—a figure which was probably intended to indicate the present size of these balances and investments. Egypt no doubt sees difficulties in achieving an early liquidation of the abnormal part of this substantial sum, and assumes that there will be less difficulty in getting from Canada the kind of import goods she will most require after the war than if she has to wait in the queue of war creditors of the United Kingdom. The suggestion which is being made to Canada is that that country should accept as payment for exports to Egypt some of the sterling that is now lying on Egyptian account in London. The proposition is unlikely to receive a very kindly reception in Ottawa. There is no particular reason why Egypt should receive preferential treatment in solving the problem of her abnormal sterling accumulations. The initiative taken by the Egyptian authorities, however, stresses the urgency of tackling the problem of sterling debts at the earliest possible opportunity. Delay, and the apprehension it would cause with the creditors, might undermine the position of sterling as an international currency and as the basis of a great and world-wide currency group.

Uncertain Markets

It is difficult to explain the present uncertain tone of the Stock Exchange, except in equally uncertain terms of uncertainty. Since *The Financial News Index* reached its high figure of 116.9 on August 9th, there has been a reaction to 114.6, with a certain amount of "tired" selling but no really striking falling off in the volume of dealings. This movement has hardly been attributable to even a temporary shifting of market emphasis from equities to fixed interest stocks; for dullness such as this has been, has affected gilt-edged securities also. To link the movement with war developments, convincingly, is not easy. The market has still to make up its mind whether, at the present level of values, an early and complete Allied European victory would be a bull or a bear point for prices. Its reactions to extremely favourable events in Normandy suggested the latter view; yet news of the Riviera landing put quotations firmer by the close on Tuesday afternoon. There may, in fact, be some substance in other suggestions for present dullness.

which are purely temporary and "technical" and do not, *in toto*, add up to anything like a "trend." For example, a certain amount of selling has been reported from followers of Dow Theory, which calls for action on chart conjecture without reference to broader but more problematical background considerations. The advent of fine and sunny weather in the Straits of Dover, again, has been brought in as an explanation of the decision of some market operators and representatives of large investment institutions to take an unexpected and delayed holiday and allow their reduced commitments to "simmer" meanwhile. Certainly, the higher prices which prevailed before the present modest reaction, succeeded in bringing out sizeable amounts of stock, mainly from holders who were then rather more ready than before to believe that the higher prices went, the higher they looked. But this week it has been said of jobbers generally that they would prefer to have short books now and longer ones next week—or maybe later. Altogether, it does not look as though the present movement goes very deep, or amounts to much more than the "breathing pause" which a three months' almost unbroken rise in share values would normally demand. It might mean more than that—there is admittedly a not unimportant section of market opinion which is looking suspiciously for the first well-marked sign of a change of dominant trend—but events alone can decide that question.

Civil Aviation

The political, strategic and economic problems of international civil aviation are so vast and complex in their implications that it is hardly surprising if the international negotiations preparatory to a successful world conference appear to be somewhat tortuous—and so far abortive. Hitherto, the United States has tended to be the centre of discussion; there have been talks between America and Britain, and, last month, between America and Russia. These talks have not yet even produced any general principles; they have been tentative and explanatory. All that has been established definitely is that complete internationalisation of air transport, favoured by this country, is unacceptable to the United States. Nothing is known about Russia's views on this, but much can be guessed. The approach of the three countries to the problem is inevitably governed by their geography and strategy. For example, from the British point of view, the best possible solution would be a policy of Freedom of the International Air, with the Commonwealth treated as a unit, and with a mutual sharing of Imperial cabotage rights with the French and Dutch Empires. But such an arrangement would hardly be acceptable to America, whose 48 states form one geographical entity. To the United States, Freedom of the International Air tends to mean freedom of the air over the British Commonwealth. Some of the problems of international air transport are analysed systematically, and in greater detail than hitherto, in the second report of the self-styled Independent Committee on the Future of Civil Aviation. The Committee strongly presses the British point of view; it asks for as much freedom as possible within a regime—government-controlled but privately operated—which would extend the meaning of cabotage to all territories under the same sovereignty, but, in the case of the British Empire, would not include the self-governing dominions. Above all, its chairman, Captain A. S. Lamplugh, stresses the need for good will.

We have the advantage of controlling actual or potential air bases indispensable to the development of international air lines. The United States has the advantage of an existing organisation made possible by the rapid development of air lines within its own territory, and of a wartime production which has been able to concentrate far more on the development and production of transport aircraft than any other country. Here are the obvious seeds either for rivalry and dispute, or for good will and co-operation.

There has been no lack of good will in recent negotiations; the aim should be to evolve principles of co-operation that do not place this country at a disadvantage simply because, unlike the United States and Soviet Union (or Soviet Commonwealth, as some have christened it), the British Commonwealth is not a single geographical entity.

Ministry of Production

In its seventh report of the present session, the Select Committee on National Expenditure has expressed its views

on the regional organisation of the Ministry of Production. It still believes that the Citrine Committee—its report was published in May, 1942—was right in recommending that the Ministry of Production should be a super-departmental authority to "control and supervise" the Supply departments at the centre and in the regions. If the function of the Ministry and its regional organisation has been limited to one of co-ordination, this is due, largely, to the fact that they were set up too late, that is, at a time when the Supply departments had already settled down to an independent existence. Nevertheless, even within their limits, the Ministry of Production and the regional boards were essential to the smooth working of war production. In the Committee's view:

The conception of a Ministry of Production meets a recognised need, in that such a Ministry is able, together with the Ministry of Labour, to take a bird's eye view of the whole productive capacity of the country. Decentralisation to the regions and districts is essential for the day-to-day work of production, and the influence which these two Ministries can exert affords some guarantee that the competing claims of the various supply departments do come under impartial review at a reasonably low level. . . . It is gratifying to report that there is now a readiness to utilise the services of the Ministry of Production in composing differences which arise from the competing claims of the three Supply departments. . . . As co-ordinating bodies under full-time chairmen the regional boards have built up a position of value to the supply departments and to the Ministry of Labour.

The Capacity Office Organisation, designed to ensure a more even distribution of work by bringing together firms overloaded with contracts and firms with idle capacity, has "not fulfilled the high hopes that were originally entertained." Although the capacity offices have worked a standard system for recording capacity and load, the use made of them has on the whole been "disappointing." Since nearly all the larger firms have for years had their own organisation for finding capacity for sub-contracts, the new machinery could never have dealt with anything but the fringe of sub-contracting capacity. In sum, like all agencies superimposed upon an existing regime, the Ministry of Production, at the centre and in the regions, has been able to do no more than smooth down rough edges and offer guidance; but within these limits it has performed a vital function.

* * *

Post-War Functions

Although essentially a device for ensuring the smooth flow of war production and the fullest possible use of resources, the question is inevitably being asked whether the regional machinery of the Ministry of Production can perform any useful function in peace. On a first view there would seem to be little to do for such an organisation after the period of transition when the Government's place as the chief purchaser of supplies will be taken by private traders. But, if the Government is to be successful in ensuring the maintenance of "a high and stable level of employment," it will require the fullest possible information about the trend of employment, of orders, stocks and production in the various industries and regions. It will still require a bird's-eye view of production capacity as a whole and it will still need "eyes and ears" in the regions. The regional boards have acquired a wealth of knowledge of local conditions and their capacity offices have evolved an efficient system of recording capacity and load; in other words, they might well be transformed into the regional intelligence centres that will be essential after the war.

Shipping Share Deals

The revival of interest in shipping equities on official news of a bid for the shares of the Lancashire Shipping Company, at a price equivalent to 113s. 4½d. per £1 unit, by an unnamed purchaser, is the latest incident in the "break-up values" campaign in this rather untypical market. Obviously, however misleading a measuring rod the net worth of balance-sheet assets may be for the shares of going concerns, the case is altered when "break-up" becomes an urgent practical proposition, not for a company but for the individual shareholders who own it—particularly when the industry, like shipping, is one in which the whole trend of war conditions has been towards greatly increased liquidity, while it has hindered the ability to estimate probable future earning power. The suggestion

behind the Lancashire Shipping offer, and many others, actual and potential, is that the special parties who offer particular terms have their own means of gauging future possibilities, which shareholders do not possess, with the rider that, when it comes to naming figures, a £5 note in the till should be worth at least £5 in cash (if not more) when, in fact, the till holds an unusually large number of such notes. In the Lancashire Shipping case, an earlier offer of 100s. was turned down, and the present figure represents a definitely higher value than the break-up price of the stock. The buyers, in short, are willing to pay more for "prospects" than others, such as Lamport and Holt a few weeks ago. But both, clearly, may be right—everything depends on factors peculiar to each case. The truth is that, of all kinds of share dealings, activity in the market for "shipping offers" is the most chancy. To deduce from first principles which companies will catch the favourable eye of intending purchasers (and more than one powerful group is seeking opportunities to bid) is a very different proposition from diagnosing the future of an industry. In the last resort, a market where these conditions rule must be the worst of all markets for rational investment, since "inside information" is its ruling force. Movements like the renewed spurt in Anchor Line shares at the end of last week, and the noteworthy though less extensive rise in Dene Shipping, emphasise the point. Where "someone knows," or at least can persuade others that he does, the scope for interested buying or external manipulation is at a maximum. The only preventive is the utmost frankness of directorial disclosure, even in general terms, when negotiations become reasonably firm, and not when the ink is dry on the complete agreement.

* * *

Aircraft Manufacturing Uncertainties

Aircraft manufacturing is still regarded as one of the most speculative of post-war investments. This is illustrated by the *Actuaries Investment Index* for end-July which gives a yield on aircraft shares of 7.84 per cent, compared with an average yield for all classes of industrials of 4.08 per cent. The industry is handicapped by the fact that it needs to make its plans for a considerable period ahead but can obtain little insight into post-war conditions and demand, factors closely bound up with Government policy which remains as yet largely unstated. Bitter memories of the last post-war era cloud the hopes of producers and damp the spirits of investors. Some of the difficulties with which the Bristol Aeroplane Company is now faced are outlined in the statement by its chairman, Mr Verdon Smith, which accompanies the accounts for 1943. On the accounting side, it is claimed that the slowness and complexity of Government progress payments makes them inadequate for the task of financing production, which required last year a still higher average of borrowings from the company's bankers, and retards for many months any accurate computation of annual sales; above all, Government methods create an institutional atmosphere, which is

infectious to many who come in touch with it, and detrimental to efficient management.

More important than these difficulties is the need put forward for the Government to decide its post-war policy, especially as regards exports and air transport. It is pointed out that four or five years are needed to bring a new aircraft or engine from the initial design to the stage of production, and that technical progress advances so rapidly as to require a well-conceived programme in the technical, production, sales, and financial branches for a number of years ahead. Mr Verdon Smith's plea for enough stability to make post-war planning possible deserves the Government's sympathetic consideration. But the Government, in its turn, is faced with uncertainties—as to what scale of military production will be desirable after the war, for instance. This makes it all the more necessary that those policies which can be formulated should be, notably one for civil aviation.

* * *

A Problem in Reconversion

Inevitably, the transition from war to peace production after the defeat of Germany will have to be a gradual process. It will have to be gradual, not only because the war in the Pacific will continue to make demands on British industry, but also for purely technical reasons. The process of reconversion is generally envisaged as one whereby

peace production gradually displaces war production in individual factories. In many industries, such as textiles, there is no difficulty in effecting a smooth change-over. But in some, organised on mass-production lines, awkward problems may arise. For example, the big motor manufacturing concerns operating a flow system of production may find it difficult to resume and progressively to increase the output of cars in proportion to the decrease in war orders in individual plants. They will have to do one thing or another; but they cannot efficiently do both. If this is the technical position, the best solution, in theory, would be to maintain some plants on war production and to release others completely for the manufacture of cars. In the United States, where the big motor companies own a number of plants, this solution presents no difficulties. But in this country it would involve a choice, not between the plants of a single concern, but between the single plants of different companies. If the choice presents itself in this form, the companies whose plant is released would obviously have the advantage of a start over those which have to continue on war production. Is the Government to make the choice? Or, what is more likely, will it seek the industry's advice in this matter? And, if so, what decision will the latter make? Will it decide by ballot or seek a solution in some pooling device? The problem of reconversion, clearly, needs careful examination if friction and muddle are to be avoided. The scaling-down of war orders needs examination, not merely in the British context, but, like the dove-tailing of war production through the Combined Production and Resources Board, in the Anglo-American context.

* * *

Trade and Bombing

The retail trade report for June, published in the *Board of Trade Journal* of August 12th, shows that the flying bombs had an immediate effect on trade, particularly in central and suburban London. The target area in the South of England region is obviously too small to have influenced the figures, except, appropriately, in the sports and travel goods section. In this section, the South of England and suburban London areas show a large increase—in the former turnover was 47.9 per cent, in the latter 40.7 per cent, above that of June last year. As was expected from earlier bombing experience, central London and the West End lost most: the fall here in non-food sales, compared with June, 1943, was 17 per cent. Trade for the country as a whole was maintained, and the index of the average value of daily sales (1942 = 100) of non-food merchandise was 86, compared with 84 in June, 1943. Sales of food and perishables were higher than the year before in all districts, and an interesting side-light on evacuation is the rise of 16.6 per cent in cafe and restaurant turnover in the London suburbs. (The breakdown of the food and perishables section in the statistics into (a) grocery, provisions, bakery; (b) perishables, sweets, tobacco; and (c) cafe and restaurant, is a new departure in the report.) Reports for July and August will probably show greater falls in turnover in London than the present one. Evacuation increased its pace in July, and, in addition, there has been much holiday travel. West End stores may have had some success with their July "offers"—they were not called sales—which were probably meant to attract coupons as much as money.

* * *

"True and Correct"

Mr F. R. M. de Paula has squarely thrown down the gage against the entire basis of present accounting theory in his evidence, now published, before the Company Law Amendment Committee on May 19th. What is "a true and correct" view of a company's position? Accounting practice, making prudence a major virtue, replies that a document which habitually and uniformly under-estimates assets and over-estimates liabilities answers that description. A "true and correct" view, in fact, is described as one which designedly shows the position to be worse than it really is. Mr de Paula contends that accounts based on under-statement, whose extent is quite unascertainable by outside observers, tend to induce a lack of confidence among the investing public, or even a dangerous tendency to exaggerate the under-statement—in other words, to produce the very result which the compilers of the accounts

are anxious to avoid. The basic principle, he declares, should be that the accounts of companies should be designed to give a full, true and complete view, in broad outline, of the financial position and the true earnings for each accounting period. Expediency, mathematics and logic all appear to be on Mr de Paula's side. In no art or science based on numbers (except in accounting) is an estimate with a margin of error accepted as being "true and correct" only when it is *minus* of its probable mean point. The mathematician's ideal balance-sheet would show each figure with its zone of probable error—plus and minus so much per cent. But that is likely to remain an ideal for a long time to come, and meanwhile Mr de Paula's suggestion that the compilers should strive to reach, and publish, the nearest estimate they can of the true mean position, has everything but long-standing habit and prejudice to commend it. Certainly, as Mr de Paula points out, that would not prevent companies from building up all the reserves deemed necessary for the development and maintenance of their undertakings. Boards need neither do good by stealth nor blush to find it fame—nor, in Mr de Paula's view, need they fear that disclosure will have ill effects, from their companies' viewpoint, on shareholders, workers, or outside competitors. When the argument shifts to the latter ground, the case for accurate disclosure is even more self-evident.

Under-statement for prudence' sake is one thing, but obscurantism, meant to throw dust in outside eyes, is quite another. The suggestion that the creation of secret reserves is an inevitable instrument in the general process of providing for changes in the real as distinct from the money value of a company's assets and arriving at the net real value of earnings rather than cash income, will hardly stand up to close examination. In fact, so far as it is the acknowledged function of accountancy to provide for the effect of changes in general price levels (itself a matter of keen controversy among accountants), the appropriate media are open and disclosed allocations to specified "provisions" and "reserves," not covert jugglery with asset and liability values. In short, auditors might well decide that "correct" means—well, simply correct, and leave directors to justify, to shareholders and public opinion generally, their own view of what prudence subsequently demands by way of withheld profits and accumulated reserves.

