can produce the boiling rage or the icy reproof, he is forced to be tepid. Since he may not put his left foot in front of his right, or his right in front of his left, he is compelled to stand still. Since every speaker who begins to acquire a radio personality will have a growing number of enemies, anyone who begins to be interesting must be removed. Since the fact that any programme is popular will increase the alarm of those who disapprove of it, popularity must be frowned upon.

A competitive system, on the other hand, has at all times a perfect answer to all such pressures. "If you don't like my line of goods, you are at liberty to go elsewhere." That is the method by which any practitioner protects his own freedom of judgment. Anyone who is engaged in competition is not only compelled to concentrate on pleasing, even if it means annoying, he is also free to do so—which is much more important. A competing broadcasting concern is as clay in the hands of its listeners. But towards the interests it can be just as strong as its independent judgment dictates. A monopolist avoids mistakes, a competitor seeks successes.

(It is perhaps necessary to make clear that none of this is a reflection on the energy, the intelligence or the devotion of the staff of the BBC. On the contrary, the wonder is that, with all the defects of the system against which it has to contend, the BBC is not worse than it is.)

The problem is, then, to devise means by which variety and competition can replace the dull respectabilities of monopoly, but without incurring the different defects of an advertising system. But any administrative mechanism must work within the limits imposed by technique, and before proposals for the administration of broadcasting can be framed, they must be carefully adjusted to the probable developments in the technology of radio.

The dominant technical fact is the crowding of the ether. This is particularly bad in an area like Western Europe, where the population is dense and where there are several states and languages, each trying to provide a full broadcasting service. The wave-length allocations of the Geneva Convention were already, before the war, regarded as unduly restrictive, and the position will be worse after the war as radio for uses other than broadcasting begins to multiply. If there is to be any increase in the number of programmes offered—as will be necessary if the listener is to have a greater range of choice—or even without such an increase, steps will have to be taken to relieve the pressure on the broadcast wavebands.

According to some of the technical experts, this will lead, especially in urban areas, to the provision of broadcast entertainment by wire. This does not mean an extension of the present relay services, which get their programmes from the air at wholesale, so to speak, and only deliver them at retail by wire. The suggestion is that the whole service, from the studio to the loudspeaker, should be by wire. A large number of programmes could be put on the same wire simultaneously, and a radio

set would be needed at the reception end to tune in the programme desired. To the listener, the effect would be exactly the same as with wireless waves, except that he could get better reception. The same set could be used to get domestic programmes from the wire and international programmes from the air. The capital cost of wiring the country might be large, but not impossibly so, and there would clearly be an immense relief to the crowded ether.

The other possible development is towards the use of much shorter wave lengths. In the form of Frequency Modulation, this is already being experimented with in the United States, and has the great advantage of much improved reception. A Frequency Modulation station has a radius of only a few miles, and the number of them can therefore be multiplied without causing jamming. To cover the whole country with FM stations, particularly if several of them were to be receivable in each district, would mean a lot of stations. But here again there is no reason to believe that the capital expense would be impossible, especially in a small country such as this.

Either of these systems would solve the wave-length problem. A system of a large number of FM stations could be used to transmit the same national programme, or the same national group of programmes, all over the country. So could wired radio. But equally either of them could be organised to provide local variations. Indeed, with either system, there would be the possibility of a "network" on the American pattern—that is, one or two or three chains of local stations, each station taking a proportion, perhaps a large proportion, of its material from national headquarters, but providing the rest locally. This again opens up further perspectives of variety of programmes. It would be a mistake, especially in a centralised country like this, to expect any great volume of interesting programme material to be available outside London, except in a very few large cities. But clearly such local variation, under local management, as can be made to sustain the listener's interest is of value and should be encouraged.

Another large and impending development is the growth of television, which will probably be found to have made large strides during the war. There are those who hold that television broadcasting will soon kill the purely aural brand, just as the talkies killed the silent film; there are others who deny this on the ground that non-visual broadcasting can be listened to with half the attention and will therefore always have a larger clientele than a variety that requires the complete attention of eye and ear. Clearly, television will have an enormous effect on techniques of presentation, and possibly on the social influence of radio. But for the present articles the chief point to be noted is that the influence of television will work in the same direction as the technical factors already mentioned—that is, away from the large-radius medium-wave station, and towards a much larger number of stations with a much smaller radius. If there is a case for FM on aural grounds, it is much stronger when television is added.

(To be continued.)

NOTES OF THE WEEK

The China Problem

General Stilwell's recall is important in itself, since it marks a new phase in Chinese policy. In spite of President Roosevelt's attempt to represent it as a mere clash of personalities, the General's recall really marks the end of the American attempt to use the Kuomintang regime as a major arm in the war against Japan. It has been an open secret for many months that General Stilwell thought the Chinese could do more than they have been doing and could make a more effective use of even the scanty supplies they have been receiving. An accommodation with the Communists has been urged as a means to the same end; but the American pressure has merely resulted in the present explosion. Of even more far-reaching significance than the local military consequences is the reaction that is being produced in America. Informed American circles have long

realised that the truth about China is almost the direct opposite of the popular picture of a democratic and progressive nation, strong and united in its resistance to Japan. But hitherto a discreet and tactful silence has been preserved. Now the floodgates are opened and correspondents recently returned from Chungking are mincing no words. Mr Brooks Atkinson, in the sober *New York Times*, for example, speaks of

a moribund anti-democratic regime which is more concerned with maintaining its political supremacy than with driving the Japanese from China.

How far the reaction will go it is impossible to say, but at least some reality can now be expected to creep into discussion of the Far Eastern problem. It is a very painful position that is thus revealed, but nothing is to be lost by facing the truth. Among the truths to be faced is that China

is not now, and is not likely for a long time to be, a Great Power. Indeed, it is not even possible to be certain that there will be one clearly legitimate Chinese Government, recognised by all the other Great Powers. Is it not most unwise, in these circumstances, to reserve a permanent seat in the new Security Council for China? How can we be sure that, say, America and Russia will agree on the proper occupant?

Russia Stays Away

The International Air Conference has opened this week at Chicago with delegates from fifty-four nations and vacant chairs for those of the fifty-fifth. The Soviet Government's last-minute announcement, phrased as a roundabout denial of reports that it was in fact going to be represented, was generally unexpected. It certainly caused more surprise and disappointment for being delayed so long. The official reason—that Spain, Portugal and Switzerland, which for a number of years conducted policies hostile to the Soviet Union, were to be represented—is most unconvincing. The unpredictable temperament of Russian foreign policy and the peculiar nature of Russia's interest in civil air transport both provide more likely reasons for the refusal to join the conference. Russian domestic air services have to travel over territory equal to about one-sixth of the land-surface of the globe. It will be a long time before Russian civil aviation is able fully to exploit the enormous potentialities of the domestic market for air travel. In the meantime, the Soviet Government will almost certainly not commit itself to any arrangements which would open Russian air routes to foreign aircraft. "Socialism in a single country" was an old slogan; "Aviation in a single country" may be for a long time to come the underlying principle of Soviet policy. Whatever the reason, the Russian withdrawal is a blow not only to the ideal of universality in international consultation, but also to the American campaign against regulation of air traffic by an international authority. Clearly, the US delegation, which includes Mr Adolph Berle and Dr Edward Warner, hoped for the support of the USSR in their opposition to the policy outlined in the British White Paper. The British representatives, led by Lord Swinton, on the other hand, are reinforced in their hopes of gaining something more than a purely technical international authority by the unanimity expressed at Montreal and the outline map drawn up of imperial air routes. With Russia absent, more will depend on the attitude of the smaller countries, which are not likely to be unduly sympathetic to a form of "freedom" that in fact means American dominance.

The Red Army at Kirkenes

For some time the Germans have been withdrawing their Lapland army from northern Finland. The operation took a more dramatic turn when Russian forces landed in Petsamo, newly ceded to them under the Finnish armistice, and advanced from there twenty miles to the west to take Kirkenes, the nearest town in Northern Norway. The arrival of Russian troops in Western Europe may not have any immediately decisive effect on the fighting. True, the Germans are withdrawing towards Narvik down the coastal road which they have built and they may be planning to withdraw even farther south. Near Bodø, to the south of the Lofoten Islands, units of the Royal Navy have attacked German shipping concentrations, which suggests a withdrawal by sea. But northern Norway—Finmark, as it is called—is impossible country for campaigning on a large scale. The Germans will probably keep rearguard garrisons in strategic positions such as Vardø, Tana, Hammerfest and Tromsø. They could bar the way effectively to any important movements southwards. The King of Norway has sent a message to the Russian Government in which he said:—

The population of the northern areas of Norway will greet the armies of our Soviet ally as liberators.

The possibility of a Russian advance was foreseen earlier in the year when the Norwegian Government concluded agreements with Britain, America and Russia covering the question of civil administration in liberated territory. The Germans have tried to create nervousness in Norway, raising the "Bolshevik bogey" and warning the Norwegians that the Russians will demand Kirkenes and Narvik. But more important than any potential scaremongering is the threat of extreme economic shortage this winter. The

German Lapland army under General Rendulic is moving southwards and as the Germans withdraw, the Norwegians will be compelled to feed them from their already very scanty resources. Thus there is a hard winter ahead with no immediate prospect of liberation.

Russia and the North

The symbolic importance of Russia's appearance in the "Western fringe" is greater than its immediate military significance. The traditional basis of international relations in Scandinavia was a balance of power between Russia and Germany. Since the last war this equilibrium has given Norway, Denmark, Sweden and Finland the opportunity of working together and of creating a close though informal Scandinavian bloc. Germany's victories in 1940 destroyed the balance. Norway was occupied, Finland became a battleground, and Sweden purchased immunity only by modifying its neutrality in Germany's favour. The eclipse of Germany is bound to create new attitudes in all three Powers. The Norwegians now look more than ever to Britain, the United States and to the Atlantic community for the bulwark of its independence. The idea of a Scandinavian bloc is not very popular. In Sweden, there are signs of some re-orientation towards Russia, particularly in the economic field. Traffic between Leningrad and Stockholm has been resumed for the first time since 1941. The Finnish merchant navy, placed at Russia's disposal under the armistice, now carries Swedish goods to Russia. Many Swedish business houses are planning for a great intensification of trade with Russia after the war. Meanwhile the Swedish Communists are obediently attacking the Government with allegations that the Germans still enjoy transit rights across Swedish territory; and both the Russian press and the Swedish Communist newspapers criticise the Swedish Government for admitting anti-Russian refugees from the Baltic states. Swedish foreign policy is still somewhat indefinite, but so are the conditions with which it will have to deal. The Government is anxious for closer relations with Denmark and Norway—the Norwegian Foreign Minister and Minister

WHAT WILL IT BE LIKE...

... THAT POST-WAR CAR OF 1944? Your expectations will run high after these years of waiting. Perfection of design and workmanship... reliability... comfort... speed... economy, these are the things you will naturally look for.

The post-war LANCHESTER will give you all this and something more; a quality of personal distinction, created from the experienced craftsmanship of individual designers and engineers. 'The car which crowns performance with personality.'

LANCHESTER

THE LANCHESTER MOTOR COMPANY LIMITED · LONDON AND COVENTRY

of Justice are in Stockholm on a visit. In general terms, the Swedes see themselves as a bridge between Norway, with its Atlantic orientation, and Finland, which must now look East. The Finns are trying hard to adapt themselves to their new circumstances. M. Zhdanov, Governor of Leningrad and now chairman of the Allied Control Commission, is watching the process sternly from Helsinki. He should have little cause for complaint, for the Finns are fulfilling the armistice conditions honestly and scrupulously. The Russians have acknowledged this in not unfriendly words, although they criticise the Finns' rather slow military operations against the Germans to the north of the Gulf of Bothnia. The new orientation in Finland's foreign policy is bound to entail changes in its domestic outlook. Branches of the Society of Soviet Finnish Friendship have been set up throughout the country, and Marshal Stalin recently addressed a friendly message to their leaders. The internal crisis in the Social Democratic Party is not yet over; and M. Tanner is still maintaining his leadership against a very strong opposition. His survival is a sign that, although the situation may be modified quite suddenly, so far Finland has a large measure of internal freedom of action.

First In—Last Out

The size and severity of reconversion problems in any country are directly related to the intensity of its war effort—to the degree to which its resources have been diverted from normal uses and committed to the struggle. That being so, it would have been no more than prudent had Britain begun its reconversion effort (the planning side of it) much earlier. Indeed, if it were thought equitable and reasonable that Britain and America should make a simultaneous return to peaceful production and commerce, the British should by now be much nearer the economic rendezvous. As things are they will be very late, and the Americans cannot be expected to wait. The immense sacrifice involved in the British war effort is apparent from the statistical records belatedly issued by the Government. A higher proportion of available manpower and womanpower has been conscripted for the fighting services by Britain than by any Allied nation. Overseas investments and export trade have been surrendered on the same scale of self-abnegation. By contrast, American sacrifices (material sacrifices, that is) have been much less severe. A very large part of the prodigious American effort of war production has been accomplished, as Mr Garro Jones said last week, "by taking up the pre-war slack." Certainly there has been no sacrifice, by 1939 standards, of American export trade. America will emerge from the war greatly enriched in productive capacity and, very probably, with production and trading plans of both Government and industry far more advanced than in Britain. The Commodity Credit Corporation's scheme of large state export subsidies for high-cost cotton and wheat has reached the stage of provisional agreement. Arrangements for the disposal of surplus war property have been completed. National and regional projects for resource development (notably for a new TVA in the Columbia valley) have been worked out. New York City's new airport at Idlewild is nearly completed. These items are representative of the scope, detail and advanced nature of the American policy of reconversion. By comparison, British industry is still hopelessly in the dark. The Government's intentions—particularly those emanating from the Board of Trade—appear in unsatisfactory dribbles. There are a number of sound, but vague, general principles but very few blueprints.

Successful reconversion is obviously even more vital for Britain than for the United States. The American problem is essentially an employment problem—how to find economic outlets for the productive capacity of an estimated surplus post-war of sixteen million workers. This figure will be reduced by the reversion to normal working hours, by the maintenance of large peacetime armed forces, by industry's need for capital replacement and re-equipment and by the steady improvement in the standard of living implicit in schemes of social security. Even so, the problem is very large. American industrial productivity per head is already about double that of the British worker. The gross national product, at least 50 per cent greater than before the war, is quite sufficient, equitably distributed, to maintain a very high standard of living. For the United States, the search for international markets is not primarily a struggle to pay for necessary imports—as it is for Britain

—but a contribution to the solution of the employment problem. It is essential to the social and economic stability of America—and therefore of the world—that this solution should be found. For Britain, the recovery and expansion of the export trade are almost matters of life and death; certainly matters of prosperity or poverty. Without markets, old and new, the British people cannot hope to maintain their standard of living. The urgency of the task before Government and industry is now perfectly clear. There is no longer any sufficient excuse for delay or vagueness in the Government's plans; and there is a definite need for an overhaul of wartime agreements, lend-lease and other, where they prove inimical to the early execution of such plans.

Background to a Debate

The House of Commons (which is debating the Social Insurance plan as *The Economist* goes to press) will take into consideration the reactions of the various organisations most intimately concerned with social insurance. In general, the principles of the White Paper have been welcomed, but there is much criticism on details. Point of controversy arises on the question of the administration of National Health Insurance and on Workmen's Compensation, which will be debated next week. A group of Liberal National MPs have tabled a motion calling for the retention of the Approved Societies, and the Societies themselves, not unnaturally, have expressed resentment at the proposal to dispense with their services in the administration of health insurance. At an emergency conference last week, the Association of Approved Societies, though welcoming the White Paper as "the most important sociological advance of the century," adopted a resolution that the existing arrangements should only be supplanted if the new system embodied the best features of Approved Society administration. This moderated disapproval is in strange contrast to the attitude of the Midland Employers' Mutual Assurance Limited, which is up in arms against the "socialisation" of workmen's compensation. In a pamphlet called *The Writing on the Wall* it expresses indignation that "one relatively small industry has been chosen as the first free-of-payment offering to the Moloch of Totalitarianism" and compares the Government's proposals to the methods by which Hitler and Mussolini acquired power. "The minnow of workmen's compensation insurance will not satisfy the whale of state control"—therefore, "What industry has the right to regard itself as safe?" This pamphlet, though an amusing example of last-ditch invective, need not perhaps be taken too seriously. More weight will be attached to the views of the Mineworkers Federation, whose members are, after all, the most directly affected of any workers by the new scheme. As Mr Arthur Horner pointed out at Blackpool, the miners represent only 1/26th of the manpower involved in the scheme, but account for one-third of compensation payments. They welcome the pooling of risks and the spreading of the burden, and are not opposed to the divorce of compensation from earnings. But they consider (and this point will be taken up by Labour MPs) that the proposed benefit rates, especially in cases of partial disablement, are insufficient to maintain the injured man's standard of living.

Belgian Crisis Postponed

Last week a political crisis seemed to be brewing in Belgium. The two Communist Ministers threatened to resign from M. Pierlot's Government; and there was some talk of the imminent creation of a Left Bloc including the Communists, Socialists and Liberals. For the time being it looks as if the crisis had been deferred, either because the Communists have decided not to carry out their threat or—which is more likely—because the partners of the proposed Left Bloc have not come to terms among themselves. But in Belgium, as in other liberated countries, the real difficulties lie more in economics than in politics. It is perhaps still too early to assess the general effect of M. Gutt's sweeping monetary restrictions, which are the subject of a note on p. 612. But they have obviously not done away with the black market, if one is to judge from M. Gutt's statement on Saturday last that "we must start the decisive struggle against the black market." He also announced some minor relaxations of the restrictions—for example, after November 17th the 2,000-franc limit imposed on the withdrawal of money deposits will be raised to 3,000 francs. But these measures are unlikely to alleviate the hardships endured by the work-

ing classes or to ease the social unrest in the country. The position in the coal districts is, according to all reports, appalling. The mines have been working only two days a week, because of the acute shortage of pit-props and of food—a few days ago a delegation of the mine-owners promised the Government to start work on the basis of three days a week instead of two. The whole of liberated Europe is short of coal; and so is Great Britain. No effort should be spared to supply the coal-miners on the Continent with food and pit-props. Both in Belgium and in France they are the centres of the greatest political, social and economic dislocation.

Government or Resistance in France?

The ban on the *Milices Patriotiques*, announced in Paris last week-end, marks a decisive step in the endeavour of the French Government to establish a single administration in France. The militias were formed by the National Council of Resistance as a species of auxiliary police force early this year. Their special task was to track down collaborators. Later on, in the days of liberation, the militias were entrusted with the work of protecting industrial establishments, railways and public utilities against sabotage and destruction by the enemy. At that time the ranks of the militias were very much swollen, chiefly by workers in the factories and mines. The militias therefore had a more pronouncedly class character than the French Forces of the Interior, with which they were only loosely connected. After liberation, the militias have tended to obstruct the working of the administration and to substitute themselves for the normal police force. The dissolution of the militias caused some clash between the Government and the National Council of Resistance, which came out in defence of the militias, on sentimental rather than on political grounds. The resolution which the National Council of Resistance passed in reply to the ban "took cognisance" of the Government's decision and at the same time asked that the militias be allowed to continue. The wording of the somewhat half-hearted protest clearly reflected a marked divergence of views inside the Council. The Communists, who exert a strong influence on the militias, are demanding the lifting of the ban; and mass demonstrations against the ban have been reported from Toulouse. But the Communists are fairly isolated in their protest; and the Socialist paper *Populaire* has unreservedly endorsed the Government's attitude. Nevertheless, the prestige of the Resistance and of the Communists as the *parti des fusillés* is such that the Government will have to proceed cautiously in enforcing the ban. The militias are only one example of a general tug-of-war that is going on between the new Government and the old organs of the Resistance. The National Council has asked that no changes in the legal status of the various Resistance organisations should be made without consulting the Council. The Government's attitude, on the other hand, is that the Council must loyally co-operate in the Government's decisions, with or without consultation. In Paris, the Government has decided to replace the Committee of Liberation, which played a leading part in the fight for Paris, by a Provisional Municipal Council, appointed by the Ministry. This has given rise to a struggle and some bitterness. It is, indeed, tragic to see the inexorable needs and developments of government thrusting aside the spontaneous and heroic improvisations of France's fighting days, but all sections of the Resistance, including the Communists, voluntarily accepted the authority of General de Gaulle's Government; and now that the Government demands that its authority should really be accepted, they can hardly refuse to submit.

The Future of Shipping

The war has played ducks and drakes with the world's shipping. When peace comes the total tonnage of merchant vessels afloat will probably be roughly equal to that of 1939, but its composition and ownership will be entirely different; the British merchant navy may be no more than half its pre-war size, while that of the United States is likely to have trebled. In the House of Commons, on Wednesday, Mr Alexander revealed for the first time the figures of Britain's very large wartime shipbuilding achievements. In the four years 1940-43, 4,415,000 tons of merchant shipping and 1,183,501 tons of war vessels, were launched from British yards. Throughout this period the shipyards have operated

with fewer workers, and under greater physical hazards and difficulties than in the years 1915-18, when the tonnage of merchant vessels launched reached 3,770,000. The shipbuilders have not been able to keep one eye on the peace time uses of the ships they have constructed—the U-boat menace has been too pressing. It follows that when normal commerce is resumed there will be acute shortages and embarrassing surfeits of certain special types. The debate on Wednesday was an attempt to elicit from the Government some statement of their policy for rebuilding an adequate and balanced Merchant Navy. In this it failed. Minister had nothing but generalities to offer, save for the very obvious step of appointing a committee to decide on priorities. The questions to which answers are needed are the probable volume of international trade, the source of the finance needed to replace the sunken ships, the responsibility for ensuring a steady volume of shipbuilding, the prospects of profitable operation. These are still unanswered questions.

Unconditional Surrender

Questioned in the House of Commons last week, the Prime Minister said:

Unconditional surrender, in the sense of "no bargaining with the enemy," is still the policy of His Majesty's Government.

If this could have been said when the "unconditional surrender" slogan was first put forward at the Casablanca Conference, much quite needless argument and disunity would have been avoided and the war might well have been shortened. Unconditional surrender, if it is to be taken literally (and no other interpretation was encouraged), is obvious nonsense. It is an unworkable policy which encourages the enemy to fight to the last gasp, and it provides opportunities which Goebbels has certainly used to the full. No German will surrender until he knows, or thinks he knows, what surrender involves. A refusal to bargain is sensible; a refusal to give some indication of the terms—if any terms exist—is, at this stage of the war, to miss the finest chance yet presented for effective psychological warfare. The mischievous phrase of "unconditional surrender"—now admitted to be misleading—has been a barrier to sound policy. It should be buried.

Common Soldier

Lawyers often claim that nothing can be more decisive and clear-cut than a decision of the House of Lords. That is true, but only in a limited way, as was shown by the case of *Blyth v. Lord Advocate (on behalf of the Inland Revenue Commissioners)*, in which that noble body has recently given judgment. The point at issue was of both social and practical importance. Are estate duties payable on the death of a member of the Home Guard killed in the performance of military duty? The facts were very simple. A Major Mirrieles, of Aberfeldy, during an instructional parade of the LDV's, as the Home Guard then were, was on August 17 1940, accidentally killed by the explosion of a hand grenade

He left an estate of some £300,000, which attracted a claim for the not inconsiderable sum of £64,000 in estate duty. The law is not so simple. Since 1694 exemption from death duties for those killed on active service has been a principle of the law, but the principle has not been too well defined in words. The most recent statute in operation, the Finance Act of 1894, contains a provision keeping alive all exemptions from death duties in the case of "common . . . soldiers who are slain or die in the service of Her Majesty." So the avoidance of all death duties in the case of Major Mirrielees depended on whether or not he was, on August 17, 1940, a common soldier. He had been a regular army major, but had retired before 1940. Here is the first unsatisfactory point. Major Mirrielees was, in one sense, a common soldier only because the LDVs in August, 1940, consisted of nothing else. It was not until November, 1940, that the LDVs, by then the Home Guard, were split up into commissioned and non-commissioned ranks. So this decision is only strictly applicable to those Home Guards who were killed between May and November, 1940, a fact which limits its direct application very considerably. But the Crown had other arguments to advance to defeat the claim for exemption. Its advocates argued that the term "common soldier" could only mean "full-time soldier," and that, consequently, no one could ever claim exemption from death duties in the case of the estate of a Home Guard member. That was not an argument that appealed to the House of Lords. A Home Guard on duty is subject to military law and to the commands of his military superiors. He was required and expected to offer his life to defeat his country's enemies, and might forfeit his life if he shirked that responsibility. If "soldier" does not mean an individual in just that situation it is difficult to see what it can mean. The decision leaves uncertain at least one other substantial point: is it necessary for the cause of death to be a direct consequence of the service? Or would a fatal attack of pneumonia caught on a night exercise be as effective as the more rapid grenade in avoiding the liability?

Mr Eden in Greece

During his stay in Greece Mr Eden had a glimpse of the first phase of that country's liberation. He saw Greece in the throes of utter destitution and political chaos; but he also saw the Greek Government making its first brave efforts to overcome the staggering difficulties ahead. M. Papandreou is establishing his Administration without any great difficulty. This is due to a large extent to the unreserved support he is receiving from the leaders of the EAM and the ELAS. Before his departure from Greece Mr Eden saw the Greek Communist leaders, M. Santos and M. Zevgos, who restated their intention to abide by "a democratic solution of national and political difficulties" and pledged themselves to remain loyal to the present Government. Some disturbances and excesses have been reported from various parts of liberated Greece, but they have nearly all been incidents on a minor scale, and in any case unavoidable in a country where German occupation and Greek quislings have left a heavy legacy of bitterness and resentment. Only on the island of Lesbos, the Greek Prime Minister's own constituency, has the authority of the Government been challenged by a local revolutionary administration. Otherwise the Greek scene in many ways resembles other liberated countries. The emergence of the underground movements lends a quasi-revolutionary colour to the picture; but the direct participation of the leaders of the Underground in the Government helps to clear the ground for the setting up of a normal administration. The partisans are partly incorporated into the regular army—M. Papandreou has just announced the mobilisation of four classes for the regular forces—and partly disarmed and sent to their homes. Yet the chief difficulty is only beginning now, after the dissolution of the various partisan detachments and militias. Unemployment is rampant. The food situation is disastrous. The prodigious inflation of currency creates a feeling of insecurity and tension. The prolongation of the war in Europe may give the Balkan front more importance than was estimated this summer. It is therefore essential that economic and political stability in Greece should be achieved as soon as possible. The promise given by Mr Eden on his departure from Athens that Greece will receive 60,000 tons of food a month was very timely. Until last week, only one food cargo had been unloaded in Greek harbours. The currency problem can be solved only if some goods reach the market; and the

British Financial Mission which has gone to Athens under Sir David Waley will find on the spot that it is useless to attempt to tackle the currency situation without working at the same time to get goods into circulation. The political situation is still potentially unstable as a result of these economic difficulties. M. Papandreou has appealed to the Greeks to be patient for another two months. Then, he believes, the sufferings of the population will be relieved. Military necessity, political expediency, and, above all, the Allies' moral obligations to Greece demand that Allied assistance should enable the Greek Prime Minister to keep his promise.

Bulgarian Armistice

On October 26th the Bulgarians completed the evacuation of their forces from Western Thrace and Greek Macedonia. With this they fulfilled the pre-condition of an armistice with the Allies. Two days later, the armistice agreement was signed in Moscow. Its conditions are more lenient than those offered to any of Germany's former satellites. Unlike Finland and Roumania, Bulgaria has not been compelled to make any immediate territorial concessions to its neighbours, although the Greeks have emphatically demanded a rectification of their frontier with Bulgaria. Similarly, no reparations have been fixed, although with this reservation, that a sum may be fixed in the future. The Bulgarian Government has undertaken to supply food to Greece. Bulgaria used to sell a considerable surplus of agricultural produce to Greece, and this surplus may now be available for export without payment. In the years of war, the food grown in western Thrace and Macedonia—the most important wheat-growing areas in Greece—used to go to Bulgaria and Germany. There is therefore nothing harsh in the demand that Bulgaria should now contribute to the relief of starving Greece. But it is very probable that since the Russian forces in the Balkans are compelled to live on the land, there may be some overlap between their needs and relief for Greece. Meanwhile Bulgaria seems to be working its passage home more effectively than any other satellite. Bulgarian forces are fighting with Tito's partisans under Russian command in Yugoslavia; and now that the Bulgarian Armistice Mission in Moscow, headed by the Foreign Minister, M. Stoyanov, has made an effusive confession of Bulgarian guilt, the Bulgars have high hopes of Russia's quick and complete pardon.

Future Budgets

The Chancellor of the Exchequer, in a written answer to a Parliamentary question, has collected the various figures that are available on the permanent increases in Government expenditure that have emerged since 1939. The debt charge, as at March 31st next, will be £230 millions larger than in 1939—though since virtually the whole of this is subject to income-tax, there will be a large offset on the revenue side of the account. Increases in social services already provided cost £75½ millions more (of which £55 millions is in Supplementary Pensions), and there will in due course, in accordance with the provisions of existing Acts, be a rise to £128½ millions above 1939, most of the further increase being under the head of education. There are, in addition, prospective increases under the schemes for social insurance, industrial injury insurance, school meals and trunk roads of £89 millions, rising to £344 millions (of which £279 millions will be for social insurance and £59 millions for school meals and milk). The total of the above figures is an immediate increase of £394½ millions, and an eventual increase of £702½ millions. But these totals are very incomplete. They do not include the cost, as yet incalculable, of housing subsidies, war pensions or war damage. Nor do they include anything for policies not yet determined, such as permanently larger armed forces, or assistance to industry in the transition period. Nor, finally, do they cover the increased cost, due to higher prices, of the general administration of the country. But they are quite enough to underline the severity of the problem that will face postwar Chancellors of the Exchequer.

British Communists

Nowadays the annual Congress of the Communist Party of Great Britain cannot pass unnoticed—as was formerly the case—for the Communists, though small in numbers—their membership between January and July,

1944, is given as 45,070—exercise an influence out of proportion to their numerical strength. This is due to the fact that the Communist Party, like Common Wealth, is attracting young people (the average age of the 754 delegates at last week's Conference was only 32½) who are well disciplined and full of a crusading spirit for the "win the war and the peace" policy put forward by Mr Harry Pollitt in his opening speech. The emphasis in the new "line" is on *British* rather than *Communist*; and recent propaganda is patriotic, straightforward (the use of jargon is deplored) and attractively produced. The traditional picture of the long-haired Bloomsbury parlour Bolshevik is being replaced by that of the trade-union-conscious shop steward. It was significant that one-third of the delegates at the Conference were engineers, while miners and office workers were well represented. There is now a Communist in his own right on the General Council of the TUC. The Executive report gives some interesting information about Communist activity and organisation. The Communist Party's income of £48,000 in 1943 was largely made up of contributions and membership fees (£22,568) and sales of literature (£18,697). In eighteen months it has produced over 100 pamphlets and memoranda, and the *Daily Worker* has a circulation of 100,000. Over 5,000 public meetings have been held in the past year, as well as special "schools" for new and old members. All this activity, at a time when normal political life as a result of the electoral truce and wartime difficulties is largely at a standstill, must make somewhat uncomfortable reading for Transport House. The Communist Party is putting forward 52 candidates at the next General Election, but it is still hoping for affiliation to the Labour Party. Under the Labour Party's three-year rule this issue cannot, however, be raised until 1946. The Labour Party has rejected all Communist approaches, and last week turned down a similar application from Common Wealth. Labour is still suspicious of "dictation from Moscow," but to the outsider it would seem that the advantages to Labour of having the off-white sheep within the fold are more important than the disadvantages.

William Temple

The death of the Archbishop of Canterbury is a heavy loss to the nation. Dr Temple was, above all, a statesman who came at a time when such a man was most needed to resolve the discords between religious groups and to bring the Church back into contact with the life of the ordinary citizen. An Archbishop who was a member of the Labour Party, a leading spirit in the Workers' Educational Association, and the writer of a Penguin, was something of an innovation, and, however much his particular beliefs might be criticised, it was at least a healthy reaction to that exclusive immersion in doctrinal affairs which fails to carry significance in everyday life. Dr Temple had an eager and consuming interest to interpret Christian ideals in terms of modern social conduct and economic activity. The complexity of his chosen subjects may have laid him open on occasion to specialist criticism, but it must be admitted that the ordinary man is just as likely to applaud his zeal as question his wisdom in attacking such an intricate institution as banking. Dr Temple was, perhaps, more of a philosopher than a theologian, and his theory of the nature of personality brought, typically enough, his abstract thought into line with his practical conceptions. But it will not be either as theoretical thinker or as practical reformer that he will be chiefly remembered, but as a tireless worker for social reform. In the century of the common man, he was the common man's Archbishop.

Standing Down

An article on page 609 describes the preparations the Nazis are making for the defence of German territory. In this country, the Home Guard was stood down from November 1st; invasion stocks of food are to be distributed; and evacuees from the south coastal areas are to be given facilities to return home. Home defence is thus officially at an end, and, except in the Greater London area and parts of the south-eastern region, civil defence is drawing to a close. Moreover, although, in Mr Churchill's opinion, the war against Germany will not be over before next year, there will be increased rations for Christmas. Psychologically it is sound to abolish unnecessary restrictions and

regulations, to help people to return home and to allow extra celebrations at Christmas. But the Government would be well advised to follow up this policy with a statement of the sort of controls that will have to be maintained after the armistice. People expect that rationing, both of food and clothes, will go on. They are prepared for shortages of necessities, such as household goods, to continue. But they do not expect to have to work so hard or to save so much. Just as employers have been given no clear indication of the hows, whats and whens of reconversion, so workers have not been told what will be expected of them when the war with Germany ends. There may very well be a general holiday in industry after the armistice, which it would be impossible to deal with by wartime disciplinary measures because of the numbers involved. The consequences on the production of supplies for the war against Japan and on the manufacture of civilian goods for this country, especially if the holiday is coupled with a buying spree, would be disastrous. Since propaganda takes time to have any effect, it is surely not too soon to begin telling the people that standing down must take place in an orderly manner.

War Marriages

The thorny subject of divorce law has been raised once more by the Government's Bill for war marriages—the Matrimonial Causes (War Marriages) Bill. The new measure is to apply only to marriages made between September 3, 1939, and a date five years after the withdrawal of foreign troops from this country. It deals only with marriages between women living in the United Kingdom and men normally living abroad, of whom the greater part will have been soldiers serving over here in one or other of the allied armies. Its limitations are therefore arbitrary, the more so since the redress offered by the Bill does not extend to any wife who has actually visited her husband's country since her marriage, for however short a time. The purpose of such a change, clearly, is to ease the existing law of domicile, which decides that a woman marrying a man from a foreign country automatically loses her British domicile in favour of her husband's. Legally, she is held to live in his country, even if in fact she continues to live in the United Kingdom. This anomaly has the obvious result that if she is given grounds for divorce, she can seek legal redress only in her country of domicile, to which she has never been, and to which she must make a long and costly journey to regain her freedom. Once there, the fact that her evidence can only be fully substantiated in her own country may create further difficulties. Such situations existed long before the war—particularly during the last war. But apparently the Government is only prepared to overlook the threadbare dogma that hard cases make bad law when there are a large number of hard cases.

The Bill will thus create an even more mixed and contradictory system of divorce law than before. Some will be able to get divorce, others not, and the division will rest purely on circumstance and not at all on principle. Moreover, by waiving the general rule that divorce cannot be granted until three years after marriage (for war marriages of this special type but not for others) it makes nonsense of the Herbert Act of 1937. Such in brief is the argument of those who are belittling the present proposal. Led by Mr Herbert, the crusading minority demand the withdrawal of the Bill and its substitution by a more comprehensive reform of divorce. But, even if the inadequacy of the Bill is admitted, there are reasons why a general reform would be better introduced at a later date. For the moment, some relief is better than none at all. When Parliament has fewer urgent demands upon its time, the three-year limit on divorce, which was originally introduced as a compromise clause to win over ecclesiastical opposition, can be reconsidered on its merits. More important in the context of the present Bill, the whole question of domicile in relation to divorce must be a subject of international discussion. Extending the divorce rights of domicile to a woman marrying out of the country clearly invites a conflict with the divorce law of the husband's country of domicile and the position may arise where two people are married in one country and divorced in another. Between the wars, much was done through international consultation to resolve the anomalies of double nationality and statelessness. So long as national divorce laws differ, the next step must be to reach an agreeable compromise on the law of domicile.

Until then it would clearly be premature for this country to invite dispute over its right to extend domiciliary rights to subjects marrying into another member of the family of nations.

Planning Inquest in the Lords

After a rather tame conclusion last Friday to the Town and Country Planning Bill's stormy passage through the Commons, an inquest into its sins and omissions has been conducted *de novo* by the Lords this week. Lord Woolton put the Bill back into its perspective as one step in the Government's rehousing programme, dealing with the requisition of "blitzed" and "blighted" land and tackling them together as being inseparably intermixed. Viewed in this limited light, it is, despite its injustices, a small Bill to cause such a big fuss. Its limitations were illustrated by renewed pleas that neither the County of London plan nor the Plymouth plan, both of which have been widely approved, could begin to be implemented under it. The simple difficulty is the smallness of the financial assistance offered to the "blitzed" cities, which should certainly be increased by supplemental legislation. But, underlying this, is the fact, pointed out by a number of peers, that this is not a town and country planning Bill at all. It grapples, blunderingly and partially, with the question of land ownership, for which a comprehensive policy is essential to physical reconstruction. It does not touch on the reorganisation of local government areas and finances which is equally essential.

A Cold Christmas

An extra eightpence worth of meat and extra supplies of margarine and sugar will not compensate Londoners for leaking roofs and empty cellars this Christmas. It is too late to introduce fuel rationing, with all the extra ad-

ministrative burden it would entail, especially as those with the money and the facilities have been able to stock their cellars to the maximum permitted amount of a ton and a half of coal. Moreover, people who can stock are, generally speaking, those who can supplement their coal fires and boilers with electricity and gas appliances. Every effort from now on should therefore be spent on seeing that necessary supplies of fuel reach those who find most difficulty in obtaining it during the winter, that is, people living in isolated country districts and the inhabitants of working-class blocks of flats. It is not enough to arrange for the coal to be delivered to the wharf or the merchant. Steps must be taken to see that the merchant actually delivers it to consumers with the highest priority. It is well known that coal merchants dislike delivering small quantities and frequently refuse to carry coal to individual flats. The Government should find means of compelling them to do so.

The problem of repairing London's damaged houses is even more urgent and more difficult. In a debate in the House of Commons last week, Mr Willink stated that we are "moving towards a terribly difficult winter." In the four weeks from September 22nd, only 120,000 of the 800,000 houses needing repair—a total which excludes those only needing "field-dressing" and those too serious to tackle this winter—had been brought to a reasonable state of comfort. He admitted that the work, which will cost some £30-35 million, cannot be accomplished before Christmas, but he claimed that everything possible was being done as quickly as possible. In a few weeks, the building force engaged on war damage in the London region will number nearly 140,000 workers. This is all very well, but to the ordinary observer, who cannot count the number of workers or the 46 millions of square feet of plaster board and so on said by Mr Willink to have been delivered to London, there still seems a complete lack of urgency about the actual operations. The loophole for private repairs of a structural nature or for purposes of sanitation seems to be too large. Dunkirk is a nightmare of the past, but Dunkirk methods should be revived for the rehousing of Londoners this winter.

Letters to the Editor

Colonial Constitutions

TO THE EDITOR OF THE ECONOMIST

SIR,—*The Economist* (in company with many less well-informed journals) assumes that universal adult suffrage is always desirable, no matter what the local conditions. The ballot-box has proved its worth in Britain, but Britain has an essentially homogeneous population, with no racial minorities to arouse ill-feeling. The ballot-box is in similar use in Ceylon, but it regrettably has not proved its worth.

Before the recommendations of the Donoughmore Commission were implemented, racial feeling in Ceylon was existent in small degree. Now there is universal adult suffrage, which makes use of coloured ballot-boxes for illiterates, and other devices; and with what result? Unscrupulous persons, in their desire for office, arouse racial and religious animosities, so they may obtain the votes of their compatriots. The illiterate, knowing the colour of the ballot-box and but little more, and being aroused by appeals to their pride of race, vote accordingly—the greater the tension, the more the votes for representatives of the numerically greatest class. Add to this impersonation of voters and widespread bribery—the picture is not pretty. Will the new Royal Commission bow to British public opinion, or will they withdraw the present suffrage and grant the vote only to holders of certain qualifications (whether of literacy, property or otherwise)? Let us hope they study the realities of the present, and not the idealistic hopes for some future generation.

Since the British system of suffrage has clearly shown its present unsuitability in Ceylon, cannot limited voting rights be adopted there and elsewhere, that are adapted to local circumstance? And would not such a slower progress prove quicker and more lasting in the end?

I would mention a suggestion I have recently met referring

to a certain colony. That voting powers should be limited to classes like university graduates, members of professions, holders of responsible positions in commerce and government, ratepayers and property-owners, etc. This, while considerably limiting the suffrage, would yield immediately a more intelligent body of voters—while the right to vote would be extended with the development of education and citizenship.—Yours faithfully,

Brentwood

F. W. STEPHENS

The Shape of Agriculture

TO THE EDITOR OF THE ECONOMIST

SIR,—Few will disagree with the statement in your recent leading article, to the effect that the soundest basis for the future of British agriculture is to secure a rapid and substantial increase in its technical efficiency. The achievement of this ideal involves at least two considerations—viz., (1) the provision of new capital goods, and (2) the development of fuller knowledge and skill amongst employers and employees. In regard to this second consideration, it is certain that capital outlays will be required here also for better housing and other amenities, to attract and hold higher standards of intelligence.

Although the need for new capital is not confined to agriculture (*vide* your series of articles entitled "A Policy for Wealth"), yet farming does, I think, deserve specially sympathetic treatment. In the last hundred years there have been only three short periods of prosperity for British agriculture. The first, 1850-70, was before the modern age; the second, 1915-20, was before the development of farm mechanisation as we now understand it; while in the third, the present war period, the incidence of taxation, coupled

with the difficulty of obtaining materials, has prevented adequate reinvestment. In the intervening periods, surpluses have scarcely been sufficient for the maintenance of permanent equipment, let alone modernisation. Further, at no time have public issues of capital been available to agriculture as they have been to most other industries.

The present need for new capital is, I believe, of prime importance to the future of British agriculture. It may be hazarded that comparatively few farm buildings are less than a hundred years old, while the geographical lay-out of many farms falls far short of what is necessary to permit efficient modern management. Very substantial sums are required to rectify these inherited defects, to supply gravity water to field and buildings, to improve farm roads and fences and to renovate the drainage systems of catchment areas.

In regard to farm equipment, obvious requirements are electric power, threshing mills, chaff blasts, grain and straw conveyors, grain driers, grinding mills and milking machines, together with implements designed to pull behind modern tractors. The provision of proper implement sheds and work shops is a necessary addendum.

In round figures, I suggest that somewhere in the neighbourhood of £1,000 million new capital is required for these various purposes. In so far as farmers are themselves to be allowed to contribute towards this new capital, it seems obvious that during the rehabilitation period (a) there must be a reasonable level of profits for the industry, and (b) taxation must be designed to encourage maximum reinvestment. Depreciation rates on equipment should be made more generous, and the present Inland Revenue line dividing capital from current outlays made more elastic, particularly in regard to outlays classed as "improvements," whether of buildings or equipment.

If British farmers are allowed to acquire the equipment, buildings and amenities that modern conditions call for, they will have a chance to compete in a reasonably organised post-war world market.—Yours faithfully,

R. MACG. CARSLAW

Forreviot, Perthshire

PMH

TO THE EDITOR OF THE ECONOMIST

SIR,—There will be few, I hope, to dispute the main thesis of your article, PMH, in your issue of October 28th, or the contention that it is urgently necessary to raise the technical efficiency of the cotton industry. Yet the answer to the question of the precise direction in which greater efficiency may best be sought is not so simple as is sometimes implied. No doubt the reorganisation and re-equipment of the cotton industry, to enable part of it to produce

on a mass-production basis, is essential. But there is a real difficulty in deciding on how large a part of the industry ought to equip itself for such a type of production, in face of the uncertainty surrounding the opportunities after the war for exports of bulk goods and specialities respectively, and in face of the demands that will be made by other industries on our limited resources for re-equipment.

In this connection the pre-war experience of our main competitor in foreign markets for cotton goods is worth considering. It is well known that in Japan there were, before the war, two distinct sections of the cotton weaving industry; first, that conducted by the combined spinning-weaving firms organised for bulk production and equipped with automatic looms, and, second, that which was in the hands of small and medium specialist weavers equipped with ordinary looms. The former concentrated almost entirely on shirtings and sheetings; in 1935 over 70 per cent of its output was of these two lines, and the concentration of this section of the industry on those lines was increasing. On the other hand, the latter section had a diversified output. One of the most marked features of the period between the world depression and the outbreak of the Sino-Japanese war was the growing importance, both in production and in the export trade, of the specialist, independent weavers. In 1929 these specialists are believed to have been responsible for about 40-45 per cent of the total output of wide piece-goods in quantity; by 1935 this proportion had risen to 56 per cent. In 1929 the specialists provided only 39 per cent of the piece-goods exports in quantity (44 per cent in value) and in 1931 only 36 per cent in quantity (42 per cent in value); by 1935 they were responsible for 51 per cent in quantity and 58 per cent in value. Japan was being forced by competition to diversify the character of her cotton exports, and as she moved from bulk goods into fancy goods the position of the specialist weaver, using ordinary looms, improved in relation to that of the mass producers.

This, of course, does not suggest that mass production methods, including the use of automatic looms, are not necessary for the manufacture of bulk lines, nor is it an argument against the adoption of high draft for spinning. In fact, Japan's spinning mills began to go in for high draft on a significant scale as long ago as 1929, and by 1934 the bulk of her mills were equipped with either newly installed high draft spindles or remodelled high draft spindles. In the weaving sections of the combined spinning-weaving mills the change to automatic looms had been practically completed by 1931. Nevertheless, the trend to which I have referred above ought not to be left out of account in any detailed plans for reorganisation, as I suggest that Japanese experience is just as relevant to the future planning of the British cotton industry as is American experience.—Yours faithfully,

G. C. ALLEN

AMERICAN SURVEY

Alaska: The Outside Moves In

(By a Correspondent recently in Alaska)

(Note.—*Alaskans divide the world into two parts: Alaska and the Outside; now the Outside moves in.*)

THIS is a Nordic land, created for Nordic people. . . . It is only waiting for . . . people who are a match for it. . . . Here one can study how a great empire is conquered. If we think of the future of our race, we should not forget Alaska."

Did a Yankee promoter say this? No. It is quoted from *Lebensraum*, a book written for Hitler by one Alfred Woolschlager, when the Nazis planned to take over the world. But the Nazi leader is neither the first nor the last to predict great things; now that the war has front-paged

Alaska, and Alaska-stationed servicemen are vowing to return to this last frontier, Americans have been discovering their continental empire—and making their own forecasts: "Alaska can some day support more than 10—perhaps 35—million people. . . . Northern British Columbia, Yukon and Alaska will provide untold opportunities for thousands of returned servicemen. . . . Alaska has 30,000 square miles fit for farming. . . . It will be a world aviation centre—our bridge to the Orient."

These statements are true if we do not look at the clock. But Alaska's development will be slow, hard, and much more costly than North Americans like to believe. It is

likely to go through three successive stages. First, outsiders will move in, to visit and to live. At the same time, exploring will continue, existing trade will improve and new business grow up, especially in service fields. Next, Canada and the United States must jointly finance north-western highways, waterways, airways, and development of water power. This will take years. Finally, big business will move in. For the north-west empire calls for heavy industries spending huge capital to develop oil, timber, minerals and their by-products.

Alaskans are now preparing for a post-war tourist boom which may be sensational. Before the war, Alaska was just a glamorous name. Since, few have been allowed inside its borders. Shrewd Alaskans and Canadians anticipate a tourist business, the instant war restrictions lift, that may eventually yield profits of \$5,000,000 yearly.

At the same time, some thousands of returned soldiers and other hardy young people seeking frontier work and chances will be finding jobs and starting business in this northland. Exuberant prophets predict "millions," pointing to the flood of inquiries about jobs, homesteads, living conditions, now pouring into the US Department of Interior and offices of Alaska and Seattle officials. Experienced Alaskans and outsiders who know the land foresee no stampede, but rather an immediate postwar population perhaps twice that of 1940—some 200,000 all told. Decades must pass before "millions" can live there. But various opportunities in farming, fishery by-products, furs, diversified mining and urgently needed services will create many

is on the shortest route between North America and the Orient. Passenger and cargo planes will soon end for ever the Far North's worst isolation. So runs common opinion.

Aviation has indeed accomplished wonders. The Civil Aeronautics Administration has developed some 7,000 miles of airways in Alaska, roughly divided into the "inside" airway, up from the American middle west through Edmonton, Whitehorse and Fairbanks to Nome, and the coast airway from Seattle to Anchorage to Nome. Tomorrow's Alaskan aviation centres will be Anchorage, Fairbanks, McGrath and Nome. Local air travel will, of course, expand in step with population and volume of business. But passenger travel still costs 5 cents a mile, and Alaska's strategic air location is vital in wartime, but not in peace. What urgent business calls for many flights from the United States and Canada to Russia, China and India via the north route? Flights to and through Alaska make headlines, but they cannot soon generate much business.

Concerning air cargo, W. A. Patterson, president of United Air Lines, has pointed out that a Liberty ship carries 6,400 tons 7,500 miles in 30 days for \$210,000; to do the same job by air would require 144 large four-engined planes and cost \$29 million. The north-west empire has few materials so precious that they must be air-shipped, nor does it need much costly cargo from the outside.

Highway and waterway networks, on the other hand, would revolutionise the Far North. To build them will cost billions. The North Americans have thus far been pinch-pennies in their north-west domain. In a world that deals in billions and trillions the two governments have allowed mere tens and hundreds of thousands of dollars for study and development of this last frontier. Until Canadians and Americans with brains, vision, vast venture money and the adventurous spirit in the grand manner take over the empire, the land will remain just a place to hunt and fish. The northland waits a Cecil Rhodes.

Timber Prospects

Alaska's timber offers one of the most promising prospects. In time, a large pulp and paper industry might produce at least a million tons of newsprint yearly without depleting Alaska's enormous reserves. This would yield some \$40 to \$50 million of products yearly and employ around 25,000 workers directly and indirectly. But not at the profits that most business now seeks. Frontier costs still hold it back.

Last spring the US Forest Service reconsidered old plans. It invited bids until November 30, 1944, on a Tongass National Forest pulp timber unit. The plan calls for a yearly output of 40,000 tons for the first ten years and thereafter for 130,000 tons yearly.

The United States alone consumed 19 million tons of paper and paper board in 1941. The trend is still upward toward a probable 24 million tons in 1950. If the rest of the world used pulp and paper products on a US scale as of 1935, when *per capita* consumption was 226 lb., world consumption would expand five or six times.

But can a small Alaskan pulp industry compete with Canada's five-million-ton capacity plant, which produced more foreign exchange before the war than any other business and hired half a million workers? Canadians must export. Can Alaska's unborn industry compete with the Canadian giant, which survives only by holding world markets?

And how about Scandinavia? Its forests are in prime shape for postwar exports. Before the war, one in four of Sweden's workers held jobs in the forest products industry, producing nearly four million tons of wood pulp and a million of paper board. During the past three years Sweden has used perhaps less than half its pulp and paper plant capacity.

A new Alaskan pulp and paper industry must have large capital investment, pay high wages and be prepared for high labour turnover, at least at first. It must fight distance from markets as well as the stiff competition of Canada, Scandinavia, the American South, and, in time, probably Russia, which even now has been sending the United States pulpwood under reverse Lend-Lease. Before World War II the Russians were unloading shiploads of north-east Siberian lumber on the Shanghai docks, and had even begun to sell it in New York City at prices far below those which North American mills could meet.

This is the toughness of the task. But the resources are there.

American Notes

Whirlwind Finish

With three speeches in as many days, President Roosevelt has recaptured the initiative from the Republicans. His last minute appearances in the doubtful states have effectively countered rumours of his ill-health which had become so persistent that even the *Herald Tribune* has insisted that the choice really lies between Governor Dewey and Mr Truman, the Democratic vice-presidential nominee. In his speech at New York, President Roosevelt brought the foreign policy issue back to the centre of the campaign. With deadly effect, he pointed to the isolationist records of Republicans like Mr Joseph Martin, Mr Hamilton Fish, Senator Hiram Johnson and Senator Nye, who would succeed to key positions in a Republican Congress. He denounced, as putting party before country, the suggestion that Republican Senators would support a Republican, but not a Democratic, President in the making of the peace; and by his dramatic insistence that the American delegate to the Security Council must be endowed in advance with authority to act, he forced Governor Dewey into almost equal precision. This was reluctant but significant tribute to the President's hard hitting. At Philadelphia, Mr Roosevelt defended his Administration's conduct of the war. This is home ground, and a position already almost impregnable was further fortified by General MacArthur's landing in the Philippines and the news of the great American naval victory in the Pacific. The prospect of continued fighting in Western Europe disposes of Governor Dewey's contention that it is a peace President that is to be elected, and the timely proof that the Pacific theatre is no step-child of the Administration further undermines the thesis that "It's time for a change." Finally, at Chicago, the President made the most of the central dilemma of the Republicans, their realisation that they must support the main reforms of the New Deal while damning their author. In Mr Roosevelt's sparkling parody the Republicans are made to say:

"These incompetent bunglers in Washington have passed a lot of excellent laws about social security and labour and farm relief and other things—and we promise, if elected, not to change any of them."

But the ideological raiding is not all on one side. Mr Roosevelt at Chicago held out the promise of jobs for 60 million, partly through the trebling of American foreign trade, but mainly through private enterprise, whose virtues he extolled without any inconvenient memories of his early battles with the economic royalists. This is a campaign in which the game is to force an unwelcome issue upon your opponent. Governor Dewey has attempted to make the battle one between free enterprise and government regimentation; President Roosevelt has raised the cry of isolationism and internationalism. The last week of the struggle finds Governor Dewey calling the President an isolationist and Mr Roosevelt appearing as the champion of business. But on balance it is the President who has succeeded in manoeuvring Governor Dewey on to ground of his own choice.

Wise Money

With only a week to go, pollmakers and bookmakers still seem to be talking about two different elections. All the polls predict a "photo finish," except that sponsored by *Fortune*, which gives Mr Roosevelt a 7 per cent lead. It is even suggested that the result may not be known until December, when the votes of Servicemen overseas are finally counted in the eight States whose laws provide for delayed returns. If the race is really close, this is not impossible, for one of those eight is the doubtful state of Pennsylvania, which casts 35 electoral votes. Yet the betting odds, in Wall Street and on Broadway, obstinately stick at 3 to 1 on Mr Roosevelt; and even at that figure there seems to be little Dewey money about. The bookmakers, who have a close, if non-partisan, interest in the outcome, refuse to be influenced by the findings of so eminent a pollster as Dr. Gallup that the President's lead over Governor Dewey has declined to a bare 2 per cent. It is not so certain that the public, which has a human desire to be on the winning side, is equally unaffected, or that the polls have as neutral an effect as their sponsors might wish. There will be no repetition of the *Literary Digest* fiasco of 1936. The polls admit

that there is in their figures a margin of error which is usually put at 4 per cent; and in view of the closeness of their tallies, this is enough to save their technical reputations. It is their forecast of a neck and neck race, rather than of the final outcome, which is at stake. The disparity between the public opinion polls and the views of experienced observers is partly to be explained by the fact that the polls deal with the popular vote, the practical politicians with the vote in the Electoral College, which may be a very different thing. Yet even in specific states, where this consideration does not operate, the same puzzling differences persist. In New York, for example, where Dr. Gallup finds equal popular support for both candidates, the odds are 2 to 1 on President Roosevelt. Would things be different if Wall Street took the poll and Dr Gallup made a book?

* * *

The Rest of the Ticket

No President elected in recent times has failed to bring in with him a House of Representatives of his own political complexion. History and habit are both ranged against those prophets who predict that Mr Roosevelt, if elected, will be saddled with a Republican Congress. The gravitational pull of the "top of the ticket" is always powerful. It helps would-be Aldermen for city precincts as well as Senators with state-wide constituencies. The parties are almost evenly divided in the present House of Representatives—211 Democrats against 212 Republicans, with four members of small parties and three unfilled seats. But this was the House elected in the "off year," 1942, when there was no Presidential election. If Mr Roosevelt carries the country, it is virtually certain that his tide of votes will sweep in Democratic candidates in a number of districts that went Republican by small majorities in 1942 when the general poll was low and local grievances eclipsed national causes, and the greater the President's majority, the more this will be true. As for the Senate, one-third of which is elected next Tuesday, Republicans would have to be elected in the South (a miracle equivalent to Orangemen winning in Cork) before its Democratic majority was destroyed. This should not be taken to mean that Mr Roosevelt, if elected, will enjoy an amenable Congress.

promising and a few sensational opportunities for new settlers.

Before long, the United States and Canada must jointly tackle the toughest job of all, to end the north-west's isolation. The region is Canadian-American; it stretches from Nome to Seattle; its gateways are Seattle, Vancouver and Prince Rupert. Its trade is North American, and long will be. Frontier costs, normally high, eliminate the region from world trade, especially as North America becomes the profit system's last stand. Canada and the United States have long co-operated through such international commissions as the International Fisheries Commission, more recently the North Pacific Planning Project, and the North American Arctic Institute now being considered. There are, indeed, sound arguments supporting E. T. Kenney's year-old proposal to the British Columbia Legislature that all the area north of the 54th parallel in British Columbia, Yukon and Alaska become an International State of America. The TVA pattern could be brilliantly applied here. It might help North Americans to catch up with the Russians in mastery of the Arctic—to-day they are at least generation behind.

The Aviation Dream

It is popular to say that airplanes have ended the north-west's isolation, that Fairbanks is only a few hours' flying time from the States and every world capital. Alaskans are the most air-minded people on earth—many who have never seen an auto have been flying for years. Besides, Alaska

As a matter of fact...

there is still available in this country a cigarette which gives you a pleasure which millions seek but never find. In the full flavour and the rich aroma of the best Turkish leaf you find not the titivation of the senses but smooth soothing satisfaction. Anti-Administration Democrats have shown that they can be as obstructive as any Republican, and in the past they have joined hands with the Republicans more often than not on domestic issues. But this elasticity of party conscience is less operative on international questions.

*

The race for the Presidency has inevitably absorbed attention, but there are a number of interesting contests for the House and Senate in which principles and personalities are equally involved. One of the most genuine Liberals in American public life, Senator Robert F. Wagner (Dem.), comes up for re-election in New York, and the closeness of the Presidential struggle in that state gives point to the strong appeal of the *New York Times* for discriminating support for a Senator whose virtues are esteemed by all sections of the community. In Ohio, Senator Robert Taft, the ablest exponent of Isolationism in the Senate in the days when that doctrine was still respectable, seeks a renewal of power, this time as a believer in international co-operation, with reservations. But that mystical quality "human interest" most closely attaches to two Congressional races. The one is in upper New York State, where Mr Augustus Bennet, supported by a galaxy of literary talent, is striving to unseat that *bête noire* of American Liberals, Mr Hamilton Fish. The second is in Connecticut, where Mrs Clare Boothe Luce is challenged by a woman Democrat, Miss Margaret Connors. Mrs Luce, who once wrote an acid play about her own sex, "The Women," has herself become a target of widespread feminine criticism as a result of her intemperate campaign against the President, and to be opposed by a woman is regarded as a novel form of poetic justice.

Spot Authorisation

The publication, though not the preparation, of far-reaching plans for the reconversion of American industry on the defeat of Germany now appears to have been a trifle premature. Equally, last summer's insistence by the Services that claims for any expansion of civilian production should be rigidly sifted are shown to have been no more

than prudent. Some expansion is taking place, but it is on a small scale, and only under the "spot authorisation" plan which proved Mr Nelson's swan song at the War Production Board. Applications have been coming in at the rate of 500 a week from companies, particularly small businesses, who feel that they have surpluses of man-power and materials which might be used with advantage for civilian production. So far, however, only 1,278 plants have been authorised to go ahead, and their scheduled production only amounts to \$202 million, with \$57 million expected in the last three months of this year. This is partly the result of the continued high level of demand for basic materials, such as steel, by war industries; but it is also proof of the effectiveness of the controls which the Services demanded should be included in the plan. These provided that even where materials are available, the War Manpower Committee may refuse its consent on the ground that man-power might be diverted from more essential work, and a further veto power was granted to special production committees in which the Services have a voice. These general restrictions will hardly be abandoned until the end of the war in Europe. There is, however, a possibility that spokesmen for small business may secure an earlier relaxation. Congress in the recent demobilisation law provided for an exemption for small concerns. A good deal hinges on the definition of smallness. The Manpower Commission, which in this matter is the spokesman of the Services, might be persuaded to allow plants employing fewer than 50 workers to reconvert without its permission; but to go much higher than this, it is felt, would disrupt the man-power controls.

Shorter Note

The Commodity Credit Corporation has announced agreement among the industry advisory committees on the principles to govern cotton and wheat export subsidy programmes. In both cases the plan is for the payment of Government subsidies to permit wheat and cotton to be sold at competitive world prices. A textile export subsidy may be considered later.

decisions which all members shall be expected to accept. This is the substance of a repeated observation by Mr Mackenzie King—that, to ensure peace in the future, the nations must organise a preponderance of force on the side of peace. If that preponderance of force is composed entirely of the resources of the Great Powers, the result may satisfy the requirements of peace for some time. But this would not produce a genuine world organisation. It would not be an organisation of the world community at all. It would be necessary, to achieve such a world organisation, to devise methods by which a small-power membership acquired sufficient significance, in the eyes of the citizens of the secondary nations, to justify their honest and continuing support. That this can be done without disturbing the principle of ultimate and decisive responsibility resting upon the Great Powers may be expected to be the viewpoint of secondary powers when the Dumbarton Oaks draft finally reaches a conference of united and associated nations.

The difficulties are smaller than might appear at first glance. Since the new League serves as a continuation of the alliance of nations opposed to the Axis, the function of the middle and smaller powers could be recognised. They have had their place on a growing scale in the allied organisations for directing and mobilising the war effort. Possibly all that is needed at the present time is an assurance that this tendency will be encouraged in future organisations of the United Nations. At the Dumbarton Oaks conference of officials, it is now clear, the attitude of the United Kingdom has been to favour the erection of a world organisation assuring a place to the smaller nations, while the United States and Russia have not looked upon this principle with such favour. The attitude of the United States, it is felt in Ottawa, may change after the presidential election. In any case, the views of the British Dominions are well known to the United Kingdom Government as a result of the Commonwealth Conference in London last May, and they are known to one another. When the Dumbarton Oaks draft comes before a general conference of governments, discussion of how to assign a role to the smaller powers will undoubtedly find many of them ready to present their views.

Uneasy Stabilisation in Germany

GERMAN armies are retreating rapidly from the southern Balkan countries, but for some time there have been no major movements on the western, eastern and Italian fronts. The great summer campaigns on all fronts and the collapse of Roumania, Bulgaria and Finland have reduced Germany territorially to what it was after the defeat of Poland in the autumn of 1939, except that Northern Italy, Denmark and Norway are still under German domination. Against tremendous odds the Nazi regime is determined to defend Central Europe to the last.

Nazi Germany's ability to maintain a defence against new major offensives from the west and the east cannot be measured in anything approaching exact terms. The ability to prolong an effective resistance is not a purely political, military or economic problem; but the mainstay of resistance must at present be sought in the political sphere, that is, in the determination to continue the war at any cost. The regime has been able to overcome an extremely dangerous situation, and there has undoubtedly been some temporary recovery from the first shock of the heavy military defeats.

One of the secrets of this recovery is the structure of the totalitarian administration. The conspiracy of the generals left the leading circles of the Nazi party intact. The rank and file of the army and the people at home are not equipped, either morally or materially, to oppose the regime; they will be directed to fight and to work as long as the administration remains effective. It is of some importance that after the conspiracy of the generals the huge bureaucracy was the chief victim in the search for manpower to make up the losses in Russia and in France. The comb-out of the administrative machinery has undoubtedly yielded a considerable number of men and women either for the armed Forces or for war production. Indeed, this comb-out seems to have been conducted with utter disregard for the functioning of social and so-called cultural services. In towns and

THE WORLD OVERSEAS

Canada and Dumbarton Oaks

[FROM OUR OTTAWA CORRESPONDENT]

October 13th

THE statement issued by the Prime Minister, Mr Mackenzie King, in commenting upon the draft proposal for a world security organisation prepared at Dumbarton Oaks, made a point of the fact that:

Before the draft charter takes its final form, there will be full opportunity for its revision in the light of views expressed by other countries.

The extent to which the Canadian Government may in due course offer suggestions for changes in the draft has not been indicated in definite form, except insofar as Canada's attitude has been revealed in previous discussions on post-war international organisations. The substance of it has been that although, admittedly, the fullest reliance should be placed upon the principle that ultimate responsibility for success or failure must lie with the Great Powers, ample scope should be provided for the influence and functioning of other nations.

This is the view, in general, which may be expected from a power such as Canada, occupying a middle position between the Great Powers and those of insignificant weight in world affairs, and from some other nations such as Brazil in the Western Hemisphere, Australia in the Pacific, and the Netherlands, Belgium or Norway in Europe. These nations have a genuine stake in the preservation of peace,

for they play a part in the world community as trading nations, and they possess economic resources which must be taken into account in the employment of sanctions to preserve peace.

The Council of the United Nations League, as the draft sets it out, will exercise the exclusive responsibility for the preservation of peace. Within the Council, the rule of unanimity will apply only to the five nations which qualify as Great Powers—the United Kingdom, the United States, Russia, China and France. The other six elective memberships, which are likely to be filled on most occasions by delegates representing middle powers, would be able to exercise a limited measure of authority by means of unanimity in veto action. In short, the decisive authority will rest with the Great Powers, and there can be no reasonable dissent from this principle.

Nevertheless, the exercise of decisive authority by the Great Powers need not exclude the smaller powers, and the extent to which such nations find scope for registering their influence upon League decisions may well be the main concern of a country such as Canada. This depends in the main upon political considerations. If the impression existed that the new League would operate merely as a façade in which domination of the Great Powers assumed the appearance of a world community, the governments of second-class powers would encounter obvious difficulty with the electorates from which they derive their authority. No less than the Great Powers, these governments must solve the problem of marshalling public opinion behind the decisions of the new League Council. The technique must not be that of imposing the will of the powerful majority upon a minority, but rather of furnishing the means by which the minority shall exert some influence upon the

villages these only exist to a minimum extent. Secondary schools and universities have been cut down. The production of books has been suspended, and the numbers of newspapers and journals that are still being published are extremely small. Only the cinema and the radio are left for entertainment.

The huge and complicated financial machinery of the regime has been reduced by the simple device of suspending the assessment of taxes. A great number of taxes are now being paid on the basis of former assessments. The postal services are barely sufficient for necessary business correspondence; and civilian travelling has become almost impossible. All these measures have certainly yielded manpower, and there are signs that the war factories cannot absorb at once the men and women who have been directed to work by the labour exchanges. This apparently paradoxical situation is the result of a political move which is designed to bring home to the entire people the need for an extraordinary effort.

The latest and probably the last step in this direction was the organisation of the "Volkssturm." Here, again, the political importance is greater than the direct military value. The young and the very old in this "Volkssturm" will mainly do sentry duties at home and will thus replace fit men sent for service to the fronts. Nevertheless, this is a formidable array of the 85 million German-speaking people who live in the territory dominated by the Nazi regime. In addition, there are roughly eight million prisoners of war and foreign civilian workers available as well as the people of Norway, Denmark, Bohemia and Moravia, western Hungary and western Poland, who number 40 millions. Foreign workers and people in occupied countries are, however, a potential danger, and full service either at the front or at home can only be expected from Germans.

From a purely political point of view the regime could probably continue to resist for some time yet. The question arises, therefore, how long the country's resources will last against an incomparably stronger Allied combination of armies and resources. In simple terms, it could be said that Germany's material ability to resist will end after the loss of the Ruhr-Rhine area and of Upper Silesia. But as long as these areas are not captured, production will remain for some time on a considerable level.

Any estimate of the size of this production would be

"Why I read The Yorkshire Post"

"To begin with, I like the paper. It seems to me to have everything. I like its sincerity, its honesty, and its sense of fair play. I don't mind betting that business men everywhere would get a clearer vision of things by reading The Yorkshire Post regularly. "Take politics. While upholding its own political viewpoint, it is also fair to the other fellow's points of view. And that's more

than you can say about many newspapers. Take finance. You'll always find full reports of local trade meetings, not summaries. And in post-war matters—amid the babel of voices planning Brave New Worlds, its realistic outlook helps a plain man like me to understand what our post-war tasks and opportunities are really likely to be."

purely speculative after five years of war. It can, however, be said that some important industries will have to deplete during this winter the carefully accumulated stocks of raw materials such as high-grade iron ores, manganese ores and other hardening metals, copper, tin, lead and bauxite.

Virtually the entire output of the manufacturing industry is now reserved for the war. Household goods, clothing and furniture are no longer manufactured for civilian use. The barter of civilian goods has become general over the whole country, and under a help-your-neighbour scheme household appliances such as electric irons, and even pots and pans, are lent from one household to another or by retailers to customers.

The most important problem is, however, the maintenance of factories under constant bombing, particularly in western and central Germany. The first great bombing offensive in 1943-44 led to an extreme dispersal of factories over the whole countryside, with a decided trend to transfer them from the west to the east. The smallest towns and villages were invaded by new prefabricated factories. At the same time, dispersal was carried further by engaging the population, especially women and children, in assembly work in their own homes. This dispersal naturally demanded the utmost standardisation of plant, machinery, machine tools and design and, above all, mobility of the labour force. Foreign workers living in camps could easily be transferred, but the German population, too, has become very mobile, a position which has even been forced upon it by the destruction of many towns.

Below Ground

While this dispersal was being carried out, growing numbers of vitally important factories have been established underground. Propaganda to the effect that all such factories have been or will be established underground is quite exaggerated, but it is a fact that with some initial expenditure of labour a considerable number of factories can be put below ground. The southern fringe of the Ruhr area and the mining district in southern Westphalia are honeycombed with disused mines which were closed down during the rationalisation period from 1924 to 1929. In Central Germany there are a number of potash and salt mines which can also be converted into underground factories. The actual number of these factories must remain small. But the point is that extreme dispersal above ground, combined with the establishment of some factories below ground, provides effective protection against even heavy and continuous bombing. If the determination is there, production can be carried on even under bombing from the air and shelling from the ground, although the actual output will be small if the assault is continuous.

The dispersal of factories naturally creates special transport problems which may in the end prevent it from being successful. The authorities concerned have conceived the idea of making the different fronts in the west, the east and the south, and even particular sections of these fronts, autarkic as regards supplies. The idea seems simple, but its realisation would entail a great deal of decentralisation and initiative, which are alien to the totalitarian regime. It is clear, however, from the present position on the fighting fronts that the Ruhr area, with a system of underground factories, could make the western front autarkic for most of its necessary supplies. A considerable stretch of the eastern front could be served in the same manner by the Upper Silesian industrial area. The industries in Central Germany and in Bohemia could then manufacture specialised products for the supply of all the fronts. But there is as yet no indication that the transport system, and indeed the whole system of economic organisation, have been adapted to this plan.

There has been no shortage of ideas or resourceful experimentation in Germany's war industry. The bombing offensive and the retreats on all fronts have provided an impetus, and there is no doubt that some very difficult problems have been solved, as is shown by actual experience at the fronts. There is, however, an overriding question, and that is the time factor. A comparatively quiet winter on the fighting fronts would doubtless allow many plans to be achieved. For a final production programme stocks of raw materials will be sufficient, especially as there is no lack of machine tools. Heavy bombing may hamper this programme, but bombing alone cannot stop it. It can only be prevented by a break-through this winter into the vitally important industrial parts of Germany in the west and east.

THE BUSINESS WORLD

Scotland: Development Area

THE Government's decision to rechristen the former Special Areas "Development" Areas has been welcomed in the country generally—and nowhere more than in the Areas themselves—as an indication of a positive approach towards the problem of industrial location. Indeed, perhaps the most concrete and progressive section of the Employment White Paper is the chapter on "the balanced distribution of industry and labour," which recognises the need for securing a greater diversification of employment in areas hitherto dependent on certain heavy industries. According to the White Paper, it is proposed to "steer" new industry into the Development Areas, by such means as the use of building permits, the granting of financial assistance to suitable enterprises and by developing and improving the Areas' basic services and communications. The Government has thus shouldered responsibility for preventing the re-emergence of Depressed Areas after the war. It is reported that legislation is shortly to be introduced to give effect to these proposals. There is little time to lose. Unless the necessary measures are taken before their wartime activity comes to an end, the Areas may well sink back to their pre-war state of chronic depression. The available evidence suggests that not much progress will be possible in the regions until a concrete policy has been formulated at Government level.

Scotland provides an example of an area which is now working at nearly full capacity on war production, which used to contain one of the country's largest Special Areas, and where there is grave concern for the future. Scotland used to be one of the most depressed of the depressed Areas. In 1932, nearly 400,000 workers, or one-third of its insured population, were unemployed. To-day there are less than 20,000 out of work. But Scotland, as was pointed out in an article in *The Economist* on September 25, 1943, was relatively late in the day in securing war production. It had no shadow factories, it missed the first waves of aircraft production, and until the autumn of 1942 was regarded mainly as a useful storage dump. The position has improved since then. Between October, 1942, and February, 1944, the three Supply Departments spent over £10 million on factories and plant; and in the last six months of 1943 they approved 79 new production units or extensions which provided employment for 10,000 workers. But Scotland to-day is afraid that the same delay that was experienced in the first two years of the war may operate to its disadvantage in the process of reconversion from war to peace, and that unless positive measures are taken now it will again "miss the bus." An independent estimate is that the end of the war will find Scotland with some 180,000 unemployed.

Fears have been expressed that the Government's policy of concentrating permanent munitions production in the Development Areas, though it will guarantee employment to a certain number of workers, will mean in practice that other areas, released from war production, will be first in the field in securing peacetime production. There are, it should be said, very few signs that the reconversion to peacetime industry is beginning in Scotland. Many firms are anxious to start on post-war projects. Their war orders are slowing down, and though the programme changes have not affected industry in Scotland to the same extent as in the Midlands, there are already beginnings of redundancy. So far, only experimental work is being allowed and many firms, though they have their own plans for production, complain that they are not allowed to go ahead with them.

Plans there are in plenty. Quite apart from the White Papers which are being produced in Whitehall, Mr Tom Johnston, Secretary of State for Scotland, has appointed a multiplicity of committees and councils to advise him on various aspects of postwar reconstruction. The Scottish Council on Industry—a non-political body which represents industrialists, trade unionists, chambers of commerce and

local authorities—is acting as a focal point for planning activity. It is surveying and reporting on every possible future development; it claims that it was largely responsible for reversing the pre-1942 tendency to "ignore" the north, and for stopping the "export" of Scottish girls to the south, which was regarded in some quarters as a kind of industrial white slave traffic.

There are two aspects of this problem of industrial balance about which there can be no degree of certainty. One is whether the firms which evacuated to Scotland or set up branch factories will remain after the war; the other is what new enterprise can be attracted to the north. Though some firms have not yet made up their minds, it is safe to say that at least 50 per cent of those now in Scotland have decided to stay, though what they will produce and how much employment they will provide is still not known. For example, a well-known southern firm which now employs over 20,000 workers on aeroplane engine production near Glasgow, is likely to stay, but it will hardly employ anything like the same number of workers on peacetime production. The most compelling reason for remaining is said to be the quality of Scottish labour, which has given great satisfaction and in many cases has resulted in a higher output per head than in similar production in England.

The Council on Industry has evidence that many firms from the south are thinking of settling in Scotland after the war. There are, however, many deterrents, some physical and some psychological, some genuine and some illusory. The lack of amenities; the bad housing conditions and the shortage of suitable houses for business executives in industrial towns; the distance from London; the Scottish Sabbath—these are only a few of the factors which business men will take into consideration. The legend of turbulent Scottish labour has largely been disproved by the experience of the war—the time lost through industrial disputes for the whole of Scotland for 1943 was only one-third of a working day per worker per year. A more real deterrent for an industrial area at a distance from the main market is the weight of railway charges—a matter on which the Government will have to pronounce if there is to be an effective location policy. But perhaps the most formidable obstacle is the shortage of suitable factory premises. In a region so largely dependent on heavy industry there are few factories which can be adapted to modern engineering needs, and much war production has been carried on in converted textile mills. The factories built by the Govern-

The BRITISH MUTUAL BANKING COMPANY LIMITED

The Bank provides prompt and individual service for customers in all parts of the country. In addition, it acts as a Registrar for Companies. This service includes the preparation of dividend warrants, etc.

LUDGATE CIRCUS, LONDON, E.C.4

ment during the war cannot fill the gap, because the majority are for explosives or other special products; there are perhaps not more than a dozen suitable modern Government factories which could be turned over to peacetime production. In Dundee, which is Scotland's problem child number one, such new war production as it has is carried on in converted jute mills, but nothing can be done about Dundee unless and until it can offer suitable accommodation to new enterprise.

What is needed, therefore, is sufficient modern factory premises and the extension of trading estates, with standard factories built on speculation or to order, and providing communal facilities and services. At present it is impossible to obtain building materials or building labour to start on these factories, though it is claimed that there is immobile labour in the area which could be utilised. The very few new standard factories, which have already been approved, will help, but far more are needed. It might, of course, be argued that all available resources should be concentrated on meeting housing needs, both from the political and the social standpoints, but it is obviously useless to build houses for people unless they are assured of work. There are very many goods which could as well be manufactured in Scotland as anywhere else: light engineering products, electrical and radio equipment, machine tools, textiles and textile machinery, household goods, clothing and footwear—the list could be continued indefinitely. Housing alone should be able to provide plentiful employment. The present target—500,000 houses in 10-12 years after the war, with 20,000 in the first and 30,000 in the second year after the war—seems miserably inadequate in view of the appalling congestion and slum conditions in Glasgow and Lanark.

Whether the Government's proposals for "steering" new industry to Development Areas and the exercise of a rather negative control over industrial location will suffice to meet the needs, remains to be seen. The experience of financial inducements to industrial settlement during the depression years was not too happy. But compulsory location, except under very exceptional circumstances, would hardly be feasible, so it will be necessary to provide very substantial inducements, in the form of factory buildings and cheap credit, combined with the revision of rail transport charges and the measures that the area can itself take to improve its communications, amenities and services.

But it will not be enough merely to bring new "light" industry to Scotland. Many of these industries will employ mainly female labour and work must be provided for the men, who will not be needed in their present numbers in shipyards, iron and steel works or coal mines. This is one of the main anxieties of the trade unions. The Scottish Trades Union Congress convened a conference in Hamilton last Saturday of trade unions and trades councils in Lanarkshire, which called upon the Government to provide suitable work for male labour. It seems likely that shipbuilding and heavy industry generally will continue to work at high pressure for some years after the end of the war with Germany to meet requirements for the Japanese (mainly

naval) war and the capital rehabilitation of Europe; but there is bound to be some contraction of the war-swollen capacity, especially if the much-needed modernisation and rationalisation of these industries is effected. There is already redundancy in the Lanarkshire iron and steel industry; its long-term prospects depend on how far it can be rendered technically fully efficient and on the stabilisation of the price of coal. In shipbuilding, an important need is for the unions to abandon some of their demarcation practices. As regards coal, the Fife collieries are among the most efficient in the country; while many of the Lanark mines (on which the prosperity of Clydeside was originally based) are nearing exhaustion. The miners' claim that the introduction of a centralised pumping system would release many millions of tons now lying under water is regarded by some authorities as uneconomic. This proposal should be carefully examined, and, if "dewatering" is found to be impracticable, then it is essential that alternative work should be provided in the area, or that the workers should be transferred elsewhere under properly organised schemes, and not allowed to rot in the derelict coalfield. The need is for a long view; Scottish heavy industry cannot be maintained by artificial respiration, and its hope must lie in a concerted effort to improve its technical efficiency and its competitive position.

Scotsmen are inclined to pin their faith on two projects, both of which are of long-term rather than of immediate significance. The first is Prestwick, which has become one of the United Kingdom's major airports in war-time. Scottish Aviation, Limited, has ambitious plans for developing world air services and for constructing an amphibian station, but it is still waiting to know the Government's intentions on civil aviation. Prestwick, together with a scheme which is still very much in the air for developing an international seaport in the Clyde, should help to promote the Scottish tourist trade, which has considerable employment possibilities. The second hopeful factor is the hydro-electric scheme. Eventually it is hoped to develop chemical and electro-metallurgical industries, such as light alloys, fertilisers, synthetic rubber and plastics, all of which depend on cheap and plentiful electric power, but the time-lag may be considerable; it will be perhaps ten or twelve years before such industries can come into full operation.

It would be foolish to be pessimistic about Scotland's industrial prospects. The Scots have many plans, and Scotland is rich in natural resources, many of them still undeveloped. It has two great assets: power and skilled labour. It is true that it contains only five million out of Great Britain's 45 million population, and that it has no right to expect priority over the rest of the country. But Scotland and other Development Areas are entitled to ask for help in working towards the maximum utilisation of their resources of material and men. The Government has announced its principles for the Development Areas. It should lose no time in putting them into practice. Sir Charles Bruce-Gardner, now in charge of Industrial Reconversion, should realise that the Board of Trade's "Make do and mend" policy is all very well for war-time trousers—but it cannot be applied to industrial development.

favour a security with a life of a full decade. So, for a period which the Chancellor fixed as "a few months only," a concession is to be made to this view, and, incidentally, the neglected field of the discount market is to be tapped for the first time in recent years. For the banks immediately, and for the discount market after mid-February next, there is to be a chance to "fund" TDRs, in the case of the former, and Treasury bills, in that of the latter, into genuine "shorts." The present intention is that the Exchequer bonds should not remain on tap for long, and that the total issued should not be very large. The Chancellor said that the Treasury will "in due course revert to an issue of the type of National War Bonds." That does not seem to exclude the possibility of a second issue of Exchequer bonds on terms even more favourable to the borrower than those now announced. But it is reasonable to assume that, after adding real shorts to their portfolio, the banks may be more willing to convert TDRs into medium longs. The "tap" for the old bonds closes on Monday, and the new Exchequer bonds will be on offer from the following day.

Market Reaction

As already indicated, the terms offered for the new 1½ per cent Exchequer bonds fit nicely into the scheme of yields existing before the offer was known. Some sample net redemption yields, grossed up at the full rate of tax, showed 25s. 10d. per cent for National War 1946-48, 30s. for 2½ per cent Conversion 1944-49, and 41s. 7d. for National War 1949-51. It is, therefore, surprising that the immediate effect of the announcement on the market was a stepping-up of all quotations. It is intelligible that there should have been a very slight appreciation in such few real shorts as exist and in the medium longs, since the increase in supply is to be suspended for a period. But there seems no justification for rises of ½ point in 3½ per cent War Loan and of ½ point in Old Consols. Certainly it was not easy to discover any enthusiasm for the terms among bankers. Possibly the marking-up was a precautionary measure, taken by the market in view of the misleading character of some of the first reports of the evening papers. If so, it has already lasted far too long. It is, however, possible that the rise owes as much to the Prime Minister's statement that no election is to be looked for until next autumn. It is a tradition on the exchange that elections are destructive of investors' morale.

While awaiting the final effects of the new issue on prices, the market is already speculating about what security will follow it. In the decade 1945-54 there are compulsory maturities amounting to some £3,700 million, excluding maturities amounting to some £3,700 million, excluding £1,911 million of 3½ per cent War Loan which will almost certainly be dealt with in 1952. On that assumption there are large maturities in every year except 1946. After 1954 there is an optional maturity of some £302½ million of 3 per cent War Loan in 1955 and then nothing of importance until 2½ per cent Funding and 4 per cent Consols in 1957. No claim can be made to forecast the intentions of the Treasury, but if there is a reversion to past policy, of the issue made in the spring of next year, to mature in the spring or early summer of 1956, would fit well into the pattern. When the 1949-51 issue was made in October, 1941, the maximum life was almost nine years and ten months. The corresponding figure for the 1952-54 offer of September, 1943, was 10½ years. The suggested dates would give some 11½ years. Bonds of that life, carrying the usual 2½ per cent and offered at par, would provide the customary stepping-up of the terms against the lender.

Taxing the Foreigner

A point of some interest in the new issue of 1½ per cent Exchequer bonds is the fact that the concession of tax exemption in favour of non-residents in the United Kingdom is not being made. Before the war this exemption was granted in respect of certain stocks, and all the wartime issues of National War Bonds and Savings Bonds have contained a provision exempting non-residents. It is not easy to say exactly what this change portends. If it is merely a recognition of the fact that this issue is, or will very soon be, a genuine "short," it may be that no great harm is done by the change. It is the case that there is no point in encouraging "hot" money which may be switched at any moment from one centre to another as soon as exchange control is relaxed. If, however, it marks a new policy of discouraging the investment of foreign money in this country, that would be another matter and would set a very bad example to any countries which are still disposed to regard Britain as a leader in matters of finance. It is very possible that the short date of the bonds has been the deciding factor, but in the absence of any definite statement on the point it is possible that the wrong conclusions will be drawn, both here and overseas.

The Russian Currency Puzzle

The Russian armies are now fighting on the soil of eight foreign countries, not counting Germany. Four of these countries are Allies: Norway, Poland, Czechoslovakia and Yugoslavia. Three—Finland, Roumania, Bulgaria—are satellites who have already concluded armistice agreements. In all these countries the Russian armies must somehow buy food and other goods, and spend their roubles.

Yet with none of those countries has any currency agreement been concluded so far, or if some agreements have been concluded they have not been announced. In the case of Czechoslovakia it is known that negotiations on currency arrangements have been conducted since early this year. On some points agreement has been reached easily and quickly. Right from the beginning the Russians have accepted the principle that the Czechoslovak Government is to be the only authority entitled to issue banknotes on Czechoslovak territory that militarily comes under the Russian Command. But for many months now the negotiations have turned, without any positive result, on the rate of exchange between the rouble and the new Czechoslovak currency unit that is to be issued. In Roumania and Bulgaria most of the needs of the Russian armies must have been met by requisitioning, but it is hard to believe that no transactions involving the exchange of money have taken place at all. It is possible that the Soviet Government should against all precept and precedent leave the rouble in those countries to find "spontaneously" and freely its own parity in the unfettered interplay of supply and demand. If so, the rouble may well fetch a very high rate of exchange, since the currency of a victorious power is a victorious currency; but it may also largely eliminate the national currencies.

Belgium's Financial Plan

At the end of last week the Belgian Finance Minister, M. Gutt, was able to give a fairly hopeful and reassuring review of the immediate results of the currency conversion and blocking operation. On the eve of the issue of new notes there were about 100,000 million francs of Banque Nationale notes of 100 francs and over in circulation. Of these, 14,000 million francs were immediately exchanged for new notes at the rate of 2,000 francs per head. Since the population of Belgium is just over 7,000,000, it will be seen that every person in Belgium, however poor, somehow managed to mobilise the maximum permissible holding of notes for exchange into new. In addition, 76,000 million francs were declared and credited to temporarily blocked special accounts. This left 10,000 million francs unaccounted for. Part of this probably represents old notes held abroad, and the balance notes lost or destroyed because the holder did not wish to attract the official inquisition which the declaration of such holdings would have invited. Reports of a widespread strike against the Government's note conversion plan which was said to have occurred, especially among the peasants, are thus seen to have been without foundation. M. Gutt announced that from November 17th people in Belgium will be allowed to draw 3,000 francs per head from blocked bank deposits, as well as from the special accounts created by the deposit of old bank notes. This is the first of the promised releases of blocked currency and bank deposits. It accompanies a definite easing of the supply position in Belgium, and thus conforms to the original plan of the Government, which, after the first drastic compression of the currency, was to allow a gradual expansion as the supply of foodstuffs and other consumer goods increased. Every indication goes to suggest that the bold currency schemes of the Belgian Government are going according to plan.

Greek Currency Crisis

In dealing with the problems of Greek liberation, the Allies are giving deserved priority to the currency question. In his review of British relations with the Allied nations,

The New Issue

Sir John Anderson's announcement in the House on Tuesday that the Government proposes to suspend the issue of 2½ per cent National War Bonds, 1952-54, which have been on offer for 14 months, caused no surprise. The issue amounts to about £690 million, and both from the standpoint of securing a convenient size of maturity, and from that of the investor, who has a very limited market for the bonds so long as they are on tap, a change was fully due. The decision to issue instead 1½ per cent Exchequer bonds at par marks, however, a new departure. In view of the maturity date, February 15, 1950, the terms offered fit very closely into the existing rate structure. There is a slight stepping up of the terms against the lender, but it is no greater than is usual in the field where the demand of the institutional investor is the deciding factor. What is interesting is the acknowledgment by the Treasury of the undoubted fact that, as the war wears to its conclusion, industry and, presumably, the banks, are less inclined to view with

Head Office:
LIVERPOOL LONDON
North John St. Lombard St.

Mr Churchill last week pledged British help in the task of stabilising the Greek currency, "which has been a special mark of sabotage by the Germans," and announced that highly competent officials from the Treasury were on their way to Athens. The experts, headed by Sir David Waley, have arrived. Their immediate problem is to determine whether anything can be salvaged from the existing drachma currency and to devise appropriate conditions for launching the new circulation which has been prepared to take the place of the old. The conditions that face the experts are wholly chaotic. It is true that a statement by the Minister of Finance last week that "the drachma had not become entirely worthless" was followed by an appreciation of the exchange rate from 1,865 milliard to 655 milliard drachmae to the pound, but these rates are becoming increasingly meaningless. The primary task of the authorities is to keep some monetary system functioning until a sufficient stock of consumer goods has been accumulated to give the launching of the new currency a reasonably propitious start. To meet the immediate requirements for currency, further issues of old drachma notes are inevitable. Long before an inflation has reached the stage at present prevailing in Greece it acquires an irresistible momentum which cannot be repelled unless the whole economic life of the country is thrown on to a barter basis. This cannot be allowed to happen in a community that has reached the stage where certain individuals have merely their services to offer. In order to pay the salaries of bank clerks and other urban vicious circle of inflation by introducing a certain amount essential. Some attempts have been made to break the vicious circle of inflation by introducing a certain amount of gold currency from the Middle East, but existing conditions in Greece have rendered the country a sponge for bullion and the coins have immediately disappeared from circulation. As soon as supplies of foodstuffs and other materials have been built up, the position should be ripe for a drastic monetary conversion in which the existing drachma is unlikely to meet a better fate than that of the German currency in 1923 when one million million marks were made equal to one new mark and the old currency, together with all debts expressed in it, was in effect wiped out.

Crude and Synthetic Rubber

The United States, British and Dutch Governments have recently considered the means by which crude rubber supplies found in Eastern producing countries after their re-occupation can be speedily accumulated and shipped to war factories in this country and the United States. Practical arrangements, which include the accumulation of equipment behind the front line for rubber planters, are understood to have been concluded, and will be kept under review by the three Governments to ensure the best possible results. Two American statements, published last month by the Foreign Economic Administration and the Petroleum Administration for War, indicate that the United Nations' supply position of aviation petrol and synthetic rubber has reached a new stage. Their production is no longer hampered by competition for the same basic materials. United States' production has for some time filled the domestic demand for synthetic rubber and is this year supplying 86,000 tons to this country, as well as a substantial quantity of finished tyres. The larger production of 100 octane aviation petrol allows for the accumulation of working stocks. The importance of these improvements cannot be overestimated. Nevertheless, the report of the FEA is a reminder that the natural rubber supply position has become more critical. Despite progress in the manufacturing practice of synthetic rubber and the reduction in the quantity of natural rubber needed for admixture, the present average ratio between crude and synthetic rubber consumption is still about one to four. The amount of crude rubber needed in the United States this year will be at least 200,000 tons. This means that crude rubber stocks, which early this year were down to a bare working

minimum, will be considerably further reduced. The tyre supply position will therefore remain critical until the re-opening of at least part of the rich Far Eastern sources of natural rubber.

Skilled Engineers in the Transition

Serious disagreement has arisen between the Amalgamated Engineering Union and the Minister of Labour about the re-allocation of engineering labour in the immediate postwar period. The union and the employers reached agreement a few months ago to the effect that where there was redundancy of labour in engineering factories, the principle of "last in, first out" should apply, and that dilutees should be discharged before skilled men. Mr Bevin, however, stated in the House of Commons, on October 11th, that skilled men were needed in key reconstruction work, and should be the first to be transferred. The union, in a bellicose statement issued last week, has thrown the ball back to the Minister, by insisting that voluntary industrial agreements should be honoured—a principle on which Mr Bevin has frequently expressed himself very strongly. The AEU accuses the Minister of "distorting the facts" in stating that it asked for the retention of skilled men and the discharge of dilutees. The point made by the union is that workers who are discharged will be deprived of the protection afforded by wartime legislation, such as the guaranteed weekly wage under the Essential Work Orders. It asks that instead of a discharged worker receiving the 24s. a week unemployment benefit which is now allowed, workers who become redundant should not be treated as unemployed, but as "temporarily displaced," and receive the guaranteed working wage. Further discussions between the union and Mr Bevin will take place in the near future, which it is hoped will clear up the issue. It is, however, difficult to treat the engineers' case in isolation, especially before the general plan for reallocation of civilian labour is announced or the future of the Essential Work Order is decided. The union's anxiety, remembering the last post-war slump, to protect its members is very understandable. At the same time, it is obviously in the interest of the AEU that its skilled men should be placed in key reconstruction jobs rather than in the diminishing war sectors, and it would be foolish to stick out for principle, when principle is opposed to practical needs. The answer lies clearly in the adoption of a programme for industrial reconversion, which would give the engineers an assurance that, as soon as practicable and as rapidly as possible, skilled men would be reabsorbed into peacetime production.

A Better Tone

The general level of industrial equities showed only minor fluctuations during the month of October. The "bulls" confidently suggest that prices are "bumping along the bottom." The index of *The Financial News*, of which a chart appears on page 620, shows a rise of one per cent on the month, and the optimistic view is encouraged by the fact that since last Saturday, the point up to which these figures are carried, there has been a further improvement of similar extent. It is difficult to discover any logic behind the movement at the moment, but it undoubtedly owes something both to the clear indication that an election is not imminent and to the continuous appreciation in fixed interest securities. This has been in progress, with few halts, since early August, and, although it still amounts to less than one per cent, against a 5 per cent net fall in equities over that period, it has an appreciable influence. The past few days have seen some expansion in turnover, but there is as yet no clear indication that any major movement is in sight. Outside the industrial list there have been opportunities for considerable speculation both in foreign bonds and in rubber plantation shares. At the moment the leaders in the former field, Brazilian bonds, still suffer from lack of sinking fund buying, but there is some sporadic speculation for a rise. Meanwhile, a rather premature boomlet in plantation shares has been followed by a moderately sharp reaction which coincided, oddly enough, with the statement of international agreement to ensure collection of any rubber available in liberated territories.

Safety in Mines

The 22nd report of the Safety in Mines Research Board shows that good progress has been made in the past year with research into methods of accident prevention. The report covers research into coal dust explosions, fire damp explosions, new methods of using electrical apparatus, conditions of gas ignition by mining explosives, falls of the ground and methods of roof support and roof control, improved haulage and wire rope systems. The Board is an independent body, financed largely by grants from the Miners' Welfare Commission. Its work is of exceptional importance, both from the immediate point of view of reducing loss of tonnage through accidents and extending mechanisation without increasing risks, and from the long-term point of view of rendering the industry safer and more attractive to new entrants. Its expenditure of £65,000 a year on research into safety seems very inadequate, and it seems essential that the Board's work should be extended and, equally, that its findings should be translated into practice and passed on to miners in their safety instruction. The general toll of mining accidents has been steadily rising. The death and injury rate per 1,000 workers employed increased from 165 in 1938 to 229 in 1942, and many of these accidents were due to falls of ground. It is, however, encouraging to find by contrast from a report of the Northumberland Falls of Ground Advisory Committee that in that county accidents due to this cause were the lowest on record in 1943, with 15 deaths—nine less than in 1941—and 42 non-fatal accidents. Northumberland's death rate was 2.23 deaths per million tons of saleable coal in 1941 and last year was only 1.41, appreciably lower than the rate for Britain as a whole. Further improvements were recorded in the first six months of 1944. The improved position is attributed to higher standards of roof control in general, better support of roadheads and more careful attention to safety by managements and miners.

Scottish Coal Output

While it is somewhat invidious to single out any particular coal-producing area as particularly responsible for the general decline in coal output, there seems to be little doubt that the Scottish coalfield is one of the blackest spots at the present time. According to Lord Traprain, Regional Fuel Controller for Scotland, output is going down at the rate of 20-30,000 tons a week, and stocks of house coal are about half as much as at this time last year. Scotland is now importing coal from the North of England to meet the deficit, but with the reduced allocations of house coal and coke allowed to domestic users during the coming three months, and the continued demands of coal for the war fronts, the future outlook is very gloomy. Lord Traprain considers that increased absenteeism and unofficial strikes are mainly responsible for the present state of affairs. A very important factor, which largely accounts for the bad attendance, and to which insufficient attention has been paid, is the shortage of consumable goods in mining towns and villages. Though miners now have more money to spend, they have little on which to spend it and consequently less incentive to increase their output, while the savings habit has nowhere been adopted. This is true of nearly every coal-producing area. Scotland's absenteeism has increased by about the same rate as that of the country as a whole, that is by about 25 per cent since the conclusion of the wages agreement last April, but the loss of coal through unofficial disputes, contrary to the union's advice, is above the national average. In fact, in September, 1944, Scotland was responsible for nearly half the nation's total tonnage (60,000 tons) lost through strikes. The majority of these disputes have been in Lanarkshire, where there is some evidence of activity on the part of irresponsible elements among the miners. It is significant that output per man-shift at the coal-face has actually increased in Scotland compared with a decline in the country as a whole. But, as a result of fewer man-shifts being worked, output per face worker has declined. It was 12.38 tons per week in September, 1944, compared with 12.71 in September, 1943. Absenteeism and strikes are, of course, not the whole story, and they do not apply with equal strength in all parts of the Scottish coalfield. There is room for increased mechanisation, especially in the process of coal conveying, and the structure of the industry, particularly in Lanarkshire, which is the largest of the three

Scottish coalfields, is in great need of technical re-organisation.

Gold Sales in India

The underlying weakness of bullion prices in the Bombay market has been accentuated in the last few days by the increase in the Reserve Bank of India's sales of gold and silver. The daily offerings on official account have been raised from 30,000 to 50,000 tolas in the case of gold and from 100 to 200 bars of silver. Bullion prices were already sagging when on Tuesday of this week the news of increased offerings caused the gold quotation to fall from Rs 64/8 to Rs 62/8 per tola while that for silver followed from Rs 119/4 to Rs 116 per 100 tolas. These quotations compare with this year's highest prices of Rs 76/15 and Rs 143, respectively, which were reached towards the end of last April when the Japanese invasion of Manipur State led to a heavy hoarding demand for the precious metals. The severity of the drop is in large measure explained by the happier turn of the war news, which conjures up visions of a return to freer international movements of gold and silver and, therefore, of reasonably integrated bullion prices in all the principal markets of the world. The downward movement of prices has also been helped by official sales of both gold and silver. These have been canalised through the Reserve Bank, but are made on British and American Government account. They serve the dual purpose of mopping up the inflation of rupee notes and of providing the British and American Governments with the rupees they require for their large expenditure in India. It has been suggested that the larger offerings by the Reserve Bank are intended to keep pace with the continued increase in that expenditure.

Money and the New Loan

There was some surprise in money market quarters that for the past week, which would normally have seen heavy Government disbursements, floating debt borrowing should have been kept down to such small dimensions. Apart from the £10,000,000 excess of Treasury bill payments over maturities, Treasury Deposit Receipt payments of £60,000,000 called for only £2,000,000 of new money. It is true that expectations of abundant money were completely contradicted on Tuesday, the last day of October, but the shortage of credit on that day, which called for considerable special assistance to the market, was largely due to the fact that Barclays Bank, whose monthly calling normally affects the market to a considerable extent, was making up for its October return. By Wednesday the position in the money market was exceptionally comfortable. The true reason for the Treasury's small floating debt borrowing became apparent with the news of the imminent closing of the National War Bonds tap. This was bound to lead to a rush of last-minute applications for these 2½ per cent securities, and, in fact, this factor began to affect credit conditions by the latter part of the week. Fortunately these subscriptions could in no circumstances become a really serious drain on the volume of bank cash

since the banks would, on the threat of such a development, finance their clients' subscriptions to War Bonds by pre-encashing TDR's. Such pre-encashments have probably been made on a fairly large scale and will have helped to balance the bank cash position during a week of exceptionally heavy monetary turnover.

Texas Land Dispute

A considerable volume of evidence exists to support the suggestion that, since the early spring of this year, a struggle has been in progress for the control of the Texas Land and Mortgage Company. The business of the company has for long been the lending of money on mortgage in Texas and the holding of securities of an investment trust character. For a substantial period the loan business went badly and large amounts of real estate fell into the hands of the company. Over recent years it has been possible to sell this land and invest the proceeds in London. By March 31st of last year, the latest date for which figures are available, this movement has gone so far that real estate stood in the balance sheet at £30,000 odd and investments at some £813,000. The position had been made clear in the statements of the chairman from year to year, and there seems no reason to suppose that the proprietors were dissatisfied with it. The issued share capital of the company consists of 66,000 shares of £10 each, on which only 50s. per share is paid up. The fact that they are partly paid gives the board power to refuse transfer of shares, and this power they used until a point was reached where numbers of sellers raised considerable protests. The board had the right, and the duty, to satisfy themselves that the new buyers were sufficiently solid to find the money for the call of £7 10s. per share which they can make, and it is understood that there was no difficulty under this head. It appears, however, that they sought to make the registration of transfers contingent upon the transferee giving an undertaking to retain the existing board in office. In these circumstances, a group of shareholders has decided to attempt to secure representation on the board and to put through a scheme of reconstruction which would, *inter alia*, eliminate the uncalled liability.

Whatever the reason for which it was sought to purchase control, there would seem to be no legal objection to such action. Too often in such circumstances the financial facts are not disclosed, but in this case the accounts are reasonably informative. Proprietors who sold did so with a fair knowledge of the financial position. But there remained the trouble that the proprietors could have no idea that an attempt was being made to obtain control of their undertaking, since the buying was done in the name of nominees. For the same reason, the existing management was unable to give chapter and verse for any movement which they considered might be in progress. Clearly this is a case where an obligation to disclose beneficial ownership would have brought the whole matter into the open in a way which is still impossible. As to the appropriate action for the existing proprietors, it is clearly in their interest to eliminate the uncalled liability. They are at present receiving 5 per cent free of tax from properties, mainly stock exchange securities, which have a break-up value, according to the 1943 accounts, of just under £6 for each

share of 50s. Since the concern has for long been run in part as an investment trust there is no obvious reason to distrust the existing board's ability to run it entirely as such. The points which the shareholders ought to bear in mind are whether continuance or liquidation is desired, and, if the former, whether there is any reason to support a change in management. This question cannot be answered satisfactorily without an exact knowledge of true earnings.

Murex Declining Profits

The profits of Murex, which fell by £110,000 last year, have gone down by a further £75,000 for the year ending June 30, 1944, to £443,000. Taxation, however, requires £120,000 less, partly due to the recovery of £40,000 over-provision for the last three years. Earned for ordinary works out at 27.3, against 33.2 per cent, the lowest, except for 1939, for the last twelve years. The 20 per cent dividend, which has been paid regularly since 1936, is still adequately covered. The accounts are analysed in full on page 617. Clearly there has been a considerable falling off of wartime activity, and according to the chairman, Mr George Joseph, demand has slackened for certain of the company's main products. One of these is magnesium, manufactured by one of Murex's two wholly-owned subsidiaries, which has now ceased work. Since the post-war market for this product is unpromising, and surplus capacity large, the works in question may close down permanently, and the investment be written off out of reserves created for that purpose. On the other hand, the great wartime strides made in the application of electric welding should lead to increased postwar activity on the part of the other wholly-owned subsidiary, Murex Welding Processes. The parent company has developed a number of new departments for different types of metal production during the war, although sustained demand for their products cannot be guaranteed. Mr Joseph rightly stresses the need of modernising plant, towards which an obsolescence reserve of £350,000 has now been created. An encouraging factor is the increased strength of net liquid assets, which are now over £750,000. Ordinary capital is £1,000,000, of which £730,000 was created as a capital bonus in 1935 and 1937. Murex will have to plan a full and efficient deployment of its strong reserves if there is to be any hope of such windfalls in the post-war world.

Packing for the Tropics

The provisioning of armies operating in the tropics involves methods very different from those in more temperate climates. In packing and transportation, the greater distance of the battlefields, the climate—hot, humid and wet, the terrain—mud and jungle, and the insects all have to be reckoned with. Unless adequate protection is provided, metals corrode, paper disintegrates, textiles rot and glass deteriorates. Even when the distances were shorter and climatic conditions less severe, during the Tunisian campaign for example, stores were often wasted by insufficient and inefficient packaging. If it was difficult to achieve wasteproof packing for temperate zones and relatively short distances, it is much more difficult to pack for the Far East. An Anglo-American Services Exhibition on Preserving and Packing has been arranged at the Central Ordnance

Depot, Feltham, so that manufacturers and others concerned may see the latest methods of "tropic proofing," worked out from information received from the war fronts and on the results of research in Britain and America. The importance of efficient packaging cannot be too strongly stressed. Without it the effort of making munitions is unstressed, and the hardships endured by the troops are increased unnecessarily. Hitherto the main burden of preserving, labelling and packing war material has fallen on the Services themselves. The policy now is to get manufacturers to do as much of the packing as possible, but the shortage of suitable labour is almost as great an obstacle in the factories as it was in the Services. The aim of the exhibition is to inform the manufacturers of the technical progress made by Service packing units, and to encourage them to put the object-lesson into practice. Before the war it was usual for the manufacturer to pack his products for shipment, and this will be necessary after the war. The Services' research will be useful in this context, despite the smaller peacetime strain on transport and storage. The packaging of warlike stores has to be done in a "retail" fashion, and spares packed in quantities sufficient for the requirements of small units; after the war "wholesale" packaging will be good enough. Nevertheless it is essential that manufacturers should learn to pack war supplies to meet Service requirements.

After Utility Furniture

Following representations by the Post-War Reconstruction Committee of the furniture industry, the President of the Board of Trade has decided to appoint a Furniture Production Committee to advise him on questions relating to the manufacture of an abundant supply of domestic furniture at reasonable prices. Its terms of reference are wide. Essentially, they cover the provision of furniture in the transition period, which means the gap between utility production, with all its restrictions of materials, design and distribution, and full peacetime freedom for manufacturers and consumers. Prices of secondhand furniture show that it is not possible to pass from one period to the other without a gradual relaxation of control. Utility furniture has done its wartime job well, but it is only temporary furniture. The new Committee can point the way towards furniture of more lasting quality and more varied design, but still at reasonable prices. It will not presumably be hampered as the designers of utility furniture were hampered, by quite such severe restrictions on materials, and designs will consequently be correspondingly more varied. It is to be hoped that the Committee will be able to investigate the possibilities of new materials and methods of construction discovered during the war. The Report of the Furniture Industry Post-War Reconstruction Committee, which has been in the hands of the President of the Board of Trade for ten months (it was reviewed in *The Economist* of March 18, 1944, page 380), will provide the Committee with a basis for their discussions on the relaxation of control.

The Post-war Biscuit

The Cake and Biscuit Manufacturers' War Time Alliance has published a Report on the Post-war Rehabilitation of the Biscuit Industry. Biscuit production has been cut to one-third, and the labour force in proportion. There has been control over variety, materials, packing and prices, and biscuits have been zoned and rationed. The report envisages three stages in the return to peacetime production, the first covering six months, the second a year and the third two years after the end of the war in Europe. There appear to be no special difficulties attending the return to full production, provided factory space, materials and labour become available, and controls are relaxed. The restoration of factory space is of first importance. Enough machinery exists, and no major replacements are required in the early stages. Apart from a few key workers, most of the labour employed in biscuit production is unskilled, which leads the industry to suggest that it could provide a useful outlet for labour in the transitional period when some unemployment is inevitable. The industry is in a fortunate position compared with many others whose wartime products are radically different from those of peace. There is no problem of re-tooling to be solved, and new products do not have to be found. So far as the export trade is concerned, competition is likely to be less keen than in many other industries; the report claims—not without pride—that "Britain has been acknowledged as the maker of the best

biscuits in the world." Good biscuits depend on the use of the right kind of flour, and British-grown wheat is especially suitable. While the industry is anxious to resume its export trade at the earliest moment, it quite rightly expresses the view that it would be detrimental in the long run to begin until quality can be raised to pre-war standards. To avoid unnecessary delay, an allocation of materials specially for the export market is recommended. The report is in the hands of the Ministry of Food. Last month, when the Minister of Food spoke to the Alliance, he said that Army and welfare requirements were dropping off, and that he had authorised an extra allowance of biscuits for civilians, which would not only increase supplies but would make for more variety.

G.E.C. *In war or peace—at the service of the Empire*

The design and construction of plant and equipment for the speedy handling of bulk materials were early activities of the G.E.C., the largest British electrical manufacturing organization in the Empire. Materials handling schemes have developed in size and importance as the need for more efficient equipment for industry has increased through the years, and the Company's installations, handling up to 2,000 tons an hour, can be seen in mines, collieries, electric power stations, gas works, steel works, factories, docks and harbours, etc., in all parts of the world. The long experience of the G.E.C. in this specialized branch of engineering has been of the greatest value to the Nation during the war. In designing equipment for the many individual requirements of war industries, the Company's knowledge has still further been enriched, and after hostilities the resources of the G.E.C., which during the last few years have been available only for the war effort, will once again be at the disposal of all concerned with material handling problems in any part of the world.

Electrification Schemes

G.E.C. Electrification Schemes have been applied to all industries, including: Aircraft Factories; Chemical Works; Collieries; Food Factories; Gold Mines; Iron, Steel and Copper Works; Motor Car Works; Oil Refineries; Ships and Shipyards; Textile Mills, etc.

G.E.C.—always in the forefront of electrical progress

UNITED DAIRIES, LIMITED

INCREASED PROFITS

QUALITY OF PRODUCTS MAINTAINED

MR L. MAGGS'S STATEMENT

The twenty-ninth ordinary general meeting of United Dairies, Limited, was held, on the 27th ultimo, at the Connaught Rooms, Great Queen Street, W.C. Mr Leonard Maggs (chairman and manager director) presided.

The Chairman, in opening the proceedings, said: Ladies and gentlemen,—I regret that I have to apologise for the absence of my brother, Mr Joseph Maggs, who has been seriously indisposed. This is the first annual general meeting since the company was formed which he has missed, but I am very pleased to say that he is definitely making good progress.

The Secretary (Mr Allan Mair, C.A.) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement which was circulated with the report:

The deaths of Mr A. Gordon Raymond and Mr John W. Rigby, referred to in the report, are deeply regretted by their colleagues. Both were primarily associated with the management of our retail business in London, Mr Raymond having relinquished his manager directorship in June, 1940, and Mr Rigby having retired from active management in December, 1942.

The accounts do not call for much comment. The liquid assets, including Government securities £1,349,188 and tax reserve certificates £1,553,400, show an increase on last year, and a considerable increase compared with pre-war days. Under war conditions, with the Minister of Food acquiring our manufactured products on production, the general curtailment of credit allowed, and the restrictions limiting re-equipment and repairs, the operating companies do not need the same amount of working capital, and the increase in liquid assets is to a great extent reflected in the reduced amounts owing by subsidiary companies. Undoubtedly when the war is over, and we are freed from Government control, very large sums will be needed for re-equipment and for working capital, including the financing of stocks.

The profits of the group are slightly higher than last year, but the same conservative policy has been adopted as in previous war years, and only sufficient revenue has been brought in from subsidiary companies to maintain dividends as previously. The reserve for deferred repairs has been increased, and provision has been made in the accounts for the estimated liability for all taxation, including taxation on the profits under review.

TRIBUTE TO FOOD MINISTER

Naturally with every year of war things have become more difficult. The shortage of all equipment and materials has become more acute, and there has been an increasing depletion of our trained staff. To add to our difficulties, during recent months we have had to contend with the menace of flying bombs, which have caused considerable and widespread damage to our properties in the London area, and a reduction of trade as a result of evacuation, though I feel sure that this latter will revive when the population of London returns, as was our experience during the lull following the blitz period of 1940-41. The conduct of our London staffs in all departments during this very trying time

has been beyond praise. Colonel Llewellyn, the Minister of Food, recently paid a very welcome visit to one of our South London processing depots, and in addressing the staff expressed appreciation of the way workers in the milk trade generally had carried on with their duties. Despite all these difficulties we have striven to maintain the quality of our milk and products at the high pre-war standards, though it has been impossible to continue to give the same standard of service as in normal times.

As I predicted last year, realisation of the desirable measures taken by the Minister of Food to improve the quality of the nation's milk supply has been hampered by the difficulty of securing the necessary machinery and equipment, but undoubtedly progress, although slow, is being made along the right lines.

During the war years dairy farmers have responded wonderfully to the Government's appeal to keep up the production of milk. The present milk production is actually in excess of what it was before the war, but the liquid consumption has increased to an even greater extent, with the result that the quantity available for manufacture is less.

EFFICIENCY OF RAILWAY TRANSPORT

The milk industry is very dependent on the railways, and despite the strain which must have been placed upon them by war-time traffic, particularly during the invasion period, I feel they are to be congratulated on the efficient way in which they have handled the traffic in this highly perishable commodity.

Since my last statement to you we have acquired two more country creameries, at Wrexham (Denbighshire) and at Dunchurch (Warwickshire). We have also acquired wholesale and retail milk businesses in the Cardiff area of South Wales, which it is our intention to develop on similar lines to our milk business in London, though we are hampered in making rapid progress by the difficulty of securing the very necessary equipment.

I am glad to say that we have been able to assist in connection with the latest marvel of medical science, Penicillin, by supplying one of the constituents used in the manufacture thereof.

Our engineering and utensil companies are still required to devote much of their productive capacity to essential government work, with the result that they are unable, with their depleted staffs, to satisfy fully the demands of the dairy industry.

Our laboratory and scientific departments have maintained their rigid control on the quality of our milk and milk products, and carried on with their researches despite their dwindling staffs.

I should like to pay tribute to the splendid service rendered by all members of the staff under most trying and difficult conditions, and to express the hope that the 5,121 members away with the Services may soon be back with us.

The report and accounts were unanimously adopted.

The auditors (Messrs Peat, Marwick, Mitchell and Co.) were reappointed, and a hearty vote of thanks to the chairman, directors, management and staff concluded the proceedings.

THE UNITED STEEL COMPANIES, LIMITED

HIGH LEVEL OF PRODUCTION

SIR WALTER BENTON JONES'S STATEMENT

The annual general meeting of the United Steel Companies, Limited, was held, on the 1st instant, at the Iron and Steel Institute, Grosvenor Gardens, London, S.W., Sir Walter Benton Jones, Bt. (chairman and managing director) presiding.

The secretary (Mr R. Gresham Cooke) read the notice convening the meeting and the report of the auditors.

The chairman said:—Gentlemen, before proceeding with the business of the meeting there is a personal matter to which I wish to refer. Since my statement was made—in fact only on Friday of last week—we have suffered a severe loss in the death of Dr Thomas Fwinden, our director of research. Dr Fwinden was the foremost metallurgist in this country and his reputation was world wide. He was a great scientist and a man of great experience and capacity, but what we feel more at present is a loss of a colleague of long standing, whose patience and sympathetic and genial personality made everyone his friend.

The following is the statement by the chairman which had been circulated with the report and accounts and was taken as read:—

The form of the balance sheet has been rearranged so as to show capital, reserves, liabilities, and assets in a more orderly form. As usual, a statement of combined assets and liabilities of the company and its subsidiary companies is included.

The balances of profit for the last three consecutive years are stated in the directors' report. The variation in results from year to year may be taken to be due more to the intricacies of assessing war-time taxation than to any other factor.

Production has again been maintained at a high level for which we have to thank our operatives as well as our staff.

TRIBUTE TO STAFF

Continuous working at high pressure and under conditions which require even more attention than in normal times leaves a little opportunity for relaxation and puts a great strain on the staff. On behalf of the shareholders I take this opportunity of conveying to them our special gratitude.

With regard to the future, post-war conditions are likely to require the production of our raw materials and primary products, coal, coke, sulphate of ammonia, basic slag, benzol, and tar derivatives, iron ore and pig iron, at a maximum rate, as well as heavy finished steel products for buildings, railways, road vehicles and shipbuilding. It is hoped that the demand for our lighter products may also be well maintained.

Programmes for overtaking such normal replacements of plant as have not been permitted in war-time, and also post-war developments for a number of years, have been prepared for all the branches and will be proceeded with as and when we may be allowed to undertake them.

The report and accounts were unanimously adopted and the proposed final dividend at the rate of 5½ per cent. less tax, making 8 per cent less tax for the year, was approved.

The retiring directors, Mr. J. Ivan Spens, Sir Herbert Walker, Mr Richard F. Summers, and Mr Gerald Steel, were re-elected; and the auditors, Messrs. Peat, Marwick, Mitchell & Co., having been re-appointed, the proceedings terminated with a vote of thanks to the chairman and directors, and to the management and staff.

ZINC CORPORATION, LIMITED

INCREASED PROFIT

MR J. R. GOVETT ON RECAPITALISATION

The thirty-third ordinary general meeting of the Zinc Corporation, Limited, was held, on the 26th ultimo, in London, Mr John R. Govett (the chairman), presiding.

The following are extracts from the chairman's statement, which has been circulated with the report and accounts:—

The net profit for the year, namely, £103,716, shows but little change from that of the preceding year.

Provision for taxation has again called for a large amount, namely, £228,930. It will be realised that such provision can only be based on estimates; however, earlier provisions have proved sufficient to date to meet the corresponding liabilities and I trust that this year's provision will prove no different in this respect. Realising as we must do the necessity of meeting as much of the cost of the war as is possible from current income, this heavy taxation is paid ungrudgingly. I am, however, entitled to emphasise two points, namely, the heavy strain it imposes on our liquid resources and the fact that our revenue which is subjected to taxation is in the main received from the mining and treatment of the ore in our mine—in other words, our capital. We carry on in the hope that some relief from both these factors may soon be given to us.

It is interesting to note that in the four years ending December 31, 1943, we have provided for taxation and royalty a total of no less than £1,000,000 sterling, or £1,250,000 Australian.

RECAPITALISATION ARRANGEMENTS

I regret that it has still not been possible to complete arrangements whereby the scheme of recapitalisation could have been put before you to-day for your approval. Various changes have had to be made in the original proposals, to which I referred last year. In its modified form I am glad to say it has received the approval of the Association of Investment Trusts, who will be prepared in due course to recommend it to their members for acceptance.

As soon as approval is received from the authorities to whom it has now been submitted, special meetings of shareholders will be called to consider, and if thought fit to approve, the proposals. The delay has been great, but such matters are not easy to arrange in time of war.

TONNAGE TREATED

As a result of the continued shortage of manpower, the tonnage treated during the year showed a reduction of rather over 80,000 tons, the deficiency being to some extent counterbalanced by an improvement in the grade of ore. Notwithstanding the decline in output, it should be recorded that considering we are in the sixth year of war, that we lost many men for war service and that practically no new labour has been or could be expected to be available, we have preserved a relatively excellent production and efficiency record in all our operations. To meet the demands of the war, we have had to sacrifice normal exploration and development work to the requirements of production. We have now arrived at the time when special efforts must be made to make up the leeway in

exploration and development and this may, for a time, prevent the expansion in our output which we had hoped to achieve in 1945.

Our ore reserves remain at just under 4 million tons; but for the effect of our response to the urgent demands for production they would have been substantially greater.

Your property and the mine are in excellent shape, and everything is being done to make living conditions of our employees at Broken Hill second to none in Australia.

The report and accounts were unanimously adopted.

CABLES INVESTMENT TRUST, LIMITED

The ninth ordinary general meeting of Cables Investment Trust, Limited, was held, on the 26th ultimo, in London.

Sir Edward Wilshaw, KCMG, who presided, said: The improvement in the value of the company's investments which was reported at the last meeting has been sustained in the period under review.

The profits on sales of investments and discount on debenture stock purchased during the year amounted to £66,395, which raises the capital reserve to £378,230. This figure, added to the carry-forward of £258,150, makes a substantial total reserve of £636,380, which your directors consider to be not unsatisfactory.

The report and accounts were unanimously adopted, and a final dividend of 3 per cent., making 5 per cent. for the year, was approved.

ALLIED INDUSTRIAL SERVICES, LIMITED

PRODUCTION MAINTAINED

The tenth annual general meeting of Allied Industrial Services, Limited, was held, on the 27th ultimo, at Bradford, Mr W. H. Rhodes (the chairman) presiding.

The following is an extract from the chairman's speech circulated with the accounts: Whilst the trading results for the year under review show that the total production of the company's factories—including those additional units which commenced operations since the outbreak of war—has been maintained, the profits for the year show a slight decrease attributable in the main to those difficulties inescapably associated in the fifth year of the war with the maintenance of adequate supplies to our customers, so many of whom are engaged on work of vital importance.

After making proper provision for depreciation of the company's properties, plant, etc., the trading profit for the year amounts to £228,327, of which £161,500 has been absorbed to meet taxation and £25,000 placed to general reserve. The balance of profit, namely £41,827, together with the amount carried forward from last year of £13,774, make a total of £55,601 available for allocation, as set forth in the accompanying report, to which your approval is sought.

Whilst I am able to report that so far during the present year our factories have been well engaged, your directors in reviewing the prospects for this year are fully aware that the hoped-for early Allied

victory in Europe and cessation of hostilities there will create for a time a period of transition, and that this change-over can undoubtedly bring with it a certain amount of trading difficulties and probably some measure of dislocation.

The report was adopted.

NEW BROKEN HILL CONSOLIDATED, LIMITED

The eighth ordinary general meeting of New Broken Hill Consolidated, Limited, was held, on the 25th ultimo, in London, Mr John R. Govett (the chairman) presiding.

The following is an extract from the chairman's statement, which has been circulated with the report and accounts:—

Further diamond drilling has been done from the Nos. 16 and 18 levels. Borehole No. 50 intersected 86½ ft. of about average-grade ore, a true width of approximately 70 ft. (namely, 13 per cent. lead, 2.9 oz. silver, 11.9 per cent. zinc) and No. 53 intersected sections with many high values, suggesting a substantial tonnage of good-grade ore. We consider that the results from borehole No. 50 may be accepted as confirming the extension of the Zinc Corporation lead lode on the 18th level to at least 1,000 ft. into our leases.

The report and accounts were unanimously adopted.

NEEPSSEND STEEL AND TOOL CORPORATION, LIMITED

MR STUART C. GOODWIN'S REVIEW

Mr Stuart C. Goodwin, J.P., chairman of directors, presided at the 24th annual general meeting of the Neepsend Steel & Tool Corporation, Limited, held at the registered office, Neepsend, Sheffield, on October 26th. In his statement he said the directors considered the results satisfactory and have confidence in the prospects of the company and its subsidiaries in the post-war period.

On the assets side of the balance sheet sundry investments at £370,901 represented an increase of £26,474 due to additional investments, less certain redemptions. The market value of their securities had improved over that of last year and the present depreciation reserve of £38,493 covered their small fall in value several times over. Cash at bank and in hand stood at £47,973, which together with £28,813 in the bank and cash accounts of their subsidiary companies made a total of £76,786, which the directors considered sufficient for current requirements.

On the liabilities side the sums owing on current account to certain of their subsidiaries by the Corporation amounted to £176,805, whilst the sums owing on current account to the Corporation by other of their subsidiaries amounted to £113,094. This left a net amount of £63,711 of subsidiary companies' monies held by the parent company, a decrease of £100,186.

Net revenue after deduction of taxation was £109,702, compared with £108,216, an increase of £1,486. The general reserve receives £20,000, making that fund £110,000, and a further £5,000 is transferred to contingencies reserve. It was not considered necessary to increase the £150,000 which had already been provided towards the anticipated E.P.T. liability of the subsidiary companies.

MONEY RATES, LONDON.—The following rates remained unchanged between October 26th and November 2nd:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 4-14%. Short Loans, 1-14%. Bank deposit rates, 1%. Discount deposit at call, 1%; at notice, 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between October 26th and November 2nd. (Figures in brackets are par of exchange).

United States. \$ (4-88½) 4-02½-03½; mail transfers 4-02½-03½. Canada. \$ (4-88½) 4-43-47; mail transfers 4-43-47½. Switzerland. Francs (25-221)

(Continued on page 622)

(Continued from page 620)

FINANCE AND BANKING

THE MONEY MARKET.—The Bank return reflects all the influences on the money market discussed in a note on page 615. Bankers' deposits though £10,746,000 down, remain at the comparatively high level of £193,037,000. The whole of the net outflow of bank cash is accounted for by an end-month rise of £6,644,000 in the note circulation and by an increase of £5,226,000 in Public Deposits. The latter movement was probably due mainly to the incidence of TDR payments.

RECORDS and STATISTICS

INDUSTRY AND TRADE

Clothing Industry Labour.—New measures have been announced to increase the labour force of the clothing industry. In addition to the suspension of withdrawals from nucleus firms in reception areas, and the restoration of the cut in their "approved labour force" previously announced, clothing workers in all areas who are not required for other work will be allowed to return to nucleus firms even if these already employ their approved labour force. Skilled tailoring workers who have been released from war-work will not be submitted for other vacancies while they can be absorbed by nucleus tailoring firms. These measures are necessary to overcome the present prospect of a shortage of clothing.

Trade Disputes.—The number of working days lost in September through industrial disputes was 186,000, a rise of 62,000 on the August figure. The number of people involved was 50,000 against 34,300. In coal mining, 27,000 workers were involved in stoppages during September, and an aggregate of 51,000 working days were lost. In the metal, engineering and shipbuilding industries 19,400 people lost 119,000 days.

Cotton Yarn for Experiments.—The Cotton Controller is to issue licences for the use of cotton and rayon yarns for experimental work in textiles. While the announcement is welcomed by the trade, it is believed in Lancashire that these special licences will be granted with caution, as supplies of yarn are still below essential needs of the war effort.

"The Economist" Sensitive Index.—There was no change in the index during the week ended October 31st. The complete index (1935 = 100) was 158.6; crops 135.6; and raw materials 185.5.

GOVERNMENT RETURNS

For the week ended Oct. 28, 1944, total ordinary revenue was £69,896,000, against ordinary expenditure of £123,979,000 and issues to sinking funds of £220,000. Thus, including sinking fund allocations of £349,408, the deficit accrued since April 1st is £1,876,280,000 against £1,858,605,000 for the corresponding period a year ago.

Total	604,976	335,007	347,944	12,515	12,749

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £917,075 to £2,608,313, the other operations for the week (no longer shown separately) raised the gross National Debt by £54,558,252 to £21,461 million.

NUNDYDROOG MINES, LIMITED

The question of the declaration of an Interim Dividend for 1944 has been considered at a meeting of the Board of the Company held to-day.

The Company's operations during the six months ended 30th June showed a profit in spite of the failure of the power supply resulting from the accident to the Government Power Plant on the 19th May. The full effect on the results for the six months to 31st December cannot yet be assessed and in the circumstances the Directors decided to postpone the consideration of a dividend until the results for the full year are available.

By Order of the Board,

C. H. D. GARLAND, Secretary.

2, White Lion Court, Cornhill, London, E.C.3. 26th October, 1944.

Parliament on Beveridge

LAST week's debate on the Social Insurance White Paper was remarkably free from atmospherics. Reception on all sides was good. Most speakers, whether they had any real criticism to offer or not, seemed awed by the significance of the occasion—as though they still found the Government's arrangement of "Beveridge" too good to be true. It is almost two years since Sir William Beveridge produced his famous report and twenty months since it was first discussed in Parliament; but the delay has not been unfruitful. It has permitted the fullest public discussion of principles, ways and means and has enabled the Government to produce a scheme that is broadly satisfying to all parties.

The Government's scheme is a compromise between ideals and hard facts. But it is not perfect and may require amendment at several points before it is drafted for legislation. There is much criticism, for example, of its proposals regarding family allowances. The Government are accused of robbing the children to pay the pensioners by reducing the scale of family allowances suggested in the Beveridge report from 8s. to 5s. They are accused, too, of infringing the principle of parental responsibility when they propose to supply school meals and milk to every child between the ages of five and sixteen.

