The best method of reabsorbing inflationary purchasing power would have been for all countries concerned to increase their taxation. This task, however, for political and administrative reasons, has proved far beyond their powers. Such increases in taxation as have occurred have mostly taken the form of indirect taxes, whose incidence has proved to be highly regressive. No real attempt has been made to raise direct taxation even where the machinery for it was ready to hand, as in the case of land taxation in Egypt.

Another obvious method of mopping up redundant purchasing power is to raise loans in the domestic market. The main obstacle to this policy in the Middle East is that the local investor does not take very readily to fixed-interest Government loans. Such issues are not popular unless baited with the chance of lottery prizes. Last October the Palestine Government offered £1,000,000 of bearer lottery bonds carrying interest at 1 per cent and, in addition, the chance of substantial prizes, to be drawn for quarterly. The issue was a great success. As the Colonial Under-Secretary explained at the time:

To a considerable section of strictly orthodox Moslems the receipt of a steady 3 to 3½% through a Government loan, which would seem entirely respectable to a Quaker community here, is utterly abhorrent. It is the sin of usury in their eyes. On the other hand, large casual or adventitious gains, which might well seem objectionable to the respectable sections of our own community, would not cause the slightest twinge of conscience in the Moslem world.

Iraq has since copied the device with an issue of 100,000 bearer bonds of 10 dinars each redeemable in 20 years and carrying interest at 2 per cent, with a further 2 per cent devoted to prize money. This loan was fully subscribed in two days, and it is estimated that three times the amount issued could have been placed. There is evident scope for development of this particular anti-inflationary technique.

Another powerful weapon wielded against inflation has been the sale of gold in most of the countries concerned. In all of them there is a long tradition of gold trading and of actual gold circulation. The machinery was, therefore, ready to hand for the initiation of sales of gold by the Allied authorities. The objective of these sales has been to cover as much as possible of the military expenditure in the countries concerned and to give the local populations some tangible medium of hoarding which they would hold in preference to the stocks of foodstuffs and other materials which the peasants might, given the scarcity of consumer goods, have been unwilling to send to market. The efficacy of this gold selling policy has been increased by the fact that in all these countries the open market price of gold, at which official sales have been made, has risen considerably above the official price. The gold sovereign, whose official price is 39s. 3d., was, at the end of 1944, quoted at 105s. 2d. in Egypt, 104s. in Palestine, 104s. 5d. in Syria and Iraq, 93s. 10d. in Persia, and 93s. 3d. in the Sudan. These open-market quotations are fairly well integrated through an active arbitrage traffic which successfully braves and overcomes all the official restrictions on gold movements between these countries.

The measurement of the true extent of inflation in the Middle East is a particularly difficult problem to solve, despite the collection of accurate price statistics. Part of the rise in prices is a function of scarcity and transport dislocation, and it is difficult at present to distinguish between the effects of smaller supplies and of inflated purchasing power on the level of prices. Some fall in prices

Throughout the world the name of MILNERS is a synonym for SECURITY. The same sound craftsmanship which has made MILNERS' SAFES and STRONG-ROOMS so universally respected is embodied in MILNERS' STEEL EQUIPMENT, which is designed to promote office and factory efficiency. When peace returns MILNERS' organisation will be ready to resume its world-wide service, using past experience to ensure efficient designs for the future.

is inevitable as supplies come in. That corrective is already evident in Turkey, where prices began to decline in June, 1943. The index of wholesale prices, based on the first half of 1939, touched 715 in that month, and has since declined, according to the latest available figures, to 459. This is partly due to the suspension of competitive bidding for Turkish produce by the belligerents, but is also the result of the good 1944 harvest and of an ampler supply of imported goods.

When this factor of abnormal scarcity is removed, part of the present price distortion in the Middle Eastern countries will disappear. But, as may be seen from the growth in the monetary circulation of each of these countries, it is only the froth of the existing price inflation that will be removed. Unless a considerable measure of monetary contraction takes place it is probable that prices, wages and costs in the Middle East will after the war remain hoisted on a level much higher than those in the United Kingdom.

If anything like the present disparity between the rise in prices in the Middle East and the United Kingdom is perpetuated considerable adjustments of exchange parities will have to take place after the war. These rates have remained rigidly controlled and unchanged during the war. Admittedly, there will be a two-way pull on the Middle East exchanges with sterling after the war. The capital position of each of these countries vis-à-vis the United Kingdom has been improved. They all hold much larger sterling reserves than formerly, and if there were to be any attempt to convert a substantial part of these balances into local currency the effect might well be to cause the Egyptian pound and the other currencies concerned to appreciate in

terms of sterling. But much of these reserves must in any case remain immobilised as security for expanded note circulations. The rest will, in all probability, be funded on reasonable terms and thus deprived of their ability to disturb the exchange markets. On this assumption, the pull of the capital factor is likely to be rapidly outweighed by the influence of the relative price levels on the trade of the countries concerned. In Palestine, for example, this factor will come into play rapidly, because there are industries in that country which will depend on export markets after the war and which will then have to export at prices adjusted to the world level. These exchange adjustments, however, cannot be made until a truer measure of the comparative inflation suffered by all currencies concerned can be obtained than is at present available. Where the process of deflation has already begun, as in Turkey, the position may be ripe for fairly early decisions. In no country can they be postponed much beyond the point at which normal trade, determined by relative costs and prices, takes the place of the pre-emption and subsidised commercial operations of the war period.

One pointer that such exchange adjustments are expected is the current price for gold quoted in the Middle East countries. It is not altogether illogical or irrational that buyers in these countries should be prepared to pay two-and-a-half to three times the world price for the metal—calculating the parities at the official rates of exchange. When those rates have been adjusted to allow for the wartime damage inflicted on all the currencies concerned, it may be found that the Middle East will have paid about the right price—in terms of its own currencies—for the gold acquired during the war.

UNSCC

ACCORDING to a news item which recently appeared in the daily press, a prominent American industrialist has estimated that the difference in British and American standards for screw threads has added a sum of at least £25 million to the cost of the war. This report, which was occasioned by the holding, at that time, of an international conference on screw threads in the United States, indicates the significance which standardisation has in world economic relations. In spite of this, it normally receives hardly any publicity. Thus few people know that to the already considerable number of United Nations' organisations a new one, the United Nations Standards Co-ordinating Committee, has been added a few months ago. Although UNSCC is not an organisation of governments, it could become an important instrument of progressive international economic relations.

Modern industry depends entirely on the existence of accepted standards which are an essential condition for the employment of mechanised power. The importance of international co-ordination of standards lies in the fact that it eliminates the need for special manufacture for export and the resulting increase in production costs. It is particularly useful to small countries which have to rely on exports, because their home markets are not large enough to support those industries which they must be expected to maintain if they are to enjoy a minimum of prosperity.

Since the economy of whole continents will have to be rebuilt after the war, the present time offers not only a rare opportunity, but imperatively demands concerted action in the sphere of international standardisation. The activities of the one organisation which was principally devoted to this task, the International Federation of National Standards Associations, with its seat in Zurich, have been completely paralysed since the outbreak of the war. Thus there was, at a crucial time, a vacuum which the new body would seem designed to fill.

The object of the UNSCC, as defined in its constitution, is "the maximum possible co-ordination and unification of standards for the war effort and the immediate post-war period." Established, in the first place, for two years, an extension of its duration is to be considered towards the end of this period. Membership is to be confined to "national standardising bodies of such of the United Nations as may desire to participate and support the work of the Committee." Moreover,

the national standards bodies are the ultimate authority, and any co-ordination achieved between two or more bodies shall be implemented by each such national standards body itself.

publishing the agreed standard with a note indicating which other national standards bodies have accepted it and are publishing an identical standard.

Although standardisation has long been recognised as an extremely important economic factor, the governments of most countries (the chief exceptions being Soviet Russia and, more recently, Germany, Mexico and China) have taken little direct part in its administration, which was left in the hands of the industries immediately concerned and the co-ordination bodies set up by them. Only during this war has there been some active government participation, and, in Britain, certain emergency standards have been made compulsory by Government orders. One of the chief difficulties in the way of reaching international agreement, especially in the older industries, has been the expenditure which any change of standards involves. Neither party was, as a rule, prepared to give way to the other, and negotiations rarely produced a result. Instead, standardisation was often used as a means of trade protection. The work of the ISA was still more complicated by the fact that most standards are based on, or expressed in terms of, weights and measures, in regard to which the world is roughly divided into the British Empire and the United States on the one hand and the rest, comprising the countries of the metric bloc, on the other. As the countries using the metric system comprised the majority, ISA did not enjoy the support of the Anglo-Saxon countries, and decisions reached were mostly limited to countries using the metric system.

UNSCC has been established only for war and reconstruction purposes, and whilst it is difficult to see how agreement can be reached and decisions implemented in time for these purposes, any results produced are bound to be permanent, even if there should be no extension of its provisionally fixed duration.

The limitation of its membership to the United Nations eliminates not only all enemy countries, but also all neutrals, in some of which, particularly Sweden and Switzerland, standardisation has already reached an advanced stage. Since, moreover, only national standards bodies can become members, countries still occupied by the enemy are, for the time being, excluded as well. It may be a coincidence that the countries thus affected all belong to the metric bloc and that on the new body the Anglo-Saxon countries must have, if not a numerical majority, at least an overwhelming economic preponderance. (It is worth recalling that on ISA the British Empire was represented solely by

the British Standards Institution, whereas on the UNSCC the organisations of the United Kingdom and all the Dominions are participating separately.) This is a possible source of danger which must be carefully watched, if the less favoured members of the United Nations family are not to be alienated from the very beginning.

Originally, the constitution of the UNSCC envisaged its first executive committee to consist of representatives of the national standards bodies of Canada, Great Britain, the United States and Russia. A clause to the effect that the representatives would not necessarily have to be members of the UNSCC was obviously inserted for the benefit of Russia, all other participants being initiators of the scheme. The first meeting, held on September 5, 1944, was attended by leading officers of the American, British, Canadian and Australian organisations, by two representatives of the UNSCC (of whom one combined in his person the secretaryship of the BSI, the chairmanship of its executive committee, and the chairmanship of the executive committee of the UNSCC), and, by invitation, by representatives of the Soviet, American and New Zealand Governments. The Soviet representative having stated that he was present as an observer only, since no reply had yet been received from his Government, the executive committee was formed of the representatives of Great Britain, Canada and the United States.

During the proceedings it was stressed that UNSCC "should be kept rigidly a United Nations body," and whilst "that did not mean that UNSCC would in any way disregard the work done in other countries . . . the greatest caution would obviously have to be exercised." Subsequently, at this and the following meeting on September 12, 1944, a number of points were raised about the co-ordination of certain standards. Not in a single instance, however, were standards other than American, British or Dominion even so much as mentioned, still less were they considered, in connection with the proposed co-ordination.

Particularly significant, as an example, are flat-bottom rails. The BSI had suggested reaching an agreement on 75-lb. and 100-lb. rails, and proposed that "the discussion of the matter should be limited at present to the United States, Great Britain and Canada, as the export of rails for the immediate purpose contemplated was likely to be confined to these three countries." What is this "immediate purpose contemplated"? According to the constitution of the UNSCC it is the needs of war and reconstruction, and for these it would seem desirable that Continental stocks and producing plants should be employed to the largest possible extent. Yet whilst continental rail standards are fairly uniform, they are certainly not expressed in lbs. per foot, and the unilateral imposition of foreign standards would only impede the alleged purpose. Furthermore, whatever the immediate aim, the new standards will only cause unnecessary complications in the long run, unless they represent a solution which can be fairly accepted on the Continent. In Britain, flat-bottom rails are not generally used. From this and the frank admission of the proposal to restrict negotiations to the three countries to which "the export of rails is likely to be confined" it must be assumed that the measure is intended solely to serve the trade of the exporting countries and not the interest of all the United Nations and, in a wider sense, of the world as a whole.

It will take time before a reasonable stability of the political and economic structure of the world is established. Until then, the traditional means of implementing trade policy—through tariffs, licences and currency agreements—can be adapted fairly easily. But if the existing diversity of standards remains, it will be a serious obstacle to the adjustment of economic relations to changing circumstances. Universal standardisation is not, in itself, part of any particular trade policy. Its outstanding advantage would be to provide a degree of resilience which is essential to economic peace.

There can be little doubt that the present time is particularly suitable for an all-out effort to achieve the universal standardisation of a great number of goods where, for some reason or other, it has not been possible in the past. Any alteration of existing standards is admittedly both difficult and costly. But, if it can be effected, it makes hardly any difference whether it is done on a bilateral or trilateral basis or on a universal scale. What is needed is the honest desire to make the new standards serve the economic

interests of all nations instead of strengthening existing differences for use as protective barriers or instruments of economic imperialism. If the handling of these problems by the UNSCC were such as to convince those Allies and neutrals not represented on it that its purpose is sincere and the method employed fair and impartial, they would most probably be willing to agree to a common solution, even though they had no part in its making. It could even be imagined that the adoption of certain standards might be imposed upon enemy countries through the peace treaties. But for this to be done, complete agreement in regard to such standards would first have to be achieved among the United Nations themselves.

At present, in the sphere of standardisation the Anglo-Saxon world is separated from the countries of the metric bloc, although there is far from complete unity on either side and many standards extend over both. Yet there is the danger that this gap, instead of being bridged, will be perpetuated and even deepened by regional co-ordination. Experience after the last war provides a warning that material relief may be abused for political ends. Now the subtler method of supplying goods made to different standards might appear to be tried as a means to bring exhausted countries into the economic sphere of the more fortunate ones. As the inevitable integration of large regions takes place, strict economic partition would contain the seed of conflict.

It has become a truism that the peace and prosperity of the world depend on the unity of the big Powers. Can it be permitted, then, that trade policy is being carried on in complete independence from the declared foreign policy? Standardisation is the only sector of economic relations which is still, in many countries, entirely outside government influence. Officially it is still considered a purely technical matter, and left entirely in the hands of industry, which has not failed to realise its economic significance. UNSCC ought not to be allowed to imply, by its name, that its aims are identical with those of the United Nations, unless the Governments of the participating countries make it their task to ensure that its activities are in accord with these aims.

Conserving THE FOOD VALUE of our Milk

FRESH DAIRY MILK consists of two elements—water, which averages 87½%, and 'MILK SOLIDS' (fat, protein and milk sugar). As the chart shows, Cadburys Milk Chocolate retains all the MILK SOLIDS of all the milk used, and only the water is eliminated. It is easily kept and transported and requires no elaborate packaging. (It retains the full food value of the milk almost indefinitely without special storage or canning.)

Cadbury means Quality

Business Notes

Markets at the Rubicon?

The stock markets have recently shown how much "the little more" can be. The volume of business has not markedly increased, but just enough to turn a favourable though hesitant, into a definitely firm trend. Share prices, without moving more than a decimal point or two at a time, have carried *The Financial News* Index at least to the verge of the chartist's rubicon, if not right over it. To those who venerate high and low points, the Index now presents a nice problem. The main trend of prices is now an upward trend, a downward trend, or a neutral one, according to the interpretation of the signs and portents. Last August the Index (July 1, 1935 = 100) fell heavily from a peak of 116.9, but started quickly to recover, and by the middle of January had reached 115.0. Thereupon it showed a little vertigo, dropped back to 111.5, and started to rise again. On Wednesday night it was 115.4—that is,

FIXED INTEREST AND EQUITY PRICES.
CONSOL 2½% AND EQUITY YIELDS
Financial News Indices of 20 fixed-interest securities and 30 ordinary shares (July 1, 1935 = 100) with corrected yield on the latter and return on Old Consols
(Logarithmic Scale)

four decimal points above the secondary level from which it slipped back six weeks ago and 15 decimal points below the peak figure of 1944—and the whole war period.

Investors who walk merely by the light of common sense, wondering why so much should turn on so little, will doubtless conclude from the examination of the accompanying chart that since the setback of last August the generally rising trend of markets has been maintained, but with appreciably reduced impetus. But from the viewpoint of the chartist, the market in January seemed about to register a major change of direction because it fell back before it had reached and passed its precedent "high." Now the whole issue trembles in the balance. If the Index can re-attain and surpass the level of last August, a bull market will be maintained. If it fails, chart followers will keep a close watch for confirmatory evidence that the long rise, which started at the end of June, 1940, is over and done with. To argue on these lines seems to infer a touching faith in the significance of small marginal changes, which the mathematics of index number computation hardly warrant.

Clearly, the general direction of share values is still upward, but the larger institutions, which have been relatively inactive for some weeks, are still holding off. An encouraging sign, however, apart from the slight but perceptible

widening of investment business as such, is the absence, this time, of any inverse correlation between market prices and good war news. The evidence, generally, is hardly strong enough to support ultra-optimistic expectations of a sharp and early rise in values. But there is no suggestion whatever of an early decline. Perhaps the most significant indicator for market watchmen in the immed. ate future will be the index of the volume of market activity.

Capital Issue Control

The Stock Exchange has issued a notice this week giving the text of recent correspondence between the Chancellor of the Exchequer, the Governor of the Bank of England and the Chairman of the Stock Exchange in connection with the confirmation and extension of existing capital issue control arrangements, referred to on page 252 of *The Economist* last week. In a letter to Lord Catto, Sir John Anderson asks that steps be taken to make his Parliamentary statement on policy on February 20th known to "those principally concerned," especially financial institutions with whom the position of transactions in unquoted securities has recently been discussed. Lord Catto, in passing on the Chancellor's letter, asks Sir Robert Pearson to draw the special attention of Stock Exchange members to the continuance of "grey market" arrangements and to bring the Chancellor's statement to the notice of the Associated Stock Exchanges, the Oldham Stock Exchange and the Provincial Brokers' Stock Exchange.

This official action is noteworthy for two features: First, the use of the London Stock Exchange by the authorities as a recognised, formal channel of communication with all other Stock Exchanges in the country; and, secondly, the publicity given to the reminder which members of every Stock Exchange, including London, have received from the highest quarters that dealings in existing but unquoted securities outside the range of the gentlemen's agreement made some months ago are not, in the Government's view, gentlemanly acts. The authorities now appear to have done all they can to bring moral pressure to bear in preventing leakages in "grey market" control which obviously, from the large number of organisations potentially concerned, is far more difficult to operate by "request" technique than the placing of entirely new securities. Whatever degree of success attends these efforts, the impression will still remain that the counterpart of City co-operation should be a frank statement of the principles on which the Treasury's policy is being administered.

The Principles of Control

Efforts to deduce the principles of control from a study of the terms of recent issues authorised by the Capital Issues Committee have not revealed any obvious, clear-cut and convincing canons on which the Committee's judgment might appear to be founded. For example, no one has any idea by what criteria the CIC separates the sheep from the goats—the "essential non-Government issues" (of which the Chancellor spoke last week) and the non-essential issues. Does the Committee still regard direct contribution to the war effort as the sole test, or are issues for post-war transitional purposes to be looked on with a favourable eye? In fact, a number of recent decisions suggest that funding of bank loans by share issues has first place in the Committee's list of priorities—presumably on the ground that this is a "transfer" operation which does not (in the Committee's view, though not in the market's) involve any "new money." Again, what is the Committee's attitude towards the much-maligned "bonus" issue? Quite recently the Treasury authorisation has been given to schemes—e.g., those of the Zinc Corporation and F. McNeill—which have involved considerable watering of preference capital in order to reduce the rate of dividend paid per preference share. Presumably, the authorities regard such transactions as of the nature of "conversion" operations, which enable the companies concerned to make a nominal reduction in the percentage rate on their "fixed interest" capital at the

expense of higher capital payments to preference holders in the event of any future liquidation. But ordinary share bonuses, it is understood, are still taboo, even in cases where, for example, a company might wish to pay out no extra dividend but merely to reduce the rate from, say, 20 per cent on existing capital to 10 per cent on a doubled capital.

Instances such as these suggest that the Committee is still employing a purely "stone-walling" technique. Its object, apparently, is to prevent any kind of new issue activity which will add appreciably to an applicant's immediate interest or dividend obligations, even if serious modifications in its future capital engagements may be involved. Possibly this policy may be appropriate to the final stages of a war during which, it has been decided on the highest authority, no restrictions bearing directly on any part of the war effort can be relaxed. But there may be serious danger that, when Allied victory transforms the situation, the control may, unless those concerned show greater elasticity of mind than they have shown hitherto, act as a brake on the speedy and large-scale provision of capital for the transition of British industry from a war-time to a peace-time footing. The danger is all the greater because, during part of the transitional period at least, the Treasury will still, presumably, be borrowing "on tap." The Committee will have a difficult task, at best, in balancing its rival objectives of protecting the tap issue and re-financing industry. The best way of proving that the authorities are clear in their own mind about the lines on which they mean to act in this all-important matter would be for them to tell the public, at the earliest possible time, how in fact they do mean to proceed.

Franco-Belgian Payments

The financial discussions between France and Belgium have led to a preliminary payments agreement to which the Bank of France and the National Bank of Belgium are the signatories and which, without prejudice to a later and more formal inter-Governmental agreement, provides all the machinery required to make commercial and financial payments between the two countries. For the time being, transfers of capital remain forbidden, but current payments may now be effected between the two countries at rates of exchange based on a parity of 100 French francs to 88.30 Belgian francs. The foreign exchange required by each country to make these payments will, if necessary, be provided by mutual overdraft facilities granted by the two central banks. The limits to these facilities are 1,000 million French francs and 883 million Belgian francs. If the overdrafts of the National Bank of Belgium or of the Bank of France exceed these respective limits the excess will have to be covered by the transfer of gold or some other currency acceptable to the creditor. The agreement applies to the whole French Empire, to the customs union of Belgium and Luxemburg and to the Belgian Congo. It has been accompanied by a partial unblocking of French assets in Belgium and Belgian assets in France.

The agreement marks another important stage in the process of restoring freedom of current payments between Continental countries and their colonies. Prototypes of this agreement have already been provided in those signed between Belgium and the Netherlands, and Belgium and the United Kingdom. All these reciprocal payments agreements are of a non-discriminatory character and can be incorporated bodily into wider international monetary arrangements. Indeed, the greater the number of regional payments agreements of this character the easier it will be to erect and operate a mechanism such as the proposed Monetary Fund.

United States Cotton Politics

Last November the United States Commodity Credit Corporation introduced an export subsidy for raw cotton of four cents a pound; the subsidy is subject to variation if this should be necessary to sustain American shipments. Its aim is to regain, for the United States, a bigger share in the export of raw cotton. Its share had shrunk substantially in the 'thirties when domestic prices were deliberately raised above world market prices in order to ensure a better income to growers; although the area under cotton was reduced, it was not reduced far enough to eliminate heavy surpluses. In consequence, the United States accumulated

stocks almost equal in size to a year's crop. Another result of the policy of the United States was the expansion of production in other countries, such as Brazil; in the absence of an increase in the total demand for cotton, these countries are bound to suffer from American dumping.

One possible interpretation of the meaning of the export subsidy was that the threat of dumping might be used as a means of inducing other cotton-growing countries to join the United States in an international cartel. This view has now been strengthened by the reported decision of the United States Department of State to convene an international cotton advisory committee; the committee includes, besides the United States, India, Egypt, the Sudan, Brazil, British cotton-exporting colonies, Russia, French cotton-exporting colonies, Peru and Mexico. The committee is to consider the advisability of calling a conference of major cotton producing and consuming countries. There is, of course, no reason why such a conference should not be held; but is it to be the first step towards the conclusion of an American-sponsored international cartel?

Clothing Ration Future

There was a time when the smooth organisation of clothes rationing was a matter for congratulation, but if its efficiency is to be maintained drastic action will have to be taken. The position is that the stabilisation of the ration at the rate of four coupons a month since 1942 was made possible by the wise policy of relating production to the vast stocks of clothing in the hands of retailers and wholesalers. In the face of these stocks, it was not essential that production should keep pace with the ration.

The point has now been reached where further depletions in stocks would seriously endanger not only the easy translation of the consumer's coupons into garments he requires, but the size of the ration itself. In his statement this week, the President of the Board of Trade reminded the public that the present coupon allocation might have to stretch over an extra month. This step by itself—anyone holding the view that it is an essential step would be a realist rather than a pessimist—would not be enough to stem the dwindling of stocks. They fell persistently during 1944, despite the fact that during 1943 there were more garments (but less dress material and footwear) in the shops than during 1942. During 1944, retail stocks were roughly three-quarters the size, by value, of those in 1942. The bottom of the clothing expenditure curve was reached in 1943 in terms of value and quantity. Last year expenditure rose again to slightly above the 1942 level.

The essence of the position is that the depletion of stocks and the consequent difficulty of turning coupons into precisely the clothing required will become progressively greater during this year. The Board of Trade's immediate task is to ensure the planning of production now, so that next autumn and in the spring of 1946 there will be enough clothing to honour a ration of the present size. It has also to take into account the possibility of demobilisation; this would mean an increase in the number of ration-book holders. There is no evidence that the Board of Trade has taken steps to ensure adequate supplies. The alternative to increasing production at every stage, beginning with spinning, is a reduction in the ration. Unfortunately, the longer rationing continues, the harder would a reduction press on the civilian population.

Manchester Ship Canal

The incidence of EPT and extensive war damage has prevented the Manchester Ship Canal Company from earning profits comparable with those of last year. The accounts for the last four years, up to December 31, 1944, now published, tell a tale of mounting receipts offset by mounting taxation. After making provision for necessarily deferred maintenance work and allocating the usual sum of £35,000 to contingencies and repairs reserve, enough has been left to maintain the ordinary dividend at 1½ per cent throughout the war years. The chairman, Sir Frederick West, marshals an impressive array of considerations which have precluded the Board from increasing the dividend, not least among them being the need to maintain it at a steady rate in order to facilitate post-war borrowing.

The future prosperity of the company is closely bound up with that of industrial Lancashire and, more widely, with

that of international trade. Steps are being taken to improve the transport facilities offered to industry by the Manchester Ship Canal. It is also encouraging to note the Board's anxiety to put the wartime decasualisation of dock labour on a permanent basis.

Sir Frederick West fears that future industrial development alongside the canal, for which there is plenty of space, may be prejudiced by local planning schemes, and he wants final authority in this matter to rest with the Ministry of Transport. Close proximity to a canal or docks is of chief value to heavy industries which use bulky raw materials or to factories that are engaged in converting imported goods. Direct delivery to such firms cuts out the cost of double-handling. The chemical industry in particular, which is strongly represented in the area, can derive great benefit from good canal services. But the admitted need for allowing and even encouraging industrial development does not mean that factories should be permitted to grow up at any point along the Manchester Ship Canal. The aim of local planning schemes should be to group industry in suitable areas and to develop amenities elsewhere.

Taxation Disclosure in Accounts

A matter of importance to many investors arose during the annual meeting of the Manchester Ship Canal Company when a shareholder, Mr Horace B. Samuel, pressed for more information about the company's taxation position than the chairman, in his speech, had seen fit to give. Sir Frederick West, the chairman, had disclosed the company's decision to depart from its earlier practice of including provision in the accounts only for the proportion of the current year's assessment for income-tax to the balance-sheet date, (based on the profits of the previous year) and to include provision for taxation on profits of the current year. Unfortunately, he declared, the company had not been able to set enough aside to bring about this desirable change in its entirety, but only to go "approximately half-way towards it." As to EPT, Sir Frederick West refused to disclose any figures, because negotiations with the Inland Revenue were still proceeding. He revealed, however, that the company was operating on a substituted standard and that this advantage had enabled the board to provide for war damage, deferred maintenance and an amount towards future taxation.

Mr. Samuel's point was that unless more detailed figures were given of the taxation position—including the break-up of the balance-sheet provision under separate headings for income-tax and EPT—shareholders were quite unable to form any judgment about the true dimensions of earnings actually available for dividend distribution. In effect, Mr Samuel made a frontal attack on the practice of using global taxation estimates as a possible medium of accumulating internal reserves. Further, on the question of EPT, he declared that it ought to be possible to give shareholders an approximate idea of what the Inland Revenue was claiming, how much the company had admitted, and whether the provision in the accounts was based on one figure or the other.

Without going into the merits of the Manchester Ship Canal Company's policy (which obviously can only be assessed when the directors find it practicable to disclose more detailed information), many investors undoubtedly feel that there is a strong case for the issue of considerably more information in company reports about taxation in general, and EPT in particular. With public utilities, particularly, security considerations might plausibly (though not always convincingly) have been urged at an earlier stage of the war as an excuse for using "blurred" taxation figures as a smoke-screen to prevent the enemy from learning, through fluctuations in a company's real profits, of the success of his efforts to bomb their properties. In some instances, such treatment may have saved the publication of a company's accounts from being banned altogether, under the defence regulations. But that is now a thing of the past. Where a company's EPT basis has been settled—as it now has with the great majority of companies—there is no reason, other than directorial obscurantism, why a complete statement should not be made of the basis of assessment, the amounts paid, and the estimated EPT refunds accrued to date. Even where EPT questions are

still outstanding with the Inland Revenue—as in the case of the Manchester Ship Canal Company—it is surely practicable for directors to give shareholders an intimation of the upper and lower limits within which the liability is expected to fall.

In the matter of income-tax, there should be no difficulty at all in following the recommendations of the Institute of Chartered Accountants and showing an estimated provision in each year's accounts for tax on the profits of that year. The importance of detailed disclosure is great precisely because taxation is so high. When anything from 50 per cent to over 90 per cent of actual profits may go to the tax-gatherer, even a moderate variation in the amount of provision may alter residual profits available for dividend very substantially, while the adoption of a basis which is related to past rather than present facts may prevent shareholders from discovering the basis of current earning power altogether.

The Indian Budget

In his Budget Statement on February 28th, the Finance Member, Sir Jeremy Raisman, gave a comprehensive survey of India's finances. For the year ending March 31, 1945, Government revenue is estimated at £267.7 million, expenditure charged to revenue at £384.5 million, leaving a deficit of £116.8 million. For the year 1945-46 revenue is expected to yield £266 million, expenditure is estimated at £388 million and the deficit at £122 million. Small changes in taxation are expected to yield £6.4 million. One of the most interesting features of Sir Jeremy's statement is his proposal to give taxation reliefs to Indian industry similar to those that are to be introduced in this country. On the subject of India's sterling balances he expressed the view that negotiations cannot usefully be entered upon before the end of the war with Germany.

Sir Jeremy, exploring possible new sources of revenue in the future, suggested that perhaps insufficient attention had hitherto been paid to the question whether it would not be advisable to extend state ownership of industry as a source of additional revenue. According to a cabled report, he continued,

it may well be that in future the state may find it necessary to nationalise certain industries, especially those with a large possibility of expansion, in order that it may have at its disposal additional sources of income for the sustenance of the national well-being as a whole.

Sir Jeremy has added an interesting new argument to the existing ones in favour of nationalisation.

State-owned Railways in India

The Member for War Transport, introducing the railway budget in the Delhi Legislative Assembly on February 15th, stated that Indian railways were now almost completely Indian-owned. There were two major Indian rail-

Railway System	MILEAGE OF INDIAN RAILWAYS UNDER DIRECT STATE CONTROL		Total Mileage now under State Control
	Mean Mileage Previously under Company Control	Mean Mileage under State Control	
Assam Bengal.....	1,306	...	1,306
Bengal Nagpur.....	3,468	...	3,468
Bombay, Baroda and Central India.....	3,407	...	3,407
Bengal and North Western..	2,740	...	2,740
Madras and Southern Mahratta.....	2,946	...	2,946
South Indian.....	2,487	...	2,487
Eastern Bengal.....	...	2,152	2,152
East Indian.....	...	4,218	4,218
Great Indian Peninsular....	...	3,581	3,581
North Western.....	...	6,923	6,923
	16,354	16,874	33,228

way systems under direct state control during the last war. Twenty years ago two others—the East Indian and Great Indian Peninsular—passed from company to state control. This war has seen the remaining six major Indian railway systems, hitherto under the management of British companies, pass into Government control. These recent addi-

tions to state management are the result of the declared policy of the Government of India. The latest acquisitions were facilitated by the sterling credit balance accumulated during the war by the Indian Government; the desirability of utilising it may have influenced the decision to terminate prematurely by negotiation certain of the contracts not due to end for some time to come. These new state acquisitions double the mileage under Government control. Since 1942 the 90 mile route of the Dibru-Sadiya railway has been operated as part of the Bengal-Assam railway as a war measure, and proposals for its purchase by the Indian Government were recently approved by the stockholders of the Assam Railways and Trading Company, Ltd.

Under the Convention, separating State Railway finances from the general finances of the Central Government, railways are to be operated as a commercial undertaking. This control devolves on the Government of India's Railway Board, which comprises the Chief Commissioner, Financial Commissioner, and two members for Transportation and Establishment. It was recently strengthened by the addition of a member to deal with post-war reconstruction problems. Ultimate responsibility rests with the Member for War Transport in the Viceroy's Executive Council who presents the railway budget to the Central Legislature.

Sir L. Misra, Engineering Member of the Railway Board, revealed late in 1944 the Government's basic 7-year plan for the post-war development of Indian railways, involving an outlay of Rs. 319 crores (£239½ million). This plan was concerned with rehabilitation, improvement of organisation and new developments. The authors of the Bombay Plan propose to increase India's railway mileage by half, double the road mileage and add to port facilities at a capital cost of £672½ million. Improvement of India's transport, port and tele-communication facilities will greatly benefit the country's agriculture, industry and commerce—and generally its social and economic well-being.

German Note Circulation

It has recently become apparent that in proportion to territorial losses and the intensification of the war the Reichsmark note circulation increased at a greatly accelerated pace.

On December 31, 1944, the Reichsbank reported that the notes in circulation had increased to Rm. 50,100 million. Three months earlier, on September 30, 1944, the Reichsbank notes in circulation were still at Rm. 38,579 million. The actual monthly increase during the last months of 1944 was as follows:—

(Million Reichsmark)			
August, 1944	1,691	November, 1944	2,166
September, "	3,722	December, "	3,230
October, "	2,403	January, 1945	1,707

These actual monthly increases compare with an average monthly increase of the notes in circulation amounting to Rm. 177 million during the first year of the war from September, 1939, to the end of August, 1940. During the second year of the war the monthly increase amounted to Rm. 289 million and during the fifth year of the war, from September, 1943, to the end of August, 1944, the average monthly increase in the notes in circulation amounted to Rm. 795 million, and at the end of January, 1945, notes in circulation had risen to Rm. 51,207 million, which is almost five times the notes in circulation on August 31, 1939, when it amounted to Rm. 10,907 million.

There are many reasons for the accelerated rate of currency expansion. The first and most important one is undoubtedly the loss of material and financial tributes from liberated countries. Secondly short-term borrowing in much larger proportions has been necessary. More intense bombing of large centres of population, the mobilisation of the Volksturm, and in general the reduction of civilian consumption tended to increase the amount of notes kept by the public. Refugees from lost territories and from bombed towns, for example, withdrew their savings. At the same time subsistence allowances, military pay and the total wages increased considerably. The conversion of Reichskreditkassenscheine, on the other hand, was relatively small. Total circulation of this military currency was already below Rm. 1,000 million when the new acceleration of the notes in circulation began.

The Reichsbank report, which deals with the comparatively normal conditions experienced in 1944, has to admit that already in that year state expenditure had greatly outstripped income and that new taxes would be necessary "to maintain confidence in our currency and safeguard savings." It is a far cry from this evidence of monetary expansion to the claims already being made that the reichsmark is well on the way to galloping inflation. There is no evidence to suggest that despite the difficulties experienced in Germany to-day there has been any relaxation in the efficiency of the price control or in the wages discipline. The damage to the German currency is still repairable and is certainly smaller than that indicated by the rate of exchange of 40 marks to the pound fixed some months ago by the Allied military authorities.

Dorman Long

Profits of Dorman, Long for the year ended September 30, 1944, struck after taxation, debenture interest, and sinking fund are £1,147,666, against £894,830. But this apparent increase of £253,000 in earnings is in fact illusory; £106,860 represents surpluses arising from past years and is used to increase the allocation to general reserve from £150,000 to £250,000. Other appropriations are the same as the previous year and the ordinary dividend is maintained at 8 per cent. The remaining extra £145,000 odd of profit is needed to cover the dividend on the 1,900,000 new ordinary shares issued in November, 1943, for the purpose of redeeming the 5 per cent debenture stock. The saving in debenture interest of £153,000, which is not shown, is almost exactly offset by the cost of paying an 8 per cent dividend on the new ordinary shares.

It can be deduced from the preliminary statement that the company's position is roughly unchanged. There was no reason to suppose that the debenture replacement operation would lead to any increase of the ordinary dividend. On the contrary, the new gearing of capital will make the ordinary dividend less susceptible to changes in earnings. Dorman, Long possesses wide and varied interests in mining, manufacturing, and engineering. The demand for its products, which include not only iron, coal, and steel, but finished products such as tar, gas, and bricks, will continue to be very high during the period of reconstruction—although the company's long-term prospects are much more debatable. The yield of £6 2s. represents a very moderate valuation of the company's prospects.

Scientific Cattle Marketing

Before the war the raising of fatstock—in terms of value—was the largest single branch of British agriculture, and for the future there is already a large measure of agreement that the health and prosperity of farming will depend more upon cattle raising, for milk and meat, than on other activities. Although the first necessity is milk production—Mr Hudson's recent reminder that rationing could be expected to continue until 1949 is proof of that—there is every reason to examine what prospects there are for providing the farmer with a better return for livestock.

A recent paper read to the British Society for Animal Production by Mr T. J. Shaw examines the problem of processing and marketing which has hitherto received insufficient attention. Mr Shaw's aim is to improve efficiency by rationalisation; his approach is entirely technical. His thesis is that the difference between the price the producer gets and the consumer pays could be considerably reduced, to the advantage of both. There is room for improvement in every stage of distribution from farm to butcher. The main proposal is for a re-organisation of abattoirs. Under the pre-war system, much of the value of the animal was entirely lost because of the almost complete absence of factory-abattoirs in which every part of the animal could be utilised or processed. Before the war there were too many small slaughter-houses, and as much as half the slaughtering in England and Wales was done by butchers themselves. A system in which no part of the animal was wasted would mean that the farmer could get a better price, and by rationalising marketing and distribution not only would home-killed meat reach the retailer in better condition, but its price could be lower.

Mr Shaw's suggestion that a centrally controlled marketing machinery, comprising farming, wholesaling and abattoir interests, should be set up is worthy of serious

consideration; but perhaps any discussions based on his paper might also take in the desirability of including consumer interests. After all, the activities of any marketing organisation are finally directed towards supplying the needs of the consumer, without whose co-operation they would be of no avail.

Earnings in July, 1944

The Ministry of Labour's six-monthly summary of the average earnings and hours of 6,000,000 wage-earners in the principal manufacturing industries (contained in the February issue of the *Ministry of Labour Gazette*) shows that there was very little change in earnings between January, 1944, and July, 1944. As shown in the accompanying table, the average for all workers in the first pay week of July was 96s. 8d., compared with 95s. 7d. in January, though compared with 53s. 3d. in October, 1938. It shows that the disparity between men's and women's wages has been maintained unchanged.

Date	Men	Youths and Boys	Women	Girls	All Workers
Average Weekly Earnings					
October, 1938	69/-	26/1	32/6	18/6	53/3
July, 1940	89/-	35/1	38/11	22/4	69/2
July, 1941	99/5	41/11	43/11	25/-	75/10
January, 1942	102/-	42/6	47/6	26/10	77/9
July, 1942	111/5	46/2	54/2	30/3	85/2
January, 1943	113/9	45/1	58/6	32/1	87/11
July, 1943	121/3	47/2	62/2	35/10	93/7
January, 1944	125/8	46/10	63/9	34/3	95/7
July, 1944	124/4	47/4	64/3	34/11	96/8
Percentage Increase since October, 1938					
	Per cent	Per cent	Per cent	Per cent	Per cent
July, 1940	29	35	20	21	30
July, 1941	44	61	35	35	42
January, 1942	48	63	46	45	46
July, 1942	61	77	67	64	60
January, 1943	65	73	80	73	65
July, 1943	76	81	91	83	76
January, 1944	79	80	96	85	79
July, 1944	80	81	98	89	82

The slight nature of the change is presumably due to the fact that more normal hours have been worked throughout industry. The average hours of all workers was 48.6 in July, 1944, compared with 49.2 in January, 1944, and 50.0 in July of the previous year, the pre-war level being 46.5 hours. Hourly earnings were 1s. 11.9d. for all workers, compared with 1s. 11.3d. in January, 1944, and 1s. 1.7d. in October, 1938, an increase over six years of 74 per cent.

The increase of 82 per cent in average weekly earnings compared with October, 1938, is by no means mainly due to increased rates of wages, which have in fact risen by only 35-36 per cent during this period. It is due to a combination of factors, in addition to higher rates, such as longer working hours, with more night-shift duties, extensions in systems of piecework and payment by result, leading to greater production on the part of the workers employed on such systems, and changes in the proportions of men, boys, women and girls employed in industry.

"Staggered" Working Hours

The London Passenger Transport Board has acquired a valuable experience of the effects of "staggering" working hours, through the wartime schemes which it has been operating in the Greater London industrial area. It is claimed that some 600,000 factory workers are now covered by "staggering" schemes, as well as thousands of office and shop workers. Fifty-three local transport groups, covering in all 1,200 undertakings, have been set up to co-ordinate and direct the process. These groups operate under the London and South-Eastern Regional Board, and consist of representatives of managements and employees, the Ministries concerned and the trade unions. Each group acts as the focal point for discussion of transport problems and for dealing with complaints.

The actual amount of "staggering" needed is not very great; it is said that a margin of 15-30 minutes is enough to make all the difference. For example, if four factories in the same district which are served by the same bus routes arrange to start work at 7.15, 7.30, 7.45 and 8 a.m. respec-

tively instead of all starting at 8 o'clock, an appreciable spreading of transport and a more comfortable and less wearing journey are the result. This is common sense, but before the war there were few effective attempts to "stagger" starting or stopping hours. Mr Noel-Baker's estimate that the annual cost of traffic congestion in pre-war London was about £25 million may be an exaggeration and "staggering" of industrial working hours by itself would make little difference to traffic bottlenecks in, say, the City at midday. But it is certainly desirable that every possible means to reduce the peak periods of London traffic should be adopted.

Apart from the practical merits of these schemes, the LPTB's transport groups provide a useful occasion for joint consultation on immediate problems affecting the workers in each factory. The system might with advantage be adopted in other large cities and industrial centres, and it might be applied to the very urgent, though complex, problem of "staggering" holiday periods.

District Heating

Discussions about the advantages of heating entire districts from central stations (by, for example, the conversion of obsolete electric power stations into heat stations and by adapting others for the dual purpose of supplying heat as well as electricity) are a reflection of healthy open-mindedness, of a desire to learn from other countries and to adopt new ideas. The method of district heating is used, together with other forms of heating, in Russia, the United States and in Continental countries.

There is, however, a good deal of confusion about the meaning of district heating. It may be advantageous to supply heat from a central station to a limited district, such as a series of blocks of flats. It may also be advantageous to use this method in limited areas in towns that have been extensively damaged by bombing. But it is quite another thing to convert a large district—containing thousands of houses—to this form of heating. This would involve, besides substantial capital expenditure, extensive works, such as the laying of mains and the installation of pipes and fittings in individual houses.

District heating, in sum, is one of those things that are technically possible but are not necessarily economically advantageous. It is only one of several methods of heating, rather than one that can be suggested for universal adoption. It should be regarded as an alternative to traditional methods in the planning of new building areas, but its adoption must be guided by comparative costs and advantages.

Shorter Notes

With the object of ensuring the efficient operation of the British trawler fleet and providing continuous employment for trawlermen, the Ministry of Labour is establishing under the Essential Work (Trawler Fishing) Order a system of registration. At each port, a committee composed of representatives of employers and workers will be responsible for maintaining a register of trawlers, owners, and trawlermen of all grades, and only registered owners and men will be allowed to engage in trawler fishing. This scheme is intended to do for trawlermen what the Dock and Merchant Navy registration schemes do—on a larger scale—for the decasualisation of dockers and seamen.

In keeping with its reputation as a good revenue month, February called for only £50,678,000 of borrowing by the Government. Of this, barely £2,000,000 was provided by floating debt. The most noteworthy achievement of the month was the collection of £49,750,000 from the new 1½ per cent Exchequer bonds. Tax Reserve Certificates have now come into their own, and no less than £112,297,000 of these were used last month in payment of taxes. Against this, new certificates were taken up to the amount of £62,550,000. Helped by £45 million of pre-encashments, Treasury Deposit Receipt maturities last month got to within £1,500,000 of the £230 million of new money raised by this means. A net repayment of £52,548,000 of Treasury bills last month was almost exactly offset by the increase of £53,150,000 in Ways and Means advances from public departments. The satisfactory inflow of tax revenue reflected in the modesty of the recent borrowing programme suggests that the budget estimates for the year 1944-1945 will be closely realised.

COMPANY MEETINGS

MITCHELL COTTS AND COMPANY, LIMITED

DIVIDEND OF 15 PER CENT.

The ordinary general meeting of Mitchell Cotts and Company, Limited, was held, on the 27th ultimo, in London, Mr Alexander Hamilton, the chairman, presiding.

The following is an extract from the chairman's statement circulated with the accounts:—The trading profit for the year to June 30th, 1944, amounted to £183,625. Provision for income tax and directors' fees together absorbed £81,250, leaving a net profit for the year of £102,375, compared with £101,226. Two interim Ordinary dividends of 5 per cent. and 10 per cent. respectively have been paid—again making 15 per cent. for the year.

As stated at the time, the second interim took the place of a final dividend and the directors do not recommend any further payment for the year ended June 30th, 1944.

The consolidated balance-sheet shows that our group has fully maintained its position, the capital and surpluses now amounting to £1,331,375. Of the total assets of £3,440,731, nearly 75 per cent. are in Africa. As regards the future, a forecast can only be made with the usual reservation, but, on the information at present available and the results so far achieved, I believe that the year to June 30th, 1945, will show as favourable a result as the year under review.

The directors wish once again to express their appreciation of the loyal and efficient work performed by the staffs of our group of companies. We again express our very best wishes to those serving in the Forces, whom we look forward to welcoming back before long.

Shareholders will no doubt be interested to learn that this year marks the fiftieth anniversary of the founding of the original business now carried on by this company, it having been established in 1895 in Durban by the late Sir William D. Mitchell Cotts, Bart.

The report and accounts were adopted.

STERLING TRUST, LIMITED

DIVIDEND INCREASED

The twenty-eighth ordinary general meeting of the Sterling Trust, Limited, was held, on the 27th ultimo, in London.

Mr Richard S. Guinness (the chairman), in the course of his speech, said: At our last meeting I referred to the reduction in debenture interest payable in future resulting from the conversion of £1,443,760 debentures from a 5 per cent. to a 3½ per cent. rate of interest. Our accounts this year derive the full benefit of this operation with a gross saving of over £21,000. We recommend an increased ordinary dividend at 5 per cent.

During the period subsequent to the formation of this trust the class of investment considered to offer the double advantage of sound security and attractive yield lay in bonds and debentures, with the result that we have in book value £1,768,692 so invested. A goodly proportion is represented by holdings in Europe, Asia and South America, which at current values show a heavy depreciation and contribute less than 3 per cent. in average yield to our revenue account. These depreciated holdings perhaps contain prospects of gradual improvement when times of peace and the resumption of international trade returns.

As regard capital values, after allowing for the contingent fund, our invested funds, with a total book value of £4,509,329, show a modest appreciation at market values as on 31st December last. When I remind you that at the end of 1941 the depreciation then shown was 21 per cent., I think we may feel gratification at the substantial improvement.

The report was adopted.

THE IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN AND IRELAND) LIMITED

HIGH COST OF LEAF

DEMAND WELL MAINTAINED

STATEMENT BY THE CHAIRMAN, LORD DULVERTON

The forty-third ordinary general meeting of the Imperial Tobacco Company (of Great Britain and Ireland), Limited, was held on the 27th ultimo, at Bristol, the Rt. Hon. Lord Dulverton (the chairman) presiding.

The following is the statement by the chairman which was circulated with the report and accounts and taken as read:

In the directors' report we have had to record with regret the deaths of two directors—Mr Lawrence Hignett and Mr E. S. Tansley. I referred briefly to Mr Hignett's death at last year's annual general meeting. Mr Tansley had been a director of the company and a member of the management of the John Player and Sons branch for over 20 years.

You will also have seen that Mr H. F. Field, who had been a director for some 10 years, has resigned from the board. His resignation on account of ill-health has been accepted with regret.

ACCOUNTS

As in previous war years, I shall confine my comments on the accounts to the main features.

The first variation of note is in stock-in-trade, which is £1,367,149 less than last year, largely on account of a reduction in our stocks of manufactured goods. Two years ago I told you that at the request of the Government we had built up our manufactured stocks to a level a good deal higher than normal; but the necessity for this has since almost disappeared, and we are now authorised to hold much less by way of reserve stock.

As regards unmanufactured leaf our stocks are less in quantity, but rather higher in sterling value, owing to a substantial rise in the cost of leaf. I shall refer to this matter later in my general comments.

Debtors were down by £1,113,492. Loans to corporations and public boards, etc., stand at £345,284 compared with £1,447,602 last year. Several big loans matured during the year, and as we needed the money in our own business they were not renewed.

On the capital and liabilities side, creditors, taxation, etc., are down by £3,945,273, the chief reason for this being that our estimated outstanding liability for Excess Profits Tax unpaid at October 31, 1944, was less than the corresponding figure at October 31, 1943. Bank overdraft, though lower than last year by £1,075,458, remains at a very considerable figure for the reason to which I have referred in my last two statements, namely, the incidence of a very high rate of duty.

YEAR'S PROFIT

In the profit and loss account the profit for the year is shown at £15,363,557, which is £198,685 less than last year. Against this figure are charged directors' fees (£10,000) and income-tax on profits for the year (£7,725,000), resulting in a balance brought down at this stage of £7,628,557. To this must be added the balance brought forward from the previous year £1,869,758, making a total of £9,498,315. Out of this sum £500,000 has been transferred to general reserve (bringing it up to £10,500,000), leaving £8,998,315 available for distribution. The proposed disposition of this balance is clearly shown both in the directors' report and the accounts.

You will notice in the directors' report

that the final dividend and bonus on ordinary stock is to be paid a week later than has been customary. In recent years we have found that additional time is required for the preparation and audit of the annual accounts. For that reason it has become necessary to hold the annual general meeting a week later than usual, which means that the payment of dividend has similarly to be postponed.

GIFT TO STAFF AND WORKPEOPLE

For many years past we have thought it well to mark our appreciation of the loyal and willing service of our employees both at home and abroad by a gift over and above the ordinary salary or wage. I am sure that once again stockholders will welcome the decision of your board to make a gift to the staff and workpeople of a sum equivalent to 16 per cent. of the total salary or wage received from the company during the twelve months ended October 31, 1944. The general conditions of the gift are the same as in previous years, and the directors, as usual, reserve to themselves a discretion to grant or withhold a share in the gift in any case that may appear to them to require exceptional treatment.

GENERAL COMMENTS

I have already referred to the subject of leaf prices. These have risen steadily throughout the war, and the average cost of our leaf stocks now stands at a higher level than ever in the history of the company. Our purchases of American leaf, by far the major part of our total raw material requirements, are subject to the control of both the U.S.A. and the British Governments.

During last year one of your directors visited the tobacco markets in U.S.A. and reported very favourably on the excellent quality of leaf tobacco that was being bought from the 1944 crop, from which a full year's supply has been obtained.

During the year under review the demand for our goods has been more than maintained. We have supplied the home market to the limits of our capacity, and in addition have undertaken an increased share of the export trade for the troops abroad. Difficult as these increased commitments have been with our reduced staff and labour force, we have thought it right to undertake them even though for a short time it meant a slight curtailment of deliveries to the home market; and we know that the extra supplies we are sending overseas are much appreciated by the men in the Forces.

Our principal difficulty is still the shortage of labour and staff—over 8,000 of our employees being still away in the Forces or on various forms of Government service. Preparations for their reception on their return from the Services are not being neglected, and we trust that before this year is over many will have been able to resume their former activities with us.

The report and accounts were unanimously adopted, and a final dividend of 7½ per cent., together with a bonus of 2½ per cent., both free of income-tax, was declared on the ordinary stock, making a total distribution for the year of 17½ per cent.

The formal business having been transacted, a vote of thanks to the chairman concluded the proceedings.

LEWIS'S, LIMITED

TOY AND CLOTHING PROBLEMS

MR J. TRINGHAM'S ADDRESS

The thirty-sixth annual general meeting of Lewis's, Limited, was held, on the 28th ultimo, at Liverpool.

Mr J. Tringham, (executive chairman) who presided referred at the opening of his address to the death since the last meeting of the late chairman, Lt. Col. S. S. G. Cohen. He then dealt with the various items on the balance-sheet and said that the profit for the year ended February 1, 1945, after provision for taxation and debenture stock interest, was £766,563, compared with £751,023 for the previous year. It was proposed to increase the carry-forward to £66,722, against £58,412 brought into the accounts this year. Referring to the increase in accrued liabilities to £1,031,998, the chairman continued:

This figure includes not merely the higher provision we have had to make this year for excess profits tax, but also the reserve which we established for the first time last year to meet Schedule D income-tax liability on our current profits. We hope eventually to put the company on a pay-as-you-earn basis, to the extent of being able, if necessary, to provide out of the profits of the current year for the Schedule D income-tax liability on the profits of that year. The sum involved is substantial, but including the reserves we have set aside in the present and last year's accounts, we have now reached roughly half-way to our goal. We feel that when we eventually achieve this object we shall have gone a long way towards consolidating the great financial strength of this company.

PROGRESS OF SUBSIDIARIES

I would like this year to devote more time than usual to the affairs of our subsidiaries. I am glad to say that we have received satisfactory dividends from them all, and each in its separate way has made substantial progress during the year.

Our oldest subsidiary, Bon Marche (Liverpool), Limited, is a fashion store which was established in 1879. The company has had a most successful year, but as during the EPT standard years it was going through a period of reorganisation it has a low EPT standard, and, in consequence, it has been obliged to pay out in taxation a substantial proportion of its total earnings. Nevertheless, it is clear that that reorganisation has proved eminently successful, and we are confident that the store can now fully justify its claim to be the leading fashion house in the North.

Our second oldest subsidiary is Lewis's Bank, Limited, which was first established as a department of Lewis's in 1928. By 1934 it had sufficiently expanded to justify a separate existence as a private company under the financial control of Lewis's. Its purpose has always been to provide our many thousands of customers with an up-to-date banking service at hours more convenient to them as shoppers than ordinary banking hours. It has achieved that object so successfully that after having been in existence only 16 years it has, by all the recognised banking standards, built up a financial position of great strength. As a result of the year's operations it has been able to pay the parent company a satisfactory dividend on its investment.

S. REECE AND SONS' RECORD YEAR

Our two other subsidiaries date from early 1936. In that year we acquired an interest in the well-known Liverpool catering concern of S. Reece and Sons, Limited, and after a difficult period of reorganisation had been successfully overcome, this business in recent years has reported a steady

and uninterrupted development. In the year under review turnover and profit reached record levels, and although once more the Chancellor of the Exchequer will receive in taxation a sum many times greater than the parent company has received this year in dividends, we were so confident about the future earning capacity of the business that during the year we acquired the whole of the outstanding ordinary share capital. Through an associated company of Reece's called Merseyside Dairies, Limited, we have in addition a substantial stake in the distribution of milk throughout Merseyside, and this business also has had a highly successful year.

Finally, our fourth subsidiary, Lewis's (Midland), Limited, opened its doors for business in Leicester in March, 1936, and acquired by that quite fortuitous circumstance an unfavourable EPT standard. The business, which might be described as a Lewis's in miniature, has shown steady expansion both in turnover and profit year by year, but owing to the incidence of taxation it is only this year that the parent company has been able to receive any return on its investment. I am happy to say that the whole of the arrears on the preference share capital, all of which is held by Lewis's, were paid off during the course of the year, and unless anything totally unforeseen occurs, the decks are now clear for some return on the equity.

STEADY PROGRESS AND EXPANSION

I hope that the impression left on you by this short review of our subsidiaries is one of steady progress and expansion. As you will see, we have spread our commercial activities over trades and areas which are complementary to our principal business. The investment of the substantial capital sums involved called for both courage and judgment, and may I add that the exercise of no little patience has also been demanded while the growing businesses were being developed and getting firmly established. It is a matter of regret that during the process such a large proportion of the fruits of our efforts has been appropriated by the Chancellor of the Exchequer, but sooner or later the overwhelming burden of taxation on trade and industry must be alleviated, and then we may look forward not merely to a more generous return on our capital outlay, but also to still further expansion and the possibility of providing wider scope for employment. In the meantime, we can regard the cumulative sum we have now paid in EPT as a substantial contribution to the finance of the war effort as well as a useful cushion against any future fall in profits below the standard. Furthermore, we are entitled to look to the 20 per cent. refund of EPT paid at the 100 per cent. rate for the reserves which we have been prevented by taxation from providing out of our own resources.

Turning now to merchandise matters, we have had perforce to operate throughout the year on unusually low stocks, and certainly during the second half-year our rate of stock turn can seldom have been equalled in the history of the business. It is true that we shall welcome an increased flow of merchandise as soon as the labour and raw material position of the country justify the Board of Trade in releasing additional supplies for home consumption. On the other hand, low stocks and high stock turn have always constituted the platform on which the success of this business has been built, and at this period of the war low stocks of much war-time merchandise are greatly to be desired. It means that when goods of the quality we prided ourselves

on selling in peace-time again become available, we shall have little or no losses to take on unsatisfactory merchandise, and from this point of view our stocks have never been so clean.

THE PRICE OF TOYS

In this connection we note with satisfaction the increased quota releases which the Board of Trade have recently announced for certain categories of merchandise, but once again we would enter a plea for some improvement in quality as well as increase in quantity. This consideration applies with particular urgency to toys, which is a problem that has been referred to from this chair every year for the last few years. In the case of no other merchandise does the retailer receive so many complaints from the public nor such ill-deserved abuse. It cannot be too often repeated that the blame for high prices cannot be laid at the door of the retailer, as his margin is strictly controlled in relation to the price at which he buys; but if he is to have any stock to sell at all, the price at which he buys is very far from being subject to the same control. Moreover, that price is inflated by 33 per cent. purchase tax, and very frequently by a purchase tax uplift of up to 17 per cent. as well. The public's chief complaint is not about the high prices of toys as such but of their high price in relation to their often deplorable quality—in other words, about the value which the retailer is able to offer. It will not meet that complaint to release additional supplies of toys of the same poor value. Either quality must be improved without altering the price—and that is primarily a production problem in which supplies of raw material and labour may also be involved; or if that is impossible, and we have to remain content with the present indifferent value, then the price must be reduced by, we suggest, removing purchase tax and uplift. We note that the same principle has recently been adopted in connection with aluminium ware, and we see no reason why toys, selling at less than a given price should not be regarded as utility merchandise and so rendered free of purchase tax.

This public reaction against poor quality merchandise has long been very marked in the clothing field as well. The gradual elimination of non-utility apparel may be part of high national policy, and if, as such, we must accept it, then we would press for increased supplies at the upper end of the utility range. As in the case of toys, it will inevitably in the long run prove wasteful to increase supplies only of lower quality merchandise which the public in the interests of obtaining the best value for their coupons are no longer willing to buy.

TOWN PLANNING

I do not apologise for referring again to the subject of town planning, which was touched upon in the chairman's speech last year. A year has elapsed and no measurable progress has been made in clarifying the position of those firms who are unfortunate enough to have bomb-damaged premises in areas scheduled for town planning. Indeed, the outlook has, if anything, deteriorated, in that various Government pronouncements have confirmed the attitude of the War Damage Commission in their refusal to recognise what has come to be called a "portable cost of works claim." As this issue goes to the root of town planning in all bomb-damaged areas, we still hope that some practical compromise may be reached. So far as we are concerned, we would regard it as a tragedy if the opportunity presented by bomb damage were not seized, in order to improve the layout of our cities.

I have no doubt that shareholders will authorise me on their behalf to convey to all ranks of staff a special message of appreciation for their efforts during the past year.

The report and accounts were adopted.

SUN LIFE ASSURANCE SOCIETY

MR. W. M. PRYOR'S STATEMENT

The annual general meeting of this Society will be held at 63, Threadneedle Street, London, E.C.2, on the 13th inst.

Mr. W. M. Pryor, D.S.O., D.L., chairman of the Society, has issued a statement to shareholders, which in outline is as follows:—I much regret to report the death during the year of three of our directors, Lord Herbert Scott, C.M.G., D.S.O., Lord Essendon, and Cmdr. Sir Charles Craven, Bt.

FUNDS, INCOME AND OUTGO

The total funds of the Society as at December 31st last amounted to £57,465,000, of which £51,799,000 was represented by the Life Assurance Fund. The increase in the total funds over the year was £2,183,000. The premium income in the life account for 1944 was £5,692,000 as against £5,520,000 for the preceding year.

The gross interest income of the life assurance fund was £1,968,000, the corresponding net interest income being £1,519,000. The gross rate of interest earned on the fund was £3 19s. 1d. per cent. per annum, representing a reduction of 2s. 2d. during the year.

Claims by death amounted to £1,716,000, including war claims of £284,000, as compared with a total of £1,363,000 for the year 1943. Claims by maturity at £2,462,000 were slightly above those for the year 1943. Surrenders amounted to only £157,000, a figure which is a low record for very many years.

NEW BUSINESS

The new business for the year was 16,081 policies for sums assured of just over £11,250,000, representing an increase upon the results of the previous year of nearly 700 policies and sums assured of over £800,000, and I think it eminently satisfactory that a growing proportion of our business is being effected with participation in profits.

As you are no doubt aware, it has been the consistent policy of the Society to encourage wherever possible the effecting of assurances on a with-profits basis because of the flexibility which the profit-sharing principle introduces into the contract. The directors have accordingly decided that with-profits assurances now being effected shall cover all civilian war risks whilst the policy-holder is in Great Britain or Northern Ireland and that no extra premium shall be required on that account.

STAFF PENSION SCHEME

A substantial proportion of our business relates to assurances which have been effected under the numerous staff pension schemes which we have arranged for industrial and other concerns. We have, in fact, specialised in this class of business for many years, and the experience which we have gained enables us to offer attractive facilities to employers who realise the urgency of solving their staff pension problems.

HOUSE PURCHASE SCHEME

Last year I informed you that the Society hoped that after the war it would be able to expand its house purchase business. We have recently taken a step towards this end by issuing a prospectus dealing with a deferred house purchase scheme under which an endowment assurance effected at the present time may be eventually utilised to increase the amount of the loan which could ordinarily be advanced to a borrower for house purchase purposes.

REVIEW OF ASSETS

For many years the Society has limited its investments to securities with final dates of redemption, and at the present time no less than 98 per cent. of the assets are so invested. Since the commencement of the

war the whole of the increase in the funds, as well as a large proportion of the amounts accruing from the repayment of existing investments, has been applied in the purchase of British Government securities, which have now reached a figure of £25,800,000.

In each year from 1941 onwards we have been able to report a growing excess of the market value of our assets over the balance sheet value, and this trend was continued in 1944.

TRIBUTE TO THE STAFF

Once again it is my privilege to extend on behalf of the board our thanks to the staff for their patient and unremitting efforts in carrying out their duties throughout the year.

I also welcome the opportunity of again sending our best wishes to all those who have left our service to join H.M. Forces.

GENERAL INVESTORS AND TRUSTEES, LIMITED

The thirty-eighth ordinary general meeting of General Investors and Trustees, Ltd., will be held on March 8, in London.

The following is an extract from the statement of the chairman, Mr W. C. Cripps, circulated with the report and accounts:—The revenue for the year has increased sufficiently to allow the payment, for the sixth year in succession, of a dividend of 9 per cent on the ordinary stock. Alongside this increase in revenue has continued the rise in capital values. Last year we were able to tell you that the company's investments were worth £17,865 more than their book cost. This year the surplus has increased by a further £169,278.

I should say that the revenue is about stabilised at perhaps a slightly lower level than that of the year under review until we re-invest our liquid funds and until we receive income again from our holdings in countries under enemy control or from countries which have lately been delivered from the hands of the enemy.

THE ENGLISH ELECTRIC COMPANY, LIMITED

DIVIDEND OF 10 PER CENT

The twenty-sixth annual general meeting of this company was held, on the 1st instant, in London.

Sir George H. Nelson (chairman and managing director) said that creditors had been increased by £2,256,000, which was largely offset by an increase in work-in-progress and stocks; the net liquid assets now stood at over £3,000,000. It was proposed to allocate the sum of £100,000 to general reserve, bringing that item up to £1,000,000. On the assets side there was an increase in the written down value of land and buildings and a slight decrease in plant and machinery.

The profit carried to the balance-sheet was £434,984 and, after providing for the preference and ordinary dividends, plus £100,000 for general reserve, there was a carry forward of £87,870, or £25,239 greater than the sum brought in. The time had not come when the complete story of the company's war activities could be told, but its efforts had directly contributed to the success of our Forces.

Looking forward, orders for normal products were being received in satisfactory volume, and the company had taken steps to ensure that it would play its proper part in the export market. He was disturbed by some of the political propaganda on nationalisation because of the ultimate disadvantages he was sure it would bring. He had heard no argument at all to show that nationalisation would ultimately achieve what was their greatest need, if they were to compete with the rest of the world, viz., improved efficiency.

The report was adopted and a dividend of 10 per cent. declared.

MANCHESTER SHIP CANAL COMPANY

SIR FREDERICK WEST'S REVIEW

The eighty-seventh ordinary general meeting of this Company was held, on the 26th ultimo, at Manchester.

Sir Frederick J. West, K.B.E. (the chairman), in the course of his speech, said: At this, our sixth war-time meeting, I am able to give you more information than has been permitted in recent years.

Some shareholders may be disposed to relate the company's financial experience in this war to that of the last and to these I would point out important differences which materially affect the revenue accounts. In the last war your company enjoyed freedom from excess profits duty; such is not the case to-day. Again, no necessity arose then, as unfortunately it does now of having to make provision for damage sustained by enemy action nor was it necessary to defer repair and maintenance works to anything like the same extent. Civil Defence has, in this war, been a very heavy charge. Again, port charges have been subject to close Ministerial scrutiny as part of the national policy.

DIVIDEND POLICY

The dividends your Board recommend are:—3 per cent on the Manchester Ship Canal Corporation Three and a-Half per Centum Preference stock; 3 per cent on Preference shares; and 1 per cent on the Ordinary shares. These are the dividends which have applied throughout the war years, but there may be some shareholders familiar with the contribution the port has made to the war effort who will have looked for some increase.

The principal reasons which determine the Board in its recommendations were:—It is inadvisable to increase dividends unless there is good prospect of their being maintained at the new level for some years. We would wish to avoid any repetition of the company's experience, when in 1938 it had to halve dividends increased in the previous year. Such a recurrence would be damaging to our prestige and make it difficult to raise money on favourable terms for new projects which it is anticipated will be necessary within the next two or three years. Our future liability in the matter of war damage is also unknown. The extent of our excess profits tax is also unknown. Post-war development is another factor which has had to be taken into consideration.

Summarising the position, the extra net profits made during the war years has been required for the following purposes:—Taxation, including excess profits tax and reserve towards income-tax on the current year's profits; war damage and deferred maintenance. You will understand, therefore, that it has not been possible to increase the annual reserves required for the renewal of working plant such as craft, cranes, rolling stock, etc.

The net revenue at £1,244,541 shows an increase of £24,246 over that of the previous year. As there was a saving of about this amount in the cost of Civil Defence the working results of the two years were almost identical.

POST-WAR PLANNING

I believe as a result of the prudent policy we have followed for some years we are in a position to plan our future with some confidence and I would say at once that such planning has been the subject of a very great deal of consideration.

During the past two years, despite the pressure of our operational and technical departments, the management has undertaken a detailed survey of all our plant and equipment and closely examined the services and facilities of the port.

We confidently hope—at no distant date—to emerge from this long and testing struggle ready, so far as intelligent foresight can make us, to face the future with assurance—determined to win for ourselves a becoming reward.

FINANCE AND BANKING

THE MONEY MARKET.—Money has been wanted in the market this week for a variety of reasons. The end of the month and certain clearing banks' making up for their February statements have involved heavy calling from the market. Tax payments have again been considerable. There have, in addition, been heavy applications for Tax Reserve Certificates. The banks had £80,000,000 to find against Treasury Deposit Receipts and though this was almost matched by the current maturities, there seems to have been some unevenness in the balancing of payments and maturities. The banks hurried their payments in order to hold late September maturities. The result of this combination of influences was to make credit keenly wanted in the early part of the week and the authorities had to come to the rescue of the market with heavy open market purchases of bills. These are reflected in a rise of £14,050,000 in Government securities in the latest Bank return. Bankers' deposits have risen by £11,101,000 to £207,775,000 and it was evident that by Thursday the credit position was easing rapidly. The immobilisation of funds in Public deposits, which rose by £7,815,000 to £18,142,000 over the week, was also responsible for the apparent dearth of funds in the market.

MONEY RATES, LONDON.—The following rates remained unchanged between February 22nd and March 1st:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, ½%. Discount deposit at call, ½%; at notice, 1%.

INDUSTRY AND TRADE

Scottish Fish Landings.—The first statements of fish landings to be resumed are those relating to Scotland. Figures for the rest of the United Kingdom are expected to follow shortly. Meanwhile, the Scottish statistics are given in the accompanying table:

FISH LANDED IN SCOTLAND BY BRITISH FISHING VESSELS

	Pelagic*	Demersal	Total
	'000 cwt.	'000 cwt.	'000 cwt.
Jan., 1938.....	87.3	38.6	125.9
" 1945.....	47.9	55.3	103.2
1938.....	2,876.3	1,084.5	3,960.8
1944.....	1,495.9	1,741.1	3,237.0

* i.e., herrings, sprats, sparlings and mackerel.

Total landings in 1944 were only a little above half those in 1938, whereas the value of the reduced quantity was about half as much again. It is interesting to note that the price of demersal fish has risen more steeply than pelagic.

"The Economist" Sensitive Index.—There was no change in the index during the week ended February 27th. The complete index (1935=100) was 158.7; crops 135.8; and raw materials 185.5.

GOVERNMENT RETURNS

For the week ended Feb. 24, 1945, total ordinary revenue was £97,593,000, against ordinary expenditure of £110,299,000 and issues to sinking funds of £290,000. Thus, including sinking fund allocations £12,408,210, the deficit accrued since April 1st is £2,539,508,000 against £2,503,126,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £68,856 to £2,931,408, the other operations for the week (no longer shown separately) increased the gross National Debt by £8,861,058 to £22,120 million.

The German Problem

AT last the Allies stand upon the Rhine, and to-
morrow they may be across it. Cologne, the third
city of the Reich, is already in Allied control, and the
moment for applying the chosen solution of the German
problem is at hand. Decisions cannot be much longer
delayed. But, by all appearances, they have not yet been
finally made, and there is still an opportunity, though pos-
sibly fleeting, to plead for a peace that will last.

There is no intention of reiterating here the arguments
that *The Economist* has often used in favour of a policy
of moderation. Those arguments have not been based on
any sentimentalism or any pity for the hard fate of the
German people, still less on any calculating desire to curry
their favour or to make future use of them in any diplo-
matic combinations. It has simply been a desire to learn
the lessons of the Versailles settlement and to insist that
we should not bite off more than we can chew. Neither
the American nor the British people will for long enforce
a settlement that has the double disadvantage of raising
doubts about its justice and of requiring painful efforts
for its enforcement. This is not to say that the German
people ought not to be punished or that they ought not to
be compelled to make heavy material restitution for the
damage they have done—but that these policies should
be limited in time to the short period during which the

will and the means to enforcement are likely to be pre-
sent. The long-period and complete disarmament of
Germany is an essential requirement, but it would be as
well to limit the permanent penalties to this one.