Suburban and Provincial Second Thoughts

There will be general satisfaction that the directors of Suburban and Provincial Stores have decided to modify their proposals for reorganising the ordinary share capital, to meet criticisms expressed by shareholders and the press, and will submit an amended scheme in the early autumn. The original proposals, which were discussed in *The Economist* on July 29th, quite apart from their own merits or demerits in relation to the company's affairs, would, if carried through, have left on record at least two precedents which to many observers seemed to go right to the heart of shareholders' rights in general. They would have resulted in the complete extinction of the existing ordinary shareholders' equity in a going concern which, actually, was still earning profits at a rate showing available earnings on the shares to be dedicated to the headsman. And this would have been the first stage in obtaining from shareholders the equivalent of a fresh call, in cash, on a fully-paid share. The directors quite frankly made it clear that their original circular was of the nature of a *ballon d'essai*, and they are undoubtedly to be congratulated on their dual decision to bow to the weight of outside shareholders' opinion—though their own group held the great majority of the total shares affected—and to recognise, in the wording of their latest announcement, that the power of the press extends even into company matters which some other boards of directors, at different times, have tried to treat as family matters between themselves and their own shareholders. Both the judges in the case—shareholders and press (on behalf of the public)—will now want to know how far the revised terms are based on what was the fallacy of the previous scheme—that share rights have no value unless they are backed by tangible balance-sheet assets whatever their actual or potential earning power.

Oil Companies Results

The reports for 1943 and their accompanying statements, now issued, of two important oil companies, the Anglo-Egyptian Oilfields and the United British Oilfields of Trinidad, give little insight into either their current operations, which cannot be discussed for security reasons, or their future prospects, over which a veil is drawn. The immediate preoccupation of these companies is with taxation, although the actual amounts paid under this head are no longer revealed. EPT relief in respect of wasting assets has been granted to both companies, but it is made clear that the sums thus now made available—£215,000 for United British of Trinidad and a still undetermined amount in the case of Anglo-Egyptian—will be fully needed for the work of restoring oil reserves. United British of Trinidad announces as well the freeing of a further £85,000, representing past over-provision for EPT, but this is more than swallowed up in the creation of a special reserve of £100,000 for overdue repairs. It is clear that the heavy wartime demands are eating up plant and reserves at a considerable rate, and that rehabilitation will be costly. Despite these increased provisions for the future, the net profit of United British of Trinidad shows a rise of £24,000 to £142,662, thus enabling the ordinary dividend to be raised from 7½ per cent to 8½ per cent. Anglo-Egyptian, on the other hand, shows a fall in net profit of £28,000 to £137,820, and maintains its "B" share dividend at 12½ per cent; but it is pointed out that the fluctuations in its profits over the last three years are largely the result of difficulties over tax computation. Taxation ambiguities, in fact, make it still harder to gain a true picture of the real state of the two companies' fortunes. The proved oil reserves of both Trinidad and Egypt are high in relation to these countries' pre-war production, although there has clearly been a considerable stepping-up of output since the war. They form an important part of the oil-producing areas in the British orbit, and their future will be vitally affected by the advice proffered by the proposed International Petroleum Commission, and, still more, by any multilateral agreement which follows the Anglo-American interim oil agreement.

Municipal Loans Conversions

The proposed machinery for canalising municipal borrowing through a bigger and better Local Loans Fund may get into its stride sufficiently quickly to help deal with a considerable volume of municipal loans conversions falling due next year. Under the wartime arrangement such conversion operations, having been approved by the Capital Issues Committee, are underwritten by the Treasury. The holders of the existing stock are given an offer to convert into a new stock and the Treasury undertakes to provide any cash required to meet the claims of non-converting

	Present Rate %	Amount Outstanding £	Maturity Date
Hull	4½	1,000,000	Feb. 1, 1945
Rotherham	4½	248,285	Feb. 1, 1945
St. Helens	4½	400,000	Mar. 2, 1945
Leicester	4½	1,500,000	Jan. 1, 1945
Newcastle	4½	858,940	Jan. 1, 1945
Plymouth	4½	824,000	April 1, 1945

holders. The accompanying table shows some of the municipal loans whose conversion or repayment have already been notified. This cash is made available out of the Local Loans Fund. Thus, by screwing up the terms of conversion sufficiently close to the prevailing gilt-edged yield and depriving holders of maturing municipal stocks of the small margin of yield they have in the past enjoyed over and above the gilt-edged yield, it may be possible for the authorities to transfer a considerable proportion of the maturing loans to the Local Loans Fund.

Clearing Bank Statements

The clearing bank returns for July reveal a further increase in bank credit, the underlying trend towards expansion being more than sufficient to take up the seasonal contraction that normally occurs after the June 30th balance-sheet figures. Part of that contraction is evident in the fall of cheques in course of collection and transit items from £179,415,000 to £133,423,000. Despite the seasonal fall in

this item and the consequent reduction in the duplication of deposits, these have risen between June and July from £4,100,189,000 to £4,121,383,000. The last figure is a new high record. The main stimulus to this latest expansion of bank credit has been provided by the banks' increased holdings of Treasury Deposit Receipts which have risen from £1,245,500,000 to £1,310,000,000. The increase in the weekly issue of Treasury bills by tender is reflected in the clearing bank statements which show bills discounted at £212,909,000, which is about £10,000,000 higher than the total for the end of June though still £31,000,000 less than it was in July, 1943. Since the outstanding amount of Treasury bills issued through the tender has risen during the past twelve months from £1,170,000,000 to £1,430,000,000, the accompanying decline in the clearing banks' holding of bills is an indication of the increased investment of overseas funds in this type of security. The other bank asset to show an appreciable increase during July in investments, the total of which has risen by £6,000,000 to the new record level of £1,175,170,000. Thus all three items recording direct bank lending to the Government show some expansion and their movements dominate the picture of bank credit changes during last month. By contrast, loans and advances show a substantial drop, from £770,280,000 to £755,036,000. This movement brings further confirmation of the theory that the previous recovery in this item had been largely due to tax loans made in the first quarter of the year.

Rubber Discussions

The negotiations on rubber, held in London from August 1st to August 9th, between representatives of the United States, the United Kingdom and Holland have reached "a large measure of agreement on the broad outlines of the position, and on the nature of the problems that lie ahead." A first programme of studies has been prepared following a comprehensive survey of the rubber position covering both natural and synthetic rubber; arrangements for carrying out these studies are now being made. More could hardly have been expected now. The international rubber position has been thoroughly dislocated through the temporary loss of some 90 per cent of the crude rubber production to Japan, and the development on a very large scale of synthetic rubber production in the United States. The long-term economic problems caused by these developments—these were discussed in *The Economist* of July 1st and July 8th—will not arise until some time after the war. At this stage neither the exact position of the Eastern plantations after their liberation, nor the economic and technical potentialities of synthetic rubber—this is being continuously strengthened through increased experience both in production and application—can be foreseen with any degree of accuracy. Definite arrangements for the future production and marketing of the two types of product will thus have to wait; all that can usefully be done at this stage is to discuss general principles, and to organise economic and technical studies as a basis of future policy. Within these limits the preliminary discussions have been successful, and the fact that the negotiations are to be continued soon gives reason for the hope that eventually close co-operation between the producing areas of both crude and synthetic rubber will be established. As the United States is the predominant producing country of synthetic rubber, and it is at the same time the largest consumer of crude rubber, it should be possible ultimately to adopt a policy that will benefit both producers and consumers.

Australian Interest Cuts

Australian trading banks have recently been called upon to reduce the interest rates applying both to their advances and deposits. These reductions, made under the National Security Regulations, have brought interest rates in Australia to their lowest recorded levels. The charge for bank overdrafts and life insurance policy loans has been reduced from 5 to 4½ per cent. Interest on fixed deposits with the trading banks has been reduced to ½ per cent for three months deposits, ¾ per cent for six months, 1½ per cent for a year and 1¾ per cent for two years. The rate on Savings banks deposits from £501 to £1,000 has been reduced from 1½ to 1¼ per cent. These cuts have been decreed in order to encourage the flow of savings to Government war loans. The proportion of subscribers to population in the case of Commonwealth war loans has

been considerably lower than in Canada and New Zealand, and though the amounts offered have been subscribed in full without recourse to the Commonwealth Bank, the proportion provided by the trading banks has been unusually large. The banks, for their part, are not unduly enamoured of the fixed deposit account system which has long flourished in Australia, but which, in the past, has at times been the source of financial instability. Although the reductions in deposit account allowances were decreed by the Commonwealth Government, it can be assumed that the move is wholly in keeping with the banks' wishes. The lower rates that now apply to deposits fixed for more than six months place this form of investment wholly out of the range of competition with Government bonds. The cuts are, therefore, expected to divert considerable amounts to the Commonwealth Loan.

Shorter Notes

The Canadian Pacific Railway Company has decided to pass its interim dividend on the ordinary capital. Last year, no interim was paid but a final dividend for 1943 of 2 per cent, the first payment on equity for twelve years, was declared this March. The accounts for 1943 showed record earnings of \$297 million odd and, although costs in wages and supplies were shown to have increased considerably, they were fully offset by the rise in earnings per train mile. Earned for ordinary was more than 11 per cent. Going on the 1943 results, the market had expected better things of the CPR, and the disappointment which followed the announcement set the shares back ¾ to 1½. The non-payment of an interim dividend is explained by the company as being due to the "onerous expense liability" incurred by the award made by the National War Labour Board in favour of the railway workers who have been pressing for an increase of wages to US standard, although it is added that the final issue of this award is still unsettled. Onerous as this new burden may be, it should be remembered that the Canadian Pacific need little encouragement to adopt a cautious policy.

Whisky distillation is to be resumed over the coming twelve months, but it is pointed out by the Minister of Food that it must be limited by the availability of supplies. The announcement, which was made in the House of Commons on August 3rd, is nonetheless welcomed by distillers, who have been afraid that because of the length of time needed to produce whisky, they would have little or none to sell in the post-war period. Whisky normally enjoys an important export market, and the case for an early relaxation of restrictions has now been recognised; it is to be hoped that similar decisions will be made where possible in other trades where time is an important factor in production.

PARKER'S BURSLEM BREWERY, LTD.

DIVIDEND MAINTAINED

CAPTAIN G. W. DOBSON ON POST-WAR PROBLEMS

The 56th ordinary general meeting of Parker's Burslem Brewery, Limited, was held, on the 10th instant, at the George Hotel, Burslem, Captain G. W. Dobson, O.B.E. (chairman and managing director), presiding.

The chairman said: Before moving the resolution you will wish me to give you some account of the past year's trading, and I shall be glad to answer any questions you may like to put.

In common with other brewery companies we have, during the whole year, been unable to meet the demand either for draught beer, bottled beer or spirits, although we have been working to the maximum capacity of the brewery. This condition of affairs may appear satisfactory from a financial point of view, but there are grave drawbacks to it. In the first place, as I told you last year, a strict system of rationing has had to be imposed on all our customers, who consequently find themselves unable to keep their premises open to the public during the statutory licensing hours. The danger of this situation is obvious, since we may be told that the already short hours are unnecessarily long and a further curtailment may be imposed after the war.

I am glad to say that in most cases our tenants and managers have done their best to meet these difficulties, and I take this opportunity of expressing my thanks for their willing co-operation. Customers of public houses are liable to get annoyed if they find their "pub" continually closed at their usual calling-time, and either discontinue calling altogether or go elsewhere. We all know that habit is a difficult thing to break, but once broken is seldom taken up again. In the second place, we are putting a severe strain on our plant and also on our employees; you can keep a man or a machine running at top gear for a certain time only without doing serious damage, and we have managed to keep going at full steam for the whole five years of the war—not a bad record—but without adequate replacements in men and material, neither of which we can obtain at the present time, the machine must slow down.

INCREASED DUTY

In the Budget in April a further rise of 1d. per degree of gravity was imposed; this was too little to pass on to the public, and the brewer has to stand the increase. I understand that this was done in order that the controlled price of barley should be reduced to bring it nearer to that of wheat. Whilst I am in favour of giving agriculture every possible help, I must say that I regard this innovation in taxation with great suspicion; I cannot help thinking that it opens up a new and indirect method of taxing the brewer, who seems to be always the main target for any Chancellor of the Exchequer. I must again reiterate, what I have said in the last two or three years, that the price of beer is too high. A pint of pre-war 5d. beer is now 11d. and is, incidentally, weaker. In 1939 the duty on this quality beer was £2; it is now over £8. As soon as the war is over, I consider that we must press as a most urgent matter for the beer duty to be reduced so that we shall be in a position to give the public a better and cheaper glass of beer.

I am glad to report that both our draught and bottled beers have retained the high standard which we set ourselves and have, I think, gained in popularity. We receive many queries as to why we cannot give our customers more of our 1s. bitter, and the answer is simply that owing to the restriction of average gravity of all the beer

brewed at Parker's, only a comparatively small percentage can be brewed at the higher strength. Other breweries, who had a higher average in the pre-war period and who have a variety of districts to serve, are in a better position than ourselves.

THE YEAR'S RESULTS

If you will now turn to your copy of the accounts, you will see that the trading account shows some £55,000 increase, whilst the net profit, before taxation, also shows the same increase; in other words, the extra trading profit is net, which I think is extremely satisfactory and gratifying. The general expenses and repairs are slightly up—due to increases in wages and cost of materials—but are offset by a reduction in the charge for War Risks and War Damage Insurance and premiums. The provision for tax is some £42,000 more, which leaves us an extra £13,000 net profit, due to the fact that our Excess Profits Standard is operating, as I explained last year, more favourably, and we have been able to pass to the future taxation reserve the amount of £30,000 now released from previous years' E.P.T. reserves, bringing this reserve—as you will notice from the balance-sheet—to a figure of £60,000. This, we are advised, is sufficient to cover income-tax up to the end of the fiscal year ending April 5, 1945.

IMPROVED LIQUID POSITION

As regards the balance-sheet, on the assets side you will notice that we have improved our liquid position still further, our investments and cash totalling £437,000. Freehold and leasehold properties are up some £12,000 more, due to purchases of freehold public houses, and I think the figure is fairly conservative. On the liabilities side, the figure for sundry creditors and provision for taxation is again very large, but the increase is partly due to higher beer duty and provision for deferred maintenance. I have already explained the reserve for future taxation, and you will see from the report that the balance of net profit is £71,716 against £58,000 odd last year, which, with the £42,656 brought in from last year, makes a total of £114,372. This year we are asking you to put £20,000 to the rebuilding reserve. We shall—I hope and expect—have very large commitments on this fund as soon as building restrictions are raised, and we must have adequate resources to meet them.

After paying the preference dividends and making provision to the sinking fund for the 4 per cent. "A" debenture stock, we propose maintaining the dividend on the ordinary stock at the usual 14 per cent., and also paying a bonus of 4 per cent., an increase of 1½ per cent. over last year, which will leave us an increase of £5,000 odd to carry forward. It is always pleasant for your directors to recommend a bit more to the stockholders, knowing that they will be pleased to agree and possibly—like Oliver Twist—even ask for more; but the time may come when we may have to do the reverse, and then kicks will be, I expect, more the order of the day, but let us hope that "we can all meet triumph and disaster and treat those two impostors just the same."

THE PROBLEMS OF PEACE

A few words as to the future. So far this year the conditions of trade are the same, but he would be a bold man to prophesy from one day to another what is likely to happen, and I therefore confine myself to hoping that the war will soon be over and we can settle down to the

problems of peace. These will not be easy or plain-sailing, and your directors have before them many far-reaching projects, some of which we hope we may be able to implement as soon as restrictions are removed on building, etc. In this connection you may have recently read in the local Press of a proposal of ours to erect a licensed house in the Clayton district of Newcastle. The proposal seems to have aroused fierce opposition from a certain section; whilst I respect those who hold definite opinions on the drink question, providing that they are honestly held, surely everyone should look at these matters with a broad mind, and not with any bigoted or biased opinion. I would like those who write so strongly to study the Report of the Committee on War Damaged Licensed Premises, presided over by Mr. Morris, K.C., presented to the Home Secretary. I venture to quote *in extenso* paragraph 65 of this Report:

"In regard to the policy sometimes adopted of banning public houses on housing estates, some of the evidence we have received shows that the policy may be unsatisfactory not only for the residents but also in relation to redistribution generally. For example, licensed houses have been banned on housing estates of various sizes containing up to 20,000 people or more. In some cases this has led to the licensing of premises on the perimeter of the estate, or has caused inconvenience and unnecessary expense to residents who desired the amenities of the public house. Witnesses have suggested to us that unfortunate consequences may be the result of having too few public houses as well as of having too many, and it must be recognised that an insufficiency of public houses leads to the growth of uncontrolled and undesirable methods of supply. Thus social dangers may arise from maldistribution of licensed houses, whether this takes the form of having too many or of having too few, and both forms of maldistribution are bad by standards of good planning for the community."

A SANE AND IMPARTIAL REPORT

The whole Report is eminently sane and impartial, and worthy of careful study, particularly those paragraphs devoted to the type of houses recommended in the future. But the attack on the trade will not be confined to those organisations with which we are familiar. Successful brewery companies are always eyed with jealousy, and we are given to understand that in the new social order propounded by the Home Secretary we are to have a corporate State directed by bureaucrats armed with five years' experience of war trading; Parliament will have little or no say except to direct, and the local business of Government is to be delegated to those unknown petty tyrants who, presumably, will wish to control everyone and everything. Surely a pernicious form of Totalitarianism.