These arguments are overstated. The suggested allowances in kind are eventually to cost virtually as much as the cash allowances. It is true that they will be spread over a larger number of children, since they cover first children as well as the second and later children for whom cash allowances will be given. But they are certainly not negligible. Moreover, they are allowances that would reach the children directly—even those children with the least responsible parents. The argument that parental responsibility forbids the gift of allowances in kind is an extremely old-fashioned one which it is astonishing to hear from Sir William Beveridge himself. On the contrary, the provision of school meals and milk for all children represents a particularly worthy and economic form of communal activity; and a logical development of a service already well established. It will be some time (Mr Butler mentioned a three-year programme) before all children can be catered for; when they are, the nation will surely have made an excellent start in the task of eliminating want among children. It is true, as Sir William Beveridge pointed out, that the scheme is inconsistent with the White Paper judgment that assistance for the first child is not normally necessary. But the inconsistency is surely a creditable one. It is true, too, that the under-fives would not, at present, share in these allowances in kind; nor, under existing conditions, would any child absent from school or on holiday. The retention of the national milk scheme and the provision of welfare foods (such as orange juice) would solve the first difficulty; Mr Butler's

new powers might be invoked to find an answer to the second. With children's allowances, as indeed with all benefits, there are strong temptations to be more generous on paper than is either prudent or practical. The Government's solution of a difficult problem is certainly worth trying.

The outstanding difference between the Beveridge and White Paper proposals is that benefits under the latter are not guaranteed to be adequate for subsistence. They may be related to the cost of living but do not provide, and are not intended to provide, a basic standard of material security. Sir William Jowitt's defence of the Government's attitude was that subsistence is a term that defies precise definition. If subsistence needs are interpreted as a basic minimum, as enough to keep body and soul together, it is still necessary to prescribe differently for each body and soul. In a comprehensive insurance system it is not possible to relate individual payments to individual needs which vary "from person to person, from place to place, and from time to time." The provision of an adequate basic minimum is further complicated by the extreme variety of rents, the least flexible of all household expenses. Since the Government have decided to preserve the contributory principle and a flat rate of contributions (rates levied according to ability to pay would be more equitable but less in keeping with traditional policy), a guaranteed subsistence benefit for all could be financed only by very high contributions from all.

The Government's case is that those who cannot provide additional cover for themselves through voluntary insurance should, where necessary, obtain supplementary relief from the Assistance Board. Without a clear relation of benefits to the cost of living the whole justification for the scheme breaks down. If rising prices widen the gap between benefits and subsistence, and the great majority of beneficiaries have to apply for supplementary assistance, the logic and economies of a unified system of insurance would disappear. Everything depends on the manner in which the Government's principle of "reasonable premiums and reasonable benefits" is interpreted. At the moment there is no clear indication of their intentions. During the debate Sir John Anderson would say only that

there is nothing whatever in this scheme to prevent the Government and the House from taking the question of subsistence rates, of what is adequate for subsistence, fully into account in settling rates of benefit and the rates of contribution for which provision is to be made in the Statute. . . .

The Government's approach to the problem was "make up your minds what you think is right. Fix the rate of benefit and fix the contribution, and if circumstances

REMEMBRANCE

EQUITY & LAW LIFE ASSURANCE SOCIETY

LINCOLN'S INN FIELDS

Temporarily removed to

163-164, STRAND, LONDON, W.C.2.

change by all means look at it again." This was something less than frank. There is a need for caution, and it should be stated. The difference between reasonable-benefits-plus-assistance and subsistence benefits is partly one of principle, and the country will not be happy until it gets the principle. But it is also one of administrative economy. It is common ground that no one is to be allowed to fall below subsistence level, but one method combines a fine and sweeping principle with a good deal of waste; the other secures economy at the cost of the principle. With so many factors unknown in the immediate economic future—the level of prices, the yield of taxation, the size of competing claims on the revenue, the shape and size of the national income—the Government are playing safe.

Whether they are right to play safe depends on the answer to the question "Can we afford it?", which has been disputed and submitted to attempted ridicule so often during the past two years that it is now almost as unpopular as an unsavoury cliché; so unpopular, indeed, that it was avoided far too carefully during the debate. Mr Greenwood contented himself with a downright "We must afford it," and Sir William Beveridge said that "the change of a few figures" would turn the Government's plan into "a plan to abolish want." It was left to Sir George Schuster to tackle the cliché boldly:

Having declared these postwar dividends, it is high time that we put our heads together—and they [the Government] must be frank with us—about how we are to earn the revenue from which these dividends have to be paid.

These are words of elementary caution. The Social Insurance plan is one part only of a great scheme of social improvement and re-development. It takes its place (a dominant place, it is true) in the reconstruction of Britain along with housing, a national health service, a new system of education and the regeneration of industry and commerce; and each of them will make great demands on the national income and capital. When the question "Can we afford it?" is posed to each of these separately, the answer is clearly affirmative. But when it is posed to all of them together, the public has no material for an answer. Sir John Anderson has been unable to supply the *pro forma* budget of national resources which he pro-

mised last February; and the figures he produced during the debate are a poor substitute.

While Social Insurance is financed almost entirely by a redistribution of the national income the effects of that redistribution on the nation's economic life may be very considerable. Social improvements in the last analysis involve more consumption. All reasonable people regard the ultimate perfection of these services as a highly necessary and desirable objective. The supreme problem at the moment is how much of the national effort can "reasonably" be employed in the provision of goods and services for domestic consumption; for the solution of that problem determines automatically how much can be devoted to the task of equipping the country with the capital goods it so sorely needs. The present tendency is to make haphazard allocations of resources for increased Government activity (armed forces, education, medical services), for increased consumption (social insurance) and for increased provision of consumers' capital (housing). All these things are necessary and desirable; each of them, separately, can be afforded. But if the net effect of the whole process is to crowd out the fourth category and to leave no allocation at all for producers' capital—that is, wealth-producing equipment—then the national income will be too low and too stagnant to support the burdens placed upon it. The standard of living—and the social services are a real element in the maintenance of that standard—depends ultimately on the efficiency of British industry; and efficiency requires the rapid accumulation and maximum utilisation of capital resources. Until that is safeguarded, all caution cannot be abandoned.

The nation can probably afford the Government's "Beveridge" as it stands; how much more it can afford in the way of social security is impossible to assess until the national resources have been listed and computed. Parliament has given the White Paper an encouraging welcome. It is now a time for action. Sir William Jowitt's advice:

Do not let us lose the good which is in this scheme by stumbling forward towards what we think is a best which may prove unattainable

is sensible and practical. If it is followed there should be no great difficulty in getting the forthcoming Social Insurance Bill on the Statute Book before the general election.

Beveridge on Employment

WHILE the House of Commons, with Sir William Beveridge's personal assistance, has been debating the Government's proposals for giving effect to his famous Report, Sir William himself has published his long-awaited report on another of the great economic problems of the age. The Report on Social Insurance, landmark though it was, was in the main a monument of administrative clarification. The new Report essays a much more difficult task, that of re-formulating the common-sense truths of modern economic theory in a language which, Sir William hopes, will enable any interested person to see the truth behind the paradoxes of the economist. His new Report on "Full Employment in a Free Society,"* which he prepared "in a wholly private capacity" on the basis of "continual consultations with economists outside the Government Departments," is a masterpiece of clear thinking and brilliant exposition. It surveys the facts and theories of unemployment in peace and in war; it presents a programme for action in the peace to come, without neglecting the internal and the international implications of full employment to the political setting within of a full employment policy; and it relates the economic which it will have to be tackled. Altogether, the Report represents an outstanding achievement of Sir William's private enterprise.

The first impression is that the differences between Sir William Beveridge's diagnosis and prescription and those

* "Full Employment in a Free Society." Allen and Unwin. 429 pages. 12s. 6d.

of practically all modern economists, inside the Government and out, are small. "The main diagnosis," he says himself, "is on the same lines, representing the general agreement of economists that employment depends on expenditure. . . . This is common ground, as it is common sense." Nor does Sir William depart from the common ground of informed opinion when he demonstrates, by statistics and by argument, that the two principal factors that impart instability to total expenditure are, first, the fluctuations of private expenditure on investment and, second, the variable expenditure on imports in relation to exports. This wide measure of agreement is a phenomenon of very recent years, and it is the chief reason for encouragement. But the unanimity is not perfect; beneath the wide agreement on the nature of full employment policies there are still difficulties, and there are disputes of some substance.

Moreover, even where economists are agreed, there remains the fundamental difficulty of carrying the public with them—of becoming not merely intelligible but convincing. This difficulty arises only partly from the economist's jargon; its main cause rests in the fact that the economist's way of looking at the "body economic" is necessarily different from that of the ordinary business man, trader, or employee. The individual knows that his expenditure is (by and large) determined by his income; the economist proclaims that, on the contrary, income is determined by expenditure. While each nation knows that its capacity to pay for imports is determined by its exports, the economist insists that, on the contrary, the imports

of the world as a whole determine how much can be exported. The individual knows that he must save before he can invest; the economist says that the community's investments create its savings. Of such paradoxes there is no end; on all the general economic questions of our society, the economist is driven to conclusions which appear to run directly counter to the daily experience of all those who are actually engaged in the economic process. And even when the logic is accepted, there is the almost irresistible temptation to relapse, when it is a question of practical measures, into the habits of mind bred by individual experience. The exposition of the new doctrines, therefore, requires a more than usually lucid and vivid pen—such as Sir William Beveridge commands. His new Report is bound to exert a most healthy influence on all economic discussion; it will help immeasurably to bridge the still existing gulf between the economists and the general public.

★

It may also help to bridge some of the remaining gulfs among the economists. Even if they will not all be able to follow exactly his line, his factual and theoretical exposition of the problems and possible remedies should make it easy for the various schools of thought, if not to agree, at least to understand one another better. Perhaps the three most important grounds for dispute are, first, the extent to which a full employment policy will prove compatible or incompatible with the present structure or ownership of industry; second, the extent to which it will require the abandonment of the canons of "sound finance"; and third, the extent to which it can be pursued, or ought to be pursued, by one country alone, if other countries do not adopt similar internal policies.

Sir William Beveridge is quite unambiguous on all three of them. For example, while he does not rate the liberty of a private individual "to own means of production and to employ other citizens in operating them at a wage" as one of the essential rights of citizenship, he does not propound a Socialist doctrine in the accepted sense of the word. He is more concerned with asserting the state's control over the total volume of expenditure than with "different phip of the means of supply"; "socialising grammes. Tr than production" is, in his view, the next There is, fir be taken.

designed foration of the means of production in every relaxation ould not be an alternative to the policy of dians, musiutlay for full employment; it would only e. ne conditions under which that policy had to be ed. Nationalisation of particular industries may be us ul as part of this policy, but it is even less of an alternative to it; the adjustment of total outlay to total manpower (which is the essence of a full employment policy) is meaningless, except as a global policy covering the whole of industry.

Sir William Beveridge, as he claims himself, "by-passes the socialist-capitalist controversy."

The policy outlined in the Report . . . can be accepted by persons holding many different views on that controversy—by those who desire Socialism at once, by those who oppose Socialism at any time, and by those who are prepared to judge private enterprise and public enterprise on their merits in the light of experience.

The system of private enterprise must justify itself not merely by enterprise and efficiency, but also by stability. If private investment expenditure, to whose notorious and "dangerous" instability the Government White Paper on "Employment Policy" referred as one of the two "most serious obstacles to the maintenance of total expenditure," cannot be stabilised through the actions of private business men themselves or through the efforts of the state to induce stability, then some modification of the system will indeed be necessary. But Sir William evidently does not think it will be necessary to go so far. It is quite true that he is far more insistent than the White Paper—and rightly so—on the necessity for stability in private industry.

My Report, in place of accepting the inevitability of fluctuation and aiming merely at offsetting it (through counter-fluctuations of public expenditure), accepts the

necessity of stability not merely in total expenditure but in each main section.

And the inference is that this can be done. But it is only an inference, for the main gap in Sir William's otherwise very comprehensive treatment is that he does not adequately discuss the practical ways and means by which public policy can exercise a stabilising influence on private industry. This is unquestionably the region towards which the attention both of economists and business men should now be turned. A public works policy, offsetting fluctuations in industry, is not only distasteful in principle, since it assumes that large masses of labour will be shuttled to and fro, but it would almost certainly run up against crippling practical difficulties. Nor can the problem be solved by wholesale nationalisation which, even if it were desirable, would impose an intolerable strain on the administrative apparatus of the country. If full employment is to be attained, the only practical route is by inducing private industry to stabilise itself. But to say this is not to say that it is an easy route or one that has been fully surveyed.

★

The second "debatable" subject—that of fiscal policy—is developed in the Report at considerable length. There are here none of the financial inhibitions so painfully prominent in the Government's White Paper. Sir William lays down three rules of national finance:

The first rule is that total outlay at all times must be sufficient for full employment. This is a categorical imperative taking precedence over all other rules, and over-riding them if they are not in conflict with it. The second rule is that, subject to this over-riding categorical imperative, outlay should be directed by regard to social priorities. The third rule is that, subject both to the first and the second rule, it is better to provide the means of outlay by taxing than by borrowing.

On the first rule—adequacy of outlay—there is already widespread agreement. The second rule—on social priorities—runs counter to one of the most cherished of the newer doctrines, that a deficit is good or bad according to what it is spent on. The rule that "social priorities," and nothing else, should determine state expenditure demolishes the idea of the "double budget" (of which the part devoted to public investment can safely be borrowed) and so does his third rule. It is *always* better to provide the means for state outlay by taxation than by borrowing, irrespective of whether the outlay of the state leads to the creation of permanent assets or not. In one respect, therefore, Sir William carries "unorthodoxy" a stage further: he says, in effect, that there are no particular reasons for treating funds raised by borrowing any differently from funds raised by taxation. In another respect, however, he is far more orthodox than the advocates of the "double budget"; he says, in effect, that the balanced budget remains the ideal budget, and that capital expenditure is no sufficient excuse for a deficit.

To the two established schools of Public Finance there is thus added a third. There is, first, the traditional orthodox theory, based on nineteenth century economic doctrine, which holds that all budget deficits are "unsound"; there is, second, the now widely-held unorthodox theory, which holds that budget deficits, incurred for the purpose of avoiding unemployment, are quite sound provided—but only provided—that they lead to the creation of "productive" assets for the state; and there is, third, the neo-orthodox theory, vividly summed up in Sir William Beveridge's three rules of public finance, which reinstates the ideal of a balanced budget, subject to the over-riding rule of adequate total expenditure. This is, of course, the policy pursued by Governments in wartime and the position at which the man in the street, without the advantage (if it be one) of theoretical reasoning, has already arrived by instinct.

Sir William's objection to Budget deficits is not an economic one—not that they are "economically unsound" or likely to lead to bankruptcy—but a social one, that they expand the rentier class. And similarly, his advocacy of taxation serves a social purpose as well as an

economic. Progressive taxation inevitably acts to redistribute net incomes, which is not only good in itself but also increases the "propensity to consume"—that is, diminishes savings and thereby reduces the dimensions of the gap in the circular flow of income by which unemployment is caused.

But, under this head, as under the previous one of public *versus* private ownership, Sir William does not expect anything very revolutionary to be necessary. One of the Appendices contains some calculations by Mr Nicholas Kaldor according to which, in 1948, under conditions of full employment, the pre-war rates and structure of taxation would yield as much as 94 per cent of the necessary current expenditure of the Government, on the probable post-war scale. The budget deficit, or alternatively the increased taxation, will, on this calculation, not need to be very large. There are some distinctly optimistic assumptions in Mr Kaldor's estimates, but even if the precise calculation is not accepted, the basic conclusion stands. Instead of unbalanced budgets being necessary for full employment, full employment is necessary for balanced budgets.

The third major issue named above—that of the international implications of full employment policies—has in the Report a part to itself which is distinguished by its clear and well-documented exposition of the conditions of multilateral trade. These problems have received a great deal of attention in this journal and Sir William's conclusions are not markedly different from those reached here. In this field, too, public discussion, both national and international, will benefit greatly from the sober and scientifically-minded exposition.

Sir William Beveridge is to be congratulated on the great public service he has rendered by producing this

new Report.* There are aspects of the policies proposed that are questionable—for example, the proposal to create a permanent sellers' market for labour has implications for wage policy and for Trade Union responsibility which require much more careful examination than Sir William has given them. But the main triumphs of the book are in exposition rather than in advocacy. Perhaps no one was better qualified to sift and to combine into an authoritative document the many promising and valuable ideas which modern economics has produced since Lord Keynes gave a new realism, and thus a new effectiveness, to the whole science by the publication of his "General Theory." No one who has followed the public debate of recent months can fail to be struck by the sense of responsibility and scientific honesty which is slowly gaining the upper hand in discussions only too easily vitiated by dogmatic political partisanship. Whatever political effect the new economics might have in the future—and no economic theory worth the name is without political implications—its effect is likely to be a healthy one. Sir William Beveridge, a born educator, declares ignorance to be "an evil weed, which dictators may cultivate among their dupes, but which no democracy can afford among its citizens." To win full employment and to keep it, we must will the end, but we must also understand the means. The new Beveridge Report will be invaluable both for clarifying ends and means, and for advancing general understanding.

* Sir William fully acknowledges his debt to others, and particularly to the Institute of Statistics at Oxford, of which he is chairman. The Report draws special attention to a book entitled "The Economics of Full Employment" recently published by the Institute (Basil Blackwell, 213 pages, 12s. 6d.), in which, Sir William says, "many of the difficult economic problems briefly noted in this Report are the subject of special study." The book, which is by several authors, contains what is perhaps the first consistent attempt to develop, in rigorous scientific terms, the body of theoretical doctrine lying behind Sir William Beveridge's report.

A Plan for Broadcasting—III

THE second article, in a technical digression, set out the reasons for believing that broadcasting is not likely to continue for long on the basis of a comparatively small number of stations covering the whole country on medium wave-lengths. The overcrowding of the ether is becoming so serious that broadcasting is likely to move either in the direction of a larger number of Frequency Modulation stations on ultra-short-wave lengths, each with a restricted radius, or else to diffusion by wire, a large number of programmes being diffused on a wire network, from which the listener's receiving set would select one. (This should not, of course, be confused with the present rediffusion services, which are merely distributing at retail programmes which are transmitted at wholesale by medium wave radio.) In either case, something more like a network of local stations instead of the present national stations would come into being. This conclusion is likely to be greatly reinforced by the advent of television, which, if it is to cover the country, requires a large number of small-radius stations.

This is the technical framework within which any system of broadcasting would have to be organised and financed. The preceding articles have also argued that, whatever system is adopted, it should not be one of monopoly. To many people, to plead for a competitive system of broadcasting is the same thing as asking for the American system of programmes "sponsored" by advertisers. But this is not so in the least. Let it be made quite clear that these articles, in arguing for competition and variety, are not pleading the case of the advertiser. An advertiser-sponsored radio would probably be distasteful to the British public. This is a probability, not a certainty, for most of those who have had a real opportunity of comparison would probably agree that the American radio is usually very unjustly treated by British critics—most of whom have never listened to it.

The advertising talk itself is, admittedly, different. It does not make the American programme the British in standards of taste, while it makes the British in standards of interest. Perhaps, more comedians and fewer symphonies, but not very many, and both the comedian and the symphony concerts are of very high quality. The level of comment on public affairs on the American radio is infinitely above the British—because there is virtually none on the British radio. There is a less self-consciously uplifting air about the American radio, and a great deal of inane patter—the one, perhaps, offsets the other, lack of dignity balancing lack of dullness. A course of listening to the American radio is calculated to give an Englishman a higher opinion of its merits than he sets out with.

Nevertheless, the sale of time to advertisers can hardly be recommended as a desirable means of financing radio. If the results are not actually bad in America, they will be in Britain. It is not right that the radio, with its great powers, should be even potentially and negatively at the command of commercial interests. If there is any way by which competition on the air could be secured without advertising it should be preferred.

There is a school of thought which holds that since this country will probably be bombarded, after the war, with advertising programmes, either from the Continent or from Eire (where American interests are believed to have secured a foothold), British broadcasting will have to admit advertising "in self-defence." But the argument is not very convincing. Such evidence as there is tends to show that the average listener does not roam the ether to distant stations unless the dullness of the local fare drives him to it. Most of the pre-war triumphs of Radio Luxembourg were scored on Sundays. If the local fare is interesting, there will not be much listening to foreign stations. And even if there were, why does that make it necessary

to follow suit? British advertising, after all, is hardly an infant industry which has to be protected. The utmost concession that should be made to advertising on the air is that, if other sources of finance are inadequate, the sale of time might be admitted as a small supplementary source of income in off hours. As a main source of income it should be rejected.

The problem, then, is to find some means by which a competitive organisation of broadcasting can be financed other than by selling time. The only other ways are by direct state subsidy out of the general Budget (which would be even more dangerous) or a licence duty, as at present. It should not be very difficult to adjust a licence duty to the needs of a competitive system. Suppose that there are three competing broadcasting companies, the ABC, the BBC and the CBC. It could be provided that, out of each licence fee paid, one-quarter should go to each company, while each individual listener, when paying his fee, should nominate which of the three was to receive the final quarter. Each company would then receive a certain minimum income. But it would also have the possibility of doubling its income if it could please the customers better than its rivals. These proportions are not, of course, sacrosanct; one-sixth might go automatically to each of the three and the remaining half be competed for; the smaller the automatic proportion the larger the element of competition. But, whatever the exact proportions fixed, here is a simple method by which a licence fee could be combined with competition. Each company could be required, in return for its fixed income, to perform its social duty (in so far as this is distinct from giving maximum pleasure to the listeners); the condition of the licence should be that certain general stipulations as to number, type and length of programmes were observed. But each company would also have the maximum incentive to make its programmes genuinely interesting. Each company would have an impregnable defence against the busybodies and the interests.

This would secure both competition and variety. But it would be desirable to go further and attempt to introduce the second sort of variety—not merely several different programmes, but several different sorts of programmes. Three broad categories can be distinguished. There is, first, the general entertainment programme designed for the great mass of people who listen for relaxation only. This would cover such things as comedians, music hall, dance bands, light music, the simpler

and more popular talks, and so forth. Then there is, secondly, the cultural programme, consisting of more serious music, plays, opera, serious talks and the like. And thirdly there is the educational programme, designed to give instruction not merely to children and the schools but also to anyone of any age who is bent on improving his mind. These three categories are not, of course, by any means mutually exclusive, nor is there any reason why they should be. News, for example, enters into all three; so, probably, does religion. The broad outlines of the distinction, however, are tolerably clear. It would be unreasonable to insist on having all three programmes going at all hours—there is probably little call for symphony concerts or serious talks in the middle of the morning. Indeed, the practical way of envisaging the matter is probably to think of a general programme which divides into three separate programmes at the peak hours.

The competitive system would, therefore, consist of an ABC, a BBC and a CBC, each committed, by the terms of its licence, to produce a general programme for, say, about eighteen hours of each day and two special programmes, defined in the licence, for say, about eight hours a day each. The definitions of these programmes would necessarily have to be in somewhat broad terms. In the case of the educational programme, for instance, the licence should list the sorts of items that were to be regarded as being educational and specify that not less than, say, two-thirds of the time allotted to the educational programme should consist of these items. But beyond that, the greatest latitude of judgment should be left to the programme-maker.

If this scheme were carried out, the listener—in urban areas at any rate—would at all times have three programmes to choose from, and at peak hours he would have nine—three of each of three different sorts. (In country districts, the choice would necessarily be smaller; in addition to the nine programmes put out by wire or by short-wave, the general programme of each company might be broadcast on the present medium waves or on long waves, for the benefit of less thickly populated areas.) Compared with our present meagre fare, this may seem a bewildering variety. But it is very much smaller than the choice the public has of every other form of entertainment or instruction, such as books, newspapers, periodicals, theatres, cinemas or concerts. And it is only in such competitive variety that radio will find both the freedom and the incentive to develop its full potentialities.

(To be concluded.)

Spotlight on Palestine

THE two Jewish terrorists who murdered Lord Moyne in Cairo on Monday performed, as they struck, the greatest disservice to official Zionism, which naturally condemns any deed so wanton and so politically stupid. They deprived it, as Mr Churchill has pointed out, of a good and well-informed friend; they also created for the British Government a situation in which, for some time to come, any concession to the Zionists will be interpreted as yielding to violence. Their act, together with the almost simultaneous swearing-in of Lord Gort as the new High Commissioner in Jerusalem, have focused attention on a state of affairs in Palestine that comes as news to many people in Britain. All recent visitors from the Middle East are astonished at our ignorance. The reasons for it are two: first, the smallness of our newspapers and their absorption with war news; second, the fact that the troublemakers of 1944 have been the Jews, that every British daily but one employs, for lack of other journalistic talent in Palestine, a Jewish correspondent, and that these have tended to play down the degree of tension that prevails.

Last Monday's murder turns the spotlight full upon it. Jews all over the world condemn the murders, as they have condemned all this year's other attempts on British lives, but they cannot escape one implication of it. Lord

Moyne was, to Zionists, more than HM Principal Representative in the Middle East. No matter how much he had changed his mind during his twenty-seven months of office there, he was by many of them, both in public and private, steadily criticised for a speech he made in the House of Lords on June 9, 1942. In that speech, which Englishmen have forgotten because it was so balanced, he made three points which are, to any liberal spirit, logical, but to a Zionist, heresy:—

(1) Lord Wedgwood's proposal that the Arabs should be subjugated by force to a Jewish régime is inconsistent with the Atlantic Charter and that ought to be told to America...

(2) Surely it is time for the Zionists to abandon that appeal to force and to seek a settlement with the Arabs by consent... The war will end with the heavy problem of trying to resettle these most pitiable victims of Nazi abominations... A merciful settlement must be a quick settlement. We ought therefore to look at once in all directions... The Zionists look only to Palestine... It is to canalise all the sympathy of the world for the martyrdom of the Jews that the Zionists reject all schemes to resettle these victims elsewhere—in Germany, or Poland, or in sparsely populated regions such as Madagascar...

(3) But even in their wish to occupy the pre-Christian

home of the Jewish race, the Zionists are far too narrow in their outlook. Palestine itself is but a small fraction of the ancient land of Syria. I do not believe that the problem of overcrowding applies to Syria and the Lebanon and Transjordan as it does to Palestine. It would be physically possible for those states, if they were willing, to absorb large numbers of Jews to mutual advantage and without any threat to their political independence. If the fear of Jewish domination could be removed they might indeed be glad to welcome Jewish immigrants with their well-known industry and intelligence and with their capital.

There spoke a man who knew the Middle East. That he should in time be murdered represents in miniature the crux of the present problem, which is that the Zionists, with American backing, want the whole of Palestine and that anyone who proposes less is earmarked as their enemy.

The thread of events in the war years, which have had such poor coverage in the British press, is not difficult to pick up. On the outbreak of war, both Jews and Arabs gave proof of loyalty to Great Britain. The latter, through their notables and newspapers, gave out that they had no intention of embarrassing Britain while it had a major war on hand. The bombing and gunning that had been euphemistically called "disturbances" was, they said, off for the duration. They have kept their word. The few Jewish bodies that had retaliated in kind also declared a truce, while the official Zionists asked leave to raise a Jewish force fighting under its own flag for the defence of Palestine or indeed to fight elsewhere. This request was refused; on political grounds the British Government decreed that all who served must serve as Palestinians. Many did so. From 1940 to 1942, the local problem was in abeyance, overshadowed by greater events, notably in Crete and at Alamein. But during those years of local quiet and war-time boom, Palestine was full of arms, and also is—like Britain—full of money but short of goods. Both communities, Arab and Jew, therefore invested in armaments. The difference between their investments was that, whereas the Arabs bought sporadically and individually and because it was pleasant to have a good gun, the Jews bought on a large and organised scale for their two secret organisations the *Hagana* or "Defence" and the smaller but more extreme *Irgun* or "National Military Organisation," both of which had developed, out of legitimate self-defence during the pre-war Arab "disturbances," into illegal but fully fledged military formations. In the summer of 1943 a court-martial of two British soldiers, followed by the trial of their Jewish suborners, publicly revealed the large-scale method by which these formations were amassing armaments. Thus equipped, the extremists began to practise terrorism on fellow Jews. In 1942 the notorious Stern gang, which stood for no truce (and from which Lord Moyne's assassins were drawn), ran bank robberies and hold-ups in order to secure funds; by 1943 non-Zionist Jewish newspapers were finding bombs in their printing works.

Beginning early in 1944, the terrorists switched their fire on to Englishmen in an attempt to force Britain to change her policy. Their attacks included fully-equipped assaults on the well-fortified Tegart police posts that sprinkle the country, on the Immigration Office and on the Government broadcasting station. That the *Irgun* was back at work became clear through its own statements, through the use of its flag during assaults, and through the strength and discipline of the attackers who on one occasion fought in a formation 150 strong. Relatively few of the offenders have been caught. Jewish authorities deny the official British statement that the Jewish community does not co-operate in catching them, but the fact is that anyone in a non-self-governing community—from a Jew to an Irishman or Dutchman—respects the call of kinship more strongly than the arm of the law. The terrorist of a night is the peaceful farmer by morning.

Murders of British officials became common, and on August 8th an attempt was made on the life of Sir Harold MacMichael, the then High Commissioner. Unfortun-

nately this was followed on September 20th by a British War Office announcement that the Government had decided to accede to the request of the Jewish Agency that a Jewish brigade should take part in active war operations. Not unnaturally, many people deduced cause and effect. Thereupon Sinn Féin tactics grew in volume and intensity; the Moyne murder has several features in common with that of Sir Henry Wilson in 1922.

*

Throughout the quarter-century of the mandate, there run several constant factors which must be remembered before any solution can be proposed. One is the truly understandable Zionist longing for a national background that will enable Jews to look the world between the eyes and say "I am a Jew" with the same significance as other men impart when they say "I am an Englishman," or "a Swede" or "a Pole." Another is that the Arabs of Palestine fear being outnumbered, and that to impose this fate upon them is to jettison the first of the four freedoms. A third is that Britain, which cannot please both local communities, cannot, as second best, go straight for a solution shaped to its own imperial ends because it always needs to take into account two outside pressures. The first comes from the United States Government, which invariably responds to Zionist influence. The second outside pressure on Britain is that of Egypt, the Arab states and the other Moslem peoples who dwell along the lines of communication and among the oil-sources of the Commonwealth.

But besides these constant elements there is one variable factor which is often forgotten. It governs the dimensions of Britain's problem. It is the degree of Jewish (as opposed to Zionist) desire and need for refuge. The year 1933—the date of Hitler's accession—was the date at which it began to swell. At the date of his fall, we do not yet know how many Jews will be left in Europe, but we do know that their exodus will abate. We also know that many Jews who have escaped have chosen to await return in Britain or America, or even on a "transit" ticket in Lisbon, rather than embark on a life exclusively among fellow Jews in an eastern land. We can also guess that, once the Nazis are discredited and gone, few people in Europe will care to profess the anti-semitism that was their rallying cry. We also hear that a queue of Jews over 10,000 strong awaits exit permits from Palestine. It is premature to fix on a solution until we know the long-term answer to the all-important question: "How many Jews will want to go to Palestine once Jewry no longer needs a refuge from Hitler?" All that can be said is that of the four major possibilities—to wit, a Jewish Commonwealth, partition and Lord Moyne's suggestions numbered 2 and 3 above—the first is incompatible with one of the freedoms for which the war is being waged and the second involves a welter of corridors and enclaves in a land the size of Wales. Of the other two, federation in a greater Syria looks attractive to all liberally minded gentiles, but fails to give the Jews any more than they already possess in more congenial countries. There remains unlimited Jewish immigration, subject to placing upon the Jews the onus—never yet shouldered—of winning Arab consent. This might be coupled with the establishment of territorial dependencies of the National Home in Europe or Africa or both; again, when the present abnormal conditions abate, such extra living space for refugees might not be wanted or necessary.

Difficult though the task may be, Lord Gort must therefore hold the balance while enlightenment on this point is awaited. Proper timing by the British Government is the key to a conundrum that has baffled it for twenty years, and which is, for the moment, at an unnatural zenith because the Zionists are in a position to capitalise the humanitarian instincts of the whole world. To offer a solution now would be to solve on a basis that is transitory. It would also—in view of recent Jewish terrorism—be interpreted as a surrender to violence that would afford a fatal example not only to Palestinians but to the many communities whose affairs will come up for settlement at the peace conference table.

NOTES OF THE WEEK

Mission to Paris

General de Gaulle has invited Mr Churchill and Mr Eden to Paris, and has addressed a similar invitation to the President of the United States and to the Secretary of State. Few of his many wartime journeys could have had so much attraction for the Prime Minister as this one. Mr Churchill was the godfather of the Fourth Republic, and has now been invited to the ceremony of confirmation. He and General de Gaulle have not always seen eye to eye, but each in his own way has worked for the same end—the liberation of France. The time has now come for both to review the results of their labours, to consolidate a common victory and to gather in its first fruits. The French Provisional Government has been recognised by the Allied Powers, which is a political success for Mr Churchill as much as for General de Gaulle. Will the French Government now recognise its wider international responsibilities? Will the future of the Anglo-French Alliance be secured? Can the Western Union become an economic, political and strategic reality? These questions should figure on the top of Mr Churchill's and Mr Eden's agenda. Inside France the need for the two countries to come together and to pool their forces after the war has not yet been clearly realised by all sections of public opinion. One trend of opinion tends to scent in all suggestions of a Western Union an attempt on France's national pride. Another trend sees in it a hostile alternative to a Russo-French Alliance, though it should be clear that those in Britain who support the Western Union also support the consolidation and strengthening of the alliance with Russia. British policy, on the other hand, should be permeated more thoroughly than it has been hitherto by active sympathy for France's desire to regain a status among the Great Powers. Finally, there are misunderstandings to be cleared away. For instance, Lebanon and Syria recently again became the subject of somewhat uneasy comment in France.

* * *

The Caudillo Speaks

"Cervantes smiled Spain's chivalry away." . . . General Franco hopes to talk away the domestic miseries of his regime and his black record in the war. In a recent press interview he labelled his dictatorship "an organic democracy," in which "the popular will and purest Christian tenets make up the fundamentals of Spanish political organisation." "The process," he went on, "is now being studied"—presumably by the numberless inmates of the Spanish concentration camps. Not satisfied with this democratic masquerade, the Caudillo staked his claim to a seat at the Peace Conference, basing it on the grounds that "the nations that have remained at peace must take part in making the peace." In other words, those who have not taken part in the fighting have thereby demonstrated their right to share in the fruits of victory. General Franco conveniently forgets the period of Spain's co-belligerency with Germany, the Blue Division on the Russian front, the Tangier coup and the innumerable provocations of Great Britain by the Falange. Not without reason he has interpreted Mr Churchill's "kind words to Spain" as an enervated sign of Britain's short memory. But Mr Churchill cannot now say that Franco has shown even the gratitude that is the lively sense of favours to come. Before he received this encouragement the only prospect before Franco's eyes was that of a steadily widening political abyss. Now he has regained enough self-confidence to boast that

Spain could never ally herself ideologically with nations not guided by the principle of Catholicism.

* * *

What Next?

The moral of the story is short. The attempt to appease the present Spanish regime has been as undignified as it was futile. As long as the regime lasts, Spanish policy will not be friendly towards Great Britain. It is Franco's ambition to sponsor the idea of a "Catholic bloc" to counter British influence in Western Europe and the Mediterranean. British policy would commit a grave error if it were

to confound politics with religion and allow itself to be drawn into an obsolete controversy between Catholic and anti-Catholic conceptions. The real issue is not Catholicism but the fate of Franco's dictatorship. It is obviously in Britain's interests that it should vanish. To overthrow it is essentially the task of the Spanish Republicans. But British influence can be used to strengthen the hands of General Franco's opponents. Hitherto, it has been used to weaken them and to strengthen the hands of the present rulers. This should now cease. Constitutional and democratic groupings inside and outside Spain that work against the dictatorship should know that from now on they can count on whole-hearted British sympathy and British help. But this is not enough. There is at least one unsettled and strangely forgotten issue between Great Britain and Spain. The international status of Tangier was abolished by Spain at a time when Great Britain could not afford a conflict over it; and the Spanish action has not yet been reversed. What could be more natural and justified than a British ultimatum to Madrid demanding the immediate restoration of the international status of Tangier? If General Franco refuses to accept the demand, sharper forms of pressure, such as economic sanctions and political warfare, would be justified, since, in this case, they would almost certainly achieve their purpose of destroying a regime which is already rotten.

* * *

Mr Hudson's Economic Defeatism

Mr Hudson's speeches on agricultural policy show a remarkable alternation between home truths and half-truths. In one speech he tells the farmers that they will have to increase their productive efficiency if they are to deserve a growing share in the home market. In the next speech he argues that because of the collapse of international trade, they will have to supply most of the market in any event. It was the latter aspect that was uppermost in last week's speech, in which he maintained that "one of the difficulties facing agriculture today"

is the existence of many people . . . to whom it seems that there is an antithesis between our export industries and home food production. Such people argue that our export trade is vital to our livelihood as a nation, and that if we wish to export we must be prepared in exchange to import all the food and raw materials that other countries wish to send to us in payment.

This is indeed perversity—or ignorance. There is no virtue, in the long run, in the export trades, except in so far as they provide a means by which the country can get goods it cannot produce, or cannot produce so cheaply, at home. To argue that employment in the export trades is the reason why people prefer cheap imported food to more expensive domestic food is to ignore everything that has happened in the past decade, both in nutrition policy and in employment policy. The argument for imported food is that it is cheaper and that British wage-earners can buy more of it with a given income. It should be one of the objects of public policy to see that this great advantage is not withheld from the nation if it can possibly be secured. It is true that our international economic affairs may be so badly bungled that the country may not be able to pay for all the imports it wants. But this is a contingency to be warded off, not one to be capitalised in advance—and made inevitable—by restrictions on food that is badly needed. A manufacturer whose factory has been damaged may reasonably fear that his custom has suffered in consequence. What should he do—work hard to regain his business, for which he has experience and natural aptitudes, or abandon the attempt before it is made and try to support himself by growing vegetables in his back garden? Mr Hudson, being an economic defeatist, would have Britain do the latter.

* * *

Planning Now

From the Lords this week have come renewed demands that the Government should put the Town and Country Planning Bill into its proper context by outlining national policy for physical reconstruction. If, as Lord Simon ad-

mitted, this Bill is no more than a necessary first instalment, what and where are the other instalments? The immediate issue is that the Bill cannot, as the Government seems to imagine, stand indefinitely in isolation. Such as it is, it will have to be accepted. But Lord Simon's vague and dilatory defence contained only one definite statement, that the Commons would debate the White Paper on the control of land use next session—or a good six months after its publication. There was no mention of any proposed legislation. On the subject of compensation and betterment, he reiterated the importance and difficulty of securing agreement and, when pressed, defined agreement as a plan "which will command the support of the great mass of the country." What the Government apparently refuses to realise is the degree to which the present opportunity for planning is fugitive. When the need for action is inescapable almost any solution is better than none. Even a costly plan of land compensation would cost the nation much less than the waste of resources which will take place if there is no plan ready when the first houses are built and the first roads laid.

—Or Never ?

Compensation and betterment is by no means the only problem that must be faced soon. Persons other than the Lords now suspect that necessary administrative changes could be made immediately without costing anyone a penny or upsetting any interests other than those that are supposed to be servants of the public. The Planning Bill assumes that there will be dispersal of population and industry from congested cities. The need for their dispersal is not merely the one accepted principle of modern town planning—it is common ground between all parties. The present local authorities cannot themselves direct this movement. Yet recent Government pronouncements give the alarming impression that it is for the smaller authorities to prepare the plans, and that it will then be for the Minister of Town and Country Planning to piece together the bits of paper as best he can. In fact, it is obvious that nothing can be done without national direction and regional co-ordination—in that order. Without such machinery, how can the "blitzed" and "blighted" cities be supposed to know where to put their surplus industry and population, what open spaces to acquire, what road and housing schemes to start on? By all means, as the Government insists, let local considerations have full play. But these problems are all regional to start with; ultimately they, become national problems too. If the aim is merely to put patches on war-time scars, then purely local policies will of course suffice. Already it is stated that Plymouth's council is considering reducing the scale and scope of its very fine plan, because the means to carry it out are lacking. In reply, Lord Woolton could only state that the Boundary Commission, which the Government hope eventually to set up, would give prior attention to the "blitzed" cities. But, apart from the fact that this is "jam tomorrow" again, it is not the sort of jam that is wanted.

Chicago Conference

The opening stages of the international conference on air transport have been covered more or less according to expectations. Full—and conflicting—statements of policy have come from British, American and Canadian delegates, but beyond that, little progress has been achieved save in the field of technical agreement, and in the discussions on international air routes in the transitional period. In spite of the strong bargaining position enjoyed by the United States delegation, the policy of free competition in international air traffic advocated so disarmingly by Mr Berle seems unlikely to be accepted without modifications. Quite apart from the attitude of Great Britain, the Dominions and the European powers such as France, Belgium and Holland, the agreement of the Latin American countries to the US plan has been seriously hindered by what the Mexican delegate denounced as the "dictatorial" methods used by Mr Berle in seeking their support. Some correspondents have seemed perhaps unduly optimistic in their hopes of a compromise solution to the deadlock. The wide difference of opinion on the main question of whether or not the international air authority shall have power to allocate routes and frequencies of service, may yet prove too great. The conference

has less than two weeks to run; if it should adjourn without making substantial progress on this question, the effects of indecision will be a more severe disappointment to the British countries than to the Americans, since the British conception requires the positive act of empowering an international authority, while the American wish for bilateral negotiations is much closer to the existing *status quo*. Whether things would actually work out as the Americans wish would depend on how much willingness they found in other countries to concede, in bilateral negotiation, the "freedom" the American airlines desire. It would also depend on the extent to which the British nations and the others who hold their views decided to share their cabotage rights and build up regulated joint services from which the Americans would have excluded themselves. The present position gives every nation the freedom to do what it likes. The Americans, for all their talk of freedom, want to limit other countries' freedom to do what the Americans do not like. If they cannot get this, they may yet find the British plan the next best thing.

Canadian Liberals in Trouble

For more than five years Mr Mackenzie King has been giving one of the most perfect exhibitions of the party politician's art ever seen. His problem has been to keep a heterogeneous party together in spite of an irreconcilable difference of opinion within it on the most important problem of the day. The Canadian Liberal Party draws support from all over the Dominion, and it therefore reflects within itself the majority view that, in time of total war, man-power should be conscribed for overseas service. But the particular advantage that the Liberal Party has over its rivals is that it normally commands the allegiance, in Federal politics, of the French Canadians of Quebec, and they are unalterably opposed to conscription. Mr Mackenzie King has hitherto, with great skill, driven this most unruly team. The shifts and devices to which he has had recourse have been extraordinary—but he has kept his party together. In deference to the majority, he has always said that conscription would be enforced if it became necessary; he has even enforced it for service within Canada—but overseas service is still voluntary. He held a plebiscite to give himself powers to conscribe for overseas service—and refrained from using the powers when he had them. The performance has been wonderful; but success is getting more difficult. Last week, Colonel Ralston, the Minister of National Defence, who recently returned from a visit to the Canadian Army in Italy and the Netherlands, resigned from the Cabinet, and it is understood (though not yet admitted) that the cause was his failure to persuade the Prime Minister that conscription was now at last necessary to replace the heavy losses of troops in action. But the Prime Minister's skill is not exhausted, for he has replaced Colonel Ralston by General McNaughton, the very popular commander, until a few months ago, of the Canadian Army in Europe, who has always been a firm advocate of the voluntary method. The General's prestige is, for the moment, muffling the explosion of protest provoked by the Colonel's resignation. But it is rumoured that other resignations were threatened and may yet come. Even Mr Mackenzie King's virtuosity may not save his Cabinet. Yet his political dilemma is exactly what it was before. The tide has been running so strongly against the Liberals in the Provincial elections and in Federal by-elections that their only hope of avoiding signal defeat is to hold their Quebec seats, and Quebec will not have conscription now or at any time, whatever may be the effect upon the Battle of Holland. He cannot yield, yet the pressure of the majority is becoming so great that he cannot not yield. He cannot even wait, since the General Election must come before next summer. The irresistible force is about to meet the immovable object—with Mr Mackenzie King in between. He will have to be very slippery to get out in time.

The Persian Conflict

The refusal of the Persian Government to accept the Russian demand for oil concessions in northern Persia has been followed by a violent war of nerves against the Saad Government. The Russians report that in the whole of

Persia, but especially in the northern provinces, mass demonstrations against the attitude of the Teheran Government have taken place. The "people's anger" is said to have expressed itself in general strikes which ended in sanguinary clashes between the pro-Russian demonstrators and the Persian army and police. The Persians, on the other hand, complain that Russian army units stationed in Persia have given armed protection to demonstrations staged by the People's Party at Teheran; if this is true, it constitutes a flagrant act of interference in Persia's internal affairs and a breach of the promises given to Persia by the chiefs of the Allied Governments in the Teheran declaration. The Persian Government originally believed that the uncompromising attitude taken by M. Kavtaradze, the head of the Russian oil mission, would not be backed by the Government in Moscow. However, this hope has now been dispelled by the Persian Ambassador to Moscow who arrived in Teheran a few days ago. The view is taken in Moscow that the Persians have violated the Treaty of 1921 under which Persia undertook not to grant any concessions to foreigners in the former Russian sphere of influence in northern Persia, from which the Russians had voluntarily withdrawn. In spite of that obligation, the Persian Government, it is alleged, has already granted an oil concession in northern Persia to an American company. This allegation is not the only evidence of the distinctly anti-American twist that has now been given to the Russian polemic against Persia. *Izvestia*, discounting Saed's argument that he has acted in the interest of his country's independence, has asked why American soldiers are present on Persian soil, though no agreement providing for this has been concluded between the USA and Persia. Russian propagandists are also recalling the Russo-British hostility in Persia that preceded the conclusion of the 1921 Treaty. There is every reason to fear that, in the absence of energetic action at the highest levels, the present crisis in Teheran may well widen into a political controversy of the first magnitude, not merely between Russia and Persia, but between the great Allied Powers themselves. It is already more than probable that Russia's sudden refusal to attend the Chicago conference must be debited to this account. A Persian mission is expected to go to Moscow next week. But the Persian problem ought now to be frankly discussed between Moscow, London and Washington and not merely between Moscow and Teheran.

Russia and Switzerland

The Russian Government's ostentatious refusal to establish diplomatic relations with Switzerland, announced from Moscow last Saturday, was bad policy as well as bad psychology. The motive of the refusal was that the Swiss Federal Council, in its request for the establishment of diplomatic relations, passed over in silence the question of Switzerland's "anti-Soviet and pro-Fascist policy." That Swiss policy until quite recently suffered from a strong anti-Soviet bias is quite true. It dated back to the years in which the problem of Czarist debts, renounced by the Soviets, was still an acute issue. But to accuse the Swiss of a pro-Fascist attitude is a grotesque distortion of the truth. Switzerland's previous objections to relations with Russia sprang from what might be termed doctrinaire democratic motives, but not from Fascist sympathies, although the same motives did not, it is true, prevent the Swiss from maintaining diplomatic relations with their Nazi or Fascist neighbours. For ten years now the Russian issue has been in the centre of Swiss domestic policies. The Socialists and the Left Liberals had made the demand for diplomatic relations with Russia a plank in their electoral programmes. The late President Motta stubbornly resisted the pressure from the Left, and, until recently, so did his successor, M. Pilet-Gola. The decision to approach Russia was, therefore, a victory for the Left opposition, and the Russian refusal may be a blow to them. What the Soviet Government demands from the Swiss is in effect a "confession of guilt," a gesture which Swiss democrats will probably find it difficult to perform. Relations with Russia may, however, become a vital necessity for Switzerland in view of the extension of the Russian influence over parts of Europe with which Switzerland has close commercial and cultural ties.

Merchant Navy Reinstatement

Widespread publicity has recently been given to a case in which a merchant seaman was refused reinstatement

rights, and great resentment has been expressed in the Merchant Navy at the implication that it was not an armed force or that its members would be less well treated than those of the other Forces of the Crown. The Ministries of Labour and War Transport have therefore thought it advisable to issue a statement, which set out the position of merchant seamen and officers under the Reinstatement in Civil Employment Act, and affirms that there is full recognition that the services rendered by the Merchant Navy are as important and dangerous as those performed by serving men and women and Civil Defence workers. The position is actually quite clear. The Merchant Navy is a civilian service—and remained a civilian service at its own request; its members work under conditions of employment and receive civilian rates of pay determined by their own industrial organisation, the National Maritime Board. There is no parallel with the Armed Forces or the Civil Defence Forces, whose members were called up under the National Service Acts and work under service conditions at service rates of pay, and whose jobs will necessarily terminate at the end of the war. The Reinstatement in Civil Employment Act is a limited measure and applies only to the Armed Forces and the Civil Defence Forces. It is pointed out that 90 per cent of the men of the Merchant Navy are in it as their life's work and do not intend to find shore jobs after the war. The 10 per cent who volunteered or were directed will be treated in exactly the same way as industrial conscripts, and have no legally enforceable rights to reclaim their civilian jobs—though there may be a moral obligation on employers to re-employ them. Technically, of course, the Ministries are quite right. But public opinion would be greatly concerned if any merchant seaman, who had risked life and limb to bring food and essential supplies to this country, were to be found at the head of an unemployment queue after the war. The answer to this, as to other reinstatement problems, is to reach a position where there will be plenty of jobs to go round.

BUSINESS ENTERPRISE AFTER THE WAR

Small and medium-sized businesses in all branches of industry and trade must have every opportunity of contributing, by their enterprise and initiative, towards the nation's economic well-being after the war. They must be given full support in developing British trade at home or in overseas markets.

Changes due to war conditions call for a far-sighted policy concerning the financial aid they may need. This Bank, through its branch managers, will therefore be prepared to consider enquiries from promising undertakings, whether old or new, conducted under good management. It will base its consideration of each proposal as much upon the prospective borrower's integrity and business capacity as upon his material resources.

MIDLAND BANK LIMITED

Trieste

The Trieste controversy, familiar after the last war, has now been revived by Marshal Tito's demand for the incorporation of the city into Yugoslavia. In reply to this, public meetings have taken place in Italy, at which Italy's exclusive right to Trieste has been re-stated. The arguments of both sides sound like a repetition of the polemical statements they made at the last Peace Conference. The Italians insist on the indubitably Italian character of the town, while the Yugoslavs point to the predominance of the Slavonic elements in the surrounding country. On purely ethnical grounds, it is hardly possible to arrive at a satisfactory settlement. Whoever has Trieste, one nationality is bound to have a grievance. In the first world war both claimants were in the Allied camp, which involved the Peace Conference in a delicate dilemma. That this time only one claimant is an ally—or at least started out as an ally—may add some weight to Marshal Tito's demand. But this does not alter the fact that the constant raising of demands for frontier revisions—whether at the cost of Allied or of enemy countries—is the worst possible procedure that can be adopted in the preparation of a peace settlement. The desire of each state to “redeem its territory to the last kilometre” must make confusion even worse confounded. It is, at any rate, a paradox that nationalist claims for frontier revisions should come from the leader of the Yugoslav Left.

After the Slovak Rising

The Slovak rising, which started in the last days of August, has suffered a grievous setback. After two months of fighting, the insurgents have now been dislodged from Banská Bystrica, their last stronghold in Central Slovakia (Western Slovakia has been in German hands all the time). Like the rising in Warsaw, the struggle in Slovakia was not synchronised with the Russian operations. The insurgents, however, received Soviet help right from the beginning; and the failure of the insurrection has not been followed by political recriminations. The Slovaks' disappointment has been mitigated by the sure knowledge that their defeat is of short duration. The adjacent Subcarpathian Ruthenia has already been freed by General Petrov's forces, and General Malinovsky's army is approaching Slovakia from Transylvania. The political events that took place during the rising afforded a glimpse into the future of Slovakia's relations with Bohemia and Moravia. The authority thrown up by the movement was the Slovak National Council, which was evenly divided between two blocs: on the Right, the Democratic Bloc embracing all moderate, agrarian and Catholic groupings which had been opposed to Tiso's quisling regime; and on the Left, the Socialists and Communists merged into a single party. The National Council formally recognised the authority of President Benes' Government on the condition that it be thoroughly overhauled and its composition completely changed after the liberation of Czechoslovakia. But the Council refused to submit to the authority of the Governmental delegation, headed by M. Nemetz, which had been sent to Slovakia from London in order to take control of the administration in the freed areas. The Slovaks obviously wish to re-establish their union with the Czechs within the framework of a single state, but they are still opposed to the Czechs' policy of centralisation. President Benes, if he is to achieve Czechoslovakian unity, may have to make far-reaching concessions to those who demand a federal Republic.

One Miners' Union

The result of the ballot for the formation of the National Union of Mineworkers, which showed 430,630 votes for the scheme and 39,464 against it, brings to an end a long history of negotiation and division between the unions in the various coal-producing districts. The result was a foregone conclusion. The principle of establishing a single union was accepted by the Mineworkers' Federation at their conference in 1942, and the constitution of the new union was approved by a special delegate conference in Nottingham in August. Two surprising features of the ballot however were, first, the relatively small poll—230,000 miners did not vote—and, secondly, the large favourable majority in the Nottinghamshire district, where opposition had been expected, on the ground that the merger would

bring them down to the level of the poorer districts. The new union will have about 700,000 members; it will elect a full-time president and general secretary—the present officials will continue in office for the time being; it will start with a fund of £500,000, raised from members' capitation fees, and will collect contributions of 4½d. a week from adult members and 2½d. from junior members. All questions of industrial policy, including strike action (which will only be taken if agreed on by a two-thirds majority on a national ballot), will be determined centrally; the district associations, to be known as area councils, will continue to deal with purely local negotiations and carry on their friendly society activities. The miners' decision is welcome; it is indeed overdue. The placing of wages, negotiation and arbitration machinery on a national basis had rendered completely illogical the continued loose federal structure of the union. What is needed now is for the scheme to be translated from paper into practice, by the speedy reorganisation of the union, for the miners' leaders to show statesmanship and responsibility in speaking for their united membership, and for the rank and file of the miners to respect the authority of their new union.

Industrial Injuries

The Government's Industrial Injury Insurance scheme had a very mixed reception on Wednesday, the first day of the two-day debate in the House of Commons. The proposals, which Mr Morrison described as “a revolutionary advance” and a departure from the “fundamentally Victorian conception” of the old scheme, were generally welcomed in principle, especially by Labour MPs, many of whom have had first-hand experience of the defects of the existing system. Mr Quintin Hogg, however, criticised the whole basis of the new proposals. He objected to the linking of compensation with insurance, and he deplored the abandonment of the relation between compensation and earnings. The Labour Party—somewhat surprisingly, since this is in direct opposition to the evidence supplied by the Trades Union Congress to the Royal Commission on Workmen's Compensation—does not criticise the scheme on these grounds. Mr Grenfell levelled his main criticism at the inadequacy of the proposed rates of benefit, and held that workers should not be expected to contribute to the scheme unless the rates were improved. Sir William Beveridge, whose original proposals were on very different lines, welcomed the proposal to divorce compensation from earnings and to introduce a flat rate of benefit; but he joined with Labour MPs in criticising the suggested amounts of compensation and the departure from a subsistence basis. This criticism, which can equally well be applied to the whole insurance plan, is fundamental; and unless the Government agrees to a revision of the proposed rates there is a danger that the opposition to the whole scheme may be formidable. Workmen's compensation is, of course, only one side of the picture. Equally important, and equally urgent, as is shown from the Factory Inspector's Report (described on page 649) is the need to prevent accidents in the first place, and later, to rehabilitate injured workmen, psychologically as well as physically, and to enable them to resume employment as rapidly as possible.

The New House of Commons

The Select Committee on the rebuilding of the House of Commons has produced its report with commendable speed. The recommendations follow very closely the arguments put forward during the debate a year ago in favour of harmonious reconditioning rather than novel reconstruction. Once the decision to limit rebuilding to the portion destroyed or damaged by enemy action had been taken, there could be no thought of departure from the late Gothic architecture of the rest of the Palace of Westminster. Any modernist experiment would be quite incongruous. Limitations of ground space restrict total accommodation to very modest proportions, but it is not for this reason that the Committee has decided against any increase in the number of seats available for members. The next House of Commons will have 640 members and seating accommodation for only 437. It will preserve that atmosphere of intimacy which was so much valued in the old building. Sir Giles Gilbert Scott's plans make no concession

to the fashion for amphitheatrical legislative chambers recently adopted overseas. Structural economies will provide additional space for interviewing rooms, and for a considerable increase in the number of seats for “strangers” and pressmen. The exterior will conform in design to adjoining courtyards, and will be constructed of selected Clipsham stone; panelling and joinery will be of English oak. There will be no stained glass, and the over-elaborate enrichment of the old ceiling and walls will be replaced by ornament of simpler character. Dr Oscar Faber's report on the heating and lighting of the Chamber makes proposals that should add greatly to the comfort and efficiency of members. The old system encouraged hotheads with cold feet; the new one is designed to reverse that tendency.

Air College

A new departure in scientific education has been proposed by an inter-departmental committee, headed by Sir Roy Fedden, who for 24 years was chief engineer of the Bristol Aeroplane Co. The committee have recommended, and the Government accepted the principle, that an independent college of aeronautics should be founded to train the new leaders in British aviation. The college will be used by about 300 students of post-graduate standard, most of whom will be attending short refresher or specialist courses with about 100 students on two-year courses in the engineering, technical and scientific aspects of aeronautics. This scheme, which would begin at the RAF Station, Abingdon, and would later move to its own buildings in another part of Berkshire, would cost about £3½ million in the first five years, including capital outlay and on the assumption that the college would stay at Abingdon for two years. The Committee have recommended that most of the cost should be borne by the Exchequer, but clearly some fees should be paid to the college for students from the Services and for students sent from the aircraft industry. At the same time, there are strong reasons why students entering the college on their own initiative, after the long preliminary training of an engineering or scientific degree, should be encouraged by state bursaries or by very low nominal charges. The novelty of the proposal, however, lies chiefly in the fact that it will be affiliated to no existing university. Even if the difficulty of choice between rival claims is admitted, the wisdom of founding yet another centre of aeronautical research is open to question, since it is liable to complicate even further the problem of integrating scientific progress. The closest collaboration with industrial, military and university research will therefore be imperative if the taxpayers are to be sure that this comparatively large outlay on higher education is going to be spent in the best possible way.

Football Pools

The proposal emanating from the Football Association that betting on match results by means of football pools—legally classed as “skilled selection”—should be prohibited has been given considerable publicity and has already gained some support. The objection raised by the FA is based on the principle that a sport in which the returns to clubs and players are strictly limited by agreement should not be the source of large profits to outside individuals. The Football Association is right about the large profits. In spite of the fact that football pool promoters have agreed to limit profits to 5 per cent of total income, the 5 per cent is often calculated after commission and expenses have been deducted. With a pre-war turnover of between £40 and £50 million a year, football pools still pay a considerable dividend. The wartime ban on posting coupons has not only saved manpower but has helped to cut down the turnover of the pools to something like £8 million a season. This figure will undoubtedly expand enormously when the war comes to an end and the ban is lifted. Any proposal to force prohibition on an unwilling people, however, would invite disaster. On past experience, attempts to stamp out wasteful habits, whether of drinking or gambling, by prohibition are destined to fail. Such a policy would serve only, as prohibition of street-betting has done, to bring the law into disrepute and to widen the gap between people and government. Efforts to

prohibit football pools in Sweden in the early 1930's have already proved the uselessness of compulsion. The solution reached in that country was to limit football pool betting to a single government-licensed company, whose residual profits were used to develop all kinds of public facilities for sport and recreation. In this country, many would feel strongly opposed on moral grounds to the disguised participation of the state in a business which profits from human weakness. For this reason, a more practicable solution to the problem of controlling large profits made by private interests might be to put a heavy tax on football pools. Mr Churchill's betting tax of 1927, aimed primarily at horse-race betting, was a sorry failure; it realised barely £2½ million out of an estimated £6 million annually, and was widely evaded before it was finally abandoned in 1929. But a tax on gambling which of necessity is conducted by post is another matter, and the Football Association would do well to consider whether it would not meet their objections to the present system.

Planning Merseyside

The physical reconstruction of the face of Britain should be regarded not merely as a difficult task for the experts and the authorities but as a challenge to the initiative and ingenuity of the ordinary citizen. Between the wars town-planning was hardly a subject for popular participation. The shape and size of a town, its growth or decline, its buildings and parks, its amenities and facilities, were factors beyond the control, and often beyond the interest, of the average resident. Side by side with the present opportunity has come a new public enthusiasm, which many voluntary societies are trying to put to practical use. Local authorities should certainly give the amateur planner every encouragement. A good example of how to give practical direction to popular enthusiasm is provided by the competition for replanning Merseyside, recently organised by the Merseyside Civic Society and the *Liverpool Daily Post*, and the public discussions which have developed from it. These revealed a widespread desire to protect Liverpool's centre, to increase recreational facilities and open space, to co-ordinate the municipal transport systems, to widen roads and introduce ring-roads, and to reduce dirt and overcrowding. The public's suggestions included the regional control of transport and public utilities, and the central control of Merseyside's town-planning. The winning entry in the competition advocated the creation of a Merseyside County Council. In grasping the need for such administrative changes, the amateur often has advantages over the professional, and to pick the public's brains can prove profitable as well as desirable.

Shorter Note

London fire-guards are being reduced by half, or more than half in some cases. This new Order, announced by Mr Morrison last week, will reduce the gap between the London area and the rest of the country, where fire-guard duties have already been completely relaxed. The new Order will apply to all fire-guards paid and unpaid (i.e., receiving the flat rate of 3s. per night) but not to the street fire-parties who already sleep at home and turn out only when there is enemy activity in their neighbourhood.

Letters to the Editor

The Coal Industry

TO THE EDITOR OF THE ECONOMIST

SIR,—In your issue dated October 28th, Mr Charles A. Liddbury expresses his considered opinion that "for psychological reasons" nationalisation of the mines is necessary.

Mr. Liddbury's view is apparently based on the alleged hereditary succession to control of the industry and on what he describes as "the fixed attitude" of successive generations of those controlling the industry. I share his dislike of the hereditary selection of those responsible for the management of industry (and warmly welcome your pressure for a more enlightened policy in the appointment of directors), but I suggest that it is misleading to contrast the coal industry with a "modern progressive business." In the coal industry, as in other industries, there are progressive undertakings and others; it may be that the movement towards more suitable boards of directors has progressed more slowly in the coal industry than in some others, but it would not be difficult to point to colliery companies which in efficient operation, development of research and provision of welfare facilities compare favourably with undertakings in other industries. It would surely be a great mistake to nationalise a major industry by reason merely of an alleged weakness in the appointment of directors.

In 1939, the British coal industry was free from control, except in regard to safety and selling prices. Since that date there have been the following extensions of control, which might (apart from the nation's need for coal) have been expected to remove or reduce the "psychological" objections of mineworkers to working for private profit:—

- The restriction of the profits of the industry to a fixed and moderate level.
- The acquisition of minerals (and thus control over their development) by the Coal Commission.
- The inauguration of a Ministry of Fuel and Power, with full powers to control all colliery operations and with regional organisations dealing with production and labour problems at all collieries.
- The installation of complete conciliation machinery.
- The Essential Work Order and the National Arbitration and Conditions of Employment Order, closely controlling conditions of employment and restricting the powers of employers.
- The appointment of Pit Production Committees, with direct access to officials of the Ministry of Fuel and Power.

It is clear that whatever the position may have been in 1939, it is no longer true that those employed in the industry are unable to have their grievances redressed or are justified in feeling a sense of frustration or thinking that their efforts are for the benefit of private individuals.

Moreover, wages have increased by approximately 100 per cent. The latest average wage quoted by the Minister for the industry is £6 per week; as this includes all the lower-paid surface workers and youths, it is clear that the wages of adults working underground are now at least high enough to compensate for the disadvantages of underground work.

What is the result of these changes? A falling output, heavy absenteeism, strikes, go-slow campaigns, non-cooperation and refusals to refer disputes to the conciliation machinery; possibly even more serious are the vicious attacks on conditions in the pits, which inevitably hamper the recruitment of boys and youths which is vitally necessary, however the control of the industry may be vested. It is probably true that large numbers of miners are not directly involved in these unfortunate events, but the fact remains that the recalcitrant minority enforces its will.

Does this history support the view that nationalisation would yield the desired results? The miner does not ask for nationalisation in the community's interests; he asks for it as the road to higher wages for less effort. It becomes more and more likely that if nationalisation of the mines does occur, the miners will be extremely disappointed with the results, and troubles within the industry are likely to be more serious than any now being experienced.

I make no pretence that the management of the British coal industry has not justified criticism in the past or that there is not urgent need to press for a forward and enlightened policy. Furthermore, I accept the test of the community's interest as the deciding factor in determining the methods of organisation of the industry. It would, however, be fatal to remove the competitive incentive from an industry on which so many other industries are dependent.—Yours faithfully,

COLLIERY DIRECTOR

The French Currency

TO THE EDITOR OF THE ECONOMIST

SIR,—Your Note, "No Deflation, No Devaluation," which appeared in your October 28th issue, quotes me as the author of statements which I did not make. As a matter of fact, the statements which I actually did make not only differ as far as their text is concerned, but they have also quite different implications.

Although I was aware that the acoustics of the Grand Amphithéâtre de la Sorbonne, where I delivered my lecture, were not perfect, I would never have thought that they were so imperfect as to mislead your informant into the "quotations" which you published. I am the last to object to being criticised for something I said, but I certainly object to being criticised for something I did not say.

First, you have quoted me as saying that France's malady was due rather to the contraction in production than to the inflation of the currency. I did not make such a statement. Moreover, I would disagree with such a statement. I stated specifically:

It is difficult to assess to what extent prices express the over-supply of currency and to what extent they express the temporary lack of goods.

Secondly, you have quoted me as saying that the principal remedy should be "gradually to restore the wealth-producing machinery." I did not make such a statement. I said:

Inflation is a terrible malady which may be cured by an appropriate treatment, by a combination of far-reaching measures, political, economic and financial.

Thirdly, as regards the rate of exchange the various quotations of your informant constitute neither a literal translation nor a correct interpretation of what I said. The general philosophy of my opinion on the subject is expressed in part in the following sentences of my exposé:

The exchange rate of a currency does not express the comparison with its former value, but with the present value of other currencies.—*France has been issued in order to produce goods which were delivered to the Germans, but pounds and dollars have been issued in order to produce goods which were hurled at the Germans.* From a moral and a military standpoint, the difference is no doubt considerable; from a monetary standpoint, it is not, except in so far as the future French productive capacity has been more affected than the future British and American productive capacity.

Fourthly, you have quoted me as expressing opposition to "any over-hasty measures of deflation." The wording which I use in French was: "déflation brutale," which has the meaning of "violent deflation," quite different from the meaning of "over-hasty." The opposition, which I expressed very clearly in my exposé, was not directed against immediate action, but against too drastic an action.

Fifthly, you referred to me as an official apologist. I have no doubt that those who know me personally would readily vouch for the fact that I have never expressed an opinion other than my own and personal one. When I stated at the beginning of the lecture: "If I was an official spokesman, I could not express myself freely and my exposé would perhaps lose in interest what it would gain, at least I suppose, in authority," I was stating a pure fact and not using common phraseology. The text of my lecture was known to no one prior to its delivery.—Yours faithfully,

Paris

ANDRÉ ISTEI

[Our comment was based on an agency report, as published in the press. M. Istel's letter underlines the necessity for a speedy removal of the restrictions on travel and communication between London and Paris, if misunderstandings such as this are not to arise.—EDITOR.]

AMERICAN SURVEY

Ins and Outs

A significant feature of the Congressional elections has been the rejection of some of the more prominent of the former Isolationists. Senator Nye in North Dakota, Senator Danaher in Connecticut, Representative Hamilton Fish in New York and Representative Stephen Day in Illinois have gone down to a defeat so marked that it is likely to prove a deterrent to other politicians. The election results leave no doubt of the public's resolve to have done with Isolation and Isolationists. The victories of Mr Roosevelt and Senator Scott Lucas in Illinois attest the failure of even the powerful *Chicago Tribune* in the traditional citadel of the creed. The reproach of Isolationism was sufficient to defeat Senator J. J. Davis in Pennsylvania, whose tenacity in holding to office through the decades was proverbial. Senator Taft has retained his seat in Ohio. More widely welcomed was the return of Senator Wagner (New York), author of the Labour Relations Act and a pioneer in social insurance legislation. The vigour of the new feeling for international co-operation which is abroad in the Far West was demonstrated by the success of Mr Wayne Morse (Representative), who succeeds the bitter obscurantist, Mr Holman, as Senator from Oregon. Mr Morse had the distinction of being one of the few Republicans to be backed by the CIO. A gifted young Democrat, Representative Fullbright, whose Resolution has already made his name famous, comes to the Senate from Arkansas. In Connecticut the combined efforts of the Democrats and of the Political Action Committee failed to defeat Mrs. Clare Luce, who beat her woman opponent by 3,300 votes, although the State went overwhelmingly Democratic.

Lend-Lease: The Second Phase

A dispatch by Mr Arthur Krock, of the *New York Times*, has put the most prejudicial interpretation possible on Lord Keynes' negotiations for an extension of Lend-Lease during the Japanese war. According to Mr Krock, who is the first to lift the veil of official secrecy, Mr Churchill proposed to Mr Roosevelt at Quebec that Britain should receive \$6.5 billion of Lend-Lease, of which \$3.5 billion was to be of a non-military nature, and "open for re-sale in her export trade." The latter figure has already been reduced, Mr Krock reports, to \$2.5 billion. Mr Krock goes on to suggest that Mr Roosevelt's sympathetic reception of this proposal may have misled the British, and points out that as the unexpended Lend-Lease appropriation at this time is only \$5 billion, of which most is already earmarked, Congress would have to appropriate fresh money to finance this second phase of Lend-Lease, as well as approve the removal of the ban on Lend-Lease goods entering into British exports. The mischievous effect of this dispatch lies, not so much in the premature estimate of the amounts involved, but in the completely false suggestion that Britain hopes to re-establish its export trade by the direct re-sale of American Lend-Lease goods. A large part of the non-military section of Lend-Lease consists of food and petroleum, of which there will be a severe shortage in this country, and which will be needed here if the war against Japan is to be effectively prosecuted. And of the rest, there is no question of the direct re-sale of American goods in the form in which they are received. It is a question of whether British goods must be withheld from export, as at present, because a small part of their value consists of raw materials that have been obtained under Lend-Lease—a very different thing from the meaning that will be attached to "open for re-sale" by the readers of Mr Krock's column. Indeed, the present ban goes still further. It not only requires that American materials should not be present even in the smallest quantities in British exports, but forbids the export of wholly British products similar to those received under Lend-Lease; and puts the revival of the export trade at an intolerable disadvantage. The creation of a new basis for the second phase of Lend-Lease obviously will have to secure

the sanction of Congress. Under the most favourable circumstances this might have been difficult to secure. Prejudgment of the issues involved, on the basis of this malicious report, will fortify the belief that the United States is being asked to conduct an "international WPA." It is fortunate, at least, that Mr Krock's revelations came too late to make Lend-Lease the subject of campaign misrepresentations.

The Republican Future

The Republican Party has suffered its fourth Presidential defeat in sixteen years. Neither Mr Hoover, Mr Landon, Mr Willkie, nor Governor Dewey proved capable of leading the party to victory over Mr Roosevelt. This is not a record calculated to maintain the zeal of the party's workers or the confidence of its backers. The Presidency is the great prize in the electoral system, not only for the patronage it dispenses, but for its decisive effect on local politics and national policy. To be out in the wilderness for sixteen years is a new experience for the Republicans. It should prove sobering. Some of the responsibility will be laid at the door of the defeated candidate. Governor Dewey was never very popular with the party machine; he was "drafted" because he convinced the bosses that he could win the election, not because he had endeared himself to the party. But, just as it would be a mistake for the Republicans to delude themselves into believing that their misfortunes are merely the result of an unlucky choice of candidates, and an unluckier choice of opponent, it would be wrong for outsiders to underrate the vitality of the Party.

**IF YOU
CABLE •• THEN —**

Don't send jokes which may not be understood. Delay is caused in checking back messages which the receiver fails to understand. Mark your cable 'VIA IMPERIAL'

EASE THE BURDEN

It is a useful corrective to recall that after Al Smith's disastrous defeat in 1928, the imminent dissolution of the Democratic party was prematurely predicted. The Republican party is not dead; but if it is to survive it may need a blood transfusion. This was Mr Willkie's great thesis in the year before his death. In the last two decades the Republican party has become a petrified forest; the trees are imposing, but there is no sap in them. It has failed to keep pace with the transformation of the subject-matter of public affairs which has been Mr Roosevelt's most significant domestic achievement. Had Mr Willkie lived, it cannot be doubted that he would have initiated a new crusade to cut away the dead wood and make the party a living force. Without Mr Willkie to drive home the moral, even this bitter lesson may go unheeded. But it is too soon to be sure that worthy followers of Mr Willkie will not be forthcoming, or that they will not attain a more decisive place in the party's counsels.

* * *

The Ghost of Zinoviev

Izvestia chose the closing week of the election campaign to announce joyfully that Mr Roosevelt's return was secure

and that Mr Dewey's chances were negligible. Displaying an enviable freedom, not only of opinion, but with the facts, it included the *Herald Tribune* as one of Mr Roosevelt's supporters; denounced elements in the Republican party as not only Fascist, but pro-German; and concluded by the sensational suggestion that to retrieve their waning fortunes the Republicans would stage a fake attempt upon the life of their own candidate, which was to be ascribed to the Communists and submerge President Roosevelt at the polls. American politics are notoriously heated, but they are seldom carried to such lengths. This lively account makes British reserve on the subject look a trifle old-maidish. Distance, apparently, lends an immunity to the anxieties felt in this country. British comment has been meticulously pruned, from first to last, to avoid the slightest grounds for any charge that the right of Americans to choose their own President was being influenced. The *Izvestia* writer, who predicted another Zinoviev letter, or Reichstag fire, seems not to have realised that, had the article appeared sooner, it might have been used against the President with fatal effect; or that had Governor Dewey been elected, Russian-American relations might have been strained by the suspicion that Moscow had less than perfect confidence in the new Administration.

THE WORLD OVERSEAS

Canada and Newfoundland

(From Our Ottawa Correspondent)

October 26th

THE acquisition of Canada of rights for ninety-nine years to control and operate Goose Bay airport in Labrador for defence purposes may be the beginning of a new pattern of relations between Canada and Newfoundland. These relations have suffered from years of neglect, marked in modern times mainly by the dispute over the boundary of Labrador which the Privy Council arbitrated in 1927. The Labrador air-base lease is a new point of departure for Canadian policy, for it means that Canada has assumed long-range obligations for the defence of Newfoundland territory. In bringing Newfoundland and the Coast of Labrador into the scheme of Canadian defence, a pattern which has developed during the war will become permanent. It is a long way, though less than forty years in time, from the discharge by British forces of responsibilities of defence in Canada to the present position in which defence obligations in Newfoundland territory are assumed by Canada.

Goose Bay airport is, of course, an important air base on the great circle route for aircraft across the North Atlantic. Canada's lease does not cover commercial use of the base. Civil aviation rights will be determined later, under a clause of the agreement which stated:

The development of the air base being primarily for defence, the air base and its facilities shall not during the war be used for civil or for commercial operations (except where such operations are related to the war effort). The question of its use or their use for civil and commercial operations after the war, and all matters incidental thereto, will form the subject of discussion between the Governments of Canada, the United Kingdom, and Newfoundland, and this discussion will take place not later than twelve months after the war.

Newfoundland and its Labrador territory assumed new strategic importance in the Battle of the Atlantic after the fall of France. Canadian troops were dispatched immediately to Newfoundland, where the great Gander Bay airport served as a stopping point for aircraft flying to the United Kingdom and as a base for ocean patrols. The United States secured three bases in Newfoundland in the 1940 transfer of over-age destroyers. The new Canada-United States joint permanent defence board assumed the planning of defence over the whole region. Newfoundland troops were amalgamated with Canadian troops. Canada built installations, including two air bases, of which Goose

Bay airport in Labrador cost \$25 million. The Goose Bay project was started in September, 1941, but only now has a formal agreement covering its uses for defence been arranged. One point worth noting is that Canada dealt with the Newfoundland Commission, the temporary successor to autonomous government, while the United States leases in Newfoundland were secured from the British Government.

Implications regarding the future of Newfoundland and Labrador have recently come under study by a wider audience than ever before. The Peace of Paris of 1763, which dealt with the settlement of British North America after the conquest of French Canada, recognised Labrador as part of Newfoundland. The motive, as it appears from the record, was to eliminate French competition in the fisheries in Labrador waters, based on Newfoundland. Captain Thomas Graves had the Coast of Labrador added to his governorship of Newfoundland, through the issue to him of a new royal commission. French Canadian interest in salmon and seal fisheries in the Gulf of St. Lawrence as far as the Strait of Belle Isle formed the basis of Quebec claims to Labrador, and the territory was returned to Quebec in 1773. The following year, the Quebec Act of 1774 recognised the Quebec claim to Labrador. But, under Quebec, the whale and cod fisheries of the Atlantic coastal water of Labrador suffered neglect, and Newfoundland's case for a return of Labrador was recognised in the Newfoundland Act of 1809.

The boundary of Labrador had never been clarified, and in 1927 Canada and Newfoundland joined in requesting the Privy Council to define it. There was consternation in the Canadian House of Commons when the Privy Council decision was announced, and defined the Coast of Labrador as "the watershed of rivers falling into the sea on that shore." Instead of a narrow coastline including a few miles used by cod fishermen to dry their catch, the territory took in 110,000 square miles, including 60,000 square miles of timberland and the Hamilton River watershed. The late Right Hon. Ernest Lapointe, Minister of Justice, warned the Canadian Parliament that since Canada had agreed to accept arbitration, the boundary was settled.

One suggestion advanced was that Canada should purchase Labrador. In 1869, Newfoundland had rejected a

proposal to enter the Canadian Confederation. Since then, the question of Newfoundland joining Canada has not been raised seriously. In July, 1943, Mr Mackenzie King said:

If the people of Newfoundland should ever decide that they wish to enter the Canadian federation and should make that decision clear beyond all possibility of misunderstanding, Canada would give most sympathetic consideration to the proposal.

There the matter stands. Newfoundland obtained representative government in 1832 and lost it in 1838, regained it in 1842 and lost it in 1933. Culturally and economically, Newfoundland has moved slowly towards the Canadian orbit. The territory is part of the Canadian banking system, and Canadian currency is legal tender there. Canadian educational standards exist there and the United Church of Canada includes Newfoundland within its organisation. Public opinion both in Canada and Newfoundland regarding union is difficult to gauge as a yardstick of future prospects. Official opinion in Ottawa tends to regard the question as something which Newfoundland should raise; Newfoundland opinion is believed to hold many reservations about joining Canada. Meanwhile, the 99-year lease of Goose Bay airport involves long-range defence co-operation which may in the course of time foster public opinion for union. But until then the main concern between Ottawa and St. John's will be friendly co-operation.

Spain Without the Axis

THE liberation of France has stopped Spain's trade with Germany, but it has also ended, at least temporarily, Switzerland's trade with Spain as well as the transit trade of Swiss exports through Spanish ports. Spanish minerals such as wolfram, iron pyrites, copper and mercury, which played an important part in Germany's supplies, are of no great importance when compared with the large output of these minerals in the allied countries. If all foreign trade between the United Nations and Spain were stopped, it would hardly affect the supply position of the United States and Great Britain. Spain, however, would feel the loss of imports, unless the Latin American countries increased their exports. Even after allowance has been made for the general smallness of international trade in wartime, Spain's foreign trade has been extremely small; and the most important branches of Spain's industry depend on foreign imports of coal, coke, oil, cotton, machinery and capital equipment. If there are no wheat imports, the country's nutritional standards, which recovered slightly in 1943, would again decline.

Wartime difficulties in foreign trade relations had caused the Franco regime to adopt a policy of self-sufficiency which involved greater changes than the same policy in Germany or Italy. Once the regime had decided on a policy of self-sufficiency, the main problem was whether it could be achieved by bringing agricultural production up to modern standards, or whether a thorough industrialisation had first to be attempted to enable agriculture to be supplied with modern machinery. Restrictions on foreign trade have more or less forced a solution to this problem, and Spanish industrial and agricultural policy has, in the main, been dictated by the need to replace lost or banned imports.

Under the Falange administration far-reaching plans have been made, but the actual results of the plans have been small. Even to-day, production in agriculture and industry as a whole is behind the pre-civil war output. The 1944 wheat harvest, although larger than in 1943, and thereby allowing an increase in the bread ration to 5.3 ounces a day, was only three-quarters of the ten-year average before 1936. Bread and fodder cereals are at least 1,000,000 tons short.

As has been the experience of other countries, the policy of agricultural and industrial self-sufficiency made continually conflicting claims on natural resources and on the available labour force. In Spain, everything depends upon an increase in coal production, which actually reached a total of 10.8 million tons in 1943, against a peak production of 7.3 million tons in 1935. Of this total, 1.2 million tons are brown coal. In spite of large iron ore resources, the output of pig iron and steel is still far below the peak production of 1929. It is the shortage of coke and the inability to renew blast furnaces and steel plants which have prevented an increase in production. Yet, under these conditions, the authorities actually planned to produce synthetic oil, which was to reach by 1947 an annual output of some

300,000 tons, or 37 per cent of the total pre-war consumption of oil. Part of this synthetic oil is to be produced from shale and part from lignite. There are large resources of shale and lignite in Spain, but the available labour force is already fully employed in mining lignite for use as solid fuel. The manufacture of synthetic oil demands, of course, considerable electric power, and the plan includes, therefore, the construction of electric power stations, which are also to supply plants for the production of fertilisers. At the same time, another plan has been published for the electrification of more than 4,000 kilometres, or 30 per cent, of the entire railway system, which means that when other plans have been allowed for, the present annual generation of 4,500 million kwh. would have to be increased to at least some 20,000 million kwh. No doubt German interests were instrumental in these plans. The technical equipment and the leading engineers for these vast projects would have to have been supplied by Germany.

Only where supplies of raw materials were restored to pre-war figures was any industrial recovery noticeable. This happened in the textile industry. During 1943, imports of cotton reached four-fifths of pre-war imports, and wool supplies were sufficient from home resources. The sheep population, with 23 million heads, is actually the second largest in Europe, but the wool is inferior and it was reported that there had been negotiations with Australia for the import of high-quality Australian wool.

It is clear that the changing war situation has affected many industrial and agricultural plans, but it is equally clear that the regime is intent on continuing all the different and conflicting projects after the war. During recent years a considerable number of new industrial companies have sprung up. The total number of registered companies increased from 1,539 in 1940 to 2,709 in 1942. During 1943 there was a reduction to 2,004, although the total capital fell only from 2,245 million pesetas in 1942 to 2,190 million in 1943. This reflects industrial concentration enforced by the "Institute of National Industries." It has become a familiar process for the companies concerned in leading industries to agree on a policy of co-ordinating their activities, ostensibly in the national interest. This reflects the growing control of the state over private enterprise, which in certain instances has retained only nominal control.

Under these conditions labour has lost even its nominal freedom of movement, and it is now the normal procedure for the Labour Minister, in collaboration with the army and the compulsory syndicates, to direct large bodies of workers into certain industries. A short time ago, orders were issued for the coal mining industry to be supplied with another 5,000 workers. This method no doubt contributes much to the low efficiency of workers under the Falange regime.

Conflicting industrial and agricultural programmes, and particularly the continued decline of agriculture, have led to the flight of peasants and agricultural workers from the land. Attempts to stop this were unsuccessful, and it was finally acknowledged to be necessary because of the large industrialisation programme. The production estimates, which are certainly no underestimates, show that in general the productivity of labour must have declined. Continued political opposition to the regime may be one cause and undernourishment another, but the spread of bureaucracy certainly plays an important part in the fall in productivity.

Growing state control of industry and agriculture have made it necessary for incentives to be provided in the form of production premiums. The low productivity and general backwardness which are characteristic of industry is making it difficult for the regime to equip the armed forces. Purely civilian planning seems to have interfered with the production of war material, and General Franco himself some time ago decreed the creation of a "High Council" for the armament industries, which is not unlike

the economic general staff under Goering in Germany. The chief of the General Staff of the armed forces has been appointed president, and the most important members are the president of the "Institute of National Industries" and representatives of the army, navy and air force and industrial experts. This seems to indicate that since this spring General Franco thought it necessary to subordinate all industrial activities to military necessities in preparation for the expected change in the military situation.

Russia at War

Stalin's Review

MARSHAL STALIN'S speech on the anniversary of the Russian Revolution was in part a routine review of military and political situation. Its chief interest lay not in his account of the military operations, but in some political statements and understatement, as well as in some significant omissions. Politically, the most striking passage was that in which the Russian leader described Japan as an "aggressive nation." He did this *en passant*, when speaking about the "historical law" according to which the freedom-loving nations are usually less prepared for waging war than the aggressor nations. This passage of Marshal Stalin's speech was in striking contrast to the studied neutrality of his very few previous utterances on Japan. It tallied well with references that had appeared in the Russian press to the "sacred Russian soil of Port Arthur," conquered by Japan forty years ago. It would probably be incorrect to draw from this any sensational deductions about Russia's imminent entry into the war against Japan. But one conclusion can safely be made: Russia has switched over from absolute neutrality in the Pacific conflict to an attitude of what may be called moral co-belligerency.

The Russian public must have taken Marshal Stalin's reference to Japan as a sure sign that the Alliance is spreading into new fields. He did his best to bring home to his listeners the fact that the Alliance is not only widening, but also gaining in stability:

THREE NUNS SAVES MONEY

—because of its
SLOW-BURNING CUT

There are two special reasons why 'Three Nuns' Empire Blend Tobacco saves the smoker money. It is scientifically cut to burn slowly, each ounce lasts longer, you smoke fewer ounces a week. It is made from fine leaf which is favoured by the lower duty on Empire Tobacco. To enjoy the fullest pleasure of smoking at a moderate cost, take to 'Three Nuns' Empire Blend.

The alliance of our country, Great Britain and the USA is based not on accidental, ephemeral motives, but on vitally important lasting interests.

His words that "the Alliance will stand up to the test of the concluding stage of the war" can be read as a cautious rider. The Russian public, which is accustomed to read between the lines of the leader's speeches, may well wonder what lies beyond "the concluding stage of the war." Here Marshal Stalin refrained from outlining far-reaching projects. He emphasised the importance of the Dumbarton Oaks schemes, and the need for the new international organisation to be equipped with full powers to prevent aggression. But he made no fetish of international machinery:

The activities of this international organisation . . . will be effective if the Great Powers which have borne the brunt of the war against Germany continue to act in the spirit of unanimity and concord. They will not be effective if this indispensable condition is violated.

The Next War

Marshal Stalin defined the task of the new international organisation in a way which some people will regard as too narrow. It is "to avert a new aggression on the part of Germany, or at least to stifle it at the very outset." The present war aim of the Allies is thus presented as the chief, if not the sole, bond that is to keep them together in peace. The positive tasks of economic and political reconstruction have been left out. Throughout the whole speech this war cast its shadow ahead to cover the whole period of the peace right up to the beginning of the next war. "Germany will be disarmed economically, militarily and politically"—the phrase reflects the Russian view on the right sequence of the various aspects of Germany's disarmament. But expectations that Germany, now rendered harmless, will not recover its power "after twenty or thirty years," were described as "naïve." The new international organisation should then be used in order to stifle a new German aggression "at the outset," that is, in order to make the future war as short and as little destructive as possible. The recurrence of war cannot be avoided, but wars can be replaced by lightning and not very costly punitive expeditions. This seems to be the main theme of Stalin's argument.

In domestic affairs the outstanding fact, duly celebrated by victory salvos in all the great cities of the Soviet Union, is that the whole of Soviet territory, including the lands acquired between 1939 and 1941, has now been cleared of the enemy. The purely defensive phase of the war is thus over. In connection with this, Marshal Stalin fed the Russian people's self-confidence when he termed the Soviet Union "the main opponent of Germany" in the battlefield, and supported this by comparing the 75 German divisions pinned down by the Allies in the west with the 200 German divisions pinned down by the Soviet armies. The Russian victories, he went on, were not only the triumph of Russian arms, but also the triumph of the Soviet economic and social system. Russia, he asserted, had surpassed Germany in economic strength, thanks to the stimulus given by the Revolution. This was the only context in which anniversary reminiscences mingled with present policies.

The most conspicuous omission in the speech was any description of the political situation in the liberated countries of Europe. Traditionally, when he spoke as the leader of the party, Stalin used to preface his speeches with surveys of the international political scene, and especially with reviews of the labour movements of the world. In his latest speech, however, he did not refer to these matters at all. He said nothing about the situation in countries where the Red Army had entered, though this entry has caused a political earthquake throughout the Balkans. It could almost be said that Mr Churchill's phrase—the war is becoming less ideological—might have been the text of Marshal Stalin's anniversary speech.

Make FUEL EFFICIENCY the basis of your INDUSTRIAL ECONOMY

New Textbook for Managements
and Engineers

THE ATTITUDE of industrial managements towards fuel economy has undergone a significant change since the Ministry of Fuel and Power first insisted on its urgency. At first the suggestions were adopted as a necessary evil, but it was soon discovered that fuel economy often carried with it a substantial reward in reduced production costs. Now, to meet the needs of industrialists, the Ministry has produced "The Efficient Use of Fuel," an all-embracing textbook on fuel utilisation.

OVER two hundred leading authorities have co-operated in writing this book. It collates information drawn from the vast experience accumu-

lated by technicians, lecturers and investigators who have had direct access to tens of thousands of industrial plants and have had the opportunity to observe an immense amount of experimental work in every type of organisation. The book, which contains 34 chapters and 303 illustrations, is published by H.M. Stationery Office at 12/6d net, 13s post free, and is now on sale.

FUEL ECONOMY is more than ever necessary, and the commercial advantages to be gained by a continued use of the knowledge amassed under war exigency will more than repay for the fuel-saving effort in which business principals have been, and are still, taking so successful a part.

France's Liberation Loan

THE first part of the French Government's plan of attack on the problem of redundant purchasing power was announced last week-end. It abjures such compulsory measures as those of the Belgian monetary plan, and relies on the voluntary co-operation of the people. The plan takes the form of an issue of 3 per cent National Loan, for which the lists opened last Monday. The terms of the issue are approximately in adjustment with open market valuation of French Government credit. The 3 per cent perpetual Rentes have recently been quoted at about 103 on the Paris bourse. No limit has been fixed for the new loan, but it has been authoritatively hinted that at least 100,000 million francs must be subscribed if it is to succeed in its purpose. That purpose has been variously defined. The official communiqué announcing the issue suggests that the loan is intended, not to meet the revenue requirements of the Government, but to absorb Bank of France notes. The French Minister of Finance, M. Leperq, appears to have placed a somewhat different interpretation on the issue. He is reported to have described it as "necessary to meet war expenses as well as urgent needs for social and economic reconstruction," adding that "it will also help in absorbing a large quantity of bank notes issued during the occupation." The two statements are not irreconcilable. The present exchequer position of the French Government is said to be favourable owing mainly to the response since the liberation to issues of

Treasury bonds. It follows that the receipt of anything like the suggested amount of 100,000 million francs from the new loan would have an immediate effect in deflating the currency, since it would enable the Government to repurchase advances from the Bank of France, and cancel notes to the equivalent amount. On the other hand, it is difficult to believe that the fiscal machine in France is at present in a position to provide a revenue equal to the existing and even more, the prospective outgoings of the Government. It is possible, therefore, that the immediate deflationary impact of the new loan may be followed by gradual re-expansion as subsequent deficits have to be financed by inflationary borrowing, and that after some delay, the proceeds of the new issue may in part be utilised in the way M. Leperq suggested.

The important aspect of the operation is its indication that the French Government have—no doubt for compelling reasons—set their face against compulsory measures of currency contraction. They are steering a course which the Dutch Government had already charted—on paper: that of appealing to the patriotism and good sense of the people "for the liberation of the national finances." Compulsory powers remain in reserve, and the official statement issued over the week-end threatened that "if the notes to be reabsorbed are not forthcoming for the new loan, other measures, less to the taste of note-hoarders, may be taken." Nor does the loan do away with the need for some operation for the conversion of notes. Large quantities of the old notes were taken away by the Germans, and by the active collaborators who fled with their masters, and these are finding their way to the free market in Switzerland. For this reason alone the French Government may be compelled to suspend the legal tender attributes of the notes in their present form, and either require their conversion into a new issue or, at least, their stamping with some distinctive mark of the new French authority. Measures taken for this purpose, however, need not, as in Belgium, be accompanied by a temporary and partial blocking of the existing currency, though as in Belgium they might well provide a useful item in the data that will be required by the French Government in its plans for assessing and taxing war profits.

The effectiveness of this funding operation depends upon the magnitude of the task to be performed. How much currency and other liquid purchasing power is it necessary to absorb? The object is to ensure for the French franc a purchasing power corresponding to the recently fixed exchange rates of 50 francs to the dollar and 200 francs to the pound. In order to assess the prospects of achieving this adjustment, allowance must be made, therefore, not merely for the inflation of currency and credit and the rise in prices that has occurred in France, but for the comparable changes in the countries with which the exchange has been linked. Allowance should also be made for the fact that during the immediate pre-war period the French franc was appreciably undervalued at the exchange rate of 176 to the £, at which it had been stabilised following the Reynaud devaluation; a figure of about 150 would probably have been nearer the economic parity. In other words, the rate of 200 francs to the £ now fixed should allow for a 33½ per cent deterioration in the French currency and price position relatively to that in Great Britain.

After the last war, these questions were discussed arithmetically, by the comparison of index numbers of prices and wages. In present circumstances, such calculations can be of only quite minor assistance, partly because accurate data are lacking, partly because they tend to ignore the great variety of circumstances that can, and do, so frequently alter cases. For what little they are worth, however, the comparison can be made on the basis of two sets of data that are available—the trends in the note circulation and in the level of wage rates. Since the end of 1938 the Bank of France circulation has been multiplied by about six; it has risen from 109,000 million francs to something over 600,000 million francs, and bank deposits have increased from 33,578 million francs to 106,930 million

(February, 1944), that is, about threefold. Over the same period the Bank of England circulation has risen from £504 million to £1,171 million, i.e., by about 2½ times, and British bank deposits from £2,553 million to £3,897 million, or about 50 per cent. The total of currency and bank deposits has risen about fivefold in France and by two-thirds in England. These comparisons would suggest that the withdrawal of 100,000 million francs will not be enough to achieve statistical equilibrium between the experiences of the two countries. It has been estimated that of the present Bank of France circulation of 600,000 million francs, some 200,000 million francs are hoarded. At least the whole of this margin of 200,000 million would have to be absorbed by the new loan, and other parallel measures in order to give France a currency circulation not greatly out of alignment with the external value given to the franc. That is twice the figure which the present loan is expected to yield. Nor does this rough comparison take account of the fact that the monetary circulation in France to-day has to serve a much smaller fraction of the volume of trade transacted in 1938 than is the case in Great Britain. In other words, even the withdrawal of 200,000 million francs from circulation would, on the available evidence, leave a considerable margin of redundant currency in circulation and, therefore, a persistent pressure on prices and stimulus to black market activities.

The wages equation appears to be much more reassuring. During the German occupation of France the general level of wages had been kept controlled at about 43 per cent above the end of 1938 figure. One of the first steps of the new French Government was to allow a general 40 per cent increase in wages as an essential adjustment to the rise in the cost of living. The present index of wages would, therefore, appear to be exactly double the end of 1938 figure. This compares with a figure of 145 for Great Britain. Allowing for the undervaluation of the franc in 1938, and for the subsequent depreciation in its exchange value, the French wages index should stand at around 190 in order to keep pace with the rise in the British figure. The difference between that and the actual figure of about 200 is not such as to cause concern; though here, again, it should be pointed out that wage rates are not necessarily a guide to

comparative weekly wage payments in the two countries; thus weekly earnings, as distinct from rates of wages, have risen by about 80 per cent in this country since 1938.

These quantitative comparisons cannot be driven too far. Even on the most mechanical versions of the Quantity Theory, the volume of money is not the only factor in the equation, and if the hoarded money can be relied upon to stay hoarded, then there would be no point in insisting on exact ratios. It is the volume of expenditure relatively to the goods available that matters, and that is more likely to be determined by the level of incomes than by the volume of money. Nevertheless, even the most sophisticated adherent of the new economics would not deny the danger that lurks in an excessive currency, and the comparisons of wage and price levels are instructive if they are used only to determine the rough order of magnitude of the excess.

In any case, the aim of the funding operation is not to bring about a final adjustment between the franc and the pound and the dollar. It is the more modest one of draining off some of the excess of purchasing power in the hands of the public. The attempt to handle the problem by voluntary means is commendable, but it would seem likely, on the basis of the information available, that more drastic handling than the Government are as yet prepared to give it will be needed. If the methods of voluntary co-operation are to be adhered to, the Liberation Loan should only be the first instalment of a note funding scheme. The second part of such a scheme should be a drastic measure of retrospective taxation of war profits. The third chapter of the plan for monetary rehabilitation, and by far the most agreeable to all concerned, must be the re-expansion in economic activity, and in the volume of consumer goods that must underpin the value of the currency. Owing to disrupted communications, dearth of raw materials and damage to factories, this third chapter will inevitably prove a long and difficult one. It is because of the magnitude of the task to be accomplished in restoring the volume of French production that the most sympathetic observer must take leave to doubt whether the voluntary plan launched by the French Government for funding the redundant part of the note issue will by itself be found adequate. It can—and is no doubt intended to be—only a beginning.

Business Notes

The Funds Advance

The decision to offer a 1½ per cent short instead of 2½ per cent medium loan has been, in part at least, responsible for a revival of interest in the gilt-edged market and for a very material improvement in turnover. There is also a substantial rise in prices of longs and a declining tendency in most of the shorter 2½ per cent National War Bonds. The reason for this is a last-minute decision to sell in order to increase holdings of the 1952-54 series, for which the tap closed on Monday. Now that this supply is cut off for the time being, a recovery in medium-dated bonds may be expected, and, about the end of the year, a seasonal fall in long-dated and irredeemable stocks. The improvement in the Funds has spread outwards into debentures, but, so far, preference shares have been scarcely affected. Meanwhile, the recovery in industrial equities has continued. The figures of *The Actuaries' Investment Index*, of which a selection is given on page 652, shows that a substantial part of September's fall was made good during last month. Since October 31st the figure of *The Financial News* shows a further appreciation of over ¼ of one per cent. This means that both prices and yields are, for this small selection of market leaders, back to end-August levels, but still some 4 per cent below the peak. The *Actuaries'* figures, for a much larger selection and made up only once a month, show a net fall from the July peak of some 2.6 per cent to end October. Present indications are that the rise will continue.

Rush for War Bonds

The last-minute rush for National War Bonds before the tap was turned off last Monday broke all records in the history of subscriptions to the Government's tap issues. In the week which ended last Tuesday the amount subscribed to the tap issues other than savings certificates was £126,417,199. Of this record total, £119,272,239 was subscribed to National War Bonds 1952-54. Not the least

interesting aspect of this extraordinary acceleration in the subscriptions to Government loans was its impact on the credit position. The authorities had prepared for a rush of this kind by keeping floating debt borrowing down to small dimensions. Last week the net borrowing from the banks and the discount market was kept down to £12 million, and this week the figure was £15 million, namely a £5,000,000 excess of Treasury Deposit Receipt payments over maturities and the now customary £10 million excess of Treasury bill payments. The banks offset their own and their customers' subscriptions for National War Bonds by encashing TDR's prior to their maturity. The disturbance of the last minute rush for National War Bonds was not, however, so simply segregated as to allow the pre-encashment of TDR's to achieve the whole, or even the bulk of the balancing operation. The funds required for subscriptions to the bonds were to a large extent mobilised by sales of slightly shorter dated Government securities in the market. The gilt edged jobbers probably found themselves carrying abnormal positions at the end of last week and the beginning of this; corroboration of this is provided by the keenness of the demand for loans from the Stock Exchange this week. The authorities have also neutralised the disturbance of subscriptions to National War Bonds on the credit situation by open market operations which appear to have taken the form of purchases of bills from clearing banks. By recourse to all these devices the exceptional turnover of money during the past week, though reflected in persistent demand for credit, has never led to stringency, and has not called for direct assistance from the authorities to the discount market.

Machine or Handmade Goods

The report of Sir Frank Platt's Textile Mission to the United States has not merely revealed a gaping disparity between the productivity of the cotton industries of Great Britain and America. It stands as a challenge to the traditional conception of many British industries engaged in the

production of consumers' goods that lend themselves to mass-production—that is, the concentration on specialities. The production of specialities, by definition, means production on a small scale; they offer little scope for mechanisation. Industrialists in the United States have successfully pursued the opposite policy of adopting large-scale, highly mechanised production methods wherever these could be applied. The enormous productive capacity of the United States is based on the machine rather than on the hand; the fruits of this policy have been a standard of living far above the British. It has brought the modern amenities, such as motor-cars, refrigerators and the rest, within the means of the lowest income groups. As the reaction to the Platt report in Lancashire has shown, the traditional British conception still exists. It is advocated by many more strongly than ever on the grounds that specialities whose costs embody a high proportion of skill—that is of labour—will stand a better chance on the export markets after the war than standardised articles embodying a high proportion of overheads. If the reward of skill by hand were as high as the reward offered by the machine, the argument would be valid. But in many products this is the exception rather than the rule. In any case, the argument in favour of specialities, as often stated, quite overlooks the fact that mechanised production in bulk demands a high degree of skill in the manufacture of machines and in the organisation of production, from the management down to the foremen. The export of skill, which is certainly desirable, does not necessarily mean the export of specialities. If the production process were viewed as a whole, instead of at the finishing-end, it would be seen that skill plays a vital part in American industries based on mass-production. In a sense, the criticism that British industries making consumers' goods cater only for the rich and the middle-classes is justified. With their conventional methods they will not bring the range of modern amenities—now accepted as a matter of course in the United States—within the reach of the lower income groups in this country for many years. Where the convention has been broken, as in men's suits and in women's dresses, the results have been highly successful. The sooner it is broken in other industries, the sooner the public will be able to enjoy good homes, furniture, motor-cars and the rest. This does not mean that there will be no further room for the more expensive specialities. On the contrary, there are still many industries in which the reward of skill by hand matches the reward of the machine.

Argentine Exchange Concessions

The Argentine Government has modified its hostility to the British investor. Indeed, to have persisted much longer in a policy as arbitrarily severe as the Red Queen's, in which "off with their heads" was the rule for British capital and earnings alike, would have ended all rational investment relations between the two countries. The British investors' chief interest is in the Argentine railways, towards which two concessions have now been announced. Last week it was stated that the railways may continue to charge the existing higher tariffs to the end of 1946 and may add a further 10 per cent on freights. But this does little more than keep pace with increased operating costs, although to accomplish even this may seem surprising. Much more important are the exchange concessions, rumoured on Monday and now officially confirmed after a short bout of market scepticism. The special rate for financial remittances to this country is reduced from 16.15 pesos to 14.15 pesos to the £, and the rate for the railways' purchase of urgent stores and necessities from this country is reduced from 15 to 14 pesos to the £. The change in the former rate is of great importance to investors, since its level determines the extent to which any earnings do in fact reach them. Previously it was highly unfavourable. The change means quite simply that the net profits received by London offices will be increased by about an eighth, so that there can hardly fail to be some gain to debenture and preference stockholders. The change in the rate for purchase of stores is much smaller, and this rate has, in any case, only a limited application to total purchases. Whether these concessions represent a genuine change of heart or merely a move of political expediency remains to be seen. The exchange improvement is carefully stated to be "temporary." Further, no noticeable improvement can yet be seen in the treatment accorded to the railways' capital assets, on whose satisfactory condition earnings must ultimately depend. There have been rumours of a reduction in the railways' liability for making

up wage retentions, concerning which the position remains obscure. But it must be remembered that the overwhelming and continuous rise in wage rates and the cost of materials, which has outpaced the permitted increase of railway charges, has prevented proper provision for the maintenance and depreciation of track and rolling stock, let alone their much-needed modernisation and expansion. The Argentine Government is in a position to revise any limited concessions it makes whenever expediency dictates; and past experience has not shown it unwilling to be wantonly capricious. So that for the time being the British investor would be well advised to regard the Argentine market as showing no more than an amber light.

The New Drachma

A new Greek currency is due to make its appearance at the end of this week. This is not too soon if the urgency of the situation is to be measured by the state of collapse of the old currency; but it may be too soon if the essential pre-requisite of a stable currency, namely, an adequate stock of commodities on which the currency can be spent, is to be satisfied. The Greek authorities in facing this dilemma have probably been pushed into action which might appear premature on the second count, partly by the advice of the British Treasury experts now in Athens, partly by an even more urgent consideration, the virtual annihilation of the old currency. To tide over the short "currencyless" interregnum the Greek authorities have this week decided to make available supplies of gold sovereigns provided by the British Government from its Middle East reserves. These coins were being sold this week through the Bank of Greece at the rate of 20 trillion (twelve noughts) drachmas to the sovereign. The British Military Authority pounds which have in the past three weeks provided the only other stable element in the circulation have changed hands at about six trillion drachmas this week, or about double the rate quoted last week. The new currency will be put into circulation in exchange for holdings of old drachma notes at the rate of 50,000 million old drachma to one new. The new drachma will be fully secured by gold and foreign exchange and will be given a rate of 600 to the pound.

Banks and Politics in Australia

Banking and currency provide one of the more inflammable topics of Australian political life. It has recently generated a good deal of heat again as a result of a pamphlet advocating the complete control of the banking system by the Federal Government circulated by the Minister for Home Security, Mr Lazzarini. Mr Lazzarini, who is also Minister assisting the Commonwealth Treasurer, attacked the private banks, which he accused of being guilty, at least technically, of "counterfeit coinage." This pamphlet has in its turn been attacked by Mr Menzies, the leader of the opposition, who said that the Prime Minister, Mr Curtin, must accept responsibility for the "clotted nonsense" published by Mr Lazzarini on banking policy. The furor caused by Mr Lazzarini's pamphlet has been sufficient to extract from the Commonwealth Government a statement that the banking legislation which the Government plans to introduce next year will not be based on the ideas set out in this publication. No hint of the likely character of this legislation has yet been given, but it may be assumed that it will conform to a well established trend—that of extending the functions of the Government controlled Commonwealth Bank at the expense of the privately-owned trading banks. Some perpetuation of the control over profits of the trading banks by the compulsory special deposit system is also likely to figure in the new legislation. The preliminary skirmishing on the proposals has already become apparent within the Commonwealth Bank itself as may be seen from the fact that the Government are not re-electing one of the industrial directors, Sir Clive McPherson.

Rouble and Lei

The Roumanian Minister for Finance and the Central Bank of Roumania announced on November 2nd, on the Bucharest radio, that all holders of roubles and Soviet lei were ordered to offer these notes to specified banks for exchange into ordinary Roumanian lei. The exchange rate

is lei 100 for one rouble and lei 5 for one Soviet lei; and the time limit for the exchange was fixed at December 1, 1944. This is the first statement on the fact that roubles, together with a special occupation currency, the Soviet lei, have been in circulation in occupied Roumania. During this war all armies of occupation have brought with them their special currency, and all exchange rates have had to be fixed arbitrarily because of the absence of free markets and free exchanges. Over-valuation of the currency of the occupying Power has been the rule, and the rate of exchange fixed by Russia in Roumania is no exception. Unfortunately, there is no possibility of estimating the approximate external value of the rouble or the lei. Yet even an arbitrarily fixed rate of exchange must have been based on some measure of the value of the currencies to be exchanged. Shortly before the war the quotation of Russian roubles and of Roumanian lei on the London exchange market or the Berlin Bourse worked out at one rouble, roughly equal to lei 26.6. Since the beginning of the war Roumanian prices have increased on an average at least four times, but nothing is known about the price development in Russia. In 1940 one litre of fresh milk at a state co-operative shop in Russia was sold at roubles 2.10. At that time one litre of milk in Bucharest was lei 10. In 1944 the official milk price in Bucharest had increased to lei 60, but the effective price was probably around lei 80. Prices in Russia—that is to say, the official prices, not the prices of the "free market"—increased only slightly. The Russian soldier purchasing milk in Bucharest with roubles would be able to buy with roubles 2.10, equivalent to one litre of milk in a Russian town, at least 2½ litres of milk in Bucharest. Naturally, this example cannot be generalised, especially as it is based on official prices in Russia. A considerable over-valuation of the rouble in Roumania in terms of the lei is obvious. The influence on the price and monetary situation in Roumania depends on the magnitude of Russian purchases. From August, 1939, to September, 1944, notes in circulation had increased almost five times, and with the inevitable disruption of the administration Roumania's currency seems well on its way to total inflation.

Redundancy in War Factories

The demonstration outside the House of Commons of workers discharged by a group of aircraft factories in the London area serves to emphasise the need for speed on the part of the Government in the formulation of its plans for industrial reconversion. The promised statement on the re-allocation of manpower between civilian employments is still delayed. Mr Tomlinson, Joint Parliamentary Secretary to the Ministry of Labour, stated in the House of Commons on Tuesday that about 1,800 workers would become available within the next two months from the main factory of the aircraft group, and that many more would be available at a later date; no difficulty was expected in absorbing them in the London area. This factory is not an isolated case, and reports of curtailment of war production in the Midlands and elsewhere have been increasing. It was for this reason that Mr Bevin, at the week-end, gave an assurance that spells of unemployment, due to temporary dislocation, would be of short duration. He counselled patience and appealed to the workers not to get mixed up in political demonstrations but to take their troubles to their trade unions. With the best will in the world, however, trade unions cannot cope with the problems of labour surplus to war production, which are a national and governmental responsibility. Nationally there is still an overall shortage of labour, and workers will be needed both for continued war production and for peace-time industries. The Government's intention, it seems, is to stagger the releases of labour as it becomes available through programme changes and cuts, to re-open concentrated factories and start on civilian production, and to call up men of military age for the armed forces. It is true that in this process of changing-over, there are bound to be temporary dislocations. What matters is that the period of dislocation should be as short as possible. The Government can assist by enabling firms to start on peacetime projects.

Winter Coal

The Ministry of Fuel's decision to introduce a priority distribution scheme for consumers who are finding excep-

ISSUE OF

1 ³/₄ % EXCHEQUER BONDS, 1950

Interest payable half-yearly on the 15th February and 15th August.
A first interest payment will be made on the 15th February, 1945.

PRICE OF ISSUE £100 PER CENT.

PAYABLE IN FULL ON SUBSCRIPTION

Bonds of this issue are an investment authorised by The Trustee Act, 1925, and The Trusts (Scotland) Act, 1921.

THE GOVERNOR AND COMPANY OF THE BANK OF ENGLAND, by authority of the Lords Commissioners of His Majesty's Treasury, offer the above Bonds for subscription. Subscriptions will be received on Tuesday, 7th November, 1944, and thereafter until further notice in the "London Gazette." Subscriptions may be lodged at any office of the Banks hereafter mentioned.

Subscriptions will be accepted in any amount not being less than £50. Subscriptions must be accompanied by the full amount payable in respect thereof.

The Principal of and Interest on the Bonds will be a charge on the Consolidated Fund of the United Kingdom.

The Bonds will be repaid at par on the 15th February, 1950.

The Bonds will be registered at the Bank of England or at the Bank of Ireland, Belfast, and will be transferable by instrument in writing in any usual or common form in accordance with the provisions of the Government Stock Regulations, 1943.

Bonds will be transferable in sums which are multiples of one penny. Transfers will be free of Stamp Duty.

A first interest payment, calculated from the date on which the subscription accompanied by payment is lodged to the 15th February, 1945, will be made on the 15th February, 1945; thereafter interest will be payable half-yearly on the 15th February and 15th August. Interest will be paid by warrants transmitted by post and Income Tax will be deducted from payments of more than £5 per annum. The first interest payment will in all cases be payable to the original subscribers or to their nominees.

Subscriptions, which must be accompanied by payment for the full amount of Bonds subscribed, may be lodged at the Bank of England Loans Office, E.C.2, or at any office of the following Banks:—

Bank of England.	IN GREAT BRITAIN:	Lloyds Bank, Ltd.
Bank of Scotland.		Martins Bank, Ltd.
Barclays Bank, Ltd.		Midland Bank, Ltd.
British Linen Bank.		National Bank, Ltd.
Clydesdale Bank, Ltd.		National Bank of Scotland, Ltd.
Commercial Bank of Scotland, Ltd.		National Provincial Bank, Ltd.
Co-operative Wholesale Society, Ltd.		North of Scotland Bank, Ltd.
Courts & Co.		Provincial Bank of Ireland, Ltd.
District Bank, Ltd.		Royal Bank of Scotland.
Glyn Mills & Co.		Union Bank of Scotland, Ltd.
Grindlay & Co., Ltd.		Westminster Bank, Ltd.
C. Hoare & Co.		Williams Deacon's Bank, Ltd.
Isle of Man Bank, Ltd.		Yorkshire Penny Bank, Ltd.

Bank of Ireland.	IN NORTHERN IRELAND:	National Bank, Ltd.
Belfast Banking Co., Ltd.		Northern Bank, Ltd.
Hibernian Bank, Ltd.		Provincial Bank of Ireland, Ltd.
Munster & Leinster Bank, Ltd.		Ulster Bank, Ltd.

A commission at the rate of 7½d. per £100 nominal subscription will be paid to Bankers or Stockbrokers on subscriptions bearing their stamp.

Subscriptions must be made on the printed forms which may be obtained, together with copies of this Prospectus, at the Bank of England Loans Office, London, E.C.2, or at any of the Branches of the Bank; at the Bank of Ireland, Belfast; from Messrs. Mullens & Co., 13, George Street, Mansion House, E.C.4; or at any Bank or Stock Exchange in the United Kingdom.

BANK OF ENGLAND, LONDON.
6th November, 1944.

tional difficulty in obtaining their winter coal should help to alleviate some of the hardship which might otherwise be experienced this winter. Those who will benefit under the scheme are householders who buy their coal in small quantities from roundsmen, and who have little storage space in their homes, and those whose homes have been damaged by flying-bombs. Consumers who normally buy their coal in small quantities by order will be divided into three classes of priority according to the amounts of coal they received between May 1st and September 30th. The amounts for each priority class in the southern and northern districts are as follows:—

	Priority 1	Priority 2	Priority 3
Eastern, South Eastern, Southern, South Western, London	Less than 10 cwt.	10 cwt. to 1 ton	Over 1 ton
Midland, North Midland, Northern, North Western, North Eastern, Scotland, Wales	Less than 15 cwt.	15 cwt. to 25 cwt.	Over 25 cwt.

Occupiers of bomb-damaged premises who are not already in the first priority group will receive one degree higher priority than that to which they would normally be entitled. The scheme comes into force on December 1st, and will be on a voluntary and not a statutory basis. Its success, therefore, depends on the co-operation of consumers and merchants. It will perhaps be in country districts that the test of the fairness of distribution will come. The scheme should not be taken as a signal that the stock position is any easier or the coal position any less serious than it has been. On the contrary, with falling output and rising demand—especially from SHAEF for high-grade locomotive coal—there is grave danger of a serious domestic coal shortage this winter. The shortage of alternative fuels, such as coke and anthracite, owing to increasing military requirements, the needs of high priority industry in this country and rising consumer demand, will make additional pressure for house coal, and before the winter is over, there may have to be drastic inroads into stocks. No doubt Major Lloyd George will continue to make his appeals for more production and economy among consumers, in order to bridge the gap between production and consumption. An unknown factor is the weather; it proved an ally to the Minister during the last two years, but it may not always be on his side.

Temporary Plywood House?

The Portal house goes into production next January. There are, however, other types of prefabricated dwellings to contribute to the production of temporary houses, which it is expected will reach a peak of 2,000 to 2,500 a week. A few firms—including, among others, Tarran—are to make houses in materials other than steel, but using the same equipment and plan as the Portal house. The Ministry of Works has recently had submitted to it by a firm which has been engaged in aircraft manufacture a house made entirely from plywood. The walls resemble a sandwich, the outer layers being of Canadian birch plywood which are bonded to an insulating core of waste wood and paper, with a special synthetic resin. This composite material has strength and durability, and is, in fact, similar to that used for deck-houses on motor torpedo-boats. The house differs from the other temporary types in that it needs no frame. On the site a concrete and wood foundation is all that is needed, and a total of a thousand man-hours goes to produce and erect it. The factory at which it has been made can turn out a hundred units a week. Every encouragement should be given to firms which are prepared to assist in the provision of temporary homes, but the decision on which types should be put into production must rest with the Government. Since production is to start before the end of the war, the materials used will be subject to control. It is essential that there should be no conflict with war requirements. For this reason the latest design, laudable though it is, may not be suitable for immediate adoption, since birch plywood comes from Canada, and shipping space may not be available to bring it. Again, it is obviously more economical that temporary houses should be completely standardised, and if the same rent is to be charged for them, they should all be of the same quality. The estimated cost of the plywood house, at £600, is about the same as that of the Portal house. If the Portal fittings are substituted for those at present incorporated in it, and if the difficulty of importing materials can be overcome, it might be possible

to incorporate the plywood house in the temporary housing scheme.

What is a Director?

The question which forms the title of this note is inspired by certain resolutions which the board of Dorman, Long and Co. have just submitted to their shareholders. Wishing to improve the status and widen the experience of certain members of the staff, the directors propose to appoint them *special directors* of the company. They accordingly invite the shareholders to amend the Articles of Association so as to make this possible. It may come as a surprise to some that the Companies Act, while it lays down certain duties and powers of directors, attempts nothing which can be described as a definition of the directorial function. So far as that is covered at all, it comes under Table A, as amended by the Articles of the company. So a director may be just what the proprietors decide. These new directors are to have few of the powers or duties which are normally associated with the office. They will not be expected to have any share qualification, they are appointed by the board and their appointment will not require ratification by the shareholders. They hold their office entirely at the pleasure of the ordinary directors, who decide their remuneration. Further, they are not to be entitled to receive notice of or to attend or vote at any board meeting except at the express invitation of the ordinary directors. It may be questioned whether it is worth going to the expense of changing the Articles to invest the members of the staff in question with such minor privileges instead of merely inviting them to attend meetings as and when it was thought they had a contribution to make or which were likely to widen their experience. By and large, the plan does little to give the executive an increased sense of responsibility towards the shareholders.

"Chartered" Small Holders

The board of the British South Africa Company has taken a very unusual step in putting forward a scheme designed to eliminate all very small holdings of its shares. These shares are of 15s. nominal value, and they have recently received dividends of 8½ per cent, less tax. It is suggested that on holdings of less than 20 shares it is scarcely worth the trouble of cashing the dividend warrant. They have therefore arranged with the Rhodesia Railways Trust that it shall offer 27s. 6d. per share in cash for all holdings of less than 20 shares, this being the middle price for the shares immediately before the offer was published. This is a matter which the small holder must decide for himself, and there is, of course, no element of compulsion. At the same time, it is open to doubt whether an attempt to eliminate the small holder is desirable. No figures exist to show the average holding of shares throughout British industry, but it is certain that a very large number of holdings yield less than 12s. 6d. net per annum. Further, in view of the known desire of industrial managements for equity finance and of the need to interest more and more people in the conduct and results of British industry, anything which tends to discourage small holdings is to be deprecated.

Gaumont-British and Better Films

The profits of the Gaumont-British group for the year ended March 31, 1944, show a slight fall of about 2 per cent to £2½ million, operating costs having slightly outstripped increased takings. The ordinary dividend of 6 per cent, again paid by the parent company, is covered by earnings of 6.9, against 7.2 per cent; but these earnings are reached after deducting the sum retained by subsidiaries, which this year is up by £16,000. This increase is considered prudent in view of the non-recurring nature of taxation benefits brought in and the calls on subsidiaries for debenture repayment. It is also stated that the provision for EPT, whose basis of calculation has not yet been agreed with the authorities, should prove conservative. Certainly, a conservative policy on the part of the board is more than justified in view of the excess of current liabilities over liquid assets and the high amount of loan and debenture stock outstanding. The accounts for the last three years are analysed in some detail on page 651. The chairman, Mr Rank, gives a favourable report of the activities of the two manufacturing subsidiaries, now engaged on essential work, Cinema-Television, Ltd., and British

Acoustic Films. But his most interesting remarks concern the quality of British films. This, he maintains, is steadily improving and he gives high praise to three of his company's productions—in defiance, incidentally, of the views of some leading critics. Certainly box-office results—which in all three cases were excellent—are the obvious criterion for the film industry to follow. But are present takings a fair guide to post-war conditions, when more competing attractions to the cinema will become available? Again, Mr Rank mentions the high export possibilities of British films, but the only current success claimed was in the home market. That Gaumont-British should realise the need for improving British films is much to the good. But perhaps a self-laudatory attitude is better kept in storage until the company's productions have won peacetime applause, and have proved their worth with overseas exhibitors and audiences.

Bicycles after the War

Like so many other trades the bicycle and motor cycle industry has submitted a report on reconversion problems to the Board of Trade. Inevitably a substantial proportion of this industry has been harnessed to the munitions programme, though a few firms have continued to produce bicycles and motor cycles. Provided labour and materials are available, manufacturers of bicycles will be able to reconvert their factories quickly and expect, if need be, to raise their output to an annual rate of 6,000,000 units within twelve months from the cessation of hostilities. (A unit includes both complete machines and parts.) Reconversion will take somewhat longer in the motor cycle section of the industry; it depends on skilled labour to a higher degree than the bicycle section; it will have to overcome the difficulties created by the restrictions on design and development since the outbreak of war. Nevertheless,

PRODUCTION AND EXPORTS IN 1937.			
	Numbers.	Total.	Exports.
	Production.		Empire.
Bicycles	1,850,000*	692,500	138,600
Motor cycles...	77,700*	15,800	9,500

* Estimated.

the report suggests that the industry might be able to step up production to an annual rate of 500,000 units. It is estimated that about half the existing machinery of the bicycle and motor cycle industry will require to be overhauled; but it has not been possible to give an indication of its needs in respect of "remodelling or modernising of its export trade. The accumulated demand—especially for bicycles—must be substantial, and it is suggested that for bicycles—must be substantial, and it is suggested that UNRRA might need large quantities of bicycles as one means of overcoming inadequate transport facilities in liberated countries. Moreover, competition from other exporting countries may be less than before the war, when Germany and Japan were large suppliers of bicycles, and Germany and—to a lesser extent—Italy of motor cycles. It is recognised that the industry will have to face keen competition from local bicycle assemblers in the Dominions and India. But the bicycle and motor cycle industry should have no difficulty in reaching the prescribed export target, that is to increase exports by 50 per cent in volume on the pre-war level.

No, Thank You

The report of the British Cycle and Motor Cycle Manufacturers and Traders Union has caused alarm in India. In commenting upon it Mr R. D. Birla, chairman of Hind Cycles, Ltd., pointed out that his firm and other Indian cycle manufacturers had prepared a post-war programme for the manufacture of 500,000 cycles to meet "fully" the requirements of India. He reminded the Board of Trade and British manufacturers of the repeated assurances given by the Secretary of State for India that it was the settled policy of the British Government to allow Indian industries to develop to their full capacity. Finally, he expressed the hope that British manufacturers would not resort to "uneconomic and unfair" competition. It would indeed be very wrong if British industry set out to prevent the industrialisation of India. But there is no trace of any such suggestion in the report of the bicycle manufacturers. They merely stress the difficulties they would have in exporting to the Dominions and India if these countries were to "bolster up" local manufacture with import duties. Mr Birla wants to keep them out of India altogether. If this is to be the aim of industrialists in India, how can Great Britain be expected to pay its war debt to that country?

Safety in Industry

The 1943 Report of the Chief Inspector of Factories contains an encouraging record of improved safety in industry generally. Last year the number of both fatal and non-fatal industrial accidents were lower than in 1942—there were 1,220 fatal accidents (10.5 per cent less than in 1942) and 309,924 non-fatal accidents (1.1 per cent less than in 1942). The number of fatal accidents was the lowest since 1939. It is satisfactory that this should have been so in the fourth year of war. Sir Wilfrid Garrett, Chief Inspector of Factories, attributes it to a variety of causes: the progressive reduction in working hours; the stabilisation of the labour force; the growing experience of the formerly untrained workers; the imposition of stricter penalties by the Courts; improved safety measures, and the development of joint safety committees in factories. There are still black spots in the industrial record. The number of accidents to women actually increased between 1942 and 1943, bringing up the percentage increase since 1938 to 400 per cent; this is due mainly to the influx of women into industry. Many of these accidents could be prevented by what Sir Wilfrid calls "good housekeeping" in factories, while the number of women who suffer scalping accidents because of "unfortunate" styles of hairdressing is still unnecessarily high. Shortage of staffs has increased the inspectorate difficulties—390 inspectors and canteen advisers, of whom 118 are temporary, seems far too small a number to cope with the enormous work of inspecting, enforcing and advising involved, and for any effective schemes to be operated after the war an extension of the inspectorate seems essential. The key to the whole problem of industrial safety lies perhaps in raising the standard of education and training of new entrants. It is not enough to display posters and rules, the factory worker must be made "safety conscious" throughout industry.

The Report looks forward to the development of new ideas about the working conditions of the future. Many backyard factories were not congested. Their siting is due to the fact that rent was low—probably lower than that of communal factories. The backyard congested workshops of the past will not be tolerated in industry after the war, and plans are being considered which are described as "revolutionary" for the development of communal factories on bombed sites and elsewhere. These factories would provide well-designed rooms with adequate lighting, heating, ventilation and canteen facilities, which would be let off to small occupiers. The idea of communal factories in itself is not new. There have been "tenement" factories and there are trading estates on a somewhat larger scale. But it is clearly a scheme which will benefit small employers and their workers, and result in economies of overhead and transport costs. The war has led to increased consciousness on the part of managements, workers and the public about the importance of industrial welfare and safety, and this will have a permanent effect on the organisation of British industry.

COMPANY MEETINGS

MUREX LIMITED

DISTRIBUTION OF 20 PER CENT.

The twenty-fifth ordinary general meeting of Murex, Limited was held, on the 6th instant, in London, Mr George P. Joseph (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the accounts:—We again present a consolidated balance-sheet incorporating the subsidiary companies. The general reserves of the parent company and its wholly owned subsidiaries now stand at £715,000 after giving effect to the allocations out of the profits of the year under review and the balances of profit carried forward to next year are again slightly higher at £131,957.

RESERVES STRENGTHENED

It is essential that we should continue to strengthen our reserve position as far as present circumstances permit to provide against the ultimate scrapping of obsolescent plant. Accordingly, in addition to the provision for depreciation on buildings, plant and machinery, amounting to £112,786, and the special writing off against profits of £27,075, representing plant already scrapped, we have allocated £75,000 out of the profits of the year under review to obsolescence reserves, which now stand at £350,000. Further substantial additions have been made to buildings, plant and machinery during the past year.

The profit for the year, after providing for depreciation, is £412,514, a decrease of £76,476, and reflects the falling-off in the demand for certain of the company's main products. During the war period we have developed new departments for the manufacture of low carbon ferro chrome, the refining of cobalt alloy and blister copper, and a considerable sum has been expended on the establishment of a department for the manufacture of tungsten carbide tips, tungsten and molybdenum rod and sheet and wear-resisting dies.

After including a dividend from Murex Welding Processes at the same rate as for the previous year and adding sundry income, less expenses, the balance of profit is £439,446. Taxation has been provided on the same basis as in recent years. The directors recommend on the ordinary stock a final dividend of 10 per cent. and a cash bonus of 2½ per cent., both less income-tax (making a total distribution of 20 per cent. for the year), leaving £125,398 to be carried forward to next year.

SUBSIDIARY COMPANIES

Murex Welding Processes, Limited, has again shown satisfactory expansion, and during the year under review extensions have been made to the main factory and to the laboratory and research buildings. Owing to the substantial developments in the application of electric welding during the war period the extensive new factory into which we moved in the latter part of 1938 will be inadequate to meet the post-war demands for our products, and further expansion is contemplated when circumstances permit. Manufacture of magnesium metal ceased at the works of the other wholly owned subsidiary, Magnesium Metal and Alloys, Limited, on December 31st last at the request of the Ministry of Aircraft Production, and it is unlikely that the productive capacity of these works will be required again during the war period.

I have already referred to the considerable amount of reconstruction work that will be necessary at our factories in the post-war era. It has been your board's policy to strengthen our reserves and preserve our financial resources, but the heavy incidence of wartime taxation and the provision of additional buildings and plant have substantially depleted our cash resources. Future plans are dependent on the Government's post-war policy, and it is impossible to forecast the future.

The report was adopted.

SIR ISAAC PITMAN AND SONS, LIMITED

LOOKING FORWARD

Mr C. E. Pitman, the deputy chairman, took the chair at the 48th annual general meeting and said the year's profits, after allowing for taxation, were £36,990. All sections of the business had done well. After paying dividends of 5½ per cent., 5 per cent. and 6 per cent. on the three classes of shares, it was proposed to devote £12,300 to the staff betterment fund and apportion the remainder between the reserve for contingencies and the profit and loss account.

The future offered great scope for the company. The world was becoming increasingly English reading; educational standards at home and abroad were improving; there would be a growing demand for books. These factors would benefit, not only the company itself in all its departments, but also the subsidiary companies.