This is a brief summary of an argument which has been
often repeated and often criticised. Of the more reasonable
criticisms, two stand out. The first is that a purely
negative attitude of objecting to other people's solutions
of a difficult problem is not enough. Those who say of a
policy of severity that it will not work should be under the
obligation of proving that their alternative would work
better. Moreover, a policy of severity may be only the
opening phase of a long-term constructive programme for
re-aligning economic and political forces in Europe in such
a way that the compact war-making potential of Germany
will pass away for ever and leave in its place a more stable
equilibrium which will be able, in due course, to maintain
itself without external force. If the heavy industry of the
Ruhr, for example, were in the hands of controllers who
could be relied upon not to use it for aggressive purposes,
the German problem would be largely solved.

The second line of criticism is that, if the British
Government were to preach a policy of moderation, it
would merely alienate all its European Allies, and disrupt
the Grand Alliance on which the peace depends as much

as it does on the disarming of Germany. The European nations have been invaded, exploited and crushed. They have seen every principle of humanity violated. A veil of suffering and bloodshed hangs between them and the old ideals of liberalism and democracy and people's rights. Any British attempt to prevent these emotions of passionate hatred from finding expression in action would merely bring the alliance to an abrupt end and precipitate a disaster of the first order. Anything that can be done to guard against it should certainly be attempted.

But the preservation of the alliance requires a consideration of what the Western Allies can tolerate, not merely of what the Continental Allies want. To commit ourselves to a policy which we shall not, in fact, implement would be the worst of all possible ways of keeping the Alliance alive, since it would lead to differences of view, and possibly to bitter recriminations at a time when, in the natural course of events, the ties of the alliance may, in any case, be suffering some relaxation. No American Congress or British Parliament can commit its successor. The greater is the necessity for being absolutely certain that nothing is promised that is not likely to keep a sufficient degree of popular support to ensure its performance. If this involves some difference of opinion, it is far better to say so now, when it cannot possibly be ascribed to misplaced affection for the Germans, than to leave it to later years, when suspicions may be more easily roused.

There can be very little doubt that both the Russian and the British Governments are, at the moment, deeply sincere in their anxiety to remain allies for an indefinite period. But that does not mean that all suspicions are dead. The Soviet regime has, all through its career, suspected Great Britain of anti-Bolshevist designs—and not wholly without reason. The favourite nightmare of British diplomats, ever since the Treaty of Rapallo, has been a German-Russian alliance, and it is less than six years since it seemed to be on the verge of coming about. Each country wants to be friends with the other. But each country has also, within less than a decade, given the other grounds for suspecting it of hostile deals with Berlin. This is a situation in which, even with the closest relationships and the most complete interchange of information, distrust may easily arise. London and Moscow are compelled by the mere logic of geography to keep a very sharp eye on each other's German policy. For the sake of the Russian alliance, more even than for the sake of an effective settlement of the German problem, it is absolutely essential that the policy, once jointly agreed, should be jointly pursued without wavering. And that in its turn means that the utmost care must be taken not to put into the policy anything that will not be performed.

*

If there were no possibility of an accommodation between the sort of settlement that is desired by the Continental Allies and the sort of settlement that British and American public opinion will support, the outlook would be gloomy. It is the purpose of a short series of articles, of which this is the first, to explore the possibilities of an effective synthesis of the two approaches.

One obvious line of compromise is on time limits. Very fortunately, the time when the Continental insistence on retribution and restitution will be at its maximum is the time when the objections to severity from the British standpoint are at their lowest—that is, immediately after the Armistice. If there is a penal period, during which every practical measure is taken to convince the German people, in their own persons, of the unprofitability of aggressive war, and during which their productive powers can be fully pre-empted in making goods to replace what they have stolen and destroyed, this might meet the very legitimate desires of the liberated and victorious allies. But if this penal period is short—say, not more than five years—there is comparatively little danger of Western opinion weakening in its resolve. A short, sharp period of penal servitude may be the means of effecting a considerable reconciliation between the two views.

A second point of agreement is on the complete and permanent disarmament of Germany. Even those who

most doubt the possibility of permanently enforcing a severe peace agree with the necessity for taking all arms out of the hands of the Germans, for completely disbanding the Wehrmacht, and for prohibiting the manufacture of all important munitions. Indeed, one of the chief arguments for a moderate long-term policy is the desirability of concentrating all efforts on this one permanent provision; for which Senator Vandenberg's recent proposal indicates the strong probability of American support. This, then, is a second matter on which agreement can be secured and performance honestly promised.

These two points go a long way. But it would be idle to suppose that they go far enough to meet those who, not content with disarmament (or perhaps not trusting that it will be enforced), wish to have some more organic assurance that Germany will not again make war. This is the starting point of those who advocate a so-called "constructive" settlement. This school of thought recognises that the only lasting peace is one of stable equilibrium—that is, a settlement which will maintain itself of its own internal strength when, in due course, the external force of Great Power coercion is withdrawn. But before that time comes, they hope to have produced such a natural re-alignment of European forces, such a re-arrangement of the atoms, that Germany will no longer be strong enough to make war, even when it is released from all its restrictive impositions.

Clearly, the most complete embodiment of this order of ideas would be a complete federation, a United States of Europe, with a central government strong enough to control all international relations, armaments and industrial policy. Within such a federation Germany could safely be allowed to be a free and equal member without being a menace. But such a solution is obviously so far outside the realm of practical politics that it need not be further discussed.

If federation is impossible, the "constructive" policy can make an approach from the economic angle. Germany's strength for war lies in its industry, particularly its heavy industry. This heavy industry could, of course, be destroyed or removed and its replacement prohibited, as the Morgenthau plan proposed. But a plan that would drastically reduce the standard of living not merely of Germany but of all those parts of Europe that have over the decades been integrated with German industry could hardly be called "constructive" and would be likely to be repudiated by Mr Morgenthau's countrymen within a very few years. The Ruhr is the source of German's aggressive power, but it is also the source of a large part of Europe's material wealth. It is impossible—save in a few exceptional cases—to draw a distinction between industry that is useful in war and industry that is useful in peace.

Hence arises the proposal to leave the industrial areas in being, but to remove them from German control. Fortunately, the two chief industrial areas lie on the flanks of Germany, not in the centre. Silesia is to be annexed to Poland. Could not the Ruhr and the Rhineland—so runs the argument—be detached from Germany, not for annexation to or exploitation by any other state, but as an independent German state? The inhabitants would not be impoverished or tyrannised; they would be self-governing in local matters; but their external relations would be supervised by the United Nations; and their commercial policy would be so directed that the metallurgical industries of the Ruhr gradually fitted themselves into a West European pattern instead of into the war economy of a Greater Germany. This, it is hoped, would be a painless operation to sterilise Germany's aggressive potential. The hope would be that, after a generation or two, the advantages of Western liberalism and prosperity would make the Rhinelanders definitely prefer their independence to Prussian militarism. The forces of Europe would have been successfully re-aligned; Germany would no longer be strong even when it was free; and a new stable equilibrium would have been achieved.

This, in very brief summary, is the proposal. It will be further examined and its prospects of stability analysed in subsequent articles.

Capital for Industry

LAST Friday's debate in the House of Commons on the two proposed Finance Corporations produced little that was not already known. The Chancellor of the Exchequer properly disclaimed responsibility for more than the broadest generalisations of policy, and his reply to most questions was therefore that the directors of the new bodies would decide—including, significantly, the question whether capital for industry can best be supplied as fixed-interest debt or as equity participation. On the Socialist benches there was a great deal of talk about determining the investment of capital by social instead of by commercial considerations, though few who talked in this vein made it clear whether they thought the new corporations ought to be advised to try to lose their money.

It was, as often before, Mr George Benson who hit the right nail most squarely on the head. After declaring that "a great deal too much fuss is being made about these two Finance Corporations," he said that the real problem was to see that financial capital, of which there is a surfeit rather than a lack, is turned into real industrial plant. So long as there is a policy that concerns itself with Finance Corporations, but not with the far larger stream of capital formation financed from other sources, "we really have a policy that controls the dog's tail, but makes no attempt to control the dog itself." This is no more than the truth. The proposed Finance Corporations are a useful piece of technical machinery—useful, if for nothing else, to convince the public that no sound proposal will be turned down for purely financial reasons—but they hardly touch the basic needs.

What those needs are is slowly becoming more apparent. A recent pamphlet of the Tory Reform Committee* is the latest demonstration that the fundamental realities of economic arithmetic are penetrating into current discussion. This is an immense gain. But it carries with it some dangers of over-simplification, and there is still some disentangling of issues to be done.

It is not, for example, as fully realised as it should be that there will be two sharply distinct periods in the post-war era—indeed, three, if the preliminary phase of demobilising manpower and industry and getting transport going again is to count as one. There will be a period, which may last from two to five years, or even longer, when there will be a universal sellers' market and the major difficulties of economic policy will be those that arise out of the apportionment of scarcities. In this period there may well be a famine of capital. But it will be a famine of physical, not of financial, capital. As was argued in an article on "Post-War Arithmetic" in *The Economist* two weeks ago, the danger in this period will be lest current consumption and the needs of the Government should, between them, engross too large a share of the national output and leave far too little to meet the needs of the community for the replacement and increase of its capital equipment.

The calculations are done in terms of money, since money is the only medium in which all forms of economic activity can readily be compared. But this may be misleading, for it is not money that will be short. On the contrary, there is an enormous mass of liquid capital available. The repayments due under EPT, even after the deduction of income tax, will by themselves be as much as the entire capital of the Finance Corporations. Bank deposits are virtually double their pre-war level and an enormous volume of Government obligations has been issued during the war. The deposits and the bonds stand to someone's credit—and the "someone," in overwhelming measure, is the business world. The difficulty in this first pre-war period will not—save in the rarest cases—be to raise money, but to lay hands on the manpower and the materials to undertake any real capital formation. The Finance Corporations will be useful in taking care of the exceptional cases. But they are no contribution at all

to the major problem of capital formation in this period, which will be to set up some order of priority between consumption, Government requirements and capital formation, and to see that the last of the three does not get entirely overlooked owing to the political pressure for the other two.

*

Sooner or later, however, this period of universal scarcity will come to an end. How long it will last will turn, among other things, on the volume of capital re-equipment that the community, without further prompting, will wish to do. The Tory Reform Committee puts out a figure of £8,000 million as a rough measure of the volume of capital formation that ought to be undertaken. But this is a measure of need, not of effective demand; and it may be that before the cumulative total has reached this figure, the actual demand will show signs of giving out. Sooner or later it must be expected that the conjuncture will change and that the problems of stretching the physical output of the community to cover the expenditures that it is trying to undertake will give place to the opposite, and more familiar, anxieties of expanding the total of expenditures so as to occupy the nation's productive capacity. When this moment arrives, as it surely will, nearly every economic policy will have to be put into reverse, and among them the policy for capital formation. Until that moment, it will be a question of choosing, from a clamorous queue of applicants, those who best deserve an allocation of scarce resources; thereafter it will be a question of finding means of stimulating industry to use capital. Until the tide turns, the danger will be of inflation; afterwards, of deflation. Up to the crucial moment, the community needs to restrain its propensity to consume, in order that capital formation should not be squeezed out; after it, consumption should be stimulated, in order that the investment of funds in capital equipment shall have a prospect of being profitable.

But one thing will not change. Neither in a buyers' market for capital nor in a sellers' is there any real reason to suppose that there will be a shortage of money. In the first period it is men and materials that will be short, and anybody who can get these will be able to raise the money. In the second period, it will be the willingness of industry to embark upon capital formation which may be inadequate; and any one who is willing to take the risks will, in the future as in the past, be able to get the money to do so. It may be that there are exceptions, that some varieties of business men have had difficulties in the past in raising capital for worthwhile ventures. There may be a "Macmillan Gap"; and in any case it is sound policy to make public demonstration of willingness to close it. It may be that, compared with earlier periods, there is a smaller volume of capital available on participating, risk-taking terms—this is a gap which still remains to be closed. But these are minor matters. The volume of capital formation (on which both Full Employment and High Productivity depend) does not turn on the availability of money.

It turns—in a normal period such as is now under discussion—on the willingness of enterprise, whether private or public, to take the money that is plentifully on offer and to invest it in productive capital. The reasons why this willingness has in recent decades been on an inadequate scale were analysed in all their complexity in a series of articles called "A Policy for Wealth" which appeared in *The Economist* rather more than six months ago. With all the dogmatism of brevity, it can be said that there are three major obstructions to an adequate flow of capital formation. The first comes under the head of labour policy. The great strength of the Labour movement has been too often misapplied into mere Luddite obstructiveness instead of concentrating on the main issue of high earnings, which are at once the cause and the

* "Tools for the Next Job." Published for the Tory Reform Committee by Europa Publications, Ltd. 2s. 6d. net.

consequence of rapid investment in labour-saving machinery. Secondly, heavy taxation has been rigidly applied without any sufficient thought to its economic consequences. At all times, the chief source of savings for the most productive investment lies in the ploughing-back of industrial profits, which has been so grievously throttled. Thirdly and most importantly, inadequate capital formation has been due to the endemic slump-mindedness of British industry, which leads to restrictive practices and protectionism of all kinds, seeking rather to ensure a return on existing capital, however obsolete, than to clear the way for new investment.

All these can be summed up in the one word Risk. It is not so much that the rewards of successful enterprise in capital formation are less, or less attractive, than they were. However high the level of taxation, if a business man can be reasonably sure of a return, however small, he will in most cases go ahead. The difficulty is that the risks of making a loss are now much greater—or at least that they seem to be much greater—than they were. This is the field within which a national capital policy should properly operate, and where any success in diminishing the risks of capital formation is likely to be embodied, at once and manifold, in an increase of national wealth. Action in this field will be far more effective than any rearrangement of the financial structure, useful though this may be in a technical way. Yet this is the field that has been strangely neglected. The Government, in its White Paper on Employment Policy, gives the appearance of being content with a volume of industrial capital expenditure that fluctuates widely and of proposing to offset it by equal and opposite fluctuations in public works. Sir William Beveridge deals with this conception with very proper severity; but he too has very little to say on the practical means of inducing an adequate and stable flow of industrial capital formation.

Balkan Turmoil

TOWARDS the end of February, Field-Marshal Alexander visited Yugoslavia and conferred with General Tolbukhin, the Soviet Commander-in-Chief in the Balkans, and with Marshal Tito. Presumably, they discussed ways and means to complete the liberation of the Balkans. Nearly the whole South-East of Europe has now been freed, though scattered pockets of German resistance exist throughout Yugoslavia. The Wehrmacht, however, still holds the whole of Croatia as well as the area between Lake Balaton and the Danube in north-western Hungary. These two strongholds cover the approaches to Austria. The liberation of Croatia might possibly be a preliminary to two converging thrusts into Austria, from east and south. The fact that Croatia is still under German occupation is certainly disappointing. But the liberation of the whole of Yugoslavia was apparently not one of Marshal Tolbukhin's tasks. He was mainly interested in forcing a passage from Yugoslavia through into Hungary. The liberation of Croatia has apparently proved too big a campaign for Marshal Tito's forces. The Partisans are fully engaged in policing Serbia, possibly because the Serbs are not very enthusiastic about the regime established by the Croat Communist leader.

The political situation in the Balkans and in the Danube Basin is far less satisfactory than the military position. Uncasiness and tension prevail throughout the area. The freed peoples are suffering under two old and familiar scourges: the violence of social and political conflicts and the intensity of an infinite number of nationalistic feuds. Both the internal upheavals and the national conflicts are in one way or another linked with the relations between the great Allied Powers. The old and familiar Balkan problems are reappearing in a form that is only partly new; and they threaten to create international trouble.

The most striking feature is the instability of the Governments that have been installed in the Balkans in the course of recent months. In Rumania a grave internal crisis which lasted nearly a month has now ended with

Yet this is the key to the whole problem. The respite of five years or so, when the problems will be those of policing the queue, should be used to work out a carefully co-ordinated programme designed to reduce the risks of engaging in capital formation. It is a task admirably fitted to be performed by the new alliance of public and private enterprise to which several speakers alluded last Friday, since success would require contributions from Labour, from Industry and from the Government, while the results of success would accrue to all. Moreover, the reduction of the hazards of enterprise requires, on the one hand, some liberation of the entrepreneur and, on the other hand, some assumption by the state of responsibility for the general economic climate—so that it ought to appeal to both sides of the (largely fallacious) Freedom-and-Control debate. Once the hazards of risk are reduced (they neither can, nor should, be removed), there would be an immediate flowering of economic progress, in which the antithesis between consumption and saving, which necessarily exists in a regime of scarcity, would largely disappear. The productive investment of savings would ensure a rapidly rising standard of living, and prosperity would, in turn, be its own best Savings Campaign.

Thanks largely to the new quantitative techniques of the statisticians and economists, public opinion has made enormous strides in the last few years in its understanding of the fundamental principles of economic policy. The chief barrier that remains to be demolished before a practical policy of deliberate expansion can be evolved is the remaining misapprehension about the rôle of capital formation. If the economists and the pamphleteers will turn their attention to this, we may be on the verge of solving one of the major problems of the twentieth century—how to secure economic progress by democratic methods.

the dismissal of General Radescu and the formation of a new Government by M. Grozea. General Radescu's Government was in office less than two months; and it had taken the place of two equally short-lived Governments headed by General Sanatescu. The new Government has been formed under strong pressure from the Rumanian Left and from Russia—Commissar Vyshinsky, who is in Bucharest, may perhaps be regarded as its midwife. In the course of the crisis the Monarchy, which had previously been spared by the Left, came under the fire of the National Democratic Front. For the time being, however, King Michael seems to have saved his face as well as his throne by a compromise with the Left. The new Prime Minister, M. Grozea, has been the leader of the Ploughmen's Union, the Left Wing of the former Peasant Party. The Ministry of the Interior has been taken over by M. Georgescu, a Communist leader, while General Rascanu, a rival of the former Prime Minister, has been appointed Minister of War. M. Maniu's Peasant Party, which was represented only by some of its lesser lights in General Radescu's Government, has now been left out of the coalition altogether. Nor has the Liberal faction, led by M. Bratianu, been included. But M. Grozea has succeeded in securing the cooperation of another Liberal group headed by the former Prime Minister, M. Tatarescu, known as a staunch defender of a pro-Allied policy in pre-war Rumania. M. Tatarescu himself is Vice-Premier in the new Government. The outcome of the crisis reflects a deepening breach between Right and Left and a considerable strengthening of the Communist influence inside the Government. Only events can show whether the new coalition will be stronger and will last longer than its predecessors.

In Yugoslavia the conflict between the King and Marshal Tito over the composition of the Regency has been solved by the appointment of three Regents: Dr Budisavljević (a Serb), Dr Mandich (a Croat) and M. Sernetz (a Slovene). The Regents have appointed Marshal Tito to

be Prime Minister. Yet it is no secret that Marshal Tito's Committee of Liberation enjoyed only very limited support from the Serbs, while its following among the Croats and Slovenes, though definitely more solid, is still an unknown quantity. Whether his Government will have more support than his Committee depends on how real the broadening of the new Yugoslav administration will be. The Yalta agreement provided for the inclusion in the Avnoj, the legislative body of the new regime, of 100 former deputies of the old Skuptchina. However, the provision has been added that only such deputies are to be co-opted who are not compromised as collaborators. Much depends on how that rider will be interpreted. In addition, the last Skuptchina was elected under Stoyadinovitch on the basis of a rather queer electoral law, which secured Parliamentary seats to official candidates by a ridiculously small number of votes and barred from Parliament the leaders of the Opposition regardless of the vote they received. The moral authority of the old Parliamentarians can therefore not be very high, and their chance of influencing the new regime may be slender. Yet the fact that the Serbian Democratic Party has now joined Marshal Tito's Government—its leader, M. Groll, has been appointed Vice Premier—may well be an augury of some political pacification in Yugoslavia.

Nor does the position of the Plastiras Government in Greece seem to be very stable. True, the EAM has carried out the Varkiza agreement. The ELAS has laid down its arms; and the number of the rifles handed over by its members has exceeded the stipulated figure by several thousands. But as a result of the civil war, Royalist propaganda has gained much impetus—the Regent's speeches during his recent trip to Salonika were constantly interrupted by crowds shouting Royalist slogans. Should the plebiscite be in favour of the Monarchy, General Plastiras (with his drastically Republican record) would hardly remain in office. His Government would probably not be acceptable to a victorious Royalism, but his effort to reconcile the defeated Left can hardly be regarded as consistent so far. Underhand reprisals against the EAM still continue, as is shown by the wholesale dismissal from Athens University of the Professors who adhered to the EAM. The only Balkan Government that has so far not suffered from any sharp political shocks has been that of General Miklos in Hungary. But Hungary is still a theatre of war; and consequently the political passions there have not yet come to the surface.

The nationalist moods in the Balkans have been reflected in the long list of territorial claims that have already been put on record by nearly all the Balkan Governments. The campaign for a "Greater Greece" is in full swing in Athens and Salonika. Archbishop Damaskinos' recent visit in the "northern lands" served as an occasion for violent Chauvinistic demonstrations, which marched under such slogans as "Occupy Bulgaria for 55 years," "Sofia! Sofia!" and "We want a frontier beyond the Struma!" The entry of Turkey into the war has posed the

problem of the Dodecanese Islands. The Greeks fear that as an ally Turkey will be in a position to claim the Dodecanese at the Peace Conference. At the same time the Greek demands for the annexation of Southern Albania have grown very vocal. The Greek Government is thus imprudently plunging into territorial conflicts with all its neighbours simultaneously. The new Yugoslavia turns a nationalist face towards Italy—from which it wants to annex Istria and Trieste—and an International, or rather Slavophile, face towards the Bulgarians, with whom a surprisingly quick reconciliation appears to have been arranged. The Bulgarians seem to have accepted the plan of an autonomous Macedonia within a federated Yugoslavia; but they have not yet altogether renounced the hope that Russian influence may help them to gain an access to the Aegean. The Rumanians are disappointed with the fact that the Russians have not yet allowed them to take over the administration of Transylvania which, under the Armistice terms, ought to return to Rumania. The ostensible motive for this refusal is that the Rumanians started a slaughter of the Hungarians in Transylvania; and that the transfer of the province must therefore be postponed until tempers calm down. It cannot be ruled out that the Russians want to reward Hungary for the services now rendered and to give one portion of the debatable land to the Hungarians and another to the Rumanians. To whom Southern Dobrudja will eventually be awarded is not yet known. The province still seems to be under Bulgarian domination.

The disturbing feature of this typically Balkan turmoil is that the local leaders, generals and chieftains apparently hope that they may be able to exploit possible rivalries between the Great Allied Powers in order to further their own claims. Almost automatically a situation has arisen in which the Left, on the whole, looks for assistance to Russia and the Right places its hopes on the intervention of the Western Powers. Vague political calculations are based on the most grotesque assumptions. During the fighting in Greece the extreme Right whispered about an imminent clash between Great Britain and Russia. Undoubtedly similar whispering campaigns must for a time have uplifted the spirits of those extreme "slavophiles" in Sofia who find it hard to abandon the dream of a Greater Bulgaria. In Rumania, Maniu and Bratianu are commonly regarded as the "British party," while the Communists, of course, head the "Russian Party"; and each successive reshuffle of the Government is viewed as a duel between the two parties. It is idle to deny that the policies of the Great Powers on the spot sometimes lend colour to such interpretations. Thus, in the course of the recent purges in Sofia, the victims included not only the pro-Axis Regents and politicians, but also members of the Mushanov Government which had conducted armistice negotiations with the Western Allies before Russia de-

clared war on Bulgaria. Communist propaganda in Eastern Europe sometimes tends to label as Fascists those politicians who are suspected by the local leaders of Western sympathies. It is probably right to say that undue suspicion of the pro-Russian elements may also sometimes colour the attitudes of British or American officials on the spot.

It is not difficult to detect in these facts the symptoms of an incipient rivalry which, if allowed to develop, may bring disastrous consequences to the Balkan countries. The aftermath of the first world war in the Balkans was a series of martial adventures and minor wars, of which the Turkish-Greek war was the most important and disastrous. Will this war produce a similar aftermath? Very probably it will, if the various countries continue to multiply their territorial claims against each other without waiting for the Peace Conference. Similarly, the impression that the various political factions, Right or Left, can hope to derive profits from antagonism between the great Allied Powers is bound greatly to aggravate the chaos now pre-

vailing. Most of the disquieting symptoms were, up to a point, an inevitable by-product of the conviction, which gained ground after Teheran, that the Allies had shared out "spheres" between themselves in a spirit of complete exclusiveness. The overlapping fringes of the alleged spheres tended to become the breeding grounds of adventure and intrigue. The Yalta Agreement, if loyally carried out, ought to calm some of the political fever. The local Governments, parties and factions ought to be told quite bluntly that their hopes of benefiting from inter-Allied rivalry are futile; and they ought to hear this warning from all the Allied Powers concerned. The joint responsibility of the Big Three for the political and economic situation in the Balkan countries ought to be translated from general principles into concrete and continuous action. Recent events suggest that many political crises in the Balkan countries may still lie ahead; and there will be plenty of opportunity for the Big Three to exercise their joint responsibility in meeting trouble half-way and in surmounting crises when they arise.

NOTES OF THE WEEK

One More River

The first week of March saw battles on the Rhine and the Oder which opened the final chapter of the European war. The Allied armies in the west are reaching the Rhine on a long front, from Coblenz to the Dutch frontier. Rundstedt, hopelessly outfought, has not even been able to keep the big towns on the left bank of the Rhine as bridgeheads for the Wehrmacht. Bridgeheads have in fact not much value unless they are used as springboards for offensives or counter-offensives; Rundstedt has obviously been bent on defence and orderly retreat, and he has no prospect of hitting back. His real objective can only be to delay the establishment of Allied bridgeheads across the Rhine for as long as possible. Even some success in this would bring no real relief to Germany. But can he hope for delay? The technique of river crossings has been greatly developed in the last years; the Rhine on this sector is relatively narrow; and the fact that the Allied armies will soon be holding a very long stretch of the river will offer them many alternative possibilities for the building up of bridgeheads. In the east, the Russian approach to the Oder has now been nearly completed. Marshal Zhukov's and General Rokossovsky's sweeping advances to the Pomeranian coast have cut off large German armies in the Polish Corridor and around Danzig; and they have brought Stettin itself almost within Russian grasp. Whether the Russians will try to take Stettin is doubtful. The crossing of the Oder at its mouth would seem to present difficulties almost as great as the crossing of the Rhine at its mouth. But this week's gains in Pomerania secure the northern flank of the Russian front. The Russians, too, are confronted with the task of finding bridgeheads across the lower reaches of the Oder—they by-passed its upper reaches in Silesia long ago. The next few weeks are thus certain to see the last two great battles for river crossings in the German war.

Great Power Votes

The voting procedure proposed for the new Security Council is an attempt to give the Powers, Great and Small, the greatest possible latitude in the discussion of international difficulties and disputes. In the old League, Council decisions had to be unanimous. At Dumbarton Oaks, it was suggested that decisions should be taken by a majority of the Council, provided that majority included the five Permanent Members. The question left open was whether a Great Power should be able to prevent any dispute in which it was involved from coming before the Council. The procedure adopted at Yalta is complicated. On matters of procedure, a majority of seven out of eleven will suffice—that is, Great Powers can be in the minority, but not all of them at once. On all other matters, all five of the permanent members must be included in the majority of seven—that is, even the abstention of one of them apparently imposes a veto. But to this there are two exceptions: on motions to discuss a dispute in which a permanent member is involved, or to refer it to a regional security body, that permanent member shall not vote.

What this means in effect is that a Great Power cannot prevent the discussion of a dispute in which it is concerned, but that it can prevent any action being taken. This is an inevitable restriction, since the imposition of effective sanctions on a Great Power means a major war, in which case the machinery of international peace will in any case break down.

There will inevitably be a certain amount of discontent among the smaller Powers at the extent to which the form and content of the new League have been drawn up in advance by the Great Powers and at the manner in which a realistic appraisal of the balance of force between Great and Small Powers has found its way into the proposals. At Mexico City, 15 of the Latin American republics, while endorsing the Dumbarton Oaks proposals in general, proposed three amendments designed to strengthen the position of the smaller states. They ask that more power be given to the General Assembly, that the Security Council's powers be correspondingly reduced and its membership widened to give greater representation to Latin America; finally, they wish to see the jurisdiction and competence of the International Court of Justice extended. All these provisions weaken Great Power domination, and the line of criticism is likely to be popular at San Francisco. In this context, the decision of the French Government not to act as a convenor of the Conference may be the first step in an effort to lead the non-Great Powers in concerted criticism of the domination exercised by the Big Four. It is hard to see what final benefit the French would gain from the manoeuvre, since they, too, are to be in the praesidium of the Great; the decision was probably dictated by motives of home policy—a gesture to cover the political void. It will not interfere with French participation in the new League, and as for Small Power criticism, it hardly needs to be concerted. Each nation can produce all its own reservations without help or pressure.

Regional Bodies

One of the most interesting and intricate problems on the San Francisco agenda will be to define the scope and functions of the Regional security bodies referred to in the Dumbarton Oaks Draft. What is a region? Is membership of a region compulsory? How are regional organs to be linked with the Security Council? What will be their degree of authority? To what extent will nations be asked to accept obligations outside their own region? Or to what extent will the Security Council override regional decisions? The Dumbarton Oaks formula specifically states that no enforcement action shall be taken under regional arrangements or by regional agencies without the authority of the Security Council. The French, therefore, are already asking whether the provisions of, say, the Franco-Russian treaty covering a threat of German aggression would be automatic or whether they would depend upon a prior decision of the Security Council? In the New World, the delegates meeting at

Mexico City went further in their support of regionalism. The representatives of Peru and Chile argued that the world organisation should take cognisance of American disputes "only if the inter-American system fails" and deprecated the idea that disputes in other parts of the world should involve Latin America in a military responsibility. The Act of Chapultepec, signed at Mexico City on March 6th, is a regional instrument. It provides for the solidarity of all American States in the face of aggression from within or without. They shall concert together steps to assist the endangered state and within the scope of their "constitutional war making powers," take joint action against the aggressor. The Act will only last until the end of the war, but the proposal is put forward that the States shall extend it by formal treaty after the war.

The Act is clearly a regional agreement of first-class importance. What is not clear is its relation to the proposed world organisation. If, as Peru and Chile suggest, all inter-American disputes are to be settled regionally, and no American State need accept responsibility elsewhere, may not this pattern be adopted in other areas to the final exclusion of any universal system? The answer may well be in differentiating between Great Power and Small Power responsibility. Since this will, however, rearouse the half-stilled fears of the smaller States, the discussions in San Francisco promise to be lively.

De Gaulle and His Advisers

In his speech to the Consultative Assembly last Friday General de Gaulle dealt with the economic situation in his country. Once again he brought into relief the sombre picture of war devastation and impoverishment. As so often before, he appeared to confuse the right things with the wrong ones, in this instance the legitimate anxiety for the rehabilitation of his country with less weighty considerations of military prestige. The same mixture of motives underlay the perspective, drawn by the General, of France's future economic growth and expansion. His vision of France with a doubled industrial and agricultural potential was as appealing as it was imaginative. The General had, on the other hand, nothing to say about the immediate economic or financial measures which his Government proposed to take. This omission became the target for criticisms in the Consultative Assembly as well as in the press. The critics were even more outraged by the emphasis which General de Gaulle placed on the need to postpone all radical reforms until they can be passed by a regularly elected Constituent Assembly. The Left felt that a great opportunity for social renovation had slipped through France's hands. Paradoxically enough, the cautious policy expounded by the General met with the strongest criticisms from the veterans of the Resistance who had followed him from the first days of his struggle; and applause was forthcoming from that section of French opinion whose ties with the Resistance were fairly loose.

In spite of growing disappointment with the General's statements on home policy, his political star will neither pale nor be eclipsed. Nobody in France to-day can challenge the legend or the mystique of de Gaulle. "The General is all right; he has surrounded himself with the wrong advisers"—this is an almost typical comment. And the Consultative Assembly has recently been busy bringing to account the "wrong advisers"—the Ministers of Food and of Justice.

The Miners' Reply

For the National Union of Mineworkers to do anything other than reject Mr Foot's "Plan for Coal" would have been extraordinary, and in their statement issued last week they give very good reasons for their assertion that the Foot proposals for government of mine-owners by mine-owners for mine-owners would be no solution for the ills of the coal industry. Yet it is disappointing, after a wait of nearly seven weeks for their reply, that the miners should have so little new to say and should produce so little fresh evidence in support of their claim that nationalisation is the only alternative to completely free enterprise. It is probable that some form of public control is the only workable alternative, but Parliament, which will in the last resort decide the future of the coal industry, will need more convincing proofs than the miners have so far offered.

The statement deals with the two most important ele-

ments in the present critical coal situation: falling manpower and falling output per mine-worker, with the emphasis on the first rather than on the second factor. The industry has managed to retain its complement of around 700,000 miners only by the injection of new blood from outside the industry. As soon as the Essential Work Order is lifted, the wartime recruits will leave, and the main problem is therefore to render the status and conditions of work more attractive to existing miners and to new recruits. The miners, very naturally, are not convinced by Mr Foot's promises that, left to themselves, the owners will bring about this happy state of affairs, and they put forward their own programme for wages, welfare, working conditions and recruitment. Given conditions such as they themselves envisage, and with an assurance of steady employment in publicly-owned mines, the miners promise the co-operation of their members in any schemes for modernising and mechanising the mines. Without public ownership, it is implied, their co-operation would be withheld.

The miners maintain that the vast sums required for the re-equipment of the industry will obviously have to be found by the State. Finance is certainly the weakest link in Mr Foot's chain of argument, and the miners are justified in their scepticism about the owners' capacity to raise the necessary capital without recourse to public funds. But about the method of transfer to public ownership, and about the management of a nationalised coal industry, they have very little to say. Presumably, the details will have to be filled in when the full plan for nationalisation, now being prepared by the miners' Union in co-operation with the Labour Party and the Trades Union Congress, is published some time this spring.

Housing "Switchover" Re-defined

Mr Willink's speech on Friday added little to Mr Sandys's confused statement a week before. No mention, significantly, was made of the "switchover" from temporary to permanent houses announced by the Minister of Works. According to Mr Willink, the Government's target for permanent houses in the first two years after European victory is in fact the same as ever, neither more nor less—three hundred thousand houses, with the old afterthought "built or building" added as a textual safeguard. As for temporary houses, instead of the original target of 200,000, as many as possible up to the 100,000 allocated to local authorities are to supplement the permanent programme within the shortest possible time. In other words, Mr Willink has re-defined his colleague's "switchover" as a halving of the temporary housing programme for the first two years after victory.

Neither of the two statements alters the fact that the number of houses to be built in the first two years will be very small in comparison with the needs. This is a deplorable fact—and, in the logic of politics, anything that is unfortunate is Ministers' fault. That perhaps explains why Ministers are so coy about admitting the truth. They will apparently go to almost any lengths of equivocation to avoid a plain statement of facts. A fully documented account of

exactly what the difficulties are would pay them better in the end.

Eleventh Hour for Land Planning

Lord Woolton stated recently that long-term housing plans would be governed by the agreement reached on three matters—compensation and betterment in connection with the control of land use; the distribution of industry; and the adjustment of local government boundaries. These three factors do not, of course, in any way affect the physical task of producing enough houses; what they do determine is whether or not houses—and other buildings—will be erected in the right places.

The need for legislation on all these matters has long been recognised. The problems involved have been exhaustively discussed in the Barlow and Uthwatt Reports and in three White Papers. There has been some action on the second and third of these matters—the Distribution of Industry Bill and the decision, now approved by Parliament, to appoint a Boundary Commission—though from the viewpoint of land planning it is hopelessly inadequate. And on the first topic, there is no progress at all.

So much familiar approval has become associated with the names of Barlow and Uthwatt that it may come as a surprise to some that nothing whatever has been done about most of the suggestions which were made, as a matter of urgency, five and four years ago. Even the Government's own proposals on compensation and betterment are now nine months old—yet they have not been even debated by Parliament, and Lord Woolton recently indicated the small likelihood of the present Government making them the subject of legislation.

The urgency of the problem is shown by the resolution passed last week by a conference which included representatives of 660 local authorities. This called for an immediate Land Bill on the grounds that

We shall not get proper homes for our people without the solution of the old problem of compensation and betterment.

The urgently needed housing programme cannot wait for planning decision. If Lord Woolton's statement of the conditions governing long-term housing was intended as an excuse for further housing delays, it will not for one moment be accepted by the public. The Government cannot excuse themselves for what they are not doing in housing by pointing to what they have not done in planning. Sites are now being selected and prepared for the new houses; but the local authorities' plea for an immediate Land Bill is sufficient indication that they are not the right sites.

Second International

The season for the revival or creation of international bodies and organisations is in full swing. A new League of Nations and a new Trade Union International are coming into existence. Yet the oldest of the internationalist bodies, the Socialist International, is still lagging behind. It is only this week that a private "Conference of European Socialist Parties" has taken place in London under the chairmanship of Mr Hugh Dalton. The modest character of the gathering reflects the fact that the International is for the time being little more than a pathetic rump. No exiled German or Austrian Socialists were invited to the London Conference. In the Trade Union International the gap left by the once powerful German *Gewerkschaften* has now been filled by two such solid newcomers as the CIO and the Soviet Trade Unions. The Socialist International cannot hope to replace its losses in a similar way. The Socialist movement in the USA is still very small and its present prospects of growth are slight enough. Unity between the Western Socialist Parties and the Communist Parties of the USSR or of any other countries is not contemplated, even though the Comintern, once the formidable rival of the Second International, has duly signed its own death certificate. This week's Socialist Conference has therefore decided merely to call another gathering, of a similar "rump" character, in a few months' time; and this next conference will presumably try to clear the ground for a possible reconstruction of the International.

In spite of this, the motions accepted at last week's Conference deserve some attention. The gathering, after all, represented all the Socialist movements of the Allied countries, as well as of some neutral countries on the Continent.

The delegations consisted in part of old and venerable Socialist leaders who have no new gospels to preach and no startling political revelations to make. But the Conference also included some representatives of a new Socialist generation which has received its first schooling in the European Underground of the last few years. And newcomers may perhaps give some new twist to Socialist policies.

Socialist "Fourteen Points"

The most important resolution adopted by the European Socialists was a "Fourteen Points" programme for Germany. The fourteen points seem to be an almost deliberate reminder of President Wilson's idealistic appeal to the German nation in the last war. The reminder is not only in the number of the points, but also in the substance of the resolution. The Socialists have paid their tribute to the spirit of the time, have repeated many of the provisions for a "harsh peace" which are familiar in other political documents dealing with the issue. This is quite understandable, because the "Fourteen Points" had to be accepted by the adherents of the two orthodoxies which now compete with each other inside the Labour movement: the Orthodox Vansittartites and the Orthodox Marxian Socialists. Even so, their version of the "severe peace" is profusely diluted with the idealism that was current in 1918. It is noteworthy that Vansittartite orthodoxy has gained the least ground where it might have been expected to have won the most. The French Socialist delegation is said to have criticised very energetically the schemes for annexation of German lands by Germany's neighbours. Moreover, the French, who really have the right to speak for Hitler's victims, objected to any advocacy by the Socialists of the scheme for a separate state of the Rhineland. In their opposition they were backed by the former president of the International, M. de Brouckère, while another ex-president, M. Huysmans, was the spokesman of the "annexationist" tendency. The two orthodoxies, as it were, confronted each other in the persons of the two presidents.

The tug-of-war resulted in a compromise resolution which speaks of "no annexations," although it "does not exclude necessary changes of frontiers nor the establishment of a special regime for the Rhineland, the Ruhr and the Saar." The resolution further demands that the period of Allied military administration of Germany "be as short as circumstances permit"; that Germany should pay reparations "primarily by transfer of goods and services through the intermediary of an International Distribution Board"; and that the heavy industries of the Rhineland "be internationalised and administered by a co-operative organisation." Those who believe that Allied opinion will in the long run support annexations or dismemberment of Germany should read carefully the Socialists' "Fourteen Points."

Family Allowances

At one time it looked as if the second reading of the Family Allowances Bill, which was taking place as *The Economist* went to press, would be mainly concerned with the right person to receive the allowance—the father or the mother. The Bill as drafted seems to settle this question sensibly. In the case of a man and wife living together the allowance belongs to the man, but either he or his wife can draw the money. If, however, the court is satisfied, on representations made to it, that the man or the wife is not a proper recipient of the money, it can order the allowance to be paid to the other only. Those who press for the allowances to belong of right to the mother should remember that there are reckless women as well as spendthrift men.

But it may well be that the debate will be even more critical of the decision, announced by the Chancellor of the Exchequer on Tuesday, to make the allowances subject to income-tax. He excused this decision by saying that the present income-tax allowance of £50 a child will continue. But there is no connection between the two allowances. The former is a contribution from the Exchequer to the cost of maintaining a child. The income-tax allowance is a means of adjusting the tax liability of two families of different sizes, but with the same income. It gives no public money away, but determines how much of his own money a man may keep. It is an attempt to make the income-tax more equitable by distinguishing between differently sized families in the same way that the earned income allowance

distinguishes between earned and unearned income. If the Chancellor persists in this absurd course, the Family Allowances Bill becomes a farce. It would really be better for the Government to withdraw it and concentrate on providing for children in kind than to waste Parliamentary time in passing a measure of 28 clauses which will give such a paltry sum.

London Dock Strike

The strike of London dockers, which began on Thursday, February 28th, and came to an end exactly a week later, was a sorry affair. Like all wartime strikes, it was due rather to a cumulation of minor irritants than to any single deep-rooted grievance. Its immediate cause was the moving of a calling-on hut, where dockers have to "prove attendance," from outside to inside the gates of the Royal Albert Dock. The men opposed the move, as it meant a stricter control over their engagement. The Royal Albert Dockers' example was swiftly followed by men from other docks, who came out in sympathy with the strikers or in protest against the suspension of absentees by the National Dock Labour Corporation. Absenteeism had been increasing, and the Corporation decided to take disciplinary measures, which, according to the dockers, were unnecessarily harsh. Many of the 10,000 men who came out on strike probably treated the occasion as an opportunity for a few days' holiday; others merely wanted to show loyalty to their work-mates. The strike being unofficial, no strike pay has been paid, but since dockers have been earning exceptionally good money the financial factor presumably did not carry very much weight with them.

The dockers' strike followed the familiar pattern of wartime strikes. The union leaders condemned the men's action and tried to persuade them to resume work; an inquiry into grievances has been promised; the men at first refused to listen to their leaders, and the Minister of Labour's intervention was proposed when union authority failed to secure a resumption of work. On Wednesday the dockers accepted the recommendation of the Transport and General Workers' Union officials to return, on a guarantee that there would be an immediate inquiry into the Corporation's administration, and provided the stevedores also agreed to return. The stevedores, however, who belong to a different union, the National Amalgamated Union of Stevedores, at first withheld their agreement, but at a meeting on Thursday morning decided to return.

A strike of miners in Scotland, which began on the same day as the dockers' strike, was having equally damaging effects on the war effort, and has resulted in a loss of output estimated at about 15,000 tons a day. The cause of this strike was the claim put forward by the Scottish Colliery Deputies and Firemen's Association, which is not recognised as a negotiating body, for an increase of 3s. 6d. a shift, and the stoppage of deputies and firemen paralysed many pits in Ayrshire and Fife. The National Union of Mineworkers condemned the Association for its action in holding up coal production at this critical stage of the war.

Elections in Brazil

President Vargas has announced that elections will be held in Brazil within 90 days. Under his new constitution, all posts—the Presidency, membership of the Executive, and of Congress—are to be elective, even though the President, once elected, will exercise very wide powers. It is difficult to say what kind of elections will follow from the Presidential decision. No political parties exist in the *Estado Novo*. The constitution makes no provision for electoral machinery. In any case, 90 days is a very short period for building up an electoral machine over a country 65 times the size of Great Britain. It seems likely, therefore, that the elections, in which all persons over the age of 18 are to vote, will take place on single lists, and the only element of choice will be provided not by parties but by personalities.

The President has not yet announced his decision to stand or not to stand. He has ruled Brazil for 15 years, and although his regime is authoritarian and in the early years maintained itself only by forcibly crushing resistance from the Left and the Right, there can be little doubt that President Vargas' singularly unbrutal dictatorship suited his easy-going people. Moreover, in recent years, the country has grown greatly in international prestige and economic power. President Vargas' greatest legacy to his people may be his ambitious schemes for opening up the undeveloped areas of Brazil, particularly on the Amazon, and thereby ending the economic domination of Brazil by the two rich states

of Sao Paulo and Minas Geraes. In former days, these two states alternately provided Brazil with a central government. Vargas has fought this type of regional domination by using the resources of the richer areas to develop the more backward. By doing so he has probably changed the political balance of forces as much as the economic.

At the forthcoming elections, the Brazilians may only have President Vargas to vote for. But that does not mean that, given a wider choice, they would not vote for him just the same.

Chinese Deadlock

Marshal Chiang Kai-shek's decision to call a National Assembly on November 12th and to set up a constitutional Government will have very little effect on the stony hearts at Communist Yen-an. The Generalissimo directed an appeal to the Communists to join him, promising that

all political parties will have legal status and enjoy equality. The Government has offered to recognise the Communist Party as soon as it agrees to incorporate its army and local administration in a national army and Government

Unhappily for the future peace of China, it is precisely this last condition which the Communists will not accept. In the last months both Yen-an and Chungking have been playing to the gallery of world opinion. In their propaganda the Communists, with a model republic and a good guerilla record, have so far scored most points. The Chungking regime has been compelled, both by internal and external pressure, to broaden its basis and liberalise its policy and its leadership.

But no amount of local Communist success and achievement can cover the fact that the Communists are an armed party, controlling a state within a state, and that they do not mean to abandon power or to share it with other parties. In such a situation, no offer short of abdication from Chungking will change the situation, and that is the last step the Generalissimo either can or will take.

Commonwealth Relations

At a time when the broad structure of a world-wide security organisation is slowly being hammered out in official circles an unofficial conference, under the aegis of Chatham House, has been meeting to discuss the relations between members of the British Commonwealth within the wider international structure. A brief summary of the conclusions arrived at was issued last week. Broadly speaking, the emphasis was on an extension of Commonwealth consultation and co-operation, but against any extension of formal commitments in either foreign or economic policy, particularly with regard to British policy in European affairs. The discussion of economic relations showed a strong, though not unanimous, feeling that the principles of the Ottawa agreement should give way to more internationally-minded expansionist policies. The content of the discussions throughout showed clearly that Commonwealth relations would be closely dependent on the nature of world organisation.

The work of the conference is chiefly valuable as an indi-

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

cation of the kind of problems which, now and in the future, face the members of a widely scattered association of independent states. Many of these problems—of defence and of economic policy, for instance—will already have been discussed at meetings of Commonwealth Prime Ministers. But of the results achieved the public has little knowledge save the usual assurance of full agreement and cordiality. Unfortunately, the conclusions of the Chatham House Conference cannot be taken as any sure indication of the conclusions of Government representatives, but they do serve to emphasise the dominant lines of opinion on these questions among the Dominions.

The major question underlying all these discussions concerns the effect of the new concepts of regionalism on the traditional, but unwritten, solidarity of the leading members of the British Commonwealth. For each Dominion the claims of regionalism are different, but in unequal degrees they all arise partly from reasons of defence and partly from reasons of economic policy. In Canada, the tug towards the United States is mainly for security; in South Africa, the tug of regionalism, though less insistent, is primarily an economic one.

Such forces, emerging from the enforced unity of war, are in some danger of being ignored or underestimated in this country. By acknowledging and discussing them the conference has made a useful contribution to an ever stronger and more flexible evolution of Commonwealth relations.

Commission on Poland

In an article "Verdict on the Crimea," which appeared in *The Economist* of March 3rd, it was incorrectly stated that neither the Prime Minister nor Mr Eden had given a precise definition of what they meant by "a representative Polish Government." In fact, Mr Eden's speech, which had not been fully reported at the time of going to press, laid it down clearly that the new Government

must be representative of the Polish parties as they are known and include representative national Polish figures.

These two provisions are the only basis for an acceptable regime, and it can be assumed from Mr Eden's words that the instructions which have been despatched from the Foreign Office to the British Ambassador in Moscow will give him very precise and detailed terms of reference within which to work as representative of the British Government on the Allied Commission for Poland.

If the negotiations are carried out on the basis of the "known parties," and genuinely representative figures are invited to confer with the Commission, there is every reason to hope that an acceptable solution will be achieved. Much will depend, however, on the vigour and force with which the British Ambassador carries out his instructions. Right terms of reference are a pre-condition of success, but everything turns upon the effectiveness with which they are interpreted.

Politics in Buganda

If little has been heard of Uganda in this country, it is because the protectorate seemed to be pursuing a settled contented course undisturbed by the political and economic

ferment in other parts of the colonial empire. This placidity has now been shattered. In the middle of January, there were strikes and riots, mainly confined to the Buganda kingdom, as a result of which there were nine deaths and several wounded.

There was an economic factor in the riots. Wages had not kept pace with the rise in the cost of living, which had been intensified by the shortage of piece goods. Before the strikes began the Governor had accepted a committee's recommendations for increased war bonuses for Government employees, and had also set in motion machinery for the fixing of minimum wages. He claims, therefore, that on economic grounds the strikes were unnecessary.

But he also claims that their main object was political. They aimed at bringing pressure to bear on the Kabaka of Buganda to compel him to change his Government. By the Treaty of Mengo in 1900, the British, with their passion for established dynasties, promised that the Buganda kingdom should be preserved provided British overlordship was recognised. The result is that today Buganda is still ruled by chiefs appointed by the Kabaka, who governs his kingdom with the help of a Prime Minister, a Chief Justice and a Minister of Finance. There is also a Parliament—the Lukiko—which consists entirely of an upper house of chiefs and notables. Most of the Buganda Government's powers and the appointment of the Ministers and important chiefs are subject to the approval of the Uganda Government. But from the apparent political discontent it looks as if this approval were not properly exercised. There is extremely little information available in this country about the recent events—which seem to belong to Balkan rather than African politics. But the resignation of the Finance Minister on January 22nd evidently pacified the strikers, and last week-end it was reported that the Governor of Uganda had ordered the deportation of Samwiri S. Wamala, the Prime Minister. It seems, therefore, that there were solid grounds for complain even though the resort to strikes and violence was completely unjustified. Moreover, the present Kabaka—Mutesa II, who came of age in 1942 and, according to the Governor, is "an enlightened ruler whose sole desire is to promote the welfare of his people..."—had already been considering the reconstruction of his Ministry, and last November he announced his intention to make the Lukiko more representative. There are stirrings in Uganda after all.

Food in Germany

The German food position grows more strained with each Russian advance across the food producing provinces in the East. Not only have the rations to be cut drastically, but for the first time the Nazis have been compelled to alter the distribution in a great hurry without any previous preparation. The influx of refugees has altered the balance of consumption in Central Germany and the degree of differentiation in rations between various categories of workers makes any change in the rations a major administrative operation. Normally changes in the monthly allocation were prepared months before they came into force. Now everything has had to be improvised. By extending the current four-week period to five weeks and declaring a number of coupons invalid, the Nazis have managed to reduce the total rations by about 20 per cent.

The ordinary consumers—about a third of the population—have suffered most heavily. They will receive 24 per cent less bread, 11 per cent less meat, 20 per cent less fat, 30 per cent less sugar and *Nährmittel* (semolina, etc.), and 15 per cent less potatoes. However, these rations are still higher than were the official rations in Belgium and France under German occupation. The normal consumer still receives 3.8 pounds of bread, 11 ounces of meat and meat products, 6.3 ounces of fats, 5 ounces of sugar and 6½ pounds of potatoes. There is so far no question of starvation or even of severe undernourishment.

The real problem lies ahead. How can these rations be maintained as the territory of the Reich diminishes? At present, evacuated livestock is being slaughtered for lack of fodder. For a time, there will be no shortage of meat. But all other supplies will be dangerously low until the harvest. Nor is it easy to see how the Nazis can plan the programme of spring cultivation. The peasants have been told to concentrate on foods for direct human consumption, but the plans are bound to be makeshift and the chief emphasis will be on potatoes. Meanwhile, by concentrating most of the feeding in schools and community centres, and by making each zone as nearly self sufficient as possible in the production of foodstuffs, the Nazis are trying to meet

the strain of distribution. On the food front as elsewhere, the party maintains a vigorous will to retain its power and carry through the impossible. But the whole vast improvisation cannot be maintained much longer.

Future of Merseyside

Familiar features of regional planning, with one or two interesting variations, are to be found in the Merseyside plan, prepared by Mr F. Longstreth Thompson for the Minister of Town and Country Planning. Liverpool and Bootle on one side of the River Mersey and Birkenhead and Wallasey on the other form the closely built-up centre of the region. The Wirral peninsula and part only of the St. Helen's coalfield are included. It is perhaps a pity that a larger plan has not been prepared for the whole of the South Lancashire industrial area. Liverpool has two main problems—overcrowding and unemployment. Even with rebuilding at fairly high densities, it is estimated that a quarter of a million people should leave the area. It is suggested that the majority should be accommodated by an extension of Liverpool's suburbs described as

carefully controlled extension in the form of radial spurs with wide wedges of open land separating them.

The prospect of Liverpool's further growth is not a cheerful one. Besides the danger of ribbon development, the new suburbs are likely to be filled up exclusively by working-class housing estates while the well-to-do migrate to Deeside and the coast resorts.

One reason for the plan's rejection of the idea of new "satellite towns" in favour of expanding Liverpool itself is that there are no suitable sites in the vicinity unless good agricultural land is encroached upon. But a more potent reason is the extent to which labour is tied to the docks and closely associated industries, such as ship repairing, grain milling and soap.

Undue dependence on the port resulted in a 1939 unemployment rate of 18.8 per cent (or twice the rate for the United Kingdom), and it is estimated that after the war 100,000 people must somehow be absorbed by new industries. The most suitable type are light consumers' industries which, apart from baking and biscuit-making, are at present ill-represented; but the affection felt for light industry in all parts of the country inevitably leads to the suspicion that there will not be enough of it to go round.

The Merseyside plan, quite naturally, can make no

authoritative suggestions for curing unemployment. But, though some further growth of Liverpool may be inevitable because of the way in which its industries are tied to the river, it is disappointing that the new industries for the prospective unemployed cannot be located well out of the crowded city.

Sweden Looks Ahead

The Royal Swedish Commission on Post-War Economic Planning, under the Chairmanship of Professor Gunnar Myrdal, has for some months been busily engaged in studying the problem of post-war employment. Almost simultaneously with the publication of the White Paper on Employment Policy in this country, the Commission issued a "comment" recommending that public investment should be varied in the opposite direction to private investment. Its most recent memorandum states, however, that

the question of co-ordinating municipal investments with the Government's general anti-cyclical policy has so far not been satisfactorily solved. The possibilities of fitting municipal investments into the general employment policy by expanding them during a depression and by restricting them during a boom have as yet been too limited.

The recognition of these limitations has now led to the proposal that (a) investment in housing, if incapable of anti-cyclical expansion and contraction, should at least be stabilised so as to avoid its taking part in and reinforcing general cyclical fluctuations; and that (b) every possibility should be explored of evening out the flow of private investment expenditure.

The evolution of thought in Sweden has thus proceeded along exactly the same lines as in this country. A study of the methods of co-ordinating the capital expenditures of private industry is now recognised in both countries as one of the most important problems of Employment Policy. What are the methods that might be employed? The Swedish Royal Commission proposes the immediate setting up of an "Investment Council" to study primarily three different methods: voluntary co-ordination; the creation of economic incentives by investment subsidies, tax reliefs and interest policy; and direct control. The importance for full employment purposes of industrial location and of labour mobility is as clearly recognised in Sweden as it is here. As these investigations proceed, a more intensive exchange of views between the two countries should prove of value to both.

AMERICAN SURVEY

Missouri River Development

(From a Correspondent in Colorado)

UNCERTAINTY is the curse of life in the huge Missouri River basin, whose people largely depend on agriculture, whether directly or indirectly. In the Eastern end of the basin, drought destroys the crops about one year in twenty; in the centre, more nearly ten years in twenty; and in the West, crop-farming will hardly furnish a livelihood at all, save by irrigation. This uncertainty is graphically illustrated by the crop-values for North Dakota; in the drought and depression year of 1932 the State's crops were valued at \$66 million; in the lush, high-price year of 1943 a smaller number of people produced \$660 million.

The huge, and so far uncontrollable, river during its "spring rises" annually floods millions of acres, and menaces the cities along its middle and lower course, beside annually carrying 400 million tons of the best topsoil in the region away for ultimate deposit in the Gulf of Mexico.

In 1943 and 1944 floods did more than \$100 million in reckonable damage, such as washed-out crops, flooded cities and towns, blocked transportation, etc., as well as vast indirect damage in interruption to war production. Until recently, conquering the river has been a "some day" proposition. The very size of the task, estimated to cost between \$1½ and \$2 billion, daunted the planners in days when that amount of money was still a staggering sum.

The Missouri rises in Western Montana, with its tributary headwaters less than 500 miles from the Pacific Coast. Its watercourse is nearly 2,500 miles long, and its watershed covers 530,000 square miles, the largest river basin in the United States save that of the whole Mississippi system of which it is a part. It is an empire in itself, but a relatively unpopulated empire. Only about 7,000,000 people live within it. The four states of its central tier (North and South Dakota, Kansas and Nebraska) lost an aggregate of 232,000 people in the Drought Decade of 1930-40, and this emigration has continued since, North and South Dakota each having lost some 10 per cent of their civilian population since 1940.

When, following the drought years, the great floods of 1943-44 called attention to the completeness with which the people of the Basin were at the mercy of their river, two rival federal agencies rushed forward with plans. The Army Engineers Corps proposed a relatively few, relatively large reservoirs, mostly along the main stream, to supplement the existing dam at Fort Peck (Montana), which is the largest earth dam in the world. These dams were proposed for navigation and flood control purposes, with irrigation and power development distinctly secondary. The Bureau of Reclamation, an agency of the Department of the Interior,

proposed many smaller reservoirs, a few on the main stream and many on the tributaries, with irrigation and flood control the primary purposes. The navigation and flood control interests of the more populous Lower Basin, championing the Army plan, got a head start to the extent that the Flood Control and Rivers and Harbors Bills of 1944 contained the essence of their plan; the irrigation proposals seemed at that time to have much smaller chance of securing immediate Congressional action.

According to the Bureau of Reclamation, nearly 5,000,000 more acres of dry land can be feasibly irrigated in the Upper Basin—about an equal acreage is already irrigated. This would provide a magnificent prospect for post-war pioneering, and a stable core for the economy of the region. At a recent meeting at Billings, Montana, such facts were developed as that in a dryland county during the worst of the drought, 75 per cent of the people were "on relief," while in a neighbouring county, almost entirely an irrigation area, only 5 per cent were. But, according to the Bureau's engineers, much of this development would be impossible if too much water had to be taken (under the Army plans) to maintain an open-channel of nine-foot standard depth for navigation lower down. Thus there was a bitter and apparently insoluble conflict of purpose. Western legislators rallied in Congress to protect the rights of arid-land states. The Congressional battle might nevertheless have ended in defeat for them, but for one thing.

In 1944, and probably not without design, the nation has been flooded with books, pamphlets and articles celebrating the really magnificent accomplishments of the Tennessee Valley Authority, in rehabilitating the economy of what had been one of the nation's economic dead spots before TVA took hold. The obvious idea was seized upon in the Missouri Valley by the *St. Louis Post-Dispatch*, and the National Farmers Union, among others: Why not a Missouri Valley Authority?

Neither the Bureau of Reclamation nor the Army Engineers want to surrender any of their jurisdiction to a new authority. In this they are joined by other Federal agencies, and by the governors and other politicians of the Missouri Valley states, and by Western proponents of irrigation generally. In short, the threat of an MVA drove the feuding agencies into each others' arms. Through amendments to the Flood Control Bill, virtually the entire Army and Bureau of Reclamation plans were welded into one whole—called "an artificial Siamese twin" by MVA proponents, who also acidly characterise it as the offspring of a "shotgun wedding."

In signing the Flood Control Bill, President Roosevelt characterised it in effect as authorising the preliminary engineering work for an MVA. He also referred to his old and never-relinquished dream of Authority development of most of the great river basins of the nation. Encouraged by this, a Bill providing for an MVA has been introduced in the new Congress by Senator Murray of Montana, who forbore from pressing a similar Bill in the old Congress as an amendment or substitute for the Army-Bureau plan, only because many senators assured him they would not vote for it as such, but were open-minded as to its separate consideration later.

Agitation for an MVA has increased rather than diminished in the region. MVA Associations have been formed in St. Louis, in Montana, and elsewhere. It is only a question of time until a valley-wide organisation will be formed. Some of the more conservative organisations are also coming round, such as the Colorado Grange (Patrons of Husbandry) which in the heart of the region considered most hostile to an MVA, approved "TVA-type development" of Western river basins. MVA proponents contemplate that some concession to the hostile irrigationists must be made. Since a Western farmer is helpless and pauperised if he loses his water-right, its preservation is his central idea, and enemies of MVA have made effective use of the thesis that a river authority could override it. Effective use, on the other hand, has been made by proponents of an MVA of the contrast between the economy of the states containing the Missouri Basin, and the states containing the Tennessee Basin. Briefly, as between 1930 and 1940, that of the Missouri Basin has shown no progress, or has lagged behind the general advance of the country, in most economic respects; the TVA region, on the other hand, has progressed much faster, and its huge blocks of hydro-electric power have played a particularly impressive role in the war emergency.

Another argument advanced against an MVA is that the Basin's area—some 12 times that of the Tennessee Basin—and its vast and varied interests render it unsuitable for development by any one central authority. The outstand-

ing differences from TVA here are the intrusion of navigation into the list of purposes for which provision must be made, and the lack of opportunities for developing hydro-electric power. In the Missouri Valley, the Bureau of Reclamation estimates that, apart from the power needed by the irrigation projects themselves for pumping, etc., the Valley provides opportunity to develop only about 750,000 kilowatts, as contrasted with a present development of nearly 2,000,000 kw. in the Tennessee Valley. This is serious, because the TVA development is being carried by power revenues, whereas hydro-electricity promises no such comparable rôle in the MVA development. There are two counteracting possibilities: Power from the huge trans-divide diversions being planned to bring water across the Continental Divide into the Missouri Watershed from the Pacific Slope; and the presence in the Missouri Valley and around its western edge of what is said to be the world's largest single reservoir of bituminous and sub-bituminous coal, which, mined cheaply in large quantities, could compete with water-power in cheap electric production.

Perhaps the single most significant economic comparison, and one which shows the urgency of large-scale power projects in the Missouri Valley if it is to keep up in post-war development, is in this same electric power. In the Tennessee Valley, householders are now getting electricity for an average over-all cost of about two cents per kilowatt-hour, and industrial and commercial users for about three-fourths of a cent. In the Missouri Valley, the comparable costs are respectively more than four cents, and more than two, or from two to three times the TVA costs. In the forthcoming electrical age, such cost advantages or disadvantages may well be decisive. Overall, however, the Missouri Valley and its adjacent region are far richer in natural resources—those of the top soil, plus those of such minerals as phosphates, coal, non-ferrous metals, etc.—than is the Tennessee Basin.

American Notes

The President Reports

"Unless you here in the halls of the American Congress—with the support of the American people—concur in the decisions reached at Yalta and give them your proper support—the meeting will not have produced lasting results."

Thus President Roosevelt set the tone of his talk to the combined houses of Congress and clearly established that he recognised their responsibility and importance in international dealings. Mr Churchill had the satisfaction of an overwhelming vote of confidence from the British Commons. But the American system provides no means by which Mr Roosevelt's report could do more than establish a mood: a mood of confidence among the people and a mood of support in Congress. This he set about to do.

The stage was well set. All the techniques that have ever been used to make Americans want a new car every year had been set in motion by the State Department to make the ordinary American understand that security in terms of a job and a home and a feeling of sureness about the future was meaningless without the international security that will protect him from future wars. Teheran and Dumbarton Oaks and Yalta and San Francisco are not just place names in America now. They are symbols all tied together on the magic thread of security.

In contrast to Mr Churchill, Mr Roosevelt flitted over France and the problems of liberated areas and Poland and unconditional surrender, but he lighted with emphasis on the broad question of World Peace and on the coming San Francisco Conference as its instrument. World Peace, he said, "is not a party question any more than is military victory," and he invited an equal number of Republican and Democratic members to San Francisco. Republican Senator Vandenberg, the last to accept, did so only after the President had convinced him that he would have freedom of action at the Conference.

The President seems to have majority support in both houses and in the press for American participation in a new security organisation. True, many Congressmen were disappointed that he did not give them more news, new news. One Republican said "it was a good report of reports already reported." Some were worried about secret agreements: some could not overlook an occasion to take a dig at the Soviet Union on the matter of Poland. Those who were worried about the mystery surrounding voting pro-

cedures at least have something to criticize now. But on the whole public opinion is behind the President, so far as continued membership of the United Nations is concerned. Whether America has taken a temporary fork in the road or is prepared to change her course entirely depends on rather more than membership of any organisation, and may, therefore, not be demonstrated at San Francisco or for quite a time to come. But the acceptance of membership is at least a preliminary gain.

Tools for the Job

Mr Wallace was confirmed this week in his new post as Secretary of Commerce by a Senate vote of 56 to 32. The lending agencies, which were divorced from the Department to restrict Mr Wallace's power to put his full employment programme into effect, will be headed by Judge Fred Vinson, who has steered an uncontroversial course as head of the Office of Economic Stabilisation, and who is welcomed both by Mr Wallace and Mr Jesse Jones. Mr Wallace already has made a conciliatory gesture by inviting the co-operation of Mr Eric Johnston, head of the Chamber of Commerce.

Even so, Conservative circles are not entirely satisfied that the clipping of Mr Wallace's wings has gone far enough. The Department of Commerce provides a platform from which Mr Wallace can exert his talents for persuasion and public education; it also controls agencies, like the Bureau of Foreign and Domestic Commerce, and the Foreign Trade Zones Board, which may be used to expand imports; inland waterways, an instrument which might be used to bring down discriminatory freight rates; the Patent Office, a weapon against monopoly; and the Civil Aeronautics Administration, which may become a vehicle for federal spending on airports. Mr Wallace also becomes a Director of the Export-Import Bank, whose lending powers are expected to be expanded from \$750 million to \$5 billion.

Even more alarm has been created by Mr Roosevelt's evasive reply as to whether he intended to shift the Foreign Economic Administration to the Department of Commerce, for the FEA controls through subsidiaries preclusive buying, petroleum and rubber policies, on which Mr Wallace is known to have unpopular views. He favours, for example, the dismantling of many synthetic rubber plants in the interests of the rubber-growing countries. There is also a rumour, probably baseless, that old-established agencies like the Federal Trade Commission and the Interstate Commerce Commission may follow FEA into Mr Wallace's pocket.

All this is speculation. What is more to the point is that in his small business crusade Mr Wallace will find eager allies in Congress; that the Anti-Trust Division will assist his campaign against monopoly; and that Southern and Western Senators will support any attempt to retain the war industrialisation of their states in the interests of full employment.

Bark or Bite?

While a potentially serious strike situation, which union leaders admit they may not be able to control, still exists in Detroit, it is clear that the greatest threat to war production still lies in the coal pits. For this is the year the personal battle between Mr John L. Lewis and the Administration may come to a head. A coal strike at the present moment would be most unfortunate. Soft coal stocks held by industrial consumers and retail dealers on January 1st were down to an average of 32 days' supply. Steel production is off and war needs were never more urgent. Before negotiations with the operators had even begun, Mr Lewis, with scrupulous legality, announced that within the provisions of the Smith-Connally Bill a dispute exists between the United Mine Workers and the bituminous coal industry, and gave the required 30 days' strike notice.

This year Mr Lewis, whom even his enemies respect as one of the most effective and daring of union negotiators, is launching an enfilading attack, since he learned in his last major dispute with the War Labour Board in 1943 that frontal assaults are too easily curbed. Then his original demand for a flat \$2.00 a day was trimmed down to \$1.12 under the stabilisation formula, although an additional 38 cents were later granted by cutting lunch-time down to 15

minutes. As a substitute for a flat wage increase, this year Mr Lewis is demanding 10 cents a ton royalty on all coal that comes out of the mines, the proceeds to go to a union fund for medical service, hospitalisation, insurance, rehabilitation and economic protection. In addition, he wants full pay for all time underground, instead of the current two-thirds rate for travel time and nothing at all for lunch period. He wants time-and-a-half for everything over a seven-hour day and a 35-hour week; he wants premiums for second and third shift workers; double the present vacation pay; and full pay for six legal holidays. Among other things, he wants shoes, boots, explosives, goggles and fuses to be provided by the employers. And he demands the right to strike to prevent coal from being shipped to a consumer whose employees are engaged in a legal strike.

*

The operators estimate that at the present production rate the royalties alone would cost them \$60 million yearly and that the total of Mr Lewis's money demands would increase the nation's fuel bill by \$400 million. Mr Lewis will reply that increased production under better conditions by better paid and fed workers, and the economies that could be effected in operations, would cut down the astronomical figure considerably.

In the coal mines, as in Detroit, one cannot blink away the distrust that exists between worker and employer, each trying to establish himself in the most favourable position for the difficult days after the war. But Mr Lewis, the master bargainer, has managed to isolate the mine workers from the rest of American Labour. His sponsorship of strikes in wartime and absolute refusal to join the other large unions in a no-strike pledge has contributed as much as anything to that isolation. In Detroit it is said the workers were in a mood to welcome a Government seizure of the struck plants so they could go back to work without strengthening management's position. But in the coal fields the word has always been "you can't mine coal with bayonets."

Trial Run at New Bedford

The Bill which the Senate Military Affairs Committee hopes to substitute for the labour draft passed by the House relies on the extension and enforcement of "man-power ceilings" to free labour for critical war programmes. The past fortnight has produced a test case at New Bedford, Massachusetts, of how the Bill is likely to work. In that city there are two plants making heavy cord for tyres, one of the most urgent of present shortages. These plants desperately need another 240 skilled workers, who could most easily be found in the local mills making fine textiles.

The War Manpower Commission, after failing to secure a voluntary transfer, set man-power ceilings for the textile factories, to set free labour for the cord plants. Of 118 men then called up for interview, only 12 agreed to move, 75 refused and appealed, and the remainder failed to appear at all. In this they are openly supported by the Local American Federation of Labour Council, which has denounced the "Gestapo tactics" of the Commission, by the city's Mayor, who has appealed to President Roosevelt, and tacitly, it is said, by the textile employers.

The Manpower Commission does not, it is true, yet possess the enforcement powers the Senate Bill would confer; but as these only apply to employers, they would hardly solve New Bedford's problem, which is one of persuading workers to move. The city's Mayor has insisted that a labour draft would be instantly obeyed; and certainly in the strained labour-management relations which exist, and not only in New Bedford, the granting to employers of the right to decide which workers they will dispense with when quotas are fixed, seems calculated, not only to secure the least satisfactory workers for the war plants, but to increase labour resentment.

The New Bedford story underlines the inadequacies of the state Bill. Whether a real programme of labour conscription would meet with a better reception, as the Mayor insists, is open to some doubt. A reporter on the spot, while admitting the part played by mishandling on the part of government agencies, by wartime strains and by mutual suspicion between labour and management, says that the main trouble is that "contact seems to be missing between Iwojima and New Bedford." If the genteel approach of the Manpower Commission is confused with Gestapo tactics, that link probably would not be supplied by more forceful methods.

THE WORLD OVERSEAS

Nigeria's Constitution

THE framing of a new constitution for Nigeria must have caused many a headache. A White Paper (Cmd 6599), giving the Governor's dispatch to the Colonial Secretary on the subject, points out that there is not one colony involved but four. There are the Northern Provinces, which include three-quarters of the total area of the territory and over half its total population. For the most part they consist of highly organised Hausa Emirates, which are Moslem in religion and culture, but they also contain important pagan communities. In the forests of the south-west, in the so-called Western Provinces, there are other highly organised native states, but they are completely different in structure from the Moslem Emirates. In the south-east, in the Eastern Provinces, there are numerous tribes whose social organisation is based on the family unit. Finally, there is the Colony of Lagos and its hinterland, where the people have had much closer contact with European influences.

In framing his proposals for a new constitution the Governor says he had three objects in view: to promote the unity of Nigeria; to provide adequately within that unity for all these diverse elements; and to secure greater participation by Africans in the discussion of their own affairs. At present, the Legislative Council, which is the only means the Africans have of discussing measures affecting them, has an official majority. Moreover, it contains no representative from the Northern Provinces; nor does its legislative powers cover them.