TRIBUTE TO STAFF AND EMPLOYEES

Before concluding, I would like, on behalf of my colleagues and myself, to say how much we are all indebted to our overworked and long-suffering staff and employees. I have already said that we cannot expect to make "every post a winning post" for five years, and many of them are feeling the strain; even so old a warrior as Mr. Heard was off duty recently for the first time in 25 years. When the history of the brewing trade during the war is fairly considered, the operative brewers will be found to have done a great job of work, and to have produced a sound article under conditions which, before the war, would have been considered unreasonable.

The report and accounts were unanimously adopted and the dividends as recommended were approved.

The retiring director, Mr. James Cadman, DSC, DL, JP, was re-elected, and the auditors, Messrs Price, Waterhouse and Co., having been reappointed, the proceedings terminated with a vote of thanks to the Chairman.

BOOTS PURE DRUG COMPANY, LIMITED

LORD TRENT'S SPEECH

The fifty-sixth annual general meeting of Boots Pure Drug Company, Limited, was held on Thursday the 17th instant at Beeston, Nottingham. The Rt. Hon. Lord Trent, chairman, presided, and said in the course of his speech:—

It is with real sorrow and with a deep sense of personal loss to many of us that I have to report the death during the year of Dr. Pyman, under whom the research side of our business had made great strides during the past fifteen years. To his widow and family we offer our deepest sympathy. The directors have appointed Mr. E. R. Walker to fill the vacancy on the board, and he will come up for re-election at this meeting.

ACCOUNTS

This year we have made a number of alterations in the presentation of our accounts, which we hope will give a clearer picture of the firm to our shareholders. The main differences are:

(a) Provision for the full liability for Income Tax Schedule "D" on the profits of the year, is shown clearly in the profit and loss account.

(b) The income tax deducted from the dividends paid is now allowed for in the appropriation account instead of the profit and loss account. The effect of this alteration is to show the dividends paid at the net amount received by the shareholders, instead of the gross amount of the dividends as in previous years.

In addition we have added a combined statement of assets and liabilities of the retail subsidiary companies.

During the year we have increased substantially the liquid reserves of the company. Though we have as far as possible kept our plant up to date, it has been worked very hard during the past five years. In addition there is a great accumulation of deferred repairs and renewals of damaged shops and premises. These arrears will have to be caught up at the earliest moment merely to bring us back to the position which we held before the war, and naturally we wish to improve upon that. All this will make great demands upon our resources apart from new laboratories which are urgently necessary.

STAFF

During the past year over 1,000 additional members of our staff have joined the forces, which brings the total serving to over 7,000.

I regret to say that since the beginning of the war 123 members of the staff have been reported either killed or missing. In addition, 18 civilians have been killed by enemy action; to their relatives we offer our sincere sympathy.

One hundred of the staff are prisoners of war, and 33 have received decorations.

The staff have worked splendidly, often under very trying conditions, and on your behalf as well as our own I offer them our grateful thanks.

Our scheme of allowances to the permanent members of the staff in the forces has been revised to benefit particularly the lower paid worker.

YEAR'S ACTIVITIES

The year has been an exceedingly busy one for all sections of the business and many records have been broken, the number of prescriptions dispensed, and sales both retail and export all have reached new high levels.

Shareholders will be interested to know that during the years 1930-1940 the company spent on development of the business over £6,000,000, of which £3,820,000 was from profits. This was used not only for erecting new plant and factories and warehouses, but also for building and equipping large numbers of new shops. I would like to quote a paragraph from my speech in 1934. "As an instance of what has been

done, I may quote the action of our own company, which in the period since 1930—that is, during the depth of the depression—has spent £2,147,972 on properties, fixtures and plant. This has meant that large numbers of people have been given employment by the firm quite apart from our own 17,788 employees, an achievement only possible because we had the funds available and because the directors had sufficient faith both in the firm and in the country to put the work in hand in bad times."

It is sometimes stated that the multiple shops are driving the individual shopkeeper out of business. That this is not so in the chemist's business is shown by the fact that during the twenty years between the wars, the number of chemist's shops in this country increased by 5,000 or 50 per cent. according to the most reliable figures available. Obviously what has happened in this case is that more business has been created and the private chemists have been quick to profit by any lessons they have been able to learn from us. I have no hesitation in saying that largely thanks to our example the public were getting a much better and more complete chemist's service at a lower cost in 1939 than they were in 1919.

At the same time we recognise the vital importance of maintaining the highest possible level of employment, and know from experience that we shall get our full share of any increase in the general trade of the country. That is the principle to which we have always adhered, rather than attempting to establish any kind of monopoly.

RESEARCH

We are alive to the ever pressing need of research (in all branches of our organisation) and to this end we have added considerably to the personnel of our research staffs, especially in the chemical, bacteriological, and pharmacological laboratories.

In our post-war programme we have made provision for extensive developments so that we may continue to expand our research, particularly on problems connected with human and veterinary therapy, and in agricultural fields generally.

With reference to our recently recommended dividend, knowing that many of our shareholders have been hit hard by the war, that the bulk of the shares are held in small amounts, and bearing in mind the fact that the staff have had substantial increases during the war, and that we are paying nearly £200,000 a year in allowances to those in the services, we feel it is only right now to restore our dividend to approximately the same amount as it was before we suffered so heavily in the blitz.

In my speech at the annual general meeting in 1939 I drew attention to the anomalous position of those directors who were under the necessity of foregoing their pension rights when they joined the board, owing to our original decision that directors should not participate in the pensions scheme. The directors recommended the addition of a new article of association to deal with pension and superannuation funds and cognate matters, and a resolution to this effect will be moved at the extraordinary general meeting which has been called to follow this meeting.

CONFIDENCE IN THE FUTURE

There is, obviously, little that I can say about the prospects of the company at the present time when so much is in the melting pot. From its very inception our firm has been built upon enterprise that was only interrupted by the restrictions imposed upon us in wartime. We are aware that some of the controls with which we are burdened to-day must continue after hostilities have ceased in Europe, but if those are progressively removed at the earliest possible moment I have every confidence in the company's powers of rapid recuperation and expansion.

The report and accounts were adopted.

RICHARD THOMAS AND COMPANY, LIMITED

INCREASED NET PROFIT

The ninety-fifth ordinary general meeting of Richard Thomas and Company, Limited, will be held, on the 30th instant, in London.

The following is an extract from the statement by the chairman (Mr. E. H. Lever) circulated with the report and accounts:—

The net profit for the year, after allowing for payments under the War Damage Act, has increased from £632,439 to £740,123. Part of this increase is due to the varying incidence of taxation, and is, therefore, fortuitous, but part of it, such as the advantage resulting from increased wear and tear allowances may be expected to continue so long as the company earns profits above its EPT standard.

In view of the entirely artificial conditions now prevailing it would not be proper to base any long-term forecast upon the figures of current earnings. After careful review, however, of the contributory factors to the increase in the current year's profit, and being fully satisfied as to the inherent earning power of your company, your directors have decided this year to recommend a dividend of 12½ per cent. (less income-tax).

REDUNDANCY AND MODERNISATION

In collaboration with the rest of the tinplate industry, we have throughout the year been seeking to solve the allied problems of redundancy and reconstruction. Redundant capacity has existed in this trade for a long time, and repeated efforts have been made to formulate a plan for its elimination. Such a plan was evolved during the year, was unanimously approved by the industry in November last, and was submitted to the Board of Trade for approval. Up to the time of the preparation of this statement approval had not been given, but discussions were still in progress.

The tinplate industry has not, however, allowed the delay in the formulation and approval of a redundancy scheme to hold up the evolution of its plans for reconstruction, although naturally these plans have been framed on the assumption that the redundancy scheme would eventually be approved. As I informed you last year, our policy in this respect was to endeavour to solve the problem on a co-operative basis, and as a practical step in this direction a company was registered in February last called "Tinplate Processes, Limited," of which most of the leading firms in the trade, including Richard Thomas, are members, and which represents approximately 75 per cent. of the industry.

GENERAL AND PERSONAL

It is, perhaps, too little appreciated how important a part your company plays in the economic structure of the country. Not only does it give regular employment to some 25,000 to 30,000 people, but its ownership is also widespread, there being at least 30,000 preference and ordinary shareholders, with an average shareholding of well under £300. Out of gross manufacturing and trading receipts of £26,000,000 some £15,000,000 was absorbed in paying for raw materials, materials for plant maintenance and sundry expenses other than remuneration to employees, while a further £926,000 was accounted for by depreciation and obsolescence. Of the balance of approximately £10,000,000 about £7,100,000 was spent in wages, salaries and other forms of remuneration to employees and £1,760,000 will go directly to the Government in payment of taxes. Debenture interest accounted for £450,000, tax on which is borne by the recipients, and £740,000 was left for the benefit of the shareholders, of which £460,000 is being paid in preference and ordinary dividends.

MARIEVALE CONSOLIDATED MINES, LIMITED

NATIVE LABOUR SHORTAGE

The ninth ordinary general meeting of Marievale Consolidated Mines, Limited, was held at Johannesburg, on May 10, 1944.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks said: Owing to a shortage of native labour production fell slightly below the rate of the previous year, but working costs were reduced so that the working profit was fully maintained.

The ore treated showed a decrease of 15,000 tons to 582,000 tons, and the yield per ton milled was virtually unchanged at 5.34 dwt. The working revenue amounted to £1,309,203, of which £826,191 was absorbed in working costs, leaving a working profit of £483,012, which was £32,941 more than for the previous year. The amount provided for taxation was £248,929, and, after taking into account the other items specified in the accounts there remained a net profit of £230,130, or an increase of £16,932 over the previous year.

The amount available for distribution, including the unappropriated balance brought in from the previous year, was 410,153, from which two dividends, totalling 1s. per share, being the same rate as in 1942, were paid.

Development operations continued to be on a restricted scale owing to the war, the footage accomplished during the year showing a further reduction due to the shortage in the native labour supply. A total of 21,665 ft. were driven, of which 11,310 ft. were on reef and sampled and 4,570 ft., or 40 per cent., were payable with an average value of 14.5 dwt. over 18 in.

It has been decided to sink a new vertical shaft, called No. 5, to serve the north-central and eastern portions of the mine. This shaft, which will have a final depth of about 2,700 ft., has become necessary to ensure the maintenance of future production, but work will only proceed as material and labour become available. The funds required for sinking the shaft with temporary equipment are being provided by making an appropriate charge to development through the medium of working costs as from January 1, 1944. The question of providing funds for permanent equipment and accessories is being deferred for consideration until the time arrives when it becomes possible to place orders for such items and the cost can be ascertained.

The ore reserves at the year-end showed a decrease of 250,000 tons to 2,250,000 tons, the value being unchanged at 6.0 dwt., and the estimated stoping width of 39 inches one inch greater. I think you will agree that, in view of the restrictions placed on the scale of development, the position shown may be regarded as most satisfactory.

Arising out of the report of the Witwatersrand Mine Natives' Wages Commission, which was published recently, the Government decreed that, with effect from April 1, 1944, the wages of surface and underground natives be increased by 4d. and 5d. per shift respectively and that overtime and Sunday work be paid at the rate of time-and-a-half. The cost to each mine of these increases will be met, as far as possible, from a common fund into which the Government has undertaken, as a temporary measure to pay the "gold realisation charges" collected by it during the twelve months from April 1, 1944. As is well known, these charges, which have been in force since 1940, represent a levy by the Government on gold produced.

The report and accounts were adopted.

GEDULD PROPRIETARY MINES, LIMITED

MR P. M. ANDERSON'S REVIEW

The forty-third ordinary general meeting of Geduld Proprietary Mines, Limited, was held at Johannesburg on 9th May, 1944.

Mr. P. M. Anderson, the chairman of the company, presided, and in the course of his remarks, said: The past year has been a most trying one for, quite apart from the difficulties of operating under war conditions, there was an acute shortage of native labour, which caused a decline in production. The company did well, therefore, in achieving the results obtained, though the dividend rate was slightly below that of the previous year.

The tonnage milled showed a decrease of 70,000 tons to 1,323,000 tons, and the yield per ton milled was a little lower at 4.73 dwt. The working revenue totalled £2,635,205, of which £1,297,884 was absorbed in working costs, leaving a working profit of £1,337,321. With the inclusion of sundry revenue amounting to £422,485, which consisted mostly of income received on our shareholdings in East Geduld Mines, Limited, and the Grootvlei Proprietary Mines, Limited, the gross profit amounted to £1,759,806. The amount provided for taxation was £845,767, and, allowing for the other items set out in the profit and loss account, the net profit was £901,379, or £6,460 more than the figure of the previous year.

The amount available for distribution, including the unappropriated balance brought forward from 1942, was £1,192,096, from which two dividends totalling 12s. od. per share—a decrease of 3d. per share over the rate for the previous year—were paid.

Development work, owing to war conditions, has been curtailed to a minimum and work on the Main Reef horizon has been virtually suspended. The work done during the year on the Black Reef horizon was confined to preparation of a framework of haulage ways, from which active work can be readily commenced when conditions permit. The footage driven on the Black Reef horizon amounted to 8,140 feet, and of 2,610 feet on reef and sampled, 300 feet, or 11 per cent., were payable, with an average value of 5.4 dwt. over 28 inches. The total work accomplished to date on this horizon has been of limited extent and, as I have pointed out in previous addresses to shareholders, much remains to be done before the economic possibilities can be assessed.

The ore reserves at the year-end recorded a further decrease of 600,000 tons to 7,700,000 tons, the value at 4.0 dwt. was lower by 0.2 dwt. and the estimated stoping width of 53 inches was one inch greater.

Arising out of the report of the Witwatersrand Mine Natives' Wages Commission, which was published recently, the Government decreed that, with effect from 1st April, 1944, the wages of surface and underground natives be increased by 4d. and 5d. per shift respectively and that overtime and Sunday work be paid at the rate of time-and-a-half. The cost to each mine of these increases will be met, as far as possible, from a common fund into which the Government has undertaken, as a temporary measure to pay the "gold realisation charges" collected by it during the twelve months from 1st April, 1944. As is well known, these charges, which have been in force since 1940, represent a levy by the Government on gold produced.

Our shareholdings in East Geduld Mines, Limited, and the Grootvlei Proprietary Mines, Limited, remain unchanged, and I am pleased to say that both of these companies recorded satisfactory results during the past year.

The report and accounts were adopted.

EAST GEDULD MINES, LIMITED

DEVELOPMENT WORK CURTAILED

The seventeenth ordinary general meeting of East Geduld Mines, Limited, was held at Johannesburg on May 9, 1944.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks, said: The tonnage milled showed a decrease of 51,000 tons to 1,872,000 tons, whilst the yield per ton milled rose by 0.09 dwt. to 5.88 dwt. The working revenue was £4,632,515 and working costs absorbed £1,443,000 leaving a working profit of £3,189,515, which was £101,186 more than in the previous year. Taxation increased by £73,004 to £2,180,870 and, after taking into account other items set out in the profit and loss account, the net profit was £1,043,720, or £37,102 more than that of the previous year.

The amount available for distribution, including the unappropriated balance at the beginning of the period, was £1,426,046, from which two dividends totalling 11s. per share—the same rate as in 1942—were paid.

Owing to war conditions, development work continued to be on a drastically curtailed basis, and this policy, combined with the shortage of native labour, resulted in the work done being of negligible proportions. It has become necessary, however, to increase development to make available some new stopes in the No. 2 Shaft area, and this work was taken in hand during the current year.

At the year-end the ore reserves, due to the policy of curtailing development work, showed a further decrease of 700,000 tons to 14,500,000 tons, the value of 5.2 dwt. and the estimated stoping width of 59 in. remaining unchanged. While a reduction in tonnage was inevitable under present-day circumstances, the position of the mine remains most satisfactory in view of its having such a substantial amount of ore developed ahead of its milling capacity.

Arising out of the report of the Witwatersrand Mine Natives' Wages Commission, which was published recently, the Government decreed that, with effect from April 1, 1944, the wages of surface and underground natives be increased by 4d. and 5d. per shift respectively and that overtime and Sunday work be paid at the rate of time-and-a-half. The cost to each mine of these increases will be met, as far as possible, from a common fund into which the Government has undertaken, as a temporary measure, to pay the "gold realisation charges" collected by it during the twelve months from April 1, 1940. As is well known these charges, which have been in force since 1940, represent a levy by the Government on gold produced.

The report and accounts were adopted.