Praising the loyalty and fine team work of the staff, the chairman then proposed the formation of a welfare company to be run by representative members of the staff, the principal company retaining a power of review.

It was also proposed, he said, to contribute £40,000 gross over the next eight years to form a family community centre at Bath, where a large proportion of the staff lived and worked.

A FIELD FOR ENTERPRISE

There appears to be great scope for enterprise and development for our company, and the opportunities seem to be embarrassing in their variety and possibilities. One field lies in producing books for a world which, if it may not become increasingly English-speaking, is almost certain to become increasingly English reading; another field lies in printing and in binding books which, with growing educational standards at home and with expanding demands from overseas, not only our own publishing interests but other publishers will continuously require. Our colleges have also a fine field of opportunity—again firstly at home, the raising of the school-leaving age and the provisions for part-time education offer increased opportunities of service to the public in those specialist lines which we have, with considerable success, made our own.

TRIBUTE TO THE STAFF

The provision of £12,300 for the staff betterment fund represented the biggest sum yet allocated and would, incidentally, have been bigger still but for high taxation. The pension contributions were paid from the fund, and they anticipated a bonus of one week's wages for all those who had been on the staff for more than a year, including those serving with the Forces. This left sufficient balance to meet pensions and pay a similar bonus next year.

THE FUTURE OF TAXATION

Deploping the present high rate of taxation, Mr C. E. Pitman reminded his listeners that the success of their enterprises had been made possible largely by profits ploughed back into the business. He remarked that had taxation in the past approximated to the heights of the present day, there would have been very little development or enterprise.

Their 975 shareholders had between them contributed £36,000 capital; an average of £369 each. The average dividend per head, after payment of tax, was only £10 5s. 1½d. per year. £70,000 this year went to the Chancellor of the Exchequer; a lion's share.

It was clearly right that at this period the British people should tax themselves thus highly, but we all hoped the sacrifices of life and savings in this war would soon bring the peace for which these sacrifices had been made. When we returned again to peacetime conditions, however, if taxation did not ease considerably, it was hard

to see who would wish to provide the savings for future enterprise and development.

A BENEFIT OF INDIVIDUALISM

Individual initiative has played a great part in the successful development of our business, and the happy balance of steady employment which we have maintained was not purely accidental, but it represented the individualism of some 50 primarily responsible and some 1,000 secondarily responsible men and women who were relatively unfettered in the exercise of their discretion and capacities to prepare products and services for submission to the public—that great conglomeration of free men from which alone, in the exercise of his freedom, the customer has been drawn.

We may question whether a collective State plan would be successful in maintaining the same happy continuity of head of work and of consequent full employment and of security.

The report and accounts were approved.

BRITISH TIMKEN LIMITED

MR. MICHAEL DEWAR ON THE WORKING OF "CONTROL"

Mr Michael Dewar, presiding, on the 8th instant, at the 24th ordinary general meeting of British Timken, Limited, in Birmingham, said: Our net profit for 1943, after providing for depreciation and taxation, amounts to £60,866, compared with £54,096 for 1942.

For many years I have combined the functions of chairman and managing director. With the developments of recent years, your board have deemed it advisable to separate the two functions. I am sure you will heartily endorse the board's decision to appoint Mr John Pascoe as managing director. Mr Pascoe has borne the burden and heat of the day magnificently through a war expansion, about which, some day, I hope to be permitted to speak. I feel certain we could not have found a more competent managing director.

Since your company purchased control of Fischer Bearings Company, Limited, that subsidiary has been managed, under the direction of your board, by Mr Leonard Moritz, who has been with that company since its inception. Mr Moritz has devoted his skill and energy with no small success in the expansion of that company. To link the companies more closely we have appointed Mr Moritz, a director of British Timken, Limited, and we ask your approval at this meeting.

Our industry has recently come into prominence through efforts to stop the export of bearings from Sweden to Germany. As with many other industries, there is a Government Department which professes to control us. I would point out that the coordination of all controls is carried out by companies like your own. The bureaucrats have not yet found it possible to control industry through one channel. Factories are the perquisite of the Ministry of Works and the Board of Trade. Labour is the responsibility of the Ministry of Labour. Machine tools are governed by the Machine Tool Department, responsible partly to the Ministry of Supply and partly to the Ministry of Production. Provision of our raw material is mostly the function of the Iron and Steel Control.

Many people regard planning and "control" as the only hope for the future. Those of us in industry who have had experience of such "control," can only pray for their rapid return to a state of affairs in which it is possible to reach a decision without having to consult endless committees of people whose experience of industry is so limited as to be almost negligible.

I cannot conclude without reference to the loyal and devoted services of all members of the staff and workpeople during the past year. Particularly would I refer to the devoted efforts of that very considerable number who have been with us since the days when we were a very small manufacturing concern.

The report and accounts were adopted.

D. GESTETNER, LIMITED

The annual general meeting of members of D. Gestetner, Limited, was held, on the 9th instant, at the registered office of the company, Fawley Road, Tottenham Hale, London, N. 17.

Mr Sigmund Gestetner presided. The notice convening the meeting and the report of the auditors having been read, the chairman suggested that the directors' report and statement of accounts

for the year ended August 31, 1944, which had been issued to the members of the company, should be taken as read, to which they agreed. The chairman moved, and Mr J. Clatworthy seconded, that the directors' report and statement of accounts for the year to August 31, 1944, now submitted, be received and adopted. The motion was put to the meeting and carried unanimously.

A dividend of 12½ per cent. for the half-year ending August 31, 1944, and a divi-

(Continued from page 649)

construction for the Government, including the forces, and the resumption of any substantial peace-time demand for constructional materials. It was, therefore, to be expected that there would be some falling off in the activity of cement, which has done better during the war than most other materials in this section. In June last, Sir Malcolm Stewart, presiding at the annual meetings of the Associated and British Portland Cement Companies, warned shareholders that demand was heavily down, but it has, nonetheless, caused considerable surprise that the boards of both companies have decided to pay no interim dividends in respect of the current year on the ordinary capital. A reduction in dividends had been thought probable, but the decision to make no interim payments caused surprise, if only because the final payments last year were so much larger than the interims as to suggest that the cut should come in the final. The directors have, however, been influenced in part by the uncertainty as to the final effects of certain questions still outstanding with the Ministry of Works. On the news the shares of Associated fell about 3s. 6d. to 60s., but within a matter of hours the market was receiving a number of enquiries which promise to result in purchases on any further fall.

Oil Output Figures

A new and welcome lifting of the statistical blackout is the removal of the ban on the publication of figures of production by oil-mining companies. The first concern to take advantage of this relaxation is the Trinidad Petroleum Development Company, which during the five years to July 31, 1944, produced an average of over 3,200,000 barrels per annum. This is rather over double the estimate made in the prospectus of early 1937, and the difference is due to two causes; an over-cautious evaluation of prospects and acceleration of drilling to meet the growing war demand. Unfortunately, full production was scarcely achieved before the war, so that it is difficult to give a quantitative split up of the two factors. It will, therefore, be necessary to await particulars of other companies in order to obtain a general picture of the position in Trinidad. The report of the company does, however, state that reserves must have been substantially greater than was at first supposed. Actual production in the latest year was 2,823,368 barrels. On that basis, and in view of the concessions on wasting assets granted by the Exchequer in recent years, the company expects to obtain an EPT re-fund in respect of that year. Subject to priority being granted for necessary materials, increased boring is to be undertaken forthwith. From the standpoint of profit, the company has done well during the war. Prices paid have been pre-war dollar prices. Costs have risen materially, but the writing down of the pound at the outset of the war has meant an appreciable exchange profit on all sums remitted to this country. In consequence of this and of a conservative dividend policy, the company has very substantial liquid resources. The £1 shares, standing at 81s. 3d. ex dividend, yield £2 15s. 3d. per cent tax free.

* * *

The Future of Copper

There are indications that the consumption of copper is slackening with the curtailment of the war production programmes of the Allies. The Government's plan for the reduction in the Rhodesian output of copper, announced last January, proved to be premature and was subsequently withdrawn because the United States was then still in need of additional quantities of the metal. But the United States has now begun to reduce its imports of ore and concentrates—though not of refined metal—from Chile. Moreover, last September, when the British Government's bulk-purchase contracts with Empire producers came up for re-

dend of 3½ per cent. for the half-year ending August 31, 1944, on the preference shares was declared, making 25 per cent. and 7 per cent. respectively.

The retiring director was re-elected and the auditors were reappointed.

A special resolution was also passed changing the name of the company to "Gestetner Limited."

The proceedings terminated with a vote of thanks to the chairman, directors and staffs of the company.

newal, they were extended for only four months instead of, as hitherto, for a year. The contracts will shortly have to be reconsidered. Reports from Ottawa have it that the British Government—it has hitherto purchased the entire output of Canada and Rhodesia—is anxious to curtail its purchases in Canada, as well as to secure a reduction in price. In fact, decisions will soon have to be made about the future of the international copper market. Productive capacity has been appreciably increased during the war and, at its end, the Allied Governments will hold substantial stocks. If the war will be followed by a period of active business and high industrial activity, the higher output of copper might possibly be consumed. But there is likely to be a transitional phase—this has already begun—when there will be a surplus of productive capacity and heavy stocks. The resuscitation of the pre-war copper cartel would hardly be the best method of overcoming the difficulties. The readjustment of the wartime copper contracts is obviously a matter for the Governments concerned; they might with advantage collaborate with the aim of maintaining an equilibrium between demand and supply—that is, of preventing excessive swings in prices, at least during the difficult period of transition. For a time, producers of copper can hardly avoid lower profits; but this need not cause undue anxiety to low-cost producers.

USA versus Paramount Pictures Inc., et al.

The Government of the United States is relentlessly pursuing its policy to eradicate monopolistic practices from the film industry in that country. These practices were somewhat restrained by the consent decree secured by the Department of Justice on November 20, 1940. Now the Department is intent on rending asunder the vertical combines, that is of making the exhibition of films independent of their production and distribution. It has filed an application for the modification of the original consent decree in the District Court of the United States for the Southern District of New York. Among other things the Department prays that,

(a) no decree defendant shall hereafter acquire, directly or indirectly, any financial interest in any theatre;

(b) each decree defendant which is directly or indirectly engaged in the production, distribution and exhibition of films shall within three years from the date of this modification completely divorce its exhibition business from its production and distribution business to the end that no defendant directly or indirectly engaged in producing or

distributing films shall then own any financial interest in theatres and no defendant directly or indirectly engaged in operating theatres shall then own any interest in the production or distribution of films;

(c) each decree defendant directly or indirectly engaged in operating theatres shall within such time and upon such terms as the court may deem reasonable divest itself of such theatre interests as the court may in the course of supplemental proceedings hereunder, find should be divested in order to insure theatre operating competition in the communities where they are now monopolising theatre operation;

(d) all of the theatre-owning agreements, implied or expressed, by which any two or more of the decree defendants share in the financial benefits from the operation of theatres jointly owned or controlled by any two or more of them are hereby declared void, and each decree defendant is enjoined from entering into or enforcing any similar agreements.

The application of the Department of Justice in the United States is perhaps not altogether irrelevant to the position of the industry in this country as disclosed by the report of a committee of the Cinematograph Films Council published last August.

RECORDS and STATISTICS

INDUSTRY AND TRADE

Utility Fur Coats.—The Board of Trade announces that in order to assist the fur trade to maintain its organisation, especially with a view to the restoration and, if possible, expansion of its export trade, it has been decided to add coats and other garments made of inexpensive furs to the utility range. These garments will mostly be made of rabbit ("coney") or sheepskin, but it is hoped that some other inexpensive skins will be included. A range of useful garments with specifications has been submitted by the Joint Fur Trade Delegation, together with suggested prices, and these are at present under investigation. The coats will continue to be subject to purchase tax, but the rate of the tax is under consideration.

Pig and Poultry Rations.—A small increase is to be made from January 1st next in the basic rations for pigs and poultry. At present, rations are allowed for one-eighth of the number of pigs and poultry being kept in June, 1939, subject to a deduction proportionate to the acreage of the holding. The increased rations will be allowed for one-sixth of registered numbers in 1939, with an acreage deduction amounting to only two-thirds of the present deduction.

"The Economist" Sensitive Index.—There was no change in the index during the week ended November 7th. The complete index (1935 = 100) was 158.6; crops 135.6; and raw materials 185.5.

GOVERNMENT RETURNS

For the week ended Nov. 4, 1944, total ordinary revenue was £59,392,000, against ordinary expenditure of £135,325,000 and issues to sinking funds of £40,000. Thus, including sinking fund allocations £8,389,408, the deficit accrued since April 1st is £1,952,253,000 against £1,944,261,000 for the corresponding period a year ago.

A change has been made in the method of showing in excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £312,998 to £2,921,311, the other operations for the week (no longer shown separately) raised the gross National Debt by £76,665,373 to £21,542 million.

On Nov. 3 applications at £99 14s. 11d. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday and Friday of following week were accepted as to about 41 per cent. of the amount applied for, and applications at higher prices in full. Applications at £99 15s. for bills to be paid for on Saturday were accepted in full. £110 millions of Treasury Bills are being offered on Nov. 10. For the week ending Nov. 11, the banks will be asked for Treasury deposits to the maximum amount of £60 million.

be, possibly, just as mistaken to be too hypnotised by the bogey of 1918. The Government should not, for the sake of safety first, go to the other extreme, and cling to controls which might prove unworkable or unwarrantable. Control is a means and not an end. If unwisely applied, it might develop into a boomerang. The balance must be struck, and as Mr Churchill said, the approach must be "severely practical," and each control judged on its own merits. What the Government should do, without delay, if indeed it is not already doing so, is to review the entire structure and technique of wartime control. It should examine the network of emergency legislation, the series of Defence Regulations and the 10,000 odd Statutory Rules and Orders. Controls which can be discarded without affecting policy should be removed. Nor is it enough simply to make the obvious rule that controls which can be discarded without affecting policy should be removed. Every control assists some policy to some degree, and if they are looked at one by one, the result will be to keep too large an apparatus. But if one thing is certain, it is that the popular impatience to be freed from all restrictions will be much greater than anyone now imagines. After six years of war, what Bernard Shaw has called "the intense repugnance of the average man" to regulation of his life is bound to assert itself. The average man, whether little or not, will want, like Christian, to slip the burden from his back.

This popular feeling is the greatest hazard. It is one thing now, while the war is still going on, to say that the process must be cool and orderly and logical. It will be an entirely different thing to adhere to the same view when six years of effort are producing their reaction—especially if a General Election comes at the crucial moment. It will therefore be the path of prudence for the Government to survey the whole structure of controls and to decide whether, as a whole, it is more than the public is likely to bear. The best way to preserve the really essential controls will be to relax all the unessential and semi-essential ones. The best friends of an orderly transition will be those who decide every doubtful case in favour of relaxation.

*

But which are the really important controls? Can there be any criterion to guide the Government through the maze? In principle, there should not be any real difficulty in reaching a decision; in practice it may not be so easy. Controls are essentially an instrument for executing policy in scarcity, a technique for allocating between alternative uses resources which are in short supply, whether it be labour, materials or industrial capacity. In the interim period, there will still be an overall scarcity, not only absolutely, but in relation to needs. As and when the scarcity factor becomes less and the most vital needs are met, so will it be possible to relax the controls.

Of the main wartime controls, those over civilian consumption are among the most stringent. There is a positive control through rationing of necessities and a negative control through shortage of all other goods. As soon as the market becomes reasonably restocked with civilian consumption goods, the negative control will disappear and much of the pressure on prices and supplies which has made so many controls necessary will also vanish. Control of necessities by rationing, however, may have to be continued for some time. Food rationing has been generally accepted as not only inevitable but fair, and fortunately, in its present refined and developed form, it is a flexible instrument; there are many methods of gradually relaxing the present severity of control. The first step is obviously to increase the rationed quantities as supplies become available. A second step back towards freedom and variety might be to transfer to the points ration, with its much greater flexibility, some foods now rationed by quantity. Then gradually, one by one, items could be removed from the points list. So handled, it is unlikely that public opinion will insist on sweeping away the whole apparatus of food control.

Food rationing, however, cannot be considered in isolation, for it is bound up with the whole question of imports.

With the exception of milk and potatoes, a large part of every food normally consumed in this country has to be imported. Though the end of conveying will automatically increase the total volume of imports, shipping space will still have to be allocated between alternative uses, and there will also be a financial reason for keeping a tight hand on imports, at least from "hard currency" countries. It might, for example, be necessary to choose between importing butter and timber; whatever the consumer's choice might be, the needs of the housing programme might dictate timber rather than butter. The same consideration applies to clothes rationing, which probably bears more hardly on the average citizen than any other control. Though the output of the textile industries probably depends on the labour supply more than on any other factor, such things as the proportion of productive capacity to be devoted to exports and the amounts of raw materials to be imported would have to be considered in any review of the clothes ration.

It will be essential in the interim period to retain controls over raw materials. These represent a valuable instrument for executing policy and should not encounter the same kind of pressure for their removal as the rationing controls which impinge directly on the individual. But here again generalisations may be misleading. Some materials may cease to be in short supply almost immediately after the Armistice. But the state of supply is not the only criterion that should determine the moment of relaxation. Some materials, where supply will at least approach demand, are of great importance because of their strategic position in the national economy—steel, for example—and the power to allocate these materials will be a powerful weapon of general control. Other materials, of course, will be scarce for a long time to come. Timber is one outstanding example. Rubber may be another, unless the reconquest of Malaya and the restoration of normal production come about earlier than now seems probable.

The control of raw materials, in short, is likely to be one of the major instruments of public policy in the transition period. And since control means controls, it is necessary to raise once again the question of their personnel. Protests have from the start been made against the practice of choosing the Controllers from the trades they have to control. The results have not, perhaps, been quite so disastrous as they might have been, though the recent report of the Select Committee on the chemical controls shows that the system has not been without disadvantages. But if there are disadvantages in wartime, there will be many more in the transition to peace, when normal competition is re-starting. It is essential that every Control that is to last more than a very few months should have a disinterested Controller.

*

Control over labour, as it deals with human beings and not with bales of cotton or loads of timber, presents by far the most thorny problem. The scheme for the redistribution of manpower, whether it is released from munitions production or from military service, attempts to solve the difficulties in a fair and workmanlike manner. But it would obviously be quite unthinkable, and contrary to the principles of fairness which the scheme seeks to follow, for the Government to exercise powers of direction over one section of the population—the young men between 18 and 27 who will be liable for military service or for the mines and the men in Class B of the demobilisation scheme who will be released out of turn for the most urgent civilian employments—without having control over labour in general. How far and for how long the workers will accept the proposed controls over employment it is impossible to say, especially if the control were to be exercised by a less acceptable Minister of Labour. In the interim period, labour will enjoy a seller's market, and any check on the natural tendency to gravitate towards higher-paid employment might be resisted while employers may equally resent the restrictions on their right to engage labour. The trade unions have accepted the principle that control over industry implies some measure of control over labour, and the Trades Union

Congress, through its representatives on Mr Bevin's Joint Consultative Committee, have been consulted, and have presumably approved, the Government's proposals. Yet, only a few days before the White Paper was published the TUC told the Government that the unions would oppose the continuation of compulsory direction, after the end of the war with Germany. There may or may not be a source of conflict here but, if friction is to be avoided, it is essential that the scheme should be administered humanly and sensibly, and that the TUC should show responsibility in representing to its membership the need for continued control.

Equally, responsibility will have to be shown in regard to wage demands. The absence of any wages policy in wartime has not, in the event, turned out to be so fatal as might have been expected, owing to the fact that there has not been unreasonable pressure from the unions for wage increases. Wage policy determines price policy and is in turn largely influenced by it. If wages rise, prices cannot be kept down. And one of the chief reasons for moderation in wage demands is the policy the Government has pursued in stabilising the cost of living by subsidy. A tolerable equilibrium has been kept, but it is an uneasy one. It requires much optimism to assume that there will not be heavy pressure for increases in basic wage rates as soon as earnings begin to come down with the disappearance of overtime. And on the other hand, though the Government is committed to the maintenance of the price stabilisation policy for some time, it clearly

cannot contemplate an indefinite extension of so heavy a burden of expenditure. This is the weakest link in the whole chain of control, and there is little to be done about it but to counsel moderation. Efforts can be made to support the level of real wages, not only by subsidy but by the retention of the utility principle in clothing, furniture and household fittings. But if large increases in real wages are insisted upon, the whole delicate equipoise will be upset.

It would be altogether unrealistic to view the question of Government control in the interim period without taking full cognisance of the political factors. The Government has designed a blue-print for reconversion. The design is sound enough, though many of the details have to be filled in, but the test will come when it has to be put into operation. Whatever may be desirable in logic and economics may not turn out to be practicable in application. The best-laid schemes of statesmen and economists are liable to be upset by unpredictable events or pressures, and pressure for the removal of controls may become irresistible. For this reason, the guiding motives of Government policy in the critical interim period should be chosen with this eventuality in mind. One of these principles should be selectivity: those controls should be retained that will give the greatest effect for the smallest irritation. And another should be flexibility and humanity in administration; for every restriction will be compelled, to a far greater extent than now, to undergo the scrutiny of a jealous public.

The Broken Spell

LAST week, a political crisis threatened in Belgium over the disbandment and disarming of the left wing groups of the Resistance. Two Communist Ministers, M. Marteaux and M. Dispy, and the representative of the Resistance, M. Demany, resigned from the Government. At one point, the conflict became so acute that Major-General Erskine, the Allied Deputy Supreme Commander in Belgium, warned the leaders of the opposition that if they disobeyed the Belgian Government, the Allied Command would have to take action to enforce law and order. This warning has proved effective. The Communist Ministers have called on the resisters to hand over their weapons to the Allied Commands before November 25th. But the crisis is not yet over, and it is likely to leave a political aftermath. The three Ministers who resigned remain outside the Government; and the gulf between Government and Resistance has not been bridged.

These events have not occurred in isolation. Similar conflicts have flared up in France between the Govern-

ment and the Patriotic Militias, and in Greece between the Government and the left-wing guerillas of ELAS. Like General Erskine in Belgium, General Scobie in Greece has used his influence to persuade the leaders of the Left that they should disband the guerillas. But unlike General Erskine, General Scobie had no need to issue a drastic warning, for the EAM Ministers have so far loyally co-operated with the Greek Prime Minister, M. Papandreu, on the basis of the Lebanon Charter concluded earlier this year, which provided for the liquidation of private armies and for the creation of a single national army. In France, no Allied intervention has taken place. General de Gaulle's own authority has been sufficient to induce the opposition to accept a compromise under which the Patriotic Militias are being re-formed into civic guards while the other armed groups are being either incorporated into the army or disbanded. But in all these cases it cannot yet be taken for granted that the questions at issue have finally been settled or that no new conflicts can arise.

Have you heard of —

A CAPITAL ANNUITY

Part capital, part interest . . . £250 per annum guaranteed for thirteen years . . . of which, on average, £212 is capital repayment and £38 is taxable interest . . . and, after the thirteen years, an annuity of £375 (subject to tax) continuing for life . . . this can all be secured by a female life aged sixty-four for a present investment of £4,000

EQUITY & LAW LIFE ASSURANCE SOCIETY
LINCOLN'S INN FIELDS

Temporarily removed to

163-164, STRAND, LONDON, W.C.2

The controversies over the Resistance have thrown a sharp light on the political situation in the liberated countries. They have also put very delicate questions before the Allied commanders, who are naturally concerned that there should be internal security behind the theatres of war. All the liberated countries are going through an extremely difficult transitional period. The normal instruments of government had broken down and the departure of the quislings had left an administrative vacuum. The new governments have to contend with economic and political chaos, which can only be overcome if they secure the good will and the ready co-operation of their peoples.

Most of these Governments are broadly based coalitions, and as such they should be able to keep in touch with the mood of their peoples. Nevertheless, some crises are inevitable. The underground movements have outlived their functions, if the latter are defined as the struggle against a foreign invader; but it is the weakness of human institutions that they are unwilling to leave the stage when their part is over. Yet the existence of several armed bodies in a liberated country clearly raises the danger of civil war. The political cleavages in the liberated countries are still recent and deep. Former collaborators and former resisters are in opposition. Grievances are very real and passions run high. Two conditions must be fulfilled if civil strife and disillusionment are to be avoided. The Resistance should obey the orders of the recognised governments; and the governments for their part should identify themselves with the popular movements with which the groups of resisters have been associated. The resisters, who are asked to give up their arms and to regard their glorious role as over, must feel confident that their grievances will be redressed and their wrongs righted by the legitimate rulers of their country.

The critical events of the last weeks have pointed to a distinct political *malaise* in the liberated countries. It was recently described by the French Christian Democratic newspaper, *L'Aube*, in words which are applicable to other countries as well as to France:

The impression exists that on the home front these three months could have been better used. The Government has not taken from the start the energetic measures that it should have taken to galvanise the entire country. The bright flame burning in the first days was allowed to dim; let us beware lest a gust of wind puts it out for good. The administrative machinery remains badly entangled in red tape, and justice progresses very slowly, at least in Paris. The guilty begin to lift their heads: some are set free, others escape. The Black Market is more flourishing than ever, the Purge is cramped; and the people, who are watching things closely, are beginning to complain.

It is in this atmosphere that cleavages, both old and new, between Right and Left are coming to the surface. The years of the underground struggle were years of national unity among the resisters. Inexorable pressure from the common enemy had brought together Communists, Socialists, Catholics, Liberals and even former Fascists, all determined to sink their differences and to work in unity for the overthrow of foreign oppression. The resisters were under the spell of a common national purpose. But now that spell has been broken. Old social divisions are reasserting themselves—the more powerfully the more they have been suppressed. Mutual suspicions and mutual fears are growing. The Right suspects that the armed bands of the resisters will be used as an army for civil war. The Left is haunted by the spectre of a coalition of powerful “vested interests” and ex-collaborators.

It would be wrong to exaggerate this tension. Revolutionary ferment has been the inevitable aftermath of every modern war. What is surprising, when it is seen against the background of the tremendous unsettlement caused by this war, is not that the ferment exists but

that it has been relatively so weak. This emerges very clearly if the social and political landslides that followed the first world war are compared with the present disturbances. No Lenins or Liebknechts have arisen from the European underground and no important political movements have challenged the legitimacy of the governments of the liberated countries. As *The Economist* once pointed out:

Compared with the social and political aftermath of the first world war the present “radicalism” seems to be more spontaneous and widespread, but less determined and much less clear-headed and organised. The end of the war will probably see the Right discredited almost everywhere in Europe and the Left strengthened but immensely confused.

Confusion and civil strife behind the Allied fighting lines cannot be tolerated; and this justified the Allied intervention in Belgium. But the limits of intervention ought to be very clearly defined. The Allies are entitled to secure their lines of communication against riot and disorder. But they would not be justified in going beyond this to interfere in the domestic affairs of the liberated countries or to lend their support to any Allied government against its own people. Nor is there any reason to believe that Allied policy, whether in Belgium or in Greece, has aimed at anything more than immediate military security.

Political intervention in the affairs of a foreign country, even if the circumstances of war make it unavoidable, is always a difficult and dangerous operation. A situation, for instance, in which the western Allies might be suspected of intervening against the Communist parties in western Europe and the Russian Command of fostering Communist governments in eastern Europe might have disastrous consequences. But unfortunately there are signs that things may drift in this direction. Along with the disarming of the “White Army” in Belgium, the Roumanian National Guard of Transylvania has also been disarmed summarily. The leader of the Peasant Party, M. Maniu, has issued a declaration calling on the National Guards to submit their arms to the Roumanian Government. Commenting on this, Moscow Radio has stated significantly:

M. Maniu's declaration is extremely tardy, since even before this order of the Roumanian Government the Red Army Command had liquidated all bandit groups styling themselves volunteer detachments, battalions or volunteer guards.

Should each Ally be anxious to carry out a political *Gleichschaltung* in its area of military operations, then the result will inevitably be open ideological warfare between the Allies. Even the mere appearance of such a warfare ought to be carefully avoided by all sides concerned, and the most sensible epilogue to last week's crisis in Belgium would be the return of the three Ministers who resigned to M. Pierlot's Government. There is not the slightest reason why the western Allies should have any objection to Communist members of liberated Governments. Quite on the contrary: it is essential that one of the strongest streams of popular thought in Europe today should be put to work to bear responsibility and to face practical difficulties. If there is any wildness left in present-day Communism, this is the way to tame it.

Moreover, the present Governments in the liberated countries have all of them only provisional titles to authority. They have not yet stood the test of a free democratic election. For the time being, neither the French nor the Belgians intend to hold general elections, and the absence of large numbers of prisoners of war and deportees from these countries is a strong argument against any immediate appeal to the electorate. Even so, France will hold its municipal elections in February, which will give a preliminary reflection of the relationship of political forces in the country. The essential criterion of democratic liberty is that a people should be able to choose its representatives freely. The presence of Allied armies in any liberated country ought not to detract, to even the smallest extent, from this essential freedom.

Liberals and Radicals

THE political prospect is much clearer than it was six months ago. It is now virtually certain that the General Election will be conducted by a Conservative Government with the Labour Party out of office. And it is also virtually certain that this General Election will not come for some months. This clarification of the outlook has been mainly the work of the Labour Party, whose refusal to countenance another four years of Coalition government has forced the issue. The Conservative Party has been compelled to acquiesce in a decision which was not its own—though there have been few signs in Tory circles of any real aversion from the party fight.

The Liberals have also been left to adjust themselves to the prospect of an early return to party politics. Their first and quite natural thought was to attempt to repair the breach made by the secession from the main party in 1931 of Lord Simon and his followers. This attempt at reunion has now failed, and correspondence between Sir Archibald Sinclair and Mr Ernest Brown, the present leaders of the party and of the schismatics, has been published to register the fact. To those who are in touch with the personalities on either side, the failure is hardly surprising, but it is none the less to be regretted.

What is interesting, however, is the reason given on each side for the decision. Sir Archibald writes to Mr Ernest Brown that

you and your friends have decided to continue your previous association with the Conservatives and not to oppose Conservative candidates in any constituency at the General Election.

And Mr Ernest Brown bases his refusal to agree to reunion on

the tendency to seek association exclusively with Socialists which has shown itself in your party.

In short, Sir Archibald rejects Mr Brown because he is a Tory, and Mr Brown rejects Sir Archibald because he is a Socialist. Neither accuses the other of not being a Liberal; indeed, Mr Brown's letter says that “discussions on policy had gone a considerable way toward agreement.” It is difficult not to conclude that the Liberal leaders have themselves, however unwittingly, provided some evidence for the major parties' argument that there is no positive substance left in Liberalism, and that a Liberal is either a timid Tory or a timid Socialist.

But is this true? Are shades of emphasis all that is left of Liberalism? Is the policy of the Liberal Party inevitably a dilute mixture of other people's doctrines? Is the only room for argument whether the balance of ingredients, borrowed from others, is the right one? Or is there a body of doctrine, adapted to the needs of the day, that is quite distinctively and uniquely Liberal?

There is, indeed, one body of doctrine that meets with no sympathy at all in the Labour Party and with nothing but lip service from the Tories. It is, moreover, a doctrine than can claim direct apostolic succession from the great days of Mr Gladstone. This is the doctrine now chiefly known as Individualism, which sees in the removal of bureaucracy and a reversion to uncontrolled private enterprise the sovereign cure for the economic ills of the community. To believe in a programme consisting of nothing but Peace, Retrenchment and Reform is, in these days, to stand not in the middle but at the extremity of one wing of public opinion. Yet the Individualists are all lifelong Liberals; their stronghold is the Reform Club; and nobody can deny them their claim to some at least of the title deeds of Liberalism. Nevertheless, in spite of the fact that the Society of Individualists is said to be in a flourishing condition, it does not seem likely that the Liberal Party will go to the country at the General Election under their banner, or that it would be very successful if it did. Nevertheless, it is their views which, to many people, are the meaning of “Liberal.”

But there is another entirely different view of public

affairs, held by a very large number of people in this country, which is positive and coherent, but finds no satisfaction at all in either of the two larger parties. More particularly it is the view of the younger generation, who are too young to remember the days when the Labour Party itself was fresh and new and when Socialism seemed to be the embodiment of every dream. Socialism is an old-fashioned creed to the products of the modern secondary school education; especially when it merges, in practice, into the self-interest of the trade unions. To be acceptable in the twentieth century, a political programme must have a scientific and a technical flavour to it.

Bagehot foresaw the effect that technology would have on politics when he said, nearly eighty years ago, that “the co-operative agency of the state” ought to be used “in applying to our complicated society those results of science which are new to this age.” The physical sciences have, indeed, transformed the world; but the social sciences have done almost as much. Alongside the growth in the powers of production and destruction, there have been great social inventions too—techniques of collective welfare which, whether their application has been to the conquest of insecurity and the increase of wealth in peacetime, or to the safeguarding of social health amid the strains of total war, have opened up new vistas of possible achievement by the route of social organisation. What the modern world chiefly resents in the elderly political parties which occupy the stage is that they deny the application of the scientific method to public affairs, that they obstruct the necessary technical revolution in the apparatus of the community. The Tories block the way because they are pleased enough with the world as it is. The Labour Party blocks the way partly through the personal incompetence that is the inevitable result of its constitution, partly through its subservience to the trade unions, the most conservative element in the state, and partly through its devotion to a rigid doctrine which has been left behind by the march of events. Of all the sections of opinion in the last thirty years, the Socialists have learned least.

The new line of thought holds that twentieth century problems can only be solved by twentieth century methods. But equally it holds that, if these methods are used, the problems can be solved within the framework of a free society. The problem of poverty can be solved by the policy of the National Minimum. The problem of unemployment can be solved by skilled scientific treatment. The problem of productivity can be solved by a single-minded devotion to technical requirements. But none of these problems can be solved if the technical treatment of them is to be beset by the timidities and prejudices of the embattled interests of the Right and the Left. Public pressure has impelled the Tory-Labour coalition some distance along these roads. But there is always a sticking point, and it is the purest delusion to suppose that the resistance comes more often from the Right than from the Trade Unions. Neither of the large parties is sincerely converted.

The man who, more than any other, has given voice to these ideas is Sir William Beveridge, and he has named the instrument which he thinks best for securing their application. His phrase is “a Liberal Party with a Radical programme.” If this is what “Radical” means, then probably the largest part of the thinking people of the country are Radicals today. And a Radical programme should be congenial to the Liberal Party, for what is most needed at the moment is a work of liberation. The chief phenomenon of the past quarter-century in the democratic world has been its frustration. Negation has never been at a higher premium. Two principles have been in conflict, those of social organisation and of individual freedom, and they have succeeded only in obstruct-

ing each other. Those who have seen the advantages that can flow from a purposive direction of some of the community's activities, have, by exaggerating their case, succeeded only in hamstringing the essential force of individual enterprise. Those who have carried the banner of freedom have succeeded only in stultifying the first cautious experiments in collective economic organisation. What is needed now is a programme of liberation, a policy that will permit the benefits of organisation, where it is technically the most appropriate, to be reaped to the full, while at the same time, in the rest of the economy, searching out and removing the obstructions to the exercise of individual enterprise and imagination. There is room for a fruitful partnership between the state, which should be responsible for the stability of the main framework or (to change the metaphor) the equability of the economic climate, and the vigour and imagination of individual enterprise, which can provide the community with wealth in abundance and variety. Only by this means can democratic Britain secure that release of human energies which from time to time startles History with the spectacle of a Golden Age.

This is the opportunity for the Liberal Party. Is the party in a position to seize it? Hitherto, there has not been any very visible tendency for the younger people

and the newer ideas to find in the Liberal Party the political vehicle for their expression. Sir William Beveridge may now convince them, both by his precept and by his example, and there have been some notable additions recently to the list of Liberal candidates at the next General Election. But even the most sympathetic cannot avoid some doubt about the reality of the Liberal revival. The lot of a third party in the British system is hard, and the lot of a third party that is split is still harder. The Liberal Nationals stand for nothing that is distinguishable in the way of faith and doctrine; but they control substantial parts of the Liberal machine up and down the country. The Liberals have also suffered from the lack of leaders who can command and hold a nation-wide audience, and Sir William Beveridge cannot by himself put that right. If British politics still worked in the classical way, the Liberals would find their leaders by the secession from the Tory and Labour parties of men who could no longer stomach their policies. Perhaps that may happen even today, for the present position of two large parties without any faith and a faith without a party that can hope to attain power cannot last indefinitely. In politics, as in physics, nature abhors a vacuum and it may yet be the Liberal party's destiny to fill it.

NOTES OF THE WEEK

Towards the Rhine

The past week has seen the development of six offensives all along the western front, from the Dutch to the Swiss frontier. The co-ordination of the six thrusts has put an enormous strain on the enemy's forces dispersed over a distance of four hundred miles. The reaction of the German High Command has been to retreat on the left flank and to concentrate the bulk of its defensive strength on the right. The French First Army under General Tassigny has therefore met with relatively weak opposition in its advance through the Belfort gap to Mulhouse and Colmar. The fall of Strasbourg to the First French and to the Seventh US Armies seems to be imminent, and both armies may soon roll up the German defences all along the western bank of the Rhine from the Swiss frontier to the Saar. Yet these victories open no prospect of a drive into Germany beyond the southern Rhine, where the mountains of the Black Forest form a mighty obstacle to the attacker. The immediate operation made possible by the recapture of southern Alsace is a drive northwards along the Rhine valley which would outflank the Saar from the south at a time when the Third US Army has, after the liberation of Metz, approached it from the west. The real hinge of the whole western front remains in the north, where the British and the Americans are still slowly and stubbornly battering their way through towards the Rhine and the Ruhr and the great northern German plain beyond. There, in the north, the most decisive battle is now being fought—the Caen of the present campaign.

Russia and the West

The idea of a regional grouping of the nations of Western Europe continues to be the centre of discussion on the post-war settlement. Criticism of the idea has been almost equally vocal in Soviet Russia and in the United States. In France and Belgium, Communist propaganda against it has reached its climax on the eve of General de Gaulle's departure for Moscow. French official spokesmen, obviously anxious to avoid any commitments, have so far sought safety in vagueness. It would seem, however, that the Russian objections have made an impression, and during their visit to Moscow the French Ministers will probably try to discover how far these objections, which have so far been of a propagandist nature, reflect the official Soviet view. Both General de Gaulle and M. Bidault emphasised in this week's debate on foreign policy in the Consultative Assembly that France's interests are not confined to the west of Europe. M. Bidault spoke of the French interest in the Danube area and General de Gaulle announced that the French Government will make its own proposals for the delimitation of Germany's frontiers in the east as well

as in the west. There is something of a dilemma for Moscow here. It is most unlikely that French initiatives in Central or Eastern Europe will be anything but most unwelcome to Russia. But how is it possible to argue regionalism in the east and universalism in the west? For the moment, the emphasis is all on universalism, and Marshal Stalin has told a Polish delegation that Poland must not look to the east alone but must remain allied to Great Britain, France and the United States. Is it perhaps Russian policy to preach universalism (for the confusion of the Western Union) but silently to practise regionalism nearer home?

Cabinet Changes

The changes in the Government which have been announced this week are not of sensational importance, though they are nevertheless of interest. Two posts of Cabinet rank were already vacant—those of the Ministers Resident in West Africa and the Middle East—and the Prime Minister has created a third vacancy by calling for the resignation of the Minister of Works, Lord Portal, on the ground that the Minister in charge of that most essential department must be in the Commons. The reason is valid enough, though it is difficult to understand why Lord Portal, who is a shrewd and energetic Minister, has to go out of the Government altogether, when many Ministers who are of distinctly inferior calibre remain in office. Sir Edward Grigg, who has held no office since he vacated an Under-Secretaryship at the War Office over two years ago, is sent to Cairo, and Captain Harold Balfour, who has hitherto been one of the Under-Secretaries at the Air Ministry, goes to West Africa. Both are experienced administrators, but neither the Nile nor the Niger will be set on fire. By far the most interesting nomination is that of Mr Duncan Sandys to the Ministry of Works. Mr Sandys thus reaches Cabinet rank at the age of 36. The infusion of youth into the highest ranks is always to be welcomed, but it will be regarded throughout the country as an extraordinary coincidence that, of the three men in their thirties whose merits have, since the last war, been judged sufficient to raise them to the Cabinet, one has been the son, and another the son-in-law, of the Prime Minister who appointed them. The building problem will soon give the measure of Mr Sandys's qualities. The present changes are completed by the nomination of Commander R. A. Brabner and Mr John Wilmot to the vacant Under-Secretaryships at the Air Ministry and the Ministry of Supply. It is also announced that the Ministry of Economic Warfare will come to an end on December 31st, since the volume of its work is no longer sufficient to justify the existence of a separate Ministry.

ABC Plans at Chicago

Nearly ten days of discussion between United States, Canadian and British delegations at Chicago have resulted in a draft convention—with important blank spaces still undecided—for the regulation of international air traffic. Although the points agreed on have yet to be accepted by a special sub-committee of the conference, it seems likely that the draft will provide the basis of a convention. It is not a solution since it is so far incomplete and, if first reports can be relied on, even contradictory in places. For instance, the international authority is to permit, and in some cases has power to recommend, the pooling of services and transport organisation between countries. At the same time the draft proposes a ban on "discrimination" and the granting of exclusive privileges to any other country or airline. Again, members may make bilateral arrangements on traffic rights with non-member countries, yet are apparently obliged to prohibit the transit of aircraft whose country of origin does not conform to the multilateral agreement. Probably these apparent contradictions will be cleared up when something more than the present brief reports emerge. As they stand, the authority's power is open to grave weakness. As to its composition, an assembly of all participating countries plus a board of 14 directors, seven representing the great air powers, represents a concession to the smaller nations from the original American and Canadian proposals. The specific powers and duties of the authority remain the major difficulty. The three countries have been able to agree on a great many subjects, on the supervision of rates and fares decided on by associations of air-line operators, the provision of meteorological and air navigation services, and on technical standards. This is a substantial achievement. But on the major issue of the control of traffic frequencies they do not seem to have been able to advance beyond an agreement to disagree. The Americans still want freedom, the British still want regulation. The recognition of what has been called "the fifth freedom of the air" is still undecided. It would allow aircraft flying from one country to another to land and pick up pay-load, apart from internal traffic, at intermediate points. On these two points hinge the real success or failure of the conference. In spite of the prevailing optimism on the spot, the outlook for a real solution does not at present appear very promising.

Chinese Government Reshuffle

The political crisis in the Kuomintang has apparently gone deeper than was thought a few weeks ago, when President Roosevelt recalled General Stilwell from Chungking. The last session of the Political Council of the party ended in an unmistakable demonstration by its members against the most criticised personalities in General Chiang Kai-shek's entourage, and partly even against the General himself. Soon afterwards a reshuffle of the Government was announced. Two members, the Minister of War, General Ho-Ying-Chin, and the Minister of Finance, Mr Kung, were dismissed from their posts. General Ho-Ying-Chin has been reputed to be one of the Kuomintang's most influential die-hards, stubbornly opposed to any co-operation with the Communist armies of Yen-an. Mr Kung's political reputation has declined together with the value of the Chinese currency. The new Minister of War is General Chen Cheng, who is believed to be more in favour of close co-operation with the United States than was his predecessor. General Ho-Ying-Chin, however, has retained the post of the Chief of Staff, which means that he will continue to exert very strong influence on the army. It is too early to say how much this reshuffle of the Government will help General Chiang Kai-shek to overcome the difficulties with which he has been grappling. Inflation is rampant and will continue to be so for a long time yet. The prejudice against military co-operation is strong both in Chungking and in Yen-an. Even so, the chance of a better understanding, at least between Washington and Chungking, is now probably greater than it was before; and Mr Donald Nelson's mission to China may perhaps clear up some of the misunderstandings that caused the recall of General Stilwell.

Retreat from the Balkans

From the end of August German troops have been slowly and laboriously retreating from the Balkans. Some 15-17 German divisions are being forced to fight their way back to the line of the Sava, the river that runs roughly

eastwards and flows into the Danube at Belgrade. The Germans, who have already been entirely cleared out of Greece, have been opposed by advancing Russian armies, by Tito's Yugoslav Army of Liberation, by Bulgarian units under Russian command, by the British detachments known under the name of "Land Forces, Adriatic" and by innumerable guerilla forces in Greece and Yugoslavia. On the German side, Chetniks, Croatian Ustasas, Serbian police detachments organised by Neditch and some Russians recruited from prisoners of war have been identified during the fighting. An extraordinary feature is that Crete and a considerable number of the Aegean islands are still occupied by German garrisons—like the Channel Islands in Western Europe. Samos, Lemnos, Naxos and some islands to the north of Crete are, however, in British hands. In the west the entire Dalmatian coast has been freed by Tito's forces; only the naval base of Kotor (Cattaro) is still used by the Germans. No Germans are left east of the river Morava. The most southerly point of the fighting in the historical Kossovo Plateau, where the town of Pristina fell to Tito's army. The disputed area comprises northern Albania, the Sanjak of Novibazar, Western and Eastern Bosnia with the railway lines from Knin to Fiume and from Kotor to Sarajevo, whence there is a branch to Cacak on the western Morava and another to Brod on the Sava. Its main communications are with great difficulty kept

free by the Germans for the retreat of their forces in Albania and Macedonia. Right up to the Austrian frontier in Croatia and Slovenia and on adjacent Italian territory, guerilla forces have been active against German communications and strong points. The first Russian crossing of the Danube near Apatin, above the confluence of the Danube and the Drava, has been reported; this constitutes a dangerous threat to the bottleneck from Fiume to Zagreb through which the Germans will have to retreat from northern Yugoslavia west of Belgrade, Novi-Sad and Sombor. The Russian advance across Hungary shows that eventually the Germans will have no other choice than to retreat to a line roughly marked by the Trieste—Vienna—Cracow railway. This will complete the encirclement of Germany in the south. In fact, the theatres of war in Slovakia, Hungary and Yugoslavia are closely integrated. The Slovak rising took place on territory only 113 miles to the east of Vienna. If it had been successful, Hungary could have been invaded from the north, and the way into the famous Morava gap from Vienna to Cracow would have been open.

Sites for Bungalows

There is a note of desperation in the memorandum on temporary housing prepared by the Ministries of Health and Works for the guidance of local authorities—a note that contrasts strongly with the dilatory handling of the

problem of public acquisition of land. Four types of temporary bungalow accommodation will soon be in full production and the first deliveries are expected early in the new year. Thus the local authorities have at most only a few months in which to acquire and prepare the necessary sites. They will have to accept immediate delivery of the bungalows when they are ready, since no arrangements can be made for their storage. Some authorities will be able, no doubt, to meet the requirements satisfactorily, for their plans have been made in advance of legislation. But others will find themselves so pressed for time that the complicated problems of siting will not be afforded the attention they need. The four categories of land regarded in the memorandum as permissible include sites that will ultimately be used for permanent housing and other purposes and marginal strips of agricultural land adjacent to existing housing estates. Clearly the very greatest care must be taken to prevent a hold-up of the permanent building programme through the faulty siting of the bungalows. The aim should be to leave enough suitable land free for permanent building as will occupy available building resources for ten years—the defined life of the bungalows. It is neither necessary nor desirable to leave more acquired land than this unoccupied. There will be “Skin Game” complaints from tenants and landowners if the bungalow settlements are placed too near to existing property, but the housing problem is so acute that such complaints must fall on deaf ears. Land will have to be used—temporarily—more or less wherever it can be found. A second difficulty that will confront the local authorities will be in the allocation of the bungalows. The “special guidance” given in the memorandum is too vague to be of much use. Tenants will be selected according to the size of their families, their war service, and the availability of alternative accommodation. It is not unreasonable to predict that the inevitable lack of uniformity in the priority systems to be worked out by the local authorities will be a cause of much friction. The Government should relieve the authorities of an unpleasant burden by defining the qualifications for tenancy more closely.

Spanish Republicans

The last few weeks have brought a strong revival of activity among Spanish Republicans in exile. The two chief centres of Spanish political life outside Spain are southern France and Mexico. In southern France a supreme junta of National Unity has been formed which claims to speak on behalf of a broad bloc of Republican groupings. It seems that the Communists are playing the leading rôle in the junta. In Mexico the Left Republicans, led by Señor Martínez Barrios, and the moderate Socialists, the followers of Indalecio Prieto, have formed a National Committee of Liberation, which intends to act as a quasi-Government in exile. Finally, from this country the Republican ex-Premier, Dr Negrín, follows closely the events in his country, confident that Republican Spain—if resurrected—will recognise his claim to be the legitimate head of the Spanish Government. In Portugal, Señor Gil Robles, the leader of the Catholic Party, keeps aloof from the Republican groupings, and sets his hope on the restoration of Monarchy. In addition, there is a number of smaller groups ranging from the Basque Catholics to the anarcho-syndicalists. The fact that the Republican politicians have not yet managed to detach themselves from the feuds and rivalries of the thirties is, of course, a serious handicap in their ability to take effective political action. The time has really come for the opponents of General Franco to look forward instead of backward, and to face new tasks instead of old defeats and failures.

The Law of Compensation

The recent decision of the Court of Appeal in the case of *Rothwell v. Caverswall Stone Co., Ltd.*, underlines the importance of the Government's new plan for dealing with industrial accidents, in replacement of what has so far been known as Workmen's Compensation. Edgar Rothwell, employed by the Stone Co., met with an accident in the course of his employment in March, 1943, and dislocated his shoulder. He was taken to hospital and, through faulty diagnosis, the dislocation was not noticed and treated. He was first seen and X-rayed by a specialist in June, 1944, and it was then too late to reduce the dislocation, with the result

that Rothwell will always have a permanently stiff shoulder and arm. The point of the case was whether the employers were liable to pay compensation indefinitely, on the basis that Rothwell's earning capacity had been permanently reduced by the stiffened arm and shoulder, or whether they were only liable to pay compensation for the period during which the original injury incapacitated him, since they were not responsible for the events that converted a curable injury into an incurable one. The Court of Appeal took the latter view, as indeed they were bound to do under the existing Statutes. It is true that it would be inequitable to make an employer (or its insurance company) pay compensation indefinitely because of someone else's failure. But it is equally inequitable that a workman who is, broadly speaking, incapacitated by an industrial accident plus its treatment, over neither of which he has any control, finds himself without compensation and with only a right of action for damages against a hospital, an uncertain and expensive civil suit. While workmen's compensation remains a purely domestic affair between individual employers and their own workmen this kind of situation can always arise, but once the risks of injury are spread over industry as a whole it should be possible to ensure that an injured workman does not fall into distress or dependence on charity through legal loopholes.

Efficiency in Mergers

There is an important point of general economic policy to be observed in connection with the proposed merger between Richard Thomas, Ltd., and Baldwins, Ltd., the industrial and financial details of which are properly the province of Business Notes. The merger is between two large firms, one of which has, through re-equipment, made itself the cheapest producer in the industry, while the other owns a great deal of obsolete or obsolescent plant. The obvious, though unexpressed, object of the merger is to remove the high-cost plant and concentrate production on the new low-cost mill at Ebbw Vale. This is a highly praiseworthy endeavour. In the strictest *laissez faire* theory, the high-cost firm ought to be competed into bankruptcy and the more efficient firm ought to go its way with its costs entirely unencumbered by any of the overheads of its defeated competitor. In practice, especially in industries where fixed capital is heavy, things do not happen as theory dictates. The high-cost producer may go bankrupt, but he does not disappear; he remains as an incubus on the industry; he has a claim to be allowed some production; and he is an influence in the counsels of the industry for high prices. It is almost always worth an efficient producer's while to pay something to get rid, once and for all, of his high-cost competitors. But it makes a great deal of difference how the payment is made. If there is a purchase for cash or for debenture stock, or if there is anything in the nature of a levy on production to pay for scrapped plant—if any of these methods are followed, then the retirement pension that is paid to the high-cost producers enters into the costs of the survivors. Dying, the inefficient leave behind them as a legacy their pressure towards higher prices and more restricted markets. Even if the compensation is paid in the form of preference shares, there is a natural tendency in the same direction. Only if the compensation is paid in the ordinary shares of the surviving producer is this not so. Only in that case does the merger get the full benefit of the lowest costs of its most efficient plant. This is the method of amalgamation that is very much to be preferred in the general public interest. In most cases it will also be in the interest of the existing shareholder for minimum costs mean a maximum market and profits enough to pay the pensioners and leave something for himself. In so far as amalgamations play a part in industrial reconstruction—as they surely must—this is the principle that should be followed.

The Voluntary Hospitals' Finances

The annual statistical summary of King Edward's Hospital Fund, which gives figures for the income, expenditure and work of 169 London voluntary hospitals, has special interest this year because of the Government's proposals for a hospital service as part of a national health service.

The summary hardly supports the view, expressed in the White Paper and widely accepted, that—

The voluntary hospital is, in essence, an independent charitable organisation, deriving its money from the voluntary subscriptions or donations or endowments of benevolent individuals or associations. . . .

In London, at any rate, the largest source of the total ordinary income of a voluntary hospital comes, not from voluntary gifts, but from the patients themselves for services rendered. Last year, voluntary gifts by way of subscriptions and donations and central funds amounted to £1,358,169, and accounted for 25.9 per cent of their income. Receipts for services rendered, on the other hand, amounted to £3,153,116, of which £1,430,195, or 27.3 per cent of the total income, came from public authorities and grants under the Emergency Hospital Service, and £1,722,921—32.9 per cent of the total—from patients, whether directly or through contributory schemes. If, therefore, the White Paper proposals for a health service are carried through as they stand, it seems that the voluntary hospitals' largest source of income will dry up overnight. The individual will pay for his right to a free hospital service through his social insurance tax, and it has been officially admitted that there will thus be no place for the hospital contributory schemes. In place of these payments from patients, the voluntary hospitals will receive increased payments from local authorities—in the guise of joint authorities—on the basis of “a specified sum in return for services rendered,” which “should not be assessed as a total reimbursement of costs incurred,” and, in addition, a direct grant from central funds, which will include the share of the hospital service in the social insurance contributions levied on the public. The result will be that in the case of the London hospitals they will only be able to count on some 38 per cent of their income coming from personal benefactions or their own financial resources, whereas the White Paper laid down that they must “still look substantially” to these sources of income if they are not to lose their autonomy, and that if public funds were being used to guarantee their financial security “the end of the voluntary movement would be near at hand.”

Bad Teeth

The Inter-Departmental Committee under the chairmanship of Lord Teviot, which was appointed to consider dentistry in all its aspects, has published an interim report (Cmd. 6565) for the guidance of the Ministers engaged in drawing up legislation for a national health service. The picture it presents is very different from the brief reference to a dental service in the health services White Paper, which gave the impression that the supply of dentists could not meet the demand for treatment. On the contrary, the Teviot Committee finds that before the war there was no lack of dentists . . . to meet the actual demand for treatment.

And this lack of demand means that

the state of the dental health of our population is bad, and its effect on their general health is bad.

From the dental condition of a large and representative sample of Army recruits it appears that 90 per cent of the men and 86 per cent of the women required dental treatment on enlistment. An approved society, which provided treatment for young people aged 16-19, found that in one year no less than 12.2 per cent of those who applied for it needed full upper and lower dentures. Nor is it lack of means that has restricted the demand for treatment, because less than 7 per cent of the insured population entitled to dental benefit claim it each year and, in 1938, one-third of the elementary schoolchildren found to be requiring treatment, which is provided free, did not accept it. The restricting factors are rather fear, apathy and ignorance, and a dental service will be useless if it is not accompanied by an attack on these—not an easy task, for the fact that a timely visit to the dentist hurts less and costs less than a belated visit is one of those simple truths that are so unpalatable as to be quite unacceptable. When a proper demand is created, this in itself should, as the Teviot Committee hopes, stimulate recruitment to the dental profession, which is at present falling below replacement levels. Since, however, the growth of demand may outpace the supply of dentists and prevent a comprehensive dental service, which should form part of the national health service, from being effective immediately, the committee supports the view of the White Paper on the health services

that attention should be concentrated on meeting the needs of expectant and nursing mothers, children and adolescents. These special services should form “the sharpest point of attack of the dental force of the country upon dental disease.”

Overseas Leave

Mr Churchill's statement last Friday, that “exeat” leave is to be granted to a small proportion of the men on overseas service, has been warmly welcomed. The War Office, after continued pressure, has evolved a plan by which some 6,000 men can be brought home each month for a period of four weeks' leave before returning to their units. The distribution of exeat passes among the different theatres of war is apparently a matter to be decided by arrangement between the commanders-in-chief. The apparent limitation of the scheme, moreover, to men who have “for a considerable time borne the burdens of campaign” is sufficiently vague to invite an inequality of standards both between different units and between different theatres of war. Unequal standards already apply—in practice even more than in theory—in the time-limits on what Mr Churchill calls the “overseas tour” (i.e. before final repatriation). On September 26th Sir James Grigg declared that he hoped for a reduction of the maximum for troops in India and Burma to four years and for other troops overseas to four and three-quarter years or less. Although hedged with reservations, this was probably as near to a promise as the men could hope for. The additional concession of exact leave, therefore, should be quickly followed up by a more precise definition of those to whom it does apply, and under what system, however rough and ready, of priorities. Otherwise, a good scheme will get less than the appreciation which it deserves.

Boarding-House Geometry

The drain of population away from coastal defence areas and the disappearance from these areas of the holiday-catering trade has made these towns, in a sense, war

Chinese horse typical of the T'ang period

FLYING MONEY

Fei-Tsien—Flying Money—the ancestor of the bill of exchange, was invented in China in the seventh century. It provided a means of transmitting money from place to place and thus assisted in developing trade and travel in China's vast territories.

The Emperor of the T'ang dynasty who originated this method of payment little knew he was sowing a seed which would grow into a highly specialized financial system enabling nation to trade with nation.

Modern international commerce calls at many stages for facilities which only a bank with wide ramifications can provide. In whatever overseas transactions you are interested, and whatever the nature of your engagements, this Bank, with an extensive branch system in the home country and banking connections throughout the whole wide world, is able to offer you unrivalled services at whichever of its 1800 offices is most convenient for your purpose.

casualties. Sir William Jowitt, after touring the areas, has announced the Government's intention to make available interest-free loans, out of which local authorities can lend a maximum of £150 (probably at a low rate of interest) for the re-equipment of small traders and boarding-house keepers. It has not so far been the Government's policy to compensate for trade lost through war conditions, and this exception in favour of coastal traders may be followed by equally good claims from other directions. The simple justification for this concession is the fact that up to 30 million people will want—and deserve—a holiday in the first post-war year. This demand assures a return of prosperity to the coast resorts, which should soon relieve the present desolation. But before holiday-makers can be received, boarding-houses and shops must be put into repair and re-equipped. The main difficulty here is not so much a lack of capital as lack of supplies and of labour to repair premises and to staff them. Sir William Jowitt emphasised that building labour could not be directed to coastal resorts. It would clearly be unthinkable to break off the repair of London homes in order to re-establish holiday resorts. Nevertheless, the sooner the south and east coasts can be rehabilitated, the sooner can the nation take its well-earned holiday and the sooner can tourists from overseas be welcomed. The opportunity should not be lost to see that landlords' sheets which fail to meet though "projected ever so far," and other horrors of boarding-house geometry should have no place in a post-war world of brighter holidays.

Shorter Notes

The Foreign Office has followed the unusual course of issuing an official commentary on the Dumbarton Oaks agreement. (Cmd. 6571, 2d.) The commentary follows the text closely, and makes a brave attempt to show that, by marrying powers to responsibilities, and by removing legal obstacles to action (in particular, the unanimity rule), the proposed new organisation will be stronger than the League of Nations. But it does not discuss the crucial question, which is whether the Great Powers, who have the power and the responsibility, will, in fact, be willing to use the one to meet the other.

The Canadian political crisis has not yet relaxed. Parliament has been summoned to meet this week, and Mr Mackenzie King has laid the causes of his dispute with Colonel Ralston before the House. The issue turns on how strong a case can be made by the Prime Minister and by the new Minister of National Defence for their view that voluntary methods can provide the drafts that, by common consent, are needed for the Army overseas. The pressure of the conscriptionists is strong, but their success would mean the splitting of the Liberal Party and possibly disastrous disunity in the Dominion.

The General Council of the Trades Union Congress has endorsed the proposal of the Amalgamated Engineering

Union that war workers who are released as "redundant" should not be treated as unemployed and receive unemployment benefit, but should be paid their normal wage under the Essential Work Order while waiting to be re-absorbed in other employment. This claim, which will be raised forthwith with the Minister of Labour, is likely to prove controversial in the extreme.

Five years of the War Savings campaign were completed this week, with a grand total of just under £8,500 million in loans to the Government, over £3,000 million of which has come in small savings. The achievement of the savings movement in campaigning against unwise spending and in spreading the habit of saving must be fully acknowledged. In spite of the possibilities of duplication, the 17½ million holdings of Savings Certificates and the 18½ million deposits in the Post Office Savings Bank make impressive totals.

Mr Bevin announced on Tuesday that up to D-Day the total mobilisation of the man and woman power in Britain had reached 25 millions out of a population of 46 millions. It is quite true, of course, that the war effort in all its aspects has claimed the services of a very high proportion of the population, but the figures quoted are so lacking in definition that they are almost without significance. They could only be justified, surely, if the term mobilisation were stretched to include registration for mobilisation.

Mr Williams told Parliament last week that long-term agricultural policy would follow the nutritional aims accepted at Hot Springs. A first step towards the encouragement of "protective foods" was the guaranteed prices for livestock products up to the summer of 1948, laid down in Mr Hudson's four-year plan. This statement is welcome, but the readiness of the Government to contract severely some branches of farming, as well as to expand others, was left in doubt by the statement that a large measure of agreement has been reached over policy with the National Farmers' Union.

A report of the Royal Scottish and the Royal English Forestry Societies demands greater attention to the preservation of private woodlands through the establishment of regional conservators and forestry colleges, and the allocation of up to as much as £150,000 a year for research. The Societies' criticism of the present independent Forestry Commission, which they wish to replace by an authority directly responsible to some Minister, is hardly justified. But it is true that extensive replanting of many private woodlands is urgently needed, and since many land owners lack the necessary capital, state action is called for—preferably through the existing Commission.

The controversy between Mr John Watson, a juvenile court magistrate, and the London Council Council over the conditions existing in an LCC remand home appears to be one of those disputes which engender so much righteous indignation on both sides that the public tends to get confused. The question to be decided is not, surely, whether the home was badly run, which the LCC convincingly denies, or whether Mr Watson spoke too loudly and too hastily, but whether the circumstances ought ever to have arisen. It will come as a shock to many people that the law could allow a little girl of seven, whose only fault was that she had been grossly and pitifully neglected by her parents, to be sent to a remand home while her future was being decided, even though she was segregated from the delinquent inmates. Attention should be concentrated, not on vindicating the LCC or the magistrate, but on enabling neglected children to have a better fate than this.

Jamaica's new constitution, which restores to the island a considerable amount of internal self-government, was proclaimed by the Governor on November 20. The constitution grants universal adult suffrage, and an election to the new House of Representatives will be held next month.

Letters to the Editor

Beveridge on Employment

TO THE EDITOR OF THE ECONOMIST

SIR,—I have not had a chance to read Sir William Beveridge's book, but I have read two summaries made by very able and responsible men, Colonel Elliot and your reviewer.

Colonel Elliot describes Sir William as believing that until full employment has been reached there is no permanent advantage in international trade.

To me this can only mean that unless full employment is secure there should never be (except in an emergency) any commercial contact between nations. But this is so fantastic that it must be wrong, and Sir William's true meaning must be beyond my understanding.

In your review you say that all economists, including Sir William, insist that exports do not determine imports, but that the imports of the world determine the volume of exports. This means to me that, when Britain imports beef from Argentina while Argentina imports whisky from Britain, then, viewing the transaction from East to West, beef determines whisky; viewing it from West to East, whisky determines beef. This is so meaningless that again the economists' true intent is clearly beyond my grasp.

I would not trouble you with my perplexities but for your last paragraph, which emphasises the danger to democracy of ignorance in the electorate. Very true. But modern political economy is as much the domain of specialists as ontology. Not one voter in a thousand can or will understand Keynes or Hawtrey or Beveridge, form an independent judgment on their views, and express it intelligently at the poll.

So if the main course of government and the regimentation of our lives are to be decided on the abstruse teaching of present-day economists, don't ask the common man to vote on the issues involved. He is, as he will remain, completely blank on them.

It would be better, I suggest, not to raise hopes of an educated electorate that will be eager to measure the gap in the circular flow of income or evaluate the implications of the neo-orthodoxy of William Beveridge as against the pliocene-orthodoxy of William Gladstone. Better make up our minds that the subtlety and delicate balance of High-brow Government are not compatible with democracy—and decide which of them we want.—Yours, etc.,

Lloyd's

D. E. W. GIBB

[What *The Economist* (not Sir William Beveridge, though he would doubtless agree) wrote was that "the imports of the world as a whole determine how much can be exported." Mr Gibb has overlooked the words in italics. The volume of foreign goods that the nations of the world as a whole decide, through their tariff and protective policies, to let into their countries determines how much they can all export. Is that as incomprehensible as Mr Gibb makes out?—EDITOR.]

Europeans and Russians 1940-70

TO THE EDITOR OF THE ECONOMIST

SIR,—In your article in the issue of November 4th you say several times that the population projections prepared by Dr Notestein and his colleagues at Princeton, and recently published by the League of Nations, are "based on levels of fertility and mortality in each country which do not vary from the pre-war figures." This is wrong; what the calculations assume is, in the words of the authors, "an orderly continuation of recent fertility and mortality trends in the future." The text and charts of Chapter I of the report make it clear that it is assumed that both fertility and mortality rates will decline substantially from their pre-war levels in every European country (including the USSR) in the period under consideration.

There is also another mis-statement of less importance. The figure given in the report for the population of the USSR in 1940 is not, as you say, 40, but 60, million less

than that of North-Western and Central Europe at the same date.—Yours faithfully,
London, N. 6

W. A. B. HOPKIN

Spotlight on Palestine

TO THE EDITOR OF THE ECONOMIST

SIR,—The press in its reactions to the murder of Lord Moyne, has, on the whole, been distinguished by characteristic British sanity and by an absence of bias. As a regular reader of *The Economist* I am the more surprised by the article in your issue of November 11th which seems so contrary to the liberal-minded tradition of the paper.

This article is so packed with mis-statements that I cannot ask you to allow me space for a discussion of its basic outlook and argument. I shall therefore pick out one or two examples.

The article states that "On the outbreak of war, both Jews and Arabs gave proof of loyalty to Great Britain. The latter . . . gave out that they had no intention of embarrassing Britain while it had a major war on hand. . . . They have kept their word." The writer implicitly assumes that Arab loyalty to the Allied cause need never be more than passive—how many Arabs have volunteered for service? And what Arab leader has rendered to Britain services comparable with those which the Mufti of Jerusalem, by far the most prominent figure among Palestine Arabs, and Rashid Ali, Premier of Iraq, have rendered to Hitler? With how little the writer is satisfied where Arabs are concerned, and how much he is prepared to overlook! And this although at the outbreak of the war the Arabs had just attained, as a surrender to violence, practically all that they asked for through the White Paper of May, 1939.

Although that document was in Mr Churchill's words a "breach and repudiation of the Balfour Declaration," to the Jews loyalty meant active service in the war. Perfunctorily your article touches upon the Jewish offers of military service and the way in which they were cold-shouldered, but has not a word of tribute to what Palestinian Jewry has done both on the battlefield and in the factory. On the other hand, the writer recounts with gusto the activities of the terrorist gangs, and makes the suggestion, as insidious as it is utterly unfounded, that the conceding of a Jewish Brigade Group has stimulated faith in the methods of violence. Would it not be more reasonable to suppose that if the enthusiasm of Palestine Jews for active service at the front had been met sympathetically at an earlier date, some of those who now risk their lives in criminal activities might have achieved real heroism in fighting the enemy?

I pass now to the sting in the tail of your article, suggesting that the Moyne murder should be used as an argument for shelving consideration of the Jewish claims which are based on the Balfour Declaration and the Mandate, because to do otherwise would constitute a "surrender to violence." Since when has it been British practice to make the rights of nations dependent on the acts or crimes of individuals? You yourself do not seem to apply the same standard to the Palestine Arabs; what your article refers to as having been "euphemistically called disturbances" was directed by their chosen leaders, some of whom have continued their treasonable activities during the war.—Yours faithfully,
London, W. 1

S. GESTETNER

Those Billions

TO THE EDITOR OF THE ECONOMIST

SIR,—Whatever respect may be due to our great Ally, there can be no doubt that, in the matter of billions our own usage is to be preferred to the American. If billion means a million squared, trillion a million to the power of three, and so upward, the form of the word suggests its meaning and avoids confusion. Moreover, for the number one thousand million there is already current the word milliard. If "billion" is used for this number, "milliard" is thrown out of work, while "billion" does double time thus causing a loss of efficiency all round.—Yours, etc.,

AMERICAN SURVEY

Thawing the Wage Freeze

Both Labour conventions, meeting this week at New Orleans and Chicago, are turning the heat on the wage freeze. Mr Murray, of the CIO, has demanded an upward revision of the "Little Steel" formula on the grounds that the commitment to maintain a stable relation between wage rates and prices has been flagrantly violated. This argument has already been sustained, to some extent, by the War Labour Board's hearings on the cost of living, and it gains new force from the increase in cotton and wheat prices engineered by the farm bloc. The drive for wage revision is concentrated in four industries, shipbuilding, textiles, automobiles, and steel, although Labour's case is most advanced in the last. The greatest emphasis, however, is now put, not on the cost of living, but upon the possibility of a "reconversion depression" when pay-rolls drop with the return of the 40-hour week. Union spokesmen argue that to maintain purchasing power, a guaranteed annual wage, or the payment of 48 hours' wages for a 40-hour week, is essential. Mr Henry Ford has characteristically announced his eagerness to pay high wages as soon as it is permitted; but this is the only break in an otherwise solid opposition by industry to the proposition that war-time increases in productivity and the end of overtime payments, will make higher basic rates feasible. Labour's anxieties are enhanced by the realisation that with the end of the war in Europe, opportunities in the high-wage war industries will decline, and there will have to be a movement back to the lower-paid consumer and service industries. During the war wage inequalities have been exaggerated, partly to recruit labour for the war plants, partly because of the greater bargaining power of the unions in the mass production industries. On the grounds of equity and of maintaining purchasing power, as well as the need to attract workers back into peacetime production after the war, the greatest efforts might well be devoted to evening out these inequalities; but it is far from certain that this is what will happen. Mr Murray's eloquent plea for the continuance of the anti-strike pledge follows the line taken by responsible trade union leaders in the individual unions. The Electrical and Rubber Workers have already voted to renew the pledge. Some observers, however, have read into the heated debate of the Automobile Workers, and their decision to postpone the endorsement of the pledge for 90 days, a strategic link between wage adjustment and industrial peace. Mr Byrnes has insisted that the wage ceilings must remain; and it is believed that Mr Roosevelt may hope to delay a revision of the wage formula until "V-E Day," or victory in Europe. Presumably this would take the form of a limited increase in rates to compensate for the loss of overtime. Announcement of the Administration's intentions, however, cannot be postponed too long, without exaggerating the "reconversion jitters" of the rank and file, and putting a severe strain upon the authority of labour's leaders.

Labour Politics

"We have set reaction back upon its heels," said Mr Murray to the convention of the Congress of Industrial Organisations, celebrating the success of Labour's first large-scale intervention in politics. "Clear everything with Sidney" may have been a bit of Republican apocrypha, but with the evidence of the vigour and effectiveness of the Political Action Committee, particularly in the great industrial states, Mr Hillman emerges as a portent as well as a political power unprecedented in American labour history. By supporting a few Republicans, and opposing some Democrats, the PAC justified its claim to non-partisanship. But the link with Samuel Gompers has worn very thin. Democrats, as well as Republicans, are impressed by the possibility that the PAC will transform the balance of power in the party structure, and, that this explosive new force may disrupt the Democratic party after Mr Roosevelt retires from its leadership. These speculations would have even more force if the PAC had succeeded in obtaining the co-operation of all the main labour organisations. There was a moment, after the passage of the Connally Anti-Strike Act, when it looked as though anti-labour agitation, then at its

height, might produce a solid labour front to combat misrepresentation, and bring pressure to bear on Congress. The splits proved too deep to be healed, even in this emergency, and during the election campaign some spokesmen of the American Federation of Labour and of the Railway Brotherhoods (which are independent of both the AFL and the CIO) were profoundly critical of the PAC as likely to antagonise the public further. Mr Murray's repudiation of reported overtures from the AFL suggests that the CIO may be less receptive to peace offerings now than it was before its demonstration of political strength. These continued divisions in the ranks of labour are reflected in the refusal of the AFL to join the CIO in accepting the invitation of the British Trades Union Congress to attend the world trade union conference in the New Year. It is said in Washington that this will further increase the prestige of the CIO, and that the AFL is cutting off its nose to spite its face. This is very likely true. But the CIO, however incontestable its claim to labour leadership, remains only a segment of the American labour movement.

The Power of the Press

Mr Harold Ickes recently commented, with his usual tartness, upon the gulf between the press and popular opinion disclosed by the election. It is said, although no very precise analysis is possible, that only about 15 per cent of the newspapers actively supported Mr Roosevelt, with about 60 per cent in the Republican camp and the remainder on the fence. Far from being new, something like this proportion has prevailed in Mr Roosevelt's earlier campaigns. Some time before the election, Mr John S. Knight, owner of the *Detroit Free Press*, and the new proprietor of the *Chicago Daily News*, admitted that the newspapers, by and large, are out of touch with the people. It would be wrong to say that the press had no effect upon the election. The *Chicago Tribune* failed to hold Illinois for Governor Dewey; but the editorial policy of such journals as the *New York Times* and the *Louisville Courier-Journal* unquestionably had a deep effect upon the independent voter, and columnists like Mr Walter Lippmann and Miss Dorothy Thompson were valuable Democratic assets. In part, the decline of the influence of the press is the measure of radio's gain. Mr Roosevelt's mastery of the microphone more than outweighed his unpopularity at the editorial desk. It is worth remembering, in analysing the campaign, that the lower the income group, the greater the tendency to look to the radio, rather than to the newspaper, for news and comment. What sells the American daily is entertainment as much as political guidance. Joe Palooka and Caspar Milquetoast have no less devoted, and perhaps a wider, following than Mark Sullivan and Arthur Krock. The *New York Times* is the only newspaper which has been able to resist the invasion of the "funnies." It is said of the newspaper public, that 90 per cent "read" the picture page and more than 80 per cent read any comic strip, while less than half read any leader. This is a fact which reduces the penalty for an unpopular editorial policy; and has discouraged the great crusades which marked American journalism a generation ago. In the place of the independent, there is, increasingly, the national chain and the syndicated article; and an immense increase in the capital investment required to produce a paper. Although it would be hotly denied in the United States, extremes of wealth and consequently of economic interest, have created something like Disraeli's two nations. This isolation from the trend of public opinion is shared by the newspaper proprietors and has produced as unrepentant an Old Guard as either of the political parties can show. And the newspaper world feels only at second hand the defeat at the polls which, in time, has its corrosive effect upon the Old Guard of a party.

The Case for Cartels

Sir Clive Baillieu's defence of cartels as being neither all black nor all white, and the unanimous adoption of a report calling for immediate study of Governmental and

business agreements regulating production, marketing, prices, and patent exchanges, have been the notable developments of the Businessmen's Conference at Rye. American delegates to the Conference could hardly help accepting the report, since the other participants appear to have been almost unanimous in its favour. But their position is embarrassing, in view of the determined campaign against cartels which has been waged by the Administration, and a popular reaction which was summarised by Senator Kilgore's reference to the conference as

"largely a gathering of broken-down European big business men plotting a revival of the cartel system."

It is only a fortnight since a State Department Committee, completing a three-year study of cartels, recommended that the United States Government take a firm stand against restrictive international agreements of all kinds, except for purposes of national defence, to conserve scarce commodities, and in cases involving public health, such as narcotics. Moreover, this has been almost the only subject on which the United States Chamber of Commerce agreed with the Roosevelt Administration. Public opinion has been prepared for a root-and-branch attitude towards cartels by frequent revelations of the extent to which American war production was hampered by restrictive agreements, mainly with the German cartels. A Senate sub-committee headed by Senator Kilgore recently reported that the rooting out of the cartel system is essential if another war is to be avoided and full employment is to prevail. The Kilgore report not only denied any virtue in cartels; it refused to accept the thesis that by regulation and registration they might be made to serve the public interest. The only American voice to be raised in favour of a more realistic policy is that of Mr Milo Perkins, formerly executive director of the Board of Economic Warfare, who in the current issue of *Harper's* propounds the novel thesis that the United States cannot hope to force the Sherman Anti-Trust Act on the rest of the world; and goes on to point out that Americans preach, but do not always practise, free competition. Mr Perkins insists that the international commodity agreements are, in effect, inter-Governmental cartels which the United States may well wish to join; and he suggests, in addition, that a sizable part of American business may wish to join post-war cartels in order to protect its rich domestic market. It is Mr Perkins' conclusion that where cartels cannot be eliminated, or where foreign trade is better handled through co-operation than competition, cartels can, and must be, gradually modified into instruments which will benefit the public.

Political Pricing

Last winter's prophecies of an American famine have vanished in the light of this season's abundance. Even the feed shortage seems at an end with a corn crop of over 3 billion bushels and a wheat crop of over 1 billion. Despite the progressive relaxation of rationing restrictions this year, there is a growing anxiety about the disposal of farm surpluses, and the ability of the Government to make good its price commitments to the farmer. It is a truism that the foundation of post-war agricultural prosperity, particularly in the South, is diversification, and the substitution of meat, dairy products, luxury fruits and vegetables for the single crop. The price policy forced upon the Administration in recent months by the farm bloc seems destined to slow up this process, and to guarantee the production of unmanageable surpluses of the more staple lines. It is the background to the export subsidies for wheat and cotton discussed in a note on page 708. In recent times, American agricultural exports have been hampered by the high level of domestic costs; and these were lifted still further by the Administration's attempts to solve the farm problem by raising farm prices. The Parity Price concept has, for example, made the growing of wheat unduly profitable, as its costs of production have fallen since the base period 1909-1914. This situation has been exacerbated by the extension of the Stabilisation Act this spring, which required that the price of cotton be held at 95 per cent of parity. In consequence, the War Food Administration has announced a policy of buying at 100 per cent of parity and reselling at 100 per cent of parity plus carrying charges. Immediate increases in the grain and cotton markets followed. The Commodity Credit Corporation, which is the instrument for carrying out these purchases, already owns more than 2 million bales of old cotton, and under the new scheme, it is expected that it may hold, under loans and purchases, more than 11 million

bales by the end of the current marketing season. The Corporation also owns more than 100 million bushels of wheat, and holds another 70 million bushels as collateral for loans to farmers. The use of export subsidies, as provided in the Surplus Property Disposal Act, is the only method of maintaining agricultural prices and production at their war-time levels without accumulating disastrous surpluses in the warehouses.

Prescription for Victory

General Eisenhower's appeal for more munitions for the battles in the West is the most dramatic, but not the first, of a series of pleas to war workers to stay on the job at this critical moment. The present manpower shortages are small, relative to the manpower resources of the United States, but their effect at the fronts is causing grave anxiety. There is no doubt that the belief that the war is as good as won, and the consequent desire of war workers to move into jobs promising more security, is largely responsible for the failure of some schedules to be maintained. The lack of adequate manpower controls has made it impossible to stop drift from the war plants. If the United States had a national service law, the recruitment of the 200,000 men which it is estimated are needed to fill the gap would present no great difficulties. In its absence, other means must be found. The Army has agreed to release 1,000 men with experience in foundry work; and unless the appeals of the Services have the desired effect, Mr Byrnes has threatened that he will suspend all industrial reconversion under the "spot authorisation" plan. This is an inefficient weapon. It can hardly guarantee the type of labour needed for the industrial bottlenecks. But it may serve to drive home the point that where it is a choice between the desirability of cushioning reconversion, and the necessity of finishing the job in Europe, war needs still come first. This is a choice which might have been avoided with more effective controls from the outset, for unquestionably the United States has sufficient reserves of manpower to meet both demands.

WHITE HORSE

still as fine as a fine liqueur

Suppose that good fortune has brought you a bottle of White Horse, as sometimes it may, even in this sixth year of war.

You pour out a modest measure of this genial spirit into your glass. What is your immediate reaction? First you recognise the delicate and distinctive aroma of the White Horse you have known in times of peace. You raise the glass to your lips and at once your palate confirms your first impressions—that White Horse Whisky was never better than it is to-day.

This is quite true, and here is the reason. The White Horse Whisky in your glass is a whisky of the past and was growing old when this war was young. Stocks laid down long ago, matured and maturing, provide the White Horse supplies for to-morrow as well as to-day. Whisky as great as the White Horse you knew in time of peace, whisky which will always be 'fine as a fine liqueur.'

The present system of regulated supply is an essential provision to ensure for you the enjoyment of really good whisky both to-day, and in the years to come.

MAXIMUM PRICES:—Bottles 25.9d.; Half-bottles 13/6d.
as fixed by The Scotch Whisky Association.

THE WORLD OVERSEAS

Norway Prepares for Liberation

IT was Russian troops who began the liberation of Norway when they crossed the Norwegian frontier in the Petsamo region and occupied Kirkenes, the most important German base in North Norway, on October 25th. In the succeeding days Russian troops advanced to the nearby town of Neiden, but no further advances have since been reported. The capture of Kirkenes, however, was a starting-point for new diplomatic, military and economic activities, while, on the other hand, the Germans, in combination with the Quisling government, set in motion their plan of withdrawal from North Norway.

The situation in North Norway—that is, in the provinces of Finnmark and Troms, whose population numbers roughly 250,000—is now for the most part literally obscured, for the Arctic winter has begun. At the North Cape the Arctic night will last from November 18 to January 23, 1945. But some facts are known. The withdrawal of German troops has been combined with the compulsory evacuation of the civilian population. The town of Vadsø and the fortress of Vardø, which cover the approaches from the sea to Kirkenes, are reported to have been destroyed by the Germans, who retreated by sea and along the coast road which had been built by Russian prisoners of war. Hammerfest, the most northern town, has been cleared of civilians, and the first stop for the Germans and the evacuated Norwegians is obviously Tromsø. Troops of the German Lapland army, under General Rendulic, are, however, still in Northern Finland, retreating along two main roads whose most important junction has not yet been reached by Russian troops. It seems that, as usual, the Germans will try to maintain some hedgehog positions along the coast of northern Norway. Tromsø and Narvik have been selected as the most important positions. It has been reported that Tromsø's population has trebled, and extensive preparations are being made in Trondheim, and, indeed, in many places in southern Norway, for the reception of evacuees from the north. There is no doubt that Germany looks upon the occupation of Norway as playing an important part in the defence of Germany itself.

From the point of view of war economy, Norway has lost its importance for Germany. Communications have become precarious; valuable industries have been destroyed by bombing or by sabotage; and the manpower resources of the country have so far successfully evaded the orders for total mobilisation. Norwegian seamen have left Norway in a steady stream, and in recent weeks more and more sailors have deserted ships used by the Germans. At the same time, the Germans have been forced to man some of the railways with their own countrymen.

At the moment, the Norwegian Government's chief problem is Russian and Swedish participation in the liberation of the country. The agreements concluded by the Norwegian Government with Great Britain, Soviet Russia and the United States of America on May 16, 1944, provided for the reinstatement of the civilian administration as soon as mili-

tary conditions permitted. With Russia it was agreed that Norwegian troops would take part in the liberation side by side with Russian troops. The Norwegian Foreign Minister immediately proceeded to Moscow from his recent visit to Stockholm, and it was announced that a Norwegian military mission, under the Norwegian Military Attaché in Moscow, had been established in the Kirkenes area. Contingents of the Norwegian army, navy and air force, who had been training for years in Great Britain, are now on active service in North Norway. But it can hardly be expected that there will be much fighting during the Arctic winter, and for some time the main military activity in North Norway will probably be troop movements following the withdrawing German armies.

Sweden's Role

At present there are many indications that Sweden may eventually play some part in the liberation of Norway. For some time, about 9,000 Norwegians have been undergoing training as a police force on Swedish soil, and the first contingents of this force are now ready to go to the first liberated towns in North Norway, which, however, are either destroyed or depopulated. Moreover, during his visit to Stockholm, the Norwegian Foreign Minister negotiated a Swedish loan to Norway amounting to Kr. 100 million. The proceeds will be used to defray the cost of training the police force, which had hitherto been paid out of the gold and dollar resources of the Norwegian Government.

There is no doubt that Sweden will also take an active part in relief measures when more of Norway or the whole of the country has been liberated. The general war situation, and particularly the withdrawal of German troops along the Swedish-Finnish frontier, combined with increased tension in the Baltic area, has persuaded public opinion in Sweden to favour a more active intervention in the liberation. It may even be possible that a Swedish volunteer force will again appear on the scenes, to fight this time against the Germans. Many Swedish newspapers have recalled the activities of the Swedish volunteer force in the Finnish-Russian war, with the obvious intention of persuading the Government to give facilities for the organisation of another volunteer force. If this came to anything, it is difficult to see how Sweden could maintain diplomatic relations with Germany.

In southern Norway, particularly in Oslo where almost 10 per cent of the entire Norwegian population lives, the coming winter will probably be the most difficult Norway has experienced since the occupation. No sugar has been available for many weeks, and in the last rationing period the butter ration was reduced by 50 per cent. The potato shortage is still most serious. During the whole of the summer, food rations were on an extremely low level. Frozen and dried fish, whale meat, mutton sausage and cabbage were the most important items in the diet of the urban population. The fuel situation will certainly be more difficult than last winter. Although timber resources are abundant, there are few transport facilities for them, and they are mainly used for the army and for industry. Electricity has been rationed, and in Oslo schools will close from December to March 15, 1945.

The political situation has become tense. Changes in the Quisling Government indicate that it is having difficulties, but at the same time there are signs that the German commissar will try to keep the Quisling Government in office by all available means. Probably as part of the policy of evacuating North Norway, Quisling decreed that under certain conditions provinces could govern themselves without waiting for the consent of the central authority. The Norwegian Government in London, on the other hand, has been preparing for the resumption of ordinary justice and administration, and special regulations have been made for dealing with all active collaborators.

Rehousing in West Africa

[FROM OUR ACCRA CORRESPONDENT]

HIGH on the priority lists of the development programmes of the West African Colonies, which are now in various stages of completion, is the rehousing of the native population. The Government of the Gold Coast, for example, proposes to spend £800,000 on housing over a period of four years. Although figures for Nigeria have not yet been published, it is understood that an expenditure which would be roughly the same in proportion to the population is contemplated.

While the actual lay-out of houses and courtyards and the type of material used may differ considerably between Bathurst and Lagos, the northern territories and the coastal fringe, town planning and the standards of house accommodation and sanitation are uniformly bad.

The type of house predominating in the coastal belt is of swish (a lateritic earth made into sun-dried bricks or daubed, wet, on to a wattle framework), with a thatch or a corrugated iron roof. Inside, light and ventilation are at a discount. The growth of towns and villages, as would be expected, has been quite uncontrolled, and few of them have been able to cope satisfactorily with the increased population which has been attracted to the larger towns during the war or with the increase in traffic which has come with the large troop garrisons. The import of village building methods and materials into the towns has resulted in a congested sprawl of swish huts, with a high "mortality" rate every wet season. On the other hand, in old-established African residential quarters of the coastal towns there is a tendency for the better-off to imitate European cement-building, and they invest part of their savings in large mausoleum-like edifices of cement with corrugated-iron roofs.

West African towns conform to a pattern: the centre is given over to the Government Departments and the offices and shops of the large European, Syrian and Indian concerns, interspersed with smaller African shops; the roads are usually metalled. This area may be reasonably laid out, as in the case of Freetown, or may be a series of twisting streets, meeting at unexpected angles, as in the case of the two largest towns in Nigeria—Lagos and Ibadan. Spreading in all directions from this hub are the swish houses of the local population, usually split into very rough tribal or racial communities. At a discreet distance, again probably with metalled roads and evidence of a planned lay-out, will be the European residential area.

Town Planning

To set certain standards for the whole of British West Africa and to give each colony the benefit of experience in the other three and the benefit of recent developments in Britain, a West African town planning office was added to the Resident Minister's organisation at Accra towards the end of 1943 under an architect with a world-wide reputation, Mr E. Maxwell Fry. A team of architects has now been mustered to make blue-prints for improved town layouts including recommendations for land tenure legislation, to design buildings and model settlements, to give advice on materials and building methods, and to give the architect's and the planner's point of view on questions affecting future development in West Africa, including the development of air and sea communications.

Their work must of necessity be partly experimental and exploratory. The office is expected to continue in existence until the various colonies have their own town planning organisations. The field is enormous and work must be largely selective. Like all pioneers of the scientific method in the tropics, the staff are hampered by lack of data. Land surveys are often out of date, sometimes inaccurate, sometimes non-existent; yet to plan a town layout involves assumptions regarding the tenure and the transfer of land. Their work cannot progress beyond the blue-print stage unless legislation is forthcoming which will put the rehousing of the people before the interests vested in the land. Their main contribution in the long period is, therefore, likely to be in the buildings and layouts which they draw up for immediate construction, the example these will be for their successors, the influence they may have on the policies now being formulated in the four Colonies in the field of town planning—for instance, the office has drawn up recommendations for land acquisition—and the invigorating effect they may have on Government departments, as experts working on only a short-term government contract. They are certainly one of the first *ad hoc* teams

of specialists sent to the Colonies with terms of reference drawn up on a regional basis to do a specific practical job.

Progress in the Colonies

It has been realised in the four Colonies for a long time that improved housing conditions were long overdue, but lack of funds in the early thirties, and the shortage of men and materials during the war have set strict limits to what could be done. The mines have laid out labourers' estates of varying degrees of suitability. The Gold Coast Government has experimented with housing estates at Accra and Takoradi in the inter-war years. The Nigerian Government has laid out an estate near the only West African coalfield at Enugu, and there have been other sporadic attempts.

Now that men, money and materials are expected to be available after the war, a stimulus has been given to housing schemes, and to research into building materials. Some colonies have appointed architects to their Public Works Departments, and plans to set up town planning organisations are under review. All four colonies are making efforts to establish the brickmaking industry or to resuscitate it where it is already there. Tiles are being made, though as yet on a small scale, as a protest against the somewhat unhygienic and unæsthetic, though cheap, imported corrugated iron. Survey departments are taking an increasing interest in clay deposits. Although the opinion is often held that bricks may be too costly to make and too costly to lay in those areas to which cement can be transported—that is, in urban areas—it is conceded that the people in outlying villages can be taught to make an improved brick by simple and inexpensive clamping methods. Meanwhile, research into standard building materials to find out their degree of adaptability to tropical conditions continues. Technical research has made some progress, but there is still the problem of forecasting the post-war price trends of materials imported before the war and the possible trend of the present high level of local timber and wage costs in the larger coastal towns, which makes it difficult for the governments to reconcile the search for economic building materials and methods with socially desirable standards of housing.

Health and amenities apart, the importance which a correctly timed rehousing programme might have on the reabsorption of labour after demobilisation is fully appreciated.

No. 3—NIGERIA

THE Colony of Lagos and Protectorate of Nigeria covers 372,000 square miles. With over 20 million inhabitants, it is the most populous territory of the Colonial Empire.

Lagos was formerly the main centre for slave dealing on the West African Coast. Early in the Nineteenth Century Britain led a crusade for the suppression of this traffic. In 1807, British subjects were forbidden by Act of Parliament to engage in the slave trade and in 1861 Britain obtained the cession of the Island of Lagos and so stopped the trade.

Nigeria exports groundnuts, palm kernels, palm oil, cotton, cocoa and tin. There are large timber resources.

The average annual value of the external trade of Nigeria for the years 1935-39 was approximately £23,000,000.

The Bank has branches in this area at Lagos, Ibadan, Zaria, Kano, Port Harcourt, Jos, Ijebu Ode and Victoria. Those concerned with trade in Africa, the Mediterranean or the West Indies, are invited to communicate with:—

Incomes and Prices in Eire

[FROM OUR DUBLIN CORRESPONDENT]

THE report of the Central Bank for the year ended March 31, 1944, states that the legal tender note issue reached a maximum of £28,910,794 on December 21, 1943. The expansion in the circulation of these notes since the outbreak of war is shown by the following table:

AVERAGE OF SATURDAY FIGURES

1939.....	10,087,431	1942.....	15,651,549
1940.....	10,930,576	1943.....	20,841,335
1941.....	13,305,494	1944.....	25,580,213

In addition to legal tender notes, there circulate in Eire consolidated bank notes and old Irish bank notes. English notes also circulate in comparatively small quantities, but no record of their amount is available. The total circulation of all Irish notes and coin increased as follows:

AVERAGE OF SATURDAY FIGURES

Aug., 1939...	17,305,026	Mar., 1942...	26,187,252
Mar., 1940...	18,798,709	Mar., 1943...	30,993,663
Mar., 1941...	21,307,104	Mar., 1944...	35,354,578

Deposits of banks associated with the Central Bank increased as follows:

Average of Quarter Ended	Current Deposit and Other Accounts	Average of Quarter Ended	Current Deposit and Other Accounts
Sept., 1939...	114,377,980	Mar., 1942...	143,487,308
Mar., 1940...	122,371,540	Mar., 1943...	157,627,376
Mar., 1941...	130,019,715	Mar., 1944...	177,146,063

Banks' debits also increased:

Year	Bank Debits	Year	Bank Debits
1938.....	758,355,000	1941.....	801,855,000
1939.....	755,550,000	1942.....	859,328,000
1940.....	794,384,000	1943.....	926,539,000

It is interesting to observe the different rates of increase of currency, deposits and debits. Currency increased by

104 per cent, bank deposits by 55 per cent and debits by 22 per cent. The board of the Central Bank states that

the large increase which has occurred in the note circulation is offset to an appreciable extent by a diminution in the velocity of circulation and that in particular substantial quantities of notes are being hoarded in rural areas as a means of conserving savings.

The large increase that has taken place in the circulation of notes of larger denominations—£100 and £50—suggests black market activities, but the Central Bank has not, so far, followed the example of the Bank of England in discontinuing the issue of such notes.

The Irish price-level has risen steadily during the war. In a paper read before the Statistical Society of Ireland, Dr R. C. Geary estimated that compared with the years 1938-39 wholesale prices in 1944 had risen by 98 per cent, retail prices by 75 per cent, wages and salaries by 27 per cent, rents by 1 per cent and securities by 10 per cent. The weighted index for the above items amounts to 70 per cent. It is obvious that the Irish currency is overvalued at its present par of exchange with sterling. The board of the Central Bank are, rightly, of opinion that the increase in the circulation is the effect rather than the cause of the rise of prices.

That the movements of these indices in recent years have had the character more of cause than of effect is suggested by the fact that they rose more rapidly than the total note circulation during the first two years of the war, and that even now the war-time increase of the Agricultural Prices Index is almost in the same ratio as the increase of note circulation, notwithstanding that part of the latter increase is represented by unused purchasing power to the extent of the hoarding already mentioned.

The statistics of bank debits indicate that the new deposits are not actively employed, and it is almost certain that the same conclusion could be drawn about the new currency if statistics of retail sales were available. To argue that, in the conditions that have prevailed in Eire during the war, the price-level has been raised by the increase in the monetary circulation would pay a quite undue tribute to the quantity theory of money. It is for this reason that certain Irish economists refuse to admit the existence of inflation. Rising prices are a symptom of inflation, but they are also a symptom of scarcity, of rising real costs of production and of profiteering or the abuse of monopoly powers. The only strictly inflationary elements in Eire are remittances from workers in Great Britain and the expenditure of tourists from Northern Ireland.

Whether the rise in the cost of living is or is not inflationary is largely a question of definition. It is certainly a question of little interest to the numerous people with fixed incomes, whose standard of living has been gravely depressed. The lot of the salaried class has been extremely hard. Income tax has been steeply raised, prices have nearly doubled and all but the most modest increases of salary are forbidden by law. There is a growing volume of complaint and protest against this grievance. It is asserted that the price stops have not been enforced with sufficient vigour, that agricultural guaranteed prices are unnecessarily high, and, above all, that business men have indulged in considerable profiteering. A standstill order has been made prohibiting any increase in the price of a very wide range of goods and services above the level at which they stood in May last.

The Minister for Supplies has stated in the Dail that the standstill order in its present form is meant to apply to the acute emergency situation—

the critical situation which had arisen in regard to the shortage of fuel supplies, and the imminence of a further serious decline in the volume of production and in the volume of turnover in the distributive trades, with the possibility of a rise in manufacturing and distributing costs.

He explained that a permanent stop on all prices might cause unemployment owing to the impossibility of obtaining imports except at increased prices. The time seems to be approaching, he stated, when it might be necessary to prevent further increases in prices "at any cost." Rather than allow the price level to rise further it might be necessary to reduce profits even below a "reasonable" level, to reduce production, to go without imports and to endure unemployment. The Minister went on to say that the decision to adopt such a course of action would involve major questions of policy, for which he would require the sanction of the Dail. No such sanction has been sought since the Dail reassembled for the autumn session. Meanwhile the emergency continues and, likewise, the emergency policy, with what success remains to be seen.

THE BUSINESS WORLD

Charts and Markets

ONE of the commonest of human fallacies is the belief that opposite views are necessarily contradictory. In the contemporary stock markets there are two schools of thought. The first maintains that the wartime rise in share prices, given its present extent and duration, cannot go much further—that a bull market will shortly be replaced by a bear market. Another section of opinion, smaller in numbers but increasing in influence, insists that present prices have as yet hardly begun to discount two major, related factors which together must inevitably raise the level of equity shares much above its present level—namely, the prospective increase in the money value of the post-war (as compared with the pre-war) national income and the effect of capital "gearing." There is, actually, a third body of investment opinion, much larger than either of the others, which at the moment is quite unable to make up its mind at all about the post-war prospect and is chiefly marking time and awaiting the market sequel to decisive military events. But its views cannot be a subject of discussion because, by definition, it has none to offer.

The argument between the two definitive schools of thought, on the lines on which it is now being conducted, threatens to resolve itself into a controversy on the relative merits of the historical and the economic approach to market probabilities. More people have imbibed the ideas which were finding expression before the last war in various "chart theories" (of which the American Dow Theory was perhaps the best known) than would be willing to plead guilty to that impeachment. Believing that a market price index sees everything, knows everything and can neither err nor lie, they contend that, once its movements have been put into perspective, by being plotted on a chart, they provide an infallible guide to the dynamics of share market history. Particular trends, revealed by charting and "confirmed" when necessary by the movements of other indices—e.g., the volume of daily dealings or prices of railway stocks—afford presumptive evidence of probability, amounting, in given situations, almost to certainty. Suppose a specified series of undulations in, say, *The Financial News* Industrial Share Index, occurring in conjunction with given movements in the "confirmatory" series, preceded a change in "dominant market trend" in 1928 and in 1936. Then, the "chartist" argument runs, it is much more likely than not to herald a similar reversal of trend if it recurs in 1944.

That is a fair summary of the basic tenets common to all market "chart theories" in their simplest and, mathematically, their most defensible form. Many of their humbler practitioners adopt a cruder and often slightly necromantic posture. An extensive quasi-technical vocabulary has grown up. Chartists eagerly scan their pictorial records for "repeated selling signals," "triangles," "breaks through the lower parallel," "secondary reactions," and so on, somewhat after the manner in which the Roman augurs examined the sacrificial entrails or the witches in "Macbeth" prepared their stew.

That chart interpretation should carry any association of

black magic is regrettable; for it tends to divert the attention of sceptics from its possibilities and of believers from its limitations. It is, in fact, no more than an example of the practical application, in a particular context, of the general theory of probability. It is an accepted axiom among users of scientific methods that if A entails B in situation P in the year X, it is more likely to entail B than C, D or E in a similar situation, in years Y or Z. Of course, it may not—the "law" would hold if it were proved true four times out of seven, but a particular period may throw up one of the three exceptions.

In this present month of November, 1944, a practitioner of "chart theory" may or may not be able to build up a convincing case for arguing that the general market situation resembles, in certain important respects, the position which existed eight years ago and, possibly, sixteen years ago. He cannot, however, proceed to draw the conclusion that market

CHART A

prices must infallibly take the same course in 1945 as they did in 1937 or 1929. He must be content to show that the odds are in favour of their doing so. There is always the possibility that some new and overlooked factor may be present, which will be powerful enough to swing the balance the opposite way. Indeed, the cautious phraseology in which many commercial exponents of chart theories voice their professional predictions suggests that they are, perhaps, a little more conscious of the limitations of the historical method than they would like their clients to know.

There is, however, a further reason—operative, at least, in the kind of economy which Britain knew in times of peace—for allowing a measure of validity to "chart methods," as a useful weapon in the investor's armoury, provided their scope be accurately delimited. The pattern of market price fluctuations—the so-called "market cycle"—is, normally, not an independent but a derived phenomenon. Ups and downs in the market conform broadly to ups and downs in industry, though experience shows that they frequently tend to precede them by some months in time (through the operations of informed insiders) and to exaggerate them in amplitude (because company profits, being a residual item, fluctuate more

ARE YOU OVER 17 YEARS OLD?

UNLESS you are over 17, there have been no Black Magic Chocolates since you were 14; and at that age (if we remember aright) chocolates were chocolates and never mind the name.

But if you are over 17, the words "Black Magic" probably strike a chord in your memory.

Let us help a little.

A very plain box—glossy black, with a few white lines on it.

Twelve different kinds of chocolates, in simple paper cups, without any fripperies.

Truffle-and-Nougat, Hazel Cluster, Liquid Cherry, Orange Cream, Strawberry Cup... heigh-ho. The girls loved 'em; and the boys took no poor view of them, either.

And now, you say, here it comes—"Come Peace, come Black Magic." But nothing of the sort. There will be a lot of pre-war goods back in the shops before Black Magic; for though we shall move fast, we shall take no short cuts—no half measures, no skimping.

Don't expect to buy Black Magic on Armistice Day; but when you do buy it, it will be as good as ever. We believe it will be better, but that will be for you to say.

Black Magic

ROWNTREE & CO. LTD., YORK

widely than industrial activity). The turning points in market booms and slumps usually occur anything up to half-a-year before the corresponding changes in national prosperity. When a peacetime series like *The Economist's* Index of Business Activity dropped by 15 to 20 per cent between prosperity and depression, the index of ordinary share prices normally fell by 40 to 50 per cent. But the important point was that both sets of fluctuations had a common cause, or set of causes.

So long as market chart exponents confined themselves to inferences about the "dominant market trend"—i.e., the cyclical trend—they had the whole conspectus of economic

investor's suffrage between charts and brains. The charts accompanying this article afford a good example of the kind of diagram which those who employed "chart methods" would have compiled for their purpose in two earlier periods when the share market was in a particularly interesting phase. The situation depicted in Chart A occurred when ordinary share prices were well set on an upward course which, in fact, was maintained for nearly another couple of years after the last dates shown on the chart. Chart B shows their course during a typical "bear market." Both charts are drawn with a logarithmic vertical scale, so that equal percentage variations are represented by equal distances.

The two curves which have been plotted are, respectively, the sensitive equity share price index of *The Financial News* and the number of bargains recorded in the Stock Exchange Lists (in hundreds). Observations in both cases have been taken daily.

It will be noted that, although the main direction of the share index curve is upward on Chart A and downward on Chart B, there are at least five occasions on which its immediate direction is downward in the bull market and at least seven on which it is upward in the bear market. In other words, periods when the "dominant trend," upward or downward, is interrupted for days, weeks or months at a time, are a characteristic feature of market experience. Their incidence, however, to judge from the charts, appears to be far too irregular to be acceptable as evidence of probabilities affecting the main movement in any way whatever. As regards the index of Stock Exchange bargains, there is a tendency for the volume of

dealings to move with the short-term market trend—that is, to rise (exaggeratedly) when the immediate course of the share index is upward and to fall when the share index is suffering a "secondary" or "tertiary" decline. Apart from that, all one can say is that the average volume of dealings is greater when share prices are high than when they are low—which, of course, is merely the same thing as saying that dealings are more active in a bull than in a bear market.

The conclusion rather forcibly suggested by this evidence is that, so far as short-term market fluctuations are concerned, expert research into what at present are classed as chance factors, must be carried much further before any really satisfactory "forecasting" technique can be evolved.

(To be concluded)

CHART B

forces as their universe. Provided they were sufficiently diligent in accumulating, sifting, and building up their evidence, and in checking the movements of their market series with those of a really considerable number of "external" figures, they could afford to rely, with reasonable confidence, on the accuracy of their cyclical diagnoses. "Secondary" and "tertiary" market movements, superimposed on the main cyclical trends, however, were quite another matter. These, it was discovered, were not paralleled by corresponding changes in non-market indices; they were specialised fluctuations, usually of a "financial" rather than a "real" character, registered only inside the market itself and proportionately hazardous as a basis for generalisation.

A few examples may help to point a current moral in what has been irreverently described as a battle for the

New Building Materials

THE Englishman's traditional home is a brick house. But brick construction is expensive of skilled building labour, which in the immediate post-war period will be more scarce than materials and which will in fact be the weakest link in the building chain. Suitable alternative materials to brick, such as cement, steel, and timber, make it possible to employ a higher proportion of unskilled labour—and also, in some cases, to build more quickly. Similar conditions of urgent demand after the last war led to the development of new types of houses, but their production was abandoned as soon as enough skilled labour became available to build the traditional brick house. Only in Scotland did a need for experimental methods continue, where it was met by the formation in 1937 of the Scottish Special Housing Association, which has specialised in timber constructions. The long-term, as opposed to the immediate, demand for new building materials must depend upon whether they can achieve a reduction in housing costs. (Throughout this article, all materials alternative to brick

are classed as new; and the discussion is confined to houses only—not blocks of flats, etc.). Does a steel or concrete house give as good results for the same outlay of money as a brick one? The emphatic negative with which this question has so far been answered by the practice of the British industry owes something to the prejudice of tradition, but a great deal more to the fact that new methods of house construction are of recent origin and need to be greatly improved by intensive research before they are fully acceptable. Their current claims may be much exaggerated, and it is still broadly true to say that the all-brick house cannot, at the moment, be beaten. Its alternative, it should be made clear, is not so much a house made entirely of some other material as one constructed of a combination of several materials, which may include brick.

There are at present few authoritative data to show the relative advantages of new forms of house construction. A great number and variety of new methods were tried in the inter-war years; but the experiments were mostly on a small

scale and undertaken at a time (before 1928) when the lack of competition meant that contract prices for all houses were roughly similar. There is little reliable information about costs, and few records were kept of the speed of erection. Such data as exist have been carefully sifted in the first of a number of studies on building materials to be undertaken by an inter-departmental committee,* as a preliminary to its task (not yet completed) of making recommendations for post-war building practice.

Taking the standard brick house with 11-inch cavity wall as its basis of comparison, the committee found that what constitutes a satisfactory house has never been properly defined. It formulated, for the first time, the basic technical standards which should underlie all house construction, and then proceeded to consider how far, in each case, these standards were realised. It was found that nearly all materials, except brick, are defective under one or more of the headings which are laid down as determining a house's habitability. These are strength and stability; freedom from moisture penetration and condensation; thermal insulation; sound insulation; lack of fire hazard; easy maintenance and durability; and freedom from vermin infestation. Thus steel sheets exclude the rain but do not provide thermal insulation; concrete is, generally, a bad insulator; and timber suffers from a greater liability to fire hazard and vermin infestation. The logical solution is to combine the materials in such a way as to secure the particular advantages of each; and, partly as an alternative and partly as an additional necessity, to select wall linings and methods of external rendering and painting very carefully so that they fit and supplement the main walling materials used. It is in the use of new walling systems that most experience has so far been gained, and not in flooring or roofing—although the use of steel for these latter purposes has possibilities.

The results of the inter-departmental committee's investigation showed, as a very tentative hypothesis, that the new types of house examined were, in the main, roughly similar to brick in cost and, apart from a number of remediable mistakes, in quality and appearance as well. It is possible to draw a few specific conclusions.

For the purpose of saving skilled labour, the best results come from factory prefabrication of steel frames, metal panels, and timber frames, and from many types of poured concrete construction, all of which use extensive unskilled labour. On the whole, frames, especially steel frames, are usually preferable to panels, and all-steel houses (of which a number were built) less satisfactory than the use of a steel frame in conjunction with light internal and external claddings of other materials. Steel structures offer good possibilities, if combined with highly complex wall boards. Satisfactory boards are now in production, but may prove costly. It is claimed that all types of house, including brick, can benefit from using a light steel superstructure, which gives cohesion before building commences. The saving in speed and in the avoidance of scaffolding is said to offset the fact that steel itself costs more than brick.

Timber has been widely used as a building material in the United States, Sweden, and elsewhere, and wholly or mainly factory-built houses have been produced abroad on a large scale; but it has been little used in this country, and the shortage of supplies, which will last for some years, and its comparatively high price must severely limit its post-war use. Savings of 20 per cent and more claimed for timber houses have not so far been realised in practice.

Concrete constructions have been the most frequent alternatives to brick in this country, and concrete walls have been constructed either of a single-leaf layer, poured on the site, or of precast slabs or blocks which are usually jointed to load-bearing piers. Even in the latter case, the slabs are better cast on the building site, and concrete prefabrication has only limited possibilities. Houses of concrete slabs do not save skilled labour in the same way as poured concrete houses, since the casting of the slabs requires a certain minimum of skill. But their general value is perhaps greater and the committee went so far as to say that "with good organisation (these houses) should be built more cheaply and quickly than brick houses." These possibilities have so far been vitiated and maintenance costs greatly increased by the use of unsound aggregates—especially faulty clinker aggregate—for whose composition a British Standard has now been introduced. The Ministry of Works is now inquiring into the possibilities of producing some selected forms of light-weight aggregates and concretes. In addition, the danger of cracking in concrete makes the use of some light reinforcement generally desirable.

* "Post-War Building Studies: No. 1, House Construction" (H.M.S.O., 2s.).

Highly interesting types of wall or building board, nearly all of them satisfactory improvements on old-fashioned plastering (which can be done over a number of the boards), were considered by the committee. They are made from widely differing materials, each of which has some defect. Consequently, composite boards give the best results—for instance, in the United States insulating fibreboard is combined with the hygienic, self-decorative value of laminated plastics and sold under the name of "fibre-tile board." Few composite boards have, so far, been produced in this country. Sheet materials can always be glued together on the building site, but the use of resin-bonded plywood—and the development of the plastics industry generally—hold important possibilities for the prefabrication of composite boards. Some standardisation of size is especially necessary in the production of wall-boards, whose width varies enormously at present, severely limiting their range of application.

*

It is impossible to enumerate all the new materials and methods which may have a valuable part to play in future housing construction. Many new building materials, unlike brick, can be used under widely different forms. Timber, for example, can be used to provide the entire shell of a house or merely the framework, or it can be repulped to form a valuable plastic material for wall linings such as resin-bonded plywood (in this form the disadvantages of importing timber arising from its bulkiness are reduced); or, again, timber waste products can be bonded with cement to form new types of light-weight aggregate. (Concrete itself can be combined, in different proportions, with a great variety of materials ranging from coke breeze to sawdust). Again, the combination on the site of what may already be highly composite materials can be done in innumerable ways.

But for the great wealth of possibilities thus opened up by new materials and methods to be even partially realised, a number of urgent steps must be taken. To start with, the greater the number of materials—or sections—in a house, the more essential becomes a much greater standardisation of the various parts. This need—already experienced in the provision of factory-produced internal fittings—becomes much stronger where part or all of the main structure is to be prefabricated. The cost of prefabrication is closely related to the scale of production, and a fair-sized demand is thus necessary for the employment of many new types of building technique. Bulk purchases of prefabricated materials by the Government are one way of reducing building costs. They also assure industry of large and continuous orders which are essential if it is to make an effective contribution to housing.

Prefabricated structures should display their special advantages. These include greater adaptability—it is much easier to change the size and nature of rooms and passages; and greater elasticity—it is easy to add new external sections and economy in floor space, which for brick-building is the principal determinant of total cost, is relatively unimportant. The appearance of some new types of house has been unattractive—partly due to the fact that some of the main materials used need very careful rendering to look presentable. Much more attention should be paid to architectural design, in which new and pleasing styles could be evolved to suit the characteristics of new materials. Finally, the use of new materials increases the need for co-ordination between

COMPANY
LIMITED**

Founded 1857

The Bank provides prompt and individual service for customers in all parts of the country. In addition, it acts as a Registrar for Companies. This service includes the preparation of dividend warrants, etc.

LUDGATE CIRCUS, LONDON, E.C.4

the many trades engaged on some branch of house construction. It is partly the lack of proper organisation within the building industry proper—between contractors, surveyors and architects, for instance—which has given Britain its low standard of efficiency compared with the United States revealed by the Bossom Report. It is especially necessary—indeed, it is absolutely vital—to the utilisation of a wide range of materials to provide machinery which will bring satisfactorily together, so that each can contribute of its best, hand craftsmanship and the machine—or building and industry. This urgent need has led to the proposal, from the Committee for Industrial and Scientific Provision of Housing, for a Housing Production Council.

Enough has been said to indicate that, as a whole, new materials have valuable possibilities, although it is difficult to single out which individual materials afford the best investments. This will depend partly upon which of their present and future combinations turn out to be most satisfactory. At the moment there is no best method of house construction, and the most skilful and ingenious combination of the many new building materials can show to date few improvements (in value for money) upon the 11-inch

cavity wall brick house which is equipped with modern fittings. But the point to remember is that the application of science to the building industry is still in its infancy. Research has great possibilities and changes may come rapidly. It can at least be said that for economy in skilled labour during the period of its acute shortage, especially good possibilities are offered by prefabricated steel frames and by poured types of concrete construction. When cost becomes once more the all-important factor, it is difficult to predict which, if any, of the systems discussed will survive. But steel frames and houses of (this time) precast concrete blocks have again a good chance, and new types of wall and building board should have an assured market. A satisfactory synthesis may be reached between, for instance, brick and steel. The present possibilities of new materials may perhaps point in the direction of bigger and (in some ways) better rather than cheaper houses. To raise housing standards is extremely important. But it is even more certain that any methods which can cheapen the much too high existing cost of housing deserves every encouragement and will have great success.

Business Notes

Thomas-Baldwins Fusion

The Thomas-Baldwins fusion is plainly of the first importance for the future of the tinplate industry. Also, among its other implications, is a very substantial adjustment in the steel-sheet trade. In tinplate, the position is that the industry possesses one modern plant, that of Richard Thomas at Ebbw Vale, while the rest of the country's equipment is in old hand mills. It is believed that Richard Thomas owns, or controls, almost half the total capacity of the country; of this total possibly 40 per cent is covered by the new plant at Ebbw Vale. A further amount of possibly one-seventh is owned by Baldwins, while the next largest unit is believed to be Briton Ferry, with something like one-tenth of the capacity. There are a couple more concerns of similar size and a number of very small ones. Some of this capacity is considered "redundant" and plans for its elimination have been under consideration, without any great success, for a long period. The evolution of a successful scheme was to be followed by plans for the erection of more modern plant, presumably an up-to-date copy of Ebbw Vale, and it is widely assumed that it will be under the same control as that unit. Richard Thomas and Baldwins had already undertaken to abandon two-thirds of their old hand mills as a contribution to the scheme, but the terms of compensation could not be agreed. So much for the internal set-up. As to the outlook, the position is that one continuous mill, as at Ebbw Vale, cannot cope with the domestic demand without assistance. Further, tinplate is one of the things for which there will almost certainly be a considerable export demand, and it is one of the fields in which the manufacturer is anxious to expand his overseas sales. It is evident that, in these circumstances, the near future—a period of some years before a new continuous mill can be working—will involve cooperation by some at least of the old hand mills. Evidently speed is essential, and it was, perhaps, the main object of reaching the projected fusion that it does in fact resolve the conflict of interest between old and new plant. It is likely that there will be no difficulty in finding terms acceptable to the few larger firms outside the fusion, and that cash compensation can be paid, where necessary, to firms to suspend the use of old mills for the manufacture of tinplate without raising the price to the consumer by more than, possibly, a half of one per cent. It is impossible, until full terms are published, to say what the real cost of the compromise will be, but it is evident that, if it is only of the order suggested, it may well be in the national interest if the only alternative is continued delay.

Monopoly Dangers

The fusion in itself will not do a great deal to increase the element of monopoly enjoyed by Richard Thomas in tinplate. But, if that company owns the second new mill, monopoly will be virtually complete, even if none of the other interests joins. There can be little doubt that the

fusion will favour a monopolistic set-up by withdrawing the only competitor with really large resources. Actually, pooling or cartel arrangements existed in tinplate at various times before the war, but there was, even up to the present time, the remote contingency of an effective challenge to any effort at price control. The fusion must not, however, be judged solely from the angle of tinplate, which is far from being the principal asset of Baldwins—although it may prove to be one of the main assets transferred—and is perhaps not a majority interest of Richard Thomas. The steel and steel sheet sides of Baldwins are of substantial interest in the national context and in that of finding employment in South Wales, while the new aluminium and light alloy business is by no means negligible, although the future of this type of business is at present far from clear. When the extent of assets actually to be transferred and the degree of co-operation between the new Baldwins holding company and the Richard Thomas group are fully known, it will probably be found that the ramifications of the fusion cover a considerable section of the whole steel industry. It is, of course, claimed that concentration of control in a few hands is essential for modernisation and effective bargaining power. If, as seems certain, the policy has official support, the public is entitled to demand full information and official supervision directed to ensuring that the benefits claimed do in fact emerge and that they enure to the public after due provision for capital replacement and remuneration for any remaining element of risk.

Principles and Practice

The United States Commodity Credit Corporation has lost no time in implementing the provisions of the Surplus War Property Act of last month, which authorised it to sell farm surpluses in foreign markets at world prices even if this means the granting of export subsidies. Last week the Corporation fixed export subsidies for raw cotton and wheat, but there is no indication that these will, in fact, be confined to war surpluses. In spite of a heavy crop, the United States is expected to have little wheat available for commercial export this season. In cotton, on the other hand, available supplies will be big enough for a substantial export trade; but America's export surplus in cotton can hardly be classified as surplus war property. At the beginning of the season stocks were about 11 million bales, that is, they were almost as large as the new crop; yet the new crop is not expected to equal the average of the pre-war decade, and stocks, large though they were at the beginning of the present season, were about one-fifth smaller than at the outbreak of war. The resumption of subsidised cotton exports, in fact, suggests that the Government has decided to continue the policy adopted before the war of increasing its share of world trade in cotton, which had previously been reduced because prices had been deliberately raised above world prices as a means of improving the position of cotton growers. If this is to be the policy, countries such as Brazil and India, which had benefited from the restrictive policy

previously pursued by the United States, are bound to suffer unless—an unlikely event—total exports rise to, and are maintained at, a level which will enable them to maintain the volume of their exports at the same price as that which would obtain in the absence of the American subsidy. This has been fixed at four cents a pound, but is apparently subject to adjustment if this should be necessary to sustain American shipments. It may be that the threat of dumping, which the United States abhors in principle, is primarily calculated to induce other cotton-growing countries to join an international cartel, though these are no less violently denounced in principle. If this is, indeed, the meaning of the subsidies, the United States could hardly be shocked by the inference drawn elsewhere that it is ready to depart from principles when their application is inconvenient in practice.

Protecting Overseas Investments

Mr Molson raised in Parliament last week the vital need to protect such overseas investments as Britain has not sold to help pay for the war. Income from these investments not only provides a valuable source of taxation, but—much more important—foreign currency with which to purchase vitally needed imports. Mr Law's reply showed the Government's determination to take any possible steps to prevent unfair and discriminating treatment by foreign governments. But what steps can be taken? The idea of a new, wider, and more official council of protection, which would extend to investments in private companies the protection already given by the Council of Foreign Bondholders to governmental and municipal borrowing, was rightly rejected. Such a council would have to deal with widely assorted cases, already represented (unlike bondholders) by their own elected boards, and frequently in a position to gain more from local than from Governmental action. The threat to curtail imports from an offending country is this country's chief economic weapon, but it is one that needs extremely careful timing, and should only be used very sparingly, if at all. It is, in fact, hard to know what to do with an offending country. It is when the offending country is prosperous and has itself a favourable balance of payments, that default, obstruction, or discrimination becomes wholly inexcusable. This is the chief ground of complaint against Argentina's treatment of the private investor. Mr Law pointed out that the exchange concessions recently granted to the Argentine railways cannot compensate for the inadequate earnings which result from compulsorily low fares and charges. He stated that the Argentine authorities are self-admittedly postponing the question of railway reform and reorganisation for use as a bargaining counter in post-war trade negotiations. Sooner or later the Argentine Government will either have to acquire the railways and other transport itself, or make it possible for these undertakings to re-equip themselves. This will be the time for the British Government to bring all its influence to bear, although the hope of securing anything approaching justice seems very slight. Meanwhile, in hopeful distinction from the "rogue's gallery," Guatemala is redeeming its external debt at par and Paraguay is expected to produce a satisfactory scheme for service on its external debt.

France's Liberation Loan

Last Sunday, a fortnight after the opening of subscription lists, General de Gaulle appealed to the people in a broadcast to ensure that the three per cent Liberation Loan will be not merely a success—this, he said, was assured—but a triumph of the confidence of the French people in France. He emphasised the potential threat to financial stability arising from excessive holdings of cash, and he appealed to national pride by asking what status, and what place France would have if she appeared to her Allies as a country unable to put her affairs in order. General de Gaulle has thus made the response to the loan a test of confidence. Only a resounding response can now satisfy this test—to meet its purpose, it has been stated, at least frs. 100,000 million must be subscribed. If the Loan turns out to be a triumph, the initial hurdle in restoring financial stability will have been overcome, and the Government's reliance on the voluntary co-operation of the people will have been justified. Much is at stake. In Great Britain, the results of a Government appeal of this nature could be measured by the response to it within a few days of its

launching; in France, however, which neither has the habit of, nor the machinery for, quick subscription, it may take some weeks before the response can be measured.

Franc-Mark Exchange Rate

As the French armies liberate Alsace and Lorraine their currency follows them, and is being exchanged for the reichsmarks that had been circulating in these territories since their incorporation in the Reich. The French authorities, acting on their own initiative, have fixed an exchange rate of 15 francs to one reichsmark for the conversion of locally held German currency. This rate is widely out of alignment with the rates fixed by the Allied authorities for francs and marks, namely, 200 francs and 40 marks to the pound, with corresponding rates for the dollar. Taking the rate fixed by the French authorities for the conversion of reichsmarks and the Allied rate of 40 marks to the pound, the cross parity between francs and sterling becomes 600 francs to the pound. Looking at the equation from the angle of the official franc rate of 200 to the pound, the reichsmark-franc conversion rate gives a sterling-mark parity of 13½ marks to the pound, against the official rate of 40. These are huge disparities, but this figure is probably nearer the true parity than 40 Rm. = £1, and unless the operations they govern are hedged with considerable care and reservations, they may lead to damaging arbitrage traffic. To arbitrage across a battle-front may have its difficulties, but they are difficulties that will not be altogether proof against the temptation of a 200 per cent profit. One result of the advertisement of this highly favourable mark-franc rate may well be to create in the part of Alsace-Lorraine yet to be liberated a much greater density of reichsmark currency than obtained until recently. The motives of the French authorities in fixing so favourable a rate of conversion can readily be understood and appreciated. They do not wish to penalise their nationals who had reichsmark currency forced on them since 1940. The rate of 15 francs to the mark, in other words, is a compassionate and not a market rate. Great care will have to be taken, however, to prevent this compassion from flowing into the wrong pockets.

Businesses for Sale

The announcement over last week-end, that the Government is prepared to re-sell five businesses taken over during the war, marks a further step in removing the direct wartime ownership of manufacture. So far as is known, the total number of companies taken over is small and in these five cases the individual concerns are of quite moderate size. By far the largest, as judged by capital, is John Fowler and Company, of Leeds, with a paid-up capital of £200,000. The announcement states that the shares are to be sold to approved buyers, but the intention is that each concern should be taken over by a single buyer. Further, although the Ministry of Supply no longer considers Government ownership useful, it is only prepared to sell to people of whom it approves. The basis of selection is the same as that adopted in selecting occupants for Government factories. It may be recalled that on July 25th the President of the Board of Trade definitely rejected the principle of competitive tender in favour of a choice by the authorities. The principles guiding that choice were to be balanced distribution of industry in the area; the need to expand exports and to maintain a suitable war potential; the requirements of town and country planning and the ability of the purchaser to use the factory with a minimum of reconstruction. To these are added in this announcement, ability to develop production and give employment. It will certainly be objected that the surest criterion of ability to use the assets to be acquired is provided by the price which the purchaser is prepared to pay, but under existing conditions it might well be the case that the purchaser might wish to restrict development of the particular line of business acquired. There is, therefore, much to be said for a careful "vetting" of all offers, although it is by no means clear how due weight is to be given to all the considerations which Mr Dalton wishes to keep in mind. With such small concerns there is little point in urging that the share capital shall be spread. But, when it comes to a sale of some of the larger undertakings—Short Brothers is a case in point—there may be legitimate objections if the public is not given an opportunity to re-acquire an interest.

BINC on Prefabricated Houses

The Building Industries National Council—its associated bodies include, among others, the National Federation of Building Trade Employers, as well as the National Federation of Building Trade Operatives—has given its qualified support to the adoption of prefabrication methods in a report issued last week. BINC admits that prefabrication methods should be “regarded under normal circumstances as a form of technical progress.” It agrees that the adoption of a scheme making maximum use of standardisation and mass-production methods would add to the capacity of the traditional industry, and, hence, make for higher speed and lower costs. It suggests caution in the arbitrary introduction of new processes employing improved materials, and recommends the provision of adequate safeguards, especially the formulation of standards. In view of the long life expected from houses, adequate safeguards to ensure durability are, indeed, essential. But for all the support given to technical progress in the report, it does not sufficiently emphasise the overriding need of bringing adequate new homes within the means of the income groups that could not afford them before the war.

Clothes Stocks and Output

The building up of war supplies for the European battles made necessary the removal of more clothing workers from civilian production early this year. In addition, Service demands have been heavy, both for uniforms and for demobilisation outfits. This has meant that stocks have had to be drawn upon to meet the civilian ration to a greater extent than has been the case since clothes rationing began. The latest statistics reveal a disquieting position. During August and September, retail sales rose, mainly owing to the issue of a new block of coupons, and stocks were drawn upon to meet the demand. At the end of September, according to the Retail Trade Report published in the *Board of Trade Journal* for November 11th, the value (at cost) of stocks of women's wear was 19.2 per cent below the level of a year before, and that of men's and boys' clothing stocks dropped 22.4 per cent. The Wholesale Textile Association figures show more serious reductions in stocks over the same period of 29.6 per cent in women's and children's wear, and 27.1 per cent in men's and boys' clothing. The potential dangers inherent in an exhaustion of stocks has not escaped the Board of Trade. Efforts are being made to raise production by a gradual increase in the labour force. The principle to be followed is that skilled clothing workers who are released from war production will be allowed to return to clothing firms, who may take on workers up to the limit of the approved labour force (a percentage of the number employed in June, 1942), which has in some cases been increased. It will take time before sufficient labour can return to the production of civilian clothing, and in the interval scarcity is likely. While the position is serious, it is not desperate. The danger of a reduction in the ration can be averted by two parallel courses of action. One is the increased production already promised, and the other is the voluntary curtailment and postponement of consumption wherever and whenever possible, until output is higher and stocks are replenished. There will be an additional demand from service-men for garments not included in the demobilisation outfit. Output must take this into account. Only when stocks are large enough to cover this contingency, as well as to improve the present stock position, can any increase in the basic ration be contemplated.

Australian Banking Legislation

Next year should see the introduction of controversial banking legislation in Australia. The exact provisions of the

proposed laws are a well-kept secret, but there is little doubt about the Government's intentions. A section of the Federal Cabinet, led by Mr Chifley, the Treasurer and Mr Lazzarini, his assistant, favours the nationalisation of banking, and the complete control of the Commonwealth Bank by the Government. Dr. Evatt, the Attorney General, during the course of the referendum campaign last summer, was asked how the Government proposed to get the money to implement its post-war plans, and whether it intended to “get control of the Commonwealth Bank, and use money from that source.” To that, Dr. Evatt replied, “Yes, that is Labour's policy, and now that the Labour Government is in power in both Houses, it is going to carry it into effect.” These intentions must in recent weeks have crystallised into the first drafts of proposed bills, for there has been a sudden outburst of anticipatory protests both from the political opposition in Australia and from the commercial banks. The National Bank of Australasia has recently issued a public statement condemning the extension of Government control of the banks as a threat to public confidence in the banking system. The chairman of the Bank of Adelaide has warned the country that Government control of banking would lead to inefficiency and heavy loss to the taxpayer. Mr Menzies has stated that it is an open secret that the Labour Government intended to introduce legislation placing rigid controls of a permanent kind on the Australian banking system, and to deal drastically with the position of the Commonwealth Bank. He specified the latter charge by suggesting that the Government proposed to reduce the board of the Commonwealth Bank to a purely advisory status, leaving the effective control of the bank's policy to the Government of the day. Fortunately for Australia, the storm over the control of the banking system will break at a time when the Commonwealth's external finances are strong. The London funds of the Commonwealth Bank have risen over the past year from £73,000,000 to £139,000,000. At the outbreak of the war they were around £24,000,000. This position will allow the contestants to have their domestic quarrel without undue concern for what the neighbours may think.