The Governor proposes that under the new constitution the Legislative Council should be widened in scope and membership, and that it should have a direct link with the Africans of the villages through three new Regional Councils to be established in the three provinces, and under them through the Native Authorities. For instance, the Northern Regional Council would consist of two chambers. There would be a House of Chiefs, presided over by the European Chief Commissioner of the province; first-class chiefs would sit as of right and other chiefs would select a panel from their own numbers. The lower chamber would be a House of Assembly. It would consist of 19 officials, including the proposed new deputy heads of the principal departments of government, and 20 unofficial members. Fourteen of the latter would be selected by native authorities from their members other than major chiefs, and six would be nominated by the Governor to secure the representation of the pagan community and other interests. The other two regional councils would consist of a House of Assembly only. They would have a similar membership to the one

described, except that, in the case of the Western Provinces Council the unofficial members would include three chiefs nominated by the Governor.

The Regional Councils would, to begin with, have no legislative authority, though a committee is to consider whether any legislative powers should be devolved on them. But all Bills, except urgent Bills, would be discussed in the councils before being submitted to the Legislative Council, and amendments could be suggested. The councils would also be given some financial responsibility. Regional budgets would be drawn up, on which would be borne the cost of all Government services in the region, including salaries, except central services. Regional revenue would consist of the share of the direct tax at present paid to the central government and also of block grants from central revenue. The regional estimates would be debated in the councils and amended if desired, after which they would be submitted for the Governor's approval. But for the time being, and until they are given legislative powers, the councils would have no power of appropriating expenditure, which would remain with the Legislative Council.

Local Finance

These proposals are not intended to detract from the existing responsibility of native authorities for operating their local services and financing them from their own revenues. They would share the direct tax with the regional councils, and the representation of the native authorities on the councils should ensure the co-ordination of regional and local expenditure. The Governor points out that the relation between the native authorities and the regional councils is as important as is the relation of the latter with the Legislative Council.

His proposals for reconstituting the Legislative Council would reduce the number of official members from not more than 30 at present to 20. The unofficial membership, on the other hand, would be increased from 21 to 29. Of the latter, the Governor would nominate four members—presumably Europeans—to represent banking, shipping, industry and commerce, and mining, and an African member for the Colony of Lagos. The remaining 24 would also be Africans. The three members for Lagos municipality and the member for Calabar would be elected by ballot as at present. But the others would be nominated by the regional councils which would thus serve another function as electoral colleges.

This summary of the Governor's very interesting constitutional experiment shows that his proposals have borrowed from reforms in other colonies. Regional councils of Africans have been tried out in Northern Rhodesia. There are Provincial Councils of chiefs in the Gold Coast Colony. A suggestion that the regional Houses of Assembly should form committees to deal with such matters as education and development also has a familiar ring. It is a method that has been used in Ceylon and is being introduced in Jamaica, under its new constitution, to give colonial peoples a training in the practical work of administration. But the new constitution proposed for Nigeria would still leave the colony a very long way behind those two islands. It would give the Africans slightly more powers but hardly any more responsibility. They would still not be able to initiate legislation. Nor would they be given even a limited franchise, except where it exists at present—as the Governor points out, the use of the ballot would be beyond the comprehension of the mass of the population at present. But to construct a Nigerian Federation out of such diverse elements; to break down the parochialism of the people and create in them a sense of Nigerian unity; to hold the balance between the communities; and to give new life and purpose to indirect rule—all this, which is a pre-condition of self-government, the new constitution makes a bold attempt to do.

Irish Cows

[FROM OUR DUBLIN CORRESPONDENT]

IN spite of the great accumulation of sterling assets which has been piled up during the war, the necessity for increasing exports in the post-war period is fully realised in responsible circles. The possibility of founding industries capable of exporting their products is under consideration. In the immediate post-war period, however, reliance will continue to be placed upon the export of animals and animal products, which have always constituted the bulk of the Irish export trade. In the years 1934-40, exports of cattle and dairy produce amounted to 45.6 per cent of total exports and to 58.8 per cent of total agricultural exports. Since the establishment of the Department of Agriculture in the year 1900, great attention has been paid to increasing the output and improving the quality of Irish livestock products. As a result of the activities of the Department and of the legislation regarding the breeding of livestock and the manufacture and packing of dairy produce, great advances have been made. The possibility of further improvement has been investigated by the Committee of Inquiry on Post-Emergency Agricultural Policy, which has recently issued an interim report on the subject.

This committee found that a very great improvement has taken place in the quality of Irish store cattle, particularly in regard to their potentialities for beef production. A corresponding improvement has not taken place in dairy cattle, as is shown by the failure of milk yields to rise. The average milk yield in the whole country is about 400 gallons, which is insufficient to render production profitable, either for the export trade or for the home market. The main cause of the low milk yield is stated to be inadequate feeding, both in quantity and quality. Adequate feeding alone would raise the milk yield by at least 150 gallons per annum. Breeding, as well as feeding, is of course important. The committee therefore recommends that breeding policy should be directed more specifically to the production of cattle of higher milking strains. The elimination of bovine diseases and the provision of better housing would also help. The committee is not in favour of departing from the dual-purpose shorthorn breed. The fact that Irish agriculture has to pay equal attention to beef and milk production creates problems absent in purely dairying countries such as Denmark.

In making detailed recommendations regarding breeding special attention is directed to the development of cow-testing. Of the total number of cows in the country, only 4.2 per cent are being tested for yield of milk and butter fat. Yields have shown very little improvement in the last 15 years. The principal factors which have militated against cow-testing are stated to be, first, the low plane of nutrition; second, the retention in dairy herds of very low-yielding animals; and, third, the conditions of employment of cow-testing supervisors. The committee recommends that payment of fees to cow-testing associations by farmers should be discontinued and that a levy should be made on all milk delivered at creameries at the rate of twopenny per hundred gallons. The annual proceeds of this levy would amount to about £15,000. The state should provide double this amount and the total thus realised should cover the total cost of the cow-testing scheme. The cow-testing associations should, in future be known as dairy cattle improvement associations, and should be responsible for the improvement of the dairying industry in every respect.

The Beef Industry

Beef production has in recent years been faced by intensive competition, owing to the advance in chilling and refrigeration in overseas countries. The fat cattle subsidy paid to British farmers applies to cattle imported for fattening, provided that they are at least two months in the country before being offered for sale as fat animals. The subsidy on fat cattle is, however, less than on home-bred animals. This British subsidy has affected the Irish cattle trade in several ways. There is an increased demand for forward stores requiring the shortest time to fatten on British farms. This concentrates demand upon the better quality of store cattle, with the result that many cattle which were formerly exported as young stores or as calves are retained in the country for a longer period. The demand

for the food- and fodder-producing resources of the country is therefore increased. There has recently been a severe slump in the market for cattle not suitable for export. Large number of calves are being killed and their carcasses sold at completely unremunerative prices. The committee recommends that the present policy regarding beef breeds should be continued and that the standard for the licensing of bulls of the beef breeds should be progressively raised. It is further recommended that consideration should be given to the compulsory dehorning of all male calves which are not to be used for breeding purposes. The absorption of a possible surplus of calves in the future by the development of a trade in veal should be considered.

Improved breeding will not raise the milk yield without proper feeding. Even the most efficient factory must have adequate raw material. The lack of winter feeding is producing devastating results both on dairy and store cattle. The Irish dairying industry is extremely unbalanced throughout the year, comparing in this respect most unfavourably with its Danish rival. A better distribution of the existing food consumed would in itself be beneficial, but there is also need for additional food. The committee states that:

A radical change in grassland husbandry is required so as to produce better grazing over a longer period of the year, and during winter to make available, in the form of silage and high-quality hay, a considerable portion of the grass produced so abundantly in summer. In addition, or as an alternative to silage, green forage crops and roots must be used more extensively. Cattle are specially suited by nature for the conversion into human food of pasture, silage, hay, roots, straw and green forage crops, and on the maximum utilisation of these farm-produced foods together with a proportion of cereals and other home-produced concentrates the economic production of milk, store cattle and beef depends.

The technical problems involved in securing this extra supply of food for livestock will be considered by the committee at a later stage and will form the subject of a separate report.

"Inspiring Cigarettes"

SURPRISED in the act of smoking, a Victorian undergraduate explained that he was 'seeking inspiration'. — 'Remarkable cigarettes!' replied the don. 'You would do well to secure a liberal supply!' Whether you smoke for 'inspiration' or frankly for pleasure, you will find unqualified satisfaction in our Navy Cut

Medium. A cigarette worth discovering! Through the Rothman Service you can get regular supplies, fresh from the blending room, at 11/- a hundred (postage 3d. extra). Call in at any Rothman shop to-day, or post your order to headquarters for delivery by return. Rothmans Ltd. (Folio 27 13) 5 Pall Mall, London, S.W.1.

THREE NUNS SAVES MONEY

—because of its
SLOW-BURNING CUT

There are two special reasons why 'Three Nuns' Empire Blend Tobacco saves the smoker money. It is scientifically cut to burn slowly, each ounce lasts longer, you smoke fewer ounces a week. It is made from fine leaf which is favoured by the lower duty on Empire Tobacco. To enjoy the fullest pleasure of smoking at a moderate cost, take to 'Three Nuns' Empire Blend.

Universal Salesman...

For years to come, demand will outpace supply. This demand will be world-wide, and speed in introducing—and supplying—products to markets abroad will be as essential as speed in manufacture. Manufacturers will need to become air-minded; they will need to recognise that the aeroplane is the logical instrument for universal salesmanship... essential for reaching potential markets quickly, and necessary for supplying established markets regularly and speedily. The "Bristol" Freighter has been specially evolved to assist national industrial revival in peace. Designed and built to give maximum efficiency in all points essential for economy, reliability and minimum maintenance, the Freighter is, literally, a made-to-measure aircraft with an adaptability which makes it the ideal aerial salesman for industry. The Bristol Aeroplane Co., Limited.

THE BUSINESS WORLD

Railway Charges

THE feature of the railway meetings has been the preliminary warning, given by the chairmen, that the railways will have to increase their fares and charges after the war. At present they are very prosperous—except that the prosperity accrues to the Government, not to the shareholders. But the prosperity arises entirely from the abnormally large war-time volume of traffic. The prices that the railways pay for labour and materials have increased by more than 50 per cent since 1939; their charges, on the average, by only 15 per cent. The railway companies are clearly anxious to make it known that, when traffic falls to more normal proportions, they will not be able to support this disparity between what they pay and what they receive. Charges will have to be raised to meet the higher expenses.

Those who like to have the story in facts and figures will find it summarised in the accompanying table. Between 1937 and 1943 the combined gross receipts of the controlled railways and of the London Passenger Transport Board rose by nearly 90 per cent; as the average increase in charges since then has been only a fifth (5 per cent in October, 1937, 10 per cent in May, 1940, and 6½ per cent—excluding certain traffics—in October, 1940), the volume of traffic must have risen by about two-thirds. Expenditure, on the other hand, rose by only 67 per cent between 1937 and 1943, despite the marked advance in the price of labour and materials. Consequently, the excess of gross receipts over expenditure in 1943 was two and a half times that of 1937 and nearly twice the famous "standard" revenue laid down in the Act of 1921. Since the income of the railways has been fixed for the war years by the agreement with the Government which came into operation at the end of 1940, they did not benefit from this increase in revenue; in 1943, the Government's share of the revenue—eyed with some envy by the railways—substantially exceeded that of the railways themselves. Although statistics for 1944 have not yet been published, the scissors of gross receipts and expenditure probably began to close again in that year. Traffics have reached their peak, while expenditure is probably still rising. This, as much as the approach of peace, may explain the chairmen's anxiety to ventilate the matter. None of the railway chairmen has ventured to name the rate of increase in charges that they consider necessary, though Sir Charles Hambro, of the Great Western, said that

on the quantum of traffic which we carried in the years immediately preceding the war, the pre-war level of our charges would have to be raised by about 50 per cent to cover the increased costs and yield the pre-war net revenue, and by about 60 per cent to give us our "standard" revenue.

In an attempt to sort out the figures, it has become customary to go back to 1937—when the volume of traffic was above that of an average of pre-war years—and to assess the increase in charges that would be necessary to produce the net revenue of that year if costs remained 50 per cent above the pre-war level, while the volume of traffic sank back to that of the pre-war year. (The year 1937, it should be recalled, was an exceptionally good pre-war year, for which revenue was almost as high as the fixed war-time income, though it was well below the "standard" revenue of old but persistent memory.) In 1937, the expenditure of the railways and of the LPTB was £163 million; with a 50 per cent increase in costs it would have amounted to £245 million. On the other side of the account, gross receipts were £202 million; at present rates and fares they would have been £240 million. In other words, gross receipts would have fallen £5,000,000 short of expenditure and £44 million short of the amount required for the maintenance of net revenue at the level of 1937. To bring gross receipts up to the required amount—that is £284 million—fares and rates would therefore have to be raised by about 18 per cent above the present level. The overall rise in charges since October, 1937, would then be about 40 per cent, a figure which is still slightly below the average rise in the general price level, and below that calculated by Sir Charles Hambro from a different set of assumptions.

The question is, first, whether this is a sound basis of calculation and, secondly, whether it is a rational approach to the problem.

There is reason to believe that, exceptional though the year 1937 may have been in the thirties, the volume of traffic in the post-control period may be higher, especially if control is maintained during the difficult period of reconversion. (The agreement between the railway companies and the Government provides that control is to be continued for a minimum period of one year after the cessation of hostilities; but the Parliamentary Secretary to the Ministry of War Transport, Mr Noel-Baker, stated last December in the

RECEIPTS AND EXPENDITURE OF THE CONTROLLED RAILWAYS AND LPTB FOR 1940-1943, COMPARED WITH 1937

(The Railways include the four Main Lines and six Minor Railways)

	1937 (Estimated)	1940	Index 1937 = 100	1941	Index 1937 = 100	1942	Index 1937 = 100	1943	Index 1937 = 100

* Present agreement operated from December 31, 1940.

House of Commons that this period is more likely to be two years than one). On a very modest set of assumptions, the national income may well be some 10 per cent higher after reconversion than before the war; on more sanguine—but still justifiable—assumptions, it would be about 20 per cent higher. If, for the sake of argument, it be assumed that the volume of traffic will show a roughly proportionate increase, the picture changes. A volume of traffic 10 per cent higher than that of 1937, would have yielded gross receipts, at the level of charges in that year, of £222 million; a 20 per cent increase would have lifted them to £242 million. With present charges the lower figure would become £264 million, and the higher one £288 million. True, costs would go up, too, but in nothing like strict proportion to the rise in the volume of traffic. Assuming a rise in costs half that of the increase in traffic—this may be an underestimate—they would amount to £257 million, with a volume of traffic 10 per cent higher, and to £269 million, with one 20 per cent higher. On the smaller assumption of the prospective rise in the volume of traffic, the amount to be found to maintain the net revenue of 1937 would be £32 million, and on the bolder assumption it would be only £20 million.

All this, of course, is mere playing with figures. Although it seems reasonable to assume that the volume of railway traffic will be higher after reconversion than it was before the war—unless there is another marked shift in traffic in favour of the road—the nature of the traffic may be different. About the level of wages and material costs two or three years hence, it is equally difficult to make precise assumptions at this stage—that is to say, assumptions that would justify serious calculations about the relation between gross receipts and expenditure two or three years hence. A further rise in the price of labour and materials might throw all calculations out of gear.

Nor is this approach to the problem necessarily a rational one. Presumably the railway companies, like other enter-

prises, are anxious to maximise their profits. And since, on the average, their costs rise less than proportionately to any increase in traffic, their profits increase—given their existing capacity with an increase in the volume of movement. (The war years have given the most sensational proof of this principle.) A rational policy with respect to charges must therefore take account both of the elasticity of demand for transport in general, and of the proportions of the whole that can be secured by road and rail. It is quite conceivable, and even probable, that, by comparison with pre-war cost relationships, the railways will be more favourably placed than the road transport industry. For example, the expenditure of road operators contains a bigger element of prime costs than those of the railways. It is an advantage, in a period of rising prices, to have a heavy burden of fixed money charges. Or, again, petrol, an important item in road costs, is unlikely to be cheaper. By pursuing a bold—and low—price policy likely to attract traffic, the railways might, therefore, possibly gain more than by one that sets out in advance to achieve a given net revenue by raising charges in accordance with some rigid formula based on past experience. It may be that the railway companies have become so accustomed to the diversion of traffic from rail to road in times of peace that they can no longer visualise the possibility of a movement from road to rail.

It is, of course, quite conceivable that the railway chairmen are merely preparing the ground for a rise in charges as a matter of precaution, and that they have no real intention of pressing for so large an increase. Some increase may well be necessary, and it will be more readily accepted if it falls below expectations. It may also be, on the other hand, that they are thinking in terms of something very different from the pre-war revenue, possibly the "standard" revenue. The present stage is merely that of tuning up the instruments. What tune is to be played has not yet been disclosed.

Standard Production

A VEIL of secrecy hangs over the efficiency of British industry. There are no efficiency statistics. Even the methods for compiling such statistics have not been fully worked out. Sometimes some corners of the veil are lifted, as by the Report of the Cotton Textile Mission to the United States. The Report caused something of a sensation. It showed that the gap between American and British production per man hour is not only large, but widening; and not only widening, but widening at an increasing rate. Similar information about the coal industry has been collected but not published. Fragmentary information about a number of other industries exists and, though incomplete, points in the same direction.

It is, of course, true that not all American industry is highly efficient, nor all British industry inefficient. There are large sectors in the American economy where efficiency is low and living standards are poor. The *per caput* income of the United States in 1934-5 was only 7 or 8 per cent higher than that of the United Kingdom; in 1937 it was 10 per cent higher, and at present it may easily be as much as 30 or 40 per cent higher. Relatively higher unemployment in America is part of the explanation of the small difference in the earlier years, but the main reason why the superior productivity of American industry is not reflected in an equally higher figure of *per caput* income lies in the fact that Britain had about 45 per cent of her workers in industry, compared to only about 25 per cent in pre-war America. If the comparison is restricted to manufacturing industry alone, the superiority of American productivity per man-hour of labour is very large. What is it due to?

Some new light is thrown on this question in a recently published book* by Mr Lewis C. Ord, a consulting engineer with wide experience of production in the United States, Canada, Australia and the United Kingdom. Mr Ord has many shrewd things to say about British methods of production, few of them palatable. He insists that it is mass production, above everything else, where America scores and Britain loses. But

mass production is not merely a mechanical means or part of a system of factory operation which enables work to be produced more cheaply than in any other way. Factory layout, system and methods of operation are only a part, and often a small part, of the methods of business management and of

company policy which must all be combined to produce really efficient mass production.

Without steadily rising volume of work there is not likely to be the falling costs, the rising confidence, the readiness to adventure and to spend so necessary to achieve the highest results.

The fight for volume is the main characteristic of modern American industry. Large output with small profit margins is felt to be a more secure and more defensible basis for high profits than high margins on a small output.

Even more important to the success of mass production than great volume is lack of variety. American firms did not achieve that great output of a single product, without change of design or type, which has been the foundation of their greatest success, merely by realising its value and desirability. Their customers, whether the public or other companies, wanted variety. They disliked the obvious limitations of standardisation. They would only drop their insistence on variety at a price. It was only by reducing the price of the standardised article so far below the price of variety that customers were won over. Where the public and the trade demand variety; where the profit margin is high and variety is catered for in generous measure, real mass production is quite impossible.

There can be little doubt—although Mr Ord refuses to admit it—that the American development of mass production has been assisted, if not made possible, by the large, protected home market which the United States possesses, and that the relative inferiority of British industry is partly due to the relatively much smaller "free trade area" represented by the British home market. A large market often has room for a large number of standardised products, combining the advantages of standardisation with those of variety. But it would be dangerously complacent to argue that this applies to all lines of production.

Nor does this argument explain the high efficiency attained by many industries in Canada and Australia, and in other countries with much smaller protected markets than are open to British industry. There can be no doubt whatever that, even after the different size of the market is allowed for, American industry has pushed standardisation very much further than British industry—that, in fact, the British manufacturer frequently imposes upon the public a degree of variety that is utterly uneconomical, satisfies no genuine consumers' wish, and restricts even further the volume of sales possible within the British home market by the high prices it causes.

The American National Bureau of Standards published

some years ago a "Circular Letter" setting out the reduction of varieties effected by standardisation. The most frequent percentage reduction quoted ranges from 80 to 90 per cent—that is to say, the number of varieties before and after simplification were as 8 or 9 to 1. Every type of product can be found on the list, with a high preponderance of production goods, tools and materials. To say that standardisation necessarily limits consumers' choice is erroneous. There is a wide field for it in respect of articles used for production rather than for direct consumption.

This simplification is the essential pre-condition of efficient mass production. The savings it effects are only partly savings in the amount of "productive" labour required for a given output; they are mainly savings in "unproductive" labour:

To the manufacturer: Less capital tied up in slow-moving stocks, simplified inspection requirements, longer runs with fewer changes, less idle equipment, less stock to handle, larger production units, less special machinery, more prompt delivery, less chance of error in shipment, and less obsolescence in material and equipment. To the jobber, wholesaler, and retailer: Increased turn-over, elimination of slow-moving stock, staple lines—easy to buy and quick to sell—greater concentration of sales effort on fewer items, decreased capital invested in new stocks and repair parts, less storage space required, and decreased overhead and handling charges. To the consumer: Better values than otherwise possible, better service in delivery and repairs, and better quality of products.

This is also Mr Ord's principal thesis. The greatest achievement of American production methods is the reduction of overhead costs and of all costs arising out of "unproductive" labour. About Ford's mass production methods he says this:

The new motor-car assembly line contained only one new principle which was an advance, production-wise, over its freight-car assembly line predecessor—continuous movement. The reduction in overhead charges was enormous. The material handlers had literally disappeared out of the shops. . . . All the paper controls were dropped. . . . No tickets were issued. . . . There was no piecework. There was no detail costing. . . . There was no inward store, no sub-store, no finished part stores. There were no truckways, trucks or truck drivers. There were no material racks, containers and shelving for production material. There were no production stores attendants. There were no job cards, time cards or move cards. One man could run the whole production control for one shop. There were no machine change-overs and machine setters once the job was under way.

In England, Mr Ord and his colleagues found "an almost universal belief that as efficiency of production improved overhead charges must go up." But his thesis, on the contrary, is that "mass production was devised to prevent overhead charges from rising in such circumstances," and could usually lower overheads per unit of output. That is, in his view, the secret of the successful firm—something more than just the physical machines, plant, layout and method of manufacture. "The machines, the tools, and all the equipment may be purchased anywhere. The layouts and the methods may be copied by anyone wishing to visit them." Machine cutting-time cannot be reduced to make the difference between failure and success. Other costs have to be reduced.

A check of a dozen British motor firms, twelve or fourteen years ago, disclosed the following condition. Not including advertising, sales or service departments, for every hundred productive workers these firms employed from a low of 35 to a high of 140 non-productive personnel. . . . A check of some American motor firms made about the same time and on the same basis approximated 25 non-productive personnel to each hundred productive workers.

To achieve this is the really difficult job—"a much greater strain on the knowledge and experience of management" than the mere introduction of new machinery. "Is it surprising," he asks, "that such (successful) firms do not disclose how low a non-productive ratio they have achieved nor the means by which it was attained?"

There are thus two essential conditions for real productive efficiency. One is standardisation and, with it, an organisation of the distributive mechanism that ensures, through the "bulking" of orders, continuous production processes without an undue amount of re-setting for variety. The other is scientific management inside the factories. Along both these lines a large part of American industry has achieved outstanding successes. To attain the conditions for repetitive mass production within the relatively smaller British market, a high degree of conscious

* National Bureau of Standards, Letter Circular LC 501, September 3rd, 1937. Cf. also Temporary National Economic Committee Monograph No. 22, "Technology in Our Economy," pp. 225-27. (Washington 1941.)

organisation may be required. The close connection between size of market and efficiency of production also suggests that new methods may have to be tried in the organisation of the export trade, so that export markets may become more nearly equivalent, in terms of risk and predictability, to the home market. The introduction into wider sectors of British industry of scientific management is long overdue, and its delay represents one of the major failures of private enterprise in this country. More efficient management, as the American example shows, tends also to improve, not merely working pace, but, what is more important, working morale. "Because of better leadership," says Mr Ord,

working men of British birth and training now living in the United States work better for higher wages, enjoy a higher standard of living and are happier under that system than are British workers in their homeland. . . . No other country has men who take greater pride in their work or who are easier to work with. Britain is fortunate in her working men.

But on the quality, energy, enterprise, training and method of selection of men for leading positions in British industry, Mr Ord has not much to say that is positive and reassuring. His general dictum that the superiority of American industry is primarily due to the fact that "the United States alone of all the great industrial nations has striven to keep her industries sharply competing"—that it is due, in other words, to the American Anti-Trust legislation—has considerable truth in it, but not enough (in view of what has become known about monopolistic practices in America) to bear the weight that Mr Ord puts upon it. But it is none the less certain that American firms do compete much more vigorously amongst themselves than British firms; that American private enterprise is more daring and aggressive, more prepared to try new methods, both of production and of distribution. Explanations for this discrepancy can no doubt be found that are not wholly discreditable to British industrialists. But the discrepancy cannot be explained away. And the future of Britain will largely depend on its reduction or elimination. Mr Ord himself is no pessimist: "Perhaps I am, biased when I say that British industrial efficiency can once more be made equal to any other. I believe it to be not only possible, but urgent and necessary."

LOOKING AHEAD

THE Post-War World will need business initiative, foresight and courage. The services of Westminster Bank are at the disposal of all those who are, or will be, engaged in the great task of reconstruction and expansion both at home and overseas. CREDIT facilities will be readily available to meet the requirements of all classes of trustworthy borrowers.

Business Notes

Anglo-Swedish Monetary Agreement

The main purpose of the financial agreement concluded this week between the British and Swedish Governments is to re-establish more normal economic and financial relations between the two countries. Its chief advantage for Great Britain is to make possible, during the difficult years after the war, an import of goods from Sweden in excess of British exports to that country. Great Britain will need substantial imports of materials, such as timber and timber products, including prefabricated houses; but—and this is by now commonplace—it is short of gold and foreign exchange and will require some time to raise the volume of its exports to a level at which it can balance its accounts with other countries. (Since the outbreak of war, and especially since the spring of 1940, Great Britain has financed its adverse balance of trade with Sweden with gold; this, obviously, has hitherto been more satisfactory than a credit arrangement that would presumably have been extended to Germany to avoid discrimination between countries at war.) Sweden, in its turn, will benefit from the agreement; the country will be able to resume more normal transactions with the sterling area and to import commodities it requires from that area. Sweden is badly in need of coal and oil, though, for a period, it may be difficult to meet these requirements to the full. Discussions between the two countries are proceeding to ensure a speedy revival of trade.

Technically, the new agreement is analogous to that concluded by this country with Belgium. There are some special features. No ceiling has been fixed to the amount of sterling Sweden can hold—or to that of Swedish currency Great Britain can hold—though, in practice, Great Britain will presumably confine its imports from Sweden to essentials. Sweden, in turn, can use its sterling holdings to finance imports, not merely from Great Britain but also from other members of the sterling area. Further, the rate of exchange between the currencies of the two countries has been fixed at Kr. 16.90 to the pound sterling; capital transfers that “do not serve direct economic or commercial purposes” are to be prevented. The agreement, which is subject to review and adjustment, is to run for five years—unless previously terminated—with effect from January, 1945; there is nothing in it that would preclude it from being fitted into a world agreement.

Quoter Markets

Far from showing the hoped-for broadening, as a necessary prelude to more active conditions, the volume of business in the stock markets this week has tended to fall off. The undertone is still described as very firm, but large investors are finding the task of estimating the remaining duration of the European War as difficult as ever, and are even more reluctant to take chances than they were before the Allied advance to the Rhine began. Price movements have been of the isolated “news headline” kind, with some demand for brewery shares and to a lesser extent for stores shares, on presumably favourable earnings prospects. Gilt-edged have been slightly reactionary, while home rail stocks have disappointed their sorely-tried supporters by their stoic refusal to show any appreciably favourable reaction to voices from Euston. King's Cross and Paddington prophesying higher post-war fares.

Prices as a whole have been holding up well. The latest figures of the Actuaries' Investment Index, indeed, which carry the story to the penultimate day of February, and are analysed on page 328, show that the trend of almost all markets is still upward. Progress which is almost invisible viewed from day to day, becomes satisfyingly perceptible when measured over the last month. Between the end of January and of February, for example, the Actuaries' Index (December 31, 1928 = 100 throughout) of 2½ per cent Consols prices rose from 146.4 to 147.5, while the Ordinary Share Index for industrials of all classes rose from 86.4 to 87.0. The greatest beneficiaries from February's markets were building materials shares (with an improvement from 101.5 to 104.0), electrical manufacturing (173.6 to 175.4), oil shares (96.8 to 99.0) and stores and catering shares (90.1 to 93.6). Clearly, it is difficult for even a jaundiced eye to read into this any suggestion that a “bear market” now prevails. In fact, there appears to

be nothing wrong with underlying conditions, except the extreme disinclination of professional investors—who, as distinct from day-to-day private buyers, are the markets' standby—to make up their minds about what the relatively near future may bring.

Shipping Replacement Costs

The British merchant navy will have to make a large claim on the nation's savings after the war if it is to replace its obsolete and worn-out tonnage and to make good war losses.

Some four years ago Sir Amos Ayre, who has long been intimately connected with shipping problems, suggested that 13 million gross tons of shipping would have to be built within ten years if the British merchant navy were to maintain its efficiency. He estimated that, at pre-war prices, this would involve an expenditure of about £300 million. Since shipbuilding costs have virtually doubled, the cost at present prices would amount to the huge sum of £600 million.

At the end of 1943, the actual deficiency in tonnage, in terms of vessels of 1,600 gross tons and over, was about 4,000,000—that is to say, after allowing for ships returnable to other flags, the gross tonnage flying the British flag was down from 17½ million to 13½ million. A programme of 13 million gross tons would thus include 4,000,000 tons for losses and some 9,000,000 tons for replacement. It is probable that the calculation made by Sir Amos will need revising in the light of present facts; indeed, a fresh estimate of the new tonnage needed to restore the size and efficiency of the merchant navy should be prepared—if it has not already been prepared—as soon as possible.

The problem of reconstituting the merchant navy has two aspects: First, shipowners may not be able to finance the programme without assistance; secondly, the heavy claims upon the national savings of a programme of speedy reconstruction—and there are many other claims—nor merely underlines the need for devoting to physical capital a bigger proportion of the national income than before the war, but also that for planning a combined programme of capital expenditure and for ensuring that the requisite proportion of the national income is made available for its fulfilment.

Stock Exchange Council Ballot

The feeling of many Stock Exchange members, on reading this week's announcement of a ballot on March 20th to appoint thirty ordinary members of the new Stock Exchange Council, must have been that the more the “House's” constitution changes, the more its elections are the same thing.

During the Stock Exchange year now closing, the proprietors have taken the first steps towards a revolutionary change in Stock Exchange governance, which promises, ultimately, the complete extinction of the dual control system, under which the trustees and managers were responsible for finance, and the Committee for General Purposes for the regulation of dealings on the Floor. From March 25th there will be a single Stock Exchange Council of 39 members (to be reduced to 36) on which the personnel of both the former bodies will serve, though the representatives of the quondam trustees will still enjoy separate powers analogous to those they exercised in the past.

But the ballot for the “ordinary” members follows wholly traditional lines. As before, thirty members are to be elected. Ballot papers will contain the list of candidates in alphabetical order with members of the retiring Committee for General Purposes distinguished by an asterisk. Members will have to put a cross against a minimum of twenty-five names if their voting papers are to be valid. Many members will, as usual, find that they know personally only a minority of the gentlemen indicated, and will fill in the rest by one or other variant of the theory of chance. In point of fact, this first election of the new Council is the last to which the old balloting method will apply. Subsequently, only one-third of the ordinary Council members will retire each year, and the maximum number to be elected at any one time will be ten—and, later, nine

Courtaulds' Earnings

There is a welcome loquacity about the preliminary statement of Courtaulds' profits for the calendar year 1944 which should please, among others, the Stock Exchange authorities who have lately been doing their best to educate companies in the virtues of frank and adequate disclosure in such statements.

Profits before taxation were £3,202,434, compared with £3,687,422 for 1943. Of the reduction of £484,988, some £348,281 relates to trading profit, and is very largely due to the reduction (last March), with the approval of the Board of Trade, of selling prices of viscose rayon staple. Wartime controls have prevented the increased volume of production and sales which otherwise would have restored the position. The remaining £136,707 of reduced trading profit is attributable to a drop in investment income following a recent and temporary setback in the profits of a subsidiary company whose position, it is stated, is now considerably improved.

Taxation takes 71 per cent of the profits, against 69 per cent in 1943. Large as the proportion is, from the company's viewpoint it has its compensations, since the decrease in trading profit is absorbed by the EPT “cushion,” and does not affect the amount available for stockholders. Actually, the balance of profit for 1944 available for dividend purposes is only £924,183, against £1,133,123 for 1943, representing earnings of slightly over 6 per cent on the ordinary capital—on which an unchanged total distribution of 7½ per cent is being paid. The directors declare that a substantial provision in the accounts for deferred repairs and renewals to properties, plant, etc., has been disallowed as an expense under the present income-tax regulations. As and when the corresponding expenditure is actually incurred, however, it will be allowable, and for that reason the directors feel justified in drawing on the carry-forward for £175,817 to maintain the ordinary dividend.

Altogether, the Courtaulds' statement can be taken as illustrating, in a converse way, the moral brought out some weeks ago by the British Celanese statement—that in these days of high taxation mere distributable profits figures (and, even more, mere rates of dividend) may give a wholly misleading impression of changes in earning power unless they are supplemented by detailed figures of tax transactions. Far from being a “bear point” for Courtaulds' stockholders, the company's experience in 1944 is of definitely good augury. The amount of the disallowed deferred repairs provision will be recouped in future years (subject to any intervening change in the standard rate of income-tax), while in the matter of viscose rayon staple selling prices the company appears to have had decidedly the best of it in its relations with the authorities. The step, which is in line with the company's long-term policy, should bring increased sales when controls are lifted. Meanwhile, the financial impact falls, not on stockholders, but on the Treasury, which is collecting less, *pro tanto*, from the company in EPT.

Lend-Lease Aid for France

An agreement recently concluded between the United States and French Governments will enable France to obtain badly-needed materials and equipment on special terms. It is reported that the agreement includes two schedules.

First, the United States is to supply France with primary products for manufacture into munitions and into goods for civilian consumption on lend-lease terms. After the termination of lend-lease deliveries the French Government will be able to take over any stocks remaining in the country; their purchase is to be financed by a 30-year loan to the French Government, carrying interest at the rate of 2½ per cent.

Secondly, the United States is to supply France with capital equipment. There is to be a cash payment of 20 per cent of the price of such equipment; the remainder will be financed by a 30-year loan, on the same terms as the purchase of materials under the first schedule.

The chief problem, as M. Jean Monnet pointed out last week in Paris before his departure for the United States, is now to secure a bigger shipping tonnage to carry supplies to France.

Building Societies in 1944

The accompanying table gives comparative statistics, for 1943 and 1944, for the results of some 90 building societies, whose combined assets are equivalent to about three-quarters of those of the movement as a whole. The outstanding feature of the results is the doubling of advances on mortgage during the past year; this is a reflection, not so much of an expansion in new building as of a higher rate of transfer of the ownership of existing houses. Advances made by the building societies as a whole

RESULTS FOR 90 SOCIETIES

	1943	1944	+ or -
Advances on mortgage.....	20,196,881	40,200,200	+ 20,003,319
Mortgage assets.....	437,360,053	427,541,706	- 9,818,347
Investments and cash.....	153,283,601	184,692,374	+ 31,408,773
Other assets.....	5,989,312	6,459,866	+ 470,554
Total assets.....	596,632,966	618,693,946	+ 22,060,980
Reserve funds.....	37,198,153	38,379,244	+ 1,181,091

probably totalled about £50 million; this is still only a third of those made in the best pre-war years, but it is five times as high as in 1941. Mortgage assets showed a further, though much smaller, decline than between 1943-1944, when the fall was £23 million; for the 90 societies the fall was equivalent to about half the increase in the volume of new advances.

Swedish Shipyards

Compared with the position at the end of the last war the capacity of the Swedish shipbuilding industry has virtually trebled. (The tonnage of merchant ships of 100 gross tons and over launched in 1938—the highest recorded up to that year—was 166,000.) This increase has been achieved more through modernisation of shipyards and shops, provision of modern machine tools and a general rationalisation than through an increase in the number of building berths. The most far-reaching modernisation work was necessitated by the introduction of electric welding in the yards, which demanded far more space both in the workshops and around the berths, a different stock of machines and more powerful lifting gear at the berths and in the welding departments. For vessels of the larger type, that is over 5,000 deadweight tons, the number of berths increased from 14 to 25, and a small number of additional berths are planned or are under construction. In the end the physical capacity rose by 50 per cent. The largest Swedish yards are at the moment working at only 50 per cent of their capacity.

Shipbuilding orders in hand are substantial. Yards constructing larger ships could have their berths occupied until the beginning of 1948, which is a record. But anxiety about obtaining materials clouds the picture, for requirements are not covered with certainty beyond the summer of this year. Allocation of domestic steel for the shipbuilding industry is small. In the four years 1940-43 the industry secured in all 250,000 tons of steel, equivalent to 62,500 tons a year, compared with a normal annual consumption of 100,000 tons in the inter-war period and 150,000 tons which could be used if capacity were employed fully. Of the 250,000 tons only about 90,000 came from Swedish steelworks. If the raw material problem cannot be solved before current stocks are used up there may be serious difficulties next summer. Repair works could be carried on with much smaller supplies than new construction. The industry hopes for a good flow of repair work after the war, as that part of the Swedish merchant fleet strenuously engaged in traffic outside the blockade during the war would need a thorough overhaul.

— 35/- per cent per annum —

is the present Interim Bonus rate on Whole Life policies. The rate on Endowment Assurances ranges from 25/- per annum for maturity age 50, to 35/- per annum for maturity age 70.

NATIONAL PROVIDENT INSTITUTION
FOR MUTUAL LIFE ASSURANCE
Established 1835

48 Gracechurch Street, London, E.C.3

Next Valuation - 31st December 1945

The outlook for the Swedish shipbuilding industry will largely depend on factors outside its control, for it is heavily dependent on foreign orders; but it is confident of building ships of specialised types, that is, fast liners, fruit carriers and tankers.

Cotton Yarn Shortage

Discussions about the prospects for the clothing ration when the next allocation of coupons is due have drawn attention to the inadequate output in the spinning of yarn. Current cotton yarn production covers only about two-thirds of requirements, limited though these are to war needs and, on the civilian side, by rationing. The Cotton Controller had hoped that output would be raised by the working of four hours' overtime a week during the summer months, as was done last year. A ballot among the 90,000 or so workers has, however, turned down the proposal by an overwhelming majority.

While at first sight it is tempting to condemn the refusal of spinning mill operatives to raise their hours to 52 a week, it must be remembered that their average age is high, and a large proportion of them are married women with domestic responsibilities. It is possible that the gravity of the situation was not sufficiently stressed. Another attempt might be made to induce the operatives to work longer hours, possibly for fewer months than was originally contemplated.

Meanwhile, other more determined steps must be taken to increase yarn output by drafting workers into the mills. The labour force six months ago was only 60 per cent of that of 1939. The registration of women ex-cotton workers of the autumn of 1943 and other measures have been insufficient to offset normal labour wastage. The Minister of Labour recently said that measures "are in preparation for augmenting the number of workpeople in the spinning section of the cotton industry." These measures must be pursued with speed and vigour, to widen the spinning bottleneck. The time-lag between spinning yarn and production of finished garments is so long that unless more labour is immediately found for cotton spinning the consequences for war needs, civilian clothing and the export trade will be lamentable. Unless the position in the other textile trades is carefully watched, they may possibly find themselves in the same boat as cotton.

Gas Companies

The publication of the accounts of gas companies, which has been prohibited for four years for security reasons, has now been resumed. The accounts for 1944 of four companies which operate in and around London all tell a sad tale of wartime difficulties, created by bombing and evacuation, although the varying extent to which this has affected their financial position is indicated by the following table:—

	Ordinary Dividend				1944 Sales of Gas as percentage of 1938 Sales
	Average 3 years 1936-38	1941	1943	1944	
South Metropolitan	5.5	Nil	3	2	77
South Suburban	6	4	5	5	92
Commercial Gas	4.8	Nil	Nil	Nil	58
Gas Light & Coke	5.6	Nil	4	5	†

† Not available.

Gas sales as a whole have picked up from their very low levels of 1940-41, and two of the companies have resumed dividend payments on something approaching a pre-war scale. The Gas Light and Coke Company, which normally serves a population of about 4,600,000 living in an area stretching from Windsor to Southend, is easily the largest of the four companies. Last year, its governor, Sir David Milne-Watson, mentioned the company's success in recovering from the difficult position in which it found itself after the blitz. But the Commercial Gas Company, which covers a highly industrialised area of the East End that has suffered extensively from bombing, is not only unable to resume dividend payments, but shows a deficit on carry forward of £368,000 for 1944, compared with a credit of £7,000 for

1939. By contrast, the South Suburban reports an increase in its industrial load.

The gas companies are faced with a rise in costs, which for the future will be more important than bombing problems. Two companies report that the cost to them of coal, a major item in total costs, has more than doubled. The rise in coal costs has, of course, equally affected electricity undertakings. One gas company puts the rise in labour costs at 40 per cent, and mentions that the quality of labour has deteriorated. Against this, the prices charged per therm of gas are in the neighbourhood of 14-16d., against pre-war prices of around 10d.-12d. These prices are controlled by the Government, and some resentment is felt that greater increases have not been allowed. The chairman of Commercial Gas, Mr Jones, points out that his company has in effect subsidised the sale of gas at prices well below cost.

The gas industry, in common with all public utilities, has still not been told the Government's intentions with regard to war damage. It is impossible to gauge how well placed the companies are for undertaking post-war re-equipment. The gas companies are at present facing the new and difficult problem of providing supplies for temporary housing programmes. The future of the industry, and the possibilities of developing and cheapening post-war gas supplies, are at present being reviewed by a Committee under the chairmanship of Mr Geoffrey Heyworth.

Retail Stores in North and South

The preliminary results for the year 1944, published recently, of three companies owning large London department stores all tell a tale of little change over the last year. Swan and Edgar's show net profits as being £3,000 lower. Harrods and John Barker both show a rise in profits, of £31,000 and £39,000 respectively, but these increases are more than swallowed up in increased taxation allocations. The ordinary dividends of all three companies are unchanged, and it may be of interest to compare recent payments on equity shares:

	3 Years Average (1936-38)	1941	1943 and 1944
Harrods	18	4	8
John Barker	15	10	10
Swan & Edgar	6.5	3	4

The eclipse which London stores suffered at the beginning of the war, and from which they have not yet recovered, has not been shared to the same extent by large multiple or department stores operating in the North of England. The main reason for this is undoubtedly the lower incidence of bombing in the North and the fact that, latterly, many large Northern towns have been reception rather than evacuation centres. This fact is illustrated by the continued rise of profits after tax shown in the accounts of Lewis's for the year ended February 1, 1945. The payment of Lewis's deferred ordinary shares, which are privately held, has been maintained throughout the war at its pre-war level of 275 per cent, with the exception of 1942 and 1943 when 250 per cent was paid.

Lewis's operate large clothing and general stores in Birmingham, Liverpool and Manchester. It possesses its own clothing factory and in addition controls subsidiaries, one of which operates stores in Leicester and the Midlands, while another conducts wholesale and retail dairy trade in the Liverpool area. The executive chairman of Lewis's, Mr Tringham, mentions the high profits which have been earned by the company's subsidiaries, although in most cases these have been negated by unfavourable standards for EPT. Lewis's prosperity is said to be founded on a basis of low stocks and high turnover, and this fact should facilitate the post-war task of improving the quality of its goods. Mr Tringham makes a plea for an early improvement in the quality of goods as well as their quantity, and instances toys in particular. Few will dispute his contention that the majority of toys at present being produced are of excessively high price for their poor quality.

Workers' Earnings in July, 1944

The Ministry of Labour survey of the average weekly earnings of 6,000,000 workers in July, 1944 (published in

the February Ministry of Labour Gazette), shows that there was only a slight increase over earnings in January, 1944, from 95s. 7d. to 96s. 8d., but that the level of earnings had risen by 82 per cent over the level of October, 1938, when the weekly average was only 53s. 3d. A table on page 328 shows the increases in the various industrial groups covered by the survey. Its most significant features are the high earnings of men in the metal, engineering and shipbuilding group (139s. 1d. a week), an increase of 85 per cent over October, 1938, women's earnings in this group having increased by 113 per cent. Building and civil engineering, with an average of wage of 99s. 1d., comes relatively low in the list in view of the fact that builders worked well above the average hours (51.4 hours per week compared with the average for all workers of 48.6). Textile and clothing workers are the lowest on the scale, and are the only groups earning below 70s. a week. If the labour shortages in these industries are to be remedied, it would appear that greater financial inducements will have to be offered.

The principal industries excluded from the survey are coal-mining, railway service, docks, distribution, catering and entertainment, commerce and the banks. Information supplied from sources other than the Ministry of Labour shows that the average weekly cash earnings of miners in July-September, 1944, were 108s., an increase of 90 per cent over the same period in 1939, while earnings per manshift at 22s. 3d. had increased by 96 per cent over 1939. The proportionate increase over 1939 in the earnings of railway workers was considerably lower (66 per cent); for all grades of railway workers the average weekly earnings in March, 1944, were 114s. The most interesting fact—especially in view of its bearing on the London dock strike—is that dockers were the highest paid of any industrial group. From April to June, 1944, their earnings averaged 161s. a week, rising to 172s. 2d. during the week of the invasion.

Fish Landings

Statistics of fish landings in Great Britain have been released for the first time since the beginning of the war. They are for 1944, with 1938 for comparison, and for January, 1945, with January, 1938. The salient figures are given in the accompanying table. They reveal a number of interesting facts. Foremost is that total landings in 1944 were rather less than one-third the weight of those of 1938. The value, on the other hand, was only a fraction lower in 1938. Thus prices in 1944 were about three times above the level of 1938. Consumption has not been reduced to the same extent as landings, since exports during the war have been negligible, while before the war they were substantial. The total quantity available for consumption is augmented by imports. An official guide to civilian consumption is to be found in the War Effort White Paper

FISH LANDED IN GREAT BRITAIN BY BRITISH FISHING VESSELS

" 1944	130	144	1,405	1,648	1,535	1,792

(Cmd. 6564). The latest figure relates to 1943, when civilian consumption per head was just under three-quarters of the average for 1934-38.

For some time after the war demand will exceed supply—meat will still be scarce—and fishermen will be able to sell all the fish they can catch. The long-term outlook, when supplies of all foodstuffs are again plentiful, is not so rosy. It is important that fishermen and the Government should not be blinded by early post-war prosperity into thinking that the fishing and fish trades will need no

rehabilitation. Plans for herrings are already well under way. Last year the Herring Industry Act was passed and the Herring Industry Board set up. The white fish branch of the industry had fallen on evil times in the inter-war years. It, too, will need to look to its equipment and methods of distribution—there is scope particularly for a great development in the use of refrigerators. Demand for fish, when meat is no longer rationed, will be a fickle thing unless actively encouraged.

US Silver Operations

The centre of gravity of the world silver markets has during the war inevitably shifted to the United States, and the annual review of Messrs Handy and Harman, the New York bullion dealers, now provides the fullest available information on the course of the silver market. Even in its information on the London market this review is less constrained than those of the London bullion brokers. It points out that silver imports into the UK on private account were small, consisting of refined bullion from New Zealand and lead concentrates from Australia. On Government account substantial quantities were imported under Lend-Lease from the United States, plus a few hundred thousand ounces from Canada. There were no exports on private account. Silver for industrial uses was restricted entirely to war purposes, the required supplies being released from Government stocks.

Dealing with conditions in India, Messrs Handy and Harman point out that official sales of silver by the Reserve Bank which commenced in early August had, in the 15 weeks ending November 22nd, been estimated to aggregate between 8,000,000 and 9,000,000 ounces. The absorption of silver by India for the whole of 1944 should amount to about 38 million ounces.

In the United States silver may be divided into three separate classifications. First, there is foreign silver, for which the OPA has maintained a price of 45 cents per ounce. Imports declined last year, but were more than sufficient to meet requirements for the uses specified by the War Production Board. These are industrial uses with high preference ratings. Much of the imported silver has been bought by the Metals Reserve Company, which at the end of October had 5,803,000 ounces of such metal on hand. Secondly, there is Treasury silver which has been released for essential war purposes under a WPB order. Thirdly, there is domestic silver. During 1944 less than 200,000 ounces of this output was acquired by the US Treasury. The bulk of the output of 34,500,000 ounces was bought by industry for civilian purposes as permitted by the WPB. Most of this silver goes into jewellery and other articles which Messrs Handy and Harman define as "so-called non-essential." The greater part of the review is, in fact, devoted to proving that the silver made available to these "so-called non-essential" uses has been entirely inadequate and that the available quantity of domestic silver would fail to meet even the rational civilian demand. The review makes a plea for the release of stocks of Treasury silver to meet this severe stringency in domestic silver.

Agricultural Mechanisation

Reduced manpower and the need to increase agricultural production during the war inevitably led to a greater use of machinery on farms. The number of tractors in use in Great Britain is now about 150,000, nearly three times as many as in 1939. If agriculture is to raise its productivity and produce cheap food, it will have to turn more to machinery than it has done in the past.

One of agriculture's handicaps is the small size of the average farm, which puts the capital outlay for machinery and their running costs outside the reach of the small farmer. The compelling force of war has led to schemes designed to get over the difficulty by the joint use of machines. Pooling schemes are operated all over the country. These do not work to a set of rules laid down by the Minister of Agriculture. The procedure is that County War Agricultural Executive Committees call farmers together in suitable districts, and the farmers themselves elect a committee to run a machinery pool. The arrangements consequently vary from county to county and pool to pool. Very often a scale of charges for equipment lent by one farmer to

(Continued on page 327)

LONDON MIDLAND AND SCOTTISH RAILWAY COMPANY

RESULT OF YEAR'S WORKING

LORD ROYDEN'S SPEECH

The twenty-second annual general meeting of the London Midland and Scottish Railway Company was held at Euston Station, London, N.W. 1, on Friday, the 2nd inst.

The Right Hon. Lord Royden, C.H., chairman of the company, presided, and in the course of his speech said:

The total net revenue for the year amounted to £15,679,000, or £6,000 less than for the year 1943. The main item in the net revenue is the fixed annual sum of £14,750,000 received from H.M. Government under the Railway Control Agreement, the principal remaining earnings outside the Control Account being the £511,000 (a fairly constant figure) received from the company's investments in road transport undertakings, and the £226,000 which accrued from the earnings in 1944 of our Northern Counties Railway in Ireland.

The revenue of the Northern Counties Railway during the war years has been exceptionally good, but has now commenced to show signs of a falling-off, and with the changing phases of the war and increased cost levels we must not expect that the recent high earnings will continue. After covering the interest and dividends on the pre-ordinary holdings, and setting aside £400,000 for war-time contingencies (an item which I will refer to again later), the balance available for ordinary dividend is £2,453,000. Out of this the board recommend the payment of a dividend of 2½ per cent., which will absorb £2,380,000, leaving £73,000 to be carried forward.

BALANCE SHEET ITEMS

Our renewal fund balances continue to grow, and now total over £35,000,000, the cause of this increase being that we have been unable to carry out the normal amount of renewal work. The same applies to repair work, and a large part of the £15,487,000 shown under "Liabilities, Miscellaneous Accounts" is for arrears of repairs. The monetary arrears in respect of both renewals and repairs have their counterpart in the assets figure of approximately £28,000,000, representing our payments to date into the trust fund set up under the Railway Control Agreement.

Contingency Fund: The contingency fund now stands at £2,512,000, and includes the £400,000 I have already mentioned as having been set aside in 1944 for wartime contingencies, which is the same as for the year 1943. The reasons I gave last year for strengthening this fund still obtain, and the financial position with regard to the war damage to the railways of Great Britain still remains obscure. The precise intentions of Parliament in this respect have not yet been declared, and your board feels it is essential to adopt a conservative policy in the matter.

One final word on the balance-sheet; during 1944 our cash position improved to such an extent that it was found possible to acquire a substantial holding of tax reserve certificates. The accounts show that we have taken up £4,500,000 of these.

RAILWAY CONTROL AGREEMENT

Last year, following on the annual general meetings of the four main line companies, the chairmen submitted to the Minister of War Transport a memorandum giving the reasons why, in the opinion of the proprietors, the agreement should be further considered. In particular they pressed for—

- (i) An increase in the net rental; and
- (ii) an adjustment in the basic figure for maintenance, to cover the inevitable addi-

tional depreciation of the maintainable assets due to vastly increased user.

This memorandum was discussed very fully at a meeting between the Minister and the chairmen on April 20th last. At the conclusion of the meeting the Minister stated that he could not agree to any increase in the annual net rental, but that he was prepared to examine, with the representatives of the companies, the question of whether some allowance should be made to cover abnormal wear and tear. The point here is that Article 11 of the Railway Control Agreement limits the amount payable for maintenance to the average sum charged in the basis years 1935, 1936 and 1937 adjusted for changes in quantities of assets, and for price levels except in so far as the Minister may agree to an additional allowance for wear and tear that can be shown to be abnormal as compared with the base period. After further discussions, in the course of which it was shown that there was a substantial amount of abnormal wear and tear to date, the Minister has informed the chairmen that he is prepared to make an allowance to cover the cost of such abnormal wear and tear as shall be shown to his satisfaction to have accrued over the whole period of control. The actual amount cannot be definitely ascertained until the end of control and the final figures are available.

RESTORATION OF STATUTORY MACHINERY

Continuance of Government control; and restoration of statutory machinery governing the level of charges: Article 33 of the Agreement provides that control is to be continued for a minimum period of one year after the cessation of hostilities, but, as stated last December in the House of Commons by the Parliamentary Secretary to the Ministry of War Transport, control is more likely to last two years than one year after hostilities have ceased. Mr Noel-Baker also pointed out that a definite meaning has yet to be given to the phrase "cessation of hostilities," bearing in mind the two wars in which we are now engaged.

The same article provides that—
"Before control comes to an end (i.e., before all statutory rights and obligations as they exist at that time again apply to the controlled undertakings) time will be given for the operation of any statutory machinery governing the level of charges."

AN IMPORTANT PROVISION

I have previously explained to you the importance of this provision; it raises fundamental questions affecting the railways, which will have far-reaching consequences. The existing statutory rights and obligations which are suspended are contained in Sections 35 and 59 of the Railways Act, 1921; these deal with the general level of charges in relation to the standard revenue. Unless Parliament decides otherwise (and the article I have quoted recognises that it may do this), these Sections of the Railways Act will be automatically restored, at the end of control, when we shall resume the annual revisions of charges. As you know, in 1939 the Government announced their decision to grant a substantial relaxation of the regulations governing freight charges, and this decision will doubtless be reviewed in dealing with the matter, together with the subsequent discussions we have had with the Minister in the last two years on major questions of post-war policy. Once the charging machinery for peace-time operation is decided upon, it will require a considerable period before it can be put

into force, so that the time is approaching when the Agreement will need to be implemented in this respect. There is the further important point that, whereas since 1939 railway charges have with certain exceptions been increased by 16½ per cent. only, the cost of labour and material have risen much more steeply, and, assuming higher costs of operation will continue after the war, it will be necessary to adjust charges accordingly to cover increased costs. Further, regard must be had to the net revenue in relation to the standard revenue which Parliament has decided it is in the public interest that the company should earn a reasonable return on its capital.

SPECIAL TRAINS ON GOVERNMENT ACCOUNT

The number of Services and Government stores trains in 1944 reached the highest level yet attained in any one year; 57,605 special passenger and freight trains were run over our line, compared with 39,211 in 1943—approximately 47 per cent. increase.

Freight Train Traffic: The net ton miles for 1944 totalled 10,522,000,000, an increase of 3,585,000,000, or 52 per cent, over the 12 months before the war. The loaded wagon miles were 1,725,000,000, an increase of 410,000,000, or 31 per cent, compared with pre-war. General merchandise traffic, which is mainly responsible for the station handling work, continues to increase, and in 1944 was about double that of pre-war.

ABNORMAL OPERATIONAL DIFFICULTIES

The exceptional nature and volume of the Government priority traffic, together with the large increase in ordinary passenger travel, played havoc with the time-keeping of many of our passenger trains, and to add to our troubles, we experienced in the early weeks of this year most adverse weather conditions. To add to our difficulties, sickness among our staff during the winter was greatly in excess of the normal for the time of the year. In spite of all these difficulties, our railway machine never ceased to function. At times it was delayed but it never stopped—and it never will stop, even when victory, now happily in sight, has been won.

I think in all modesty we may claim that the nation has good cause to be satisfied with our performance, and notwithstanding all the problems of operation I have mentioned, the railway still functions 24 hours a day, seven days a week. The report and accounts were adopted.

JEREMIAH ROTHERHAM AND COMPANY, LIMITED

The forty-seventh annual general meeting of this company was held, on the 7th instant, in London.

Mr Joseph Hockley (chairman and managing director) addressing the shareholders said: I would like to take this opportunity of stressing the importance of the wholesaler who has played an important part in the distribution of the clothes rationing scheme. I do not think the public realise the vital work which wholesalers are called upon to do. A wholesaler's function is to anticipate the requirements of the retail trader, by placing orders a long time in advance, to carry a representative stock, to forecast the trend of fashion and run risks of a fluctuating market. The advantage to the retailer is that he is able to obtain his sources of supply from wholesalers whose stocks consist of up-to-date manufactured goods from all markets, instead of his having to deal direct with many manufacturers.

This enables the retailer to be in a position to make early display of seasonal goods to meet the demands of the consumer. Some of the successful retail businesses of today were assisted by the wholesaler at the start of their business career. The report was adopted.

GREAT WESTERN RAILWAY COMPANY

POST-WAR POLICY

SIR CHARLES HAMBRO'S SPEECH

The annual general meeting of the Great Western Railway Company was held, on the 7th instant, in London.

Sir Charles J. Hambro, K.B.E., M.C., (the chairman), in the course of his speech, said:

The expectation of an early cessation of hostilities brings into prominence the need for an early decision on the question of the future of all forms of internal transport.

The achievements of the railways in meeting the unprecedented demands made upon them during the war are an eloquent tribute to the efficiency of their organisations and to the high pre-war standard at which their lines and equipment were maintained. Our view, therefore, is that the main line railways should continue as four separate entities and that co-ordination of all forms of internal transport should be effected in such a way as to secure to users as far as practicable a free choice of alternative facilities, with competition on a fair basis.

CO-ORDINATION OF ROAD AND RAIL FACILITIES

The main problem is to determine the best means of co-ordinating rail and road facilities, but little progress can be achieved in this direction until we know what arrangements are being made to put the road haulage industry on a properly organised basis.

We are not concerned in regard to road hauliers operating purely local services but, in our opinion, co-ordination of competing transport industries cannot be effective until all parties are subject to similar obligations and responsibilities with respect to the provision of reasonable facilities for traders, the regulation of rates, and their application without discrimination between traders and between routes. The whole position is one which is no doubt engaging the attention of the newly formed National Road Federation, and we have indicated our desire to meet their representatives at the earliest possible date for an exchange of views. Meanwhile, I am glad to say that the Road-Rail Conference, set up at the instance of the Transport Advisory Council in 1939, is making good progress with the preliminary work of preparing a common classification of freight traffic, uniform conditions of carriage and new rate structures.

HEAVY ARREARS OF MAINTENANCE

After the cessation of hostilities our first consideration must be the overtaking of the heavy arrears of maintenance which have accumulated during the many years of war. We are anxious not only to restore the pre-war standards of passenger and freight traffic at the earliest possible date, but also to introduce many improvements. We have in contemplation a large programme for the construction of new locomotives and carriages over a period of five years and in carrying out this work, many improvements will be incorporated. Our programme includes new and up-to-date designs, more comfortable carriages with more attractive upholstery and improved lighting, better buffet, dining and sleeping cars, etc., our aim being to provide the public with the finest service in the world.

The rapidity with which we can carry out these long-term programmes for new and improved facilities must necessarily depend upon our being able to secure an adequate supply of labour and materials in the post-war period, and in view of the fact that so many post-war developments are dependent upon the provision of adequate transport we hope that special arrangements will be made to release the 15,000 members of our staff now serving with His Majesty's Forces at the earliest possible date.

RATES, FARES AND CHARGES

The provisions of the Railway Control Agreement provide for the continuance of control for a minimum period of one year after the cessation of hostilities, and, before it comes to an end, time is to be given for the operation of any statutory machinery governing the level of rates, fares and charges. The Parliamentary Secretary to the Minister of War Transport recently stated in the House of Commons that control was more likely to continue for two years than one, and, in view of the difficulty which is likely to be experienced in fixing the level of charges under post-war conditions and in dealing with other problems, I am afraid we can hardly hope for its termination at an earlier date. The post-war level of charges will, of course, depend on the company's traffic and costs, and these are obviously matters for speculation. The present earnings of the railways do not afford any guide to the probable post-war position. They are largely derived from war-time traffic and they benefit in consequence of the existence of restrictions which although justified now would not be tolerated in normal times.

Equally, our receipts in the years immediately before the war cannot be regarded as indicative of the probable post-war earnings. We may assume that by then road motor competition will be properly regulated, and we anticipate considerable benefit from increased employment, the arrangements proposed under the Distribution of Industry Bill, and the development of holiday and tourist traffic. On the expenditure side we have to face the fact that the cost of salaries, wages and of materials, which prior to the war represented nearly 90 per cent. of our total expenditure, has increased considerably. While, as I have said, we hope for an improvement in our post-war earnings, I think it well to point out that on the quantum of traffic which we carried in the years immediately preceding the war, the pre-war level of our charges would have to be raised by about 50 per cent. to cover the increased costs and yield the pre-war net revenue, and by about 60 per cent. to give us our standard revenue. The increase since 1939 is broadly speaking 16½ per cent. only.

AIR TRANSPORT

As you probably know, the four main line railway companies have submitted to His Majesty's Government a comprehensive plan for air transport within this country and to the Continent of Europe. The bases of the proposal were:—

(i) A separate air company to be formed to operate regular services in Great Britain (including Northern Ireland, the Channel Islands and the Isle of Man) and to Eire and the Continent of Europe, and to undertake charter business.

(ii) The new company to offer partnership to any independent air operators who provided regular services in this country before the war, and to those short-sea shipping lines who had a community of interest in traffic to the Continent.

(iii) The new company to operate the services without subsidy assuming that neither subsidies nor special advantages will be given to other air services, including foreign air lines entering this country.

The ultimate aim is to provide a comprehensive network of air services in and from the British Isles to the principal cities and holiday resorts of Europe, and a cardinal feature of our plan is the use of British aircraft.

Certain conversations have taken place recently with the Minister of Civil Aviation, and it is understood that a White Paper will be issued at an early date outlining the Government's policy on post-war air transport throughout the world. The report was adopted.

LONDON AND NORTH-EASTERN RAILWAY

INCREASED TRAFFICS

The annual general meeting of the London and North-Eastern Railway Company was held, on the 2nd instant, in London.

Sir Ronald W. Matthews (the chairman) in the course of his speech, said: The net revenue for the year 1944 was £10,753,279, which is an increase of £97,838, or 0.92 per cent., compared with the year 1943. The net revenue is made up of £10,136,355, which is the company's share of the annual payment for the use of the railways by the Government in accordance with the Railway Control Agreement, and an amount of £616,924 obtained from items excluded from the Railway Control Agreement and consisting mainly of interest and dividends from our investments in omnibus and road haulage companies. The directors recommend the payment of final dividends of 2 per cent. on the 4 per cent. first preference stock and 2½ per cent. on the 5 per cent. redeemable preference stock (1955), and a final dividend of 1½ per cent. on the 4 per cent. second preference stock, making 2½ per cent. for the year, the same dividend as for 1943.

COMPARATIVE FIGURES

We are still unable to publish a full review of the company's activities during the year, but I am able to give you a few figures which will afford some indication of the remarkable increases shown by the 1944 traffic, as compared with those for the 12 months immediately preceding the outbreak of hostilities. During 1944 the number of loaded wagon miles run on the company's lines was 1,395 millions, 349 millions more than in the twelve months before the war. Empty wagon miles, at 551 millions, were 29 millions less. The net ton miles worked totalled 8,200 millions, compared with 5,726 millions, an increase of 2,474 millions, or 43.2 per cent. Freight engine mileage run was 99 millions, an increase of 17 millions. All these figures show the burden of war-time freight traffic that has fallen upon the railways. Passenger miles have increased by at least 60 per cent. compared with the pre-war year, but the passenger train mileage was 30 per cent. less.

POST-WAR PLANS

The trading community and the travelling public have suffered serious inconvenience during the war years, but I wish to make it perfectly clear that no blame attaches in any way to the railway companies, who have rendered inestimable service to the community throughout the war. The pressure has been intense, but railway organisation, railway track and rolling stock have stood up magnificently to the stresses and strains they have had to bear. Naturally there will be a great deal to be done after the war is over before the railways can achieve that high standard of service to traveller and trader which is their objective. Our plans are all laid, we know what we want to do and how to do it.

The speed at which we carry out those plans must be, and will be, conditioned by the supplies of labour and material. But I have every confidence that provided the railways receive from Parliament and the nation the fair treatment in relation to other forms of transport to which their great services to the community indisputably entitle them, and which the national interest demands, it will not be long before they reach that triple goal—the finest possible service to the travelling public and the trader, regular employment for the staff at a fair level of wages and under the best possible conditions, and last, but by no means necessarily at least, for those who have provided the capital to make these great services possible a fair and reasonable return on their investments.

The report was adopted.

SOUTHERN RAILWAY COMPANY

CONTRIBUTION TO "D" DAY

The annual general meeting of the Southern Railway Company was held, on the 8th instant, in London.

Colonel Eric Gore Browne, DSO, OBE, ADC (the chairman), said that the net revenue for the year at £7,000,052 was £866 more than 1943. The balance available for dividend on the deferred ordinary stock was £711,879, which would enable them to pay a dividend of 2 per cent., the same as for 1943.

1944 had surely been the greatest year in the history of their undertaking, for it was from the coast of Southern England that the vast armies of Great Britain and the United States had set forth to liberate Europe. What a task and what an honour for the company to be an integral part of it!

MEASURE OF THE TASK

He would like to give a few figures as a measure of the task. The number of Service personnel conveyed on duty—but not on leave—was 5½ million. In comparison, that number was about five times as many as conveyed in 1941. The total number of special trains they had had to operate for Government requirements last year was over 26,000, nearly 2½ times as many as in the previous year. At the same time—even on "D" Day itself—they had maintained, with a few modifications, their full service of trains morning and evening for travel between home and business.

The men, the munitions, the tanks and the stores of the Armies of Liberation had been conveyed to the ports along the permanent way and in the trains provided over the years under a system of private ownership with the stockholders' money. Eighteen of the Southern Railway steamships had played their part in the invasion, and their modern train ferry vessels had made a special contribution. Those major operations of war, on the success of which our national existence depended, would not have been possible unless, in the years between the two great wars and before, the board and its officers had ploughed back annually into the undertaking large sums of money which might have been distributed in dividends, but which it was thought well not to distribute, and to devote to keeping the undertaking up to the highest possible standard of efficiency and maintenance. That was a cold, hard fact, and was often forgotten by some of the political leaders of to-day. Surely it was a great achievement of private enterprise, and one of which they might well be proud.

POST-WAR PLANS

Speaking of the future, they were in the transport business in all its forms, and their aim would be to see that the public had the most efficient service possible by rail, road, sea and air.

Next must come the job of making good the arrears of maintenance which had arisen during the war. They must, for instance, restore their permanent way to a condition capable of withstanding heavy loads not only at pre-war speeds, but faster still. Then new rolling stock would have to be provided. They were also planning an extension of electrification for both passenger and freight trains. In full knowledge of their duty to the public, to the staff and to the stockholders, they would do their utmost to keep their flag flying whatever wind might blow. They were confident that the Southern Railway Company under the proved system of private ownership could continue efficiently to serve the country and its people, and in that confidence they faced the future.

The report was adopted.

MIDLAND ELECTRIC CORPORATION FOR POWER DISTRIBUTION LIMITED

PROGRESS SINCE 1939

SIR ALEXANDER ROGER'S REVIEW

The forty-seventh ordinary general meeting of the Midland Electric Corporation for Power Distribution, Limited, will be held at Liverpool on the 14th instant.

The following is a summary of the statement of the chairman, Sir Alexander Roger, K.C.I.E., circulated with the report and accounts:—

The last annual accounts sent to you were in respect of the year 1939, and these were reviewed at the ordinary general meeting held in April, 1940. Since that date you have been required to possess yourselves in patience and trust as to the operations of your company. This was due to an Order made under the Defence Regulations whereby public utility undertakings were prohibited from publishing accounts. I am pleased to say that this Order has now been withdrawn.

COMPARATIVE FIGURES

The accounts now submitted show comparative figures for the year 1943, and shareholders may obtain the accounts for the years 1940 to 1943 inclusive upon application to the secretary at the company's registered offices.

Shareholders have been furnished with a summarised statement of the results of the past five years, which cannot be reproduced in full owing to the exigencies of space. The comparative figures for 1943 and 1944 are:—

	1943 £	1944 £
Profit, including interest and dividends receivable	167,231	169,568
Add balance brought forward from previous year	49,047	49,646
	£216,278	£219,214
Absorbed as follows:—		
Provisions for taxation	73,132	82,299
Debt interest	19,500	19,500
Transfer to reserve account	25,000	20,000
Net dividends on Preference and Ordinary shares (7% and 9% respectively)	49,000	49,000
Balance carried forward	49,646	48,415
	£216,278	£219,214

A SATISFACTORY ACHIEVEMENT

In addition to the maintenance of the ordinary dividend at the rate of 9 per cent, it has been possible during the five years to place to reserve account the sum of £155,000, while in 1941 £12,750 was transferred to special purposes and contingency fund. I think you will agree that this is a very satisfactory achievement. The cost of electricity, mainly due to rises in the price of coal, has shown substantial increase over the war period. Industrial consumers have been required to bear a part of such increased cost, but the price of domestic supplies has remained unchanged. Revenue from sales of electricity has shown a progressive increase and in the year 1944 reached the record total of £1,184,527.

Throughout the period, depreciation by means of sinking funds, has been charged against revenue at the rates provided by the company's order. War-time restrictions on development have naturally been reflected in much reduced capital expenditure,

which for the five years 1940-44 was £357,171 or an average of approximately £71,500 per annum, as compared with an average of over £240,000 per annum for the previous five years. In the post-war period, however, your directors have every intention of continuing their policy of vigorous expansion, and plans have been completed awaiting only the release of labour and materials, for the further development of the company's area, both urban and rural.

CONTRIBUTIONS TO WAR EFFORT

In reviewing the company's assistance to the war effort, I am expected to keep to generalisations, but I can indicate the avenues in which we have served and their effect on our past and future operations. In such a highly industrial area there have been many and varied opportunities open to our consumers to assist to a marked extent in production vital to the war. On the other hand, some of our consumers have had production seriously curtailed, but their products will be in great demand in the post-war years. Notwithstanding these restrictions our progress has been maintained, as will be seen by a comparison of annual sales and connections:—

	Units sold	Total kw. connected
1934	101,666,794	110,143
1939	190,162,042	204,710
1944	313,634,766	314,116

This progress reflects the normal type of production of consumers but which has been directed to war requirements. The plant provided entirely for war purposes is small compared with expansion of normal products. We share the general feeling of our consumers that there will be a period of industrial activity as soon as the removal of restrictions permit.