GROOTVLEI PROPRIETARY MINES, LIMITED

INCREASED PROFIT

The thirty-seventh ordinary general meeting of the Grootvlei Proprietary Mines, Limited, was held on May 9, 1944, at Johannesburg.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks said: During the period under review, which is the sixth year since production commenced, the tonnage milled showed a comparatively small increase to 1,900,000 tons and the yield per ton milled was 5.12 dwt. The working revenue amounted to £4,089,076 and working costs totalled £1,735,990, leaving a working profit of £2,353,086, or £173,273 more than for the previous year. This increase in the working profit was largely

due to a reduction in the amount provided through working costs for development work, which continues to be on a reduced scale owing to war conditions.

After allowing £1,451,819 for taxation, the net profit amounted to £898,634, or an increase of £119,936 over the previous year. Including the unappropriated balance at the beginning of the year, there was available for distribution an amount of £1,083,158, from which two dividends totalling £822,165 ss. 9d. per share, or an increase of 1s. per share over the figure for the previous year, were paid.

Development work continued to be on a curtailed basis, while practically no work was done in the Palmietkuil section. The position was rendered more difficult by a shortage of native labour, and, in order to utilise the available labour and materials to the best advantage, the greater portion of development work was again concentrated in the No. 3 shaft area. The total footage driven was 31,290 and, of 23,020 feet on reef and sampled, 12,925 feet, equal to 56 per cent., were payable with an average value of 16.4 dwt. over 21 inches. These results compare favourably with those obtained in the previous year, but naturally the payable footage developed was insufficient to maintain the ore reserves. These at the year-end showed a further decrease of 400,000 tons to 9,200,000 tons, the value at 5.2 dwt. being unchanged and the width of 47 inches half an inch higher.

Arising out of the report of the Witwatersrand Mine Natives' Wages Commission, which was published recently, the Government decreed that, with effect from April 1, 1944, the wages of surface and underground natives be increased by 4d. and 5d. per shift respectively and that overtime and Sunday work be paid at the rate of time-and-a-half. The cost to each mine of these increases will be met,

as far as possible, from a common fund into which the Government has undertaken, as a temporary measure, to pay the "gold realisation charges" collected by it during the twelve months from April 1, 1944. As is well known these charges, which have been in force since 1940, represent a levy by the Government on gold produced.

The report and accounts were adopted.

VAN DYK CONSOLIDATED MINES, LIMITED

DECREASED ORE RESERVES

The tenth ordinary general meeting of Van Dyk Consolidated Mines, Limited, was held at Johannesburg on May 10, 1944.

Mr P. M. Anderson, the chairman of the company, presided, and in the course of his remarks said: Owing to the native labour position the tonnage mined had to be supplemented by drawing ore from surface dumps, and the total amount of ore milled was 1,177,000 tons, or a decrease of 10,200 tons compared with the previous year. The yield per ton milled, in conformity with the value in ore reserves, showed a decrease of 0.36 dwt. to 4.63 dwt. The working revenue for the period amounted to £2,293,941, and working costs, which were lower by a penny per ton milled, absorbed £1,573,282, leaving a working profit of £720,659. The sum provided for taxation was £285,906, and after allowing for the other items specified in the accounts there remained a net profit of £426,185, or £15,064 less than for the previous year.

The amount available for distribution, including the unappropriated balance at the end of the previous year, was £708,354, from which two dividends, totalling 1s. 4½d. per share, were paid.

Last year I mentioned that the restrictions that had been placed on the scale of development work, in order to assist in conserving materials had proved to be excessive. Unfortunately, owing to the inadequate native labour supply, it was not possible to improve on the footage accomplished in 1942 and, in fact, the total was a little less last year. The footage driven was 81,128 and of 51,345 feet on reef and sampled, 7,475 feet, or 15 per cent., were payable with an average value of 13.8 dwt. over 20 inches. The percentage of payability has continued to be disappointing, but the value showed a small increase over the figure of the previous year. The ore reserves at the year-end amounted to 2,600,000 tons, or a decrease of 400,000 tons while the value of 4.6 dwt. and the estimated stoping width of 41 inches remain unchanged. In view of what I have said regarding development work in general a fall in the tonnage in ore reserves was to be expected, but there is cause for satisfaction that the decrease was limited to the extent shown and that the value was maintained.

Arising out of the report of the Witwatersrand Mine Natives' Wages Commission, which was published recently, the Government decreed that, with effect from April 1, 1944, the wages of surface and underground natives be increased by 4d. and 5d. per shift respectively and that overtime and Sunday work be paid at the rate of time-and-a-half. The cost to each mine of these increases will be met, as far as possible, from a common fund into which the Government has undertaken, as a temporary measure, to pay the "gold realisation charges" collected by it during the twelve months from April 1, 1944. As is well known, these charges, which have been in force since 1940, represent a levy by the Government on gold produced.

The report and accounts were adopted.

RECORDS and STATISTICS.

FINANCE AND BANKING

THE MONEY MARKET.—The position in the short-loan market has been comfortable this week, but there has been no superabundance of credit and very little ½ per cent. money has been available. The banks were called upon to pay £90 million against Treasury Deposit Receipts. This compared with nominal maturities of £70 million which, owing to pre-encashments had been reduced to about £50 million, so that some £40 million of fresh money had to be found. Treasury bills payments have again equalled maturities at £110 million. The market had a 36 per cent. allotment of this week's bills to take up. The credit position has been eased slightly by a return of notes from circulation. The Bank return shows a net notes reflow of £3,614,000. On the other hand, public deposits increased by £2,427,000 over the week. The reduction of £4,292,000 in bankers' deposits is balanced by a fall of £4,820,000 in Government securities, but the prevailing level of the former, at £171,889,000, is in keeping with the adequacy of credit experienced in the money market this week.

MONEY RATES, LONDON.—The following rates remained unchanged between August 10th and August 17th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%; Treasury Bills: 2 months, 1½%; 3 months, 1½%; Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, ½%. Discount deposit at call, ½%; at notice, ¾%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between August 10th and August 17th (Figures in brackets are par of exchange).

United States. \$ (4.862) 4-02½-03½; mail transfers 4-02½-03½. **Canada.** \$ (25.223) 4-43-47; mail transfers 4-43-47. **Switzerland.** Francs (25.223) 17-50-40. **French Empire.** Francs 197½-200½. **Syria.** p. 8-81-85. **Portugal.** (18.189) T.T. 16-85-95. **Dutch West Indies.** Florins (19.11) 7-58-62. **Belgium.** (110) 99-80-100-20; mail transfers 99-80-100-30. **Panama.** 34-02-04; mail transfers 4-02-04½. **Brazil.** 83-64½ cr. (buying); mail transfers 83-56½ tr. **Uruguay.** 7-6597 p. (buying).

Fixed Rates for Payment at Bank of England for Clearing Offices. **Spain.** Pesetas 44-00. **Turkey.** Piastres 520. **Italy.** 71-25 lire.

Market Rates.—The following rates remained unchanged between August 10th and August 17th.

Egypt. Piastres (87½) 97½-1. **India.** Rupees (184. per rupee) 17½-18½ d. **Belgium.** Congo. Francs 176½-1. **China.** National \$3-3½. **Iran.** Rl 124-130.

Special Accounts are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London. Rate for payment into Argentine special account: 16-16 pesos.

Forward Rates.—Forward rates for one month have remained unchanged as follows: **United States.** ½ cent pm-par. **Canada.** ½ cent pm-par. **Switzerland.** 3 cents pm-par. **Sweden.** 3 cent pm-par.

The End in Sight

THE dramatic freeing of Paris by its own Parisians is not only the token of a great nation freed and arisen. It is the token also of a war that is won, however grim the death-struggle of the desperate foe may be. The fall of Paris, unfought-for, four years ago, was the warning of world defeat, which fate and valour avoided. Its liberation now, and the military scene in which it is set, is the proof of Allied victory in the Second World War.

In 1940, General de Gaulle marked a turning point in history, and the arrest of disaster, when he told the people of France, from Britain alone, that though a battle had been lost, the war had not. In 1944, as he speeds to Paris, with his brave faith and that of all fighting Frenchmen justified, he can tell them that not only a battle has been won, but the war also.

Historians may be surprised to record with what apparent reluctance the rulers and people of Britain looked this victory in the face, after all they had done to bring it about. They will find, perhaps, only one parallel: the refusal of the same rulers and people to recognise defeat four years ago. Then, there were only stout hearts and

faith to go upon. Now, there is the unassailable evidence of fact. Yet, of the Allied leaders, only one has committed himself. Before Paris was freed, General Montgomery had already told his troops—and the world—that "the end is in sight."

The facts speak for themselves. Paris is only the sign and the symbol. A rout of Germans is being pressed northwards in the bloodiest fighting, to and beyond the Seine; and that river has been flung behind the Allied advance at too many places for the enemy to ignore the double threat to his remnants and to the Reich itself. Here, it is reported, the Marne—and all it means—has been reached. There, Sens has been liberated, the Yonne crossed, and Burgundy entered. The Rhine lies ahead. There, the Army of the Mediterranean, with Marseilles taken and Toulon hemmed in, is racing to the Rhone and the Saone, to Lyons and Chalon—and, again, the Rhine.

It is the substance of victory to break an army and to pursue it to surrender. Of perhaps three-quarters of a million hostile soldiers in Western Europe, perhaps half have

been put out of action, with another quarter in flight, beleaguered or cut off. In magnitude of losses both of men and, even more, of material and equipment, this can count as the biggest victory in history. It will not count so, unless the pursuit succeeds—the pursuit not only of fleeing regiments and of the detachments, scattered far and wide over France, but the pursuit into Germany itself as well. It is because these wider possibilities are so crucial, and still hang in the balance, that military wisdom remains conservative and cautious. General Eisenhower put out a discreet warning against "wishful thinking" over a week ago: and Mr Churchill has since repeated his refusal to predict the end of the German war.

But events still march; a decisive battle has been won, and the pursuit goes on, northwards and eastwards. The Allies are leading in the race for Germany: there is no "Dunkirk" this time. Dunkirk was, above all, an escape; and there is no escape for the Germans in France, as Allied columns swing north-west to the Pas de Calais and south-west to Bordeaux, or race from west and south to the ancient gates to the Rhineland. As by giant scissors the ways of escape will be cut. And, when Germany is reached, there is no brave new army to stand on or beyond the West Wall, but only the scrapings of a "too late and too little" total mobilisation and the dull strivings of a people tried already past endurance.

No doubt the Allied leaders are prudent to make no promises. They cannot say the war will end very soon; so they will not say it can. No doubt it is common sense for the people of this country, after so much toil and so many disappointments, to show reserve as they wait for a sure signal to rejoice. They will endure, if need be, though not joyfully, another turn of the year with war and, perhaps, bombardment. Dates cannot be put, in either

direction, to great campaigns; and so much still depends upon the temper of both fighters and civilians—on both sides—upon the quick wisdom of commanders and the wit of statesmen. And, it is feared by some, it should be said, with less than justice, that the British people, given cause for the highest of hopes, might slacken in the work and the struggle.

There are other reasons—reasons of the highest policy—for the official refusal to point to the tremendous chance now so plain. The Allied statesmen are resolved this time to "make an end of it." They still lack complete confidence in their ability to lay the ghost of Dr Goebbels for ever; they hear the quarter-century-old echo of "They will cheat you yet, those Junkers." They will say no word that might encourage any hope in any German, even though nothing whatever might be lost by doing so. They would rather risk extra battles than endanger a single item in the settlement which, they hope, will this time endure.

A great majority of the Allied peoples, on the eve of another year of the war which failure after 1918 permitted Germany to make, perhaps approve this resolution—though in retrospect, when passion is spent, it will seem less certainly right. But the same majority hopes for, looks for and even expects victory before winter comes. They cannot believe otherwise as they watch the unfolding of events in western Europe—and the resumption in the East, at yet another striking-point, of the Russian progress. And they are right: the facts cannot tell any observer, lay or expert, when the last shot will be fired; but from them can only be read the clear possibility that pursuit may secure surrender before the leaves of autumn have finally fallen. It is not an idle optimism that adds to "Paris is free" the rider "The war is won."

A Tale of Two Cities

FIVE years ago next week three nations went to war together against German aggression; and it would be a gross betrayal of all that this war for freedom has meant if the British nation, or the French, were to forget, in the moment of triumph, the terrible fate that has come upon the Polish nation. The bells have pealed out for Paris freed; for Warsaw they must be tolled in mourning. The contrast is heartbreaking.

The peoples of both cities rose to drive out the Germans, and to the aid of the Parisians there came armies of Allies and Frenchmen, working together in swift and sure accord until the citizens and French Forces of the Interior were able to open the gates of Paris to French armour from overseas. All over France the same story has been told of co-operation between Allied soldiers and the home resistance in plan and act. This is the main reason why France is so quickly free.

In Poland, whose people have fought the longest and suffered by far the worst of all the Allies, there is the most tragic of contrasts; and if any possible deed to aid the sufferers has been left undone, sorrow for the suffering must surely be accompanied by anger as deep. Unhappily, there is cause for reproach. For three weeks now, the people of Warsaw have been fighting a vastly bloodier and more desperate battle than the four-day rising in Paris; and, for most of the time, they have been almost unsupported by their Allies, materially or even morally. Instead, they have been rebuked for acting too soon and for failing to wait for Allied orders.

In terms of cold calculation, the Pharisees who wish to make a military offence of this brave, forlorn hope may be partly right. The French risings have been so successful because they were concerted with the Allies. But it is not the resisting Poles who have made it almost sure that the hope is to be forlorn. It is those who have done nothing to help them. It is not the people of Warsaw who have refused to co-operate. The Russian armies are engaged in heavy battles at the gates of Warsaw; but still

no contact has been made between them and the men who fight on their side within the city.

Only from the West, far-off, sporadically, inadequately and at a high cost to Polish and Allied fliers, does any help come by air. Yet there are Allied airfields within easy distance behind the Russian lines, and Allied aircraft and pilots who have already bombed remote enemy oilfields and factories from their Russian bases. This state of affairs is intolerable. The Russians are undoubtedly now doing their utmost to take Warsaw, which would best ensure the expulsion of the Germans. But this battle still hangs in the balance; and meanwhile it is sheer casuistry to withhold other forms of aid which might save many thousands of Poles—and perhaps Warsaw itself, which unlike Paris is being finally destroyed by the Nazis—on the ground either that the Polish and Soviet Governments are, diplomatically, not on speaking terms or that the Warsaw insurgents took matters into their own hands. It is known that the British (who know so well their fighting Polish friends, and their first Allies in the war) and the Americans have pressed for Russian assistance to Warsaw.

The political conflict in Poland is one thing, and there have been grievous faults and blunders on both sides. The Alliance in arms against the Germans is another thing altogether, and an infinitely greater. Mr Churchill and President Roosevelt have never flagged in stressing the paramountcy of the common battle. It cannot surely be less plain to Marshal Stalin. The rising in Warsaw is a glorious contribution to the Allied cause, and cannot be refused. Talks are now going on about aid to Warsaw from near Russian sources, and for the amount of cooperation that the merest military common sense demands. In honour and expediency alike, they should have only one result, and that speedily. But, incredibly, the present prospect is said to be precisely the opposite. To our joy in victory it seems that the Allies may still have to add the ultimate shame of desertion.

Pacific Victory

IN the last three months, the pattern of Pacific victory has been decisively established. Its chief instrument is the United States Pacific fleet, one of the most terrific engines of war ever engaged in battle. Larger than the entire British navy at the beginning of this war, commanding thousands of aircraft and landing craft, able to remain for months at sea supporting itself from its own supply train, this fleet is a veritable floating empire. By means of a vast amphibious advance, the Americans have cleared the enemy from their chief bases in the Mariana Islands, and have launched the attack on Halmahera, off Dutch New Guinea, with a violent air bombardment. Only the islands of Yap and Palau remain to be cleared before the great fleet moves forward to the assault on the Philippines.

Admiral Nimitz has indicated in general terms the subsequent line of advance for his great forces. With the Philippines secured, the way will be open for landings in South China. Formosa will fall, and with naval and air forces established in a wide arc round Japan from Hongkong through Formosa to Bonin Island the Americans will have cut Japan off from all its southern conquests and areas of supply. The blockade of the Japanese islands will have begun. Admiral Nimitz clearly thinks that blockade accompanied by bombing is likely to be decisive, since he is reported to be doubtful whether aggressive landings on Japan itself will be necessary.

At this point, however, the development of the campaign will depend not only on the American fleet but on air operations based on the Chinese mainland. The fleet alone cannot easily complete the blockade of Japan. The Japanese Grand Fleet, which is still in reserve, may yet be an effective deterrent to any straightforward American advance through narrow waters past the Korean Peninsula into the Sea of Japan. If the Japanese can keep control of their inland sea, they will still be in contact with the chief base of their industrial war power, North China and Manchuria. The establishment of an effective blockade demands that the advance from the sea should be supplemented by air attacks based on the Chinese mainland. Here, too, in the last few months, the Americans have started to sketch in the pattern of victory. The new super-Fortress bombers are now undertaking regular raids from Chinese bases on industrial and military targets in Japan and in Manchuria.