* * *

Australian Conversions

The report, so far lacking official confirmation, that the £4,000,000 of Queensland 3½ per cent stock falling due on January 1, 1945, is to be repaid in full without option of conversion raises the much larger question of the treatment of the loans with optional maturities next year. It may be recalled that in the last extensive borrowing and conversion operations, the Commonwealth and States raised very large sums at 5 per cent repayable 1945-75. If to these stocks is added a 5 per cent loan of New South Wales repayable 1945-65, the total involved exceeds £100 million. The first of these maturities occurs on July 1st, and a large proportion of them fall due in the autumn so that it will be some time before any action is called for. Meanwhile, it is extremely probable that all opportunities will be taken to prepare the market for a substantial cut in interest rates. The present indications are that Commonwealth credit is on a 3½ per cent basis. A cut from the 5 per cent running on the stocks to be converted would cause a number of investors to look elsewhere, but they will not easily find a return much in excess of 3½ per cent in trustee securities. The Commonwealth is in a very strong position since it can effect a substantial repayment if it so desires. Figures for the accumulation of sterling resources are given in the note above and if expansion continues at the present rate, it seems probable that there will be a repayment large enough to force the rate offered on the remainder down to 3½ per cent if not lower. At current prices, it already pays the ordinary investor to sell these stocks. These conversions, with similar operations in the few succeeding years by both Australia and New Zealand will make a drastic change in the return obtainable on that portion of Dominion loans which may then remain in existence.

L'Appetit Vient . . .

Spokesmen for India lose no opportunity of reminding the world at large of the debts to their country which the United Kingdom is accumulating as a result of the war. The latest occasion for pressing this reminder has been provided by the international business conference now being held in New York, where the Indian delegation appears to have called a Press conference at which a certain amount of

dirty Empire linen was washed in public. The burden of the Indians' complaint was that India was not given complete and unfettered freedom to dispose of the proceeds of her exports to the dollar area. They disclosed that last March India was allowed to retain 20 per cent of her net income of exchange other than sterling. The surplus in question must refer mainly to US dollars, of which India's receipts have greatly increased as a result of the substantial US military expenditure in that country. The dollars are not being spent, but are accumulating as a reserve for future use. This concession does not appear to have satisfied the Indian representatives at the business conference. They “see no justification for the continuation of an Empire dollar pool,” and as a first step toward its liquidation they have pressed for a declaration by Great Britain on the extent of its dollar holdings. These are the kinds of questions and pressures to which Great Britain has laid herself open through a financial agreement which over the five years of war has enabled India to repay £360 million of sterling debt and, over and above this, to accumulate £870 million of sterling assets. Here is another illustration of the proverb: *L'appetit vient en mangeant.*

* * *

The Gold Cure

Gold sovereigns continue to be made available to the Greek public through market sales by the Bank of Greece. They are being sold at 2,400 drachmas per sovereign, which is four times the official rate of the pound. Since the sovereign in Great Britain is worth 39s. paper, it will be seen that the coin is being sold to the Greek public at twice the official sterling price for gold. In this respect the sales of gold in Greece conform to those made, on official account, in the Middle East and in India. The programme of gold sales in Greece has been justified on two counts: that it will foster confidence in the new drachma, and that in the continued absence of consumer goods, gold serves the essential purpose of providing some objective on which the purchasing power of the currency can be exercised and therefore tested. Neither argument holds much weight in the peculiar circumstances obtaining in Greece. The gold coins sold to the public appear to vanish from circulation. The fact that the new currency has a 100 per cent backing of gold and foreign currency does not endow it with its purchasing power. That value derives from the limitation of its issue and from the volume of goods against which it can be tendered. The new currency is very strictly limited owing largely to the fact that the former drachma circulation against which it was issued had lost the greater part of its global value. Admittedly, new drachma notes are steadily finding their way into circulation, but it cannot be said that Greece is now suffering from a redundancy of currency. It is where such redundancy occurs—as in India, for example—that sales of gold are justified. In the conditions that obtain in Greece the gold sold to the public is unlikely to achieve much more than provide a convenient hoarding medium for the wealthy.

Belgium Taxes War Profits

Following the compulsory conversion of currency and blocking of bank accounts, the Belgian Government have tackled an even more formidable problem: the retrospective taxation of war profits. Not to pay taxes during the war was evidence, or could be pleaded as evidence, of resistance to the Germans. This happy combination of virtue and expediency is now over, and the time for paying up arrears has come. The first step in assessing these profits is the taking of a detailed inventory of all private fortunes in Belgium and a request for justification of the means by which any surpluses over the amounts held in 1940 have been acquired. The compulsory declaration of bank notes and blocking of bank accounts went some way towards providing the data required for this investigation. Obviously, these two items left undisclosed many other types of assets into which war profits might have been canalised. Those are now being declared and analysed in the most meticulous probe into private fortunes which any Belgian Government has ever dared to undertake. Resentment is said to be considerable, which is understandable, but does not by any means disprove the need or justification of the Government's initiative. Resentment against the currency conversion was also keen and widespread. Last week there were noisy demonstrations by the shopkeepers of

Brussels outside the Ministry of Finance demanding larger releases of bank notes. The opponents to the monetary purge have gained new and surprising allies: the Belgian Communists. During last week-end's anti-Government demonstration in Brussels there were Communist banners demanding the immediate release of all bank balances up to 50,000 francs. The Communist party is evidently anxious to gain the confidence of the middle-class. But most men of good will in Belgium have admitted both the courage and the justice of the Government's attempted solution of the currency problem. When the data on war profits is completed, a heavy retrospective tax on them will be levied. This is expected to yield over 50,000 million francs—or about half the note circulation at the time of liberation. This operation, if it succeeds, should play its own highly important part in speeding the process of currency deflation and getting the circulation down to the basis from which healthy re-expansion can begin.

* * *

More Capacity for Electricity

The Central Electricity Board has announced details about its post-war expansion programme. Broadly, the capacity of selected generating stations supplying the grid is to be increased by 3,000,000 kilowatts during the period up to the winter of 1948. This is equal to about a third of the installed capacity in 1939—it was then 8,875,000. If the post-war programme is fulfilled in time, the total capacity of selected stations in the winter of 1948 will, of course, exceed the 1939 figure not merely by 3,000,000 kilowatts but also by the new capacity installed during the war. No figures have been released for war-time additions—it is difficult to understand the continued ban on publication—but those may be equivalent to as much as 1,500,000 kilowatts. Total capacity at the end of 1948 is thus planned to show an increase of nearly 50 per cent over the pre-war total. This is a substantial increase, but in view of the large-scale house construction plan and of the need for modernising British industry, it is hardly excessive. By the terms of the Electricity (Supply) Act, 1926, the increase in capacity

A short-dated security . . .

WHICH WILL BE WELCOME

1½% Exchequer Bonds, which are on tap for a few months only, are issued at par and will be repaid at par on 15th February 1950.

Here is a new Government security which will appeal strongly to all those who want to continue their support of the war effort and are looking for an attractive short-term investment.

★ Subscriptions will be accepted in any amount, not being less than £50. Interest will be payable on the 15th February and 15th August each year. Income Tax will be deducted from interest payments of more than £5 per annum.

FOR MUTUAL LIFE ASSURANCE

Founded 1835

48 Gracechurch Street, London, E.C.3

planned by the CEB is to be financed by the owners of selected stations; it is estimated that the expenditure on new capacity will exceed £90,000,000—though the basis of this estimate has not been disclosed. Total expenditure, inclusive of distribution and consumers' equipment, will be appreciably higher. Since export demand for electrical equipment is also expected to be good, the electrical equipment industry seems assured of a heavy volume of orders after the war.

Help for Hydro-Electricity

Another step towards helping the development of hydro-electricity in the Highlands has been taken by the introduction of a Bill to reduce the high level of local rates in Scotland, whose present method of calculation bears far more heavily upon water-power than upon steam electricity undertakings. The chief beneficiary of this Bill will be the North of Scotland Hydro-Electric Board, the non-profit making body set up last year to bring prosperity to the Highlands by a policy of large-scale electric generation and cheap local rates. It has suggested two big schemes involving an initial outlay of £5½ million for Central Perthshire and £4.6 million for Loch Sloy. These have still to receive Government assent, and opposition, which should be surmounted, has come from large landowners and (in the case of Loch Sloy) from the county council, whose water supply must be properly safeguarded. Low costs are all-important to the Board's success and for the influx of light industries. The Board is confident that its generating costs can be kept at least as low as the best steam stations in the country, and the new rating concessions should enable its costs to be considerably lower. But the chief difficulty in hydro-electricity is that, for the same plant capacity, the initial capital outlay is about twice as much as in steam generation. The Treasury can guarantee the Board's borrowing up to £30 million (which is, in fact, its intended outlay over 30 years), but the Board's heavy capital expenditure will unavoidably involve it in high interest charges. Hence the crucial issue will be the size and profitability of the Board's bulk exports of electricity to the Central Electricity Board for use in the Lowlands. It is the duty, and it is certainly the wish, of the Development Board to use this surplus revenue to extend electricity supplies, and to reduce rates, to Highland consumers. The ideal is that the whole of the Highlands and Western Isles shall be covered by a network of plentiful and cheap power, encouraging light and crofters' industries, helping agriculture and improving domestic conditions. One difficulty is that the Board has no power of direct supply to the most accessible parts of the Highlands (which are naturally the area most suitable for development), since they are already served by existing supply undertakings; and its service to the very isolated areas left, which are so far completely without supplies, must necessarily be uneconomic. Care should be taken to see that the advantages of cheap electricity fall where they are most needed in the Highlands, which have gained much encouragement from the Board's proposals.

Second Thoughts

Shareholders in the Tinsley Park Colliery Company may think themselves fortunate that a few of their number held out for an investigation eight months ago. At the end of last year the United Steel Companies, who had for some time been general managers and part owners of the Tinsley Company, made an offer of one share of £1 for every five similar stock units of the colliery company. The United Steel ordinary then stood at about 24s. 6d., while the Tinsley Park ordinary, which have an imperfect market, were quoted around 6s. 6d. The reasons urged for acceptance of the offer by United Steel were the large overdraft, £230,000, of J. and G. Wells, a Tinsley subsidiary, and the need to raise new capital. The suggestion was endorsed

by the then directors of Tinsley and accepted by them in respect of their own holdings. Subsequently acceptances were received from holders of a majority of the capital of £775,532, but the stipulated 90 per cent acceptance was not forthcoming and the offer was finally withdrawn. Following the 1944 annual meeting and an extra-ordinary meeting called by dissentient shareholders, the board of Tinsley was largely changed, certain assets were realised and the overdraft reduced to a satisfactory level. J. and G. Wells is working at a profit but needs considerable outlay, and Kilnhurst, another colliery subsidiary, is running at a loss. In addition, Kilnhurst is under obligation to supply coking coal to Stewarts and Lloyds. The new Tinsley chairman has secured a conditional offer from the Manvers Main Colliery to purchase Kilnhurst, in consideration of which United Steel are prepared to take over J. and G. Wells and to assume some part of the obligations with regard to the supply of coking coal. As part of this arrangement, they now offer for each £1 stock unit in Tinsley, not as before one-fifth of a share, now quoted at about 26s. 6d., but 12s. 6d. in cash. In January the original offer seemed reasonably fair on the information provided. No mention was made of realisable assets or of particular difficulties, other than financial, at Kilnhurst. It is difficult to see what the new chairman has achieved which might not have been accomplished by any competent board which was in touch with the situation. It can only be hoped that the success which has crowned the labours of the dissentient minority on this occasion will encourage other shareholders to use the rights they have and to demand more.

Coal-Mining Industry Consolidation

There has been a significant development to the statement of the Minister of Fuel and Power in the House of Commons on October 10th last that the future of Part II of the Coal Act, 1938—giving the Coal Commission statutory powers to expedite integration in the industry—was then "under consideration." In May, 1939, the Commission addressed to colliery owners a memorandum outlining a scheme for the creation of suitable geographical areas with only one undertaking within each; but on the outbreak of the war its consideration was suspended, although undertakings were left free to arrange voluntary amalgamations. Last June, however, colliery owners were advised by the Commission that it had decided to resume its task on the basis of the 1939 memorandum. In the meantime, on the recommendation of the Mining Association, committees of colliery owners had been appointed in each district to consider the local problem of reorganisation in the light of the proposals of the Commission, and these committees were asked to inform the Commission by the end of July to what extent action had been taken by them. In the local investigations into the possibilities of consolidation the districts had acted independently, but by the end of September the Commission was fully informed about the progress made. Meanwhile, however, the Ministry of Fuel and Power, in the exercise of its powers under the White Paper of June, 1942, had assumed effective control not only over operation finance but also over the organisation of the industry, and particularly under the scheme of group production directors announced by Major Lloyd George last December, empowering the regional controllers, among other things, to prepare for the approval of the Minister plans for the grouping of pits in their respective areas with a view to the more efficient operation of the industry. The application of these grouping schemes would have to be immediate if they were to serve their purpose, while the consolidation plans of the Commission related to the long-term policy of reorganisation; but apparently there has been some inconvenient over-lapping, and the Commission has been asked by the Minister of Fuel and Power not to take any further action for the present in the implementation of Part II of the Act. The colliery owners have been informed of this development, and the application of the proposals of the Commission for the reorganisation of the industry is thus indefinitely suspended.

Royal Bank of Scotland

Banking experience north of the Border during the past year appears, on the evidence of the Royal Bank of Scotland figures for the 12 months to October 14, 1944, to have conformed very closely to that of the English clearing

banks. The Royal Bank's deposits have risen from £95,336,000 to £104,005,000 and its note circulation from £7,622,000 to £8,979,000. The main counterpart to the rise in deposits has been a rise from £7,000,000 to £12,500,000 in Treasury Deposit Receipts, while the holding of gilt-edged securities has increased from £43,310,000 to £45,259,000. The bank has done rather better than the clearing banks in maintaining its advances, the latest total of £25,135,000 comparing with £24,215,000 a year previously. The rise in deposits carries the Royal Bank's total above £100 million for the first time. Adding to the latest figure, the deposits of the two controlled banks, Glyn Mills and Williams Deacons, an aggregate deposit figure of £246,864,000 is obtained. This puts the Royal Bank group sixth in the ranking of British banks.

The Causes of Fires

Some interesting statistics relative to the causes of fires have been collated by the Fire Offices' Committee with the cooperation of the Home Office Fire Service. They embrace ten Fire Force areas and cover the period from July 1st to September 30th. During that period the total number of fires attended was 4,108; 1,801 fires (43.9 per cent) are ascribed to carelessness other than careless smoking, 530 (12.9 per cent) to careless smoking, 380 (9.2 per cent) to children playing with fire, 404 (9.8 per cent) to rubbish fires, and 207 (5 per cent) to electrical defects; the remaining 786 fires (19.2 per cent) are unexplained. These facts confirm the expert view that most fires originate in acts of carelessness. They are being used for purposes of education and, in order to increase the effectiveness of the campaign against fire waste, the statistical test should be repeated at intervals. Moreover, it is obviously in the national interest that the Fire Offices' Committee's campaign against loss of life and property through avoidable fires should be continued after the war. During the war attention has been focussed chiefly on the fire hazard in factories and warehouses—and rightly so—but there is a great deal that could be done in averting tragedy in the home by instructing parents in simple rules and devices for the protection of their children and property. The number of outbreaks attributed to children playing with fire is altogether too high.

Training for the Land

The incessant and irrepressible demands from men in the Services for facilities to settle on the land after the war has led the Government to announce its agricultural training scheme. Suitable candidates without experience, who will be selected by the County War Agricultural Executive Committees, will be given a year's training on selected private farms at the Government's expense. At the same time, a number of temporary centres will be set up to train men with experience, as farm managers or foremen. There is no mention of what will happen to the inexperienced candidates after their year's training. They will find a reasonable demand for skilled labour. Both the attractiveness of a labourer's life and farming efficiency would gain greatly from better opportunities for promotion and from an accompanying increase in the size of some farms. But most ex-Servicemen want simply "to be independent," and to run smallholdings of their own. The dismal failure of many individual smallholdings between the wars was due much more to their uneconomic size and function than to inexperience or to insufficient capital, which in most cases was part-provided by the Land Settlement Association. This time smallholders will have to face additional difficulties, such as the growth of co-operative marketing which tends to shut out their products. Except for specialised products in certain areas, individual smallholdings pay neither their owner nor the nation. There is, however, limited opportunity for co-operative farms or groups of smallholdings, buying and selling jointly and under skilled central management, as has been illustrated by the very high wages earned on the market garden settlements of the Welsh Land Settlement Association. Since many prospective smallholders cannot be discouraged, the Government should promote some type of co-operative scheme. It has been pointed out that the Ministry of Agriculture (or the county committees) possesses extensive land, skilled foremen and advisers, and up-to-date machinery, all of which could be utilised to set up, at low cost, co-operative schemes of smallholdings.

Military land and camps no longer required, which are already equipped with essential services, would also provide suitable centres. The Government should make it clear that the total number of new entrants which can be absorbed in agriculture is strictly limited.

Shorter Notes

The Institute of Chartered Accountants has just published in pamphlet form the recommendations of its Council on accounting principles.* These recommendations were made known at various times between December, 1942, and July of this year, and have already had an appreciable effect on the form of some published accounts. A foreword by the President of the Institute, while stating that the form in which accounts are submitted to shareholders is a matter for the discretion of directors, makes it plain that a reasonable degree of uniformity of principle and practice is considered desirable. The pamphlet is in loose-leaf form, thus encouraging the hope that further recommendations are to be made.

The resumption of dividend payments by Mufulira Copper, with a payment of 7½ per cent, and the consequent distribution of 8½ per cent by the holding company, Rhodesian Selection Trust, has caused some surprise. This is the greater since profits show a decline on the year. It ought, however, to be remembered that Mufulira passed its dividend three years ago, resumed dividends for 1941-42, and made no payment last year, whereas Roan Antelope, the other mine under the Chester Beatty management, paid dividends each year until 1943. The RST shares of 5s. rose to 13s. 3d. on the announcement, at which they yield £2 8s. 7d. per cent free of tax.

* "Recommendations on Accounting Principles." Gee and Company. 28 pages, 1s. 6d.

If the Board met in the boiler house . . .

Though the firemen might feel put out at first, they would quickly see that the directors meant business about fuel efficiency. Everybody about the place would be on his toes in consequence. Is that so with you?

Or have you and your colleagues allowed fuel watching and the rest of it to degenerate into a meaningless routine? In particular, can your recent records show any economies to match the following?

- A FAMOUS MOTOR WORKS** has made savings of from 25% to 50% in coke, coal, electricity, and gas by:
- 1—reducing the factory temperature
 - 2—using extra care in switching off lights and removing unnecessary bulbs
 - 3—letting in more daylight
 - 4—reducing the night staff
 - 5—lagging boilers and process equipment, and
 - 6—serving cold meals now and then in the canteen.

HOW THESE BULLETINS CAN HELP YOU.

The latest specialized knowledge on almost every conceivable fuel subject is at your finger-tips in the Fuel Efficiency Bulletins—advice and help that ordinarily would have to be heavily fee'd. If you've mislaid your copies, apply now to the Regional Office of the Ministry.

COMPANY MEETINGS

THE WALL PAPER
MANUFACTURERS, LIMITED

CHAIRMAN'S SPEECH

The forty-fifth annual general meeting was held at the Midland Hotel, Manchester, on Tuesday, the 21st instant.

The chairman (Mr Alan V. Sugden, J.P.) referred to the goodwill item, which he said appeared on the books at too high a figure to ignore, despite its inadequacy if earning capacity and past results are taken into account. As this asset is subject to wide fluctuations it seemed wise to repeat the earlier expressed intention of the board to write the figure progressively down to a nominal one as and when opportunities present themselves.

After commenting on the accounts, the chairman continued:—

RECOMMENCEMENT OF WALLPAPER
MANUFACTURE

I wish to emphasise the reference to this question in the directors' report. It is of vital importance to our future wellbeing.

No other industry of importance, to my knowledge, with one exception, has been deliberately put out of business in the interests of other users of its raw materials, and none has suffered this real calamity for so long a period.

The effect at home has been a great impetus to the use of substitutes but, apart from this, the volume of arrears at the cost of dirty interiors, is quite immeasurable.

Psychologically we believe this has not been a good element in the maintenance of home morale, and since the advent of a great increase in war damage the deprivation of the opportunity of using wallpaper, easily the cheapest and most effective means of rendering first aid to interiors, has created real hardship.

Abroad we have been compelled to watch with folded arms the passing of our markets, including some whose establishment has been entirely our own creation, into the hands of competitors from overseas, favoured with plentiful and cheap paper supplies and abundant labour.

When we start up we shall have to re-create a lost business, and, unlike our overseas competitors, with old designs, plant which has not been running for three to four years, and which has not had the advantage of renewal, modification, and improvement.

We shall be faced with much higher costs for paper, our most important raw material, than will be the case with our overseas competitors.

Our wages will have advanced to a greater degree than those of the same competitors and we shall be for many months working below the capacity of the plant, an entirely uneconomical situation.

On the more cheerful side we have first of all an insistent public demand for wallpaper which no discouragement appears to be able to stem, whilst on our part we have a national capacity for adaptation to new circumstances which we believe to be unequalled. We have craftsmen, technicians and designers who are second to none and we have a team which can be relied upon in any circumstances, however difficult.

Our financial position is strong. We have no anxieties from this source.

As you know we have used these resources in an ever-growing degree to spread our interests and our risks and we shall continue to do so.

ORGANISATION

Within the present year the board has initiated a reorganisation and concentration of the company's internal and domestic structure.

In future the administrative centre for home affairs, including sales and manufacture will be in Manchester, where in fact the head offices will be housed.

The registered office and export department will, when opportunity permits, be removed back to High Holborn.

JOHANNESBURG
CONSOLIDATED
INVESTMENT COMPANY,
LIMITED

STRONG FINANCIAL POSITION

The annual general meeting of Johannesburg Consolidated Investment Company, Limited, was held, on the 21st instant, in Johannesburg. Mr G. H. Beatty, who presided, said that the strong financial position of the company had been maintained. The book value of the assets totalled £10,983,637, while the liabilities made up of provision for taxation and sundry creditors, deposit and current accounts of associated companies and dividend No. 52, amounted to £2,769,599, thus leaving an excess of assets over liabilities of £8,214,038. The market value of the company's holdings was substantially in excess of the value shown in the balance-sheet.

The net profit for the year, after making provision for taxation, for all ascertained and estimated charges and depreciation, amounted to £831,969, which compared closely with the net profit of £881,423 for the previous year. After adding to the net profit the balance of £258,569 brought forward from the preceding year, there was available the sum of £1,090,538. Dividend No. 52 of 3s. per share, subject to United Kingdom income tax, absorbed £592,500 and £250,000 was transferred to reserve fund, leaving a balance of £248,038 to be carried forward.

A DISTURBING FEATURE

The tonnage crushed by the gold-mining industry showed a further decline, caused almost entirely by a scarcity of native labour. That reduction in operating scale was, however, not serious. The most disturbing feature was the rise in working costs. The country was mainly dependant upon the maintenance of gold production, and for a considerable period would be dependant upon the output of the present working mines. Gold production on an adequate scale depended upon the maintenance of low costs. That did not mean that living standards must fall, but it did mean that the country must realise that, if it desired to increase or even maintain existing living standards, it could not afford to indulge itself in luxuries which gave only an emotional satisfaction.

The following were the principal features of the aggregate results of operations of the gold-mining companies of the group for the six months ended June 30, 1944: Tons crushed 5,325,000; yield 869,968 oz.; yield per ton 3,267 pennyweight; working costs £5,868,096; working costs per ton 22s.; working costs per ounce of fine gold produced 134s. 11d.; gross profit, including sundry revenue, £1,503,355.

Two of the gold mines of the group, namely the Van Ryn Deep, Limited, and the Langlaagte Estate and G. M. Company, Limited, were in difficulties owing to rising costs and it became necessary to give the Government notice of the probable closure of those mines.

FREE STATE DEVELOPMENT

The Free State Development and Investment Corporation, Limited, was registered in February, 1944, with a view to acquiring options over mineral rights in various areas in the Free State, and to exploring the possibilities of gold mining.

The company was under heavy financial obligations in regard to option payments, having such large areas under its control. It was, therefore, the policy primarily to drill, with the available machines, a large number of exploratory holes spaced over the areas held, to investigate quickly its potentialities with the object of discarding, as soon as possible, such portions which might be proved to have no economic importance. The company was at present operating nine drilling machines in the field, and it was hoped to have three or four more units at work in the near future. The report was unanimously adopted.

MODDERFONTEIN EAST,
LIMITED

(Incorporated in the Union of South Africa)

MR W. M. FRAMES'S REVIEW

The annual general meeting of Modderfontein East, Limited, was held in Johannesburg on the 16th instant. Mr W. M. Frames, chairman, presided, and moved the adoption of the report and accounts.

The chairman said the total profit for the year had been £913,408. Provision on account of outstanding liability in respect of miners' phthisis compensation was £5,695, provision for taxation £481,188, provision for lease consideration £124,325, and dividends accounted for £302,512.

Development during the year was again restricted in order to conserve stores and labour, footage accomplished being 5,678, compared with 6,699 in the previous year. Total payable ore developed was estimated at 661,922 tons, having an average value of 4 dwt. per ton. Available ore reserve at June 30, 1944, was estimated at 6,259,000 tons, averaging 3.6 dwt. over a stoping width of 41.6 in. Compared with the estimate at the close of the previous financial year, the available reserve had shown a decrease of 453,700 tons, the average stoping width being 0.1 in. lower, while the average value was unchanged.

The native labour supply throughout the year had been much below requirements, and operations had been seriously restricted. Failing an improvement in the labour supply, of which there was no present indication, the increased development programme would cause a further decrease in the tonnage milled.

The price received for gold and the rate at which taxation had been payable had remained unchanged throughout the year.

During the year the report of the Witwatersrand Mine Natives Wages Commission had been published. Shareholders are aware that the Government had not accepted in full the recommendations of the Commission but, nevertheless, had decided that from April 1, 1944, certain increases should be made in the wages paid to Witwatersrand Mine native labourers. Briefly, the increases amounted to 5d. per shift for the natives employed underground and 4d. for those employed on the surface, with payment at time and a-half for all overtime and Sundays.

GOVERNMENT AND GOLD REALISATION
CHARGE

Since January 1, 1940, gold-mining companies had been obliged to pay the Government a gold realisation charge, and since September 1, 1940, that charge had remained fixed at 38s. 3d. per cent. The Government had decided to place in a pool the sums thus collected during the year ending March 31, 1945, and to distribute those funds among individual mining companies in proportion to their share of the increased costs in respect of native wages. On present estimates the amount thus made available is only sufficient to meet about 90 per cent of the additional direct burden placed on the company.

Since the close of the year the board had accepted with regret the resignation of Brigadier R. S. G. Stokes from the position of chairman and director. Brigadier Stokes had joined the board and had been appointed chairman in January, 1936. He had rendered valuable service to the company.

The report of the proceedings will not be circulated to shareholders, but copies are obtainable on application to the head office in Johannesburg or to the London office.

A large number of the company's European employees were absent on military service and the company continued to give full support to the national war effort. The report and accounts were adopted.

CONSOLIDATED MAIN REEF
MINES AND ESTATE,
LIMITED

(Incorporated in the Union of South Africa)

DR HANS PIROW'S ADDRESS

The annual general meeting of Consolidated Main Reef Mines and Estate, Limited, was held in Johannesburg on the 16th instant.

Doctor Hans Pirow, chairman, in moving the adoption of the report and accounts, said that the total profit had been £369,523. Dividends absorbed £218,330, provision for taxation amounted to £131,349, net capital expenditure £5,974, and provision on account of outstanding liability in respect of miners' phthisis compensation has been £13,152. Total expenditure on capital account had amounted to £14,595, from which had been deducted £8,621 received in respect of sales of plant and freehold. Main items of expenditure had been on account of hoisting and shaft equipment and installation of two tube mills which had been completed during the year with beneficial effects on the residue.

Development accomplished during the year totalled 56,843 ft., an increase of 4,468 ft. compared with the previous year. Payable ore developed had been estimated at 725,000 tons, averaging 3.3 dwt. per ton, a decrease of 659,300 tons compared with the previous year.

The available ore reserve had been re-estimated at June 30, 1944, at 7,489,000 tons averaging 3.6 dwt. over a stoping width of 56.7 in. Compared with the previous year, the available reserve showed a decrease of 1,386,100 tons, the estimated stoping width being 0.7 in. less and the average value unaltered.

LABOUR

The price received for gold and the rate at which taxation is payable by the company remained unchanged throughout the year. During the period under review operations had been severely hampered by a serious shortage of European and native labour, also by abnormally heavy rains last February.

Since the company's last meeting the report of the Witwatersrand Mine Natives Wages Commission has been published. Shareholders will be aware that the Government had not accepted in full the recommendations of the Commission, but, nevertheless, had decided that from April 1, 1944, certain increases will be made in wages paid to Witwatersrand Mine native labourers. Briefly, the increases amounted to 5d. per shift for natives employed underground and 4d. for natives employed on the surface, with payment at time and a-half for all overtime and Sunday work.

Since January 1, 1940, the gold mining companies had been obliged to pay to the Government a gold realisation charge, and since September 1, 1940, that charge had remained fixed at 38s. 3d. per cent.

The Government had decided to place in a pool sums thus collected from the industry during the year ending March 31, 1945, and will distribute those funds among individual mining companies in proportion to their share of increased costs in respect of native wages. On present estimates the amount thus made available will only be sufficient to meet about 90 per cent of the additional direct burden placed on the company.

In order to conserve paper stocks, the report of the proceedings at the meeting will not be circulated to shareholders. Copies could be obtained on application to the head office in Johannesburg or to the London office.

A large number of the company's European employees were absent on military service and the company continued to give full support to the national war effort.

The report and accounts were adopted.

NEW MODDERFONTEIN
GOLD MINING COMPANY,
LIMITED

(Incorporated in the Union of South Africa)

DR HANS PIROW'S REVIEW

Dr Hans Pirow, chairman, presided at the annual general meeting of New Modderfontein Gold Mining Company, Limited, held in Johannesburg on the 17th instant.

In moving the adoption of the report and accounts, the chairman said the total profit had been £150,028. Dividends had absorbed £105,000, provision for taxation had amounted to £34,996, and provision on account of outstanding liability in respect of miners' phthisis compensation had been £39,612.

Development work undertaken during the year had amounted to 30,517 ft., an increase of 16,864 ft. compared with the previous year's figure. Payable ore proved had totalled 222,300 tons, valued at 3.0 dwt. per ton, which was a decrease of 98,000 tons compared with the previous year's total, the value being 0.4 dwt. higher. No improved prospects had been shown by development, and there was very little hope of adding any appreciable tonnage to the reserves on any of the reefs.

Ore reserves were now insufficient to supply mill requirements and a large proportion of the mill tonnage was obtained from sources outside the reserve, with the result that the yield per ton milled showed only a small margin over working costs. It followed that any further decline in the value of ore mined or any increase in working costs would have serious results. Available ore reserve had been re-estimated as at June 30, 1944, to be 2,188,200 tons of an average value of 3.0 dwt. over a stoping width of 46.4 in. Compared with the previous year's figure the available reserve had shown a decrease of 1,280,000 tons, the average value being 0.3 dwt. higher, while the stoping width had been 0.9 in. lower. In view of the unlikelihood of any new areas of payable ore being developed it must be expected that the tonnage contained in reserve would show a continuous decrease.

The price received for gold and the rate at which taxation had been payable by the company remained unchanged throughout the year.

LABOUR PROBLEMS

During the period under review operations had been seriously hampered by the serious shortage of native labour and had also been adversely affected by abnormally heavy rains which had occurred in February last.

Since the company's last meeting the report of the Witwatersrand Mine Natives Wages Commission had been published. Shareholders would be aware, no doubt, that the Government had not accepted in full the recommendations made by the Commission but, nevertheless, had decided that as from April 1, 1944, certain increases should be made in the wages paid to the Witwatersrand mine native labourers. Briefly, the increases amounted to 5d. a shift for natives employed underground and 4d. per shift for natives employed on the surface, with payment at time and a-half for all overtime and Sunday work.

Since January 1, 1940, gold-mining companies had been obliged to pay to the Government a gold realisation charge, and since September 1, 1940, that charge had remained fixed at 38s. 3d. per cent. The Government had decided to place in a pool the sums thus collected from the industry during the year ending March 31, 1945, and to distribute those funds among individual mining companies in proportion to their share of the increased costs of the industry in respect of native wages. On present estimates the amount thus made available would only be sufficient to meet about 90 per cent of the additional burden placed on the company.

In order to conserve paper stocks the report of the proceedings would not be

circulated to shareholders. Copies of the report could be obtained from the head office in Johannesburg or from the London office.

A large number of the company's employees were absent on military service, and the company continued to give full support to the national war effort. The report was adopted.

NOURSE MINES, LIMITED

(Incorporated in the Union of South Africa)

IMPROVED DEVELOPMENT

The annual meeting of Nourse Mines, Limited, was held in Johannesburg on the 17th instant. Mr W. M. Frames, chairman, presided and, moving the adoption of the report and accounts, said the total profit was £237,646. Provision on account of outstanding liability in respect of miners' phthisis compensation was £16,174, provision for taxation £88,096, and dividends absorbed £117,550.

Rainfall last February had been exceptionally severe and an excessive quantity of water had entered the mine, flooding some lower levels and causing considerable disorganisation and delay. The sinking of No. 3D incline, which had been restarted at the beginning of the financial year, had been interrupted by floods and had not been resumed until June. Although reorganisation of the underground pumping system had been completed it had been delayed owing to the late arrival of some equipment and the enlarged plant had thus not been available in time to deal with the flood water. During the critical period an agreement with City Deep had enabled some excess water to be passed to that company's mine.

Development amounted to 11,623 ft., an increase of 2,759 ft. over the previous year. Flooding of the incline had delayed operations in 3D section, where development was urgently required to open up new ore reserves, and the scarcity of native labour now made it difficult to divert an adequate labour force for that purpose. Continual attention was being given to the development position and since the end of the financial year footage had been further increased. The favourable values disclosed in 3D section in past years were well maintained in recent development.

AVAILABLE ORE RESERVE

Available ore reserve at June 30, 1944, had been estimated at 2,419,700 tons, averaging 4.3 dwt. over an estimated stoping width of 47 in. Comparing the position with the previous year, the available reserve had shown a decrease of 623,900 tons with the average width and value unchanged.

The price received for gold and the rate at which taxation had been payable by the company had remained unchanged throughout the year. During the period reviewed, the report of the Witwatersrand Mine Natives Wages Commission had been published. Shareholders were aware that the Government had not accepted in full the recommendations of the Commission, but had decided that, as from April 1, 1944, certain increases should be made in the wages paid to Witwatersrand mine native labourers. Briefly, the increases amounted to 5d. per shift for natives employed underground and 4d. per shift for natives employed on the surface with payment at time and a-half for all overtime and Sundays.

Since January 1, 1940, gold-mining companies had been obliged to pay the Government a gold realisation charge, and since September 1, 1940, that charge had remained fixed at 38s. 3d. per cent. The Government had decided to place in a pool the sums thus collected during the year ending March 31, 1945, and to distribute those funds among individual mining companies in proportion to their share of the increased costs to the industry in respect of native wages. On present estimates the amount thus made available was only suffi-

cient to meet about 90 per cent. of the additional direct burden placed on the company.

Since the close of the year the board had accepted with regret the resignation of Brigadier R. S. G. Stokes from the position of chairman and director of the company. Brigadier Stokes had joined the board and had been appointed chairman in January, 1936. He had rendered valuable service to the company.

The report of the proceedings will not be circulated to shareholders. Copies were obtainable on application to the head office in Johannesburg or to the London office.

A large number of the company's European employees was absent on military service and the company continued to give full support to the national war effort.

The report and accounts were adopted.

BLIVOORUITZICHT GOLD MINING COMPANY, LIMITED

(Incorporated in the Union of South Africa)

BETTER VALUES DISCLOSED

DR HANS PIROW'S ADDRESS

Doctor Hans Pirow, chairman, presided at the annual general meeting of Blyvooruitzicht Gold Mining Company, Limited, held in Johannesburg on the 17th instant. Moving the adoption of the report and accounts, the chairman said that expenditure charged to capital account during the year under review had been £133,255, principal items being in respect of sinking at No. 2 shaft and provision of additional dwelling houses and quarters, leaving a balance of working capital at the close of the financial year of £13,526.

Operations at the mine during the year had resulted in a net profit of £171,456, which, added to unappropriated balance brought forward at beginning of the year, namely £42,992, had given a total of £214,448. After providing £43,284 for taxation, £702 in respect of miners' phthisis outstanding liability and writing off £64,301 in respect of preliminary expenses and share commission, there had remained an unappropriated balance of £106,161 at June 30, 1944, which, together with capital funds in hand, had totalled £119,687.

Development accomplished during the year had amounted to 35,349 ft., an increase of 8,591 ft. compared with the previous year. That included 754 ft. of shaft sinking in No. 2 shaft, which had reached a depth of 3,009 ft. at the end of the period under review. The development done to date did not clearly indicate any shoot direction for values nor did it indicate any large area of low value.

Throughout the development, operations

on the reef had shown remarkable consistency with occasional very high values. During the past year, however, there had been a tendency to disclose rather better values in drives progressing towards the east than in those advancing to the west.

INCREASED ORE DEVELOPED

Ore reserves re-estimated as at June 30, 1944, had totalled 3,270,600 tons, valued at 15.2 dwt. per ton over an assumed stoping width of 45 in. Compared with the tonnage of ore developed at June 30, 1943, that represented an increase of 1,844,600 tons, the value being 0.1 dwt. higher. Of that total, 593,500 tons, valued at 14.4 dwt. per ton, were contained in the shaft pillar. A balance of 2,677,100 tons, valued at 15.4 dwt. per ton over the assumed stoping width of 45 in. would become available for stoping when a connection had been made with No. 2 shaft.

During the year forty drill compressors had been purchased and installed, 2,200 drill compressors were on order, and tenders had been called for a supply of electric hoists for No. 1 shaft capable of raising an 8-ton load.

In order to ensure satisfactory ventilation throughout the life of the mine it would be necessary to sink a circular ventilation shaft, and it was hoped that it would be possible to commence work at that shaft when sinking of No. 2 shaft was completed.

Ore milled during the twelve months under review had totalled 125,900 tons, and in addition the remaining 22,300 tons of accumulated slime, assaying 4.414 dwt. per ton, had been treated in the reduction plant. Gold recovered from those two sources had totalled 69,069 oz. fine, or an average of 10.972 dwt. per ton milled, with a residue of 0.316 dwt. per ton. A notable feature of the reduction operations was the fact that waste sorted on surface had increased from an average of 14.05 per cent. of rock sent to mill in 1942-43 to 15.87 per cent. in 1943-44.

On October 31st No. 2 shaft had reached a depth of 3,597 ft. and had to be sunk a further 1,226 ft. to the horizon of the Sixth Level Haulage. If no serious difficulties were encountered in sinking No. 2 shaft or in driving the Sixth Level towards it, it was estimated that a connection would be made in about twelve months' time. When that connection had been made, limitations imposed by mining regulations on single outlet mines would fall away, and considerable expansion of the scale of operations would normally take place. Naturally, the extent to which expansion would be possible under prevailing conditions would be governed by the availability of material, equipment and labour. It was hoped, however, that at that stage the milling plant could be increased to a capacity of some 40,000 tons per month, and steps were being taken to finance by temporary loan

arrangements the purchase of necessary equipment as it became available, profits earned by milling the development rock obviously being insufficient to meet capital expenditure involved.

LABOUR SHORTAGE

Owing to a serious shortage of native labour throughout the year under review it had been impossible to do all the necessary development work, particularly in connection with ore-pass systems and shaft bins at No. 1 shaft, nor could the mill be kept supplied with ore to its full capacity. Unless the labour position improved, the post-war development of property was likely to be retarded, although everything possible was being done to ensure that, when conditions became more favourable, expansion commensurate with the promising results obtained to date could take place.

During the period under review, the report of the Witwatersrand Mine Natives Wages Commission had been published.

Shareholders would no doubt be aware that the Government had not accepted in full the recommendations made by the Commission but, nevertheless, had decided that as from April 1, 1944, certain increases should be made in wages paid to Witwatersrand mine native labourers. Briefly, the increases amounted to 5d. a shift for natives employed underground and 4d. a shift for natives employed on the surface, with payment of time and a-half for all overtime and Sunday work.

Since January 1, 1940, gold-mining companies had been obliged to pay the Government a gold realisation charge, and since September 1, 1940, that charge had remained fixed at £1 18s. 3d. per cent. The Government had decided to place in a pool sums thus collected from the industry to distribute those funds among individual mining companies in proportion to their share of the increased costs to the industry in respect of native wages. On present estimates the amount thus made available would only be sufficient to meet about 90 per cent. of the additional direct burden placed on the company.

Since the close of the financial year, Brigadier R. S. G. Stokes had resigned as chairman and director of the company on taking up an important position with Central Mining and Investment Corporation in London.

The board desired to record its sincere regret at the resignation of Brigadier Stokes and its high appreciation of the services he had rendered to the company since its inception.

The report of the proceedings at the meeting would not be circulated to shareholders, but copies could be obtained on application to the head office in Johannesburg or to the London office.

The report and accounts were adopted.

GOVERNMENT RETURNS

For the week ended Nov. 18, 1944, total ordinary revenue was £43,085,000, against ordinary expenditure of £93,034,000 and issues to sinking funds of £360,000. Thus, including sinking fund allocations £8,959,408, the deficit accrued since April 1st is £2,061,186,000 against £2,057,207,000 for the corresponding period a year ago.

A change has been made in the method of showing a excess of Post Office Expenditure over the Post Office revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £51,502 to £2,630,335, the other operations of the week (no longer shown separately) used the gross National Debt by £2,135,591 to £21,654 million.

On Nov. 17 applications at £99 14s. 11d. for bills to be paid for on Monday, Tuesday, Wednesday, Thursday and Friday of following week were accepted as to about 36 per cent. of the amount applied for, and applications at higher prices in full. Applications at £99 15s. for bills to be paid for on Saturday were accepted in full. £110 millions of Treasury Bills are being offered on Nov. 24. For the week ending Nov. 25, the banks will be asked for Treasury deposits to the maximum amount of £90 million.

Liberation Pains

THE political crisis in the liberated countries continues. For the time being Belgium is still the chief storm centre. After the leaders of the resistance had agreed to hand over their arms to the Allied commands, demonstrations and shootings took place in Brussels last Saturday; and widespread strikes took place on Tuesday. The Belgian Parliament has mirrored the present discontents and, though the Government was granted the special powers it asked for, the debate was bitter. The opposition to M. Pierlot's Government is fairly widespread. It includes many Left-wing Catholics and Liberals as well as Socialists and Communists. But the opposition has not hardened enough to overthrow the present Government; and it has not found enough positive and common ground to form an alternative administration. In Italy and in Greece the crises have been of a more creeping or latent character. Last week Signor Bonomi resigned from his post because of the dissensions among the six parties of his coalition; but he has now apparently been asked by the representatives of those parties to remain in office and to reshuffle his Government. In Greece, the critical date of December 10th, when the guerillas are to lay down their arms, is approaching; and in the meantime uneasy tension, caused by jockeying for political positions between the Left and the Right, still prevails.

Allied policy, and British policy in particular, cannot ignore these events. The sharp clashes of opinion, the sudden release of pent-up emotions, the social antagonisms and the political rivalries, are developing close behind the Allied fronts and astride the Allied communication lines. The military campaigns and the politics of the liberated countries are confused in a difficult and complex tangle. The needs of the war tell very heavily upon the economic situation in every liberated country; and political events inevitably affect the Allied commanders' freedom of movement and military action. A general strike immediately behind the fighting lines may be a serious threat to military security. A clash of opinion that may lead to a clash of arms is bound to cause the gravest concern to any military commander. Yet these are Allied countries and order cannot simply be imposed by the bayonet, even if there were bayonets to spare. Difficult and distracting though it may be, it is necessary to understand the nature of the political and social tensions among the liberated peoples before there can be any hope of removing them.

Easy optimism over the political affairs of the liberated countries would be cut of place. For all these countries the approaching winter means hardship and suffering. The Allied armies have brought war as well as liberation

to their frontiers. Liberation has not been painless. For the four years of the German occupation the French, the Belgians and the Dutch lived under a reign of terror. The lives and property of many of them were in constant peril. But the mere length of the occupation gave something like an air of stability and normality to the material existence of the great mass of peaceful and non-political citizens who shunned the hazards of active resistance. It is true that the enslaved nations were impoverished; but, within the limits of their poverty, life went on. The shopkeepers carried on somehow; and the miners received the additional rations to which, as heavy workers, they were entitled. Most of this artificial normality has now been upset. Food is short, or badly distributed; fuel is lacking; and communication lines have been disrupted. True, some improvement has been achieved. General de Gaulle has stated that the French coal production has already risen to about half of the pre-war level. Locomotives are being repaired. Railways and harbours are being restored. But the improvement is unsteady and painfully slow; and it will remain so in the coming months. And restored means of transport will be used, in the first place, to feed the Allied war-machine and not the civilian population. This, clearly, is a situation which can easily be exploited by demagoguery and irresponsibility to foster anarchy, and much of the recent political trouble is doubtless to be attributed to this source. But much of it must also be debited to the faults of leadership among the Governments—or to its total absence.

The purge of ex-collaborators is the cause of endless trouble in the political life of the liberated countries. The demand for a purge has been so widespread, genuine and persistent that the political atmosphere is almost certain to remain poisoned as long as its scale and methods are undefined. Hitherto it has been a tragic farce. In France, as well as in Belgium, the courts are investigating tens, if not hundreds, of thousands of cases of alleged or genuine collaboration. At the same time "spontaneous" attacks on collaborators are a daily occurrence. Trials have taken place in which death sentences have been pronounced on minor culprits. Yet there are constant complaints that ex-collaborators are entrenched in the civil services and in public life. It is not for the British to lay down the law in a matter where national pride is so fiercely engaged. But the friendly observer can advise what will have to be done if the purge is not to develop into a witch-hunt that may go on for years. The denunciation of small fry ought to cease; punishment ought to be confined to the big men who collaborated with their eyes open. But within these restricted limits the purge

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

ROYAL EXCHANGE Assurance

Head Office at the Royal Exchange, London

ought to be carried out with severity and speed. So far, the whole issue has been almost hopelessly confused by the light-headed promises of impracticable purges that have been made by the Governments, promises that are coming to be regarded as empty lip-service to popular passions. On the other hand, the violent propaganda of the Communists has reduced the issue to an absurdity. They have so often labelled any opponents of Communism as Fascists and Fifth Columnists that the charge has become almost meaningless. The demand for a "wide purge" has been the most effective obstruction to the execution of real justice upon those few who bear the heaviest burden of guilt. During the occupation years, the active resisters in each country were a small minority. The passive acquiescence of the ordinary citizen cannot be regarded as criminal; the mere absence of heroism is not a felony. Nor ought heroism in resistance to be regarded as a title deed to office and power after the liberation. In the period of direct action against the enemy, the minority of active resisters counted most; but this does not mean that the political views of that minority can be taken to be a valid expression of the will of a whole country. Where fighting impinges so closely on politics, the military rule should be followed: decorate for gallantry but promote for efficiency.

It is easy to propound these logical rules in England, whose sufferings, though no smaller, have been psychologically so different. In the liberated countries all is still emotion, and for some time to come the role of the active minority of the resisters is bound to be much greater than its mere numbers would justify. No parliamentary elections are to take place in the liberated countries before the end of hostilities. The process which gives an equal vote to the active resister and to the passive citizen and puts them both on an equal political footing has thus been deferred. Meanwhile, political life is largely an affair of the townspeople, and of the active minorities among the townspeople. The countryside and the large mass of citizens in the towns remain silent and passive spectators in the background. It is possible—perhaps even probable—that there is a great gap between them and the active groups. But for the moment all is guesswork. Democracy is trying to function without its basic sanction in a clearly ascertained public will. The Governments are being accused of being dictators. But in present circumstances, no Government can have an electoral basis, and if the critics succeeded to office they would have even less claims to legitimacy than the present Ministers.

This does not, of course, mean that the Governments

have no need to seek public support. On the contrary, their obvious duty is to keep in the closest possible touch with the active minority of resisters who have kept alive the spirit of the nation, but without forgetting their wider duty to act as trustees for the great inarticulate mass of their peoples. The two duties are not always compatible with each other, and most of the recent trouble has arisen when one of them has had to be subordinated to the other. The Belgian Government has almost certainly estranged itself too strongly from the Resistance. The Greek Government, which has tried hard to march in step with the resisters, is in trouble with the Right, which claims to speak for the peaceful citizen.

And over all the turmoil presides the Allied commander. His first duty is to the fighting armies. But his second duty is to regard himself as the chief guardian of democracy in the liberated countries. The first duty makes it imperative for him to secure law and order—that is, to support the constituted Government, whatever the imperfections of its constitution. The second duty points in the same direction at least as far as the stage where all private armies are disarmed, for nothing is more certainly fatal to the prospects of democracy than the private possession of arms. But the Allied commander's duty does not stop there; he needs not only a Government but a popular Government; and he should use all his influence in this direction. He can rightly distinguish between constituted authority and armed dissent; indeed, he must do so. But it would be a calamity if he gave the impression that some parties were the Allies' friends and some their enemies. In particular, irreparable harm would be done if it got about that the Allies disapproved of the Resistance movements—disapproved of them, that is to say, not only as armed bands which might disturb the peace but also as parties which might give to their countries' politics a twist that would be unwelcome in London and in Washington. The only valid criticism of the action that General Erskine has taken in a very difficult situation in Belgium is that he has not made this distinction sufficiently clear, and much good might be done if an opportunity were taken to state publicly that the British Government, for its part, will think no less highly of a Government that contains Communist members than of any other. The next few months will be very hard and very unpleasant, and the trustee must expect far more kicks than ha'pence. He may have to be severe and hard-hearted. But time will bring forgiveness for these harsh necessities if only he can establish and maintain confidence in his impartiality.

International Cartels

THE sustained and violent American campaign against international cartels has now reached the point at which the word "cartel" has become an indiscriminate imprecation. The campaign has its roots, of course, in the familiar American trust-busting tradition, but this particular variant has romantic features all of its own. The wicked cartelist has taken the place of the wicked arms manufacturer in popular demonology. Any attitude that is unpopular, whether it be the British stand on civil aviation, or opposition to the dismantling of German heavy industry, is indiscriminately attacked as the handiwork of the cartel interests.

The subject of international cartels, and of international economic organisations in general, obviously takes its place on the agenda for discussion in the reconstruction period. But the prejudicial atmosphere that has been created does not make a cool and unimpassioned treatment of the subject any easier. This is the more true since the American attitude itself is far from consistent. Individual Americans, as producers, are by no means proof against the temptations offered by combinations in restraint of international trade. And where the national interest of the United States as a whole is that of a high-cost pro-

ducer, as in cotton and wheat, American Governmental policy is in the forefront in establishing organisations of precisely the type condemned, in general terms, as cartels.

Another of the difficulties of the subject is that no one seems to be very sure what a cartel is. The word is of German origin—which perhaps explains why it has been selected for propaganda use—and had, at the beginning, a restricted and particular meaning. It was applied to an association of manufacturers who, while maintaining their separate existence, agreed to accept, and work to, quotas of production and division of markets. But the word is used, in current discussion, in much wider meanings and has become synonymous with almost any form of international arrangement to control production, sales or markets.

In this wider meaning, there can be said to be three main types of international cartel.

First, there are the agreements among primary producers designed to regulate the volume of supplies to world markets by production or export control, or both, as a means of preventing excessive and socially destructive fluctuations in prices. Sometimes, as in tin, control is supplemented by buffer stocks or, as in the first rubber

agreement, additions to productive capacity may be restricted. Where there is a multiplicity of producers—as in tin, rubber, sugar and wheat—these schemes are generally sponsored and supervised by governments. Where the number of producers is relatively small—as in copper—they have been operated privately.

Secondly, other cartels go one stage further in that they use price fixing as a means of making sure of profitable operation. Often they even go so far as to divide the world into spheres of influence. Among primary products, aluminium, mercury, oil and nitrate come into this category; among manufactures, the international steel cartel, with its various appendages, is a stock example; in transport, the liner conferences and the tanker pool have used price-fixing devices.

Thirdly, there is the multitude of—usually secret—cartel arrangements among producers of patented goods. Apart from the usual devices of control over capacity, supplies, prices and markets, owners of patents enjoy direct control over the location of production. If there are rivals in other countries—as in chemicals—they can eliminate competition by entering into agreements about the location of production, the sharing of markets and profits and the fixing of prices.

These three broad categories could, of course, be subdivided into dozens of specialised types. The detailed methods used vary with conditions of supply and demand, with the degree of monopoly power they wield and with the policy of the personalities who run them. Fortunately, very few have ever been completely watertight or have remained so for very long.

*

International cartels, of any of these types, have one outstanding difference from domestic cartels. Their activities may have political and strategic consequences, as well as purely economic. Indeed, economic consequences, when they cross state frontiers, have a habit of becoming political. An attempt to mulct consumers for the benefit of producers is bad enough in any case; but when the producers are in one sovereign state and the consumers in another, there may be serious political repercussions. The influence that a cartel can exert on the location of an industry, by discouraging or forbidding new entrants, is a far more serious matter when it affects the relative industrial strengths of nations. This is the strongest reason for saying that Governments must necessarily concern themselves with the activities of international cartels.

But with the large exception of these political aspects of the matter, the case for and against international cartels is, in the main, the case for and against domestic combinations in restraint of trade. They are a distinct species, but still members of the same genus. The general attitude to be taken to cartels, both internal and international, should be the same—again with reservation of the special political aspects of the latter. And that general attitude cannot be other than one of suspicion. Anything which acts, or might act, as a restraint on production is inherently suspect, since it prevents wealth from coming into existence. And any restraint which is exercised by the producers is doubly suspect, since their interest is the opposite of the community's. If the answer has to be black or white, then all cartels are black.

But it is no more possible in the international sphere than in the domestic to argue in terms of black and white. To condemn cartels is one thing, but to condemn all forms of economic organisation that include the exercise of purposive direction over production is an entirely different thing. In the international sphere, as in the domestic, it is necessary to distinguish and to define. This may not be much to the taste of the propagandist, who likes sweeping judgments, but it is necessary. In domestic matters it is now all but universally recognised that there are legitimate cases for the exercise of some immediate restraint in order to secure wider objectives. Similarly, nobody would argue—and certainly no Government would contend—that international trade must never, in any circumstances, be quantitatively controlled. A sweeping condemnation is not a practical attitude. It is necessary

to attempt the much more difficult task of distinguishing cases.

In a purely domestic context, the questions to be asked of any proposed restraint of trade are "Will it, in the long run, increase real national income?" and "Even if not, will it avoid an amount of social and political trouble that is worth the economic cost?" International cartels, and any other form of international organisation of production and trade, need to be tested by exactly the same questions, substituting only the concept of "real world income" for real national income. Judged by this test, there are three main sets of circumstances in which some restraint is justified.

The first is to prevent excessive fluctuations of the prices of primary materials. It is hardly necessary to argue either the social damage done by these fluctuations in the producing countries, or the economic damage they do in stimulating over-investment at some times and under-maintenance at others. Real world income, not to mention world social welfare, would unquestionably be enhanced if raw material prices, without being higher on the average, could be stabilised.

The second leading case is at the other end of the economic scale, in industries which require a very heavy investment of fixed capital. In these industries, since the prime cost of production is so far below the total cost (including overheads), there is always the possibility of "weak selling" and the consequent consumption of capital. The community loses in the end, when it finds itself with a derelict industry on its hands and faced with the necessity of very heavy expenditure for rehabilitation. Without some assurance of stability, investment will not be undertaken, and since a steady flow of investment is the chief prescription for a rising world income, as for a rising national income, anything that will ensure stability is in the common interest. Here again, there is a case for restraint and for the fixing of minimum prices, provided that they do not, on the average, lead to excessive profits.

Thirdly, there is the case of an industry or activity where one nation, through reasons that may be historical rather than economic, enjoys a considerable advantage in cheapness or efficiency of production, but where other nations, for political reasons, insist on retaining their share of the business. Civil aviation is a case that is very much in point. Some form of international regulation is usually preferable to subsidy, wars or Navigation Acts.

*

There may be other equally legitimate cases, but these will serve to make the point that it would be foolish to ban all forms of organisation, even if they exercise some immediate restraint over trade. But there are those who would concede this argument, but would still maintain that, where there is a case for restraint, it should be done by Governments. Private international cartels, they say, are still to be condemned.

This is a powerful argument, for which a great deal of sympathy will be felt. But there are two reasons for doubting whether it can be sustained. The first is that the machinery of Government is not equipped to do the job. Even in countries like Great Britain, it is necessary, in normal times, to go slow in piling tasks of economic organisation on to a relatively small Governmental machine. Other countries are less well equipped (and less honestly served). Secondly, there is no reason to suppose that Government-sponsored international cartels would be any better than private ones. Governments are often interested parties, or can be influenced by interested parties, and Government-sponsored cartels are among the choicest specimens in the rogues' gallery of international economics.

Nevertheless, it would obviously be impossible to leave the private cartel-monger unhampered. Because some forms of restraint are justifiable, it does not follow that all instances are excusable, or even that all those who sail under a legitimate flag are wholly innocent of piracy. There is a plain necessity for some public supervision. Publicity is the first requirement, and the minimum precaution that a country should take is to provide that the terms of any cartel, or similar, arrangement entered into

by its nationals with the nationals of another country should be published, exception being made only where proof can be brought that damage to the public interest, or gross individual harm, would be caused by publicity.

But publicity by itself is hardly enough. For domestic restraints of trade, *The Economist* has, on more than one occasion, suggested the passage of a declaratory Act, re-asserting that restrictive practices—specifically the fixing of minimum prices or maximum production quotas, the division of markets, the limitation of entry to a trade or any combined action to destroy productive capacity—are contrary to the law, but providing for the issue, upon proof, of licences to commit any of these acts. Before any licence was issued, the licensing authority would be required to satisfy itself not merely that the interests of the consumer were fully protected, but that no particular class of consumers was likely to be prejudiced. Provisions of this sort would obviously cover the international cartel. Similarly, the way to deal with the restriction of trade, both domestic and international, through the abuse of patent rights is through a general revision of domestic patent laws. The approach to the international problem must be through the domestic.

But this would hardly meet the full case of the critics, for a cartel might be licensed by all the produc-

ing countries and yet be against the interest of the world community. Yet it is difficult to see what, as a practical matter, could be done to secure a uniform policy, because of the obstruction provided, as in so many other directions, by national sovereignty. The nations might be prepared to agree to impose obligations of disclosure on their nationals, and to exchange the information disclosed. They might perhaps agree to the constitution of an international board of review which would express opinions on the facts disclosed. But it is highly unlikely that any of them would be willing to give any such body power to enforce its decisions. There would be all the usual resistances of national pride and jealousy. Even beyond these, there would be the difficulty that the nations have no agreed policy on the whole subject. It is unlikely, as Mr Milo Perkins has recently pointed out, that the United States will be able to impose the Sherman Act on other countries. And, in the present temper of American opinion, it is even less likely that other countries will be able to convert the United States to the more discriminating view contained, for example, in the resolution passed, at Sir Clive Ballieu's motion, by the recent International Business Conference. In all the circumstances, it is probable that an exchange of information is the most that can at present be achieved, and that will seem very little to the extremists in Washington.

Armchair Cricket

MR BERNARD SHAW once said that since history repeats itself and the unexpected always happens, man must be quite incapable of profiting by experience. The paradox holds enough of truth to serve as a maxim for these troubled times. Until recently there seemed to be a real danger that the lessons of the last war would lie unheeded; and that peace would find Britain totally unprepared for the struggles ahead. When the men came home from the war of 1914-1918 it was to an England that was wholly deceived by the subtleties of Warwick Armstrong—an England scattered like chaff before the whirlwind deliveries of Gregory and Macdonald. If the indignities of that dreadful aftermath are not to be repeated the credit will be due to a handful of zealots whose selfless exertions have kept the flame alight through the darkest hours.

These men, some of them at least, gathered on Tuesday under the auspices of the Royal Statistical Society to hear two papers dealing with the statistical analysis of cricket scores. Not all who heard could understand. The many famous cricketers present were, no doubt, mentally in the pavilion—Sir Pelham Warner confessed as much—but one's deepest sympathies were reserved for several distinguished foreign statisticians who, for once, were completely out of their depth. Have so many brows been puckered at any previous meeting of the society?

Sir William Elderton's paper was entitled "Cricket Scores and Some Skew Correlation Distributions." The statistician has been described unworthily as one who proceeds from an unwarranted assumption to a foregone conclusion. There was nothing unwarranted in this paper and only the most tentative and academic of conclusions were reached. But Sir William Elderton is neither a Cardus nor a Selincourt, and his discourse, while preserving the authentic atmosphere of the game, suggested a bad light and a wicket of shocking difficulty.

By contrast Mr George H. Wood's paper seemed all sunlight and green grass—to the mere cricketer. He showed that, as a general rule, the scores of individual players tend to obey the law of geometrical progression. Cricketers have suspected something of the sort for many years even when their efforts have been more geometrical than progressive. But the GP is not perfect and every cricketer would agree wholeheartedly with the results of Mr Wood's careful analysis (1) "that all (batsmen) failed to score more frequently than their common ratio required" and (2) "that all played too many innings of 1 to 4 runs." This paper was a bit of an all-rounder; it contained something for everybody. It revealed the many

traps that await the unwary sporting journalist. For example, it would be asking for trouble to write "Tunnicliffe and Warner in 1907 were wonderfully consistent" when every statistician worth his salt knows that they were 21 per cent and 17 per cent inconsistent respectively.

At least one important lesson can be drawn from these papers—that the average club cricketer is in urgent need of statistical net-practice. It is not enough for the batsman to see the ball clearly, to have the measure of his assailant and to be on good terms with the umpire—he must adjust his play to his statistical background. In the past many good cricketers have failed because they have omitted to master the theory of probability. The odds against any batsman making three ducks in a row are very great, and yet . . .

The papers should not, however, be regarded in isolation but as a sequel to developments in the technique of scoring that were apparent before the war and as a foretaste perhaps, of what may be expected after it. Cricket has always been the statistician's delight and every cricket fan with his score-card is something of a statistician. Already the text-books chronicle such records as:

Fifty runs in both innings of a match—with a bruised hand.

Most "wides" bowled in the first over after lunch.

Most catches missed in one innings through some faulty positioning by the sun.

What then does the future hold? One can imagine the press account of a match played in 1954. "The England innings was opened, of course, by X and Y to the bowling of A and B. X, who was generally expected to score either 67 or 81, faced the bowling and took a single off B's first ball—thus refuting Hackenstein's Theory of Cyclic Improbability. Y, who has been 18 per cent inconsistent throughout the season, looked supremely confident and drove his first ball to the Tavern rails. With his score at 10, however, he was well caught at extra-cover (frequency .9961, Morr's Scale). The spectators applauded a very fine prediction. Z, who followed, was somewhat abstract and his movements lacked correlation. It was no surprise to the statisticians when he was clean bowled by a long hop with the score at 38. (See page 2 for the Wisden Sensitive Second-Wicket Index.) At lunch . . ."

But enough of levity. The statisticians are seeking to improve their status. However strong their case may be it will be all the stronger if their services to cricket are taken into account. The MCC might attend to this—it is the least they can do.

NOTES OF THE WEEK

Last Lap

The King's Speech at the opening of a session whose length cannot be forecast is necessarily a tentative document. But the Gracious Speech delivered on Wednesday was even vaguer than it need have been. It did, indeed, mention the possibility of legislation on a long list of subjects: health services, national insurance, industrial injury insurance, family allowances, national water policy, electoral reform, the resumption of local elections, export credits, the extension of colonial development, the capital expenditure of local authorities and the adjustment of their areas. But many of these are to be proceeded with only "as opportunity serves," and other important subjects, notably full employment and industrial location, are contained in the paragraphs which do not promise legislation. There is a tendency to attack the Government because it does not now promise to do more in this Parliament's last session than can be squeezed through the time-table and because the Prime Minister persists in talking of a General Election in less than twelve months time—which would mean an abbreviated session. But this is not the real point of attack. Time is now very short, and there is a real dilemma. Though every effort should be made to press on with agreed legislation, it is far more important to have a new Parliament at the earliest possible moment, since, the parties having now agreed to part, it is obvious that no progress can be made with controversial issues until the election is over. The real criticism is that so much has been left for the last session. Many fewer reconstruction measures have been placed on the Statute Book in the fifth year of this war than in the fourth year of the last. The Government's culpable delay lies not in the future, when they will clearly be racing against the time-table, but in the past, when they obstinately charged with lack of patriotism all those who gave warning that precisely the present dilemma would certainly arise.

The Polish Crisis

The resignation of M. Mikolajczyk, the Polish Prime Minister, marks the beginning of the most difficult and dangerous phase in Russo-Polish relations. Before he resigned, M. Mikolajczyk had sounded both the British and American Governments on their attitude to the Russian demands. Mr Churchill, in his statements to the House of Commons, left no doubt that the British Government took a favourable view of the Russian proposal that Poland's new frontier in the east should be based roughly on the Curzon line. Mr Churchill, it is believed, also approves the suggestion that Poland's new frontier in the west should be on the Oder. Until recently it was not quite clear whether the United States Government also favoured a settlement on these lines. However, Mr Harriman, the American Ambassador to Moscow, who arrived in London last week, made it fairly clear that the British and American views on the issue were on the whole agreed. The Polish Premier then presented the leaders of the other Polish parties with the draft of a reply to Moscow which he hoped would be acceptable to all the Allied powers and would help to break the protracted diplomatic and political deadlock. M. Mikolajczyk's proposals were rejected by his colleagues; and so the Premier, finding that his views did not command the support of a majority in his Government, resigned. M. Mikolajczyk's attitude has been unanimously supported by the Peasant Party, which decided not to join any Government that would be committed to a policy opposed to agreement between Russia and Poland. At the time of writing, it is reported that the Socialist, M. Arciszewski has, in spite of strong opposition in his own party, formed a Government in which the Peasant Party does not participate and which is based on an artificial coalition of the Socialists, or the anti-Russian tendency among the Socialists, and of the extreme Right. It is doubtful whether such a coalition will be capable of asserting itself against the Lublin Committee of Liberation. The controversy between the Government and the Committee may easily become a conflict between two minority factions of which neither really represents the broad mass of the Polish people.

Allied Responsibilities

M. Mikolajczyk's resignation may be interpreted as evidence that the policy of a compromise between Poland and Russia has failed. Should this interpretation prove to be correct, then each of the Great Allied Powers would bear its share of responsibility for this tragic outcome. M. Mikolajczyk's willingness to make concessions and to come to terms with Russia has so far not met with any real response or encouragement from Moscow. It would have been in the Russian interest, if Russia really intends to respect Poland's independence, to strengthen the hands of the conciliatory Polish politicians by meeting them part way, if not half way. The essence of any policy of compromise is give and take. So far the Russians have proposed to give the Poles the dubious benefits of a frontier on the Oder without giving them any convincing assurance that in Poland proper they will be the masters of their own fate. The Poles have been told that they will be given Stettin, but they do not know yet whether Warsaw will really be theirs. This explains the striking growth of anti-Russian sentiment among the Poles. British—and even more so, American—policies are to be blamed for their glaring inconsistencies. The Poles were left for far too long to believe that they would find support in Allied countries for intransigence towards Russia; and that the Western Allies would be able and willing to intervene actively in eastern European affairs. This period of illusion led to a correspondingly more painful disillusion. The Western Allies have now swung over to the other extreme and has backed the Russian viewpoint far beyond the limits of reason. If British and American diplomacy could do little or nothing to help the Poles, it ought at least to have refrained first of all from encouraging them to get themselves into a hopeless position, and then later from endorsing the Russian policy when it became manifestly unjust and wrong. Past mistakes do not absolve the Allied Governments from future responsibilities. The possibilities of a just and workable agreement between Russia and Poland ought to be explored anew. They will not be found if a broadly based Polish Government is not re-appointed; and they will not be exploited unless the policies of the British and American Governments are more balanced, realistic and just than they have been hitherto.

Chicago Bargaining

The debate on the blank spaces left in the draft convention on civil aviation continues at Chicago. How it is progressing is so far unknown, since discussions are being carried on in private. It is clear, however, that the conference has already achieved more than could have been expected, and the convention, even if the blanks are not filled in, will cover a wide range of technical matters and many of the less contentious items on the economic side. The points that are still in dispute are the closely connected ones of the regulation of traffic by quota and of the so-called "fifth freedom of the air" (that is, the right of aircraft flying on world-wide routes to pick up traffic en route—for example, the right of an American aircraft flying between New York and Moscow to carry traffic between London and Paris). It has been very difficult for observers in London to find out what has been happening on these issues. Like other recent conferences in America, it has not been fully reported and has been surrounded by a cloud of prejudicial nonsense created by the American reporters, who, on this occasion, have been particularly childish in reporting everything as a "victory" for their own side. The truth is that the two extreme positions, those of the United States and the United Kingdom, have been steadily approaching each other and there have been compromises on both sides. The original American proposal, which was for an international organisation

having power in technical matters and having consultative functions in economic matters,

has been widely departed from, and the American delegation has accepted the principle of quotas. (This much is evident from the discussion on the interpretation of the "escalator clause," which governs the methods by which quotas can be increased in the event of an increase in

traffic carried; if there were to be no quotas, there would be no escalator clause.) On the other hand, the British delegates, by accepting the principle of an escalator clause, have equally departed from their original position and have made a concession to the view that those (i.e. the Americans) who can get the traffic should be allowed to carry it.

On these lines, it would appear, an agreement could have been reached some time ago. But the question of the "fifth freedom" was then tossed into the ring—it would appear, by the Americans and (it would also appear) contrary to their original proposals. What this "freedom" means in substance is that if the United States could, in bilateral negotiation, persuade a country at the other end of the earth—let us say Siam—to permit an American airline to terminate in its territory, then it would have the right, not merely to cross other countries to get there ("the right of innocent passage"), not merely, on the way there, to carry passengers between New York and London, or between New York and Paris, but also between London and Paris. Clearly, by this means, American airlines, with their enormous initial advantages, would be able to scoop the pool. The British attitude was not (as it well might have been) to refuse this "fifth freedom" completely, but to say that it could only be permitted if it were governed by the quota arrangements—that is to say, the number of flights made by American airlines from New York to Bangkok would be governed by the amount of traffic arising from New York to Bangkok, and it would only be on these flights that intermediate traffic could be carried. What is more, since Orient Express services would be provided on a journey more suited to a local train, higher fares should be charged for local traffic carried on through flights. These proposals the Americans have rejected, claiming that their quota for intermediate stages should be determined by the traffic they can attract on these intermediate stages, irrespective of the amount of through traffic carried. If this were granted, the "through" character of the flights would be merely a farcical formality. There, apparently, the matter rests at the moment. The emergence of the "fifth freedom" explains what was so difficult to understand in the early stages of the conference—namely, why the Americans, who harp so much on "freedom," also insisted on bilateral negotiations, which are *prima facie* the most restrictive system. It is now clear that they had no intention of engaging in bilateral negotiations with other countries who possess civil aviation of their own, since that would inevitably have meant a division of traffic with those countries. The American intention was to limit their bilateral negotiations to securing terminal points—plenty of countries without flying ambitions would be ready to oblige—and then to claim from the intermediate countries, in virtue of these terminal agreements and the "fifth freedom," all that they wanted. This would seem to be another instance in which the fine moral principles proclaimed in Washington turn out to have very special definitions, tailored to fit self-interest.

British Air Policy

The British attitude to the whole problem stands halfway between that of the American and the Australasian delegates. While unwilling to see a complete monopoly of air transport in the hands of an international authority, as Australia and New Zealand, backed by France, have advocated, Britain is supported by almost all European countries in demanding some regulation of unbridled American competition. American airlines have clearly gained a relative benefit from the war, while the development of British and European air transport has necessarily been hampered and interrupted by the interference of the war, both in the production of planes and in the building-up of routes and services. The whole wrangle is bound up with the benefits accruing to American aviation from late participation in a war carried on at a greater distance from its home territory. At the same time, the liberated European countries are hesitant to oppose American ambitions in the air too strongly so long as they are primarily dependent for their material reconstruction on American relief and lend-lease. The smaller nations have secured a gradual expansion of the national representatives on the board of the organisation to 21 members. But if the organisation is to be powerless to protect them from intense American competition in Europe and elsewhere, this concession will not be of much value to them. The feeling against the British

attitude in America is, not unnaturally, very strong. Lord Swinton has done much to make it clear that Britain is not alone in its "obstruction," but the belief that it is Britain that is hampering the progress of aviation is still not balanced by any clear appreciation of the points at issue. In effect it is the United States, not Britain, which, in its bid for a mastery of the air comparable to British mastery of the sea in the past, is running counter to the hopes of all for "a fair chance to operate international lines."

Sir William Beveridge on Tour

Sir William Beveridge's "Midlothian Campaign" has raised new hopes of a Liberal revival. The policy put forward at Newcastle-upon-Tyne and Oxford, though stronger in its principles than in its practical proposals, is one that should command considerable support. At Oxford, on Monday, Sir William's main task was to show that positive planning by the state is not incompatible with the freedom of the citizen. He condemned the attitude of mind that regards all liberties as equally important:

The essence of Liberalism is to distinguish between essential liberties, to be preserved at all costs, and lesser liberties, which should be preserved only so far as they are consistent with social justice and social progress.

This is a most useful corrective to the rival views of those individualists and collectivists who contend either that all controls are odious or that the degree of state control is a measure of social and economic progress. The Liberal party has discovered a worthy champion and the champion is working energetically to formulate and propagate a truly liberal creed. If Liberalism is regarded at the polls as no more than the policy of a centre party with a bias to the left and a programme of compromises it has very little chance of success. The Liberals should now define their practical aims and methods and should show clearly, and repeatedly, where their tenets differ from those of Labour. The recent history of the party is such that it will not do to leave the public to draw its own distinctions and conclusions.

Parliament's Watchdog

The Select Committee on National Expenditure is becoming a public institution, and its reports—though sometimes too readily regarded as omniscient and conclusive—have made a valuable contribution to the efficient and economic prosecution of the war. It may therefore come as something of a shock to the general public to read in the Committee's latest report that the present Select Committee on National Expenditure is a purely *ad hoc* body, appointed year by year, with terms of reference limited to the examination of public expenditure on purposes "directly connected with the war." This limitation has not, it is true, prevented the Select Committee from covering a very wide range of subjects, as is shown from the catalogue of its activities since 1939; it must, however, limit its usefulness in the forthcoming transition period, which will call for careful supervision of public expenditure. No such limitation was imposed on the Select Committee of 1917-20, and the Committee's suggestion that it should be re-appointed with its terms of reference amended is obviously sensible. Equally sensible, though it raises far wider issues, is the proposal that Parliament should appoint a special Select Committee to enquire into the whole machinery for Parliamentary control of expenditure. The Committee points out that

the House has been successful in setting up machinery capable of securing that money is spent only upon the objects for which it was voted, but has not succeeded in devising satisfactory permanent machinery to secure due economy in that expenditure.

It draws attention to certain snags in the present procedure for supervising public expenditure. One is the form in which estimates are presented to the House—the "penny notebook" system—which makes it impossible to determine what the real total expenditure has been or would be on any particular object. Another is the danger of overlapping with the Public Accounts Committee, whose duties are more in the nature of a post-mortem, and which is mainly concerned with seeing that the actual expenditure of departments corresponds to the estimates approved by Parliament. It is clearly desirable to enlist Members of Parliament for the all-important service of scrutinising the nation's expenditure, yet there are very real disadvantages

in creating permanent standing committees, which are apt to produce a privileged caste of legislators. Whatever final solution may be reached, a full report on the mechanics of Parliamentary control of expenditure must be the first step.

Trade Union International

One of the most important decisions announced at the recent meeting of the Trades Union Congress was the calling of the world trade union conference early in February, 1945. The Conference was originally to have been held in June, but had been postponed because of the war situation. Next week the Conference's Preparatory Commission, consisting of representatives of the British TUC, the Soviet Trade Unions and the American Congress of Industrial Organisations, meets in London to prepare the agenda and arrange the administrative details. The Commission will be faced with a more difficult task than its terms of reference would suggest. The position of the British representatives is particularly delicate, for, as always, they will be expected to hold the balance. The TUC has always maintained close links with the American Federation of Labour—there is a joint trade union committee and there are mutual exchanges of "fraternal delegates" at annual conferences. It has no such links with the CIO. The Federation has now reaffirmed its intention not to attend the world conference because the invitation has been accepted by the CIO and by the Soviet trade unions, which they do not consider "free" trade unions. What the British must decide, now that force of circumstances has flung them into the arms of the CIO, is what their future relationship with the AFL can be. Macheath's dilemma was child's play compared with that of Sir Walter Citrine. This problem leads to the wider problem of the future world trade union organisation. One of the declared objects of the February conference is to reconstruct the trade union international. But what is to be its basis? Mr Sidney Hillman, fresh from his successes in the Presidential campaign, is putting forward proposals for a World Political Action Committee. The Soviet point of view, sharply expressed in an article in *War and the Working Classes*, is that there can be no question of a resurrection of the Amsterdam International, which excluded the Russians and the CIO and was dominated, until 1933, by the German unions. This International, however, is far from being dead; it will be represented at the conference and most of the European movements still acknowledge it. The international trade union conference, it would seem, will call for as much diplomacy as any inter-Governmental conferences.

Visit to Holland

More than four-fifths of the Dutch population is still under German rule, and the liberated provinces of Limburg, Brabant and Zeeland are an operational zone. The liberation of Holland is thus in its first stages, and at the moment, even in the liberated provinces, Shaeff's authority cannot be questioned. The local administration has been put into the hands of Military Commissions nominated by the Dutch Government in London. Economic activities are almost at a standstill, and workers in the coalmines and factories of Limburg province are virtually without employment, although they are kept on the payroll. The food situation and the punishment of collaborators seem to be the first concern of the section of the Dutch people which has been freed. But they have suddenly begun to take an interest in politics as well, and there is no doubt that their ideas do not coincide with the Government's plans for the political reconstruction of Holland. The Press, both old and new, in the liberated provinces, which are predominantly Catholic, is emphatic that something new should be built in national policy, some structure of a united Holland in which professional politicians and party interests will no longer have any place. The three different trade unions, the Free, the Catholic and the Christian unions, already appear to have achieved some unification of their policy. The newspapers are unanimous in demanding swift and just punishment for collaborators. Both workers and management of the Eindhoven factories even staged a short strike to demonstrate against the lenient treatment of collaborators interned in one particular camp. This popular dissatisfaction seems to have prompted Professor Gerbrandy and some of his colleagues to visit Holland. The Prime Minister stated that he intended to get first-hand information about the situation

and to solve the problems of food distribution, of the purge and of the organisation of a new Dutch army on Dutch soil. The Premier himself will soon return to London, but some of his Ministers—notably the Minister of Justice, who is also head of the police, and the Minister of War will stay in Holland and will doubtless try to establish their authority as Ministers of the legitimate government. It is thus not only a visit for information purposes. The Dutch Government has clearly found it necessary to back up the authority of the Military Commissioners, who in some places are alleged to have maintained collaborators in important positions. As long as the liberated provinces remain an operational zone open conflicts are hardly likely, but the differences between the Government and the people are large enough to foster discontent.

Canada and Conscription

The Canadian political crisis over the application of conscription for overseas service is still at its height. Feeling is running high on both sides. The advocates of conscription, who appear to be in the majority, are making the most of the fact that the supply of adequate drafts for the Canadian Army is now virtually impossible by voluntary means. But in Quebec resistance to conscription is adamant and French Canadian troops stationed in British Columbia have reached a state of insubordination officially described as mutiny. In the midst of these passions, Mr Mackenzie King has not abandoned the attempt to steer a middle course. An Order in Council has been passed authorising the conscription of 16,000 men, but this has not quieted the storm, since Quebec is enraged at the principle, and the critics complain about its insignificant application. Having lost one Minister, Colonel Ralston, in protest against the refusal to conscribe, the Prime Minister has now lost another Minister, Mr Power, in protest against the decision to conscribe. It is impossible not to have sympathy with Mr Mackenzie King's objects. It will really make very little difference to the course of the war, or to the magnitude of Canada's part in it, whether a handful of men are conscribed or not, while, on the other hand, the damage done to the relations between French-speaking and English-speaking Canadians might disturb the unity of the Dominion for decades to come. The difficulty is that the course that Mr Mackenzie King has chosen to follow in evading the issue has involved so much equivocation and ambiguity, so little candour and so much misleading, that he has destroyed his own moral authority and is now, it would appear, not fully trusted by either side. His policy has been to appear to concede the principle of conscription without in fact applying it. He did this when he asked the Canadian people, in a special plebiscite, to give him powers to impose conscription—and having got the powers, refused to use them. It is believed that the new Order in Council is the same thing on a smaller scale, or at least that it will not be applied to any citizen of Quebec. Had Mr Mackenzie King been willing, earlier in the war, to widen his Government to a coalition basis, he would not now be open to the imputation of putting his party's interest before the country's. The imputation is the more unfair, since his present course bids fair to achieve the exact opposite. He may succeed in pre-

venting an open breach between Quebec and the rest of the Dominion—which is certainly the patriotic thing to do—but the Liberal Party's chances at next year's General Election, poor before this crisis arose, are now much worse.

Change of Government in Persia

The new Persian Government, headed by M. Bayatt, presented itself to the Diet in Teheran last Sunday. The former Prime Minister, M. Saed, had resigned in order that the tension between Russia and Persia, which had followed his refusal to accept the Russian demand for oil concessions, should not be aggravated. It does not seem likely that the new Government will be much more amenable on this point, but it has started in office with some friendly gestures towards Russia, and some of the most outspoken anti-Russian newspapers have been banned. The Russian attitude towards M. Bayatt's Government has not yet been clarified. At first, M. Bayatt was strongly criticised, but, more recently, the Russians have adopted an attitude of wait and see. Meanwhile, the situation inside Persia is still troubled. Russian propaganda is hard at work through all sorts of channels, from the People's Party and the Societies of Friendship with the Soviet Union to the Societies of Moslems which were recently founded under Russian auspices. Resolutions and petitions demanding the granting of oil concessions to Russia continue to pour into Teheran. Some Persian newspapers, however, claim that people in northern Persia have been forced by Russian soldiers to sign those petitions, and that those who refused have been deported by the Russians. Resentment against Russian interference has been voiced fairly widely, and its expression has culminated in the demand that the head of the Soviet Mission and Vice-Commissar of Foreign Affairs, M. Kavtaradze, who is blamed for most of the trouble, should leave Persia. The next week or two will show whether M. Bayatt's Government will be more fortunate in improving Russo-Persian relations than its predecessor.

* * *

FBI and Bretton Woods

The Federation of British Industries has issued an interesting report on the Bretton Woods Agreements. The gist of it is that since "an abundant and prosperous international trade is of vital importance to the United Kingdom" and since a regime of free interconvertibility of currencies is obviously the ideal, "the successful functioning of the Monetary Fund and the International Bank would make an important contribution to Britain's prosperity." But the operative word is "successful" and the FBI is not hopeful of success until progress has been made in commercial policy, in the "orderly marketing of staple commodities at fair prices," in measures to alleviate the problems of reconversion, and in "an international understanding to maintain high levels of employment and rising standards of living." It is accordingly recommended that the full application of the Bretton Woods agreements should not come into effect until a further conference has been held at the end of the interim period to review the progress made in these directions. This is the view that is held by a very large number of people, perhaps the majority, in this country. "Bretton Woods will work if the nations, America in the first place, balance their trading accounts and maintain full employment. Let us wait and see whether those conditions are observed." It is a temptingly attractive view. But there are two difficulties about it. The first is the familiar difficulty of any interim period. The pressure to finalise, especially when one powerful country has an interest in finalising, will be immense and very difficult to resist. A few easy years would make caution and delay look like recalcitrance. The second is that, if we are to wait for a full test, we may have to wait for much more than three or five years. After the last war, a final verdict could not be passed on the feasibility of the new currency system until 1931, thirteen years after the Armistice. Nevertheless, this middle course may be the only way out of the dilemma into which the country has been allowed to drift. It has disadvantages, but they are probably smaller than those that would attach either to complete acceptance or to outright rejection. In the meantime, while these arguments rage round the Monetary Fund, the International Bank is neglected. The Bank is less controversial than the Fund and more urgently needed. In the Final Act the two are tied together, but if the Bank could be untied and set up separately, great advantage would result.

National Airways in Australia

The Australian Government has put the match to political dynamite with its decision to nationalise interstate airlines. The announcement, made by the Acting Prime Minister, Mr Forde, was quite unexpected. It proposed a statutory authority to take over—by July next year—the assets and staff of the airline companies at a compensation cost of between £2 and £3 million (Australian currency). The Government already own and maintain all airfields, radio and meteorological services, and the extension of public ownership is likened to government operation of railways and broadcasting. Overseas air transport would remain the monopoly of Qantas, the Australian counterpart of BOAC, while the question of airlines operating within state boundaries—mainly small feeder lines—is still under consideration. Mr Forde's announcement, which has naturally caused a storm of protest against "socialisation by a labour caucus" and "arrant political confiscation" from the ranks of the opposition, is an interesting sequel to Mr Curtin's defeat at the August referendum. By a majority of nearly 54 per cent, the electorate then refused the transfer of powers for post-war reconstruction from the states to the Commonwealth Government. Among the list of subjects over which Mr Curtin sought power to legislate was air transport. Consequently, although opposition to the necessary legislation will probably be futile against Mr Curtin's strong Labour majority, the Bill will probably be questioned on constitutional grounds. What the decision of the High Court would be it is impossible to tell, but the Government have apparently taken the plunge fortified by the advice of the Crown Law Department. Whatever the outcome, it will be a test case. If successful, Mr Curtin may be able to put through a social and economic policy which apparently received a severe setback at the time of the referendum. Obviously, he will be able to count on better support if he attacks the opposition of business to "socialisation" and the opposition of Labour to "bureaucratic direction" separately, on different issues, rather than together as in the referendum.

* * *

Tito and Mikhailovitch

The bitter rivalry between Marshal Tito and General Mikhailovitch has now ended with Marshal Tito's complete triumph. General Mikhailovitch has fled to Italy, since he obviously has no hope of being recognised as an ally by the Russian Command in Yugoslavia. At the same time an agreement between the Soviet Government and Dr Subasitch, the Yugoslav Prime Minister, has been announced from Moscow. How far this will result in a real merging of the Government and of Marshal Tito's Committee of Liberation cannot yet be foreseen. It is even less certain whether Marshal Tito and Dr Subasitch between them will win the support of the Serbs, since both can much more confidently speak for the Croats and the Slovenes than for the senior of the three partner-races. Marshal Tito has made an attempt to win over the Serbs by announcing an amnesty to General Mikhailovitch's Chetniks on condition that they give themselves up to his authorities before a specified date. But the implication of the amnesty is that it has been an offence to have served under General Mikhailovitch.

* * *

Coal for the Winter

The Ministry of Fuel appears to be muddling its coal publicity as badly as it has muddled its coal policy. When the coal shortage first became apparent, the economy campaign did achieve considerable savings which, together with warm winters, enabled the Ministry to scramble through to the summer. The Ministry's latest announcement, however, seems to be almost a positive incitement to people not to economise. Just as the very serious position in the coal industry has begun to be recognised by the whole country, the director of supplies at the Ministry states that there will be sufficient coal supplies for industry and domestic consumers during the coming winter. It is quite true that he also said that this will depend on three conditions; but two of those conditions—that enough is produced and not too much consumed—are such truisms, and the third—that transport conditions are reasonably good, which largely depends on the weather—so incalculable that the public will be forgiven if it ignores them and fastens upon his main pronouncement. It would surely have been

wiser, at this stage of the winter and the war, to have emphasised first of all that coal output continues to decline. The consequences of this for military operations ought then to have been frankly stated. This would probably bring the need for fuel economy more sharply home than anything else, for the prospect of a sixth summer of war is more alarming than the unlikely chances of an empty grate.

* * *

Institutions and Homes

The Home Secretary has ordered an inquiry into the provision of remand homes made by the London County Council and into the administration of the homes. In the interest of the children and young persons detained in the homes, the inquiry will be held in private, but the report will be published. The inquiry arises from the criticisms of the LCC made by Mr John Watson, a juvenile court magistrate, but the case before him was only the latest in a series of incidents that have awakened public interest in the fate of children who come before the law. It is, therefore, a pity that the inquiry is to be so limited in its scope. The Home Secretary's new advisory council on the treatment of offenders is, it is true, to give special attention to juvenile delinquency. But it is not only the fate of offending children that needs investigation. It is the fate of all neglected, abandoned, illegitimate and orphaned children, of the children of Mrs. Paneth's "Branch Street" and of "Our Towns," that should be inquired into. In a remarkable correspondence in *The Times* this summer, writer after writer urged the drawbacks of even a well-run institutional life for a child, and the impression was left that all but the exceptionally bad homes are to be preferred to an institution. As a result of the correspondence, the Nuffield Provincial Hospitals Trust has made a grant to the Provisional National Council for Mental Health to undertake a research into the social adaptation of children brought up in institutions. But this again is too limited an inquiry, though it will be valuable to have scientific evidence to confirm or correct personal impressions. It is not enough to prove that institutional life is bad for a child; the alternatives of adoption, boarding out or leaving the child in its own abnormal home life should be considered. A motion, supported by over 200 MPs of all parties, has been tabled in the House of Commons asking for a Commission to inquire into "the provision made by Government Departments, local authorities and charities for children deprived of a normal home life." It is a far-reaching inquiry of this sort that is wanted.

United We Stand

The discomfort of railway travel has been one of the most unpleasant wartime burdens of the civilian population. For five years the passenger's cry has been "United we

stand"—a pathetically pointless if noble watchword since whether united or divided there has been no room to fall. The British railway train, like the British legislature, is bi-cameral; and from time to time both upper chambers, the first-class compartment and the House of Lords, are bitterly attacked by class-conscious critics. The mistake that such reformers make is that they are content to level down when the means of levelling up are at hand awaiting development. But if it is true, as a correspondent of *The Times* has alleged, that first-class accommodation on the railways is subsidised by third-class fares, there would seem to be a case for the abolition of the upper chamber. The subject is clearly a matter for careful inquiry. After the war the public's first demand will be for adequate seating accommodation rather than luxury—and it might be a good idea to resuscitate the defunct second-class as the one and only compartment for this purpose. The needs of those regular long-distance travellers who must work on their journeys might be met by a system of seat reservation. The retention of "First" and "Third" smacks a little of Disraeli's "Two Nations" which is surely a little out of date.

Shorter Notes

The tributes that have been paid, from every quarter, to Mr Churchill on his seventieth birthday leave little more to be said. As a war leader, he has deserved supremely well of the state. As a man, he commands a degree of personal affection that few of the great achieve. It must be enough to say—and the Prime Minister himself will take it as the highest compliment—that somewhere in the shades another Churchill, who also served his country as Captain-General and who also did his best work late in life, must this week be very proud of his descendant.

*

The "five-year settlement" of mining wages is coming unstuck already, since the mineowners are proposing to make the payment of the guaranteed minimum dependent on reasonable diligence by the workers. The Mineworkers' Federation say they reject this entirely. But what alternative proposal have they to meet the now well-established fact that the more that is conceded to the miners the less work they do?

*

The BBC, according to its Director-General, Mr W. J. Haley, is to have three home service programmes after the war. In addition to the existing Home Service, there will be a second programme "capable of regionalisation in the same way as programmes were regionalised before the war," and a third programme whose contents were still being planned, but would "inevitably widen the scope of broadcasting enormously." In addition, there would "eventually" be television. This does not sound like enough variation from the mixture as before to make any difference.

AMERICAN SURVEY

American Notes

Mr Hull's Successor

Ill-health has brought about the resignation of Mr Hull after nearly twelve years in office. He is to be succeeded by Mr Edward Stettinius, who went to the State Department from the Lend-Lease Administration when Mr Sumner Welles retired in September 1943. President Roosevelt's reference to Mr Hull as the "Father of the United Nations" and the hope that Mr Hull may recover to preside at the opening session of that body, do no more than justice to the untiring efforts of the Secretary of State in the cause of international collaboration. The policies of the State Department, under Mr Hull's administration, have not always been popular; and the Secretary did not take kindly to criticism. But on the main issues there has never been any doubt of his single-mindedness, his integrity, and his disinterestedness. His unique place in American politics, where party rancour seldom discriminates, was attested by Governor Dewey's suggestion, during the election campaign, that if he were elected he would seek to retain Mr Hull's

services. His influence on public opinion, and particularly on his old colleagues in the Senate, will be sorely missed in the Administration, which is most vulnerable on the score of its relations with Congress. Early in his period of office, Mr Hull, a last representative of the Southern low-tariff tradition, was responsible for the Reciprocal Trade Treaty programme, with which he attempted to mitigate the rigours of the American tariff. The participation of the United States in a firm system of collective security was the goal to which he devoted his later years. In this Mr Hull's greatest strength has been his realisation that to take the Senate into his confidence, step by step, was the surest means of preventing a repetition of the veto of 1919. To gain this end he has shown an unexpected patience. The discriminating repudiation of isolationists in last month's election is the measure of his success. The new Congress, with which Mr Stettinius will have to work, contains few of the old obstructionists and a host of new and able allies; and a mandate for international co-operation is clear. It is said in the United States that Mr Stettinius' appointment means that President Roosevelt is now free to act as his own Secretary of State. The President, who was returned to office primarily on the issue of foreign policy,

certainly will be no more indifferent to the workings of the State Department than he has been in the past; and the choice of Mr Stettinius no doubt reflects a similarity of outlook. But there is nothing in Mr Stettinius' record to suggest that he will be content to be a cypher.

* * *

The Job Programme

During the election campaign President Roosevelt promised that after the war there would be jobs for 60 million people. Congress already is debating a series of public works measures which are designed primarily to implement that promise. One is a post-war highway programme, to cost the Federal Government an estimated \$100 million. Greater interest is aroused, however, by the proposal to spend approximately \$1 billion on a flood control programme for 23 river basins and for work on 290 river and harbour projects. In the past, rivers and harbour improvements have often had a strong flavour of the pork barrel; and at best they have been piecemeal and unco-ordinated, with the advocates of navigation rights at loggerheads with the advocates of public power development and irrigation. The Tennessee Valley Authority has provided the country with an example of what can be done by integrated planning for the development of the power, soil, navigation and irrigation potentialities of a whole river region. An amendment to the River and Harbour Improvement Bill, providing for the creation of a Missouri Valley Authority, has now been proposed by Senator Langer of North Dakota and Senator Murray of Montana. In 1933, in his original TVA message, Mr Roosevelt said:

If we are successful here, we can march on, step by step, in a like development of other great territorial units within our borders.

Advocates of the use of existing federal agencies will put up a stiff fight against their supersession, but the success of the TVA has been so manifest that this may be the golden opportunity for extending its techniques. Another project which is being re-examined in the light of its effect on employment is the St. Lawrence Seaway. This was to be a joint US-Canadian undertaking, to deepen and dam the 1,900 miles of the St. Lawrence in order to provide cheap power and "maritime coastlines" for the Middle West of both countries. In 1934 the Senate failed to muster the two-thirds majority necessary to ratify the treaty to this effect signed in 1932. Senator Aiken of Vermont is now pressing for reconsideration, and a Senate subcommittee is holding hearings to determine whether the project needs to go through the process of treaty ratification, or whether it might be passed by a simple majority of both Houses in the form of an executive agreement. The acknowledged need for Federal public works to supplement private employment after the war can, if it is imaginatively handled, be made to yield great national benefits.

* * *

Cracks in the Solid South

In the Electoral College this year the Southern states are as solidly Democratic as they have ever been. But the voting in the Southern states suggests that last summer's "revolt" was not as ephemeral as it seemed at first glance. Mr Roosevelt's popular majority in the country as a whole was slightly over 3,000,000 this time, compared with a lead of 5,000,000 over Mr Willkie in 1940. The greatest defections came in the 17 Southern and Border states, where Mr Roosevelt polled 1,400,000 fewer votes than he did four years ago. Alabama cut his majority by 110,000; Arkansas, 58,000; Florida, 64,000; Maryland, 89,000; Mississippi, 69,000; North Carolina, 173,000. In the same states Governor Dewey only ran 238,000 behind Mr Willkie, and in Virginia he polled 145,000 votes to Mr Roosevelt's 235,000. Some Southern votes, of course, were cast in the northern industrial cities, to which Southern workers have migrated. But even allowing for this population shift, it appears that about three-quarters of a million normally Democratic voters failed to turn out for Mr Roosevelt. The decisive Democratic victories were rolled up in 13 cities with populations over 500,000. Mr Roosevelt could, in fact, have won without the electoral vote of a single Southern state. But this is a feat probably impossible for any other Democrat. What is more probable is that a candidate of the sympathies, say, of Mr Wallace, might, in 1948, lose much of the South and with it the election. In Congress, the similarity of interests between the conservative Southern

Democrats and the Republicans on domestic issues has been amply demonstrated. The legacy of bitterness left by the Civil War has ruled out any shift of party allegiance in the South, except in such unusual circumstances as those of 1928. In that year eight Southern states rebelled against Mr Al Smith, the Democratic candidate, because of his Catholicism, his stand against Prohibition, and his Tammany connections. But the Democratic Party, like the old grey mare, "ain't what she used to be." The influence of Labour on the party, which the South has always resented during the Roosevelt Administrations, has been immensely enhanced by the achievements of the Political Action Committee of the Congress of Industrial Organisations. Republican strategists are unlikely to neglect the evidences of disaffection in the South when they plan their campaign for 1948. A realignment of both parties is in the cards.

* * *

Press Paradise

Mr Kent Cooper, general manager of the Associated Press and author of "Barriers Down," is leading a crusade to incorporate a "charter of freedom for news and communications" in the peace settlements. In an article in *Life* he demands freedom of access to news, freedom for agencies to compete or to exchange news, and an end to preferential rates of transmission. Mr Cooper, like most big business executives, experiences a peculiar moral glow in finding that his idea of freedom coincides with his commercial advantage. In his ode to Liberty there is no suggestion that when all barriers are down the huge financial resources of the American agencies might enable them to dominate the world. His desire to prevent another Goebbels from poisoning the wells will be universally applauded, but democracy does not necessarily mean making the whole world safe for the AP. In this, as in other post-war issues—such as civil aviation—commercial practices are habitually confused with such big words as Liberty and the Rights of Man. One of Mr Cooper's happier suggestions is that news correspondents abroad should enjoy diplomatic immunity, without any of its responsibilities. This would turn the Fourth Estate into a king that can do no wrong. The comments of Marshal Stalin and the Generalissimo on the proposition that the war is being waged to secure extra-territorial rights for, say, the *Chicago Tribune* would be worth hearing.

* * *

Military Training

The need for a system of compulsory military training after the war is being kept before the public both by the Services and the President, and it is believed that the Administration will take active steps to secure legislation to this end when the new Congress meets. The stiffening of the opposition underlines the importance of striking while the iron is hot. The most determined resistance is being offered by the Churches, both Catholic and Protestant; and they have been reinforced by a broadside from the National Education Association. Peace-time conscription offends the instinctive anti-militarism of the Protestant Churches, who are convinced that to introduce universal military training is to surrender to the very forces with which America is at war. The Catholics are even more alarmed by what they regard as a threat to the influence of the home and parental control over the young. The Administration is on the strongest ground when it relies upon the Service view that this is a matter of urgent military necessity. This is the argument which will be supported by returning Servicemen. Mr Roosevelt has chosen, however, in a recent press conference, to suggest that national defence is only one of a number of ends which might be served by exacting a year of service to the state from all young people; and that such a scheme would bring a substantial return to the nation in the improved health and training and widened democratic outlook of its young citizens. The President does not seem quite clear, in short, whether this is a case for treatment by Dr Win-the-War or Dr New Deal. By this approach he may hope to disarm anti-militarist sentiment. But it is a tactic likely to be resisted by many who would otherwise feel compelled to assent. It has already been attacked as another New Deal scheme for indoctrinating American youth with the belief in the omnipotent state; and in practice, the most austere scheme would not be immune to the charges of political bias which plagued the old Civilian Conservation Corps.

THE WORLD OVERSEAS

Polish Cross Currents

(By a Polish Correspondent)

POLAND'S attitude towards Russia has always been the central problem in Polish politics. It is generally assumed that the different policies on the question more or less coincide with the accepted divisions between Right and Left. The present crisis in the Polish Government, discussed on page 727, has revealed that this is only partly true. The crisis itself has been caused by the opposition of some Socialist leaders to the policy of conciliation with Russia for which the Peasant Party and its leader M. Mikolajczyk stood. The Right Wing, of which the National Party forms the core, has been divided on the issue. The controversy has cut right across the political divisions between the parties.

Present motives as well as historical traditions explain these cross currents. The Polish Socialist Party has, since its inception, been the party of Polish patriotism, the Party of Independence *par excellence*. As such, it was primarily anti-Russian up to the end of the first World War. By far the largest part of Poland was then under Russian rule; the Socialists saw their chief enemy in the Tsarist Empire, against which they fought with incomparably more bitterness than against the Austrian and German dynasties that ruled over the western Polish lands. At that time Tsardom was regarded as the chief enemy of international Socialism as well. (Significantly enough, it was at a meeting convened to express the sympathy of western Socialists with the Polish insurrection of 1863 that the first Workers' International was founded by Karl Marx.) But the nationalist sentiment in the Polish Socialist Party and the grievance against Russia were strong enough to set barriers of distrust between the Polish Socialist Party and the Russian Socialists. Under the Tsarist Empire, the Polish Socialists used to coalesce with the Left of other oppressed nationalities, the Latvians, the Finns and the Georgians. Together, they dreamed romantically of a wide federation of all these nationalities after their liberation from the Russian yoke.

Their dreams died hard even after the Russian Revolution. They coloured Polish politics in the first years of Poland's independence, when Pilsudski's federalist plans found a considerable response among the Socialists. Memories of those dreams could still be traced in the more recent Polish plans for a federation from the Baltic to the Aegean. Nevertheless, in the inter-war years, the anti-Russian edge in the policy of the Polish Socialist Party was blunted. Russia's appeal for proletarian solidarity was not altogether ineffective. It induced the Socialists to abandon their old paths. Immediately before the war they were foremost in demanding that Poland should adhere to the policy of collective security, which was a synonym for an alliance with Russia and the western democracies.

The Policy of the Right

The traditional pattern of the Right Wing was entirely different. The National Democrats, who in later years assumed the name of the National Party to mark their divorce from democracy, were primarily anti-German and pro-Russian until 1914. The leader of the National Democrats, Roman Dmowski, whose teachings are still gospel to his disciples, preached and practised collaboration with Tsardom. The attitude of the patriotic Polish Left towards Dmowski's party in those years might be compared with the attitude of French resisters towards Vichy. The National Democrats were pilloried as traitors to the national cause. But the "Polish Vichy" lasted more than a century, and the National Democrats were quite in harmony with the unromantic outlook of their middle-class following when they sought accommodation with their foreign rulers. Paradoxically enough, and yet in conformity with this

historical pattern, the National Democrats were in semi-opposition to Pilsudski's march into the Ukraine in 1920. The inclination to pro-Russian policies on the Right Wing reasserted itself even as late as 1941 when the Polish Minister of Information, Professor Stronski, a former leader of Dmowski's party, welcomed the Russo-Polish agreement, concluded by General Sikorski, as a posthumous triumph for Dmowski's political principles. Nevertheless, the pro-Russian tradition of the Right clashed strongly with social and nationalist motives which, after 1917, threw Nationalist opinion into the anti-Russian camp. The National Party was a persistent, though frustrated, imitator of fascist political models. For ideological reasons it had to become anti-Russian.

The re-alignments have, however, never been quite completed, and they have caused open or latent splits on the Right as well as on the Left. In the inter-war years, the Socialists almost contrived to live down their anti-Russian tradition and the Nationalists unlearned their pro-Russian inclinations. Yet at present it is again the Socialist President-Designate, M. Arciszewski, and the Socialist Vice-Premier, M. Kwapinski, who have come to the fore as spokesmen of the anti-Russian policy, while the veteran leader of the Nationalists and Chairman of the National Council in London, M. Grabski, has represented the most conciliatory attitude towards Russia. But the strongest section of the Nationalists in exile still adheres, together with the Pilsudskists, to the most extreme anti-Russian policy, while inside the Socialist Party the anti-Russian line meets with considerable opposition.

The Third Policy

The Peasant Party has been least of all affected by these dilemmas. It is the youngest and most influential of Poland's popular movements. It grew to maturity and became a decisive factor in Polish politics only after the rebirth of the Polish Republic in 1918. It has not been torn between pro- and anti-Russian traditions. Its Right wing has been socially conservative; and its Left wing radical. The party as a whole has drawn its strength from central and western Poland, and not from the east, where the peasantry is not Polish. The eastern borderland, with the exception of Eastern Galicia, now also claimed by Russia, have always been to the Polish peasants remote and misty. The Polish element there has consisted of landlords, intelligentsia and a few workers. The Ukrainian and the Byelorussian peasants were organised in their own national parties, which had little in common with their Polish counterpart. The gentry and the intellectuals, on the other hand, regarded those lands as strongholds of Polish tradition and character. It has been from there that some of Poland's spiritual leaders and her staunchest nationalists have hailed. The intelligentsia of gentry stock, who have strongly influenced the political outlook of, among other movements, Polish Socialism, have surrounded those eastern borderlands with romantic legend and national exaltation, which carefully ignored their non-Polish character.

Among the peasants of central and western Poland, however, exaltation over the eastern borderland has had no response. It was no accident that in the phase of the Russo-Polish war, when Pilsudski sought to extend the eastern frontier of Poland to the Dnieper—to a line drawn from thoughts of 1772—the Peasant Party was the peace party. Its leader, Witos, headed the Government of national defence only when the tide of war turned against the Poles and the Russian army approached the gates of Warsaw. The Riga Treaty of 1921 was a triumph for the Peasant Party achieved in spite of stubborn obstruction from

Pilsudski, who hoped to wreck the peace negotiations and to prolong the war. This is not to say that the Peasant Party now agrees to the cession of the eastern borderlands to Russia without bitterness or heartache. It would, generally speaking, be wrong to underestimate the extent to which Poland's frontier in the east, as it existed in 1939, has become an essential part of Poland to the present generation of Poles, to whom the two decades of their reborn independence, within their pre-1939 frontiers, have been something more than a transient whim of history. Yet while the fate of Poland itself may hang in the balance, the fate of its eastern borderlands has already been decided; and the Peasant Party, which speaks for more than half of Poland's population, can reconcile itself more easily to the decision than can any other section of Polish opinion.

This survey of the various Polish attitudes towards Russia shows clearly that the anti-Russian mood has deep roots. But it also shows that the seeds of pro-Russian policies are present in almost every camp. With more understanding, insight and good-will Russian policy could have cultivated and nursed those seeds and perhaps eventually gathered a harvest of genuine Russo-Polish friendship. But the recent period in the relations between the two countries has been one of wasted opportunities. The seeds of friendship are being nipped by a severe eastern frost.

South Africa and the Indians

[FROM A CORRESPONDENT IN NATAL]

IN 1943, General Smuts, "caught in a storm" to use his own phrase, gave ear to the importunities of Europeans in Natal and introduced what is popularly known as the Pegging Act, to restrain Natal Indians from residing and purchasing property in European residential areas. This discriminatory Act aroused the Government of India and the quarter of a million Indians in Natal to loud and vigorous protest. It was a temporary measure, to remain in force until a judicial commission appointed to investigate the life, labour and status of the Indian community has produced its findings and recommendations. Early this year, after some preliminary discussions among the parties concerned, the Prime Minister came to an agreement with the Natal Indian Congress, based upon the admission by Indians that they have no desire to live at close quarters with Europeans and by Europeans that their main objection to the presence of Indians in Natal is due to their unwillingness to accept residential proximity.

There have been periodic waves of anti-Indian agitation in South Africa's history, and successive governments have attempted to make room for the growing Indian community in the country. These attempts reached their peak in the Cape Town Agreement of 1927, which, in its "Uplift Clause," gave encouragement to those Indians who were prepared to adopt western standards of life, and which contained a comprehensive scheme of emigration to India for any who were willing to leave the country. The prospect of being considered "an integral part" of the South African nation provided Indians with a sense of security they had never before enjoyed. Prospect, however, fell far short of fulfilment. Their history in South Africa is marked by a long series of privileges lost and democratic rights withdrawn, from the parliamentary franchise in 1896 and the municipal franchise in 1924 to the restrictions of the Pegging Act.

The Pretoria Agreement provided some relief from the harsher disabilities and indignities of the Pegging Act, and it was clearly the Prime Minister's wish to find a solution to the problem in the interests of Commonwealth unity. The Pretoria Agreement envisaged machinery whereby changes in the racial character of the residential accommodation of Durban could be controlled. Durban contains the largest Indian population of any city outside India, and complaints had been loud and long against the "penetration" of Indians into European areas. These European claims were not all of them justified. The Broome Commission, appointed to investigate the complaints, found that between 1927 and 1940 the number of cases of penetration into European residential areas throughout the whole of Natal was 512. But in Durban, where the problem is most severe, the cases had become more frequent between 1940 and 1943, and though a feature of the "intrusions" was that they were in areas contiguous to predominantly Indian areas, they were enough to encourage European fears.

The Agreement, however, did not satisfy European opinion, and when legislation was put in train to implement it, opposition became so implacable that the Natal Provincial Council, instead of referring the matter back to the Prime Minister, incorporated in the legislation control of the acquisition by Indians of residential property for investment, thereby introducing a feature which, in the Pegging Act, had occasioned such vigorous protests from Indians and from the Government of India. This legislation is known as the Residential Property Regulation Ordinance. The opposition of the Natal Indian Congress continued, and its spokesman appeared at the Bar of the House of the Provincial Council, but failed to make any impression upon the legislature.

Natal Europeans find it difficult to accept the view that the treatment of Indians in South Africa is anything more than a domestic matter confined to South Africa. The Commonwealth implications are set aside as of little moment. The position of General Smuts was made more difficult by the fact that his own supporters in Natal combined with the Dominion and Labour parties to insist that the economic activities of Indians should continue to be controlled. On the other hand, the Natal Indian Congress and the Government of India see in this new Ordinance a departure from the Pretoria Agreement on a specific issue and also a threat to the whole status of Indians outside India. For not only does the Residential Property Regulation Ordinance prevent an Indian from occupying a dwelling in certain areas; it also forbids him from making any purchase of residential property without a special permit from a Licensing Board. Moreover, this single measure is one of several legislative objects passed by the Natal Provincial Council to determine the territorial racial pattern of the whole Province. A comprehensive post-war plan has been drawn up, based upon principles of racial zoning, whose main object is to separate the races residentially and to prevent residential intrusions from one territory on to another.

Racial Rivalry

This policy is the result of fears for European supremacy in a country where, numerically, Europeans are in a considerable minority *vis-à-vis* the Bantu population, though they are in a majority over the Indians. The commercial rivalry between Europeans and Indians is intense. The colour bar and labour policy close the doors of many employments to Indians, forcing educated young men into the few which are open, particularly into commerce. There is, thus, an overloaded Indian trade, and though it is broadly segregated by the operation of the licensing laws, it is still, in the opinion of European traders, dangerously competitive. The Indian, for his part, complains that a shortage of housing and land development, and the pressure of his growing population, force him to enter areas contiguous to his own which are at present occupied by Europeans. His domicile in South Africa is confined to the province of his birth. Provincial barriers prevent him from moving from one province to another, which means that the vast majority of the Indian population is concentrated in Natal, thereby creating in the mind of the European a firm conviction that the problem is Natal's and not, as the South Africa Act established, for the Union Government to decide.

The question to be settled is the future status of Indians in South Africa. Articulate European opinion fastens upon big emigration schemes and upon residential, social and economic segregation for those who are left behind. Indians are implacably opposed to both emigration and segregation. It is thus a serious situation for the Prime Minister, who has to consider, not only that a problem of a racial minority must be solved, but that South Africa is part of a Commonwealth fighting for the aims of the Atlantic Charter.

THE BRITISH WAR EFFORT

The following pages contain a full summary of the text of two White Papers, Cmd. 6564 ("Statistics Relating to the War Effort of the United Kingdom") and Cmd. 6570 ("Mutual Aid: Second Report"), together with the greater part of the statistical tables and charts included in them.

The tables taken from Cmd. 6564 are numbered as in the original. Those omitted are Nos. 3 (detail by age-groups of changes in female employment), 8-12 (year-by-year figures of production of munition items), 33-36 and 38 (national income, expenditure and taxation figures derived from the Budget White Paper, which was fully summarised in The Economist of May 6, 1944). Cmd. 6564 also contains five appendices (not reproduced here) giving more detailed figures for some of the summary tables in the body of the document.

The statistical annexes to the White Paper on Mutual Aid are reproduced in full.

Introduction

Statistics giving a general picture of the mobilisation of British resources during the war can now be published, although reasons of security still demand that some remain secret until the defeat of both Germany and Japan. The vast reorganisation shown by the published figures has been achieved under front-line conditions of black-out, air attack and spare-time mobilisation for Home Guard and Civil Defence duties.

I—Manpower

In the five years up to the middle of 1944 the British labour force (men aged 14-64, women aged 14-59) in the Services and in civilian employment was increased by 3½ million to 22 million. The increase is made up of 1¼ million unemployed and 2¼ million not previously occupied. Another million can be added if all ages are included and part-time women workers counted as one each, instead of one-half. By the end of 1943 labour was fully mobilised, and since then some reduction from wastages has been unavoidable, both in the Services and in industry.

The distribution of the labour force at the middle of 1944 was:—

	Millions	Percentage
Services, Civil Defence and Group I Industries producing munitions.....	10.3	47
Group II Industries:—		
Extractive, shipping and transport, Government service, public utilities, and food and drink production.....	5.7	26
Group III Industries:—		
Building, civil engineering, textile and other manufacturing. Distributive trades and civilian services.....	6.0	27

Of 7.6 millions in the manufacturing industries, only 4 per cent were producing for export, compared with 15 per cent in 1938, whereas 76 per cent were on Government work and 20 per cent were producing for the home market.

Mobilisation of labour has been achieved mainly through the compulsory registration since 1941 of 10 million men born between 1892 and 1926 and 11.6 million women born between 1893 and 1926.

TABLE 1.—NUMBER OF MALES AGED 14-64 IN GREAT BRITAIN. (Thousands)

* Mainly housewives. At the middle of 1944 about 900,000 women were doing part-time work and have been counted half in this group and half in the appropriate industrial group. Domestic servants are also included in this column.

CHART I

men employed in other industries has been reduced. Of the 11.2 million men still in civil life, 3,000,000 were doing part-time Home Guard or Civil Defence duties.

The high degree of mobilisation achieved in this war has been largely due to the contribution made by women (analysed in Table 2). Numbers in the Services, CD and industry increased by 2½ millions since the beginning of the war, and 1½ million women were doing part-time work in industry and Civil Defence, besides large numbers in the Women's Voluntary Services and in paid or unpaid part-

time work. The majority of women mobilised have been aged 18-40, of whom 55 per cent were in the Services or industry in 1943. Between mid-1938 and mid-1943 112,000 girls aged 14-17 were added to the numbers already in the services, munitions and Group II industries.

The mobilisation of men and women together for the three groups of industries is analysed in Tables 4, 5 and 6, and a general table (7) compares the numbers and percentages mobilised in each group in 1944 and 1918.

The first group of industries covers the engineering, ship-building, aircraft, metals and chemical industries. In the last five years their labour force was increased—largely through the recruitment of women—from three to five millions, and

TABLE 6.—NUMBERS EMPLOYED IN GROUP III INDUSTRIES IN GREAT BRITAIN

is about equal to the strength of the armed forces and whole-time Civil Defence. (If Commonwealth and Empire forces, casualties and releases are added, the total is raised to over 10 millions, compared with 9 millions in 1918). Working hours have risen on the average, from 48 to 54 a week. The decrease in numbers shown in Table 4 since Novem-

ber, 1943, is due to increased intake of the Services in preparation for the 1944 invasion.

In Group II, the principal basic industries and services, numbers have been generally maintained, but only by the substitution of 800,000 extra women for a loss of 600,000 men. In agriculture, for instance, 117,000 women entered

CHART II

the industry, while 98,000 men left it between 1939 and 1944.

Group III industries, producing goods and services for the private consumer, suffered a decrease of one-third of their labour force since 1939, thus providing more than half the men recruited to the armed forces and many more to the munitions industries. Direct Government orders are absorbing as much as half the total output of the manufacturing industries in Group III—49 per cent of textiles,

TABLE 7.—MOBILIZATION OF MANPOWER IN GREAT BRITAIN IN 1918 AND 1944

for instance. Workers in the building and civil engineering trades have been cut by 52 per cent since 1939, and the distributive trades have lost nearly a million employees through mobilisation.

The total losses to Britain's mobilised manpower from

CHART III

September 3, 1939, to September 3, 1944 (August 31st in the case of civilian casualties), are tabled below.

Armed Forces—	
Killed	176,081
Missing	38,275
Wounded	193,788
Prisoners-of-war	154,968
	563,112
Merchant Navy—	
Killed	29,629
Interned	4,173
	33,802
Civilians and Civil Defence	
Killed	57,298
Injured	78,818
	136,116
Total	733,030

II—Home Production

The needs of British, Dominion, Empire and Allied armed forces and the material assistance given to Russia and other Allies have caused a six-fold expansion in the monthly output of British munitions since the war. The following table gives figures of the total production of a number of items in the period of 58 months from September, 1939, to June, 1944:—

Naval Vessels—	
Major naval vessels	722
Mosquito naval craft	1,386
Other naval vessels	3,636
Ground munitions—	
Field, medium and heavy artillery equipments	13,512
Heavy anti-aircraft equipments	6,294
Light anti-aircraft equipments	15,324
Machine guns and sub-machine guns	3,729,921
Rifles	2,001,949
Tanks	25,116
Wheeled vehicles for the Services	919,111
Aircraft—	
Total aircraft	102,609
Heavy bombers	10,018
Medium and light bombers	17,702
Fighters	38,025

Of the total supply of munitions of all kinds available to the forces of the British Commonwealth, 70 per cent has been provided by the United Kingdom, 10 per cent by the other countries of the Commonwealth and 20 per cent by the United States. Of the American 20 per cent, four-fifths have been provided on Lend-Lease, the remainder have been paid for in cash.

In naval construction, the effort to expand production of offensive and escort ships has had to be combined with the production of landing craft and small patrol boats for the invasions. At the same time, demands for repairs and refittings were high, and naval munitions and equipment com-

CHART VII

paratively heavier and more varied than at the outbreak of war. The production of naval guns, for instance, was raised from 1,486 in 1940 to 20,023 in 1943.

The general picture of ground munitions production is one, not only of all-round expansion, but of change in the types of equipment produced. While numbers of tanks and

anti-tank guns increased, the individual units produced also tended to become heavier, and new types of equipment, such as aircraft landing track and Bailey bridges, and more elaborate versions of items such as wireless equipment, had to be added to the general list of ammunition, clothing, weapons and vehicles needed for a modern mechanised army.

The same increase in weight was noticeable in aircraft production. By numbers, output increased three-fold between 1939-1943; by weight, six-fold. The expansion in

CHART VIII

heavy bomber and fighter output rose respectively from 41 in 1940 to 4,614 in 1943, and from 110 a month in 1939 to 940 a month in 1944. As an index to the increased power of

aircraft, the total horse-power of new engines delivered rose from 17.4 in 1940 to 41.92 in the first half of 1944, and the average horse-power of engines produced was doubled between the end of 1939 and June, 1944. This increased power

CHART IX

was able to carry heavier loads, an average of 4 tons in 1943 compared with 1.2 tons in 1939. The great expansion of air forces, however, brought an increasing need for repairs. For every six new aircraft produced in 1943, four old ones underwent major repairs in United Kingdom workshops.

Behind the greatly expanded production of munitions of war lay an effort to increase home production of raw

TABLE 16.—LIVESTOCK POPULATION
(Millions)

1944	3.6	6.0	9.5	20.3	1.9	55.2

materials. Imports of raw materials—particularly of iron and steel—had, at the same time, to be severely economised. Home output of iron ore was increased by more than one-half since before the war and exports of steel products severely curtailed. Total steel production was kept consistently above the pre-war average, and the production of timber increased to four times pre-war output. Most spectacular expansion has been in the light metals industries, particularly magnesium. By contrast, the raw materials of cotton yarn and newsprint production were severely curtailed to save shipping space.

An increase in agricultural production was equally necessary in order to save shipping space. The output of food has been increased by ploughing up grassland, and so increasing the physical yield of the land, and by growing more crops suitable for direct human consumption. Land reclamation was able only partly to offset losses of cultivable land to military and other needs.

By 1943 the wheat and potato harvests were double the pre-war average. Vegetable production has increased by 30 per cent, partly as a result of the "Dig for Victory" campaign, which increased the number of allotments from 800,000 before the war to about 1,500,000 in 1943. Fodder crops have also been grown in larger quantities, partly to replace a loss of 7½ million tons of imported feed, but they have been insufficient to maintain the output of meat, poultry and eggs. Numbers of sheep, pigs and poultry have all declined, though dairy cows have increased to maintain milk production against the falling-off in yields due to loss of feeding-stuffs.

In spite of the 50 per cent cut in imported food and the loss of male labour, British food production, in terms of calories and protein, has increased by at least 70 per cent and rationing and price control have ensured fair distribution.

Numbers of fish marketed have had to be severely reduced to nearly one-third of 1938 takings, owing to the requisition by the Navy of two-thirds of the deep-sea trawler fleet and nearly three-quarters of the steam-drifter fleet.

III—Shipping and Foreign Trade

The character of the war has made great demands on the use of our limited shipping resources. Since the close of the campaign in France in 1940, and the entry of Italy and later of Japan into the war, the British Commonwealth and Empire Forces have had to be supplied over very long shipping routes. The opportunities the enemy has had to attack our merchant shipping have been greater than in the last war and each successive campaign—Libya, Tunisia, Sicily, Italy and France—has made large demands on shipping for military purposes.

A pre-war merchant fleet of 17½ million gross tons (including all ships of over 1,600 gross tons) was reduced by losses to a fleet of 15½ million gross tons by the end of 1943, of which 2 million gross tons were ships which in due course will be returned to other flags. If these, and Dominion ships are deducted, the total loss at the end of 1943 was 29 ships. This was in spite of 4½ million gross tons added per cent. by the production of British shipyards, by Canadian production, by further additions of ships, new and old, from the United States, and by capture of enemy ships. The gross British losses shown in Table 17 total over 11½ million gross

1943	11.5	12.8	2.0	26.4
1944—January to June	5.4	6.1	1.3	12.8

* Including tobacco. See Table 12.

tons, and although the losses in any one month have not been greater than in the worst periods of 1917-18, enemy attacks have been maintained at a high level for a much longer period.

The output of British merchant shipbuilding has been correspondingly increased to an average tonnage nearly one-fifth higher than that produced in the years 1915-18. Not only were types more varied and specialised, but armament and equipment became necessarily more complex. Repairs to ships injured by enemy attack and by the bad weather of the North Atlantic and North Sea convoy routes meanwhile absorbed over half the manpower available for merchant shipbuilding.

The following table shows the tonnage of new merchant ships of over 100 gross tons completed in the United Kingdom:—

1939	Sept. to Dec.	243	thousand gross tons.
1940	" " "	810	" " "
1941	" " "	1,158	" " "
1942	" " "	1,302	" " "
1943	" " "	1,204	" " "

Of the total available merchant fleet, less large numbers (at one time over 2½ million gross tons) under repair, many had to be allocated to the Navy, for the transport of troops and supplies and to Empire and Allied countries.

The remainder available was so small as to necessitate

CHART X

drastic cuts in United Kingdom imports. From a pre-war annual average of 55 million tons, imports (other than petrol and tanker-borne products) were reduced to 23 million tons in 1942 and 26 million tons in 1943, compared with 34 and 30 million tons in 1917 and 1918 respectively. Imports of food and raw materials were both cut by half, and imports of finished goods almost wholly confined to munitions. The substantial cuts in wheat and sugar imports and the even greater reduction in animal feeding-stuffs are fully shown in Table 19. Table 20 shows the drastic reductions in raw material imports, particularly of steel and timber, which have necessitated the great increases in home production. Before the war, out of a total of 26 million tons of raw

material imports, 17½ million tons were steel, steel-making materials and timber. In 1943, these items amounted to only 6½ million tons, in spite of a considerable increase in imports of finished and semi-finished steel.

After 1941, when Canadian Mutual Aid and United States Lend-Lease made direct payment for essential imports largely unnecessary, the United Kingdom was able drasti-

* Excluding bunker coal. † Excluding exports of military vehicles.

cally to reduce production for export. Allowing for rising prices, exports were cut by 71 per cent from the 1938 level of £471 million. Quantities of different exports have been adapted, as shown in Table 22, to the exigencies of war, in order to economise in labour, particularly in male labour, and in the productive capacity of war industries making steel, cars, coal and machinery.

IV—Civilian Consumption

The rise in private incomes, shown in Table 23, due to reduced unemployment, higher earnings and longer working hours, is shown to have been largely offset by increased taxation. By the time deductions have been made for the increase in personal savings from 3½ to nearly 20 per cent of total income, for the rise in direct and indirect taxes and for higher prices, the total of incomes available for personal expenditure (Table 24) is shown to have fallen by 21 per cent since 1938. Moreover, this is a measure of quantity; it makes no allowance for the severe deterioration in quality of the goods purchasable with the remaining 79 per cent of 1938 expenditure.

Short supplies of food, particularly of meat, fats and sugar, have compelled rationed civilians to eat more bulky

and starchy foods. Of all staple foodstuffs, only potatoes, vegetables and bread are in unrestricted supply. Fruit is very scarce and the consumption has fallen by over half. The nutritive value of the country's total food supplies has fallen slightly, but rationing and other measures have helped to reduce inequalities in pre-war food consumption, particularly of protective foods, such as milk. Individual rations in some cases have been smaller than the amounts consumed, as shown in Table 25, but the difference is accounted for by the food allocated to hotels, restaurants and canteens, and by food grown by people for their own consumption. Some part of the amounts shown, on the other hand, will have been consumed by British, US and Allied forces on leave.

TABLE 24.—PERSONAL EXPENDITURE ON CURRENT GOODS AND SERVICES

Of other consumers' goods, expenditure has been most severely cut on durable goods. One-fifth as much furniture and household textiles were bought in 1943 as in 1935. Pre-war stocks of durable consumers' goods, including clothes and shoes, have been almost completely exhausted through shortage of new production. The figures in Table 27 show reductions in clothing expenditure, brought about chiefly by rationing, which has prevented the average man from buying (for example) more than one pair of shoes in thirteen months. No motor-cars, refrigerators, pianos, vacuum cleaners, tennis or golf balls have been produced since 1942, and only very few radios, bicycles, watches and fountain pens.

Civilians wishing to travel have found it increasingly difficult. Although the number of passenger-miles on British railways has gone up by 60 per cent—through more and

longer journeys, particularly by British and Allied forces—the number of passenger train-miles has been cut by 30 per cent. of the pre-war level. The result of the two movements is that the average train-load has increased by 125 per cent. With increased freight loads for essential war purposes, net ton-miles transported by British railways have risen by 40 per cent. Bus services have also had heavier loads to carry—between 30 and 50 per cent more passengers than in

CHART XI

1938. In spite of a reduction in total mileage of 40 per cent, the number of passenger-miles carried has increased by one-third. Since 1941, the small unconditional petrol ration for private cars has been cut out altogether and motor-spirit used for the 700,000 private cars still licensed for essential

purposes (compared with the pre-war 2 million) is only one-eighth of pre-war consumption.

Housing-space for civilians is as crowded as travelling-space. Almost no new houses have been built in wartime. Out of 13 million houses in the United Kingdom, one-third have been affected by enemy action. Over 200,000 have been destroyed (by air attack) and 4½ million damaged, and many houses have been requisitioned for the Services. Repair work is restricted and overcrowding has been intensified by evacuation.

CHART XII

V—Finance

Central Government expenditure has increased, almost exclusively through war expenditure, from £1,013 million in 1938 to £5,782 million in 1943, including Mutual Aid supplied by Great Britain and paid for by the United Kingdom Government, but excluding Lend-Lease and Mutual Aid received from abroad.