In the domestic field we have suffered considerably. During the pre-war period we were connecting new consumers at a rate of between 7,000 and 8,000 a year, while from the outbreak of war in 1939 to the end of 1944 the total connected is much below the number normally connected in a single year. This arose from instructions issued to the industry due to the necessity to conserve materials and labour. Under this regulation we have refused thousands of applications, and there is every indication that the domestic demand will show an increase over the pre-war basis of expansion when restrictions are removed.

CO-OPERATION WITH PUBLIC UTILITIES

The company's area, taken as a whole, has suffered comparatively little from air raid damage. The early war damage incidents showed the desirability of closer co-operation between the public utilities than was visualised in the regional scheme. Our managing director therefore called a conference with our friends in the gas, water and other utility services, and together they formed an association for mutual help in war emergencies.

Fortunately this has not had to operate to any extent, but suggestions from that conference proved their worth in regional tests and were adopted in general outline, as accepted practice, in the area. We hope this friendly association will continue in peace-time conditions.

LOCAL AUTHORITIES AND THEIR OFFICIALS

During the war we have continued our close association with the councils whose administrative districts form the area we

serve. We have always accepted, and the councils recognise, the position that, as an essential part of their public service, there rested on us a special obligation to co-operate and assist in the service and development of the area.

We had exceptional opportunities of contact with the officials of the respective councils, and observed the many and unusual additional duties placed upon them. There is a general tendency by the public to take these additional services for granted, and we desire to pay tribute to the cheerful and efficient manner in which these duties have been carried out.

We have continued to assist industrial consumers beyond the usual boundaries of giving supply, and in return they have done their utmost to co-operate with the company. When the fuel position deteriorated and appeals were made by the Minister of Fuel and Power to reduce load, our consumers, at great inconvenience to themselves, met the request; a large number of them voluntarily closing on Saturday mornings to enable the maximum advantage in fuel saving to be obtained from the reduced load.

During the war our load increased by 50 per cent. and our staff and employees were reduced by 30 per cent. The bulk of those who have left us are in His Majesty's Forces, but help was also given by releasing technicians for war industry. Your directors have remained in the closest touch with the area, and I have personally paid periodic visits, except during the time I was engaged on a special mission abroad on behalf of the Government. I am sure you will desire to thank our managing director, Mr C. Heathcock, and his staff for bringing the company through so difficult a period in so satisfactory a manner.

BOVRIL, LIMITED

The 48th annual general meeting of Bovril, Limited, will be held in London on Monday, 12th instant.

The following is an extract of the statement by the Lord Luke (chairman) circulated with the report and accounts:—
In the profit and loss account, the profit before taxation amounts to £494,389, a decrease of £87,893 as compared with the previous year. This result was reached after a considerable increase in sales had been

(Continued from page 323)

another is drawn up. The County Committees, too, own machinery which they hire to individual farmers.

Another aspect of mechanisation is the development of new machinery. This is kept under review by the Agricultural Machinery Development Board, which was set up in January, 1942, and which has recently been re-appointed. Its main functions are to make recommendations on the types of machinery which farmers want, to advise manufacturers and to test new machinery. It is assisted in its work by the National Institute of Agricultural Engineering. The Institute is at present engaged, in addition to its other work, in conducting a farm mechanisation enquiry in order to get accurate information about the way machines are actually used on a representative sample of farms.

Lead Supplies

Following a United States War Production Board reminder recently that the lead supply position this year would be "very much worse" than last, some restrictions on United States consumption have now been ordered. In this country the supply position shows little change. Because the United Kingdom supplies, apart from those from Canada, had to come from distant sources—mainly from Australia—the Ministry of Supply has kept a tight grip on lead allocations. In the United States, however, lead was the only non-ferrous metal which had not entered the "critical list," and which has been, in the main, in comparatively easy supply.

Most other metals are becoming more abundantly available, and the shortness of lead supplies appears to be due to three factors. First, there is a shortage of labour and, in

counterbalanced by a greater rise in the cost of production. The estimated provision for taxation, including excess profits, arising on the profits to December 31, 1944, is £304,000, a reduction of £91,429 as compared with last year. The net profits after taxation are therefore £3,501 up, at £165,765.

Your directors recommend a final dividend on the Deferred Stock of 6½ per cent., making 9 per cent. for the year, a transfer to reserve of £35,000, leaving £108,993 to be carried forward to next year.

PEARL ASSURANCE COMPANY, LIMITED

RECORD OVERSEAS NEW BUSINESS

The annual general meeting of this company will be held, on the 22nd instant, at the registered offices, High Holborn, London, W.C.

The following is an extract from the statement of Sir George Tilley, F.C.I.I. (president and chairman), circulated with the report and accounts:—

New business in the ordinary branch was £6,521,469 in sums assured, with an annual premium income of £388,204. This is a meritorious achievement by a depleted staff. It is worthy of mention that our overseas branches produced a record amount of new business. There has been an increase in death claims of nearly £100,000, the total amount paid being £1,028,440. War claims have again increased, the amount paid during the year being £122,596. Maturities at £3,239,187 are slightly less than last year. The expense ratio has reached a new low level of 9.78 per cent.

INDUSTRIAL BRANCH

There is continued expansion in the industrial branch, the premium income of £11,771,043 showing an increase of £497,667. The lapsing of policies remains at a satisfactory low level. Death claims at £3,399,261 show an increase of £169,155, of which nearly £100,000 was due to heavier war claims which total £231,327. Maturities at £2,690,032 continue to rise and illustrate the growing importance of

endowment assurance in this branch as well as the increased extent to which we are serving the public and the nation in the encouragement of thrift.

The expense ratio is 25.03 per cent., showing a further fall. We have now reached a level of expense which is commendably low and which should help to refute one criticism of the conduct of the business. Moreover, we are confident that it would be impossible for a Government-controlled organisation to maintain a similar service to the public at so low a cost.

The total amount paid in war claims in the life branches since the beginning of the war is nearly £1,200,000.

FIRE AND OTHER DEPARTMENTS

In the general experience, as compared with the previous year, fire losses in the United Kingdom are estimated to have increased by 28 per cent., those in U.S.A. by 13 per cent., and those in Canada by 31 per cent. The total of premiums has increased—not through increases in rates, but through the increase in insurable values—but the increase in premiums has not kept pace with the increase in losses.

The premium income in the accident branch amounted to £418,175, a satisfactory increase of £46,296. The personal accident account has once again been very profitable and contributed £35,000 to profit and loss account.

In the employers' liability account a satisfactory profit has been secured and this account contributes £5,000 to profit and loss account. In the motor account there is a profit of £27,997.

The total surpluses in the life funds emerging from the valuations as made by the actuary, Mr H. A. Lane, including £4,890,741 brought forward, amount to £7,546,835. These have been allocated by the Directors as follows:—To policyholders, £422,631; to profit and loss account, £431,032; to staff pension fund, £190,000; industrial branch investments reserve fund, £250,000; leaving £6,253,172 to be carried forward.

The balance of the profit and loss account at the end of the year was £424,824. After the addition of the amounts to be transferred from the life branches, there will be a balance of £855,856, out of which it is proposed to pay £240,000 as a final dividend to the ordinary shareholders.

the United States, a lack of reserves. Secondly, the war-time use of lead as a substitute for scarcer raw materials absorbs a sizeable tonnage; and, thirdly, some standard uses for lead are coming into their own again. The second factor creates the least difficulties, since most of the emergency uses can fairly easily be dispensed with. The demand for lead to meet the revival of building and for electrical purposes will become increasingly pressing. On the other hand, military lead consumption, mainly in ammunition, battery plates and tetra-ethyl lead, has lately been greatly increased and is near its war-time peak. When war and industrial programmes have been readjusted, a large tonnage of lead will become available to the building industry.

Lead production has not been expanded to the same extent as that of other metals owing to the previous adequacy of North American supplies and the distance of other producing areas. Moreover, in the United States production of lead is seriously handicapped by the growing scarcity of rich ore reserves. Lead, indeed, was the only major base metal in the United States whose war-time peak output (467,367 short tons in 1942) did not overtake the pre-war maximum (the 1925-9 average was 660,525 tons).

Undoubtedly, given adequate labour, lead production in and outside the United States could be raised by a substantial tonnage, but there is a prospect—admitted last month by the secretary of the United States Lead Industries' Association—that the United States will permanently need imports. While the statistical evidence is not full enough to allow a correct assessment of the world lead supply outlook, it is safe to assume that, in the years following the war, in contrast with the majority of other metals, there will be no serious surplus problem. On the contrary, an effort may have to be made to meet the demand for lead, which, in view of the expansion in building and of industrial development, is likely to be heavy.

* In calculating the averages for women and for all workers, given in this table, women employed as part-time workers for not more than 30 hours a week have been included, on the basis of two part-timers taken as representing one full-timer. † The number returned in this group was very small. ‡ In the case of the Government industrial establishments, the comparisons between the average earnings in October, 1938, and January, 1944, are materially affected by the fact that the returns for the latter date covered a number of establishments, employing large numbers of workers, which were not in operation in October, 1938.

INDUSTRY AND TRADE

Trade Disputes.—The number of working days lost in January was 104,000, compared with 65,000 in December, 1944, and 236,000 in January, 1944. There were 173 stoppages, compared with 160 in December and 230 the year before. The

(Continued on page 330.)

GOVERNMENT RETURNS

For the week ended March 3, 1945, total ordinary revenue was £107,760,000, against ordinary expenditure of £173,459,000 and issues to sinking funds of £2,526,069. Thus, including sinking fund allocations, the deficit accrued since April 1st is £3,607,733,000 against £2,557,713,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £192,388 to £2,739,020, the other operations for the week (no longer shown separately) increased the gross National Debt by £67,933,283 to £22,188 million.

(1943 Accounts)

THE ALEXANDRIA WATER COMPANY, LIMITED

ALEXANDRIA, EGYPT.

NOTICE IS HEREBY GIVEN that the sixty-seventh ORDINARY GENERAL MEETING of the shareholders will be held at the company's offices, 61 Avenue Fouad 1er, Alexandria, on Thursday the 5th April, 1945, at five o'clock in the afternoon for the transaction of the ordinary business of the company, pursuant to Act of Parliament.

Holders of share warrants to bearer desiring to attend or to be represented at the meeting must deposit their share warrants in London before the 22nd March, 1945, or in Alexandria before the 2nd April, 1945, until after the meeting, at the National Bank of Egypt, 6 King William Street, London, E.C. 4, or at the National Bank of Egypt, Alexandria, or at some other approved bank in London or Alexandria.

Dated, Alexandria, Egypt, the 26th January, 1945.

By order of the Board.

T. D. KEY } Joint Managers.

R. WALTON }

A TRANSPORT Undertaking invites applications from experienced Accountants over 30 years of age for a Post as an Assistant for special financial duties. The essential qualifications are a good general education, sound experience of Accounting and Costing practice, and ability, without detailed oversight, to undertake and supervise financial investigations and to draft clear and concise reports thereon. Possession of a recognized professional qualification in Accountancy is essential. The successful candidate will be required to pass a medical examination and to serve satisfactorily a probationary period. Applications from ex-Service men will receive special consideration.

The initial salary will be a minimum of £600 per annum plus war wage and will be subject to periodical review. There is a contributory superannuation scheme.

Applications, stating age and giving full particulars of qualifications and past experience, with special reference to the essential qualifications stated above, should be forwarded so as to reach Box 58, THE ECONOMIST, Brettenham House, Lancaster Place, London, W.C.2, not later Saturday, 24th March, 1945.

BRAINS TRUST. "A United States of Europe?" Beverley Baxter, Dr. Joad, F. L. Josephy, Sir Walter Layton, Lord Strabolgi. Question Master: Leslie Mitchell. Friends House, Euston Road, Monday, March 12th, 6 p.m. Tickets, 3s. 6d. 2s. 6d. Is., from Federal Union, 3 Gower Street, W.C.1.

SEALE HAYNE AGRICULTURAL COLLEGE, NEWTON ABBOT, DEVON. Required immediately, Assistant in the Department of Agricultural Economics under the Ministry of Agriculture Advisory Scheme. Salary £300 per annum, plus War Bonus. Degree or Diploma in Economics and/or Agriculture necessary. Applications to be made to the undersigned. —C. C. CATERMULL, Secretary and Bursar.

WANTED, Freehold or Leasehold Factory of 50,000 sq. ft. minimum, anywhere in Greater London area. Possession not later than 1947 is essential. Advertisers are prepared to dispose of their 40-year lease of premises of 35,000 sq. ft. in W.C.2 district in exchange.—Offers to Box 3,463, Scots, 9 Arundel Street, Strand, W.C.2.

Post-War Taxes

AT this season of the year, in normal times, the air is thick with Budget prophecies. The Estimates are out, the yield of taxes is easily calculable, the prophets sharpen their pencils and enter with zest into the joyful pastime of adding a million or two here or subtracting sixpence there on the way to their conclusions of hope or gloom. This year, nothing of the sort can be heard. By tacit consent between the taxpayer and the Chancellor of the Exchequer, the rates of taxation are assumed to be as high as they can be pushed. And it would take a particularly hardy brand of optimism to foresee the possibility of any relief from the load in the Budget which is no more than a month ahead. Lest there were any risk of optimism breaking out, Sir John Anderson took occasion in the House of Commons a fortnight ago to say that, so far as he could foresee, "the very high rates of direct taxation which have been in operation now for a considerable period of years" are likely to continue "for some considerable time to come"—though, in the context, the remark clearly referred to the general level of taxation rather than to the particular rates now in force, and should therefore be classified rather as a platitude than as a statement of policy.

Heavy taxation is, indeed, likely to be the lot of the British people in any foreseeable future. The proportion of the national income represented by the Government's

expenditure on goods and services will be swollen after the war by the higher commitments for defence forces, for schools and hospitals, for teachers and doctors, for houses and public utilities. The statisticians, in their calculations of national income, take no account of the service of the National Debt or of the cost of Social Security, on the ground that these disbursements are merely transfer payments which do not absorb any goods and services but simply transfer the power to consume from one set of individuals to another. But the Chancellor of the Exchequer cannot make any such comfortable simplification. He has to raise the money not only to employ manpower and materials on public work but also to effect the transfer payments. And to the toad beneath the harrow, the tooth point of a tax for transfer payments is as painful as any other. If the Government is to take a higher proportion of the national income for its real expenditure, and if transfer expenditure is also to be higher, then it follows, as the night the day, that the burden of taxation must be higher than it was before the war, and that it will continue to be higher until the policies that produce those circumstances are changed—that is to say, until health and education are given a lower priority, until international security without arms is attained, until the National Debt is repaid or repudiated, and until Social Security is deemed unnecessary.

Various attempts have been made to make precise estimates of the task that will face the post-war Chancellor and of the rates of taxation that will solve his problem. It is not intended to contribute another such estimate here. It must be enough to say that rates of taxation will be higher than they were before the war and lower than they are now—and perhaps to add that, as a working hypothesis, the assumption that they will be about halfway between seems about as good as any other. This is, it must be admitted, less hopeful than many other estimates that have gained currency. Mr Kaldor, for example, in the estimates appended to Sir William Beveridge's book (to which reference was made in these columns three weeks ago) reaches the heart-warming conclusion that a standard rate of income tax of 5s. 10d. in the £, and a corresponding increase in the taxes that existed before the war, will be enough. But the optimism that is apparent throughout Mr Kaldor's estimates reaches its culmination in this figure, for to a very high estimate of national income he applies an almost incredibly low estimate of Government expenditure (providing, for example, an increase—at constant prices—of only £100 millions a year above the pre-war figure, and of only £16 millions in expenditure by local authorities). To say that these prophecies are wrong would be to do less than justice to an honest attempt to give quantitative shape to the various possibilities of the future. But it would be as well to regard them as considerably better than can be reasonably expected to materialise.

Public discussion can be more usefully concentrated on a different order of questions—not on the size of the post-war tax burden but on its shape. To say how high taxes will be involves knowing the unknown. But to ask what sort of taxes should be levied, by what sort of fiscal means the future Chancellor is to raise his revenue, is a much more worthwhile proceeding.

It may also have a certain urgency. Strict economic logic, it is true, would not justify any reduction in taxes when the European war is over. The need to limit consumption expenditure will, for a time, be as great as ever. But Budgets are not based on strict economic logic alone and, in an election year, another logic may have equal force. Taxation has hitherto been based on the illogical rule of thumb that it should cover about half of expenditure, and when expenditure falls after the end of the fighting in Europe there will be pressure to continue the "50 per cent rule" and accord some interim relief to the taxpayer. It is therefore not too soon to be thinking about where these concessions should be made.

It is disconcerting to see, in several of the discussions of the subject that have appeared, the bland assumption being made that the Excess Profits Tax will continue—at a reduced rate, no doubt, but still at a high rate. This would be wholly wrong. The principle of EPT is of very doubtful equity in wartime and would be quite outrageous in peacetime. EPT is a tax on growth and on enterprise as such. When the conduct of the war dominates the whole economy, it is possible (but only just) to assume that any increase in profits above a pre-war level is due to the war and therefore properly taxable. But no such assumption can properly be made in peace, and it follows that EPT should disappear as quickly as possible. It would be a great pity if anybody were deceived by its title. It should be realised that companies which were making excess profits before the war and have continued to make them during the war have not paid a penny of EPT. It is not, in fact, a tax on excess profits, but on rising profits. It should be reduced in the transition period and then swept away.

EPT has overshadowed its puny elder brother NDC. This is a straight 5 per cent levy on all corporate profits. Unlike EPT, it does hit the company with high but stable profits harder than the company with low profits. It is therefore much more equitable. But it would be a great pity if the decision were therefore taken to retain it. The need of the times is to lighten the burden of taxation on the

profits of business, so long as they are kept in the business. So far from retained profits being taxed more heavily than other forms of income, they ought to be taxed more lightly. NDC also should therefore pass away. If past history is any guide, it will be an economy to abolish these two taxes promptly before profits start falling below the standard levels and giving rise to claims for repayment of tax which, after the last war, cost the Exchequer very large sums indeed.

The other great fiscal innovation of wartime has been the Purchase Tax. In so far as Purchase Tax is levied on the necessities and simple comforts of the people, it ought to go. Any indirect tax on consumption expenditure inevitably has a regressive element, and when the need to hold purchasing power in check has disappeared, it would be wrong to tax this sort of expenditure. There may, however, be a case for retaining part of the Purchase Tax. At present, it is levied at three rates, at 33½ per cent (of the wholesale price) on necessities such as clothing, at 66½ per cent on an intermediate list of goods and at 100 per cent on luxuries. The lowest rate ought clearly, in peacetime, to be reduced to nil. So, probably, should the intermediate class. But there is something to be said for retaining the highest class—not, of course, at 100 per cent—as a general luxury tax. If this were combined with any form of nutrition subsidies, or with other means of stimulating the consumption of necessities, there would be little risk of any harmful regression, and a very useful contribution to the revenue might be secured.

With this possible exception, however, the path of wisdom would seem to be to abandon the new wartime taxes and to revert to reliance on the old standbys, Customs and Excise, Income Tax, Surtax and Death Duties. This does not, however, mean that there is no need for any overhaul of these familiar taxes. Income Tax, in particular, needs some very careful examination—the more so since it will have to be levied at higher rates than were ever known before the present war. The British income tax has always been recognised to be most effective in combining high yield with comparatively little damaging effect on the economic activities of the community. But not even its most devoted adherents would argue that it has no harmful effects at all, and it is obvious that the higher the tax the greater the harm done. There are really three separate purposes to be served by direct taxation. There is, first, the levying of a universal basic contribution to the revenue from virtually all incomes. This cannot be considered apart from the universal benefits of social security, and there might be large dividends in simplicity and ease of administration to be earned by considering them together. There would at least be no such farcical procedures as the granting of family allowances with one hand and taxing them with the other. Secondly, there is the object of levying steeply progressive taxation on large incomes. At present, it is virtually impossible for any individual to enjoy a net income of more than £4,000. In a community which still relies so heavily on the incentive of private gain, this is too low a limit. But what figure can more appropriately be substituted? If in its first aspect direct taxation has a part to play in fixing the minimum below which no income can fall, in its second aspect it has a very direct rôle to play in determining the maximum above which no income can be allowed to rise. Both involve far-reaching social judgments, too important to be allowed to emerge as accidental by-products of fiscal technique. And thirdly, there is the very vexed question of the taxation of industrial reserves. It is here that taxation probably has its maximum economic effect and it is here that the old doctrine, that the tax-gatherer need not concern himself about effects so long as he collects the money, can least easily be tolerated.

All these are complex questions of high policy. They are believed to be under review by the Inland Revenue. But they will have to be decided, in the last resort, by public opinion and it is as well that public opinion should begin to concern itself about them.

An Independent Rhineland?

GERMANY could not fight an aggressive war without control of the heavy industries of the Ruhr and the Rhine. Nor, without their industrial capacity, could it even use force to reunite the lost provinces with the main body of the nation. It can therefore be argued that a stable peace would be achieved by the creation of an independent Ruhr-Rhine state. Rump Germany might not be reconciled to such a settlement, but it would be powerless to undo it.

This stability would, however, depend upon the Allies' determination to see that no voluntary amalgamation or *Anschluss* of the Rhineland with the Rump took place. In other words, the settlement would have to rest not only on the Germans' inability to use force, but on the Allies' readiness to use it to check all efforts—peaceful, voluntary, or disguised—to restore the separated areas to the Reich. This clearly is a much more difficult proposition. Dismemberment of national territory is not a solution which either Britain or the United States or indeed many liberal elements on the Continent can accept easily, without any twinge of conscience. The opposition of the French to the proposed Customs Union between Germany and Austria in 1931 was severely criticised in this country and had the Germans persisted and the French mobilised, no urging on earth could have brought the British to support the use of force to maintain this particular separatist provision of the Versailles settlement.

The policy of creating an independent Rhineland is not, therefore, one that can safely be tried just on the off-chance that it might work. If it did not work, it would leave the general position far worse than if it had never been tried. To create an independent Rhineland, and then to allow it, after a few years, to merge itself once more in Germany, would be a disastrous policy. It would encourage the Germans to believe that, if this provision of the settlement could be undermined, all others—including the vital disarmament provisions—would also yield to a little sapping and mining, a little bluster and blandishment. It would also inevitably create discord and distrust among the major Allies, one party criticising the other for destroying the settlement, the other criticising the first for clinging to it too rigidly. This is no idle apprehension. It is in both respects—both in the encouragement of the Germans and in the disruption of the Allies—exactly what happened to the Treaty of Versailles. The only safeguard is to enter upon nothing that will not be carried through, to adopt no policy merely on the outside chance that it might prove effective.

The independent Rhineland policy should therefore be adopted only if it stands a more than even chance of working. And this in its turn means that it must not outrage too far the accepted principles and beliefs of the Western democracies who will be responsible for it. They are not likely to continue for long to make the effort of supporting it if the people of the Rhineland are actively hostile, or if it involves a radical impoverishment for what was one of the richest areas of Europe. It is not that the Rhineland Germans have an inherent right to liberty or prosperity; the governing fact is that the democracies are incapable, in the long run, of enforcing a regime of tyranny or starvation. A state seething with frustrated patriotism, a victim of mass unemployment, a permanent centre of unrest and misery, would hardly allay the uneasiness which the mere fact of dismemberment would have aroused. Such a state would be a constant reminder that the settlement was not working and a constant and potent plea for the modification of its terms.

It would be wrong, at this stage of the argument, to conclude that the "independent Rhineland" solution would not work. But it is right, before going into details,

to insist that an essential condition of its working would be some degree of acceptance by the Rhinelanders themselves. That Rump Germany would never accept it may not be an entirely conclusive objection—though it would certainly increase the difficulties. But that the liberal democracies of the West would be prepared to be directly responsible, over an indefinite period, for the government of a large, skilled and well-educated population who persisted in being outraged by their own compulsory independence, is clearly out of the question. At least passive acceptance is an essential condition of any positive policy of state-building even with Allied troops in occupation. And the acceptance would have to be active before the troops could be withdrawn and the independent Rhineland state could take its place in a new stable alignment of European forces. The argument, therefore, turns on the prospect of securing some degree of acceptance among the Rhinelanders.

It is difficult to feel very optimistic about this prospect. The experiment of lopping off provinces from a modern centralised highly nationalist state and giving them independence has not yet been tried. The only close analogy is the behaviour of national groups and minorities who are separated from the parent nation. In Europe most of these are German and certainly their recent record suggests an overwhelming preference for union in one Reich. Austria, after the last war, the Saar in 1935, do not offer much hope for the quick political pacification of a Rhineland state. Quite apart from the original grievance of dismemberment, the Rhinelanders would—at least for a time—lack many of the attributes of full sovereignty. The Allies would presumably control their foreign policy and their trade policy. Yet who can deny that the desire for full self-government is a political passion in the modern world second only to nationalism itself?

Much would obviously depend upon the economic settlement. It is possible for a country to be economically prosperous and politically discontented. It is absolutely certain that a ruined country will feel even more bitterly its political discontents. The chances for the economic development of a separate Rhineland-Ruhr state are particularly difficult to assess at this moment. It is possible to give production figures for the area before the war when, with a population of fourteen or fifteen millions, it produced about 150 million tons of coal, 38 million tons of coke, 57 million tons of brown coal, 15 million tons of pig iron, 18 million tons of steel ingots, and nearly 20,000 million kwh of electricity. These figures represent a very high proportion of Germany's total output—81.2 per cent of its coal, 87.5 per cent of its coke, 29 per cent of its brown coal, 84 per cent of its pig iron, 87.5 per cent of its steel ingots, and 40 per cent of its electricity.

All these figures, however, have been made rather meaningless by Bomber Command. The Ruhr towns have been pulverised. According to official estimates, over 60 per cent of Cologne and Duesseldorf have been destroyed, 50 per cent of Essen, over 80 per cent of Bochum. The Nazis are said to be adding to the ruin by flooding and firing the coal mines. Many thousands of workers have been transferred to Central Germany. Many others are retreating with the Nazis. The Allies are likely to find a Rhineland which is little more than an empty derelict shell. The problem may well be not to control the German economy but to keep the people alive without one.

The fact of so much destruction may, in the very first stages of the peace, give the Allies a means of reconciling the Rhinelanders to independence. If a measure of reconstruction in the devastated Ruhr-Rhine area is given a far higher priority than any reconstruction work in other parts of Germany, the sheer need to live and eat may

encourage the peoples of Western Germany to accept independence and even move into the independent zone. In Austria after the last war, enthusiasm for the *Anschluss* was at its lowest in 1923 and 1924 when Germany was going through its great inflation. There is also a direct Allied interest in achieving some measure of reconstruction in the Ruhr-Rhine area. Europe is desperately short of coal and the next winters are likely to be even harder than the last. The immense Ruhr-Rhine coal reserves will be needed so urgently that the measures necessary to reopen the pits and get the men back to work will probably have to be taken quickly. And these measures might have the political consequence of making the Rhineland for a time the most economically attractive area in the whole devastated and disorganised Reich.

No one, however, would pretend that a temporary programme of partial reconstruction in certain industries would provide a permanent foundation for the proposed state. Its economic problems will be formidable enough. If it be assumed that something like the pre-war number of people remain in the area, there would be a density of population made possible in other countries only by intensive industrial activity. The basis for this will have been very largely destroyed by the war. How much of the Rhineland's industrial structure will be restored, apart from urgent needs such as the coal industry? And, when restored, how much of it will find a market? It is quite clear from the experience of liberation so far that all Europe will be crying out for industrial reconstruction and that, until the end of the war with Japan and for some time after, the physical means of reconstruction will be in very short supply. The Russians will naturally claim the highest priority, both in goods and loans. The claims of the Western countries—France, Belgium and Holland—will be quite as pressing. Where, on this strained list, will the Rhineland stand?

After the last war the Germans had at least their economic system intact. They could immediately play a considerable part in their own reconstruction. Even so, they needed—and received—over 7,000 million Reichmarks in long-term loans between 1924 and 1930 and at the same price they received an even higher figure in short-term loans. In each year between 1924 and 1929, they had a deficit in their balance of trade. They were importing more than they sold to the extent of 3,688 million RM in 1925; in 1927 the deficit stood even higher at 4,093 million RM. After this war, the German economy both in the Rhineland and the Rump will hardly be in a position for much self-help. Left to their own resources, the Rhinelanders would face ruin. But if loans and goods on such a scale were necessary to help a functioning economy after 1918, on what scale ought the assistance to be given after this war, to restore a totally disrupted system? Will the Rhineland be given the necessary priority? Will the Allies think it a matter of urgency to restore some semblance of economic activity, when other calls on their physical and financial resources are so pressing?

Indeed, is it envisaged by Allied policy that any form of assistance at all will be given? The Crimea Agreement speaks, on the contrary, of reparations. They are, it is true, to be reparations in kind, but this may well result in a heavier effective burden being placed upon the German economy than after the last war. There is reason to believe that the Big Three are thinking in terms of exacting reparations to the tune of about £1,000 million a year for twenty years, in addition to the restitution of what has been stolen. Is any part of this burden to be put on the new Rhineland state? And if so will it make possible the attainment of a standard of living that will breed even passive acceptance of their lot among the Rhinelanders? The asking of these questions does not imply that there is anything necessarily wrong or impracticable about reparations. It does lift into very clear relief the difficulties that lie in the way of combining a reparations policy with any constructive attempt to build a new stable equilibrium in Europe—one, that is to say, that will stand

of its own strength when—as must happen some day—the compulsive force of the victors is withdrawn.

Even if it is assumed that the necessary capital investment and imports are forthcoming and that the Ruhr-Rhine state is restored to something like its pre-war productivity, very difficult economic problems would still have to be met. The most urgent would be to find markets for the great output of coal, steel and chemicals which were formerly absorbed by the whole Reich. Rump Germany would presumably not continue to be a market on the same scale, because the whole purpose of the Rhineland scheme is to break up the German nexus. If the engineering works of Central Germany were still fed, although perhaps at slightly higher prices, from the heavy industrial output of the Ruhr-Rhine, then German economic dominance in Europe would be unchanged. The policy of a separate Rhineland demands special tariff arrangements—quotas, export duties—to see that the flow of the Rhineland's exports is diverted from Rump Germany to new channels. But where would they be found?

If no special arrangements were made to replace the German hinterland, Rhineland goods would have to compete on a world market which would have shrunk by the amount of Rump Germany's lost capacity to consume. Rhineland coal and steel and chemicals would therefore compete with British and Belgian and French supplies, all of which would in their turn be trying to find buyers in international markets. Under such conditions, the Rhineland could probably maintain a certain economic activity, although it would probably be much lower than the pre-war level and might well entail widespread unemployment. After the last war, Czechoslovakia, cut off from its old markets in the Austro-Hungarian Empire, managed to compete on the markets of the world, but there was prolonged depression in the German-speaking areas—and in any case, Czechoslovakia was a much more self-sufficient area than the Rhineland could ever be. In the Rhineland such a limited degree of economic prosperity would probably offer little compensation for the people's continuing political grievances. No stability would be achieved, no genuine rearrangement of the European pattern.

There remains one other possibility, the integration of the Rhineland into a European, or at least a West European, structure that provides for substantial freedom of movement both of goods and of men, and for substantial pooling of national sovereignty, within its borders. If the Rhineland were not left to make its way as best it could in a Europe of nationalist economies, a Balkan state in a Balkanised continent, if it could form part of a large area within which the principle of the division of labour was allowed to operate with some freedom, the problems of markets and employment might be solved. If the major issues of security and diplomacy were taken over by some super-national body, the Rhinelanders could safely be given a wide degree of political autonomy. If, in short, Western Europe is to be an integrated area—politically and economically—then there is some prospect that the independent Rhineland state would serve the purposes for which it is intended. In those circumstances, the Rhinelanders could reconstruct a life of economic prosperity and political liberty that might well come to be more attractive than the war economics and Prussianism they have known in Germany. In those circumstances, the industries of the Ruhr might face West rather than East and play their part in enriching a pacific Western Europe rather than in strengthening an aggressive Greater Germany. It might then eventually be possible to withdraw the coercive force of the present victors without the whole structure collapsing. But these are the only circumstances in which all these fortunate results can reasonably be expected or in which the establishment of an independent Rhineland can be counted on to be a positive contribution to European stability.

The next task, which will be attempted in the following article, is to enquire whether these attractive circumstances are likely to be translated from dreams into reality.

Policy for Aviation

LORD SWINTON, the Minister for Civil Aviation, has presented Parliament and the country with a White Paper (Cmd. 6605) on Government policy for civil air transport. It is a brief, ten-page document, covering the organisation which will carry passengers, freight and mails on domestic and overseas air-routes. As such it is complementary to the other White Paper on civil air transport, brought out before Lord Swinton's appointment in October, which dealt with Government policy in international air transport. Since then the Chicago Conference of 54 nations has decided—temporarily, at least—on the limits of international co-operation and exchange of transit and commercial rights. It is now clear that this British policy cannot at the moment be incorporated in a multilateral international agreement, but that it must first be tried out, in a small way, in bilateral and tri-lateral agreements. The present White Paper outlines the organisations to be entrusted with putting that policy into practice. It is the Government's answer to the hotly-debated question of free enterprise or "chosen instrument" in air transport.

That Lord Swinton has chosen to use both—to accept, in fact, the third and too often ignored alternative of a workable intermediate organisation—is a tribute to the very real contribution which each has to make in the development of air transport. The critical period of world-wide reconversion demands, more plainly than ever before, a unity of organisation and a planned expansion which no possible collaboration between private enterprises could hope to achieve. It demands an organisation large and competent enough to meet foreign competition on an at least equal footing. And for the good name of air transport, it is vital that British airlines should have both unquestionable financial stability and the highest possible labour standards. All these needs could be fully met by a chosen instrument, but the enterprise and the spirit of initiative and adventure rightly associated with private airline operators would still be lacking. The organisation would be starting up after the war, in hot competition with foreign airlines, with only the limited and none-too-effective experience of commercial transport methods inherited, through British Overseas Airways Corporation, from Imperial Airways and, in the European continent, from British Airways.

The way in which the Government proposes to combine the chosen instrument with private enterprise is ingenious and says much for the confidence of the interests concerned in the future of British air transport. Instead of the single body—felt to be too unwieldy for real efficiency—three new Corporations are to be set up, in which the common denominator, linking them together, will be

the participation of British Overseas Airways Corporation. In the immediate post-war period, BOAC's most important contribution, as the only major organisation operating during the war, will be its physical assets. The other participants, presumably, will make their subscription to the Corporations mainly in cash. The White Paper makes it clear that no payment will be made for goodwill or for past development expenditure.

The routes which British aircraft will fly in peace are to be divided up between the three Corporations. The first Corporation, which in effect is to consist of BOAC itself, will serve all the Commonwealth routes and, connecting with them, other foreign long-distance routes—to North America and the Far East, for example. Many of these routes may, for legal or other reasons, have to be flown by subsidiaries of BOAC, and provision is made for the participation of shipping companies in those subsidiary flying routes in which they are interested.

The second Corporation, in which BOAC will have a substantial, but not a majority, share, will serve the European and domestic routes. Instead of a rigid division, between domestic airlines and continental services, such as existed before the war, the new Corporation will be able to create new continental routes connecting smoothly with domestic timetables. This is clearly right, for the technical limits are set by the distance than can be flown in the daytime, not by the narrow borders of this island. The railways and the short sea shipping lines, whose programme for continental services was announced last October, are, together with the travel agencies, to be the other major partners in this second Corporation, but other pre-war operators are to be offered the chance either of participating in the capital of the new Corporation, or of joining with it to form joint subsidiaries to run the particular routes that the independents worked before the war. Several of them, it is understood, have accepted this arrangement, though others have not. So far as concerns new routes—that is, routes, in Europe or elsewhere, not included in the original schedules—the White Paper leaves the door ajar for the outside operator.

It is not intended to make any present commitment as to the right to operate new routes. The Government consider that any new routes should be left open to whatever operator—whether one of the main Corporations or some entirely new operator—can establish that he is best fitted to run them.

This—added to the fact that the operation of charter aircraft—"air taxis"—is to be left without restriction, is the concession that the new system makes to the merits of free competition.

Have you heard of—

A CAPITAL ANNUITY

Part capital, part interest . . . £315 per annum guaranteed for twelve years . . . of which, on average, £271 is capital repayment and £44 is taxable interest . . . and, after the twelve years, an annuity of £472 10s. (subject to tax) continuing for life . . . this can all be secured by a male life aged sixty for a present investment of £5,000.

EQUITY & LAW LIFE ASSURANCE SOCIETY

LINCOLN'S INN FIELDS

Temporarily removed to

163-164, STRAND, LONDON, W.C.2

The third Corporation, in which BOAC will have the smallest of all its shares, will be responsible for the development of routes to Latin America. The shipping lines operating the sea routes have shown their anxiety to run these lines, and the majority interest in the Corporation will be theirs. By ranking this third organisation with the other two, the Government provide the key to their whole policy. In general, their object is to meet the needs for an efficient British airline service wherever it is obviously in the country's interest to do so. Supplementing this is the no less important principle that wherever outside help is willing to make, unaided, a contribution to the existing schedule of routes, it shall be given every assistance and encouragement. Whether the assistance shall include subsidy cannot be determined until it is known what other countries will do. But the British Government hopes that civil aviation can be worked without subsidy, and the policy of creating large inter-connected Corporations is regarded as a means to this end. Within each Corporation the more lucrative routes can support the less profitable ones that the Corporations are to be required to run. And the shareholding of BOAC in the European Corporation—which will undoubtedly be the most lucrative—will help to support the Commonwealth routes.

The "no-subsidy" principle generally adopted for the Corporations will, however, have certain exceptions. The subsidy for some of the Commonwealth routes will be continued, where an air service is vital to Commonwealth communications. On other foreign routes, the principle is only accepted provided that essential services are not faced with highly subsidised competition. Thirdly, the Government claim power to direct that a new route shall be flown, even if a subsidy should prove to be necessary. In brief, the Government makes plain its dislike of subsidies, but, by these saving clauses, reserves the right to retaliate if ever it should become necessary.

One of the most attractive parts of the scheme lies in the scope it offers for co-operation between the Corporations. All three will benefit from a combined organisation for the overhaul of aircraft, a uniform system of "model" working conditions and security provisions for their staffs, and a combined training establishment for air crews and ground staffs. What relation this establishment will bear to the Air College proposed by the Fedden Committee is not stated in the White Paper.

A further omission is noticeable on Government policy for the ownership and management of airports. Before the war, airports were, in general, either municipally or privately owned, only rarely by the airline operator. In the future, the United Kingdom will need more than the pre-war 48 airports of all sizes serving large towns and cities. More important, British airports will not only need enlarging and improving (except where the RAF has already seen to this) but will need considerable capital investment to make them both efficient to operate and attractive to travel to. The cost is likely to be high and, with other reconstruction demands on their resources, it is doubtful if single local authorities will be inclined to incur it for a number of years. The Minister stated in the House of Lords on Tuesday that a comprehensive review of this question is to be undertaken.

As for the aircraft to fly the scheduled routes, the White Paper is less informative than might have been hoped. If the general public needs reassuring on any one aspect of British air transport after the war, it is this: will there be aircraft enough in this country to stake a claim against foreign competition? No fact has been more widely emphasised than the lack of civilian transport aircraft, both efficient, up-to-date and economical. On the long-term principles for the supply of aircraft, plans are apparently being soundly laid for bringing the Corporations into direct contact with manufacturers and their design staffs. In the meantime, the appalling scarcity of civil transports is to be met by the Government leasing "the aircraft which they have ordered" to the Air Transport Corporations. What the nature of these aircraft are, what their

numbers and the terms of the leases, are undisclosed. Nor does the White Paper shed any light on the possibility or desirability of using converted bombers in the first few years. The railways, when first they announced their continental programme, admitted that it would be necessary, at first, to use American Dakotas. If under the new organisations, the Government will be able to help them out with an alternative, it can do the Government no harm to reveal what it hopes to achieve. The proposed leasing system would offer a method by which the heavy cost of operating converted bombers could be overcome.

Not the least important section of the White Paper is that devoted to co-operation with Commonwealth and foreign operators. It is in this field that the British policy of "ordered progress" in international air transport, unsuccessful at Chicago but still strongly held, will have the greatest opportunity of demonstrating its value in peaceful development. Where Commonwealth and international routes are concerned, it is assumed that the services of the three British Corporations will be run "in parallel" with those of other countries, frequencies, timings and fares being jointly agreed. It is stated that the Commonwealth Governments have already agreed to this principle—with the addition, in some cases, of pooling of revenue and expenditure—and that detailed arrangements for facilities are being made, presumably through the recently established Empire Air Transport Council. But it is also made clear that the British Government would welcome a further development from parallel operation to joint operation, both within the Commonwealth and with foreign countries.

This new policy, being a compromise between publicly-owned monopoly and privately-financed competition, will no doubt fail to please the adherents of either doctrine. But it should go a long way to satisfy the main body of public opinion. In two of the three geographical spheres—in the long-distance Commonwealth and inter-continental routes—the case for a chosen instrument has always been strong. On these routes, where the traffic, relatively to the miles flown, is light and where foreign competition can be expected to be very strong, the division of the task among a number of British lines would probably succeed only in ensuring that all of them were weak and inefficient.

But the case is different on the shorter routes of Europe and the British Isles. There the volume of traffic can be expected to be much heavier, and competition among British operators both more possible and more necessary. Completely unrestrained competition could hardly be permitted—the "pirate plane" would be as commercially noxious as the "pirate bus." But it is a pity that the Government has so nearly closed the door to competition. Much depends on the interpretation of the language used and on the loopholes left for competition by the schedule of routes reserved to the Railway-BOAC Corporation. There should be a definite bias in favour of competition. It would, for example, be proper to limit the schedule to those routes that the Corporation can in fact fly within a short specified period after the start. There should be no reserving to the chosen instrument of routes which it is not ready to fly but which independent operators might be ready to undertake. The Government will be pressed on this point when the policy comes to be debated in Parliament, since many Members are fully seized of the point of view of the potential competitors. Quite an impressive movement of Scottish nationalism, for example, is being grouped around the claims of Prestwick as a home port for a network of Scottish air routes. The Government will be wise to give proofs of their intention of leaving as large a field for healthy competition as can safely be permitted without undermining the basic structure of the scheme.

Subject to this, the White Paper deserves, and will probably receive, general support. Decisions were long overdue and now that they have been made, it would be a pity to lose more time in quibbling. The energies of the Minister should be set free for the tasks of finding the people to run his Corporations and the aircraft for them to fly.

NOTES OF THE WEEK

Starving Europe

Mr Attlee has returned from his tour of investigation in liberated Europe, and it is to be hoped that his findings and the Government's reactions to them will be made public as soon as possible. Gradually realisation is spreading that the plight of Europe is grave beyond words, and that a new attitude to its problems is absolutely necessary. As Sir James Grigg told the Commons during the Army Debate:

I cannot conceal from the House my fear that in the coming months the demands for foodstuffs may become almost overpowering. . . . The combined resources of the Allies may be strained to the utmost to prevent hunger and, indeed, starvation.

The first step is to impress upon the people of America and the British Commonwealth how urgent is the need; but it is even more important to tell them in concrete terms what ought to be done. Is the machinery for relief incapable of improvement? Miracles of organisation and improvisation have been achieved to direct the flow of resources into the channels of war. So far, the organisation of civilian relief has shown little of this efficiency. Has not the time come to transfer some of the first-class administrators from war to peace? Could not a new attempt be made to transcend the limits imposed by national sovereignty? The Combined Boards are in being. Is it inevitable that they should have to work through so many different agencies for relief—Civil Affairs, the national governments, UNRRA? As the year wears on, and the problems of a totally devastated Germany are added to all the others, it is surely clear that something like a European General Staff for Relief will be needed to deal with the crisis on an adequate scale.

Machinery is only one aspect of the present failure. It is even more urgent to find out from which sources the extra supplies can be secured. They can only come from the well-fed democracies. If the need were squarely put to the British people by the Prime Minister, they could probably be persuaded to forgo some of their rations, far from lavish as they are, in order to ensure that Europe did not starve. There may also still be some possibility of drawing upon stocks for a time. But the only place from which a large quantity of food can come is the United States, where the margin is so much greater and where there is very little rationing. Or again as a temporary measure, surely much more could be done to organise voluntary help under official direction. The pressure on Civil Defence and on such bodies as the WVS is slackening. Many volunteers could be found to organise a nationwide campaign to collect help for Europe—clothes, hoards of tinned goods, all the various household necessities which could, in spite of the shortages here, still be spared.

AMG in Germany

The Allies are now in occupation of nearly the whole left bank of the Rhine. In pre-war days, the area included between 3 to 4 million people, but very many Germans have withdrawn or have been forcibly evacuated. Probably not more than a third of the earlier population remains. Nevertheless, with the fall of big towns like Cologne and Krefeld, the invaded area is large enough and complex enough to foreshadow the general problems of military government. The war-torn countryside and battered cities are the shape of things to come, and one may wonder, from the meagre reports received so far, whether Allied Military Government is fully prepared to meet its problems.

The orders already issued by General Eisenhower, establishing martial law, banning all Nazi party organisations, and forbidding fraternisation, are general guides to administration, not detailed instructions for dealing with concrete problems. There is not much evidence to show how the day-to-day situation is being handled. The people are being registered, local officials are told to carry on with their duties, workers are being directed to work for the Allied armies, and it appears that local agricultural and industrial activities are to be maintained as far as possible. This amounts to a framework of strict military supervision. It gives no idea of what forces are being allowed to grow up to replace the universally banned Nazi party. In these first

dazed weeks it is very likely that nothing will stir. Correspondents have given appalling descriptions of the degree of apathy and indifference to which the inhabitants of the constantly bombed towns have sunk. They are not likely to think of self-government or of political activities when life is the barest, crudest struggle for survival. In Cologne there is not even the semblance of a local administration.

Yet this mood will presumably change in time, and it is important that the Allied attitude represented by the "no fraternisation" order should not impede the rebirth of thought and action among the Germans. In Italy, the appearance of old and new anti-Fascist groupings was immediate. In Germany it may take longer, but any new attempts should be encouraged, not crushed.

The Master Builder

Mr Churchill's speech to the Conservative Party conference on Thursday was very far from being an electioneering address. It can only be interpreted as an appeal to the Labour and Liberal parties to maintain the Coalition, which had been so successful in its prosecution of the war and had already, in a series of White Papers, laid the foundations for the future economic and social organisation of the nation. He regretted the publicly announced decisions of the Labour and Liberal parties "to resume their full liberty of action and thus bring this famous Coalition to an end," and deplored the prospect of party strife with his former colleagues in the administration. He did not, as some had hoped, indicate the date of the General Election, which would "refresh this ten-year-old Parliament," though, with typical understatement, he thought the war might be over this summer, or even sooner. The Prime Minister did, however, say that when the Coalition Government did break up it would fall to him, as leader of the largest party, to form a Government to carry on until the election, and he would call not only on Conservatives but on men of goodwill.

This statement can only mean that, as all parties are equally opposed to a snap election when the German war is over, Mr. Churchill is inviting Labour and Liberal Ministers—with or without their party—to remain with him, and he was probably directing his appeal especially to Mr. Bevin, whose assistance in demobilisation will be indispensable if the transition from war to peace is to be smoothly achieved. But it is very doubtful whether any response will be made. The Labour and Liberal parties, as parties, are committed probably beyond recall, and it is difficulty to imagine any of their leaders breaking party discipline to accept Mr. Churchill's summons. Indeed, the prospect of a return to party politics had been so generally accepted that Mr Churchill's remarks will come as a surprise to many people—and perhaps as an unwelcome surprise to the party politicians. This section of the speech was certainly the least well received by the Conservative conference, which clearly inclined more to Sir Herbert Williams's desire to throw off the "shackles of coalition." Mr Churchill was more applauded when he assured the conference that wartime controls would be relaxed as soon as conditions permitted and that there would be no "control for control's sake." Indeed, the whole emphasis in the conference was on the opposition to state control and bureaucratic interference with free enterprise.

Mr R. A. Butler, the chairman of the conference, expressed the hope that Mr Churchill, whom he described as "the master builder," would devote his great energies to the solution of pressing home problems. The Prime Minister's speech certainly indicated that this hope is likely to be fulfilled. He reminded the conference of his Four-year Plan for the next Parliament, which, subject to the overriding needs of defeating Japan, would give priority to housing, the export trade and food production. Mr Churchill, as the conference has confirmed beyond all possible doubt, is still the Conservative trump card.

The Manpower Budget

One of the successes of the war has undoubtedly been the smooth mobilisation of the nation's manpower, for which credit must largely go to the Ministry of Labour's method of planning the use of labour resources by means of a

periodical manpower budget. The recent White Paper on the War Effort showed the extent to which the labour force had been diverted from civilian to wartime activities between 1939 and mid-1944. Sir Godfrey Ince, Secretary of the Ministry of Labour, has now added a postscript. In a paper read to the Manchester Statistical Society on Wednesday, he brings the mobilisation figures up to the end of 1944, thus giving a complete statistical picture of five years of war. Now that the veil has been so far lifted, it is surely pertinent to ask whether manpower figures could not be published at regular intervals, as they have been for the coal-mining industry.

The six months July-December, 1944, are particularly significant, since they were a period of all-out military offensive and at the same time a period during which industry's pressure for reconversion to peacetime production began to increase. The figures—which are indicated in a note on page 354—show, however, no signs of any relaxation of the stringent military demands for manpower. There was a slight decrease in the total numbers mobilised from the peak of 22½ million in September, 1943, and a correspondingly slight increase in the numbers unemployed; these shifts were due mainly to changes in the production programme. The number of civil defence workers declined, and there was a slight decrease in the numbers employed in industry as a whole, owing to the call-up of men for the Armed Forces and the growing wastage among women workers. Of the industrial groups, the decrease is most marked in munitions; the labour force of the basic industries and services was well maintained, and there was actually a slight increase in Group III (less essential industries), building and distribution being the chief beneficiaries.

The total nature of wartime mobilisation makes it imperative that demobilisation should be controlled. In Wednesday's debate, Mr Arthur Henderson, Financial Secretary to the War Office, repeated previous assurances that the process of releasing men from the Army would be fair and orderly, so that when the European war is over there will not be a mad rush back to civilian life such as there was after the last war, while at the same time the call-up of younger men will continue. Valuable lessons in mobilising manpower have been learned in this war, and it is vital that they should be applied when it comes to reverting to civilian activities.

Mr Hudson's Economics

The Minister of Agriculture has been at it again. He journeyed to Manchester last week in pursuance of his strange campaign to persuade the urban population that it will be better off if there is no cheap food. These performances are always entertaining, but Mr Hudson apparently rates the public memory as low as he rates the public commonsense, for he does not observe even the elementary rules of consistency. Last November he was pouring scorn on those misguided people who

argue that our export trade is vital to our livelihood as a nation, and that if we wish to export we must be prepared in exchange to import all the food and raw materials that other countries wish to send to us in payment.

But last week the welfare of the export trades was the mainstay of the argument against cheap food.

It is, of course, true that the cheaper food is the more we can get for any given quantity of the products we have to sell. But it also means that the primary producers . . . have far less money to buy them. . . . You probably remember as well as I do the distress and misery caused by the growing unemployment in our export trades during the inter-war years.

In Hudsonian economics, the way to get rich is evidently to buy smaller and smaller quantities at higher and higher prices.

It is really astonishing that a Minister of the Crown can go round talking such nonsense. The only circumstances in which his arguments would even have a specious air would be those of heavy unemployment. Even then, making a gift to the foreigner so that he may make some work for British industry would be the most topsy-turvy economics. That sort of charity ought to begin at home. And before the Minister makes any more speeches based on the assumption of permanent slump in this country, somebody in the Ministry of Agriculture ought to lend him a copy of the Government's White Paper on Employment Policy, so that he can see what his colleagues have been committing themselves to.

As with most economic matters, the truth is simple, not complicated or difficult to understand. The British community can best enrich itself by devoting the fewest possible

man-hours to getting its food. For non-economic—or not wholly economic—reasons, the domestic farmer is to be assured of a decent living. But there is no principle of economics or commonsense that would make it to Britain's advantage to pay more for its imported food than it has to. Cheap food has always been the foundation of British industrial prosperity (that industrial prosperity out of which agriculture can now be assisted), and it will be so even more in the years to come when the material resources of the community will be in very short supply for all the work they have to do.

Elections in Finland

Among the belligerents in Europe Finland is the first country to go to the polls. The elections to the Finnish Diet are scheduled for March 17th and 18th. The event is of considerable international interest, because the vote will show to what extent the Finns have really reconciled themselves to their new position vis-à-vis Russia, and disavowed the policy of those leaders who were in office during the two Russo-Finnish wars.

In the electoral campaign the political parties virtually form two blocs. One bloc is headed by the Social Democrats, and includes the Agrarians and Progressives. It is the bloc of those who have accepted the armistice terms as a dire necessity, without much enthusiasm or conviction. Originally the Social Democratic list of candidates was headed by Tanner; but he had to withdraw his candidature under a special ruling, issued by the Prime Minister, that members of the war governments could not stand for the new Diet.

A pro-Russian bloc has been formed by the Communists, the Small Farmers, and by two Social Democratic dissident groups. The election will in a sense be a plebiscite for or against Tanner, in spite of the fact that he has withdrawn from the battle. The future of Russo-Finnish relations will turn on the outcome of the voting. An electoral victory for the Social Democrats of Tanner's tendency may well lead to a sharp Russian reaction. *Pravda* foreshadowed this rather bluntly when it said that this election was not merely Finland's internal affair, and accused "the leaders of certain old parties" of regarding friendship with Russia as a "transient and temporary measure." A redeeming feature of the tense pre-electoral campaign seems to have been the complete freedom in which it has taken place.

French Isolation

Sober-minded Frenchmen may reasonably be growing anxious over the position of isolation into which the "adventurism" of General de Gaulle's foreign policy has led them. In the past, particularly in his dealing with Britain and America, the General has managed to gain most of his points by playing a stiff and lonely hand. It is apparently not so easy to play this game with the Russians. Last week Paris was surprised and disturbed by the publication of a despatch from Moscow in which the Franco-Soviet Pact was declared to be secondary or accessory to the Yalta decisions.

This despatch is a direct rebuke to the French Foreign Office for its attempt to elucidate the relationship between the security pact and the voting formula before undertaking to sponsor the San Francisco Conference. It is less clear whether in fact the Russian Government does wish to make the operations of the Franco-Soviet Pact dependent upon British and American consent. At this moment it probably wishes to avoid any interpretation which would lessen the unanimity of the Big Three at San Francisco. French opinion is beginning to draw from Russia's attitude the conclusion that the French would be wise to come to a closer understanding with the other Great Powers. As Pierre Bourdon put it in a radio commentary:

The Moscow communiqué opportunely reminds us that our lack of *points d'appui* in the West, far from making our alliance more precious in the opinion of the USSR, on the contrary weakened the practical significance of the agreement.

Advocacy of a Franco-British Pact has reappeared. There is in this reaction a rather unpleasant touch of opportunism. If the value of a pact with Britain depends only on the humours of Moscow, it cannot have much real foundation. In reality, very solid French interests are involved, but General de Gaulle's conduct of foreign affairs has allowed them to be obscured.

Even on the home front, the isolation of France, however temporary, is likely to have unfortunate results. With an opportunism far surpassing the General's, Maurice Thorez seems to be serving notice that the brief honeymoon between the Government and the Communists is coming to an end. At a mass meeting last week, after criticising French foreign policy, he raised again the questions of the Resistance and of nationalisation, both problems which were to have been shelved in the interests of national unity. It is not only from Moscow that the Russians are putting on the screw.

No Progress in Poland

More than a month has elapsed since the Yalta Conference took place, but there is no sign yet of any progress in carrying out its decisions on Poland. The Commission of Three in Moscow has not yet apparently sent out the invitations to the Polish leaders who were supposed to meet at the round table and form a Provisional Government of National Unity. The reasons for this delay are obscure. There must have been some disagreement either about the procedure of the proposed conference or about the list of Polish participants. From Poland itself no sign has come that the political tension between the prospective partners in the new Government has been eased. None of the parties that have remained in opposition to Lublin has been given the freedom to resume political activities in the open. It is true that in his report to the House of Commons Mr Eden hinted that weeks or months might elapse before a new Government is formed in Poland in accordance with the Yalta decisions. There would perhaps be no reason for disappointment at the delay, were it not almost certain by itself to make eventual conciliation and agreement more difficult. During the interregnum the Lublin administration is exercising its monopoly of power to the detriment of the other Polish parties; and this must widen the gulf between Lublin and those political groups which might otherwise be prepared to carry out the Yalta decisions. A delicate situation may in addition arise in connection with the San Francisco conference if no Provisional Government in Poland is created before April 25th. Since the British and the Americans would not agree to the participation of Lublin, and the Russians would object to the participation of the London Government, it is possible that Poland will not be represented at San Francisco—and this in spite of the fact that the Poles booked their ticket, not on March 1, 1945, but on September 1, 1939.

D-Day for Education

Zero hour for the Ministry of Education is April 1st, when most of the provisions of the new Act come into force. Though wartime difficulties make it impossible to translate the high ideals and promise of the Act into immediate fact, every effort is being made to observe at least the letter of the law so that a sound framework for future operations shall be established.

On Tuesday the Ministry published new draft regulations prescribing the conditions to be satisfied by schools (county and voluntary, primary and secondary schools, nursery schools, and direct grant schools), in order to qualify for grant. These concern the qualifications of teaching staff, size of classes, pupils' leave of absence, examinations and school terms. Ultimately, there is to be one grade of teacher—the qualified teacher. But until sufficient teachers and training facilities are available, unqualified recruits will be needed in the profession, and schools are accordingly empowered to engage approved temporary teachers for a period of five years.

The same patchwork is necessary with regard to size of classes. Although the regulations prescribe that the maximum number of pupils on the register of any class will be 30 for children between the ages of three and five, 40 for those between five and twelve, and 30 for the over-twelves, it will be permissible to exceed these maxima if shortages of staff or accommodation are sufficiently acute. The temporary relaxation of standards is, of course, unavoidable; but there will be much disappointment among teachers that the ultimate figures have been fixed so high.

Other regulations define a maximum school year as at least forty weeks in all schools other than direct grant schools, and, to assist "staggering," permit the granting of two weeks' leave of absence from school for family holidays.

Financial Aid for Students

On Wednesday the Ministry of Education published draft regulations empowering Local Education Authorities to give financial assistance and special scholarships to pupils who would otherwise be unable to take advantage of educational facilities available without themselves or their parents suffering hardship. If these humanitarian powers are employed boldly and with imagination they are capable, almost by themselves, of creating a new order in education. The educational value of well-directed extra school activities, which will figure prominently in the new system, is now fully recognised.

Financial assistance may be provided for the purchase of school uniforms; to cover expenses and subscriptions in respect of school camps and expeditions, clubs and societies; and to assist the maintenance of pupils over the compulsory school age who are still in attendance. It is clearly important that some uniformity should be established in the matter of scales of assistance, and the authorities in each region are urged to consult for this purpose.

Other regulations deal with assistance to students at universities and other places of further education. The necessary ministerial approval of maximum awards will be granted where the net income of the recipient's parents does not exceed £600, and of purely "honorary" awards where net income exceeds £1,500. Net income is defined as gross income less allowances of £50 in respect of other dependent children and the educational expenses of such children. Suggested maxima are £175 a year at Oxford or Cambridge, £160 at London and £140 elsewhere; for day students, £90 at London and £75 elsewhere.

Development Areas

The Medway District Full Employment Council has got off the mark promptly. It has already asked to be scheduled as a Development Area, under the Distribution of Industry Bill, so that it can acquire its share of new industry. It claims that two firms which approached the Board of Trade for permission to set up factories in the Medway district were told that they should go to South Wales or the North.

Conserving THE FOOD VALUE of our Milk

FRESH DAIRY MILK consists of two elements—water, which averages 87%, and 'MILK SOLIDS' (fat, protein and milk sugar). As the chart shows, Cadbury's Milk Chocolate retains all the MILK SOLIDS of all the milk used, and only the water is eliminated. It is easily kept and transported and requires no elaborate packaging. It retains the full food value of the milk almost indefinitely without special storage or canning.

Cadbury means Quality

The Medway Towns' action is an example of the kind of difficulties which the Board of Trade may expect when the Bill comes into operation. There would not seem to be any special reason why the Medway district should claim Development Area treatment. It has not been exceptionally subject to unemployment in the past; it is near London and well situated for the export market; it is a small area; and with Shorts, the naval dockyard at Chatham, and other engineering firms, it could normally expect to maintain a fairly steady level of employment. There would seem to be many areas with better claims, though perhaps with less energy in pressing them. Lancashire and the West Riding of Yorkshire, for instance, are largely dependent on single industries, and could justifiably request assistance in securing a more diversified structure. There is also a case for helping bomb-damaged areas, such as Plymouth, Southampton and Hull, to restore their industrial activity. Though the Distribution of Industry Bill provides for the replacement of bomb-damaged factories, it does not apply to badly blitzed areas such as such. Within the framework of the Bill, such areas might temporarily be scheduled as Development Areas, to assist them in the initial task of reconstruction.

The Board of Trade, playing for safety, has perhaps wisely confined the term "Development Areas" in the first place to the former Special Areas, whose needs are generally recognised. It will admittedly be difficult for the Board to pick and choose between conflicting claims, but a certain amount of latitude in exceptional cases might be desirable. It is all a question of the way in which the Bill is administered.

Roatta and After

The mysterious escape of General Roatta from his imprisonment in Rome has caused some political tremors in Italy. The Left has become alarmed by this obvious sign of insufficient vigilance in the Administration, and apart from this, by signs of increasing self-confidence among the former fellow-travellers of Fascism. General Roatta's escape is unlikely to prove an isolated event, devoid of political significance. Clandestine Fascist organisations have been increasingly active exploiting the difficulties with which the Bonomi Administration has had to contend. General Roatta could hardly have escaped and remained hidden for so long without the assistance of some secret organisation or—and this would be even more disturbing—of some influential political group. Popular suspicion has, of course, turned against the Court; and turbulent demonstrations took place in front of the Royal Palace last week. The Socialists and the Action Party, both boycotting Prince Umberto and Signor Bonomi, have demanded the immediate dismissal of the Government.

The Communists have adopted a rather ambiguous attitude. As partners of the Governmental coalition, they could not join openly with their rivals on the Left in denouncing the Government. Nor could they afford to be outpaced in radicalism by the Left opposition. Thus a curious situation arose; some Communists were very vocal among the demonstrators, while others were rather meek inside the Government. For a while it looked as though the coalition of the four parties was breaking down. The Liberals were outspoken about the somewhat double-faced policy of Signor Togliatti. Events have not developed into a breach. The four parties have solemnly renewed their *Trêve de Dieu*, and promised to work together "in full agreement." The only concrete outcome of the crisis is to be the reorganisation of the High Commission for the punishment of Fascists.

Russia and Latin America

Although the question of relations between Russia and Latin America lay outside the terms of reference of the Mexico City Conference, the meeting, as a prelude to the deliberations at San Francisco, appears to have been a starting-point for several more Latin American moves towards diplomatic relations with Russia. So far, Brazil and Venezuela are reported to be contemplating this step. Until 1943, when Cuba and Russia exchanged ambassadors, Mexico was the only Latin American country to maintain diplomatic relations with Soviet Russia. Six of the twenty republics now do so, Cuba, Colombia, Uruguay, Costa Rica and Chile having since established them, Chile as recently as last December. This change reflects Russia's enormously enhanced prestige gained during the war. It is only six years ago that the Latin American states played a leading part in expelling Russia from the League over

Finland—a humiliation which the Russians will not lightly forget.

There are now reports that the Russians are anxious to extend their influence in Latin America through greater Communist activity. In most Latin American states the party is, however, illegal. It is recognised only in Mexico, Chile, Costa Rica and Cuba. Even in these countries its record is chequered. It helped to shape Chile's Popular Front, but the Front has disintegrated, leaving the Centre parties in power under an anti-Communist President. Its influence is stronger in Mexico, where, although Communists have no part in the Government, Communist influence is strong in the Mexican trade unions.

The community of interest between Mexico and Russia is based more on trade than on political doctrine. Since Brazil's trade with Russia has shown recent signs of development, it is likely that in opening diplomatic relations with Soviet Russia for the first time President Vargas is influenced by the same motives; he may also see some advantage in offering this bait to Leftist elements in the event of his either convening or postponing the promised presidential elections.

Strange Happenings in Bucarest

The formation of the new Rumanian Government under M. Grozea has had two rather spectacular sequels. One was the sudden agreement of the Russian Government to transfer Transylvania to Rumanian administration. The other was the flight of General Radescu, the former Premier, to the offices of the British representative in Bucarest, where he has been afforded asylum. The return of Transylvania to Rumania raises no doubts. Provision for this was made under Article 19 of the armistice with Rumania which was signed by Great Britain, the United States and Russia. The delay in implementing that provision was, according to official Russian statements, caused by the massacres of Hungarians which the Rumanians committed when they had moved into Transylvania. This sounds like a plausible explanation; and the fact that the Grozea Government has undertaken to respect the rights of the Hungarian minority is all to the good. The Radescu incident appears to be rather baffling. Semi-official statements from Moscow accused Radescu of connivance in pro-Nazi activities. If the words meant what they said it was very odd indeed that the new Government in Bucarest should have stated that General Radescu had had no reason to seek asylum because no prosecution against him had been opened. Again, if the accusations from Moscow were meant seriously, then there should have been no reason for affording sanctuary to General Radescu. The British representative on the spot must thus have acted on the assumption, if not on the knowledge, that General Radescu's life was endangered by his political opponents; and that this was the real motive for his flight. However, it is impossible to pronounce on the merits of the case, as long as no impartial reports on the situation in Bucarest reach the British public. What sows seeds of suspicion in the mind of the public is not this or that act of Russian policy, but the fact that the outside world is not allowed even a glimpse of happenings in the "Russian zone." To this situation an end must be made; and the sooner the better.

Peacetime Nurseries?

A short debate took place in the House of Commons last week on the future of wartime nurseries. The wartime nursery is in most cases a combination of the pre-war day nursery and the nursery school. But as its object is to release mothers for work, originally war work but later any form of employment, its emphasis is on the care and protection of children up to five years of age. Thus the matron has to be a state registered nurse, with another nurse as deputy, and as Mrs Creech Jones points out in a Fabian pamphlet,* this bias towards nursing—with the tendency to regard all children as sick children—is resented by the teaching profession from which the staff for the children aged 2-5—the nursery school age—is drawn whenever possible.

If wartime nurseries are to continue after the war some revision of policy will therefore be necessary. The future

* "Nurseries and Nursery Schools." Fabian Publications. Ltd. 6d.

of the nursery school is assured; under the new Education Act it is an accepted part of the country's educational system, and Miss Horsbrugh said in the debate that in most cases the buildings and equipment of the wartime nursery will be used for the new nursery school. But whereas the nursery school exists solely for the education of the child, the nursery exists primarily for the welfare of the mother—though in most cases secondary benefits accrue to both mother and child from both institutions. What is not certain is whether there is a big demand for nurseries for the under twos. In wartime, when the employment of mothers is at its highest and local authorities are relieved of all financial responsibility for the nurseries, the number of places for children under two, according to Miss Horsbrugh, is 18,000 out of a total of 70,000 for children under five, but a great number of these 18,000 places are not taken up. As a rule, the mother with a small baby does not work, and in peacetime the Government's policy should aim at enabling her to look after her child in her own home—by, for one thing, adequate family allowances—rather than in encouraging her to hand it over to the care of others.

Yet it is fairly certain that there will still be a need for day nurseries—for the babies of mothers who want to work, for babies with bad home circumstances, for household emergencies and to provide an amenity for non-working mothers. The difficulty is, as Miss Horsbrugh pointed out, that to be any use a nursery should be situated near the mothers' homes, but in very few small areas would there be enough babies to justify a nursery. The cost of running a nursery is fairly high. The maintenance cost of a child per day varies, but, according to Mrs Creech Jones, is estimated at 3s., to which the parents contribute one shilling. But since the children's attendances are very irregular, even in wartime, the income received from fees is very much less than a third of the cost.

Family Allowances Debated

Three main points were discussed when the Family Allowances Bill received its second reading last week. The first, which received most attention, was whether the allowance should "belong" to the father or the mother. The Government is leaving the question to be decided by a free vote. Would it not be possible to leave it to the parents' choice? It is not unreasonable to suppose that eligible parents would prefer that they themselves should decide to which of them the allowance should belong; in default of any expressed preference it should belong automatically to the father. If, as seems likely, the Commons decide that it should be paid to the mother, the position would be that she is the legal owner of the money but the father is legally liable for the tax on it.

This second point, whether the allowances should be taxable, received far less attention. The Solicitor-General's reasons for including them in a family's taxable income were vague and unconvincing. He said that the right principle was that people with large incomes should pay most of the allowance back in taxation and that people with small incomes should retain it in full—in other words, that the allowance should not be paid at a flat rate but should be subject to a means test applied retrospectively. Yet the Government has accepted the principle of a flat rate social insurance tax and flat rate benefits. Moreover, allowances in kind are not taxable, even when, as in the case of nurses' salaries, they are given an official valuation, nor are the family allowances paid to the members of the armed forces.

The third point was whether there should be duplication of benefits. So far as the Service children's allowance is concerned, the Bill proposes that both it and the new allowance will be paid unless the Minister makes a regulation to the contrary. But the children's allowances under the present social insurance schemes will not be paid in addition to the new allowances. Again, the Government's motives were left obscure. There is a strong case for paying both sets of allowances in the case both of Servicemen's children and orphans and of social insurance beneficiaries. In the first case, the old allowance is designed to lessen the gap between a soldier's pay and a civilian's wage. In the second case, the wave-earner has paid for part of the children's allowance through his insurance contributions. There are surely grounds for permitting him to retain at least enough of the old allowance to bring the total children's allowance up to the amount

recognised by the Assistance Board as being necessary to provide for a child's minimum needs—which varies from 6s. to 9s. according to the age of the child.

Local Government on View

The local government exhibition at County Hall drives home pictorially the fact that it is the numerous local authorities, and not the central government, which administer nearly all public services, and which hold the bulk of publicly-owned property. In 1939 the local authorities spent about 3s. 6d. per week per head of the whole population on a multitude of services, supervisory, protective, and beneficial. To these services have been added the difficult wartime tasks of evacuation, rehousing, and bomb damage repair, which by their nature have brought local government much closer to the people. But, as Mr Willink said in opening the exhibition—

In normal times the ordinary man and woman knew far too little of what the local council did for them—the great range of services which make daily life possible, and yet are taken as a matter of course.

The indifference to local elections displayed even by ratepayers shows how formidable is the task of arousing the active interest of the 10 million new electors, who will be able to vote for the first time next November. As a first step, local authorities should pay much greater attention to informing their electorate of their plans and activities. Some councils are admittedly helpful, but others display an almost pathological desire for secrecy. The fact that publicity on a national scale, such as the present exhibition, is left entirely in the hands of the National Association of Local Government Officers is a sad reflection on the initiative of local councils and their organisations.

The importance of the tasks and responsibilities to be discharged by local authorities in the post-war period can hardly be exaggerated. This is why it is so essential to secure the high quality of both councillors and staff that Mr Willink rightly demanded. Beyond hoping that women would play a greater part in local government, he made no suggestions as to how the right people should be found. One step would be to end the tiresome method of annual elections at which a third of the council retires. Another would be to pay the travelling expenses of councillors, which alone are sufficient to deter any farm worker from standing for the county council. A third and vital step would be to prevent employers from penalising or otherwise discouraging their workers from becoming councillors. At present, few unskilled workers other than railwaymen have the temerity to seek election. Finally, only a drastic reorganisation of local government areas along the lines recently urged in these columns can make it possible for many authorities to afford good staffs, and for many citizens to recapture interest in their locality. It is useless to demand the best brains in local government until the willingness of citizens to serve is encouraged rather than thwarted.

Advice for the Citizen

The need of a simple Everybody's What's What and Who's Who to sort out and explain the innumerable wartime controls and agencies to the puzzled citizen first led to the creation of Citizens' Advice Bureaux. This highly organised and efficient service is described in a pamphlet issued by the National Council of Social Service—the body which advises and aids the numerous bureaux with the help of a Government grant. Most CABs are staffed by unpaid volunteers working under a trained social worker. In answering inquiries, they enlist the help of welfare and assistance officers, local barristers, solicitors, doctors, clergy and social workers. The measure of their success is the width and strength of their local contacts. A good CAB can gain a swift hearing for any victim of official muddle or oversight.