There is unhappily a weak link in this chain of advance. The maintenance of bases in China depends on continued and effective Chinese resistance to the Japanese invaders. The Americans have built up bases to the east of the Hankow-Canton railway and Kweilin, capital of Kwangsi, is a centre of American activity. Now the Japanese are pushing along the railway from north and south. In the

north, Hengyang has been taken, after some stubborn Chinese resistance. In the south, the Japanese are pressing in the direction of Shiuchow. Their aim is to seal off the American airbases on the Chinese seaboard and so far, the campaign has gone heavily in their favour. If the bases in South-East China are lost, there will be all the more need to establish other bases within striking distance of Manchuria and Japan. In the north, the areas firmly held by the Chinese are largely under Communist control. It would be possible to build up bases there, but the political consequences of such a move have to be considered.

For the weakness in China is not only in the military sphere. A number of political problems make the position in China unstable. Although negotiations still continue in Chungking between Marshal Chiang Kai-shek's Government and representatives of the Communists, no accord has been reached. The Communists will not abandon their demand for military and administrative autonomy. The Marshal will not modify his denunciation of autonomy as rebellion.

While this division exists and the Chungking blockade of Communist Shensi is maintained, the united struggle against Japan is weakened; and the Americans would face an exceptionally delicate situation if they sought to establish advanced air bases in Communist-controlled territory. The prestige of the Chungking Government has been somewhat diminished by the military defeats of this summer. There is some opposition to the regime inside the Kuomintang itself and military defeat always brings with it sporadic revivals of provincial war-lordism. It is hardly the moment to add to this instability. On the contrary, the need to maintain bases on the Chinese mainland makes it vital that the prestige of the Chungking Government should be supported and even enhanced. The visit of Mr Wallace, the American Vice-President, was well timed. So are the forthcoming visits of Mr Donald Nelson and General Hurley which seem to promise economic and military reinforcement. Nevertheless, China remains the uncertain link in the chain of victory and its internal weakness and disunity might delay by months a complete Allied victory.

The question of bases in China would be less urgent if it were certain that Russia, after victory in Europe, would throw its strength into the Far Eastern balance. The Japanese are naturally concerned about this possibility. They are pursuing a policy of scrupulous non-provocation, on the one hand, and keeping the pick of their armies in Manchuria, on the other. If with massive Allied backing the Far Eastern Red Army were to turn to the offensive, and give the aid of Soviet bases to both the blockade and the bombing of Japan, the defeat of Japan

would obviously be extremely rapid. But nothing certain is known of Russia's intentions. The Soviet Union has suffered, spent and sacrificed prodigious quantities of treasure and manpower in the common cause in the West. It is impossible to argue, after these immense labours, that there is an unqualified obligation upon the Russians to enter another war. Yet Russia is a great Eastern Power as well as an Ally. Military victory over Japan may be possible without Russian co-operation, though it may be so much delayed. But complete victory, with an assured and settled peace, is not possible without that co-operation. The chance that Russia may not enter the Far Eastern war does not only entail certain strong military disadvantages. The political handicaps are quite as great. There is some evidence to suppose that a number of Japanese

statesmen are already convinced of the likelihood of defeat. They pin their hopes of survival, as the Germans have done, on differences and splits within the Allied camp. The creation of a genuine United Nations front in the Far East would put a final end to any Japanese hopes of disunity. It would at once reduce Japan's will to resist.

Russia's absence also makes it very difficult to draw up peace terms for Japan. The policy of "unconditional surrender" must be assumed to mean, in the East as in the West, terms which the enemy must accept without parley, and not a complete absence of terms. This assumption was borne out at Cairo, where the return of Japan's conquests to their original owners was made a condition of peace. In his recent report on his Pacific tour, Mr Roosevelt gave further hints of policy when he said that surrender would not spare Japan a military occupation, and spoke, rather obscurely, of sealing off the Japanese community for a number of years. Yet peace

terms in the fullest sense can hardly be drawn up when one of the greatest Pacific Powers is not party to them.

It would be tempting to argue that the absence of definite peace terms, like the possibility of Allied divergence, is contributing something to Japan's continued will to resist, the one through fear, the other through hope. It is, however, exceptionally difficult to draw any inferences from a possible Japanese reaction to harsh or moderate peace terms. The Japanese reaction to hard or magnanimous defeat is unpredictable, just as is the reaction of Japanese garrisons to extermination or of Japanese civilians to national disgrace. The Western world understands the psychology of Japan too little to dogmatise. The absence of settled peace terms is dangerous, not as a delayer of victory—though it may be so—but as a confuser of the peace.

Terms for Japan are the core of more general terms for the Far East. The kind of peace that is imposed on Japan is inseparable from the question of the post-war relations between the Allied Pacific Powers. President Roosevelt admitted this when he spoke almost in the same breath of the unconditional surrender of Japan and of the securing of United States bases throughout the Pacific. Are the security arrangements for the Far East to be unilateral or joint? Is the disarmament of Japan to be maintained by co-ordinated or single-handed action? In the economic field, is the old American policy of the Open Door to give way to special relationships, say, between the United States and the China of Chiang Kai-shek? If it is to be the Open Door, is it the intention of the Allies to admit Japan or is a cutting off of outside supplies of raw materials to destroy Japan's industrial system and the living of its inhabitants? To whom will the Japanese Pacific Islands be transferred? Are they to come under United States sovereignty? Or is some regional body to oversee colonial rights and welfare?

At the Canberra Conference in January this year Australia and New Zealand made a promising beginning in the joint study of these closely inter-related political and economic problems. They proposed a system of common defence with joint bases, pooled defence schemes and joint staff arrangements for the United States, Australia, New Zealand, Holland, France and Portugal, to cover roughly the area of General MacArthur's South-West Pacific Command. They proposed, too, a South Seas Regional Council for Colonial Welfare and Economic Collaboration. It is not known whether their initiatives have been followed up. The whole shape and future of a Pacific settlement still appears to be as unconditional as Japan's surrender itself.

This, clearly, is not the way to Pacific victory in the fullest sense. It is a disturbing fact that whenever a statesman raises, as Mr Roosevelt has done, the veil of secrecy which hangs over all governmental post-war planning, the fleeting picture is almost invariably one of unilateral, not joint, policy. The absence of Russia from the Pacific Alliance is only one obstacle. The policies of Great Britain and the United States are only relatively more clear. The more convinced Mr Churchill is that a Japanese defeat will follow close on the defeat of Germany, the more confident are Mr Roosevelt and Admiral Nimitz of a speedy and complete victory, the more urgent it is to lay the foundations of Pacific peace.

A Policy for Wealth—II

The Origins of Productivity

IT was suggested in the first article of this series that, in addition to Full Employment and Social Security, the British community needs to give itself a third target of economic policy, Productivity. It was further suggested that a convenient definition of the aim might be to raise the annual rate of increase of productivity per head from the $1\frac{1}{2}$ per cent that has prevailed for many decades to $2\frac{1}{2}$ per cent. This would make it possible to double output

per man-hour within a single generation—an ambitious project; yet the rate of increase would be smaller than has been attained in Russia and the level of productivity reached at the end of the process would still be lower than that already attained in America. Something of the sort, indeed, is necessary if Britain is to keep its place among the richest nations in the world.

That is the aim; but how to secure it? The first task

is obviously to attempt an analysis of the causes that lead to one country being more productive than another. Why is it that the average British industrial worker produces only about half as much in an hour's work as the average American worker? One would have thought that it would have been possible to give an answer that embodied the considered result of intensive research. Strangely, this is not so. Indeed, the ground is cluttered with a lot of popular beliefs which can easily be shown to be false.

For example, the reason that would most frequently be given for the wealth of America is the size of the internal market. But wealth is not a function of size. New Zealand is one of the wealthiest countries of the world per head; India and China are the poorest. (New Zealand, it is true, has access to a very large overseas market; but until 1932 every other country had access to the same market on the same terms.) Natural resources are often quoted as a cause. But Malaya, the Netherlands Indies and Russia are examples of very richly endowed countries where the wealth per head is low. Great Britain itself is an example of a poorly endowed country which, however much ground it has lost, must still be counted among the richest in the world. Transport facilities may have something to do with wealth; but if Britain is rich because of the ease of ocean transport, America must be rich in spite of the handicaps of being a continent. As between Western Europe and, say, Equatorial Africa, climate and racial character may be of importance; but hardly between Britain and the United States. Nor can the system of government be very convincingly pleaded, for if it is the democracies that are the richest, it is the Soviet Union that has recently shown the most rapid progress.

Some or all of these factors may have their influence on a country's wealth, that is, on its output per man-hour. But it seems overwhelmingly likely that none of them is the dominant element. That is almost certainly to be found in the volume of capital. The American worker produces more in an hour because he has more mechanical equipment to assist him. It is strange that this simple truth is not more widely recognised. There would be no dispute that the enormously greater productivity of the Britain of 1944 as compared with the Britain of 1744 is due to the great accumulation of productive capital that has occurred in the two hundred years. The Industrial Revolution has been carried further in the United States than in Great Britain; the Soviet Five-Year Plans are nothing but an immensely accelerated and intensified application of the Industrial Revolution to a country that it had passed by; and the poverty of India and China is at least in part to be explained by the fact that man there labours almost totally unaided by the machine. The formula "Horse-Power per head = Wealth per head" may not be strictly accurate; but it is a most enlightening first approximation.

It is not very difficult to show that capital per head is considerably larger in the United States than in Great Britain, though it is difficult to separate the productive capital of industry from other forms, such as buildings, whose influence on the output of wealth may be less direct. According to some figures of Mr Colin Clark's, capital per head in the United States was already 44 per cent larger than in Great Britain in 1913, and the disparity has certainly widened since then. Confirmation can be derived from figures of the consumption of electricity. In 1937 the total consumption of electricity was 414 kilowatt-hours per head of the population in Great Britain and 771 in the United States. Unfortunately, the statistics do not permit a direct comparison of the consumption of electricity for power, which should be closely correlated with the amount of mechanical equipment in existence. Consumption for power in Great Britain was 224 kilowatt-hours per head. In the United States, consumption for light and power in large establishments (i.e. omitting, by comparison with the British figure, power in small establishments but including light in large establishments) was 398 kilowatt-hours per head.

Without entirely ignoring the other elements in the problem, we can safely conclude that this is the master key. By far the most important reason why industrial

productivity in Great Britain is so far below that of the United States is that each British pair of hands is assisted by a much smaller volume of mechanical equipment. And much the most important way by which the rate of increase of productivity can be speeded up is by increasing as rapidly as may be the amount of horse-power per head.

★

This is, of course, only a first approximation. It is necessary to have not merely the right volume, but the right kinds, of capital equipment. It is necessary to use the machines with skill, and to prevent their wealth-creating capacities from being stultified by human foolishness. These are important but subsidiary issues; the main one is to get the capital. This is the truth that Stalin saw, and which entitles him to the title of the world's greatest capitalist, for assuredly no country has ever made such sacrifices for capital or, as the classical economists would have said, practised abstinence on such a heroic scale—and with such triumphant success—as Soviet Russia. Britain, being richer, can find more capital with less sacrifice; and, being further along the road, does not need to travel so fast. The methods of the Russian experiment are, therefore, as unnecessary for us as they would be unpleasant. But we should at least learn the lesson that economic wealth depends upon capital.

The influences that govern the accumulation of capital are many and diverse. But the more important of them can be grouped under six heads:

1. *Supply of Savings.*—If the rate of increase of productive capital is too small, it may be because the community is not saving enough, or because not enough of the community's savings are productively invested, or because the financial mechanism fails to build a bridge between the supply of savings and the demand for capital.
2. *Organisation of Industry.*—It may be that the

Chinese horse typical of the T'ang period

FLYING MONEY

Fei-Tsien—Flying Money—the ancestor of the bill of exchange, was invented in China in the seventh century. It provided a means of transmitting money from place to place and thus assisted in developing trade and travel in China's vast territories.

The Emperor of the T'ang dynasty who originated this method of payment little knew he was sowing a seed which would grow into a highly specialized financial system enabling nation to trade with nation.

Modern international commerce calls at many stages for facilities which only a bank with wide ramifications can provide. In whatever overseas transactions you are interested and whatever the nature of your engagements, this Bank, with an extensive branch system in the home country and banking connections throughout the whole wide world, is able to offer you unrivalled services at whichever of its 1800 offices is most convenient for your purpose.

MIDLAND BANK LIMITED

OVERSEAS BRANCH:

122 OLD BROAD STREET, LONDON, E.C.2

system of organisation, or ownership, of industry reduces productive efficiency and that some reorganisation could effect a change.

3. *Restrictive Practices.*—It may be that the existence of monopoly, on one form or another, has removed the incentive to a constant increase of efficiency.

4. *Labour.*—The growth in the power of organised labour may be obstructing the search for maximum efficiency.

5. *Scientific Research.*—It may be that inadequate atten-

tion is being paid to developments in productive technique.

6. *Quality of Management.*—It may be that the system of education or the social environment or the structure of industry is preventing the emergence of sufficient managerial skill.

And under each of these heads it may be found that the intervention of the state, with its laws, its orders and its taxes, is having an adverse effect.

In the remaining articles of this series each of these subjects will be passed in review.

In Aid of Universities

MOST attention in the present discussion on educational reform is naturally being paid to the middle categories of schooling, to secondary schools and to methods of continuing study in the adolescent years. This is the main theme of Mr Butler's Education Act, and it is based upon the very right assumption that unless secondary schooling can be made accessible, suitable and progressive, for all children and for all capacities, every other branch of education will be a blind alley. It is also necessary, however, to look below and above the secondary stage. The primary school is, and will continue to be, "education" to the great bulk of citizens-to-be; it is the base and fundament of the tapering pyramid. And at a higher level, it is upon the products of universities and advanced institutions, fittingly fed by the reformed secondary schools, that the British society and economy must rely for the special contribution that education in the fullest sense can make to the community's welfare.

It is therefore welcome that a deal of earnest consideration has lately been given to the rôle of universities and colleges in post-war Britain. Much of what the universities have to do to better the quality and the results of their work, they must do themselves in their own way. There is a whole range of pressing topics, such as methods of teaching, the range of courses, the character of staffs and the scale of payments, which must be decided by them at an early date, in the light of their traditions, their aspirations and their duties, both social and educational. Nothing would be more disastrous than a policy of reform which adopted a slum clearance principle and ruthlessly uprooted the tradition and continuity of so many years of growth. But there is another range of problems, upon which these internal decisions themselves depend, that involve crucially the relation between the universities and the state.

It is the purpose of this article to look briefly at some of these issues of reconstruction which must become matters of public policy: to pick out one obvious need—the expansion of universities; to examine one obvious implication of this expansion—increased financial aid from public funds; and to consider one obvious danger of this development—a loss of essential independence.

There are two immediate reasons why the work of universities must be extended. One is the requirements of demobilisation which will arise soon, when many men and women, baulked by the war of their chance of a university education, will come back to start again. Secondly, the developments in higher education projected in the Butler Act imply early and considerable calls upon the facilities and the output of the universities. To these two may be added a third and less measurable reason for expansion: the certainty that, to hold its own, British industry will require a much increased number of higher technicians and scientific researchers—as well as much more of the kind of research that can only be done in university laboratories.

During the last war, university education in Britain virtually ceased; but by 1920 the number of university students had risen to over 48,000 compared with fewer than 30,000 in 1914. About 13,000 of the post-war students were ex-Service men, assisted by Government grants. This time the universities have not suffered so

severely; a proportion of their work has continued, especially in the scientific department. But the war has already lasted considerably longer than the last one, and the number of students seeking entry when it is over are likely to be much more numerous than in 1918. There will be the accumulation of six years normal recruits seeking entrance in a few months. In addition, there will be thousands of men and women, who might not otherwise have gone to universities, anxious to take advantage of special Government schemes. The Association of Scientific Workers has suggested that the number of university students may reach the pre-war figure of 50,000 by the first autumn term after the end of the war with Germany, and that if accommodation allows, these figures may be doubled by the fourth post-war session.

Indeed, if the need for more teachers and for more professional and scientific workers of all kinds is to be met, an even greater multiplication of numbers may be indispensable. The universities must be in a position to draw fully upon an ample pool of secondary school pupils if the reforms at present proposed are to be carried through. In the past, more than a third of the best elementary school children have been denied promotion to secondary schools, for many diverse reasons. Of the children passing to secondary schools, only a half of those who have succeeded in obtaining Higher Certificates have gained admission to universities. A series of bottlenecks has blocked opportunity and wasted correspondingly the nation's resources. The new order in education is designed both to widen these bottlenecks and to end this waste. If the Butler Act is in effective operation by 1946 or 1947, the number of university students will be increased further and very considerably by this factor alone by the early fifties.