Only a great increase in national income, from £4,604 millions in 1938 to £8,172 millions in 1943, has made it possible to finance government expenditure so largely out of current resources. The following table shows how the 1943 expenditure was provided:—

Taxation and Government revenue	50 per cent.
Savings (personal and business)	30½ „
„ (public)	3½ „
Disinvestment abroad	11 „
„ at home	3 „
War damage payments re-borrowed	2 „

To obtain not only more revenue, but an increased share of the national income, direct and indirect taxation have both been heavily increased. Income-tax yields have increased from £336 millions in 1938-9 to £1,183 millions in 1943-4, partly by an increase of the standard rate from 5s. 6d. (1938) to 10s. (1943), and partly by an extension of liability to income-tax from 4 to 13 million people. After deducting personal, marriage, children's and other allow-

TABLE 32.—CENTRAL GOVERNMENT EXPENDITURE, REVENUE AND BORROWING (£ million)

1940	4,376	1,210	5,586
1941	4,624	1,472	6,096
1942	4,925	1,614	6,539
1943	5,049	1,749	6,798

ances, the aggregate incomes of the £250-£500-a-year group paid income-tax of 3 per cent in 1938 and of 14½ per cent in 1942; those of the £500-£1,000-a-year group paid 11 per cent in 1938 and 28 per cent in 1942; and those of the £2,000 to £10,000 group paid 29 per cent and 52 per cent respectively.

With the proceeds of the Excess Profits Tax, increased from 60 per cent to 100 per cent in 1940, direct taxes yielded £1,781 million to the Government in 1943, compared with £494 million in 1938; a cumulated amount of £305 million is due to be repaid after the war.

Indirect taxation on personal consumption increased

TABLE 39.—SOURCES OF CENTRAL GOVERNMENT REVENUE (£ million)

* In these years the figures represent private net investment at home.

revenue by £725 million between 1938 and 1943. Tobacco and alcohol, particularly, have been heavily taxed, and have yielded two-thirds of all revenue in a pre-war year. A

Purchase Tax ranging from 16½ per cent of wholesale value on some goods to 100 per cent of wholesale value on luxury goods has been in force since the outbreak of war. Total receipts from indirect taxation rose from £371 million in 1938 to £1,026 million in 1943. Against this must be set the cost—£190 million in 1943—of increased subsidies for food and other essential goods.

To supplement the total revenue of £2,876 million in 1943 the central government had to raise £2,906 in loans

CHART XIII

GOVERNMENT BORROWING

1 January 1939—31 December 1943

in the same year. Business and personal savings (which have increased ninefold since 1938) gave £1,749 million, and the extent to which additional methods of borrowing have been used throughout the war is shown in Table 40.

The effects of heavy taxation and large-scale loans to the Government have been serious. Private savings have, as a consequence, not been spent on improving and repairing capital resources. Industry has only installed new capital

VI—Mutual Aid

THE present report (Cmd. 6570) is designed to supplement the first, which covered all Mutual Aid up to the end of June, 1943, by giving a review of the development of the system in the year to June, 1944. The system, under which goods and services flow freely where they are most required for the common war effort, has been a vital factor in the achievements of the United Nations in the field. In the past year it has reached an even higher scale than before. Besides increased contributions from the United States and Canada, the steady flow from Australia, New Zealand and India and the provision made by European governments for US and British invasion forces, the British Government has extended the scope and amount of free aid provided for its Allies in the United Kingdom and Empire. The total British contribution up to June, 1944, has been valued at

over £1,000 million, and has been necessarily made at the cost of imposing further sacrifices on British civilians since production has already been expanded to its furthest limit.

Aid to the United States passed in the year 1943-44 from the stage of preparation to that of maintenance. It was not till the autumn of 1943 that numbers of US troops in this country began substantially to increase. British ships in the past year brought 865,000 uniformed Americans to this country to join an ever-growing army, to whom, in the quarter preceding D-Day, Britain gave goods and services at the rate of £330 million a year compared with £182 million in the corresponding period of 1943. Capital construction for these forces cost £167,600,000 and involved the

diversion of 100,000 men for building alone; 133 airfields, 89 million sq. ft. of open and covered storage, 100,000 hospital beds, 200 clubs and all furnishings and stores were part of this vast programme.

American forces were fed, at a cost of £8 million, trained and transported. Stores and personnel in the first half of 1944 required 650,000 wagons and 9,225 special trains. Besides this, the transfer of 19 ambulance trains and 16 mobile workshop and break-down trains placed a heavy burden on Britain's overworked railway system.

For the invasion, underground headquarters, maintenance and landing-craft bases, embarkation facilities and nearly 50 transport and hospital ships were made available to the United States. The two prefabricated harbours, one for US forces, were both designed and built in this country at a cost of about £25 million and a diversion of 20,000 men for the concrete caissons alone.

Besides goods and services given to American forces in Britain, the United Kingdom has made available other supplies elsewhere. Oil from American and British sources has been treated as a common pool, and British supplies have gone to India, West Africa, and the Middle East and elsewhere. Bulk foodstuffs and raw materials (mainly rubber) valued at £13½ million have been shipped largely from the Colonies to the United States.

Next to the United States, the USSR was the principal recipient of Mutual Aid from Britain. Particulars are given in Table A, and include supplies to Soviet armies, air force and navy.

Aid to China is limited by transport facilities rather than finance, and has been confined to arms, munitions and military equipment, apart from supplies and services for Chinese troops in Burma and the transport of supplies contributed by other Allies.

Mutual Aid has also been extended, retrospectively, to cover the supply, equipment and training of French, Polish, Czech and Greek forces since 1940, and further agreements have covered aid supplied to Dutch, Belgian and Norwegian

I.—Reciprocal Aid Afforded in the United Kingdom GOODS AND SERVICES

1. Total goods and services transferred up to June 30, 1943	113,000,000*
2. Goods transferred during year to June 30, 1944:—	
i. Tanks and vehicles	2,405,000
ii. Guns and ammunition	7,299,000
iii. Scientific and engineer's equipment	13,215,000
iv. Aircraft	10,765,000
v. Aeronautical equipment	8,031,000
vi. Barrack and camp equipment	6,497,000
vii. Clothing	6,353,000
viii. Food	7,718,000
ix. Transportation stores	2,537,000
x. Medical supplies and service	2,298,000
xi. Miscellaneous supplies	5,665,000
xii. Petroleum products†	58,882,000
Total supplies	£131,665,000
3. Services rendered during year to June 30, 1944:—	
i. Shipping services	54,717,000
ii. Internal transport services	18,891,000
iii. Building and works maintenance	10,314,000
iv. Miscellaneous services	15,045,000
Total services	£98,967,000
Total goods and services transferred during year to June 30, 1944	230,632,000
Cumulative total, goods and services, to June 30, 1944	£343,632,000

CAPITAL FACILITIES

	Cumulative to June 30, 1944
Barracks, hospitals, etc.	49,200,000
Airfields, etc.	105,600,000
Aircraft repair depots	5,500,000
Port installations, etc.	7,300,000
Cumulative total to June 30, 1944	£167,600,000

* Allowing for adjustments to figures in first Mutual Aid Report.
† Including oil bunkers to U.S. naval and merchant ships world-wide, and Lend-lease oil estimated at £24 million retransferred to U.S. forces in the United Kingdom. World-wide.

II.—Food and Raw Material Exported to the United States

	Year to June 30, 1944	
	Quantities	Value
(a) Raw Materials* :—	Tons	£
Asbestos	3,886	191,000
Chrome	20,343	76,000
Copper	18,000	130,000
Goatskins (thousand units) ..	3,529	386,000
Graphite	1,219	58,000
Hides (thousand units)	635	210,000
Pyrethrum	1,702	243,000
Rubber	38,366	5,946,000
Sisal	37,314	1,021,000
Other†	...	149,000
Total raw materials	...	8,410,000
(b) Bulk Foodstuffs :—		
Cocoa	55,849	1,833,000
Tea	10,206	2,075,000
Oils and fats	58,538	1,295,000
Total bulk foodstuffs	...	5,203,000
Total food and raw materials	...	£13,613,000

* Mainly from Colonies. † Items below £50,000.

III.—Total Reciprocal Aid to the United States

	Goods and Services	Capital	Total
I. Reciprocal Aid in the U.K. (as above)	£ 343,632,000	£ 167,600,000	£ 511,232,000
II. Food and Raw Material Exported to the U.S. (as above)	13,613,000	...	13,613,000
III. Other Supplies Exported to or Transferred to the U.S.	25,135,000	...	25,135,000
IV. Reciprocal Aid Afforded in British Colonies and in Overseas Theatres of War*	47,539,000	7,211,000	54,750,000
Totals, cumulative to June 30, 1944	£299,919,000	£174,811,000	£604,730,000

* To March 31, 1944.

approximate and, in some cases, incomplete. Repair services, technical information and experience have not, and cannot, be priced and added to the general totals. No true comparison can be drawn of the comparative cost to Britain or other Allies of Mutual Aid supplied to the common pool. For one thing, Government accounting systems and price structures are widely different, and, though some indication is given in the tables, no valid conclusion can be drawn from this haphazard selection.

In conclusion, the extent of Mutual Aid supplied to all the Allies, totalling over £1,000 million, is no small achievement for a country totally mobilised for front-line warfare.

WILL'S "THREE CASTLES" CIGARETTES

20 for 2'8

W. D. & H. O. Wills, Branch of The Imperial Tobacco Company
(of Great Britain and Ireland), Ltd.

At 2/8 for 20, Abdulla No. 7 is a cigarette* of outstanding quality with a charm of its own—a charm which comes from superb tobacco and masterly manufacture. It's larger and firmer than the ordinary cigarette, too.

P.S. In the wardrooms of H.M. Navy, they smoke literally millions of No. 7 every year—and you know what sailors are!

* For Virginia smokers

ABDULLA No. 7

Satin Stripe Lustre Pyjamas

We have a good variety of fine quality satin stripe lustre pyjamas on coloured or white grounds at 45/6. Also other qualities in self colours or fancy stripes from 30/- . Chest measurements, 36" to 44".

**VITAMINS
FOR
EUROPE**

Here, in the Roche laboratories, research is carried out on the synthesis of vitamins that are identical with natural vitamins. In the Roche plants in Britain a number of these synthesized vitamins have been made by the ton during the war. Thus it is practicable to provide vitamins for the peoples of liberated Europe in sufficient quantity without adding to the tremendous strain that perforce will fall on the transport services. For example, a plane-load of synthesized Vitamin B₁ and Vitamin C would supply the specific requirements of these vitamins for the whole population of Athens for many months.

ROCHE PRODUCTS LIMITED

BACKGROUND TO ACHIEVEMENT

Industry

DURING the past 50 years BTH has contributed greatly to the progressive efficiency and productiveness of British Industry. A large proportion of the electric motors which drive the mechanical paraphernalia of industry were made in the BTH works; and all modern electric power and control equipment owes a

great deal to BTH engineers and research workers. BTH has also taken a leading part in the effective lighting of industry. Mazda and Mercra lamps, and now the Mazda fluorescent lamp, have helped to transform the "dark, satanic mills" of Blake into modern palaces of production where working efficiency is ever at the peak.

Charts and Markets—II

THE first half of this article, which appeared last week, reached the conclusion that chart-reading, by itself, is of comparatively little assistance in forecasting short-term fluctuations in market prices, since chance factors can so easily upset the deductions to be drawn from past experience. "Chartism" is, however, on rather firmer ground when it is a question of the longer-term or cyclical fluctuations. Even there, however, there are limitations. What the enthusiasts for chart methods seem often to overlook is the extent to which their case derives its strength from their ability to relate cyclical market fluctuations to the broader background of the national economy. They do not, where "dominant trends" are involved, have to judge the market by the market: they can go outside, and the further they go the better. Restriction of their inquiries to the market, and attempts to draw conclusions merely from phenomena like the duration of earlier bear phases or bull phases, or the levels of peak points reached years before, involves reliance on a field of observation which, to the scientific mind, seems dangerously narrow.

This criticism (which, incidentally, tends to throw doubt on a great deal of current "chartist" prognosis of an early and necessary down-turn in share prices) may be illustrated by the implications of Chart C, which shows the "dominant trend" of *The Financial News Ordinary Share Index* from the beginning of 1929 up to the present time. The picture is cyclical; fluctuations of a lower order have been largely removed, so that the eye can follow the main course of the index, from high to low and back again, with a minimum of distraction. The point at which the curve begins was in fact the peak of the 1928-29 market boom. Another peak, it will be seen, is reached at the end of 1936. There are low points in the middle of 1932 and of 1940. The present level of the index is slightly below a recent high point, which was nearly, but not quite, equal to that of 1936.

The "chartist" view that prices may shortly turn downwards rests mainly on two theses. The first is that the rising market of 1932-36 lasted 4½ years and that, as the rising trend of 1940-44 will, by the end of this year, have endured for a similar period, it will then be ripe for reversal. The second point made is that share prices, before their recent setback, were back nearly to the high point of the preceding cycle and, consequently, were loitering, so to speak, in a dangerous area. Both arguments, it must be declared, seem crude and unconvincing. The suggestion that the duration of the main phases of the market cycle is set unalterably in a Procrustean mould is readily disproved by past experience. The rising market of the 1920's (not shown in the chart) lasted, for example, for seven years. The second argument—that the peak prices of 1936 are an *Ultima Thule* for the market in 1944 or later—runs strangely, seeing that the 1936 crest was itself 24 per cent higher than its predecessor of early 1929.

In fact, attempts to maintain that history will invariably and exactly repeat itself are calculated only to bring undeserved discredit on the historical method in general. So long as a broad correspondence—and no more—is presumed between successive cycles, chart interpretation may serve something to reach the forward-looking investor. Possibly, a Full Employment policy, which aims at smoothing out post-war industrial fluctuations, will deprive "chartism"

of its main scientific buttress. But the trade cycle has been a regrettably hardy economic phenomenon in the past; and even during the war, with cyclical changes in industrial activity suspended for the duration, there has been, as Chart C clearly shows, quite a considerable market cycle. But an examination of the markets' records for anything up to 70 years reveals, conclusively, that arguments based on the supposed uniformity of different cycles must fail. Their duration and amplitude have varied widely; and, what is more, there has been a persistent tendency for peaks and troughs to be established at progressively higher levels.

This last point is crucial. It calls attention to a fundamental omission in "chart theory," as hitherto set forth by the majority of its exponents. And it suggests a satisfactory means of reconciling the views of those who, to-day, maintain that share prices may decline in the next year or

CHART C

two and those who maintain that prices must rise considerably in the next three, five or ten years.

The truth is that the so-called "dominant market trend," with which chart theorists concern themselves, is itself only an intermediate type of trend. If the course of share values be plotted on a chart for half a century or more, the cyclical trend reveals itself as a series of fluctuations on either side of a longer-term trend line which, in fact, has been rising for a great many years past. Some idea of what such a chart looks like can be obtained from Chart D, on which the thick continuous line has been drawn (to a logarithmic scale) from the figures of the London and Cambridge Industrial Share Index from 1870 to 1939. The many cyclical variations which have occurred in the course of these seventy years can be plainly seen.

Superimposed on the annual figures, on this chart, are a ten-year and a 25-year moving average. Although a ten-year average eliminates purely cyclical fluctuations, it will be noted that there has been a certain rhythm in the "medium-term" trend of share prices. The curve has a strongly rising tendency for much the greater part of the time, interrupted by stagnant periods in the 1880's and the first decade of the present century. The "ultimate trend" appears to be quite clearly brought out by the 25-year average, which rises continuously at the rate of approximately 2½ per cent per annum and has a slightly concave shape—i.e., it rises rather more quickly in the later than in the earlier years of the period it covers.

The trend of ordinary share prices, thus measured, can be shown to have a relatively high degree of correlation with the trend of the money value of the national income during the seventy years, if allowance is made for distracting factors like changes in the level of interest rates. That, indeed, is what first principles would lead one to expect;

for ordinary share values represent the capitalisation of current equity profits at a number of years' purchase determined largely by prevailing interest rates.

Here, it may be suggested, lies the answer to the dilemma posed by the "chartists": fear that share prices may fall in the near future and the confidence of other commentators that equities will rise during the next few years, in response to a higher money national income. The "chartists" will be right if the cyclical trend of the market curve happens to fall, in anticipation of (or in response to) a drop in industrial profits during the period when industry will be coping with change-over difficulties in the transition from wartime to peacetime production. But the more optimistic prophets will be justified in their generation if that movement proves, as everyone believes it will prove, purely temporary. Once the national economy has passed the transitional stage, and the post-war period, properly so-called, has begun, then (for reasons set out at greater length in an article in *The Economist* of August 26, 1944, page 291), the readjustment of share values to an increased national income (in money terms), will have to be made.

When that adjustment occurs the upward long-term trend of share prices, which makes so impressive a showing on Chart D, will be found to have continued through the decade of the '40's. There may, of course, be far-reaching changes, after the war, in the relations between owners of the capital and the state, which may affect the amount of net income equity shareholders are allowed to retain and, consequently, may limit any future rise in share values. That is a question which only the future can decide. So far as it has any bearing on prospective market conditions, it suggests that it may not be imprudent to end this present series of articles with a *caveat*. The historic rise in ordinary

share prices was accomplished in a "free" economy, with an "open" capital market.

CHART D

Debts in America

(From Our New York Correspondent)

THE most striking development in the composition of debt in the United States during the war has been the increase in Federal obligations and the decline in all other major categories. The former comprised only 22.1 per cent of all public and private debt at the end of 1940, but had risen to 53.8 per cent by December, 1943. The explanation is threefold. Increased Government expenditures have increased business profits, consumer income and local government revenues, and they made debt retirement possible, and at the same time Government financing of the needs of industrial expansion has limited the need for additional private credit. Shortages of goods have restricted spending by business firms, by local governments and by consumers. Direct government controls have been important in contributing to the contraction of consumer credit as well. Long-term corporate debt, the second largest component of the debt structure, now represents only 15.5 per cent of the total, as against 23.8 per cent in 1941. Short-term corporate debt also declined after the initial spurt which occurred during the 1940-41 "defence" period. The following table summarises the significant figures:

	Millions of Dollars			
	1929	1938	1940	1943
Total New Corporate Issues	10,026.4	2,140.5	2,762.6	1,080.9
Total Bank Loans	41,861	21,261	23,751	22,241
Total Money (Currency and Deposits)* ..	54,713	58,955	70,761	122,812
Total Corporate :-				
(a) Current Assets	28,006	22,089	27,606	51,000
(b) Current Liabilities	12,138	8,257	10,967	27,000
(c) Working Capital	15,868	13,832	16,639	24,000
Total Net Corporate Long-Term Debt ..	47,280	44,850	44,000	42,629
Total Corporate Short-Term Debt	28,615	18,454	19,800	21,558
Total Government Debt (Net)†	29,412	48,300	52,931	161,799

* Includes time and US Government deposits.
† Federal, State and Local, eliminating duplication.

NOTE:—All figures end of year except first line, which is annual total.

Recent studies by the Securities and Exchange Commission, the Department of Commerce, the National City Bank, the National Bureau of Economic Research and the Federal Reserve System reach substantial agreement on the pattern of business finance during the war which underlies these changes, and more qualified agreement on its meaning for the transition and post-war periods. These analyses show that business as a whole has earned higher profits than in the pre-war years, even after higher taxes, and that it has retained a large portion of these increased earnings.

These have been used to expand plant and equipment, and the expansion has been financed about equally by government and internal business funds. (Increased allowances for depreciation have recently been in excess of declining private capital expenditure.) Business has had little recourse to the security markets since 1940-41. Retained earnings have also been employed to enlarge working capital. The National City Bank shows increases of 26 per cent and 38 per cent respectively for two groups of large non-durable goods and durable goods' manufacturing companies. Here, also, Government assistance has been given in the form of direct advances on supply contracts and allowance of billing as work progresses. This has resulted in a sharp rise in the ratio of sales of large manufacturing corporations to average inventory held and a concomitant falling off in commercial bank loans, in direct opposition to tendencies during the first World War.

Not only has working capital increased, but a high level of liquidity has developed in current assets, which consist to a large extent of cash and government securities. Furthermore, receivables and inventory represent largely claims due from the government; and though their liquidity depends on contract termination procedures, their values are probably not susceptible to the usual credit and market risks. To the extent that reserves for taxes are larger than necessary in view of probable post-war tax refunds, liquidity is probably even greater than the position shown on the balance sheets.

From these developments students have concluded that, in the aggregate, business can finance the transition to a pre-war level of peace-time output, and perhaps a considerable margin of expansion above that level without recourse to external sources. They hasten to add that for this to be true for each individual business would imply a pooling of resources which will not occur in practice. Many companies will require funds for rebuilding inventory, meeting pay-rolls and tax liabilities, financing consumer credit needs, and financing expansion. Important considerations affecting these requirements are the speed with which claims against the government are met, the costs of reconstruction and arrangements made for disposing of government-owned plants.

Beyond the immediate transition period, the question is whether the long-run changes in debt composition and

financing methods which were evident in the pre-war period will again reassert themselves. Investment and commercial bankers are not the only persons concerned: institutional investors looking for outlets for funds, savers seeking a better return on their money, economists interested in solving business cycle problems instead of depending on the Government to do it, and perhaps fearful that the country may actually be on the toboggan of "secular stagnation" as a result of impediments to investment, those desiring adequate credit for small business and new enterprise generally—all these have an interest in the matter.

Among the longer-run changes, the twenty-five years since 1920 have witnessed the almost uninterrupted decline of the commercial bank loan. This type of credit failed to rise even during the business expansion of the 1920's. Since corporate security issues did increase until the end of that decade, the reverse tendency in commercial credit has popularly been ascribed to the use of long-term credit to finance short-term needs, together with growing self-sufficiency of business enterprise. Another factor of importance probably was the more efficient use of manufacturing inventories, making possible an expansion of business on the same volume of inventory. The result has been a marked change in the nature of commercial banking. In 1921, 70 per cent of Federal Reserve member bank loans and investments were short-term, and commercial loans by themselves were 52 per cent of the total. In 1940 the corresponding proportions were 41 per cent and 18 per cent. To maintain earnings, the banks have had to discover new sources of revenue. They have instituted service charges in current accounts and have developed new services, such as collection of bills. They have established personal loan departments, have made term loans, life insurance policy loans, home mortgage loans. Recent efforts have been devoted to the establishment of regional credit pools the more adequately to provide this department store kind of financial accommodation in the highly competitive credit markets envisaged in the post-war world—a far cry, indeed, from the appropriate functions of a commercial banking system as outlined by Walter Bagehot.

The drop in short-term business credit was followed by a falling off in the demand for long-term credit in the 1930's. With the exception of 1936, no year since 1930 has seen a volume of corporate issues even one-third as large as the 1929 volume. Even in 1936 the level was less than half that of 1929, and only about one-fourth of the total were issued for new capital purposes. The rest were refunding.

*

Some analysts interpret these movements as cyclical phenomena, consistent with a period of long-continued depressed business activity. A study made by the National Bureau of Economic Research, covering the period 1920-1939, concludes:

Business Notes

Wilt-Edged Speculation.

The feature of the stock markets during November has been the further steady appreciation of fixed interest stocks which have improved a whole point to 99, according to the index of *The Financial News*, on the basis July 1, 1935 = 100. The movement has been led by buying of very long-dated gilt-edged stocks, and Old Consols now stand at 82, compared with the 94½ maximum touched in 1934. The rise in the other constituents of this index have, however, been almost equally rapid. There seems very little doubt that the rise is based on a belief that the authorities intend to effect a further reduction in the long-term rate of interest. This argument is particularly popular because it makes it possible to accept the higher current yield obtainable on long-term securities without making provision against a possible fall in capital values. The basis appears to be frankly speculative, for there is no evidence that the Treasury wishes to push matters to extremes, while there are distinct possibilities that there would be effective opposition to the drastic controls which such a policy, were finally adopted, would involve. Up to the middle of the month the rise was accompanied by a rally of larger proportions in the equity index, which touched 112.7, or our points below the best of the year and just over five

points above the intervening low of September 12th. Since then, however, there has been a recession, and the latest figure is 111.9. The rise in the first half of the month was associated with some increase in business, but this, too, has fallen off. There are two elements which may help to explain the sluggish demand for equities. Neither is new, but both have rather gained in weight. One is a considerable increase in interest in foreign investments, particularly those of European countries. This is a small factor at any time and is almost certainly of transient interest. The second is the growing evidence of declining Government demand, on the one hand, and of inability of industry to replace it by other activity. Plainly the investor has not yet any great confidence that any actual idleness will be of very modest dimensions and of short duration.

Over the two decades as a whole short-term borrowings of large corporations decreased relative to other sources, although during the expansion of 1933-37 they sustained a greater relative increase than any other source of funds.

To others, the decline in corporate issues indicates a secular trend resulting from automatic business saving in the form of retained earnings and depreciation reserves. The evidence submitted to the Temporary National Economic Committee by at least one witness indicated that the proportion of business investment financed internally was growing, and that the bulk of these savings were made by the larger corporations which, by reason of their size and established importance, could have had access to the capital markets.

Smaller enterprises probably have greater need for outside savings, but at best have only limited and costly access to capital markets. This obstruction in the regular flow of savings toward investment has been accentuated by the growing institutionalisation of individual savings. Trustee institutions (savings banks, life insurance companies, etc.) have been prevented both by legal restrictions and by practice from investing to any considerable extent in smaller and untried ventures. A corollary has been the natural preference of institutional lenders for debt over equity investments, which probably partly explains the decline of yields on bonds relative to those on stocks.

Some revival of private new financing from the low wartime level seems beyond doubt. And the higher business activity and commodity prices are, the greater the volume is likely to be. Some new funds will doubtless be needed by some businesses to adopt processes that have been developed during the war and to adjust themselves to peacetime conditions. Consumer credit will probably be required in large amounts to finance purchases of the wonderful new products of the post-war world and to satisfy demands deferred by the war, even though the liquid position of individuals is just as striking as that of business firms. Urban mortgage financing will be needed to the tune of, perhaps, \$5 billion per annum if the top estimates of post-war home construction are realised. Some expansion of state and local government credit also will be required to finance needed capital projects and delayed maintenance of roads and public works. And some growth in agricultural indebtedness seems likely. But the enormous volume of cash and liquidity will be a limiting factor.

And above all other factors, of course, the dominating characteristic of the capital markets will continue to be a Federal Government debt of over \$250 billion, together with the financial operations connected with that magnitude.

* * *

Texas Land Control

The annual report of the Texas Land and Mortgage Company is now presented, and a letter accompanying it reveals that voting control has been acquired by Mr Denys Lowson and some of his associates. Of 66,000 shares of £10, on which only 50s. per share is paid up, the new group hold 33,182, and 30,425 of these have been bought in the

last year or so. In the course of these purchases the price is said to have risen from 72s. 6d. to a maximum of £6 6s. 3d. It is now approximately 95s. After control had been acquired, attempts were made to secure the election of an independent chairman, but it appears from the company's statement that no arrangement was satisfactory to the new group which did not provide that Mr Lowson, or his nominee, should be in the chair with at least one other director recommended by his group. None of the nominees appeared to the present board to possess qualifications which they regarded as essential. Thus a deadlock occurred. It was in these circumstances that, as stated in *The Economist* of November 18th, the Lowson interests proposed for election five directors, including Mr Lowson. The notice convening the annual meeting includes resolutions to elect four of these and to increase the number of directors to seven, the present figure being, apparently, four. The existing directors announce, however, their intention to resign if the new nominees are elected. The present board consists of Mr G. A. Mitchell, his son of the same name and Mr J. G. Archibald, who was appointed temporary chairman on the death of Lord Meston, who had for eleven years been a director of the company. The board and their predecessors have paid dividends of more than 11½ per cent per annum gross averaged over the 61 years of the company's existence. Dividends were passed in the three years following 1933, but, since the resumption, over 9 per cent gross has been averaged. Balance-sheet figures, including written down valuations of securities, show an appreciation on the present paid-up capital of 211.5 per cent, while if market values at balance-sheet date, March 31, 1944, are taken, the figure is 276 per cent, giving the 50s. shares a gross break-up value of 188s. If the present board remain in office they hope to secure the consent of the debenture-holders to the cancellation of the uncalled liability.

Future Policy

It is commonly supposed that Mr Lowson's interests include a number of financial, investment and unit trusts, and the circular of the present directors of Texas Land states that they are understood to include also the control of five unit trust management companies. Companies and individuals associated with these management concerns already hold some of the Texas Land shares acquired, but before conclusions are drawn from this fact it is only fair to point out that Mr Lowson was under the necessity, if he wished to secure control, of finding at least 33 holders, since the maximum voting power in any one land is limited to that on 1,000 shares. In reply to a question from the present board whether it was intended that "the shares purchased should later be passed on to some unit trust or trusts," Mr Lowson replied:

It is legally impossible for a unit trust to hold shares of a company like Texas Land owing to the uncalled liability; and no trustee could consent—quite apart from the fact that no trustee would consent owing to the company's past record. The insinuation which you suggest is most improper.

Since they hold that the uncalled liability can be cancelled, the present board do not consider this reply fully satisfactory, and they express the view that it is undesirable that persons engaged in the management of unit trusts should become directors in companies in which the unit trusts they manage have important holdings. How far these points are relevant to the matter at issue can only be shown by the future policy of the group, but it is certainly the case that there is much to be said, as was pointed out by the Departmental Committee of the Board of Trade in 1936, against a divorce of beneficial interest from control. In the circumstances, the old board is proposing two resolutions, first, that

The investment business of the company should be conducted on conservative investment trust company principles. The company should not by itself, or jointly with others, attempt to acquire a controlling interest in any company, but should confine itself to moderate investments for its own account in quoted Stock Exchange securities, not more than 1 per cent of the company's funds being invested in any single investment, other than trustee securities;

and, secondly, that

A detailed list of the company's investments should be maintained at all times and be open to inspection by any shareholder.

If the Lowson group intend to run Texas Land on the principles of an investment trust—which has been the

practice for a long time past—they should have no difficulty in accepting these recommendations, or something very like them. It is, in fact, desirable that some such obligations should be placed upon all those who wish to benefit from the special relaxations which the law permits to this class of undertaking. Unfortunately, it has not been the practice of the present board to publish its investments, practice on this point varying from trust to trust, irrespective of the degree of success attained.

Surplus Stores

The main purpose of the ninth report from the Select Committee on National Expenditure (Session 1943-44) was to record the progress that has been made in the setting-up of the departmental organisation for the disposal of surplus consumer goods, machinery and equipment since the publication, last July, of the Government's White Paper (Cmd 6539)—this was discussed in *The Economist* of July 29th. On one aspect of the problem, that is the application of the principles that should govern disposals, comprehensive interdepartmental arrangements have been made for the co-ordination of disposal procedure. These arrangements are set out in a memorandum (printed as an appendix to the Select Committee's Report) from the Interdepartmental Committee on Disposal of Surpluses set up by the Board of Trade under the chairmanship of the Parliamentary Secretary; they cover consumer goods and most machinery and equipment, but exclude food, machine tools, munitions and all surplus buildings for which other arrangements have been, or will be, made. Three principles are to guide the formulation of disposal schemes in the home market:

(a) Stocks are to be released fast enough to get the goods into the hands of consumers when they are most needed, but they should not cause the market to be so flooded as to have an adverse effect on production plans;

(b) Care should be taken to ensure that the goods are sold to the ultimate consumer at prices reasonable in relation to the current prices of similar articles, and to prevent profiteering on the part of dealers handling the goods, or an unnecessary number of subsidiaries.

(c) Unless there is good reason to the contrary, goods should be distributed through traders or manufacturers who would normally handle or use such articles to ensure that both the traders or manufacturers and the ultimate consumers in different parts of the country get their fair share of the quantities available.

It is stated that these objects cannot be achieved in the immediate post-war period if the goods are sold by unrestricted competitive tender; this method is to be used only where the goods for disposal are of doubtful importance or small in volume. The aims of policy as set out in the Memorandum are unexceptionable; everything depends on how they are carried out. Distribution through "normal" channels is not necessarily a guarantee against abuse.

Remittances to France

A beginning has been made this week towards the restoration of normal financial relations between Great Britain and France. Though France is still, technically "enemy territory" and French assets vested with the Custodian for Enemy Property, some loosening of obstacles in the way of mutual remittances has been announced. In the first place, France will no longer be regarded as enemy territory in respect of the export of sterling bank notes and every traveller to that country will, therefore, be allowed to take £10 in notes with him. Banks authorised to deal in French francs now have authority to sell francs against approved Forms E at the rates of 199 francs for the pound for telegraphic transfers and drafts, and 199 francs for Bank of France notes. The Bank of England will normally be prepared to approve applications for francs for travelling expenses incurred "on approved business and official journeys," and for the maintenance of relatives and dependants subject to a maximum of £50 per month per person or £150 per month per family. Remittances will also be authorised for the upkeep of property in France on a care and maintenance basis. These first beginnings of financial relations between private persons in the two countries should soon be followed by more sweeping measures which are no doubt being discussed during the Chancellor of the Exchequer's visit to Paris. These measures should be preceded by a complete removal of the Trading with the Enemy regulations as applying to

France and they should envisage some exchange stabilisation and clearing machinery similar to that incorporated in the monetary agreement between the United Kingdom and Belgium.

Greece and the Sovereign

The Bank of Greece has made an interesting change in its gold sales policy. It has raised the price of gold sovereigns from 2,400 to 2,750 drachmas and is keeping the price flexible, adjusting it to the parities of the prevailing gold prices in Alexandria and other Middle Eastern countries. The need for changing the parities became manifest soon after the Bank began to intervene in the market by selling gold, for active arbitrage with Egypt, Syria and Iraq immediately developed. At the prices at which the Bank sold gold soon after the liberation of Athens, much of the metal made available to the market immediately left the country. It should be stressed that the Bank of Greece has not been selling gold on demand, and that its intervention in the gold market does not, in effect, make the new drachma a currency convertible into gold. The official gold sales were intended to prevent an excessive rise in the price of the metal, which might have been construed as disparaging to the new currency. The sales, though "secret," have always been well advertised in Athens, and before each series of such operations by the "hidden hand," long queues of would-be purchasers formed up outside the offices of the Bank. It is estimated that some £8 millions of gold sovereigns are in circulation or hoards in Greece. The new drachma currency which was put into circulation against the deposit of old notes is still insufficient even for the present depleted currency needs of the country. Owing to the virtual collapse of the value of the old notes, the initial issue of new notes amounted to the equivalent of £235,000 only. Before the war the normal currency circulation in Greece was equivalent to slightly over £20 millions, so that a substantial expansion in the note circulation is to be expected. The danger is that this expansion may take place solely as a result of covering the Government's budget deficit. That way lies disaster for the new currency, and no metallic backing will avail against that danger.

State-Owned Coalmines in Holland

The Dutch coal-mining area in the province of Limburg is now freed from German occupation; but it still remains part of the operational zone of the western front. It is estimated that even under normal conditions several months will be needed to restore the mines to full working order. Shortly before the war the annual output of the Dutch coalmines had reached 14.3 million tons, against some 4 million tons in 1920 and less than 2 million tons in 1913. Although there has always been a considerable import and export of coal, the record output covers in volume roughly the total demand for coal in Holland. The interesting fact about the Dutch coal-mining industry is that, in 1937, 59 per cent of the total output was raised by four state-owned mines. The remaining 41 per cent were mined in eight privately owned mines. This and a number of other interesting facts about the coal-mining industry in Holland have been disclosed by the Fabian Society in its "Research Series Number 84," with a preface by Mr Jim Griffiths, Labour MP. The facts and the figures are arranged in such a manner that a case is made out for the nationalisation of the mines in Great Britain. The problem is, therefore, whether the high output per man shift—1,770 tons in 1937 against 1,196 in the United Kingdom—is a result of state ownership. If instead of a comparison of the average output per man-shift in Holland and other countries Dutch output figures had been compared with the output in the Ruhr area it would have become clear that during the inter-war period there had been the same increase in output per manshift in Holland and in the Ruhr area—before Hitler came to power. In fact in 1932, the last year with reliable German figures of output per manshift in the Ruhr area, where roughly one fifth of the coalmines were state-owned, had reached 1,627 tons, against the 1,500 tons in Holland.

Unfortunately international comparisons of different coal-mining industries are extremely difficult. What is shown the Dutch coal-mining industry is that it began working on a large scale after the last war. Private industry based on the same standard achieved equal results. Pithead baths,

housing and social insurance, the training of miners and particularly of overseers and mining engineers were largely influenced by German practice. A close study would show that general conditions in the state and privately owned coalmines in Holland as well as in Germany before the advent of Hitler were not very different. It is by no means nationalisation which achieved results in Holland similar to those in Germany but the facts of concentration and the more extensive use of machinery in getting and transporting coal. In Holland the state provided the financial and other means for this concentration; in Germany it was largely the private industry which received considerable state subsidies in various forms. By implication the case made out by the pamphlet is rather that in free economies under equal geological, technical and social conditions, private and state-owned coalmines are equal in efficiency, in working conditions and social conditions for the workers.

New Issue Control

Two Regulations were issued last week-end both of which tend to tighten the Treasury control over new issues. The first removes the exemption which has hitherto operated in favour of issues of £10,000 and under, except in so far as special permission can be obtained. The object of this change is to prevent the raising of larger sums than £10,000 by the expedient of forming a number of companies with that amount of capital all under one control. No change of principle appears to be involved, and the new position is, thus, rather less objectionable than the old. The second is in some measure a consolidation of previous circulars to local authorities on the subject of borrowing by non-negotiable mortgages, with which it is principally concerned. Permission must still be obtained to raise additional accommodation by this or other means, but re-borrowing may be effected by these mortgages provided the minimum life is seven years. The main purpose of the circular appears to be to impress upon local authorities that, except where shorter dates are obligatory, there should be every effort to borrow by mortgages for longer periods than the minimum. No doubt the Treasury is right

You'll enjoy a cup of BOVRIL

For its delicious flavour, for the way it warms and cheers, for the grand feeling of well-being it gives, take a cup of hot Bovril. The war has changed many familiar things, but the high quality of Bovril remains the same.

In bottles—1 oz. 7½d.; 2 oz. 12; 4 ozs. 21½; 8 ozs. 39; 16 ozs. 6½

in saying that the existing levels of interest rates favours such a practice, and it may safely be assumed that the local authorities will do what they can. But every extension in the life of these mortgages—even when they incorporate clauses under which the lender is entitled to premature repayment in an emergency—increases the disadvantage of there being no market for them. The fact that the Treasury finds it necessary to urge its point at a time when all marketable fixed interest securities are rising—a fact of which the finance officers of local authorities can scarcely fail to be cognisant—itself suggests that there is a preference among lenders for shorter dates. Experience shows that investors are prepared to pay a high price for a good market and for insurance against temporary capital depreciation.

Motor Export Impediments

The report of the Associated Equipment Company indicates that shortage of labour and unwillingness to work overtime—apparently as a result of the introduction of PAYE—have reduced production. The report is chiefly notable for a statement by its chairman, Mr. C. W. Reeve. This concerns the all-important question of British exports of motor vehicles, on this occasion commercial vehicles. He states that application was made to the Ministry of War Transport for permission to alter certain main dimensions of goods and passenger carrying vehicles with a view to facilitating export. The new dimensions had been approved by both operators and manufacturers and only official sanction was wanting. One would have supposed that such a suggestion would be given immediate and sympathetic consideration. But, Mr Reeves states,

a decision was, however, withheld, in spite of repeated reminders, until November 20th, and the decision then given seems wholly to ignore the export requirements.

If this is a fair statement of the position, it is difficult to condemn too strongly the action of the responsible authorities. It may well be the case that to increase the dimensions of vehicles for domestic use involves changes in regulations, but the prime need of this country is an increased willingness to adapt itself to modern conditions in which it can no more practise isolation in the economic and technical fields than it can in the political or military. Even the most well-established practice should be critically examined if it conflicts with the interests of either domestic or overseas consumers. In this particular case, there can be no doubt that many people in this country would welcome rather wider vehicles in passenger services, and, if the operators are prepared to work them, only the most compelling reasons would suffice as grounds for rejection of a plea for greater liberty in design.

Rubber and Tin

In spite of the expansion in the output of synthetic rubber in the United States, natural rubber is still needed in substantial quantities. Extra-Pacific supplies are barely enough to go round; hence, the Combined Raw Materials Board, for the third time this year, has issued a reminder that strict economy in its use is essential. Stocks have fallen to the lowest level of the war; production in Ceylon—now the chief source of supplies—has been hampered by unfavourable weather and supplies from other countries are not up to expectations. This does not mean that the shortage is a critical one; but it emphasises the fact that in many of its uses natural rubber still holds the field, irrespective of price. After the war natural rubber will again be in heavy demand; plans have been prepared for the speedy resumption of shipments from Far-Eastern producing countries as soon as these are liberated from Japanese occupation.

In tin, the shortage is less acute; it has been possible to meet essential needs within the limits of extra-Pacific supplies. The proportion of the world's total tin supplies formerly drawn from the areas in Japanese control is smaller than that of rubber—that is, about two-thirds, against nine-tenths. As in rubber, efforts have been made to expand supplies from countries still accessible to the Allies, but the results have been somewhat disappointing. In spite of substantial financial inducements, shipments from Bolivia—the chief producing country still accessible to the Allies—fell from 42,884 metric tons in 1941 to 38,901 tons in 1942; a slight expansion in 1943—to 40,959 tons—has been followed by a renewed decline this year. It has been found that limiting factors, such as the shortage of labour, of transport and the capacity of the developed mines, could not be overcome as rapidly as expected. The production drive in Africa, after its initial success, has not been maintained. In Nigeria, the sharp rise in production in 1942 is reported to have been followed by a setback. Production in the Belgian Congo is not expected to exceed 18,000 tons in 1944, against 20,000 tons in 1943 and 12,400 tons in 1940. As in natural rubber, the speediest method of expanding supplies after the war is to hold ready equipment and stores for shipment to Far-Eastern producing countries as soon as they are liberated. The necessary preparations are on foot; moreover, the reorganisation of British-owned mines in the Far East. In contrast to the preparations for an expansion in the output of rubber and tin, the copper producing industry may soon have to prepare for curtailment. According to a cabled report, the Governor of Northern Rhodesia, Sir E. J. Waddington, informed the Chamber of Mines that the present contract between the Ministry of Supply and copper producers would not be renewed after February 1, 1945.

"Emmies" Expansion

The full accounts of Electric and Musical Industries for the year ended June 30th last show a further expansion in earnings to what would appear to be a new record, although consolidated figures do not go back far enough for this to be asserted with confidence. The shareholders reap no direct benefit from this, as is shown by the three-year comparison given on page 753, since higher tax provision absorbed the bulk of the increase. Tax is, however, provided on all profits to date, including estimated EPT liability. The earnings have been secured on business 96 per cent of which is on Government account, and, presumably, at very low profit margins. As will be seen, net liquid assets exceed £4½ million at June 30th, and, even if the prospective tax liability is deducted, the net figure is still £3,000,000; net fixed assets stand below £1,000,000, but all intangibles and all sums sunk in overseas subsidiaries are written down to £4. Profits have been earned during the year in India, Australia and New Zealand, and the company has recently learned that its factories in France and Belgium have not suffered from military action. As to the general condition of the factories and their contents no information is available, but it is evident that they must have a very substantial value. The group has many other overseas interests of which particulars are still lacking. War-time research in the field on which the group specialises will have valuable peacetime applications, and the group seems well placed to take advantage of post-war develop-

ments. But, apart from the question of the specificity of existing plant, the future of the group will depend in no small measure on how far it succeeds in catering for a large and popular demand. In the past, it has seemed, in some lines at least, to prefer high profits on a restricted output of goods, admittedly, of superior workmanship. There is no intention to advocate the second rate, but in the post-war context expansion of output should be the keynote of policy.

Planning Furniture Production

Industries and firms are beginning to turn their attention to reconversion, and, within the framework of continued controls, wish to plan their production programmes in advance. Before they can begin, there are many points which need to be cleared up, and the answers can only come from the Government. General principles have now been sketched, and the details to be applied to individual industries need to be filled in. An example of the range of questions the answers to which are becoming urgently required is provided by the *Third Interim Report* of the Furniture Industry Post-War Reconstruction Committee. This industry is one whose output for civilian consumption has been cut as much as any, and only the fringe of wartime demand has been covered. The White Paper on the British War Effort (Cmd. 6564) shows that expenditure in 1943 on furniture and furnishings at 1938 prices was £33.8 millions, or 23 per cent that of 1938. The extent of demand after the war will be such that the sooner production can begin the better, and even the speediest reconversion could not abolish the need for controlled distribution. For this reason, every step possible should be taken to minimise delay. The furniture industry makes a plea, in the strongest terms, for information about the quantity and kind of raw materials it can expect to receive in the "interim" period. Without such information no plans can be made. The industry's dependence on imported timber places it completely at the mercy of Government decisions. The report suggests that the Timber Control should be reconstructed so as to allow consumers of timber to make their views known in the planning of imports. The industry also needs to know what machinery will be available, and suggests that this information may be in the possession of the Machine Tool Control. The type of machinery needed will depend on whether plywood or hardboard is to be the predominating raw material. It may be well that, in the case of the furniture trade, the Board of Trade's Furniture Production Committee, now sitting under the chairmanship of Mr. Charles Tennyson, will provide at least preliminary answers to many of the industry's questions. But it is clear that there is need for much hard thinking and for speedy and detailed decisions from the Government, for the benefit of the furniture industry as well as of others.

Shorter Notes

The announcement by the directors of Tankers that they are paying a further 5½ years' arrears of dividend on the 8 per cent cumulative participating preference capital brings the payment up to date to September last. It also means that 84 per cent in all will shortly have been distributed on this class of capital since May of this year. Virtually the whole of the shares are held by United Molasses, which took them over at a 20 per cent premium at the end of 1941. Some idea of the importance of the sum may be gathered from the fact that, on a modest estimate of the actual holding, it represents some 30 per cent on the ordinary capital of the parent company. It will be interesting to see what use is made of this very large return, a substantial part of which must be regarded as a capital, rather than a revenue, receipt.

The shortage of cotton yarn in Lancashire has become increasingly acute. This has been due partly to the suspension of overtime working in the mills at the end of October and partly owing to a higher rate of absenteeism through sickness. It is estimated that output is about 8 per cent lower than two months ago. The shortage of yarn inevitably affects supplies of cotton textiles for the United Nations; and an attempt is now being made to restart idle mills in France. At the end of last week Sir Frank Platt, the Cotton Controller, with some members of his staff, went to France to assist in organising production; it is reported that the United States is prepared to export raw cotton to France for manufacture into clothing for the American forces in Europe.

Another member of the Australian Government has this week given interesting indications of the forthcoming banking legislation. He is Mr Arthur Calwell, Minister of Information, who in the course of a defence of the Government's decision to nationalise the internal air lines said:

The Government is determined to put its policy into effect not only in respect of airlines but also of banking. We have the mandate, the power and the numbers to do it. The Labour Party was never more united and more determined and never more certain of the support of the overwhelming majority of the Australian people. Labour is resolved that vested interests shall not rule and ruin Australia after the war. The people will not be cheated by bank directors of the fruits of their sacrifices in this war. Our banking policy is designed to make sure that there will be no depression after the war.

There is no mincing of words or veiling of intentions in this statement. It is not surprising that the shares of the Australian trading banks have been an extremely weak market since this Ministerial statement was made.

In a memorandum submitted to the Ministry of War Transport—this was discussed in *The Economist* of November 18th, page 674—representatives of the shipping and shipbuilding industries recommended the creation of a joint body for the licensing of shipbuilding orders in the period immediately following the war as a means of ensuring the adjustment of new orders to building capacity and an equitable distribution of new ships among shipowners. On Wednesday it was announced that the First Lord of the Admiralty and the Minister of War Transport have appointed a committee to advise the Ministers on priorities in the construction of various types of vessels and on the allocation of building facilities between British, Allied and neutral shipowners.

THE CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA, LIMITED

NOTICE IS HEREBY GIVEN that the Ordinary General Meeting of Members of The Consolidated Gold Fields of South Africa, Limited, will be held at THE CHARTERED INSURANCE INSTITUTE, 20, Aldermanbury, London, E.C. 2, on Thursday, the 7th day of December, 1944, at 12 noon, for the purposes following, namely:—

To receive and consider the Statement of Accounts and Balance-sheet and the Reports of the Directors and Auditors thereon for the year ended 30th June, 1944; to confirm the dividends paid on the first and Second Preference Shares; to sanction the declaration of a dividend on the Ordinary Shares; to elect Directors and Auditors, to transact the other ordinary business of the Company, and as special business to consider, and, if thought fit, pass a Resolution approving the alteration of the Articles of Association of New Consolidated Gold Fields, Limited, by the addition of an Article extending the existing authority of its Directors to grant pensions or other allowances so as to include the Directors, such Article to be in the form set out in the Report of the Directors of that Company dated 24th November, 1944.

Holders of Share Warrants to Bearer wishing to attend or vote at this Meeting must deposit their Warrants with the Company at the Registered Office in London, 49, Moorgate, E.C. 2, not later than 2nd December, 1944, together with a declaration on the form obtainable at that Office.

Dated this 29th day of November, 1944.

By Order of the Board,
R. CARR TAYLOR, Secretary.

Registered Office: 49, Moorgate, London, E.C. 2.
Emergency Office: Motcombe House, Motcombe, near Shaftesbury, Dorset.

ROYAL BANK OF SCOTLAND

ANNUAL GENERAL COURT OF PROPRIETORS

SATISFACTORY RESULTS—INCREASED PROFITS

DUKE OF BUCCLEUCH'S ADDRESS

The annual general Court of Proprietors of the Royal Bank of Scotland was held at Edinburgh on the 29th ultimo, His Grace the Duke of Buccleuch and Queensberry, P.C., G.C.V.O., Governor of the bank, presiding.

His Grace said,—I assume it is your pleasure that the annual report and balance sheet, with auditors' report, which have previously been circulated, shall be taken as read.

Before dealing with the ordinary business of the meeting I have to refer to the loss sustained by the bank by the death of the Rt. Hon. the Earl of Strathmore and Kinghorne, K.G., K.T., G.C.V.O., who was appointed an extraordinary director of the bank in 1904 and had filled the office of deputy-governor since 1917. His Lordship displayed a warm interest in the affairs of the bank, and we acknowledge with gratitude his long association with us. The death has also occurred of Mr William D. Graham Menzies, one of our extraordinary directors. Mr Graham Menzies had been an extraordinary director since 1917, and in his passing we regret the loss of another loyal and trusted colleague.

In May of this year Sir William Whyte retired from the post of general manager of the bank, a position he had filled with outstanding distinction since 1933. He was appointed an ordinary director in January, 1944, and we are glad indeed to have the continuing advantage of his skilled knowledge and experience at our command. Our new general manager is Mr John McArthur Thomson. Mr Thomson, who has spent most of his career in the Royal Bank of Scotland, was for some years with our associate bank, Williams Deacon's Bank, Limited. As general manager of that institution he discharged the responsible duties of his position with distinction, and we welcome the return of one so ably equipped to maintain the traditions and high standards of the office he now holds.

BALANCE SHEET

Turning to our balance sheet, deposits and other credit balances at £104,004,568 are a record, and are specially noteworthy for the fact that we have now passed the one hundred million mark. I can but add how much we wish that this fresh record had been achieved under happier circumstances. Our note circulation at £8,978,587 exceeds last year's total by over £1,350,000, and I would once more appeal to the public not to retain in their possession any more bank notes than are necessary for their normal requirements. The need for saving is still as great as ever, and I can think of no better way of caring for surplus cash than by lending it to the Government through the already well-known channels which exist for the purpose. The total of acceptances and indorsements and other obligations is around last year's figure and does not call for comment.

On the assets side you will observe that our position is again very liquid. Quick assets total £27,655,874, and these, with Treasury deposit receipts £12,500,000, represent almost 35 per cent. of our liabilities to the public. British Government securities at £45,258,835 are up on last year's total by nearly £2,000,000. These figures, in conjunction with an increase of £500,000 in Treasury deposit receipts,

evidence substantial support to Government needs.

All our investments are valued at or under market prices ruling on the date of our balance, and short and medium-dated loans form a high proportion of our Government investments. Our bill portfolio shows a modest decline of £85,395. The support of customers engaged in vital war work is still of paramount importance, and we are pleased to report an increase of £919,350 under advances on cash credit and current accounts.

PROFITS

After providing for all taxation, profits show an increase of £7,658 which, I feel, must be considered satisfactory in view of the weight of taxation and increases in charges of management.

APPROPRIATIONS

The directors are pleased to be in a position to recommend that a dividend for the half-year on the capital stock at the rate of 17 per cent. per annum be declared; that £30,000 be carried to property maintenance reserve account; that £60,000 be contributed to the staff pension fund, and that the balance of £89,368 be carried to our inner reserves against contingencies.

BUSINESS OF THE BANK

The business of the bank continues to progress along sound lines. Our associated banks, Glyn, Mills and Company and Williams Deacon's Bank, also continue to prosper, and I would again commend to the attention of our numerous customers the direct services we are in a position to offer to them through our association with these two institutions.

POST-WAR PROBLEMS

The wonderful achievements of Allied Arms during this year, with their assurance of complete and final victory at no far distant date, have directed special attention to the problems of the peace, and I feel that, in the interests of all, we must be prepared to face some measure of control for some time to come. When the production of goods for civilian consumption has, by force of war needs, been restricted to the barest minimum and when, despite heavy taxation, potential spending power has gone on accumulating over the same period, it might well prove disastrous if this spending power were unleashed before production has been given adequate opportunity to make up the leeway.

FINANCE FOR INDUSTRY

In so far as finance is required to set the wheels of industry in motion, I do not doubt—in fact I feel sure—that the banks of this country will play an effective part, and that legitimate and reasoned demands for accommodation will be fairly met where character and credit-worthiness are established. But finance is not everything: in itself it is but a form of fuel which, if the drive from other directions is lacking, is bound to burn itself out. For a prosperous Britain after the war there must be a maximum of productive effort, and this

applies to employer and employee alike. Each in his own sphere will have to display the highest standard of efficiency, and the highest standard of efficiency is possible only when the individual employer and employee are permitted to work under conditions which afford the best possible encouragement to both of them.

EXPORT TRADE

In the years immediately following the end of the war, and owing mainly to the great need for an increase in the supply of goods for civilian consumption, a state of something like full employment should be achieved by the orderly dispersal of demobilised men and women into industry. Taking a short-term view, therefore, the industrial outlook for this country in the immediate post-war years should not present many difficulties which cannot be overcome. But the short-term view—necessary as it may be on occasions—is only permissible as a matter of expediency. We have not only to visualise the prospect of a return to a highly competitive world, but to prepare for it and, when we do so, we must think of ourselves largely in relation to our efficiency as an exporting nation. Figures issued recently by the Government show how substantially we have had to sacrifice our exports to war needs. That was inevitable and, with the tasks ahead of us, there is little to be gained by looking backwards. For a time, our international trade may well be influenced by Government regulations affecting both exporter and importer. But, for a start, we may well accept as fundamental the fact that nothing but our best—our best is still a standard which others will find it hard to excel—will enable us to export on a scale which will make it possible for the country to enjoy a high standard of living. Buyers abroad will not purchase our goods when others are offering equally attractive wares on more attractive terms.

AGRICULTURE

Agriculture has played a magnificent part in serving the country's needs in wartime and, if that has been achieved with some advantage to itself, the industry deserves well—and it is to be hoped will continue to receive well—for all it has done. Changes must no doubt be faced in agriculture as in other industries, and we can be concerned in this old and basic industry of our country, the future policy will provide for all those engaged in agriculture the fair reward which their services deserve.

SCOTTISH AFFAIRS

There are few industries in Scotland not linked up in one way or another with wartime needs, and so I can again only speak in general terms of Scottish affairs. It is common knowledge that the heavy industries have prospered during the war years and that the lighter industries allied thereto have likewise done well. But what of the future? If there were a falling off in shipbuilding how would Scotland fare? Every effort must be made to attract new light industries. We know that the Secretary of State for Scotland and the Scottish Council on Industry are actively interested in these matters. Industrialists with receptive minds must also be ready.

APPROVAL OF ACCOUNTS—DIVIDEND

I now beg to propose that the report, containing a statement of the accounts and balance sheet, be approved, and that out of the profits of the year a dividend at the rate of 17 per cent. per annum for the half-year, under deduction of tax, be declared in conformity therewith.

The report was approved and the Governor, extraordinary directors and the retiring ordinary directors were re-elected and the auditors were re-appointed for the ensuing year.

LAKE VIEW AND STAR, LIMITED

MR G. GOLDTHORP HAY'S STATEMENT

The thirty-fourth ordinary general meeting of Lake View and Star, Limited, was held, on the 27th ultimo, in London.

Mr G. Goldthorp Hay (chairman and managing director) presided.

The following is an extract from the chairman's statement, circulated with the report and accounts for the year ended June 30, 1944:

The operating profit amounted to £311,819, as compared with £389,378, the reduction being due to the lower tonnage treated, namely, 315,175 tons, against 321,509 tons, and to a fall in the grade of ore, namely, 5.27 dwt., against 5.95 dwt. In comparing these figures, shareholders are reminded that the higher grade of ore treated in the previous year was due to the inclusion of rich patches of specimen ore encountered in the Eastern Group.

An interim dividend of 12½ per cent., less tax, was paid in June last, and the directors recommend the payment of a final dividend of 25 per cent., less tax, making a total distribution of 37½ per cent., which is the same rate as the previous year. These dividends absorb £105,000 net. £15,000 has been transferred to general reserve, leaving a balance of £30,637 to be carried forward.

ORE RESERVES

Ore reserves estimated at 4,097,500 tons averaging 5.01 dwts., show a reduction of 5,100 tons from the preceding year, while the value remains the same. The difference in tonnage is accounted for by a reduction in broken ore of 39,700 tons and an increase in positive ore of 24,600 tons. Positive and broken ore at 3,779,500 tons with an average value of 4.9 dwt. represent 92.2 per cent. of the total reserve. This satisfactory result is mainly due to concentration of development in the most promising sections and to further discoveries of new ore in working stopes that need little or no development. It might be mentioned that 76.7 per cent. of the reserve is in the mines of the Western Group and 23.3 per cent. in Lake View and Associated, but during the year, in order to concentrate operations in areas most easily worked, 56 per cent. of the tonnage mined came from the Eastern Group, where the Lake View Mine produced nearly 40,000 tons more than in the preceding year, over 4,000 tons of 26.9 dwt. ore being won from the Perseverance Lode last branch stope.

At Chaffers Plant 315,175 tons averaging 5.27 dwt. were treated for an extraction of 10.78 per cent., and 794,935 tons of residues averaging 0.86 dwt. were also treated at the retreatment plant.

The report and accounts were adopted.

WILLIAM DOXFORD AND SONS, LIMITED

MR E. P. ANDREAE'S STATEMENT

The annual general meeting of William Doxford and Sons, Limited, will be held at the company's offices, Sunderland, on the 6th. instant.

The following is the statement of Mr E. P. Andreae (the chairman) which was published with the report and accounts:

The net profit for the year after providing for taxation and deferred repairs is £73,323, as compared with £164,005 for the previous year.

The general reserve has been increased £50,000, and a further £30,000 has been added to reserve for contingencies.

As shareholders were informed in a circular dated October 10th of this year,

completion of the accounts was unfortunately delayed. Your directors therefore decided to declare a second interim dividend of 10 per cent., less tax, on the ordinary shares, to be payable on the customary date, namely, November 1, 1944. In consequence, no final dividend will be recommended to the annual general meeting.

I again take the opportunity of paying tribute to all the officials, staffs and work-people of the company for their loyal and unremitting efforts throughout the year.

WALTER SPENCER AND COMPANY, LIMITED

OUTPUT MAINTAINED

DIVIDEND OF 12½ PER CENT.

The eighth annual general meeting of Walter Spencer and Co., Limited, was held, on the 29th ultimo, at the Royal Victoria Hotel, Sheffield.

Mr John R. Winskill, the chairman and managing director, presided.

The following is the chairman's statement circulated with the report and accounts for the year ended September 30, 1944:

The output during the year was more than maintained, and the gross profit was almost identical with that of the previous year, with the exception that your directors have deemed it advisable to make provision for rebate to the Government on the sales of certain products during the whole of this year and nine months of the previous year; the reduction shown in the balance from trading account is approximately equivalent to the amount of that provision. The negotiations are not yet concluded, but in the opinion of the directors the provision is ample.

During the year the taxation liabilities on the accounts to September 30, 1943, have been agreed, and the reserve for taxation includes the balance of liability to that date and provision for liability for income-tax and excess profits tax to September 30, 1944. No credit has been taken in the accounts for the post-war credit in respect of excess profits tax.

ALLOCATION OF PROFIT

Your directors recommend the payment of a final dividend of 7½ per cent., less income-tax at 10s. in the £, making (with the interim dividend of 5 per cent. paid, less tax at 10s. in the £) a gross dividend of 12½ per cent., less tax at 10s. in the £. After providing £3,750 for the final dividend and £5,000 to be added to reserve (making that account £35,000) and writing off £471, the cost during the year of war damage insurance of plant and buildings, there remains to be carried forward £24,497, subject to the further liability to income-tax on profits earned to September 30, 1944, and due for payment after that date.

Serious consideration is being given to the necessity of providing for post-war conditions, and your directors are satisfied that the company is in a position to meet any problems that may arise; there is evidence that as soon as the Government give the word to "Go ahead" there will be little to fear.

Mr E. Ransom Harrison, FSAA, chairman of the Rover Company, has been invited to join the board, and I am pleased to say that he has accepted; his appointment will come before you for confirmation at the annual meeting.

Your directors are again pleased to place on record their sincere appreciation of the services and loyal co-operation rendered by the staff and employees during the year, and they also, on their own behalf and on behalf of the shareholders, extend best wishes to all employees serving with His Majesty's forces.

The report and accounts were adopted.

AGAR, CROSS AND COMPANY, LIMITED

RESUMPTION OF DIVIDENDS

MR S. C. SHEPPARD ON THE OUTLOOK

The thirty-eighth ordinary general meeting of Agar, Cross and Company, Limited, was held, on the 28th ultimo, at the Institute of Chartered Accountants, Moorgate Place, London, E.C.

Mr S. C. Sheppard (the chairman) presided.

The following is the chairman's statement circulated with the report and accounts:

The report and accounts for the year ending June 30, 1944, are clearly set out and call for little explanation. Your attention is drawn to the improved financial position of your company. £138,600, the balance of the 5½ per cent. five-year unsecured notes, has been paid off and a satisfactory cash balance built up for such times as replenishments of imported stocks are possible. There are no trade bills under discount nor advances from banks.

THE YEAR'S PROFITS

The net profits for the year, after allowing for all known charges and Argentine taxation, are slightly less than those of the preceding year. You will note that, in addition to a substantial provision for Argentine income-tax and social law requirements, this year's profits have to bear the estimated charge of £77,000 for UK income-tax and National Defence contribution, the carry forward of previous years' income-tax losses now being exhausted.

No Excess Profits Tax standard has been agreed with the authorities, since profits to date do not come up to the estimate of this standard.

Bearing in mind the difficulties with which we have to contend, your board consider the results satisfactory, and at long last they are able to recommend the distribution of a dividend on the ordinary stock.

During the past year I am able to report a further improvement in the sales figure, but no doubt a portion of this must be attributed to higher prices. Shipments of goods from both here and North America are increasingly difficult and scarcer than ever, but no efforts are being spared in making every preparation for the coming day when restrictions will be relaxed.

Considerable progress is being made in Argentina in local industrialisation, and it is reported that during the past calendar year the net value of local industrial production exceeded the net value of farming production. How much of this is due to war conditions remains to be seen, but it is not easy to visualise Argentina's future internal economy being other than predominantly agricultural and pastoral, nevertheless, as I mentioned to you last year, we are always adjusting our many trading connections to meet changing conditions.

THE OUTLOOK

As to the future, I must confess that it is harder than ever to forecast. Argentina is financially very strong, her exchange is stable, local industries are thriving and cattle and cereal prices leave a good margin. Therefore, were it not for the increasing difficulties in importing new machinery and plant of all kinds, I would unhesitatingly look for a steady improvement in your company's fortunes, but difficulties stand in the way and the future is obscure. I can only hope that the existing troubles may fade away, for we are ready, both financially and otherwise, to take full advantage of all opportunities as they arise. Once again I would like to tender the thanks of the board to your staff in all departments, and to wish success to those members who are serving with H.M. Forces.

INDUSTRY AND TRADE

Jute Mill Conditions.—An informal technical committee, consisting of representatives of employers, employees and factory inspectors, has been appointed, with the consent of the Minister of Labour, to consider practical methods of improving conditions of work in the jute industry. Its terms of reference cover methods of implementing certain requirements of the Factory Acts, 1937. Atmospheric conditions, cleanliness, exhaust ventilation, fencing and spacing of machinery, and the establishment of medical and welfare services, will be considered. The committee, under the chairmanship of Mr F. W. Hunt, has begun its meetings.

The "Economist" Sensitive Index.—There was no change in the index during the week ended November 22nd. The complete index (1935 = 100) was 158.6; crops 135.6; and raw materials 185.5.

Castles in the Air

A LIMITED working edition of Professor Abercrombie's outline plan for Greater London has been released this week to the press and to the local authorities in the area. Copies will be made available to the public as soon as the maps and diagrams can be printed. The plan forms the second half of a vast and comprehensive blueprint for the London area, the first half being the plan for the County of London—the inner area—drawn up by Professor Abercrombie and Mr Forshaw. The present plan covers all of Middlesex, Surrey and Hertfordshire, large parts of Kent and Essex, and smaller parts of Bedfordshire, Buckinghamshire and Berkshire. Put together, the two plans cover an area extending between twenty and thirty-five miles outwards from Charing Cross and containing a pre-war population of 10½ millions, 4 millions in London County and 6½ millions in the rest of the area. This is indeed planning on the largest scale—but no larger than is needed, for London's tentacles stretch even farther than do these two plans.

It is fortunate that the London County plan and the Greater London plan had the same guiding genius, or they stand or fall together. The recipe now offered to London is actually much the same as the Aber-

crombie recipe proposed for other blitzed and congested cities, such as Merseyside and Plymouth. But this time there can be much less doubt whether the recipe is the right one—and much more doubt whether it can be effectively applied. London's problem has been summed up simply: it is too big. Of this there can be no shadow of doubt. It is shockingly overcrowded over a wide area, it falls short of the most elementary standards of open space, its average worker spends an eighth or more of his waking life in travelling, its transport congestion is the despair of the authorities and a serious cause of industrial inefficiency. With size has come sprawl—a continuous jumble of factories and flats, docks and tenements, offices and houses, frequently so placed as to offer the maximum inconvenience to firms and workers alike.

The London plans offer a clear-cut remedy. In the first place, London should be forbidden to grow any farther and as much as possible of its overcrowded population and congested industry should be sent elsewhere. In the second place, its "green belt" should be enlarged, both to round off and stop urban spread and to provide an adequate recreation ground for its vast population. In the third place, its "decanted" population and industry

should be resettled in suitable existing towns and in specially created new satellite towns beyond the widened "green belt."

The important issue is, of course, not the desirability of such a policy of decentralisation but the scale on which it can be attempted. The London County plan tentatively suggested a general maximum density of 136 persons to the acre, involving an exodus of 618,000 of the county's population. Those critics, such as *The Economist*, who thought this target too low, must welcome the wider ambitions of the Greater London plan. This defines four concentric rings outside the County of London, the "inner urban," "suburban," "green belt," and "outer country"; and it proposes not only that there should be no more building in the first two rings but that a total of 415,000 people should be decentralised from certain areas within them. This means that roughly a million people altogether, from the County and from the first two rings round it, would have to be resettled farther out. It is suggested that a quarter of them should go to existing towns and nearly 400,000 to eight entirely new satellite towns, both types of "reception area" being mainly in the "outer country" ring; that a further quarter of a million should go right off the map beyond the plan's orbit; while 125,000 would be accounted for by existing immediate housing schemes.

It is recognised that population movements of this scale would be completely impossible without a parallel and co-ordinated decentralisation of industry; and great care has been taken to select the new sites with full reference to their industrial suitability. That brand-new towns should be the main reception areas for decentralisation is the plan's boldest feature. But experience indicates that it will be harder and slower work to attract both industry and workers there rather than to existing centres.

The main proposals of the Greater London plan are summarised in full on page 798.

It would be tempting to praise the undoubted excellence of the London plans; to stress the necessity of implementing at once their main principles; to point out that there is nothing impossible or even, compared with many wartime tasks, very difficult about doing this, and that the gain in efficiency and happiness would vastly outweigh the effort involved; and then to sit back and await results. But the hard fact is that results will not follow. The blueprints for London and other great cities have been greeted with great and unanimous applause from press, public and politicians alike. But it is a case of all praise and no action, of all cackle and no horses. The truth is that at the moment regional plans are no nearer realisation than castles in the air.

There are three reasons for this, which, put together, create a major dilemma for the planners. In the first place, there are still no powers to implement regional plans of this character, nor are any likely to be created in the near future; secondly, if and when there are adequate powers, the present planning machinery—and the present plans—will have to be largely superseded; and thirdly it is by no means certain that the community would accept in practice the limitations on individual freedom of decision which large-scale regional planning would entail.

That there are no proper powers for regional planning was made clear by this year's debates on the Town and Country Planning Bill. The essence of regional planning lies in the orderly placing of housing and industry. Since public authorities can now exercise control, if they choose, over housing location, the linchpin of the whole policy lies in an effective control of industrial location. Such control was foreshadowed in the White Paper on full employment. But it is highly doubtful whether industrial control, when it comes, will extend so far as the positive direction of factories to particular sites, and in any case it is to be exercised by the Board of Trade with the primary aim of avoiding unemployment.

In the meantime, the regional plans require that some very small authorities should undertake vast housing programmes, while many large authorities should abandon

all building in their areas. Clearly nothing of the sort is going to happen. On the contrary, it is far more likely, for instance, that existing vacant frontages in the London area, which are intended by the plans to provide for local population adjustment, will be among the first sites chosen for general rehousing. Moreover, these somewhat pessimistic conclusions relate to the exercise of control over the location of new houses and factories, and difficult though this may be, it is clearly infinitely easier than the re-location of existing buildings. The prospect that adequate powers will be given to local authorities for re-location, or that they would be exercised if granted, is obviously even more remote. Yet, with population growth at an end, re-planning without re-location will move very slowly indeed.

Nor is it simply a matter of legal powers; the financial aspect of comprehensive planning must also be considered. The cost of replanning their areas in a bold and spacious way will be prohibitive to most local authorities without the introduction of some effective method of collecting "betterment" to offset the ruinous "compensation" they will have to pay. Even if betterment is effectively diverted to the public coffers, it will tend to come in long after the compensation has to be paid. Moreover, both compensation and betterment relate only to the land and do not touch the cost of what is done with the land after it is acquired. It is most unlikely that the Coalition Government will enact an effective solution of the land problem even if it attempts the task. But, beyond this, regional planning would weigh very differently on the various local authorities in the area, giving to some and taking from others an inordinate amount of population and rateable value. This is inevitable if the interests of the region as a whole are to be served, but local interests cannot or will not see this. Regional planning requires regional government; but local government reform, theoretically one of the easiest, is in practice the most intractable of legislative problems. The Government's suggested remedy of a new boundary commission is merely laughable when applied to the London area, in which the need is to move people over distances which span ten or more local government areas; and it is hardly less laughable in the case of Sunderland or Southampton.

It would be stupidly fatalistic to abandon any attempt at regional planning merely because the necessary powers are hard to get. On the contrary, such powers should be constantly and eagerly pressed for. But the King's Speech has shown that there is no hope of new planning legislation in the present session—perhaps not in the next year. In any case, the thorny nature of the issues involved precludes any quick solutions. It is rapidly becoming clear that the main chance has already been lost. Houses will have to be erected at once when the war is over, and as they cannot be put where they ought to go, they will go where they can.

The second planning difficulty—that when, and if, the legal power and the financial ability to plan come into the hands of authorities willing to use them, the existing machinery and plans will be found inadequate—is much less obvious. The point to remember is that the regional plans that have been prepared for London and other great cities are not "town plans" at all but highly complex economic schemes—of the type that, in a totalitarian economy, would be worked out by a large, varied and highly skilled team of economists. Fully implemented, they would greatly affect the efficiency of industry and the welfare of innumerable individuals; and they would require a very high degree of co-ordination between senior Government departments.

It is no disrespect to the Ministry of Town and Country Planning to say that its very junior status and its rather one-sided staff do not fit it at present for such a task of co-ordination. Similarly, Professor Abercrombie's plans for London and other cities will never, and surely are not intended to be, carried out in exact detail. For example, the siting and size of the proposed new satellite towns around London with a population of about 50,000 each is a highly technical question, calling for

close attention from a team of skilled industrial advisers. The Board of Trade and industry itself would rightly demand to have a direct say in the location of the satellites. Professor Abercrombie, with the best will in the world, has not the staff or the facilities to give a final judgment on such vital and intricate issues.

The third obstacle in the way of regional planning—the possible unwillingness of the community to accept its implications—can be put briefly. Planning of this type involves not only close control over the freedom of movement of industry and the individual, but in some cases their compulsory uprooting. Such powers may be willingly accepted by firms and workers as necessary in the long run to their efficiency and welfare. But the issue is by no means certain. To paint the Government as obstinately refusing to oblige a public which is eager to be planned would be a gross distortion of the picture.

It is true that the public wants much stronger planning powers than the almost negligible ones which exist at present. But it is highly doubtful whether it would welcome in practice the full implementation of the present regional plans or similar detailed schemes. The immediate aim should therefore be to bring together plans and practice—to increase the means of action and reduce the plans. The Government should be incessantly prodded to create adequate legal powers; but the advocates of regional planning should not forget that only the free will of the community can sanction their full use and the very heavy expenditure which this would entail. The public will need persuading as well as the Government.

Meanwhile the planners could do great service both to the public and to themselves by approximating their plans more closely to existing realities and to the present

state of public opinion. A new and modified plan for London or elsewhere, which has some chance of being acted upon immediately, would be worth a pile of "super-plans" discarded because they aimed too high. This is not to say that the present regional plans are worthless. Far from it, they are extremely valuable. They represent a vast amount of detailed and laborious work, conscientiously carried out. They have fired and stimulated the public imagination, giving to the inhabitants of Plymouth and Liverpool an idea of what their towns can look like, if only they will it and work for it. This perhaps is their greatest achievement. But it is clear that they should be regarded as pointers to the ideal rather than as programmes for practical action.

Yet much can be done at once to implement the general aim which lies behind all the various regional plans—that of decongestion and its corollary, decentralisation. The present absolute powers over housing of the Ministries of Health and Works could be used to encourage voluntary dispersal to suitable sites. Voluntary evacuation from congested areas by firms and workers can be officially encouraged and helped. All these and other forces could be set into motion by a definitive lead from the Government. Such voluntary action is all the more necessary when it is realised that effective and complete regional planning is impossible without powers and funds which seem at present to be beyond "the great beyond."

It is a depressing task to greet with cold water a courageous and imaginative plan for the greatest, and one of the most sorely tried, cities in the world. The Londoner, of all persons, deserves a fine city, as Britain deserves a fine capital. But it would be a poor service to the cause of regional planning to echo the applause without pointing to the lion in the way. Only by a cold assessment of the realities can the best possible results be achieved.

The Western Front

IN August, when the Allied armies were sweeping across France and Belgium and liberating territory at a mile a minute, it was not only ordinary men and women who said "It will be all over by Christmas." Chiefs of staff committed themselves to the same view. Later, after the setback at Arnhem, the estimates were modified to "the Rhine by Christmas." But Christmas has nearly come and the Allied line, in the crucial sector, still stands well to the west of the river. Only in Alsace have the Allied armies been able to recapture the *élan* of the earlier battles. On the borderlands of the German Rhineland the fight is a bitter yard-by-yard advance through a densely populated countryside.

This fact helps in part to explain the effectiveness of the Germans' stubborn defence, but the central fact in their resistance is the Nazis' success in overcoming the grave political crisis of the summer. It is perhaps even true to say that the efficiency of the German military machine has profited by the Generals' conspiracy, which appears to have put an end to Hitler's disastrous strategic intrusions and made it possible for some of the ablest Generals to be brought back into an almost unchallenged position. The structure of the *Volksgrenadier* divisions, where very young men are fighting side by side with old and seasoned soldiers, the mobilisation of the *Volkssturm* and the drafting of all available civilian labour to defence digging—all these point to a unity of purpose between Himmler and the Generals which Army and Party had increasingly lacked in the preceding years.

The material situation is, however, growing more desperate week by week. The only assets to set against dwindling resources are much shorter lines of communication and a far more compact front to hold. It is just possible that with the comb-out of last summer, the call-up of every spare civilian and the year's new conscript classes, the Germans can still put into the field as many men—though not so well equipped—as at the time of the attack on Russia, in spite of very great losses in killed, wounded and prisoners. But this has been made possible

only by throwing all resources into the war and leaving no margin for civilian life. However, the example of Russia has shown how long life can still be supported under these conditions. The harvests have supplied sufficient rations, there is still enough coal, iron ore, oil and light metals to keep the wheels of war industry and the war machine turning. If the present front can be held, neither a political nor an economic collapse is very likely to break the German front.

The present front is, however, crucial. It defends the two powerhouses of the German effort—the Rhine-Ruhr complex and Silesia. If either were lost, a serious full-scale military defence would become impossible in a very short time. This fact is reflected in German strategy. Every yard on the way to Cologne is stubbornly defended, whereas, in Alsace, a general withdrawal has been carried through.

Quick victory depends upon an Allied break-through in west and east to sever Germany's economic heart and brain from its titan body. The other two fronts—the British front in Italy and the Russian front in Central Europe—are subsidiary, for neither will bring the Allies to the heart of the industrial Reich. So far, on the two crucial fronts, the Germans have achieved a measure of stabilisation. In the west they have had the help of unspeakable weather. Air superiority cannot be fully deployed over the battlefield and the shattering of Germany's communications and oil reserves from the air is intermittent. The Germans have also earned a high dividend on their investment of men and arms in the Channel ports. The enormous divergence between the productive capacity of Germany and the Allies has been growing day by day more unfavourable to the Germans, but the lack of ports and bad communications in western Europe have prevented the Allied Commanders from making their steadily increasing physical superiority register in the field.

It may be, too, that the actual organisation of the military command has had a retarding effect. Ever since Field Marshal Montgomery left the post of overall mili-

tary commander, under General Eisenhower, of the ground forces in western Europe, no one leading soldier has had immediate oversight over the whole western front, on which five or six armies are now engaged. It is impossible for the layman to dogmatise on such matters, but it is perhaps relevant to ask whether the pattern of the latest battles—a frontal attack on each segment of the front—is not in part dictated by the separation of each army command. All the really decisive break-throughs in the war so far have been achieved by the synchronised development of a feint at one point of the front followed by a full thrust elsewhere.

Victory both in the east and in the west is not in doubt. The Allies' overwhelming superiority in physical power is sufficient to drive the enemy back, if necessary yard by yard, however stubborn his defence. But the prospect of fighting such a war across the densely inhabited lands of Germany is an appalling one. It may well be that, as at Caen, the present dogged phase of the fighting is a prelude to new and sweeping advances, and obviously

every strategical and physical resource is being strained to that end. Yet it may still be asked, even though the question has been posed so often since the war began, whether the total absence of political warfare from the campaign is not assisting the uneasy stabilisation the Germans have managed to achieve?

Even today, when German territory is already in Allied hands, the average German has still not the faintest conception of what will be his fate at the Allies' hands after his country's defeat. Worse still, those who might be in a position to repeat the Generals' conspiracy have no idea whether on the one hand the coalition of Russia and the West may not after all break down in time to allow for "negotiated peace" or on the other whether a dictated peace would be any better or worse than Himmler's Terror without End. Those who still press for a clear statement of the terms for Germany have by now been belaboured into despondency. Yet in the present military situation can any factor be neglected which might contribute by a day to a shortening of the war?

Old Man of the Sea

IT is easy to understand why there was no reference to the coal industry in the King's Speech this year. No other subject has throughout the war been so productive of controversy or compromise, or has aroused so many party political passions. At the present stage of strained party relations no Government, uncertain about its length of life, would risk burning its fingers handling coal. But the omission, even if natural, is regrettable. It means that this coming winter, when the demand for coal will be greater than ever, production will be at its lowest. Output, as will be seen from the latest production figures shown on page 822, is declining at an alarming rate, and there seems to be no hope of arresting the decline. No doubt it will be possible to muddle through, as the nation has muddled through five winters of war. But if ever rapid decision and firm action were needed to set the coal industry on its feet and ensure the stability of the country's most important industry, it is now.

In a recent speech Mr Herbert Morrison described the coal industry under its present ownership as backward and inefficient, "an old man of the sea" which the Labour Sindbad must cast off as rapidly as possible. This week, the Labour conference is discussing how to do this. Its plan for nationalising the fuel and power industries, however, concerned mainly with the technique of administration, does not prove that nationalisation would in fact result in greater efficiency, and it is doubtful whether the Labour party as a whole realises the technical implications of its programme. It may be that Mr Robert Foot's plan, expected before the end of the month, will get nearer the mark. But just as most miners tend to be bemused by the words "nationalisation" and "control," so the owners, on their side, are so nostalgic for their pre-1939 "freedom of action" that they tend to pin their hopes on the removal of Government control or on a sudden improvement of human nature among the miners. Caught between two fires, the Government's position is far from enviable. But both owners and miners are right to press for a decision, since the industry will be starved of capital so long as uncertainty lasts. The general public, wishing "a plague on both your houses", is getting impatient in its desire to see peace and production in the coalfields.

There will be no wish to prejudice the owners' plan. For all that anybody knows, it may provide the heavenly solution. The Mining Association certainly shows, in choosing an outsider as chairman, their desire to start with a clean slate, while Mr Foot's sincerity in wishing for better industrial relations is not in question—though the owners' proposals for attaching disciplinary conditions to the payment of the minimum wage threatened to have the very opposite effect. The decision, announced on Wednesday, to postpone this scheme and instead to set up a joint owner-miner committee to investigate the causes of falling

output, may be taken as a welcome sign that both sides are ready to bury the hatchet in the immediate national interest. But the test of this committee, as with the innumerable committees set up to examine the coal problem, will be its effects in terms of output. Good will and cooperation, though important ingredients, cannot solve the coal industry's problems, which must be tackled in a severely practical manner.

To say that a fresh approach is the only hope has itself become the stalest of clichés. Yet there has never been any doubt about what the fresh approach should be. It should be technical; it should concentrate on so rearranging the industry, regardless of ownerships, that the maximum possible productivity with present equipment is secured and the best possible basis is provided for the further application of technology and capital. The criteria should be neither financial nor political but physical; how can output per manshift be most rapidly increased? The immediate goal should be to raise output from its present level of one ton per manshift (of all wage earners) to the 1938 level of 1.12 tons. And the further objective should be to increase output per manshift at least to 2 tons. This productivity criterion is not a complete programme for the industry. The miners' standards of life and welfare could be further improved, and the distribution of coal after it leaves the pithead is notoriously inefficient. But output per manshift is by far the most important consideration. It is much more important than the controversy whether the industry should be publicly or privately owned, the answer to which will emerge as a by-product of the technical argument.

There is equally little doubt about the chief means of achieving a higher productivity. They are two in number: first, such a redistribution of the available labour force between the pits that labour is applied where it will be most effective; and second, a much more rapid application of modern mechanical and scientific technique within each pit. The first implies large-scale consolidation. The second requires large-scale injection of capital. It has been obvious for at least a decade that the industry, as at present constituted, will not carry out the first and cannot provide the second. That is the practical and technical justification for agreeing with Mr Morrison that "root and branch" reforms are necessary.

It does not in the least follow that nationalisation, as usually understood, would produce the result. Indeed, in so far as it meant an indefinite continuance of Government control, with the Miners' Union sitting on the controller's doorstep and with the lodges objecting to every measure to increase productivity, whether it be the closing of an

uneconomic pit or the installation of labour-saving machinery, nationalisation would make matters worse. The nearer the industry can get to being run by its mining technicians, without interference from boards of directors or union lodges or bureaucrats in London, the healthier will it be.

The proper use of technical skill should, indeed, be the central idea of any reorganisation scheme. The most promising method of procedure would be to concentrate the mines in a number of regional groups, each group being as large as can be run by one group of technical managers. In some cases that would mean the whole of one of the present districts, in other cases there would be several productive units to each district. In the whole country there might be between two and three score. Each of these should not merely (as the fashionable phrase goes) "be regarded as a unit," it should be a unit, in one ownership and under one management, with no inhibitions about concentrating production on the most economic pits. But such a policy involves social as well as technical considerations, so it is important that the redundancy programme should be planned over a sufficiently wide area to ensure that the closing down of pits did not leave a trail of derelict villages and idle workers. In most cases, the miners could be conveyed to and from their work, but if necessary there should be an ordered transfer of mining populations. An overwhelming advantage of such centralised planning should be the spreading of technical ability.

The spreading of technical ability would open the way to the second stage of the programme—the application to the whole industry of the most modern and effective methods of production now in use in this or other countries. This means, in the main, mechanisation. The 1943 figures show that 69 per cent of the output is cut and 66 per cent conveyed by machinery, but mechanisation is very unevenly spread between the districts. There is room especially for increased mechanisation of underground transport systems and for modernisation of preparation processes. The American mission are said to have been struck by the needless numbers of men employed on haulage underground, who could be released for the coal-face if more processes were mechanised.

The mechanisation of the industry makes it more than ever important to ensure that the miners are properly trained in the efficient and safe utilisation of the machines. The Ministry of Fuel is proceeding on the right lines with its juvenile training scheme and its school for mechanised mines at Sheffield. The present accident rate is disturbing, so is the incidence of industrial disease. Mechanisation not only permits a higher standard of living for the miners; it also requires it. Pit canteens should obviously be retained and the pithead baths programme, interrupted by the war, resumed until 100 per cent of the men, instead of 65 per cent as at present, are covered. The housing problem in mining areas should be tackled and efforts

made to break down the isolation of the miners by improving amenities. Pit production committees could be made more effective and scientific methods of labour management—which have always met with opposition before—introduced in all collieries. Such measures would assist in removing the old conception of a pit as a place where parents refuse to send their sons, which, more than anything else, has been responsible for the present decline of mining manpower.

This, with all the dogmatism of brevity, is the outline of a programme for the mines. In theory, it could be carried through without insisting on public ownership. Indeed, in practice, if any such productive unit can be constituted under private ownership, and with an assurance of sufficient extra private capital to attain the necessary technical standards, it is difficult to see what principle of public policy would prohibit it. But such cases, if there were any at all, would be likely to be very rare. The mine-owners have been given abundant opportunities to carry through private amalgamations, at a time when consolidation on a far smaller scale than anything here envisaged would have been acceptable, and none of these opportunities have been taken. Moreover, even if such large consolidations were undertaken under private initiative, it is doubtful whether private capital would be forthcoming in large enough amounts to finance further development. The figure of £300 million has been estimated as the cost of new capital investment to modernise the industry.

For these two reasons, it is almost certain that the programme would have to be carried out by the Government. Nevertheless, care should be taken to protect its technical character and to avoid any form of political "control." The best procedure would be to constitute each producing unit as a company, in which the vendor enterprises could be given shares as the purchase price of their undertakings. The Government should then provide as much further capital as was required by purchase of additional shares, and if these were not enough by themselves to give control, the voting power could be adjusted accordingly. A separate board of full-time directors, chosen for technical or commercial skill, should be appointed to each company. The allocation of shares among the existing owners would, of course, be a complicated business, in which both output and present profitability would have to be considered; but it would be no more complicated than any other compensation problem.

All this, however, is subject to one big condition: the co-operation of the miners to make a publicly owned industry a success. Their present mood seems to be one of frustrated obstinacy. Concessions and appeals for coal for the war front have failed to

move them. Nationalisation would not mean the sudden solution of their grievances—on the contrary, if it was effective, it would involve a lot of things they do not like. Will the miners realise this? There are two hopeful factors. One is that when the war is over the better type of miner, now in the Forces, may return to the industry and the more recalcitrant elements may leave. Another is the formation of a single miners' union, which may be able to exert a more unified and purposive influence than the old Federation. The union's leaders will have

to show statesmanship and responsibility; they will have to look forward and not back. And they should face up to the fact that, unless output is improved, the present wage structure is in danger of foundering. No one would call £5 a week a high minimum rate, but even this wage level cannot be maintained unless it is related to higher productivity. If the miners fail to realise these truths and to co-operate in full production, the effort of nationalisation would be wasted, and any Government which attempted it would be discredited.

The Greater London Plan

The following are the main proposals of the Greater London Plan:

Population.—The Plan divides the area into four concentric rings:

- (1) The Inner Urban Ring, comprising the fully built-up areas adjoining the County of London.
- (2) The Suburban Ring, comprising a wider area beyond (1), which is again largely built-up but at a much less density.
- (3) The Green Belt Ring, with a width of about five miles, containing much acquired open space.
- (4) The Outer Country Ring, much the largest part of the Plan's area, containing many distinct towns situated amidst agricultural land.

Roughly, (1) and (2), together with London County, can be taken as constituting London proper, e.g., the almost continuous town which stretches for about 12 miles in all directions from Charing Cross.

It is proposed that there shall be no more building in Rings (1) and (2) except for urgently needed LCC and Croydon housing schemes that are already planned, and the building-up of existing frontages. Generally speaking, new building will also be prohibited in the Green Belt Ring (with similar exceptions).

Maximum residential densities of 100 and 75 persons per acre for the Inner Urban Ring and 50 per acre for the Suburban Ring are to be enforced. This will require the decentralisation of 415,000 people from certain areas in Rings (1) and (2), the largest "decanting" being 93,800 from West Ham. Those areas in Rings (1) and (2) which contain less than the maximum densities allowed will not, however, be allowed to build up to them.

Including the 618,000 which fall to be decentralised from the County of London under the County Plan, a total of 1,033,000 altogether have to be decentralised from "London proper." They will be accommodated as follows:

- (a) 125,000 under existing LCC and Croydon housing schemes.
- (b) 261,000 to existing towns, mainly in the Outer Country Ring.
- (c) 383,000 to new satellite towns, all in or beyond the Outer Country Ring.
- (d) 164,000 to existing towns within a 50-mile radius of London, beyond the Plan's orbit.
- (e) 100,000 to "beyond the London influence."

There are also in existence vacant frontages, equipped with essential services, which could accommodate 386,000 persons. These provide a margin for population adjustments and a freer choice of homes.

Alternative figures for decentralisation have been worked out on the assumption that the LCC reduces its residential density to 100 instead of 136 persons per acre.

Industry.—The decentralisation of 1,033,000 people from London proper is estimated to involve the parallel decentralisation of 1,720 factories, employing directly 258,000 people. No detailed analysis is made of which factories should move out, and they should go, although general recommendations are made as to the industrial contraction or expansion of each area.

No new industry should be allowed in the Inner Urban and Suburban Rings, except in the neighbourhood of (a) Barking-Dagenham, (b) Mitcham-Croydon, (c) Erith (to a limited extent), and (d) the Cray valley (conditionally).

Decentralised factories will go to the new satellite towns and to specially selected existing towns in the Outer Country Ring. Generally speaking, industry will be banned from other existing towns, rural villages, the open countryside, and the Green Belt Ring.

The closest collaboration should be aimed at between industry and all transport authorities, in order to increase their mutual efficiency and to reduce the journey to work.

As far as possible industry and population should be decanted from the same areas. Special provisions must be made for the time-lag of industry behind population.

Satellites.—Ten sites are suggested for the eight new satellite towns which are to accommodate 383,000 of the decentralised population, and a large proportion of decentralised industry. Three are in Essex at Chipping Ongar, Harlow, and Margaretting; 3 in Hertfordshire at Stevenage, near Redbourn, and at Stapleford; 2 in Surrey at Crowthurst and near Holmwood; 1 in Kent, near Meopham; and 1 in Berkshire at White Waltham. All the sites lie roughly between twenty and thirty miles from Charing Cross.

Suitable sites in the region for these entirely new towns have been hard to find. Only two of those selected lie west of London, those near Redbourn and at White Waltham. Five are grouped to the north-east of London.

Good transport for industry is an essential qualification for a satellite town. The three sites to the south of London are not fully suitable for heavy industry, since this requires good communications to the North and Midlands.

The population of most satellites would be between 50 and 60 thousand.

Agriculture.—The agricultural character of the Outer Country Ring will be jealously guarded and building confined to definite centres. Near the urban fringe pockets of agricultural land should be delimited and protected.

The practice of building on good agricultural land when suitable alternative land is available will be stopped. The avoidance of unco-ordinated sprawl will, by itself, be a great gain to agriculture. There should as well be strict control over sand and gravel excavations.

Communications.—(1) Roads. Ten express arterial highways will link up with the ten main radials of the County of London Plan. Five ring roads (two in the LCC area) will include an express arterial ring road running at a radius of 12 miles from the centre of London.

(2) Railways. No drastic additions will be needed, as decentralisation will reduce the volume of daily travelling. Several new branch lines to the north-west of London will link up the proposed new satellites with existing centres.

Most of the railway system in the Greater London region should be electrified. The suggested terminals for main-line electrification are Didcot, Princes Risborough, Aylesbury, Watford, Luton, Hitchin, Bishop's Stortford, Chelmsford and Basingstoke.

(3) Airways. A ring of airports round London will include one trans-ocean airport at Heathrow, near Heston.

Open Spaces.—London's main "green belt" will be widened considerably and extensive new acquisitions of open space made in London proper. The deficiency in the Inner Urban and parts of the Suburban Rings is 4,243 acres on the basis of 7 acres for 1,000 persons.

Individual Areas.—The plan includes brief studies of the population, industry, topography and shopping facilities of all the local government areas in the region, and recommendations as to each area's future.

Administration.—There are 131 separate planning authorities in the region. Comprehensive planning is an impossibility on this administrative basis. Professor Abercrombie puts forward, as one possible solution, the formation of a special Planning Board which would administer a "master plan" for the whole London region, compiled from the existing City, County and Greater London plans. The Board would have power to buy and develop land. Day-to-day administration of local planning would be done by joint committees of local authorities.

NOTES OF THE WEEK

The Debate on Greece

In a debate which none but he enjoyed, Mr Churchill did nothing to allay the doubts and fears raised by present British policy in Greece. His general appreciation of democracy was unexceptionable but irrelevant, for the point at issue was not whether private armies were bad but whether the British Government was not being led by its fear of Bolshevism to favour the unconstitutional forces of the Right against those of the Left. Mr Churchill did not once mention the vexed point of the Mountain and Sacred brigades and the request for their disbanding. For the men of EAM, whom a year ago he was prepared to arm in their fight against the Germans, he had only terms of vilification—ruffians, bandits from the mountains. Above all, he stated quite openly that he sent British forces into Greece to counter an expected Communist revolution.

I pointed out that . . . it was very likely that the EAM and the Communist extremists would attempt to seize the city and crush all other forms of Greek expression but their own.

If this was the psychological atmosphere in which Mr Leeper and General Scobie went to work, it is difficult to see how any pretence of impartiality could have been preserved. Worst of all, Mr Churchill offered the House of Commons no solution for the Greek disaster but civil war to the bitter end. Happily for British prestige and interests in the Balkans, Mr Eden was able to throw the mind of the Members forward from sterile one-sided accusation to the essential problem of securing an immediate truce.

Towards a Greek Settlement?

Shortly after the Commons debate it was announced that Field Marshal Alexander and Mr Harold Macmillan would go to Athens. They arrived on December 11th, and although the Field Marshal spent only one day in Greece, Mr Macmillan is presumably to remain. The EAM reaction to this visit was the sending of an emissary, Mr Porphyrogenis, to inquire if there were no possibility of agreement. Two British terms were laid down—the evacuation of Attica by ELAS and the handing over of all ELAS arms in Athens and the Piræus. If these two conditions were fulfilled, Field Marshal Alexander would undertake to

initiate the necessary steps to put an end to the present turmoil in Greece and restore to all Greeks, whatever their opinions, peace and full enjoyment of their democratic liberties, the first step to which must be the disbandment of all private armies.

It is obvious that the two terms are a pre-condition of understanding. But as a guarantee of a genuine settlement, the promise given by Field Marshal Alexander is probably too vague and unsatisfactory to persuade EAM to do precisely what they are fighting to avoid—disband their armies without a corresponding disbandment of the suspect Mountain and Sacred brigades. If a real truce is sought, it is surely necessary to offer inducements as well as terms. The nature of such inducements is not easy to define without more knowledge of the local situation, but examples can be taken from the similar experience of other countries. In France, the diversion of the keenest elements in the *maquis* from the struggle at home to the struggle against the invader greatly eased political tension. In Greece, the fears of EAM could perhaps be dissipated if it were announced that, in return for their disarming, the Mountain and Sacred brigades would return to Italy to fight the Germans and that recruiting centres and training camps would be established at once under impartial leadership for any volunteers from left wing ELAS and right wing EDES and from the civilian population who wished to train for the final struggle against the Germans.

Precision on these military terms is not, however, sufficient. After the events of the last ten days there inevitably arises a question of confidence. It will be difficult to re-convince all factions among the Greeks that the British are impartial or that any new Greek administration is genuinely representative. The British officials concerned, particularly the Ambassador and the local commanding officer, should not only be impartial but must

also be accepted as such. On these grounds it is certainly necessary to remove Mr Leeper and possibly General Scobie, although naturally he carries no personal responsibility for the disasters at Athens. Similarly, the British Government can only prejudice the chances of settlement if it persists in supporting a Prime Minister who cannot achieve a popular coalition. Mr Papandreou may be able to do so. If he cannot, he should give way so that other leaders can make the attempt. Finally, in the matter of elections, it is essential that Field Marshal Alexander's pledge should be translated into concrete terms. These should include not only the offer of British trusteeship, but a promise to accept any other international or neutral oversight the Greeks may desire, to purge at once the still largely unpurged police and to initiate—as in Bulgaria—electoral registrations immediately as a guarantee of sincerity. All this demands from the British imagination, sympathy, courage and a willingness to abandon policies that have obviously failed. This was unhappily not the mood of Mr Churchill in last week's debate. Unless a new spirit prevails, the outcome can only be a disaster both for the Greek and the British people. This is not a problem that can be solved by unconditional surrender.

Labour's Dilemma

The Labour party conference has gone according to plan—according to the plan, that is, of its National Executive Committee. The decision that Labour should remain in the Government until the end of the war with Germany, or until the dissolution of the present Parliament, was not seriously challenged. Nor was the decision to go to the country on an independent Socialist platform. Indeed, proposals for electoral agreements with other left-wing and

THE WISDOM OF MAKING A WILL

Unless you make a will the provision for your dependents may be different from that which you had intended. Several reasons, including unwillingness to place the responsibility of executorship upon the shoulders of an intimate friend or relative, who may pre-decease you, may have caused you to defer completing plans for the future.

No need exists for further delay, since you can appoint this Company as executor and/or trustee, either solely or jointly with your wife or husband, a relative, or a friend, and thus be assured of continuity of administration and of security. You are invited to ask any branch manager of the Bank for particulars of this service. Alternatively, you may apply to one of the Company's own offices at the following points:

Head Office: Poultry, London, E.C. 2.
Branches: 70 Pall Mall, London, S.W. 1, and in Bangor, Birmingham, Bournemouth, Brighton, Bristol, Carlisle, Hull, Leeds, Leicester, Liverpool, Manchester, Newcastle-on-Tyne, Nottingham, Oswestry, Sheffield, Swansea and Torquay.

progressive parties were turned down without any discussion. So long as Labour continues in the Coalition, it must accept responsibility for Coalition policies. How to reverse those policies without breaking-up the Coalition was the dilemma which faced the Conference most acutely when it came to debate an emergency resolution on the Greek situation. This resolution, prepared by the Executive, called upon the Government to take steps to bring about an armistice, and to secure the resumption of negotiations between the parties, with a view to establishing a provisional national government, and thereafter, as soon as practicable, to hold a free and fair General Election. Nobody could disagree with these objectives, and the resolution was adopted by an overwhelming majority, but its terms were not strong enough for the delegates, whose tempers were running very high on this issue. It was far less strong than resolutions submitted by the railwaymen's and transport workers' unions, which condemned the British Government's action in Greece; but owing to conference procedure, no further resolutions could be called and no amendments could be moved to the official motion. As speakers for the Executive pointed out, if the Labour party condemned the action of a Government in which its representatives were included, and for which, as Mr Bevin said, he took his full share of responsibility, the position of Labour Ministers would have become untenable, and the earlier decisions to continue the Coalition would have been reversed. The debate on this resolution was, in some ways, a re-enactment of the situation in which Labour MPs found themselves last Friday. It was also a demonstration, if such a demonstration was needed, of the consternation in the Labour movement at events in Greece, and of its fears that even if the Greek affair reached a satisfactory settlement, similar misfortunes might attend British policy elsewhere, and bring a share of discredit upon Labour Ministers.

Preparing for the Election

The Labour party, thus committed to continue in the Coalition, is at the same time to proceed with its electoral preparations and propaganda. The economic and social programme on which the party will go to the country is being debated too late for comment this week. But there are grave doubts about whether Labour is equipped to face the challenge at the polls. Mr Harold Laski, who presided in the absence of Miss Ellen Wilkinson, urged constituencies to adopt younger candidates, and appealed to the party not to cling to narrow sectarian principles. He used fine words, but it cannot honestly be said that this year's Conference, presumably the last before the General Election, has provided signs that Labour is prepared for the fray, or has given confidence in the qualities of its leadership. Mr Attlee delivered an admirable lecture on collective security, but did not speak in the vital debates on coalition or Greece; it was left to Mr Arthur Greenwood to open both discussions, which he did without much enthusiasm; while Mr Bevin, who holds no official position in the party, was brought in as a big gun to quell unruliness. There was a general impression that the platform was out of tune with the floor, and at times afraid of it. From this point of view the most interesting feature of the proceedings was the election to the Executive of Mr Aneurin Bevan, who should certainly inject some stimulant into the milk and water of Transport House. Satisfactory, too, was the return of Mr Herbert Morrison, who has in recent months done more to crystallise Labour's case than any other of its spokesmen. But two swallows do not make a summer, and without really effective leadership, and so long as it cold-shoulders all potential allies, Labour can hardly expect to appeal to the millions of non-political voters, who will, after all, determine the issue at the next General Election.

The Franco-Russian Treaty

General de Gaulle crowned his visit to Moscow by signing a Treaty of Alliance with Russia. The news has been enthusiastically received in Paris, and in this country, too, the alliance has been given a warm welcome. It marks another step on the road of restoring the system of European security, which, faulty at best, was torn to pieces by the Nazis between 1933 and 1939. German victory has always depended upon the separation of East and West, and to-day, in the last desperate stages of the battle, the Nazis still pin their hopes on a rift between Russia and its Western allies. The Franco-Russian Pact is another span in

the bridge which must be built to bind together Eastern and Western Europe. As such, it is an effective answer now to the Nazis' political warfare of "Divide and defeat," and later it can be a valuable reinsurance of European peace. This latter function depends, however, upon the manner in which it is combined with existing security agreements and other wider arrangements still to be made. The coalition that has defeated Hitler has not been a Russo-French coalition, but a fighting alliance between Russia and all the West European democracies and between all these states and the English-speaking democracies of other continents. Anything short of this coalition will not be a reliable foundation for peace. In the first place, therefore, the Russo-French Pact needs to be brought into relation with the Anglo-Russian Treaty, and, as a second step, the nations of Western Europe should themselves gather into a closer association to make certain that the Western pillar of the European bridge stands on the surest possible ground. This bridge, in its turn, needs to be fitted into the wider security arrangements outlined at Dumbarton Oaks. It is significant that sections of the American press are already criticising the new alliance as a manifestation of the balance of power. The interests of Russia, France and Britain alike demand that the new alliance system growing up in Europe should be accepted on the other side of the Atlantic as a reinforcement of any general security plan and not as its negation. The converse is equally true—that regional security pacts should be accepted in America as a welcome strengthening of a universal system which must necessarily be weaker in some of its limbs than in others.

Housing Repairs

Last Friday's debate on housing did much to clear the undergrowth from a tangled subject. Mr Sandys and Mr Willink both gave encouraging proofs of quickened progress in repair work over the last three months. Both acknowledged the gravity of their task, and both made some definite promises for the future. The increased concentration of building labour in London, revealed by the Minister of Works, is something to the credit of the past administration. From 21,000 in June, 1944, it jumped to 59,000 at the beginning of September, and to 126,000 by the beginning of December. The repairs programme has also been got under way; 200,000 of the Government's winter target of 719,000 houses to be restored to "a tolerable standard of comfort" were completed at the beginning of this month, and over 12,000 premises have been requisitioned for housing since September 22nd. So far so good, but not good enough. Problems of repair, other than of seriously damaged and uninhabitable houses, require only the organised direction of men and materials, in which art the Government should by now be well practised. Even so, this first stage in the London campaign is serious enough. In 53 districts 10 per cent of the inhabited houses have leaking roofs; of the position in the remaining 42 districts, Mr Sandys said nothing, and the percentage may well be higher. Over 500,000 houses are still to be repaired, and the promise of completion by April 1, 1945, was received in the House with some scepticism.

Permanent and Temporary Houses

It is the second stage of re-housing—that of providing new houses—that will prove the greatest test of Mr Sandys's ability as GOC Building. Lord Woolton has sounded a warning note in the Lords this week by saying that no possible effort can produce houses for everybody by the end of the German war. That fact has become increasingly obvious in recent months, but it should not be allowed to excuse the non-fulfilment of the scheduled programme. Mr Sandys's announcement, so abruptly made, that Portal "pressed-steel" houses cannot even be started until after the defeat of Germany is not in itself of great importance. Other materials are available, and existing designs and specifications can, where necessary, be speedily adapted to them. Certainly, the shortage of steel in wartime, which Lord Portal himself foresaw, might defer production, cannot be made into a beating-stick for a scapegoat. What is postponing the housing programme is not the failure of Lord Portal, but the success of Marshal von Rundstedt. It was Lord Portal himself who safeguarded the production of temporary homes by giving the go-ahead to the Uniseco, Tarran and the rest, and the Government would be well

advised to discourage any witch-hunting arising from Mr Sandys's announcement. The Portal house has from the start been the target of criticism from a formidable combination of interests—those who want to build houses out of materials other than steel combining with those who want to make other things out of the steel they would require. Some of these interests, prematurely proclaiming that the Portal house is dead, are now turning their fire on the proposal to import 10,000 second-hand timber huts or bungalows from the United States, which are condemned on grounds ranging from the shortage of shipping space to the fire hazard. This criticism, it is not surprising to learn, comes from the people who want to build brick houses. It is difficult to be patient with such facetiousness. What if the Portal house is sub-standard? What if wood is an inflammable material? Shelter for homeless people can be provided in these ways more quickly than in any other ways—and that, in a crisis, is the important thing.

On the wider aspects of the problem, the disquiet expressed in the House was well grounded. The target for temporary building is 200,000, and under half have so far been allocated to local authorities. London is to have 27,000, but only 7,000 to 8,000 sites have so far been found for them, let alone prepared. Even if the 20,000 remaining sites can be found in time, the allocation will still provide only one-tenth the number of London houses destroyed and seriously damaged by the enemy. In the face of this situation, the latest move of the Government seems to be robbing Peter to pay Paul. Prefabrication methods are to be used to build permanent (or convertible-to-permanent) houses "to replace the tail-end of the temporary bungalow programme." Where these are to go Mr Sandys has not disclosed, but to build houses to some of the Northolt designs in the immediate future—in the haphazard way that is permissible with the temporary types—is to court the worst possible nightmares of unplanned "development." Second to the 60 per cent saving in building labour, the advantage of temporary housing (from the Government point of view, at least) is that it puts off the evil hour of co-ordinated planning of location. But if some of the "temporary" houses—those built to relieve the immediate pressure—are to be built to last, the imperative need for decisions on land control and national and regional planning becomes not less, but more, emphatic.

First Steps in Holland

Dr Gerbrandy, the Dutch Prime Minister, has returned from Holland after an inspection of political and economic conditions in liberated territory. Want and dislocation of all normal means of life dominate the picture. Food supplies are actually lower than under the German occupation, for the fighting has disrupted all communications. Bridges are down, railways bombed, dykes broken and flooding completes the ruin wrought by war. Since the opening of Antwerp, however, the situation has started to improve. A central Transport Bureau has been set up to deal with the chief cause of starvation—the lack of transport—and SHAEF and the local Dutch authorities are making the distribution of supplies their first priority. Compared with the search for food and fuel, political problems occupy only a secondary position. A state of siege has been declared and a Dutch military authority responsible to the War Minister and, in second instance, to the entire Dutch Government, has taken over local administration under the general directions of SHAEF. Under the Dutch Constitution, all burgomasters are appointed by Royal Decree and there has been little difficulty in appointing local officials. In most cases, the former burgomasters who were dismissed by the Nazis have been reinstated. The only real index of political feeling is the flood of newspapers—35 in liberated territory, most of them clandestine papers now appearing in their first light of day. It is impossible to draw general conclusions about the rest of Holland from the experience of the liberated areas. They are solidly Catholic and include no big towns where the Communists and possibly the Socialists have grown in strength under the occupation. Yet it is believed that the overwhelming desire apparent in the press for unity and for an end to a regime of splinter parties—53 before the war—may well be found to be general. It may presage a sharp cleavage between the resisters who, especially the young ones, are looking for new political forms and insti-

tutions, and the older politicians who wish on the whole to return to an unchanged 1939. It seems that Dr Gerbrandy is aware of this problem and has taken note of the lessons from other liberated territory. Recruiting centres have already been open to train resisters and volunteers for the Pacific war and for local garrison duties. And Dr Gerbrandy has announced that when Holland is entirely free, he will give in his resignation to make place for a leader of the resistance movement.

The BMA Decides

The third and fourth days of the annual representative meeting of the British Medical Association were mainly devoted to discussions of the administration of a national health service. The meeting showed itself opposed to virtually the whole of the administrative structure proposed in the White Paper: it resolved that the profession should not be controlled by the local authorities—the words “as at present constituted” being omitted from the final form of the resolution; that the central administrative body should be predominantly medical in composition and that the Minister should be required to take its advice on medical questions; that the Central Medical Board, which in the White Paper proposals would be the employing body for general practitioners working in the public service, should be entirely medical in composition and should have no powers to restrict or direct doctors wishing to take up a public practice; and that, until local government areas and functions are reformed, regional councils for hospital and medical areas should be established, which would be representative of the local authorities and the medical profession. But equally important is the fact that the BMA is willing to negotiate with the Minister of Health and has appointed its share of the negotiating committee. It may well be that when the negotiations are resumed some of the uncompromising resolutions passed at the meeting will be allowed to slide into the background. But it seems perfectly clear that the BMA is emphatically and finally opposed to local authority control and that, judged by the questionnaire, the profession as a whole supports it on this point. Since, therefore, a national health service, financed by public funds, must be publicly controlled through a Minister responsible to Parliament, the only possible basis of negotiation on the administrative questions seems to be complete nationalisation of all the health services. Provided there were no clinical control and provided private practice might continue, this would meet the doctors' most rooted objections. More important, it would enable the services to be properly co-ordinated, whereas under the White Paper proposals they would be in many respects more uncoordinated than ever; in particular, it would enable areas large enough for a hospital service to be established. Finally, as *The Economist* has urged before, it would provide a solution to local government financial problems. Mr Willink said recently that the Government did not propose to weaken local government by transferring to the state its more important functions. He may have to reconsider the statement.

Future Savings

The National Savings Movement has been awarded its colours—a flag with a laurel wreath surmounted by a crown on a white field—to be hoisted on all appropriate occasions. Last week Sir John Anderson made a strong appeal to the nation to maintain its savings effort after the war. During the war the public has saved well, partly through prudence and patriotism, but largely because of the difficulty of finding satisfactory alternative employment for its money. After the war much of the capital expenditure required for schemes of reconstruction and social development will have to be met by the local authorities out of loans made available by the Government. And to finance these and other operations in a sound and orderly manner the Government must be able to command the largest possible volume of savings. How much saving can be induced by appeals to patriotism once the exigent conditions of war are removed? The answer depends finally on the people's estimate of the genuineness and practicability of the reconstruction programme. A Government that could capture the public imagination would capture its pocket fairly easily. If the approach is to be more pedestrian the best incentive to saving would be the certainty of complete redemption in terms of real value. There is another point. The war has drawn an effective line between the period when national savings were drawn largely from the rentier class and the future when they must come increasingly from the wage-earners. To-day 16s. 6d. out of every pound of personal income (after tax) goes to those with incomes of less than £500 a year. This change in the distribution of the national income will upset the savings habits of the community. Certainly the incentive of higher yield will not prove so effective as in the past, for the small saver is much less interested in the return on his investment than its capital value. The whole subject of savings demands the most careful attention. Flag-waving is not enough.

Burma's Future

The debate in the Commons on the future status of Burma revealed the anxiety of all parties that the Burmans should look upon the advancing British forces as liberators, and should not feel that they were simply exchanging one conqueror for another. There was a division of opinion, however, on the method the British Government should adopt to underline their acceptance of a completely free and self-governing future for Burma. Some members urged that Dominion status should be promised unequivocally from the morrow of liberation. Mr Amery demurred from this, and proposed that the transition to Dominion status could only be made after a period of reconstruction. Provided always that the Government is sincere in wishing Burma—and India—to achieve Dominion status speedily—and there is every reason to accept its sincerity—Mr Amery's point is sound. Burma will be for some time to come a battlefield. The devastation is enormous, and the people are in serious distress after the rice requisitions and the forced labour imposed by the Japanese. All these things have been done under a nominally independent Burmese Government. The Japanese declared Burma "independent" in 1943, but continued to use the Ba Maw Government as a complete puppet. It may well be that the politics of independence will at first be less interesting than the economics of reconstruction. This should be the first task for the British, and by their way of setting about it they can amply prove whether they seriously intend independence. In preparation for a constituent assembly, the British Governor should be assisted by a Council of Burmese to whom as much authority as possible should be transferred. In economic reconstruction, stress will need to be put on bringing Burmese into the economic controls of the country. The biggest single matter is the Indian problem. Some estimates are that nearly 60 per cent of Burma's capital is Indian owned, and in many cases the industries and ricefields of Burma have been subject to a galling remote control from Madras and elsewhere. There will be no economic future for Burma unless this balance is redressed. It is equally true that there will be no communal peace—and no full self-government—until the two national communities can meet on equal terms.

Jugoslav Agreement

After joint consultations in Belgrade, Marshal Tito and Dr Subasitch have reached agreement upon the com-

position of the provisional Government which is to be set up to establish the local administration in liberated Yugoslavia and to prepare for a Constituent Assembly. The chief point in this Government's composition is that it is to represent "all peoples and all the federal units of Yugoslavia." The agreement is a hopeful sign that Yugoslavia may be spared the misfortunes of Greece, but until the actual composition of the Government is announced and there is more factual information about the state of affairs inside Yugoslavia, it is impossible to say whether the Provisional Government will have the backing and authority it needs to bring together the different nationalities who at no time have co-existed very happily inside the Yugoslav state. The Germans are leaving behind them the usual legacy of feud and hatred and, no doubt, the usual gangs of *agents provocateurs*. It is also unhappily true that, although Marshal Tito has decreed an amnesty for all Chetniks who served under Mihailovitch, the fighting between guerillas and Chetniks still goes on. Their struggle reflects the greatest political obstacle to peaceful transition. It is by no means certain that the mass of Serbs accept the federal plans of the Liberation Committee. A federal scheme uniting Slovenia, Croatia and Greater Serbia would perhaps be acceptable. But the present federal schemes break up Greater Serbia by granting autonomy to Serbian Macedonia, to Moslem Bosnia and to Montenegro as well. In such a coalition the Serbs would feel outnumbered and outclassed. Anxiety on the smooth progress of these schemes would be less if Marshal Tito had rallied some Serb statesmen of real standing to his side.

Employees in Politics

The directors of the Royal Insurance Company have issued a notice to their staff encouraging them to take an active part in "county, municipal or other public service in local affairs" and promising sympathetic considerations for any application for re-arrangement of work to make such participation possible. This is a praiseworthy initiative on the company's part. The overwhelming majority of citizens today are wage-earning or salary-earning employees and if the conduct of public affairs has to be left entirely to the rich, the retired and the self-employed, they will inevitably suffer in consequence—indeed, they have already suffered. Nor should it be regarded wholly as altruistic public service on the employer's part to encourage his employees to perform their civic duties, since in many cases their usefulness will be enhanced by the experience they will gain. The trend of recent years, however, has been in the opposite direction and there must now be many millions of people who are debarred, by trade practice or even by formal contract, from taking an active share in their common concerns. Perhaps the Royal Insurance Company's action is a sign of a changing tide. It applies only to local politics, and wider questions might well be raised by an extension of the principle to national politics. In many cases, Parliamentary candidatures—and still more membership—would be wholly incompatible with private business duties, and in all cases there would be inconvenience. But against this must be set the plain fact that Parliament can never be fully representative until members of all sections of the people sit in it. It would be well worth paying the price of some inconvenience to secure a wider representation of the public in both local and national bodies.

Germany's Oil Reserves

After overrunning the oilfields of Galicia and Roumania, the Russian armies now stand before the town of Nagy-Kanizsa, on the outskirts of Hungary's principal oilfields. Germany has already lost 67 per cent of its crude oil resources, and the loss of Hungary would bring the figure up to 74 per cent. Over two-thirds of its remaining reserves are at Zistersdorf, only 31 miles from Vienna. Meanwhile the Allied bombing forces in the west have for months past made Germany's synthetic oil plants their chief target. Will the result be that at long last, after so many false hopes and false predictions on the Allied side, the Germans will really run out of oil? The estimates must, of course, be tentative, but the answer is almost certainly that now, as in earlier years, the Germans may be gravely inconvenienced, but are not defeated by the Allied offensive on oil. With Austria and Germany intact the Germans will still be pro-

ducing about 2,300,000 tons of crude oil, compared with 609,000 tons in 1938. The increase has been due to a vast development in the centralised exploring and drilling of new resources. If the figures for synthetic oil are added, the German total for 1944 perhaps reaches 6,000,000 tons, although bombing may in fact have reduced the output even below this figure. Some stocks have been destroyed by bombing, but it would be wrong to conclude that the Germans are carrying no stocks. Meanwhile in 1943 and 1944 more and more vehicles have been transferred to generator gas, and more horse-drawn transport has been introduced for military purposes. The series of great retreats has also relieved some of the strain. It would therefore be unsafe to assume that the minimum amount of fuel and lubricating oil necessary to keep the tanks moving and the planes flying and the submarines diving will not be forthcoming for another six months. Germany's tremendous losses of natural oil have undoubtedly brought it nearer to the edge of collapse. But past experience shows that the Allies always underestimate how much room there is still left for balancing on that edge.

Liability for Injury

On September 3, 1939, Parliament passed the Personal Injuries (Emergency Provisions) Act, to provide a special scheme of pensions for war injuries. The Act has just received its first fundamental challenge in the courts. The basic plan of the Act was to deprive an individual of all his peace-time rights to claim damages if he received injury or was killed by a war injury and to give him instead the right to a Governmental pension. But the pension was not payable in all cases in which an individual could have claimed damages before the Act was passed. For example, a man whose wife is killed by the negligence of someone else can claim damages for her loss, but, if her death was due to a war injury, he can only claim a pension if he was in fact wholly or partly dependent upon her. That was the position in the case of *Billings v. Reed*. In that case the plaintiff's wife was killed by an aircraft in circumstances which, but for this Act, would clearly have entitled the husband to recover damages. Since he was not entitled to a pension, he sued for damages, was successful in the High Court, but lost in the Court of Appeal. Leave to appeal to the House of Lords was given, so in all probability the last has not yet been heard of this point. The social implications of this issue are considerable. Hitherto the decision whether a man received compensation if he was hurt depended solely on whether the injured person or the person who injured him were negligent. The social consequences of leaving him and his dependants without money and without any capacity to earn did not come into the picture at all. If he and his family starved, there was always charity or the poorhouse. The new doctrine is less legal and more social; in the new view it is not so important that an injured man should receive a lump sum of damages if the other party has been negligent and nothing if he has not, but it is important that the family group shall not suddenly be deprived of a section of their income because an accident has befallen one of their number. Naturally, in a period of transition, there are still many gaps and inconsistencies, but the gradual emergence of this new principle from the Workmen's Compensation Act in 1897 to the Social Security plans of 1944, is a fascinating study in itself.

Free Education

Only three months remain before the Education Act—a large part of it, at least—comes into force. From April 1, 1944, the payment of fees is abolished in all primary and secondary schools maintained by public funds. Fees may be charged only for special tuition, of the kind usually given outside school hours, in such subjects as dancing and instrumental music. In future, education fees will continue to be charged for evening-class tuition, but will be remitted in necessitous cases. The Minister recommends that all first-year evening-school students should receive tuition free if their progress and attendance are satisfactory. For students released by their employers to attend part-time day courses at technical colleges, tuition fees will continue to be settled by arrangement between the authority and the employers. After April 1st all new secondary school entrants will be "scholarship" students. One result of this will be that

many would-be fee-paying students will have to—or will wish to—find accommodation outside the secondary schools. Private schools should experience a temporary boom—a curious result of an Act whose main purpose was to develop the systems of public education. It is most unfortunate that the provisions of the Act must be applied piecemeal. The original conception made an impressive pattern; the pieces now being fixed in position may produce a patchwork that will take a lot of unpicking.

The Cost of Dying

There is, in this country, no activity so unnecessarily costly as dying. Much wasteful and redundant expenditure on burial insurance will be ended through the death grant proposed by the White Paper on social security. But this cash benefit, which is reasonably high, may prove inadequate to meet the present high cost of funerals. The problem is intertwined with strong social customs. Family pride, which dreads a "pauper's funeral" even in the respectable form now provided by Public Assistance authorities, is a cause of lavish and thoughtless expenditure on inefficient services. In no other transaction is the consumer so often indifferent to making a good bargain. To prevent exploitation of his carelessness or ignorance, there needs to be a statutory maximum for undertakers' charges, as well as full publicity for all the many items of cost involved. Burial fees to clergy and cemetery charges, which at present follow no common principle, ought to be standardised. Medical certificates necessary at death or cremation should be issued more cheaply. The trade also requires technical reorganisation, which should include the elimination of the present costly variety of coffins and perhaps the pooling of hearses, cars, and labour among smaller firms. Local authorities, who have made small use of their permissive powers to date, should be encouraged to set a good example in cheap and efficient burial or cremation. As a first step, they should be made responsible for all cemeteries and crematoria, which in some districts are still run by private companies, whose costs are increased by the method of attracting undertakers

MILK CHOCOLATE & the Nation's Milk Supply

THE contribution of the Milk Chocolate Industry in ensuring Britain's milk supply during these critical war years is not generally realised.

Before the war this industry was using 40 million gallons of milk a year. Cadburys took more than half of this vast quantity. It came from the counties of Hereford, Gloucester, Salop, Stafford, Flint and Denbigh where Cadburys have consistently encouraged dairy farming over a number of years. In these areas they have established four Milk Factories which have greatly assisted in developing milk production. Today these four factories alone collect and distribute sufficient fresh milk for well over a million people.

Cadbury means Quality

with a commission. In addition, they should be allowed to provide funerals at approved charges. The first need is clearly for some official regulation of fees and practices. Its administration would probably require the appointment of funeral inspectors by the local authorities, who are best suited to take the lead in this reform.

Shorter Notes

A first sum of £700,000 is to be made available to Jamaica to help repair the damage caused by a hurricane. A free grant of £196,000 will be distributed among banana growers for replanting, and the balance will be an interest-free loan to be made to growers of bananas and other crops for replanting, new planting and other rehabilitation purposes. The total expenditure arising from the damage is estimated at £1,325,000.

Mr Herbert Morrison announced in the House of Commons last week that a committee, to be appointed jointly by himself, the Minister of Health and the Minister of Education, will be set up to inquire into existing methods

of providing for children deprived of a normal home life. Its terms of reference are wide, and should enable it to range farther than the mere administration of the institutions to which orphans and neglected children are sent.

The following table gives the number of civilian casualties in air-raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.....	22,282	28,522	50,804
Total, 1941.....	20,863	21,839	42,702
Total, 1942.....	3,221	4,149	7,370
Total, 1943.....	2,357	3,462	5,819
Jan.-May, 1944.....	1,561	2,916	4,473
June-Aug., 1944.....	5,479	15,934	21,417
September.....	170	360	530
October.....	172	416	588
November.....	716	1,511	2,227
Totals to date.....	58,315	81,089	139,404

Those killed in air-raids during November included 269 men, 345 women and 102 children under 16.

Letters to the Editor

Lessons of Five Years

TO THE EDITOR OF THE ECONOMIST

SIR,—May I submit that the "sample figures" you give in your article on "Lessons of Five Years," to show that output of war equipment in 1942 had reached only between 60 and 71 per cent of the maximum, are extremely misleading. The list of six items you give could easily be matched by an equally impressive and more surprising list of items in which the maximum was reached in that year. They include tanks, field, medium and heavy artillery equipments, heavy anti-aircraft equipments, gun and mortar ammunition and most types of naval vessels. Does this not suggest that the further increase in the output of the items you mention was in a large measure made possible by a reduction of the output of other things which by that time had proved to be less urgently needed?—Yours faithfully,

Cambridge

F. A. HAYEK

[There was no intention, in our article, of underrating the performance of the earlier years in some lines, and it was stated that "there are other items where the comparison is more favourable." The six items for which figures were given were chosen with some care as being items for which there was very urgent demand from the earliest months; they were certainly not held back (as Professor Hayek implies) by higher priority for other things. Indeed, two of the six, aircraft and aero-engines, had a super-priority for most of the time. But it is refreshing to find Professor Hayek coming to the defence of state planning.—EDITOR.]

The Greek Disaster

TO THE EDITOR OF THE ECONOMIST

SIR,—It is most unfortunate that in your otherwise moderate and well-balanced article on Greece you should refer to the "Mountain Brigade" and the "Sacred Squadron" as "two divisions." Military terms must be used with some sense of their meaning even by political commentators. The Mountain Brigade, of which the Sacred Squadron forms part, is, as its name implies, one-third of one division, and this fact invalidates the whole argument.

There must be others besides myself who opened their eyes rather widely at the suggestion that a unit of the regular Greek Army which has fought in the desert and in Italy and which has been purged only of mutineers should be treated as if it were nothing but a collection of partisans. But whatever the position, the retention by the Government of one brigade under arms in a newly-liberated country hardly merits the attention which you seem to attach to it. The Brigade was not even concentrated in one place, but dispersed partly outside the mainland of Greece.—Yours, etc.,

House of Commons

QUINTIN HOGG

A Plan for Broadcasting

TO THE EDITOR OF THE ECONOMIST

SIR,—Your Plan for Broadcasting has the right foundation with its advocacy that this country should adopt the best of both systems, sponsored and unsponsored. Both systems have their faults and their advantages, and it is in our favour that, at this stage of broadcasting, we are able to profit from everyone's experience and make a fresh beginning after the BBC Charter expires.

I agree with you that there should be three networks in competition, but my view is that there should be only one system run on BBC lines, mainly cultural and educational, but with the other two networks run by commercial interests.

The listening public will always divide itself into two audiences, the majority who turn to radio for entertainment and the minority who want uplift or mental stimulation. First-class entertainment is costly to buy, and a single commercial network, with an annual programme expenditure of between £5,000,000 and £10,000,000, would swamp the two opposition networks with only the £1,000,000 a year

budget the BBC expends on talent for its Home and General Forces programmes.

The power of radio lies in its command over millions of listeners at a time, and it would be virtually a monopoly for a single commercial network to be in a position to dictate to the masses their standard of entertainment and to control their hours of leisure. Far better to have two competing commercial stations with annual licences from the Government battling for the favour of listeners' attention, in their turn competing culturally, both in their advertising programmes and in their sustaining programmes, with the unsponsored BBC-type network.

Your article calls for bold experiment, but surely the situation is more urgent than that. Plans are now being finalised for a radio onslaught on Britain the moment war is over. From the West, by short-wave and long-wave, we shall have American-sponsored programmes (the BBC has been generous enough to build up British audiences for, Fred Allen, Jack Benny, Bob Hope and Charlie McCarthy, all ready for when their sponsors besiege this market). From the East we can expect British-sponsored radio from Continental stations.

Radio is too potent a force for the Government to allow out of its control. Instead of losing our home audience to overseas stations we must give listeners what they will demand, a wider choice of broadcasting and a higher standard of entertainment.

The lesson I have learned as a programme producer in

AMERICAN SURVEY

Economic Contradictions

(From Our New York Correspondent)

NEW YORK, November 9th.

THE United States has held an election, but has not made a choice either of foreign policy or of domestic economic policy—the inseparable sides of the coin of welfare. Indeed the country did not even have the possibility of making a choice in the election. The time of decision is not yet come—even though the delay is probably loading it with greater difficulty.