Bureau workers will listen sympathetically and patiently to anyone's troubles. This in itself afforded a valuable "emotional release" to many anxious or distressed inquirers during air raids. This personal interest has turned the CABs into something much more than a wartime information service. They receive inquiries not only about clothing coupons or bomb damage, but about rent and hire-purchase, insurance and housing, and domestic worries of all sorts. This suggests that there is scope for CABs in peacetime, but it also raises the problem of where to draw the line between mere advice and actual assistance.

Letters to the Editor

Sunday Cinemas

SIR,—After reading the note in *The Economist* of February 10th, I feel some statement is needed on behalf of those who have urged and supported the Surrey County Council in its decision, for it is they, rather than the Council, who must bear the charge of being "unwise and unkind" and of being prompted by "sabbatarian zeal."

While it is true that better attended Sunday Schools would be welcomed, very few of those who favour the Sunday cinema restriction seriously believe that a child excluded from the cinema is immediately gained for the Sunday School.

What is really causing deep concern is the influence of present-day films upon the mind and outlook of the young people. If there were some evidence that the young people who enter the cinemas normally came out from them healthier in this respect, and perhaps a little nearer to the Christian perceptions of life's true meaning and responsibilities, then the Churches themselves might encourage Sunday cinema attendance. It is because the results are all the other way that there is much to be said for shielding young people from the influences that are so damaging to them. If this can be achieved only on one day of the week it is not to be despised, especially as Sunday is the day when parents should realise their responsibility of linking their children with the Christian Church and of protecting them from, rather than leading them into, what is frequently an unwholesome atmosphere. Relaxation and entertainment for the whole family on Sundays may be a high priority in this sixth winter of war, but not at the price of still further undermining the Christian upbringing of our young people. Without some measure of discipline, even though it be labelled sabbatarianism, there can be no progress in the Christian life.

At the same time it must be admitted that the Sunday ban leaves untouched the problem of the cinema's influence on the other days of the week, and that the policy can

achieve good results only if it is part of a wider effort which is mainly positive in character. The main work on behalf of the young people must be in the direction of better houses and homes, better educational and recreational opportunities, and, last but not least, better films.

But this wider policy will take time, and meanwhile the modern film is one of the many forces undermining the future moral and spiritual stability of our nation. In the past our country has used legislation to protect children from work in factory and mine, from ill-treatment and other damaging influences. Those who to-day seek to restrict access to cinemas, at least on Sundays, are moved by the same deep concern, which is to protect young people from what is positively harmful and to give them a better chance of developing into healthy citizens of the future.—Yours faithfully,

D. ALLON SMITH

St. Andrew's Presbyterian Church of England,
Cheam

Location of Industry

SIR,—I notice that in the article on the Distribution of Industry Bill, in your issue of March 3rd, nothing is said with regard to the very serious disadvantage blitzed areas will suffer by comparison with development areas. It does not seem to be realised that material and labour are available to development areas immediately, but will not be available to blitzed areas until housing and development area requirements are satisfied.

The consequence is that some blitzed areas, at any rate, will suffer, and may indeed become themselves depressed areas through their inability to restore their buildings.

Very serious unemployment is inevitable in blitzed areas when the men return from the Forces, unless business premises can be restored or re-erected, to enable them to be employed.—Yours faithfully,

FRED M. BURRIS

Westbury-on-Trym

AMERICAN SURVEY

The Comic Heritage

(From a Correspondent in New York)

MRS ROOSEVELT complained at a recent press conference that all the children she saw in her frequent train journeys were reading comic books. She might as justly have complained that the drug stores which purvey literature to American small towns, or the post exchanges which supply army camps, devote a large part of their book space to the same material. The comics may be childish, but they are by no means created for the exclusive amusement of the young. Their potential customers number most of the hundred and thirty million people in this country, with the possible exception of a few intellectuals and children under three.

In the more leisurely and devout nineteenth century the day began in this country, as in England, with a Bible reading. It still does in some families. But most Americans now start with the newspaper. News on the front page—the steam off the altar of America's number one god, progress. Comics on the inside back page—America's folklore, its morality tales, its miracles, its daily Bible story. The comics supply wonder, fantasy, thrills and chills to to-day's rushing slaves of the time-clock as did the folk tales of the Old Testament and the miracles of the new to an older agricultural generation.

You like Samson the strong man? We have Joe Palooka and Popeye. You give a tender reminiscent smile to Balaam and his talking ass? We enjoy Uncle Elby and his gangling cur Napoleon, whose tail and ears say it without words. Instead of the Queen of Sheba we have Dixie Dugan or Mary Worth, every bit as ravishing on a showgirl's salary as was the old Queen with the wealth of the Orient to

hang around her neck. You fancy miracles? Watch Superman or the scientific knight-errant Buck Rogers.

"Comics" is the generic name for a type of continued picture story which appeared first as a coloured picture supplement to the Sunday newspaper for the amusement of children. Then it made its way into the daily papers in the form of a strip of four to six units strung across the top of a page, the whole telling a story complete enough in itself to satisfy its reader and at the same time leading him to wait breathless for the next instalment. Its latest incarnation is in the form of books—cheaply printed and brilliant in raw colour—which sell literally by the millions.

The first essential of the comic strip is the character. Whether he be human, or an animal like Donald Duck, or a mechanical creation with a mind of its own like some of the automobiles, airplanes and Buck Rogers rocket guns that have from time to time taken rôles in the comics, it is the character and the things that happen to him—or that he makes happen—which hold the reader's interest. There are no mass movements in the comic strips. This is the realm of the hero or the heroine, and a large part of its appeal lies in the reader's ability to identify himself with the principal character and either laugh at daily doings very like his own or—more frequently—move out of his dull, mechanical job into a fantastic world of excitement, adventure, romance—a world that is at once satisfying, strange and comfortingly familiar, where he can have all the excitement of slaying Goliaths with a Tommy-gun and facing fiery furnaces in an asbestos suit.

The second essential is the plot. Obviously, a plot which

is to delight millions must be simple, must have its motives well founded in human character, and, if it is to continue to hold interest day after day and year after year, it must be flexible and susceptible to infinite extension. To hunt for something that is lost—hidden treasure, a stolen sweetheart—to escape from impossible prisons or demonic enemies, to manoeuvre for love, for business advantage, for power—these are the commonplaces of the comics plot. Moving four to six pictures at a time, Superman can take a year to find the missing heiress, indulging on the way in the incredible adventures to which his superhuman endowments entitle him.

The more subtle comic strips, like the recently arrived Barnaby, current delight of the more sophisticated, rely on topical adventures of shorter duration, and depend for their long appeal on charm of character and juxtaposition of absurd incidents. Barnaby is an appealing small boy of perhaps five years who has a fairy godfather, invisible to everyone else, named Mr O'Malley. Mr O'Malley is a modern pixie who has a wide acquaintance with ghosts, leprechauns and other inhabitants of faery. He wears two wings sticking through his tightly-buttoned business suit, a Homburg hat and a fat cigar, and is the epitome of common business sense applied to most unbusinesslike situations. Much of the charm of this comic lies in Mr O'Malley's ability to fail at everything and yet maintain his infrangible certainty of being right.

Mr O'Malley and Barnaby are not, however, typical. Most of the comics are not very funny. Some of them were funny in the beginning, a few depend, like a fire-cracker, on a long fuse and a snapper ending. Most of them have moved into a fantastic world of terror and thrills where virtue is always triumphant, *Deus* is always *ex machina*, and rescue from the most hair-raising situations is sure to come if you only sit tight and wait for the next instalment.

*

As substitutes for the daily Bible story these carry, of course, no religious implications. Their hold is in terms of those other attributes which made Bible stories so compelling to generations of people living in very different parts of the world: they must be compared as tales of wonder and mystery, as folklore embodying traditional behaviour which in turn becomes a pattern for the young or as a common heritage of narrative, character and situation which binds together a whole population, however different its racial backgrounds.

As tales of mystery and wonder, the comics, like the Old Testament stories, are full of terror, though a very different terror. In the comic world human devils operate and death rides monsters that are mechanical. The only god is science; everything can be explained in its terms. Science is never angry and never kind. Nor can science be placated as Jahweh could. Science operates according to known rules, and if you get in its way, the only thing that will save you is to invoke the scientific antidote. On the other hand, chance and coincidence play a large part in the comics. They are the permitted unknowns.

As tales of human behaviour serving as patterns for the young, the comics are easier to deal with than Bible stories ever were. More than one Sunday-school teacher has boggled over the vagaries of King David, and while leaning heavily on his adventures with Goliath has passed lightly over his predilection for the captain's pretty wife. There are no such pitfalls in the comics. Theirs is a Puritan pattern; black is black and white is white, and the two meet only as enemies. Good characters are always good, bad characters always bad. Eve, whose comic name at the moment is Monica Lee, has no more complicated rôle than to tempt Adam. The comics are simple and moral with a rubber stamp morality that goes on repeating itself without variation and with no more depth than the sheet of paper on which they are printed.

How far the comics fill the need for the common heritage of narrative, character, situation which Bible tales filled so richly is a question. Certain characters have passed into common speech. "Rube Goldberg plumbing" is American shorthand for the superbly crazy collection of pipes, valves, wires and gadgets which the cartoonist of that name put together in lampooning the Yankee love for machines. A "Buck Rogers set-up" is a slightly derogatory description of a mechanical marvel too wonderful to be real. "Casper Milquetoast" is an epithet applied to the completely timid soul, the appeaser who suffereth long and is kind no matter what agonies it may cost him or his neighbour.

But none of this lasts very long in popular speech. In

the Bible-reading days, for grandfather, son and grandson, Daniel was perennially in the lion's den, Joseph was perpetually denying Potiphar's wife, the same Cain was always in the act of killing the same Abel. It was the individual response, the reaction of each new generation to the same folk tale, that gave richness and meaning and depth to the telling and the receiving. The links thus forged held the generations together and created a whole literature of allusion that stretched around the world. Popular as the comics are, they cannot yet claim any such deep hold on the American people. For one thing, the constant demand for change makes it almost impossible for the comic strip creators to keep a character intact very long. That gaudy flaneur Mr Jiggs is perhaps thirty years old, and has recently taken to re-living his youth, but he is an exception. Gasoline Alley made its first fame when the automobile was still exciting and unpredictable, but to-day's strip of that name is inhabited by two soldiers on a South Sea Island.

Nor have the comics, as patterns of human behaviour that show the young how people act, much authority. The Bible tales were rich and subtle models with revealed religion behind them and with enough depth and variety to hold attention as children grew older. But the comics are perpetually adolescent. They follow, they do not lead. They depend not on the magnificent but on the commonplace.

True, they glorify that commonplace, they lead it into bizarre situations and hair-raising struggles, they give it a winged costume and call it Superman, they provide it with the most advanced inventions of a scientific age and send it in a rocket to the farthest stars. But it is still the commonplace, still the everyday human being chained to a machine civilisation, solving his problems only by material means, his only conceivable heaven the possession of an unlimited supply of those means, his hell the existence of a superior supply of those same means (or others even more powerful) in the hands of human devils.

The comics hold life very cheaply. Murders are done as children pretend them—by pulling out a pistol and saying "Bang bang." And nobody seems to care very much. Revenge is the chief emotion they awaken. Theirs is a terrifying child's world, with a child's ideas of morality carried into adult terms and armed with adult tools.

*

Yet, for all their shortcomings, the comic strips and comic books are an index of American character that cannot be disregarded. The pitfalls in the way of any foreigner who tries to read them are many, but three fundamentals at least stand out. First, the fact that science, particularly as it takes mechanical form, is god in the popular American mind. Second, that anything can happen, and usually does if you wait long enough. Here is no vestige of a closed frontier. The mind that makes these comics and the mind that enjoys them may be limited, but not their area of operations. Third, here is no evidence of any class feeling or of any separation between rich and poor, privileged and under-privileged. The world is divided, but not along those lines. It is divided between the good and the bad. It is also divided between those who wait for things to happen and those who make them happen—American admiration goes to the latter.

American Notes

Vandenberg and Stassen

Two of the Republican nominees, Senator Vandenberg of Michigan and Commander Harold Stassen, former Governor of Minnesota, have accepted President Roosevelt's invitations to San Francisco—Commander Stassen, immediately, Senator Vandenberg, somewhat reluctantly, and only after assurance from the President that he would not be "bound" by the Conference, that he would have "freedom of action."

Senator Vandenberg's first concern appears to be his freedom to criticise, and from his speech last week it could be deduced that if there were nothing to criticise, this comparatively new entrant from the ranks of isolationism into the internationalist world could be depended upon to dig something out. Commander Stassen, on the other hand, seems concerned with throwing all the weight he carries behind a world security organisation, and his weight promises to be considerable, since he appears to be growing into the late Mr Wendell Willkie's shoes. Commander Stassen stated last week, clearly and simply, that he would

go to San Francisco committed to the decisions reached in the Atlantic Charter, at Moscow, Teheran, Dumbarton Oaks and Yalta. He looks at the San Francisco Conference as a chance to "win a beachhead in the battle for a just and lasting peace." Like Mr Willkie, Commander Stassen sees in America an expanding capitalism, a boundless system of free enterprise in the framework of which he believes "freedom and equality of our citizens" can be achieved. And he sees the huge reservoir of American wealth as a source to be tapped for the advancement of living standards of people the world over.

Meanwhile Senator Vandenberg, who believes a "constant, conscious mandate to seek and maintain justice as the basis of peace" is lacking thus far except in the World Court chapter of Dumbarton Oaks, promised that he would produce concrete proposals at San Francisco, but would not reveal them now. He repeated his demand that all agreements made under the stress of war should be subject to "full, free and fair review" at the peace table. And last week he was still very worried about Poland. Indeed, his first foreign policy declaration since his acceptance of Mr Roosevelt's invitation is regarded by many observers as a prelude to a debate at San Francisco on this inflammatory subject.

It will be unfortunate if a united front cannot be forged by discussion and argument among the American delegates between now and April 25th. For a divided American delegation, with the ghost of the two-thirds rule always present, could take the heart out of the Conference.

Three Shifts

Mr William H. Davis, chairman of the War Labour Board, has been appointed to fill the place as Director of the Office of Economic Stabilisation left vacant when Judge Vinson moved into the job. Congress would not trust Mr Henry Wallace to do effectively—that of Federal Loan Administrator. Mr Davis' WLB job has gone to Mr George B. Taylor, public member of the WLB, and formerly assistant chairman. The Little Steel Formula is his rather uncomfortable monument, and for that monument he is not loved by Labour, which thus far has not committed itself on his appointment. Mr Taylor is on leave from the University of Pennsylvania, and the more irreverent labour people make no bones about wishing he were back on the campus.

The Conservative press fears that Mr Davis, as director of the OES, will initiate an epidemic of "fringe" pay rises for night shifts, holidays, travel time and the like. The "maintenance of membership" clause, invented by Mr Davis, is as unpopular with management as the Little Steel formula is with Labour. And since Mr Davis shares the responsibility for that formula, he is under fire from both sides. His first real test in OES will come if Mr John L. Lewis stands by his demands, which he can be counted on to do.

It would be a mistake to measure Judge Vinson's qualifications for the job of Federal Loan Administrator against those of Mr Wallace. The former Kentucky lawyer was not chosen for his professional qualifications, but because he is acceptable, non-controversial, economical and reasonably competent. Not a single dissentient voice was heard in the Senate.

So much attention has been paid Judge Vinson for his uncompromising attitude on wage increases that his former advocacy of subsidies as a means of reconciling rising costs of production with a stable cost of living tends to be forgotten. Subsidies have always been anathema to the Conservatives, and it may be that the Conservative press, in acclaiming his appointment so wholeheartedly, is really not so much cheering for Judge Vinson as for the fact that he is not Mr Wallace.

Help Wanted . . .

Governor Dewey, of New York, has signed the Ives-Quinn Bill which, for the first time, puts on a state's statute books a law making discrimination in employment because of race, creed, colour or national origin a misdemeanour, punishable by a \$500 fine, a year in prison or both. The operation of the statute will be watched with keen interest. Unfortunately, not all states will wish it as well as the five which are at present considering similar measures: Ohio, New Jersey, California, Connecticut and Massachusetts.

In the whole of the United States, minority groups number some 30 million, or almost one-fourth of the population. The Negroes are the largest, but by no means the only

element. When the war programme was still in its tooling stages it became apparent that these 30 million persons would be needed in the factories. Since a national law against discrimination would not have had the slightest chance of passing through both houses of Congress, the President, in June, 1941, issued the unprecedented Executive Order 8802, authorising a Committee of Fair Employment Practice to "receive and investigate complaints of discrimination . . . and to take appropriate steps to redress grievances. . . ." In 1943 the FEPC was set up as a fully staffed, independent Agency, but still with no statutory standing, and with no powers to enforce its decisions.

The FEPC can discuss and recommend and hear and issue directives, but the only pressures it can bring to bear are through anti-discrimination clauses in public contracts and through the President's power, as Commander-in-Chief, to seize the plants of offending employers. In jurisdiction, the FEPC is limited to complaints against Federal Agencies or employers (and unions in their plants) having contracts with the Government, and to complaints against employers who are regarded as essential to the war effort. Discrimination is condemned in principle far more widely than it is eschewed in practice. The CIO and AFL are officially committed to abolish discrimination within their organisations. But many of their affiliated unions violate the official stand, sometimes barring negroes and sometimes discriminating in more circuitous ways.

In some quarters there is anxiety about the prospect of race friction when the servicemen—white, brown and black—come home. Traditionally the negro is the last one hired and the first one fired, which will make trouble for the FEPC during the reconversion period. The Senate Committee on Labour, aware of this, is expected to hold hearings this week on a bill to set up a permanent Federal FEPC, taking the committee away from executive order and placing it under statutory authority.

In the meantime, in New York state at least, the familiar advertisement, "Wanted, clerk, white, Christian," will have to disappear.

The Co-operative Movement

Private enterprise in the United States has always been hostile to the co-operatives, not because of their volume of business, but because they were co-operatives. Last year, although the total volume of consumer co-operative business, at about one billion dollars, was a mere drop in the consumer's bucket, the increase over the previous year was as much as 33 per cent, which is enough to alarm the professional defenders of private enterprise. The euphemistically named National Tax Equality Association, which co-operators identify as the former League for the Protection of Private Enterprise, has mobilised a strong lobby in Washington to deprive the co-operatives of their present exemption from taxes. The co-operatives' contention, in America as in Britain, is that they have no "income" or "profits" as such, and therefore cannot be subject to income-tax. Their "income" belongs to their members, not as profits, but as rebates on "overcharges."

The NTEA can only see the spectre of socialism as an end result of too much co-operating. They object not so much to the fact that rebates are tax exempt as to the fact that a great many members leave their savings with the co-operatives, taking them in stock or credit, thus financing the growth of the movement with ploughed-back dividends. The co-operatives are not defenceless. They are using the threat that, if their "divs" are taxed as income they will follow the lead of the Swedish co-operatives, and undercut prices instead of meeting competitors' prices and giving consumers their savings in dividends.

The great, virtually untapped area for expansion of the American consumer co-operative movement, is in organised labour. At present only about 25 per cent of the co-operative business has been done in areas where 75 per cent of the people live. The co-operative League has set up a Labour Service Division; the American Federation of Labour has started a department of Consumer Co-operation and a number of CIO unions have been studying plans for co-operative development and propaganda.

These possibilities for growth depend to a large degree on a tightening and centralisation of the movement, which is at present sprawling and loosely organised. There is certainly no lack of variety in co-operative activities, which include the refining of petroleum, baking bread, processing soybeans, hatching chicks, selling insurance, delivering babies, burying the dead, printing, dehydrating, and selling every imaginable kind of consumer goods.

HOUSING ENTERPRISE

One of the nation's tasks is to apportion its resources to the best advantage. On this basis public policy after the war should be so devised that all who desire to purchase houses for their own occupation can do so as soon as practicable. The builders of good houses will be ready to play their part; so will the Abbey National and other building societies. Thus may free enterprise make a worthy contribution equally with public effort.

THE BUSINESS WORLD

A Steel Constitution

ON Tuesday representatives of the iron and steel industry voted themselves a new constitution. The avowed purpose of the reconstituted British Iron and Steel Federation is to ensure for the industry "self-government within the framework of Government policy," presumably on the assumption that protection by tariff or quotas will be an essential part of the framework.

The new constitution, a revised version of that of 1934, provides for a strong central governing body; the various sections of the industry—the members of the Federation—are to be grouped into strong associations or "conferences" with freedom to manage their own affairs insofar as these do not impinge on matters of general policy, the preserve of the central governing body. The reconstituted Federation will thus be a tidier one than that created in 1934; in matters of general policy it will be all-powerful, but in the management of the branches it will not interfere. The Federation will be governed by a representative council, on which each Conference will be represented "in proportion to its relative importance." Real power is vested in a smaller executive committee, to be chosen from the members of the Council; it is to include members from each Conference, and its chief executive officer, as hitherto, is to be an "independent" chairman, chosen from outside the industry, but paid by the Federation.

The industry has set itself high ideals; it promises to render efficient service to the community, to maintain full and regular employment, to ensure that reasonable and steady rewards are paid to the labour employed, and to the savings entrusted to it, to promote exports, and a great deal besides. But it is much more reticent in its published statements about the means it will adopt to fulfil these laudable aims—from which alone in many cases a precise notion might be derived of the interpretation likely to be put in practice on these high-sounding abstractions.

The layman may, perhaps, be allowed to ask two questions. First, what are to be the incentives that are to ensure that this highly protected and centralised industry is to be brought to, and maintained at, the highest pitch of efficiency within the limits of technical knowledge, and that the fruits of its efficiency are to accrue to the consumer? Secondly, what tangible evidence is there of the industry's intention to carry out an adequate programme of technical reorganisation after the war?

In all fairness, it must be conceded that the industry has attempted to provide at least a partial answer to the first question. Alive to the danger of inertia inherent in monopoly, the Federation has set up an Efficiency Committee. This Committee of experts, to be drawn from the industry, and, presumably, to be paid by the Federation, will have the double task of advising on proposed schemes of reconstruction and expansion, and, on its own initiative, of surveying each of the main sections of the industry with the object of advising on improvements and modernisation. The Federation has also set up a Price Policy Committee; the general policy is that selling prices

should be based upon the costs of economically efficient plants, and that it should be accepted as a fundamental principle that such plants are enabled not only to obtain a reasonable return on the capital invested, but also to set aside a sufficient amount towards research and development.

As a safeguard to the consumer, the industry would "welcome" the creation by the Government of a tribunal such as the Import Duties Advisory Committee, with the function of examining costs in relation to selling prices. The cynic might be forgiven for reflecting that if the industry did not welcome the existence of a tribunal as lenient as IDAC has proved to be, it would be ignoring its own interests. The real point is whether the industry would welcome a tribunal that was *not* like IDAC.

There is no published evidence about the industry's plans for technical reorganisation after the war, except that relating to the manufacture of tinplate. Statements have been made to the effect that the industry is planning to spend about £100 million on re-equipment as soon as possible after the war. This sum compares with the £50 million

spent on major schemes during the seven years preceding the outbreak of war—at prices much lower than those likely to rule after the war. The mere intention to spend £100 million, however, has little meaning; everything depends on the nature of the projects. Admittedly, the industry cannot be blamed for the lack of evidence available to the layman. It has, in fact, submitted its post-war plans to the Ministry of Supply. These should be published, at least in outline, as soon as possible. There is no reason why the Ministry of Supply should not follow the precedent set for other industries by the Board of Trade. Without the fact the public has no means of assessing the merits of the industry's reorganisation plans. In the early 'thirties a major change in steel policy was foisted by the Government upon an ignorant public—that is, ignorant of the contents of reports prepared by a number of committees; this must not happen again.

Judged on the basis of published statements, the steel industry's aims are similar in content to those announced by the coal, cotton and other industries. The industry wishes to consolidate its position and run its own affairs, equipped with effective price-fixing powers. It could hardly be expected to divest itself voluntarily of its monopoly powers, but in some respects—as in the creation of an Efficiency Committee—it has at least recognised the need for cheap steel (present British prices are about a fifth above those current in the United States). It is now for the Government—representing the public interest—to scrutinise the steel industry's plans, and to provide the "framework of policy" within which the industry asks that it should be allowed to operate.

Clearly, the industry's unpublished plans for technical reorganisation after the war deserve the closest scrutiny by the Government. Great Britain will no longer be able to afford a steel—and a coal—industry that is not in line with present technical knowledge applied to the special conditions of this country in the matter of raw material supplies and markets. It may be questioned, indeed, if technical proposals, made by an industry secure in its monopolistic position, can be readily assumed to be those that are most likely to raise its efficiency to the highest possible level within a given time limit. The issue is so important that it might be advisable to seek independent expert opinion, based on an investigation by a small technical committee, with American experts as consultants. A visit of this committee to the United States may have a salutary effect, even if its findings are not as devastating as those of the Cotton Mission.

The Efficiency Committee set up by the Federation is a welcome innovation. But, again, it may be asked whether a body of experts drawn from, and paid by the industry, will be sufficiently ruthless in tendering advice on the steps needed to maintain the efficiency of the industry at the highest pitch, even if that advice were accepted. How, for example, would a company react to the suggestion that its plant should be closed because it is in the wrong place? And even if the Committee proved to be effective in bringing the laggards up to the average, how can representatives of the industry be expected to force up the average itself? Before there will be real reason to believe that the pressure for efficiency is adequate, some stronger mechanism will have to be devised. One method would be to turn the Efficiency Committee into an expert body independent of the industry, though this would hardly be acceptable; another would be to set up a parallel inspectorate of experts consisting of consultants in the service of the Government on the analogy of the price tribunal suggested by the Federation; a third would be to have a joint committee, consisting of experts in the service of the industry as well as of experts in the service of the Government.

In the matter of price policy, the Federation's statement is far too vague. It is not enough to suggest that prices should be fixed on the basis of the costs of efficient producers. What are costs? And what is efficient? A Price Policy Committee, such as that which has been set up, can only perform its task effectively if it is given precise in-

structions—a specific formula—about the method by which, and the level at which, prices are to be fixed. An example that has already been suggested would be to determine minimum prices on the basis of the total costs of the lower quartile, that is, the total costs of the firms whose costs stand one-quarter of the way up from the lowest to the highest. Obviously, if prices are fixed by reference to the costs of the cheapest producers, too many firms might be driven out of business; if they are fixed by reference to the dearest producers they would put a premium on inefficiency; if they are based on the average costs of all firms they might still encourage complacency. There should be no difficulty in devising a series of formulae appropriate to the various sections of the steel industry. A special Government tribunal with power to investigate the relation between costs and selling prices, such as is suggested by the Federation, would be an additional safeguard, on condition that it is an

Bretton Woods: American Criticisms

(From Our New York Correspondent)

THE Bretton Woods proposals are now squarely before Congress, but it is still difficult to forecast whether they will be passed, and, if so, whether there will be substantial modifications. There is perhaps a general pre-sumption, based on the last election, that what the Administration really pushes has a better than even chance of being enacted, but this is not a very reliable foundation for prophecy in specific cases. The two most authoritative banking institutions, the American Banking Association and the New York State Bankers' Association, and the two most influential newspapers, the *New York Times* and the *New York Herald-Tribune*, have all taken a critical line. But there are minorities among both the bankers and the newspapers, and economists are similarly divided. Not as a forecast of defeat or amendment, but simply as an attempt to elucidate the discussions, a survey of the main lines of criticism that have hitherto emerged may be of interest.

In general, the International Bank for Reconstruction and Redevelopment has provoked considerably less controversy than the International Monetary Fund. The very fact that the latter has been susceptible of such varied interpretation is lending weight to the most usual criticism, which is that the provisions of the Fund proposals lack clarity and are ambiguous. One authority, an eminent bank economist, ascribes this ambiguity to the dual parentage of the Fund, with its stated emphasis on both exchange stabilisation and economic expansion, the respective goals of the White and Keynes Plans. As might be expected, a section of American opinion would devote the Fund to the first objective, and either expect the latter to follow automatically or to be promoted by other means. A corollary to the same argument of mixed parentage and confused objective is the opinion that the Fund is far too large if it is to be used for exchange stabilisation, but that no fund, however large, can suffice if the other purpose is to be served by simply passing out money.

A related criticism involves the familiar argument about causes and effects. The friends of the Fund hold that monetary stability is indispensable for economic stability, which is, in turn, a prerequisite of political stability. But the critics question the logic of this chronological sequence. Real exchange stability, they say, results only from the prior removal of trade and exchange barriers and the setting of each country's domestic house in order. There is some irony in the fact that the arguments used in defence of the Fund represent a complete reversal of the opinion held by the Roosevelt Administration at the time of the World Economic Conference of 1933. Even some of the staunch supporters of the Fund urge that it should not be brought into action until the transitional problems of "hot money," unbalanced budgets and disorganised balances of payments have been dealt with by more direct means, and the state of the world is propitious for the Fund's success. In any case, it is stated, the need for exchange in the transition period will be less urgent than the need for investment credit.

A related series of criticisms views the Fund essentially as a lending agency. In some quarters, the size of the American contribution is thought to be excessive. Even more frequently the contention is heard that the Fund will be unworkable because the plan, either inadvertently

inspectorate of independent experts, and that it is given precise instructions as to policy.

These are some of the issues that must be faced by the Government if it is to provide the industry with a framework within which the industry will be able to manage its affairs of its own as well as for the public good. The framework should consist of a set of conditions within which the industry will be free to pursue the business of making steel; the overriding public interest demands that this should not mean self-government in the sense in which that term has come to be used. The steel trade, in a sense, will provide a test of the Government's will and ability to set industry on the road to progress so far as this is within its powers. Unlike the coal industry, it is not overlaid with long-standing antagonism between workers and employers. It is an industry in which it should be possible to devise technical solutions to a technical problem.

or deliberately, has failed to consider or make clear the probable results of the disparity between the American commitment to supply dollars and the potential demand for dollars, consisting of the aggregate quotas of other countries. In any event, the American contribution may, under the scarce currency provisions, far exceed its initial quota. As a result, the Fund may be saturated with domestic currencies unwanted by the rest of the world.

Furthermore, some feeling exists that the United States should not blindly give a "blank cheque" of this order to the Fund. This is not so much an argument against the size of the ultimate American loan as a feeling that the interests of both borrowing and lending countries will be better served if advances are specifically tailored to the needs of each country. The alternative "tailoring" suggested would include not only generous loans, but outright grants-in-aid where justified. The provisions of the fund are under fire because loans are to be granted automatically

London, 14th March, 1945.

without regard to credit-worthiness or economic need and with no termination date for the loans. The fear exists that if the resources of the Fund become tied up in investment credits, its character as a revolving fund will be destroyed.

A fourth basic criticism of the Fund rests upon the premise that the real problem of monetary stabilisation is internal, not international. Any mechanism which pours funds into gaps in international payments will, it is contended, merely postpone necessary readjustments and the voluntary application of correctives by each nation. The Bretton Woods proposals are said to be obsessed with the idea of machinery rather than with basic principles. These apprehensions are enhanced by the ease with which exchange rates may be changed under the agreement. Indeed, in some circles, the Fund is interpreted as little more than a device for making periodic devaluation respectable. The fact that the Fund is not to be allowed to reject such changes on account of the domestic, social or political policies of the devaluing member seems, in this perspective, completely unrealistic.

Other criticisms proceed from diverse frames of reference. Lawyers are apprehensive that the Fund's immunity from judicial process may lead to one-sided decisions. A more comprehensive procedure is required to enforce the obligations of each state. The proliferation of autonomous international agencies is viewed with some alarm; it is felt these require integration with the general structure of international co-operation, most probably through subordination to the Economic and Social Council envisaged by the Dumbarton Oaks plan.

The critics who propound these arguments are not mere iconoclasts; they offer alternatives to the Fund proposals. These substitutes are: a return to the traditional gold standard; the provision of large United States credits to stabilise the pound sterling and perhaps other "key currencies"; and the creation of "currency blocs" through the pegging of world exchanges to outstanding currencies, such as the pound, dollar and rouble. These counter-proposals have been the signal for the adherents of the Fund to abandon their defensive positions and advance to the attack in their turn.

Business Notes

Doing Things Differently in Australia

In most highly-developed modern communities the administration of finance has come to rest on three tiers. First comes the Ministry of Finance, which determines general policy; next comes the Central Bank, which administers the policy; finally, there are the commercial banks and specialised institutions speeding the flow of commerce within the limits of general policy determined by the Ministry of Finance and administered by the Central Bank. This, broadly, is the system that has been gradually evolved and, at present, is the best there is.

Judging by the speeches made on the second reading of two banking bills—one for the Commonwealth Bank and one for the commercial banks—Mr J. B. Chifley, Treasurer of the Commonwealth of Australia, seems to hold the view that there is virtue in being different, irrespective of the consequences. The complete text of his two bills is not yet available, and detailed discussion of the proposals, therefore, must be deferred. But the substance of his speeches suggests that he dislikes the three tiers; he is out for drastic simplification by bringing the whole business under one hat, at present his own. The commercial banks are to be made to wither away because, in his view, the Commonwealth Bank (the central bank) can administer policy as well as deal with Australia's banking customers; the Commonwealth Bank itself is to lose all independence and is to become a mere department of the Treasury. In other words, the Government is to determine policy, administer policy and deal with the customers.

This dogmatic statement may be doing Mr Chifley an injustice; it may be an exaggerated version of the consequences of the legislation he proposes; but nothing but the object of gaining complete control over central and commercial banking—that is, nothing save complete innocence of modern administration of finance—can have inspired the two bills as described in his speeches.

Briefly, the Commonwealth Bank is to compete "actively" with the commercial banks. And, in order to

All three possibilities would divide countries in their monetary relations into blocs, gold and non-gold (since all the nations do not have the necessary reserves), dollar and sterling, etc. Rivalries might develop between groups and trade would tend to be canalised within them, thus obstructing the realisation of maximum expansion of trade and employment. Furthermore, it is doubtful whether key countries, particularly Great Britain, would willingly enter into rigid stabilisation agreements because of the fear that these might in time interfere with internal objectives.

The Bank for Reconstruction and Redevelopment has secured relatively wider acceptance, or, at least, has met with less criticism, precisely because it cannot be attacked on most of the counts charged against the Fund. The purpose is clearly stated and the institution will undoubtedly fill what to many observers seems a real need for reconstruction and development funds both in the immediate post-war period and in the longer run. The aggregate possible commitments of the Bank and the obligation undertaken by each member are considered to be relatively clearly stated. Loans are to be related to need and borrowers' credit-worthiness is to be scrutinised. Even so, some questions have been raised. Chief among them are the following: Since the United States will provide the major part of the capital, why should not an enlarged American Export-Import Bank assume these lending functions? If the Bank is largely controlled by debtor nations, will creditors be able to protect their loans? Is the Bank really needed, since private capital is available to finance most good projects and uneconomic projects should not be financed in any case?

Despite these doubts, there is a large body of vocal opinion in favour of action on the Bank agreement in the near future. Some sections of opinion would postpone action on the Fund until the problems of the transition period have been solved and further study, and perhaps amendment, of the Fund provisions has become possible. Others would abandon the Fund completely, and include instead an exchange stabilisation department in the Bank. The relative weight of these bodies of opinion has now to be assessed by the Senate and House of Representatives.

avoid "secondary credit expansion of formidable proportions after the war," the Commonwealth Bank "must be given authority to immobilise the liquid reserves of the trading banks to whatever extent may be desirable"; these are therefore to be transferred by the trading banks into special accounts with the Commonwealth Bank, and in future the Commonwealth Bank "may require each bank to lodge in its special account each month such an amount as may be specified in writing." Put in another way, the Commonwealth Bank will have the power to limit the size of the business of the commercial banks, while expanding its own, and to prevent them from taking part in financing post-war expansion. Moreover, the directorate of the Bank is to be deprived of all vestiges of independence. Since 1924, the Board of the Bank has consisted of six members who had been actively engaged in agriculture, trade, finance or industry, and two *ex-officio* members, the Secretary to the Treasury and the Governor of the Bank. Mr Chifley proposes that, in future, the Governor should be assisted by an Advisory Council, consisting of the Secretary to the Treasury, the Deputy Governor, an additional representative of the Treasury and two officers of the Bank. Further, "if the Treasurer and the Bank are unable to reach agreement (on policy), the Treasurer may inform the Bank that the Government accepts responsibility for the adoption by the Bank of a policy in accordance with the opinion of the Government. . . . The Bank shall then give effect to that policy."

Second Thoughts

Mr Chifley quoted extensively from the report and recommendations of the Royal Commission on Monetary and Banking Systems in Australia in justification of his proposals, and he made play with the shortcomings of the existing system.

Nobody would contend that the Australian banking system, as now operated, is not capable of improvement.

But why throw a spanner into the system when its natural evolution has been in the direction of that now in operation in most modern communities, including this country? It is obvious that Mr Chifley has framed his proposals not on the basis of technical merits, but from political motives. Even if his party felt that an element of control stronger than, say, in this country was desirable and acceptable, they could still have maintained the technique of the efficient modern three-tiers system. So far as can be ascertained from Mr Chifley's speeches, his proposed set-up is devoid of technical merits.

Furthermore, while the kind of banking system Australia is to have is entirely for Australia to decide, the proposals surely infringe the undertaking given by the Prime Minister, Mr Curtin, that he would not introduce measures of "socialisation" of this kind. Perhaps, upon reflection, Mr Chifley may have second thoughts.

Income Tax Bill

The first impression created by a more detailed study of the Income Tax Bill, 1945, is greatly to strengthen the view that the taxation of company profits, like the taxation of wages, would benefit by a formal separation from the general body of law and practice concerning income tax. There is no sign of a move in this direction in the actual form of the Bill, and it is not even clear whether the various reliefs are to be considered as deductions before arriving at assessable profits or as rebates of tax. The old mills and factories allowance was of the former type and most other wear and tear allowances of the latter. This is a point which may be cleared up in the course of the passage of the Bill.

The most important section of the Bill is Part II, dealing with reliefs on machinery and plant, and it will probably be the section which will cause most uncertainty. It seems reasonably clear that the initial allowance of 20 per cent is additional to normal wear and tear allowances, and that it does not have to be deducted in determining the basis on which future wear and tear allowances are to be allowed. What is a reasonable allowance for wear and tear is, as in the past, to be determined by the Commissioners, but it is not clear how far their view of what is "reasonable" will be affected by the fact that the addition to the basic figure given by them is to be increased from 20 to 25 per cent.

It also seems to be the case that it is within the discretion of the Commissioners to base the percentage on original cost—or some other figure—and not necessarily on written down values. In point of fact, with the institution of the new machinery of balancing allowances and balancing charges, it seems quite unnecessary, from the standpoint of the Inland Revenue, to apply rigid rules as to what may be charged in any particular year. Whatever the view of the taxing authority, the desiderata are that at least the whole cost of acquisition should be allowed as a charge against profits or a deduction from tax payable, and that it should be left largely to the firm in question to arrange with the Commissioners the most equitable method of achieving this object. But whatever is intended, the intention should be clear beyond the possibility of misunderstanding.

A provision which will almost certainly arouse a great deal of comment is that which requires that the vendor of patent rights shall be taxed on the proceeds of the sale even when, under existing law, the proceeds would be regarded as a capital receipt and, as such, exempt from taxation. There are already a number of anomalies in tax law on the question of what is capital and what revenue, and this provision threatens to add to them.

Discriminating Allowances

A general criticism of the scope of the Bill must be left until later, but it is necessary to mention the restriction of the new reliefs on buildings to those of productive industry. This constitutes a measure of discrimination which would appear, in some degree at least, to apply also to the provisions of Part II. It is quite clear that the need for improvement and the benefit to be derived from it are as great in some other fields as in productive industry. It is far from being established that the conditions in distribution or in the provision of certain services, such as hotels, are so different that they would not reap a corresponding benefit from reliefs.

This is a point which was taken by several speakers in the debate on the second reading of the Bill, when the Chancellor of the Exchequer, as reported, specifically stated that the Government was weighting the scales in favour of those forms of capital investment most necessary to the industrial strength of the community. This point was driven home by Mr Peake, Financial Secretary to the Treasury, who said he could not accept the view that any taxpayers outside productive industry would have to foot the bill, since it was hoped so to stimulate production as to produce a higher revenue. As regards hotels, it appears that new plant will benefit under Part II, but the position of outlays on equipment, including office equipment, remains obscure.

Apart from establishing the point that the Government intends to use discriminating taxation as an instrument of policy, the debate did little to clear up the uncertainties already mentioned. There was more than one demand for the adoption of a simpler concept of what ought to constitute taxable profits, and the Bill was welcomed as a step reducing the gap between the official and commercial idea, on the subject. Most speakers, however, wished for more concessions.

Engineering and Housing

It is becoming increasingly clear that the housing problem cannot be solved by traditional building methods alone, and that the building industry will have to accept the infusion of outside, non-orthodox practices, if the enormous public demand for new houses is to be satisfied. In other words, steel and aluminium must combine with bricks and mortar if the post-war housing programme is to succeed. A thoughtful contribution to the solution of the problem is provided in a memorandum on "The Engineering Industries and the Rebuilding Programme," prepared for the Engineering Industries Association by an architect and an engineer. Those responsible for housing policy, and in particular those in control of the building industry, would be well advised to study very carefully the report which is now being circulated to industrialists and to Members of Parliament.

On the assumption that the building industry can itself provide approximately 300,000 houses per annum by traditional methods, and estimating an average building of 600,000 houses a year over a period of ten years, the Engineering Association propose an annual target of 200,000 factory-made houses and 100,000 composite houses, partly by traditional construction and partly built with steel frames. As Lord Davidson (Chairman of the Engineering Industries Association) has pointed out, if the building industry alone has to carry the burdens, the number of building workers would be swollen far beyond its long-term needs—the immediate number

STAGGERED WORKING HOURS SAVE WORKERS' TIME

and greatly increase comfort. Already more than 600,000 London workers have proved this, but the maximum benefit will not be felt until the idea is generally adopted. Staggered hours of work mean less crowding on trains, buses and trams, less weariness, smaller queues, and a faster journey.

required might be two million, whereas the long-term needs might be only 800,000. Apart from its rôle in the actual construction of houses, the engineering industry will obviously be of vital importance in the production of household fittings and components, such as complete bathroom or kitchen units, whether for factory-built or conventional houses, for the conversion of houses to flats or for use in schools, hospitals and public buildings.

As a practical step, the report suggests that small research groups should be set up to carry out initial experimental work, while sub-committees of the Association should be formed to establish relations with the building industry and to explore the possibilities of exporting components and factory-made houses, or both. Opposition is expected from certain sections of the building industry, which have a vested interest in traditionalism, to the incursion of engineering into their field, but the Association hopes that, in view of the overriding national interest, their co-operation will not be withheld.

But while the engineering industry will no doubt be able to make a valuable contribution to the post-war building programme, the rate of construction suggested in the report seems too high if there is to be a simultaneous improvement in the other components of the standard of living; the report, in fact, illustrates the need for combining the technical with the economic approach in post-war planning.

Demobilisation and Control

Although gaps caused by casualties still have to be filled and some new recruits will be needed, the tide of mobilisation for the Services has almost reached turning point. Soon the reverse process will begin, and it will be a much more difficult one. Mobilisation has been a steady process. Demobilisation will be an "avalanche"—to use Mr Bevin's word—even though plans are made and have been generally agreed. Much will depend upon the conditions in which demobilisation takes place.

These conditions hinge almost entirely upon controls. The debate in the House of Lords last week showed that too many people, in an effort to scrap controls that can be dispensed with immediately after the ending of hostilities, are prepared to see all wartime controls thrown overboard, regardless of their usefulness. But if price control is continued until production is adequate, inflation can be avoided. If rationing is continued until demand can be satisfied without it, there will be "fair shares" for all. If quality is controlled, a hungry market will not be flooded with shoddy goods. Reconversion plans should be dovetailed so that factories and houses are built to an integrated plan. Production for export and for the home market have to be co-ordinated. Mr Bevin, speaking last week to the Multiple Shops Federation, made it clear that unless the state plays its part in the process of reconversion, no thing but chaos would result.

This was his most important point, but he had other things to say. The distributive trades, at no time on the list of reserved occupations, have probably made a bigger contribution to the Services than any other section of industry. They will therefore have more ex-Service men and women to re-absorb. Mr Bevin appealed to the Federation (and incidentally to all employers) to extend a welcome to their returning employees. It is perhaps not yet sufficiently appreciated that the man who has been uprooted from normal life for a number of years needs special treatment. His eagerness to adjust himself may be tempered by military experience; sympathy and tact on the part not only of his employers but of his fellow workers will assist him to regain his civilian form.

First Stock Exchange Company

Considerable surprise has been caused by the news that a firm of brokers on the Stock Exchange has decided to act on the facilities of Rule 57b and to convert itself into a company with unlimited liability. It is true that, with the end of EPT possibly not very far off, a considerable advantage may accrue from being taxed as a company, on profits retained in the business, instead of paying sur-tax on earnings irrespective of the use to which they are put. There remains, however, the overwhelming disadvantage

that, if death duties are charged on the basis of past earnings, the estate of a deceased member may find itself with a heavy deficit. The present position on this matter was set out on page 125 of *The Economist* of January 27th, and there is no information as to any fresh development since then. In the circumstances, the firm in question, which has not hitherto been associated with the negotiations, seems to be taking substantial risks, but it presumably knows its own interest. There is no reason to suppose that there will be any difficulty in obtaining the consent of the Committee to the change, provided the requirements of the rules are fully met, but it is doubtful whether the example will find any followers until the outlook is clearer or whether the unlimited company form will ever make a wide appeal to brokers.

Canadian Pacific Revenue

The raising of the dividend on Canadian Pacific ordinary stock from 2 to 5 per cent was a fair indication that something had occurred to offset the fall of some \$6 million in net railway earnings, which was then all that was known of the 1944 results. The figures of income and profit and loss accounts, now available, show a very marked change indeed from those of recent years. It is true that other income continued to fall, at least in the shipping and miscellaneous sections. But instead of provisions for lines abandoned and depreciation, which have hitherto increased as more money became available to meet them, there are actually credits of \$4,500,000 received from the Great Northern Railway for release from obligations under the joint section agreement, and of \$1,045,235, a portion of steamship insurance recoveries representing compensation for increased cost of tonnage replacement. Further, there is a fall of over \$1½ million in fixed charges, which was not unexpected. Thus, while the income available for fixed charges is down by almost \$10 million to \$55½ million odd, that available to meet ordinary dividends and reserves is some \$33,880,000, against rather under \$30 million for 1943.

This means that after paying the increased ordinary dividend it is possible to add some \$17,130,000 to the carry forward, against \$23,300,000 a year ago. So far, so good. But it is not to be expected that stockholders will regard this as more than a modest addition to their resources, and at that one which may not be used to assist their dividends. Both credit items are obviously of a non-recurring character, and it remains the fact that in the future, as in the past, each year's accounts are likely to bring their quota of unpredictable items. Great as the influence of these has been on the net balance available, they seldom exceed in amount 2 per cent of the gross railway traffic. It is upon the maintenance of these and on securing a lower expense ratio that the payment of regular and reasonable dividends must depend.

Electric Supply Companies

The removal of the security ban on their publication has led in the last few weeks to the appearance of the accounts, for the first time since 1940, of a number of electric supply companies. Unfortunately, the informativeness of the accounts varies greatly, and makes comparison between the companies difficult. A more comprehensive picture should be obtainable when a number of annual meetings have been held.

Electricity undertakings have suffered little financial loss as a result of the war. Some have experienced appreciable gains. An interesting feature is that London companies, while they have naturally done less well than concerns operating in the North of England, have suffered less than might be expected from the effects of extensive bombing and evacuation. The ordinary dividend payments of four northern companies—North-Eastern Electric Supply, Yorkshire Electric Power, Electric Distribution Company of Yorkshire, and Northampton Electric Light and Power—have been maintained throughout the war at their pre-war level of 7, 8, 9 and 10 per cent respectively. By contrast, the County of London Electric Supply and the Metropolitan Electric Supply companies have each paid 8 per cent during the war years, against 10.5 and 10 per cent respectively pre-war. This decline in payments is very mild in comparison with the experiences of London gas companies.

Confidence that adequate reserves for re-equipment have been built up is expressed in the statements of two undertakings operating outside London, and is reflected in some increase in carry forwards and general reserves. Taxation

has inevitably increased steeply in all cases, but nevertheless more companies are able to adopt the practice of providing in their accounts for the current year's taxation.

Costs and Prices

All accounts reflect the great wartime increase in both electricity consumption and cost of generation that had already been indicated in the report of the Central Electricity Board. The sales of the County of London Electric Supply Company have risen from 2,007 million units in 1938 to 2,209 million units in 1944. In both years, about 680 million units were retained by the Central Electricity Board, so that supplies to the companies' own consumers rose by over 15 per cent; but in reception areas the increase in sales has been very much greater. For instance, consumption approximately doubled between 1938 and 1944 in the area of the Northampton Electric Light and Power Company.

No other sales figures are available, but the wartime trend is illustrated by the following operating results of three large undertakings:—

	Trading Receipts		Cost of Generation and/or Current and Distribution		Trading Profit		+ or - in Trading Profit
	1938	1944	1938	1944	1938	1944	
County of London	£000	£000	£000	£000	£000	£000	%
Metro. Electric Supply	4,837	7,333	1,829	4,609	3,008	2,724	- 10
Yorks. Electric Power	1,707	3,033	1,049	2,056	658	977	+ 48
	1,441	2,851	457	1,545	984	1,498	+ 51

Operating costs appear to be now between double and treble their pre-war level, mainly due to the rise in the cost of coal. Revenue has not risen anything like so steeply. This is natural in view of the fact that there has been no general increase in tariffs. In some areas the average charge per unit has fallen due to increased use of the cheaper bulk rates, although in others there have been percentage increases to the electricity bill of private consumers. It should be remembered, too, that part of the rise in coal costs is passed on to user under "special contracts" with industrialists. Nevertheless the fact that net profits have not suffered indicates how much electric supply companies, which carry a heavy burden of fixed charges on capital, stand to gain from expanded consumption.

US Lend-Lease Aid for France

The primary purpose of the lend-lease agreement between the United States and France is to assist in the mobilisation of the resources of the French nation. The United States has already equipped, under lend-lease, eight French divisions, some of which, in the words of the Secretary of War, Mr Stimson, "fought superbly by the side of American troops" during the past year. Additional divisions are to be equipped. The new agreements go beyond the supply of equipment for the formation of military units; they are designed to harness French productive capacity more fully to the combined war effort, and involve the supply, not merely of raw materials, but also of food to keep the people in good health, and of certain items of capital equipment.

The new agreements consist of a master agreement and a mutual aid agreement similar to those concluded by the United States with other members of the United Nations. France, in fact, has furnished the United States with "reverse" lend-lease ever since D-Day in the form of railway and port facilities, hotels, warehouses, military vehicles, textiles, batteries, telephone wire, and so on. But they also include an agreement under section three (c) of the Lend-Lease Act, the first of its kind. (A similar one is in negotiation with Russia.) This consists of two schedules, one providing for the supply of raw materials for war use, as well as of food and other essential civilian requirements, to the amount of \$1,670 million, and the other for the supply of capital equipment, such as locomotives, ships and machinery to the value of \$900 million.

Supply schedules are normally subject to revision, and the deliveries may be stopped when the President of the United States decides that they are no longer necessary for the prosecution of the war. But the agreement under section three (c) of the Lend-Lease Act contains a provision whereby France can purchase all outstanding

deliveries in the first schedule by making payment in thirty annual instalments, with interest at the rate of 2½ per cent. It provides, moreover, that the capital goods specified in the second schedule—these are expected to outlive the war—are to be purchased outright by France; 20 per cent of the value of deliveries is to be paid in cash and the remainder in thirty annual instalments, the amount outstanding to carry interest at the rate of 2½ per cent.

The agreements have had a favourable reception in France; the promised deliveries hold out some prospect of relief. They are, of course, quite inadequate, even in relation to the most pressing civilian needs. The allocation for food in the first schedule—\$185 million—is but a small proportion of the amount that would be needed for the provision of an adequate minimum. Nor is the need for imports likely to end with the next harvest, which, because of the shortage of labour (this could be partly remedied by the recruitment of a "land army"), fertilisers and other difficulties, is again likely to fall below the pre-war output by a quarter or more.

Agreement With Switzerland

After negotiations between Allied delegations and the Swiss Government that lasted nearly a month, an agreement was signed on March 8th. The agreement is mutually advantageous; to the Allies it is an act of economic warfare, and to the Swiss a means of material gain. Altogether it is a testimony to the fact that Switzerland is no longer geographically isolated from the Allies.

The Swiss undertook to suspend the facilities enjoyed by Germany in moving coal, steel and other materials through their country; this will render more difficult German communications with northern Italy. They have agreed to cut still further their exports to Germany; these will in future be only some 5 per cent of the 1942 level, and then only against payment in goods; gold will no longer be accepted. Exports of electricity are to be sharply curtailed, making available additional supplies for France. The Swiss have agreed, further, to list all funds held on behalf of residents in Germany and German-occupied territory (German funds in Switzerland had already been blocked); this will assist in the recovery of looted property.

The Allies agreed to allow Switzerland to import much-needed food and raw material supplies. The French will allow the Swiss to use the port of Toulon; they will also allow the Swiss to bring in supplies overland from Spain, but as they are themselves desperately short of transport, the Swiss will have to use their own railway rolling stock and lorries. Since the Swiss have few steam locomotives left—these are said to number less than 100—and as coal and many other materials Switzerland requires are short and badly needed in liberated countries, there can be no rapid expansion in Switzerland's imports. But the concessions made should bring a measure of alleviation.

Export Mutual Aid

The appointment of the new Minister at the Department of Overseas Trade is awaited with interest, for on him much of the success of the export drive will depend. Many of the export groups of manufacturers which were set up with Government encouragement before Lend-Lease have kept themselves in being against the time when exports could be resumed. Those which have been least active could now be resuscitated and the formation of new groups encouraged.

Some export groups have already given thought to post-war expansion. Among them is the Hosiery and Knitwear Export Group, which held its fifth annual meeting this week. It expects to increase the export trade in knitwear fourfold, from its pre-war value of £2,500,000 to £10 million. A preliminary survey of world markets has already been made, and to increase marketing efficiency manufacturers will pool their resources for research and trade promotion. An encouraging aim of the group is to meet overseas demand not only for better quality goods—in which British knitwear manufacturers excel—but for "a wide range . . . suited to all tastes and pockets." The utility programme, in which knitwear has been one of the most successful, should have taught manufacturers many lessons in producing attractive goods cheaply.

The Board of Trade is considering a proposal of the group that a levy of ½d. a lb. should be made on all yarn

issued for export to certain special markets, and the revenue so raised spent on export trade development and market research. This proposal for co-operation might well be adopted by other groups; mutual aid can only be of benefit to all.

Leaseholds Outlook

The declaration of a second dividend, making the usual wartime total of 15 per cent, by Trinidad Leaseholds over three months ago gave no indication of the trend of results for the year to June 30, 1944. The full accounts contain for the first time particulars of wartime production and development and so make it possible to obtain some idea of the present position and prospects of this leading Trinidad concern. The year brought an increase from £1,424,107 to £1,608,506 in revenue and the net improvement, after increases in both head office expenditure and depreciation provisions, was some £163,000. Of this £70,000 is absorbed by raising the tax provision to £720,000, but this understates the tax burden, for dividends are taken into the accounts for the first time before deduction of local taxation. This means that the total tax provision ought to be increased to £765,000 to make it comparable. After this heavy drain, it is still possible to add £250,000 to contingencies compared with appropriations of £200,000 to specific reserves a year before. The total of all reserves exceeds £3,290,000 and net liquid assets amount to rather more than this sum, of which only £1,400,000 is represented by stores and stocks of oil and produce.

The company has, thus, very ample liquid resources and, as in the case of other oil concerns, it may well need them. Production has been pushed up from 4,774,000 barrels in 1938-39 to a maximum of 6,799,800 in 1943-44 and almost the same figure in the preceding year. But, whereas the pre-war drilling programme amounted to some 222,800 feet per annum for the five war years has averaged some 268,000 feet of which about 25 per cent was in joint interest fields. The increase in production has been accompanied by some decline in purchases, but the refinery throughout was over 13 million barrels in 1942-43 and 12,827,100 barrels in the succeeding year.

Throughout the war supplies of steel have been based on obtaining the maximum immediate output per foot drilled and development has got badly out of balance with output. In consequence, the company is faced with a considerable programme of exploration into less developed areas and deeper horizons. In addition, heavy outlays will be necessary to catch up with deferred repairs and replacements. There is no immediate danger of any fall in output below pre-war standards, but wartime figures may not be repeated. As to profits, these must depend largely on post-war price levels.

Farm Wages and Prices

Farm workers have recently been awarded 5s. of the 25s. wage increase which they have been claiming. The new national minimum wage of 70s. per week is more than double the pre-war average minimum wage of 32s., although it is still low enough in comparison with industrial wages to bear out the claim of Mr Hudson—and the farm workers—that the services of primary producers are disproportionately undervalued.

The effects of the wage increase can be seen in the new range of agricultural prices, fixed under the recently introduced machinery for annual consultation during the next four years between the Ministry of Agriculture and the National Farmers' Unions. The machinery has apparently worked smoothly, and farmers are reported to be satisfied with its results. The provision for an increase of 5s. per ton of sugar-beet and of 10s. per ton of potatoes grown for the 1945 harvest indicates both how expensive of labour are these crops and how important it still is to minimise imports of bulky foodstuffs. There is to be no change in the price of cereals, for which compulsory cropping orders are already being relaxed. It is possible that no compulsory cropping orders will be issued for the 1946 harvest, in which case this year's increase in the price of potatoes and sugar-beet will be withdrawn and the acreage payment on wheat and rye reduced from £4 to £2.

The new range of prices indicates the beginning of a transition to greater emphasis on livestock and livestock products, most of which are awarded a price increase, including, significantly, fat pigs and eggs. Milk receives an increase of 4d. per gallon. In view of the continuing need

to expand winter milk production, it is to be hoped that this increase will be spread differentially throughout the year.

The improved prices offered for livestock products will encourage farmers, if they are allowed to do so, to grow more crops for feeding to livestock instead of for human consumption. It is possible that the total arable acreage will not fall for several years. The NFU have expressed their determination to maintain the wartime volume of food production, while changing its emphasis by rehabilitating pig and poultry production. The desirability of reducing crops grown for human consumption appears to have been accepted, conditional upon livestock encouragement; but the test of the present agreed agricultural policy will come when cheap imports of feeding stuffs, and of bacon and meat, are once more available.

Manpower Statistics

The number of men and women of working age (in Great Britain) in the Forces, Women's Services, Civil Defence and Industry at the end of 1944 was 21,713,000, compared with 21,956,000 in mid-1944 and 22,265,000 in September, 1943, the peak period of mobilisation. The decline in the case of men is due mainly to war casualties and in the case of women to the increased rate of wastage. The numbers unemployed at the end of 1944 were 130,000, compared with 102,000 in the middle of the year.

The total number of men and women in the Armed Forces reached its peak at the end of 1944 with 4,983,000—4,526,000 men and 457,000 women. This represents an increase of 14,000 over mid-1944 and a progressive increase since 1941, when it was 3,374,000. In 1939 the number was only 477,000.

The labour force in industry at the end of 1944 was 16,517,000—the lowest figure of the war—10,072,000 men and 6,445,000 women. The peak of the industrial labour force was reached in the middle of 1942, with 17,494,000. The decline was greatest in the munitions group, which had 4,758,000 compared with the peak of 5,233,000 in mid-1943.

The number of workers in basic industries and services (agriculture, mining, transport, shipping, etc.) was 5,685,000 at the end of 1944, a decrease of only 1,000 over mid-1944 and an increase of 53,000 over mid-1943. This group remained fairly steady throughout the war. Group III (less essential industries), which includes building, distribution, manufacturing for civilian consumption, began to recover some of the labour force which it had lost. This group comprised 9,277,000 workers in 1939 and was reduced by one-third to 6,008,000 in mid-1944—at the end of 1944 the figure was 6,074,000 and is progressively increasing.

Company Result

Dorman, Long.

	1942	1943	1944
Profit after tax*	1,058,397	1,106,938	1,144,828
Directors' fees	12,167	13,000	13,000
5% Debenture stock interest	194,346†	193,047	44,957
Other Deb. interest and sinking funds	46,075	46,061	46,065
Depreciation	275,000	275,000	275,000
Pension fund	15,000	15,000	15,000
Preference dividends	238,803	238,803	238,803
Preferred ordinary dividend	82,110	82,110	82,110
Ordinary shares:—			
Earned	194,917	283,917	499,893
Paid	126,492	126,492	278,491
Earned %	14.9	25.3	16.5
Paid %	8	8	8
General reserve	65,000	150,000	1250,000
Carry forward	55,746	63,171	71,433
Net fixed assets	6,066,183	5,810,430	5,516,181
Net inter-company items	1,521,685	1,740,919	1,666,613
Net liquid assets	4,342,222	4,780,713	4,666,960
Gross liquid assets	7,639,552	8,577,707	8,705,587
Total share capital	5,615,243	5,615,243	7,515,243
Ordinary share capital	1,581,148	1,581,148	3,481,148
Mortgage and prior lien stock	4,066,768	4,066,945	984,926

* Including income from subsidiary and associated companies. † Including £39,172 to sinking fund. ‡ Including £106,860 surplus arising from past years.

The £1 ordinary shares, standing at 27s. 3d. ex dividend, yield £5 17s. 4d. per cent.

It should be noted that £44,957 has been paid during the year ended September 30, 1944, in respect of interest on the 5 per cent Debenture Stock which was redeemed in November, 1943. Since the whole of the 1,900,000 new £1 ordinary shares, which were created to effect this debenture redemption, participate in the 1944 dividend, the effect of the 1944 figures is to undervalue the normal earning power of Dorman, Long ordinary capital. Ignoring 5 per cent debenture interest, earned for ordinary in 1944 would work out at 13.6 per cent.

COMPANY MEETINGS

TEMPERANCE PERMANENT BUILDING SOCIETY

RECORD FIGURES

MR CYRIL W. BLACK'S REVIEW

The 91st Annual Meeting of the Temperance Permanent Building Society was held, on the 15th instant, at Wigmore Hall, London, W.1.

Mr Cyril W. Black, F.S.I., F.A.I., J.P., chairman of the Society, in the course of his Speech said:—

The year which has recently closed is probably one of the most memorable in the Society's history as, in spite of the many difficulties arising from the war situation, it has witnessed outstanding progress in every branch of our activities. May I draw your attention to the major developments which have made the past year exceptional.

TOTAL ASSETS

(1) The total assets of the Society have risen by £1,663,000 to a figure in excess of £8,200,000—a record in our history. On the other side of the Balance Sheet are the amounts due to Shareholders and Depositors which have increased by an approximately similar amount, to a new record total of £6,958,000.

Members might like to be reminded that we are still open to receive investment monies at 2½ per cent. per annum interest in the case of Shares, and 2 per cent. per annum interest in the case of Deposits, Income Tax paid by the Society in each case.

RESERVES

(2) Our reserves, including the balance of profit carried forward, amount to approximately £1,138,000 a higher figure than ever before. These reserves represent over 16 per cent. of the aggregate share and deposit capital, or over 24 per cent. of the share capital only, the latter being the manner in which the reserve ratio is calculated by some other societies. In this respect the Society continues to occupy the premier position among all National Building Societies, its reserve ratio being much in excess of that of any of its competitors. Our cash and investments total nearly £1,700,000, again a record, this representing, in the view of your directors, a substantial and satisfactory degree of liquidity.

ADVANCES

(3) The amount advanced during the year was over £1,550,000, easily a record in our history. The highest amount ever previously advanced was in 1936 when the mortgages completed totalled approximately £1,296,000.

The volume of mortgage business transacted also compares favourably with that transacted during the same period by any of our competitors. It should be noted that the great majority of the loans made during the year were of comparatively moderate amounts on properties being purchased for personal occupation, and not, to any great extent, on large blocks of property. I am glad to be able to inform members that we have not relaxed in the slightest degree those standards of prudence which it has always been our custom to observe in considering applications for advances. In all, we received during the year applications for mortgages of an amount of approximately £3,306,000 and the figure actually advanced represents only a little more than 50 per cent. of this amount. These figures well illustrate the fact that we have not been reckless or imprudent but have applied rigid tests to all applications made to the Society and have only accepted business with which we have been completely satisfied.

(4) Our policy of securing and opening

Regional Offices in districts which we have regarded as suitable for the extension of our business has been continued during the year. It may be of interest to members to know that the mortgage money which we are at present advancing is being put out approximately half in the Greater London area, and approximately half in other parts of England, and in Scotland and in Northern Ireland. We are thus securing that spread in our securities which is generally regarded as making for strength and stability.

(5) During the year the society has acquired No. 227 Regent Street which, together with Nos. 223 and 225 Regent Street, previously acquired, will make a future dignified and worthy head office for the society.

PROFIT AND LOSS ACCOUNT

Turning now to the profit and loss account, you will find on the income side that increase in the income from borrowers and from investments which would be anticipated from the increased funds invested both in mortgage securities and in other investments. On the expenditure side of the account, the management expenses have risen, largely as a result of the opening of additional regional offices, and the increased cost of advertising and commission which it has been necessary to incur in order to achieve such a satisfactory increase in our mortgage business. Interest on deposits has risen consistently with the increase in the volume of our deposits. The liability for taxation has remained substantially unchanged. The balance carried down to appropriation account shows an increase of nearly £9,000. We have transferred to general reserve fund a sum of £15,000 (raising this fund to £965,000), and to contingencies fund a sum of £5,225 (raising this fund to £155,000), and have carried forward an amount of rather more than £18,000. Our ability to strengthen our reserves is severely curtailed by the heavy burden imposed for taxation and our share of our borrowers' war damage contributions. While taxation remains on its present crippling scale it is difficult for business undertakings to make adequate additions to reserves.

SATISFACTORY PAYMENTS BY BORROWERS

I am glad to be able to inform you that our borrowing members are continuing to honour their obligations satisfactorily. In many cases combined family incomes are higher to-day than ever before and this is reflected in the fact that the great majority of our borrowers are meeting their payments without difficulty and in many cases are making repayments in excess of their legal obligation. In cases of difficulty we have done our utmost to meet the requirements of members by modifying capital repayments to meet altered circumstances, and I have no hesitation in stating that there has never been a time when we have enjoyed more harmonious relations with our borrowers than to-day. We are continually receiving letters of appreciation from members for the help and consideration afforded to them in any periods of difficulty in which they may have found themselves.

Such properties as are in the possession of the society, or are being administered by receivers appointed by us, are, with very few exceptions, satisfactorily let. The net income received is in nearly every case adequate both to meet the interest on the mortgage money outstanding and to pro-

vide a surplus which is applied year by year to the reduction of the capital. In nearly every case, as a result of the general increase in property values, the securities could be readily realised for a sum more than sufficient to discharge the outstanding mortgage debt.

It would not be fitting for me to conclude my remarks without expressing the appreciation of my colleagues and myself to the general manager, Mr Ronald Bell, and all members of the head office staff, and also to the regional office managers and members of their staffs. The very satisfactory results of the year have not been achieved without unprecedented efforts on the part of all concerned. Those of you who are engaged in business of any kind are aware of the tremendous difficulties inherent in the present situation. The general manager has borne a heavy burden of responsibility and the successful inauguration of the regional offices has made great additional demands upon his time and energy. To him and all those associated with him our best thanks are due.

BUILDING SOCIETIES AND HOUSING

He would be a bold man indeed who would attempt to forecast the shape of things to come; with this one prophecy I will content myself, that the future housing needs of the nation will require the utmost that the building society movement can give and that it will be found that building societies will be called upon to play an even more important part than any they have fulfilled hitherto. Your directors are determined to do their utmost to maintain the outstanding prestige of the Society and to extend its sphere of usefulness both to investors and to borrowers.

The directors' report and statement of accounts were adopted.

SCOTTISH LIFE ASSURANCE

ROCK-LIKE STRENGTH OF LIFE OFFICES

SIR JOHN LORNE MACLEOD'S SPEECH

Sir John Lorne MacLeod, chairman of the board of directors, presided at the annual meeting of the Scottish Life Assurance Company, Limited, held in Edinburgh on Wednesday the 14th instant.

In moving adoption of the report and accounts for the year 1944, the chairman said:—

This is our sixth wartime report, and I am sure we all trust it will be the last—so far at least as the war in Europe is concerned. We are witnessing to-day many far-reaching changes in our national life which have been precipitated by the war—some good, some not so good—but we are also witnessing proof of the remarkable strength of our great financial institutions which are standing up to the strain of war with unimpaired, perhaps even with enhanced, reputation. Among them the Life Assurance Offices of the country are again showing a rock-like strength, for twice within a generation have they been called upon to absorb the shocks of a world upheaval. Nothing short of a disastrous defeat, happily no longer to be imagined, can now imperil the security on which our policyholders rely. Truly a life assurance policy is a bulwark against adversity, and never is this better brought home to us than at the present time.

MODERATE ADVANCE IN NEW BUSINESS

The net new business of £772,000 shows a moderate advance on the amount written in 1943. This means that the branch secretaries and agents with whom they work have acquitted themselves well, for in these days when the procuring of new business is faced with so many obstacles it is an arduous task to keep up the returns.

While on the topic of new business, I

take the opportunity to mention that since the close of the accounts it has been decided to modify the operation of the war clause which it is customary to insert in life policies, so far as it concerns new policy-holders and those who have joined us since the beginning of the war. The new privilege extends full cover to civilians against war risks so long as the policy-holder is on land within the limits of Great Britain, Northern Ireland, Eire and the Isle of Man, and it applies to both with and without profits policies in the main classes of assurance. This move has been prompted by the greatly improved military situation, and the view that it is sound is shared by a steadily increasing number of other life offices.

PREMIUM INCOME WELL MAINTAINED

The premium income is being well maintained despite the difficulty of war-time conditions. The figure this year is approximately £629,000, which includes a renewal premium income of £608,000, practically the same amount as in the previous year. Interest received, less tax thereon, appears as £319,067, and shows a net return on the invested funds of £3 8s. 2d. per cent. The gross return before deduction of tax is £4 10s. 11d. per cent. We may take it as a matter of congratulation that considering the large amounts annually invested in new Government issues which yield on the average less than 3 per cent. gross, the overall yield on the company's funds has not been more adversely affected. Turning to the other side of the account, the death strain, even allowing for the inclusion of many claims directly due to war operations, is within the figure which we would expect in peacetime. Claims arising from matured endowment assurances have reached £451,000. Surrenders are again extremely low, while commission and expenses of management have further contracted, working out at 12½ per cent. on the premium income.

TOTAL ASSETS TOUCH £10,000,000

Coming now to the balance-sheet you will see that the life assurance and annuity fund stands at roughly £9,568,000, representing an increase of £86,000 during the year. For the first time the total assets of the company have touched £10,000,000. Our holdings in British Government securities now total £2,821,000, which is 28 per cent. of the company's total assets, or 32 per cent. of the marketable securities included therein. During 1944 the upward movement in Stock Exchange prices generally has continued and our margin of appreciation over book values is now, I think, amply sufficient to take care of any possible shrinkage in values which may occur during the period of transition to a peace-time economy, even if such shrinkage should be substantial.

The motion, having been seconded by Mr William Lawson, was adopted.

CONSOLIDATED MINES SELECTION COMPANY, LIMITED

The 49th ordinary general meeting of this company will be held, on the 20th instant, at the Institute of Chartered Accountants, Moorgate Place, E.C.

The following is an extract from the statement of Mr S. S. Taylor, C.M.G., D.S.O. (the chairman), which was circulated with the report and accounts:—

The net profit for the year was £123,152, to which has to be added the balance brought forward from 1943 of £24,077, giving an amount of £147,229.

The dividend recommended by the directors is 13½ per cent. actual, equivalent to 1s. 4½d. per 10s. unit of stock, less income-tax (after allowing for Dominion income-tax relief) at 4s. 9½d. in the £, being the dividend for the year ended December 31, 1944.