★

It is plain, therefore, that the universities must be greatly and quickly expanded, if this can be done without diluting the quality of their work, which must be their constant concern. Quantitatively, there is a remarkable difference between Britain and the United States in the provision of university education. In 1938 the United States, with a population of some 130 millions, had over a million students, compared with 50,000 in this country with a population of 48 millions; there were twice as many university teachers in the United States as Britain had teachers. Qualitatively, it is true, American university education has suffered, except in a number of special instances, from the extent and rapidity of its growth: but, on balance, the American community has benefited. In American industry, for instance, the responsible and influential positions are normally held by university men and women, while in this country this is the exception. Sir Ernest Simon has pointed out that in the cotton industry

there are hardly any university men in important positions; and largely for this reason very few of the firms are scientifically equipped to make full use of the results of the excellent work of the Cotton Research Association.

Nor, as already pointed out, is it, or should it be, solely a question of staffing industrial and business concerns; public administration and professional work, no less than

manufacture and trade, require the aid of the highest education, suitably contrived. Finally, there is the overriding need for the achievements of democratic advancement to be properly reflected, as they conspicuously have not yet been, by corresponding achievements in the broad field of education and culture.

The main problem turns on the consequences that ought to flow, and those that ought not to flow, from the increase in public aid that is inevitable if this expansion is to take place. The universities draw their money from three main sources; fees, endowments and grants. The following table, taken from Sir Ernest Simon's "The Development of the Universities" compares the total university income of Great Britain and the United States for the year 1938-39.

	U.S.A. (in £ million)	Great Britain (in £ million)
Fees	34	2
Grants from all government authorities	32	3
Endowment income, gifts and sundry	31	1.5
	97	6.5

The university student at present contributes between a quarter and a third of his total training; but the current trend is such that this fraction is more likely to fall than to rise. As their number grows, students will be drawn more frequently from poorer families and the proportion of fees paid from public funds will tend to increase. Moreover, the relative importance of income from fees in the total income of the universities will fall steadily and considerably if the physical equipment and amenities of the universities are brought up to the desired standards. Inevitably the finances of the universities will be increasingly dominated by public grants.

This is all the more probable because the part of university income derived from endowments is also likely to diminish. The prospect of a long period during which interest rates will be low will affect the returns from existing endowments. The gradual drying-up of the source from which private endowment came is likely to go on. Contemporary levels of taxation are reducing both the size and the number of private fortunes. It is true that some mitigation of this tendency may follow from the state's decision to provide completely for these social services which in the past have depended largely upon public charity; the schemes for a National Health Service and for Social Security may divert considerable sums from these purposes to education. Moreover, there have been recent signs that corporate or institutional endowments, such as those given by large industrial firms out of their large profits, may, to some small extent, take the place of private bequests. But this development is not likely to prevent the downward trend of total endowments—and it carries with it some danger of sectional controls or influences over university policy.

It is, therefore, to public funds that universities must now look for the greater part of their capital and their income; and it is the extraneous control or influence of the Government or the local authorities that they must most watch with care. In 1938-39, the total income of the universities was £6,712,067. Of this, £605,957 was contributed by local authorities and £2,400,402 by Parliamentary grants. There was provision for university independence. Government funds were made available through a Treasury University Grants Committee, made up largely of academic personnel and charged with duties of administration and advice, rather than control; and for many years this machinery has worked very well indeed. The UGC has succeeded in dispensing a large grant without infringing the basic freedom of the beneficiaries; it has set minimum standards, but it has not imposed uniformity. The essential variety remains, though in 1935-36 the Parliamentary grant represented 48.5 per cent of the University income of Wales, 38.8 per cent in Scotland and 32.4 per cent in England.

It would not be true, however, to say that the policy and development of the universities have not been markedly influenced already by certain state financial aid. Of the total university population before the war,

many students were pledged to be teachers and in receipt of fees and maintenance grants from the Board of Education. Some of the smaller university institutions were largely dependent upon these teaching candidates for their solvency, and in several, the Professor of Education was a more important personality than the Principal himself; these colleges ran the danger of being largely annexed to the teachers' training departments, whither the majority of their graduates passed for their fourth post-graduate year.

The reason for this peculiar distortion of university development was two-fold. In the first place it was necessary, because of the profession's unattractiveness, for teachers in training to be subsidised. Secondly, as a consequence of this, teaching was the only subsidised avenue to a university education, which meant that many students promised to be teachers merely in order to go to college. The result was bad for the universities, for the students and for the teaching profession. The danger that university accommodation and university budgets will be more than ever overloaded by grant-aided teachers, because of the greater requirements of the schools after the war, is very real.

The other source of public aid to the universities was local. Very largely, it was for technical and other services rendered, though in part it was also given in the form of grants towards the fees or maintenance of likely students. Where universities confer benefits—as they should confer benefits, direct as well as indirect—upon the townspeople and trades of particular places, it is equitable that there should be a corresponding contribution in local cash, and a corresponding representation of local views in university government. The trouble in the past has usually been to limit the amount of local control over university policy that should be permitted in return.

★

The expansion that is inevitable after this war will render acute these questions of public aid and public control. The magnitude of the additional aid required from taxes and from rates cannot yet be calculated. But some estimates have been made. Generally, the special committee of the British Association has recommended that the Treasury grant should be doubled at once, with the rider that "mere doubling will not suffice for long." More specifically, the Association of Scientific Workers has concluded that:

The annual expenditure of the universities is likely to rise to £15 million within five years, and to £20 million after ten (at 1939 values). Most of this will have to come from the State. The Government grant should be doubled in the first full academic year after the war and increased to quadruple (£9,000,000) in the fifth year.

It is, of course, most important that these calculations should be properly and exhaustively made and that the cost of expansion and improvement should be determined and apportioned. But it is even more important that, in this process, the right relation should be devised between the universities and public bodies. The UGC, with its minimum standards, its authoritative personnel and its wise and understanding advice (from Treasury officials as well as academics) is the right model for regional and local, as well as central, co-operation. It must clearly be recognised by the universities that they are in large part public institutions, not only because they depend, and will increasingly depend, so much on public funds, but also because they have a public duty to perform. That duty is to provide the education and to produce the graduates that the community requires. They will be tested by the results they achieve; and, whatever must be claimed for independence and cultural standards, the tests here must be material ones. If only because the supply of skilled researchers and of research facilities is scarce, it is essential that independence and "healthy competition" should not prevent the utmost co-operation between all the universities in their work and the closest contact with industry itself. Industry and trade must have their voice in the work of financial and administrative co-operation;

but if the directors of the universities can see their tasks in the right light, then there is no need for interference or control by outside bodies, central or local, in these matters any more than in the steady flow of "education for education's sake."

It is the right of the universities that they should be left free to pursue education along all its paths in the way that they know best. If they must accept, as indeed

NOTES OF THE WEEK

Roumania Changes Sides

On Wednesday night, King Michael of Roumania broadcast from Bucharest the announcement that his country had broken with the Axis, had ceased hostilities against the United Nations and had accepted an armistice offered by the Allies. He also made it clear that Roumania, like Italy, wishes to become a "co-belligerent" on the Allied side; and soon after the King's broadcast, fighting between the Roumanians and the Germans was reported. A government of National Union under General Senatescu has been formed. The majority of the new Ministers are generals who served under Marshal Antonescu, but Antonescu himself, according to some reports, is not among them and has fled to Germany. The Liberal leader, Bratianu, the old leader of the peasants, Maniu, as well as representatives of the Communist Party, have joined the Cabinet as Secretaries of State. "The dictatorship has come to an end and with it all oppression," said the King, and added the warning that

anyone who opposes the decision we have taken and who takes justice into his own hands is an enemy of our nation.

The strategic significance of Roumania's defection from the Axis is clear. Like Bulgaria's break with the Central Powers in 1918, it lays bare the German flank in the Balkans. Little is known about German strength in Roumania. But it is safe to assume that it has been decisively drained by the recent needs of the Baltic and Polish fronts. The fact that King Michael was able to make and announce his decision in Bucharest is encouraging. Now the fresh Russian advance from Bessarabia and the capture of Jassy are likely to be followed by a quick occupation of all Roumanian territory to the west of the Carpathians. As an immediate consequence of such an advance, the Germans would lose the Ploesti oilfields and the Bulgarians would break with the Axis. Once the Russians have advanced to the Bulgarian frontier, the Bulgarian Premier, Bagryanov, is certain to realise that the time for bargaining has gone and that the retention by Bulgaria of Western Thrace or of other occupied Allied territory is a forlorn, and impudent, hope. Yugoslavia and Greece are already largely controlled by their Partisan forces. Thus Hungary alone seems to offer the Germans any hope of continuing allegiance. But the Iron Gate to Hungary may soon be thrust open, while the Russian advance towards Cracow threatens to outflank Hungary from the north.

Generous Armistice

Two political questions arise from the Roumanian armistice. "Unconditional surrender" in the case of Roumania has been interpreted in a generous spirit. Not only is the Roumanian army to remain in being; but the United Nations, if King Michael is to be believed, have also committed themselves to restoring Transylvania to Roumania. This has undoubtedly speeded up the Roumanian decision. Secondly, "the United Nations have guaranteed the independence of Roumania." No confirmation of this statement has yet come from Washington, London or Moscow. If true, the statement would suggest that Russia has claimed no exclusive strategic and other interests in Roumania. The question must therefore again be asked why Russia should insist on the exclusiveness of its strategic interests in Poland and why Allied policy should appear to acquiesce in this demand. The situation becomes even less understandable when one recalls that Poland is the faithful ally of the United Nations, while Roumania until yesterday was Hitler's satellite and a direct aggressor on Russian soil.

Dumbarton Oaks

The United Nations have taken another step along their sylvan path to world order. After Hot Springs and

they must, the duty to furnish, with public aid, the maximum amount of equal access and opportunity in their classes, and the further obligation to supply the nation with men and women of the needed skill, training and outlook, they must clearly insist upon their long privilege to foster all the arts and all the sciences in the liberal and unbiased fashion which is their great legacy from centuries-old beginnings.

Bretton Woods comes the Conference at Dumbarton Oaks, where representatives of the United States, Russia and Great Britain have gathered to hold informal and exploratory discussions on the pattern of post-war security. Their conclusions are to be communicated to China, and later the rest of the world will receive a draft for general discussion. The plans of the three delegations broadly resemble each other and also have a strong family likeness to the old League of Nations, for the simple reason that when drawing up a constitution for a world of nation states it is difficult to play many variations on the original League theme. There will be Genevan ghosts behind every oak and Genevan whispers from every bough. This is not, however, a matter for melancholy. Nor is it merely nostalgia. It is not often that history repeats itself sufficiently exactly and quickly for the same generation to be able to learn from its own mistakes. The Great Powers have apparently considered the failure of Geneva, and there is general agreement that the League failed not from inherent faults of structure, but because the Great Powers did not make it work. Each of the three Powers at Dumbarton Oaks accepts this time the responsibility for making the new experiment effective. As Sir Alexander Cadogan pointed out at the outset of the Conference, responsibilities must be commensurate with power, and the Great Powers alone wield sufficient force to back a functioning security system. They alone can make the final decision of war and peace, and this responsibility needs to be formulated in some special provision. One suggestion is for a Council of Four as the final Executive in international society.

Good Neighbours?

Unfortunately the military and industrial strength which makes the Great Powers the essential foundation of world order is precisely the ground for the anxiety of smaller Powers about their rights and status. The fears of a Four-Power world hegemony which Mr Dewey saw fit to express on the eve of the Conference, and Mr Hull's assurances that full national sovereignty was not in question, both turn on a real dilemma in world order. The Powers whose force is needed to make a security system are distrusted precisely because of that force. It is useless to pretend that there is any merely institutional or functional way out of this dilemma. World order rests in the last analysis not only upon Great Power responsibility but also upon Great Power magnanimity and moderation—in other words, simply on their will to keep the peace. No amount of constitution building will alter the power relationship between, say, the United States and Mexico, Britain and Eire, Russia and Poland. If in their relations with the small Powers, the Great Powers behave like tyrants, and not like guardians of the law, no legal forms or institutional commitments will transform their policy into anything sweeter than disguised or undisguised aggression. The chief role of international institutions is thus to express their good intentions towards their neighbours. The Great Powers can underline the moderation of their policies by closely associating other nations with the work of world order. For instance, joint bases and joint staff arrangements between Great and small Powers would tend to alleviate the anxiety of the weaker members. Again, the setting up of a World Council on which smaller Powers have seats, some held permanently and others in rotation, would underline the fact that war is only the very last arbiter in international society and most difficulties and disputes can and must be solved before they are ripe to be handed over to the final military Executive of the Four Great Powers. Finally, functional organisations can be developed to express the varied content of international life—trade, communications, international investment, agriculture and food. It is perhaps an augury of success that the United Nations' Interim Commission for Food and

Agriculture set up at Hot Springs has been able, during the Dumbarton Oaks Conference, to present its plans for a World Agricultural Authority. International economic co-operation—freedom from want—can never be a substitute for an international security system—freedom from fear; but the habit of co-operation, which economic collaboration between Great Powers and small Powers helps to engender, can at least abate the fears and suspicions which Great Power predominance inevitably creates.

Terms of the Oil Agreement

The text of the Anglo-American oil agreement—signed by Lord Beaverbrook, Lord Privy Seal, and by Mr Edward R. Stettinius, Acting Secretary of State of the United States—has now been published. The two countries recognise,

- (i) that ample supplies of oil are essential for the security and economic well-being of all nations,
- (ii) that supplies are adequate for the foreseeable future,
- (iii) that supplies should be derived from the various producing areas of the world, with due consideration of such factors as available reserves, sound engineering practices, relevant economic factors and interests of producing and consuming countries, and with a view to provide full satisfaction of the expanding demand,
- (iv) that supplies should be available in accordance with the principles of the Atlantic Charter and in order to serve the needs of collective security,
- (v) that the adoption of these principles can best be promoted by an international agreement among all countries interested in the petroleum trade, either as producers or consumers.

As a first step to the conclusion of an international agreement, the two Governments are to set up an International Petroleum Commission. Its members are to be appointed in equal numbers by each Government. The Commission's duties will be partly fact-finding and partly advisory; its recommendations are to be designed to give practical application to the principles underlying the agreement. Eventually, it is to be superseded by an international agreement, and to this end the two Governments are to formulate plans for an International Conference. The new agreement will enter into force on a date to be agreed when each Government has informed the other of its readiness to adhere to it.

Oil Diplomacy

If the art of diplomacy consists in disguising intentions, then the Anglo-American oil agreement is a masterly document. It completely defies interpretation or, rather, it offers too wide a choice of interpretations to make any interpretation possible. It is not surprising that its publication was followed in the United States by the demand for an inquiry by the Oil Committee of the Senate. This is not the occasion for a detailed analysis of the world facts about oil or for any exhaustive speculation about the policies of the oil "empires" and their Governments. But three points in the agreement may be selected for brief comment. First, the British and American Governments are to respect the principle of equal opportunity in the acquisition of exploration and development rights in areas not now under concession. The countries in which Britain and America are to enjoy equal opportunity are not defined; on one interpretation the area of equal opportunity seems to lie outside the United States and countries under its jurisdiction, as well as outside the British Colonial Empire. If this interpretation is correct, the agreement accepts an important principle by treating Britain and the British Colonial Empire as a unit. The definition of equal opportunity itself has not been attempted. Secondly, the clause in the agreement about the supplies of oil to be derived from various producing countries, and their relation to national reserves and national interests, requires a great deal more elucidation. The prospect after the war is not one of an oil shortage, but a tendency to over-production that may tend to depress prices. In order to avoid a glut and falling prices the intention may be to prepare for a production, marketing and, possibly, price control agreement; if a cartel agreement of this sort can be justified, on what basis are production and marketing quotas to be allocated? How are prices to be controlled? And where do Russia and Holland stand in this matter? Thirdly, the agreement provides that the construction and operation of refineries shall not be hampered by restrictions imposed by either Government or by its nationals. The distribution of

refineries is no less important than the control of crude oil resources, but hitherto Britain has imported the bulk of its oil in the finished form. Since, for a variety of reasons, it may be desirable for Britain to engage in the process of refining, will this country have the right, under the agreement, to establish refineries even if this would involve, as in the United States, the imposition of a tariff on refined products? Without answers to these and other questions it is quite impossible to discuss the merits of the agreement. It is hardly possible that the long discussions between representatives of the British and American Governments were confined to platitudes. It may be that the agreement was restricted to a statement of general principles in order not to prejudice free discussion at the forthcoming International Conference. The approach to oil and the difficulties are, in fact, similar to the approach to civil aviation and its difficulties. But the approach is, in both cases, equally questionable since it inhibits informed discussion about a problem the manner of whose solution will vitally affect British interests.