For a long time the United States has showed the schizophrenic characteristic: it has espoused policies which point in opposite directions and carried them out with equal vigour. Each party showed the symptoms markedly in the campaign just ended, and so the election could do no more—nor less—than demonstrate the highly developed state of the condition. The country as a whole, and each party separately, favours both internationalism and nationalism, both full employment and numerous massive obstacles to the production. If there was a difference between the Republicans and the Democrats, it was that the Democrats endorse in policy—as well as in action—all views with greater vigour. The Democrats won a greater following, since more people heard what they wanted to hear, because whatever they wanted to hear was said more emphatically. The Democrats had the additional advantage that whatever was said could be given verisimilitude by pointing to one—and usually more—statutes or other actions in the past twelve years.

Three examples may illustrate the point.

First, both parties favoured high and rising wages, even higher than the present basic straight time rates, which have mounted by about one-quarter since January, 1941, on top of an unprecedented increase from 1935 to 1940. With this endorsement by both parties, reinforced by the account receivable that Mr Sidney Hillman's Political Action Committee can present to the new Administration, the "Little Steel" formula, which has hitherto restrained the rise in wage rates, will presumably soon be altered by a decision for a further general mark-up in base rates. Neither party, nor major speaker, paid any attention to the process by which higher real rates are made possible, which is, of course, by rising productivity. Though it is difficult to measure even with the American penchant for statistics, the appearance from official studies is that productivity has not risen during the past four years by anything like the increase in straight time rates of wages, even in most of those lines

three years of commercial radio plus three years at the BBC is, first, win your audience. The BBC has too rarely tried to bridge that gap between what you want to give the public and what the public wants to hear. Unless another British source of radio fulfils this need, the power of radio will be switched out of Government control.—Yours faithfully,

Gerrards Cross.

HOWARD THOMAS

Those Billions

TO THE EDITOR OF THE ECONOMIST

SIR,—This country is not the only one that uses million, billion, trillion, etc., to denote powers 1, 2, 3, etc., of one million. Russia uses the same system, which is perfectly logical.

The other two big powers, the USA and France, use million, billion, trillion, etc., to denote powers 2, 3, 4, etc., of one thousand. Not so logical. In this last system milliard is synonymous with billion, and in French is of more general usage.

Another case of our French friends not being as logical as they are reputed to be is their use of the cumbersome "soixante-dix, quatre-vingt, quatre-vingt-dix," when they have at their disposal the good old logical words "septante, octante, nonante." These latter are still normally used by the French-speaking Swiss, and Belgians always use septante and nonante.—Yours faithfully,

Wimbledon, SW19

E. A. HALET

most subject to technological improvement—and many are subject to it, if at all, only in minor degree. (The chief exceptions to this statement concern certain war goods which have been on the move from handicraft output to mass production.) It has been possible to pay the higher wages in these years only because the volume of production has skyrocketed while profit margins have declined and capital costs probably are not adequately reflected by accounting methods. Sizeable profits result while the economy operates above capacity levels, but a decline even to capacity may, and many think will, produce a drastically changed picture as the smaller profit margins become visible and as they are further reduced by the rise in overhead costs per unit which usually occurs when volume drops.

The Interstate Commerce Commission, the Association of American Railroads, and officials of various individual railroads have recently published calculations suggesting grave financial danger to the railways from present costs when the abnormal war bloat disappears from the volume of traffic, even though the decline should stop at levels of high employment. Calculations of similar import have been made for the steel industry and certain manufacturing companies, and do not even need to be made for the host of small concerns which bulk so large in the economy, such as laundries, repair shops, independent stores, real estate enterprises, and so forth. Rising prices may, in time, provide a solution for this situation and so may rising productivity, but at least for a period smaller capital investment by business enterprises and smaller markets for some goods—such as housing—may result. This would make more difficult the attainment of full employment, increase the burden on the budget, enhance demands for spreading the work (which would further increase costs), almost inescapably increase demands for the protection of markets from foreign competition, and perhaps bring demands for subsidised exports. And this may come at a time when the appearance, odour and action of many of the inhabitants of the external world will not be so pleasing to many here as during the present comradeship. The reaction of domestic economics on foreign policy may be profound.

Secondly, both parties favoured the maintenance of high prices for agricultural products, implying the present prices—or still better—for whatever quantities the farmers want

to produce. Present prices are about double the pre-war levels, and the prospects for their maintenance by market demand, when the extreme demands of the armed forces, Lend-Lease and relief—and of storage for these purposes—are over, are not dazzling, even if the national economy continues to operate at capacity production. This has led both parties to support the enactment of measures authorising the Government to support most commodities of any consequence for at least two years after the war by buying up any surpluses. The Government is also empowered to sell its holdings abroad at less than cost or at prices below the domestic level. The great political influence of American agriculture has been preponderantly cast on the protectionist side, and it could hardly be expected to become less so if production were exceeding consumption, if the Government were rapidly accumulating stocks, and if dumping at Government loss were in progress. Nor would such conduct in America be apt to hasten the reduction of barriers to trade elsewhere. Once again, domestic policies have implications which run counter to the avowed foreign policy of the country.

Thirdly, both parties favoured the maintenance of the present level and pattern of interest rates, which are the lowest in the world, and demonstrably inadequate to induce the public to buy more than about two-thirds of the deficit, even with the present limited alternative opportunities for the investment of funds. As a consequence, purchases of Government bonds by the banks have been large. The volume of purchasing power has been greatly increased; and it will be still further enlarged by the deficit still to be financed (including heavy war-termination expenditures), by the redistribution of a considerable volume of Government securities temporarily held by corporations and individuals who intend to convert them into funds for other uses when materials, labour and products become available, and by the direct borrowing that will take place for the same purposes. The existence of this volume of purchasing power causes many people to demand the maintenance of controls for a considerable period, and if controls are to be maintained they would necessarily cover the international movement of funds—a necessity likewise imposed by the strain on the reserves of the commercial and Federal Reserve banks caused by the enormous expansion, actual and prospective, in currency and in bank deposits. The internal controls would hardly be conducive to the maintenance of output at maximum levels in an economy where the chief risk in the immediate post-war years will be a shortage of demand, not (as in Britain) a shortage of supply, since every private decision to take a step resulting in output and employment would have to await one or more Government decisions. Nor would external controls be apt to be conducive to a maximum volume of international intercourse even if the institutions proposed at Bretton Woods are established.

If the greatest single contribution that America can make to international reconstruction and to the reattainment of tranquillity is to be a good customer, then these obstacles to full output are obstacles to good international relations. High imports only accompany high production.

Not only were none of these conflicts between full employment and high sectional incomes, between full-fledged international collaboration and narrowing nationalism, decided by the election, but they were not even mentioned. Nor were numerous other conflicts of similar portent which make of the future a confusing web of uncertainty—such as the settlement of Lend-Lease obligations, the disposition of the Johnson Act (which prohibits loans to countries in default on their debts from the last war), the use of the huge new merchant navy, currency policy, the management of public debt, and others. The car in which this country is to ride in the future faces both ways; like the huge electric locomotives which shuttle between Washington and New York, it is equipped with forward drives for either direction, and it has an extraordinary number of brakes, which appear to be in excellent operating condition, on all wheels.

The failure to reach decisions on the basic issues—or perhaps it would be more accurate to say, on the issues which determine basic policy—while not unusual in the democratic electoral process, means that policy will have to be made *ad hoc*. Perhaps policy is never made in any other way, but specific decisions taken haphazard on specific issues of such momentous nature in a rapidly changing environment during the next few turbulent years can produce alternative—or even simultaneous—uses of the accelerative mechanisms and the brakes on both ends of

the car. Consistency may be a virtue of small minds, but the lack of it is apt to prove uncomfortable to riders and bystanders alike.

American Notes

American Foreign Policy

The Senate shows no disposition to abandon its constitutional right to advise the President on foreign affairs. Its reluctance to approve the six new appointments to the Department of State until it learns more of the significance of the new personalities and policies of the department has drawn from Mr Stettinius a formal five-point statement of the aims of American foreign policy. These include effective support for a speedy conclusion of the war, and the prevention of renewed aggression by Germany and Japan; the creation of a United Nations organisation to maintain the peace by force if necessary; a great expansion of American foreign trade to assure full employment and rising standards of living in the United States and elsewhere; and encouragement of free and democratic institutions everywhere, "in accordance with local customs and desires." There is more involved in the Senate inquiry than a mere insistence on Senatorial privilege; it is significant that the vote to postpone ratification of the new appointments cut not only across party lines, but across the Conservative-Liberal groupings that exist in both parties. In part, there is genuine bewilderment about the meaning of the somewhat oddly assorted appointments themselves, which one commentator has neatly summarised as a "bevy of tycoons surrounding a poet." Some of the Senate resistance arises from a suspicion that "Wall Street is taking over the State Department." The old allergy to the names of Morgan and Rockefeller is not dead; but the range of the questions on the first day of the inquiry shows that no single point of view is at work. Mr Clayton is under fire for his "big business" background, which told against him with Congress earlier this year when he was Surplus Property Administrator; but in his present candour it is not certain whether his supposed tenderness for cartels—which he strongly denied—or his present support of a liberal trade policy, will prove his greater handicap. Mr Archibald MacLeish, a bird of quite a different feather, is criticised for Left-wing activities, particularly his sympathies for Republican Spain, and for the obscurity of his verse. Mr Grew underwent rigorous questioning, not only about his own views on the Mikado, but on the sale of petrol and scrap iron to Japan before Pearl Harbour. This Mr Grew defended as sheer common sense, while denying that he was committed either to the retention or to the elimination of the Mikado. In later hearings, there probably will be a demand for further information on the rumoured absorption by the State Department of such agencies as the Foreign Economic Administration, and some of the functions of the Department of Commerce. Mr Stettinius' fourth point makes it clear that whatever reorganisation is contemplated is designed with the primary end of using exports to relieve unemployment at home. While approving the end, the Senate will want to know more about means; and in particular what concessions the department proposes to make to other countries, and what steps it favours to expand productiveness and trade throughout the world.

New Brooms

Foreign policy makes strange bed-fellows. The Hearst-owned *New York Mirror* this week omitted its customary Winchell column, in which the Broadway columnist made an emotional appeal to the British people to forsake the path of reaction; and in its place printed an enthusiastic endorsement of British policy in Greece. The liberal press, which one day was deploring the victory of reaction in the new State Department appointments, found itself the next enthusiastically welcoming Mr Stettinius' statement dissociating the United States from British policy in Italy and Greece. The former head of the United States Steel Corporation found no warmer support anywhere than in the pages of the *Daily Worker*. The brusqueness of Mr Stettinius' maiden performance is, apparently, to be excused on the ingenious assumption that new brooms, as well as sweeping clean, inevitably raise a fair amount of diplomatic dust through sheer inexperience. Mr Hull, whose public tact was equalled only by his private pugnacity,

would have been guilty of no such untidiness. It is generally assumed in Washington, however, that though the voice was that of Mr Stettinius, the hand was that of the President, or at least that of Mr Harry Hopkins, who is credited with a determining voice in the reorganisation of the Department. The problems of the liberated countries evidently afforded a welcome opportunity to demonstrate the devotion of the new regime in the Department to the principles of the Atlantic Charter; and to leave no doubt that American foreign policy will be both liberal and popular.

The issue was well suited to the design, for to the professional liberals the interpretation of British foreign policy in Europe presents itself either in terms of an instinctive love of reaction natural in a monarchy or as yet another twist of "power politics." The fact that support for British policy in Greece is found chiefly among conservatives harried by the Communist menace, adds verisimilitude to a sketch in black and white. There may be more involved than a desire to underline a New Deal in foreign affairs. It probably was hoped that the snub to London would be felt in Moscow; and Mr Roosevelt cannot have been surprised by the welcome for an American foreign policy so demonstrably free of British influence. There has been an attempt by the State Department to pour oil on troubled waters, but the renewed insistence that the development of democratic institutions in other countries must be in accord with the customs and desires of the peoples concerned shows that there has been only a muting, rather than a modification of the original stand. Almost all the public comment has deplored the evidence, provided by the incident, of a failure to reach a prepared understanding in political strategy. A very few commentators have noted that the announcement of a "Hands Off" policy is, in effect, a new form of isolation. With the chaotic conditions in a liberated Europe a mere affirmation of the virtues of self-determination is not enough. As the *New York Times* points out, by itself, this may merely favour the best-armed faction, and it is to be hoped that Mr Stettinius will not be content with a statement of general principles so reminiscent of the less practical side of Wilsonian idealism.

Reconversion for Cotton

Mr Dean Acheson has pointed out that the export subsidies for wheat and cotton are hardly in keeping with the trade policies instituted by Mr Hull; and Mr Wickard, the Secretary of Agriculture, proposed this week a domestic attack upon the cotton surpluses which press so heavily upon American foreign economic policy. Granting that some relief might be found by assisting low income groups to buy cotton goods, and in the discovery of new industrial uses for cotton, Mr Wickard nevertheless urged that the true solution for the South lay, rather, in diversification, either through industrialisation or in new crops, possibly forestry. It was the great merit of Mr Wickard's testimony that he proposed a practical method for convincing Southern farmers of the need of abandoning cotton for more fruitful enterprises. In his plan, the domestic price for cotton would be "hitched to the world price," with the incomes of cotton growers made up by government payments. These payments, however, would continue only for a fixed number of years and be on a descending scale, with the hope that, at the end of five years, a considerable shift of resources (from cotton to other products) would have been stimulated. Mr Wickard conceded that the outlay might be heavy, but he argued that in the end it would put the South upon a more solid economic foundation, would make possible the retention of a permanent self-sustaining farm population, and would do away with large annual subsidies. With only the most productive lands left in cotton, American growers would be able to compete in world markets without government aid. It is a hopeful sign that the Department of Agriculture has produced a realistic alternative to the policy of rewarding cotton growers, through government subsidy, for producing larger and more unmanageable surpluses. Senator Bankhead's comments are not available.

Taxing for Full Employment

The demand for tax reduction after the war is in full swing, combined with suggestions from a number of busi-

ness sources for the reform of the whole tax system. The most remarkable feature of these plans is their unanimous insistence on the part which a reformed system of taxation can play in guaranteeing full employment and a high level of production. The recipe is simple. Mr Beardsley Ruml, author of the present pay-as-you-go plan, puts the doctrine in its most extreme form by advocating the complete abolition of the federal income-tax on corporations and the substitution of the federal personal income-tax as the Government's main source of revenue. Two other plans, known as the Twin Cities Plan and the scheme of the Committee for Economic Development, are content to urge merely the reduction of the corporation income-tax, with the elimination of the excess profits tax and the capital stock tax. The argument goes that corporation taxes, in their present form, discourage investment and consequently employment; that they result in double taxation for large numbers of people who are receivers of corporate income; and that their effect is to distort business policies on such matters as expenditure, capital transactions and pricing. Mr Ruml has taken pains in his scheme to urge steps to prevent the use of the corporate form of organisation to avoid payment of individual taxes; and all of the plans assume that elimination or reduction in corporate taxation can be combined with reduction in the rates on individual incomes, particularly in the upper and middle brackets. The Twin Cities plan, however, provides for a 5 per cent retail sales tax. There unquestionably is a strong case for reform of corporate taxation, which in its present form provides no inducement to new enterprises and stimulates excessive financing through bonded indebtedness rather than share issues. But these are only incidental to the new tax doctrine, which is that the reduction of corporate taxes points a sure road to economic salvation. No doubt the critics will enquire whether, in fact, lower taxes would always result in increased output and employment, rather than larger profits; and whether the change would not in effect shift the burden of taxation on to those less able to pay. It cannot be denied, however, that the new doctrine is ingeniously and effectively in key with the Administration's plans for maintaining a high level of employment and production after the war; and it has stimulated a wide interest in methods of public financing.

DEPENDABILITY

R.M.S. "Queen Mary"—second in size only to her sister ship "Queen Elizabeth," can carry 3,200 persons in luxury peace time travel. Four gigantic propellers representing 200,000 horsepower enable this "Queen of the Seas" to cross the Atlantic in under four days—calling to mind what millions throughout the world say of Champion Plugs, "There's Dependability for you!"

IDAC

ALMOST every discussion on the future of British trade is preoccupied with export policy—the general assumption being that if exports are looked after, imports will somehow look after themselves. This approach to the subject, though it is undoubtedly in the right general direction, would be highly unsatisfactory as a guide to working policy. It would ignore the fact that an import policy based on pre-war principles would be hopelessly inconsistent with the declared aims of national reconstruction.

In 1932, with the passing of the Import Duties Act, Great Britain became a protectionist nation. In the same year the Import Duties Advisory Committee was formed. Nothing has been heard of this body for five years, but it would be imprudent to assume that it has been interred. If it is dead, there are many who are anxious that it shall not lie down.

The IDAC was (the wish is father to the tense) charged with the tasks of examining the day-to-day working of the Act and of recommending modifications, where they were deemed necessary, in the scale of import duties. The committee consisted of three members—an actuary, a barrister and an economist. Its unusual constitution and powers arose out of the conflicting ideals of the Chamberlain school of politics. It was thought, no doubt, that a reconciliation could be effected between the diametrically opposed principles of Protection and Freedom from Government Control by divorcing the administration of the Act from direct ministerial responsibility. The compromise was not a very reassuring experiment.

The duties and functions of the IDAC, as laid down in the Act, were such that a national planning of import policy as a whole was rendered impossible. Since the body was independent, it was denied the guidance of considered Government policy. It could work only on a short-term, study of isolated problems. Its methods were empirical and its conclusions were unrelated. In its consideration of any particular case the committee was empowered to subpoena witnesses and to collect any relevant documentary evidence. But the pressure of time, circumstance and sectional interests almost invariably limited the proceedings to an examination of claims put forward by associations of traders and producers. These associations often came into existence for the express purpose of making an application to the IDAC—though they have gone on to wider activities. The interests of consumers, because they were unorganised, were usually afforded only superficial and perfunctory consideration. But even where, in rare instances, the consumers were strong enough to be heard in force (as when an organised industry consumes products of another), they appeared before the Committee as parties likely to be specifically injured by demands for increased protection rather than as advocates of reduced duties. The general public interest did not even get this degree of representation. The fundamental mistake of pre-war import policy was the naïve assumption that the safeguarding of industrial profits automatically served the best interests of the consumer and the community.

It was not really surprising that the term of office of the IDAC coincided with a period in which the trade associations multiplied and assumed a powerful control over British industry—and this fact alone is sufficient to nullify any positive good that the committee may have achieved in the narrow field of import duties. The trade associations wield great power—power enough to move the entire industrial system towards a policy of economic expansion. Unfortunately, they seem committed to a programme heading in an exactly opposite direction, with control of entry, restricted production and price maintenance as their guiding principles. The IDAC has been their foster-mother, and the circumstances of their birth, or re-birth, have conditioned their character.

Some of the committee's shortcomings were due to the queer assortment of powers conferred upon it. Thus it was

unable to recommend any reduction of duty on the products of "key industries" or goods on the McKenna list. Similarly, without an express recommendation from the committee the Treasury was unable to impose any duty at a lower level than the statutory 10 per cent. The committee's proceedings were held in camera, and opponents of any claim for tariff revision were forbidden to cross-examine those making the claim. Two facts emerge from study of the statements which the committee published in support of its findings. First, that in spite of its honest attempts to see justice done, the committee's guiding economic principles were hopelessly one-sided. How else could one interpret the ingenuousness of such statements as these?

It is unlikely that producers would jeopardise the prospects of an expansion of demand by seeking to increase prices unduly.

At the beginning of 1934 imports increased to well over 1,000 tons a month and in the second half of the year the position rapidly became worse.

Yeast being essential to the production of bread, the maintenance of the domestic supply is a matter of national importance.

[It is necessary] to protect the home manufacturer against the uneconomic price-cutting to which these goods are being subjected by foreign competition.

In general, the committee reserved its recommendations of the highest duties for luxuries and the loosely defined "key industries," and maintained low duties on the basic foodstuffs.

The second obvious conclusion is that the committee's good intentions were not enough to ensure a systematic handling of problems of great complexity. Imports of manufactured goods were usually regarded as a menace to national security, and the committee were ready to bestow an additional 10 per cent of protection on "deserving cases," with remarkable confidence in the future stability of the price-level. And if the recommendations would plainly lead to increased prices, the committee were quite sure that the change would be in the common interest, since foreign goods were well known to be inferior to British.

Almost without exception, the protection granted to industry was unconditional. Each case was judged on the facts of the moment—or rather such facts as the trade associations employed to support their claims—and very little consideration was given even to the most obvious long-term implications. Duties were imposed or raised for unspecified periods or "until such time as sufficient home supplies are made available," and no promises of reorganisation were exacted in return. One exception was the iron and steel industry, where a long overdue reorganisation was made the pre-condition of additional protection. In April, 1932, the general 10 per cent duty was raised to 33½ per cent on pig iron, girders, sheets and similar products, and to 20 per cent on finished iron and steel goods, "from rails and tubes to cutlery and screws." This step was remarkable for the fact that it made the duty on the raw material higher than that on the manufactured article. The duties were imposed temporarily—in the first case for three months, to enable the industry to draw up plans for reorganisation. But the time limit was soon extended to two years, and in May, 1934, when a plan of sorts had been produced, it was removed altogether.

The chief result of the "reorganisation" was the formation of the British Iron and Steel Federation, a body which soon won the approval of the IDAC as "a real instrument of progress . . . making its authority and guiding influence felt." Indeed, the committee expressed the hope that the work of the various trade associations forming the Federation in regulating output and prices would not be undermined by the independent action of non-members. "Reorganisation" was thus interpreted solely in terms of tighter selling organisation, and though some technical rationali-

sation followed on improved profits, progress was so slow that in 1939 the British iron and steel industry still lagged behind its competitors in efficiency. Moreover, for such improvement as was made, the public paid a stiff price. Although, in March, 1935, the Federation "categorically renewed the assurance . . . that it is not their intention to raise prices as a result of increased protection," the Board of Trade figures show that iron and steel prices increased by 30 per cent between that date and July, 1939. During the same period wholesale prices generally (Board of Trade Index) increased by only about 14 per cent.

*

It is not possible, unfortunately, to assess with any accuracy the parts played either by the Import Duties Act or the IDAC in the gradual recovery that took place between 1933 and 1939. But the IDAC's own inquiry produced the interesting comparison that while employment in unprotected industries increased (between 1930 and 1934) by some 400,000, employment in protected industries fell by 50,000. As it stands, the record of the IDAC is unimpressive enough; without the camouflage afforded by conditions of general recovery it would be many shades nearer black.

If the IDAC is not to be resuscitated, what form should the body responsible for the administration of import policy take? It may soon be possible to relax in some degree the Government's total control of foreign trade; and ultimately, it may be hoped, detailed control will be abandoned in favour of a looser form of direction. It would need the hardest optimism to believe that protective duties will not form part of this new system—indeed, the pressure from the United States is towards the doctrine that protective duties are the only form of control that a state can legitimately exert on its imports. The trade associations are already staking their claims for protection against largely invisible rivals. How should such claims be tested? And where is the responsible authority that is competent to sift the sound from the unworthy, to fix the scale of duty so that it achieves the precise result aimed at and to reconcile the objections of Government policy with the aspirations of industry in the interests of the consumer?

There are two main requirements. The first is that the Government should lay down a general policy, arrived at after careful consideration of what the general economic position of the country requires, and that the specific demands of individual industries should be considered only within the framework of the policy so determined. The policy should come first and its application later. But to leave an "independent" body without guidance on general policy, as IDAC was left, is to produce the contrary result:

Payment by Results

(By a Correspondent)

ONE of the least agreeable characteristics of mechanised industry is that the bulk of workers see little connection between their individual effort and the finished product. One of the major problems still to be solved is to find a substitute for the pride in the job which was—and is—the distinguishing mark of the true craftsman. The elements for the solution of the problem already exist in the various systems of payment by results and profit-sharing schemes. Too often, however, only very indifferent success is achieved, probably because the relation between effort and reward is too uncertain or too difficult of comprehension to constitute a real driving force. The principal purpose of this article is to describe a scheme which has been worked for over a decade by Whitehead Iron and Steel Company of Newport with conspicuous success and to see what conclusions can be drawn from this experience.

Whitehead's are re-rollers of steel, and the figures quoted relate to a modern continuous mill which, at least at the time of erection, was the most efficient works for the job in the country. This is another way of saying that cost of plant is high compared with the total paid to the workers required to run it. Almost certainly the operations required of the men must have seemed to those accustomed to less intricate plant largely "mechanical." Certainly it is difficult for them to feel any necessary connection between these actions and the forms in which their products entered into final consumption.

general policy, such as it is, will merely be the aggregation of a number of specific decisions. Nor is it enough to instruct the "independent" body to "have regard to the national interest." The national interest, in these complicated economic matters, cannot be picked out of the air by anyone endowed with common sense and good intentions. It must form part of the general strategy of the Government's economic policy, and the dispositions of each division can no more be made in ignorance of the strategic plan than they can in armed warfare.

The second requirement is that the tariff-fixing body should not derive its information from interested parties alone. In other words, it must be an expert body, equipped to form its own opinions and armed with its own information. Independent industrial experts are not numerous in this country—though the war has bred many more than previously existed. They should be mobilised for the assistance of the tariff-fixing body, and no decision should be reached without an independent report.

Too much stress, however, should not be laid on the expert report, however independent. For the vital point to be borne in mind is that the facts of the particular case should not be the determining factor in fixing a rate of duty, but only a marginal qualification. General economic policy should fix the rate, and examination of particular circumstances should be confined to ascertaining whether especial harm would be done, or excessive benefit conferred. Indeed, there has always been much force—and there is still more today—in the contention that the tariff list should provide only two or three flat rates of duty, and that the examination of the circumstances of individual industries should be confined to deciding in which categories they should be placed; the general economic strategy of the Government should then fix the rate for each class as a whole. This might not, of course, be to the taste of industries now comfortably protected. But a certain Procrustean indifference to individual cases, if it is practised in the interests of overall efficiency, is greatly preferable to precise deliberations over parts that do not fit together when completed, or to a system that wholly subordinates the good of the whole to the wishes of the parts.

The administration of import policy requires a body that is strong, expert and responsible. It must be strong enough to resist the special pleading of the trade associations. It must be sufficiently expert to recognise the interests of the consumer in the mass of evidence at its disposal. It must be responsible so that its work can be co-ordinated with long- and short-term Government policy and vetted by Parliamentary inquiry. In other words, the pattern and example of the IDAC should be carefully avoided.

In due course an *esprit de corps* can be evolved; but it is doubtful whether that alone would achieve great results. In this case it had to be built up, and the management—who were very conscious of the advantage of profits—worked on the assumption that a cash reward directly related to physical output, plus a share of profits, was the best way to produce teamwork and the highest efficiency of operation.

For each size of bars produced a "standard" output per eight-hour shift was fixed. A basic rate of wages was also fixed for each job in the mill. This basic rate is increased, by a percentage bonus, in proportion to the excess of actual output over the standard. (In fact, the "standard" output appears to have been fixed so low that it would always be exceeded provided all workers on the job were reasonably careful.) In addition to this flat percentage increase, a super-bonus is paid at the rate of 1 per cent for every 8 points of the percentage bonus up to 40 per cent and at the rate of 1 per cent for every 5 points thereafter, the object being to give a higher reward for the greater effort necessary as the limit of perfection is approached. It will be evident that, since the bonus paid in any one shift is the same for all men on the same job and is dependent on the collaboration of all these men, teamwork receives the maximum encouragement.

The effect of the scheme on wage packets is shown in

the following table, which gives the total pay, including the additions made under the industry's "sliding scale" scheme and cost-of-living bonus, for a single shift on a job for which the "standard" output is 140 tons of steel:

Actual output	140	210	280	350
Percentage increase	...	50	100	150
Job rate—per shift	10/-	10/-	10/-	10/-
Percentage bonus	...	5/-	10/-	15/-
Super bonus	...	-/8	1/8	2/9
Sliding scale and cost of living	10/-	15/8	21/8	27/9
Cost of living	8/9	8/9	8/9	8/9
Total per shift	18/9	24/5	30/5	36/6

Those are the prospects which the scheme holds out. They are further enhanced by the fact that each half-year all the men to whom the scheme applies, that is all men on production, receive a cash bonus on their earnings for the past six months at the same rate as the actual dividend paid on the equity capital. This means that every individual has an interest, and an appreciable one, in the efficiency of every element in the whole concern. Also he is enabled to contribute directly to it—apart from his work—by a system for collecting and testing suggestions for improvements from all employees. If any suggestion is productive, a share of its value goes direct to the man who made it. Many working patents in the plant had their origin in workers' suggestions.

As a result of the scheme and the general provisions making for co-operation between men on production and the management, the average bonus earned, which ten years ago was some 60 per cent, has in recent years averaged about 110 per cent. It sometimes reaches 150 per cent and, when specifications are exceptionally good, 200 per cent. The increase in the average bonus from 60 per cent to 110 per cent is equivalent to an increase of about 25 per cent in total earnings; in addition, the percentage rate of the half-yearly bonus has increased and, being calculated on larger earnings, represents an even more rapid increase in the money amounts distributed. It should be explained that this half-yearly bonus is an *ex-gratia* payment. It does not form part of wages in any negotiations between the company and the Iron and Steel Trades Confederation, and it can be withheld in all cases of proved misdemeanour. So far it has never proved necessary to use this power.

★

Figures of actual wages and earnings are not available; but the table below shows how an increase in wages is combined with a reduction in costs. The figures are calculated for a mill with a "standard" output of 140 tons a shift, and the light figures show, for various actual outputs, the extent to which costs are lower and wages and profits higher, than they would be at the standard output. But since the "standard" is fixed at such a low level that a 50 per cent increase over it is easily attainable, it cannot properly be used to represent "normal output," and the bold figures have accordingly been inserted to show the increase in wages and profits and the fall of costs above and below "normal," on the assumption that "normal" is 50 per cent above "standard." When rolling goods of smaller section than the "140 ton" class, the tonnage produced per shift is lower. Owing, however, to the fact that the selling price per ton is higher, the total net profit is little changed.

Weekly Output 10 Shifts		Decrease %		Increase %		
Tons	Increase %	Cost	Wages	Profit per ton	Profit per week	
2,100	50	13-56	30-2	21-46	82-26	
2,800	100	21-31	62-2	33-72	167-54	
3,500	33½	8-96	24-57	10-09	46-79	
	150	26-15	94-6	41-38	253-55	
	66½	14-57	49-49	16-40	93-98	

One other result of the scheme, and one which has probably a substantial effect on the results achieved, is that the average length of service with the firm of all employed on production is ten years. This is a recent calculation, made after many old hands had joined the forces and been replaced by newcomers. But for this it is believed the figure would probably be as high as 15 years.

From the standpoint of the investors, the position cannot be exactly determined. If the five years 1940-44 are compared with 1930-34, the average increase in earnings on the ordinary capital is from 100 to 785, while distributions have

increased from 100 to almost 400. These are absolute figures not rates, for the capital has been increased over the period slightly by issues for cash of a moderate amount and, subsequently, by scrap bonuses which virtually doubled it. The latest accounts show reserves of £625,000 against £28,000 in 1930, and these figures certainly understate the present position. In 1944 net liquid assets amounted to some £625,000 and there was debenture debt of £32,000. In 1930 the figures were some £100,000 of net liquid assets and a secured bank overdraft of £189,000.

★

It may fairly be claimed that this scheme has achieved results of a very satisfactory character and there is no apparent reason why something like it should not succeed in all cases where capital equipment is costly compared with the labour involved and it is possible largely to influence output. This is of the first importance precisely because increased prosperity in this country depends in no small measure on producing the increased mechanisation postulated. Further, it is often under such conditions that it is hardest for the worker to trace the social benefit of an increase in his individual efficiency. There should be a widening field in which some such scheme as this will form an appropriate solution.

There will remain, however, a great number and variety of cases where the necessary conditions do not exist. In some cases, even where the plant-labour ratio is very high, no such improvement as that of 31½ per cent—160 to 210—secured in this case may be possible. In many others, while the difference between careless and excellent work may be as high or higher, the plant-labour ratio may be low, and no large increase in wages will be possible without increasing total costs, of which they are the greater part. In this case no such percentage increases as those given for Whitehead's must be expected. In the former, it may be desirable to offer a very large reward to obtain what little improvement is possible.

The actual percentages offered must vary and may vary very greatly, but in all cases the essential requirements are the same: to interest the individual by ensuring that increased efficiency brings an immediate reward; to ensure that he is not robbed of this by the inefficiency of fellow-workers, taking disciplinary action against the latter in appropriate cases; to interest him in the general efficiency by giving special rewards for special services and a share related to total profits as well as to his own contribution to them.

There are doubtless many other excellent schemes working in the country, but war-time experience alone has produced numerous instances in which the systems of payment by results in use have been quite ineffective. If careful study is given to the matter, it should not provide too great a tax on the ingenuity of managements, assisted by experienced advisers where necessary, to produce a solution well adapted to the peculiarities of each type of job. A more difficult problem, especially in the very numerous cases of vertical combines, will be to reconcile workers on different types of job to the fact that the net product of a given dose of extra energy or efficiency may vary greatly from job to job. Evidently, as between two firms making a similar product, the one highly and the other slightly mechanised, the former would pay better and would tend to attract the best workers. This would increase the discrepancy in the costs of the two and, under conditions of competition, hasten the elimination of the lightly mechanised and the adoption of up-to-date machinery. Within a combine, however, there would certainly be great pressure to secure an equal rise in wages to all workers, and that would probably greatly reduce the incentive to efficiency.

Nevertheless, the problem has to be tackled if the best results are to be achieved. From the standpoint of management the desiderata would appear to be to provide the best equipment possible, to promote good relations with labour by any means available and to evolve suitable schemes for stimulating output. On the side of labour the adjustment of outlook is, perhaps, more radical. It is right that the labour movement should seek a higher standard of living, but it should not be done by restricting individual output to ensure that all are employed, but by the reverse process of cutting down costs to ensure that more can be sold. Perhaps even more difficult, the worker should realise that he may have to accept lower rates of pay in a job which is pleasant in itself than are obtainable in work which is more irksome.

Business Notes

Year-End Prospects

The money market has begun to envisage the prospects for the credit situation over the turn of the year. This concern has in recent years acquired a decidedly academic quality, and is a response to habits formed before the war rather than one born of real apprehension or of the need to make preparations for an ordeal ahead. This year, as it happens, would in the normal course have proved one of the real difficulty for the market owing to the accident of the calendar. The last working day of the year will fall on Saturday, December 30th, and this alone would have tested the market considerably, for however great are the preparations for the final day of the year, the actual monetary turnover on that day is always considerable and must certainly be greater than can be comfortably handled in the short Saturday session. Of greater importance is the fact that since the final working day of the year falls on the last day of a week, the market will find it impossible to transfer any part of the burden of the year-end inflation of credit on to the shoulders of the Government. This transfer has been achieved in other years by postponing payments for new Treasury bills and Treasury deposit receipts until the latter part of the week, i.e., in the new year, and concentrating all the maturities into the first part of the week, i.e., in the old year. This familiar device has lost some of its efficacy of late because the discount market, in its syndicalist approach to the Treasury tender, can be more easily regimented and ordered to spread its applications for new bills more evenly over the week—whether or not that week be the final one of the year. This year, however, the shadow of this device will not be available. All payments and all maturities, whether of Treasury bills or of TDR's, will have to be concentrated in the old year. The banks have already begun making preparations for their end-year climax of window dressing by reducing their purchases of bills from the market. Some institutions have this week announced that they will buy no more bills from the market until the New Year. All this leaves the market profoundly uninterested. It knows full well that whatever the pressure on credit conditions may be as the year 1944 draws to its close, the deficiencies will be made good by the authorities through open market purchases of bills at the open market rate of 1 per cent. Given the growth in the market's bill portfolio and the accident of the calendar, the recourse to the special buyer this year promises to break all previous records.

★ ★ ★

The Banks' Investments

The most interesting movement revealed by the clearing banks' returns for November is a rise of £20,483,000 in investments. This is almost exactly matched by a fall of £19 million in Treasury Deposit Receipts. These complementary changes are a measure of the banks' subscription to 2½ per cent National War Bonds in the early days of November that preceded the closing of the tap for these securities. The bulk of the banks' direct subscriptions for the bonds was evidently financed by the pre-encashment of TDR's. The trend of bank credit was still towards expansion during the month, and bank deposits rose by £55,479,000 to the new record of £4,397,858,000. The stimulus to this expansion was provided by the increased issue of Treasury bills to the banking system. Part of this was taken up by the banks through purchases from the market and is reflected in the rise of £28,411,000 in bills discounted. By November the banks were readily buying the January maturities, the supply of which had been increased for their own special convenience by raising the amount offered at the weekly tenders during October. In addition, the banks indirectly financed a larger issue of bills by increasing their short loans by £13,715,000 to £205,024,000. The bulk of the clearing banks' money at call and short notice is now used by the discount market to finance its Treasury bill holding, and the recent expansion in this item reflects the larger portfolios which discount houses are running and which have been built up on the basis of the larger capital now invested in the market. The clearing banks' short loans stand at a record level and have increased by about £55 million over the past year.

British Celanese

The full accounts of British Celanese for the year to July 1, 1944, are now available. They have been circulated to the press, but, owing to "inevitable delay arising out of war conditions," they have not yet been sent to shareholders. As was feared might be the case, they show that the ability to pay a maiden dividend arose not only from a revision of the EPT liability, but also from the bringing in of over-provisions of earlier years. Without the latter aid, which amounted to £260,000, the carry forward would have been reduced by £248,627 after making the numerous allocations, which include £106,477 for writing down expense of issue, and covering premiums on redemption of debentures, and £102,657 for redemption of Funding Certificates. The published terms of the resolutions which now govern the distribution of profits are too uncertain to allow of an exact computation. It appears, however, that, but for the relief of £260,000, the amounts earned on participating dividend on the second preference and on the ordinary, as well as the appropriation for Funding Certificate redemption, would all have been approximately halved. An attempt has been made on page 818 to give figures for three years on a comparable basis and reasonably classified. A comparison of the latest figures with those of two years before is instructive, but it must be borne in mind that in the earlier year preference dividends were not fully met. The report states that trading has improved since the end of the financial year and refers to further negotiations on taxation. On the basis of the published figures, it is probably fair to say that the real net earnings after a redistribution of the tax liability showed an improvement of the order of £70,000 this year over 1941-42 in the sum available after debenture interest, and that the amount earned this year on the ordinary capital was around 10 per cent. Even after the fall in price following the publication of the report, the yield of £2 14s. 10d. per cent which this would indicate cannot be considered handsome.

★

The fluctuations in price over the period from shortly before the dividend declaration to date have been frequent and violent. As was indicated on page 780 of *The Economist* of last week, this was an ideal case in which the recommendations of the Stock Exchange Committee ought to have been observed. The committee is therefore to be congratulated upon issuing for publication a notice which states that British Celanese omitted to publish figures and dividend together by inadvertence, and, it would seem, in ignorance of the terms of the committee's suggestions. The procedure of issuing a statement concerning a company for publication is quite exceptional, and it will scarcely be

LIMITED

possible for any company secretary in future to plead ignorance. There is little doubt that the recommendations of the committee, or something very like them, are already widely accepted, and the question of taking some sanction against those who do not adopt them, without due cause fully explained, might well be considered. An alternative would be to give the recommendations the force of law and a question with that object is being asked in the House.

Coal Output

Statistics published in the December 9th issue of the *Board of Trade Journal*—reproduced in tables on page 822—show that coal output in the third quarter of 1944 was about 2½ million tons less than in the corresponding period of 1943, while output per wage-earner per manshift was 4 hundredweights less. Absenteeism increased from 12.7 per cent of possible shifts in the second quarter of 1944 to 14.5 per cent in the third quarter. The more encouraging features of these statistics are that, though more coal was lost from causes other than absenteeism than in the second quarter of this year, the great part of the loss was accounted for by recognised holidays, and the time lost as a result of disputes was actually the lowest on record since the first quarter of 1943. Encouraging also is the increased output from open-cast workings, which was nearly twice as great as in the corresponding period of 1943, presumably the result of a more intensive application of American machinery. But apart from these two factors, the immediate outlook is very gloomy. It has now been decided to set up a joint committee of miners and owners to investigate the causes of falling output and to propose methods of improving it. This means the postponement of the owners' proposal, which the miners have rejected, to attach conditions to the payment of the minimum wage.

More Municipal Conversions

When in August last the terms were announced for part conversion of a first batch of small municipal loans with optional maturity dates early next year, it was assumed that the authorities wished to reduce the amount of such securities outstanding and to finance the remainder by means of a widened Local Loans Fund. It now seems doubtful whether this was their intention. The terms were so adverse to the lender that the Treasury was called upon to take up more than half the total of £2,886,798 of new stock offered, but there is some evidence that this has recently been on offer in the market. These loans were offered at 99 with a maximum life of 24½ years and a minimum five years less, the rate of interest being 3 per cent. This week there are announced two further conver-

sions. Holders of £1,126,864 4½ per cent Eastbourne stock are offered conversion, up to a total of £1,000,000, into a new 3 per cent stock, 1963-66, at 99, while holders of £1,495,000 5 per cent Swansea stock, 1945-55, and £1,000,000 of 5 per cent stock, 1945-52, are offered conversion in full into a new stock on terms identical with those of Eastbourne. Now these stocks, although the borrowers have perhaps a higher reputation on the whole than those of the August issue, run for only 21½ years at most. For the first time the terms offered under any Government-sponsored issue are more favourable to the lender than on a previous occasion. This appears to be a recognition, both of the fact that the previous terms were unduly hard and that, in the interim, the yield margin between gilt-edged stocks and municipal loans has widened. Although some people would agree that the particular margin in question has at times been extremely narrow, it must be admitted that one trouble associated with the cheap money policy, as applied, has been that it takes so very long to permeate the whole rate structure.

Export Planning

Little by little preparations are being made for the forthcoming export drive. The latest moves were announced by Mr Harcourt Johnstone before the Institute of Export last Monday. The recently resuscitated BIF Advisory Committee has on its agenda plans for the next British Industries Fair, and it is hoped the war situation will allow it to be held in the spring of 1946, or at any rate not later than 1947. The fair will pay more attention to exports than it did before the war, so it should be timed so that overseas customers can visit it. It is no less important that British manufacturers should see foreign products. Perhaps two birds could be killed with one stone if the scope of the BIF were further extended to include an international section. Thus valuable experience would be gained for a full-scale international exhibition in this country. The major factor in timing the fair is the work to be done in planning and designing before British manufacturers will have anything to exhibit, but this is not to deplore preparatory work on the exhibition itself. Mr Harcourt Johnstone referred to the Overseas Trade Development Association, which has resumed its meetings. It was originally set up in 1930, and it advised the Department of Overseas Trade until the outbreak of war. The other main point of Mr Harcourt Johnstone's speech concerned the staff of his Department. Before the war, the home establishment was 423 officers; it fell to less than a hundred, but its present number of 180 is to be increased by 70 next month. A vigorous export policy may require for its execution an even larger staff—if it is properly employed—than the pre-war one. Perhaps the most interesting staff proposal is the strengthening of the Department's overseas establishment to include "market officers" with local business experience. Too often in the past British trade has been handicapped by lack of information on local markets—both of what the customers wanted and what they could produce for themselves. These new appointments, if they result in able market research, will be of enormous value. Mr Harcourt Johnstone promised special reports and industrial surveys of different overseas markets. A few manufacturers are now being permitted to visit their overseas customers. All these pronouncements are welcome; but the major dilemma will remain unsolved until an overall statement is made, accompanied or quickly followed by the sort of detailed information on the availability of materials and scope of control, without which the individual manufacturer cannot begin to plan his programme.

Chinese Inflation

Military setbacks and the political turmoil that followed the Chiang-Stilwell incident have not helped the currency difficulties of China. Every report from Chungking suggests that the printing press is still the chief instrument of taxation of the Government. The note circulation is mounting and the cost of living is keeping pace with the movement. The evidence of price indices is no longer available, the last figure for the cost of living in Chungking being that for July, 1943, when the index, based on the first half of 1939, stood at 6,074. Since then the rise in prices has been greatly accelerated. The cheques entered in the Chungking clearing last September averaged over 500,000 dollars each and the total clearings in that month reached 54,000 million dollars. Once a point is reached at which currency values have to be expressed in these

astronomical terms experience has shown the difficulty of causing the currency to reappreciate or even of stabilising it at its depreciated level. The Chinese authorities have increased their programme of gold sales, and it was recently announced that in the three months to the end of November 10,000 million dollars had been withdrawn as a result of open market sales of gold. The achievement is not so impressive as it might at first appear if account be taken of the fact that gold has been dealt in at up to 50,000 dollars per ounce. The official exchange rate of 3d. to the dollar has, therefore, lost all contact with reality. Even the 100 per cent concession made last year for certain favoured remittances leaves the rate of exchange at 160 dollars to the pound, at which it would cost fabulous sums in sterling to maintain body and soul together in Chungking. American personnel in Free China continues to have its lot eased by the use of US dollar notes which have been sold in the black market at anything up to 1,000 Chinese to one US dollar. British personnel, without using the market for sterling notes, has found ways and means of getting its remittances from this country converted at a rate of about 1,000 dollars to the pound. This is still far from the true cost of living parity, but it is still further from the alternative rate of 160 dollars offered by the official market.

Copper Discussions

Changes in the world copper position (discussed in *The Economist*, November 11th, page 651) are becoming more apparent. The Ministry of Supply is not to renew its contract for the bulk purchase of copper from Northern Rhodesia after January 31, 1944, and discussions are now taking place in London to determine next year's rate of production. As the Ministry's copper purchases in other parts of the Empire have been transacted on the same basis as those in Rhodesia, they, too, will be affected by the new policy; although in Canada, where copper is largely a by-product, adjustments in production depend on the future demand for nickel, lead, zinc and precious metals. The British Government's decision is understandable. Although war-time consumption has been far in excess of the pre-war level, substantial stocks must have been accumulated from the heavy wartime imports. As the supply position in the United States, too, has now been more or less stabilised, and demand from other quarters is not very large, the time for adjustments in current production has obviously arrived. The British Empire, however, supplies only about one-quarter of the present world copper supplies, so that any arrangements for the adjustment of production in Rhodesia, Canada and the smaller Empire producing regions, will before long have to be supplemented by wider arrangements. In the United States, indeed, reports have been circulating lately which have found expression in the American trade press, that Great Britain is sounding other Governments about a world copper conference. These reports appear to be premature, if not wholly unfounded. The first move towards a settlement of the copper problems must be the clarification of British and American policy towards the disposal of Government-owned stocks, which are believed to be heavy. The United States is a self-sufficient market for copper, isolated from the rest of the world by a prohibitive import duty, which was imposed to protect high-cost American producers from foreign low-cost competition. The entire world surplus capacity for copper is found outside the United States, and, fortunately, consists largely of metal which can be produced at low costs. Control of the extra-United States market, therefore, should be directed towards the stabilisation of prices at a level that would stimulate consumption and thus tend to close the gap between potential production and demand. If the United States were included in a transitional regulation scheme there would undoubtedly be attempts to raise the international copper prices to a level acceptable to high-cost American producers. Such a position would not only be against the interest of consumers, and the United Kingdom is the world's largest copper-importing country, but would also be against the long-term interests of low-cost producers. In this direction the British Government will have to be on guard in discussing copper problems with other countries.

Texas Land Meeting

The old board of the Texas Land and Mortgage Company made a last-minute effort to obtain an arrangement which would ensure the future management of the company on the lines laid down in their resolutions. This was that the Governor of the Bank of England, or someone

deputed by him, should appoint a chairman and should approve of two other directors nominated by the Lawson group. Nothing was said of how the fourth director was to be nominated. This arrangement was not acceptable to Mr Lawson and it is doubtful whether the Bank of England would have undertaken the task. In the event, both the resolutions proposed by the board for the future conduct of the company were lost on a show of hands, while the resolutions of the Lawson group were carried. The old board demanded a poll in each case, but it seems extremely probable that the results will merely confirm the voting at the meeting. The principal point of the chairman's speech was to put up a very strong case for the board's resolutions, set out on page 750 of *The Economist* of December 2nd, from the point of view of persuading the debenture holders to cancel their lien on the uncalled capital of the company and he was able to read letters from two large debenture holders supporting the board's resolutions. Mr Lawson assured shareholders that he saw no difficulty in getting the consent of the debenture holders to his own plans for removing the uncalled liability. He also stated that he would run the company on conservative and sound lines, but he would not accept the board's resolutions nor, when asked by a representative of an investment trust holding shares if he intended to run the company as an investment trust or a finance company, did he give any reply. It is to be feared that the inferences which will be drawn from the un-cooperative attitude of such members of the Lawson group as were present at the meeting—and, if the truth must be told, the general demeanour or some of them—are not such as to dispel all the doubts of those who have found that the old and possibly rather unadventurous regime met their requirements. It now seems inevitable that a large dissentient minority will be left without representation and with no effective remedy.

Argentine Railway Results

The accounts for the year ended June 30th of the Central Argentine and Buenos Ayres and Pacific companies, now available, tell rather different stories. Both have secured increased traffic but, while the former has reduced its

EXTRA VITAMINS ESSENTIAL TO HEALTH

COLDS and influenza cannot be resisted when your diet is deficient in vitamin A: the daily dose of Crookes' ensures you the necessary amount. Adults cannot keep healthy and children cannot grow up with straight bones and strong teeth without sufficient vitamin D: the daily dose of Crookes' keeps your supply well above the safety level.

This extra supply of vitamins A and D will work wonders in building up your resistance and stamina through this sixth wartime winter.

expense ratio from 86.2 per cent to 82.1 per cent, the latter has suffered a further increase from 78.98 to 83.32 per cent. The result from the standpoint of the investor is that Central Argentine has a surplus, after meeting loan charges, of £287,604 against a deficit last year of £154,622, while the BAP line increases its deficit on the year from £888,982 to £1,036,968. These figures are reached in each case after debiting exchange differences which, although reduced, are still very high. So far as the comparison on the year is concerned, a substantial part of the difference in experience is accounted for by the fact that, while locomotive running expenses for the Central rose from 29.60 per cent of gross receipts to 31.50 per cent, for BAP the figures were 34.83 per cent this year against 27.22 per cent last. In the last pre-war year, 1938-39, the figures were, for Central Argentine total expenses 76.15 per cent, locomotive running 19.13 per cent, and for BAP total expenses 75.46 per cent, locomotive running 20.24 per cent. In each case the increase in the locomotive running percentage is about twice as great as that in the total figure, which suggests that, should a really material fall in the price of fuel, much of which is now substitute fuel, prove possible, there will be an important saving in costs. This is the one less sombre spot in the whole picture, for the present level of costs is far too high—as indeed was that of pre-war—to permit of efficient maintenance and a return on capital sufficiently reasonable to permit of financing any developments which require fresh money.

Cotton Merchants' Defence

The cotton merchants are indignant at the criticisms of their efficiency contained in the Platt Mission's report. The effect of these criticisms "in an industry which is dependent on world trade can only be very damaging and is much deplored," says the Cotton and Rayon Merchants' Association in a statement issued last week. The Association's comments are confined to the distributive end, and they criticise the exclusion from the Mission of any representative of the export trade and the absence of any opportunity for the representative trade organisations or the Cotton Board to discuss the report before its publication. Nobody likes to be called inefficient or conservative, and the merchants' attitude is understandable, but it does tend to confirm the existence of what is referred to in the Report as "the conservative forces of restraint" in the cotton industry. The Mission recommended as "the vital requirement of the British industry . . . a modification of the methods of distribution" with a view to securing greater standardisation of yarn and cloth types and bulk production. Its two specific charges against the merchants were that they gave their orders on too small a scale and changed their yarn counts and other cloth particulars too frequently to allow this objective to be realised, while in general there was not sufficiently close understanding between producers and distributors. The Association denies that merchants have impeded maximum continuity or bulk production in the past—the blame, if any, should be attached to the post-1929 world situation. It also points out that the comparison with the United States is unfair. The American industry exported in 1937-38 only 3.3 per cent of its production; while Britain exported as much as 51 per cent of its output in that year. The merchants are prepared to accept a "reasonable standardisation" which would not restrict consumer choice.

Their positive proposals are that the industry should adopt a scientific costing system and discard wartime fixed prices, and that the pooling of orders, on the lines of the Grey Cloth Pool, which has operated for the past year, should be continued. It is true that the marketing problems of the American and British industries are very different, and that the latter needs to be flexible and adaptable to meet its varying consumers' needs. But it would surely be possible to provide all the choice that the consumer wants with many fewer varieties than there are to-day. Give the customer 200 varieties to choose from, and someone will be found to buy some of each one. But that does not mean that everyone would not be satisfied with 50. "Consumers' choice" can be carried too far if it is used to perpetuate a scale of operations which—whether or not it is economic in the distributive stage by itself—imposes quite uneconomic conditions upon the producers. The merchants' record for developing the market has not, in recent decades, been so good that they can afford to stone-wall now. It would have been more helpful if, instead of "deploring" the criticisms and comparisons of the Platt Report, they had admitted the disadvantages of the distributing system and suggested more far-reaching means of improving them.

Rebuilding the P and O Fleet

The accounts of the Peninsular and Oriental Steam Navigation Company for the year ended September 30, 1944, show fleet earnings nearly £290,000 lower, dividends from subsidiaries much the same, and an increase in investment income of some £80,000 (mainly in Government securities)—making total profits £200,000 lower at £2,500,000. The fact that less is needed this year for debenture interest, and nothing for debenture conversion, means that earned for ordinary is only down from 27.7 to 25.1 per cent, after deducting £100,000 reserve for "special reconditioning." Deferred dividend is maintained at 8 per cent and reserves are again substantially augmented. The accounts are analysed in full on page 818. The falling-off in earnings is to be expected in view of the dwindling size and value of the fleet. The deputy chairman, Mr Lang, again states that the insured value received for ships lost is insufficient for the cost of their replacement. This problem is growing in urgency, for the company will very soon have to commence "a very considerable building programme." A passenger shipping company such as P and O can have little use for ships built during the war, and almost the whole of its fleet will have to be rebuilt. This is a vast task, increased by the fact that to compete successfully under modern conditions, very high standards of speed and service have to be aimed at. Shipbuilding costs will certainly be very high in the immediate post-war period. Unfortunately it is almost impossible to assess P and O's true position, due to the board's continued inability to republish the consolidated balance-sheet. Investments in subsidiaries of £9½ odd million account now for two-thirds of P and O's fixed assets and nearly a third of its total assets. Tonnage replacement reserve now stands at £8,300,000, and credit in the Government Tonnage Replacement Account at £1,830,000, making a total of £10 million odd specifically earmarked for the replacement of a fleet, whose gross valuation was given in 1941 as £21 million. To look at the matter rather differently, the net value of the fleet has fallen since 1938 by £6,000,000, while Government securities alone have risen during the same period by £7,000,000, and the net liquid assets of the parent company are now higher than were those of the whole group in 1938. The liquid resources of P and O and of several of its subsidiaries are at the moment exceptionally strong. Even so, it is probably true to say that the cost of fleet replacement will be so high as to demand at least their full deployment.

Motorways

As long ago as January 25th last, a statement by the Ministry of War Transport in the House of Commons gave a clear and sound exposition of the Government's intentions with regard to roads; it is still valid, and likely to remain so. In the first place, road extension and improvement will be related to the inland transport system as a whole. As a guide for the transitional period, the following order of priority is to be observed: arrears of maintenance to be made good; works closed down by the war

(Continued on page 818)

COMPANY MEETINGS

SINGER MOTORS, LIMITED

POST-WAR PLANNING

The ordinary general meeting of Singer Motors, Limited, was held, on the 8th instant, in London.

The Rt. Hon. Lord Latham, F.L.A.A., J.P., the chairman, in the course of his speech, said: It may be of interest to state that since 1936 we have expended a net sum of £84,431 on new plant, etc., and over the 7½ years from that date we have written off by way of depreciation no less than £132,424. The net available profit for the year under review comes out at £43,507 as against £42,039 for the year to July, 1943. The variation in the items in the profit and loss account call for no comment except, perhaps, the fall of £1,700 in the net rents receivable, which is due to the de-requisitioning of certain of our premises in London. With the existing level of taxation the balance of profit available cannot move upwards in other than a modest degree.

It now seems an almost certain prediction that complete victory in Europe will have been achieved before—we all trust it may be long before—we meet together again in general meeting. However, whether the period be short or long, the many problems of the change-over to peace-time activities draw nearer as each month goes by and the necessity for preparing for the change becomes more and more urgent.

RELEASE OF PERSONNEL

When I spoke to you in December of last year, I took occasion to press upon the Government the need for permitting the employment on the preparation of plans for the initial change-over of such technical and supervisory staff as is required for this purpose, in order that the period as well as the extent of the interruption of production

and, therefore, of the employment of operative workpeople might be reduced to the minimum. During the past few months the vital importance of this need has been emphasized in growing measure by those whose interests lie in many and varied industrial fields, whilst the apprehensions of workpeople generally are daily becoming more manifest.

It cannot be said that the Government up to the present have done much to meet the requirements of the situation. It is only fair to admit, however, that certain concessions have recently been made for the employment of a relatively small number of staff upon this work of preparation for the resumption of peace-time production. But these concessions will have to be much enlarged if any worth-while preparations are to go forward in time. It is, therefore, greatly to be hoped that the Government will do everything it can to make available as soon as possible sufficient personnel of the type required for this important work of preparing for the change-over.

"QUALITY, PERFORMANCE AND VALUE"

Notwithstanding the difficulties to which I have referred, your directors have continued to give close consideration to the question of reinstatement and reorganisation of your factories for normal production with the purpose of securing the highest degree of economical and efficient operation. Nor have we neglected consideration of the type and grade of motor car we should offer to the public. You will not expect me to say more at this time than that our aim will be to cater for those who seek quality, performance and value.

We are very closely considering our sales and distributive structure so that it will be well equipped to play its part in securing for Singer Cars a full share of business both home and overseas.

The report was adopted and the proposed dividend of 6 per cent., less tax, was approved.

DICTOGRAPH TELEPHONES, LIMITED

IMPROVED RESULTS

The eighth ordinary general meeting of Dictograph Telephones, Limited, was held, on the 14th instant, at Croydon, Mr Philip V. Summer (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the report:—The trading results of the company for the twelve months ended August 31, 1944, again reflect the stable nature of your investment and can only be regarded with satisfaction.

While there has been some improvement during the last year in the administration of the Machinery Control Order as affecting the company, it is nevertheless essential that this control be considerably relaxed or removed at the earliest possible moment.

The company's rental installations continue to provide the principal source of income; the gross income has been more than maintained, while a further sum of £20,262 has been written off for depreciation. Expansion of output of the subsidiary company has continued during the year, the turnover being 44 per cent, in excess of the previous year.

The current liabilities of the company are covered more than twice over by current assets, which I think discloses a sound financial position. The directors feel justified in recommending a final dividend of 6 per cent. and a bonus of 1 per cent., both less income-tax.

I believe that this company will be able to adjust itself more readily than many to post-war conditions. The opportunities for the use of our existing services should be many, in view of the extensive building programmes and the implementation of the new education and health legislation. There should be a substantial demand for our standard production in normal industrial and commercial channels which have been suspended during the war.

The report was adopted.

ELECTRIC & MUSICAL INDUSTRIES LIMITED

THE GRAMOPHONE COMPANY, LIMITED
COLUMBIA GRAPHOPHONE COMPANY, LIMITED
THE MARCONIPHONE COMPANY, LIMITED
THE PARLOPHONE COMPANY, LIMITED

ANNUAL GENERAL MEETING

HELD ON 14th DECEMBER, 1944

ACCOUNTS TO 30th JUNE, 1944

Profit for the Group for the year to 30th June, 1944, after providing for all taxation—the accrued liability of the company and its subsidiaries (the operating companies) as well as the liability in respect of the profits for the year covered by these accounts—and including charges and provision for contingencies arising from war conditions is	£182,024
Amount brought forward from last year	£295,396
Total available	£477,420
Out of which provision for the net Preference Dividend paid to 30th June, 1944, and a Dividend on the Ordinary Stock of 6%, and a Bonus of 2%, both less tax at 8/9d. authorised at the annual general meeting, requires	£144,429
Leaving to be carried forward	£332,991
General Reserve stands at	£300,000
There has been charged against profits during the year for taxation paid and accrued and for estimated tax liability for the year 1945/46	£895,267

The directors' recommendations, including payment of a dividend on the ordinary stock of 6% and a bonus of 2%, were adopted by the stockholders. Income Tax is deducted at 8/9d. instead of the usual 10/- in the pound. This reduction of 1/3d. represents income tax relief passed to stockholders in respect of profits from India, Australia and New Zealand upon which both British and Dominion taxation have been levied.

The next following payment of preference dividend in January, 1945, will be adjusted to pass on relief on the same basis as now applied to the ordinary dividend.

The immediate post-war prospects of the business are excellent.

Public interest in gramophone records, not only in this country but throughout the world, is greater than ever before.

There is a large unfulfilled demand for radio sets both at home and abroad of which your company plans to take its share.

There is little doubt that television represents one of the greatest scientific achievements of this decade. It is anticipated and hoped that the Hankey Committee, in its coming report, will recommend not only the resumption of television broadcasting immediately after the end of the European War, but an expansion of the service throughout the country.

There is also a growing outlet for additional activities in the development and manufacture of new electronic apparatus for industrial and commercial uses. The work of the research department places the company in a strong position in this field.

Employees in all the factories and departments have fulfilled their duties in a splendid spirit in the face of many and increasing difficulties and dangers, and the appreciation of the Board is placed on record.

HORROCKSES, CREWDSON AND COMPANY, LIMITED

DIRECTORS' REPORT

FOR THE YEAR ENDED 31st AUGUST, 1944

The annual general meeting of Horrockses, Crewdson and Company, Limited, was held, on the 14th instant, at the Registered Office, Yard Works, Preston, Lancs. Lieut.-Colonel Thomas Marshall Brooks, the chairman, presided.

The following is the directors' report circulated with the notice and accounts:

The audited balance sheet as at August 31, 1944, and the profit and loss account for the year ended that date are attached hereto. From these documents it will be seen that the net balance for the year after providing for all working expenses amounts to £121,980 as compared with £85,949 for the previous year. Adding thereto the balance from last year (£27,813), the provision released from E.P.T. provided in former years (£55,685), and re-charge of E.P.T. to a subsidiary (£38,256), the amount available is £243,734, as compared with the corresponding figure in the previous year of £137,431. From this there fall to be deducted the following allocations which have been made by the directors, namely:

Provision for renewals, depreciation and modernisation.....	£38,256
Contingency reserve	18,060
General reserve	85,000
Reserve for future fluctuations of stock prices.....	16,456

and the dividend of 7½ per cent. plus 2½ per cent. bonus now recommended as explained below, which, after deduction of income tax requires £24,867. These items together require £182,639 and, deducting them from the amount of £243,734 mentioned above, leave an amount of £61,095 to be carried forward as shown in the balance sheet.

During the year trading conditions proved to be very similar to those of the previous year. The company's position under concentration remained substantially the same, and although it suffered to some extent from a shortage of operatives, the directors are glad to say that production has enabled all obligations to be fulfilled within the restrictions imposed by control. The trading account, showing a credit balance of £186,767, compares with last year's amount of £194,535. It will be noticed that the figures are given before deduction of excess profits tax.

EXCESS PROFITS TAX AND DEFERRED REPAIRS

The charge for excess profits tax and deferred repairs last year, including the subsidiary company, was £44,000, which compares with a charge of nil for the year under review.

It will also be noted that in arriving at the net balance for the year, the directors have provided the normal amount of £44,800 for depreciation and renewals. In addition they are glad to state that, following the policy adopted during recent years, a further sum of £38,256 has been allocated to this reserve out of the balance of profit available.

In arriving at the available balance the profit and loss account has been augmented by a release from E.P.T. reserve during the year. The item of £55,685 has arisen as a result of further negotiations with the Inland Revenue Authorities and the other item of £38,256 is the charge to a subsidiary of its E.P.T. liability which was formerly provided in this company's accounts.

STOCK RESERVE

With regard to the balance sheet the unusual position which exists with respect to the company's property accounts has been explained on repeated occasions in previous years. The only other item which now appears to call for special comment is the stock reserve. Shareholders will recollect that in the profit and loss account for the year ended August 31, 1941, a note appeared stating that the company had

reverted to a cost or market price basis of stock valuation, and that adjustments necessitated by that change were taken to a stock reserve. The amount of this reserve last year was £158,544 to which has been added an appropriation of £16,456 from the profits available for allocation. As has been explained previously, the stocks carried by the company under war-time restrictions are far lower in quantity than are necessary for handling the volume of production and sales which can reasonably be expected when these restrictions upon output are removed. The replenishment of stocks is a clamant necessity and considerable sums of money will have to be invested if the company is to offer to its customers at home and abroad the quality and range of service to which they are entitled. To meet the attendant risks of price fluctuation on a stock of the size we normally carry in peace-time, it is in the opinion of the directors essential that a substantial reserve be carried. They are glad to be able this year to augment the amount in the way indicated.

In conformity with modern practice there is added a consolidated balance sheet which clearly indicates the position of the company and its subsidiaries.

In the chairman's previous statements to the shareholders a word of warning was uttered that the time was approaching when the company would become liable for income tax. In the accounts under review no charge for income tax has been incurred, but in the future the company must be prepared to meet a liability in this respect. This will of necessity have a marked effect upon our net results.

DIVIDEND

The directors feel that the profits of the year justify them in recommending the payment of a dividend of 7½ per cent. less tax, and in addition, a bonus of 2½ per cent. less tax. As shown above the dividend and bonus will require a sum amounting after deduction of tax to £24,867.

In order to reduce the work in connection with share transfers, it has been decided to recommend the conversion of the company's fully-paid shares into stock.

Many suggestions have been put forward for the future of the cotton trade. It is difficult to forecast the conditions under which the trade will operate until more is known of Government intentions, but given international co-operation it seems probable that the industry can make a substantial contribution to the restoration of a flourishing export trade so vital to this country. The company, covering as it does every section of the industry, with the exception of the finishing process, can be of peculiar value in this direction.

Mass production has recently been given a prominent place in many quarters in planning the future of the industry. The management of this company is well aware of the possibilities in this direction. Whilst standardisation certainly holds a place in the company's organisation there is no doubt in the minds of the Board that the future of the company lies in high-class specialities and branded lines produced by the most efficient and modern methods. This has dictated the consistent policy of the Board in building up the substantial reserves for modernisation shown in the balance sheet. The directors are determined that the reputation for quality enjoyed by the company must be maintained and no effort will be spared towards this end.

TRIBUTE TO MANAGEMENT AND EMPLOYEES

The directors record their gratitude to the management and employees for their

whole-hearted co-operation in the work of the company during the year. Their loyal support and untiring efforts in all the difficulties inherent in war-time conditions have been invaluable, and the Board recommends that the shareholders should express their appreciation of the services so rendered. To all now serving in the Forces, the Board extend their good wishes; and to the relatives of those who have lost their lives they offer their deep sympathy.

The directors retiring (in accordance with Article 100) are Mr Thomas Manners and Mr H. Crewdson Howard, F.C.A., who, being eligible, offer themselves for re-election.

The auditors, Messrs Price, Waterhouse and Co., retire and offer themselves for re-appointment.

On behalf of the board,

THOMAS M. BROOKS,
Chairman.

NOTE.—In view of the full nature of the above report the chairman does not propose to make a formal address at the general meeting.

The report and accounts were adopted; the dividend of 7½ per cent., plus 2½ per cent. bonus, less tax, approved; the retiring directors were re-elected; and the auditors re-appointed.

The company's fully-paid £1 ordinary shares were converted into stock, which will be transferable in amounts and multiples of £1.

IMPERIAL SMELTING CORPORATION, LIMITED

MR J. H. GOVETT'S STATEMENT

The 15th annual ordinary general meeting of Imperial Smelting Corporation, Limited, was held on the 14th instant in London, Mr John R. Govett (the chairman) presiding.

The following is an extract from the statement by the chairman circulated with the accounts:—The net profit amounts to £119,524, after making provision for all taxation. The preference dividend absorbs £67,829 (net) and the directors again recommend a dividend on the ordinary shares of 4 per cent., which will require a net amount of £51,172, leaving a balance of £54,244 to carry forward. The total carry-forward of the corporation and subsidiaries now stands at £76,401. Last year I drew attention to the effect on our profits of the disallowance of such items as War Damage Insurance, debenture redemption reserves, etc., for purposes of E.P.T. and Income-tax. This year, the E.P.T. standard, with income from outside investments, was somewhat higher, and after deducting the preference dividend, slightly exceeded 8 per cent. on the ordinary share capital.

Against this there was an increase in the items disallowed for taxation purposes, which were equivalent to rather more than 2 per cent. After providing for income-tax on these disallowed items (which provision required a similar amount) we are left with a surplus sufficient to meet the proposed ordinary dividend of 4 per cent., with a small increase in the amount carried forward.

FULLY EMPLOYED

As in the past years of war, there is little I can tell you of the work that has been carried out by the corporation, but I am at least able to say that we have been fully employed throughout the year in the production of commodities essential to the war effort.

In January of this year Mr S. Robson, who had been works director in charge of our smelting group for the past twenty years, resigned from this post in order to take up his new appointment of director general of a research organisation which is now being established. We attach the

greatest importance to this development, for though in the first instance the research organisation is being confined to the Zinc Corporation, Limited, New Broken Hill Consolidated, Limited, and the Imperial Smelting Corporation, it is our hope that other associates in Australia will also join with us.

The Zinc Corporation to-day represents rather more than 40 per cent. of the entire output of the Broken Hill Field and together with New Broken Hill Consolidated, Limited, controls 50 per cent. of the lead smelters at Port Pirie in South Australia. The immediate and potential value to the Imperial Smelting Corporation of the close association with these companies on the lines now envisaged will, I am sure, be obvious. Equally I have no doubt that the new organisation will prove of great value to our associates.

The report was adopted.

STRAND HOTEL, LIMITED

The 37th ordinary general meeting of The Strand Hotel, Limited, was held on the 6th instant in London, Major M. Gluckstein, the chairman, presiding.

The following is an extract from the chairman's statement circulated with the accounts: The balance of the trading account amounts to £98,981. The dividends proposed are again 10 per cent. on the participating preferred ordinary shares and an amount equal to the dividend on the deferred ordinary shares.

The volume of business done was highly satisfactory until the advent of the flying-bomb. During the period of these attacks trade in London was seriously affected. The Regent Palace Hotel sustained some damage when the annexe building was hit. Most of the rooms affected were quickly brought back into use. There is an acute shortage of moderately-priced hotel accommodation in London.

The report was adopted.

PRICES TAILORS, LIMITED

DEMAND FOR CLOTHES

The sixteenth annual general meeting of Prices Tailors, Limited, was held on the 11th instant at Leeds, Sir Henry Price, chairman and managing director, presiding.

The following are extracts from the chairman's statement which was circulated with the report: The trading results for the year, having regard to prevailing conditions, I consider to be satisfactory. The balance sheet reflects the conservative policy which your directors have maintained in past years.

Looking to the future, just how official controls will affect our trading facilities cannot be completely foreseen, but there can be little doubt that the demand for clothes will be very heavy when fighting ceases. Your company has made, and is still making, preparations for the change-over.

The three basic demands of human nature, in this climate at least, are shelter, food and clothing, with food and clothing alternating for position. But, whereas during the war years shelter and food have been very well looked after—and very well publicised, if I may say so—clothing, and particularly men's clothing, has been very much the Cinderella of the trio. We in the clothing trade and the public have willingly been content to accept this situation in the national interest, but I have a feeling that very shortly clothes will, by sheer pressure of deteriorating personal reserves, assert themselves in the public mind almost in priority over food.

I am glad to report that an increase in our labour force has been authorised, but I feel it my duty to point out that labour without the materials to keep it employed will only complicate our problems. In spite of all difficulties, the trading of the company to date compares favourably with the same period for last year.

The report was unanimously adopted.

DALGETY AND COMPANY, LIMITED

SIR JOHN H. DAVIDSON'S STATEMENT

The sixtieth annual general meeting of Dalgety and Company, Limited, will be held on Thursday next, the 21st instant, at the registered offices of the company, 65, Leadenhall-street, London, E.C.

The following is an extract from the review by the chairman (Major-General Sir John H. Davidson, KCMG) which has been circulated with the report and accounts:—The position of the war in the Pacific since my last review continues to show steady improvement, and I may be justified in saying that the menace to Australia has to all intents and purposes been removed. The company's activities continue to be restricted in many directions, and in all the circumstances our business has been remarkably well maintained, despite the numerous difficulties. Unfortunately, the seasonal conditions affecting important areas of Australia give cause for grave anxiety. The wheat area of New South Wales and Victoria is drought-stricken and the prospects for the current crop are disquieting. Parts of Victoria, the west and south-west of New South Wales, and the northern and north-western pastoral areas of South Australia are also suffering from severe drought, and heavy sheep losses are inevitable.

POST-WAR TRADE

The important question of post-war trade is constantly before us and you may rest assured that we are taking all possible steps to ensure that this company secures a fair share of business on the rehabilitation of the world's markets. Progress, however, is unfortunately impeded at the moment until the position as regards Government control and the obvious uncertainties regarding raw materials, tariffs, currencies, etc., can be more clearly defined.

I have referred before to the heavy but inevitable burden of taxation. The figures, in sterling, which have steadily risen, are— for 1940 £201,000, 1941 £225,000, 1942 £320,000, 1943 £366,000, and for the current year £388,000. Then again, there is the vexatious question of double taxation.

With regard to wool, the company's main interest, an important recent happening has been the clarification of the position regarding the British Government's purchases of the Australian and New Zealand wool clips. These purchases will be continued for one wool year after the termination of hostilities, including the war with Japan. Production showed little change, there again being some increase in the Australian clip, while that of New Zealand showed a small reduction on last season.

SEASONAL CONDITIONS

Unfavourable seasonal conditions are bound to result in some reduction in the Australian clip this season, but New Zealand is expected to show an increase. The quantity of wool passing through the company's stores totaled 664,444 bales. As regards wheat I regret to say the position is lamentable, seasonal conditions being such that the official estimate of the Australian crop is given as only about 50 million bushels, compared with last season's yield of 107,500,000 bushels.

Frozen meat, copra, tallow and butter are still under Government control, and you will probably have seen that an agreement has been reached between the Governments of the United Kingdom and Australia for the sale to the United Kingdom of the whole of her exportable surplus of meat and dairy produce until June, 1948. Similar arrangements have also been made with regard to New Zealand surpluses—all of which is indicative of the continuance of control for some time to come.

Our financial position remains strong and liquid. As regards profit and loss, beyond the large increase in taxation there is nothing calling for particular comment. We are recommending the payment of a final dividend of 3½ per cent., making 6 per cent. for the year.

IDEAL BUILDING AND LAND DEVELOPMENT COMPANY, LIMITED

DIVIDEND MAINTAINED

The tenth ordinary general meeting of this Company was held, on the 12th instant, in London, Sir Thomas Keens, D.L., the chairman, presiding.

The following is an extract from the chairman's statement circulated with the report and accounts: During the year to December 31, 1943, ten subsidiary companies were operating. Nine made profits and one a loss. The consolidated profit and loss account shows a trading profit of £105,713, which compares with £132,599 last year. The directors recommend a dividend on the ordinary shares of 4 per cent., less tax.

It has been the policy of the board to adapt the company's business to changing conditions and it is their intention to revert, as soon as possible, to the normal business of estate development and house-building in which the company has been successful in the past. It is to be hoped that private enterprise will be permitted to play its full part and that the numerous Government controls will be speedily removed. Between the two wars private enterprise provided 3,000,000 houses out of the 4,200,000 houses built. The Minister of health has stated that 3,000,000 to 4,000,000 houses is a broad indication of the housing needs during the first ten years after the war. This is a tremendous task, and every encouragement should be given to private enterprise. Our company is in a position to make a very valuable contribution towards the solution of the housing problem.

Eleven months of the current year have expired and we have disposed during that period of some large blocks of houses and maisonettes at a reasonable profit. We are purchasing, as opportunity offers, other blocks of property where we can do so at prices to yield an economic return.

The report was adopted.

CANADIAN BANK OF COMMERCE

A YEAR OF EXPANSION

The annual meeting of the Canadian Bank of Commerce was held, on the 12th instant, in Toronto.

Mr S. H. Logan (the president) said that Canada's productive capacity was beyond the needs of her people and world markets must be found for the surplus over domestic requirements. Some countries which would be good customers later might need credit for Canadian goods at the outset. There would be other countries, however, with trade balances, and competition would be keen to sell them. The Dominion, however, had developed great technical skill in making many kinds of chemicals, manufactured articles, utilities, and appliances never before dreamed of. That would affect substantially what Canada could produce and export after the war. Canadians would also have to adjust themselves to the fact that they would have to import if they were to export. He would quote the recent speech of Lord Catto, governor of the Bank of England, to the effect that the City of London would continue to play a major part in the world's commerce and finance because of the accumulated experience of generations, the integrity of her institutions and her reputation for fair dealing. It could be depended on for leadership in providing the financial sinews needed to give full scope to the vast manufacturing output and unsurpassed technical skill of the British people. All the nations, especially the creditor ones, had a great interest in maintaining the United Kingdom as the world's best customer the greatest importer country in the world. That statement, the president emphasised, indicated possible

approach of other nations to problems of world trade.

GENERAL MANAGER'S REMARKS

The general manager, Mr S. M. Wedd, laid special emphasis on the expansion and improvement this year of the merchandising and industrial equipment of Canada, and said that new warehouses, factories and stores, as well as extensions and alterations to existing establishments undertaken during the past twelve months, involved

expenditures of more than \$75 millions. The amount for industrial projects, about \$50 millions, was almost half as large again as in 1943. This year the projects included many small units, some for immediate war purposes, but most of them suitable for the production of civilian goods.

That encouraging development would have gone much further if additional labour and materials had been available. Contributing to an all-time peak in industrial production, trade and general employment were the best all-round agricultural con-

ditions ever experienced, excellent crops over most of Canada, record marketings of livestock products and the highest farm purchasing power in at least 15 years. Farmers had made a most strenuous effort to produce these results, an output one-third greater than the pre-war average having been obtained with a working force 25 per cent. below the average. During the current year there was an over-all increase of 7 per cent. in industrial activity, of 10 per cent. in domestic trade, and of 40,000 people in civilian occupations.

(Continued from page 814)

to be resumed; works essential to public safety or to the reconstruction of blitzed areas to be undertaken; and obstructions to traffic on important roads to be eliminated. When these tasks have been covered, work of general improvement could be undertaken. The promise made nearly a year ago that some motorways would be constructed was repeated this week by Mr Noel-Baker, who said that all necessary inquiries would first be made, and that the cost is estimated at £100,000 a mile, at pre-war prices. The preparation of schemes forming part of long-term and comprehensive plans has been and is receiving Government encouragement. The Government's general policy is by any standard sound, and it remains only to put it in its proper place on the list of reconstruction and rehabilitation work to be undertaken after the war. "New Roads for Britain" is an impassioned plea for the construction of a complete system of motorways. But motorways must inevitably wait until considerable progress has been made with such vital and urgent tasks as providing housing and expanding exports. In the context of the magnitude of claims on the country's limited manpower and resources, "ludicrous" would hardly be too strong a word to apply to the British Road Federation's claim that motorways must come "first and foremost" and that, "in the light of a motorways scheme, even such an undertaking as the County of London Plan must take second place." Many a case has been spoiled by overstatement, and perhaps that of the BRF is one.

Co-operative Wholesale Amalgamation

The recommendation to amalgamate the Co-operative Wholesale Society (which operates in England, Wales and Northern Ireland) and the Scottish Co-operative Wholesale Society is being considered at meetings this month; one of these, held a week ago, endorsed the recommendation by 3,977 votes to 117. The new society, if approved, will begin on January 22, 1945, with assets of well over £300 million. Joint working is not new to the societies. In 1912 they took over together the Co-operative Insurance Society, which has since become the fourth largest insurance concern in the United Kingdom, with an expense ratio the second lowest of any industrial life office. They have worked together, too, as tea planters in India and Ceylon. The merging of two organisations tends to make their joint power greater than a simple addition of their individual influences, and for this reason, the co-operative movement can look forward to enlarging its importance in the country's distributive trade. Although the Scottish society brings considerably smaller assets than the English one (about £23 million compared with £286 million), its enterprise is an asset which will be of great value to the new concern. An important task which will face the new society is the attraction of efficient workers generally, but especially for managerial and executive posts. First-class managerial ability will be essential to the larger wholesale society, and for the carrying out of the post-war plans for extensions in the Co-operative movement. The amalgamation may serve, by its example, to encourage amalgamation among retail units, and to draw attention to the advantages open to co-operatives and co-operators from inter-trading arrangements like those in operation in the Nottingham district.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability). DIVIDEND NOTICE. PREFERRED STOCK. The Canadian Pacific Railway Company to-day declared a final dividend of Two per cent. on the Preference Stock holders of record at 2 p.m. on December 29, 1944. By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, December 12, 1944.

FINANCE AND BANKING

THE MONEY MARKET.—Despite the increasing encroachment of currency withdrawals on the volume of bank cash, conditions in the money market have been exceptionally easy during the week. Owing to the larger flow of subscriptions to 1½ per cent. Exchequer bonds and to some diminution in Government expenditure, the volume of floating debt borrowing has been modest. The TDR call was maintained at the high level of £120,000,000, but after deducting effective maturities this only represented some £33,000,000 of new money. The Bank return reflects the prevailing ease. The note circulation has expanded by £22,018,000, but this has been largely offset by an increase of £16,735,000 in Government securities. Another neutralising movement was a fall of £5,223,000 in other accounts. Bankers' deposits are substantially unchanged at £181,027,000. With the reserve of unissued notes down to £24,541,000, the peak holiday circulation will only be surmounted with a small margin to spare—unless yet another increase in the fiduciary issue has to be made.

MONEY RATES, LONDON.—The following rates remained unchanged between December 7th and December 14th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, 1%. Discount deposit at call, 1%; at notice, 1½%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between December 7th and December 14th. (Figures in brackets are per of exchange).

Total	1,098,509	729,688	776,357	89,231	125,067

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £42,333 to £2,692,794, the other operations for the week (no longer shown separately) raised the gross National Debt by £90,051,498 to £21,913 million.

THE ECONOMIST INDEX OF WHOLESALE PRICES (1927 = 100)

	Mar. 31, 1937*	Aug. 30, 1939	Dec. 7, 1943	Nov. 22, 1944	Dec. 5, 1944
Cereals and Meat	93.0	66.9	107.8	106.6	107.2
Other Foods	70.4	61.1	107.3	107.3	107.3
Textiles	74.2	54	101.9	103.7	103.9
Minerals	113.2	95.4	135.9	145.5	145.5
Miscellaneous	87.0	77.6	127.2	128.9	128.9
Complete Index	87.2	70.3	113.6	117.9	118.1
1913 = 100	119.9	90.8	156.3	162.2	162.4

* Highs: even reached during 1932-37 recovery.

Retail Trade.—The indices of the average value of daily retail sales (1942 = 100) were, according to the Board of Trade Journal of December 9th, the same in October as in September, for total turnover and for food and perishables. Changes of one point only were recorded in non-food merchandise and apparel, but the figure for household goods rose from 82 to 89. With the relaxation of flying bomb activity London sales showed some recovery. Stocks continued their downward trend, which may be accelerated by Christmas buying.

National Road Transport Federation.—Six commercial road-users' organisations, Associated Road Operators, Limited, Commercial Motor Users' Association, National Road Transport Employers' Federation, National Conference of Express Carriers, Scottish Commercial Motor Users' Association and

Distribution of Coal (Million tons)

	1939	Third Quarter 1943	Second Quarter 1944	Third Quarter 1944
Total production	231.3	47.9	48.6	46.7
Consumption:				
Gas works (coal carbonised)	19.3	4.6	4.7	4.5
Electricity	15.9	5.1	5.4	5.1
Waterworks	0.4	0.1	0.1	0.1
Railways	12.2	3.6	3.8	3.6
Coke ovens (coal carbonised)	20.4	5.1	4.9	4.9
Miners' coal	4.6	1.0	1.1	1.0
Collieries	12.1	2.8	2.8	2.6
Iron and steel industry	10.2	2.6	2.5	2.3

1942	799	78	877	2,531	278	2,809
1943	655	58	713	2,357	239	2,596
1944 (1st Quarter)	141	16	157	560	71	631
2nd " "	148	8	156	619	58	677
3rd " "	138	13	151	512	49	561

Scottish Carriers and Haulage Contractors' Association, agreed this week, after lengthy negotiations, to form themselves into three bodies federated as the National Road Transport Federation. The constituent bodies are the Road Haulage Association, representing "A" and "B" licence-holders, the Passenger Vehicle Operators' Association, for public service vehicles, and the Trades' Road Transport Association, for "C" licence-holders and those who operate their own vehicles for the carriage of their own goods.

Cutlery Production.—Restrictions on the spoon and silver-plated industry have been relaxed, and nickel silver and silver-plated steel may now be used. Further relaxations are under consideration, including the manufacture of electro-plated nickel silver. The Orders covering the relaxations are the Cutlery, Spoons and Forks Control Order (SR & O, 1944, No. 1252) and the Knives, Spoons and Forks (Maximum Prices) Order (SR & O, 1944, No. 1337). Both came into operation on December 11th.

Surplus Textiles.—At the second ordinary general meeting held last Monday, the chairman (Mr W. S. Walters) of the Surplus Textiles Association, Limited, announced that so far the Association has distributed £380,550 worth of Government surplus stocks to 239 out of its total membership of 493. No considerable quantity of goods is expected to be available until the defeat of Germany.

Diamonds for Antwerp.—An agreement whereby 150,000 carats of diamonds will go to Antwerp, in addition to the 30,000 already arranged, is to be negotiated in London in the near future. The new quantity would keep 4,000 diamond-cutters at work for about five or six months.

LONDON ACTIVE SECURITY PRICES AND YIELDS

Allowance is made for net interest accrued, and for redemption for fixed interest stocks and for changes in interim dividends for ordinary stocks.

AVELING-BARFORD LIMITED

At a Meeting of the Board of Directors, held on Tuesday, 5th December, 1944, the following Resolutions were passed:—
1. It was resolved that dividends be paid, on the 1st January, 1945, on the 175,000 5½ per cent Cumulative Preference Shares of £1 each at the rate of 5½ per cent. per annum for the six months from the 1st July, 1944, to the 31st December, 1944, and that the Preference Share Transfer Books of the Company be closed from the 7th December to the 21st December, 1944, inclusive.

2. It was resolved that an Interim Dividend be paid on the 1st January, 1945, on the 1,000,000 Ordinary Shares of 5s. each at the rate of 5 per cent. actual (free of tax), and that the Ordinary Share Transfer Books of the Company be closed from the 7th December to the 21st December, 1944, inclusive.

By Order of the Board.

Grantham, 5th December, 1944.

SOCIAL WELFARE ADMINISTRATIVE OFFICER (man or woman) required, to be responsible for recruitment and training of welfare staff for relief work overseas. Thorough knowledge of welfare and general office administration, preferably with Social Science degree. Must be British or Allied national. Location of work—London. Salary £800 p.a. Applications in writing (no interviews), stating date of birth, full details of qualifications and experience (including a list in chronological order of posts held), and quoting reference No. R.S. 189, should be addressed to the Ministry of Labour and National Service, Appointments Department, Sardinia Street, Kingsway, London, W.C.2.

BEVERIDGE'S Summary of his "Full Employment" Report. 48 pages. 6d. Everywhere.—*New Statesman*, 10, Great Turnstile, W.C.1.

LLOYDS BANK LIMITED

LIMITED

EXECUTORS AND TRUSTEES

The appointment of individuals as Executors and Trustees imposes on them heavy burdens and duties which they are not always in a position to fulfil. Especially is this the case in wartime, when life is so uncertain and so many difficulties arise in the administration of estates.

When the Bank is appointed, continuity is assured and a Testator can rely on his estate having the benefit of skilled and experienced management in connection with his investments and with the many other matters incidental to its administration.

The services of the Bank's Executor and Trustee Department are available to customers and non-customers of the Bank. A pamphlet giving terms and particulars will be sent free of charge on application to any Branch.

Sibylline Books

THE debate on Poland in the House of Commons on Friday of last week was concerned largely with specific problems—the history of the Curzon Line, the make-up of the Lublin Committee, the exact nature of the guarantee given to Poland in 1939. The real issues barely emerged, and few speakers put the problem of Poland into its wider context. In 1939 Poland was a test case for far graver issues. In 1944 it is a test case for the nature of the whole peace settlement.

In the modern world, only the Great Powers command the effective force to police a settlement. For the settlement to be stable, they must maintain their friendly alliance. But no alliance will be lasting which ignores the elementary rights of smaller nations. These are the three principles of an effective peace; all three of them—authority, unity and justice—should be fused together to make a durable and acceptable settlement, underpinned by the material resources of the Great Powers and cemented by their alliance. But the unhappy case of Poland shows the principles at variance. The independence of a small nation is being threatened by one of the major partners in the alliance, and though the other two Great Powers dislike what is going on, they are unwilling to carry their protest to the point of straining the alliance. Unity struggles against justice, and authority is divided.

The case of Poland does not turn primarily upon the Curzon Line. As Mr Churchill and Mr Eden were at

pains to point out, the British Government considers the Line to be a reasonable frontier. The crux is Russia's refusal to negotiate, refusal to accept a temporary demarcation line and refusal to wait until the Peace Conference for a final settlement. It is true that, for some time, the Polish Government in London included anti-democratic and anti-Russian elements. With the disappearance of General Sosnkowski, this legitimate Russian grievance was removed. It is true, too, that to-day the Polish Government of Mr Arciszewski is no longer fully representative, for Mr Mikolajczyk's Peasant Party is not in the coalition and the Socialist Party is divided. But while one may deplore the unwisdom of forming a Government on this basis, it ought to be remembered that Moscow's intransigence over the frontier and its continued support of the men of Lublin was in large part responsible for the unhappy split in London. The Arciszewski Government is almost as much a Russian creation as the Lublin Committee.

No appeal to principle, no reference to the Atlantic Charter, no acceptance of "frontier changes mutually agreed upon" can be stretched to cover the fact that the Russians will not negotiate on the frontier question and that the Poles are being compelled to accept a dictated settlement. It is a pity that both Mr Churchill and Mr Stettinius should have sought to whitewash this fact by talking of frontier changes by "mutual agreement"

where no chance of any such agreement exists. Yet the dilemma of both the British and the American Governments is painful. Both support the Atlantic Charter. Both would like to see the postponement of territorial issues until the peace conference and wish negotiation, not compulsion, to be the method. Both recognise the Polish Government in London, and in the case of Britain there is also a formal treaty. On the other hand, neither is prepared to undermine friendly relations with Russia. Both are traditionally opposed to giving guarantees in Eastern Europe. Both know that whatever else they may do, they will not go to war with Russia. Both, indeed, know that, without Russian collaboration, they cannot make a settlement in Europe. Thus, even though they deplore the methods chosen by Moscow in dealing with the Poles, they cannot and will not push their intervention beyond a certain point.

Faced with this tragic dilemma, the British and to a lesser extent the American Governments have adopted a dual policy. On the one hand, they accept and defend the Russian case for the Curzon Line; they press it most insistently on the Poles and, in effect, demand a free agreement, slurring over the fact that Russia's policy leaves no room for unforced agreement. On the other hand, they offer the Poles compensation. Mr Churchill is prepared to give a British guarantee of Polish independence and has agreed to the transfer to Polish sovereignty of large tracts of German territory. Mr Stettinius has offered Poland help both for economic reconstruction and for the transfers of population which drastic frontier revision would make necessary.

Such a policy appears to have some balance. What is taken away on one hand seems to be restored on the other. But this superficial appearance is, in truth, most deceptive. Guarantees and compensation may seem on the face of it to strengthen the Polish state. Yet the opposite is the case. The transfer to Poland of large territories indisputably German would impose on any independent Polish government an insoluble problem of organisation and control. These would, of course, be lessened if the entire German population were moved out. But such a step would hardly protect Poland against appearing at the top of any German programme of revenge, and the new frontiers could be maintained only by utter dependence upon Soviet might. The case of East Prussia is, admittedly, an extremely difficult one, since so long as it is militarily in German hands, Warsaw cannot be defended against a German attack. Nevertheless, true though this is, it is also true that a small state, living between two large states, offends one only at the cost of throwing itself on the mercies of the other. And not even the strategic argument could be made for Polish annexation of German lands up to the Oder. Thus, if the argument is restricted to territories, the best attainable solution might be one that left Poland considerably smaller than either Mr Churchill or Marshal Stalin appears to contemplate. A smaller Poland, but one which had given no mortal offence to either of its mighty neighbours, would be more genuinely sovereign and independent than one that was superficially aggrandised but in reality enslaved by its own aggrandisement. Similarly, a British guarantee made conditional, as Mr Churchill said it would be (and as, indeed, it must be), upon a Russian guarantee and inoperative without Russian action, would do little but underline the dependence of Poland upon its Russian neighbour.

The compensations offered are no compensation, for they miss the fundamental point at issue—the genuine independence of Poland. It is on this point that British and American diplomacy should concentrate and not wave it aside by accepting, almost uncritically, the Russian case. Forceful diplomatic action is needed to press the Russians to negotiate on the basis of the Curzon Line and not to demand its acceptance as a preliminary for negotiation. It is, for instance, impossible to expect the Poles to surrender without a word the ancient Polish town of Lvov, which has never been Russian. Renewed

pressure is also needed to insist on the setting up of a genuinely representative Government in liberated Poland. Finally, the effort must be made to persuade the Russians to make some gesture of good will towards the Poles. A obvious step would be the admission of Red Cross help into Russia to relieve the tragic plight of the thousands of Polish deportees.

To such a policy there are inevitably serious obstacles. One is the attitude of the Poles themselves. To compel Mr Mikolajczyk to leave office at this critical moment is very shortsighted. He is at present the most suitable Polish leader on whose behalf the British and the Americans can make a new approach to Moscow. Those who support the Poles in their present disastrous course—whether they are English or Polish—do them the gravest disservice. No wars will be fought on their behalf, nor will events wait on them in Poland. It may not be impossible for the Russians to set up, behind their advancing lines, a Government more representative than that of Mr Arciszewski, or they may even promote the Lublin Committee to be a fully-fledged Government. Either course might better commend itself to the unhappy people of Poland than an incomplete coalition in London. Polish intransigence at this point is an obstacle to the very independence that intransigence is supposed to defend.

The other difficulty is the obvious fact that the maintenance of good relations with Russia is the cardinal point in the foreign policy of Great Britain and of the United States. Can they exercise more pressure without jeopardising the alliance? Will further efforts lead to a disastrous break? This constant preoccupation accounts for much of the hypocrisy and pusillanimity which has clouded the Polish issue. Yet surely this diffidence is based upon a misconception. Great Britain and the United States are not alone in their interest in maintaining the alliance. The Russians, too, need their allies and need the assurance of a system of stable international relations within which to develop their own national life. By their policy over Poland they will not, it is true, precipitate a war, or even a formal breach of the alliance. But they will turn what was an enthusiastic partnership into a mere arrangement of expediency, and by so doing make impossible the relations of trust and confidence between the Great Powers which, as the Dumbarton Oaks proposals openly acknowledge, is the only guarantee of a lasting peace. The Soviet Government might be well advised to take note of the fact that the almost idolatrous affection in which Russia was held by the British people two years ago has now changed to a situation in which the heavy balance of speeches in a Parliamentary debate is critical of their policy. That this is so will be plentifully lamented in London; but it can hardly be good news in Moscow.

The pressure which Britain and the United States can legitimately bring to bear on Russia is the pressure of the interest all three countries have in preserving the alliance. No strategic re-drawing of frontiers, no reinsurance, no zones of influence can replace for any one of the three the security given by a firm mutual understanding. If that is lost, all the rest may sooner or later be lost as well. Justice for small states is not an alternative to the alliance between Russia and the Western democracies, but, in the long run, an essential condition of it.

Thus in pressing the Russians to make concessions to their small neighbour, to give clear evidence that they mean to respect its independence, the British and the Americans would simply be pressing Russia to consider its own best interests. Mr Churchill quoted the sibyllin books against the Poles, and warned them that by their intransigence they were having to pay at each stage a heavier price for a settlement. The Russians, too, are allowing occasion after occasion to slip away—and each time it becomes harder for them to convince the outside world that they genuinely respect those principles of good neighbourliness which alone bring peace. Without such an assurance, the old cankers of distrust and fear will surely eat away the most imposing structure of frontiers and leagues and treaties.

Farming Efficiency

It is common ground among all—or virtually all—plans for the future of British agriculture that steps must be taken to increase the efficiency of the industry. It is not always explained how this is to be done. What is more, there is some serious misunderstanding of the sort of efficiency that is relevant. This island has strong natural advantages, in soil and climate, for the pursuit of dairying and stock-raising. Compared with the rest of Europe, the value of output per worker is very high; and compared with the new countries of other continents, the output per acre is also high.

It is, in fact, economic efficiency, not technical efficiency, that is at issue. A worker cannot be paid what this rich country regards as a living wage in agriculture unless the industry is subsidised. Those workers who produce food by exchanging manufactures for foreign food, secure, in general, considerably more food by a man-hour of work than those who produce food directly on a British farm. High though the output per worker is on British farms, it will have to be raised nearer to the North American or Antipodean level before British agriculture can enjoy unsubsidised prosperity. There is general willingness to provide a period of shelter until this is achieved—but only on condition that a term is set to it.

There are many prescriptions for raising efficiency. For example, the experience of County Agricultural Committees shows how much a mere raising of the level of practice of the worst farmers to the average would accomplish. But though intelligence and skill and research are all important, the chief weakness of British agriculture is, beyond much doubt, that it is under-capitalised. The capital needed for farming is traditionally regarded as of two sorts: landlords' capital which includes houses and cottages, farm buildings, drainage, and water supply; and tenants' capital which includes machinery and stock. The provision of capital of both types has been so continuously neglected over the last seventy years that an immediate and effective rehabilitation of British agriculture would now cost probably several hundred million pounds.

The land's fixed capital has been especially neglected. Buildings and equipment of all sorts have been neither repaired nor replaced, and agricultural capital has not been adapted to new techniques or to a changed balance of farming. Thus the need in livestock production, which has increased considerably, for water to be laid on to every field is still not met on most farms. Again, the production of clean milk is undoubtedly helped by a supply of electricity, yet the proportion of dairy farms connected is still small. Shortage of tenants' capital, while necessarily less serious, has helped to prevent any widespread application of modern techniques and machinery. Most farmers cannot

afford to buy a bull good enough to upgrade their herds. Reliable investigations have shown, for instance, that the use of a combine-harvester greatly reduces harvesting costs and that the introduction of a milking-machine normally increases output per worker—granted a minimum scale of operation; yet many farms operating above this scale do not possess these appliances. Wartime inflation of farm incomes and state assistance have helped to make up some leeway in the provision of capital; but, judged by modern standards of efficiency, many British farms are decayed or derelict.

To raise new capital of the astronomical proportions required for full efficiency is of course completely impossible. Indeed the difficulty is to see how any money at all can be raised by the traditional financial methods of the industry. Agriculture is alone among the great industries in that its property is very largely owned and financed by numerous private individuals, and not by limited companies.

Agriculture's increasing inability over the last seventy years to raise the capital it needs has been due to the impact of declining profits upon the traditional system of land tenure. The once wealthy and influential class of rural landlords have over the last seventy years sold much of their land and invested progressively less capital in the remainder. The class of owner-occupiers has grown correspondingly, owning 10 per cent of agricultural land before 1914 and nearly 40 per cent to-day. The tenant farmer has been encouraged, by legislation which safeguards his right to compensation, to provide fixed capital in lieu of the landlord. In other words, the bulk of agricultural capital of all sorts now has to be found out of the slender personal resources of owner-occupier or tenant farmer. But to finance so large and under-capitalised an industry along the lines of a large number of small family businesses is disastrous to efficiency and progress.

Even were capital easy to obtain, the size and layout of British farms are ill suited to its proper application. The average farm is very small, half of the total land belonging to farms of less than 150 acres. Farms of less than 150 acres are too small for the use of many kinds of modern machinery, although the extent to which this is a handicap depends on the type of farming. Dairying, for instance, can still be conducted on 100 acres with reasonable efficiency. But, even in dairying, a herd of at least thirty cows is desirable for the introduction of a milking-machine, and a unit of some sixty cows for the employment of the Hosier open-air system, and most dairy farms fail to meet even these standards. The

Another example of **A CAPITAL ANNUITY**

Part capital, part interest . . . £250 per annum guaranteed for thirteen years . . . of which, on average, £212 is capital repayment and £38 is taxable interest . . . and, after the thirteen years, an annuity of £375 (subject to tax) continuing for life . . . this can all be secured by a female life aged sixty-four for a present investment of £4,000

advantages of large farms are still more obvious in other respects, such as specialisation of labour, opportunities of promotion for the farm worker, and cheap and efficient marketing. Probably a minimum of 200-300 acres is necessary for fully efficient farming.

The chaotic layout of British farms is an equally important cause of inefficiency. Many farms are split into two or more scattered pieces or the same farmer operates two or more widely separated units, often in both cases owing to the difficulty of acquiring new land next to the original holding. The shape of many farms and the location of the farmhouse are often highly inconvenient and time-wasting. Worse, the divisions between both farms and fields take little account of the character of soils and sub-soil, which are very varied, or of other natural features.

It is not suggested that in all or even a majority of cases a comprehensive regrouping of farms would be worth the cost. Moreover, each area and type of farming would need separate consideration. The average dairy farm, for instance, is at present more in need of adequate buildings and water supply than of a larger area or better layout. But, in many areas, the need for drastic replanning is very great.

This conclusion is borne out by the results of a survey of rural conditions in a small sample area in the South Midlands, recently undertaken by the Agricultural Economics Institute of Oxford.* The area is predominantly arable. It was found that the layout of half the farms in the area was definitely inconvenient, even for the kind of farming for which they were originally designed. It outlined concrete proposals for converting the 123 existing farms, averaging 109 acres, into some 28 farms, averaging over 450 acres. The chaos and inefficiency of the old system would be replaced by properly sited buildings and roads, by compact, accessible, and reasonably large holdings, and by blocks of ploughland of uniform soil. The gain in efficiency would be enormous, but so would the cost, and the survey recognises that there would be a great deal of disturbance not only of occupiers but of owners.

The dilemma which faces any attempt to improve the efficiency of British agriculture can now be briefly stated. Farmers and landlords by themselves are incapable of finding anything approaching an adequate supply of new capital. At the same time, new capital cannot be universally employed to the best advantage without the creation of bigger and better-planned units; any such replanning would involve not merely the expenditure of substantial sums on new buildings, roads, and hedges, but the displacement of numbers of persons, both owners and tenants, who would have to be given compensation—that is, who would have to be allowed to take capital out of the industry. And, in any case, replanning of this kind might well prove impossible under the present system of land tenure.

It must be frankly stated that the only fully adequate solution of these problems lies in the public purchase of agricultural land. "Nationalisation" may be too frightening a word, and imply something too sweeping and dislocating; piecemeal purchase as replanning and recapitalisation became possible would be more practical. But whatever the terminology, the idea is one that the facts virtually impose. The logic of the case has forced disinterested and experienced students of agriculture, such as Mr C. S. Orwin and the late Sir Daniel Hall, into an acceptance of this view.

In no industry should the disturbance of public purchase be lightheartedly advocated—and least of all in an industry as intricate and complex as agriculture. Socialist theory to the contrary notwithstanding, the burden of proving a positive advantage should always lie on the advocates of nationalisation. Before the case can be made out it has to be shown that something needs to be done to restore an industry to health, and that it cannot be done with the existing ownership. But in the case of agricultural land, the proofs are surely easy. What

is required is a new layout of the industry and new capital. No considerable reorganisation of farms is likely to be carried out without a single ownership of all the land involved. Even if terms could be settled with the numerous present owners, the value of the reorganisation would be lost if there were no control over the type of farming to be carried on. And as for the provision of new capital, there is really no adequate source save the state. The various attempts that have been made from time to time to apply joint-stock principles to agriculture have not been very successful, and financing by individuals is, in these days, too small in volume. It is inconceivable that the state should provide capital for the benefit of the landlord, which would be the inevitable effect of giving assistance without change of ownership. These arguments would be enough, for any industry, to justify *prima facie* the consideration of public ownership. But in agriculture there is still another reason of an even more compelling nature. Agriculture is, and until its efficiency is raised will remain, a heavily subsidised industry. The prize to be secured by a thorough rationalisation is not merely (as it is, for example, in coal or steel) a general benefit to the economic health of the community, but also a specific relief to the Budget.

*

It would be too mechanistic a view of what is essentially a human problem to imply that such a change in ownership would by itself produce much result, or even that the replanning and recapitalisation for which public ownership is the necessary preliminary are all that is needed. The new layout would be based on the assumption of skilled farming, and additional capital would be useless unless applied with intelligence. The utilisation of expert advice is an important aspect of efficiency but, except under wartime compulsion, the state's provision of education and advice has been very inadequately used and applied. Agriculture has never developed its own professional class, and has regarded with suspicion or indifference the professionals provided for it from outside. Yet the industry will never be fully efficient until it is ready to take the fullest advantage of the new knowledge that the sciences of soil chemistry, nutrition, genetics, botany, accountancy, management and many others are increasingly putting at its disposal. For many of these purposes, the efficient unit is far larger than the 200 to 300 acres suggested as a minimum for actual operations. Something in the nature of grouping of farms for professional services is clearly indicated, and it would probably not be difficult to use the same structure for such things as pools of special machinery, artificial insemination and other services which require a unit larger than the farm but smaller than the county. Any such plan would quickly run up against the shortage of "experts"; but this would be a blessing in disguise, for the existence of a salaried class in agriculture would provide those missing rungs in the ladder which have hitherto forced every agricultural labourer with a spark of ambition to leave the land. All these things could be done cooperatively without any change in the ownership of the land. But they would be done very much more easily if all the farmers in a group were tenants of one landlord.

This is not the place to discuss in detail the steps that should be taken either to improve the current practice of farming or to apply such additional capital as is made available. It is the place to suggest that agriculture needs to be placed, with coal and steel and a very few others, on the list of British industries which are due for a radical overhaul before they can fully pull their weight in the national economy. The basic difficulty that British agriculture has to overcome, as has been so frequently emphasised in these columns, is that many foods can be imported more cheaply than they can be grown at home. It is to close that gap that a great rise in the economic efficiency of the industry is needed. But the agricultural revolution in other countries will not obligingly stand still while the British industry slowly catches up. This is a Red Queen's land, where it is necessary to run quite fast to stay where you are—and to run still faster to catch up.

UNRRA's Opportunity

ON December 14th, the Lords debated the question of relief in Europe and the work which UNRRA was commissioned to undertake. The noble speakers underlined the desperate need for relief which liberation has revealed. Lord Huntingdon, for instance, had telling facts to give on the state of food supplies in Western Europe. The Lords also expressed anxiety about the role which is being assigned to UNRRA. As Lord Huntingdon put it,

the members of UNRRA are very worried over their powers and position. . . . UNRRA delegates confess that it is impossible for them to cope with their gigantic tasks under their present powers.

The debate undoubtedly gave voice to a widespread feeling of puzzled disquiet. Everywhere in Europe hunger and unemployment are producing unrest and violence which are the background and in part the cause of civil strife in France and Belgium and, worst of all, in Greece. Obviously the relief of this distress should be a first call on the Allies' initiative and resources. In creating UNRRA nearly two years ago, they recognised that the need would arise. Yet now that both UNRRA and the crisis it was designed to meet exist together, it appears to be extremely difficult to bring the one to bear upon the other. Into most reports and discussions on UNRRA has entered a note of frustration and disillusion. The externals—the appropriation of money, the building up of staff, the full-scale international conference at Montreal in September—all these are in order. Why then should the structure seem to ring so hollow not only to those who think of UNRRA as a piece of phoney internationalism but also to those who pin their hopes to it as the first executive agency of the United Nations?

One reason is perhaps the inflated hopes it first aroused. Some people seem to have conceived of UNRRA as a supplying and distributing agency capable of superseding all the normal national channels of supply. Such a conception was and is in the highest degree unrealistic. There are hardly enough people to run the crumbling administrations of Europe as it is, without duplicating each with another organisation introduced from outside. The definition of UNRRA's function once given by President Roosevelt—"to help people to help themselves"—is undoubtedly right. Any other approach would at once be wrecked by the strong resurgent nationalism of the liberated states.

In Western Europe, each Allied country, with the partial exception of Norway, is in a position to buy its own supplies and will distribute them independently. Their lists of requirements are in some cases already before the Anglo-American Combined Boards for Food, Raw Materials and Supply in Washington. Even so, UNRRA is playing a vital part as referee. A close liaison exists between UNRRA and the Combined Boards and all requests for food and raw materials are balanced against the likely supply. If the needs of the countries which cannot afford to buy supplies and must rely on UNRRA are prejudiced by their neighbours' requisitions, then UNRRA sees to it that the materials in short supply are rationed.

In Eastern Europe—in Greece, Yugoslavia, Czechoslovakia and Poland—the position is different, for it is unlikely that any of these states will be able to finance its own relief. Czechoslovakia and Poland have already put in tentative demands and an UNRRA mission for the Balkans under Sir William Matthews has already been set up to administer relief in Yugoslavia and Greece. The obstacles to UNRRA's work here are part military, part political. The chief reason why UNRRA cannot operate immediately in Eastern—or indeed in Western—Europe is the fact that for some months yet relief will probably continue to be administered by the Civil Affairs branch of the Army. UNRRA officials have, however, been working with Civil Affairs in Greece and in Western Europe.

In Eastern Europe relief will be handed on to UNRRA as soon as possible. It is then that the political difficulties will arise. The first and most obvious is to secure in these war-shattered lands a government sufficiently broadly based for UNRRA to work through it without giving political offence. UNRRA cannot take over the entire work of distribution. This must be left to the local administrations under UNRRA supervision. Yet the tragedy of Greece—where the UNRRA mission has temporarily withdrawn—shows how much the work of international relief depends upon political pacification.

The other political problem is the attitude of the Russians. They stand high in the Councils of UNRRA but, unlike the United States and Great Britain, they can only be receivers and not suppliers of relief. For relief in their own territory, they will almost certainly prefer to adopt the methods of Western Europe. Either through their own resources or through lend-lease or through long-term loans, they will secure supplies which do not require, as UNRRA's supplies require, any sort of international supervision. The case is clearly different in Poland and Czechoslovakia, which fall within the Russian military command. Russia cannot supply their wants. The obvious solution would be to use the agency of UNRRA which Russia in part controls. The difficulty of divided authority in Poland does not arise, since the Polish Government in London has with rare magnanimity waived the question of the distributing agency, provided only relief reaches the suffering Poles. But the Russian Government has not yet made up its mind on the role of UNRRA in its own military sphere. After the Montreal Conference it was hoped that the Director General of UNRRA, Governor Lehman, would go to Moscow and there assist the Russians to reach a decision. His mission is only postponed, but meanwhile UNRRA can hardly be blamed for "working only on paper" in Eastern Europe.

No one will deny that these are formidable obstacles. Yet they should not be allowed to overshadow the achievement of UNRRA or the openings which await it, if it pursues the right policy. It is no small thing that through the agency of UNRRA the interests of the poorer nations are being protected against the buying power of their richer neighbours. It is no small thing that over a billion dollars' worth of supplies have already been ordered and in part manufactured in the United States, Canada, Great Britain and Brazil. It is no small thing that in any emergency or sudden crisis, UNRRA can step in and assist any nation and that trained specialist staffs are already available to answer any such call. In Western Europe, even if the major work of distribution rests with the Governments themselves, UNRRA has the responsibility for the vast problem of displaced persons, over 20 million of them. In Eastern Europe the opportunities are even greater. Whatever settlement is reached in Greece, it will not lessen the need for relief. Nor will it render an international agency any less suitable for the work of relief. In Yugoslavia the need will be as urgent. The work may be delayed in the Balkans, but sooner or later UNRRA's task will be very heavy.

The openings are so great that it is impossible to blame all UNRRA's frustrations on the European situation alone. Some at least seems to lie with the direction of UNRRA's policy. Complaints about the limitation of UNRRA's sphere have been combined with a too cautious attitude towards the resources at UNRRA's disposal. It is true that UNRRA has not been given the field of work the idealists first hoped. It is also true that UNRRA's budget of \$2 billion, voted by the constituent states, will not cover the needs of Europe. But it is not the best policy at the moment to complain on the one hand that the task is smaller than was expected and on the other that the resources are too limited to permit the acceptance of new commitments.

* "Country Planning." Oxford University Press. 7s. 6d.

For UNRRA, as for many other political agencies, the only path to success is by way of successful action. When UNRRA has one job to its credit superbly done, the other jobs will appear. The first possibilities are Displaced Persons in Europe and the Balkan Mission. If these are well done, they will influence Russia's attitude, they will create new openings in Europe, they will set the right patterns for Far Eastern relief. UNRRA will be able to add genuine industrial reconstruction to the patching and mending permitted them now; above all it will take the vital step from a paper constitution to a going concern.

The British and American Governments undoubtedly

want to make UNRRA a success. At the Montreal Conference, Mr Dean Acheson and Mr Richard Law left no doubt about their Governments' sincerity. The responsibility therefore falls squarely upon Governor Lehman and his colleagues. Perhaps the jobs are fewer and smaller than they hoped. Let them go forward and make a triumphant success of what jobs there are. Perhaps the money is inadequate. Let them spend it all, ask for more and test the Governments' backing at its most sensitive point. Action and courage are the two things UNRRA needs to-day. If they are lacking, neither bigger jobs nor greater resources are likely to come its way.

NOTES OF THE WEEK

"Winter Battle in the West"

Security silence still obscures the pattern of the broad German offensive launched on December 16th between Monschau and Trier, but obviously it is on a large scale and is the Germans' first determined offensive blow in the west since they counter-attacked at Avranches. The military reason for the offensive is obvious enough. The war to the end which the Nazis are determined to wage depends in the west upon continued control of the Ruhr-Rhine industrial area. The Allies have advanced almost to the edge of this vital territory and if they are to be held, the German High Command must seek to gain elbow-room. The attack is thus an example of offensive-defensive warfare and it has been launched at the moment when in the Germans' estimation the Allies' offensive against the Rhineland has reached its "culmination point"—in other words when it is both at its maximum stretch and minimum momentum. The timing of the offensive was probably dictated by politics as well. Since the drastic remobilisation of last summer there has been little but retreats and further retreats to show for the supposed total reorganisation of the German military machine. In recent weeks, however, the German propaganda services have been drumming out the theme of "Germany's regained military strength." Such a theme needs demonstration and von Rundstedt's offensive, to which Goebbels is giving the grandiloquent title "Winter Battle in the West," is designed not only to gain time and ground on the edge of the Ruhr but to restore confidence and possibly even a gleam of hope to the dragooned and apathetic German masses.

The Real Issue in Greece

The second Commons debate on Greece was disappointing. Few people spoke. The attendance by no means reflected the concern in the country, and the Labour spokesmen, whether dignified like Mr Greenwood or white-hot like Mr Bevan, failed to clarify the issues and call from the Government an acceptable statement of policy on the most urgent problem—the conditions necessary to secure an armistice in Greece. As an article on page 837 points out, the two weeks of fighting and negotiating have exploded the false picture of the Greek situation given by Mr Churchill in such unfortunate terms in the first debate on Greece. The EAM is not a band of ruffians and brigands. It is a large, popular movement. The EAM as a whole (whatever may be true of some of its parts) certainly did not plan a Communist *coup d'état*. No revolutionary movement bent on seizing power negotiates from the morrow of the insurrection. Finally, the real issue is not Communism at all. It is the monarchy. Why else, after days of street-fighting and parleying, should the central point be the Regency, if concern over the intentions of the King had not proved to be the first matter for controversy in Greece itself? The disturbing fact is that for a week now all parties and all commentators seem agreed that a regency, preferably under Archbishop Damaskinos, is an essential term in any armistice. Why, then, after so much concurrence of ideas, has no binding agreement been announced? Critics of the British Government's policy maintain that King George of the Hellenes in London and the Royalist-inclined minorities in Athens are responsible for the delay, all of them playing for time in the belief that the British will do their work for them by crushing EAM. Mr Eden gave absolutely no assurance that this was not the case. When Mr Driberg very pertinently asked:

If the Government can give advice to the King of Greece about remaining in this country, cannot they also advise him against sending messages to Athens in a form which can hardly be likely to promote reconciliation?

Mr Eden only replied:

I do not think that is a reasonable request.

This is a very difficult attitude to understand. British policy in Greece has for the last three years been bedevilled by its concern with a King who, far from being a source of constitutional authority above the state, is simply the leader of a small political faction. To allow his opinion, given from London, to impede the reconciliation of Greek parties and the cessation of bloodshed in Athens is folly. Both Mr Macmillan and Mr Leeper have advised a Regency. Most of the Ministers in Athens have approved it. The EAM has unofficially given it support. There is only one way in which British policy in Athens can be retrieved from irreparable harm. New terms for an armistice should come from General Scobie's headquarters and in return for an ELAS withdrawal from Athens and the giving up of arms in the city itself, there should be a guarantee that an impartial Regency will be set up, that the Mountain Brigade should be withdrawn and the Athens police purged. This would open the way to the formation of a new coalition government, under an acceptable Prime Minister, to prepare for the holding, under neutral supervision, of free elections.

Civil Service Recruitment

Mr Pethick Lawrence attributed the small attendance in the House of Commons on Thursday of last week, when the Government's proposals for the post-war recruitment of the Civil Service was debated, to "the almost complete unanimity with which they support the proposals of the Government." This seemed to be borne out by the debate, in the course of which the Government received the almost unprecedented tribute of praise and agreement from Mr W. J. Brown. If so, the more is the pity; for the scheme is not one which should have received an unconditional blessing. It has been prepared by the Civil Service Whitley Council, and though it is complicated in detail, is simple in principle. Vacancies that have occurred during the war, and new posts created in the same period, are to be filled by competitive examination of the familiar type. The age limits are to be raised by roughly the time that has elapsed since the last examination, and vacancies are to be reserved for ex-Servicemen in rather more than the proportion they bear to the general eligible population. In addition, 15 per cent of the lower posts are to be reserved for war-time temporary civil servants who may qualify by examination, while in the higher administrative grade an unspecified number of temporaries, over the age of 30 and the grade of Principal, may become established without examination. For any vacancies arising after the end of the war, examinations with the former age limits will be held—that is, the old system will be restored at once and not held in suspense as after the last war.

There is little to which objection can be taken in these proposals as they stand, and they are certainly better than the haphazard collection of unrelated expedients to which the Government were driven after the last war. Where the

attack should have been made by an alert House of Commons is on the calm complacency with which it is assumed that all is for the best in the best of all possible services. There is to be some experiment with the method of interview as opposed to examination, and a Director of Training has been appointed; but otherwise everything is to go on as before. Perhaps nothing else was to be expected from the Whitley Council, which consists half of eminent civil servants and half of full-time national officers of the old-established Staff Associations—particularly since their recommendations fell to be approved by a Minister who is himself a product of the Home Civil Service. So, after all that has happened, in spite of the great changes that are proceeding in the nature of the Civil Service's work, in face of the demonstration, repeated twice in a generation, that in an emergency the Service has to be not merely reinforced in numbers but strengthened in quality by a flood of temporaries from outside—in spite of all this, the civil servant is to continue to be recruited (so far as the highest grade is concerned) direct from the universities by competitive examination, he is to be immured thenceforth in Whitehall and, competent or incompetent, he is to remain on the establishment until the age of 60. A select few only of the temporaries are to be graciously permitted to remain within the sacred precincts—though it is difficult to see why any of them who could earn a living elsewhere should want to, in view of the shameful way in which their patriotism has been exploited during the war and of the fact that, by being established late, they will suffer seriously in seniority and pension rights. This may meet with the "almost complete unanimity" of the House of Commons. But it will not be to the taste of the many thousands who, during the war, have been able to form a view of the Civil Service at close quarters. To deny that the Service has enormous merits would be foolish; but to hold that it is perfect is crazy.

Russo-French Alliance

The Soviet-French Treaty of Alliance and Mutual Assistance signed in Moscow on December 10 resembles in all essentials the Anglo-Soviet Treaty of May, 1942. Yet there are some differences between the two treaties; and they reflect the shift that has occurred, since 1942, in the interests and preoccupations of the three Allied nations. The Russo-French Treaty lays less stress on the building of a wider world organisation, though the preamble to the Treaty contains a reference to a "system of international security." But unlike its Anglo-Soviet predecessor, the Russo-French Treaty makes no provision for any cancellation of the alliance in favour of the world security organisation. This omission ought probably to be read in the context of the Allies' failure to reach definite agreement at Dumbarton Oaks. It is also relevant that the Dumbarton Oaks proposals provided for regional arrangements to be made within the framework of a world security system. The Russo-French Treaty is much more explicit and emphatic than the Anglo-Russian Treaty on the common policy of the two countries towards Germany. The Treaty is one of double re-insurance against Germany. Its first aim is to do away with the menace of German aggression after the war; its second aim is to secure common action by France and Russia in case of a revival of that menace. Under Article 3 of the Treaty the two parties undertake to adopt all measures

to eliminate any new threat emanating from Germany and to bar the way to any kind of initiative rendering possible a new German attempt of aggression.

If in the course of taking such measures either Russia or France finds itself at war with Germany the other ally, too, is committed to war. If, after defeat, a revenge movement in Germany were to grow sufficiently in strength to induce either the French or the Russians to wage a preventive war, then according to the terms of the Treaty, the other partner would also be obliged to wage war. The Russo-French Treaty is, therefore, strictly speaking, an offensive-defensive alliance.

1935 and 1944

It is significant that no attempt has been made in Moscow to call back into being the Russo-French Treaty of alliance concluded by Laval in 1935, a treaty that has never been rescinded, but was always a dead letter. Yet the history of that Treaty contains a lesson and a warning. Treaties of alliance mean very little if the policies of the Allied nations

do not make them a living reality. The pact of 1935 failed primarily because those who then made French—and British—policy were not quite clear in their mind whether the war against Germany was really inevitable, and, if so, whether there was any value in a military alliance with Russia. The Munich interval relegated the Treaty of 1935 to the dusty archives of the French Foreign Office. Even on the morrow of the conclusion of that Treaty, it was fairly clear that influential sections of French public opinion were against it, and were prepared to obstruct its working. The reception given in France to the alliance of 1944 has been strikingly different. Those who opposed the Treaty of 1935, and who might perhaps criticise the new alliance, have, on the whole, been in the camp of Vichy. They have no say in the political life of liberated France. All the other sections of French opinion have now thoroughly assimilated the lessons of 1940, and are firmly resolved not to place their country again in a position in which it would have to take the full impact of Germany's military might in a war on one front only. In addition, the underlying motive of the new alliance seems to be a common Russian and French determination to throw Germany back behind the Rhine in the west and Oder in the east. Since General de Gaulle's Moscow visit, the possibility of French—or perhaps international—control of the Rhineland has come to the fore in the Paris press. If some such agreement indeed underlies the new Alliance, then there will be some very awkward problems, ahead for Anglo-American diplomacy. However much Allied opinion may be prepared to accept the truncation of Germany in the hour of victory, what will be the attitude of the average voter on the maintenance of such punitive terms in fifteen or twenty years' time? And if the alliance system of Europe is to stand, with Britain and France committed to common action with each other and with Russia, what would be the consequence of British hesitancy over a preventive war?

Alliances and Western Union

The new Franco-Russian alliance is not exclusive. It supplements the Anglo-Russian alliance, and in a sense it may have prepared the ground for a closer regional grouping

between the Western nations. A Western Union would now clearly fit in with the framework of the alliances which bind together Great Britain, Russia and France. It would no longer be open to the objection that it might be an instrument of anti-Russian policy. The immediate sequel to the conclusion of the Russo-French Treaty has been the suggestion that the Anglo-French Entente should be embodied in a formal treaty of alliance. The suggestion will certainly be welcomed in this country. There is no contradiction whatsoever between the conception of a Western Union and an Anglo-French Treaty which would merely formalise the existing relationship between the two countries. But the mere conclusion of such a Treaty would hardly do away with the obvious need for the Western nations to pool their resources and to co-ordinate their military and political policies. The alliances are the precondition and the framework for union in the West, but not a substitute for it.

Design in Industry

Mr Dalton announced on Tuesday the formation of a Central Council of Industrial Design (with a Scottish Committee) "to encourage by all practical means the adoption of good design in British industry." This is good news—especially if it can be taken as a sign of a more energetic and constructive policy at the Board of Trade. Certainly the new Council and the Design Centres it will help to create should make a very important contribution to the recovery of British export trade. Before the war the need for improvement in the design of manufactured goods had become obvious and serious. Poor design was at least as potent a cause of lost markets as were high prices—and a much more common cause of complaint than deficiencies of purely technical performance. British manufacturers (with some notable exceptions) had fallen into the fundamental error of regarding technical quality and design as two different and distinct aspects of their industrial products. Technical quality and design are inseparable features in all sound construction—a fact that has been amply demonstrated in the production and performance of implements of war. The new Council, under the chairmanship of Sir Thomas Barlow, is more likely to gain the confidence of the manufacturers, since its members are drawn more from industry than the arts. Its duties will be the same as those proposed recently by the Federation of British Industries—to conduct publicity for good design; to co-operate with education authorities in matters affecting the training of designers; to advise public bodies on their purchases, displays and exhibitions; and to serve as a centre of information and advice on all matters of industrial art and design. The Council's main task will be to

encourage and assist the establishment and conduct of Design Centres (for separate industries), and to advise the Board of Trade on the grant of financial assistance to these centres.

There is a vast amount of work to be done by the industrial design centres in design research, market research and in the efficient co-ordination of local education and industry. The pioneer centre, the design centre of the cotton industry, has done excellent experimental work. Its example should be of great value to the Council. It is greatly to be hoped that the Council and the Design Centres will not confine their activities to the problems of design in consumer goods industries. Improved design is needed, not perhaps so obviously, but certainly as urgently, in the producer goods industries—in the production of tools, machine tools and machines.

* * *

Local Government Elections

The Representation of the People Bill was given its Second Reading on Tuesday. Its main provisions add another important chapter to the long story of the extension of the franchise that began in 1832. The Bill extends the principle of universal adult suffrage to local government elections and will increase the local government register by about 7,000,000 electors. It provides for the resumption of local government elections (borough councils in November, 1945, and county, district and parish councils in March and April, 1946), and makes arrangements for the publication of registers of electors at certain fixed dates. The councillors who have been co-opted to fill vacancies during the war will retire before the next elections with the councillors elected in 1936—so that, on the average, about half the councillors' seats will be contested. The Bill has been criticised on the grounds that it does not go far enough;

that it misses an excellent opportunity of making bold changes in the system of local government representation. It is true, as Rear-Admiral Beamish pointed out on Tuesday, that the aldermanic system is not entirely consistent with a universal franchise and may sometimes "be fraught with unpleasant possibilities of log-rolling and worse." But the system does ensure some measure of continuity and stability in assemblies that might otherwise be wholly inexperienced and amateur. If the aldermanic system is to remain, however, there appears to be some justification for another proposal that has been put forward—that an entirely new body of councillors should be elected every three years. It is claimed that the present system, by which one-third of the councillors retire each year, encourages apathy in the electors, since, though elections are very frequent, each one is unlikely to produce any decisive change in the political character of the councils. It is unfortunate that Parliament cannot find the time to debate these important and interesting questions with the thoroughness they deserve.

* * *

Motor Vehicle Taxation

The Chancellor of the Exchequer has decided to accept the recommendation of the Society of Motor Manufacturers and Traders and charge motor vehicle licence duties on the cubic capacity of the cylinders instead of simply on their bore, as with the so-called RAC formula that has been in use for a number of years. The change is a small one, and will not make much difference to the great majority of car owners, particularly since the proposed rate of £1 per 100 cubic centimetres is designed to bring in about the same revenue as the present rate of 25s. per horse-power. It will, however, relieve British designers from the pressure they have hitherto been under to design engines with small bores and long strokes, simply for the purpose of evading taxation. The new rate will come into force at the beginning of 1946 and it has not yet been decided whether it will apply to existing cars as well as to new ones. Nor has it been decided whether there shall be a step in the duty for every 100 c.c. or whether there shall be wider classes. The Chancellor rejected, "anyhow at the present time," the various proposals that have been made for shifting more of the tax on to the fuel or for introducing a new basis of taxation, such as a tax on value.