MIDLAND COUNTIES ELECTRIC SUPPLY COMPANY, LIMITED

PROGRESSIVE RESULTS

MR WILLIAM SHEARER ON NATIONALISATION

The thirty-second ordinary general meeting of Midland Counties Electric Supply Company, Limited, was held, on the 15th instant, at Winchester House, Old Broad Street, London, E.C.

Mr William Shearer (the chairman) presided, and in the course of his speech, said: The rate of progress which we achieved in the immediate pre-war years has been maintained, not of course in the number of new consumers, but in the annual increase of load connected to the system and in the number of units sold to consumers. We are satisfied that we are very far from saturation in our areas and that, given reasonably normal conditions, a very substantial increase in the number of consumers may be expected.

Notwithstanding the anticipated loss of the war-time load a substantial replacement should be effected from increased domestic supplies, etc., shops, business premises, and new and additional supplies to the farming community.

COAL POSITION

In considering electricity charges it must be borne in mind that our raw material is coal, and that its present cost delivered at power stations is more than double the immediate pre-war price.

Apart from this enormous increase in price, the quality of the coal delivered has deteriorated to an alarming extent, affecting the efficiency of power stations and involving additional heavy expense in coal and ash handling and in boiler maintenance.

The generation of electricity has conferred great benefits on the coal industry, but the continuous rise in prices with the abnormal and extraordinary variations in quality and type of the coal supplied, largely attributable to the existing Government control of that industry, constitute a very real handicap in the efficient operation of electricity undertakings and militate against further reduction and uniformity of charges to consumers.

It has been decided to discontinue making a charge for service connections in respect of service lines not exceeding twenty yards of underground cable or fifty yards of over-head line.

Our tariffs to-day are most attractive, the average price for domestic supplies taken under the two-part tariff being as low as 1.4d. There are scarcely any commodities coming into the household to-day that are cheaper than in the pre-war period, but electricity, so far as domestic supplies in our areas are concerned, holds that almost unique position.

TAXATION AND DIVIDEND COMPARED

In reviewing the results of all our operating companies, I cannot refrain from calling attention to the contribution we have made to the National Exchequer and local government in the form of rates and taxes. Out of our total trading profits for the last five years we have paid or provided for this purpose no less than 3½ million pounds, whereas during the same period the distribution by way of dividends to holders of Ordinary stock amounted to £618,000.

These figures, read in conjunction with our low scale of charges to consumers, surely indicate how utterly misleading is a statement contained in the Socialist Party's manifesto of May, 1944, setting out its post-war policy for coal and power,

reading as follows: "The solution of the power companies is the monopoly of control for the benefit of the shareholders; ours is the solution of public ownership and control for the benefit of the community."

NATIONALISATION PROPOSALS

As the future of our industry has become the subject of controversy, I make no excuse for referring again to certain proposals for nationalisation and public control, on which I gave you my views at length a year ago.

The proposals outlined in certain quarters affect many branches of British industrial life, but it would appear that a few key industries, including our own, have been chosen as special targets by those who desire to create huge State monopolies involving a large extension of the bureaucracy with a consequent increase of political patronage.

The argument is sometimes advanced that if the revolutionary changes proposed were adopted, existing efficient managements would be retained under any scheme of nationalisation, and that, therefore, the benefits of both State ownership and private enterprise would be enjoyed. This is a specious argument, as I imagine that few men of enterprise, trained in business management, would consent to work permanently under the harassing conditions of Government control. No doubt a few would agree to carry on in these circumstances, but what of the next generation, brought up in the enervating atmosphere of rules, regulations, endless forms and returns?

The industry within 20 years would be run by men with a typical civil service departmental outlook, an excellent and very proper outlook in its own sphere, but not in industry. Everyone from the small shop-keeper to the big industrialist knows that whenever the Government enters into the realm of ordinary trading there is a hampering influence; decisions are not quickly obtainable and when given are often reversed. This is by no means a criticism of our permanent civil service, the reputation of which, as we well know, is unequalled anywhere in the world.

The Government can, of course, by reason of the powers which it properly and necessarily obtains in time of war, achieve stupendous results in the field of industry, but in time of peace similar methods would ultimately ruin the richest nation and render competition in the world's markets impossible. Nobody in the business world would suggest that the Government, except by arbitrary price-fixing arrangements, obtains the best value for money, judged by ordinary commercial standards.

The contention that the proposals I have referred to would improve and cheapen the supply of electricity to the people is, in my opinion, illusory. They are designed to place one of the most vital industries in the country under the power of a swollen and ever swelling bureaucracy.

PROPOSALS OF THE INDUSTRY

I mentioned last year that every responsible person engaged in the direction of our industry recognises that certain important changes affecting the distribution of electricity are both desirable and necessary, and having enumerated what these changes were, I expressed the view that they could be effected by relatively simple enactments which would avoid a long period of dislocation, if not, indeed, years of chaos. The power companies incorporated all their proposals in this connection in a well-considered memorandum which was submitted to the Minister of Fuel and Power in November, 1943. In the considerable interval that has elapsed, we have become more than ever convinced that these proposals, if adopted, would effect such re-organisation as is required in the interests of the public.

The report and accounts were adopted.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

MR V. A. GRANTHAM'S STATEMENT

The ninety-first ordinary general meeting of the Chartered Bank of India, Australia and China will be held at the bank's head office, 38 Bishopsgate, London, E.C. 2, on Wednesday, the 28th instant, at noon.

The following is the statement by Mr V. A. Grantham (chairman) circulated to the shareholders, with the report and accounts: Recent developments in the Pacific War raise hopes that, by next year, it will be possible to furnish you with more up-to-date information regarding the position of our branches in the Philippines and possibly of branches in other territories in the Far East. Full provision has been made for all bad and doubtful debts at agencies under our control and, as formerly reported, we have made substantial provision for possible losses at agencies and branches now in enemy hands.

The figures of the balance sheet are greater than on any previous occasion, the total at £95,564,109, showing an increase of £6,645,851 over that of last year. Certain alterations in the form of the balance sheet have been made, at the suggestion of the auditors, but changes of importance are few, however, and on the liabilities side are confined to current and other deposits, which are up by £7,839,772. This increase is offset on the assets side by increases in cash, in Government and other securities, and in bills of exchange, including Treasury bills, of £4,297,429, £2,357,094 and £1,772,924 respectively, while the balance of remittances, drafts, etc., in transit between head office, branches and agencies, etc., has decreased by some £1,992,361. The ratio of cash to our "call" liabilities is 23.2 per cent., and if Government and other securities, which mainly consist of short-dated securities, and bills of exchange, including Treasury bills, are included, the ratio is 82.2 per cent. The figures relating to enemy-occupied Agencies and Branches are included in these totals, but as these are identical with those included last year, it will be clear that the substantial increases noted above occurred at the agencies where we continue to be actively represented and will help us to meet, without any undue strain, the needs of our clients during the approaching period of reconstruction.

PROFIT AND LOSS ACCOUNT

The profit for the year amounts to £320,999 18s. 3d., which I trust, in view of the conditions ruling throughout the world, you will consider satisfactory. We brought forward from last year a balance of £371,372 1s. 11d., so that we have a total of £692,372 0s. 2d. to deal with. An interim dividend at the rate of 5 per cent. per annum for the six months to June 30th was paid last year, absorbing £75,000, and we propose that a dividend for the half-year to December 31st last at 5 per cent. per annum, costing £75,000, should be paid; that £50,000 be transferred to the Officers' Pension Fund and £5,000 to the Widows' and Orphans' Fund; that £100,000 be set aside on account of contingencies, and the balance of £387,372 0s. 2d. carried forward.

Your board is not unmindful of the interests of the stockholders, who have been so patient during the difficult days of war, but until the re-organising of our branches in the Far East enables us to be sure that the provisions against losses which we have made are adequate, you will agree that it is best to follow a conservative course in the allocation of profits.

INDIA

In the space at my disposal it is impossible to present a complete review of the year in India. Industry throughout the country has continued to operate to capacity and there is a large unsatisfied

demand for imports of almost all kinds. Mercifully there has been no recurrence of the famine conditions experienced in Bengal and although the cost of living remains at a high level, the inflationary tendencies noted in my last year's statement have been controlled, in spite of increasing expenditure within the country by Britain and the U.S.A. on the war effort.

The sterling balances of the Reserve Bank of India continue to mount, and, although since March, 1944, some proportion of the country's net surplus of exchange earnings in currencies other than sterling has been retained by India, this represents no final solution of the problem involved. In the final issue these balances can only be settled in terms of exports from Great Britain, and much goodwill on both sides will be required to arrange ways and means for orderly and gradual liquidation, which may have to be extended over a long period of years, if dislocation of the exchanges is to be avoided. There would, however, appear to be no reason why these balances should not be used to help in establishing wider trade between the countries of the British Empire within the sterling area.

CHINA

The position of China is in striking contrast to that of India. China has been ravaged by war for 7½ years and cut off from contact with the outside world, save by air, for three years. Many of the richest provinces and most of the railways are in Japanese hands, and it is not surprising that China's internal economy and finances should be strained almost to breaking point. Yet China has never faltered in resisting the Japanese aggressor and now that the progress of the war in Burma and in the Pacific holds promise of early relief, it is to be hoped that the Japanese armies will soon be forced to withdraw and allow China to face the problems of reconstruction.

THE OUTLOOK

Dependent as we in this country are upon imports for our very livelihood, no excuse is necessary for stressing also the importance of exports—in other words, of two-sided trade. I need hardly remind the stockholders that the bank was founded nearly a century ago for the purpose of providing an effective mechanism for financing British trade with the East, and we are determined that it shall continue to provide the skilled and specialised financial service that it has given in the past. Our branch system, which it is our full intention to restore, in normal times covers thirteen Asiatic countries and facilitates enormously the transaction of business between British exporters and their customers, and between importers of Eastern produce and their suppliers. The advantages of conducting the settlement of an overseas trade operation through a single British bank are obvious. Daily contact with our branches provides us, in London, with first-hand economic information not readily available elsewhere. Our credit and market information services are well organised and made freely available to the trading community. In these and in other ways the bank is performing a constructive and indispensable function.

His Majesty's Government have announced their intention of promoting the expansion of the export trade of this country immediately a substantial transfer of man-power becomes possible. The British trading and industrial communities have lost none of their traditional qualities of energy, enterprise and resourcefulness and only ask to be allowed to exercise those qualities with as little restraint as possible. This bank is prepared to do all in its power to assist them in the rehabilitation and expansion of the Eastern section of this trade.

THE EASTERN BANK, LIMITED

SIR JAMES LEIGH-WOOD'S STATEMENT

The annual general meeting of The Eastern Bank, Limited, will be held on the 21st instant in London.

The following is an extract from the statement of the chairman, Sir James Leigh-Wood, K.B.E., C.B., C.M.G., circulated with the report and accounts for the past year:—

A very welcome improvement in the speed of mails from the East has enabled us to present to you our report and accounts for 1944 with all the promptness of pre-war years. We have thus been able to revert to the former practice of recommending a final dividend for your approval at the general meeting to be held on March 21st, instead of declaring a second interim dividend prior to the meeting. The rate of 3s. per share proposed for the final dividend will make the total distribution for the year equal to 5½ per cent. as for 1943 when the figures shown were within two hundred pounds of the present net profit of £98,704 14s.

RESERVE FUND

In pursuance of the policy to increase the published reserve fund the board have appropriated £50,000 from the net profit and a further £50,000 from contingencies account bringing the fund up to £700,000. After allowing for the interim dividend paid in October and the final dividend now proposed, the balance of profit to be carried forward will be £72,876 2s. 1d., against £79,171 8s. 1d. brought in.

I referred last year to the sale of our freehold properties in India and I am glad to inform you that we have satisfactorily disposed of all but one of about £30,000 book value, yielding a good revenue.

As customary the figure of net profit was reached after appropriations to the credit of contingencies account, out of which account provision has now been made for all remaining assets in Singapore except balances with other banks there. While it is hoped that the assets thus written off are not irretrievably lost, it was considered prudent to face an unfavourable outcome.

Of other changes in the balance-sheet the most striking by comparison with the figures of the preceding year is the reduction in liabilities on current and deposit accounts of some £1,375,000 which is reflected in the smaller holding of cash by £735,425 and of bills receivable by £695,357. These changes were in fact transitory, record higher levels being reached in the first few days of January. Our holding of Government securities is greater by £300,000—in round figures—and there is a slight increase in advances to customers.

THE OUTLOOK

After reviewing conditions in India, Ceylon and Iraq, the statement continues:—

Our profits are now largely derived from interest on Government securities, the wherewithal having been provided by the great increase in deposits. While such investments result in assured returns, trade and commerce are not thereby encouraged and nourished as they would be from loans and bills of exchange to finance the manufacture and movement of goods.

With the cessation of hostilities this country will enter a period of reconstruction calling for co-operation and good will in every direction. With the long experience and adaptability of our manufacturers and merchants and the skill of our craftsmen we should win through, although the road will be long and hard. The recent vigorous speech of Mr Brendan Bracken was encouraging, and as gradually the fetters on trade imposed by the war are removed we shall hope to return, step by step, to our long held position as a great exporting nation,

BANK OF AUSTRALASIA

CONTROL PROBLEMS

MR D. F. ANDERSON'S STATEMENT

The 111th annual general meeting of the Bank of Australasia will be held, on the 22nd instant, at 4 Threadneedle Street, E.C.

The following is an extract from the statement of Mr D. F. Anderson, the chairman, which was circulated with the report:

As for the results for the year, comparison is difficult because this year we have provided out of the current year's profits for the taxation on them which we shall have to pay when due. We propose to adopt this practice in future.

BALANCE SHEET VARIATIONS

The balance-sheet variations follow the now usual trend, which merely reflects the financial policy and control of the Australian and New Zealand Governments during the war. Deposits are up and advances are down. Government securities and the Special War-time Deposit Account with the Commonwealth Bank of Australia are up. As a natural consequence of all this our advances to customers are now 44.21 per cent. of total deposits, including fixed deposits, compared with 55.73 per cent. last year, and 88 per cent. as an average over the three years to October, 1939. In other words, our funds are largely in direct Government service, and the employment of that part of them which is not borrowed by Government is closely controlled.

This is no place to review our future policy in detail, but in general we believe that the trading banks can make a great contribution to the further development of Australia and New Zealand alike. Whether in fact they will do so depends not wholly, and indeed not chiefly, on them. If they are to give of their best, their attitude must be dynamic, rather than static, but no enterprise can undertake the risks of a dynamic role if it is tied down to rewards which are sufficient only for a static part. Nor can banks make their proper contribution towards development if they are regarded by their Government as, at best, co-belligerents. Unless they have the confidence and scope extended to Allies, the service they can render particularly in an expanding community, by supporting the growing tree until it is well rooted, is greatly limited.

GOVERNMENT AND TRADING BANKS

The Commonwealth Government has recently announced its intention of acquiring full control of the Commonwealth Bank, using it as an active competitor for the business hitherto carried on by the trading banks, and of giving permanence to the war-time controls over these latter. The Government does not intend to nationalise the trading banks, and the general effect of this policy on our future will perhaps be determined as much by the spirit in which the competition and controls are exercised as by the legislation itself. If the Government has no use for us it will be in a position to make our business unprofitable. If, as I hope, it believes us to be an asset to Australia, then we need not fear the future. I make no comment on the specific legislation to retain war-time controls, since none has yet been introduced. But I do suggest that the argument—ignoring political shibboleths—behind such legislation is that Australia lacks capital and labour for immigration and development, and must therefore devote all she has to purposes deemed proper by Government. None must be "wasted." But will Australia attract people and capital on these terms, if greater scope and freedom is obtained elsewhere?

NEED FOR MODIFICATION OF EXCHANGE CONTROL

It would seem far more promising to attempt to increase the pool rather than to

canalise rigidly what exists, and perhaps the first step of all towards encouraging new capital to flow in would be to modify the Exchange Control which does not even permit of capital being remitted to London. The Exchange Control was introduced under financial conditions which appear since almost to have reversed themselves. Its retention, far from serving any Australian interest, seems now to be an anachronism and merely discouraging to new capital which is timid of entering any field which is marked "no exit."

VALUE OF INITIATIVE

As for the effect of full Government control, on individual or "company" enterprise and initiative, opinions differ. But I do not believe, for instance, that Broken Hill Proprietary, that great enterprise, would have done what it has for the industrial advance of Australia but for the initiative of individuals who had ideas, energy, and skill and were allowed the scope to drive them forward over these many years. Whether the growth of Broken Hill Proprietary would have been more or less impressive if its dealings with its bankers since 1885 had been under strict Government control, it is perhaps particularly immodest for the Bank of Australasia to speculate, but the answer is relevant to the issue.

THE SCOTTISH PROVIDENT INSTITUTION

VERY SATISFACTORY RESULTS

At the 107th annual general meeting of the Scottish Provident Institution, held in Edinburgh on the 13th inst., the Chairman, Sir Ernest M. Wedderburn, LL.D., D.K.S., referred to the very satisfactory results for the year 1944. The net new sums assured, £1,251,327, the net new premiums and the total premium income all showed increases on the previous year's figures, and the interest yields both gross and net had also risen, while the expense ratio had fallen. The claims by death were the largest yet recorded, but the increase being largely due to the steadily increasing new business was not a matter for concern: after excluding war claims the amount was less than that expected by the most recent mortality tables.

The intermediate bonus of 7½ per cent. per annum in the Special Endowment Assurance Fund and the special intermediate bonuses to policies in the common fund due to share for the first time as at December 31, 1943, and subsequently becoming claims after completion of the accumulation period were to be continued. It was not proposed, however, to resume payment meantime of intermediate bonus on policies in the common fund which had already shared in surplus.

RISING SECURITY PRICES

There was an increase of nearly half a million pounds in British Government securities, and as a result of rising security prices the favourable margin between the market and book values of Stock Exchange investments had further increased.

The directors were giving careful consideration to the part which the institution in common with other insurance offices could play in financing industry in the immediate postwar years, and were prepared to participate in any scheme commending itself to them as in the national interest and at the same time justifiable from the institution's point of view. The immensity of the problems involved in post-war finance needed no emphasis, but it was clear that the sums required for new capital outlays would have to come mainly from current savings. Life assurance was still the ideal form of saving out

of personal income. It was made especially attractive by the rebate of income-tax allowed on premiums, and the periodical payment of premiums made saving systematic.

The report and accounts were adopted.

OROVILLE DREDGING COMPANY, LIMITED

MR F. W. BAKER'S STATEMENT

The thirty-third ordinary general meeting of this company was held, on the 13th instant, in London, Mr Fredk. W. Baker (the chairman) presiding.

The following are extracts from the chairman's statement circulated with the report:—Our main active interests are still the dredging operations in the Republic of Colombia, South America, carried on by Pato Consolidated Gold Dredging, Limited, and Asnazu Gold Dredging, Limited. These operations are being conducted successfully despite wartime difficulties. The former company paid two dividends during the year, each of 15 cents, and a further dividend of 15 cents has been received since the close of our company's year. The Asnazu Company, while operating successfully and making profits, did not declare a dividend, as there was apparently a shortage of liquid resources, due to the necessity to repay loans. We are hopeful that this position will improve, when we might once again look forward to receiving dividends on our holding of 615,000 shares.

For the six months to November 1, 1944, Pato Consolidated dredged 4,937,000 cubic yards for a recovery of 65,780 oz. of fine gold, and recovered with its hydraulic units 4,579 oz. of fine gold, the value of the production being \$2,462,565 U.S. Making a simple arithmetic comparison of the value of the recoveries for the six months, with a half of the total for the whole of the year to April 30, 1944, there was an increased production of about a third. The relative figures for Asnazu are 2,727,600 cubic yards dredged for a production of 16,552 oz. of fine gold, equivalent to \$579,320 U.S., which almost exactly equals half the total production for the previous year. The successful results of these two companies must not be allowed to hide the fact that operations are carried on with considerable difficulties, due on the one hand to restrictions of supplies caused by the war, and on the other to local legislation, which remains onerous and in some respects may become more so. Both these factors tend to increase total and yardage costs. The directors of Pato Consolidated contemplate installing two large dredges, each to handle approximately 6,000,000 cubic yards annually, and one small dredge for special work, as soon as world conditions allow. I would draw your attention to the substantial dredging reserves of this company. In addition to the yardage shown, there are large areas of potential dredging ground as yet untested, the drilling of which, on a reduced scale, is proceeding. Both these companies, Pato Consolidated and Asnazu, and particularly the former, are continuing on a very satisfactory basis. The supply position has somewhat improved, and, if this is maintained, it is hoped that dredge No. 5, which is one of two dredges shut down since November, 1942, may be able to resume operations within the near future.

Our interest in Bulolo is represented by 60,680 shares. During 1944 a party of engineers made a detailed report on the condition of the dredges and other equipment. The eight dredges were found to be in good structural condition, although some of the equipment on them is damaged or missing, and will have to be replaced. The Bulolo Company has substantial funds in Australia, and the rehabilitation of the field buildings and equipment will be commenced as soon as conditions permit. The report was unanimously adopted.

INDUSTRY AND TRADE

January Retail Trade.—After the high level of sales in December, there was a sharp drop in January. The index (1942=100) for total sales was 95, compared with 128 in December and 105 for the whole of 1944. Nonetheless the average daily sales were 4.1 per cent above January, 1944. In the sixth and last month of a coupon period it was to be expected that apparel sales would drop. The apparel index was 74, compared with 114 in December and 87 for the previous twelve months. As can be seen from the table on this page, turnover was higher than the year before. The number of coupons taken was 4 per cent greater, and the average takings per coupon about as high as they ever have been. Stocks were again considerably lower than the year before, although there was a slight recovery in clothing stocks, probably due to the lower purchases during the month.

"The Economist" Sensitive Price Index.—The crops component of the index (1935=100) was 135.8 from March 7th, but on March 13th it rose to 140.3. The raw materials index was unaltered at 185.5 throughout the week. The complete index had been 158.7, and on March 13th it rose to 161.3. The reason for the rise in the crops index and the complete index was the new price of wheat in store in Canada at Fort William and Port Arthur. A rise of 21c. was made to offset the reductions in quantities taken from farmers by the Canadian Wheat Board. No. 1 Northern Manitoba from West St. John Halifax was therefore quoted on the Baltic Exchange at 163½c. a bushel.

FINANCE AND BANKING

THE MONEY MARKET.—The new issue of TDRs to the banks this week was raised to the record level of £150 millions. Prior encashments on a moderate scale reduced the level of effective maturities, and the amount of "fresh" money required at about £50 millions, though not a record, was sufficiently heavy to lead to expectations of a difficult credit position in the Discount Market. The strain was, to some extent, alleviated by the fact that a new high level of applications at the Treasury Bill tender again limited the allotment to the market to the low quota of 21 per cent. Unexpectedly heavy Government Department disbursements, however, were primarily responsible for the comfortable credit conditions which, in fact, prevailed. The Bank Return showed that, by Wednesday, Bankers' Deposits had been reduced to £190.8 millions, a drop of £13.4 millions on the week, but this is still a comfortable level in comparison with, say, the £176.5 millions of the first week in February.

Only a small amount of bills was bought by the banks during the week, however, despite the fact that the clearing banks' return for February shows a drop of nearly £20 millions in aggregate bill holdings over the month. The seasonal peak in payments of direct taxes together with a relatively high level of savings is responsible for the "true" fall of £57.6 million in the banks' deposits. There was a similar fall of £61.7 million in February last year. Money market assets, in contrast to TDRs last year, have borne the major part of the decline.

MONEY RATES, LONDON.—The following rates remained unchanged between March 8th and March 15th:—
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day:

(Continued on page 362.)

GOVERNMENT RETURNS

For the week ended March 10, 1945, total ordinary revenue was £57,737,000, against ordinary expenditure of £92,645,000 and issues to sinking funds of £235,000. Thus, including sinking fund allocations £15,169,279, the deficit accrued since April 1st is £2,642,876,000 against £2,611,918,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £76,083 to £2,815,103, the other operations for the week (no longer shown separately) increased the gross National Debt by £36,686,779 to £22,225 million.

IMPORTANT NOTICE

This world famed Sherry (formerly called Findlater's Fino) could not be registered under that name and there-
by protected from imitators. For the
safeguarding therefore of our world-
wide clientele we have re-named it—
Findlater's Dry Fly Sherry.

John Forbes, Manager.

THE ALEXANDRIA WATER COMPANY, LIMITED

ALEXANDRIA, EGYPT.

NOTICE IS HEREBY GIVEN that the sixty-seventh ORDIN-
ARY GENERAL MEETING of the shareholders will be held at
the company's offices, 61 Avenue Fouad Ier, Alexandria, on Thurs-
day the 5th April, 1945, at five o'clock in the afternoon for the
transaction of the ordinary business of the company, pursuant to
Act of Parliament.

Holders of share warrants to bearer desiring to attend or to be
represented at the meeting must deposit their share warrants in
London before the 22nd March, 1945, or in Alexandria before the
2nd April, 1945, until after the meeting, at the National Bank of
Egypt, 6 King William Street, London, E.C.4, or at the National
Bank of Egypt, Alexandria, or at some other approved bank in
London or Alexandria.

Dated, Alexandria, Egypt, the 26th January, 1945.

By order of the Board.

T. D. KEY

R. WALTON

Joint Managers.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in
Canada with limited liability).—NOTICE TO SHAREHOLDERS.
—The Sixty-fourth Annual General Meeting of the Shareholders
of this Company, for the election of Directors to take the places
of the retiring Directors and for the transaction of business
generally, will be held on Wednesday, the second day of May
next, at the principal office of the Company, at Montreal, at
12 o'clock noon. The Ordinary Stock Transfer Books will be
closed in Montreal, Toronto, New York and London at 3 p.m. on
Tuesday, the tenth day of April. The Preference Stock Books
will be closed in London at the same time. All books will be
reopened on Thursday, the third day of May.—By Order of the
Board, F. BRAMLEY, Secretary. Montreal, 12th March, 1945.

ECONOMIST AND BUSINESS RESEARCH.—Departmental
Manager, qualified engineer, wide general knowledge and
experience, 5 languages, dealing with home market and export,
modern management methods, technician and promotional litera-
ture, wants change to similar position with progressive firm.—
Box 59, *The Economist*, Brettenham House, Lancaster Place,
London, W.C.2.

WANTED, First-Class Private Secretary to go to Continent
with Senior Member of British Section of the Allied Control
for Germany. Good salary and allowances when abroad.—Apply,
in writing, stating age, experience, qualifications, etc., to Box 60,
The Economist, Brettenham House, Lancaster Place, London,
W.C.2.

EX-SCHOLAR King's College, Cambridge, 31, exempt military
service, 5 years' experience consumer and opinion research,
some knowledge economics, statistics, etc., seeks job with
prospects.—Box 61, *The Economist*, Brettenham House, Lancaster
Place, London, W.C.2.

Coalition and Compromise

MR CHURCHILL'S invitation to men of "every
party and of no party" to join him in a coalition,
first in a "caretaker" Government and later, after the
General Election, in a re-formed National Government,
has failed to evoke any response from the leaders of the
major political parties. Major Lloyd George, proclaiming
his independence from party politics, has already
announced his readiness to join such a coalition, but one
swallow does not make a summer—even the Indian
summer of a tired coalition. Without the support of the
Labour and Liberal parties, such a Government would
be no more "national" in character than was the National
Government of 1931.

It would indeed be surprising if the Prime Minister's
coalition call had met with any enthusiasm. It has created
something like consternation in certain sections of the
Conservative party, which are as eager to break with
Labour as the Labour party's left wing is to break with
them. There is no doubt about where the Labour and
Liberal parties, as parties, stand, whatever some of their
leaders may feel privately. Their recent conferences com-
mitted them to withdraw from the Government and fight
the election as independent parties. Nothing specific was
said at the Labour conference in December to prevent
Labour's representatives from rejoining a coalition after an

election, but this course could only be taken upon the
decision of a special party conference, in accordance with
Mr Attlee's pledge in 1943. To judge from the present
temper of the party, both in the House of Commons and
in the country, Labour could only give one answer.

The time-table now seems fairly definite. When the
war with Germany ends—and the general assumption is
that this will be within the next few months—the Labour
and Liberal parties will withdraw from the Government—
they may even do it sooner—and Mr Churchill will carry
on an interim administration of a Conservative com-
plexion, while each party completes its election prepara-
tions. Beyond that, all will depend on the election results,
which at this stage it would be idle to predict.

If any party gains a clear majority over its opponents,
there will be little talk of a coalition; but if the parties
run neck and neck, they might prefer to enter a new
coalition, rather than serve a fruitless term of minority
office. Such a stalemate, however, would be very unsatis-
factory and could not last long. It is difficult to see what
basis there could be for a durable all-party Government
after the war with Germany. It is true, of course, that the
Far Eastern war will call for continued national effort,
but the Japanese collapse may come sooner than has been
generally anticipated. It is also true that there will be

vast national tasks of reconstruction and resettlement, and that the new Parliament will inherit a legacy of unfinished plans, a mountain of White Papers to be translated into Acts of Parliament. But Mr Churchill's words to the Conservative conference might be paraphrased: "Never was there a time when so much was planned and projected with so little hope of being turned from paper into action." The delay in completing social insurance plans; the failure to reach agreement on land values, without which no town planning is possible; the housing muddle; the coal calamity—these are the fruits of coalition in domestic affairs, the inhibiting effects of the fear of producing controversy. The coalition is getting more and more threadbare. Every proposal for an effective alliance between industry and government is assailed by the Labour benches—and amended by their representatives in the Cabinet—on the ground that it is not socialism. The Prime Minister has refused to amend the Trade Disputes Act, because the Conservatives will not abandon the symbols of their victory in 1926.

Dilute compromise may be a necessary ingredient of domestic politics in wartime, but it would be a disaster as a permanent principle. The last twelve months have amply illustrated—if illustration were needed—the severe brake that is put on any practical progress by the necessity of attempting to reconcile the irreconcilable. The only hope of being able to confront with any success the vast problems of the post-war years is to have a Government that knows its mind and has a policy. It is true that a return to party politics does not automatically bring this about. It is further true that in foreign policy, and specifically in the negotiation of the peace settlement, a high degree of unity among the parties is desirable—and could be secured without a coalition. But the continuance of all-party government in home affairs, and particularly in economic policy, would inevitably mean flabbiness in policy and a painful toiling after events in place of an attempt to dominate them.

This would be true even if the parties evolved no better imitations of policies than they have done yet. For it is the clash of prejudices just as much as the clash of policies—perhaps even more so—that stultifies a coalition, and there is no lack of conflicting prejudices. Conservative Ministers feel themselves under an obligation to reject anything that smells of state ownership; Labour Ministers are under a similar obligation to assail anything that allows for private capital. Hence the attacks on the civil aviation proposals, regardless of their merit. Hence the coal deadlock.

But it is always possible that, in addition to their prejudices, the parties might acquire policies. There were some passages in the Prime Minister's speech last week

which sounded as if he were trying to evolve a set of principles for economic policy. "At the head of mainmast," he said

we [the Conservative party], like the United States, fly the flag of free enterprise. We are determined that the native genius and spirit of adventure, of risk-taking in peace as in war, shall bear our fortunes forward, finding profitable work and profitable trade for our people.

Amen to that. Any such sentiments will always evoke a cheer. But what do they mean? What does Mr Churchill mean when he says that the Conservatives "like the United States," fly the flag of free enterprise? He is surely not inviting the Labour party to say that "like the Soviet Union," they fly the flag of production for use and not for profit. If that was his intention, he would be doing his party an even greater disservice than his country. Does he mean that the Conservative party is now about to reverse its whole attitude and bless what it has hitherto condemned? For the Conservatives, as the record clearly shows, have been the arch-enemies of free enterprise in this country. In defending private ownership (an entirely different matter), they had, before the war, gone a long way to banish "the native genius and spirit of adventure." Risk-taking had been smothered under a blanket of protection, monopoly and restriction. If the Tories, under Mr Churchill's leadership, are now going to repent of their sins, if the "men of every party and of no party" are now to be hand-picked to exclude all the restrictionists, if the Prime Minister means by his reference to the United States that he proposes to introduce anti-trust and anti-cartel legislation—if, in short, the Tories are going to try to make capitalism work—then we shall indeed see a battle of principle in British politics.

But unfortunately the probability is that the Prime Minister meant none of these things. It is much more likely that, feeling himself in need of a peroratorical slogan, he borrowed one from that section of his colleagues—and personal associates—which is currently on the stump for "free enterprise" (a phrase that means "private ownership"), and that all that he was trying to say was that he was not a Socialist. If so, we are back in the slough of despond, desperately looking for a gleam of economic statesmanship. Mr Churchill could have been the salvation of the country, in peace as he has been in war, if he had refused to become a party leader in 1940. He might still have a chance, if he would stop using phrases that mean the opposite of what they say and apply some part of his mind to working out the high strategy of economic policy. But to paper over his own, and everybody else's, lack of general principles by talk of a coalition, which at best could only limp from one expedient to another, will get the country nowhere.

Permit their biggest concentration of strategic industry to lie in an area which might, in a crisis, even cease to be part of France. Inevitably, integration within France would mean the decline and impoverishment of the Rhineland, and therefore the turning of "Rhenish thought" obstinately to the East. And, quite apart from the inhibitions imposed on such a scheme by French conditions, it is obvious that France's allies in the West would not accept exclusive French domination.

The economic objections might be less strong to the inclusion of the Rhineland in a much larger economic unit in the West. If Holland, Belgium and France came together in a Customs Union, the unified market thus created would be based upon 73 million of the most highly-developed and prosperous peoples in Europe. If the United Kingdom were included within the Union, the figure would reach 120 million inhabitants, an economic area almost equalling that of the United States and including as large and varied a sum of resources as any other comparable economic bloc. In such a market, where full advantage could be taken of the division of labour and full employment could be planned without trammels and inhibitions, the Rhinelanders could find greater prosperity than was theirs by virtue of the German connection. If such a Western Customs Union were accompanied by a political federation—a United States of Western Europe—the political ambitions of the Rhineland could also be realised, since the Rhineland would be such a comparatively small part of such a union that it could safely be granted full equality of rights in its domestic concerns without any fear that it would dominate the federal policies. It is arguable that the attractive power of such a union would be so strong that Rump Germany would soon be seeking admission rather than the Rhineland its exit permit.

But who can pretend that an act of economic statesmanship on such a scale is even contemplated? The advocacy of closer Western integration even among its strongest supporters puts a full customs union as a remote goal and political federation right outside the bounds of possibility. The most that can reasonably be hoped for in the near future is a series of arrangements between Governments and industries which, while drawing the different communities closer together, does so only very gradually and leaves their national economic structures virtually intact. The agreement on economic consultation concluded this week between France, Belgium and Holland is a very limited affair and appears to exclude specifically any closer political connection, and, obviously, economic consultation is only the remotest ancestor of economic union.

It follows that most of the arguments which undermine the validity of the proposal to incorporate the Rhineland in France apply with equal force against the proposed *rapprochement* with Western Europe as a whole. The strategic argument is as strong for Belgium and Holland

as it is for France. The opposition of special interests, particularly of the coal and steel industries in this country, would be as difficult to surmount. The degree of integration foreseen even by the most optimistic would be too loose to replace the old unified economy of the Reich. Finally and conclusively, it is not certain that even the most modest degree of integration will be achieved. The post-war plans for reconstruction which certain industries are drawing up in Great Britain suggest rather the contrary—that in Western Europe itself the post-war world will see not integration, but more autarky, more national self-sufficiency, less division of labour.

In such a world it is impossible that the Rhinelanders should attain anything like the political status and economic hinterland they now enjoy as part of the Reich. The Rhineland would be a small and weak nation state among nation states. It would in all probability be the Ishmael of the western fringe, since the taint of war guilt would not be quickly forgotten. Nor is it even likely that it would be left any degree of independence. So long as the Rhinelanders were unreconciled to their status, it would be necessary to control at least their foreign and trade policy. Yet this control in itself would perpetuate their discontent.

It is impossible to avoid the conclusion that the only conditions under which the plan for an independent Rhineland might work—the creation in Western Europe of a close economic and political union—are not likely to be fulfilled, are not even contemplated by the Allies. The Rhineland scheme itself is therefore unworkable. On the one hand it would leave a Rhineland full of political discontent, a prey to economic depression and dominated by one desire—to find some way of returning to the Reich. On the other hand, the Rhinelanders' failure to accept their status and the doubtful principle of dismemberment on which it is based would undermine in Great Britain and in the United States the will to maintain the settlement in all its provisions and to resist, if necessary by force, attempts to modify it. The proposed Rhineland state would not lead to a stable new alignment of European forces. On the contrary, it would mean the perpetration of a basic instability; it would create a new focus of dissension. It could, of course, be maintained indefinitely by force; but the basic assumption of this whole enquiry—and of any realistic enquiry—is that a solution of the German problem must be capable of developing, some day, into something that can be maintained without force.

We come back, therefore, with regret, to the standpoint hitherto maintained by *The Economist* that a peace policy, to have a chance of enduring, must be based on leaving the German Reich substantially intact. There is no need to push this view so far as to make of it a dogma of untouchability. Thus the cession of Silesia to Poland might not be wholly incompatible with long-period peace. The area is not so important economically as the Rhineland, the population is mixed and would remain divided on the question of rejoining Germany. There is no proposal to

The Problem of Germany—III

Germany in Europe

TO separate the Rhineland from Germany means cutting off the Rhinelanders from a large unified economic market and depriving them of equal membership in a large and powerful political community. If such a scheme is to secure their acceptance, even if it is only their passive acceptance, they must, sooner or later, be offered compensating economic and political advantages—a new economic hinterland not smaller than their old German market and a status of political freedom. If neither condition is fulfilled, the Rhinelanders will look longingly to the East and neglect nothing in their attempts to undo the settlement. The discontent of Rump Germany with such a settlement might possibly not influence Allied policy, since the Allies will not be directly responsible for the Rump. But the Allies—or at least the western democracies—will not indefinitely be willing to be directly in control of a state that seethes with discontent. It is not in their nature to practise either political tyranny or economic repression for very long. Sooner or later they would start to conciliate and concede. It is therefore an

essential condition of a stable "independent Rhineland" policy that it should be capable of being eventually accepted by the Rhinelanders.

What kind of integration in Western Europe would, in the words of a recent French commentator, "gradually orientate Rhenish thought and economy westwards"? It would have to fulfil the two conditions of providing a sufficiently broad economic framework to support prosperity and enough political autonomy and equality to satisfy the legitimate aspirations of an educated people. Obviously, therefore, the proposal put forward from time to time in the French press, that the Rhineland should be "integrated" into France, has no chance of success. The French economy alone, based on 40 million people, would be no substitute for the Reich. Nor is it likely that the existing French industries and other vested interests would be ready to accept the industrial dominance of the Rhineland within the combined state that a free application of the principle of the division of labour would bring about. Nor is it conceivable that the French Government would

My Trustee

There is an intimacy and confidence expressed in this phrase. Can a corporate body create the same atmosphere? The answer is that it does and with the added advantage that it concentrates on every duty a specialised experience and that it ensures continuity of management from beginning to end.

The Royal Exchange Assurance will be pleased to act as the Executor and Trustee of your will, either alone or under a joint appointment with your personal Trustee. Your own solicitor can be retained. The fees are moderate and full particulars can be obtained from the Manager of the Trustee Department.

ROYAL EXCHANGE ASSURANCE,

Royal Exchange, London, E.C.3.

Telephone: MANsion House 9898

set up Silesia as an independent unit; it will be absorbed into the Polish economy, which in its turn will be more and more orientated towards the large unified market of Soviet Russia. It is also possible, though more doubtful, that the cession of East Prussia might be made part of a lasting settlement, providing always that it allowed for a genuine exchange of territory and population between East Prussia and the Corridor. But in any case, the fate of these areas will be a consequence of Russian policy towards Germany; there is less risk of their becoming, as the Rhineland would, a focus of dissension among the victors and therefore a determinant of their policy towards Germany. In the West, the only hope for a consistent policy towards Germany (and all inconsistent policies are weak, however much fire and thunder they may breathe at the start) is to base it on leaving the German frontiers, and the unity of the Reich, substantially intact. The "constructive" solution will not work.

Does this mean that we must fall back upon a purely negative policy? Many people will say so. "You are leaving," they will say, "the German nation in being. You are leaving it with its war potential intact. The basis of your peace is a nationalist state which has already started a war twice in twenty-five years. You are neglecting the golden opportunity of the present victory to build a new alignment of forces in Western Europe and remove the German peril forever. Could anything be more negative and unconstructive than to start the new peace under the same conditions that wrecked the old?"

It is impossible not to have some sympathy with this point of view. There undoubtedly is something negative and disappointing in the proposal to change so little, to leave so much as it was. But it is very important to realise where the negative element lies. If the Reich is left intact, the fault will lie not in our German policy but in ourselves. It is not a very satisfactory policy. It is easily possible to think up, on paper, any number of more attractive solutions. But all these solutions have one common element: they all deny, in the German case, the sovereignty of the national state. And they can therefore all be condemned as unworkable because we are not prepared to work them. The independent Rhineland would be viable as a member of a federation. But the rest of us are not ready for federation, and one state cannot federate by itself. The German nation cannot be carved up among a number of political sovereignties and be expected to accept the fact if in all other countries nationalism is rampant. In the highly

charged magnetic field of Europe, it is impossible to have the same strong current flowing in nineteen states without inducing it in the twentieth also. We cannot be narrow nationalists at home and anti-nationalists when we look at Germany, as the King becomes a Presbyterian when he crosses the Tweed. Politics, like water, finds its own level and it is quite useless to put forward a solution for the German problem, however theoretically desirable, which is no cut out of the same cloth as the solution proposed for the European problem at large. If, then, there is a negative element in the realistic policy for Germany, if there is nothing new to propose, the blame must be laid where it belongs—on the fact that the Western democracies (differing in this, perhaps, from Soviet Russia) have no new ideas about the relations between national states—no new ideas, that is to say, in which they believe enough to apply them to themselves. If we have no inspiring and convincing alternative to sovereign nationalism to offer in Germany, it is because we have no alternative to sovereign nationalism to offer anywhere else.

Nevertheless, within the framework of a world of sovereign nationalist states, the policy of a moderate peace involving no change of frontiers, in the West at least, is not merely not a negative one, but by far the most positive and constructive that can be attempted. It does not in any way mean that the Germans are to get off scot-free, or that no control is to be exerted over them, or that their wishes should be the deciding factor. *The Economist* has never advocated any of these things. It has consistently proposed one of the most far-reaching controls imaginable, that Germany should be totally and permanently disarmed. The policy proposed has always allowed for a period of penal servitude for the Germans which should be limited only in time. What are condemned as the negative aspects of the policy—no annexations, no partitions, no permanent disabilities other than disarmament—are put forward with the object of preserving these essential controls. The policy is moderate in order to be positive.

Any constructive policy towards Germany must meet three requirements. First, it must envisage a time, however remote, when the settlement will stand of its own strength, without the application of outside force. Second, it must meantime provide against the contingency of a third German aggression. Third, it must not provoke dissension among the present Allies. No policy of dismemberment can meet all three conditions. It remains to examine how far a "moderate" policy can. This will be attempted in a subsequent article.

Russian Reconstruction

It is not easy to give a picture of the Russian economy in the fourth year of the Russo-German war. Information is rather fragmentary; and it is not always reliable. But the chief difficulty lies in the strange contradictions and contrasts shown by the Russian economy itself. If one looks at it primarily in the light of the grim descriptions of devastation in the liberated areas, the temptation is to see it in excessively dark colours. It is, however, equally possible to deduce from the Russian victories an over-simplified idea about Russia's "inexhaustible" economic reserves, and thus to overlook the deep wounds inflicted on its economic organism by the war.

Behind the fighting lines of the Russian armies there lie vast expanses of "scorched earth." That the destruction wrought there has been on a stupendous scale is certain, although that scale varies from province to province and from town to town. A tentative official estimate puts the area of total destruction at 700 square miles. Fresh scores of cities and towns in the Ukraine and White Russia come reports of life shattered to its very foundations. In many towns, out of thousands of houses only a few dozen or a few hundred were left standing after the Germans had been expelled. Minsk, Smolensk, Viazma are still almost uninhabitable. In Kharkov "only" one-third of the buildings has been com-

pletely destroyed, but more than four-fifths require capital repair. This is roughly the position in the great industrial towns on the Dnieper, in the Donetz basin and on the sea of Azov. A high proportion of the urban and rural population has been forced back into quasi-troglodyte conditions. Caves and earth huts are typical dwellings. Repair and reconstruction have been going on all the time; and the lack of building labour has been partly remedied by the employment in their spare hours of the whole working population in building.

A few figures afford a glimpse into the destruction of industrial wealth. When the Germans left, the coal mines of the Donbas were completely flooded with 350 million cubic metres of water, and the daily influx of water was about one million metres. A year after liberation 60 million metres were pumped out. Lack of machinery, and especially of vertical and suspension pumps, made quicker work impossible. Out of the 4,000 kilometres of mine workings in the whole basin, only 300 (that is 7.5 per cent of the entire length) were cleared of water by last October. A scientists' report on the Donbas recommended that the programme of rehabilitation should be based on the assumption that the length of the workings will have to be reduced by about one-third. Originally it was hoped that by the end of 1944 coal output would be restored to

about one-third of the pre-war total; but that hope has not been fulfilled.

The situation is not much better in the famous iron ore mines of Krivoi Rog. Krivoi Rog used to supply Russia with 50 to 60 per cent of its iron (the Donbas used to supply the same proportion of coal). The iron mines, too, have been flooded—only one mine, called "The Yellow River," was found intact when the Russians recaptured the district. Towards the end of last year only 10 per cent of the mines were cleared of water. Lack of machinery, electrical power and labour compelled the management of the works to concentrate in the first instance on surface repair and surface construction. The supply of labour, however, both in the Donbas and in Krivoi Rog, seems to have been improved by the repatriation of some categories of workers from the Urals, Siberia, Kazakhstan and the Altai Republic, as well as by the employment of German labour.

The situation in the once powerful complex of the Ukrainian metal manufacturing and engineering industries is different. A high proportion of the plant had been evacuated to the east in 1941 and 1942. But a sustained effort is now being made to re-build the factories on the old sites without repatriating much of the old plant. The tractor works of Stalingrad and Kharkov, the locomotive plants of Voroshilovgrad and many other large concerns are reported to have restarted their work. It is impossible, unfortunately, to estimate the overall result of that effort. One indication can be derived from the figures of production in 1944, published by the Industrial Planning Commission of Kharkov, which used to be the greatest centre in the south for the production of tractors, locomotives and agricultural machinery. The value of all industrial goods produced in Kharkov last year was given at 300 million roubles. The value of the city's industrial production before the war was four billion roubles.

But the story of destruction, which can be continued indefinitely, tells only half the tale. The other half, which is not less striking, has been told by the reports on the industrial development and expansion that have taken place in eastern Russia during the war, as the combined result of the transfer of plant from the west and of an intensive accumulation of capital on the spot. Recently published figures and statements suggest that the rate of development in the east has been so great that it has enabled Russia's heavy industries to re-capture their pre-war levels of production, and even to rise above them. To take a random example, the index for the output of high grade rolled steel in 1943 was already 111 (1940 = 100), and the index is reported to have risen by some twenty per cent more in 1944. The picture of expansion has recently been confirmed by M. Kazakov, the All-Union Commissar for Heavy Machine Building. M. Kazakov announced that in 1944 the total output of Russia's heavy engineering industries exceeded the pre-war volume. In addition, a number of plants have been converted to non-military production. In the second half of 1944 the Commissariat (*Narkomtyazhmash*) produced among other things mining equipment for the annual extraction of 30 million tons of coal. The industry has to meet the competing claims of armament works, transport and agriculture. The tendency now is to give priority to agriculture, whose mechanical equipment has been very severely depleted in recent years. Thus the plan for heavy engineering in the current year provides for an output of light tractors twice as big as the pre-war output.

The Ural region has been the chief centre of the wartime industrial revolution, with Central Asia running it a close second. The basis of the industrial revolution has been an enormous expansion in electrical power capacity. In 1942 the inadequate supply of electrical power in the Urals was a major hindrance to stepping up the output of the local and the evacuated armament industries. A maximum of energy was subsequently concentrated on breaking that bottleneck. At present the whole vast expanse of the Urals, from north to south, is embraced by a huge grid of new power stations—the crowning feat of the industrial revolution in the east. The organ of the Politbureau *Bolshevik* wrote recently: "The capacity of

the electrical power stations that have been put into operation in 1944 alone is almost equal to the total capacity of the stations that were built under the whole of the First Five Year Plan." To judge from this, last year's accretion of electrical capacity must have been of the gigantic order of 2 to 2½ million kilowatts and the increase in power generation 7 to 8 billion kwh. Against this, however, must, of course, be set the fact that the output per year of the Ukraine alone, where about 90 per cent of the electrical plant is now entirely destroyed, was about 10 billion kwh. Another reflection of industrial growth can be seen in the indices of industrial production in the three "gigantic" new centres in the northern Urals—centres which served as reception areas for the evacuated industries.

	1940	1944
Sverdlovsk.....	100	700
Nizhny Tagil.....	100	850
Kamensk Uralski.....	100	855

Whether a similar rate of expansion can be maintained immediately after the war is highly debatable. There will be many difficulties in the way—the inevitable dislocation which will accompany the reconversion to peace production, the high rate of wear and tear in industrial equipment, and, last but not least, the war weariness of the working population. Even now there are signs that the liberation of the western industrial areas has already caused some relaxation in the war effort of the eastern provinces. The Karaganda Basin, the chief source of coal for the Urals, which worked under very high pressure until last year, is now lagging behind with its output. There is a marked tendency among the evacuated workers to rush home as soon as possible, a tendency which the authorities have counteracted, but not always with success. All these factors are very likely to produce a temporary slowing down of industrial output immediately after the end of hostilities.

By hard labour and unparalleled sacrifices Russia has thus succeeded in winning the war, not only militarily on the battlefields, but also economically, in the factories and mines. In spite of the tremendous devastation in the western lands, it can now find the basis for post-war reconstruction in its newly-built industries in the east. Theoretically, one might argue that its capacity for output of producers' goods is on the whole not likely to be much below pre-war capacity. But this can be true only on the obviously unreal assumption that in peace time the Russians will devote as high a proportion of their capacity to the output of producers' goods as they have done in wartime. If a greater part of that capacity is to be devoted to satisfying consumers' needs, then industrial expansion would almost certainly slow down or come to a standstill.

for a number of years. This explains the Russians' insistence on the exaction of reparations in kind from Germany and their anxiety to obtain credits from the Allied countries. They hope to "broaden" the basis of their reconstruction from both these sources. But the picture drawn here also shows that the path of continued economic self-sufficiency will not be entirely closed to Russia after the war. Continued self-sufficiency would, of course, imply

a very high degree of forced saving and investment. For savings and investment, the completely ruthless sacrifice of the consumer's interests to the dictates of the consecutive Plans—all these have now in Russia acquired the force of habit which may be carried on almost by inertia. But there are some physical limits to a policy of low consumption below which Russia cannot descend without incurring grave social and political risks.

Le Mot Juste

RECENTLY, in a speech to the Birmingham Jewellers' Association, Mr L. S. Amery attacked the word "nationalisation." He found it "misleading" and suggested its replacement by "statistation"—a word that should promptly join Mr Hawtrey's "competitivism" in the chamber of literary horrors. This word, with its suggestion of a Britannia bound hand and foot by red tape, has been nominated to take over the task for which "nationalisation" is, apparently, no longer fitted. Nationalisation, like Bolshevism, has lost its power to put the teeth on edge. Once a maxim for revolutionaries only, it has now acquired an almost middle-class respectability. Strange as it may seem, the suggested deletion of "nationalisation" is quite consistent with the recent decision, inspired by Conservative pressure, to insert National for Social in the term Social Security.

It is almost as common for the opening chapters of scientific text-books to deal with terminology as it is for their prefaces to begin "If any apology is needed. . . ." Yet the reader who skips unconcernedly across these dreary wastes pays a terrible price for his wantonness. The fact is that every branch of knowledge, every twig almost, has its own peculiar jargon—a mongrel vocabulary intended as convenient shorthand but usually achieving little more in practice than obscurity and chaos. Economics, as a text-book study, is a conspicuous offender in this respect. To take but one example. The term "abstinence" served the classical economist very well; but to-day it has many substitutes. One of them, "lacking," may be regarded, at first sight, as a welcome Saxon simplification. But the innumerable variations on the theme—long-lacking, short-lacking, dis-lacking, unproductive-lacking, spontaneous dis-lacking, induced-lacking, applied-lacking, abortive-lacking (hoarding) and hosts of relatives like automatic stinting and automatic splashing—soon shatter the illusion. Such mutilation of the language makes jazzing the classics seem mild and decorous by comparison.

Even the language of politics, which should be readily comprehended by the ordinary citizen, is riddled with inconsistencies and double-entendres. The politicians and pressmen of the Left and Right speak in different tongues and unless the citizen is bilingual he finds it difficult to weigh their words.

If he is to exercise his judgment impartially he must distinguish the catch-phrases attributed to the Right from the shibboleths alleged on the Left. He must be able to draw clear distinctions between "the little man" and the small trader; between the standard of living and "the British Way of Life"; between vested interests and private property, between democratic control and bureaucracy, between industrialists and capitalist bosses, and between free enterprise and monopoly capitalism.

It is all very difficult.

In time he may learn to identify the "ill-informed clamour" in one report as the "vigorous protest" in another, and the "planning" of one leading article as the "regimentation" of the next. But the relative demerits of juntas and oligarchies may puzzle him sorely. He will may ask why it is that while one party always agitates for reform the other merely presses; why one party is noted for its solidarity and the other for its loyalty. Only a Socialist could tell him the difference between the people and the "masses," for only a Socialist, it seems, has the temerity to use that word to-day.

There is much to be learned even from the pro-

nunciation of a single word; a capitalist is an honourable man, but a capitalist is the scum of the earth. But why is "reciprocal" less suspect than "bilateral"? Why, until recently, were outrages confined to the Irish? And why on earth should Hitlerite as a term of abuse be reserved for the special use of Communists? Captains of industry and kings of finance have departed, though the tumult and the shouting are as strong as ever. And in the City columns of the daily press even the terms magnate and financier are tinged with suspicion. Unless an employer has earned the title "enlightened," his name is mud, but nobody has suggested, so far, that the nation needs "enlightened employees."

It is a gross injustice that, even should he master the grammar of politics, the poor citizen is offered only a miserable choice between visionaries and reactionaries, between "dangerous ideologies" and "out-worn creeds."

Names offer fewer difficulties than ideas; yet a good name is almost as important to a public figure as a good address. But what is a good name? Bernard Shaw or G. Bernard Shaw is a more effective title than George B. Shaw—however appropriate that injunction may sound for the author of "You Never Can Tell." And, oddly enough, Shakespeare may owe a lot of his fame to the fact that his plays were not written by Bacon. There are people who claim that a man's politics can be assessed from his name. A hyphenated surname (they say) indicates a Tory and an abbreviated or truncated Christian name a gentleman of the extreme Left. While the distinction is clearly unscientific one must admit that Mr H. R. S. Whyte-Cliffes (Comm.) sounds as much a contradiction in terms as Bren Bracken or even Win Churchill (Cons.). The rigid economy practised by Communist speakers in this matter of Christian names (Dan, Len, Bill, Sal *et al*) is one of their most remarkable and praiseworthy attributes. Such names, unlike so much of their argument, are brief and to the point.

In business the trend in names and titles is in the opposite direction—away from the direct and unpretentious to the complex and pseudo-scientific. In recent years many butchers have become meat purveyors and undertakers have become funeral directors (morticians, in America). Shoe-shop assistants have become foot anatomists, and at Brierley Hill a rat-catcher has become a rodent operative. Smiths and wrights are being superseded in almost every trade by qualified practitioners who seem to charge much more for the same services.

Ever since 1651 when George Dalgarno published his *Ars Signorum* professional linguists have agitated (or pressed) for an international language. The idea has much to commend it. But for the moment the complications of terminology are great enough. At the national level they are the cause of hot dispute; translated into an international language they might ruin the next inter-war years.

There is a more serious side to this levity. The difficulty of communicating ideas, the earliest of man's problems in his struggle towards civilisation, has also proved the most persistent. It has been eased but not removed by the inventions of printing and broadcasting. To-day, man's worst headaches are economic and political, but the language problem, which is still very much alive, will probably outlive both of them. The trouble, in this age of speed, is that word-meanings will not stand still. Modern knowledge places an embarrassing array of facts at man's disposal, but it has not yet made their verbal expression proof against ambiguity and misunderstanding.

NOTES OF THE WEEK

Food Argument

The crisis in the supply of food in the Allied world, long threatening, has suddenly come to a head with the reported desire of the American food authorities virtually to suspend deliveries of meat to the United Kingdom. At present the United States supplies 2d worth of the British weekly ration of 1s 2d. (The rest is made up of 5d home-killed, 4½d from South America, 2d from the Southern Dominions and ½d from Canada.)

The problem is complicated enough in any case. The supply of meat is less responsive to control than other foods. There is the complicating factor of shipping, which might justify higher consumption in some countries than in others. And overshadowing the whole subject is the appalling problem of finding food for Europe. But these complications have been greatly increased by the American Press's habit of obscuring every issue with misleading figures and unjust innuendoes. Thus there has been an effort to make Britain out as the villain of the piece, hoarding vast stocks of food. The Prime Minister gave the facts on Wednesday. British Government stocks of all foods are now no more than 6 million tons. They have been reduced by shipments to Europe and are to be further reduced by June to 4½ million tons, which is a working minimum.

There is no suggestion, of course, of cutting off Britain's supplies without any reduction in American consumption, which is to be reduced by 12 per cent during the second quarter of this year. It is worth stating what this means to each country in terms of actual meat consumption. The figure of 115 lb. per head has been quoted as being the yearly rate in America for the second quarter, but for the whole year the US Department of Agriculture expects the supply to be between 128 lb. and 133 lb. In Britain, consumption of meat and meat products has amounted to just under 108 lb. per head per year for the last two years. American consumption in 1943 was 148.8 lb., and in 1944 155.4 lb. Last year American consumption was 116 per cent of the pre-war, while British consumption was only 81 per cent.

The Americans have been more fortunate than the British in regard to other foodstuffs, too. For example, only in three food groups out of the total of fourteen for which the Combined Food Board gives figures has America reduced its consumption compared with the pre-war level. These are fats and oils (94 per cent), sugar and syrup (89 per cent), and fruit other than citrus (89 per cent). In the United Kingdom consumption has been reduced (and even more drastically) in eight of the groups; increased consumption has only occurred in such foods as potatoes and vegetables. There has, of course, been an overall increase in milk consumption, but not by adults.

The possibility of a reduction in the British meat ration has caused great concern to the public. Perhaps it has been forgotten that the meat ration was as low as 1s for over three months in 1941, and that for ten weeks of that period offals were included in the ration. Other foods were in even shorter supply than now—there were no dried eggs and no "spam"—bombing was severe and working hours long and arduous. What could be endured then could be endured again. The public would accept a lower meat ration with its usual good grace if it were convinced that it were necessary.

The principle of "fair shares" is nowhere more clearly understood and accepted than in Britain. It should be understood that not only is the British meat ration in danger, but also supplies for Europe. There would be no complaint if a cut in all the well-fed nations were necessary to feed the Allied armies or liberated Europe. What would be found irksome would be that some of the United Nations should be consuming more than others for no better reason than that they were less willing to accept reductions and less efficient in their methods of distribution. The general food position of Britain and Europe must be pointed out in the clearest terms to the Americans, so that they can see how much better are their own rations. The Americans are a generous and a fair-minded people, and they would not wish to go on eating more than they did before the war at the expense of others who have been eating considerably less. Other foods than meat are in question, but meat is the most acutely short.

Housing White Paper

The Housing White Paper, brought out just in time for the two-day debate at the end of this week, is not an inspiring document. In form, it answers the general demand for a coherent statement of the housing situation and the Government's plans; but in content, it fails to give information where information is most vitally needed if the wisdom, or otherwise, of ministerial policy is to be properly appreciated.

For the most part, it is a recapitulation of the facts contained in Ministers' statements. The section dealing with the Government's programme for housing reaffirms the target of 300,000 permanent houses built or building two years after victory in Europe, adding the fact that 80,000 of these are expected to be still in various stages of erection. This is followed by a section on Preliminary Work, covering repairs and the acquisition and preparation of sites, and by a final section on Organisation, which is merely a statement of the division of responsibility for housing as it exists at the present moment.

The extent to which prefabrication is expected to contribute to the target is still unspecified, nor are there any details of costs or man-hours for different types of houses, which would make possible any rational comparison of the advantages of temporary as against permanent, prefabricated as against traditional building. The important question of subsidies has apparently proceeded no further than preliminary discussions with local authorities. Finally, although it is promised that the 110,977 temporary bungalows already allocated in England and Wales will be built, the White Paper gives no indication that the problem of finding the necessary sites for them is being realistically tackled. Only 55,000 sites—half what will be needed—have so far been approved; only 5,000 have been fully prepared. There is no hint that this deficit of sites is likely to be the greatest limiting factor on the discredited, but still important, temporary programme.

It is most unfortunate that a bad housing situation—which everyone deplores, but which, finally, no one can do much to alleviate—is being made worse by such poor presentation of policy. It is useless to criticise the Government or the White Paper for the inadequacy of their targets. It would be much worse if they proclaimed with fanfare a target which no one could humanly achieve, and hoped to be able to make excuses as they went along. As it is, the Government's target is insufficient (as any realistic target must be) but it is attainable without seriously handicapping other aspects of reconstruction. Whether they are going the right way about achieving such a target is another matter. If the Ministers responsible are unable to satisfy the House of Commons on the missing links of the White Paper and to inspire greater confidence in their enthusiasm for the task, the situation will justify severe criticism of the Government at the general election.

Leftward March in Finland

The parliamentary elections in Finland, which took place last week-end, resulted in a great success for the Democratic Union, the bloc of Communists, dissident Socialists and radical peasants. The bloc has won fifty seats in the Diet, a remarkable achievement since all those groupings were persecuted until the Armistice, and the Finnish Communist party has been illegal since 1918. The electoral chances of the Democratic Union, it is true, were partly improved by the appeals in favour of "new men" made by the Prime Minister, M. Paasikivi, and the Minister of Labour, M. Vuori. There can, however, be no doubt that the recent swing to the Left in the popular mood is genuine. The bloc led by the Communists is now equal in strength to the Social Democrats, who have lost thirty-three seats out of a pre-election total of eighty-five. In addition, within the ranks of the Social Democrats the men who oppose Tanner's war policy seem to be gaining the upper hand.

The swing to the Left has not destroyed or even upset the old political structure. The parties of the Centre and the Right, though weakened, are still strong enough to play a very important part in the new Diet. Even a coalition of the Social Democrats and the Democratic Union—a somewhat unlikely partnership—would command only a precarious majority in Parliament. More important than the

new parliamentary combinations will be the way in which the Finnish Government now tackles the tasks to which it is committed under the Armistice. On the morrow of the election, the Allied Control Commission informed the Finnish Government of its displeasure at the mildness and dilatoriness of the purge. One result of the election will certainly be a more drastic overhaul of the administration, in which those responsible for the Finnish war policy are still strongly entrenched. But the most challenging question of all—how Finland will meet its reparations bill—has not been, and could not have been, answered by the election.

Revision of Montreux Convention?

The Soviet Government has served notice on the Turkish Government that the Treaty of Friendship and Neutrality between the two countries, concluded on December 17, 1935, and prolonged several times since, will finally expire next December. The Soviet Government will propose a new "improved" Pact to replace the old one. The Treaty of 1925 was a bilateral agreement; and, technically, it can be replaced by another bilateral pact. In reality, any revision of Russo-Turkish relations at the present stage is bound to affect the international status of the Turkish Straits, which since 1936 has been regulated by the provisions of the Montreux Convention.

The Treaty of 1925 was born of Russian as well as Turkish opposition to the Lausanne settlement, under which the Straits were demilitarised and subjected to international control. The Turks saw in that settlement an infringement of their national sovereignty, while the Russians, with fresh memories of anti-Soviet intervention in the Black Sea, feared the freedom to operate in the Black Sea which the Western Powers had reserved for themselves. The Treaty was also part of a series of East European pacts concluded by Russia in order to create a counter-weight to the reconciliation between the Western Powers and Germany that had taken place at Locarno in the same year. There is therefore more than a grain of truth in the Russian assertion that the Soviet-Turkish Treaty no longer corresponds to the changed international relationships. It was, however, made partly obsolete by the Montreux Convention of 1936, which prohibited the entry in times of war of belligerent warships into the Black Sea. In recent years the Russians repeatedly stated that the clause allowing the entry of commercial vessels was a dangerous loophole which allowed the Germans to send camouflaged military craft into the Black Sea.

Russia's policy with regard to the Straits has traditionally fallen into two patterns. In times of her weakness Russia placed the greatest importance on closing the Black Sea to her potential enemies. In times of her strength (or when diplomatic relations favoured her expansive policies) Russia insisted on her freedom of egress into the Mediterranean through the Straits. This second policy found its climax in the secret Anglo-Russian Treaty of 1915, under which Russia was to acquire direct control of the Straits and annex Constantinople. The memory of that Treaty has undoubtedly haunted the Turks in recent years, though it seems very unlikely that the Russians would now go back to all the greedy dreams of Tsardom. But Russia will certainly seek to close the entry to the Black Sea even tighter than under the Montreux Agreement and probably also to secure for herself the freedom of egress into the Mediterranean. If so, there are plenty of historical precedents for a British-Russian disagreement. The Straits are part of Britain's as well as of Russia's immediate security zone. Any unilateral act committed in this sensitive point, where the security interests of both Allies overlap, would have critical consequences for their mutual relations. This is certainly a point which the makers of Russian policy must now keep well in mind.

But have the technical upheavals of this war made the traditional approach to the problem of the Straits obsolete? Air bases have become a new factor of security similar to the old naval bases; and the passage of bombers and fighters lends itself less to control than the passage of naval units through narrow straits. Too rigidly "Strait-minded" conceptions of security may be too narrow and ineffective to meet the requirements of modern military technique. This may eventually perhaps facilitate a new international agreement on the Straits; but it also tends to widen the problem of the Straits so as to include adjacent security areas in the Balkans.

Polish Deportees

The lot of the Polish deportees in Russia has been one of the chief sources of bitterness in Russo-Polish relations. The deportations were made in the years 1940 and 1941, and they affected great masses of people. The Russians' motive behind these deportations can only be guessed, but it was probably their desire to clear the borderlands of suspected or unreliable elements. The procedure was utterly ruthless and cruel. The Russians, apparently, acted on the crude principle that it was safer to deport people *en masse*, the suspected as well as the absolutely innocent, rather than to take the risk, through careful discrimination, of leaving behind any really unreliable elements (such as, for instance, the pro-German Ukrainians).

Siberian cold and the hard conditions of life in the interior of Russia, more than any deliberate persecution, have taken a heavy toll of the deportees. The Russian Government ought, obviously, to redress the Poles' entirely legitimate grievance by enabling these Polish deportees who have survived the ordeal to return to Poland. At the very least, they ought to allow Red Cross help and relief to reach them.

It is, however, difficult to see what the Poles here gain by issuing exaggerated statements on this tragic issue. The number of deportees has been put as high as 1,200,000 or even 2,000,000. In truth, the original number of the deportees was authoritatively estimated at between seven and eight hundred thousand. Between thirty and forty per cent of these were Jews whom the deportations saved from Nazi gas-chambers in Poland. Many of those Jews had fled from German-occupied Poland and were afforded refuge by the Russians on the condition that they would accept Soviet citizenship—which they did. A high proportion of the deportees were Ukrainians, who, whatever their possible grievances against Russia, do not regard any Polish Government as their trustees. Finally, more than a hundred thousand Poles have left for the Middle East with the Polish Army formed in Russia. The number of deportees, whose return to Poland may still be a practical proposition, may amount to some three hundred thousand people. This is a formidable figure and a formidable slur on Russian policy towards Poland. But the effective defence of the deported Poles is not helped by wild overstatements which expose their authors to the suspicion that they are more concerned with grinding an anti-Russian axe than with relieving the fate of their unfortunate countrymen.

Distribution of Industry

Although the Distribution of Industry Bill was given its second reading in the House of Commons on Wednesday without a division, there was cannon to the Right and cannon to the Left, and warning shots were fired in all directions. The provisions of the first part of the Bill, that dealing with Development Areas, were widely welcomed, though there was some reasonable criticism of the tendency to define these areas too rigidly.

The heaviest barrage of criticism came from those who regard all forms of planning as wicked threats to private enterprise, and it was unusual to find Sir George Schuster temporarily in their camp. He argued that the powers sought under the second part of the Bill—powers to define areas in which "the provision of further industrial premises . . . would be seriously detrimental to the proper distribution of industry"—would have a paralysing influence on initiative. He displayed a proper anxiety about the ability of the Board of Trade, as at present constituted, to formulate and administer a national plan of industrial location, and suggested

some body outside the political field which was capable of making an entirely independent and objective review of the position.

It would seem, in other words, that Sir George wants an appeals tribunal on the pattern of the Import Duties Advisory Committee. This suggestion is hardly practical. Decisions in these matters cannot be taken on the merits of each case; they can only be taken by somebody who can see the complete picture, and the points of high policy involved are so many that the Government could hardly divest itself of its responsibility. It is true that the chief instrument of the Board's control would be the power to say "No" to industrialists seeking permission to put their factories on unsuitable sites, but this power must be wielded effectively by some central authority if a rational

distribution is to mature at all. Apart altogether from economic considerations, the strategic argument, in this age of rockets, makes a policy of control of location essential, and some inconvenience, though it should be reduced to a minimum, is inevitable if the policy is to be effective.

Trade Disputes Act Again

The question of the Trade Disputes Act, 1927, which many thought had been unobtrusively shelved, has again been brought right into the foreground of the political stage. The Prime Minister's refusal to provide facilities for any amendment of the Act, because of the overwhelming opposition of the Conservative party, and his view that a decision should wait until after the General Election, appears to have come as a shock to the TUC. It must inevitably have caused the Labour Ministers considerable embarrassment. The whole question will be considered next week by the National Council of Labour, the highest authority in the Labour movement, which will probably agree to make it an election issue.

The Trade Disputes Act is hardly a subject upon which the electorate is likely to have strong feelings one way or the other. It is even doubtful how far it arouses strong passions in the breasts of civil servants, apart from the Post Office workers, whose decision in May, 1943, to break the law by applying for affiliation to the TUC precipitated a crisis, which was only averted by their withdrawal in order to facilitate a negotiated settlement. But the Act has certainly become a point of honour for the TUC, and both sides regard it as a symbol—one of victory for the Conservatives and one of defeat for Labour.

The TUC assumed—wrongly as it turns out—that the Conservatives could afford to be generous and would let bygones be bygones, after sixteen years and after Labour's co-operation in the war effort. This was certainly the impression left by Mr Chamberlain, who told a deputation in 1940 that their war record "would proportionately strengthen their position in any representations they might desire to make at the end of hostilities." Mr Churchill, too, in 1943 led them to understand that the "matter would be favourably considered" after the union's decision to confine their claim to a repeal of Clause 5 (which makes it illegal for civil servants to belong to a union affiliated to the TUC), and not to press for a repeal of the other clauses of the Act.

It is difficult to see the objection to civil service unions belonging to the TUC, if they want to, so long as there are safeguards against their engaging in party politics; 1945 is not 1926. Yet it is easy to understand Mr Churchill's position. The Conservatives would never voluntarily agree to amend the Act, and such a motion would be overwhelmingly defeated in the House of Commons, thus forcing the withdrawal of Labour Ministers. It might also be argued that since the matter has waited for so long, a few months' delay would be immaterial, and that it is an issue which should properly be decided by the electorate. But the present position is very unsatisfactory, and not calculated to make the maintenance of "national unity" any easier.

Civil Aviation

The reception of Lord Swinton's White Paper, both in the Press and in Tuesday's debate in the House of Commons, undoubtedly suffered from the imminence of a general election. A year ago, it might have been possible for the plan to be judged on its merits in the face of a given situation. Now, each aspect of Coalition policy is measured against the standards of party ideology. It was only to be expected that murmurs against the civil aviation plan would come from the Right, which resented interference with unfettered free enterprise, and from the Left, which resented the bolstering of vested interests.