Resurgence or Reaction in Italy?

For some weeks now confused rumours of unrest have reached the outside world from Italy. It is difficult to know the inner meaning of the rumours, for little genuine political reporting appears to be going on in liberated territory. The tenor of all the stories is, however, the same. The British and American authorities are said to be dissatisfied with the Bonomi Government, and to have played with the idea of its reconstitution. Some American newspapers hinted at the return of Badoglio as Minister of War under the premiership of Señor Orlando. Other papers were not so precise, but let it be understood that possible changes would be towards the Right. In point of fact, no Ministerial reshuffle has occurred. On the contrary, the prestige of the Bonomi Government has actually been increased by the transfer to its jurisdiction of several Italian provinces, including Rome itself. Nevertheless, the undercurrent of disquiet remains. Many Italians feel that the British and

Conserving the FOOD VALUE of our Milk

Milk Chocolate is a convenient medium for carrying, storing and conserving milk, but there is much more to it than that. . . Fresh dairy milk consists of two elements—water, which averages 87½%, and 'milk solids' (fats, protein and milk sugar), which contain calcium, phosphorus and Vitamin D and which constitute the whole food value of the milk. As the chart shows, Cadburys Milk Chocolate retains all the milk solids of all the milk used, and only the water is eliminated.

Cadbury means Quality

Americans are not giving anything like wholehearted support to Italy's struggling return to democracy. The Bonomi Government has to "cap in hand" to the Allies for all its requirements, and the return is felt to be all too grudging. It is difficult to understand the reason for such reservations as the Allies may have *vis-à-vis* the Italian Government. They cannot surely believe that Marshal Badoglio would give better military support, for it is obvious that the greater part of Italian resistance to the Germans has been offered by the partisans, all of them anti-Fascist and most of them strongly to the Left. It may be, of course, that it is precisely this fact that disturbs the Allied leaders. If so, they are going the worst way about dissipating their fears.

General Alexander's View

The forces of resurgence among the Italian partisans can be canalised into democratic channels provided they are accepted, encouraged and backed by the Allies. The most successful Allied leader in Italy, General Alexander, has apparently grasped this fact. Properly handled, the Italian partisans are a guarantee of political stability and efficient administration. In Florence, they had a complete structure of local government ready, and had even had the foresight to raise an internal loan for reconstruction several months before liberation. If Allied policy is guided by General Alexander, there can be little doubt that the democratic trend will not be frustrated. In a recent proclamation, the General greeted the patriots with high praise for their "courage, skill and endurance," and told them that

The Allied Military Government in no way concerns itself with political parties and factions in Italy except that it will not treat with Fascist traitors. Its only purpose is to aid the Italian people in their own interest. Italian patriots and all good citizens in the newly liberated areas can be of great assistance to Allied Military Government by organising a representative committee to meet with the officer of Allied Military Government as soon as possible after his arrival. They should be prepared to report fully on conditions in their community . . . the Allied Military Government cannot stay here. It must move forward to help others. It will leave the administration of the community in the hands of good citizens, who will no longer be under the domination of Fascist tyrants.

Mr Churchill is in Italy. He has lunched with Señor Bonomi. Less understandably, he has lunched with Marshal Badoglio as well. As a result of these contacts, will he be prepared to make a gesture to the Italian Government, to the patriot forces, to the people of Italy? Will he address a few "kindly words" to them in their struggle to relearn the ways of liberty?

Mr Curtin's Defeat

The refusal of the Australian electors to transfer powers for post-war reconstruction from the individual State Legislatures to the Commonwealth Government is the climax of a constitutional debate that has been going on now for nearly two years. Indeed, it has been going on, in various ways, ever since the colonies came together in the Commonwealth forty-odd years ago. The referendum held last Saturday turned on the question whether there should be added to the constitutional powers of the Federal Government the power to legislate on fourteen new subjects related to the economic and social reconstruction of Australia after the war—when some central guidance, however arranged, of employment, trade, production and finance will be indispensable. In October, 1942, Mr Curtin, who had then been in office for just a year, introduced a Referendum Bill to Parliament containing a draft of these proposals. The matter was then referred to a Constitutional Convention to which representatives of all parties, together with the Premiers of the individual states, were invited. The proposal was unanimously adopted by the Convention, and the state Premiers were committed to do everything possible to get the Bill through their Legislatures. When it came to the point, however, only New South Wales and Queensland agree unconditionally to the transfer. Of the other four states, Tasmania rejected it completely, Victoria made acceptance conditional on its being passed by the other states, and South Australia and Western Australia could only agree to about three-quarters of its provisions. This method of approach having failed, Mr Curtin was then constitutionally obliged to ask Parliament to refer the matter to the electors if he still wished to obtain the transfer of powers. By a good majority in the Commons and a small one in the Senate, Parliament agreed to this, and prepara-

tions were made for the referendum. The leaders of the Opposition parties were quick to resolve the issue into one of party politics, notwithstanding the full support they had given to the proposed alteration in the Constitution at the Convention of 1942. On this basis, Mr Curtin, with a majority obtained last year of 2 even in the Senate and 26 in the Lower House, might still have expected success. But Mr Menzies and Mr Fadden, both ex-Premiers who well understand the difficulty of Federal Government under changing conditions and with restricted powers—the former's advocacy of increased Federal powers will be remembered in this country—opposed the measure on the grounds that such powers were certain to be used by a Labour Government for "socialistic purposes"; and, aided by strong provincial feeling, which, in Australia, is even more deep-set and partisan than party sentiment, they carried the day. When the vote was taken a clear majority of 227,132 was opposed to the transfer of powers over the 1,506,846 electors who were in favour. Moreover, there was not the majority in four out of the six states that is necessary for a constitutional change of this kind.

Referendums and Democratic Government

Mr Curtin's defeat in the referendum must now be accepted as final. Technically, it is a constitutional rather than a political issue, so that there need be no question of the Government resigning. The Prime Minister will be obliged, however, to choose between attempting to prepare for peace-time conditions with powers which he considers, quite rightly, to be totally inadequate to his task—as indeed his chief opponents regard them also—or giving the opportunity to the Opposition to produce their own plan for dealing with the many problems that are bound to arise. The fate of the referendum has shown up the weaknesses of this particular piece of constitutional machinery. The habits of electors and politicians have been formed by the general election and the clash of policies, and it has proved impossible, in this case as in others before it, to divorce a change in the organ of government from the change in policy that may result. The fact that, in this particular instance, the validity of the transfer was limited to five years, and that a clear guarantee was included of the freedom of expression and religion and of the Parliamentary scrutiny of regulations issued by the Federal Government, counted, apparently, for little or nothing. Included in the list of powers to be transferred to the Federal Government were the right to legislate on employment and unemployment and on the production and distribution of goods. To employees of all kinds this could be made to seem like the threat of bureaucratic direction and the conscription of labour. To employers, the right of a Labour Government to legislate on company law, monopolies, foreign exchange, investments and loans, on profiteering and prices, was as good as a threat of post-war socialisation of industry and commerce. Fears such as these, assiduously fanned, were evidently strong enough to overshadow the significance of the checks and balances provided by a Parliamentary system of government. It may be that much of the result of the referendum can be ascribed to the particular circumstances and the balance of parties at the moment. Nevertheless, the unreliability of a method which, on paper, appears as a safeguard of democracy and the sovereignty of the people has again been demonstrated. It may, perhaps, provide a timely example for those European countries where the nature of the constitution by which the people are to govern remains still in doubt. There, too, the problem will arise, in an acute form, of providing for Governments which, while fully popular and democratically controlled, will be strong enough to do their job properly in modern (and post-war) conditions.

Balkan Differences

The political truce in Greece and Yugoslavia has now been concluded for good. In Greece, the EAM has at last decided to join the Greek Government on the basis of the terms laid down in the Lebanon Charter. The EAM gets control over five key departments. Professor Svolos, who enjoys the confidence of all Greek parties and groups, is to take over the Ministry of the Interior. The other four departments to be controlled by EAM are Agriculture, Finance, Labour and Transport. The Left will be able to enhance—or to compromise—its position by shaping Greek economic policy. In return for this, the EAM leaders have

now agreed to serve under M. Papandreou, whose dismissal they demanded a few weeks ago. The controversy over the fate of the monarchy is to be shelved until the end of hostilities. In Yugoslavia, the agreement between Marshal Tito and Dr. Subasitch, now published, provides for the co-existence and co-operation of the National Committee of Liberation with the Royal Government. The first is to act as the temporary home administration, the latter is to represent Yugoslavia abroad. In the words of the agreement,

The National Committee of Liberation considers that it is not necessary to give prominence and exacerbate at the moment, the question of the King and the Monarchy, as this does not at present constitute an obstacle to the collaboration between the National Committee of Liberation and the Government of Dr. Subasitch.

In the Balkans the constitutional controversy has not been thought to be sufficiently important to make impossible collaboration between the Governments who claim for themselves legal and constitutional continuity and the Communist influenced Committees of Liberation. In Poland, however, the controversy over the constitutions of 1921 and 1935 has been considered as giving sufficient ground for the assuming of all governmental functions in the freed Polish territories by the Soviet sponsored Committee of Liberation. This striking difference is not due merely to independent and divergent tactical decisions taken by the committees themselves. The Russian viewpoint is a decisive factor in determining their various tactics.

Progress to Report

The Planning Bill and the Housing (Temporary Accommodation) Bill are only pieces in the much larger pattern of replanning and rebuilding. They may work badly, or even be unworkable, without the backing of wider and more general legislation on these crucial questions. But at least it can be said that, until they are passed, local authorities cannot even begin the preliminaries of rehousing. The Government intends to rush these two measures through Parliament as soon as it reassembles. It has no option if a serious housing crisis when the war ends is to be averted. But this can only be done if, meanwhile, some compromise is reached with the Bills' main critics, and, conspicuous among them, with the local authorities, who are still boggling at the cost to be put upon them. Official discussions over the Planning Bill are centering on the memorandum submitted to Parliament by the five associations of local authorities, and Mr Morrison has held meetings with all of the associations concerned. Apparently no decision has yet been taken over the strongly voiced demand that "blighted" (obsolete housing) areas should receive the same Treasury grants as "blitzed" ones. Probably the Government should make up its mind to concede this very reasonable (in view of the great need for replanning such areas) and moderate (in view of the sums involved) request. On the other hand, local authorities should surely cease their complaints about the injustice of paying adjusted 1939 prices for land. On balance, though some details could be changed, the injustice is definitely to landowners. The necessity for speed is still more obvious in the case of the Housing Bill, since, as Mr Willink himself has pointed out, at least six months will be needed for local authorities to select and prepare sites and for the necessary jigs and tools to be assembled before mass-production of the Portal bungalow (and any other standardised type that may be accepted—the absence of alternative types is still a point of grievance) can get under way. The first step has been taken with the issue by the Ministry of Health of a circular asking the larger housing authorities to state the number of temporary houses they would like to obtain. They are also asked to estimate what land is already in their possession which could be used for this purpose without prejudicing their "permanent" housing programme, but which again should, probably, be suitable for conversion to "permanent" housing sites in ten years' time, and which should be large enough to accommodate at least 100 (or, in the case of smaller authorities at least 50) temporary houses. The answer is likely to be—very little.

The Voluntary Hospitals Protest

It is now the turn of the voluntary hospitals to give their view on the White Paper on the health services. As expressed in a memorandum by the British Hospitals Association, this view amounts to a condemnation of the pro-

posals for a hospital service, because, particularly those relating to administration and finance, they "would result in the disappearance of the voluntary hospitals." The memorandum points out that, under the White Paper scheme, the joint authorities, which in effect means the local authorities writ large, would have complete control of the hospital service within their jurisdiction and of the consultant service. They could influence the voluntary hospitals' expenditure and, by encouraging "regimented standardisation," preclude that "complete freedom in the treatment of their patients by the medical staff" which is the hallmark of the voluntary hospital; they could hamper their research work; and they could cancel contracts with individual hospitals, thereby destroying them. Instead, therefore, of the administrative set-up proposed in the White Paper, the memorandum suggests the establishment at the centre of a Central Hospitals Board, consisting of equal representation of the local authorities and the voluntary hospitals and with representatives of the consultant service. Locally, there should be Regional Hospitals Councils which would be composed in the same way as the central organisation and like it would be statutory bodies; they would be charged with the duty of planning the hospital and consultant services for their areas. These areas would be large, generally far larger than the joint areas of the White Paper, and where possible should include at least one university teaching hospital or centre. But, in order to give local interests some say in the planning and administration of the service, there should be Local Hospitals Councils composed on the same principles as the regional and central bodies. Financially, the Association proposes that the voluntary hospitals should receive a direct grant from the Exchequer for their services instead of through the local authorities and that they should be able to apply to the Government for the whole, if need be, of the capital expenditure required for rebuilding and extensions.

Clearly these proposals cannot simply be dismissed as reactionary or partisan. The vehemence with which most of the medical profession, and now the voluntary hospitals, oppose any form of control by any form of local authority strengthens the opinion, already expressed by *The Economist* on financial grounds, that the health services might be best transferred wholesale to central control—though the local authorities' case, which is not a weak one, has still to be heard with the same effectiveness as the voices of their critics. There is much to be said for having wide areas for the hospital service and for allowing a patient as free a choice of hospital as facilities allow—if necessary by the continuance of the voluntary contributory schemes. The voluntary hospitals so far are in much the same position as the direct grant and public schools. But their insistence on virtual autonomy, even when in receipt of public funds, including a 100 per cent grant for capital expenditure, makes their demands more like those of the Catholic schools. And though they insist that the patients' interests are paramount, there is precious little sign of the patient having a voice in the administration of the voluntary hospital. It is too easily assumed in the memorandum that the high standards of the teaching hospitals are characteristic of all voluntary hospitals. They can be very, very good; they can also be horrid.

Russian Trade after the War

Russian trade policy is ceasing to be, as Mr Churchill once said in another connection, "a riddle wrapped in mys-

tery inside an enigma." Self-sufficiency will no longer be the guiding Soviet principle, at least in the post-war period of reconstruction. At Hot Springs and at Bretton Woods the Russian delegations pursued a most active policy to gain for their country as many vantage points as possible in the world economic field. These are to be used not for economic expansion abroad, but for obtaining the assistance of foreign capital in the work of Russia's domestic reconstruction. The range of the assistance which Russia will need in the first years after the war will be very wide indeed: machine tools for the renovation of Russian industries; tractors and harvester combines to re-establish the technical basis of collective agriculture; cattle to replace the destroyed cattle population of Russia's western lands and the depleted stocks of the other republics; and, finally, foodstuffs and clothing. No doubt the import of producers' goods will still be the chief consideration of Russian trade policy. But, in the short run, for a year or two after the war, an appreciable priority will also be given to the import of consumers' goods. How will the Soviet Union pay for these purchases? It is difficult to say what quantities of goods Russia will be both anxious and able to export after the fighting stops. Surpluses in some of the staple articles of Russian export—oil, timber, perhaps wheat, manganese, furs—ought to be available fairly soon. But Russia will only be able to trade with the world if the means are provided to tide over several years of an adverse balance of trade, and if help is made available for reconstruction by long-term investment credits. The quota in the International Monetary Fund which Russia has received under the Bretton Woods agreement—\$1,200 million—has provided her with a very wide margin of means by which to overcome short-term fluctuations in her balance of payments. With a pre-war share in the world's trade which was only one-thirteenth or one-fourteenth of the British share, the Russian monetary quota is now almost equal to the British. This striking promotion of Russia in the world's economic councils does not, however, do away with the possibility that Russian export capacity immediately after the war may be so reduced and Russian import requirements so high that this quota may be exhausted relatively early. In any case, the quota gives Russia a considerable "mass of manoeuvre" for trading, partly on a cash basis, and for trading with selected countries. Another resource will be provided by Russia's considerable gold reserve. Here, however, it is not known just how considerable this reserve is or to what extent the directors of Russian trade will be inclined to draw on it for trade purposes.