So far as it goes—which is not very far—this is a step in the right direction: the British motor engine will not need to be quite so peculiar as it is. But the main point of the proposal to change the basis of motor taxation has been missed. The motor industry will be called upon to play its part in the great expansion of British exports that is necessary. But overseas countries, with one or two exceptions, want to buy cars considerably larger and more powerful than the midget cars which, under the pressure of the existing tax, have become the predominant type in this country. It is in the nature of the motor industry that it cannot produce—or cannot cheaply produce—special types for export. It follows, therefore, that if an export trade in British cars is to be built up, every step must be taken to encourage a growth in the size and power (which need not mean any significant increase in the cost) of the cars sold on the home market—a change that the domestic car-owner would certainly welcome once he got used to it. Therefore, the tax system should be altered so that it does not discriminate against the large car as such. One way of doing this is to graduate the taxation on value; another would be to levy a flat rate of duty on all cars, or on the whole of a small number of classes (e.g., one rate up to 15 h.p., another up to 25 h.p., and a third above 25 h.p.). Had the decision been based solely on the interests of the whole community, these arguments might have prevailed. But it has become the standard practice of the present neo-feudal age to act in consultation with the special interests concerned, who in this case are the Society of Motor Manufacturers and Traders. The motor trade, no doubt, would like to sell cars overseas—but not at the cost of its home market. Its major interest lies in preserving the peculiarities of the British car. It is of small moment to the trade that the British car cannot sell abroad, provided that the converse also applies—that the foreign car cannot sell in Great Britain. As Mr. Benson observed:

Naturally the manufacturers are all in favour of the present method of taxation. It gives them magnificent protection.

The Chancellor has clearly been strongly influenced by the SMMT. So protection is preferred to exports, which,

on the SMMT's own showing, will not be assisted by the slight change now proposed. The whole incident is a classic example of how economic policy is decided—but should not be.

Whose Move in India?

The general situation in India does not appear to be making much progress. Mr Jinnah is reported to have refused to co-operate with the mediatory non-party committee gathered together by Sir Tej Bahadur Sapru, the Liberal leader. Personalities and errors of diplomacy may have something to do with his refusal, but it seems more likely that the fundamental reason is the fear of weakening the bargaining power of the Muslim League if it joined in negotiations in which its minority position would be accentuated. If his refusal is final, and there seems no reason why it should not be so, hopes of an agreement between the Indian leaders must be lower than ever. Direct conversations between Mr Gandhi and Mr Jinnah have failed, and now indirect conciliation by as eminent and detached a non-European body as could be found has also proved useless. The reaction to these failures is, and will increasingly be, to throw responsibility for achieving an agreed solution on to the British Government. The *Hindustan Times* has called the gesture of the Chamber of Princes an index finger which will

... make the Viceroy and the British Government realise the dangerous path they will be treading if they do not tackle afresh the entire problem of India's political and constitutional advancement.

Tactically, it may be the turn of the British to play a card or two, and yet it is hardly likely that, if they did, anything more could be offered than the Cripps proposals of 1942. Apart altogether from the wisdom of initiating far-reaching changes at this crucial stage of the Eastern war, the only proposal that would go further to meet the Hindus than the Cripps offer would be an offer to coerce the Moslems. But merely to repeat the Cripps offer would probably only exacerbate Indian suspicions of the sincerity of British motives. In that case, the wider strategy of achieving the best possible solution compatible with independence may dictate a firm stand on the very liberal terms already offered and refusal to initiate detailed discussions until the Government's stated conditions are accepted and the terms of release for the imprisoned Congress leaders fulfilled. This policy has paid dividends (though not very large ones) in the past two years, and may have still more to pay. In any event, if it be granted that there is any case at all for firmness, it would surely be foolish to abandon the policy now that Congress is on the defensive. If this is the intended line, the Viceroy, in calling the Princes' bluff, may be sounding a warning to others. It may also explain the rather studied concentration of the Indian Government on problems of economic development in India.

In this context of events, the resolution passed by the Labour Party conference, against the advice of its executive, shows an admirable enthusiasm for Indian independence, but little appreciation of the complex difficulties of achieving genuine freedom for Indians. The resolution called for the immediate opening of negotiations with Indian leaders, but it failed to specify on what basis such negotiations should proceed. Unless the supporters believed that Indian leaders would find common ground in the presence of the dominating power and would forget the differences which broke up their own direct discussions, it is hard to see how such a suggestion assists a final and acceptable solution. While many will have more emotional sympathy with the Labour Party conference than with the hard-headed and obscure workings of the Government of India, it may yet be that the policy of the latter will contribute more to the formation of a free and cohesive India.

* * *

The Italian Scene

The second Bonomi Government, formed in Rome on December 10th, marks the actual end of the coalition of the six parties on which the previous Government was based. The Action Party, led by Count Sforza, and the Socialists, headed by Signor Nenni, have remained outside the Government. The coalition now consists of the Liberals, the Labour Democrats, the Christian Democrats and the Communists. Signor Togliatti, the chief of the Communist Party, and the Christian Democrat, Signor Rodino, are Vice-Premiers. The

much disputed post of Foreign Minister is held by Signor de Gasperi, the present leader of the Christian Democrats. The purpose of the new Government is essentially to keep the truce between Monarchists and Republicans to which the political parties committed themselves when King Victor Emmanuel withdrew and Prince Umberto was appointed to be Lieutenant of the Realm. But the truce is an uneasy one, and the basis for Signor Bonomi's Centre policy is becoming more and more narrow. The Action Party and the Socialists have decided to boycott the new Government because they wanted it to derive its powers from the Central Committee of National Liberation and not from the Lieutenant of the Realm. The Premier, Signor Bonomi, the Liberals, the Liberal Democrats and the Christian Democrats refused to leave the Lieutenant of the Realm out of the picture. Curiously enough, they eventually found support from the Communists. This is not to say that the Liberals or the Christian Democrats stand for the monarchy in principle. All those parties are internally divided—they include Republicans as well as Monarchists—but even the Liberal and Catholic Republicans wish to postpone the decision until the whole of Italy is liberated and the Italian people can be consulted.

*

How stable the present coalition will be it is difficult to predict. Distrust between the Communists and their partners in the Government is fairly strong; each conciliatory gesture of Signor Togliatti is still suspiciously regarded as a clever trick; and the Communists, now pale pink, are under the pressure from their Left critics—the Socialists and the Action Party. At the same time, the opposition against the political truce and the Bonomi Government is growing from the adherents of undiluted monarchism, who remain outside the coalition and are more aggressive and vocal now than at any time since the collapse of Fascism. It may be that politically only the presence of the Allied Control Commission still keeps the issue of the Monarchy from violently exploding the uneasy political truce. On the other hand, the complete unreality of the Government's position under Allied control is one of the chief causes of instability. The Italian Government has virtually no powers. The economic life of the country is still managed almost entirely by the Commission. No decisions can be taken without reference to it. In such a vacuum, political and institutional divergences loom ever larger. In the interests of Italian democracy, the Allies should find some method of giving the Italians at least a semblance of genuine self-government.

* * *

Labour Politics

The chief impression of last week's Labour party conference is one of a continuous tussle between the platform and the floor. The honours in the first few rounds went to the executive, but in the final stages the delegates came out on top. To change the metaphor, though the executive's old grey mare succeeded in surmounting the first day's obstacles—the questions of the Coalition and alliances with other parties—and in sidestepping the hurdle of Greece, it could not keep up the pace set by the delegates' spirited colt, and

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

was left behind on both the election programme and on India. The executive's resolution on postwar employment, though ably and uncompromisingly moved by Mr Shinwell, was regarded as too academic and vague. This resolution called for a planned economy to ensure full employment, and for State direction of industrial and financial policies, with Government control over the banks, national investment, and the location of industry, and international agreements to promote foreign trade and encourage the economic development of backward countries. But it did not mention public ownership. The adoption—to the consternation of the Executive—of a resolution moved by Reading now pledges the party to include in its election programme the nationalisation of the land, of large-scale building, and of all forms of banking, transport and fuel and power, and to introduce legislation for the democratic control of industry with provision for workers' and consumers' representation.

This may or may not be good electioneering from Labour's point of view. On the one hand it might be said that such a radical programme might frighten off middle-class voters and give the other side an opportunity to raise a "Red" scare. But on the other hand, there is nothing in this programme which has not always been in Labour's policy, and there is something to be said for adopting a clear-cut programme that enables the ordinary voter to know what he is voting for. The vote on this resolution certainly indicated the feelings of the majority of party workers who, restive after five years' enforced political inactivity, are longing to get back to their constituencies on a full-blooded Socialist programme, so that they can fight the next election with the gloves off—even if they have not considered very deeply what the new commitments would involve. In this, there cannot be said to be any difference between the attitudes of the political and industrial wings of the movement. The Reading resolution was after all much the same as the policy adopted by the Trades Union Congress in October. The traditional picture of reactionary trade unions swamping the progressive constituency vote was not borne out by this year's debates on home policy. Such clashes as there were arose on the question of peace terms and over the "Vansittartism" of certain trade union leaders—but this seemed to be as much a personal as a political issue. It now remains to be seen whether the party's leadership will move in the same direction as the rank and file. The conference leaves no doubt that though the Labour Ministers are left in the Government, the ties of the coalition will become increasingly strained.

West Indian Elections

This month, general elections have been held in two of the West Indies—Barbados and Jamaica. In the former, the franchise was recently greatly extended by a considerable reduction in the property qualification and by the grant of the vote to women; in Jamaica, the election was the first to be held there on the basis of universal adult franchise. The Barbados election has resulted in an overwhelming victory for the Progressive League, which has increased its membership of the House of Assembly from 5 to 15 out of a total of 24. This party has already had some experience in government—in so far as that is possible under the existing constitution—for its president, Mr G. H. Adams, was a member of the Executive Committee which advises the Governor, and another of its representatives, Mr H. Springer, is a member of a committee appointed by the Governor to consult with the Comptroller for Development and Welfare in the West Indies, and to recommend schemes for assistance under the Act. Last session was notable for the amount of social legislation that was passed. With the Progressive League in such a large majority, the pace of social advance is likely to be quickened. In Jamaica, the so-called Labour party has won a sweeping victory, and will probably have 22 seats out of the 32 in the new House of Representatives. But this Labour party is a very different affair from the Progressive League in Barbados, and even more different from the Labour party in this country, in spite of its connection with the trade unions. It is, in fact, a one-man show, run by Mr Alexander Bustamante, who was able to capture the untied electorate by his eloquence and fine promises. It is a pity that in so doing he has swamped the People's National party, which holds much the same views as the Barbados Progressive League, and, in particular, that its leader, Mr Norman Manley, one of the outstanding personalities in the West Indies, should have narrowly lost his seat to the Labour candidate in a three-cornered contest. But this is not

to support the view that universal franchise has been given to the Jamaicans too soon. Can any country, however mature politically, claim to have made no mistakes in a general election? Jamaica, too, must be given the chance to learn.

Repairs and Renewals

Delay in the repair of bomb-damaged houses has already caused needless suffering and anxiety to many Londoners. Mr Sandys's statement in the House of Commons last week and the memoranda issued by the Ministry of Health to the local authorities show quite clearly that the strong criticism of central and local handling of the matter has been entirely justified. The steps now being taken, so belatedly, to put some kind of order into the work are elementary precautions against waste and injustice and should have formed the basis of the original plan of campaign—if there was one. Hitherto the standard of repairs has been determined individually by each local authority, with the result that there have been wide differences from borough to borough. Some authorities have permitted and arranged repairs and redecorations at a standard inconsistent with the major aim of providing a maximum number of people with a reasonable minimum of comfort as quickly as possible. They have also been selfishly discriminating in their use of repair materials—and unwilling, very often, to make do with substitutes—so that shortages have been exaggerated. The new directions to local authorities are intended to avoid cross freights and uneconomic hoarding of materials; to safeguard the supplies of materials in shortest supply—plaster, plasterboard, glass and tiles; and to set up common standards of repair. One builders' merchant will be selected to advise the local authority in each area. He will assist the War Damage Officer and his Materials Officer on questions of commodity supply and allocation. Each local authority will be provided with a list of the merchants responsible for supplying contractors working for them, and the percentage of the weekly allocation which these merchants will receive. By this process the allocation of materials among the 96 local authorities of the London Region will be made in accordance with actual requirements. These proposals are obviously in the right direction. If they are carried out efficiently they may produce the extra effort that is needed to make up for lost time.

The Law of Ghosts

Under the demure title of *Rex. v. Duncan and others*, the Court of Criminal Appeal have heard the appeal of the four defendants in the eight-day prosecution at the Old Bailey under the Witchcraft Act of 1735. The defendants had been convicted of "Pretending to exercise or use a kind of conjuration" and had appealed. The appeal was dismissed. Any conviction under a two-hundred-year-old Statute has something of an antiquarian interest. This is also a neat example of the empirical British way of handling problems which we either do not understand or are indisposed to investigate fully. Statutes against conjurations and invocations have a long history. They go back to the reign of Henry VIII (33 Hen. 8 c. 8). That Act made any conjuration with any spirit an offence. In the days of Elizabeth, under the Statute 5 Elz. c. 16, the offence was "the conjuration and invocation of evil spirits." Both Edward VI and James I gave legal recognition, by Act of Parliament, to evil spirits; but, 130 years later, George II and his Parliament were more sensitive and returned to the habit of mind of Henry VIII, in that the Act of 1735 forbade a pretence of "any kind of conjuration." That is the position today. It is arguable that the parliamentary draughtsmen of George II's day, men of an age of reason, may have regarded any attempt at conjuration or invocation of any spirit as a pretence. Grammatically, that is a possible reading of their Statute. But by now the word "pretence" in law has become more technical. It relates to the false as opposed to the true. It implies that the act "pretended" may, in fact, be done in a genuine way. In short, it implies that you can conjure real spirits. That was the basis of the decision of the Court of Criminal Appeal, for they made it very clear that the prosecution had to convince the jury in the Duncan case not that the defendants were conjuring spirits, good, bad or indifferent, but that they were doing nothing of the kind, that their alleged ectoplasm was nothing but butter muslin. At this time of year it is pleasant to know, on high authority, that a chat with a ghost, provided it is a genuine ghost, is not *ipso facto* a criminal offence.

Letter to the Editor

Tourism in Britain

TO THE EDITOR OF THE ECONOMIST

SIR,—Recently in England, I determined upon becoming an intellectual, and therefore immediately subscribed to *The Economist*. I have received my first copy, dated October 21st. The proof that I have already attained the level of an intellectual is indicated in the fact that I am particularly interested in your article "Tourism in Britain."

About tourism in the United States, note particularly that I started a campaign to open the Capitol in Washington, and finally got it opened. Every Sunday anywhere from 25,000 to 50,000 people go through the House of Representatives and the Senate. During the time that it is not too cold, bands play on the square in front of the Capitol. These have been spectacularly successful. A reasonably fair proportion of those who visit are from the uniformed services of the British Commonwealths.

Why shouldn't you immediately for good will purposes open the Parliament?

In week-days it's hard enough for a well-known American with many friends to get into Parliament. It's almost like a Protestant getting to see the Pope. The cops on the doors are somewhat zealous on these week-days. As for American soldiers getting in, it is almost impossible. They must go to the American Embassy—where, of course, they are unknown—to get someone to give him a ticket or recommendation. Or, according to a rather surly individual on the Parliament entrance, the American soldier must go to "Service Clubs," although I could not find any such organisations where soldiers could get these tickets.

On Sunday the Parliament building is dead, and I mean dead. I went to Westminster Abbey to attend church, where gawking Britishers (and Americans, of course) pushed me around while I was vainly attempting actually to pray.

The point: If you drew out a big crowd with bands and the like, tourists would flood over into Parliament between the hours of 8 a.m. and 1 p.m., and it would give the people a chance to have religious devotions at Westminster Abbey.

But the point, principally, is if you open Parliament on Sunday, you will make a million friends in the next two years. Where the House of Commons has been bombed out, have signs around the place telling of the destruction. Let people roam around, as you are permitted to do at the Coventry Cathedral. On Sundays have free guides—as we do in the Capitol and in the Library, where we have the Magna Carta—have free lectures "telling all about it."

Have your lecturers trained with some neat compliments on Anglo-American relations.

Back to your article. You say your top was thirty-three million pounds per annum of tourists. I don't know how many Americans you got, but you should get five times as many after the war, and they would spend a lot of money.

You say that in England a man can "see a new way of life, eat new food and drink unfamiliar drinks." I do not wish to be impious or lacking in reverence for the land of my ancestors. But would it not be better to say *old* ways of life? As for "unfamiliar" drinks—does every American have to submit to your secret weapon, undoubtedly devised to destroy the hearts and souls of Americans—that which you falsely and libellously call coffee?

As for the improvement of hotels—and this quite seriously—hotels in England seem to me to be more expensive than American hotels. Without mentioning the names of two of them in London, they are both more expensive than the Waldorf-Astoria in New York and the Mayflower in Washington. Even the medium-priced hotels are more expensive than American hotels.

The answer is the widespread building, along with your housing campaign, of thousands of new hotels. (In the name of God, do not make them too big.) Make them out of the plastics, synthetics and new materials that we will make in America. You haven't enough bricks and lumber in all the world to rebuild England or Western Europe or even to build the necessary houses in America. But you must build more hotels. They must be put everywhere, and they must be utility hotels and cheap.

In another part of your paper you mention "Ministers of the Crown," of which you apparently have as many as ministers of the Cross. Without being at all humorous, it would seem worthwhile to make a Minister of Courtesy or Minister of Travel (do not use the word tourism), who would go about banging people's heads together demanding that hotels be built, that railroads give better service, and making a general nuisance of himself with all the other Ministers and all the business men in England to build up more tours for Englishmen and for anybody else who would come to England or who would pass through it.

As an American suffering horribly from anglophilia, I want you to realise that this is not only happy blood to be traded from heart to heart, but money to jingle in our Anglo-American pockets.—Sincerely yours,

MAURY MAVERICK,
Chairman and General Manager,
Smaller War Plants Corporation

Washington

AMERICAN SURVEY

The Argentine Issue

(From an American Correspondent)

[EDITOR'S NOTE.—This article, by a correspondent who has recently returned to the United States from Latin America, fairly reflects the dominant trend of opinion in the United States. The views of THE ECONOMIST on the dispute were stated in an article in the issue of August 5, 1944.]

Washington

IN Washington's momentous fumbblings for a world policy the State Department still seems to have the Argentine bull by the tail, unable either to let go or twist him for a fall. Meanwhile Mr Sumner Welles, ex-Under Secretary of State, like a Comanche at a party to which he has been distinctly uninvited, rides circles around the Department, popping his guns and, curiously enough, seeming to score through shooting at the wrong target.

The point actually at issue is less Argentina than a question of policy. Ostensibly the Argentine imbroglio is concerned with the doctrine of recognition, and this subject must be disposed of first of all. Mr Welles contends that

there should be automatic recognition of revolutionary governments and espouses the Mexican Estrada doctrine. His proposal for an inter-American conference to consider the Argentine-US case is generously presented as a means of achieving absolute—though perhaps unpalatable—truth by a majority vote. It carries the underlying inference that the American republics would crack down on Argentina—though the fact that the Argentine Government itself has asked for such a conference shows that they, at least, anticipate a different result. Mr Welles himself had the opportunity to bring Argentina into line by this method at the Rio de Janeiro conference in January, 1942, though he might have destroyed the Castillo Government in so doing. But whereas at that time, in the heat of rage generated by Pearl Harbour's fires, eighteen countries would have backed him (plus probably Chile for the twentieth vote), a collective condemnation of Argentina to-day is impossible to mobilise. There would be a split vote and probably a plea to call the whole thing off. Thereupon Mr Welles could

claim vindication of the policy of automatic recognition and his own policy as distinguished from Mr Hull's.

The State Department has the best of reasons for not recognising the Farrell Government. The distinct pattern of Fascist government in Argentina (which Mr Welles sedulously avoids noticing) is heightened by policy propaganda from Berlin, reaching Argentine government and military circles by short-wave radio. Yet the State Department has relied on the weakest of all weapons—non-recognition—to signify its condemnation of an outrageous condition. Its policy, if a big word must be used for this weak brew, has been hope. It hoped the Argentine people would revolt; it hoped that the military would be impressed by the tremendous Allied war effort and would decide for the victors; it hoped Farrell would fall. This hope, when sustained at all, was encouraged by slow garrotting: Argentine gold was frozen, but the measures were explained away with many assurances that they constituted no sanctions; US ships no longer touch at Argentine ports; export licences have been withheld. This slow motion has been justified on the grounds that it gives Argentina a chance to reform and not lose face in the process. It has in fact given Farrell (and Castillo and Ramirez before Farrell) time to adjust his government to new conditions. And the Argentine people, who were sympathetic in the beginning, are likely to be against the United States shortly under this pressure and the barrage of totally government-controlled propaganda—much of which is not untruthful but merely the other fellow's point of view.

The State Department has before it only two alternatives: to smash the Farrell Government by economic sanctions and be ready to use force should Farrell move on Uruguay or elsewhere; or to make up its mind once and for all that Argentine meat, wheat, corn, linseed, leather and wool are so important to Allied soldiers that they outweigh political considerations. (Such pure wartime expediency can be justified as easily as a meek policy towards Turkey for the sake of chrome.) The fact that either of the alternatives is utterly disagreeable does not alter the necessity of breaking the present stalemate.

The stalemate must be broken, since, as President Lopez of Colombia has recently expressed it, "Argentina now provides a peg for dissident American opinion." Dissident from what? From democracy. For despite their assurances to the contrary, it is the large landowners and industrialists of Argentina who have backed the Nationalist Governments of Castillo, Ramirez, Farrell. These backers are now somewhat uneasily watching the Government's leading extrovert, Colonel Peron, organise his personally dominated labour unions. The pattern of German Nazism is repeating itself. But it remains to be seen whether repentance will come early enough to Argentina's ruling classes, or whether Colonel Peron's vaulting ambition will overleap itself. The Argentine proposal for a conference may reflect some desire to find a way out, rather than merely a wish to exploit a pan-American spirit.

Action, some action, any action, by the State Department is urgently needed. When Russia declared war on Bulgaria just to be sure that the Bulgarians made up their minds in a hurry, the analogy between the United States and Argentina was drawn as fast as the newspapers hit the streets. But beyond the immediate necessity of settling the Argentine affair lies the deeper one of policy. Here the need is not for longer and prettier statements—the State Department's drafting officers are among the world's best. The need is to know whether the dedication of the people of the United States to democracy—in Latin American terms probably limited to the observance of the common human decencies and the basic rights of man—shall be translated into action through its agency for foreign affairs. Or whether profoundly antagonistic governments can flourish and grow stronger in alliance with our enemies while the State Department ponders the minutiae of procedure.

American Notes

Tail-Twisting Carnival

One of the liveliest of the Liberal columnists, Mr Samuel Grafton, has drawn attention to the torrent of anti-British propaganda which is now flooding the United States, "pronouncements, manifestos, declarations, cartoons and wisecracks." Some are put out, he says, by the Liberals who object to British policy in Italy and Greece, but some come from former Isolationists who see an opportunity to get in their own particular anti-British blows. The New York correspondent of the *Daily Telegraph* has suggested that some of this stream of criticism has been officially inspired. Mr Raymond Gram Swing counsels the British public not to take these attacks too tragically, as they are "a demonstration of intimacy" and "their very lack of restraint arises from a sense of the fundamental security of the association between the two countries." That is uncommonly like the classic defence of the Cockney wife-beater who said "he clipped her on the jaw regularly every night to show his affection." The sum total of anti-British feeling in the United States is built up out of the activities of many groups who individually would angrily disavow any intention of breaking the alliance or alienating the two peoples. These doubtless include those Zionists who pay for full page advertisements in the newspapers attacking the British Government vehemently on Palestine; the liberal journalists who berate the British as the agents of international reaction; the conservative commentators who denounce them as the partners of Bolshevism; the business men who profess to fear that the British will outwit them in the world's markets; the good Senators who spread the alarm that the British are waxing fat on the illicit profits of Lend-Lease; and the Army newspaper that suggests that US troops are going short of cigarettes because the British are getting them. Each separate tug at the lion's tail may be no great matter, but the cumulative effect of many tuggers is a subject for the RSPCA. The political consequences would seem worth the attention of the White House and State Department. It is all very well to dissemble your love, but it is poor policy in wartime to kick a faithful partner and ally downstairs.

Search for a Foreign Policy

The Senate's examination of the President's nominations to the State Department turned into something more than an inquiry into the fitness of the new appointees. Senator Vandenberg made Mr Stettinius' statement on Poland the occasion for a demand for a statement on the foreign policy of the United States from the President himself, on the grounds that only Mr Roosevelt can speak with real authority. The events of the past fortnight have created alarm in all quarters. The Polish dispute and British policy in Greece are interpreted as naked power politics; the Franco-Soviet alliance as a return to the system of alliances which Americans had hoped to see superseded by more general arrangements; the by-passing of the Atlantic Charter is deplored, and in extreme quarters there is a demand for a "withdrawal from Europe." The old isolationists are listened to with a new respect. Mr Arthur Krock, the columnist, professes, after a series of Congressional interviews, to see a danger of the resurgence of "American non-interventionism" in world affairs if satisfactory assurances are not forthcoming that American principles are not being flouted. Mr Krock is not alone in fearing that the current wave of disillusionment may have fatal effects upon the prospects of the Dumbarton Oaks plan, which, it is said, may be wrecked on the rocks of British and Russian power politics. Some of this anxiety is genuine, though it would be wrong to ignore how well it suits the books of the isolationists. A more realistic, though not less concerned note, is struck by the *New York Herald Tribune*, which points out this week that America finds herself without much voice in specific settlements largely because of her policy of looking only at the broad structure of an international order, and refusing responsibility as to the details. In defence of the Administration, it should be said that it is already clear that the implementing of the mandate for international co-operation which the President received in November will not be as straightforward as it then appeared; and anxieties on this score may well have reinforced the traditional aversion to American involvement in the complicated realities of a European settlement which

do not always lend themselves to solution by the enunciation of high principle alone. What is not always appreciated in the United States is that recent events in Europe of which Americans are so critical are to a considerable degree the product of renewed fears that, twice in a quarter of a century, the loftiness of the American design for peace will not be matched by an equal willingness to undertake the responsibilities that the plan implies. In his Inaugural Address, Mr Roosevelt may undertake to bridge this dangerous gap, which, it must be said, has been widened rather than narrowed by recent pronouncements from the State Department.

Manpower Expedients

The failure to secure a National Service Act early in the war makes it necessary to deal with each manpower "crisis" by a series of *ad hoc* and piecemeal measures. Early November production figures suggest that these have not been altogether unsuccessful. Heavy artillery ammunition last month increased 23% over October, and was 6% above the November schedule; and there have been similar increases in the production of Super-Fortresses, heavy trucks and tyres, heavy transport planes, and other items. Much of the credit for this improvement may well be due to the "morale" pronouncements of which there has been such a large output; though it is suggested in the *New York Times* that it also follows the tightening up of its scheduling procedures by the War Production Board to assure the delivery of critical component parts. The chairman of the Board further reports "renewed enthusiasm" for war work on the part of men aged 26-37 since the announcement that if they leave essential jobs they will be liable to immediate call-up. In making the announcement, Mr Byrnes pointed out that several thousand men have already been released to fill critical vacancies in war plants; and he intimated that their places in the Forces must now be taken by men hitherto deferred, but now found not to be making any substantial contribution to the war effort. Should the new compulsions prove inadequate to maintain war production, they may be accompanied by new inducements. Both the Services and the War Production Board are said to look with some favour on the institution of a bonus for war workers who stick to their

lasts. It is the suggestion of Mr Krug, of the War Production Board, that this might take the form of a "cushion" against discharge at the end of the war. Presumably this would be the end of the Japanese war. The difficulty of holding workers to war jobs is already sufficiently acute to have required a "freezing" of civilian production at existing levels. Reconversion at the end of the European phase of the war may be less extensive than was expected last summer, but it will hardly be possible to restrict civilian supplies simply for the purpose of keeping war workers at their machines, and further financial inducements may be necessary.

Giant Leaker

Mr Drew Pearson, the widely syndicated Washington journalist, was recently adjudged by his colleagues in the Press to be the most influential of the daily columnists. He helps to mould the opinions and reinforce the prejudices of many millions of Americans. His popularity and his influence are based, to a large degree, on what appears to be a unique access to the sources of news. One of the features of his column in recent weeks has been the publication of what purport to be secret telegrams sent to the United States Government. Mr William Phillips' reports to the President on India, and a dispatch by Mr Kirk, the U.S. Ambassador in Rome, detailing Mr Churchill's instructions to General Scobie on the Greek crisis, are among the forbidden fruits Mr Pearson has collected for his readers. The latest pippin from the official orchard is the alleged text of Signor Bonomi's grievances against the British Government as privately addressed to Mr Roosevelt. There is much head-shaking in Washington over Mr Pearson's leaks. Leak, incidentally, seems a pallid description; if the disclosures are really authentic it looks as if a pipe had burst somewhere. Mr Pearson evidently has not been unduly discouraged—or perhaps he has only been put upon his mettle—by President Roosevelt's reference to him last year as an habitual liar. If there is a bootleg traffic in secret papers—all of them, curiously enough, anti-British—the U.S. Administration will have to take some more effective action to reassure other Governments that it can protect their confidences if not its own.

THE WORLD OVERSEAS

Greek Political Parties

AFTER two weeks of civil war all political discussion in Athens seems to centre on the idea of a Regency, to be set up and to remain in being until the fate of the monarchy is decided by a popular vote. Archbishop Damaskinos, the Primate of Greece, has been suggested as the most suitable candidate for the post of Regent. The Regency is likely to be accepted by wide sections of Greek opinion. Moderate Republicans may support the Regency, hoping that it will bar the way to the King's return and facilitate the transition to a Republic. There seemed some hope at first that moderate Royalists would also support it, but the negotiations between the King and the Royalist Ministers in Athens suggest that this may not be the case. The fact that after more than two weeks of fighting a solution is now being sought in this direction shows that the real issue at stake is the controversy over Republic and Monarchy, and not any *coup d'état* by the Left Wing guerillas allegedly aiming at the imposition of a Communist dictatorship on Greece.

The events of the last weeks have revealed the great strength of the "rebel" guerillas. After initial defeats, suffered in the centre of Athens, the guerillas have entrenched themselves in the suburbs of the Greek capital, from where they have even been able to strike back at the centre of the city. Most of the countryside and the large provincial towns are under ELAS control. The arrival of strong British military reinforcements will, of course, tip the scales against ELAS. Even so, it is now clear that the suppression of the rising cannot be achieved by a short punitive expedition. Should no political compromise be found,

the Allied Command would be confronted with the prospect of a serious and protracted campaign.

The strength of General Scobie's Greek opponents is primarily of a political and not of a military character. It is now evident that the influence of the National Front of Liberation (EAM—*Ethnikon Apeleutherotikon Metopon*) is considerably wider than it was even recently assumed to be. True, the military force, ELAS (*Ellinikos Laikos Apeleutherotikos Stratos*) is not more than an "active minority." But behind it stands the political force of EAM, which undoubtedly speaks at least for the whole working class of Greece. In the absence of any electoral test, the general strike called by EAM has proved this conclusively. The strike has been complete. In this respect the events in Greece provide a significant contrast to the earlier developments in Belgium, where the Communists' call for a general strike was disobeyed by large numbers of workers. The fact that the Greek dockworkers have stopped unloading food supplies in the Piraeus is certainly regrettable and tragic. But, as their decision has most of all hit their own starving folk, this gesture of desperation ought to stimulate more reflection than indignation. It indicates some very acute and widespread resentment which can hardly have been remedied by angry remarks about "murder gangs" and "the iron rule of ruffians."

What does the EAM represent in Greek politics? It is, broadly speaking, a bloc of the Left and of elements of the Centre. Its chief components are the Communist Party, the Agrarian Party, the Socialist Party, the Union of Popular

Democracy, the Trade Unions and a number of other Left Wing organisations. The Communists no doubt play an influential part. According to the estimate of the Socialist leaders of the movement, the Communist following forms about 20 to 30 per cent of the EAM, but its political weight is much greater than its numerical strength. Irreconcilable revolutionaries have undoubtedly been active in aggravating the present crisis, and obstructing conciliatory policies. Even so the leadership of the movement has been in the hands of Liberals who have come from Venizelos' party. Professor Svolos, chairman of the EAM, is the author of the Greek Republican Constitution of 1924. General Seraphis, the Commander-in-Chief of ELAS, is also a Venizelist officer, who served as chief of staff to General Plastiras, and took part in Venizelist uprisings. The political outlook of the EAM has been strongly influenced by the Liberal leaders. The EAM programme has been relatively moderate. It has stood for a progressive "Leftish" Parliamentary Republic, but not for Communist dictatorship. There has been no lack of latent friction between the "moderates" and the "irreconcilables" in the EAM. Recently in the heat of the battle the more militant elements have undoubtedly come to the fore; and British policy so far seems to have strengthened, not weakened, the unity of the EAM.

The EAM's most determined opponents are the Royalists and the former Metaxists, many of whom are now entrenched in the Populist Party. Their influence is anything but popular. The main strongholds of Royalism and Metaxism are the Civil Services and the officers' corps. Unfortunately, ever since General Tsolakoglou formed the Greek quisling administration, Royalism and Metaxism in occupied Greece have at least to the popular mind become almost synonyms for collaboration with the Axis. Only to a slightly lesser extent than in France, "legitimacy" in Greece has become anti-national and unpatriotic. True, the King and some of his Ministers have gone into exile, and kept their record clear. But such props of Royalism in Greece itself, as, for instance, the police and the gendarmerie, whose personnel has remained the same throughout the years of the Metaxas dictatorship and the German occupation until the present day, have become the main target of popular hatred. Royalism has thus joined in the new contest for power in a liberated Greece with the most severe political handicaps.

The antagonism between Royalism and the EAM is now aggravated by the fact that between these two camps no political tendency or party is strong enough to act as a steady balancing factor. The EAM is in some respects a continuation of the Greek Popular Front of 1936, to which the King replied with the Metaxas dictatorship. But there is one important difference between 1936 and 1944. In 1936 the old Liberal party was still the chief spokesman of Republicanism—the Liberals then possessed nearly half of the total number of seats in the Diet. But since then, Venizelos' Party has been broken up into a number of small splinter groups; and it no longer seems to be playing the central role in Greek politics. The downfall of Greek liberalism may have been due to various reasons. Venizelism without Venizelos could no longer command its old authority. Its leaders—of much smaller stature—were not capable of opposing the Metaxas tyranny with enough vigour and determination. Some of them acquiesced in the new régime, others resisted only passively. Still others sought to continue the Popular Front in the underground, where the weight of the illegal labour organisations was greater than that of the Left Liberal splinter groups. Thus the working classes inherited as a central plank in their political programme the Republicanism of the older middle-class Liberal groups. The result was that the Liberal party seemed to lose its chief political motive, and even perhaps its *raison d'être*. Only feeble remnants of the once powerful move-

ment tried for a time to lead an independent existence. One of them was M. Papandreou's Democratic Union, a tiny political group with no popular following. Confronted with the re-awakening of the Republican sentiment in the country, M. Papandreou has tried to adopt a neutral attitude, evading a direct answer to the "institutional" problem.

Republic or Monarchy?

From this brief and general survey the dilemma of Greek politics emerges quite clearly. In all probability the Republic can be revived only as a Republic of the Left. The alternative is not a Republic based on the Centre or the Right, but the restoration of Monarchy. The Monarchy must base itself chiefly on forces that have come to be regarded as anti-national. It can, therefore, reassert itself only as the dictatorship of a minority. This was already the case in 1936, a year after the restoration when the Royalists formed a minority in the Diet, and the King's reply was: Parliament is against me; away with Parliament.

Under such conditions the fears of the Right and the Left have inevitably become feverishly violent. The Right is haunted by the spectre of a Republic which may no longer be Venizelist but "Red." The Left's fear of the Monarchy is based not only on Republican sentiment, but also on the foreboding, based on recent experience, that the Monarchy will soon become a tyranny. M. Papandreou has been caught between two fears. He is not a Royalist; nor would he, standing alone, be capable of imposing any dictatorship on Greece. But his own weight in Greek politics is rather slight. In a broad coalition Government he was for a time the balancing factor. But should that balance be upset, should the Left be disarmed, and the armed forces of Royalism left intact, then M. Papandreou would certainly be swept away by the Royalist Metaxist Right, which has been mustering its forces behind his back.

Against this background the appeals to the Left that it should express its will "through the ballot and not by the bomb" might have been effective in one case only; if the forces of the Right were disarmed simultaneously with those of the Left. The Republicans in Greece know well that in their country the contraposition of the ballot box and the bomb has been somewhat unreal. In the past those who had the bombs "managed" the ballot; and as recently as 1936 Royalism asserted itself through force against an anti-Royalist Parliament.

The fear of the "Red Republic" on the Right is genuine enough; but it has undoubtedly been heightened with imaginative tales of sinister Communist conspiracies and plots. All evidence about the activities of ELAS suggests that its units may on occasions have taken justice into their own hands and wrought vengeance on collaborators or simply on political opponents; but ELAS and EAM have certainly been innocent of any conspiracy to prepare a *coup d'état* or a civil war. Ever since the first day of the fighting EAM and ELAS have not ceased to negotiate for an armistice, a thing that has never been done by conspirators who are really bent on seizing power through force. When, for instance, in the civil war in Spain did General Franco parley about laying down his arms?

The appointment of a Regent acceptable to all parties may possibly pave the way for peace in Greece; but only the disarming of all partisan forces can prepare the ground for a rather unfamiliar experiment in Greek democracy. The alternative is civil war à l'outrance, the result of which, with hatred and bitterness, full prisons and concentration camps, will be, in Greece as in Spain, the opposite of democracy.

Conscription Crisis in Canada

[FROM OUR OTTAWA CORRESPONDENT]

SHARP political turmoil over the conscription issue in Canada has had its roots in far deeper questions than whether or not 60,000 recruits who had been drafted for the army for home defence should be despatched overseas as reinforcements for the Canadian First Army. A sense of impatience with controls, a half-formed hope that the war is nearly over, at least in Europe, a throwing off of restraints which have curbed political controversy for more than five years—all these things were discernible. The issue which brought all these forces into heated conflict was conscription for overseas service.

The reasons why Canada, unlike the United Kingdom and the United States, has not had universal conscription in this war lie deep in Canadian politics and history, outweighing the obvious advantages of a general system of national service. When France fell in 1940, the Canadian Government enacted the National Resources Mobilisation Act. That it has subsequently been used extensively, through the selective service administration, to direct and transfer labour by the use of compulsion, is almost forgotten; what has mattered has been the fact that it has not been used to obtain men for military service. An opportunity to expand the conscription law occurred when Japan entered the war, and three extra divisions for the Pacific defences of Canada were authorised. The first step in conscription had been tentative—because of the extreme sensitiveness of public opinion to an issue which has caused serious trouble in the last war—and men had been called up for thirty days only and then placed in reserve. In 1942, this was quickly changed, so that draftees remained in service for the duration and were assigned to home defence. All this time, the policy followed by the Government, on the advice and with the encouragement of the general staff, was to retain the Canadian First Army, training in Britain for European campaigns, on a volunteer basis. General A. G. L. McNaughton, then army commander, was the chief exponent of this course.

The decision to maintain the overseas army as a volunteer force, while men drafted for limited service were assigned to home defence, made it possible for the overseas army to obtain draftees only if they voluntarily changed their status. Out of 975,000 men entering the Canadian armed forces since 1939, 150,000 of them were drafted, and of these 48,000 changed to volunteer status. Wastage through discharge and other reasons left the National Resources Mobilisation Act troops at a strength of 60,000 when Mr Ralston, the senior Minister of National Defence, returned from a visit to the European fronts in September, 1944, with a report for the Government that army reinforcements were being drained off and that a new force pool was needed without delay, or else the army would suffer a shortage by early in 1945. Heavier casualties than were expected in the campaign to take the Channel ports of France, and in the Schelde estuary, were mentioned. The prospective shortage was in infantry categories. Among possible courses of action canvassed were the transfer of trained men from other categories to infantry (since the Canadian First Army is highly mechanised and heavily armoured and possessed 200,000 reinforcements of other types); the breaking up of one division out of five; and the despatch of home defence draftees as reinforcements. The actual number of trained NRMA infantrymen was estimated at 8,000, a number capable of increase through further training.

Germany at War

Volkssturm Economy

OUT of the extreme disorder of military defeats, the withdrawal of armies and civilian evacuation from the threatened frontier territories, some sort of order has been restored. Millions of people have gone to work in underground factories or have been sent to new plants in the forests and mountains of Germany. Hundreds of thousands of old and infirm people continue to live in the cellars of their ruined homes, and a growing number of workers are being housed in emergency huts which lack even the most primitive form of sanitation.

Schoolchildren and their teachers have been distributed over areas which are relatively safe from air-raids, and in the towns a great number of schools have been closed. Civilian travelling is strictly confined to business purposes. Holidays from work and leave from the army have been cut down to the barest minimum. In towns, villages and countryside there are only two kinds of entertainment—the radio and the cinema. In the frontier regions air-raids frequently make it impossible for workers to return home after their shifts, and factory managements have been forced to provide night shelter for their workers.

There is hardly a large town left in Germany that has not been bombed, and this, more than any propaganda, has made the whole of Germany a theatre of war. Moreover,

Colonel Ralston recommended that available draftees, retained for infantry service, should be sent overseas. In 1942, during a prolonged debate on conscription, this eventuality had been foreseen by the Government, and a national plebiscite had given a heavy majority vote (except in Quebec) in favour of permitting the Government to send the draftees overseas on "conscription if necessary" basis. With Colonel Ralston's recommendation before him, the Prime Minister, Mr Mackenzie King, consulted General McNaughton, who had retired from the army command. General McNaughton advised him that the situation could be handled through a retention of the voluntary basis, and on November 2nd Colonel Ralston's resignation was accepted by Mr Mackenzie King. General McNaughton became Minister of Defence.

Public Opinion

Public information, in view of military security, was not sufficient for a final judgment to be passed on the point raised by Colonel Ralston—whether or not the need for draftees was urgent. But what became clear was that the Canadian public were no longer willing to temporise with an issue which had been the cause of endless and growing friction. A division of Cabinet opinion was obvious. Inflammatory remarks poured from conscriptionists, showering with astonishing violence upon General McNaughton. The plan, if it existed, to allow him a short trial period in which to obtain volunteers, broke down. A number of officers of the 6th Division, which contains many draftees, went to the length of voicing in the press their views, claiming that the draftees waited for the order to proceed overseas. In so doing, they incurred the risk of court martial for a violation of army regulations. This incident betrayed the violence of emotions aroused. Mr Mackenzie King, who had promised to inform Parliament if overseas conscription were required, announced that a session would be held.

Finally, a group of Cabinet Ministers—five or six, it is reported, from Ontario ridings where the conscription fury was hottest—presented to the Prime Minister a request for the conscription order which would release draftees as overseas reinforcements. Mr Mackenzie King yielded, and an order was issued to make available 16,000 draftees, representing two months' requirements of infantry reinforcements. Coming when the Mackenzie King Government had almost exhausted its five-year term obtained in 1940, the conscription crisis plainly requires a general election to clear the air. But the timing of the elections has been declared by the Prime Minister to depend on the course of the war, and a shortening of the European war would quickly transfer political controversy in Canada to other issues.

the fighting zones and the immediate communications leading to the fronts reach deep into the interior. German civilians and the millions of foreign workers employed in Germany are no longer watching the war from afar; the war is right among them.

From a political point of view, there can be no doubt that the leading groups of the Nazi party are still able and, above all, determined to continue the war. The economic problems which they have to solve are, however, something like squaring a circle. The shortage of labour, which has been a constant difficulty of the Nazi regime even before the war began, has now reached a point where no reserves are left. It is openly admitted for the first time that the few hundred thousands of elderly women who could still be sent to factories would make no difference. Along with the mobilisation of the Volkssturm, every available man and woman or boy and girl from the age of 16 onwards has already been sent to a factory. Girls and boys studying at commercial colleges are now employed in factories. Those secondary schools that were still open have been closed, and at universities, technical and art colleges there are hardly any students apart from disabled soldiers.

No estimate of the total number of workers employed in Germany is possible. In mere numbers, employment, even after the total mobilisation for the Wehrmacht, is probably equal to the level of 1943. But the efficiency of this multi-national mass of workers is below the standard

of the first years of the war. This is clearly indicated by a new drive for increasing efficiency. But means and incentives for increasing efficiency are not there. Working conditions, the quality of raw materials, the technical efficiency of machinery and machine tools have been deteriorating over a long period. The wage and price stops cannot be suspended, and the new incentive has again had to be found in bonus payments in addition to wages. The Labour dictator, Sauckel, in collaboration with Dr Ley, the leader of the Labour Front, has formally abolished the distinction between skilled, semi-skilled and unskilled workers. Instead, eight different wages groups have been introduced, with a basic wage for each group. In addition to this basic wage, bonuses are paid as a general rule in accordance with individual output. This is perhaps simply a reflection of the levelling theory of the Volkssturm. Basic conditions of payment have been equalised. The result will naturally be that certain categories of workers will bring home larger wages. But, beyond his rations, the ordinary worker can buy nothing at all. Greater facilities for putting these wages into savings have therefore been provided, and there has been another prodigious increase in savings books.

Working hours have now been generally fixed at 60 a week. This means that the majority of workers are actually away from their homes, barracks or camps for 12 and even 14 hours a day. These long working hours must in the end defeat their purpose. There is certainly no possibility of maintaining, let alone increasing, output by compelling the workers to work for such long hours.

A war factory in Germany, and all factories are now engaged on war work, is a highly complicated affair so far as the management is concerned. The directors and works' managers have been reduced to a purely formal position, dealing mostly with the controlling authorities set up by the economic administration. The factories are actually run by a group of "engineers" who watch over the flow of workers, control each one's efficiency with stop-watch in hand, are concerned with economy in the use of fuel and material, and maintain the safety regulations. In sharp contrast to this complicated control stands a highly rationalised, and in parts extremely simple, working process, especially in the engineering industries. Here, again, both methods are at cross purposes. What is gained by rationalisation is mostly lost by interference from the complicated controls.

In contrast to the great mass of German and foreign workers stands a number of highly skilled engineers and research workers whose personal initiative must still be rated high. But there is no doubt that the mass of the

workers, in spite of differentiated food rations, are growing apathetic and work-shy.

The Levellers

The idea behind the reorganisation of Germany's economy, after the defeats of the summer and autumn of this year, was to create equal conditions for everybody in the Wehrmacht, in industry and in agriculture. The frequent transfer of large numbers of workers, the evacuation enforced by bombing and the dispersal of factories over the countryside had already levelled down different standards of living. This trend has now been deliberately emphasised by a massive comb-out of the political and economic bureaucracy. The broad basis of the Nazi hierarchy represented by the state bureaucracy has become smaller, but the active members of the Nazi party and the SA have been pushed into the foreground, particularly in the Wehrmacht. In other words, the political watchdogs of the Nazi party who are numbered by millions again dominate the scene in all spheres of life.

At the same time, a very determined recruiting and propaganda campaign has been begun among foreign workers and prisoners of war. Without these auxiliaries, or with serious disturbances among them, the industrial effort could not be maintained. They obviously form the greatest single source of the present precarious stabilisation.

It is extremely difficult to form a comprehensive view of everyday life in Germany in this sixth winter of the war. After the organisation of the Volkssturm battalions, all men aged between 16 and 60 are virtually under military discipline. In addition, the number of girls serving with Wehrmacht units or in the compulsory labour service must have grown to at least one million. The number of permanently disabled soldiers who are being trained for new jobs in industry or in administration is also very large. The men and girls in the Wehrmacht proper enjoy a privileged position in matters of food, clothing and housing. The working population in industry, trade and agriculture, the lower grades of the bureaucracy and the middle-aged housewives, as well as the working mothers with small children, who have no special privileges are in an extremely difficult position. Their main concern is food and clothing. The food rations are still sufficient to provide a minimum diet. In frontier districts, for example, emergency slaughter of livestock has made it possible to buy more meat in exchange for the so-called "Naehrmittel" cards, which provide semolina, pearl barley, lentils, etc. The black market in food-stuffs is relatively small and mainly confined to the higher groups of the bureaucracy. Extreme differentiation in food rations has obviously been a deterrent apart from the drastic penalties for dealings in the black market. The most valuable luxuries are cigarettes and tobacco. The ration is two cigarettes a day per person. It seems that cigarettes can buy anything that is still available. Even in the Wehrmacht they are scarce. In Western Germany life is more or less dominated by air-raids. But apart from a few country districts, no part of Germany has been entirely free from bombing. The relief and repair system, however, seems still efficient, and there is no sign yet that the medical services have not been able to cope with the casualties.

The most important thing, however, is that people are not left alone. Their working days are spent at factories. Housewives and elderly people meet at community workshops for homework, and the nights are frequently spent in community air-raid shelters. The few leisure hours that are available are usually spent in collecting rations or in trying to barter household articles. Coal, gas and firewood have been severely rationed, and most families are forced to spend their evenings in one room. In fact, life has become impersonal, all privacy has been broken down and between work and sleep there is precious little time left.

Which of you gentlemen can say what this is for?

If every member of a board were a fuel expert, the consequence might well be confusion. But if every director interests himself in fuel efficiency, nothing but good can come of it.

It makes all the difference to the workers to know that those in authority are wholeheartedly behind the drive for fuel efficiency, with its war-time emphasis on fuel economy. Is that true of you? A single case history like the following from a steel works where production has remained steady proves the immense influence that management can exert.

STEAM BOILERS. More than 7 per cent. saving on one set and as much as 40 per cent. on another. On the third set, even using low grade coal as against washed nuts, there is a 23 per cent. saving.

MILL ENGINE. Steam consumption, per ton, of steel, reduced by 24 per cent.

PRODUCERS. Coal consumption reduced by 6 per cent.

ANNEALING FURNACES. A 6 per cent. coal saving per ton of steel. From what in 1942 was described as "indifferent," the efficiency of producer plant at these works is now reported to be "much improved."

THE VERY LAST WORD ON FUEL EFFICIENCY. Over 200 leading authorities have collaborated in the preparation of a book entitled "The Efficient Use of Fuel," published for the Ministry of Fuel and Power by H.M. Stationery Office at 12s. 6d. net, 13s. post free.

Open Invitation

WHEN we first started business in Pall Mall, we had but one small shop, which quickly became noted for uncommonly good cigarettes and tobaccos. Since then, the Rothman Service has extended throughout the country. Wherever you live, you can rely on Rothmans for regular supplies of good smoking — impeccably fresh, reasonably priced. Our Navy Cut Medium

cigarettes, for example, are an outstanding blend at 11/- a hundred (postage 3d. extra). Call at any Rothman shop, or post your order to headquarters for delivery by return. Rothmans Ltd. (Folio ET10) 5 Pall Mall, London, S.W.1.

DUTY-FREE parcels to all H.M. Forces Overseas, and Prisoners of War. Ask for special order form containing full details.

Rothman OF PALL MALL
the best-known tobacconist in the world

His 1912 discovery may save a million lives in 1945

IN 1912 Sir Frederick Gowland Hopkins's writings and work gave convincing evidence of the necessity of "accessory food factors." These accessory factors are today called vitamins.

Since this early discovery, progress in this field of dietetics has been rapid. Many research chemists—including Haworth, Hirst, Bergel, and Todd in Britain; Williams in America; Reichstein and Karrer in Switzerland—have made work in this field of research their particular task.

And equally important has been the collaboration of the organic chemists with the fine-chemical industry, which has made the large-scale production of synthesized vitamins possible. A few years ago, synthesized vitamins were but scientists' formulae—today in the Roche plants in Britain Vitamin C and Vitamin B₁ have been made by the ton.

Practical Application

Now, at this juncture, it is heartening to know that because of scientific advances, and their practical application,

SIR FREDERICK GOWLAND HOPKINS, whose first discoveries led to today's wide knowledge of vitamins

it will be possible to provide vitamins for the starving people of Europe. In Greece, for example, where it is estimated that more than 75 per cent of all children of school age are seriously suffering from under-nourishment and vitamin deficiencies, synthesized vitamins, as an addition to staple foods, may well be the salvation of the people for generations to come.

ROCHE PRODUCTS LIMITED

BACKGROUND TO ACHIEVEMENT

Transport

IN the equipment of main line and suburban electrified railways, both overseas and in this country, including the unique "Tube" system of London, BTH has always been in the forefront of invention and development. This applies not only to the motors driving

the trains, and to the elaborate controlling devices, but also to the substations which provide the motive power. On the lighting side, Mazda lamps of a myriad types and sizes are used on all British railway and road transport systems.

THE BUSINESS WORLD

Coal Finances

WITH the very natural concentration of public attention on the problem of coal production, the extremely important subject of the finance of the industry has been virtually passed over. Yet during the past two years not only the financial condition of the industry, but its financial methods, have undergone a revolution, and since these methods are now to remain in force until, at least, June, 1948, they call for more public interest, and perhaps concern, than has so far been expressed in them. It is now no longer true that the individual colliery undertaking covers its costs, or attempts to cover them, by the total of its proceeds from the sale of coal. A levy, now amounting to 12s. per ton, is made on every ton of coal sold commercially, and this passes through the medium of the Government's Coal Charges Account back to individual undertakings as a payment or subsidy against costs directly incurred on a whole range of expenditure, including not only payments made under the Guaranteed Week Scheme and recent increases in compensation payments, pneumoconiosis benefits, etc., but also wages (including holidays with pay) and profits. In the special case of Necessitous Undertakings, grants amounting to over £2,500,000 in 1943, are made from the account to an extent sufficient to keep some 100 necessitous collieries in operation, and cover their costs. By the working of the Coal Charges Account, over £100 million per annum—or about one-third of the total sales revenue of the industry—is now collected out of the price charged to the consumer and redistributed to producers.

The levy scheme began in quite a small way in 1940, when the coalowners themselves introduced an arrangement, more in the nature of an insurance scheme, whereby a small levy was imposed on all coal sold in order to make grants to collieries which had suffered as a result of war conditions, particularly the loss of export markets on the Continent. At the same time, the cost of keeping necessitous pits in operation was assumed by the industry through this fund. In 1941 it was extended to cover increased costs of timber, and also the newly-instituted guaranteed wage. It was still on an insurance basis, the industry taking the view that interference with production, such as breakdowns and shortage of wagons, sufficient to require the payment for "Bevin shifts," was the risk of the industry rather than of the individual colliery company.

The revolution in the working of the scheme came in 1942. In that year Lord Greene's Board of Investigation into Miners' Wages made recommendations which led not only to an increase of 2s. 6d. in the rate per shift (an addition to the wages bill of the industry of between £20 million and £25 million), but also to the establishment of a national minimum wage. This minimum was so low in relation to actual earnings that there were few cases where wages had to be made up to it, and it had, at first, no appreciable effect on the finances of the industry. But the increase in shift-rates raised a very serious problem for many companies and for the Government. The output per man-shift in the industry ranges from a little over half a ton to over two tons; thus the increased cost per ton of the Greene half-crown varied from 1s. 3d. to 5s. Had the Government permitted an increase in price sufficient to pay the additional wage-costs of the least productive undertakings, it would have meant an excessive tax on the consumer, and an inordinate increase in the profits of the more productive concerns. On the other hand, to have allowed the less productive pits to go out of production would have meant a serious loss of output, while to have allowed them to qualify for grants as necessitous pits would have proved very costly.

The levy machinery was therefore extended: forsaking its insurance basis, it became a simple scheme of financial pooling. The levy, which had remained at 2d. or 3d. per ton until the spring of 1942, and was only 7d. at the time of the Greene Award, was increased to 3s. 7d. per ton. All additional costs resulting from the wage increases were now made directly chargeable to the Coal Charges Fund. In

other words, the more productive pits, with an output of 2 tons per shift, paid in 7s. 2d. per shift, and recovered 2s. 6d. on wages account, while the least productive pits, with an output of only half a ton, paid in 1s. 9½d. and recovered 2s. 6d. on wages account. The rest of the levy was spent on other charges.

Later in 1942 an agreement was made between the Government and the colliery-owners under which the administration of the Coal Charges Account passed into public control, while at the same time the profits of each district were stabilised and guaranteed at a standard rate per ton fixed for each district. If in any district the ascertained profit fell below the standard, it was made up to the required figure by price allowances from the Coal Charges Account.

*

Between 1942 and 1944 it was found necessary to increase the amount of the levy on a number of occasions, partly because the fall in production and the consequent rise in costs increased the payments necessary to maintain guaranteed levels of wages and profits, and partly because certain small additional costs—such as the expense of the pneumoconiosis scheme, travelling allowances for transferred miners, and the short-lived and not very costly output bonus scheme—were charged up to the Account. In 1943 the levy was 5s. per ton, and by February, 1944, although no allowance had by that time been made for the increase in wages under the Porter Award of January 22nd, it amounted to 8s. per ton.

The recent increase, announced by the Minister of Fuel and Power in August, raised this figure to 12s. Of this increase, 2s. represented the additional cost of the Porter Awards, and the wages agreement of April 20th, which were paid out of the Account, and 2s. was intended to repay money borrowed from the Treasury and to make up other charges. In October, however, Major Lloyd George informed Parliament that the effect on the costs of the industry of the continued fall in production was such that practically the whole of the increase in the levy was being absorbed in the current working of the Account, and that a further increase in price might be necessary to repay its debts.

The present position is thus that some £45 million per annum is being received by collieries from the fund on account of wages, and something between £55 million and £60 million on account of other costs, principally the amount necessary to bring actual profits (often negative) up to the standard rates. Thus nearly one-quarter of the total wages bill of the industry is met not out of the current proceeds of each undertaking, but by a direct payment, colliery by colliery, equal to the actual costs incurred in respect of wage increases. This is not to say that the industry is being subsidised by the Exchequer; it supports itself out of the present (high) price charged to the consumer. But individual districts are subsidised by other districts, and, even more, individual undertakings are subsidised by other undertakings. On the average, 5s. per ton of the total wage cost is met out of the Account: this means that individual undertakings are drawing anything from 2s. 6d. to 10s. per ton, on account of wages, from a fund to which everyone contributes 5s. In addition, according to the Minister's statement that nearly the whole of the recent increase "will have to go to meet the ordinary running of the account," an average of over 6s. per ton will have to be paid to every colliery by means of district price allowances necessary to bridge the gap between actual pit-head proceeds and costs (including standard profits).

The system of pooling wages and costs, over which so much controversy raged in 1920 and 1921, has thus now come into partial operation, and to this extent there is justification in the complaints of the more productive districts, such as Nottinghamshire and Derbyshire, that their efforts are partially devoted to the maintenance of wages in

other districts. But this is inevitable in an industry in which wages account for over 70 per cent of total costs, and in which a national minimum wage has been imposed on districts which vary so widely in productivity. If the national minimum has come to stay, some such system will be necessary as long as the industry is run by a multiplicity of undertakings marked by great variations in productivity. Indeed, even under financial unification, there would still be hidden transfers between districts and between pits. The principal argument for large-scale amalgamations or complete unification is not that inter-district transfers would be unnecessary, but that the scale of transfers between individual undertakings would be reduced by the improvement or elimination of the high-cost pits which on grounds of the present shortage of coal are kept in production. The danger is that if the industry continues to be organised on the basis of several hundred separate undertakings, the less efficient pits will be kept in being by a combination of the 1930 quota scheme and the financial pooling arrangements of the Coal Charges Account.

*

As a war-time measure, the present scheme was probably inevitable under conditions of the financial independence of the separate companies. Any other arrangement would have meant either even higher prices to the consumer or the bankruptcy of, and hence loss of production from, the least productive mines. The principal criticisms of the present arrangement have been concentrated on one aspect of its working, namely, the guaranteed wage—that is, the system by which weekly earnings are made up to the minimum—which, in fact, accounts for less than 2d. of the total 12s. levy. It is alleged, and is almost certainly true, that some colliery companies abuse the system by charging repair or development work to the fund, and by sending men home, at the expense of the fund, when as a result of natural or unnatural occurrences, there is "no work available." Major Lloyd George has told the House of Commons that in the 36 weeks ended March 11th last some 1,600,000 shifts were lost (of which about one-seventh related to cases where men were put on other work) at the expense of the account, most of them, he stated, as a result of causes outside the control of the owners. That abuse exists no one in close touch with the coalfields would deny: its main effect is, however, the loss of production, and often the building up of the profits of the individual undertaking at the expense not of the consumer, but of other undertakings in the district. (The

suggestion that the excessive drawing of "Bevin" money from the Fund is a tax on the consumer is incorrect, for the illegitimate increase in the profits of the company concerned involves an increase in the ascertained profits of the district, and hence a reduction in the price allowance paid to the district from the Account).

It is as a possible peacetime arrangement rather than as a wartime measure that the Coal Charges Account calls for critical examination. When the national wages agreement was concluded between the coalowners and the miners in April last, the Government for its part undertook to maintain the present financial arrangements in force in order to make possible the maintenance of the present level of wages, including the national minimum, at least until June, 1948. If it be assumed that the national determination of wages has come to stay, it is highly probable that machinery on the model of the Coal Charges Account, whether run by the State or by the industry, will remain as long as the industry retains its present organisation. The most serious danger in its continuance is that it dissipates responsibility for efficiency. When an appreciable proportion of wage costs is borne not directly by the individual undertaking, but by a central or district fund, the responsibility on the individual management to secure the most efficient use of man-power is reduced. Attention tends to be concentrated on organising production in the way best suited to secure repayment from the Fund, rather than in the way best fitted to secure a high output. As long as this system remains there will be a large number of undertakings, not necessarily "necessitous," who will be drawing more from the Account than they pay into it. If economic laws controlled the industry these would be rooted out and closed down, except where on some special grounds, such as the quality of coal produced or the need to conserve mineral reserves, there was a case for their continuing. But it is a serious feature of the present uneconomic organisation of the industry that probably no one knows which these undertakings are.

Whatever form of control and ownership, short of unification, is finally prescribed by Parliament for the industry, it is generally agreed that the most urgent need is for a technical revolution involving greater mechanisation and radical improvements in the underground transport of existing mines, as well as a bold policy of new sinkings. A continuation of a levy scheme which shelters less productive and less efficient mines and penalises efficiency will promote neither.

Business Notes

Shipyard Dispute

The Minister of Labour has decided to take legal proceedings against the strikers at the naval shipyard, Walker-on-Tyne. Though he had taken the unprecedented step of sending personal telegrams to 127 workers who had been identified as being on exceptionally important construction work, instructing them to return by Wednesday morning, the men failed to obey. The Minister's action is taken under the Conditions of Employment and National Arbitration Order, and the cases will be heard next week. The cause of the dispute was the introduction of certain flame-panning machines towards the end of 1943 and the employment on these machines of semi-skilled labour. In spite of long-drawn-out negotiations between the representatives of the Shipbuilding Employers' Federation and the United Society of Boilermakers, no agreement was reached locally, the men insisting that they would only work on time rates and conditions unless the machines were operated and controlled by a member of their Society. The Government intervened, and on November 29th the Minister of Labour appointed Sir John Forster as an Industrial Court to investigate the causes of the dispute. On the same date the First Lord of the Admiralty sent a telegram to the employers, instructing them to withdraw the offending machines pending the results of the Inquiry. This was done, but still the men refused to return. On December 1st the executive council of the union declared that since the operation of the machines had been suspended and the semi-skilled workers withdrawn, the dispute was at an end and the men should return. But by a three to one majority the strikers still refused to do so, except on time rates. The interim findings of the Court of Inquiry, published on December 15th, established that work of national import-

ance was being held up by the dispute and that there was no good reason why the men should not now resume work on the terms and conditions existing before the outbreak of the dispute. Quite apart from its damaging effect on vital naval construction, this dispute raises very important issues for the post-war period. The men's refusal to obey their own leaders, or to accept the judgment of an impartial court, represents a threat to the whole structure of voluntary negotiating machinery on which the smooth transition from war to peace so much depends. The men may have genuine grievances, but there are constitutional ways of settling them. Moreover, the dispute is an example of trade union restriction at its worst and of an insistence on demarcation lines which can impede the attainment of maximum efficiency in the shipyards.

* * *

You Have Been Warned

Major Lloyd George has indulged in some plain speaking to the coal industry, and has given a clearer indication of where the Government stands than at any time before. In a speech at Stoke-on-Trent, on Monday, he warned the miners that unless output was substantially improved, the present wage level could not be maintained, and he warned the owners that Parliament will sooner or later be called upon to decide the future structure of the industry. To the industry as a whole he appealed for "wise and firm leadership," for a rate of output double the present rate, for maximum technical improvements, and for improved industrial relations. Neither side, he pointed out, had made sufficient use of the pit production committees, though where these had been genuinely operated, the results had been valuable. Much of what the Minister said, it is true, has

been said before, but the oftener these truths are repeated, the more chance there is that they will sink in. It seems, however, that there is no immediate chance of a Government pronouncement on the wider aspects of the coal industry's future, and that patience will have to be exercised for some months yet. The report of the Reid Committee of technical experts is expected shortly, as well as the result of the survey of coal resources in each region. One of these surveys, on Scotland, has just been published. It makes far-reaching recommendations for increasing output immediately from existing collieries, for developing the coalfield's resources, and reorganising its structure, possibly under a Scottish Coal Board. This report provides a valuable pattern for parallel surveys of other districts. Moreover, the joint sub-committee of the Mining Association and Mineworkers' Federation, whose appointment was announced last week, has not yet met. It seems a pity that there is no representative on either side of the Nottinghamshire or Derbyshire coalfields, which have reached a high level of technical efficiency. But if the committee faces its task in the spirit of Major Lloyd George's appeal, and does not founder on political differences, it may make a valuable contribution to the improvement of the coal position.

* * *

Gold Redistribution

The November issue of the *Federal Reserve Bulletin*, of which cabled summaries have reached this country, contains an interesting analysis of changes in the distribution of gold reserves over the first five years of war. During this period the United States' holding of gold fell by \$1,215 million to \$20,825 million, while the estimated holdings of other countries increased by \$5,590 million to \$14,385 million. The combined reserves of countries other than the United States have not only grown at a faster rate than during the 1920's but are more widely distributed. The detailed estimates give blanks for the United Kingdom, Germany, Italy and Japan, but the following reserves, presumably based on official data, together with the corresponding pre-war figures, are shown: France, \$2,000 million (\$2,709 million); Switzerland, \$1,035 million (\$549 million); Argentina, \$940 million (\$466 million); South Africa, \$780 million (\$249 million); Belgium, \$750 million (\$609 million); Netherlands, \$500 million (\$692 million); Sweden, \$455 million (\$308 million). The inference drawn from this redistribution of gold, and from the existing control of international capital movements and the promised resources of the International Monetary Fund, is that the post-war period should combine some degree of stability in exchange rates with freedom in international exchange relationships. But the formula for stable and free exchanges holds more ingredients than those listed in the *Federal Reserve Bulletin*.

* * *

Steel Merger Opposition

Sir William Firth, former chairman and managing director of Richard Thomas, has issued a statement calling upon shareholders to oppose the scheme for taking over Baldwins and giving his grounds for believing it is not in their interest. Very briefly, these are that too much is being paid for the assets to be acquired; that no benefit will accrue to Richard Thomas by taking over steel assets which are neither competitive with nor, in his view, complementary to its own; and that the merger means that Richard Thomas will be saddled with responsibility for taking a larger share in erecting new plant at inflated prices than would be the case if they remained as they are. He further suggests that the profits on which the terms are

based are reached after contributions to the Central Fund by Richard Thomas and, probably, after credits from it to Baldwins. There is nothing in the known facts which makes it reasonable to doubt the truth of these strictures, but they are, in very large measure, criticisms of the existing system rather than of the scheme which has been drawn up in the context of that system. Under a system of free competition it would be very unwise for Richard Thomas, which possesses the only reasonably efficient plant in the tinplate industry, to amalgamate with a firm possessing a large amount of out-of-date equipment in that industry. But neither the Government nor the steel industry believes in free competition or the determination of prices by the machinery of the market. Nor is there any evidence that a change in this attitude is in contemplation. If it were thought that a change were probable that would be an excellent reason for postponing the merger. In existing circumstances, it may well be that the terms offered to Baldwins are on the generous side. A more serious criticism of the scheme is that it transfers over one-third of the voting rights in a solid block to the Baldwins board. This will make it extremely difficult for an opposition to pass any ordinary resolution and quite impossible for them to pass one requiring a 75 per cent majority. The equity holders of Richard Thomas have to weigh these disadvantages against the fact that the merger will place the new company at the head of a closely-knit cartel of the tinplate industry. Alternatively, they might seek an amendment of the plan which transferred the new Richard Thomas shares to the Baldwins' shareholders and not to their board. Equally, the scheme might reasonably be reflected by the Baldwins preference holders on the ground that it produces a sharp reduction in the cover for their stock. Finally, all parties might very well decide that the future policy of the group is so vital that they are not prepared to accept an arrangement which fundamentally affects the nature of their investment without more information on the matter.

* * *

Argentine Railway Position

Last Tuesday's meeting of the Buenos Ayres Great Southern Railway was the occasion of a long statement by the chairman, Sir Montague Eddy, about his views of the position following the recent negotiations and the decree of October 31st. This statement confirms opinions already formed. The position is very greatly improved as against that ruling shortly before the negotiations, but is not very different from that existing some months earlier. The one solid achievement, the establishment of the proprietary right of the companies to their rate revenue, does not result in any immediate improvement of their net receipts. Further, it does not appear that this right has been established in law but only conceded as a necessary step to finding a *modus operandi*. Nevertheless, the Argentine authorities did scale down their claims very greatly and, while they refused the plea for joint working, they appear to have given some undertaking for the co-ordination of transport services and for some relief from road competition. This, however, is all in the future. The October decree, which authorised the increased rates, contained, *inter alia*, the statement that "it is the policy of the (Argentine) Government to contemplate equitably and impartially the position of foreign capital radicated in the country." Sir Montague places great reliance on this statement and everyone must sincerely hope that his optimism will be justified by events, but there exist strange differences of opinion as to what is equitable in any given circumstances. Finally, he was able to hold out no hopes of any material further improvement in the exchange position as regards company remittances, nor has there so far been received any indication from Argentina as to how the railways are to obtain sufficient funds to deal with necessary modernisation.

Catering Wages Commission

The Catering Wages Commission has covered a great deal of ground since it was set up under the Catering Wages Act of 1943, and its task, though by no means easy, has not proved so formidable as was forecast by those who originally opposed the Act. The Commission's first measure was to recommend in January, 1944, a Wages Board for industrial catering; this was given effect by an Order in March. The Commission's latest recommendation, published on December 15th, is for the setting up of a Board to cover licensed

establishments and their staff hostels or canteens. This Board would in the main cover public-houses, and the number of undertakings affected is estimated at 70,000. The Commission's report on its recommendations for a Wages Board for unlicensed establishments (which has now been accepted by the Minister of Labour) has just been published. This Board will cover such places as tea-shops, cafés, restaurants, snack bars, fried fish shops, and coffee stalls and their staff canteens or hostels. The Commission's enquiries established "beyond question" that there was no adequate joint voluntary machinery for regulating wages and working conditions in these types of establishment. But in framing proposals for statutory wage regulation, it had to

(a) The Wages Board will not cover fried fish shops from which all sales are taken away for consumption off the premises.

decide whether it was better to set up a single Board for the catering trade as a whole, or separate Boards for its various sections. Opinion in the trade seems to be divided—some argue that as catering was a "congeries" of trades, it could not be subjected to uniform regulation, but others urge that it should be regarded as a single entity. In view, however, of the difficulty of securing adequate representation of all catering interests, and in order to avoid setting up unwieldy and slow-moving wages machinery, the Commission decided in favour of separate boards. Residential establishments, local authority, railway, Crown and theatre catering and travelling stalls are accordingly excluded from the Board's scope. Those types of establishment not already covered by the Commission's earlier recommendations will be dealt with in forthcoming recommendations. Perhaps the most interesting section of the Report is a statistical appendix, reproduced above, which, though admittedly incomplete, represents one of the first attempts to provide information about this very unorganised and unrecorded branch of the trade.

* * *

Directors' Statements

Three and a half weeks ago, when the price of the 12s. units was some 26s. 6d., the directors of McNamara and Company sent a letter to unit-holders stating that negotiations were in progress and advising them not to sell until they heard further. In the following three weeks the price rose steadily until on Friday of last week it touched 41s. 3d. Over last week-end the directors announced an offer from Transport Services of 30s. 6d. for the 12s. units. The price fell to below that figure, and it is widely suggested that the board had done more harm than good by their statement. It is always a matter calling for careful judgment how soon and how far a board should take shareholders into their confidence when negotiations are in progress. Their decision must be influenced, *inter alia*, by the extent to which they consider it possible to keep the fact secret. Very often this is not possible, and in those cases it seems that the proprietors ought to be told as soon as possible. In this case it is difficult to see what harm the statement has done except to those who elected to indulge in a gamble on the strength of a market rumour. The warning should have prevented holders from selling at any price between the level of 26s. 6d., ruling when the first statement was made, and the final offer of 30s. 6d. If the argument of those who oppose statements

is that the price would not have been run up to exaggerated figures but for the statement, then the worst that can have happened to a unit-holder is that he has failed to take advantage of the speculative buying which would not have materialised but for the statement. It certainly cannot be claimed, despite the actual wording of the original letter, that the board are to blame for that. The warning not to sell must be read in conjunction with the price then ruling, 26s. 6d. It cannot be regarded as suggesting that a sale should not be made after a rise in the quotation of over 50 per cent.

* * *

Tube Investments

The improved accounts published some weeks ago by Tube Investments have already added somewhat to the information contained in the consolidated balance-sheets and thus served to emphasise the strength of the company's position. The speech of the new chairman, Mr I. A. R. Stedeford, is also fairly informative. An increased demand for steel tubes for peace-time purposes is expected, but there is some danger that the integration of the cycle industry will lead to a fall in offtake of particular types of tube, and to provide against this the group is entering that trade itself. It has also entered into arrangements with High Duty Alloys, which ensure supplies of material and effect a demarcation in the manufacturing field, presumably with the object of reducing competition with the group's light alloy side. Shareholders may be rather surprised to learn that a survey, which is being made of all factories, suggests that the cost of bringing them to maximum efficiency may

absorb very nearly if not entirely the liberal reserves which prudently have been set aside in past years for this purpose.

[In this connection Mr Stedeford puts forward a very moderate plea for some relief from taxation on retained profits.] Reserves are established to be used, and the fact that this group intends to use them as soon as possible must be considered a bull point. It would, however, be interesting to know whether the sum which may be exhausted in the process is merely the £2,250,000 of special depreciation and contingencies reserve or some part of the remaining reserves which exceed £3,000,000. Any disappointment felt at the large scale of the modernisation programme in contemplation will be compensated in part by the news that reconversion problems are not great, and that delay in manufacture for peace-time uses will arise rather from the time spent in conversion by customers than from the group's internal problems. There should, however, be a number of immediate outlets at home and abroad as soon as labour and materials are made available. The group has already sent a mission to South America, and is sending others to the Dominions (excluding Australia, where it has its own organisation), to Europe and to the Near East. It has also high hopes of large business in Russia. All these matters are, however, dependent upon some relaxation of controls and regulations, some of which is overdue. One can agree with Mr Stedeford that it seems of doubtful utility to spend £45,000 per annum in maintaining security police at the factory gates of the group.

Building Apprentices

The Ministries of Works and Labour have started a timely drive to recruit apprentices to the building industry, thus giving effect to the second part of the Training White Paper of February, 1943, which forecast a National Apprenticeship scheme. Under the scheme, boys of 15 and over are to be trained for a period of five years under the supervision of skilled craftsmen. Local apprenticeship committees have been set up and they will make the necessary arrangements for training boys in the various crafts with local building firms, which will act as apprentice masters. The Government will arrange for the supply of the necessary building materials, and the whole scheme will come under the Building Industries National Apprenticeship Council. Boys will be engaged on actual building work, and will be paid wages in proportion to the craftsmen's rates for their district (in the first year they will receive one-quarter of the skilled man's rate, rising to three-quarters in the fifth year). The aim is to recruit about 25,000 apprentices a year. Some idea of the proportion of workers required for the various crafts can be gathered from the composition of the skilled labour force immediately before the outbreak of war. In August 1939, of a total number of 522,760 craftsmen, 29.3 per cent were carpenters, 27.4 per cent painters, 21.2 per cent bricklayers, 8.7 per cent plumbers, 7.5 per cent plasterers, 4.4 per cent masons, and 1.8 per cent slaters and tilers. There should be a good response to the Government's appeal for apprentices, for the urgency of the housing programme should offer prospects of stable employment for many years to come, and parents need not fear blind-alley jobs, while building undoubtedly offers attractions to technically-minded youths. The apprenticeship scheme is of course only one part of the Government's plans for raising the building labour force to 1½ million in ten years, but it is a very essential part. It is important not only that the recruitment should proceed rapidly, but that apprenticeship schemes should be suffi-

ciently flexible to permit of adjustments to meet changing technical conditions, and not perpetuate rigid craft boundaries.

Coffee Difficulties

The Ministry of Food has raised the price of Kenya coffee for the 1944-45 crop by £11 10s. per ton to £110 to compensate for increased production costs. In Latin America, which supplies some nine-tenths of the world's coffee, production costs have also risen heavily recently. The only important outlet for Latin-American coffee since 1940 has been the United States, where (since rationing) consumption is over 50 per cent larger than in good pre-war years. Coffee prices in the United States are controlled by the Office of Price Administration, which has consistently refused to meet requests by Brazilian producers and the Inter-American Coffee Board for higher prices. Last autumn, when Brazilian exporters interrupted their coffee shipments because selling prices in Santos were higher than the United States ceiling, the Brazilian Government promised the United States, as a result of diplomatic representations, that shipments would be kept at a monthly rate of one million bags until the end of the year. No arrangements have yet been made for next year, but producers intend to ask for higher prices. On the other hand, the United States Government declares that it would rather restore coffee rationing than break the price-line. Meanwhile the drought of recent months has played havoc with the current Brazilian crop, and production in Latin America will not be much larger than demand in the United States. There is a danger that coffee will become scarce when Europe re-enters the market (it used to absorb two-fifths of world supplies). The easing of the stringent Brazilian control system alone would not decisively alter the immediate supply outlook, since the trees require time to recover from the effects of the adverse weather conditions of the last three years.

SKF

Aktiebolaget Svenska Kullagerfabriken (SKF), the Swedish Ball and Roller Bearing Company, is actually an

international trust with numerous subsidiaries in many countries of the world. The trust is an interesting example of specialisation in modern industry and owes its existence since 1907 to the invention of the self-aligning ball-bearing by Dr Sven Wingquist. By international agreement, ball and roller bearings have been standardised, which made the world-wide expansion of the company possible. Before the war the trust maintained roughly 200 sales agencies catering for at least 150,000 industrial customers. At 10,000 different places, stocks of ball and roller bearings were kept. In 1938 the trust employed a total number of workers amounting to 27,237. In Sweden the number of employed workers numbered 9,165, in British subsidiaries 2,414, in French subsidiaries 2,415, and in the United States 1,859. Some of the largest subsidiaries were established in Germany and Japan, and in the years preceding the outbreak of war increases in production and sales were strongly influenced by the re-armament programme in these two countries. Direct exports of bearings from Sweden to Germany were small, amounting to perhaps 3 per cent of the total German production. These exports were cut by 50 per cent at the beginning of 1944 and were completely suspended last October. The SKF manufacture bearings whose diameters range from 10 millimetres to 1,400 millimetres, that is to say from ½ of an inch to about 55 inches. In 1925 the trust delivered 25 million bearings, in 1938 deliveries had increased to 75 millions and in 1943 the estimate ran into roughly 100 million delivered bearings. Yet the Swedish trust enjoys by no means a monopoly position in the world. General Motors in the United States of America maintained their own bearing manufacturing company. In Germany the Opel motor car company manufactured all bearings in their own factories. In Great Britain, the United States of America and in Germany independent companies specialised in ball bearings of various kinds. The Swedish mother concern has made active preparations for a larger post-war demand. The steel works of the trust at Hofors have been expanded and new ball-bearing factories came into production last year. In Germany, France and Italy considerable capacities for the manufacture of bearings have been destroyed by bombing; and there is no doubt that after the war the ball and roller manufacturing industries will find their markets completely changed.

Similarly, it is lack of information about the efficiency of large multiple stores and small independent traders that is the main obstacle to their harmonious co-development. Mr Lucas said:

There is a far too high percentage of inefficiency in small-establishment trading, and the efficiency which should go with the large establishment is to-day not being passed on to the consuming public.

Again it is very necessary that returning ex-Servicemen should have access to independent but well-founded advice on the prospects in the various branches of distribution. Freedom without knowledge is a dubious advantage, and one that might lead the ex-Serviceman into a tragic waste of opportunities and savings. It would be difficult to better Mr Lucas's verdict on the controversy over Government control. After emphasising the fact that the Government's overriding responsibility is the safeguarding of the interests of the consumer, he said:

Government control over all industry and trade will be in inverse ratio to the manner in which industry and trade face up to their national responsibilities.

The Board of Trade is contemplating a census of retail shopkeepers. It is to be hoped that this will be a first step in the preparation of adequate statistical information covering the whole field of distribution.

Poultry Policy

The poultry stock has been reduced by nearly half since 1939 in England and Wales, and by a quarter in the United Kingdom as a whole. Early this month the Government made its announcement on farm price policy for the next four years, and the egg and poultry industry was included. Mr Hudson said that expansion in the poultry industry was to be encouraged to the fullest extent permitted by the feedingsituation. In fact, an increase in the poultry ration is to take place next month. Last week Mr Hudson followed up his earlier and more general statement by informing the House of Commons of two practical measures to be taken towards the improvement of the poultry breeding stock. A Poultry (Stock Improvement) Advisory Committee is to be set up to keep the industry under review, to advise on existing measures designed to encourage the production of high quality breeding stock, and to suggest further steps to that end. On April 1, 1945, the Ministry of Agriculture is to take over responsibility from county councils for the accrediting schemes for poultry breeders and hatcheries, and the advice of the new Committee will be available on this subject. The improvement of the health of the poultry stock is fundamental to the future of the industry. Although the general level of health of the foundation breeding stock may well be higher at the end of the war than in 1939, it is unlikely to be as good as it was at the end of the last war. The improvement in health can be associated with the growth in accreditation, and centralised control could serve to accelerate it. Both measures are encouraging signs of the interest taken by the Government in the establishment of a sound and healthy egg and poultry industry. The next

as fixed by The Scotch Whisky Association.

A Census of Shops

During the war the distributive services have experienced great changes. Some of these changes have been inevitable; others have been introduced as temporary improvements in a system long overdue for reform. Distribution is a highly important aspect of the economic life of the community and one that has been sadly neglected by recent Governments. One result of this neglect is that there are no satisfactory statistics dealing with the matter. At a meeting of the Sales Managers' Association, last week, Mr George W. Lucas made a speech, remarkable for its candour and common sense, in which he showed that lack of information is a root cause of the many difficulties of the distributive services. The claim that the public is itself to blame for wastefully luxurious distributive methods (exemplified by overlapping roundsmen) may be true only if the public is kept in ignorance of the cost involved.

NATIONAL BANK OF SCOTLAND

RECORD BALANCE SHEET FIGURES

THE MARQUESS OF ZETLAND'S VIEWS

The 119th annual general meeting of the Proprietors of The National Bank of Scotland, Limited, was held, on the 14th instant, in Edinburgh, the Most Hon. the Marquess of Zetland, K.G., P.C., G.C.S.I., G.C.I.E., the Governor of the Bank, presiding.

The Governor, in the course of his speech, said: With larger resources available, profits amount to practically £265,000, an increase of £40,000. Adding £89,000 brought forward from last year, the sum of £354,000 is disposed of as follows:—Dividends (net), £98,000; contingent fund; £75,000; heritable property account, £15,000; officers' pension scheme, £70,000; staff widows' fund, £5,000; leaving £91,249 to be carried forward. It will thus be observed that no less than £165,000 is again applied, as was done last year, to funds which strengthen the bank's position still further.

A glance at the balance-sheet in your hands will show the changes which have occurred since November 1, 1943, the figures at that date being set alongside for convenience of comparison. Deposits at £64,000,000 are higher by £4,000,000. Notes in circulation again show an increase, on this occasion one of £900,000, making the outstanding figure of £9,151,000. On the other side, first-line liquid assets total over £22,000,000, the percentage to the liabilities of deposits and notes together being over 30.

If we add, as we are entitled to do, other liquid assets in the form of £1,800,000 bills discounted, which are almost entirely British Government Treasury Bills, and £8,500,000 of Treasury Deposit Receipts, we have the very large amount, £32,300,000, of liquid resources, representing over 44 per cent. of the liabilities already mentioned. In addition, I would mention the holding of British Government securities standing in the books at £34,000,000, a figure well below market value, and containing a large proportion of short and medium-dated stocks. In concluding these remarks on the balance-sheet, I would only say further that the totals of liabilities and assets at November 1st stand at almost £80,000,000—£79,843,000 to be exact—a record in the bank's history. These figures bear striking testimony to the strength of the position—*one, I may add, without laying myself open to a charge of undue complacency, with which the directors and shareholders have every reason to be satisfied.*

POST-WAR TRADE AND INDUSTRY

Let me now return for a few minutes to those wider issues to which I made a brief allusion in my opening remarks. In years gone by it has been customary on these occasions to make a short survey of the main trends of Scottish trade and industry which it has been a function of the bank to finance. During the past few years, with enterprise in the industrial field rigidly controlled and directed to a single end, such a review has become an unprofitable, if not indeed an impossible, task. But, if we are still unable to survey the past, we can now take at least a glimpse into the future, for both here and in America a corner of the curtain beyond which it lies hidden has just been lifted with a declaration of policy in the economic field which may well stand out for future generations as a landmark of immense significance in the economic history of mankind.

I may perhaps be permitted therefore to make a short excursion, as I have done sometimes in the past, away from the solid ground of facts and figures with which banking is primarily concerned, on to the less solid ground of theory and surmise on which the shifting systems of the political economists seek to maintain a precarious foothold.

In my address to you 12 years ago, I

attributed the economic disorganisation, which then shook the world, in large part to a chain of events, of which the main links were as follows: (1) a policy of excessively high customs tariffs on the part of the chief creditor nations, followed inevitably by (2) a disastrous flow of gold into the vaults of their banks resulting in the sterilisation of a large part of the monetary gold supply of the world, which, in its turn, was equally inevitably followed by (3) a calamitous fall, in terms of gold, in the prices of primary products, resulting in (4) a corresponding fall in the purchasing power of the customers to whom we looked for the disposal of the products of our industries, followed again by (5) unemployment on a vast scale and a still further decline in purchasing power on the part of the consumer.

The vicious chain did not indeed end even there, but I should be straying too far from the business of banking if I were to follow it further in its baleful ramifications, and in any case I have traced it far enough to enable me to draw the salutary lesson which it teaches us—namely, that the prosperity of the world, like the peace of the world, is one and indivisible, and that policies designed to promote economic autarchy possess in high degree the qualities of the boomerang and return in the fullness of time to strike at those who have unwisely sponsored them. And it is with all the less diffidence that I draw the lesson by reason of the fact that the declaration to which I have referred as a landmark in the economic history of mankind, makes it clear that it has not been lost on those in control of the destinies of the two main sections of the English-speaking world.

AN EXAMPLE OF ECONOMIC CO-OPERATION

The principle of lend-lease is, in itself, a striking example of economic co-operation, but lend-lease is devoted to a single purpose and inevitably carries with it restrictions upon trade which would be intolerable in normal circumstances, and it is one which in any case will cease to operate with the cessation of hostilities. And looking to the future, a far greater significance attaches to the request to Congress by the State Department at Washington that the Johnson Act forbidding loans to war-debt defaulting countries be repealed and a policy of world tariff reduction be supported. If those two principles, and the others embodied in the six point programme put forward by the United States Government, are generally followed, I have little doubt that an era of unexampled industrial and commercial activity awaits us.

It is scarcely necessary for me to point out, if my forecast prove to be well founded, how great a field will open out before the banks for the discharge of their own indispensable part in the mobilisation of the world's resources. Neither in face of the figures which your board have been able to lay before you, have I any hesitation in adding that your own bank has both the means and the will to respond to the demand.

The prospect is an alluring one, but we must not allow our contemplation of it to blind us to the fact that its fulfilment lies in the future. The war is not yet over, and there are still, possibly, many months before we shall be free to devote ourselves to the uninterrupted work of reconstruction.

The Governor, having paid a warm tribute to the work of the managers, officials, and the staff, concluded by moving the adoption of the report and the payment of dividends at the rate of 16 per cent. per annum, less tax, on the consolidated capital stock and of 5 per cent. per annum, less tax on the "A" stock.

The resolution was carried unanimously.

TUBE INVESTMENTS, LIMITED

RECORD SALES TURNOVER

CHAIRMAN'S STATEMENT

The twenty-fifth annual meeting of Tube Investments, Limited, was held at Oldbury, Birmingham, on the 15th instant. Mr I. A. R. Stedeford, the chairman and managing director, presided.

The following is an abridged summary of the chairman's statement to the members: The accounts now include a statement showing the profits of the subsidiary companies which, for the period under review, appear at £2,345,038. After making the necessary provisions the available balance of profit, with the amount brought forward from last year, is £1,075,689. The directors have created a reserve for research and development of £300,000 and recommend a dividend stabilisation reserve to be opened with £250,000 and the general reserve to be increased by £100,000 to £1,000,000.

The improvement in the trading profits over the previous year has no particular significance, being mainly due to the incidence of capital employed as computed for the purposes of excess profits tax. The sales and turnover is a record for the company and one which is likely to remain unbroken for a long time. The company's war effort, upon which much depended, will rank as one of many fine examples of what can be achieved in time of crisis by private enterprise, this time functioning through a group of companies under a unified control.

Referring to the increased dividend, making 22½ per cent. for the year, the Chairman said: I shall not attempt to forecast the future beyond saying that the strength of the company is such that it should be able to weather the storms to come and to secure its full share of the available trade in the industries in which it is engaged.

POLICY OF MODERNISATION

It is the policy of the company that each of the factories, which comprise some 30 in number, shall be modernised and established on the basis of maximum efficiency. Neither effort nor money must be spared in completing this task which carried through upon an adequate scale may be found to absorb the liberal reserves set aside in past years for this purpose.

Industry looks to the Chancellor for encouragement to pursue vigorously its plans for its own rehabilitation by an early declaration of the date from which the concessions he has promised industry in connection with expenditure of this kind will become effective.

RECAPTURE OF EXPORT TRADE

The company has laid its plans for the recapture of their export trade. In preparing its plans industrial enterprise has found much that is perplexing and obscure. How do we stand in this respect compared with other countries engaged in the same total war and if we have been at a disadvantage has our position now been fully remedied? Some pronouncements of Government spokesmen, though expressive of good intentions, have been somewhat nebulous in character and disquieting in effect.

No serious problems of "re-conversion" so far as the company's own factories are concerned is anticipated. Nevertheless it is improbable that they can resume normal production until industry generally has been "re-converted" and the public's buying power restored. This transitional stage is likely to be fraught with many difficulties and no one can forecast either its duration or its effect. But this period will pass and we might then have before us as a country and perhaps as a company our greatest opportunity.

The directors' report and accounts submitted were adopted.

THE COMMERCIAL BANK OF SCOTLAND, LIMITED

RECORD BALANCE SHEET

INCREASED PROFIT

EARL OF MAR AND KELLIE'S ADDRESS

The annual meeting of the shareholders of the Commercial Bank of Scotland, Limited, was held at Edinburgh on the 14th instant. The Earl of Mar and Kellie (Governor of the Bank) presided.

In submitting the report the Governor said:

After my unavoidable absence through illness from the annual meeting a year ago I am very pleased to be able to meet the shareholders again and to submit for their approval a report and balance sheet which continues to show steady progress.

I am particularly pleased to be here on this occasion, for this year marks the one hundredth anniversary of the laying of the foundation stone of this building as the head office of the bank.

The bank had only been established for 34 years when the then directors considered it desirable, to meet the needs of a steadily increasing business and to provide an ample margin of accommodation for the future, to take what was for them a very important decision in leaving the Old Town and establishing themselves in a completely new building in a rapidly developing area. Their decision was arrived at, as is recorded in the old minutes, after very full consideration and in full appreciation of their responsibility; as the minute states, "even to a distant futurity."

At the time this step was taken the total assets of the bank amounted to approximately £5,000,000, and we are now considering a balance-sheet which for the first time exceeds the £100,000,000 mark, and having in view that our head office building, re-equipped as it was a few years ago, still satisfactorily meets our requirements, the wisdom of the decision arrived at so long ago has been amply justified.

THE BALANCE SHEET

Turning to the balance sheet you will find substantial increases under nearly all heads. The note circulation has increased by over £800,000 and stands at the high figure of £9,464,000. It is the case that he steady increase in the circulation over the war years has been occasioned principally by full employment and high wages, but there is evidence from time to time of notes being accumulated in the hands of the public beyond normal requirements and the risk of loss which this involves cannot be too often stressed.

Deposit and other credit balances have reached the record figure of over £8,000,000, an increase in the year of £6,681,000. Our deposits have increased steadily over the years, although in common with other banks the rate of increase has been substantially accelerated during the war period. It is satisfactory to note that the increase is well-spread throughout our branch organisation.

On the assets side the first five items representing cash, balances with other banks, money at call and short notice, and British Government Treasury Bills and Deposit Receipts make a total of £35,790,000, or approximately £4,000,000 more than last year. To that is added the amount of our investments, which you will see are almost entirely in the form of British Government Securities, and at a value of over £54,000,000 are almost 4,000,000 more than last year. These readily realisable assets produce a total of over £88,000,000, equivalent to 95 per cent. of our liabilities to the public in respect of notes in circulation and deposits. Our securities have been carefully selected as to maturity dates and you will have noticed that it is stated in the report at the aggregate market value is in excess of the figures appearing in the balance-sheet.

Bills discounted and loans and advances

together amount to just over £9,000,000, which is a further reduction of £669,000 on the year. The circumstances of war-time finance and the realisation of stocks have resulted in a steadily reducing figure of advances, and although the liquidity of this item has thereby been amply demonstrated we look forward to the time when a much larger proportion of our resources will again be required by our customers in productive enterprise and general trade.

Property accounts show no important change.

THE YEAR'S RESULTS

As to the results of the year's operations the greater resources employed produced an increase in profit of rather over £31,000 at £352,463, which you may consider not unsatisfactory looking to the low level of our general advances to which I have referred. Out of that profit the directors have allocated £75,000 to reserve fund; £50,000 to the fund for deferred repairs and renewals to property; £50,000 as an addition to the funds of the pension trust, and £20,000 to the widows' fund. You will observe that the reserve fund now amounts to £3,525,000 as against the paid-up capital of the bank of £2,250,000.

Interim dividends on the "A" shares of 7½ per cent., and on the "B" shares of 5 per cent., less income-tax, were paid in July last, and it is now proposed that a further distribution of 7½ per cent. on the "A" shares (making 15 per cent. for the year), and 5 per cent. on the "B" shares (making 10 per cent. for the year), both subject to income-tax, be approved. After payment of these dividends and allocations the carry forward to next year's account amounts to £70,868.

THE STAFF

Out of a total pre-war male staff of 1,352 no less than 846 have gone on active service, of whom 48 have lost their lives and 18 are prisoners of war. I am sure you would desire to join with me in expressing our sympathy with the bereaved and with the relatives of those still in the hands of the enemy. 25 members of the staff have received decorations or have been mentioned in despatches, and our list of honours is headed by the Victoria Cross recently awarded to Flight-Lieutenant Cruickshank, Royal Air Force, whose gallantry, recently recognised by the bestowal by His Majesty of the highest award, was beyond all praise.

It is worthy of note that two Victoria Crosses awarded to citizens of Edinburgh in succession were won by members of the staff of the bank; the last having been awarded—unfortunately posthumously—to Lieutenant David Stuart McGregor towards the close of the last war.

THE OUTLOOK

It is our sincere hope that before another general meeting we shall see peace again restored. When that day arrives a new series of problems will require to be approached with energy and foresight. The development of export trade will be of paramount importance and the establishment and extension of lighter industries in Scotland will require all possible encouragement. These problems are being carefully considered by this bank, which I think I may claim has a traditional record of helpfulness to the business community, and will, I am sure, have even greater opportunities in the days that lie ahead.

The Governor then moved the adoption of the report and the motion having been seconded by Mr Wood was put to the meeting and carried.

AVON INDIA RUBBER COMPANY, LIMITED

SATISFACTORY RESULTS

MAJOR R. F. FULLER'S STATEMENT

The fifty-fifth ordinary general meeting of the Avon India Rubber Company, Limited, was held, on the 19th instant, at Melksham, Wilts.

Major R. F. Fuller, D.L., the chairman, presided.

The following is the chairman's statement which was circulated with the report and accounts:—

In submitting the directors' fifty-fourth annual report and accounts to the shareholders of the company, I do so again with satisfaction. Before making provision for taxation or for contribution under the War Damage Act, the net profit for the year just ended is £299,812, which compares with £328,851 in the previous year. The falling off of £29,039 is fully accounted for by the expense of the conversion to, and the increased cost of, the use of synthetic in place of natural rubber. In spite of the many difficulties, which do not appear to grow less as the war progresses, the amount of essential work accomplished by your company has been wholly maintained. I believe members will share my satisfaction with the result of the year's work of the company, both in the quantity and quality of its manufactures and in the amount of profit earned.

POINTS IN THE ACCOUNTS

The new form of accounts introduced last year—when a special effort was made, in the limited space available, to provide adequate information, clarity and details of liability and provision for taxation—met with your full approval and is repeated this year. Therefore comparison of this year's with last year's figures is particularly easy and it would seem unnecessary for me to take you through each item. I will, however, call your attention to one or two main points:—

The book value of fixed assets is this year £511,225, an increase of £11,081 on last year. Cash in hand is about half, at £26,095; but on the other hand stocks in hand are increased by £37,747. As formerly, there is no item included for patents, goodwill, etc.

On the liability side, there are, as before, no prior charges. Trade creditors, ordinary trading provisions and the total sum set aside for taxation are shown separately, and the substantial excess of total floating assets over current liabilities and provisions, amounting to £177,728, will be noticed.

PROFIT AND ALLOCATIONS

Turning to the profit and loss account, the sum available for appropriation is £331,402 8s. 9d., but, after allowing for taxation £263,810, war damage contribution £3,140, the year's dividend on the 6 per cent. preference shares £7,500 net, and the interim dividend at 3 per cent. paid on the ordinary shares in June last £4,452 net, the balance remaining is reduced to £52,499. Your directors now recommend (1) contribution towards staff pension fund £4,000, (2) final dividend on ordinary shares of 4 per cent., plus 3 per cent. bonus (making 10 per cent. for the year) £20,778 18s. 10d., less income-tax at 10s. in the £, £10,389 9s. 5d., leaving a balance to be carried to the next year of £38,109 18s. 3d., against £31,590 3s. 9d. brought in.

It is perhaps of passing interest to mention that the amount carried forward, being net, is sufficient to pay the net preference dividend, calculating at the current rate of income-tax, for the next five years.

It may also be mentioned that the total E.P.T. to September 30, 1944, amounts to £878,455, which indicates the extent of the heavy burden of taxation borne in recent years.

The company continues to be served efficiently and loyally by its staff and work-people of all grades. The current year has opened satisfactorily, and your company continues to be fully employed.

The report and accounts were adopted.

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

POST-WAR POSSIBILITIES

SIR WILLIAM GOODENOUGH'S VIEWS

The ordinary general meeting of the stockholders of Barclays Bank (Dominion, Colonial and Overseas) was held, on the 28th instant, at 29, Gracechurch Street, London, E.C.

The following is an extract from the statement by the chairman (Sir William M. Goodenough, Bt.), which was circulated with the report and accounts:—

The death of Colonel the Hon. Denys Reitz has come as a shock to the great circle of his friends and admirers, not only in South Africa, but in this country, a circle which, if I may say so, has been greatly enlarged on account of the unique character and quality of his books, which have been the source of so much interest and pleasure to a wide public. I cannot attempt on this occasion to do justice to his outstanding personality, but every one of us here will deplore his passing.

It is also with very deep regret that I refer to the death in June last of Lord Essendon. He was elected to our board in 1936, and his wide experience and knowledge of so many branches of commerce and finance were of great value to us.

MR GILLET'S RETIREMENT

In March last Mr A. B. Gillett, at his own request, relinquished the deputy chairmanship, but I am happy to say that he will remain on the board, and I take this opportunity of paying tribute to the great services he has rendered to the bank since the time of the amalgamation in 1925. He has been succeeded as deputy chairman by Mr J. S. Crossley, who was elected to a seat on the board in February last on retiring from the general management. Sir Bernard Henry Bourdillon, G.C.M.G., K.B.E., has been elected to the board, after a distinguished career in Government administration within the Empire, and we are fortunate in having the benefit of his services.

Mr R. B. Edwards has been appointed chairman of our Cape Local Board in succession to Mr G. R. Paterson. I much regret to report that Mr Paterson has felt it necessary to resign owing to failing health. He was for some time general manager in South Africa before joining our Cape Local Board, and during his long career has rendered devoted and valuable service. Mr A. W. Paterson, who had been for some years a local director of the bank in East Africa, retired and came to England last year, but he has decided to return to Nairobi and I am glad to say that he has rejoined our local board in an advisory capacity. I am also pleased to state that His Excellency Ahmed Neguib El Hilaly Pacha has been re-appointed as an advisory local director of the bank in Egypt.

FURTHER EXPANSION

Turning to the balance sheet, the figures again show further expansion. Current, deposit and other liabilities stand at the record figure of £282,175,976, or £34,402,377 higher than in the previous year, while cash in hand and money at call have increased from £87,285,289 to £102,028,404. Investments at £94,593,274 are £11,664,048 more, while advances are £3,631,782 higher at £34,066,571. The board have made the same allocations as last year to our reserve fund, which has accordingly been increased by £500,000. The proportions in which the funds of the bank are distributed amongst the various classes of assets are almost identical with those of last year. I feel, however, that it is only right to point out that these figures are in very large measure the direct result of war conditions. We should not expect to see the same tendency continued for

long after the end of the war. In some territories there has been a further sharp upward movement in prices during this period, and the question of effecting those adjustments which may ultimately prove necessary may be one of some difficulty.

FINAL STAGES OF WAR

Looking back over the course of the war, now, we hope, approaching its final stages, we may well feel thankful that our widely dispersed branches overseas have not received more damage during these past five years. We have been fortunate indeed in that not one of them has been over-run by the enemy. We can also be grateful for the fact that we have been able to be of service to the authorities during the war in so many overseas territories, and to the members of our Fighting Services themselves, particularly in the Mediterranean area and in the Middle East. I am glad to mention, too, that in many parts we have rendered similar service to our American Allies and to the Forces of so many of the United Nations. Looking forward, I think we may confidently feel that this bank will be able to play a useful part in assisting post-war development throughout Africa, in the West Indies, in the Middle East and elsewhere.

In recent years, the Colonial policy of this country has been subjected to criticism, much of which has been both misleading and unfair. No one will pretend that mistakes have never been made, but the questions involved are frequently highly complex, and their solution is not helped by uninformed criticism. We must realise that our ideas, our institutions, and ways of life, cannot be easily transplanted to other lands and to other peoples whose tradition and environment are essentially different from our own. If they are to flourish, they must be allowed to take root and in some cases growth will be slow. A lively interest in the Empire, and perhaps particularly in our Colonial territories, by people at home, will, I believe, contribute more than anything else towards a solution of these problems. The war has unquestionably had the effect of increasing public interest in these territories, and the means of development have already been greatly facilitated through the medium of air transport. I think it is true to say that rapid and efficient transport and communications are essentials without which economic development cannot make headway. It is only recently that these have at last come within our reach, but the chance, of which we should take the fullest advantage, has now arrived, and it will be for us to use it wisely when the end of the war permits.

SYMPATHETIC INTEREST ESSENTIAL

Many plans for Colonial development are being considered and discussed, but I think we should do well to remember that they cannot in themselves provide an effective substitute for the intelligent and sympathetic interest of the people of this country; nor is it possible by any artifice or contrivance of Government to create mechanism to replace the initiative, enterprise and enthusiasm of the individual.

It is idle to speculate about the future, but it would be a singularly unimaginative mind that could not grasp something of the potentialities of air transport for Africa and other parts of the Empire, and the effect of its power to bring together isolated territories, formerly separated by many days, if not weeks, of travel, and now within a few "flying hours" of each other. These opportunities bring problems in their train, but we must face them with resolution, as the pioneers of the Colonial Empire faced their problems in days gone by.

Never before, perhaps, in history has our country had the opportunity to do so much to improve the lot of so many as will come to us when the war is over. Economically backward peoples within the Empire have received a stimulus from the war which has changed the way of life and widened the outlook for many of them. Our bank, we believe, will have a great cause to serve in the years which lie ahead.

THE INDUSTRIAL CREDIT COMPANY, LIMITED

RECORD PROFIT

The eleventh ordinary general meeting of this company was held, on the 12th instant, in Dublin.

The following is an extract from the statement of the chairman.

The balance sheet deals with a total of £1,189,972, as against £963,370 at last year's meeting. During the year under review the resources of the company have been employed to moderately better advantage than in the previous year. The principal change as compared with the previous balance sheet is an increase from £60,000 to £270,000 in the company's commitments on foot of guarantees.

Investments, appearing in the balance sheet at £696,140, constitute the largest item on the assets side. Taking the quoted securities at the most recent market prices, and the non-listed securities at cost, the aggregate value of our investments is substantially in excess of the present ledger valuation, even before deducting from the latter the amount of the investment reserve.

Both our gross profit and net profit for the year, at £62,074 and £53,574 respectively, are the highest in any year since the commencement of business, despite the fact that we had no underwriting profits last year. It is satisfactory to record that after deducting a comparatively small sum representing profit on realisation of investments during the latest year our net earnings would still be higher than in any previous year.

There remains a profit balance to be dealt with of £34,639. Resolutions will be submitted to you allocating this sum as follows:—To dividend at the rate of 2½ per cent (less tax) on the paid-up capital, £12,695; to investment and other reserves, £15,000; leaving to be carried forward £6,944.

The report and accounts were adopted.

J. BROCKHOUSE AND COMPANY, LIMITED

GOOD PROSPECTS

The forty-seventh ordinary general meeting of this company was held, on the 20th instant, at West Bromwich.

Mr H. B. Burton (the chairman) said that the past year had not been without its difficulties, chief of which had been the shortage of labour, but the balance-sheet would, he thought, be considered very satisfactory. The majority of their subsidiary companies had contributed their full share to the success, both by their profits and their reputation for high-quality products together with efficient service. Their branches had again operated very satisfactorily.

As to the future, their interests and prospects in the post-war era were based on broad foundations, as they manufactured for many different trades—in all of which there was scope for development—and were therefore able to explore many markets. They had a reputation second to none, built up over a great number of years, which must help in getting a full share from those markets. Many of their works would be able to turn over to peacetime products immediately.

Mr J. L. Brockhouse, M.A. (managing director), said that the main factor exercising the mind of all industrialists was the impending change to peacetime activity. In the main, this firm was more fortunately placed than many, as most of their factories had been engaged on work similar to their peacetime production.

He did not anticipate that the combine as a whole would lack orders; in fact, there was every indication that in the period following the war they would likely to be heavily booked. They had many established trades, principally in the building, domestic and transport fields, and in addition they had many new developments.

The report was adopted.

GUY MOTORS, LIMITED

VERY SATISFACTORY POSITION

MR SYDNEY S. GUY'S SPEECH

Presiding at the twenty-ninth annual general meeting of Guy Motors, Limited, at Wolverhampton, on the 14th instant, the chairman, Mr Sydney S. Guy, said:—

This is the sixth year in which the accounts have had to be presented under conditions of war, and under the circumstances the information I can give you is still somewhat limited.

It has been pointed out to me on a number of occasions that the items freehold land and buildings, and particularly plant, machinery, tools, etc., standing in the balance-sheet at approximately £130,000 do not in any respect adequately represent the extent of our organisation, and might lead one who has not seen the factory to conclude that it is of comparatively small proportions. I must admit that these comments are perfectly fair on the balance-sheet figures, but it is the result of the heavy amount of depreciation which has been written off over the years. Whilst prices to-day are obviously inflated, I can say that even in the immediate pre-war years the value was several times higher than the book figure.

You will see that the figure of stock is down some £128,000. This is entirely brought about by the deduction made for payments on account by the Government for work-in-progress, which vary considerably from time to time, and this, of course, affects also the figure of total assets. The actual stock is almost identical with last year, and the turnover has been at the same high level.

Turning to the profit and loss account, there is a reduction in the item depreciation and maintenance of buildings, plant, machinery, etc., of some £12,000, which is almost entirely due to the fact that through the shortage of man-power we have been unable to carry out all the maintenance work which we should like to deal with. However, it does justify your directors' action in reserving in previous years for this eventuality and in building up a reserve of £22,500 under this heading.

DIVIDEND MAINTAINED

The net profit has slightly increased compared with the previous year, and your directors recommend for the eighth year in succession a dividend of 15 per cent. on the ordinary stock and the allocation of the balance of profit as set out in the report.

During the year the company has, apart from military vehicles, continued, under the instructions of the Government, large-scale production of double-deck buses, and approximately two-thirds of the bus operators of this country, including most of the leading corporations and companies, have been supplied with Guy chassis. Several hundreds of these vehicles have now run over 150,000 miles, many under the most difficult conditions created by the war, and are giving general satisfaction.

It will be appreciated that owing to Government restrictions on the use of certain materials the vehicles are all of austerity type. They are heavier than would otherwise be the case, and do not provide the same degree of comfort and finish in the body work (which is not supplied by your company).

It is the declared policy of the company, when supplies are available, to give all operators an opportunity of obtaining improved parts which in almost all cases will be interchangeable with the old, so that they can bring their vehicles up to date in accordance with the then latest design and, in the post-war years, have a fleet of Guy vehicles in which a high degree of standardisation and interchangeability has been obtained, with consequent advantage in lower maintenance and operational cost.

HIGH STANDARD OF SERVICE

I am pleased to be able to say that, in spite of well-known difficulties, a very large

number of our customers inform us that our servicing arrangements, and more particularly the supply of spare parts, have been maintained at a very high standard and are unsurpassed by any other motor manufacturer.

We recently received a letter in which an important customer writes that he "would like to place on record his surprise and gratification that we were able to supply from stock a cylinder block for a 1922 Guy vehicle, and that some time before he had a similar experience in the supply of a cardan shaft." He says "taking into consideration the great age of this vehicle, we consider that the ability of the Spares Department to supply these parts reflects great credit upon the foresight and judgment shown by the management." We feel that to receive a request for service to a vehicle twenty-two years old in itself justifies our slogan: "Guys for Life and Low Running Costs."

POST-WAR TRADE

The company was one of the very few vehicle manufacturers which in immediate pre-war years, at the request of the War Office, sacrificed some of its civilian business to give priority to the design and production of military vehicles, in which the company has had some twenty-five years' experience.

This foresight on the part of the War Office reflects great credit on those responsible, for it made it possible for this company to change over within two or three months and to devote itself wholly to a largely increased production of military vehicles.

For this reason, if for no other, it is

CROMPTON PARKINSON LIMITED

CHAIRMAN'S SPEECH

At the annual general meeting held on the 15th instant, at the Waldorf Hotel, London, the chairman, Mr Frank Parkinson, M.I.E.E., after a brief reference to the accounts and directors' report, said:

"The Government has wisely decided to pledge the country to the policy of full employment and social security for all. I welcome this act of faith in the future of British industry. Industry must play its part in eliminating waste and inefficiency and in penalising idleness.

Those of us who have eyes to see can now observe the impressive ground plan of a new Britain which should arise when the turmoil of war has passed. It might be useful to consider what part an industrial company such as ours will be able to play in this future. The fundamental fact must be stressed that the community can only distribute the wealth it creates. We hear much planning as to how we shall distribute that wealth, but relatively little attention is devoted to the more difficult subject of how we can create it. Yet in a country like ours, which of necessity must export, the question of truly economic production—the most efficient use of our man-power and resources—must be the keystone of the success of any plan.

EFFICIENT CO-OPERATION

Your company's success depends, and will continue to depend, upon its ability to serve its customers with the highest grade of product at reasonable prices. This can only be achieved by good direction, ample capital, efficient management, and complete co-operation between all workers, in the task of creating wealth by raising the output per worker.

The relationship between your company and its workers has never been on a sounder basis than it is to-day, and I look forward with confidence that our management and workers will continue to co-

operate and secure increasing production efficiency. When that has been achieved there must be strict equity in the distribution of the rewards for such success. It is our aim to convince each worker that he will get a fair deal in that respect and, at the same time, a full opportunity to realise to its utmost his earning capacity, with advantage not only to himself, but to the community.

EXPORT TRADE

The problem of re-establishing our exports is rightly exercising the minds of all who have to find overseas markets, to enable our country to pay for necessary imports. Apart from coal, we must import most of the raw materials required by our industries, and, in addition, certain goods and foods, to enable us to enjoy a reasonable standard of life.

This situation calls for the utmost wisdom possessed by industry and statesman-like direction from the Government. It cannot be solved by individual industrialists or groups, but will demand the most intelligent co-operation between industry and the Government. If we make full use of the advantages which we as a country enjoy as a very large buyer of imports, and if our industries raise their efficiency to the highest level, there will be ground for confidence in the future of our export trade.

I am sure you will all wish to join with your board in expressing sincere appreciation of the excellent services rendered by our executives, staff and all workers during five years of arduous and difficult conditions."

(Continued from page 847)

problems centre round methods of distribution and marketing.

Brazilian Bonds

There is now only one week to run before the expiry of the option granted to holders of all Brazilian bonds coming under the scheme of a year ago to accept either the "A" or the "B" plan. Except in the event of an extension of the option, which seems improbable although the market still thinks it possible, those who have taken no action by December 31st will be deemed to have accepted plan "A." That is to say they will retain the whole of their nominal capital; they will obtain no cash payment in respect of partial surrender, and they will receive in future a relatively low rate of interest. Broadly speaking, this is the better option to take in the case of bonds with a low market value per cent, but the merits of the case have still to be studied for each individual stock. Only in those cases where it pays to accept plan "B" should any action be taken, for those who would take plan "A" in any case might as well retain what little benefit can accrue to them from the contingency that the date of final acceptance may be extended. Presumably, those who have not already sold wish to retain an interest in Brazil. If they do not, they should not now sell as dealers are unwilling to assume the responsibility of getting the formalities of acceptance completed before the end of the year and prices are correspondingly reduced. Until quite recently the only real market has been in the unassented bonds. Once the option has expired better markets will gradually be established in the converted stock, but the indications are that they are likely to narrow, except at those times when sinking fund buying causes a fair demand.

Co-operative Amalgamation Rejected

Although the shareholders of the Co-operative Wholesale Society approved amalgamation with the Scottish Co-operative Wholesale Society by the overwhelming majority of 5,414 to 303, the meeting of the Scottish CWS shareholders turned it down by 442 votes to 209. Some opposition to amalgamation was known to exist in Scotland, but the large vote against it was both a surprise and a disappointment to English co-operators. The reasons influencing the Scottish decision have not been indicated, but it would be regrettable and short-sighted if the Scots had allowed their native pride to interfere with a project which could only have beneficial results for the co-operative movement as a whole. The failure comes at the end of

lengthy negotiations. It had been hoped to bring off the merger as a fitting crown to the co-operative movement's centenary celebrations. As it is, relations between the CWS and the Scottish CWS are unlikely to be strengthened by last Saturday's vote. An opportunity has been lost to the co-operative movement to enlarge its influence which may not arise again for many years.

Shorter Notes

The terms are now available for the conversion of the largest single block of municipal loan stock with an optional maturity next year, the £28,600,000 of London County Council 4½ per cent 1945-85. Almost half the total is to be repaid outright and conversion is offered up to a total of £15 million into a 3 per cent stock repayable 1962-67 issued at 99. This gives the stock a maximum life about one year greater than that of the last preceding offers and it is satisfactory to find that, in this case at least, some concession is being made to the fact that the borrower is the capital city and the issue of a size to guarantee a reasonably free market.

The question to the President of the Board of Trade on the matter of the British Celanese dividend declaration has drawn a reply which must be most satisfactory to all those who have been working for improvement and particularly to the Stock Exchange Committee. Mr Dalton not only stated that he had asked the Cohen Committee to take account of the incident, but expressed the strongest disapproval of failure to comply with the recommendation of the Stock Exchange Committee. This should greatly strengthen their hand in this matter, and perhaps in others, and is a very welcome recognition of the value of the wise use of extra-legal control by a private institution.

The Ministry of Food hopes to arrange, subject to shipping conditions, for monthly shipments during next year, of wines 3,000 tons and 50 tons of brandy from both Australia and South Africa. The maximum retail price of port and sherry type wines will be 12s. 6d. a bottle, and 8s. 9d. for table wines. The price of brandy has not yet been fixed. The Ministry is also to issue supplementary licences for barley on January 1st to whisky distillers. The production from this allocation, together with that made in October, will amount to about a third of 1939 production. The allocation will give distillers a start towards the expansion of exports of whisky, which averaged some £11,500,000 annually during 1935 to 1939.

GOVERNMENT RETURNS

For the week ended Dec. 16, 1944, total ordinary revenue was £42,383,000, against ordinary expenditure of £109,391,000 and issues to sinking funds of £300,000. Thus, including sinking fund allocations £10,179,408, the deficit accrued since April 1st is £2,384,574,000 against £2,323,665,000 for the corresponding period a year ago.

A change has been made in the method of showing excess of Post Office Expenditure over the Post Office revenue. Such excess is now included as ordinary expenditure (under "Total Supply Services") instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £103,175 to £2,589,619, the other operations for the week (no longer shown separately) raised the gross National Debt by £1,525,554 to £21,980 million.

On December 15, applications at £99 15s. 0d. for bills to be paid for on Tuesday, Wednesday, Thursday, Friday and Saturday of the following week were accepted as to about 28 per cent. of the amount applied for, and applications at higher prices in full. Applications at £99 15s. 1d. for bills to be paid for on Monday were accepted in full. £110 millions of Treasury Bills are being offered on December 22. For the week ended December 23, the banks will be asked for Treasury deposits to the maximum amount of £120 millions.

"FINANCIAL NEWS" INDICES

||
||
||

INDUSTRY AND TRADE

The "Economist" Sensitive Index.—There was no change in the index during the week ended December 20th. The complete index (1935=100) was 158.6; crops 135.6; and raw materials 185.5.

Labour for Footwear Industry.—At a meeting he'd recently between representatives of the Federation of Boot Manufacturers, the National Union of Boot and Shoe Operatives, the Board of Trade (Footwear Control) and the Ministry of Labour, methods of finding labour urgently required in the boot and shoe manufacturing industry were discussed. All withdrawals of labour from the industry, except of young men becoming liable for military service, have been suspended since May this year and any skilled workers who become available are placed in the industry. Workers who become redundant at munitions factories and who have had previous skill and experience in boot and shoe manufacture are to be returned to their former employment. These steps will not, however, provide the labour required in all districts. Arrangements are therefore being made to secure, where possible, the release from their present employment in the munitions and other industries of skilled ex-operatives who are willing to return to the foot and shoe industry.

The President of the Board of Trade has appointed a Committee to advise the Controller of Footwear (under his chairmanship) on matters connected with the industry.

Aluminium Hollow-ware.—The Board of Trade is issuing licences for the manufacture and supply of aluminium hollow-ware by any manufacturers who can make capacity labour available now for this production without detriment to war work on which they are engaged. Licences are issued, spun or drawn stewpans, kettles and steamers corresponding to certain specifications; and also for a specified range of plate utensils.

Organisation of Cotton Doublers.—The employers' side of the cotton yarn doubling trade has never been adequately organised, and at a meeting of representatives of firms held in Manchester last week it was decided to form an Association to secure co-operation throughout this section of the cotton industry. There are some 200 cotton yarn doubling firms with nearly 3,000,000 spindles. The mills are spread over a wide area: Yorkshire, Lancashire, Cheshire, the Midlands and Scotland. It is understood that the new organisation will co-operate with the several sections of cotton spinners in price fixing after the war. It may also be able to assist in sorting out the irregularities in the wages of cotton doubling operatives.

Noble Negatives

THE British have been having a bad time in the United States of recent weeks. The outburst of criticism and abuse has been one of the most violent and sustained of the war years. The trouble started with British policy in Italy, where the much-misunderstood (and quite inadequately explained) ban on Count Sforza brought a moralising rebuke from the State Department. The fat was really in the fire with the outbreak of fighting in Greece, and the Prime Minister's latest speech on Poland redoubled the fury. Those who blamed the Greek policy for being too anti-Russian, and saw in it a sinister proof of British "balance of power" policy, blamed the Polish policy for being too pro-Russian and too clear a sign of a sinister "spheres of influence" bargain. With these the main occasions of offending, the old familiar complaints have been added in full measure. Britain is stealing a march on the poor repressed American exporter. Britain has no intention of fighting the Japanese. Britain is not really fighting in Europe—it is even a subject of complaint that Rundstedt did not select the British-held front for his break-through. Britain is imperialist, reactionary, selfish, exclusive, restrictive. Britons spend half their time imitating Lord North and the other half of their time aping Dr Schacht.

All this is painfully familiar. The only novelty in the present epidemic is the evidence that the American Government itself—or at least some parts of it—is more anxious to provide ammunition for the malcontents than to correct their wild misstatements. While the outbreak

lasts there is nothing that the British representatives in America can do about it. But each time there is one of these outbursts it becomes harder simply to grin and bear it. In the sixth year of an exhausting war, in which the British people have received many kicks and lost all their ha'pence, not much tail twisting can be borne in silence. If only to act as a safety valve, and prevent worse happening, some very plain speaking is long overdue, and perhaps a journal whose general approach to the problems of the world is so obviously Americanophil as is that of *The Economist* is the right place for the plain speaking to appear.

Hypocrisy is a common Anglo-Saxon failing—indeed, a failing of the rich and comfortable all over the world—and the British have many times made themselves cordially disliked by it. But that does not exempt them from feeling resentment when they are the objects of other people's hypocrisy. What makes the American criticisms so intolerable is not merely that they are unjust, but that they come from a source that has done so little to earn the right to postures of superiority. To be told by anyone that the British people are slacking in their war effort would be insufferable enough to a people struggling through their sixth winter of black-out and blockade and bombs, of queues and rations and coldness—but when the criticism comes from a nation that was practising Cash-and-Carry during the Battle of Britain, whose consumption has risen through the war years, which is still without a national service act—then it is not to be borne. The latest turn

taken by criticism is that British policy in Greece and Poland has killed the Atlantic Charter—and this comes from the country where both political parties were ready to promise, in the hope of securing the electoral vote of New York State, that they would force a wholly Jewish State on the Arab majority in Palestine. Or, it is complained that the British are seeking a sphere of influence—when anybody with any knowledge of facts or appreciation of probabilities can see for himself that nothing is being, or could be, sought by the British half as dominating and exclusive as the sphere of influence created by the Monroe Doctrine. Again, criticism of the British for playing “balance of power politics” (whatever that may mean) comes from the very mouths that call for the annexation by the United States of all the convenient naval bases in both oceans. It is complained that the British return neither gratitude nor promise of repayment for Lend-Lease—yet the Lend-Lease Act itself declares that nothing shall be given that is not necessary for the defence of the United States.

How can the ordinary Englishman be expected to listen without mockery to all the lofty moral generalities that are proclaimed in America, when he hears them against such a background? Neither in Greece nor in Poland, neither in India nor in Palestine are the American pronouncements combined with any willingness to get down into the dust of the arena and attempt to work out, within the limits set by human imperfections, a policy that will be both right and feasible. The ordinary Englishman remembers Woodrow Wilson's statement that the United States is the only idealistic country in the world—and he also remembers that the only Great Power that made any effort to achieve Wilson's ideals in hard practice was Great Britain. With every outburst of righteous indignation in America, the ordinary Englishman gets one degree more cynical about America's real intentions of active collaboration, and one degree more ready to believe that the only reliable helping hand is in Soviet Russia.

This is the popular, the instinctive reaction. Policy however, should not be based on emotions and instincts but on cool calculation. At what the Americans call the “policy-making level,” the effect of each of these recurrent spasms of Anglophobia is to raise, each time more seriously, the question of the extent to which British policy can safely be shaped in reliance on American collaboration. Just how much British safety can be gambled on American good will? In the political sphere, is it right to refrain, in the hope of obtaining American support for a general and universal system of security, from making special arrangements to assure British security? In the economic sphere, is it right to surrender the means of safeguarding British interests, as Bretton Woods and the American commercial proposals would have us do, in the hope that American policy will be stable and sound? In general, how much purpose is served by painful attempts to adjust British policies to American wishes? It is plainly right to pay some price for an American policy of genuine collaboration. But is the price we are asked to pay too high for what we are likely to get? These are the questions that are inevitably asked. They can be answered only by asking two more. How much more shall we get by trying to please the Americans? And how much less shall we get by going our own way?

The opinion was expressed in these columns immediately after the recent election that it was a defeat for the isolationists rather than a victory for genuine collaboration. It was not to be expected that confirmation would be so quickly forthcoming. Perhaps the most significant event of the last few weeks has been the readiness of Senator Ball, the extreme advocate of “internationalism,” to make common cause with Senator Wheeler, the unrepentant isolationist, and to threaten “withdrawal from Europe,” if American wishes are not immediately complied with. Collaboration, it appears, is not a policy to be pursued in America's own interest, but a reward to be offered to European nations so long as they are good, and withdrawn

when they are bad. If so, it is not a policy that can be relied upon.

Moreover, it is important to realise that “collaboration” is universally defined in America as meaning only membership in the security council and its related organs and subscription to their funds. It does not imply anything at all about the policy to be pursued within these bodies. In so far as the question of policy has been raised at all in the current discussion, it has normally been to make it clear that there can be no promises, no commitments, no “automatic” obligations. A complete victory for Senator Ball's internationalists could still mean that the American delegates could go to the international meetings, as Philip Guedalla once said of the Baldwin Government, like inverted Micawbers, waiting for something to turn down. Nothing in fact has yet happened to show that American policy has emerged from the state that Mr Lippmann calls “noble negatives”—and unfortunately the negatives are of more direct practical relevance than the nobility.

There is still a great deal of wishful thinking in Britain, even in the highest quarters, to the effect that good behaviour on our part will procure some great prize, such as an Anglo-American alliance, or an American guarantee, specific or general, of British territorial integrity, or at least a promise to put down aggression wherever it may appear. It is as well to be brutally frank: there is no more possibility of any of these things than of an American petition to rejoin the British Empire. All that has yet been decided is that the noble negatives will be uttered inside the conference room instead of from outside. If all other nations were of impeccable character and behaviour, it is doubtful whether the present generation of Americans would promise any more. And given the rough and tumble of international life, it is most improbable that we shall get any more by trying to be good.

How much less are we likely to get by going our own way? In great crises, nations see their interests clearly, and if the ultimate extremity of 1940 should ever repeat itself, American action would be the same. No nation surely ever tried harder to keep out of war than the United States between 1935 and 1940, but to no avail. No country surely ever blotted its American copybook more carefully than debt-defaulting, appeasing Britain, and yet we were given the aid we needed. It is true that there is a great difference between Lend-Lease and Cash-and-Carry, but whether in some future crisis we are offered the one or the other will depend infinitely more on the circumstances of the time than on anything that it done now. There is, of course, some risk of stirring up in the American memory a resentment so fierce that, after many years, it would still outweigh manifest national interest. But the risk is smaller than will be run by sacrificing to the dwindling chances of real American co-operation what we believe to be essential interests of our own.

What, then, is the conclusion for British policy towards America? Clearly it is not that any quarrels should be picked. Quite on the contrary, every reasonable precaution should be taken to avoid giving offence. Nor should the hope, slender as it may be, of encouraging a genuine American collaboration be abandoned; on the contrary, it should be fostered by every reasonable means. But it is not reasonable so to fashion the peace settlement that it will entirely collapse if the hope is disappointed—that is, to have no alternatives to a dependence on American aid. And it is not reasonable to suppress legitimate British interests simply because they offend American susceptibilities. Let there by all means be a continuance of the policy of friendship and co-operation, and even of patience and forbearance under provocation. But let an end be put to the policy of appeasement which, at Mr. Churchill's personal bidding, has been followed, with all the humiliations and abasements it has brought in its train, ever since Pearl Harbour removed the need for it. Henceforward, if British policies and precautions are to be traded against American promises, the only safe terms are cash on delivery. And, if Americans find this attitude too cynical or suspicious, they should draw the conclusion that they have twisted the lion's tail just once too often.

Condition of the People

A HUNDRED years ago, a young and ardent revolutionary, Friedrich Engels, wrote a book on “The Condition of the Working-Class in England in 1844.” In the closing days of this year, it seems appropriate to attempt a review, however sketchy, of working-class conditions in 1944. Although this year is not representative, the conditions of wartime full employment, with swollen pay packets, shortages of consumer goods and upheavals of population, cannot be taken as normal. Indeed, to draw any detailed comparison between conditions in 1844 and 1944 would be a waste of time, since there can be no comparison between two incomparables. When Engels wrote his book, the total population of the British Isles was less than 20 millions. People lived and worked under primitive, barbarous conditions; herded together like cattle in their tenements, they were illiterate, half-starved, filthy and diseased. The only relaxations were liquor, horseplay and sex. Typhus and the yellow fever spread through the infested dwellings, but the toll of life was no matter because workers were plentiful and cheap. It was not surprising that the infant mortality rate was as high as 155 per thousand, nor that the average expectation of life in the labouring class in Liverpool was only 15 years. Not for nothing were the 1840's known as the Hungry Forties.