Partly for these reasons, the debate was disappointing. The number of valuable contributions was small. Whatever might be desirable, from either point of view, it is indisputable both that completely free enterprise would be disastrously wasteful in a period of enormous expansion of air transport, and equally, that a completely nationalised system would be unequal to the task and costly to the taxpayer. Labour criticism tends to discount the advantages of recruiting outside interests and to ignore the safeguards on their activities which the plan proposes. The directors of the Corporations nominated by the railways or the shipping lines will have to be approved by the Minister; the schedule

of routes flown by the Corporations is subject to strict Ministerial supervision; and as an additional safeguard, an impartial tribunal is suggested in the White Paper to adjudicate on the rates and charges and the provision of adequate and efficient services.

This tribunal could serve a most useful purpose, freeing the scheme from any of the taints suspected by its critics. Its functions might also be widened to include the judging of appeals from independent operators seeking to provide additional services. Its composition is another difficult question. Impartiality would have to be combined with technical knowledge and a certain amount of air-minded vision. On the model of the American Civil Aeronautics Board, something more than a licensing authority and something less than the full dignity (and full legalism) of a High Court Judge, would seem to be needed. It will be for Lord Swinton, when he returns from Capetown, to evolve the form of this very necessary part of his machinery.

France and Italy

After somewhat protracted negotiations, the French and the Italian Governments have now resumed "direct" diplomatic relations. This was preceded by the cancellation of the 1896 Convention under which the Italians in Tunisia had enjoyed special privileges and had been allowed to retain Italian citizenship. When Mussolini's Italy made its bid for domination in the Mediterranean, Tunisia was a bone of contention between the two countries; and Fascism was able to build up its Fifth Column in the French Empire by exploiting the special status of the Italians in Tunisia. It is, therefore, not surprising that General de Gaulle was anxious to wipe the Tunisian slate clean before re-establishing relations with the Italian Government.

The future status of the numerous Italian colony in Tunisia remains to be worked out. Semi-official French statements have declared that the Italians will be free to run their established educational and charitable institutions, though there have also been some complaints about recent French discrimination against the Italians. On the whole there has, however, been surprisingly little of the aftermath of suspicion and hostility that might have been expected. The French have not so far made any special claims on the Italians; and they are not likely to do so in the future. The Italians, on their side, are anxious to prove their good will towards France, where many members of the new Italian administration found asylum when they were political refugees.

The friendly attitude of General de Gaulle's Government towards Italy may possibly be explained by his hope that the two countries may be linked by ties of close friendship within the broader framework of a Latin bloc. Whatever the motives behind it, the recent turn in Italo-French relations shows how easily popular memories of hostility and belligerency can be lived down, if only powerful propaganda machines refrain from stirring and maintaining fruitless animosity.

A Russian Broadside

An intermittent exchange of polemical shots has been going on for some time between the Russian and the American Press. Until lately, however, the operations were confined to journalistic sniping. Russian *franc-tireurs* replied in rather shrill tones to the equally vociferous critics of Russia in the Hearst Press and in isolationist newspapers. Last week, however, *The War and the Working Class* fired

THE BRITISH LINEN BANK

a salvo which has given the campaign a more serious political turn.

The target chosen for this Russian volley was Senator Vandenberg; and the occasion was his recent statement on United States foreign policy. However, splinters appear to have broken a few windows in the State Department and even in the White House. The Russian newspaper asks

Where has it been decreed that the other countries, big and small, including the Powers who have borne the full brunt of the struggle against Hitler's Germany, must now pay the United States for its participation in world affairs by renouncing their independence?

Any attempted American veto on regional security arrangements, on frontier settlements with neighbours or on alliances such as the Russo-French Treaty would be regarded by Russia as an encroachment on its independence. As to Senator Vandenberg's "defence of small nations" the Russian paper (which counts M. Litvinov among its editors) sees in it

merely a screen to cover up encroachment upon the rights of not only the small, but even the great Powers... a mask to conceal pretentious claims to establish the dictatorship of one Great Power over all other Powers, great, medium and small. One must, indeed, lack a sense of humour to advocate such mutual relations between the Allies and to dilate on the importance of Allied unity, while recalling the unity which Jonah enjoyed when he was swallowed by the whale. Vandenberg's scheme provides for a whale with an extremely capacious belly to hold all the United Nations.

The critic attributes to Senator Vandenberg and to other "converted isolationists" the vision of "the whole world with knee bent at the entrance to the shrine of the dollar." He regrets that "some US circles hastened to endorse" Senator Vandenberg's scheme and gives a warning that no post-war collaboration will be possible on any such basis.

The broadside clearly reflects a revived Russian fear of "dollar imperialism" and a warning that if economic relations between Russia and the United States are confused with political claims and demands, the Russians do not intend to play.

Grammar School Fees

From April 1st the fee-paying system will be abolished in 1,166 of the 1,398 grant-aided secondary schools. In the 232 grammar schools which get their grants direct from the Ministry of Education, not through the Local Education Authorities, new arrangements based on the recommendations of the Fleming Report will come into force. Places in these schools are in future to be of three types. In any year, not less than 25 per cent of new admissions will be free places open only to pupils who have spent at least two years at grant-aided primary schools; a further number up to 25 per cent (or even more if the governors agree) will be "reserved"—should the free places offered be insufficient for the local authority's requirements—and placed at the disposal of the LEA, which will pay the fees for them; the remaining places will be "residuary places" for which fees may be charged. These fees will be subject to the approval of the Minister of Education, and will cover all normal expenses of attendance at the school. Those for day pupils will be remitted or graded according to the parents' income. The income scales for this purpose will not be prescribed by the Minister, but it is suggested that these should be a complete remission where gross income falls below £5 10s. a week—with an allowance of 15s. for each additional child.

In principle, the new arrangements are unexceptionable. They are in harmony with the main objective of the new Act—to make educational opportunities available to those capable of profiting by them rather than to those merely capable of affording them.

But their immediate results may be less fortunate than those planned. These changes in the direct-grant system may exacerbate the problem of "class" distinction in education. It is probable that some of the direct-grant schools will prefer to sacrifice the grant of £16 per head rather than submit to the new regulations. Many parents will be unwilling to send their children to schools operating under these conditions and will prefer to send them to independent schools, even if, to replace the grant, they have to pay higher fees. Thus the actual result of the attempt to bridge the gap between the state system and the private system may be to widen it and to break down some of the bridges that already exist. This result is inevitable so long as the other half of the Fleming Report,

which prescribes for the completely independent public schools, remains unimplemented. So long as the public schools are untouched, the grammar schools will be under irresistible pressure from the parents to be recognisably similar to them. But the new regulations make this very difficult. They compel the bridge to choose between the two banks of the river, and some will choose one and some the other. Only when the public schools themselves have been assimilated to the state system can the grammar schools be brought into line without a feeling of victimisation.

De-requisitioning

It is clearly of great importance to the reconversion programme that requisitioned land and buildings should be released as early as possible. Unfortunately, the chances of any large-scale release in the near future are remote. The "requisitioning" departments (the three Service Departments and the Ministries of Works, Supply and Aircraft Production), which at present occupy 143 million square feet with their stores, are staking claims for a further 22 million square feet for use now and during the Japanese war. With the 36 million square feet of factory space regarded by the Board of Trade as the essential minimum to be released during the first year after the defeat of Germany there is, therefore, an additional effective demand for 58 million square feet.

The Select Committee on National Expenditure, in their 94th Report, are "greatly disturbed" by the problem of meeting this demand. Their solution rests first with the creation of a "supervising authority" charged with the tasks of reviewing departmental claims, of pressing for economy and safeguarding civilian interests. Neither the Board of Trade nor the Ministry of Works (itself a requisitioning department), the two authorities responsible for land and buildings and factory storage, has the necessary powers to undertake these duties.

Much could be done to ease the situation. Maximum use should obviously be made of overseas storage facilities for goods needed in the Japanese war; the procedure for declaring stores obsolete should be speeded up; and the emergency reserve space of the various departments might be pooled and cut down. Clearly some such body as the Committee suggests, and armed with bulldozer powers, will be necessary to clear enough space without further requisitioning. There is a case for saying that the body should be something other than a mere organ of the Government, for the Government is one of the contending parties and, with the end of the German war, it will be impossible to maintain the doctrine that the least important Government purpose has priority over the most important private purpose. Ultimately the Government will have to decide whether to allow large stocks to sterilize factory space pending disposal or to resort to scrapping. The only other possibility, the erection of new temporary storage accommodation, would mean yet another—probably an impossible—call on the building industry.

Relief from Sweden

Many Swedes have long been disturbed by Sweden's isolation from the war and its immunity from the evils of occupation and destruction which have struck down the other nations of Europe. They did not question the rightness of neutrality, but they felt nevertheless that their country ought to find some way of contributing to the struggle on whose successful outcome its own liberty depended. Now that the war is drawing to an end, and the degree of devastation in Europe becomes apparent, the Swedes hope that they will be able to transform their sense of obligation to their neighbours into practical measures for their relief. Their shipping will shortly be made available to the United Nations' shipping pool—a vital acquisition to the straitened supply, for the Swedes have been building ships throughout the war, and probably have a bigger merchant fleet now than in 1939. It would, of course, have been most unsuitable if these ships had started independent trading while other merchant fleets were still engaged on war and post-war needs.

The Swedish Government recently voted large sums for relief and for credits. They are naturally anxious to spend them as much as possible in the Scandinavian countries, and it is not yet clear whether the help given will take the form of gifts or credits. Many Swedes would prefer their assist-

ance to be a straight gift, but there are two obstacles to this—the attitude of the receiving countries and divided opinion in Sweden itself. As the experience of UNRRA has shown, national governments dislike "charity." They prefer to "pay" for the help they receive. In other words, they want credits, not gifts. At the same time, the reconstruction of Swedish foreign trade is such a vital issue that many Swedes feel that all post-war Swedish credits ought to be related to the restoration of markets and trade.

Church and State in France

Between the two wars, there was a marked decline in the violence of religious controversy in France. The Catholics more or less accepted the secularisation of the State, and maintained at their own expense their educational establishments. Their acceptance weakened secularist criticism, and there was even, during the last year of Pius XI's pontificate, a tendency among the Liberals to applaud Catholicism for its stand against the Nazis.

The war has again altered the picture. Pétain, actively supported by the Catholic Right and passively by the *bien pensants*—important sections of the Catholic middle-classes—set up a regime which repudiated the French Revolution and all its consequences, and attempted to restore compulsory religion. Religious instruction was for a time obligatory in schools, and the State undertook to subsidise Catholic education. At the same time, some of the higher clergy—the two successive Cardinals of Paris, Baudrillart and Suhard, and Cardinal Gerlier, of Lyons, gave varying degrees of support to the Pétain regime and its Nazi masters.

On the other hand, the record of some bishops and of the lower clergy as a whole, was one of resistance. The curé in most districts was an integral part of the underground movement. All Left Wing Catholic movements—for instance, the group connected with the newspaper *L'Aube*—were active patriots. M. Georges Bidault, the present Foreign Minister, and a member of the *Aube* group, was President of the National Council of Liberation.

The present prospects of the Church are thus confused. From Pétain, it inherits a legacy of contempt and disgrace, from the underground Catholics, one of respect and leadership. The position of Catholicism will depend upon the relative strength in post-war France of the Right and the Left, both within the Church and in the national life. It is a bad augury for good understanding that none of the high-ranking clergy has been placed in retirement. M. Jacques Maritain, a veteran leader of liberal Catholicism, would do much for his co-religionists if in his new capacity of French Ambassador to the Vatican, he could secure some changes in the French hierarchy. It is also possible that General de Gaulle, himself a Catholic, may seek the support of Conservative Catholics in redressing the balance of his personal power against the Left, for it is only too likely that, in the event of a rift between General de Gaulle and his left wing supporters, he could count on a great mass of Catholic support. The position of the Catholic Left would then be precarious. At present, it is mainly linked with the continuing Resistance Movement, and is, therefore, critical of the General's failure to "renew" the state. It is difficult to foresee what its position would be if a strong political opposition, based on the traditionally anti-clerical parties of the Left, were to come into being. Its fate would probably be isolation.

The alignment of forces may shortly be made clear by the controversy over religious schools. Many Catholics would like the subsidies of the Pétain regime to be continued, and General de Gaulle is said to be ready to accede to this desire. It is difficult to imagine anything more politically disastrous. The one hope of relative harmony on the religious issue is to wipe out all memory of the disgraceful Pétain episode. To claim privileges granted by that regime is to invite the revival of violent anti-clericalism.

Post-War Taxes—Correction

An error and an omission occurred in last week's article on "Post-War Taxes." The present rates of Purchase Tax were incorrectly stated as being 33½ per cent, 66½ per cent and 100 per cent of the wholesale price; the figures should have been 16½ per cent, 33½ per cent and 100 per cent. The omission occurred in the reference to Mr

Nicholas Kaldor's estimates of post-war taxation. The passage should have read as follows:

Mr Kaldor... reaches the heart-warming conclusion that a standard rate of income-tax of 5s. 10d. in the £, and a corresponding increase in the taxes that existed before the war, will be enough. But the optimism that is apparent throughout Mr Kaldor's estimates reaches its culmination in this figure, for to a very high estimate of national income he applies an almost incredibly low estimate of Government expenditure (providing, for example, an increase—at constant prices—of only £100 million a year above the pre-war figure in defence expenditure and of only £16 million in expenditure by local authorities).

The three words here printed in italics were inadvertently omitted last week. Neither of these corrections affects the argument of the article.

Shorter Notes

The debate on monopolies in the House of Lords on Wednesday, initiated by Lord Nathan, elicited almost nothing from the Government. Lord Woolton was content to say that it was an important matter which the Government was considering, but that it involved a number of difficulties. He did, however, drop the hint that the promised Bill, if it ever sees the light of day, would set up "a court of some sort... to which monopolists or the citizen could appeal, in order that the practices could be investigated." This will need a lot more defining, but at first sight it does not sound very promising.

Doubtless the inter-departmental committee on the provision made for children deprived of a normal home life will investigate the methods by which foster-parents are selected. But the Gough case has left people wondering how the couple could possibly have been thought suitable persons to be in charge of children. The husband, now convicted of manslaughter of a boy in his care, is revealed to have had a previous conviction for common assault against him, and to have been of such a violent and brutal nature that his wife had applied for a separation order. Were these facts not known to the local authority concerned? Did it make no enquiries which would have elicited them? The Home Secretary is said to be considering an investigation; it should be undertaken forthwith.

The following (amended) table gives the number of civilian casualties in air-raids since September, 1939:

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,981	3,475
Sept.-Dec., 1940.....	22,273	28,548	50,821
Total, 1941.....	20,881	21,841	42,722
Total, 1942.....	3,236	4,150	7,386
Total, 1943.....	2,372	3,450	5,822
Jan.-May, 1944.....	1,563	2,916	4,479
June-Aug., 1944.....	5,479	15,934	21,413
Sept.-Dec., 1944.....	1,425	3,134	4,559
January, 1945.....	585	1,629	2,214
February, 1945.....	483	1,152	1,635
Totals to date.....	59,791	84,735	144,526

Those killed in air-raids during February included 151 men, 243 women and 89 children under 16.

AMERICAN SURVEY

Pressure on Wages

(From a Correspondent in Washington)

THE negotiation of new contracts between the mine operators and Mr John L. Lewis' powerful union involves the fate of the whole programme of wage stabilisation. The fact that stabilisation policy has withstood other formidable tests is no proof that it will survive this one. If it does, however, effective control of wages will probably be maintained for some time—at least until the collapse of German military power. Bargaining for, perhaps, their last wartime contract, the United Mine Workers will not shrink from extreme measures in order to win substantial wage increases. If they strike, as they did in 1943, the flow of munitions may be seriously curtailed. The War Labour Board, however, has already granted the miners a number of special wage concessions (including "portal-to-portal pay"—that is, pay for the full time from leaving the surface to returning to it) over and above the maximum general increase permitted under the so-called "Little Steel" formula. It is difficult to see how the Board can satisfy the miners' new demands without open abrogation of that maligned symbol of wage control.

Up to the present, the accomplishments of wage control have been somewhat beyond expectations. Although average weekly earnings in manufacturing industries have risen by about 75 per cent and average hourly earnings by about 51 per cent since January, 1941 (which marked the approximate beginning of the wartime rise of wages) these increases have resulted in part from longer hours of work, wage premiums for extra hours and for night work, the increased output of workers paid on an incentive basis, the transfer of workers into the higher-paid war industries, and similar factors. Increases resulting from such causes are held to be entirely consistent with wage stabilisation policy. A new index of the Bureau of Labor Statistics reveals that basic wage rates in manufacturing industry have risen but slightly more than 30 per cent, and more than half of this increase occurred before the passage of the Stabilisation Act in October, 1942. The average monthly increase in basic wage rates, which amounted to 0.8 per cent during the eighteen months prior to national wage stabilisation, dropped to 0.6 per cent during the following year and has recently declined further to about 0.3 per cent. Most manufacturing establishments have long since exhausted the 15 per cent general increase permitted by the "Little Steel" formula, and important gains during the last year have been confined largely to the low-wage industries, such as textiles and apparel, in which special increases have been authorised under the War Labour Board's sub-standard wage policy. Probably less than one worker out of twenty in manufacturing industry now has a basic rate below 50 cents per hour. The greatest wage increases are occurring in non-manufacturing industry, particularly in retailing and the service trades, in which wage levels are, of course, much lower than in manufacturing.

Wage stabilisation has been somewhat softened, to be sure, by the War Labour Board's liberality in dealing with the so-called "fringe issues." These involve the granting of vacations with pay, wage premiums for night work and work on holidays, and other issues that are distinct from the basic rate of wages. A very large proportion of all workers are now working under some kind of paid-vacation plan and the two-week vacation has made great headway. Some of the Board's decisions in such cases—for example, the granting of a shift premium in the steel industry, where shift rotation is practised—seem to constitute thinly disguised wage increases. The inflationary influence of such decisions, however, has been small, and they have probably served to ward off a general break in the stabilisation front.

Any union leader who could gain credit for the upward revision or complete destruction of the "Little Steel" formula would unquestionably win enormous prestige within the labour movement. This does not mean that the unions are unanimously opposed to wage stabilisation. Most re-

sponsible union leaders are convinced of the dangers of inflation and recognise wage control as an unpleasant but unavoidable concomitant of price control. In spite of occasional threats to withdraw, both the American Federation of Labour and the Congress of Industrial Organisations maintain representation on the War Labour Board. The unions contend, however, that the control of wages has been too rigid and that, as a result of rising prices, labour has borne a disproportionate share of wartime hardships. The attitude of the AFL has become increasingly bitter, and leaders of the CIO have begun to doubt the value of their victory at the polls in November.

There is no doubt that economic pressure is in part responsible for labour's opposition to the "Little Steel" formula. The cost of living appears to have risen about as much as basic wage rates in manufacturing—much less than weekly earnings. But with heavily increased taxes and deductions for war savings, many workers have little or nothing in the way of increased spendable earnings to show for their longer hours of work now, and union leaders are looking ahead to the decline in earnings that will take place when hours are reduced in the post-war period.

Beyond these considerations, however, labour's attitude reflects embarrassment over the unions' temporary impotence. For the first time, many unions feel that they have little to offer their members. They are no longer able to obtain wage increases and, in fact, non-union wages are inevitably, at this stage of the game, increasing faster than union wages. It is becoming increasingly apparent that many of the larger unions cannot guarantee post-war employment for all their members. From this angle, too, the demands of some union officials for the immediate raising of wage ceilings has had tremendous popular appeal and has forced support from even the more conservative leaders.

Despite the general opposition of organised labour, the great strength of the United Mine Workers, and the recklessness of Mr John L. Lewis, current wage policy will probably be maintained. The recent announcement of a reduction of clothing prices by the Office of Price Administration seems to indicate a determination to prevent a threatening rise in the stabilised cost of living. The public members of the War Labour Board insist on their intention of maintaining current wage policy. The firmness of the Director of Economic Stabilisation in dealing with the "fringe issues" appears to be another straw in the wind.

Yet how the "Little Steel" formula can be saved is admittedly difficult to foresee. Perhaps the board can pull yet another rabbit out of the hat in the form of a substantial "fringe" adjustment. Perhaps the miners, whose wartime record of production is impressive, will refuse to follow Mr Lewis in a protracted strike. Perhaps, in case of a showdown, the army can run the mines.

Looking beyond the immediate critical period, the wage outlook is considerably different. The early defeat of Germany, if accompanied by a substantial reduction in the scale of war production, would very probably be followed by a relaxation of wage controls. The Administration is concerned over the loss of national wage income that will result from the shortening of hours and the shift of millions of workers back to civilian production; these readjustments, unless offset by a substantial increase in employment, may eventually reduce annual wage income by as much as \$15 billion. However, many economists expect a marked increase in labour productivity, such as occurred after World War I, as management cashes in on wartime advances in organisation and technology. With this cushion for prices and with a reduced demand for labour the inflationary aspects of relaxing wage controls will be less threatening.

American Notes

Food Confusion

The Senate has voted unanimously to investigate the food shortage. The House has called for an investigation by its Agriculture Committee. One representative urged that a special committee investigate not only the food situation, but Lend-Lease shipments, foreign stockpiles and black markets. The American Meat Institute claimed that shortages in many parts of the country "border on famine" and scarcity was reported even in the great cattle areas of Texas, while in some Congressional circles rumour had it that there was no meat shortage at all, that greater stocks of live cattle and feeding corn existed in the United States now than at any time in history. The War Food Administration proposed to take Great Britain and the liberated areas off the meat list from April to June, but a spokesman of the Foreign Economic Administration said Britain should not be allowed to go short. The United States must meet international food obligations or suffer "embarrassing moments in international relations." The confusion was the only thing that was clear and thorough.

President Roosevelt stepped in, as he had to, and said quite clearly that Americans would have to tighten their belts. He was sure they would want to do the "decent thing" when the situation was properly explained to them. And that he promised to do this week.

The American meat rationing system has never made very much sense, and there has been a consistent refusal to profit by other countries' experience with rationing. In America, ten points a week cover cheese (about 6 points a pound), meat (which ranges from two points for tough cuts to 10 points for steak, which is rarely available) and butter (26 points a pound and, therefore, prohibitive). The most irrational part of the system is that the points can be saved from week to week, and spent without notice to the butcher—there is no registration, in any case. Such a system can clearly only work if supplies are fairly adequate. It is no wonder that any large cut in the present ration is declared to be administratively impossible.

Housing in War and Peace

A great deal of interest is being shown in legislation which Senator Wagner, of New York, will soon introduce into Congress for an urban and rural post-war housing programme. It will call for the annual construction of 1,500,000 housing units at an investment of \$7 to \$8 billion dollars a year. (During the ten pre-war years building averaged 275,000 units a year at an annual cost of one billion dollars.) Senator Wagner wants Congress to provide federal aid to supplement private investment; he wants long-term, low-interest loans for middle income families who do not require subsidies.

The war years have changed the face of America. It has been necessary to move 4 million war workers and their families from peacetime homes to war production communities in the middle of a mobilisation of industry that required all available energies and material. The War Production Board mobilised everything and everybody that could be spared and the workers were housed. They were housed in converted existing structures, in temporary dwellings built with federal funds, in permanent buildings erected with private capital; in well-equipped trailers and old elevated railway trains reconstructed and refurbished for living. An interesting experiment whose virtues were obscured by circus publicity, was a balloon building: a balloon was blown, wire mesh affixed to it, concrete sprayed, and the balloon deflated. To avoid ghost towns, the National Housing Administration secured from Congress a directive that all temporary housing should be removed within two years after the war's end.

Wartime housing is still keeping pace with production, and is now considered part of the whole intricate fabric. The NHA has only recently asked Congress for a \$90 million supplementary fund for 1945 needs.

Now the American worker is being wooed by real estate companies and house builders and manufacturers of plywood and plastics and aluminium, and new materials no one ever heard of before. They are offering him houses on wheels, houses that expand and contract, houses that revolve to face the sun, glass houses with collapsible umbrella roofs, and all sorts of fantasy, while what the worker wants is a house in which to live.

Aluminum Trust

A Special Court of Appeal has declared the Aluminum Company of America and Aluminum, Ltd., a Canadian subsidiary, guilty of monopolistic practices in violation of the Sherman Anti-Trust Act. This decision has the finality of a Supreme Court ruling since the special tribunal was appointed only because a quorum of six Supreme Court members with no previous connection with the Aluminum Company could not be found. The now celebrated case began back in April, 1937, when the Government first filed suit. The decision, written by Judge Learned Hand, takes the stand that dissolution of the Company is not a penalty, but a remedy—"if the industry will not need it (dissolution) for protection it will be a disservice to break up an aggregation which had for so long demonstrated its efficiency."

Actually, the question, "Shall Alcoa be dissolved?" is left to the New York Federal District Court, since the Appeal Court was only ruling on the law. Dissolution is not so urgent a question now, for the immense growth of Reynolds Metal Corporation during the war, the development of the magnesium industry and of steel alloy substitutes, have modified Alcoa's monopolistic position.

Some people would, perhaps, question Judge Hand's attribution of "efficiency" to Alcoa. It has certainly been efficient in throttling competition and in maintaining prices. But war needs have required a big expansion both of its private competitors and of publicly-owned plants. Plants financed by the Defence Plant Corporation have been built at Tacoma (Washington State), Salt Lake City and in South Carolina and other places. In all of these plants aluminium is being derived from clay in the earth's surface, in contrast to Alcoa's insistence on imported bauxite. Aluminium from domestic materials, however, is still more costly, even though, in five years of war production, costs have been reduced from around \$1 a pound to 15 cents.

Aluminium is now once again on WPB's short supply list. For the first quarter of 1945, production is 275 million pounds, about 100 million less than the amounts needed for the accelerated aircraft programme. Manpower, here as elsewhere, is a problem, with 5,000 men needed in the sheet rolling mills alone.

Exhaustible Arsenal

Oppressed by growing shortages, Mr Krug, the chairman of the War Production Board, recently said rather testily that the United States is not an inexhaustible arsenal of food and materials. "We have scraped the bottom of the barrel in several respects."

After steel, coal, food and aluminium, crude oil is the latest shortage. Although production is at the peak, it cannot meet the ever-increasing demands in Europe and the Pacific. Production is about 300,000 barrels a day under the military requirements of 5,000,000 barrels. To maintain even the present production the Petroleum Administration for War (PAW) estimates that 27,000 new wells are needed, 3,000 more than last year. But alloy steel tubing, in huge quantities, is needed for oil wells, and steel tubing, too, is short in supply and essential for rocket, bomb, artillery and shell programmes. A partial solution is the shipment of crude oil to United States refineries from the Caribbean area, particularly from Venezuela, which alone is said to have a potential output of 1,000,000 barrels a day. But potential output is not available in 1945.

Meanwhile the production of 100-octane aviation petrol continues to rise. When the United States started to prepare for war the rate of production was 46,000 barrels a day. Now the 600,000 mark has been passed. The demand for this aircraft fuel is so great and rising so fast that five new plants have had to be put under construction, with the approval of the PAW, to fill long-range military estimates.

Another headache for Mr Krug is synthetic rubber. In 1942, 96 per cent of the rubber used in the United States was natural. During 1945, natural rubber will constitute only 15 per cent of the total. The Rubber Reserve Corporation, a subsidiary of the Reconstruction Finance Corporation, says a sharp increase in the 1945-1946 programme is necessary to meet military and essential civilian requirements. The 1,000,000 tons scheduled for 1945, 58 per cent above 1944 production, can be reached if adequate supplies of petroleum, alcohol and chemicals are made available, if certain plant improvements are made, and if an ample body of skilled men is made available.

THE WORLD OVERSEAS

Canada's Next Election

(From Our Ottawa Correspondent)

THE exceptional obscurity which has clouded the Canadian political outlook for many months was somewhat clarified in a radio broadcast by the Prime Minister, Mr Mackenzie King, on March 2nd. The life of Parliament legally expires on April 17th, and it is virtually certain that the Government will not seek an amendment of the British North America Act to extend it. But meantime Parliament has been summoned to meet on March 19th, and will be asked (a) to vote sufficient supply, including, of course, war appropriations for the administration to carry on past a general election, and (b) to debate the foreign policy of the Government on collective security, so that the Prime Minister and his colleagues can go to San Francisco with an expression of confidence behind them.

The date for the general election was not announced, but the Prime Minister appeared to give a pledge that it would not take place earlier than the middle of June. How much later it may be depends on the course of events in Europe. The Government is determined to wait until hostilities cease there before appealing to the Canadian public.

Many forces have been battling for supremacy in recent Canadian political history, but transcending them all is Mr Mackenzie King's decision to avoid at all costs a general election fought on overseas conscription. Canadian unity is a laudable obsession with the Canadian Prime Minister. As a loyal follower of Sir Wilfrid Laurier in 1917, he saw with dismay the rift widen between the French Canadians and the English Canadians on the conscription issue, the evil effects of which still survive. For five years he sought to avoid bringing down an overseas conscription measure in this war—and almost succeeded, until the shortage of reinforcements, unexpectedly disclosed last autumn, created a crisis within the Cabinet overnight, and drove him against his wishes to adopt such legislation. The potential gulf between Quebec and the remainder of the country has since been disclosed in a variety of ways, the latest being a 67 to 3 vote in the Quebec Legislature adopting an anti-conscription resolution moved by Rene Chaloult of Quebec City. The Grey North by-election campaign, which ended on February 5th, unleashed a torrent of racial animosities, and provided a lurid preview of the emotions which would probably dominate any general election held in the present atmosphere.

Mr Mackenzie King has thus been driven by overriding considerations from sound political practice. Had hostilities ceased in Europe last year, there is not the slightest doubt that he would have called a general election immediately, well before the five-year term of Parliament had expired. He could probably have been returned to office then with a

handsome majority. Even had he chosen to go to the people a little later, in the midst of the reinforcement crisis, leading such Liberals as would follow him against compulsory overseas service, he might well—it is said to have been his own confident estimate—have come back with 100 seats and the largest group. But his determination not to permit a campaign on this deep-rooted emotional issue compelled him rather to ask for Colonel Ralston's resignation, to invite a Conservative, General McNaughton, into the Cabinet, and to seek to patch up for a time the controversy within his own party. All this has materially worsened his chances of coming back to power. He has been driven against his instincts to hang on to office and expose himself to the charge of clinging to power without the confidence of the country. He had no choice but to seek a constituency for the new Defence Minister, and there the party strategy went wrong, picking out a close seat and losing a Liberal riding to the Progressive Conservatives. This did further damage.

The Pressure of Events

Now events compel him to call a session of Parliament at which current controversies over reinforcements are sure to be bitterly renewed. With only four weeks left before the life of Parliament expires, the Opposition can, if it wishes to be awkward, hold up all progress, and even refuse to vote supply. Then, with Parliament no longer in existence, the Government will be compelled to make shift to finance its war effort, and the ordinary business of government, by Governor-General's warrants to the tune of \$15 million per day. If the European war drags on into the summer, the Government will be driven still further into the corner. It cannot hold off an election indefinitely. It can hardly ask for an extension of Parliament after Parliament is legally dead. In the end, it is conceivable that after the Prime Minister has moved heaven and earth to avoid a war-time election on reinforcements, the vote will still have to be taken while hostilities rage overseas. The one event which can save the Government from prolonged embarrassment, which is certainly the most acute in Mr Mackenzie King's twenty-five years of Liberal leadership, is thus an early end to the European war.

Quite apart from the damage which would be done to Canadian unity by a virulent election campaign on overseas conscription, a Parliament elected at the present moment would be chosen on an issue which will be dead as soon as the European phase of the war is finished. Clearly what Mr Mackenzie King desires is a Parliament specifically chosen to enact transition and post-war social and economic policies. Moreover, it is highly desirable, if not imperative,

that Canada's 750,000 service men and women be able to participate fully in the campaign, and that the new House should contain a good sprinkling of candidates now on active service.

The standing of the parties in the Canadian House of Commons, on March 6th, was as follows:

Liberals	155
Progressive Conservatives	40
C.C.F.	10
Social Credit	10
Others	18
Vacant	12
	245

Venezuelan Oil Expansion

[BY A CORRESPONDENT]

WHEN, in the early months of 1943, the Venezuelan Government submitted the draft of a new Hydrocarbons Act to the National Congress, the shares of British and American oil companies with interests in Venezuela began to fall on the London and New York Stock Exchanges. The Mexican oil expropriations of 1938 made investors suspicious of any move initiated by a Government of a Latin American republic. The new law has now been in force for close on two years and its effects on the Venezuelan oil industry can be assessed. In brief, the opinion expressed in *The Economist* of May 29, 1943, when the details of the new law were discussed—that the Venezuelan Government, so far from being antagonistic, was clearly anxious for the fullest co-operation with the foreign oil companies in order that oil production should be expanded—was fully justified.

The introduction of the new law could hardly have been better timed. It coincided with the Allied mastering of the U-boat menace, the first improvements in the tanker supply position and a steep rise in the oil requirements of the United Nations for military purposes. Even under the old regime, therefore, the past two years would have seen a rapid increase in Venezuela's oil production, but the new Hydrocarbons Act has helped it to expand still further. The provision allowing foreign oil companies to convert their old concessions into new ones of forty years' duration, with the option for renewal of another forty years after their expiry, enabled the companies to plan well ahead and to take risks. Moreover, the heavy surface taxes on unused oil lands, imposed by the new law, forced the companies to speed up exploration. The result has been an oil boom in Venezuela. Apart from the increased activities of the old-established producers, several big international groups have entered Venezuela for the first time. These groups include Socony Vacuum Oil, which is already producing on a small scale in one of its two Venezuelan properties, and Standard Oil of California, which, through a subsidiary, the Richmond Exploration Company, obtained two extensive concessions, totalling 2,750,000 acres, late last year. Part of the latter concessions are situated in areas west of Lake Maracaibo which have so far been only superficially explored.

A study of the latest reports and chairmen's statements of the British and United States oil companies working in Venezuela shows that, although the various groups are affected by the higher taxes and dues imposed by the new oil law as well as by the higher wages recently introduced, all of them are making the best use of the conditions created by the 1943 Act. The overwhelming majority of the old concessions have been converted into new ones of forty years' duration, and many more new concessions have been granted. All companies report intensified exploration and exploitation, and some of them—including the British-controlled Ultramar—have lately obtained new capital to finance extended operations.

The results are clearly shown in the figures of production. Venezuela's oil production, after reaching a peak of 223 million barrels in 1941, fell, owing to the U-boat menace in the Caribbean area and the partial destruction by enemy action of the Aruba refineries, in February, 1942, to roughly 180 million barrels in that year. In 1943 there was a recovery to about 200 million barrels, and preliminary returns suggest that last year's production reached a new maximum of about 237,250,000 barrels. Production was less than 600,000 barrels daily in the early months of 1944. It exceeded 700,000 barrels daily in the latter part of the year and, according to a recent forecast by the Vice-president of the Venezuelan Central Bank, it is expected to reach 1,200,000 barrels daily before the end of this year. Even at

the current rate of production, Venezuela appears to have reached, if not exceeded, the output of Soviet Russia, for many years past the largest oil producing country outside the United States. As Russia—like the United States—absorbs most of its oil at home, while Venezuela exports the great bulk of its production, the latter may now be the world's largest exporter of oil.

Oil Refining

While Venezuela's oil exploration and crude oil production has made extraordinary progress in the past two years, the schemes for expanding the country's oil refineries are, naturally, held up by the shortage of equipment. For the present, therefore, the great bulk of Venezuela's oil continues to be refined in the Dutch West Indies. But the Venezuelan Government, in the negotiations leading to the revision of the oil law, came to an arrangement with the foreign oil companies. Under this agreement, the country's oil refining capacity will, within five years after the war, be extended from the present 72,000 barrels to 192,000 barrels daily. This policy has been carried farther since 1943. Most of the new concessions are granted subject to an undertaking that the oil found is either refined within Venezuela or in the importing countries. Moreover, in January last year, a US mission visited the country, on the invitation of the Venezuelan Government, to make plans for the erection of new oil refineries at the earliest possible date. On the basis of the present plans it is, indeed, probable that, within five years after this war, Venezuela will ship roughly one-third of its crude oil production in the form of refined products and that another large part will be shipped in the form of crude oil to the final consuming areas.

These developments are of the greatest importance to the United Kingdom, which for various reasons after the war will be anxious to extend its oil refining capacity. It may be recalled that Venezuela was already before the war the largest single source of the United Kingdom's oil supplies, although the greater part of these imports passed through the refineries of the Dutch West Indies. Large direct imports of oil from Venezuela may open a large market for British industrial equipment in that country.

No. 7—TANGANYIKA

TANGANYIKA TERRITORY covers an area lying between the Indian Ocean and the great African Lakes, 360,000 square miles in extent. On its northern frontier, Kilimanjaro, one of the most remarkable mountains in the world, rising to a height of more than 19,000 feet over-looks the borders of Kenya.

The coastal belt of Tanganyika was for many centuries visited by Arab traders and pirates. Eventually it became subject to the Imams of Muscat, one of whose descendants still rules in Zanzibar, under the protection of Great Britain.

The native population of more than 5,000,000 is mainly engaged in agriculture; the coffee and sisal plantations in the North producing the staple export crops. Cotton and groundnuts, hides, skins and gold are also exported.

The average annual value of Tanganyika's external trade for the years 1935/39 was about £8,000,000.

The Bank has branches at Dar-es-Salaam, Arusha, Chunya, Iringa, Mbeya, Moshi, Mwanza and Tanga. Those concerned with trade in Africa, the Mediterranean or the West Indies, are invited to communicate with:—

TO INDUSTRIAL GAS AND ELECTRICITY USERS

These 3 Bulletins show the way to Immediate Savings

Every man and woman in industry concerned with the use of gas and electricity should get hold of a copy of each of these three Bulletins: READ THEM AND KNOW THEM. They are:

- No. 5—"Practical Economy Points for Industrial Gas Users."
- No. 14—"Operation and Maintenance of Gas Burners."
- No. 13—"Fuel Economy by Saving Electricity."

Always keep them handy in desk or pocket for reference.

The Bulletins issued by the Ministry of Fuel and Power provide the latest "specialist" knowledge on all aspects of fuel saving. They show how waste may be occurring in unexpected places, and tell what the cure is. Only when plant has been considered in the light of all the appropriate Bulletins can there be reasonable certainty that every source of wastage has been discovered.

To Managements. See that copies of these three Bulletins are circulated among your staff at once.

To Staff. Keep the Fuel Efficiency Bulletins ready to hand so you can be sure that no opportunity for fuel saving is being missed.

Additional copies of the Fuel Efficiency Bulletins and Fuel Watchers' Badges can be obtained from the Regional Offices of the Ministry of Fuel and Power.

ISSUED BY THE MINISTRY OF FUEL AND POWER

How much
do your
workers know?

Not just about their own jobs, but about the function of your firm as a whole? What do they know about your products, your markets, your processes of manufacture? Yet all your employees can benefit from such knowledge. A film made in your own factory, to tell the story of your organisation, will serve a double purpose. It will do a valuable works relations job, increasing your employees' understanding of the firm and what it stands for, quickening their interest and sense of personal responsibility in its achievement. Another version of the same film can be used for prestige selling at home and abroad.

To make such a film you must have the advice and assistance of creative people experienced in the art of successful film propaganda, backed by the best technical resources.

THE FILM PRODUCERS GUILD

PRODUCERS AND DISTRIBUTORS OF DOCUMENTARY,
INDUSTRIAL, EDUCATIONAL AND NATIONAL
PROPAGANDA FILMS

Full particulars of the Guild, and the services it offers, can be obtained from the Secretary, Guild House, Upper St. Martin's Lane, London, W.C.2

ARE YOU OVER 17 YEARS OLD?

UNLESS you are over 17, there have been no Black Magic Chocolates since you were 14; and at that age (if we remember aright) chocolates were chocolates and never mind the name.

But if you are over 17, the words "Black Magic" probably strike a chord in your memory.

Let us help a little.

A very plain box—glossy black, with a few white lines on it.

Twelve different kinds of chocolates, in simple paper cups, without any fripperies.

Truffle-and-Nougat, Hazel Cluster, Liquid Cherry, Orange Cream, Strawberry Cup . . . heigh-ho. The girls loved 'em; and the boys took no poor view of them, either.

And now, you say, here it comes—"Come Peace, come Black Magic." But nothing of the sort. There will be a lot of pre-war goods back in the shops before Black Magic; for though we shall move fast, we shall take no short cuts—no half measures, no skimping.

Don't expect to buy Black Magic on Armistice Day; but when you do buy it, it will be as good as ever. We believe it will be better, but that will be for you to say.

Black Magic

BOWNTEE & CO. LTD., YORK

THE BUSINESS WORLD

The Cocoa Quarrel

THE Colonial Office's White Paper (Cmd 6554) on the control of West African cocoa received little attention from the public when it was issued last October. But the opposition from the interested parties that has since developed seems likely to push it into the limelight. One of these interested parties is the United States, which is by far the largest single consumer of cocoa; it is reported that the State Department has protested to the British Government against the White Paper's proposals.

In brief, these were that the wartime system, under which all West African cocoa is bought at fixed prices, should continue, and that from next October organisations should be set up in the Gold Coast and Nigeria empowered to purchase the crops, prescribe the prices to be paid to the producers and be responsible for the disposal of the crops.

These organisations would be established by, and responsible to, the Colonial Governments, and would be required to act as trustees for the producers.

The Americans' case against the scheme is clear from this quotation. They object to what they consider will be a cocoa cartel, a producers' monopoly, especially as the White Paper envisages that eventually the Government majority on the organisation would be replaced by a producers' majority. But the American cocoa trade, which in one breath is assuring the State Department that the proposed "cartel" will result in higher cocoa prices, in another breath is whispering in the ears of the brokers on the Coast—so it is reported—that if control were removed it would offer higher prices. It is thus difficult to take this American criticism with full seriousness. Moreover, the Colonial Office, which has so often had to tolerate American criticisms of "imperialism" and "exploitation," would surely be justified in retorting that this scheme is solely dictated by the interests of the "exploited" native producers of the Gold Coast and Nigeria.

Why the Colonial Office has felt compelled to act in the interests of the producer is clear to anyone who remembers the buying agreements of 1937, which led to a cocoa hold-up and an almost complete suspension of the Gold Coast's trade, and who has read the report of the Nowell Commission (Cmd 5845), which investigated not only the buying agreements but the marketing of West African cocoa in general. Before the war, about 98 per cent of the Gold Coast's crop was bought and shipped by thirteen European firms. Three of these were manufacturers of cocoa, who were established on the Coast to safeguard their supplies, and in particular the quality of their supplies, and they shipped about 22 per cent of the crop. The others were firms which also imported merchandise into West Africa; they were headed by the United Africa Company, which alone shipped over 38 per cent of the crop in 1936-37 and had by far the largest merchandise business.

It is a fantastic story, the account of these firms' operations in the Gold Coast. Not by any means to their advantage, the whole system of marketing was riddled with abuses. The African middlemen employed by the firms, who comprised brokers and sub-brokers numbering some tens of thousands in all and most of whom are also cocoa farmers as well, were given advances with which to purchase the growers' crops. When a change in the cocoa price was announced, the firms used to call for a declaration of stocks from their buyers. The result was "false declarations"—the buyers would hold back stocks for a rise in price and over-declare on a fall—which the firms' agents would counter with "false drops"—the announcement of a fictitious price fall in order to draw out supplies, quickly followed by the announcement of a price rise.

"False declarations," "false drops," faulty measures, money lending, speculation—all these abuses largely reflected the fierce competition between the firms for cocoa supplies. They dared not put a stop to a buyer's malpractices because they were afraid that he might take his cocoa to a competitor. "Tonnage-hunting"—that was the disease of which these abuses were only symptoms. Heavy

overhead charges, prestige, fear of being defeated in the competitive struggle, all these were factors impelling the firms to obtain cocoa at all costs, even if it meant paying higher prices than those ruling on the world markets. Another factor in later years was the firms' knowledge that sooner or later the "insane competition," the term which they themselves used to the Nowell Commission, would give way to combination—the buying agreements of 1937 were not the first. These agreements were based on the stabilisation of tonnages on past performances; therefore the higher the tonnage acquired in the period of competition the better the position of the firm during the period of combination. It would be wrong to blame these abuses—or all of them—on the buying firms, whose profits were not excessive. Equally with the growers, they were the victims of the system.

If it is accepted that the system of "insane competition" should end—and the Nowell Commission did accept it, though remarking drily that the competition of newcomers to the trade or of firms with an expansionist policy was based as much on method as on madness—what should replace it? The firms' own solution, illustrated in the buying agreements, is useless, if for no other reason than that their combinations could never last. The stabilisation of prices by agreement attracts newcomers to the trade; the ring is broken, and competition starts all over again. It was suggested that the colonial governments should help them to make their combinations infrangible. Even if the principle that a government could in some circumstances

LONDON, 12th March, 1945.

endorse an agreement in restraint of trade were accepted, there is the attitude of the native producers, for whom the governments are trustees, to be considered. Never would the Africans concede that a buying agreement between the firms was for their own good. "We have experience of their actions and we believe them not." So said Sir Ofori Atta about the 1937 agreement, and suspicion would be no less strong after the war.

Thus the only acceptable course is for the governments themselves to secure stable conditions on the lines proposed in the White Paper. No details were given of how the selling organisation would work in practice, but the announcement of a fixed price—"fixed at any rate seasonally"—should prevent at least the abuses of over-payments and false declarations which the firms themselves regarded as having developed to a dangerous extent. It is therefore difficult to understand why the cocoa trade is opposed to the proposals, though it is understood that Cadburys have agreed to co-operate to the best of their ability. The Cocoa Association of London has issued a memorandum to members of Parliament giving its objections to the scheme. In essence, this memorandum is a plea for a return to the old system and for the abolition of state trading, though it suggests that a Government Board should have the responsibility of fixing and maintaining a minimum price for the grower. In the light of the conditions revealed in the Nowell Commission's report, this sort of argument

... the shipper, who is also the importer into Africa of merchandise of every description, should be fully maintained in all his activities, in order to encourage the export trade from this country. Any measures likely to detract from the merchants' efficiency would increase the cost of handling these exports and should be vetoed.

does not hold water. The pre-war system was anything but efficient; and if the merchants lost money on their cocoa purchases in recent pre-war years, as they claimed before the Commission—which accepted the claim with reservations—one would have thought they would have been only too glad to beat an honourable retreat, or at least be content with the reduced functions which the scheme will allow them. Or were their purchases not so unprofitable as they made out?

Et tu... there are times when one feels really sorry for the Colonial Office. Opposition from the cocoa trade, here and in America, may have been expected. But the opposition expressed in West African newspapers must be a little hard to tolerate. Actually, this opposition may turn out to be more vocal than real. Partly, it is a case of any stick to beat the Government with. Partly it represents opposition from the brokers rather than the farmers; there is evidence that the chiefs are adopting a constructive attitude. Partly it is based on misunderstanding. For instance, the White Paper's

reference to the official policy of fostering and developing the co-operative movement among producers is seized upon; our co-operatives, says the African, are not to be government affairs, they are to be "free and independent"—without realising that even in the most advanced countries co-operative societies are subject to regulation. Partly, too, there is a suspicion that the United Africa Company is after all behind the scheme. This is symptomatic of the Africans' perennial attitude towards that firm; and since their suspicions are shared by many European officials on the coast, the company, in its own interest, might welcome an impartial enquiry into the effects of its dominating position on the West African economy.

It is difficult to see any alternative to the main proposal of the White Paper. A theoretical attachment to the principle of free competition can hardly be stretched to cover a case that has involved such inequality of resources between buyer and seller and such fantastic abuses. But this is not to say that an official board, devoted to the growers' interests, is by any means an ideal solution. Past experience—especially that of the Colonial Office—goes to prove that if the prices determined by a price-fixing board are low enough to move the supplies, they are also low enough to arouse high indignation from the producers who complain that their own board is letting them down. And if, on the other hand, the board yields to the pressure of its own constituents, the resulting price is so high that it can only be maintained—and even then only temporarily—by "buffer stocks," restrictions on exports or production and the rest of the familiar devices. It will take very great wisdom and very great firmness on the part of the colonial governments to resolve this dilemma. In their favour is the fact that producers and consumers have grown accustomed to control after six years of it, and the likelihood of a world demand for cocoa for some time after the war. But before very long they may be fervently wishing that the price were fixed by external forces, by the pressure of the market—by anything or anyone other than a group of officials in Accra struggling, under constant criticism, to square the circle.

Moreover, even if the scheme works, it is important, from the West African point of view, that the sheltered position in which the growers would then be placed vis-à-vis the vagaries of the world market should be used to put their house in order. Part of the profits realised from wartime trading are to be used for research, for combating the diseases which threaten the very existence of the cocoa industry and ultimately the whole economy of the Gold Coast. It is also necessary that vigorous efforts should be made to put an end to the indebtedness of the cocoa-growing community. It is thus high time that the objects and methods of the scheme were fully explained by the Colonial Secretary. If this cocoa venture is to be a prototype, it is time the world learned more about it.

London's Fur Trade

ON January 22nd the Board of Trade fixed maximum prices for "utility furs" and simultaneously reduced the purchase tax from 100 per cent to 16½ per cent of the wholesale price. The Board of Trade's decision was designed "to provide the fur trade with the necessary basis in the home market for reviving and developing London's position after the war as a world fur centre."

The reasons that originally led to the creation of an international fur market in London are the same as those that favoured the establishment of other commodity markets in Great Britain. Originally, the furs brought to London were mainly of Empire origin; the Hudson's Bay Company held its first big auctions in 1672. At a later stage the London market attracted furs from all over the world; during the pre-war decade, when turnover reached its highest level, less than a quarter of the furs brought to London were of domestic or Empire origin. The growth of the trade in London was greatly assisted by the financial and trading facilities it offered as a market. It was also encouraged by the geographical position of London on the fringe of Europe, for more than half the world's supply of furs used to be absorbed by Europe, including Great Britain. The trade was assisted, too, by the freedom enjoyed by foreign traders in this country. After the Russian revolution a number of important fur traders from that country settled in London. Again, after 1933 Jewish fur dealers came to this country from Leipzig, and as a result London displaced Leipzig as the world's leading fur market. The

fur turnover of Leipzig, as reflected in German imports and exports, was halved (from Rm. 244 million to Rm. 125 million) between 1932 and 1937, while that of London was doubled (from £16 million to £31 million).

The real significance of the fur market to this country is not immediately apparent from the figures of trade. In 1929, imports exceeded exports in value by £4,298,000; during the last three pre-war years the adverse balance still averaged £2,176,000. This is due, of course, to the fact that a proportion of the furs imported raw or in the early stages of processing were retained for use in this country. Actually, the fur trade brought more dollars to Britain than any other product listed separately in the trade returns, with the exception of spirits. Its exports to the United States exceeded British imports from that country by £3,350,000 in 1937 and by £2,879,000 in 1938. It also had a favourable trade balance with European countries, but an unfavourable one with the countries exporting raw furs, such as Russia, Afghanistan, Iran, the British Empire and a number of other areas. In a narrow sense, the fur market does not employ a large number of workers. But the number engaged in the various stages of processing is by no means negligible. The number of workers engaged in the dressing and dyeing of furs must have increased appreciably in the pre-war decade; in 1929 there was an import surplus of £3,823,000 in dressed and dyed furs, but in 1938 there was an export surplus of £1,250,000.

There is, in sum, a strong case for the revival of the

London fur market and of its processing trades. After the outbreak of war London, inevitably, lost its position in the trade and New York has become the leading centre. New York now absorbs the greater part of the world's exports in raw furs; the leading London auction houses, headed by the Hudson's Bay Company, have transferred their auctions to the United States. True, the British dressing and dyeing industry has been kept in being; it has been engaged mainly on work for the Royal Air Force, for the Russian armies and on other essential contracts. Exports to the United States of domestic furs, especially of rabbits, have been encouraged, and have fluctuated around the rate of £1,000,000 a year. The dressing and dyeing industry, however, has made a good deal of technical progress, especially in the treatment of rabbit and sheep skins. In a technical sense, therefore, this country would have no difficulty in resuming its position as a world fur centre. But Britain's technical qualifications, personal contacts, and the measures taken in January by the Board of Trade to popularise the use of fur garments are not sufficient, by themselves, to restore the London trade to its former position. A number of other conditions must also be fulfilled.

The first of these conditions is the restoration of the facilities formerly enjoyed by the fur market in London. In so far as there will be a need for adequate shipping, warehousing, export credit and other facilities, the problem of restoring the fur market is similar to that of other commodity markets. The restoration of these facilities for furs, however, need not be conditional upon the restoration of those for other commodities still covered by bulk purchase agreements. In any case, the fur trade is unsuitable for international regulation; it is still largely a luxury trade, based on highly-skilled handling and sorting, and on close contacts between individual dealers and their clientele. Once transport is re-opened, control could largely disappear.

Secondly, steps will have to be taken to ensure supplies of raw furs to this country; this will mean, in effect, the partial re-transfer to London of supplies that have been sent to New York since the outbreak of war. In Russia and Afghanistan, two of the chief and most highly valued sources of supply, exports are controlled by the Governments, and shipments are determined largely within the framework of

general export policy. Government initiative may, therefore, be needed to resume large-scale British imports of furs from these two countries. The fur interests in New York that have taken over the trade from this country in an emergency can, perhaps, not be blamed for wishing to cling to this heritage, though, in all fairness, London has every right to make a determined effort to recover its trade. And since a sizeable part is played in the American market by British firms—notably by the Hudson's Bay Company—the effort ought not to be unsuccessful.

Finally, there is the problem of bringing back to London its former custom—that is to say, to resume the export trade in raw and prepared furs and in fur garments. This will involve, as a beginning, the re-transfer of fur auctions to London. Before the war London had the advantage over New York in that its clientele was international, whereas the latter relied chiefly on national demand; in consequence, the prices obtainable in London were often higher than those that could be obtained by direct sales to the United States. One difficulty in restoring a large and free market in this country is that Europe, formerly responsible for the absorption of about half the furs entering international trade, will be poorer, and that the United States may absorb a higher proportion of the furs than before. This is certainly true of the more expensive luxury furs. But this difficulty can easily be exaggerated, first because some of the colder countries of Europe—such as Poland and the Balkans—will again need fur garments, even if they cannot afford a high proportion of the more expensive varieties; and secondly, because the trade in luxury furs is a fashion trade which would only be lost if London and Paris were unable to maintain their position as world fashion centres.

The London fur trade, in fact, is an interesting example of the kind of difficulties likely to be encountered by trades that have migrated across the Atlantic during the war. The case for recovering the trade is strong, for it may once more become an important source of foreign exchange, especially United States dollars. But, although technically London is still qualified to resume its former position, the trade will need assistance—not merely negatively by the restoration of trading facilities, but positively in order to ensure a steady flow of raw furs to this country.

War and Post-war Banking

While the war lasts, the resources of Barclays Bank will be devoted to the fullest possible extent to helping the war effort of the nation.

When the war is ended, the Bank will add its full weight to the forces of restoration. To ease the transition from war-time to peace-time conditions, customers will find the same progressive outlook, the same courtesy and sympathetic understanding of their banking needs and the same high quality of service which have kept the name of Barclays Bank in the forefront of British banking for generations.

The small business man and manufacturer will have the active co-operation of the Bank in solving his financial problems, no less than the large merchant and industrialist.

Business Notes

Commonwealth Debt

The decision of the Government of Australia to take the first opportunity of dealing with the large mass of 5 per cent debt optionally repayable in 1945 will cause no surprise. Indeed, the main outlines which the operation was likely to assume were discussed in *The Economist* last July. In the 1920's the Commonwealth and States issued loans at 5 per cent, most of which were repayable 1945-75. Of these, £94,311,567 mature on July 1st or August 1st this year, and a further £14 million odd of New South Wales stock on December 1st. The latter must be left for the time being, but holders of stocks issued by the Commonwealth, South Australia and Victoria, with maturities in July, and of those of Tasmania and Western Australia, repayable in August, are offered conversion or repayment.

Conversion is limited to £60 million and rather over one-third of the total sum maturing is to be repaid out of accumulated sterling balances. These represent, in part, the sterling equivalent of dollar payments to Australia, and it is understood that, after the repayment, the total will still exceed £100 million. It is a further feature of the issue that, if the whole £60 million is not taken in conversion, the deficit will be taken by the Commonwealth Bank. But the British Treasury is still prepared to make advances for the repayment of any part of this £60 million which is not covered from other sources.

The new stock to be issued is a 3½ per cent 1965-69 one at par, which means that Australia is breaking new ground. The terms are even slightly more favourable to the borrower than those of the recent New Zealand offer, which was made at ½ point discount and ran only to 1962-65. The difference reflects, however, the improvement in the gilt-edged market rather than the relative status of the two borrowers. The new rate of interest and the extent of the net repayment cannot fail to have an effect on security prices. This may be greatest in other Australian stock and least in equities, but it is likely to pervade the whole market to the extent that the event has not yet been fully discounted. Since, however, the lists for conversion do not close until May 25th, or when the full amount has been taken, whichever happens first, the effects may be deferred. The immediate reaction has been a ½ point rise in the maturing issues and a slight acceleration of the improvement in the Funds.

The Saving of Interest

The Commonwealth loan operation, although by far the largest, is only the latest of a long series of conversions and repayments spread over the past 12½ years. By August next some £378 million of stock will have been converted and some £52½ million repaid, while in addition a UK Government advance of £12 million, made in the early years of the war, has been liquidated. These repayments exclude sinking funds and were all effected during the war. The saving in interest from the latest operation will be some £1,710,334 per annum and the total since 1932 some £5,300,000 or £6,600,000 Australian currency.

With the exception of the £14 million of New South Wales stock, mentioned above, and a 5½ per cent loan 1947-57 of the same borrower, the present operation eliminates all Commonwealth and State loans bearing interest of more

than 4 per cent. There are, however, £30 million outstanding and repayable at any time on due notice, bearing that rate. It would not be surprising if, provided the 3½ per cent rate is established for loans of some 25 years, conversion of these were undertaken in the autumn.

The total saving in interest is substantial in the Australian context and, coupled with the fall in the value of the pound, will very considerably reduce the real burden of the debt service to this country. It will be a welcome offset to the fact that a proportion of Australia's wartime overseas revenue will fall off after the war precisely at a time when the desire for replacements from overseas will be very much in excess of the pre-war normal. From the standpoint of this country, the conversion of the loans to a lower interest basis will mean a further cut in the income from the depleted stock of overseas investments.

US Shipping Disposals

A letter addressed by Mr Joseph Grew, United States Acting Secretary of State, to Representative Schuyler Bland, chairman of the House Committee on the Merchant Marine and Fisheries, sets out the State Department's policy on the disposal of Government-owned ships. (This House Committee is at present considering a Bill to provide for the sale of Government-owned vessels.) The significance of the letter lies not merely in its outline of general policy, but also in the methods it suggests for disposal. The disposals policy of the United States transcends the interests of British shipowners.

At the end of the war the Government of the United States will own the greater part of the world's ocean-going merchant tonnage. Mr Grew, therefore, argues:—

The general policy adopted and developed to govern the post-war sale of Government-owned merchant vessels should be in close harmony with the broad foreign economic policy which will best serve the national interests of the United States. In the post-war disposal of its merchant vessels, the Government of the United States might seem to pursue a narrowly nationalistic policy involving undue emphasis on short-range considerations. It might seek to advance its national shipping interests by endeavouring to utilise its somewhat monopolistic position as the owner of the major portion of the world's ocean-going tonnage, to face increased participation by American shipping in the internationally competitive commercial traffic of immediate post-war years. Such a policy could have only limited and temporary success, and it would be distinctly out of harmony with the broad policy of promoting the flow of trade through the reduction of nationalistic restrictions and discriminations.

If the Government of the United States were to attempt to take advantage of the war losses of other countries and of the wartime increase in its own merchant fleet to establish itself in a dominant shipping position, it would be acting contrary to its basic policy of promoting sound international economic relations and an increasing flow of commerce.

Mr Grew's statement of policy is unexceptionable, but it still remains to be translated into detailed action.

Ships for Sale and on Lease

As it stands, the Bill for the disposal of ships owned by the Government of the United States only provides for disposal to other countries by way of sale. There is no provision for chartering vessels. The absence of such a provision has given rise to a good deal of criticism and anxiety in other countries. Several million tons of United States Government-owned vessels—chiefly "Liberty" ships—are at present chartered to members of the United Nations, including Britain, which may require them, at least temporarily, after the suspension of hostilities. If there is no authority to continue these charters, the countries now operating the ships would either have to return them or purchase them. To quote again from Mr Grew's letter:

Refusal to charter such vessels might result in the forced purchase of some additional vessels by foreign operators. However, a policy of compelling foreign operators to buy ships from us for their temporary post-war needs would not be consistent with our broad national interests. It would likewise not be to the long-run advantage of the American shipping industry.

In the view of the State Department, "forced" purchases would not materially affect the rate of replacement by way of new construction in other countries. They would re-sell their forced purchases, in all probability to operators whose participation in international shipping competition is based primarily on "sub-standard manning and working conditions and operating practices." Mr Grew, therefore, suggests that authority to charter vessels of "Liberty" type to foreign shipowners should be included in the Bill for the disposal of ships; this suggestion will be welcomed by British shipowners.

The Engineering Employers' Reply

The Engineering Employers' Federation on Wednesday gave a negative reply to the ambitious threefold application of the engineering unions—for a forty-hour week without reduction of wages, for the extension of annual paid holidays from six days to twelve, and for a "substantial advance" in the wages of adult male workers. The wage claim will therefore be referred to arbitration and the hours and holidays claims will be reviewed by the engineering joint trades movement. Replying for the employers, Sir Alexander Ramsey said that the 40-hour week would be far too great a risk to add to industry's liabilities when the world's economic outlook was so uncertain, and that industry's first obligation will be to meet the economic and social needs of the country.

The engineers were the first to set the forty-hour ball rolling. They presented their claim in September, 1944, even before the Trades Union Congress had decided to place the forty-hour week in the forefront of their post-war programme. The present discussions are, therefore, in the nature of a test cast for the whole of industry, and the engineering employers' reply may be taken as representing the attitude of the leaders of industry. The unions' claim is based on the argument that with the increasing productivity of labour and the progressive improvements in methods of production, hours can be reduced without causing any reduction in output. There is undoubtedly also the underlying desire to safeguard against the possibility of post-war unemployment by spreading work over a lesser number of hours.

The same arguments are applied in the claim for higher wages. Though the unions did not specify any sum, their demand for a "substantial" increase is primarily designed to safeguard the post-war position of their members. Engineers are now among the highest-paid industrial workers. According to the latest Ministry of Labour survey, the earnings of adult male workers in the engineering and shipbuilding group in July, 1944, averaged 131s 9d a week, an increase of 85 per cent over October, 1938. (The wages of women engineers, unless they are employed "as men" under the Relaxation Agreement, are the subject of separate negotiations and are not included in the present claim.) The unions point out that wartime pay-packages are swollen as a result of abnormal conditions—overtime, night work and Sunday work—and the extension of piece-rate systems, and not because of high wage rates. The district average and weekly minimum is £4 11s 6d for a skilled worker and £3 15s 6d for an unskilled worker. Though long-term negotiations for a revision of the industry's entire wage structure, described as crazy and antiquated, are now proceeding, the engineers want to have their "jam to-day." But to claim at the same time higher wages and shorter hours is to confront the issue. In the long run, the pressure for higher wages is a powerful stimulus to the introduction of more efficient methods of production and, hence, to the rise in productivity. At this stage the unions must make their choice: more money or more leisure, and not more money and more leisure.

Planned Reconversion

Plans for industrial reconversion are now beginning to take shape, and the Board of Trade has announced that nineteen Government factories—recorded in the accompanying table—have already been allocated to private firms for peacetime production. The total factory space in these factories amounts to 7 million square feet. It represents a capital value of about £10½ million, and should provide employment for rather more than 50,000 workers. The space so far allocated is not a very large proportion of the

total space available in Government factories, but the number of applications received—2,700 applications for 100 million square feet—is about three times as great as the total space available.

In view of the excess of demand over supply, and of the importance of the premises factor in industrial location, it is very essential that the Board of Trade should, as far as

GOVERNMENT FACTORIES ALLOCATED TO PRIVATE FIRMS

LOCATION	ALLOCATED TO	PRODUCTION
Llanelli	Morris Motors Ltd.	Motor cars
Cwmbran, Newport	J. Lucas & Co., Ltd.	Motor equipment
Bristol	Bristol Aeroplane Co., Ltd.	Aero engines
Solihull, Birmingham	The Rover Co., Ltd.	Motor cars
Chester	Brookhirst Switchgear Ltd.	Switchgear

Seaton Carew	Head Wrightson Ltd.	Drop forgings
Armley, Leeds	Wilson & Mathieson Ltd.	Gas stoves
Workington	C. Corner & Co., Ltd.	Gas stoves

possible, plan the allocation of these factories—most of which are well equipped modern buildings—so as to conform to the most urgent production needs and to utilise the available labour force and plant to the maximum advantage. It would seem, to judge from the initial list, that the Board is in fact adopting the policy of encouraging the manufacture of motor cars and machinery—articles that will be in demand abroad—and of household equipment.

But some criticism has been made of the decision to allot the Speke aircraft factory at Liverpool to Messrs Dunlops for the production of tyres and footwear, which will employ largely unskilled female labour and will not absorb the skilled engineering labour released from aircraft production.

The orderly transition from war to peace should be enormously facilitated by the use of the location "planning room" which the Board of Trade has inherited from the

Ministry of Production and is adapting to peacetime purposes. The maps, charts and diagrams contained in this room provide a complete information service, in accordance with Clause 8 of the Distribution of Industry Bill. Any industrialist who is thinking of setting up a factory can obtain a detailed statistical picture of the advantages and disadvantages of any particular area—such as the availability of labour and factory premises, its transport and power facilities, and housing for workers. A location index, such as this, will surely become an indispensable feature of post-war organisation.

Mr Courtauld Protests

In view of the excellent preliminary statement of Courtaulds, dealt with on page 321 of *The Economist* of March 10th, the full accounts, summarised on page 389, call for no comment beyond regret at the absence of consolidation. This, however, is not the case with the statement of Mr Courtauld about the future of the company. A year ago he gave some vague indications of the post-war plans of the group. This year he is more precise. Orders have been given for a 50 per cent increase in the staple fibre factory in North Wales, a site has been acquired in Belfast and negotiations are proceeding for others in West Cumberland and Dundee, while British Nylon Spinners has acquired a site in South Wales for a further full-scale works. Overseas, the Canadian plant is to be extended, and among other Empire developments a site has been acquired in Australia for a large rayon yarn and staple fibre factory. Even more interesting, the group is considering the extended manufacture of chemicals for its own use and the building of improved textile machinery.

Evidently, whatever other textile manufacturers mean to do, Mr Courtauld does not intend to stand still, and he has funds, to the tune of well over £40 million, to back his projects. But so far there is no means of carrying out the plans made. Shareholders are warned that it will take years to build, equip and put into operation factories on the scale intended, and there is so far little sign of when a start can be made. And this brings Mr Courtauld to the essential point of his statement, namely a complaint at the unco-operative attitude of the authorities. Staff and directorate are strained to breaking point,

we are now in danger of seeing much of our important planning practically brought to a standstill. Some Ministers seem incapable of understanding that British industry can neither build up an export trade nor help in the development of the Empire—to say nothing of establishing full employment at home—if industrial staffs are to be kept depleted of some of their most active brains until the time for effective action is passed.

These are strong words, and all the stronger coming from a man whose public utterances have usually been very moderate in tone. The men in question are not in the armed forces and, rightly or wrongly, a large body of industrialists in the country feels that the time has come when a substantial part of the personnel, whose work has greatly helped in carrying on the war, ought now to return to their normal jobs so that industry may be prepared for peace. It is difficult to say that this claim is not justified in view of the preparations which are being made in other countries, but it may be doubted whether the fault ought

to be laid entirely at the doors of individual ministers. There are cases where they appear to have been unduly complacent, but it may well be that they too have not a call on the "most active brains" available. The fact is that the War Cabinet, even at this juncture, is absorbed in winning the war and that there is nobody of the requisite stature outside to support the claims of industrial reconstruction.

A Contrast

The full accounts of Bradford Dyers' Association show that the increase in profit disclosed in the preliminary statement was virtually all absorbed by higher tax provision, so that the increased dividend was provided by cutting down the addition to the carry forward. The transfer of £50,000 to reserve is, however, repeated. The accounts are summarised on page 389. The remarks of the chairman, Mr George Douglas, are concerned almost exclusively with the post-war position, but, in contrast with Mr Courtauld, he has nothing to say of the plans of the group or of the industry of which it forms a part. Instead, he advocates an extremely repressive policy towards the aggressors of the war. Having demanded stringent control and rigid supervision of their exports and imports, he continues:—

No half-way measures will suffice, and I would say, further, that apart altogether from the fact that past experience shows with what facility these countries have been able to apply the rewards of industry to the purposes of war, both German and Japanese products should be excluded from every market where their presence would be detrimental to the interests of the countries who have been the victims of such grievous wrongs and have endured such unheard of barbarities.

This would seem to mean that in no case and in no country may goods produced by the aggressor countries compete with goods of Allied origin, or perhaps that they might compete with American but not with UK or French goods. If this is so one is entitled to ask how the aggressor countries are to live, but one is left in very little doubt that the need for a drastic overhaul of production methods in important sections of UK textile manufacture would be somewhat reduced. It can only be hoped that Mr Douglas's words do not represent the contribution of the Association to reconstruction. Enterprise and efficiency, rather than protective devices, are the means to the maintenance of prosperous textile trades.

A minor contrast with the experience of Bradford Dyers' is provided by the fortunes of Woolcombers. From regular distributions of 26½ per cent tax free pre-war the dividend has fallen by steps to 15 per cent tax free for 1944. In conjunction with its main business the group produces wool-grease, lanoline and rust preventatives. The chairman, Mr W. E. D. Shaw, sees a large programme of reconstruction and modernisation ahead for which he would seem to have made adequate financial provision. But he is uncertain about future trading conditions. Referring to the need for a 50 per cent increase in exports he says:—

In my opinion, it is very necessary to state that unless there is considerable relaxation of Government control of industry at the earliest possible date so as to allow reasonable freedom for initiative and enterprise it will not be possible to achieve the desired objectives.

It is regrettable that Mr Shaw and others who voice similar beliefs are not more explicit. Nobody who has studied the subject believes that all Government control can be relaxed. Would it not be worth while for industrial leaders to state the minimum relaxation considered necessary so that the matter can be publicly discussed?

Budget Estimates

With only a fortnight to go from this week's Exchequer Return to the end of the financial year, the composition of Great Britain's annual balance sheet is fairly clear. Broadly, it looks as though the estimates given in the Chancellor's Budget speech will prove very near the mark. The pattern of war finance during the last two years has been much more easily predictable—in many sections it remained almost stable—than in the early years of the war. Fairly accurate estimation was therefore to be expected, though for the next financial year, and for the transition period beyond, the task may prove more difficult.

So far only excise, estate duties, motor duties and miscellaneous receipts among the important revenue items have passed the totals predicted, and the first three of these by narrow margins. With income tax it will be touch and go whether the higher Budget estimate of £1,300 million this year will be reached, and surtax seems destined to fall short of its target of £80 million. But customs, EPT and NDC will almost certainly finish well over the mark, and a total ordinary revenue surplus over the estimate of around £100 million seems likely.

On the expenditure side, the Budget estimate had to be revised in an upward direction when the last vote of credit was sanctioned at £1,250 million, against £1,000 million for the four previous ones. Actual ordinary expenditure seems likely to fall between the original estimate of £5,937.4 million and the revised estimate of £6,199.3 million, though not more than about £50 million above the former figure. This would leave the current deficit around £50 million short of the amount foreshadowed in the Budget, with revenue covering some 53 per cent of expenditure. In the financial year 1943-44, the deficit fell short of the original Budget estimate by £88.4 million.