The Question of Credits

The main key to open the Russian market is, however, long-term credit. The "ideological" obstructions to long-term credit have now apparently been overcome, both at the "Socialist" Russian end and at the foreign "capitalist" end. The United States undoubtedly holds the credit key firmly in its hands, and arrangements for the export of American long-term capital to Russia are fairly advanced. The International Bank for Reconstruction and Development will certainly be the chief instrument in the promotion of loans to Russia, since those loans are certain to be classed as "safe enough to meet the Bank's standards and yet not safe enough to float on their own merits." What is not clear is to what extent the Bank will act merely as a guarantor, and to what extent it will participate in granting the loans. Should the Bank directly participate, this would perhaps create some opportunity for other nations, besides the United States, to carrying credit operations at a time when their own balances of payments would make it very difficult for them to act independently. On the American side there have, in the meantime, appeared symptoms of a tendency to use the credit-key to Russian markets more or less exclusively. A recent speech in Moscow by Mr Eric Johnston, of the US Chamber of Commerce—of which only a few irrelevant sentences were quoted in the press—contained an implicit appeal to the Russians to discard any thought of trade with the countries of the Old World. The response of the Soviet Commissariat of Foreign Trade to this plea has not been reported, though it can be guessed. In the long run, America is certain to enjoy the advantages that follow from being chief creditor and leading industrial producer in the world; and, in the shortest run, when the nations of the Old World will still be struggling with the economic aftermath of the war, America's advantages may be more or less exclusive. But,

in the not so short run, the Old World is hardly likely to fade from the picture. Mr Johnston may, of course, have been very impressed by his geographical discovery that in the Bering Straits the USA and the USSR are neighbours "only three miles apart." But the fact remains that the frontier between the Old World and Russia runs along hundreds of miles on land, and this, too, is a fact that is not without its economic significance. Mr Johnston may not have known—as M. Mikoyan, the Soviet Commissar for Foreign Trade certainly does know—that, before the war, the United Kingdom alone used to buy not much less than one-third of the goods which Russia exported—and buying from abroad remains the least developed of the United States' very great potentialities. It may be that after the war the importance of Britain as a buyer of Russian goods will not be relatively as big as before, if the volume of Russian trade increases, and the different shares of different countries in Russian trade change. But even so, it would be an illusion to think that the focal point in the world's trade has shifted to the Bering Straits, or that there will be an Open Door into the United States for Russian goods. It would, on the other hand, be equally erroneous for British businessmen merely to rely on the comfort to be drawn from the figures of Anglo-Russian trade before the war, when Russia's share in the world's trade was not more than one per cent of the total. Russia's entry into world markets may to some extent revolutionise international trade relations; and in this country regrettably little concrete thought has so far been given to the ways and means which would enable British exporters—and importers—to play an active part in that revolution.

Labour Costs on the Farm

In an article in the 1943 Report of the Long Ashton Agricultural and Horticultural Research Station, Mr C. V. Dawe gives some interesting statistics about farm labour costs, based on an analysis of 118 farm accounts. The conciseness of his presentation means that the critic must also be a detective to draw correct—and consistent—inferences. What do these most interesting figures actually mean? In the five wartime years since 1938-39 the labour bill has risen so as to absorb 32 per cent instead of 24 per cent of total farm costs, which have, of course, also risen. Labour's share of total farm income (also increased) has remained roughly constant at about 24 per cent. This indicates, satisfactorily enough, that the labourer is getting his fair share of the farmers' increased prosperity, which is obtained entirely through a rise in receipts relatively to his other costs. More puzzling to analyse is the rise in the productivity of labour. For every £100 of labour cost total farm production was £316 in 1938-39, rose as high as £451 in 1939-40, and was £420 in 1942-43. The calculation is made in monetary terms, and would only provide an index of physical output if prices and wages had moved together. In fact, the rise in wages has tended to outstrip the rise in prices—so that the wartime increase in the actual output per head of labour is, apparently, still greater than the figures suggest. Mr Dawe confirms this conclusion by stating that, whereas the standard rate of men's wages has increased by 91 per cent in the last five years, the cost of labour per acre over the four years to 1942-43 had risen by only 57 per cent. How is this undoubted increase in labour productivity to be explained? Mr Dawe himself is undecided whether to give most credit to the farmers or the workers (very considerably diluted by all kinds of unskilled wartime recruits). But, surely in addition, much must be allowed for improved methods of farming and for increased mechanisation.

Figures and Facts

All labour statistics, however, tend to be thrown out of gear in war-time by the changed composition of the labour force. This is certainly no less true of farming than of manufacture. The eager but motley throng of harvest volunteers, schoolboys, prisoners of war—and even the much more professional Women's Land Army—can surely not hope to compete in output with the quietly knowledgeable regular labourer. The colourfulness of this array has, perhaps, given a false impression of its numerical strength, much more so of its importance, which can be truly gauged only by the farmer, whose opinion would not flatter the perspiring volunteer—necessary as his aid is. If

then productivity of the total farm labour force has gone up as much as most evidence suggests, then—for all the improvement in methods and for all the new machines—the regular farm labour must have worked wonders. The pre-war bill per farm for all types of casual labour amounted to only £23; in 1942-43 it was up to £97, but even this figure only represented one-thirteenth of total labour cost. Truly, as Mr Dane points out, "the output of food depends primarily upon the mutual understanding and co-operation of the farmer and his regular staff."

The Burden of Rent

The current issue of the *Bulletin* of the Oxford Institute of Statistics contains an informative article by Mr J. Goldmann on rent expenditure—based on an enquiry carried out in May of this year by the British Institute of Public Opinion. The method of this investigation is as interesting as its results. Of the total of 1,337 effective interviews, 1,011 were with "renting" families and 326 with house-owners. About 12 per cent of the answers were unsuitable for tabulation, chiefly because they lacked details of total income. The regional distribution of interviews was proportionate to the regional distribution of population, while the socio-economic structure of the sample was in accordance with that of the representative regions. The social status of each contact was deduced from a combination of income and occupational characteristics. Contacts were selected at random in the street or by house to house canvassing. When the results of this representative sample are checked against official information a high degree of consistency is evident. Since the subject of rent restrictions is due for Parliamentary consideration these new findings are extremely important. Last year an Inter-Departmental Committee was set up to consider the subject of rent control. There are demands from many quarters that the rent restriction scheme should be abolished, but the degree of control to be substituted for it is a matter of acute controversy. The National Federation of Property Owners and the Law Society have recommended that restrictions should be relaxed. The National Institute inquiry has shown that rent restrictions have preserved an uneconomic and unfair system of rating assessment. After the last war many of the new houses built were bought by owner-occupiers, and were assessed for rating purposes by comparison with existing rented houses. The inequitable burden of rent is augmented by a system of rating assessment that penalises the in-

Net Family Income £ per Week	Percentage of Families in Income Group	Average Rent Paid by Renting Families	Percentage of Net Family Income Spent on Rent	Proportion of Families Renting their House in Income Groups
Up to 2	4.6	8.7	29.0	87
2 to 3	7.9	10.9	21.8	91
3 to 4	17.9	14.0	20.0	87
4 to 5	18.7	15.8	17.6	81
5 to 6	18.5	17.7	16.1	73
6 to 8	14.2	20.0	14.3	76
8 to 10	7.6	22.0	12.2	70
10 to 12	4.0	24.1	11.0	51
12 to 15	3.1	25.7	9.5	
Over 15	3.5	29.4	8.9	
	100	Av. 16.6	Av. 15.6	Av. 75.5

habitants of older dwellings and the citizens of declining districts. In the table above the term "rent" includes rent, rate and water charges; income is net (after income-tax deductions). The table shows that while absolute expenditure on rent increases with rising family income, the expenditure on rent as a percentage of family income falls. Rent payments rise at a diminishing rate as family income increases. These results are in agreement with the findings of pre-war surveys, so that it is clear that changes in the wartime distribution of incomes have not materially affected the regressive character of rent expenditure. In the higher income groups only about 50 per cent of families pay rent. If there were any uniform increase in rents the burden on lower incomes would be disproportionately heavy actually and relatively. Not only does rent take a smaller fraction of net income from the upper income groups, but the fraction is paid by fewer families. Rent constitutes one of the largest single items of national expenditure. The real burden of rent cannot be alleviated until building costs have been substantially reduced.

The Madge Enquiry

Some two years ago an investigation was conducted, under the auspices of the National Institute of Economic and Social Research, into the incidence of the war savings habit among wage-earning families. An article in *The Economist* (February 6, 1943, p. 170) summarised and commented on the findings of this inquiry, which showed a remarkable concentration of National Savings in a small percentage of the working-class families interviewed. Eighteen per cent of the families, it was estimated, contributed 76 per cent of the total national savings involved, and 3 per cent contributed 31 per cent. Together with other data, this indicated a tendency for the major savings to be accumulated by families with "excess incomes" of £2 10s. or more over and above the expenditure required for primary necessities. National Savings tended to absorb an increasing proportion of wage-earners' income as income rose. Dr. H. W. Singer has now published a critique of Mr Madge's enquiry, in which he questions the reliability of both the evidence and the conclusions. Among Dr. Singer's grounds for criticism is the defectiveness of the method employed by which an instantaneous picture is recorded of weekly savings, without taking into account the small accumulations which are made before a round sum is actually invested. A second complaint is against the representative character of Mr Madge's sample, which, it is true, is far smaller than the Rowntree survey of York, for instance. The final results of the enquiry are condemned as inconsistent and incomplete. Dr. Singer's attack is searching, and gives the impression of scoring every possible point. On the other hand, in constructing his criticisms, Mr Singer himself is sometimes inclined to make assumptions equally as dubious as those of Mr Madge. Complete reliability was never claimed for the Madge enquiry, and even if the weaknesses pointed out by Dr. Singer render some of its conclusions open to doubt, there is no reason to suppose that its major contention, that war savings are by no means evenly spread over the population, is thereby invalidated. Indeed, it is doubtful whether the labour and skill of either Mr Madge or Dr. Singer were really needed to demonstrate this truism. The problem can obviously only be settled by means of a much wider survey of the total savings accumulated in individual families. Meanwhile, the Madge enquiry probably served a useful purpose in revealing, even if not with impeccable accuracy, the fact that post-war economic policy cannot rely on National Savings as a widely—or proportionately—spread reserve of purchasing power. Their greatest usefulness has been in the restriction of wartime consumption. It is as a secondary result only that some families and individuals have been able to accumulate a nest-egg, under particularly favourable conditions, for use after the end of the war.

Shorter Notes

The following table gives the number of civilian casualties in air-raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.....	22,282	28,522	50,804
Total, 1941.....	20,863	21,839	42,702
Total, 1942.....	3,221	4,149	7,370
Total, 1943.....	2,357	3,462	5,819
Jan.-May, 1944.....	1,561	2,916	4,477
June.....	1,935	5,906	7,841
July.....	2,441	7,107	9,548
Totals to date.....	56,154	75,881	132,035

Those killed in air-raids during July included 1,022 men, 1,187 women and 232 children under 16.

Road deaths during June totalled 497, compared with 380 during June, 1943. Last year, 5,796 people were killed on the roads, compared with 8,272 in 1939.

Increases have been made in the pay of whole-time members of the Civil Defence General Services, the National Fire Service, Civil Defence Reserve, and local authority Fire Guard, and they will be retrospective to June 1st. The rise for men is 2s. a week and for women 1s. 6d., raising basic rates to £4 0s. 6d. and £2 16s. 6d. respectively. Service pay in the basic grades for three years' whole-time service now amounts to 12s. a week instead of 7s. for men, and 8s. instead of 5s. for women.

AMERICAN SURVEY

Mr Dewey's Doubts

Governor Dewey created a great stir last week by appearing, on the very eve of the conference at Dumbarton Oaks, to throw the whole foreign policy debate back into the political cauldron from which Mr Hull has worked so long and so patiently to rescue it. In a widely publicised statement, he said that recent reports

indicate it is planned to subject the nations of the world, great and small, permanently to the coercive power of the four nations holding this conference

and he went vigorously to the defence of the equality and the rights of the small nations and minorities. Drawing a deep distinction between the job of keeping Germany and Japan disarmed (which he agreed was the primary responsibility of the main victors), and the organisation of permanent peace, Governor Dewey urged that the principles for which the war is being fought must not be lost in a "cynical peace by which any four Powers dominate the earth by force." Mr Hull immediately issued an unequivocal denial that any such intention was entertained by the Administration or the other Governments participating in the conference. But for a few days speculation was intense as to the significance of Governor Dewey's unexpected intervention. It was regretted that doubts concerning American unanimity on the issue of the world peace structure should have been reawakened. The Democrats alleged that this was merely a bid for the votes of the American minorities, and even that Governor Dewey, at the behest of the obstructionists in his party, was imitating Senator Lodge's example of defeating a peace by flanking movements rather than frontal assault. At the very least it was assumed that the Republicans, having their doubts as to their ability to carry the election on domestic issues alone, had determined to attack the Administration's management of the peace discussions. All this speculation now seems wide of the mark. Subsequent developments showed that Mr Dewey wanted, not to pick a fight, but to be brought into the circle. The Secretary of State has expressed his willingness to exchange views with Governor Dewey; and Mr John Foster Dulles, Mr Dewey's adviser on foreign affairs, has been chosen to represent him at the Conference. By telegram the Republican candidate assured Mr Hull of his fullest co-operation.

Bi-Partisan Agreement

There is no reason to doubt the honesty of Governor Dewey's concern about the character of the peace or the treatment of the smaller nations. His anxiety is not unique. In recent months, it has been identified with the name of Mr Sumner Welles, to name only one prominent figure among the sceptics. It will be no bad thing to have Mr Dulles' vigilance exercised in behalf of the small nations. Nevertheless, it looks as though the issue was raised largely to remind the Administration that a "bi-partisan" peace policy must be more than the work of one party. If the Republicans are to co-operate in keeping foreign policy out of the campaign they very naturally want a share in the credit. Mr Hull's ready response proves once again, if that be necessary, that political calculations have no part in his steady and devoted progress toward the creation of a bi-partisan foreign policy. Mr Hull has patiently striven to carry Congress with him in the negotiations by regular conferences with a Senate group. He is equally ready to share information and responsibility with Governor Dewey to the end that ratification of the settlement may be assured. It is said by the Albany correspondents that the inclusion of the Republican candidate in the consultations will eliminate from the election campaign the argument that continuity of foreign policy is only possible through the re-election of the Roosevelt Administration. This may be only a hope. But certainly it is a wise precaution to secure the responsible participation of a man who may have to carry through the plans for a security organisation. Even if Governor Dewey is defeated, his influence may affect the Senate stand on ratification. The extension of this practice of bi-party consultation has taken place so gradually that its extraordinary

character goes almost unnoticed. Heretofore it has been unknown in American history for two rival candidates to collaborate in advance, no matter how urgent continuity of policy might be. This drawing together of the parties in the field of foreign policy is possibly the most striking result of the war. To how great a degree it has been forwarded by political embarrassments on the Opposition side, and therefore how solid the structure will prove, is another matter. Such an unusual gift horse should not be looked too closely in the mouth.

Taking up the Slack

Before leaving for his mission to China, Mr Donald Nelson has put into effect the fourth step of his programme for limited increases in civilian production. This lifts the ban on making 79 classes of civilian articles where local surpluses of labour and machinery permit. In the list of preferred items are such articles as kitchen utensils, including tin-openers, typewriters, sewing machines, electric ranges, vacuum cleaners, alarm clocks, food processing machinery, and maintenance equipment. Mr Nelson admitted that at present the increases could not be large; and he put his main emphasis on the value of providing a mechanism for the partial conversion of industry from wartime to peacetime production. The increase may well be less than Mr Nelson hoped to achieve before the Service Departments and Mr Byrnes entered their strenuous objections. The War Manpower Commission seems to have acquired the functions of a Service watch-dog, in the fear that Mr Nelson's regional officers may be carried away by

BENEFACTORS OF MANKIND

CHARLES FRANCIS BRUSH (1849-1929)
His outstanding work was in the field of light, a subject, akin to life itself, which still engages the seeker after scientific truth, and awaits final definition. In his great old age he was described as "A Pioneer of Light". Could any epitaph be more honourable?

Pioneering

THIS brilliant American scientist interested himself in the study of gravitation and molecular physics, but his great obsession was electricity. He lived through the progressive stages of candle light, lamp light and gas light, and then he contributed the electric arc lamp to the amenities of civilisation, bringing noon-day light at midnight to city squares, boulevards and broadways. His inventions include a dynamo, and he claimed the lead storage battery as one of his original conceptions. The Brush Electrical Engineering Co. Ltd., which bears his name, sprang directly from his activities, and has carried on the tradition of his pioneering through half a century of progress.

The BRUSH
ELECTRICAL ENGINEERING CO. LTD.
LOUGHBOROUGH, ENGLAND.

TURBO-GENERATORS, TRANSFORMERS, E.H.T. and M.T. SWITCHGEAR, A.C. and D.C. MOTORS and GENERATORS, CONVERTERS, ELECTRIC TRUCKS, BUS and COACH BODIES

their enthusiasm. Under the revised ruling, they may not authorise increased civilian production until labour checks have been made, and the area representative of the Manpower Commission has certified in writing that it would not interfere with either local or inter-regional recruitment of labour for war production.

In the Goldfish Bowl