All that is a nightmare of the past, a chapter in the history books. If Engels were to return to life he would be amazed at the changed status and standards of the working population. He would find the 47-hour week established in industry, and the payment of guaranteed weekly minimum wages; the system of factory inspection and regulation of working conditions; and nation-wide schemes of social insurance and pensions. He would marvel at the spread of public education and health, at the extent of state intervention and social legislation, and in this age of popular newspapers, cinemas, radio and electricity, at the wide range of goods and services available to workers. Engels would be impressed by the strength of organised labour to-day, and at the growth of the co-operative movement which was born in 1844, though he would be disappointed to find that the revolution he so confidently predicted had not yet been attempted by the British proletariat. But he would find some things that were familiar in the working-class quarters of the large ports and industrial cities. There are still dark Satanic mills in Lancashire and the West Riding; London still has its East End, Glasgow its Gorbals, and Manchester its Ancoats.

The social investigator of the 1940's is faced with the twofold difficulty of abnormal conditions and a paucity of statistical information on which to base his conclusions. There have been many social surveys, but these nearly all relate to the 1930's, which, as a period of heavy unemployment, cannot compare with present conditions, when there are fewer than 100,000 unemployed. The available facts suggest that as a whole the working-class of this country is a great deal better off to-day than at any time in the past century. An analysis of the recent Budget White Paper shows that the share of the national income represented by wages increased from 38.2 per cent in 1938 to 41.1 per cent (excluding the pay and allowances of the Forces) in 1943, and that the working-class share of total personal incomes after tax (that is incomes up to £500 per annum) had risen from 79 per cent in 1938 to 83 per cent in 1942. This leads to the conclusion that not only have the workers gained absolutely in the war years, but that there has been a tendency for workers' incomes to rise into the higher groups, thus further blurring the dividing line, indistinct in any case, between the middle and lower classes, while taxation has driven the higher income groups into the middle ranges. The war has also tended to widen the gap between skilled and unskilled workers. For the six million workers

covered by the Ministry of Labour's periodic survey, average weekly earnings in January, 1944, were 95s. 7d., compared with 53s. 3d. in October, 1938, an increase of 79 per cent. A large part of this increase, however, especially in the engineering industry, is accounted for by longer hours (the average hours worked increased by 46.5 per cent over October, 1938), payment of bonuses, the spreading of earnings and upgrading of unskilled workers, and other factors likely to disappear under peacetime conditions. Wage-rates as such only increased during this period by about 32 per cent. But the survey excludes miners, who now have a £5 a week minimum, and agricultural labourers, who were recently awarded a 70s. weekly minimum.

It is difficult to estimate how far this increased purchasing power has been effective. The cost of living index has been kept stable through the policy of subsidising essential food-stuffs, and this has undoubtedly been instrumental in maintaining real wages, though the prices of goods outside the subsidised range, such as furniture and household equipment, have been allowed to soar. There is little up-to-date information on working-class expenditure. The recent White Paper on the War Effort showed a sharp decline in personal expenditure on consumer goods, but it did not distinguish between the expenditure of different income groups. Nor is there any information about the number of families which conform to Rowntree's “Human Needs” standard. This standard allowed a man, wife and three children a weekly expenditure, at 1935 prices, of 53s. 2d., of which 17s. 10d. went on food. An attempt to bring this standard up to date by the Oxford Institute of Statistics, in the light of wartime prices and restrictions, reckoned the necessary minimum expenditure on food for such a family at 37s. 14d., or twice Rowntree's figure.

The war, however, even if it has limited spending capacity, has had the effect of concentrating it on essentials and has certainly led to improvements in working-class nutrition. It is indeed an ironic reflection that it should need the economics of scarcity to achieve such a result. The rationing system ensuring the fair distribution of foods in short supply, the development of communal restaurants and works canteens, the expansion of school feeding schemes and the vitamin schemes for young children, have played an important part, but, above all, it is due to regular incomes and employment. Sir John Orr reported in 1936 that families with an income per head of under 20s. a week, which did not allow their diet to reach desirable nutritional standards, amounted to one-half of the population; but in a wartime survey he found that the proportion of the under-nourished had been reduced to one third, and that the worst third were better fed than in the previous survey. Better nutrition is one of the main causes of the maintenance of the nation's health in wartime and the improvements in vital statistics. In England and Wales in 1943 the infant mortality rate, at 49 per 1,000 live births, was the lowest on record; a record low maternal mortality rate was reached and there were fewer stillbirths than at any time before. On the other hand, tuberculosis, in spite of the great reduction, is still a serious social illness.

But whatever the improvements in health and nutrition, the problem of the rich and the poor, the inequalities of wealth, have not been eliminated. Disraeli's “two nations” still exist. The most recent estimate of the distribution of property, that of Mr H. Campion, shows that in 1936, out of a total of £15-£17 millions of private property (including land, houses, all types of industrial capital and foreign investments), approximately 85 per cent was held by 1.8 million persons, or 7 per cent of the total adult population. Moreover, three-quarters of the adult population possessed less than £100 worth of property, and 1.5 per cent of the adult population had property of £10,000

and over. These estimates show that, whatever levelling-up at the bottom may have taken place and however the relative share of the middle classes in property may have increased, the property structure of society has not altered fundamentally. Mr R. Titmuss, in his "Birth, Poverty and Wealth," showed that before the war, the infant mortality rate among middle and professional classes was 33 per 1,000 live births, compared with 77 among unskilled labourers. The class divisions are even sharper in education. The calculation that only 2 per cent of the population go to public schools, yet 57 per cent of the Members of Parliament come from public schools, is a striking illustration of the existence of privilege.

It is from improvements in housing, above all, that improved standards of living can be expected, since environment is the all-important factor. The war has made things worse and not better. There has been no overcrowding survey since that of 1936, which showed that the overcrowding proportion was as high as 17.2 per cent in Shoreditch and 20.6 in Sunderland against Oxford's 1 per cent and Bournemouth's 0.3 per cent, but there is no reason to suppose that an up-to-date survey would show any improvements. Indeed, the reverse is likely, since with the interruption of normal house-building and of slum clearance programmes and with the effects of bombing, congestion has become acute.

Unsatisfactory sites of houses and villages, insufficient supplies of water, unsatisfactory provision for drainage, grossly inadequate provision for the removal of refuse, widespread absence of decent sanitary conveniences, the persistence of the unspeakably filthy privy midden in many of the mining areas, gross overcrowding and huddling the sexes together in the congested industrial towns and villages, occupation of one-roomed houses by large families, groups of lightless and unventilated houses in the older burghs, clotted masses of slums in the great cities. . . .

This is not a passage from Engels; it is an extract from the report of a Royal Commission on Housing in Scotland in 1917, quoted in the 1944 report of the Scottish Housing Advisory Council, with the comment that "these evils have been only slightly mitigated by housebuilding between the two wars." As many as 405,000 houses in Scotland still have no independent water-closets and no sanitary conveniences of any kind. Conditions in Scottish mining areas, according to the recent report on the Scottish coal-fields, "can only be described as deplorable."

It is not surprising that people born and bred in such conditions should have low standards. The facts disclosed in the evacuation survey "Our Towns" in 1943 can only be understood against the demoralising background of slum conditions. Public opinion was, understandably, appalled at the descriptions, unemotionally related by trained social workers, of the dirty and verminous children,

ridden with scabies and other skin diseases, with disgusting sleeping and feeding habits, of the negligence and recklessness of their parents. It showed how ignorance and poverty were exploited by all kinds of money-lenders, clothing clubs, insurance touts, quack doctors and vendors of patent medicines.

Many of the families such as those described in "Our Towns" or by Mrs. Paneth in "Branch Street," it may be argued, are the problem families, of interest to the psychiatrist rather than to the sociologist. They belong to the "submerged tenth," the ranks of the unemployables and the "irreducible minimum." They are as far removed from the respectable, thrifty artisan class as they are from millionaires. The proportion of people living below the poverty line is steadily diminishing, and in many cases, their conditions are the result of their own follies and non-co-operation. This may be true in some cases, but there are also very many families living even now, if not in actual poverty, at any rate on the borderline. The unskilled labourer, with a large family to support, finds it difficult to maintain a decent standard, however much he may wish to, while accident or sickness may drive him into debt and thus be on the poverty line. The reduction by over half in the number of people seeking public assistance between 1938 and March of this year suggests that such cases are diminishing—though it is also due to the transfer of many needy cases from the rates to the Assistance Board, and charitable societies can still report many instances of distress. Some of this is occasioned by purely wartime circumstances and the inadequacy of the serving-man's dependants' allowances. There is also considerable hardship among old-age pensioners as the Assistance Board's records show. So long as families and individuals are on or near the poverty level there can be no room for complacency.

"Progress," said Herbert Spencer, "is not an accident." It is, or should be, conscious policy, and that policy should be directed towards raising the level of the lowest-paid, and establishing a national minimum subsistence standard, below which no individual could fall as a result of economic circumstances outside his control. The year 1945, which should bring the end of the war, will provide an unparalleled opportunity for progress towards these aims. The Government is now pledged to introduce far-reaching reforms in education, health, housing and social insurance, and is planning to bring in family allowances and to regulate the wages and conditions of the lowest-paid workers. Whatever Government is returned to power it will be committed to this programme of social reform. But to say that there has been progress since 1844 is not enough; the question is whether the advances in social conditions have been commensurate with technical and scientific progress or the nation's productive capacity, and the answer, on all the evidence, can only be in the negative.

The Air After Chicago

THROUGHOUT the Allied and neutral world, delegates—with the one exception of the Russian delegates who never arrived—are returning from the conference on international air transport held at Chicago. With them they bring agreements that will do much to shape the development of commercial air traffic in the years ahead. The conference has achieved real advances in technical matters which, when they can be fully implemented, will make international flying very much safer, more reliable and more straightforward than ever it was before the war. Secondly, an interim organisation, its life limited to a 3-years span, has been elected and set to work in Montreal. It follows, in function and structure, the broad outline of the permanent international organisation which is the third achievement of the Chicago Conference. Beyond this, the five weeks of discussions achieved only an agreement to disagree, formally recognised by attaching to the main agreement two separate appendices on the much-discussed "freedoms of the air." One, for the benefit of the British and others

of like mind, is limited to the first two freedoms, which permit all nations to fly over other nations' territory ("the right of innocent passage") and to stop for non-traffic purposes (e.g., for refuelling). The second, now signed by some seventeen states, including the United States, China, Sweden, Afghanistan and most of the Latin American states (but not including either Argentina or Brazil) includes the remaining three of the five freedoms. These are the right to set down and pick up payload coming from or destined for the aircraft's country of origin, and the much controverted "fifth freedom," which permits operators to carry traffic between two foreign points as part of a continuous service, one end of which is in the aircraft's country of origin. Signature of the first appendix by Great Britain is, in one way, misleading, since it understates the British position, which has consistently claimed a universal grant, not of two, but of four freedoms as a basis for negotiation for regulated application of the fifth. The refusal of the United States to admit the need for such regulation led,

eventually, to the present deadlock. The reasons underlying it have by now been fairly fully reported and fairly widely understood and need not be gone into here. What is most necessary now is not to rehash the arguments on each side, or to re-examine the curious tactics which led to the deadlock, but rather to enquire what the next moves should be for British civil aviation. How does Britain get into the air after Chicago?

★

The poverty of British aviation in transport planes has been so often stressed that there is growing up a belief that competition with well-stocked American airlines, already in full operation within the limits imposed by the war zones, will be well-nigh impossible. The explanation, given in the American press, of the British claim for international air regulation—that it was the defensive action of a weak-handed player—seems to have contributed to a pessimistic outlook in this country. There is a real danger lest the American refusal to admit the British claim be accepted in Great Britain as a trumping not of our best, but of our only, card.

It is true that aircraft production in the United States is now nearing half the total productive capacity in the whole world, and that the American production of civil transports is virtually the whole of the world production. It is further true that American airlines, taken over almost bodily by the Transport Command of the US Army Air Force, are gaining invaluable experience in operating virtually the same routes as they will operate in peacetime. In spite of reiterated declarations on the part of the American delegates that the United States would not use its position as "universal provider" of surplus transport aircraft to discriminate against other nations, it is hard to see how it can avoid doing so. The temptation to hold such a bait before plane-hungry states, even without explicitly using it as a direct bargaining weapon, will be almost irresistible. Certainly, it is a possibility to be allowed and prepared for. The United States will aim at concluding as many bilateral agreements as possible in implementation of the policy it favours, and will be greatly aided by the enterprising policy of the State Department in appointing Civil Air Attachés to as many countries as have an interest in international air transport. There will be no lingering at the starting point in Washington.

This makes it the more necessary that the British Government should not be laggard in developing its own ideas about the organisation of international civil aviation. The chief reason for urging this is not to widen the differences that already exist between the two countries but, on the contrary, to foster agreement. The Interim Council set up at Chicago has been directed to study the problems of "fifth freedom" regulation and to report, with recommendations, as soon as possible to the full Assembly. Without some actual experience of the two

alternative systems to work on, the Council cannot properly do its job. It is only by showing that the British system (if it may be so called for convenience) works and works well that there is any hope of convincing American opinion that a universal multilateral convention embracing the whole world is to be preferred to the short-run advantages America might be able to win, in sharp bargaining, through her possession of unlimited numbers of civil transports.

It is therefore essential that no time should be lost in negotiating "four freedom" agreements with as many countries as possible, starting with the countries of the British Commonwealth and those countries of Western Europe which share with Great Britain the problem of long imperial communications—France, Belgium and Holland. There is nothing in the Chicago Convention to prevent countries from sharing in their internal and intra-imperial traffic, provided that the arrangement is not exclusive. It ought to be possible to arrange this at least among the British countries (Australia proposed it as a second-best to internationalisation), and possibly among the Western European countries as well. Beyond these two groups, there are the countries which have concluded, or will conclude, "five freedom" agreements with the United States. This does not, of course, prevent them from concluding agreements on a different basis with Great Britain, but the problems of adjusting the two systems where they touch each other will require careful consideration.

In such a process of agreement-making there is, however, one difficulty. The essence of the "four-freedom" system is that it provides for control of routes and frequencies. It might be possible to conclude "four-freedom" agreements with the schedules left blank, but it would be a pointless procedure which many countries might consider a waste of time. It therefore becomes essential that decisions be taken almost at once on the routes, the frequencies and the starting dates of the services to be flown. This, of course, will be difficult, though not nearly so difficult as is often maintained. It must be done if the British doctrine of civil aviation is not to go by default.

★

The great unknown is the number of aircraft that will be available—not only for British use but for export to other countries which need them but which, for obvious reasons, will not like to find themselves in a position where the sole source of supply is the United States.

In the present circumstances, British airlines are faced with Hobson's choice. Really suitable first-class British commercial types able to compete with anything produced elsewhere simply do not exist. The popular conception of the gestation period of a multi-engined commercial aircraft is marvellously optimistic; five years from first design to full production is not an outside

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

For particulars apply to:—

estimate at this stage. Admittedly, the partially adapted types, such as the Avro York or the Handley-Page Hermes, are excellent pieces of work in their way. But even they and their contemporaries are not likely to be available in really adequate numbers unless British commercial aviation is going to be suicidally limited in its expansion.

Hobson's choice, in fact, boils down to converted bombers or nothing—that is, in the crucial transition period, before specially designed commercial types can reach full production and while the deliberations of the Interim Council will be determining the final shape of international rules of air transport. The primary disadvantages of the converted bomber (including some aircraft used by Coastal Command) from the point of view of the airline operator are its running-costs and its lack of comfort. Its great advantages are its speed, its proved reliability and the large numbers in which it can quickly be made available. Speed, in a disturbed world, rapidly re-adjusting itself to peaceful commerce, will clearly be an immense asset, and will largely offset, from the travellers' point of view, lack of the attractive luxuriousness of a plane specially designed for passenger traffic. Of the three main requirements of an air service—reliability, speed and comfort—comfort, or at least luxurious comfort, is definitely the third in most passengers' minds. An air service run with converted bombers is clearly very far from ideal; but it is even more clearly better than nothing—and better than a service run with somebody else's second-best products. In any case, where mails and high-value cargo are concerned comfort need not be a criterion of efficient conversion.

The most important disadvantage of the converted bomber will be its uneconomic running-costs. It is this factor which would normally rule it out for civil operation. But the cost alone should not be allowed to rule it out in the vital transition period. The dilemma in which British civil aviation finds itself is a by-product of the war. It is therefore, so long as the difficulties last, a fit object for temporary subsidy, calculated to reduce the running costs of converted bombers to the level of specially designed civil transport.

The third major concern of British civil aviation policy is with its domestic organisation. The debate between the chosen instrument and free competition is too intricate to be canvassed here. The major argument for the chosen instrument is the necessity, in an imperial system, of running some services at a loss and recouping the losses out of the more profitable services. The major argument

for competition is the need for efficiency and surprise. The political weight of the arguments is very nearly balanced, creating a situation which is usually solved, in this country, by a compromise. The compromise might be sought by treating BOAC wholly or partly as a holding company, which would go into partnership, in a number of operating companies, with the other interested parties, with the shipping companies for the longer routes and with the railways for the shorter European routes.

But in any case the first requirement now is a decision, a clear decision and a firm decision, so that the work of organisation and preparation can begin in earnest. The future of civil aviation can hardly be painted on too large a canvas. For Britain, the political reasons for stimulating the greatest possible volume of civil flying are obvious. Indeed, they are twofold: not only is there the need to knit together a Commonwealth that will become ramshackle if all its parts can move more readily to foreign countries than they can to each other; there is also the need for a prosperous civil aviation industry as a support and training ground for the Royal Air Force. But these political objects are not the only reasons for thinking big in civil aviation; there are purely economic reasons also. The demand for all forms of transport, when they are new, is far more elastic than is usually realised. The appreciation of this simple fact made the fame or the fortune of George Stephenson and Henry Ford as well as of a whole succession of shipping magnates; the world is constantly being astonished by its own desire for mobility. It may well be even more true of the air than it has so often been of other forms of transport that the provision of cheap and frequent services will by itself create the traffic to fill them. It is at least well worth while to find out, rather than to leave it to others. In the interim period, the policy of British civil aviation should be to fly every route for which any sort of aircraft can be found (there will be no shortage of pilots). It is no good talking of one route to South America, for example, when twenty different criss-crossing routes may easily prove to be too few. It will be far better to overshoot the mark than to undershoot it.

There is some substance in the complaint that the Government has acted as a wet blanket on the whole subject. This may not have been the intention, but delay in making decisions, and ambiguity in them when they come, have had that effect. Lord Swinton's advent will make a difference, if he will apply to the subject some of his energy and driving power and not allow himself to be enmeshed in the intricacies of high policy. The best way to get into the air is to take off.

NOTES OF THE WEEK

Negotiations in Greece

The arrival of Mr Churchill and Mr Eden in Athens was the signal for an attempt to bring all the parties in Greece together to discuss conditions for an armistice. The delegates met under the chairmanship of the Archbishop of Athens, and at the opening meeting Mr Churchill addressed the conference, disclaiming any British interest in Greece beyond the country's independence and reconstruction and declaring that the negotiations would be left to the Greeks themselves. Then the British leaders—Mr Churchill, Mr Eden, Mr Leeper, Field-Marshal Alexander and General Scobie—withdraw, and the conference continued to alternate between recrimination and discussion for two days. Then it adjourned *sine die*, with one point only agreed, the setting up of a Regency. The Archbishop of Athens is, however, empowered to convene another meeting when he thinks fit, and it is to be hoped that the negotiations will not be allowed to drop. Here the responsibility of the British statesmen is great. The conference broke down because, on receipt of EAM's terms, several delegates walked out. They were not ready even to consider them. Reports from Athens suggest that the Right Wing groups now rely on British arms to back their intransigence,

and every time Mr Churchill repeats that, whatever happen, Athens and Attica will be cleared, the enemies of EAM take heart. In such a mood, their desire to discover a genuine compromise may be entirely fictitious. The situation is clearly very awkward for the British. Unless a compromise is reached, they are in the invidious position of backing the Right against the Left, and the fact that this is their position encourages the Right to extremism. The firmest pressure and the sternest warnings will probably be necessary to compel the Right wing groups to return to the conference table. The British leaders should not hesitate to use either.

The question remains whether there is any will to compromise on the Left. It is significant that after so much emphasis has been laid on the widely federal and representative character of the EAM, two out of their three delegates at the opening conference should have been Communists, who are certainly a minority, whatever the percentage of the Greeks backing EAM as a whole. However, the terms they presented should be a possible basis for negotiation. They demanded the dissolution of the gendarmerie and of the National Guard formed since

fighting began. They asked that the Sacred and Mountain brigades should be disbanded and that the officers of the new National Guard should be acceptable to EAM. Most of these items have figured in EAM's minimum demands ever since the fighting started. In their reply of December 22nd to General Scobie's conditions of armistice—the withdrawal of ELAS from Athens and the Piræus and the disarmament of ELAS supporters in the city—they made disarmament of the Right a pre-condition of their withdrawal and they demanded the setting up of a satisfactory coalition government. The EAM terms presented to the Conference elaborate the meaning of a "satisfactory coalition Government." It is a coalition that would give EAM 40 to 50 per cent of the Cabinet, the posts of Minister of the Interior and of Justice and the Under-Secretaryships of War and Foreign Affairs. On the face of it, these demands are not unreasonable. But the problem is whether EAM means by them to capture the Greek state before elections and to use their powers at the Ministry of the Interior and in the National Guard to liquidate their opponents. Once again, it is a question of confidence, and, unhappily, each week of fighting adds to the likelihood that confidence cannot be restored on either side. It is to be hoped that, in this situation, Mr Churchill and Mr Eden will continue their task of mediation and bring the leaders together again. If a settlement should prove completely impossible, then perhaps Mr Churchill's suggestion of an International Commission to govern Greece until elections can be held may prove the only solution.

Men for the Army

The Cabinet's decision, announced on the eve of the Christmas holiday, that an extra 250,000 men must be found "to nourish and sustain our armies in the line" is not, it has been stressed, the result of the military reverses on the Western front. It is, rather, a form of insurance policy on the part of the High Command, which is determined to be assured of sufficient reserves of man-power to meet all the contingencies of battle. The nation's manpower is to-day fully stretched—the peak of mobilisation was reached already in 1943—and there are now no untapped reserves from which to draw. The extra men will therefore have to be found by readjusting the existing manpower pattern. Some of the requirements will be met by transfers to the Army from the Air Force and the Navy, while men already in the Army in more or less sedentary jobs will be placed on more active service. The process described by Mr Churchill as "combing the Army's tail to sharpen its teeth" may be expected to be applied with some rigour. Clerical and other administrative jobs will largely be filled from the ranks of the ATS, and a fresh appeal is being made for volunteers from among women who are not in reserved occupations, such as nursing, or engaged on essential munitions work from which they cannot be released. The normal call-up of youths who reach the age of 18 should provide a substantial number of recruits, while the policy of transferring workers, below 35 years of age, who become redundant in munitions factories, will be extended. A further source of recruitment will be men released from civil defence services. These classes should meet the bulk of the new needs, but, as well, sufficient numbers of officers and N.C.O.s to train the new recruits will have to be found. In any readjustment of manpower, it seems certain that the labour force of the basic industries and services will be maintained, and that no men will be withdrawn from mining, agriculture or transport. The less essential industries and services, Group III of the recent White Paper on the war effort, have already been severely depleted; they lost one-third of their labour force between 1939 and July, 1944. The net effect on industry may be to reverse temporarily the trend towards peace-time production and the relief of consumer goods shortages. In the sixth winter of war, the public will accept the ruling "military needs first" in the same spirit as it has accepted all earlier demands. The Government's announcement, reflecting the determination to "finish the job," should make a deep impression on opinion abroad, not least in the United States.

Provisional Hungarian Government

On Christmas Eve, while Marshal Tolbukhin's armies were encircling Budapest, a Provision Hungarian Govern-

ment was set up in Debrecen in eastern Hungary. The new Government has been constituted on the model of the other Governments in the Balkan satellite countries now under Soviet control. It is a queer coalition of the local Darlans and the parties of the Left. The Premier of the Hungarian Provisional Government is General Béla Miklos, who was Chief of Staff under Admiral Horthy. His colleagues in the Government are Agrarians, Social-Democrats and Communists. The new Government has been elected by a Provisional National Assembly which claims to have been chosen by the rural communities in the Soviet-held parts of the country. As it is highly unlikely that the Soviet Command would have allowed fully fledged elections to be held, especially at this stage of the campaign, it must be assumed that the Debrecen Assembly consists of nominees of the political groups willing to co-operate with the Russians. Their relative strength cannot even be guessed. But in Hungary as elsewhere, the collapse of the regime associated with the Axis is certain to have let loose a strong wave of social radicalism. Yet the Manifesto of the Debrecen Government proclaims that "private property will be the basis of Hungary's social order" and promises "immunity to private initiative." However, the first reform initiated by the new Administration is distribution of land among the peasants. In the Danube basin, Hungary is the only country whose large and semi-feudal landed estates were not broken up after the last war. In Hungary, as in Poland, the Russians hope to establish their influence by destroying anachronistic social conditions in the countryside and by winning the gratitude of the peasantry. Their prospects of achieving this would have been very great indeed, had it not been for the fact that the Red Army in the Danube basin has no alternative but to live off the land. With Russian help the peasant receives new land, but at the same time he must hand over his produce to the Russian quartermaster. With this balance of profit and loss, he is likely to welcome the new state of affairs with mixed feelings.

Pact With Ethiopia

The new Pact with Ethiopia seems to have met all the objections which decided the Emperor earlier this year

THE COUNTRY BANKER

... he kept a pack of hounds and dwelt in patriarchal style among his people—hospitable, freehanded and popular. He might be seen at times seated under the great elm... chatting with his neighbours.

So, in the last century, the country banker inspired and held confidence: the evidence of his worth was plainly to be seen. The rising tide of industrial development with its demand for a service which few private firms could provide caused the virtual disappearance of the country banker, but on the firm foundation which he had created, the Westminster Bank continued to build, so that it is today able to offer a service which, in its scope and complexity, might be a source of some astonishment to those pioneer bankers of other days.

WESTMINSTER BANK LIMITED

to terminate the Anglo-Ethiopian Treaty signed in 1942. The chief Ethiopian grievances were the limiting of foreign advisers to men of British nationality, the control of the Ethiopian army by the Commander-in-Chief, East Africa, the maintenance of British military occupied areas along great stretches of the Ethiopian frontier, including the town of Dire Dawa, and, finally, the operation of the Djibouti railway by the British authorities. These provisions added up in the Ethiopians' eyes to a pretty complete state of tutelage, and since the financial aid offered to Ethiopia—£3,000,000 in three years—seemed to be very ungenerous in comparison with the restrictions imposed in return, the Emperor was led, after an abortive attempt at re-negotiation, to compel the British Government to parley by denouncing the whole settlement. Lord De la Warr was sent out to Ethiopia soon after the Emperor's decision was announced, and has been successful in concluding a new agreement. Under it the British renounce their monopoly in the matter of advisers. The Emperor may now turn to any friendly nation. They have given up some of the military areas, although control will be maintained along the Somali frontier where British Somalis enjoy grazing rights. The Djibouti railway is to be run by Ethiopian officials, and although the Ethiopian army will continue to be trained by a British military mission, financed by Britain, it will come under the orders of the Ethiopian Minister of War. The British offer of £3,000,000 remains open,* but so far the Emperor has refused the condition that the money should be spent by a development board made up of British and Ethiopians. It is impossible to feel altogether easy about the whole episode. It is true that the Ethiopians are naturally intensely sensitive on the question of sovereignty and independence. But their fears of British interference are so strong that they suggest some heavy-handedness somewhere in the handling of British policy. And was not the economic assistance in any case too small either to touch Ethiopia's problems of reconstruction or to warrant so complete a degree of supervision? It may be that if British policy had been at once politically more generous and economically less cautious, a more cordial relationship might have been preserved.

National Income for the Layman

The concept of the national income, and the statistical estimates of its magnitude, underlie most of current economic discussion, and are beginning to be made the bases of public policy. This is one of the developments of the war period, arising out of the admirable Budget White Papers which have appeared every year since 1941, and the effects on both theoretical and applied economics are likely to be not far short of revolutionary. But the layman has difficulty in grasping what it is all about, for the technical terms are no less frequent and the traps for the unwary no less numerous than in other forms of specialised knowledge. The textbooks, since they date back before the development of the new technique, are of very little use (Professor Hicks's "The Social Framework" is the chief exception). A Child's Guide to the National Income is, therefore, badly needed, and it is this need that a recently published pamphlet* is presumably intended to fill. The authors could hardly be more authoritative, since one of them is employed in the Offices of the War Cabinet and the other in the Central Statistical Office. All those who use national income estimates (and their name is legion) should read the pamphlet. Unfortunately, this authority is, to some extent, its own undoing. The enquiring layman will certainly find all the information he needs, and in a very small compass. But whether it is presented in a form that he will find easy to understand is more doubtful. The pamphlet reads a little like those over-compact books of instructions that come with the more complex parlour games, and which can be fully understood only by long practice. Perhaps the authors can be persuaded to write a much longer book, in which they can make their points at leisure, while some less authoritative hand attempts the simple explanation. Something of the quality of a child, after all, has to go into the writing of a Child's Guide. On the substance of the pamphlet, two comments can be made. In the first place, the authors might have given the reader more help and encouragement in translating the money figures into "real" terms, which are the only sound basis for policy. Secondly, in accordance with what is becoming standard British prac-

* "National Income and Expenditure." By J. E. Meade and Richard Stone. Oxford University Press. 36 pages. 2s.

tice, nearly the whole discussion is in terms of net figures, without much mention of the gross estimates, which are those most used in America and most relevant for the majority of war problems. The reason lies in the absence of any close British estimates of expenditure on (or provision for) the maintenance and replacement of capital. Is not this the chief statistical lacuna still to be filled?

The Fourteenth Army

Lord Munster has produced his report on the Welfare of Troops in India and South-east Asia with commendable promptness. It makes clear that the widespread anxiety felt in this country about the Fourteenth Army—how it lives and relaxes—is not without real foundation. The sixteen recommendations with which the report closes draw specific attention to chronic shortages of supplies; inadequate and unclean camps, billets and transport services; a general lack of films, radio-sets and entertainment; and, more important, a shortage of trained doctors and nurses. All this, with slow and costly mail and telegraphic communications and difficulties over pay, adds up to a sorry state of affairs for the men out east. There is, by now, a more realistic appreciation at home of the appalling natural conditions under which the Fourteenth Army does its work. But few people realise that over most of the vast area of operations local resources are quite inadequate for the jobs of providing welfare on the scale needed and so richly deserved. Until the war in the West is over, life in the Far East will inevitably remain "sub-standard," but there is much that can be done now to repair its worst deficiencies. In the House of Commons last week Mr Churchill stated that the time has come "when the influence of the whole Government must be brought to bear on this important problem"; and he gave the welcome news that he had appointed Lieutenant-General King as his personal representative in India and SEAC for welfare matters. If the strongest efforts of the Government and the Indian authorities are co-ordinated in this matter there are good hopes that conditions for the Fourteenth Army will become more tolerable. It is the duty of Parliament and the press to keep the Army in the forefront of public attention.

Back to the Philippines

With the Americans firmly established on the island of Leyte and advancing rapidly across the island of Mindoro, the liberation of the Philippines has fairly begun. It is, of course, impossible to judge the general situation in the Philippines until the large islands, Mindanao and Luzon, have been liberated, but it is not very likely that the Americans will encounter the kind of political problems associated with liberation in Europe. It is true that when the Japanese occupied the Philippines early in 1942, very many members of the Philippine Government did not follow President Quezon first to General MacArthur's headquarters in Australia and then to Washington. The President's secretary, Jorge Vargas, had been left behind as head of an emergency Cabinet. He immediately accepted Japanese control and set up an autonomous administration under the Japanese commander-in-chief and Shozo Murata, the political head of the Japanese military government. On October 14, 1943, the Japanese granted the Philippines "independence," and a government was set up under a former member of Quezon's Cabinet, José Laurel. Meanwhile, Philippine institutions had been re-modelled on the Japanese version of Nazism with a puppet Assembly and a single party. It is unlikely that this regime has done anything but destroy whatever popularity the Japanese may have enjoyed before. The Philippines have continued to be a base for Japanese military activities and the economic situation has deteriorated very seriously. Cut off from their export markets in Britain and the United States, the Philippine Islands have had to reorientate their economy towards self-sufficiency at a much lower level of prosperity. All this political and economic regimentation has continued under the nominally independent government and can have left the Philippines with few illusions about independence conferred by the Japanese. Meanwhile, on June 29, 1944, in a joint resolution, the American Congress adopted a policy of granting independence to the islands and also providing for the acquisition of American bases. On the same day, another joint resolution set up a Philippine-United States Rehabilitation Commission to prepare for the economic reconstruction of the Philippines. Finally, as an

earnest of American intentions, the Philippine President, Mr. Osmena, accompanied General MacArthur to Leyte. It is unlikely that his administration will meet much difficulty either from the puppet government or from local resistance leaders.

What Price a Forest?

The two debates on the adjournment on the Tuesday before Christmas turned out to be something of a school for scandal. Besides the imputations against British Overseas Airways Corporation, which were answered later in the week in the House of Lords, the propriety of certain dealings of the Forestry Commission were questioned. The allegations, which had been brewing in question-time for some weeks past, were that the Forestry Commission had, in fact, been conniving at the price-fixing policy of the nursery trade association. An individual case was cited in which an MP applied to the Forestry Commission to buy some of its large stocks of young seedling trees, kept, it was explained, against the end of the war and the sudden demand to be expected from the release of labour for private planting. The Commission replied that it was unable to supply him itself, but referred him to three private firms. The seedlings were finally sold to him by the English Forestry Association and were consigned, not from them, but from the South Wales station used by the Forestry Commission. Sir George Courthope, chairman both of the Forestry Commission and the private firm in question, was asked to explain the 140 per cent difference between the price charged to the firm by the Commission and that charged by the firm to the purchaser. His explanation rested on a long-standing gentlemen's agreement by which surplus stock raised by the Commission should be sold to the nurseries at agreed wholesale prices. Wartime restrictions of all kinds had led the trade to raise very substantially their retail prices while still obtaining very surplus stock from the Commission at reasonable cost. By that time, it was considered too late for the Forestry Commission, however much it disapproved, to establish a competing distributing agency selling at much lower prices, and, according to Sir George, not only too late but also "undesirable." There is no reason to suppose that Sir George himself is guilty of using his dual position to his own advantage; his personal character is not under suspicion. What can and must be contested are the grounds of his defence, and chiefly his declaration that competition by a State Commission against a price-fixing ring is "undesirable." Public opinion, were it aware of the facts and consulted on the issue, would most likely take exactly the opposite view—that it was highly desirable that public money spent on the Forestry Commission should be used to protect the consumer rather than to support a ring of organised producers. What is ominous about this episode, unimportant in itself, is the light it sheds on the economic life practices that are accepted as normal in the economic life of the country to-day—a tight ring and excessive profits of the country to-day—a tight ring and excessive profits among the private traders; connivance at monopoly by the state; and one of the ring-leaders acting as custodian of the public's interests. If these things be done in the green tree, what shall be done in the dry?

The Cost of a Child

Now that a Bill to establish a universal system of children's allowances is being drafted, it is appropriate to compare the amounts proposed with the sums already being paid in respect of children either directly from the state or through contributory schemes. The Government proposes that a cash allowance of 5s. a week should be paid in respect of the second and each additional child in a family, and that when the breadwinner is drawing benefit the same amount will be payable for the first child. But since a child will not be eligible for an allowance after he has left school or, if still at school or apprenticed, after the 31st July following his sixteenth birthday, the "first" child does not mean the eldest child but the first eligible child; consequently, in a family of four children, aged 15, 13, 11 and 9 respectively, only two allowances will be payable if the eldest child has left school and the father is earning and only three if the father is on benefit. This is the principle that applies under the existing contributory schemes. It will be seen from the table that if no account is taken of the allowances to be paid in kind, the Government's proposals are very much in line with the allowances already

being paid under the contributory schemes. The second and each additional child of a widow will be better off; so will the third child of an unemployed man on benefit only. The sick will be distinctly better off, because at present if they have no other resources their children have to be maintained out of the rates. Orphans will receive 12s. instead of 7s. 6d. The "first" child of a totally disabled industrial casualty will, under the new workmen's compensation proposals, receive 7s. 6d. instead of the 5s. proposed under the general scheme—a somewhat incomprehensible anomaly. Those receiving war pensions will presumably keep their higher children's allowances. Income tax payers will benefit, because Sir John Anderson has forecast that income tax relief for children will be maintained after family allowances have been introduced.

The Government's proposals for family allowances in cash and kind are not intended to provide full maintenance for a child. How much that actually costs depends on each family's standard of living, but how much it is officially assumed to cost can be deduced from two sources—with very different results. The first is the allowances given in respect of their children to those receiving national assistance, which, it will be seen, vary with the age of the child. The second source is the payment collected in respect of unaccompanied evacuees. The billeting allowances shown in the table are not officially regarded as the cost of main-

minimum figure shown in the table for national assistance. Actually, the average sum collected from the parents in respect of evacuated children is under 3s. a week, so that the state is already contributing at least 50 per. cent of the cost of maintaining them.

National Eye Service

The deferment of full dental and eye services from inclusion in a national health scheme was explained in the White Paper on the grounds of a shortage of dentists and ophthalmologists. A sub-committee of the BMA has now proposed a draft scheme for a National Eye Service which has as a fundamental principle the separation of eye-testing and the sale of spectacles; it maintains that opticians should become "medical auxiliaries" to ophthalmic surgeons, acting either as sight-testers or simply as dispensers of spectacles under the general direction of the surgeon. Such a scheme would raise the status of opticians to a more professional level, but those who took advantage of it would lose the lucrative advantage of running a general "optical" shop. Nevertheless, the BMA scheme is along the right lines. In spite of opticians' protestations that their system of qualification enables them to diagnose eye disease as well as errors of vision, a reliable diagnosis can only be made by the full-time ophthalmic surgeon. The chief difficulty in implementing the BMA scheme is that opticians outnumber ophthalmologists by seven to one. The first steps, therefore, should be to establish special eye centres, at which ophthalmologists, working with the assistance of opticians, could examine patients reasonably quickly and at reasonably low cost. Unless attention from an ophthalmologist can be secured at a fee that is not greatly in excess of the optician's low charges, the public will not welcome the change. Even working with help from opticians, ophthalmologists are still far too few for the immediate introduction of a National Eye Service along the BMA's lines. The medical profession has the responsibility for producing enough ophthalmologists for its scheme to be implemented. As long as the service of a qualified eye-surgeon remains, physically and often financially, beyond the reach of the mass of the public, it is chimerical to talk of closing the opticians' shops which they patronise.

Trouble in Mauritius

Very rarely does Mauritius appear in public, but if ever publicity for this little-known colony were needed it is now, on the publication of the report of the commission of inquiry into the disturbance which occurred there in the spring of 1943. The report, unfortunately, was published in Mauritius and is not on sale in this country so that unless they are taken up in Parliament there is a danger that the scandals it reveals will remain unheard of. Only a few of them can be cited here, but, in brief, the commission—it was a local body, which gives added weight to its criticisms—found that the relations between employers and workers are bad; that working and living conditions are bad; that wages are shockingly low and minimum wages not adhered to; that the cost of living allowance lags far behind the rise in the cost of living; that the administration of the colony is weak—the Labour Department in particular is unsatisfactory—and that a number of Government officials and of the police conducted themselves improperly; and that both the local government and the Colonial Office have been inexcusably dilatory in taking action on recommendations made to them, of which the most notable were made by the Colonial Office's own Labour Adviser, Major Orde Browne, who visited the island in 1941. He summed up the condition of the people as follows:—

The picture is, therefore, of a poorly paid, undernourished, sickly population, capable only of such a limited output of work that an increase of wages offers little promise of improved performance. Such a position must obviously be equally disastrous for the employer and worker.

And his recommendations were aimed primarily at improving working and living conditions as a prelude to raising the island's standard of living. Yet the commission found that in the great majority of cases no action has been taken to give effect to these recommendations, and where action has been taken it often only means "further consideration is being given" or "a report has been called for"—for instance, the Government "is actively considering" raising the age of employment for children from 10 to 12 years. The Colonial Office and colonial governments can often justifiably plead the war as an excuse for delaying reforms.

But nothing can excuse the open victimisation and the appalling sium life revealed in this report.

The Gold Coast's Constitution

The new constitution for the Gold Coast, details of which were given in an article in *The Economist* of October 14th, page 500, was the subject of a short debate in the House of Lords on December 20th. There was little criticism of the reform, except that it was so unexpected and had passed undebated in the House of Commons in spite of the fact that it involved an important change of policy. As Lord Hailey pointed out, there are two methods of combining efficient government with an advance in self-government in the colonies: the first is by the retention of an official majority in the legislature, and the second is by the grant of an unofficial majority but with certain reserve powers retained by the Governor. The first method probably allows government to be more efficient because legislation can be enacted in exactly the form desired. The second allows it to be more popular. Hitherto, it is the first system that has prevailed in Africa, but the Gold Coast is to have an unofficial majority, for eighteen of the thirty members of the new Legislative Council will be elected. This in itself is a good reason why the new constitution should be discussed in Parliament. Another is that though it is an important step forward, in some respects it does not go far enough. There is a danger, pointed out by Lord Ammon and frankly recognised by the Duke of Devonshire in his reply, lest in giving people power to talk without at the same time giving them power to act, they are driven into perpetual opposition in order to find an outlet for their energies. As soon as possible, therefore, the people of the Gold Coast should be given some sort of training in administration. On the other hand, it is a difficult territory to promote towards self-government, for it is composed of three very differing parts, and there is always the difficulty that the backward people of the Northern territories may retard the politically conscious Africans of the Gold Coast Colony or that the latter, if given too much responsibility too soon, may submerge the rest. The new constitution, in fact, provides an admirable example of the problems to be solved in the progress of the colonial empire towards independence.

Community Centres

The lack in many areas of proper social, educational and recreational facilities for "leading the good life"—or indeed for leading any active life at all out of working hours—has led to an increasing demand for the provision of community centres. The need is especially great in villages and in new housing estates, where the lack of social consciousness often prevents the use or development of suitable facilities. The report of a committee set up by the Ministry of Education* wisely emphasises that the purely social activities of a community centre should come first both in time and importance so as to foster a sense of community and good neighbourliness. Equally wisely, the committee stresses the social value to every centre of a really good canteen. Only when there is some sense of community can specific activities, such as drama, music or sport, flourish at the centre. Nevertheless, the centre should clearly be built as a whole, and should include facilities for every type of likely activity. This means that their provision will be costly. Existing centres, which are comparatively few, have been set up mainly through the efforts of voluntary organisations, and naturally vary greatly in their standards and aims. In view of the committee's report, it has been decided to make provision of community centres a statutory responsibility and to delegate it to the local education authorities. Many centres will probably continue to be provided by grant-aided voluntary bodies and by housing authorities, who already possess appropriate powers. The Education Act, 1944, offers financial assistance to local education authorities for building and maintaining community centres, but the Committee suggests that at least the warden's salary should come from public funds, although the centre's specific activities should be self-supporting. It is important that the members of a community centre should contribute as much to its running costs as is within their means and that they should elect a council for its day-to-day management. Only through the personal interest and attention of their members can these much-needed centres thrive and flourish.

* Community Centres. HMSO, 1944, 9d.

AMERICAN SURVEY

Advice and Consent

The Senate finally confirmed all six of the State Department nominations before the end of the session, even Mr McLeish, the target of much dissatisfaction, securing 43 votes to 25. Oddly enough, the greatest hurdle was provided in the form of a filibuster, not by the Republicans, but by three good New Dealers, Senators Pepper, Guffey, and Murray, who earlier had joined with Senator La Follette in demanding the withdrawal of the whole list. Their opposition gave way only with a personal assurance from Mr Roosevelt that the new appointees would be removed if they failed to administer a liberal foreign policy. According to one commentator, this episode attests the formation of a left-wing "Young Turk" movement in the Democratic party designed to bring pressure for a "people's peace," but the result seems chiefly to have been the provision of a nucleus for a motley crew of obstructionists. The new spirit of intransigence is very marked. The St. Lawrence Seaway project was sharply defeated despite a last-minute appeal by Mr Roosevelt. The resistance sprang largely from the attempt to submit the measure as an amendment to the Rivers and Harbours Bill; and it is evident that the Senate is on its guard to prevent the substitution of executive agreements for treaties, particularly as this might be applied to the creation of an international security league. The movement to abolish the two-thirds majority rule on treaty ratification appears to have rallied, rather than silenced, upholders of the *status quo*.

The New Congress

The new Congress, elected in November and due to assemble early in January, promises, at least in its upper branch, to provide more support for the Administration than that just disbanded. It will inherit from its predecessor a mass of incomplete legislation, including the Rivers and Harbours Bill; a bill to make it clear that it is the States, not the Federal Government, that control insurance; the amendment of the Civil Aeronautics Act; and the creation of a permanent Fair Employment Practices Commission. Measures like those for a Missouri Valley Authority, and for the St. Lawrence Seaway, which failed to pass in the last session, will be given another opportunity; and a number of new measures will be presented. These will probably include the Dumbarton Oaks plan, the Bretton Woods Agreement, National Service legislation, the broadening of Social Security, and revision of the War Surplus Property Act. On the issues of foreign policy, the new Congress will be quite definitely more progressive than the old, the new line being marked by such changes as the absence of Mr Hamilton Fish from the House and the presence of Mr Fulbright in the Senate. On domestic issues, too, the efforts of Mr Hillman's Political Action Committee may have produced some shift to the Left, though a good half of the Democrats are probably still Conservatives by nature. Mr Roosevelt recently repeated that he was continuing to steer a course "a little left of the centre." The debate on the State Department nominations shows, however, that this provides no immunity from either left or right; and both wings show a disconcerting ability to coalesce in opposition to the White House.

Disquiet on the West

Events on the Western Front have made unnecessary the continued search for new means to bring home to the public, and particularly to war workers, the fact that the war is not yet won. The over-optimism of the summer and early autumn, for which official statements are not altogether innocent of responsibility, has melted in the glare of headlines announcing the worst American rebuff since the loss of the Philippines or even—as one over-excited commentator put it—since 1812. This is a moment when the notorious volatility of the American temperament may have its compensations. Thoughts of further reconversion to civilian

production have been shelved. The War Production Board has announced a new long-range munitions programme based on the assumption that no definite end to the European fighting can be foreseen. Existing production schedules are being raised; there are even plans to construct new trench mortar factories which cannot go into production before August. The demand for a National Service Act has been revived by journals as far apart as the *Herald Tribune* and the *Journal American*; and it is thought that the new Congress at this eleventh hour may give serious consideration, if not to a full-fledged plan of labour conscription, at least to means of drafting labour from surplus to scarcity areas. In the public mind there is bewilderment and dismay at the power of the new German offensive, and the presumed failure of Allied intelligence. The most ironic note has been struck by Mr Raymond Gram Swing's cautious speculation whether it was altogether prudent to have authorised General MacArthur's return to the Philippines at a time when the German capacity for making war remained so great. The diversion of supplies from the Pacific to feed Europe is a familiar grievance in the United States; to see it reversed is a measure of the disquiet over events on the Western Front. But it would be a great pity if the demand for a post-mortem obscures the fact that it is too early to indulge in disunity. In a few quarters it is being pointed out that the Germans are exploiting, and hope to increase, the lack of unity among the Big Three; the offensive has already had the effect of raising doubts about the effectiveness of Russian efforts in Eastern Europe. Such recriminations, as well as the threats of "withdrawal from Europe," are luxuries which cannot be afforded until the Allies are decisively established on that Continent—if then.

"Moral Waxworks"

As the great debate on foreign policy is renewed, there are some unhappy echoes of 1919-20, and the Versailles Treaty discussions. Over-eager mourners assist at the premature obsequies of the Atlantic Charter. Perfectionists describe themselves as driven to cynicism. There is something a little suspicious in the readiness of some of these debaters to be disillusioned. The assumption is that their faith in international partnership was a fragile plant if it could be withered by the first cool breeze. The position is being dangerously oversimplified. The tableau which is presented, of an idealistic America eager to bring into being a world security plan, but thwarted by the wickedness of Europeans intent on the pursuit of power politics, of alliances, and spheres of influence, is all too congenial to the public. It belongs to the "moral waxworks" of American tradition; and Mr Walter Lippmann is one of the few commentators of note to counter this great revival of a favourite folk legend. Mr Lippmann has pointed out that it is not possible for Britain, Russia, and France to trust their future to the American policy of "noble negatives"; and that it was unrealistic to postpone territorial adjustments until after the war or to expect nations twice overrun by German armies to wait for the United States Senate to approve the final treaty before protecting themselves against fresh aggressions. It is Mr Lippmann's view that pacts such as the Russo-British and the Franco-Russian treaties form the most solid basis for the eventual security league; and, moreover, that such arrangements are the only way in which the Americans can achieve their aim of disarming Germany for a generation without assuming the intolerable burden of keeping a large American army of occupation in Europe. But the Lippmann line does not appear to be reflected in Washington, least of all in the Senate, where internationalists like Senator Ball have used language almost indistinguishable from that of the Wheelers and Nyes in denouncing "power politics" and in warning people that the Senate may never accept the Dumbarton Oaks agreements. The Isolationists, who may have changed their coats but not their hearts, are making the maximum mischief out of this situation. With traditional emotions and ancestral prejudices aroused there is need for a new leadership to rally public opinion if the gains of the

last three years are not to be lost, something more than Mr Roosevelt's cautious declaration that the objectives of the Atlantic Charter still represent "something pretty good to aim at."

Opening the Closed Shop

One of the less-publicised results of the November election was the decision in Florida and Arkansas to outlaw the closed shop in union contracts. An amendment to the state constitution to this effect was submitted to the voters in each of three states, but in the big war-industry state of California it was defeated. The "right to work" amendments ran to the effect that

No person may be refused employment because he is or is not affiliated with a labour organisation, but this pretence of non-partisanship has deceived no one except, perhaps, a few of the voters. In Arkansas, even the maintenance-of-membership clause (that is, insistence that any employee who joins a union should maintain his membership), which has been the favoured device of the War Labour Board for stabilising industrial relations, was outlawed; and in this state the campaign for the amendment was chiefly carried on by the Christian American Alliance, which has sponsored a large volume of anti-labour legislation in the past. The fate of the amendments is not being accepted as final in any of the three states. In California, where labour was strong enough to defeat it, another proposal, said to be "a hundred times worse," is being circulated by an organisation known as "Women of the Pacific" and its chairman, Mrs Selvin, who considers it her mission to save the Pacific for the "American plan of the open shop." Labour organisations are preparing to fight the results in Arkansas and Florida, carrying the amendment, if necessary, to the Supreme Court for a decision on its constitutionality. Any court decision reached before the end of the war may follow the precedent of Wisconsin, where a similar law has been suspended on the ground that the war powers of the federal executive take precedence over state law during the emergency. After the war it is by no means certain that

the Supreme Court will uphold labour's contention that the Wagner Act invalidates state legislation against the closed shop. What is clear is that the decision, whichever way it goes, will have its most profound repercussions in the South, where, despite rapid industrialisation, labour is still comparatively weak, and where the pattern of labour relations is still fluid.

Sixth War Loan

Mr Morgenthau announced last week that the sixth war loan drive had been oversubscribed, in all, by over \$5 billion; and that both the quota for individual savers and that for banks and insurance companies were met with margins to spare. Sales of "E" Savings Bonds, designed for the small saver, appear to have been disappointing, but that may be because the goal was set too high. The same cannot be said of the drive as a whole, which aimed at a total \$2 billion less than that of the Fifth War Loan campaign. The drive, which ended on December 16th, was, however, the third in eleven months; and with subscriptions to the previous five loans totalling \$38 billion, it perhaps seemed prudent not to set the sights too high at a time when there was widespread optimism about an early end of the war. Certainly in view of the heavy spending on luxuries and entertainments, the goal of \$5 billion for individual savers does not seem excessive. In the last drive it was set at \$6 billion, and this was oversubscribed. These savings figures seem large, but they must be related to a year's civilian spending of \$97 billion. This time the Treasury extended the restrictions, which earlier campaigns showed to have been necessary. The purchases of commercial banks are not to be counted in the totals; a wide variety of issues was offered, from 25-year bonds to one-year certificates of indebtedness; and a new note was struck by enlisting the aid of commercial and savings banks to cut down the speculative "free-riding" which marked the last drive in some localities. Banks receiving orders for bonds deemed excessively large were requested to withhold the subscriptions and send details to their Federal Reserve Bank.

No. 4 — TRINIDAD

THE Island of Trinidad was discovered by Columbus in 1498 and is said to have been named by him after the three conspicuous peaks, now known as "The Three Sisters." Trinidad first became British territory in 1797, during the Napoleonic Wars. It is famous for its Pitch Lake from which Sir Walter Raleigh caulked his ships in 1595.

Sugar, cocoa and other tropical products are exported and in recent times the development of the petroleum industry has greatly increased the wealth of the Island. Its population exceeds 500,000 and the average annual value of its external trade for the years 1935/39 was over £12,000,000.

The first branch of the Bank in Trinidad was opened in Port of Spain in 1837, followed later by a branch at San Fernando in the oilfields district on the South-West Coast. Those concerned with trade in the West Indies, Africa or the Mediterranean are invited to communicate with:—

BARCLAYS BANK
(DOMINION, COLONIAL & OVERSEAS)
LONDON, E.C.3

TO BUSINESS MEN WHO CABLE IN WARTIME

By carrying out these three simple rules you will save yourself unnecessary bother, help to increase the efficiency of the service, free the Empire's tele-communication lines for vital war traffic.

1 When you dictate a cable by telephone listen carefully while it is being read back to you. Casual checking leads to errors which have to be corrected by more cables.

2 Allow your correspondents ample time to reply before enquiring about your cables. Remember that Government cables must be given priority over others in war.

3 Don't mislay cables sent to you. This causes your correspondents to cable for a reply and thus congests the Empire's circuits with unnecessary traffic.

THE WORLD OVERSEAS

The Working-Class Under Fascism

(From a Correspondent recently in Italy)

ON November 4th last there appeared on Roman bookshelves a slim volume entitled *The Working Class Under Fascist Domination* (1921-43). Its author is Matteo Matteotti, the son of that Giacomo Matteotti for whose murder Mussolini is responsible. And of all the numberless books and papers and pamphlets that have flooded the bookstalls since the liberation of Rome, this brief paper seems to be the only one that speaks directly, and with facts, for the sufferings of the Italian working class since 1921. Set it alongside the record of the easy-going, well-fed Roman bourgeoisie; alongside the hypocrisy of all those Liberal-Catholic groups whose members lived peacefully—but for their fear of Russia—under Fascist administration until it was safe to proclaim their loyalty to the Allies; alongside the prosperity of the big industrialists—and it is easy to see that it was not the middle-class, nor the Church, nor the monarchy (those tried liberals of Savoy) who suffered from the black-shirted terror—but the workers and the peasants. After reading it anyone who had experience of the Italian Army in action will find it easier to understand why the morale of the men was so often wretched and why they seemed so seldom to care if their side won or lost.

Up to 1935, the year of the war in Abyssinia, the figures are well known, being easily obtainable in the annual *Compendio Statistico Italiano*. In his summing-up, which is calm and complete in its condemnation, the author arraigns Fascism under three main headings: the steady increase of unemployment (from 156,400 in 1925 to a figure which after 1932 never fell below one million), the alarming increase of industrial casualties (from 134,336 in 1921 to well over half a million in 1942—exactly comparative figures lacking), and the equally steady and alarming fall in the quantity of foodstuffs consumed by the working-class, a phenomenon about which plenty of statistics can be quoted.

But more interesting, because elsewhere unobtainable, are the parts of the paper that deal with the war years. There is a great deal of paper printed about prices remaining stable; but prices nevertheless rocketed upwards out of sight and did not return to earth (nor have they yet). Wages of course, cannot be raised; for there is a war on, and everyone wants to show a spirit of sacrifice.

The wages of the absolute majority of the entire working class of our country (industrial and agricultural) have been increased only from 40 to 80 per cent. in these four years of war, while a minority of several hundreds of thousands, even if they have succeeded in getting the level of their wages up to 120-150 lire a day, cannot say they have done better than an increase of 150-200 per cent to offset what has been a more than ten-fold increase in prices for the period 1939-43.

Real wages sank to unthought-of levels. Many individual cases are quoted. Ansaldo at Genoa increased its capital on March 29, 1943, from 250 to 500 million, between 1939 and 1943 its ordinary share-price went from 38.25 lire to 254 lire; prices in general in Genoa are said to have risen by 800 per cent; but the general level of wages at Ansaldo's increased in the four years by about 20 per cent. At the Vivaldi naval shipyards the basic level of wages rose from 3.05 lire per hour in 1939 to 3.40 lire in 1943. Skilled workers at the Gallieni-Vigano in Milan obtained wage increases of about 30 per cent during the course of the war, whilst prices rose by more than 800 per cent. In the shipyards Odero Terni Orlando of La Spezia, skilled workers out of a total of about 4,000 workers had wages raised from 2.47 lire in 1939 to 3.42 lire per hour in 1943, whilst the rest had wages raised over the same period from 2.14 to 2.92 lire per hour. It is the same story in Turin and other industrial centres. Agricultural workers fared even worse.

It is not until the great strikes in Milan, Turin and Genoa of March and November, 1943, that some effort

can be seen to remedy this appalling state of affairs. Both strikes resulted in a general rise in wages: in the first case they rose from 14-20 per cent for office-workers and 20 to 30 per cent for factory workers, and in the second there was a general rise of 15 per cent on previous levels, together with certain provisions for the reparation of air-raid damage, the aim being to establish a minimum weekly wage (cf. *Corriere della Sera*, November 25, 1943, quoting minima as follows: workers 14-15 years old, 110 lire weekly; 16 to 18, 150 lire; 18 to 20, 200 lire; and over 20, 230 lire. For women 14 to 16, 100 lire; 16 to 18, 120 lire; over 18, 150 lire). Prices, meanwhile, rose between March and November, 1943, to levels often over 1,000 per cent of the 1939 level, thus wiping out most of the benefit. Allied bombing and the German occupation meant heavy unemployment.

No Protection

Apart from the question of the level of real wages, it must be remembered that there was a general and marked degeneration of the whole *curriculum vitae* of the average worker. Not only were overtime rates steadily cut down, the fabric of protective legislation was destroyed and in its place there was erected the dictatorship of the employing and governing oligarchy. The right to strike was abolished. Stoolie unions (corporations) were set up in architectural atrocities along the quiet streets of Rome. All question of limiting hours of work went by the board.

From official figures there were, in September, 1925, 500,945 workers out of a total of 1,798,429 (in 22,096 factories and workshops) working more than 48 hours per week. In 1928 another set of statistics gave 138,376 workers in 5,456 factories and workshops out of a total of 908,790 workers as doing more than 48 hours work a week. Figures become unreliable after the Abyssinian War; but many individual cases are cited which show that conditions became steadily worse. In Milan, during the period 1937-42, a high percentage of workers at Falk, Pirelli, Marelli, Gallieni, Isotta-Fraschini and in many other factories are said to have worked regularly from 10 to 12 hours per day. Restrictions on Sunday work were ignored or got round. The legal allowance of six days holiday-with-pay for each industrial worker was defeated by the regular practice of discharging workers shortly before their year's work was completed and taking them on again later. At Ansaldo's, in Genoa, hundreds of workers in 1943, engaged in making armoured cars, etc., had had no holidays for eighteen months. Together with excessive hours of work in one industry went half-employment or less in others.

The reality of this is shown by official figures (*Annuario, 1937, Confed. Fasc. degli industriali*) that give 19.1 per cent of a total number considered of 1,156,000 workers as working less than 40 hours per week. Almost no attempt seems to have been made to effect an intelligent transfer of workers from industries which suffered during the war, to industries working indirectly for the war. Women, it seems, were drafted largely into industry; and in 1939-42 more than 180,000 women were so employed, working in arms factories for an average of nine or ten hours a day. At the arsenal of La Spezia in 1941-43, 500 women made arms at a sweated wage of 1.90 lire per hour with 15 per cent more for overtime. The average level of women's wages was between 50 and 70 per cent of the wages for men and boys. Child labour increased under Fascism. According to *Comp. Stat. Ital.*, the number of children under 15 increased from 1931 to 1935 from 26,880 boys to 82,862, from 38,218 girls to 76,603, and this at a time when the number of unemployed adults was well over the million mark.

As the war years drag on, the misery of the Italian

working-class grows more acute. War conditions force workers to change their homes and, with rapidly decreasing means of public transport, to trudge weary miles to work. Air-raids on the great towns of the north make things many times worse. In 1940-42 war industries are placed, for reasons of national defence, under special regulations. Fines become heavier. The first day's absence from work, when not immediately announced, is fined by the subtraction of half a day's wage; the second day's absence is met with arrest. The author rounds off the picture by showing how the wages that the worker got, wretched though they were, were even then systematically milched as a regular means of income for the *gerarchia* in forms of social, health and unemployment insurance.

From 1920 to 1940 the difference between receipts and outgoings in the balance-sheet of the Istituto di Social Wellbeing (*Istituto di Previdenza Sociale*) reached the colossal figure of 15 milliards.

The number of industrial casualties indemnified by the Istituto Infortuni dell' Lavoro (INFAIL) rose in the period 1922-32, then remained almost level in successive years, while casualties rose by about 60 per cent between 1932 and 1939.

The authenticity of these statements cannot well be questioned for the main part, since they were based on the very cautious figures issued by the Fascist regime itself; no authority is given for the individual evidence advanced by the author, but there seems no good reason to doubt their substantial correctness. The book is issued with a commendatory introduction by Pietro Nenni, the general secretary of the Italian Socialist Party, and it may not be inapt to quote in conclusion from a recent pamphlet of their allies, the Italian Communist Party, the following sentiments:

It is not a question of offering this or that portfolio to this or that representative of the workers' parties. It is a question of giving greater weight to workers' organisations at every point and moment wherever and whenever they make contact with society: in industrial and agricultural reconstruction as in the affairs of government, in central and local administration as in the conduct of the war. It is a question above all of putting across the idea that Italy is not an abstract entity but a concrete reality; and that Italy is served only when the people of Italy is served, and that means essentially the workers of Italy. . . . In the last years it has been everywhere shown that a policy of social reaction is necessarily anti-national in so far as it leads to the decay of national culture and the destruction of independence.

Of this belief and this conclusion, Mr Matteotti's book is eloquent testimony.

Deflation in Palestine?

[FROM OUR JERUSALEM CORRESPONDENT]

Currency figures expressed in Palestinian pounds unless otherwise indicated.

By the end of this year, Palestine's investments in British Government securities and London bank deposits will have reached a total of some £100 million sterling, and the accumulation of liquid assets inside the country continues almost at the same rate as last year, that is, by £2-3,000,000 a month. There has, however, been a marked change in the composition of these assets. Whereas in 1942 over one-half of the additional purchasing power went into circulation, last year the proportion was only about a third and this year it is rather less than a quarter; moreover, part of the additional currency is being hoarded. There is also a slight but persistent rise in fixed deposits. The bull market for local securities, gold and real estate has come to an end. The index of wholesale commodity prices is somewhat higher than it was a year ago, but black market activities have declined, and the cost-of-living index of the Wages

Committee is now about the same level as in the autumn of 1943—about 150 per cent above the pre-war level—whereas the cost of living is steadily advancing in Syria and in Egypt.

This relaxation of the inflationary pressure has been partly due to the greater volume of imports, which in 1943 were less than half the pre-war amount, and to the prospects of further improvement next year. Moreover, military demands, which in 1942 accounted for about a third of the total national income, have slackened somewhat, although the volume of employment and of production was maintained and even, in some cases, expanded, so that larger quantities of goods are available for civilian consumption. Additional factors have been the influx of gold; increased saving, particularly in connection with building schemes; the release of consumers' stocks; and an improvement in the administration of controls, which was encouraged by the vigilance of the recently appointed War Economic Advisory Council. Moreover, the windfall profits accruing from the inflationary process declined as the local economic war effort shifted to its modern industrial sector. It has been estimated that, already in 1943, out of the 30 per cent increase in the output of goods and services compared with 1939, at least three-quarters were accounted for by industry and transport, which have doubled their output, while modern mixed farming increased its production by 50 per cent, compared with an increase of some 10 per cent in primitive agriculture. The relative shares of the various sectors in the monetary income had, however, hardly been affected. Even so, the excess of national income over national outlay in 1943 was, in monetary terms, only equal to the excess in the previous year, according to a calculation of the Government statistician, in spite of the rise in prices, the depletion of stocks and the further decline in consumption (in 1943, total consumption was some 17 per cent less than in 1939 and civilian consumption some 23 per cent). There is reason to believe that this trend was even more pronounced than in 1944.

The following table may help to illustrate these developments:—

	1939	1942	1943	1944
National income (£ million)	32.7	79.3	93.4	...
National outlay (£ million)	41.5	66.5	80.4	...
Average cost-of-living index	100*	187	229	238†
London investments at year-end (£ million sterling)	20‡	50	75	100†

* August.

† Estimate.

‡ Middle of year.

Palestine's sterling balances cannot thus be regarded as having been accumulated from inflated profits. Indeed, out of the £80 million sterling added since the middle of 1939, about two-thirds have been the result of imports of capital, mostly from Jewish sources, and the equivalent of stocks and equipment that cannot under present circumstances be replaced. Moreover, the proportion accounted for by capital imports is steadily growing—and already amounts to more than half of the accruing balances—and the pre-war situation, in which Palestine regularly paid for its huge import surpluses with the aid of capital imports, is thus returning. There is little doubt, too, that in the post-war period of construction and reconstruction this import surplus will increase in spite of efforts to boost the export of products of local industry. But both the dependence on foreign capital and the export drive demand a radical adjustment of the local price level to that of the world markets.

Prices and Industry

No wonder, therefore, that price deflation is now the central problem of Palestine's economy. The demand is voiced for increased imports at reasonable prices (on the average, the import trade accounts for about a third of the total national income, and its price level is now about three times as high as in 1939) and for the discontinuation of the Government's policy of subsidising cereal farming with the aid of surcharges on vital imports (it has been estimated that the subsidy now accounts for some 25-30 per cent of total agricultural income). On the other hand, the local economy has somewhat accommodated itself, during the prolonged period of relative stability, to the inflated price level, and there is a widespread apprehension on that the uncontrolled import of consumer goods may prove detrimental to local industry and to intensive agriculture. Various schemes have been prepared for an orderly lowering of the price level, so as to disturb local production as little as possible, but so far no policy has been decided.

THE BUSINESS WORLD

Courtaulds and Celanese

THE market flurry, with its background of directorial inadvertence, erratic share movements and polite admonition by the Stock Exchange Committee, which followed the declaration of a first ordinary dividend by British Celanese, tended somewhat to distract public attention from the historical importance of the event. Though the vagaries of wartime taxation contributed appreciably to the ability of British Celanese to open its equity score in a manner so resounding (in every sense), there can be little doubt that the event, if anything, was overdue. If the company's financial structure had been less complex, the company's financial vicissitudes had been less baffling to the investor, and if the company's advisers had taken a more Alexandrine course in cutting the Gordian knots which were the balance-sheet legacy of the more troubled days of the company's history—then, the industrial share market of the Stock Exchange might have lost its Number One speculative counter, but the company's shares would have gained an investment status more befitting the equity in one of the two leading concerns in the artificial silk industry. After twenty to thirty years of fiercely competitive evolution, that is the position that has emerged. Courtaulds, former crêpe makers, and British Celanese, ex-manufacturers of aeroplane dope, remain in possession of a field that includes others, but none of even approximately equal standing. This war has closed a definite chapter in the growth and development of both concerns, and of their industry. What is the post-war period likely to bring?

The twenty years before the present war saw the British artificial silk industry through its pioneering commercial phase in which it established its right to rank among the leading textiles. The period opened, fittingly, with a vast "bonus" capital issue by Courtaulds which, seen retrospectively, appeared as a gesture of challenge to all competitors, in the industry itself or its older rivals. The period closed, equally fittingly, with an internal price agreement which brought the era of primitive competition to its close. Even in 1939, it was clear that a new epoch was opening, in two distinct ways. Technically, artificial silk had always been a trade with a dual character. It was certainly a textile industry—there was no doubt about that. But its kinship with the chemical trades was no less apparent. A time was obviously bound to come when, internecine struggles being over, its leading productive units would have to work out, much more closely, their relationship with other textiles, especially cotton, and decide how far, and in what specific directions, they should go in for developing production in new fields of technical invention outside the textile trades altogether. The war has not changed that essential set of problems, but, on the other hand, it has left Courtaulds with a treasure chest worth approximately £45 million, partly through forced sale (at a not unprofitable figure) of its great American Viscose subsidiary, and has, on the other hand, expedited the technological advance of non-textile industries in which producers with capital resources, or the command of them, are capable of playing a substantial future part, if they choose.

Of the two companies, Celanese has, perhaps, been the readier to give various inklings of what its intentions may be. Some months ago it registered a new subsidiary called Products Development, which, the chairman, Dr Henry Dreyfus, declared at the last general meeting, is intended to "produce all the raw materials which are important from an economic point of view in the form of the intermediate chemicals needed for final textile and other products." All types of synthetic rubber, the chairman declared, were to be manufactured, together with new plastics combining the qualities of the two present main types, the thermoplastic and thermosetting types. In the preceding November (of 1943), Mr Oliver Lyttelton, Minister of Production, had already announced that a licence had been granted to a British company to undertake the bulk manufacture of synthetic rubber in this country, and it was widely known that the producer would be British Celanese. It was under-

stood, at the same time, that the first production stage would be reached in about eight months.

The Celanese organisation extends to both sides of the Atlantic. American Celanese has been pushing ahead fast, in wartime conditions which obviously have been congenial to rapid growth. For the production of what may be broadly termed organic intermediates chemicals, which are to play so important a rôle with the new British subsidiary, American Celanese has recently erected plant at Bishop in Texas, well placed strategically for petroleum chemical supplies, which appears to have been planned with an eye to intensive exploitation of new groups of plastic products, including phenolic (coal tar) and vinyl and acrylic (non-coal tar) resins. American Celanese also has a process for manufacturing the butadiene type of synthetic rubber from alcohol derived from waste from sulphite mills. The logical outcome of all this would seem to be that, eventually, the Celanese group will rank among the world's leading producers, not merely of intermediates but of finished "new" products in the fields of plastics, dyes, drugs and fibres, etc.

In the case of Courtaulds, the chairman, Mr Samuel Courtauld, has shown characteristic circumspection in discussing his company's post-war plan of campaign. The Courtauld list of products is already long, but it lies mainly inside the textile field, in its broadest sense. The company now makes rayon yarn and manufactures, "fibro," staple fibre, viscose wrappings and paper and Nylon (a joint interest with Imperial Chemical Industries). Some of these, particularly Nylon, are only in the first phase of what seems destined to be a wide expansion of production. Some of Courtaulds' enormous reserve of capital resources will undoubtedly be used in that direction—a figure of £5 million, for example, has been mentioned in connection with the possible establishment of a Nylon plant in Australia. In some quarters, a large new Courtaulds plant in Northern Ireland is being spoken of, for the manufacture of a product of whose nature even rumour as yet claims no assurance.

On the whole, however, Mr Courtauld has succeeded very well in keeping the secret of how the Courtauld millions are to be expended. Nevertheless, he has given interested commentators at least an opportunity of discerning the broad lines of the company's intended strategy. Unfortunately, Mr Courtauld's remarks have been addressed to other quarters besides shareholders, and one object, in the forefront of his mind, clearly was to tell the world that Courtaulds would never be a party to any "in-law" type of restriction arising out of an unwilling marriage of convenience with cotton textiles. "If the cotton textile field is obstructed by artificial barriers we shall be very cautious

about investing large sums in it." What could be plainer than that? If there is any question about Visca living her own life she will take her dowry elsewhere. "In that case there are other directions in which we can turn."

It is these "other directions" which are particularly intriguing to holders of Courtaulds' shares. First on the list, the chairman placed "industries to be developed in this country, other than textiles, which are to some extent allied with our own, and in which our experience is of some value." What these industries are one can only guess, but both the example of Celanese and technical logic suggest that plastics and chemicals were in Mr Courtauld's mind. Next, he instanced the whole British Empire as a field for textile development. "Lastly, there is the rest of the world, not excluding the United States, where so lately we had a very large share in the rayon industry." That again, is a challenge. Courtaulds has never made any secret of the distaste with which it viewed its enforced expulsion, in the interests of British Treasury finance of the war effort, from the American manufacturing market, where American Viscose had built up something that came near to being a commanding position. It may not be wildly wrong to credit Courtaulds with willingness, if need be, to use no inconsiderable part of the money compensation for its ejection from the American field as the price of its return. If so, the potential expenditure may be heavy, and it would be out of harmony with the careful tradition of Courtaulds, with its Huguenot qualities, if any unlimited commitments were envisaged before there has been any opportunity really to see how the land will lie in that direction. In the last resort, business wisdom will doubtless take precedence over any territorial ambitions. "Probably we shall want to develop to some extent in all these direc-

tions, in order that our business base may be as wide as possible. . . . We certainly believe that we ought to be able to find plenty of profitable openings somewhere for most of our large capital reserves. . . ." So inquirers are left with a question-mark, but not entirely without clues to the lines opportunism is likely to take—the home market first, given a fair field and no favour, the British Empire next, the company's European interests and affiliations to be re-examined when the war-fog clears, opportunity for reversing the American tragedy (from the company's viewpoint) to be awaited, and plastic and chemical developments to be kept in mind.

If one had to put all this into an investment context, one would be tempted to say that the shares of Courtaulds and British Celanese offer an interesting problem in contrasting probabilities. Courtaulds has plenty of capital, but investors have only a limited knowledge of what its post-war intentions actually are. British Celanese has made conservatism about its objects much less of a virtue, but in order to obtain the wherewithal to carry out even part of what it has clearly in mind, it will, sooner or later, apparently have to come to the market (or to whatever Investment Board may be presiding over affairs) for substantial amounts of new capital. Of the two shares, Courtaulds' ordinary and British Celanese ordinary, the latter are much the more highly geared and (deservedly in the light of past history) the more "speculative" in the widest sense. As representative holdings in companies on the threshold of very important and far-reaching developments which, under able, forthright and enterprising management, are destined to carry them very far, but whose nature at present can only be seen in the broadest outline, both offer interesting possibilities.

The Paris Discount Market

ONE of the most interesting developments of the French banking system during the years of German occupation has been the growth of the discount market in Paris. This phenomenon is not a product of the occupation period. The beginnings of such a market had appeared in the late 1920's. Nor should its subsequent growth be regarded as a direct result of the German occupation, but rather of the exceptional expansion of the French national debt required by the deficits and the German exactions of the occupation period. In the special circumstances of those four years the borrowings of the French Government to meet occupation costs and to pay the contractors whose goods went to Germany had, in large part, to be short-term borrowing. Between the end of 1939 and April, 1944, the internal national debt in France rose from Frs. 445,742 million to Frs. 1,417,000 million. Within this total the long-term consolidated debt hardly changed, increasing from Frs. 303,051 million to Frs. 420,900 million. The floating debt, over the same period, increased from Frs. 142,691 million to Frs. 996,100 million. The banks took up the bulk of these securities, and with this large increase in the supply of short-term paper it is not surprising that the market in it should have developed rapidly.

There are now five specialist institutions in Paris which may be said to constitute a discount market. Three of them date from the pre-war era. The oldest and largest is the Compagnie Parisienne de Réescompte, which was established in 1928. It has issued capital and reserves of Frs. 120 million. The two other pre-war institutions are the Caisse Centrale de Réescompte and the Banque d'Escompte. The first of the discount companies to be founded during the war is the Société Privée de Réescompte. Finally, a fine gesture of acknowledgment to the London market, comes l'Union d'Escompte. These specialist institutions have during the past few years been joined by a number of banks formed originally for other purposes but drawn to the discount market for lack of business in their previous calling and by the opportunities offering in discounts. The Banque Française d'Acceptation may be taken as a typical example of these institutions which do a mixed business and are in the market without being it, rather as Blydenstein and Company were in relation to the London discount market before the war.

The trade of the Paris discount market is almost wholly in Treasury bills. These are issued by the French Government in a variety of dates. The shortest bills are available for any period between 75 and 105 days, the choice resting

with the bank which applies for them. They are on tap at a fixed rate, which is now 1½ per cent. These bills are only issued to the banks. Then come the Treasury bills available on tap both to the banks and to the general public. The six-month bills are at present placed at 1½ per cent, the one-year bills at 2 per cent and the two-year bills at 2½ per cent. These securities, together with a small trickle of commercial bills, make up the bulk of the market's stock-in-trade. As a general rule, these houses do not hold securities having longer currencies than the two-year Treasury bills. The running and trading in bonds having up to five years to run is a development which they have yet to copy from London.

The specialist institutions are, for the most part, modestly capitalised, and the bulk of their bill portfolio is financed by short loans. This short loan fund is provided by the banks and also by certain official institutions such as the Caisse des Dépôts. The bulk of the short loan fund consists of day-to-day money which has been available throughout the recent years of monetary expansion in abundant quantities. The current day-to-day money rate is 1½ per cent, but the quotation has on many occasions fallen below this figure. In addition, the market works with monthly fixtures from the banks. These have recently been arranged at 1½ to 2 per cent. Monthly fixtures have also been obtainable from the Caisse des Dépôts, but the rate of 2½ per cent demanded for them has left little margin on the current level of Treasury bill rates.

The present size of the market and the relation between its own capital funds and the loan capital which it utilises cannot be defined with any accuracy, but the following balance-sheet of the Compagnie Parisienne de Réescompte for the end of 1942 gives an indication of the position. It should be understood that the figures have expanded appreciably since the date of this document.

LIABILITIES		ASSETS	
Francs (000's omitted)			
Paid-up capital	47,000	Cash	848
Reserves	7,547	Bills	989,502
Purchases to be settled	1,778,906	Sales to be collected	949,412
Owing to banks	22,218	Sundries	903
Unearned discount	69,237		
Sundries	4,474		
Profit and loss	11,283		
Total	1,940,666	Total	1,940,666

The feature of this balance-sheet is the dominant importance of the items "purchases to be settled" and "sales to be collected." This gives one an indication of the importance of forward operations in the Paris discount market. Bills and bonds are bought and sold for future delivery on a scale which is quite foreign to the London market. The importance of these figures also reflects the extent of the *pension* business in the Paris market. A *pension* transaction is one in which a buyer of securities raises the cash for his purchase by putting the securities in question *en pension* with one of the banks. This, in effect, means that the bank pays cash for the securities with an undertaking to resell them at the same basic price one, or two or even six months hence. The discount is calculated in the case of both purchase and resale on the unexpired life of the security. This is the sphere of activities in which the Paris discount market approaches nearest to the bond operations of the London discount market. Most of the *pension* business being done in the Paris discount market is in short-term Government securities such as Bons du Trésor.

The ultimate basis of all operations on the Paris market is access to the Bank of France in the event of trouble. All the discount houses have rediscount and loan facilities with the central bank. This help, when it is required, is usually made available by way of short loans, against which the bank charges the official rate of discount—at present 1½ per cent. The French bank rate, unlike that of the Bank of England, is not a penal rate and generally stands slightly below the open market discount rate. Since all important French banks have rediscount facilities with the Bank of France and can use them on such comparatively favourable terms, it may be questioned why a discount market should function at all. The same question might now be asked of

the London market, since direct contact between the deposit banks and the Bank of England has been established through direct operations in bills and through the inauguration of the Treasury deposit receipt system of short-term Government borrowing. The French banks may have readily available rediscount facilities with the central bank, but they have always been averse to using them, except as a last resort. This is partly a matter of prestige, but it has a more realistic basis, namely, the fact that the Bank of France handles a competitive commercial paper business, and any French bank rediscounting commercial paper with the central bank may be excused for feeling that it is giving useful business information away to a competitor. That objection hardly holds now that the bill portfolio is made up almost wholly of Government paper, but since operations in domestic bills will certainly recover considerable importance in France, the banks have every incentive to support a local money and discount market. Moreover, the banks appreciate the convenience and elasticity of a short loan market, where they can maintain their second line of liquid assets, and of a bill market where they can obtain short-dated securities other than those available on tap from the Government. Some of the discount rules of the Bank of France are also calculated to encourage the development of a discount market. Only paper maturing within 90 days is accepted, and this places the whole range of longer dated Treasury bills outside the rediscount facilities. In addition, there is a rigid ceiling to every bank's rediscount account, and these limits have not been adjusted to the post-1939 expansion in the supply of short-term paper. There seems good reason to believe, therefore, that the Paris discount market, whose progress before the war had been rather halting, has now established itself as a permanent part of the French banking structure.

Business Notes

French Liberation Loan

The technical success of the French 3 per cent Liberation Loan is now assured. It was announced from Paris this week that the total subscriptions had passed the Frs. 160,000 million mark, or Frs. 60,000 million in excess of the goal initially set for the operation. It has further been stated that as much as 47 per cent of the subscriptions were made in the form of Bank of France notes, a further 21 per cent in Treasury bonds (probably representing conversion by the banks), and the remainder were paid for by drawings on bank accounts. On this evidence, the purpose of the loan as a deflationary operation would seem to have been achieved, especially in the light of the fact that subscriptions of 100,000 francs (£500 at the official rate) and under accounted for about three-quarters of the total so far attained. The lists have not yet been closed, and it is reasonable to assume that the ultimate subscriptions may approximately double the original expectations. It is impossible to measure the deflationary impact of the loan on the note circulation because the total of the latter is still not published. The latest semi-official information on the subject was that given at the time of the liberation of Paris, when the Bank of France circulation was reputed to be around Frs. 600,000 million. On the basis of the figures given this week, some Frs. 75,000 million of notes should have been absorbed by subscriptions to the loan. This is a useful start in the task of mopping up redundant French currency—but it is only a start.

Holiday Circulation

The estimate of the Christmas note circulation that was made by the authorities when the fiduciary issue of the Bank of England was raised by £50 million towards the end of last month must have been somewhat on the short side, for the peak reached over the Christmas week-end can have left very few unissued notes in the reserve of the banking department. By the Wednesday before Christmas that reserve had been brought down to £8,205,000, and the reserve ratio had touched its low record of 3.9 per cent. The next two and a-half days must have seen the reserve "scraping bottom." By Wednesday of this week, however, notes were trickling back fast, and the reserve shown in the latest Bank return was £11,598,000, with the ratio at 4.2 per cent. Despite the presence abroad of large numbers of British and

Allied soldiers who, last year, helped to swell Christmas spending, the demand for currency over the past holiday has been approximately the same as in the corresponding period of 1943. The return of notes after the holiday has been much more rapid this year than last. The post-holiday Bank return last year revealed a net expansion of £7,660,000 in the circulation. This year it actually shows a fall of £3,393,000.

Stock Exchange Capital

The complaint has frequently been made over the past two decades or more that jobbers on the Stock Exchange are no longer prepared to fulfil their function of standing between the investor and the full force of fluctuations in prices by taking up large positions. It is also occasionally said that brokers fail to benefit from the increased opportunities which exist for giving their clients advice which takes account of the long-term factors affecting prices. The replies of members of the exchange to these strictures vary greatly on some points, but they almost invariably include a statement that heavy taxation is the cause of the trouble. This complaint has been more frequent since the great increase in war-time taxation, but it has been common ever since death duties commenced the process of dissipating the estates of the wealthy. This defence is similar to that advanced by the industrialist when faced with the accusation that his plant is inefficient, and the cases have the common element that neither has been, or is, able to place any sums to reserve without first paying tax on them, while the member of the exchange suffers from the further disadvantage that even if a partner leaves his money in the firm when he retires, it is taxed away in death duties. There are doubtless other elements which have contributed to the changed practice of the jobber, such as the fact that depressions have tended to become world-wide, so that virtually all shares may move together, and a decay in the habit of risk-taking, which is general in almost every field in this country, and may not be entirely divorced from the increased element of arbitrariness arising from Government intervention as well as from the other factors mentioned. Of these factors the only one which is capable of direct attack is the level of tax on profits. It has already been suggested by *The Economist* on more than one occasion

that there should be a partial rebate of tax on profits retained by companies for the extension and improvement of their business. There would seem to be no valid reason why this principle should not be extended to commercial and financial partnerships—with proper safeguards against tax avoidance by the members—provided that measures were taken to see that no damage was done to potential new entrants. This might involve the adoption of the form of companies with unlimited liability by most partnerships—the problems associated with limited liability are complex—but adjustments of the tax laws to remove certain very evident anomalies would remove what is believed to be the greatest hindrance to this process.

Celanese Apologia

As there were still over three weeks to run before the annual meeting, Dr Henry Dreyfus, chairman of British Celanese, issued a statement at the end of last week in reply to the comments which have been made concerning the dividend declaration. He promises at the annual meeting to provide full justification to the satisfaction of the shareholders for the original dividend announcement; he suggests that the secretary of the Stock Exchange should have asked for more information if he thought it desirable, and he states that, in making the declaration, the board took special precautions to put in certain qualifications to make it clear that the payment of the dividend was made possible by an improvement in the profit standard for both the year under review and preceding years. Even at this stage there is no mention of the fact that a large sum, provided for taxation in earlier periods, had become superfluous and had been credited to the profits of the year before paying the 15 per cent dividend. It seems quite impossible to read this into the original statement, and it is a crucial matter, for without this credit earnings would have been only some 2 per cent. As to the suggestion that the Stock Exchange should take special action in respect of individual companies, such a course would seem to be impracticable and, possibly, undesirable. The question of ensuring adequate publicity for company announcements needs investigation, but it is quite clear that the responsibility is that of the company and not of the Stock Exchange. Further, company secretaries ought to keep themselves informed of all matters which affect them. There is, however, a possibility that the Committee for General Purposes would find that a policy of keeping their actions and requirements more prominently before those concerned would forward their objects. As to Dr Dreyfus' undertaking to provide a satisfactory explanation to shareholders, it seems very doubtful whether this is possible. His latest statement tends to confirm the view that the board has a very imperfect idea of what information is required to enable a shareholder to judge the value of his holding. While the promised explanation will be awaited with interest and may, it must be hoped, prove really informative, it cannot remove the imperfection of the original statement.

Lancashire Cotton Statement

Unfortunately, vagueness in preliminary statements is all too common and an example has been afforded in the past few days by Lancashire Cotton Corporation. It may be that, in this instance, some part of the uncertainty arises from the form in which the agencies reported the statement, but in the form presented it appears that the profit is £508,331, after providing £96,167 for maintaining process stock, compared with £576,572 for the previous year after providing £100,000 for deferred repairs. The first question which arises is whether one is to assume that repairs have been fully covered in the past year, but that is not all. The statement goes on to give the amount absorbed by the preference dividend, which this year is given net instead of gross as in the past. The amount involved is not very great, but the change of practice with regard to one dividend naturally suggests the question whether the same change has been applied to the ordinary dividend; that is to say, whether the tax deduction on this occasion includes all tax—many companies have made this change in response to the suggestions of the Institute of Chartered Accountants. It depends on the answer to this question, and upon the treatment of repairs, whether there is a substantial decrease

in profit on the year or not. The question as regards taxation practice would be answered by the simple addition to the statement of the amount carried forward. It may be said that if so important a change had been made the board would have mentioned it in their statement. Unfortunately, experience suggests that such an assumption would not necessarily be justified.

Railways' Postwar Plans

The railways have carried an average passenger load about 125 per cent greater than before the war, but as a result of the withdrawal of services and the reduction in the number of trains, the number of passenger train-miles is 30 per cent less than in 1939. Both the tonnage of freight carried for essential war purposes and the average length of haul have enormously increased, and, measured in net ton (freight) miles, the railways' work has increased by about 40 per cent. At the same time, they have lost no fewer than 113,000 skilled railway workers. The main line companies are now planning to make good "six years' arrears of forced neglect" and have issued an attractive general programme with the object of regaining their pre-war efficiency. As soon as possible, trains, stations and equipment are to be cleaned and repainted; obsolete engines and rolling stock are to be replaced; arrears in maintenance will be made good; and pre-war facilities for newspaper and mail trains, long distance business trains, holiday services with cheap fares and the pre-war frequencies and speeds are to be restored. The schemes include plans for tracks capable of carrying high-speed trains, the reconstruction of bridges, the extension of electrification, and, eventually, the modernisation of stations. Express freight services will be restored and a network of branch line freight services developed, while improvements in ports and docking facilities are also planned. All this is very good news, both for the business man, who now makes necessary journeys under unnecessarily uncomfortable conditions and for the ordinary citizen who wants to be free to make wholly unnecessary journeys without twinges of conscience. The travelling public has put up with so many discomforts and inconveniences in war-time that it will expect a high standard of efficiency and comfort in the future. The companies' plans are, of course, very much in the air still, and the speed at which they can be implemented depends upon the release of materials and labour. Rather vaguely, they promise that "co-operation with the roads will be developed"—it would certainly not be in the interests of efficiency to have a repetition of the inter-necine road-rail competition of the early 1930's. The companies also say that when the plans for the re-location of industry and alterations in town and country planning are known they will disclose their full plans. The companies' policy for freight charges may, however, be a major factor in determining the location of industry.

Rundstedt and Bullion Prices

One of the effects of the German offensive in the Ardennes and of the consequent fears of a considerable prolongation of the war has been to set the prices of bullion in the Bombay market rocketing. Silver, which on December 14th was quoted at Rs 126/8 per 100 tolas, had by the beginning of this week reached Rs 135/8. The price of gold had moved similarly from Rs 66/11 to Rs 78/4. These considerable increases have taken place despite consistent official sales of gold amounting to 75,000 tolas daily and official sales of silver which have been increased from the previous daily quota of 300 bars to 1,000 bars. The rise in the price of gold may in some measure be explained by the advent of the Hindu wedding season, when up-country purchases of gold normally make a steep seasonal increase. The main factor at work, however, both in the gold and silver markets, has been the speculative demand based on anticipations of a longer duration of the war than those held a few weeks ago. With the improving news from the Western front in the middle of this week, Bombay speculators began to unload, and last Thursday's opening quotations—namely, Rs 72/14 for gold and Rs 130 for silver—show considerable reactions from the highest figures touched in the early part of this week.

Allied Notes

The facilities given to members of the Forces returning from liberated countries to exchange French, Belgian and Dutch notes into sterling at the official rates of exchange have inevitably led to some abuse. There are flourishing black markets for sterling notes in France and Belgium, where the rates offered are rather more than twice the official quotations. The temptation to arbitrage between black and official markets has been too great to be resisted, and the right of members of the armed forces, separated from their units, to reconvert into sterling at the official rate French, Belgian and Dutch notes up to the equivalent of £25, has lent itself to this type of traffic. Earlier this month, therefore, these conversion rights were reduced, the limit in all cases being brought down to £5. The volume of illegal traffic to which these facilities have given rise is probably small since holdings of local currency are normally exchanged by returning soldiers with their own paymasters—transactions which receive extremely well-informed scrutiny. The black market in sterling notes in the liberated countries is fed, in the main, from stocks of currency previously held in the countries in question, and by a certain amount of smuggling of sterling notes. Recent prosecutions have indicated how such smuggling takes place, and have also underlined the heavy risks and penalties to which the traffickers lay themselves open. A certain leakage of notes is almost inevitable so long as the state of confidence in the liberated currencies is such as to give rise to black markets in which the rates quoted vary violently from the official quotations.

Wool Prospects

The International Wool Secretariat is financed by a statutory levy on wool produced in Australia, New Zealand and South Africa. Until recently the levy was 6d. a bale, but it has since been raised to 2s. in Australia; no announcement of a similar increase has come from the other two countries. The levy finances the International Wool Publicity and Research Secretariat Fund, which was chiefly expended by the London office of the Secretariat in advertising wool fabrics. The press, dress parades, films and displays of various kinds, including exhibitions of manufactured products, as well as other means of advertising, have been used. The Executive Committee last week completed a meeting, lasting a fortnight—the first full meeting since 1938. It decided to publish a *Wool News Service* and to study economic developments affecting wool. The expansion of its scientific research programme at Leeds includes the improvement of new processes such as shrink-proofing and moth-proofing and the softening method that takes the "tickle" out of wool. The utilisation of by-products and new aspects of textile engineering will be studied. Special attention is to be paid to the needs of vast potential markets such as Russia, India and China. A branch office of the IWS is to be set up in New York, and the Paris office is to be re-opened.

The Wool Industries Research Association at Leeds, formed in 1937, struggled on with the help of a Government grant, subscriptions from the wool industry, and, of course, the contribution—its largest—from the IWS. Some reluctance on the part of English mills to support its work arose from the selfish and shortsighted view that the invention of a new process does not bring additional profits to one firm only, because the process is simultaneously made known to many competitors. This is probably one reason why several firms are even now experimenting with private non-shrink processes, even though the WIRA's own process has been highly successful and has saved the Allied armies tens of millions of pairs of socks and millions of under-garments. It is possible that the promised spurt in the activities of the IWS springs partly from the fact that at the end of the war the British Government will hold the equivalent of three clips purchased at a price considerably above wool's pre-war economic value. For three years or even longer after the war, the Government will hold enough wool to be able to break the market and ruin the grower if it sold its stocks quickly. Similarly, as each year's clip is shorn, the grower will hold enough wool to prevent the economic sale of the Government's stock. Co-operation seems inevitable, but even then, competition from synthetic fibres is likely to be so severe that wool will have to fight for markets. It cannot fight on price, because that would

spell ruin to at least one grower out of four in the fine wool areas. It can only compete by virtue of the valuable qualities it does not share with other fibres. It is for the discovery, adaptation and advertising of these that the International Wool Secretariat and the Wool Industries Research Association exist.

The Jute Industry

During the past eighteen months the jute industry has been suffering from a shortage of jute yarns, due to lack of labour. About three years ago demand for both yarns and cloth fell and over half of the workers were withdrawn from the industry. About a dozen mills and factories were closed and a fair percentage of machinery silenced. The scarcity of jute yarns has now become so acute that the Government has requested all ex-operatives between the ages of 18½ and 50, who have been employed in the spinning mills for six months or more since January 1, 1937, to register at employment exchanges, with a view to redirection to the jute mills. Supplies are urgently required to meet essential war needs and for linoleum hessians and carpets. At least one thousand additional workers are needed at once to satisfy the existing demand for bags of all kinds for foodstuffs and other stores, for cloth for emergency runways for aircraft, and for camouflage work. Jute manufacturers have been working under a quota system for the past twelve months by which they are limited to the consumption of a certain quantity of yarn each quarter. If a sufficient increase in the production of yarn can be made, supplies would be allocated to the clothing and furniture trades. To make this possible, the Jute Controller intends to substitute Calcutta cloth and bags of the ordinary makes, which can be, and are being, imported into this country, for those which have hitherto been manufactured by Dundee firms, thus allowing Dundee manufacturers to return to the making of their main constructions. These goods are of most interest to producers for the post-war years, so that an early start could be made to recapture export trade,

You'll enjoy a cup of BOVRIL

For its delicious flavour, for the way it warms and cheers, for the grand feeling of well-being it gives, take a cup of hot Bovril. The war has changed many familiar things, but the high quality of Bovril remains the same.

In bottles—1 oz. 7½d.; 2 oz. 1/2; 4 ozs. 2/11; 8 ozs. 3/9; 16 ozs. 6/2

which has been so drastically reduced during the war. The total exports of jute piece-goods during 1943 were only 9,182,000 square yards, compared with 83,853,000 square yards in 1938. Meanwhile, spinners and manufacturers are working to the fullest capacity which their labour force will allow. There appears to be no scarcity of raw material for spinners who are able to take on more workers. To ensure a good supply of labour for the future a committee has been appointed to look into the conditions prevailing in the mills and factories and to recommend improvements both in working conditions and welfare arrangements, which have been very much neglected in the past. This is a most urgent aspect of recruitment, otherwise women workers who have become accustomed to modern well-laid-out aircraft and ROP factories, with adequate welfare arrangements, would find conditions as they knew them in jute mills before the war intolerable.

Argentine Rail Merger?

Mr B. H. Binder, the chairman, was able to point at the annual meetings of the Argentine North-Eastern and the Entre Rios Railways to an increase in the net receipts of both companies, although the increase in the latter case was very slight, due to less adequate supplies of wood for use as fuel in its zone. Indeed, the Entre Rios fuel bill for 1943-44 was over 50 per cent higher than for 1942-43. Both companies, however, are able to report progress in paying off arrears of debenture interest, as is the Central Argentine Railway. Mr Binder pointed out that the effect of the settlement reached by Sir Montague Eddy was that the Argentine Government waived their claim for the payment of wage retentions and allowed the new wage increases to be met by a 10 per cent rise of freight charges for goods, livestock and parcel rates; in other words, the railways are back where they were before the Argentine Government made these unjustifiable demands. Mr Binder gave it as his own opinion that, despite the rejection by the Government of the suggestion for joint working, the amalgamation of the

four main British-owned Argentine railways, with arrangements for the smaller lines to join the scheme, is a more likely possibility than their purchase by the Argentine Government. It has still to be proved that such amalgamation would increase the railways' efficiency, and Mr Binder may in fact have been expressing only his own hopes.

Taxation of Malayan Companies

If the experience of Southern Malayan Tin Dredging is any guide, the worst that can happen to companies in occupied areas with regard to taxation is that they shall be deemed to have suspended trading in December, 1941. In the case of that company, this means a substantial tax refund, but it has the option of being regarded as having traded throughout the period of occupation, if it is ultimately found that tax payments would be lower on that basis. This seems to be a substantial concession, but a reasonable one in view of the fact that the resources of all these companies are likely to be severely taxed by the costs of rehabilitation. It remains to be seen how far these will be covered by compensation payments, and the settlement of that question has to be postponed until the cessation of hostilities makes it possible to assess the total damage. Meanwhile, it seems that, in addition to the time needed to construct new dredges, there is likely to be delay arising from a shortage of engineers with experience in this particular field. In pre-war days most of the mechanics were Chinese, and it is feared that there may be an acute shortage for some time. This is only one aspect of the problem of the dissipation of the labour force which will affect, in greater or less degree, extracting and manufacturing industry throughout the area of occupation, except insofar as the local labour force has been kept together by the Japanese. The problem is likely to be complicated by political considerations, but once the period of acute and

(Continued on page 878)

COMPANY MEETINGS

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

ANNUAL MEETING OF STOCKHOLDERS

The nineteenth ordinary general meeting of Barclays Bank (Dominion, Colonial and Overseas) was held, on the 28th instant, at 29, Gracechurch Street, London, E.C. 3.

Sir William M. Goodenough, Bart. (the chairman), presided.

With the concurrence of the stockholders present, the report and accounts and statement by the chairman, which had been previously circulated, were taken as read.

After paying tribute to the late Lord Essendon, a director, and the late Mr J. B. Taylor, a member of the Cape Local Board, the Chairman moved the adoption of the report of directors and the statement of accounts, and the payment of a final dividend of 4 per cent. actual on the 8 per cent. cumulative preference stock and 3½ per cent. actual on the "A" stock and "B" shares, less income-tax at the rate of 8s. 4d. in the £ in each case. The motion was seconded by Mr J. S. Crossley (deputy chairman) and carried.

The retiring directors, Mr Anthony Charles Barnes, D.S.O., O.B.E., the Right Hon. Lord Lugard, G.C.M.G., C.B., D.S.O., Mr Julian Stanley Crossley and Sir Bernard Henry Bourdillon, G.C.M.G., K.B.E., were re-elected.

On the motion of Sir Frank Newson-Smith, seconded by Mr Joseph Nissim, the auditors, Messrs Deloitte, Plender, Griffiths and Co.; Price, Waterhouse and Co.; Peat, Marwick, Mitchell and Co., and Cooper Brothers and Co., were reappointed.

A vote of thanks was accorded to the chairman and staff.

PENINSULAR AND ORIENTAL STEAM NAVIGATION COMPANY

FLEET'S WARTIME ACTIVITIES

The one hundred and fourth annual general meeting of this company was held on the 20th instant in London.

Mr A. O. Lang, deputy chairman, presided, and, in the course of his speech, said: All our passenger vessels were transferred to war service either immediately before or very soon after the outbreak of hostilities, some as auxiliary warships and others as transports. The epic struggle of the armed merchant cruiser *Rawalpindi* against overwhelming odds is well known to you all, and the *Rajputana* was sunk while on similar duty.

The P. and O. fleet was well represented in the Allied landing in North Africa.

With such a hazardous operation it was only to be expected that losses of ships would occur, and we have to deplore the sinking by the enemy of such fine vessels as the *Sirathallah*, Viceroy of India, *Cathay*, *Narkunda* and *Eutrick*.

I can assure you that earnest consideration is being given to post-war problems with a view to ensuring that, when the time arrives, the P. and O. Company shall take its rightful place in the world-wide trade routes in which we have been interested for more than a century.

It will be an essential condition of the re-establishment of the British mercantile marine to a healthy state that British ship-owners should not be placed in a less favourable position than foreign lines, and in this respect it is encouraging to see that the British Government has this important aspect in mind.

After certain allocations made by the board, the balance at the credit of the appropriation account, including the sum of £189,456 brought forward from last year, amounts to £442,267.

The report was unanimously adopted.

CRYSTALATE, LIMITED

SIR HERBERT MORGAN'S SPEECH

The annual general meeting of Crystalate, Limited, was held, on the 21st instant, in London.

Sir Herbert E. Morgan, K.B.E. (the chairman), said that the profit of the parent company, before charging taxation, was £44,685, and after deduction of tax, the net profit shown of £11,385 was slightly higher than last year.

Last year they had practically reached the maximum turnover of which their factories and plant were capable under the conditions existing. The company was primarily engaged as plastic moulders and in the main they were limited to the production of small parts which were used in sections of other units, the orders for which came from manufacturers in industries outside the plastic trade. Their sphere was to co-operate with them and to assist as far as the plastic section of their goods required.

The companies referred to were naturally considering the opening of export markets, a problem which was greatly exercising the Board of Trade today. The commercial community welcomed the appointment of the powerful committee which had been formed to advise the Department of Overseas Trade. He trusted that one of the first findings of that committee would be that the Department deserved encouragement and support and that, as at present constituted, it was inadequate to grapple with the problems confronting it. When one realised that the Government were spending less on the Department of Overseas Trade than many individual firms spent on developing their own business, it demonstrated the need for much greater effort. Plans for the increase in their export trade to secure an additional 50 per cent over the pre-war standard must be on a bold, impressive and grand scale.

The report was adopted.

APEX (TRINIDAD) OILFIELDS, LIMITED

WAR ACTIVITIES

The following is an extract from the report of the directors which incorporates the annual statement of Mr Malcolm MacLachlan, the chairman, to be presented at the annual general meeting of the Apex (Trinidad) Oilfields, Limited, on January 4th, 1945:—

The profit for the year amounted to £293,516, making with the balance of £144,483 brought forward from the previous year, a total of £437,999. The directors recommend the payment of a final dividend of 17½ per cent., making a total of 30 per cent. for the year.

Although it has not, until recently, been possible for oil companies operating in Trinidad to give information as to their drilling and production for the war years, it is generally recognised that both operations have been strictly controlled by the authorities under a policy of concentration of development in rich and proven areas which best justified the consumption of steel in terms of oil produced.

It is now possible to indicate how the operations of this company have fared under this policy. During the five years to September 30, 1944, approximately 521,000 feet have been drilled and production has amounted to over 20 million barrels of crude oil and 17 million gallons of casing head gasoline. The average annual production has thus exceeded the record for any year prior to the war. Production for the year to September 30, 1944, was approximately 3,760,000 barrels of crude oil and 3,127,000 gallons of casing head gasoline, and was obtained from 267 wells.

It is estimated that the production of crude oil for the current year to September 30, 1945, will amount to 3,380,000 barrels.

SOUTHERN MALAYAN TIN DREDGING, LIMITED

The eighteenth annual general meeting of Southern Malayan Tin Dredging, Limited, was held on the 20th instant in London.

Mr H. Ashworth Hope (the chairman) said that at the meeting of the parent company, Malayan Tin Dredging, Limited, he paid a tribute to the memory of their late chairman, Mr C. V. Stephens, and he did not propose to repeat it now. Mr Stephens was an outstanding personality and it was impossible to assess the value of his contribution to the tin industry.

The following is an extract from the statement of the late chairman, Mr C. V. Stephens, which was circulated with the report:—

The board is fortunate in being able to show an excess of income over expenditure for the year under review of £13,606, and to recommend payment of a dividend of 2½ per cent., free of tax.

The rehabilitation of the tin industry in Malaya may mean, as regards dredging, which is the largest producing section of the industry, the building up of that section anew. In addition to the lengthy period involved in the manufacture of dredges, and their numerous and complicated parts, there is the question of their erection in Malaya. It is probable that very few of the pre-war mechanics (chiefly Chinese) will be available when the time arrives to take such work in hand, and a shortage of experienced European dredging engineers may also for a time be anticipated.

The rate of progress made in the rehabilitation of the tin industry will chiefly depend upon the amount of assistance given by the Government. The early rehabilitation of the tin industry is of vital importance to the restoration of Malaya, tin having, in the past, been the principal contributor to the revenue and welfare of the country.

The report and accounts were adopted.

MALAYAN TIN DREDGING, LIMITED

The thirty-third annual general meeting of Malayan Tin Dredging, Limited, was held, on the 20th instant, in London.

Mr H. Ashworth Hope (the chairman) first referred with great regret to the loss they had sustained by the recent death of the chairman, Mr C. V. Stephens. Mr Stephens was the founder of this company, and was also the pioneer of bucket-dredging in Malaya. The success of this company's pioneer dredging work led to the development of dredging into the largest producing section of the tin-mining industry.

The following is an extract from the statement of the late chairman, Mr C. V. Stephens, which was circulated with the report:—

The board is fortunate in being able to show an excess of income over expenditure for the year of £4,824, and your directors recommend a dividend of 2½ per cent., free of tax.

With regard to the future outlook for tin, Malaya and the Netherlands East Indies supplied approximately half the world's production. After these countries have been liberated from Japanese domination it will probably be several years before they can get their tin operations back into full production. Consequently, when industrial activity becomes anything like normal again the market demand for tin is likely to absorb all available supplies for several years to come.

Tin as a valuable Empire export is a most important factor in promoting the interests of both Malaya and Great Britain. It is imperative for the welfare of Malaya that her production should be vigorously stepped up and her position as the world's chief tin producer regained at the earliest possible date, so that she may again be able to compete successfully under all conditions of production as she has done in the past, in world markets.

The report and accounts were adopted.

Throughout the world the name of MILNERS is a synonym for SECURITY. The same sound craftsmanship which has made MILNERS' SAFES and STRONG-ROOMS so universally respected is embodied in MILNERS' STEEL EQUIPMENT, which is designed to promote office and factory efficiency. When peace returns MILNERS' organisation will be ready to resume its world-wide service, using past experience to ensure efficient designs for the future.

MILNERS
STEEL EQUIPMENT

MILNERS SAFE CO. LTD., 21, HAMPSTEAD LANE, LONDON, N.6 Telephone: MOUntview 6655.

G.E.C. In war or peace—at the service of the Empire

An important example of how electrical inventiveness has served the urgent needs of war — afterwards to become of great service to industry generally, when the war is won — is the Mobile Rectifier Substation.

This is transported by road or by rail to wherever it may be required and, for example, provides direct-current supply to building sites; or to docks where ships are being loaded, unloaded, or undergoing repairs; to centres where it will be available for traction purposes; or to a position adjacent to a permanent substation that is temporarily out of action.

In surmounting the innumerable problems that have arisen in all applications of electricity, including the important one of electronics, the technical experience and scientific advancement of the G.E.C. — the largest British electrical manufacturing organization in the Empire — have been enriched to a degree that will be of incalculable value to all electrical services after the war. Then, just as the resources of the G.E.C. have been available for the war effort, they will be at the disposal of all concerned with reconstruction in any part of the world.

Electrification Schemes

G.E.C. Electrification Schemes have been applied to all industries, including: Aircraft Factories; Chemical Works; Collieries; Food Factories; Gold Mines; Iron, Steel and Copper Works; Locomotive and Railway Carriage and Wagon Works; Motor Car Works; Oil Refineries; Ships and Shipyards; Textile Mills, etc., etc.

The Merchant Banks

THE ranks of the London Merchant Bankers have been thinned since the outbreak of the present war, and among the survivors there are a few whose scale of activity must have been so reduced that their continuance in business is it surprising, apart altogether from the effects of the war, that in an age characterised by increasing state intervention in trade and in commerce on the one hand and by the domination of the Joint Stock colossi on the other, the Merchant Bankers—the quintessence of nineteenth-century private capitalism—should, as a class, play a steadily declining part in the financial life of this country. The temptation is therefore great to assume the rôle of Antony at Caesar's funeral, even though the burial service might this time be larded with words of praise. To succumb to the temptation would be, however, to ignore the remarkable powers of adaptation, of which the Merchant Banks have given ample evidence in their long history, and possibly to exaggerate the degree to which even in the new planned economy the private entrepreneur will be hamstrung. Although tribute must be paid to the resilience of the Merchant Banks it must at the same time be admitted that adherence to a rigid family clannishness in the admission of new partners has also on occasion been a fatal source of weakness. A large number of the Merchant Banks are more than one hundred years old, and it bespeaks an unreasonable trust in providence to expect after four generations the maintenance in the one family of a high degree of enterprise, acumen and financial skill. It can happen—the marvel is that it has so frequently happened—but the pursuit of this policy involves unnecessary hostages to fortune.

The Merchant Bankers are traditionally associated with the business of acceptance credits—a development that grew naturally out of the actual trade in merchandise which was the original business of many of these houses. So important did this new trade become that the Merchant Banks are in many text-books described simply as "Accepting Houses," and the association which now links them together in an informal fashion is indeed known as the Accepting Houses Committee. These acceptance credits were almost exclusively used to finance international trade, but their volume has, inevitably since the war, dwindled to negligible proportions. Most discussion of the future of the Merchant Banks has tended, therefore, to associate their chances of post-war revival with the resuscitation of world trade in general. But whether the sterling bill will ever regain its former popularity must remain an open question. Most acceptance credits were utilised to finance the seasonal movement of commodities grown in the New World—cotton from the USA, coffee from Brazil, Central America, etc. But these were all transactions carried on by private

traders whose credit status was carefully examined and kept under constant review by the Merchant Banker, who attached his name to the bill after a nice calculation of the risks. It is possible that the whole basis of trading in commodities may in future be substantially altered by the practice of bulk buying that has played such a prominent part during the war in the organisation of supplies, not only in this country but also abroad. The practice of bulk buying may very readily produce the practice of bulk selling, with Governments tending to move more and more into the foreground of this picture to protect the interests of their nationals, whether as seller-producers or buyer-consumers. From this it would be but a step to the grant of reciprocal Government credits à la Dr Funk. All this may, of course, be an unjustified projection on to the peace scene of developments that are more naturally associated with the conduct of economic warfare. The trend towards government in international business may be halted if agreements on the lines of those laid down at Bretton Woods prove successful in reviving multilateral trade. It would, however, be foolish not to recognise that there are powerful tendencies, deriving from the search for full employment, which may frustrate all attempts to restore the international trading system as we once knew it and lead to the formulation of bigger and better barter systems. In such an eventuality there would be little or no need for the granting of private short-term international credits, and the Merchant Bankers might find their acceptance business, in so far as it was based on international trade, threatened with extinction.

It has been suggested that the Merchant Banks could find an equally remunerative field for their activities at home by popularising the Inland Bill. Indeed, one firm has contrived, even in wartime, to maintain its volume of acceptances at a remarkably high figure by credits of this kind. There is no need at the present juncture to canvass the qualities of the acceptance credit—its cheapness but the rigidity of carrying legal obligations it involves—as compared with the bank overdraft, which is dearer but less formal. But granted the possibility of a change in commercial psychology, which is to-day a condition precedent to the popularisation of the Inland Bill, an expansion of any magnitude in the volume of acceptance credit granted to British traders by the Merchant Banks might well provoke a hostile response from the ordinary commercial banks, who would, after the war, be at great pains to restore their own sadly shrunken volume of advances. For it is, after all, the commercial banks' cash resources which, through the medium of the discount market, largely underpin the whole structure of acceptance credits. Against this it may be contended that it would require a much greater volume of acceptances than is likely, even on the most optimistic

THE CHARTERED BANK OF INDIA AUSTRALIA AND CHINA

(Incorporated by Royal Charter 1858)

assumptions, to constitute any real threat to the size of the commercial banks' advances. The threat, nevertheless, remains, as may be seen from the following rough comparison. At full stretch the Merchant Banks might, if past performances are any guide, tend to lend up to approximately four times their own actual resources. What these resources are can, of course, only be guessed at. Estimates vary from £40 million to £60 million. If a figure of £50 million is taken, this would imply a possible total volume of £200 million of acceptance credits granted by the Merchant Banks. This compares with an average total of Clearing Bank advances in 1939 of £959 million. Even if this total were exceeded in the post-war years, the upper figure of acceptance credits which, in theory, the Merchant Banks might grant would constitute competition which the Clearing Banks might find distinctly unpalatable, particularly in the pressure that would be exercised on the level of interest rates charged on bank overdrafts. That the development of the Inland Bill sketched above is wildly unrealistic may be true, but it does conceivably represent one of the ways in which the Merchant Banks might work out their salvation.

It may be taken for granted that the Merchant Banks will not pin all their hopes for the future on an expansion of their acceptance business, whether domestic or international. It is no coincidence that the houses which have closed down since the war were more closely identified with this type of business than with any of the other traditional merchant banking activities. The more successful (and let it be whispered the more enterprising) have always had a variety of other lines which were probably much more remunerative than acceptance business. For instance, the issue of foreign loans and dealing in foreign exchange have long been profitable fields of activity for the Merchant Banks. Certainly for an appreciable period after the war this country's balance of payments problem rules out all possibility of a resumption of foreign lending. Nor, in any case, would the political conditions which are likely to exist in many of the obvious borrowing countries be such as to attract for some years the private or institutional investor in this country to subscribe to any issue which the Merchant Banks might otherwise feel tempted to underwrite. But on a longer view this prospect may well be less bleak. A solution of the balance of payments question should not prove an extravagant hope if a sensible rearrangement is made with some of the other United Nations—notably France, Belgium, Holland and India—of the basis on which war expenditure incurred for the common cause has to be borne; and in due course some degree of political stability throughout the world should be achieved. The long-term outlook for foreign lending is therefore probably not so unfavourable as it is now fashionable in

Canadian Bank Act

CANADA has, this year, carried through one of the regular ten-yearly revisions of the Bank Act which regulates the activities of the commercial banks. The charters of the commercial banks have for the past seventy years been granted for the limited period of ten years only, and as each of these periods expired the basic Act has come up for revision. The last of these periods expired on July 1st last, and, as usual, the renewal was made the occasion for a detailed revision of the Act and for a parliamentary debate which ranged not only over the whole subject of banking legislation, but over the field of monetary politics, which in the Dominion is one in which vehement polemics flourish. So keen was the debate that it remained unresolved when the charters of the banks expired. They had to be prolonged by two months, at the end of which Parliament had at last exhausted its interest.

Much of the debate centred on the question of bank profits. Canada is a country where the "costless credit" or the "fountain pen credit" theory, as it is often called in the Dominion, has made large numbers of converts. Mr. Ilsley, the Minister of Finance, put the banks' case by submitting the following data on their average operating earnings and expenses and return on capital invested for the years 1929 to 1943 and separately for the year 1943. The figures were intended to answer those who contended that "fountain pen" credit was costless to create and operate, and that the banks' monopoly of this lucrative business gave them inordinately large profits. The figures given in the

some quarters to make out, and in any eventual revival the Merchant Banks should again be prominent. Their long and intimate experience of this class of business and the sense of responsibility with which in the past they have conducted it are assets of no small importance.

* What results may be expected to flow from the relaxation in the foreign exchange control cannot be accurately gauged. But this relaxation, when it comes, will most certainly be coupled with stringent control over capital movements, and it is these latter which provoke great exchange activity. The Merchant Banks, who are traditionally among the more active elements in the foreign exchange market, cannot therefore look to this source for other than a modest contribution to their profits.

No account of the Merchant Banks' activities would be complete which failed to give due weight to the importance of the investment business which they carry on. Indeed, some of the leading firms merit much more truly the description of Investment Bankers than Accepting Houses, since it is certain that dealing in securities absorbs more of their attention than the granting of acceptance credits. These dealings in securities take different forms. Some houses maintain active dealing departments specialising in stock arbitrage; nearly all are active operators on their own account; and some again undertake the management of investment trusts including several of the most successful. Yet the Merchant Banks have in the past been curiously reluctant to go in for the management of public investment trusts on a large scale, and indeed held completely aloof from the more recent development of the investment trust idea, i.e., the fixed or unit trust, which has by now assumed very large proportions. This reluctance is hard to explain, since the Merchant Banks, by virtue of their great financial knowledge, experience and integrity, are very well qualified to manage publicly subscribed funds for investment purposes. It would therefore not be surprising to find that the Merchant Banks after the war, when the domestic capital market is relieved of most, if not all, of the present restrictions, devote more and more of their attention to the management of the orthodox type of investment trust.

From this brief *tour d'horizon* of the Merchant Bank landscape some general observations suggest themselves. First the process of concentration among Merchant Banks will probably continue. Secondly, the Merchant Banks' rôle in international trade—whether as providers of short-term credit or as the channel through which long-term investments are made—will probably be much less significant. This is perhaps an inevitable consequence of the reduced importance which international trade generally may occupy in the economy of this country. Thirdly, the Merchant Banks will tend to concentrate more of their activities at home, with possibly a more marked tendency towards investment banking than has hitherto been the case.

appended table are self-explanatory, but they failed to convince the critics. Their criticism found expression in a demand that the Bank Act should require the banks to reveal their yearly appropriations to internal or secret reserves and that the books should show the total of such reserves. The proposed amendment was strenuously and finally, successfully resisted by the Government spokesmen.

The new banking legislation introduced several important amendments to the Bank Act. The chartered banks have been given specific notice of termination of their right of private note issue as from January 1, 1950. Ever since the establishment of the Bank of Canada in 1935 it has been the policy of the Canadian Government to concentrate the responsibility for the issue of paper currency in the hands of the new central bank. The chartered banks have, therefore, seen their rights of note issue gradually restricted, until by the end of 1944 the amounts of such notes outstanding may not exceed 25 per cent of the issuing banks' unimpaired capital and reserves. This balance of the banks' private note issue will have to be withdrawn over the next five years, though the chartered banks will be allowed to issue notes up to 10 per cent of their unimpaired capital for circulation outside the Dominion.

Among the many detailed regulations of banking business found in the Canadian Bank Act is the fixing of maximum rates which the banks are allowed to charge on loans or for the discount of bills. Until July 1st of this year that maximum was 7 per cent. By the new legislation passed this

for it was reduced to 6 per cent. The new Bank Act, however, for the first time allows the chartered banks to compete in the business of unsecured personal loans which

hitherto have been the specialised province of loan companies and moneylenders. As transacted by such lenders, these personal loans may be made at a charge not exceeding

American Post-War Banking

(From Our New York Correspondent)

BANKING, like every other form of business in the United States, is looking searchingly at the reconversion period and the time beyond, seeking the outline and nature of things to come. But what is to follow flows largely from what precedes, so that some brief definition of the starting-point is necessary.

In the four years since the start of the defence programme in June, 1940, loans and investments of Federal Reserve member banks increased almost two and a half times, while deposits more than doubled.

A large proportionate decline has occurred in the quantitative significance of the banks in the financial centres, and especially New York. While all banks (with perhaps the most minor exceptions) have shared in the great expansion, those in smaller places, in the aggregate, have grown most, while, at the other extreme, those in New York have grown least. This is more marked in the case of deposits than in loans and investments, as is shown in the table at foot of next column.

Despite somewhat slower asset expansion, the reserve position of New York has been continuously, and still is, weakest (even allowing for the fact that Treasury Bills can be used for reserves), while a considerable volume of cash

2 per cent per month for loans up to fifteen months. The banks are now to be allowed to enter this lucrative though dangerous field of business, and their operations of this character will be subject to a maximum discount of 5 per cent on the nominal amount of a loan repayable by twelve equal monthly instalments. Such a discount is equal to a true interest rate (calculated on the steadily falling capital amount outstanding month by month) of about 9½ per cent. In addition the banks will be able to charge the borrower the cost of an insurance policy on the life of the borrower for the period of the loan which, it is estimated, would not amount to more than 25 cents per \$100 insured. If the chartered banks avail themselves to any sizeable extent of this new clause of the Bank Act, the three balls, or whatever may be their equivalent in Canada, will lose much of their glitter.

Perhaps the most important changes in Canadian banking legislation introduced this year refer to medium-term agricultural credit. Hitherto the chartered banks have been confined in their agricultural loan operations to short-term lending. The long-term financing of Canadian agriculture has been the province of specialised mortgage and loan companies, and such Government lending agencies as the Farm Loan Board. The Government passed an Act in 1939 to set up a Central Mortgage Bank which would guarantee lending by private agencies, but the outbreak of war caused the implementation of this measure to be postponed. When it is reconsidered after the end of the war, the extraordinary improvement in the financial position of Canadian agriculture, its enhanced liquidity and the wholesale repayment of mortgage indebtedness may well call for a complete revision of the Act of 1939. The field of medium-term credit has until now been left very largely to the Farm Loan Board, which has been prepared to lend for a number of "medium-term" objectives on second mortgages. Its loans, however, have been restricted to those borrowers already indebted to the Board for long-term loans secured by first mortgages. The new Bank Act now opens the field of medium-term agricultural credit to the chartered banks, specifying the amounts that may be lent in this way, the purposes for which such accommodation may be granted and encouraging the development of such business by the offer of partial Government guarantees. The guarantee is being given by virtue of the Farm Improvement Loans Act, also passed this year, which authorises the Minister of Finance to guarantee a bank against loss up to 10 per cent of the total amount of such loans.

The technique of providing collateral for short-term loans to farmers and other borrowers whose security is constantly being turned over has also been considerably simplified. Whereas every change in the collateral had, under the earlier versions of the Bank Act, to be notified to the lending bank, a process which involved a great deal of laborious paper work both for borrower and lender, the procedure has now been simplified by providing a form of blanket security against which promissory notes are drawn as and when the bank's facilities are required.

excess reserves exists among the other parts of the country. The issue of securities and tax collections in the money

markets have greatly exceeded Government expenditures there. The much greater impact of expansion outside the financial centres is probably to be accounted for by the very wide diversification of war production and service, or in other words, by the distribution of Treasury outlay. Business is not being done at the old stand, and hence the locus of banking has altered. Bank deposits, even though enormously expanded, are a much smaller proportion of the medium of exchange in the United States than before the war: currency has increased much more rapidly. Where demand deposits increased one and a half times in four years, currency in circulation outside the banks has tripled. A large proportion of the medium of exchange of individuals is now currency. The Securities and Exchange Commission estimates that individuals held \$20 billion of cash on June 30, 1944, and \$29 billion in demand deposits. For business, the percentage is apparently much lower. Many reasons account for this development, including black markets, tax evasion, distrust of banks, inconvenience of bank location and hours, expensiveness of bank service, hoarding, larger amounts carried in pocketbooks and probably many others. But, however explainable, the banking mechanism is used for a smaller proportion of total transactions. The banks may not have lost customers, but at least they have not attracted the groups which have "come into the money."

The banking expansion has, of course, resulted from the acquisition of Government securities to finance the war; it has altered the make-up of assets, so that at present about three-fourths of total banking assets consist of government securities or of cash due from other banks (including the Federal Reserve Banks) and in vault. The banking system will start the post-war period functioning preponderantly as the supplier of funds to the Treasury, and only to a small extent as lender directly to business and individuals.

ALL FEDERAL RESERVE MEMBER BANKS
(Millions of dollars)

	June 29, 1940	June 30, 1944
Total assets.....	57,846	108,684
Government securities.....	14,722	60,339
As % of total assets.....	25.5	55.5
Reserve with Federal Reserve.....	13,751	12,813
Cash in vault.....	789	1,143
Balances due from banks.....	7,290	9,842
Total.....	36,552	84,137
As % of total assets.....	63.2	77.4

In the process of this expansion, the banking system has used up the preponderant portion of the huge excess reserves held at the beginning of the war, and is likely to finish with little more excess reserves than the present level of \$1,000 million around which the total fluctuates from week to week—if, indeed, it has as much. In addition, the excess reserves of the Federal Reserve Banks themselves will have fallen close to, and perhaps below, zero in terms of the present statute, which requires these institutions to maintain 40 per cent reserves against notes and 35 per cent against deposits. The reserve ratio, which stood at 88.5 per cent at the end of June, 1940, was 52.9 per cent at the close of business on September 20, 1944. Indeed, by the end of the war, alteration of the present statute or of present practices may have proved to be necessary.

This expansion in the earning assets of the banks has increased their income very substantially and, as capital has risen but little (19 per cent for the four-year period), has meant rising profits per share. Even though interest rates have fallen, though assets have been kept in short term, and though taxes have risen enormously and operating expenses somewhat, the enlarged pyramid on the capital has increased net earnings. High corporate taxes, including the applicability of the excess profits tax to a growing number of institutions, have led the banks to buy increasing amounts of partially and wholly tax-exempt governmental obligations, which even at almost microscopic yields leave a better net return after taxes than the higher-yielding taxables. Banking emerges from the war a very profitable business.

Some reversal of the marked trend towards the decentralization of banking is being both forecast and denied. Some shrinkage of production and service in more out-of-the-way places may cause corporate treasurers to carry a larger proportion of their cash in the financial centres. Yet a considerable part of the wartime relocation of business and income appears likely to be permanent, and while considerable shifts between individual banks and cities seems certain (and, because of the prevailing high liquidity, should occur

sion no banking difficulties) a recovery of the full pre-war proportions by the financial centres may not occur. The New York will make a full recovery seems most questionable.

Whether the banking system can recover its proportionate place in the mechanism of transactions is an even more complicated matter. Probably the most basic question is the ability of the banks to provide a service whose cost and convenience and assurance of privacy will overcome the reasons which have led to the use of currency.

Less doubt apparently need exist about the wartime trend of expansion; further and considerable expansion in the aggregate appears a certainty.

A large volume of government securities seems clearly to be in transit, bearing the tag "destination, commercial banks." At least some of the large business holdings of short-term government issues represent funds intended for other uses when materials become available. And some portion of the holdings of individuals will be redeemed (E. Bonds) or sold for the purchase of consumer goods and services. While not measurable, the total of these two doubtless amounts to many billions of dollars, and the banks must provide the funds by direct purchase or through Treasury refunding.

In addition, some loan demand will be experienced, so that non-government assets are likely to rise. The large liquid holdings of business and individuals would suggest that this demand is not likely to be large. To some degree, this loan demand will be related to the volume of government issues which will have to be purchased; to the extent that government issues continue to be held by business and individuals, the loan demand will be larger; to the extent that they are sold, smaller. But the prospects for the banking system becoming anything else than preponderantly a financier of the Treasury are remote indeed.

The expansion will, of course, be even greater should a large return flow of currency occur—that is, if the banks should make major strides in the recovery of their position in the transactions mechanism. The movement of currency must be supplied, and in addition considerable reserves to permit the further expansion of the commercial banks, the Federal Reserve Banks will have to find ways to free themselves from the present reserve requirements of the law. But, on the other hand, if currency comes back in large volume, the pressure on the Federal Reserve Banks will be greatly lessened.

Bank earnings, like deposits and assets, seem almost certain to expand somewhat further. Enlarged earning assets will contribute. So will any reduction in tax rates—and at least some reduction is expected. And so, of course, would any increase in interest rates—though both Governor Dewey and the present administration are on record against any important change, and they may mean any change at all. However, some rise, though a small one, may occur in the average rate earned on assets, to the extent that non-governmental loans and advances rise. Such paper probably would bear a higher average rate than the Government paper. The banks doubtless will seek such non-governmental paper aggressively because of the rate, because of public relations, and because they think that way. This may lead to operations considered unorthodox in the past; two of the most likely directions appear to be financing of the consumer on a larger volume and efforts to finance the small business more extensively.

Perhaps the greatest uncertainty in the banking outlook arises from the prospective reopening of financial relations with other countries, including the operation of the Bretton Woods plan and the unblocking of balances. Yet if dollars are to be as scarce in the world as most present thinking indicates, the preponderant effect on American banking would merely be bookkeeping changes in the ownership of existing balances. Only in the event of the export of considerable amounts of gold would any significant effect seem likely to be felt on the banking system.

The period of the armistice and after does not, therefore, now appear likely to bring about any very great changes in banking in the United States. Both private and central banking, through their assets, will long remain preponderantly associated with, and influenced by, the Treasury. The primary function of banking will continue to be the holding of whatever (large) part of the public debt at whatever interest rate is necessary to comply with official requirements. Presumably the banks will continue to exercise this function voluntarily. The entire system, including the Federal Reserve, has given hostages (or has had them taken from it) and it will be a long time before these are returned.