The Demand for Small Change

Complaints are being heard of a shortage of small change. The coinage situation to-day is curious. There is far more coin in circulation now than ever before, yet the banks are unable to meet their customers' demands in full. For some reason the heavy paying-in of coin to the banks that usually takes place in January with the post-Christmas shopping lull was absent this year. It seems that many tradespeople, publicans and others, fearing a possible shortage, are hoarding coin instead of banking it. This is especially true of small change. Sixpences, for instance, may be difficult to obtain from the banks, but they are plentiful in circulation. In some places there is even a glut. This coin has been freely minted during the war; some 200 million have been struck since 1939—an extra seven for each member of the spending public.

Many millions of shillings are immobilised in gas and electricity meters. The numbers so immobilised have increased lately, partly owing to the increased number of

COIN HOLDINGS OF THE BANKS OF THE UNITED KINGDOM AND EIRE

(32 Banks, including the Bank of England)

Year	Day of the Week	Gold Coin	Silver Coin	Nickel-brass Threepence	Bronze Coin
June 30 1939	Friday	45,283,569	17,403,503	224,461	2,847,271
1940	Saturday	10,255,889	17,183,538	244,486	2,656,536
1941	Monday	256,404	20,197,775	285,809	2,247,879
1942	Tuesday	903,144	19,899,236	638,337	2,106,824
1943	Wednesday	911,340	20,759,440	833,772	1,920,113
1944	Friday	922,217	18,059,395	1,025,157	1,662,643

meters installed and partly because, owing to the labour shortage, the meters, and possibly ticket machines, are not emptied so often as in the past.

The demand for pennies has risen sharply since last autumn, when it was announced that the minting of pennies had been resumed after an interval of four and a half years. This revival of demand was probably psychological, as plentiful supplies of the new threepenny bit had been minted to take the place of pennies.

There should be no real shortage of coin, as the Royal Mint has issued about 1,500 million coins since the outbreak of war. The trouble seems to lie in a slowing-up of circulation and in unnecessary hoarding. The banks, at any rate, cannot be accused of hoarding coin. Figures are now available of coin held by the banks on June 30, 1944, and these are given in the above table. It will be seen that these holdings are the lowest for some years. The bronze coin at £1,662,643 shows a very heavy fall of 41 per cent from the peak figure of £2,847,271.

New Life Assurances in 1944

The volume of new ordinary life business effected in 1944 represents an advance of nearly 6 per cent on 1943 figures, a rather larger gain than in the previous year. In the table on page 396 offices have been divided into three groups: ordinary life offices, composite offices (including in this group ordinary life offices which are actively associated with well-developed fire and accident companies) and industrial-cum-ordinary offices. Nearly the whole of the 1944 increase is accounted for by the composite offices—the second of these three groups—the ordinary offices showing only a modest gain and the industrial-cum-ordinary offices registering no change on the level of the two previous years. Measured against 1938 sums assured, however, the industrial-cum-ordinary group still shows the greatest activity, with 85 per cent of the pre-war figure, compared with 71 per cent for composite offices and 44 per cent for ordinary offices; it is this last group which has suffered most from staff shortage during the war years. In considering the tables, allowance must be made for the effect of large individual offices such as the Eagle Star, which has been energetically developing its group life business, and has a 1944 new business figure equivalent to 161 per cent of that for 1938. In view of the higher level of many incomes in comparison with those prevailing before the war, substantial increases in new business figures may be expected as soon as offices recover their pre-war staffs, and the increases may well be greatest in the ordinary life group.

G.E.C. In war or peace—at the service of the Empire

G.E.C. Electric Baking Ovens are used in every kind of bakery on land and in ships. Large baking concerns have well proved the high productive and operating efficiency of the long travelling type of oven illustrated, but the entire range is characterized by reliability, convenience, economy and extremely precise and simple working. The demands of war, especially to an organization the size and importance of the G.E.C., the largest British electrical manufacturing organization in the Empire, have resulted in the entire research and technical resources of the Company, together with its vast production of electrical equipment, being directed to the war effort and diverted from normal supply channels.

A world-wide demand for electrical equipment is expected after the war. By then, the technical advances made by the G.E.C. in all applications of electricity, including the important one of electronics, will be available to all for the carrying out of complete electrification schemes of any magnitude.

Electrification Schemes

G.E.C. Electrification Schemes have been applied to all industries, including: Aircraft Factories; Chemical Works; Collieries; Food Factories; Gold Mines; Iron, Steel and Copper Works; Locomotives and Railway Carriage and Wagon Works; Motor Car Works; Oil Refineries; Ships and Shipyards; Textile Mills; etc.

G.E.C.—always in the forefront of electrical progress

London Dock Enquiry

The committee of enquiry into the recent London dock strike held its first meeting on Wednesday. The committee consists of nine members, the National Dock Labour Corporation, the Port of London Authority and the Trade Unions having three representatives each, with a chairman, Lord Ammon (chairman of the Corporation), elected from the committee members and a secretary appointed by the Ministry of Labour. The committee's terms of reference are "to enquire into the conditions of work at the London docks," and since the men only agreed to return to work on the understanding that there would be an investigation into their grievances, it may be expected to report to Mr Bevin as rapidly as possible. The men's Strike Committee is being kept in being, for the purpose of collecting evidence and representing the point of view of the rank and file dockers, who are not directly represented on the committee.

Although the immediate cause of the stoppage was a minor incident—the moving of a calling-on hut at the Royal Albert Dock—the strike showed that there was a great deal of unrest among the dockers, who resented what they regard as the arbitrary and autocratic disciplinary methods of the Corporation's officials. There seems to be a curious conflict between the dockers' traditional dislike of outside control and their appreciation of the benefits of decasualisation which the Corporation has conferred. On their side, the Corporation points out that absenteeism has been reaching alarming proportions and that it had become necessary to take a strong line. One of the proposals which the union representatives will make is that the men should have some machinery for collectively putting forward their case. Dock employment probably does not lend itself to any form of joint production committee. Some scheme on the lines of that introduced with considerable success in certain mining districts for dealing with absentees by fining absentees on the spot, with assessors from both sides, might, however, be adapted to the docks.

It will be the committee's task to sort out all the issues and arrive at a workable solution, which will prevent the repetition of the recent deplorable strike. It would perhaps

have been wise to appoint some independent investigator, such as Sir John Forster, whose impartial conclusions would be accepted by all sides.

International Nickel

Both output and profits of the International Nickel Company of Canada have declined during 1944. Sales of copper, at 269 million lbs, were roughly the same as in 1943, and slightly lower than the average production for 1936-38; but sales of nickel in all forms, at 250 million lbs, show a decline of 15 million lbs in 1943, although still higher by some 70 million lbs than the 1936-38 average. In addition, the company has continued its wartime practice of refining a certain amount of nickel and copper on behalf of other mining concerns. While nickel production has expanded, sales of gold and silver have continued to contract during wartime. No statement on the amount of platinum produced is available, but its exclusive use for war purposes has led to an increased production of palladium for dentistry and jewellery.

International Nickel's main difficulty is the serious fall in both supply and quality of labour, which has led to further rises in production costs as well as to reduced output. Full figures for 1944 are not yet available, but trading profit has declined since its 1941 peak, while throughout the war much higher appropriations for taxation, depreciation and contingencies have been necessary. The common share dividend of \$2, paid from 1938 on, was exactly covered for 1943. For 1944, earned for common has fallen to \$1.71, which is lower than any year since 1935, and the common dividend has been reduced to \$1.60.

The outlook, however, is much brighter than falling profits suggest. Mr Stanley, the chairman and president, points out that the company has no serious reconversion problems and that, given sufficient manpower, its plants are equipped for record production. The suspension during the war of the mining development plan, which called for capital outlay of \$35 million, has added to the wartime drain on ore reserves; but proven ore reserves are still reasonably strong, and the company has strong liquid reserves for financing post-war capital development. The loss of the Petsamo nickel concession, in return for \$20 million compensation paid by the USSR, cannot be regarded as a serious blow. The company's chief market for refined copper is Canada, and for nickel the US, and the latter market, at any rate, may well expand. Good prospects in the sale of stainless and special steels, and in the utilisation of techniques arising from wartime research, further justify Mr Stanley's balanced optimism.

French Exchange Control

On January 15th the French Government made an Order strengthening its foreign exchange control system, which, until then, had remained virtually unchanged since 1939. The new Order was merely designed to close a number of loopholes in the original regulations. Its object was, first, to prevent capital exports by methods until then still permissible, and, secondly, to control financial transactions in France, likely to profit the enemy, by persons resident in neutral countries. To this end the French Government took power to call for the disclosure of foreign assets in France, and to prohibit, by decree, purchases of real estate, of shares and, in fact, all kinds of transactions involving transfers of property and capital by residents abroad or by their agents in France. In other words, the French Government decided to stop transactions of a kind that had been stopped as a matter of routine in this country long ago.

It was made perfectly clear in the text of the Order that the control of capital transactions was to be applied flexibly, in order not to prejudice French financial and economic relations with other countries, that countries which can give effective guarantees against the infringement of the blockade of the enemy would be granted reciprocal treatment, and that the Exchange Control Office was given power to grant facilities for legitimate transactions. To say that "it is obvious that the measure will lead to the elimination of foreign capital invested in France, and French firms with foreign associates will thus find themselves penalised as compared with purely domestic concerns"—as one British newspaper did—is to read into the Order intentions that are not warranted by the text.

Exports to India

The importance of relaxing onerous controls on trade as soon as possible needs no further emphasis in words. The Government of India have now decided to issue an open general licence on imports of certain consumer goods from the United Kingdom. The list of goods which can now be imported without the formality of an individual import licence is published in this week's *Board of Trade Journal*. Excluded from it are such things as cotton piece goods and cycles, which are produced, though in small quantities, in India. For these, a simplified form of control will remain, until a tariff investigation can establish the extent to which industries greatly expanded during the war can, as promised, be fiscally protected against a flood of foreign imports. In practice it will not be the Indian import controls, but rather the controls on British production which will limit exports to India in the near future.

The same is true, of course, for every kind of export to India. The Indian Government's action, however, will do much to increase the attractiveness of the Indian market to British exporters. No other Empire country has so far taken similar action. India also has the advantage that there is no reason for restricting exports on grounds of shipping shortage. As an operational base, India is assured a steady supply line and supplies for war and for civilian consumers are, as cargoes, generally complementary.

It is not surprising that the relaxation should apply only to imports from the United Kingdom. From most other exporting countries, the major limiting factor is that of shipping. From the United States, whose manufacturers have shown increasing interest in the Indian market, the scarcity of dollars makes import control a matter of vital importance to the Government.

For the present, the new relaxation can have little immediate effect on the volume of civilian supplies sent to India. That volume, however, has been steadily mounting since the trough of 1942 and 1943. Last year it was to the tune of £6,000,000. It is, however, an indication of the anxiety of the Indian Government to improve the dangerous scarcity of consumer goods in the country.

A Case of Procrastination

Earlier this month, on March 6th, Mr Astor asked the President of the Board of Trade, Mr Dalton, in the House of Commons whether he had considered the Palache Report on tendencies to monopoly in the film industry and whether he could make a statement on it. Mr Dalton replied that he had asked the various sections of the industry to let him have their views. Pressed by Mr Astor to indicate when the sectional views of the industry are likely to be submitted, Mr Dalton evaded the issue by saying that three out of eight sections had sent in replies and that it was not his intention "to begin to form a view" unless he had "those communications."

This, clearly, is a case of procrastination. The Palache Report was submitted to the Films Council in July last year (it was discussed in *The Economist* of August 12, 1944). Mr Dalton's reply amounts almost to an invitation to those sections of the industry who might have an interest in the maintenance of the state of affairs disclosed by the Palache Report not to send in their replies or, at any rate, to postpone them indefinitely. The least he could do now is to fix a time limit for the outstanding replies; and this should be short.

Shorter Note

The figures of the Capital Issues Committee's operations provided by the Chancellor of the Exchequer throw little light on this aspect of war finance. They cover the war period up to the end of last month; they show that applications have been numerous and that the amount involved has been

	Approved		Rejected	
	Number	£ Mn.	Number	£ Mn.

Conversions.....	3,683	599.3	330	38.2
Total.....	12,353	841.3	675	69.5

substantial. No classification is provided beyond the statement that £207 million came from Governments, local authorities and public bodies. There is no differentiation between issues on the capital market and the creation of

charges to cover loans. Finally, the relation between rejections and acceptances is an indication of differences of opinion as to the scope of the regulations and not of the amount of money which would have been sought had they been less restrictive.

"Why I read The Yorkshire Post"

"When I was a much younger man, a colleague gave me a useful tip. It was, simply, to keep an eye on 'The Yorkshire Post,' as a gutter does on the ball. Through the years I've proved the wisdom of his advice. You see, we business men need to have a broad vision of men and affairs. We can't afford to have blind spots through lack of inside knowledge, as it were."

"Experience has shown me how important it is to understand what

the North of England is thinking, not only of finance and politics, but of matters in everyday living. After all, Yorkshire is not only the heart of industrial production, but a big slice of our National consuming market.

"The Yorkshire Post," you will find, gives just that ordered and detailed knowledge of the North that is essential to guide your judgment. That is one reason so many people outside Yorkshire read it."

The Yorkshire Post

Voice of the North

COMPANY MEETINGS

THE NATIONAL BANK OF INDIA, LIMITED

STRONG LIQUID POSITION

VITAL IMPORTANCE OF INDIAN AGRICULTURE

The annual general meeting of the National Bank of India, Limited, will be held, on the 27th instant, at 24 Bishopsgate, London, E.C.

The following is an abridgment of the statement by the chairman, Mr R. Langford James, circulated with the report and accounts:

In my address to the shareholders last year I commented on the admirable manner in which the many difficulties arising from the war had been tackled successively and overcome by business concerns, and I mentioned that assistance in this respect had come from a speeding-up of the overseas mail service. The regularity and speed of the Eastern mail service have been still further improved, and this is exemplified by the fact that, whereas in 1943 we found it impossible to place our report and the annual accounts in the hands of the shareholders before the middle of May, and last year not before the middle of April, this year we are able to hold our annual meeting at its accustomed time, the end of March.

A RECORD BALANCE-SHEET

The total of the balance-sheet at £66,623,503 1s. 9d. creates another record for the bank. It is an increase of about £4,750,000 over the previous year. It is accounted for entirely by an increase under the heading current, fixed deposit and other accounts, and reflects the continued increase in the volume of money passing into the hands of the bank's constituents largely as the result of war expenditure. It is of interest to note that the total of the current, fixed deposit and other accounts at about £61,000,000 is more than double the total of these same accounts in our balance-sheet of December 31, 1939. Cash on hand and with our bankers and money at call at £23,000,000 show an increase of nearly £2,000,000. This with our large holding of Treasury bills, which has increased by over £2,000,000, constitutes a very liquid position, which in these times is highly desirable. Government securities are up by almost £1,000,000.

Since we met last what a remarkable and what a heartening change has been effected in the war situation! But though this affects all of us, of course—and the temptation to dwell on the broad subject must be obvious—I will confine myself to affairs in the territories that principally concern the bank—India, Burma and Ceylon. Of these, Burma presents most interest, for in the past few months the Allies have embarked on large-scale operations which are surely, though necessarily comparatively slowly, evicting the Japanese from that country. We have in Burma two branches, in Rangoon and Mandalay, awaiting reopening, and our arrangements for doing so are complete so far as it lies in our power to make them. There still appears to be some doubt as to whether the Government's plans are in a corresponding state of advancement, but this is presumably a matter that is receiving unremitting attention.

ACHIEVEMENTS IN INDUSTRIALISATION

The Japanese are being pressed back with much success, and, in the case of India and Ceylon, it is not being over optimistic to suppose that, so far as actual fighting is concerned, they have seen the last of the war. But of course they are still intimately concerned, India as an arsenal and a producer of supplies of every description and

Ceylon as the headquarters of the South-East Asia Command. To both—and particularly to India—the war has brought great prosperity. It is probably not an over-statement to say that without the war the degree of industrialisation attained in India in the past five years might not have been reached within perhaps 25—possibly more.

Achievements to date have quite naturally fired enthusiasm, and so, in addition to the Bombay Plan, to which I referred last year, other "plans" for the economic development of India have been produced. Indian capitalists are shrewd, and my individual opinion is that they could be relied upon to develop industries at a pace at which the resulting products would find markets without any attempt at hot-house forcing.

Be that as it may, however, and whether any cut-and-dried programme is adopted or not, I venture once again to stress the vital importance of giving agriculture a foremost position. The distressing famine conditions of 1943 are sufficiently vivid in the minds of all interested in India for them to be regarded as a solemn warning. In a lecture at Delhi in January Sir Jogendra Singh estimated that by 1971 the population of India may be about 580 millions. Industrialisation would come naturally and normally (that seems obvious), but to me it appears that the primary need of the country is such an improvement in agricultural methods that the increase in food production shall keep pace with the expected increase in the numbers to be fed.

MERCHANTS' AND MANUFACTURERS' INSURANCE

CONTINUED EXPANSION

The twenty-fifth annual general meeting of Merchants' and Manufacturers' Insurance Company, Limited, was held in London on the 20th instant.

Colonel William Parker, D.S.O., T.D., D.L., presided.

The managing director and secretary (Mr Edgar Wheeler, F.C.I.I.) read the notice convening the meeting and the report of the auditors.

The chairman said:—I am pleased to say that the company's business continues to expand and progress is particularly marked in the fire department. The premium income of the company has advanced to £188,005 and the year's trading has resulted in the satisfactory profit of £24,593. The board recommend a dividend of 6 per cent., which is at the same rate as has been paid for the past eighteen years.

As much as 58 per cent. of our funds is invested in British Government Securities and the market value of the investments is considerably above their book value so that the investment reserve is entirely free. The total assets of the company amount to £466,756.

It is our constant endeavour to keep abreast of the requirements of the business community, and to this end we issue a special motor traders' policy for the protection of garage proprietors and a comprehensive policy which covers in one document the many risks against which shopkeepers so urgently need insurance protection.

During the past year we have continued to receive the same excellent support from Lloyd's Brokers as hitherto, and to them and to all our officials and staff I express my appreciation and thanks.

The report and accounts were adopted: the retiring director, Lieut. Col. Miles Backhouse, D.S.O., T.D., was re-elected and the auditors, Messrs. Peat, Marwick, Mitchell and Company, were re-appointed.

NORTH-EASTERN ELECTRIC SUPPLY COMPANY, LIMITED
SUCCESSFUL RESULTS

At the annual meeting of the North-Eastern Electric Supply Company, Limited, held on the 21st instant, a final dividend on the ordinary stock, making 7 per cent., was declared for the year ended December 31, 1944.

With the lifting of the ban relating to the accounts of public utility undertakings, the gross profits of the company during the war period were disclosed, viz., £1,685,772 for 1940, £1,748,670 for 1941, £1,884,045 for 1942, £2,031,510 for 1943 and £2,237,239 for 1944. The carry forward to 1945 is £234,408 against £232,595 brought in from 1943. Net capital expenditure during the year amounted to £268,220, some £390,000 less than 1943. It would be observed that they had altered the form of accounts to bring them into line with the recommendations of the Council of the Institute of Chartered Accountants.

The amount of electricity supplied in 1944 exceeded that supplied in the last complete year of the pre-war period (viz., 1938) by over 634 million units. The increase in 1944 over 1943 exceeded 73 million units.

CHAIRMAN'S REVIEW

In reviewing the company's activities, the chairman, Mr R. P. Sloan, CBE, stated that during the war attention had been concentrated on meeting the heavy demand for the production of munitions. Generating plant and transmission system had been extended, including, in 1941, two additional boilers at North Tees Power Station.

Development in the domestic side of their business had, of course, practically been at a standstill during the war years, and, although there had been some relaxation of blackout restrictions, the necessity to economise in the use of electricity—as in the case of gas—was still continuing. Despite increases in costs, the company had not increased its tariffs.

Although they had not escaped interference by enemy action, they could rightly claim to have achieved a high degree of success in their endeavours to maintain continuity of supply.

NEW POWER STATION—SERIOUSNESS OF DELAY

In regard to the proposed new power station in County Durham, he stressed the seriousness of the delay in a decision being reached by the Ministries on whose behalf public inquiries on the subject were held early last December. He explained how this delay had already caused a setback of a whole year as regards availability of much-needed additional generating capacity required for meeting the demand for electricity during winter months. The electricity supply industry had played a great part in the production of munitions, and in many other ways had assisted the war effort, and it would be called upon to play an equally important part in the post-war period. But it was perhaps not generally known that the imperative need to concentrate the manufacturing resources of the country on the production of munitions of war had, for the past three years, seriously retarded the expansion of generating resources. There had been no corresponding pause in the expansion of the demands for electricity. The industry was thus faced, in the next few years, with the double task of making up this leeway and, at the same time, providing for the further growth of demand.

It was, therefore, a particularly unfortunate time for the introduction of a new public policy, under which it seemed to be taken for granted that any important extension programme must be opposed, and, indeed, frustrated, if possible, by some body or another, or at all events that it should be made extremely difficult to carry out.

COUNTY OF LONDON ELECTRIC SUPPLY COMPANY, LIMITED

IMPROVED RESULTS

SIR ROBERT RENWICK ON NATIONALISATION

The fifty-first ordinary general meeting of the County of London Electric Supply Company, Limited, was held, on the 20th instant, in London.

Sir Robert Renwick, Bt., the chairman, in the course of his speech, said:

SUMMARY OF POSITION

The output for the year 1944 was 2,481 million units, as compared with the 1939 figure of 2,243 millions. The output for 1944 was the second highest output in the history of the company. The record output was that for 1943 at 2,566 million units.

The gross revenue for the past year, at some £7,898,000, shows an increase of 6.3 per cent. over 1943 and 38.6 per cent. over the year 1939. This present remarkable figure compares with a revenue of just over £3,000,000 in 1934 and £4,000,000 in 1936, and has shown a substantial increase each year during the war years. On the other hand, our expenditure on revenue account for the year 1944, at £4,956,000, has increased by £1,869,000 since 1939, and is attributable to extra expenditure arising out of war conditions.

The number of our consumers at present totals 357,983, an increase of nearly 11,000 over the 1939 figure. The figure for the inner London area shows a decrease of some 9,000 consumers over the 1939 figure; in our outside London areas the total has grown very substantially.

The excellent position has been achieved with only a very moderate increase in our prices to consumers.

REVENUE

As I have said, the gross receipts on revenue account are £7,897,985. The increase in expenditure over the previous year is some £346,700, and of that increase no less than £288,000 is accounted for in the cost of coal. Again, there is an increase of some £65,800 in the purchase of current, which also reflects the increased price of coal. The increase in the price of coal per ton since 1939 is no less than 88 per cent.

A final dividend for the year has been declared on the ordinary stock of 5 per cent., making with the interim dividend 8 per cent. for the year, and there remains to be carried forward £796,941, as compared with £787,759.

ENGINEERING ASPECTS

In spite of adverse circumstances our generating station at Barking has come through the period with flying colours, without any interruptions of supply to our consumers and with the record of meeting efficiently all demands made upon it. The plant capacity at Barking has been increased during the war period by the addition of another 75,000-kw. generator and four boilers.

It is not possible to give you a full story of the difficulties under which Barking has operated during the war period. Quite apart from other troubles our main difficulties have arisen from labour and coal. It has been, indeed, a major difficulty at our station to obtain a sufficient number of suitable men to replace the experienced pre-war regular workers, and, in addition, to make up the number needed to operate and maintain the additional plant installed. You will appreciate that under such conditions it has been difficult to sustain the high standard of maintenance upon which we had always prided ourselves.

INCREASED FUEL COST

I have mentioned previously the alarming increase in the cost of fuel, even though

METROPOLITAN ELECTRIC SUPPLY COMPANY, LIMITED
INCREASED SALES

The fifty-eighth ordinary general meeting of this company was held, on the 20th instant, in London.

Major H. Richardson, M.C., J.P. (chairman and managing director), said that at the end of the year supply was being afforded to over 206,000 consumers, the net increase for the year being only 173, the new consumers in the western area being offset by further evacuation of consumers from the company's London areas. In spite of that decline and the Government's appeal for economy in the use of fuel, they had sold approximately 84 million units in the London areas, 484 million in the distributing undertakings and subsidiary companies in their western areas and 188 million in bulk to other authorised undertakers, making a total of 756 million, being 40 million, or 5.6 per cent., in excess of the units sold during the preceding year.

With regard to the effect of the war on the business of the company during the war years, that in their London areas evacuation of consumers, combined with lighting restrictions and later the fuel economy campaign, had caused an immediate diminution of business so drastic as to result in a loss of net revenue from those areas. The setback, however, was more than compensated for by the large increase in business in the other undertakings operated by the company in the western area.

Combining the London areas with the western area, gross revenue during the period had increased from £1,707,000 to £3,032,000, an increase of £1,325,000, or 78 per cent., whilst the surplus on trading rose from £431,000, to £681,000, an increase of £250,000, or 58 per cent. Despite the loss of net revenue from the London areas the dividend to ordinary stockholders had remained at 8 per cent. for each of the last five years.

The report was adopted.

NATIONAL PROVIDENT INSTITUTION

STRONG POSITION SHOWN

The following is a summary of the address to be submitted by the chairman, Mr Vincent W. Yorks, at the annual general meeting of the National Provident Institution for Mutual Life Assurance to be held, on the 27th instant, in London.

Our new business shows a moderate increase over that of 1943 and is satisfactory in present circumstances. Our claims by death are larger than in the previous year and include some £60,000 due to the war, but the total is still within that expected according to the mortality tables on which the actuarial valuation is based.

Our funds now amount to approximately £13,500,000, having increased during the year by about £260,000. We have again given full support to the Government War Loans, and our holdings of British Government securities now stand in the books at £3,553,000.

Our financial position is strong; our assets are worth a good deal more than the figure at which they stand in the books, and our interest earnings have been maintained in spite of heavy taxation and the necessity in present conditions of investing large sums at relatively low rates of interest. After a careful review of the position we have felt justified in increasing the rates of interim bonus fixed two years ago, and the present rate of interim bonus on whole life policies is 35s. per cent. per annum, while that on endowment assurance policies varies according to the maturity age from 25s. per cent. to 35s. per cent. per annum.

As at December 31st next we shall make the customary triennial actuarial investigation of our assets and liabilities. I cannot, of course, foretell what the result will be, but the present rates of interim bonus may be taken as an indication of the sort of bonuses we hope to declare at the end of the year.

the fuel is far inferior to our pre-war grades. It is not for me to dilate here upon the position or future of the mining industry, but I will only observe that large consumers of coal such as ourselves, and, indeed, I think the whole industry of this country, are even more concerned with the position than our friends in Parliament. It is worthy of note that the votaries of nationalisation of the coal-mining industry claim that it will be necessary for the taxpayer to subsidise this industry for a long time to come. Ordinary business people like ourselves might wonder why the running of this most vital of all our national industries could not be got on to the ordinary business principle of paying its own way and having some regard to its consumers' interests. I wonder if the trouble is that the mining industry has been sunk in politics for so many years. If I am right—and I think I am—what a warning it is for so many industries threatened with political interference.

GREATER PRODUCTIVITY

Perhaps I may now turn to the future. There is one thing abundantly clear to me—that to these two persistent and very virtuous slogans of "Full Employment" and "Social Security" there needs to be added even more persistently and even more virtuously a third, namely, "Greater Productivity." Without greater productivity there can be no full employment and the social security we all want. So much does your company believe in it that already our programmes of development have been submitted to the authorities, and, so far as material is available, work has already been put in hand. You have doubtless heard of the £90,000,000 programme of expenditure on generating stations throughout the country. You will be interested to hear that the estimated generation expenditure for this company and our associated companies, alone, over the next ten years, which has already been considered by your board is of the order of £21,000,000.

With regard to transmission and distribution, the estimated expenditure even for the next five years is something of the order of £12,000,000, and we believe that if this country is to revive and become once again a leader in industrial matters, such a programme is absolutely essential.

FUTURE OF THE INDUSTRY

These vast sums of money are not going to be found by subsidies from the Government or even by the Central Electricity Board. They are to be found by people like ourselves who have to put such experience and such wisdom as we have accumulated into the wise expenditure and operation of these vast resources. I was asked recently by a politician as to why we should involve ourselves with all this planning and expenditure in the light of what he thinks is a possibility of this industry being nationalised or regionalised in some way. The only immediate answer I could think of for him was that we were not politicians.

It appears to be, however, that there are ideas in the minds of such as my friend and others that a prosperous industry such as ours should be nationalised and that the Government—that is, the taxpayer—would find these vast sums of money for development. What is always forgotten is that with the industry as it is at present there is a background of vast technical and other professional experience among both directorates and staffs. Some people think; apparently, that all this experience will pass over to the Government at salaries and fees consistent with Treasury regulations. We have only to look at the record of this industry during the war years, which proves that it is highly organised and efficient, and it will be a very unwise Government which decides on any interference of a major character for no other reason than that of political expedience. I have said to you before that your board is strongly of the opinion that no major operation is necessary, although improvements can be made of what I called a first-aid nature within the industry itself.

The report was adopted.

EQUITY AND LAW LIFE ASSURANCE SOCIETY

SATISFACTORY RESULTS

LIFE ASSURANCE OFFICES AND POST-WAR INVESTMENT

SIR GEOFFREY ELLIS'S SPEECH

The annual general meeting of the Equity and Law Life Assurance Society was held, on the 22nd instant, at the Law Society's Hall, Bell Yard, London, W.C.2. Sir Geoffrey Ellis, Bt., M.P. (chairman), presided.

The Chairman said: Gentlemen,—I rise to move "That the report and accounts for the year ending December 31, 1944, be received and adopted and entered on the minutes." These have been in your hands for some days and I assume may be taken as read.

First, I wish to mention some matters of general importance to all life assurance offices, and then to say something about the domestic affairs of the society. It is all too clear that the transition period which will follow the end of the war in Europe must be a period of shortages. There will be a dearth both of labour and of materials, probably for several years. The spending power of the public will need to be severely restricted, and it will be of the utmost importance that the community should continue to save. The post-war savings campaign ought to run along much broader lines than the war-time appeal to invest in Government loans. In this period we hope that life assurance will be allowed to play its part as a form of saving well suited to the requirements of many people.

"EMPLOYMENT POLICY" WHITE PAPER

After the transition period will come that shaping time of the future to which so much attention has been directed by the recent White Paper on "Employment Policy." This White Paper marks a notable development in the relationship between politics and economics. The Government "accepts as one of their primary aims and responsibilities the maintenance of a high and stable level of employment after the war," and one of their guiding principles is stated to be as follows: "Everything possible must be done to limit dangerous swings in expenditure on private investment, though success in this field may be particularly difficult to achieve."

CONTROL OF INVESTMENT DURING TRANSITION PERIOD

Life assurance offices are one of the main channels of investment. With the high rates of taxation now ruling and the consequent and continuous decline in the amounts that can be made available to industry by wealthy persons, these institutions must play an ever increasing part in transmitting the savings of the community into productive enterprise. It is stated in the White Paper that during the transition period "the use of capital will have to be controlled to the extent necessary to regulate the flow and direction of investment"; with this we most fully agree. As the transition period fades, however, we hope that a large and increasing measure of freedom will be returned to institutions such as ours. Over-all guidance will continue to be necessary, but we are entitled to expect that within such guidance we shall be free, in the light of our own knowledge and experience, to play our part and to exercise our judgment in the encouragement of productive enterprise. We support unreservedly the Government's aim of maintaining a high and stable level of employment, and we believe that the path which I have indicated—namely, that judgment shall be exercised by those qualified to do so—offers the best prospects of success.

THE NEW FINANCIAL CORPORATIONS

We welcome the proposed formation of the two new financial corporations, especially the "Finance Corporation for Industry," in which we expect to participate. The precise part which these corporations will play in the industrial and financial structure of the company can only become evident as events develop—the Chancellor of the Exchequer has already indicated the Government's views. I would say, however, that we consider it to be of paramount importance that the corporations should—to use the Chancellor's own phrase—"have an identity of their own." Their boards must be strong and independent, and—to quote the Chancellor again—must consist of "men of wide industrial and general business experience."

During the year the Government has given indications as to the manner in which they propose to carry out the transfer of man-power from the Armed Forces to civilian life, and as between one industry and another, on the cessation of hostilities with Germany. We have for some time past been giving considerable thought to the problems which will arise on the return of those members of our staff who are serving with the Forces—these men represent rather more than two-thirds of our total peace-time staff. One decision which I think will interest you is our intention to build up a larger branch organisation than that which we had before the war, and to extend our connections throughout the country. We are hopeful that many of the men now serving with the Forces will find scope and opportunity in this larger organisation.

NEW BUSINESS

During the year we wrote 334 policies providing new sums assured of £475,196 and 242 annuity contracts in respect of which the considerations were £353,154. In passing, I would remark that new business for the current year shows a substantial improvement over that for the corresponding period in 1944, particularly in respect of with-profit policies.

NEW RATES OF PREMIUM

In July last we reconsidered the rates of premium which we were charging for non-profit assurances—both whole-life and endowment. We felt that the desire and need for war risk cover for civilians in this country was no longer so pressing as when we introduced this cover in the spring of 1940. We therefore decided to exclude war risk cover from our normal form of contract and to revise our rates of premium accordingly. We believe that these rates now compare most favourably with any available in the market. We are still prepared to cover civilian war risks in this country at a premium, additional to our reduced normal rates, of 5s. per cent. per annum.

CAPITAL ANNUITY SCHEME

Our capital annuity scheme has had an excellent response, and clearly meets a need among prospective annuitants. The scheme was only introduced in June, but by the end of the year considerations amounted to £247,000, and by now they exceed £400,000. Your society is thus maintaining its reputation as a specialist in annuity business. The scheme is fully explained in our leaflets.

THE ECONOMIST, March 24, 1945 ACTUARIAL VALUATION

You will remember that our triennial valuation took place as at December 31, 1943, and the year 1944 is thus the first year of the new triennium. I am pleased to be able to tell you that the actuarial valuation, which we make every year for internal purposes, has shown that the trading results for the year 1944 were satisfactory. In my remarks to you last year I drew attention to the effect which the increase in the funds, resulting from the various transfers made as at the end of 1943, would have on the rate of interest. The rates of interest shown in the present report—£4 10s. 2d. per cent. gross and £3 10s. 11d. per cent. net—are thus not comparable with those given in the last report; they are very satisfactory, especially in relation to the strength of the investment portfolio—witness our holding of over £10,000,000 British Government securities—and having regard to current interest levels.

We look forward with confidence to the next triennial valuation, which falls to be made at December 31, 1946, and in the meantime interim bonus is being paid in respect of claims arising on with-profit policies, and is being allotted in respect of each year's premium falling due on or after January 1, 1941.

TRIBUTE TO STAFF

By the time our triennial valuation comes to be made we hope that many of our men now serving with the Forces will have returned to us. Many of these men have now been absent for well over five years—to them all we send our greetings and our best wishes for a safe and speedy return. To those of our staff who remain, and to those who have joined us temporarily for the war period, I say thank you—they have worked well, and the more senior among them are giving much thought to the return of their serving colleagues.

The report and accounts were unanimously adopted.

THE NATIONAL MUTUAL LIFE ASSURANCE SOCIETY

MR K. A. E. MOORE'S REVIEW

The annual general meeting of the above society was held, on the 21st instant, in London.

Mr K. A. E. Moore, F.C.A. (the chairman), in the course of his speech, said: The year 1944 was the first year in the new valuation period, and the report and accounts now before you indicate that the society continues to prosper. There are one or two matters of interest in the accounts on which I should like to comment.

(a) The amount of new business secured has again shown a substantial increase, and the 1944 figure is as much as 62 per cent. of our record pre-war total obtained in 1938. This fact, I think, affords evidence that the excellent valuation report we were able to put before you a year ago has been well received, and it is also a tribute to our hard-worked and greatly depleted outside staff. Nevertheless, the war has severely checked our net rate of growth, as will be seen from the fact that the premium income remains roughly at the pre-war level.

(b) An increase in the death claims has been nearly counter-balanced by a corresponding decline in the claims paid by maturity. The death claims, amounting to £197,000, included £29,000 in respect of war casualties. On the whole, the incidence of the claims was less favourable in 1944 than in 1943, which, however, was a year in which mortality profit was exceptionally high.

(c) Although interest income has increased, the rate of interest earned has declined from £3 0s. 11d. per cent. net to

THE ECONOMIST, March 24, 1945

£2 7 8d. per cent. net. Thus, for the first time in nearly 100 years, our rate of interest has fallen below 3 per cent. It will be recalled that the rate of interest in our case is calculated on all funds, including reserve funds. It thus represents the overall yield on the total net assets, including Stock Exchange securities at their market value—a calculation which, of course, yields a lower rate than the more usual method which takes into account only the life assurance fund.

(d) I have remarked before on the low level to which surrenders and lapses have fallen, and this tendency has been still further in evidence during last year. We have found also that, no doubt as a result of the larger spending power in the hands of the community, premiums are received more promptly and there has been a movement towards changing from payments by half-yearly or quarterly premiums to payments by yearly premiums and by bankers' order.

(e) The annual revaluation of Stock Exchange securities has once again yielded a satisfactory appreciation—on this occasion amounting to as much as £195,000, and, as you will see from the balance-sheet, this has been credited, as before, to the reserve fund, which now stands at the substantial total of £638,000. Amongst our securities, the group which shows again the largest movement is British Government securities, which have expanded by another £162,000—much more than the increase in the life assurance fund. The further investments made last year, in accordance with our duty to support the national finances, have raised the total sum invested in this way to well over £1,000,000 since the beginning of the war.

INTERIM BONUSES MAINTAINED

All the foregoing matters and many others are, of course, taken account of automatically in the actuarial valuation of our liabilities. For internal purposes we naturally make such a valuation every year, and I am glad to say that the results of the 1944 valuation were satisfactory, and your board, therefore, had no hesitation whatever in deciding to continue to pay the same interim bonuses as before.

SOCIETY'S CONTRIBUTION TO HOUSING PROBLEM

In the hope that the end of hostilities in Europe is not far off, we have been considering what contribution the society can make towards the housing problem, which, after the war, will obviously occupy a high place in the list of priorities. We have, therefore, decided to launch a scheme which will enable intending home owners to purchase their houses by borrowing from the society up to 80 per cent. of the purchase price, subject to certain safeguards, in conjunction with a life policy for redeeming the loan at the end of a term of years or at previous death. We propose to offer special inducements to existing members to take advantage of this scheme, and we shall hope to make it more widely known as time goes on and scope for so doing increases.

RELAXATION OF RESTRICTIONS ON WAR RISKS

Your board has also been contemplating some further relaxation in the restrictions upon war risks in our policies. A year ago I was able to tell you that the experience of our "war risks" scheme had been such that we were able to allot full bonuses to all policies covering home war risks, and that, in consequence, the society had undertaken full war risks cover in this country up to December 31, 1943, without any charge. This decision was greatly appreciated at the time by our members. We now feel justified in carrying the matter a stage further by covering war risks in this country, excluding only aviation risks, for new with-profits policies without any extra charge in the future. This means that we shall no longer require new policyholders temporarily to surrender their par-

ticipating rights in consideration of war risks in this country being covered. Moreover, this decision will be applied as far as possible to all existing with-profits policies issued since the war whether or not home war risks have hitherto been covered. We hope, and believe, that this decision also will be well received by the members and by the public.

LIFE ASSURANCE AND POST-WAR SAVING

It is now possible to visualise to some extent the general financial conditions likely to exist in this country in the aftermath of the war. Clearly there will be a vast purchasing power in the hands of the public in the shape of accumulated war savings and gratuities, coupled with a national income—on paper—far in excess of the pre-war figure—and the available goods and services at best can only increase very gradually. For some years after the war, therefore, a high rate of saving will continue to be essential.

During the war, saving has been more or less forced upon the community as the result of rationing and other restrictions of supplies, but in the post-war years it must depend to a larger degree upon voluntary effort. Here life assurance can play an important part, and, by increased investment in life policies, the individual can do himself, his dependents and the country a good turn.

No change has occurred in the composition of the board during the past year, and it remains for me to conclude these remarks by placing on record our sincere appreciation of the efforts of our much-depleted staff. We hope the strain upon them will soon be eased by the return of those at present away on military service, and to them we send our remembrances and good wishes.

The report and accounts were unanimously adopted.

BIRMINGHAM SMALL ARMS COMPANY, LIMITED

FAST WAR EFFORT

The adjourned ordinary general meeting of this company was held, on the 20th instant, at Birmingham.

Sir Bernard D. F. Docker, K.B.E. (the chairman), said that the profit on trading and income from investments, after providing for E.P.T. and N.D.C., was £1,340,371, compared with £1,306,952.

The war production of the B.S.A. Group provided most impressive figures. Of all the small arms of all kinds used in the whole of the three Services, B.S.A. were proud to have produced more than one-half, reaching a peak output of two guns per minute.

Of over 100,000 cycles supplied to the armed forces, a large number of special folding bicycles were made for our airborne troops. The B.S.A. motor-cycle had gone to the war to the tune of 100,000 machines and the number of forgings produced was 42,000,000.

As car manufacturers, the Daimler Company had actually turned with war towards armoured cars, of which they had made nearly 9,000, first with the Daimler Scout Car, incorporating many tried Daimler features, especially in engine and transmission, together with many novel ideas for this special job. It was interesting to record that it was chosen as personal transport by the late Field-Marshal Rommel, to whom many alternatives must have been available. In addition, the Daimler Company had made a vast number of engine parts and gun turrets for aircraft.

Jessop and Saville's knowledge in the making of special steels was applied to the production of vital steel for the power units of jet-propelled aircraft, and they could, therefore, look forward to participation in any of its future developments, which might be quite startling.

The report was adopted.

SCOTTISH WIDOWS' FUND AND LIFE ASSURANCE SOCIETY

SUBSTANTIAL INCREASE IN NEW BUSINESS

The 131st stated annual meeting of this Society was held at the head office, Edinburgh, on the 20th instant, Mr T. J. Carlyle Gifford, W.S. (chairman of the ordinary court of directors), presiding.

In moving the adoption of the report and accounts, the chairman said:

A year ago we were presenting our report on the quinquennial investigation and I was able to enlarge on the progress of the society's business during the war years. The results then disclosed and the bonus declared are eminently satisfactory. The report and accounts now before you cover the first period of the new quinquennium and disclose the same satisfactory position.

It is gratifying to be able to report a substantial increase in our new business, both gross and net, following the inevitable and continuing decline since the outbreak of war. Although at a little over £21 million, the new business is less than half of the average of the five years preceding the war, this is a satisfactory achievement at a time when so large a proportion both of our own field staff and of the young population in the country is in the fighting services. It is a tribute to the Society's reputation and the loyal support of our agents and connections throughout the country. As was said from this chair a few years ago, our aim in wartime has been more to conserve the goodwill of the society's connections than to achieve high new business figures.

Last year I referred in some detail to our mortality experience in the war years and pointed out that notwithstanding war deaths our mortality had been much lighter than might have been expected. In the year under review this experience has fortunately been repeated despite the invasion of Western Europe. The sums payable on deaths due directly to war operations were £169,000 as compared with £156,000 in 1943 and other death claims were also higher. Nevertheless, the net cost to the society of the total claims by death in 1944, after deducting the reserves held against the policies concerned, was slightly less than in the preceding year.

The figures in the revenue account and balance-sheet call for little comment. The same tendencies which have developed during the war years are still in evidence. The increase in our funds and a proportion of our maturing obligations have again been invested in British Government securities with the result that the average rate of interest earned continues to decline, though judged by current standards £3 8s. 5d. per cent. after deducting income-tax is a high rate. As I said a year ago, this demonstrates the stability attaching to an old society whose invested funds bear a high ratio to their annual increase. Investment values have again increased during the year and with them the substantial margin between the market value and the book value of our securities.

With the experience of another year of war behind us we have reviewed the intermediate bonus which was conservatively fixed at 28s. per cent. and have now fixed the rate for the present at 30s. per cent., the same rate as that declared for the quinquennium a year ago. This rate will continue to be reviewed from time to time.

I concluded my remarks last year by saying that the account I had given could not fail to be encouraging to those contemplating taking out a with-profits policy with the society. Those remarks apply with equal force to-day, and we trust the time is not far distant when the war will be over and those serving in the Forces will be returning. Then we look forward to the energetic development of our business which our strong position justifies and which has been interrupted by the war.

The directors' report and accounts as audited were adopted unanimously.

DORMAN LONG AND COMPANY, LIMITED

FIVE YEARS' WAR EFFORT

COMPANY'S GREAT ACHIEVEMENTS

The adjourned fifty-fifth ordinary general meeting of this company was held, on the 22nd instant, in London.

The Rt. Hon. the Viscount Greenwood, P.C., who presided, in the course of his address, said:

Profits on trading show an increase over last year. In arriving at this figure taxation has, as usual, been provided on all profits to date.

General reserve shows an increase of £730,092, of which £473,099 is in respect of the excess of the premium received on the issue of ordinary shares over the premium paid on the redemption of the 5 per cent. debenture stock and the expense of the share issue. The balance of the increase consists of £6,993 provision for sinking fund on the 4 per cent. prior lien stock and £250,000 allocated from profit and loss account.

Capital expenditure shows a reduction of £298,431. Additions during the year amounted to £72,493, against which there were realisations of £95,924 and provision for depreciation for the year of £275,000.

The whole story of our activities, and they have been entirely directed to war requirements, is too long to recount in detail, but a few facts will indicate the scope and importance of Dorman, Long's operations in the national interest.

In the five years ended September 30, 1944, the company's main steel production included over 6,500,000 tons of ingots. All this steel has gone into the war effort in a variety of forms—shells, bridges, Bailey bridges, ships, constructional steelwork, etc. Dorman, Long in the same period mined more than 16,000,000 tons of coal, 8,750,000 tons of ironstone and 1,500,000 tons of limestone.

In association with our subsidiary companies, we built 236 ships (tank landing craft and other types). We also supplied a large tonnage of pre-fabricated parts to shipbuilders engaged in the building of invasion craft.

A VITAL CONTRIBUTION

Our company also played a vital part in the construction of the invasion harbours. One of our largest constructional shops at Middlesbrough was laid out and equipped for rapid mass production of highly specialised floating bridge work, and for almost six months we operated day and night shifts and week-end working.

A great deal of our output of structural steel in the early years of the war was required in the construction of the numerous great airfields laid out in these islands. Much was supplied for special Admiralty requirements, and in this connection we erected a jetty and other works in Iceland. Our bridge department has carried out a number of contracts connected with war developments.

An important and, for Dorman, Long, novel contract undertaken by the company for the Admiralty has been for the construction, equipment, launching and testing of a floating dock of 17,000 tons lifting capacity to be built at Durban, South Africa. This is the first time the company has built a floating dock, and it is the first dock to be built in South Africa. The fabrication and assembly of the hull and the erection of all equipment has been carried out by Dorman, Long (Africa), Limited.

One of our earliest problems concerned the loss of foreign ore supplies, which immensely increased the difficulties and greatly raised the cost of pig-iron manufacture.

TECHNICAL PROBLEMS

Changes in the blast-furnace burden presented many problems to our technical and operating staffs, as you will realise our plant was designed for the use of a large

proportion of rich foreign ores. In 1939 for each ton of pig-iron produced 3 tons 14 cwt. of solid materials passed through the blast-furnaces, but the change in the burden meant that in 1944 the material passing through the furnaces had risen to 4 tons 16 cwt. for each ton of pig-iron made. It is not necessary to emphasise the difficult technical and handling problems this imposed.

The performance of the steel plants was adversely affected by the stoppage of Swedish ore supplies and the deterioration in basic iron quality. These factors caused a prolongation of the time necessary to work each charge, with consequential increases in fuel consumption and wear and tear of furnace linings, and decreases in outputs.

At the same time we had to meet an increased demand for special steels for military purposes, requiring conformity with rigid specifications. The effect of all these factors upon cost of production was cumulative.

Continuous operation of plant at high pressure over a period of five years has created many problems. Regular stoppages for repairs and overhaul have had to be reduced to a minimum, although wear and tear, due to high outputs, has been abnormal. These difficulties have been met by the skill and resource of the works managements, whose efforts have enabled us to continue to meet the many demands of the Supply Departments. In common with all similar undertakings, there will be considerable rehabilitation work to be done when the pressure of war requirements is relaxed.

Plans for post-war development must obviously be flexible. The ability of the iron and steel industry to export its products will be affected by its production costs. It is essential that large-scale development work should be undertaken by the industry, and it has been estimated that early projects of development and rehabilitation may well commit the iron and steel industry to a capital expenditure of £100,000,000.

In addition to the financing of these projects, there is the effect upon costs of production of the high price of coal and the course of prices in relation to other materials and labour. The price of coal has been doubled since 1939, and direct coal costs now represent over £4 per ton in the cost of heavy steel products. The post-war costs of foreign ore and shipping freights are not clear, while the basis on which international trade will be resumed has yet to be determined.

OVERSEAS TRADE

Our interest in export business has always been large, and before the war we exported more heavy steel products than any other steel manufacturers in Great Britain. When the war comes to an end we shall continue to display an active and energetic interest in overseas trade, whose development will be of the highest importance to your company.

The British iron and steel industry will be called upon to make a great contribution to world reconstruction, and it is anxious and ready to play its part. Much attention has been given by your board, in consultation with the special directors, to the steps necessary to enable Dorman, Long to share extensively in this great work. Although it is not possible at present to make any detailed reference to our plans, you may be assured that these have been carefully considered and are well advanced.

We are now in a strong financial position, and our plans are prepared for great developments to insure the continued progress of our company and the employment of our people in peace-time production.

The report and accounts were adopted.

GAS LIGHT AND COKE COMPANY

GAS PRICE MAY BE REDUCED

The ordinary general meeting of the Gas Light and Coke Company was held, on the 15th instant, in London. Mr Henry Woodall, deputy governor, presided in the absence through illness of the governor, Sir David Milne-Watson, Bt., L.L.D. D.L.

The governor, in the course of his speech, which was read by Mr Woodall, said: A panel of London gas company accountants was formed to investigate, amongst other things, the question of uniform presentation of gas company accounts and statistics, and a unanimous report was issued.

Compared with 1943 there has been an increase in revenue from gas of £689,000. The revenue from by-products was up by £212,000. On the other side of the revenue account the cost of manufacture of gas went up by £380,000, and was mainly due to the increased cost of wages and materials. From the revenue account a balance of £3,864,000 is carried forward to the net revenue account.

PROFIT AND DIVIDENDS

After providing for taxation on the basis of profits for the year, a profit of £942,000 is left. The directors recommend the payment for the December half-year of the full dividends on the preference and maximum stocks and a dividend at the rate of 2½ per cent. on the ordinary stock, making a total dividend of 5 per cent. for the year.

In the balance-sheet the item hire purchase has now dropped to £60,000. You will realise that the capital laid out by the company on its appliance-selling campaigns before the war has nearly all been repaid. On the other side of the balance-sheet you will see that the provision for equalisation, maintenance, renewals, etc., stands at £2,626,000. The reason for this relatively high figure is that the company has continued prudently to make provision for necessary maintenance and renewals of its plant, but has been unable to spend the money, owing to the difficulty of getting the work done.

POST-WAR PRICE OF GAS

By good management the company has re-established its finances. We have reviewed the results of the past year, and were it not that the war still goes on (and while it does so it would be imprudent to ignore the risk of further setbacks) we should now be in a position to reduce the price of gas. After the cessation of fighting in Europe a scheme for the readjustment of our charges, which will mean a general reduction, will be quickly brought into operation.

EFFECT OF ENEMY ACTION

The company suffered very severely during the air attacks on London in 1940. Practically all our works were damaged, gasholders were destroyed and many mains broken. The highest praise is due to the courage, resourcefulness and tenacity displayed by the staff. A large number of people left London, and our consumption fell by about 17 per cent., while expenditure was necessarily high. We were unable to pay dividends for the second half of 1940 and the whole of 1941, and incurred a deficit in paying debenture interest. At the beginning of the war the price of gas stood at 9.75d. per therm, but the company was forced to raise the price by 2½d. per therm in November, 1939. It was not until March, 1942, that the Government authorised us to charge an additional 1½d. per therm. In August of the same year we were again forced, by increases in the price of coal, to make a further increase of 1½d. per therm. The price of gas has been increased by 44 per cent., whereas the pit price of coal has risen by 100 per cent.

The report was adopted.

BRITISH ASSETS TRUST, LIMITED

INCREASED PROFIT

MR W. H. FRASER'S REVIEW

The forty-seventh annual general meeting of British Assets Trust, Limited, was held at Edinburgh, on the 22nd instant, Mr W. H. Fraser, chairman of the company, presiding.

In moving the adoption of the report and accounts, the chairman said:

You will see from the report that the Marquess of Lanningow was re-appointed a director last July. Since the close of the year, in consequence of his appointment as chairman of Midland Bank, Limited, we have been obliged, with great regret, to accept his resignation. His help and wise counsel will be much missed. Colonel Ivory is still overseas, but we hope that his return will not long be delayed.

TAX POSITION OF AMERICAN OFFICE

In 1936 the company established an office in the United States of America for the more efficient conduct of its important American interests. A decision of the United States Supreme Court pronounced last December, reference to which has already been made in the Press, to the effect that for the years 1936-39 inclusive the company was a "Resident Foreign Corporation" for United States tax purposes, will entitle it to relief from substantial United States tax liability for which provision has been made. The decision also covers the basis for assessment for 1940 and 1941. In the absence of actual figures the accounts have been made up on the same basis as hitherto. Since the Supreme Court's decision was announced last December, the company's counsel in the United States have advised the directors that, owing to a change in the wording of the 1942 Revenue Act, the decision does not cover the company's tax position for subsequent years, which has still to be determined.

YEAR'S RESULTS

For the past year our gross income (excluding arrears), after allowing for interest on temporary loans and Dominion and foreign taxation, but before deducting British taxes, amounted to £369,584 against the previous year's figure of £351,940. After providing for taxation, expenses of administration, interest and preference stock dividends, there remains £66,393, equal to gross earnings on the ordinary stock of 25.7 per cent. against 21 per cent. for the previous year. We recommend a dividend of 15 per cent. and, in addition, a bonus of 2½ per cent. We do not expect that income for the current year will show any marked variation on that of the year under review. Certain non-recurring arrears of Dominion income-tax relief have been received during the past year, with the result that a substantially larger amount of relief is on this occasion being passed on to stockholders.

CAPITAL POSITION

The capital position remains satisfactory. Share prices over the next few years are likely to fluctuate very considerably, and therefore undue importance should not be attached to capital values at a particular date.

As showing how widely our stocks are held, it may be interesting to note that at January 15th there were approximately 2,800 ordinary stockholders, 3,100 preference stockholders and 1,800 debenture stockholders on our registers—a total of 7,700.

The report and accounts were unanimously adopted.

LANCASHIRE STEEL CORPORATION, LIMITED

CHANGEOVER PROBLEMS

The fifteenth ordinary general meeting of the Lancashire Steel Corporation, Limited, was held, on the 19th instant, at Warrington, Mr John E. James (chairman and managing director) presiding.

The chairman said that the directors had decided to recommend payment of a dividend for the year at the rate of 5½ per cent. on the non-cumulative redeemable second preference stock and at the rate of 7 per cent. on the "A" and "B" ordinary stocks.

The production of the undertaking had, in one form or another, continued to be confined almost entirely to the national war effort. He thought, however, it was reasonable to hope that during the present year they would be allowed to return, to some extent, to the manufacture of their normal peace-time products. A changeover to peacetime requirements from those demanded by total war would be a task of considerable magnitude involving both technical matters and problems of personnel. During that changeover period they must also, without interfering unduly with their manufacturing production, carry out the necessary arrears of repairs and maintenance of plant and buildings, in order to restore these to the high standard of efficiency they observed in pre-war years. The re-instatement of employees now serving with the Forces, whom they would welcome back to civilian life, was a further matter to which much patient thought and foresight would be given.

He was not one of those who thought that this country should be content with the capacity for making iron and steel products which it possessed at the beginning of the war. Nonetheless, not only the expansion of their output, but the maintenance of the old level of production would, in his opinion, depend largely upon the raw material factor.

The report and accounts were adopted.

RUBBER PLANTATIONS INVESTMENT TRUST, LIMITED

MR H. J. WELCH'S ADDRESS

The annual general meeting of the Rubber Plantations Investment Trust, Limited, was held, on the 22nd instant, in London, Mr H. J. Welch (the chairman) presiding.

The following is an extract from the chairman's address circulated with the accounts:—With the plantations of the Far East in enemy occupation and the Ministry of Food the sole purchaser of the exportable teas of India and Ceylon, only limited opportunities have occurred of advantageously varying or increasing our investments.

Of the total investments held at a book cost of £3,174,308 the quoted portion, costing £2,295,551, exceeded their market valuation by £318,194. This is comparable with a like excess of £703,786 at the end of 1943, thus showing an improvement in quoted values of £385,592. Against the depreciation we held free reserves and "carry forward" aggregating £705,084.

The revenue of the "Trust" for 1944 slightly exceeded that of the previous year, and after providing for taxation and all expenses there remained a net sum of £18,544, which has been added to the sum carried forward, now amounting to £155,084.

Tea: Once again it is impossible to give a full review of the figures of production, home consumption, re-exports and absorption in various countries, as few of such figures are issued. The prospects for producers appear to be reasonably good for years ahead.

Rubber: Supplies of natural rubber during 1944 seem to have been more or less in line with expectations and were probably in the neighbourhood of 200,000 tons. It is unlikely that the current rate of output can be substantially increased.

The report was adopted.

WILLIAM HOLLINS AND COMPANY, LIMITED

DEMAND EXCEEDS SUPPLY

The thirty-seventh annual general meeting of William Hollins and Company, Limited, was held, on the 16th instant, at Nottingham.

Mr Douglas Hamilton, the chairman, in the course of his speech, said: The year under review has not differed in any material respect from the two preceding ones. Demand has once again greatly exceeded supply, whilst shortage of labour in all our factories, due to the demands of national service, has become even more acute than last year. We have now reached the stage when goods of our manufacture, particularly men's and boys' pyjamas, shirts, etc., will be more difficult than ever to procure. This has involved a strict and most careful rationing of all our merchandise; but, in spite of this, I am glad to say that customers in every part of the world have complimented us on the fairness with which these restrictions have been imposed.

POST-WAR AIMS

During the year your board have felt justified in devoting more time to the consideration of post-war developments. In our old-established "Viyella" and "Clydella" and our war-time utility "Dayella" we have cloths which the public, both at home and abroad, appreciate and will buy in increasing quantities as soon as available. Our aim for the future is to ensure that at every stage of manufacture, from the raw material to the finished piece or garment, there shall be a maximum of efficiency and a minimum of waste.

In spite of substantial re-equipment a few years ago, we still have a considerable amount of old machinery, and we shall not be satisfied until this has been replaced by plant as up-to-date and efficient as the best makers are able to produce.

Shareholders have, by now, become familiar with the most striking feature of our accounts, namely, the vast percentage of our profits swallowed up by taxation, compared with the very moderate amounts paid to them in dividends. During the six war years, 1939 to 1944 inclusive, your company has earned in profits approximately £1,509,000. Of this amount about £1,219,000 has been, or will be, paid to the Chancellor of the Exchequer and little more than £250,000 in dividends to the shareholders, both ordinary and preference. Whilst the Excess Profits Tax has proved a valuable source of revenue to the Exchequer, its continuance after the war would cause serious harm to British industry. It recognises no distinction between profits earned as a result of the war and those earned in spite of the war. It tends to stifle enterprise and discourage thrift.

AN IMMENSE VACUUM

When the war is over British industry will be called upon to exert itself to the utmost to fill an immense vacuum at home and abroad in the shortest possible time. Private enterprise, stimulated by the much-abused "profit motive," can do this more effectively than any other system, but it cannot be expected to operate successfully if hampered at every turn by controls and discouraged by unfair forms of taxation.

The result of the year's working shows a trading profit of £247,653, which compares with £254,015 for the year 1943, which I feel sure you will agree is very satisfactory. After providing £197,500 for taxation and £5,571 for war damage contribution, you will observe that your board recommends the payment of a dividend on the ordinary shares for 1944 at the rate of 6 per cent., less tax, which, after paying the preference dividend for the year, leaves a balance of £20,845 to be carried forward to 1945, as compared with £16,613 brought forward.

The report and accounts were adopted.

ANGLO-FRENCH EXPLORATION COMPANY, LIMITED

The fifty-fifth ordinary general meeting of this company will be held, on the 28th instant, at Winchester House, London, E.C.

The following is an extract from the report of the directors, which incorporates the information given in normal times at the annual meeting by the chairman, Mr F. A. Robinson:—The net profit is £58,827. The directors recommend the payment of a dividend of 5 per cent., leaving a balance to be carried forward of £26,089. The dividend is subject to income-tax at 5s. 6d. in the £. The net dividend is the equivalent of 7½ per cent., less tax at 10s. in the £.

The net value of the company's assets at December 31, 1944, amounts to £1,083,780, the surplus thus being £333,780.

Shareholders are being invited to approve a resolution for the conversion of

the company's shares into stock. The rights of members will not be affected by the conversion.

BRITISH HOME STORES, LIMITED

INCREASED PROFITS

The seventeenth annual general meeting of British Home Stores, Limited, was held, on the 21st instant, in London, Mr Horace Moore (the chairman) presiding.

The following is an extract from the chairman's report circulated with the accounts:—The accounts now before you show a net profit of £170,325, an increase of £26,443 over last year. Your directors recommend an ordinary dividend of 33½ per cent.

Stocks show a considerable reduction. We welcomed the utility clothing scheme and have given it our fullest support. It is regrettable that this type of clothing, representing the best value obtainable, should now be in the shortest supply and

terribly inadequate to the public demand. We hope that when more textiles can be made available the Board of Trade will recognise this situation and legislate accordingly until the return of more normal conditions. Supplies of general merchandise have shown slow but steady improvement. You will probably have seen references to our acquisition of Hills and Steele, Limited. This purchase, which gives us nine additional effective units, should prove a valuable asset. The merging of the business of Green Shops, Limited, has been completed. I believe this is an instance where the combination of two businesses has proved equally satisfactory to both parties to the merger.

Your directors record their appreciation of the support our manufacturers have continued to give. A modern efficient retail organisation is the natural complement to efficiency in production. It is only by the close liaison between the distributor and manufacturer in the interpretation of consumer demands that the public may obtain the full benefits of planned factory production.

The report was adopted.

GOVERNMENT RETURNS

For the week ended March 17, 1945, total ordinary revenue was £63,073,000, against ordinary expenditure of £142,694,000 and issues to sinking funds of £480,001. Thus, excluding sinking fund allocations £5,649,280, the deficit accrued since April 1 is £2,722,978,000 against £2,682,114,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £41,407 to £2,856,510, the other operations for the week (no longer shown separately) increased the gross National Debt by £80,246,844 to £22,305 million.

(Continued from page 396)

The new T.D.R. call from the banks of £100 millions involved no more than £10 millions of "fresh" money, as there had been few prior encashments among the nominal maturities of £100 millions. With a considerable surplus of credit in the market at the end of the previous week and substantial balances coming through from Government Departments—including the large monthly payment by the Milk Marketing Board—calling by the banks was easily absorbed and outside quarters had difficulty in finding borrowers at rates above $\frac{1}{2}$ per cent. The allotment of Treasury Bills to the market, though 6 per cent. up on the previous week, was still relatively low at 27 per cent.

With credit so easy and comparatively few bills to take up, discount houses were reluctant to satisfy the demand for bills by the banks to the full. A considerable volume of Agricultural maturities did, however, change hands. The rise of £27.6 millions to £218.4 millions in Bankers' Deposits shown in this week's Bank Return is a reflection of the easiness of credit.

MONEY RATES, LONDON.—The following rates remained unchanged between

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, $1\frac{1}{2}\%$; 3 months, $1\frac{1}{2}\%$; 4 months, $1\frac{1}{2}-1\frac{3}{4}\%$; 6 months, $1\frac{1}{2}-1\frac{3}{4}\%$. Treasury Bills: 2 months, $1-1\frac{1}{2}\%$; 3 months, $1-1\frac{1}{2}\%$. Day-to-day money, $2-1\frac{1}{2}\%$. Short Loans, $1-1\frac{1}{2}\%$. Bank deposit rates, $\frac{1}{2}\%$. Discount deposits at call, $\frac{1}{2}\%$; at notice, 3% .

Colonial Issue

WHEN the Secretary of State for the Colonies addressed a meeting of the American Outpost last week on the British colonial empire, he was probably speaking to a far wider public than his immediate audience. His recent visit to the United States may have prompted his rebuttal of the perennial American criticisms of British colonial rule. But when he spoke of the future of the British colonies, his remarks were of present importance, for the colonial question is to be one of the big subjects for discussion at the San Francisco Conference.

It is evident, from the inspired reports appearing in the American Press, that the United States Government intends to make some proposal at the San Francisco Conference on the general subject of colonies. Just what the proposal is has not emerged and, since there is to be a preliminary conference of the Big Three at Washington before the San Francisco Conference assembles, the original idea may never see the light of day. But it is apparent that the general idea behind the American proposals is that of "collective trusteeship," which is opposed to "exclusive imperialism." Clearly this might mean anything from a re-affirmation of the mandate system and its extension to all colonial territories to the complete disappearance of colonial empires and their replacement by a system of international administration. The American Government clearly cannot be seriously considering the latter extreme, but it may well have something more than the former in mind.

The whole subject probably arises at this moment not only because of the importance that the colonial issue currently enjoys in American public discussion—usually for quite mistaken reasons—but also because of the progress of the Pacific war and the need, in the near future, to come to a decision on the Japanese mandated islands. They cannot be handed back after the war to the Japanese. Nor can they be restored, in accordance with the declarations of the Cairo Conference, to their previous owner—Germany. Clearly, the power with the greatest strategic interest in them is the United States. It also has the capital resources necessary for their development. If the United States were to assume responsibility for the islands, it would find little criticism in this country. But the American attitude towards imperialism makes such action distasteful if not impossible, and the mandate solution found for the same dilemma after the last war is currently considered in the United States to be too patent a subterfuge. Hence the proposal to make the Japanese islands subject to international trusteeship. And if the Americans can pass such a self-denying ordinance, could not the other powers do the same in respect of their own colonies?

It is here that Great Britain must take issue with the American proposal. Responsibility for the colonies, as Colonel Stanley pointed out, has devolved on this country more often by treaty and agreement than by conquest.

But to-day we have that responsibility, and it is a

responsibility we cannot share with others. We believe that any such division of responsibility is not only impracticable but wholly against the wishes of the colonial peoples themselves.

In this declaration the Colonial Secretary was only reiterating former pronouncements of the British Government. It is not that the idea of a joint administration has never been tried. The New Hebrides were made a condominium of Britain and France as long ago as 1906, but the cumbrousness of the resulting administration is well known. It is also worth noting that the New Hebrides are the only dependency in the South Seas, other than the Japanese mandates, where there is no legislative council or similar body in which the administration can sound local opinion. In the interests of the colonial peoples, responsibility for administration must rest in one place. For the British colonial empire it rests in the Secretary of State for the Colonies, on whom the pressure of public opinion can be brought to bear. But how can public opinion, here or in the colonies, be effective when it has to be exercised on an international body, consisting of representatives of powers with possibly conflicting colonial policies, whose administration would have to be based on the lowest common multiple of mutual agreement? How could the colonial administrator, with so many masters to serve, know where he stood? And how could a colony make an orderly and sure progress towards self-government when one trustee might want to hasten on the process while another wanted to hold back?

*

Great Britain, moreover, is not likely to be alone in objecting to the American proposal. This country is sure to have the support of its own ex-colonies which are now themselves colonial powers. There has been nothing to indicate that Australia and South Africa are willing to share their responsibilities for their dependencies and mandates. On the contrary, South Africa would like to extend its sovereignty by including in the Union the South African protectorates at present administered by the Colonial Office. It is possibly significant that General Smuts is to be present at San Francisco.

Nor is the British Empire the only one to be considered. Even if the Dutch and Portuguese views could be ignored, there can be no mistake about the French attitude. For France at this stage, when the country is slowly and painfully recovering its lost prestige, to be asked to share its sovereignty over its colonies, which in accordance with French colonial philosophy are regarded more as vital parts of France than as individual dependencies, would be a crowning insult. Speaking in the French Assembly on the San Francisco Conference, M. Bidault referred to the "intolerable suggestions" made in connection with France and her Empire and said that nobody would dispossess France of any territory she held. It can hardly be a coincidence that the present time has been chosen for a statement of French policy for Indochina. Indochina is to become a federation under the presidency of a Governor-General assisted by Ministers drawn from the Indochinese and French residents in the territory. This Indochinese federation will, together with France itself and other French dependencies, become part of the "French Union," a new version of the British Commonwealth. On this basis, a French Union composed of metropolitan France and its dependencies, France is climbing back to the status of a great power.

But for the colonial powers to give a flat refusal to the American proposals would be a mistake. Colonial policy has not stood still in the last quarter-century and it cannot stand still in its relation to world order in general. The French are likely to point to the proposed status for Indochina. They will argue that their colonial policy aims at promoting autonomy within the French Union. Indochinese, equally with Frenchmen, will be able to serve the French Union in any of its component parts; they will even be able to represent the interests of the

Union in other countries. This, the French will claim, is a more practical ideal, and of more benefit to the French dependencies, than placing them under an international administration.

The British counter-proposal will take the form already advocated more than once by the Colonial Secretary. The British Government is in favour of an extension of the system of regional commissions for colonial areas exemplified in the Anglo-American Caribbean Commission. Such commissions would be composed of representatives not only of the colonial powers concerned but also of states "with a major strategic or economic interest" in the area—and this provision may be the loophole for a compromise with American ideas. The regional commissions would involve no diminution of the responsibilities of each colonial power for its own dependencies. They would be advisory bodies only, but reports of the work of the Anglo-American Caribbean Commission show that the international co-operation resulting from them could produce very real benefits for the colonies. Nor is the British Government alone in its support for the commission idea. General Smuts has given it his blessing, and more than a year ago a conference of the New Zealand and Australian Governments ended with the announcement that steps would be taken to establish a South Seas Regional Commission with advisory functions relating to the welfare of the South Sea islanders.

On the other hand, though the extension of regional commissions, to judge from their co-operation in the Caribbean and the Middle East, is likely to be approved by the Americans, it does not follow that they will accept it as an alternative to collective trusteeship. Nor can it be considered an alternative to the mandate principle, and it is to be hoped that recent statements by Colonel Stanley, in particular in an address to the Foreign Policy Association in New York, are not to be read as implying that the British Government wishes to throw the mandate principle overboard. Regional commissions are extremely useful *ad hoc* bodies, but they cannot be a substitute for the principle that a colonial power should be accountable to world opinion for its administration of its dependencies. Regional commissions should supplement the mandate principle but not supersede it.

In any case, the extension of regional commissions would still be no solution to the problem of what should be done with the Japanese and Italian colonies. If a South Seas Regional Commission were established, would the United States be willing to undertake the responsibility of administering the Japanese mandated islands with their largely Japanese population? Some achieve colonies, and some have colonies thrust upon them. In this respect, the United States and the United Kingdom have a common problem. Neither wants to undertake more colonial responsibilities, but both seem likely to be compelled to—the one in the South Seas and the other in East Africa.

If this in fact is what must happen, the Japanese and Italian colonies should be held as mandates; American opinion would never consent to less either for their own new dependencies or for those of other nations. The mandates system, established after the last war, has had many critics. Not the least of its drawbacks was the powerlessness of the Permanent Mandates Commission. And there is always the danger that it would be composed of men with plenty of ideals but lacking the practical knowledge of colonial administrators. Against these drawbacks should be set the advantage of the publicity given to colonial affairs by the obligation on the colonial power to report at regular intervals to an international body. If the international discussions on the colonial question could concentrate on how to improve the mandate principle instead of taking the form of impracticable proposals on the one side and flat refusals on the other, some concrete results might be achieved. At it is, it looks as if the colonial problem, which was not, as at one time seemed possible, a factor in the outbreak of war, might well become a bone of contention at the peace conference.

The Problem of Germany—IV

The Moderate Policy

THE preceding articles in this series have analysed the possibilities of the proposal to make Germany for ever incapable of making war by detaching the Ruhr and the Rhineland as an independent state. The conclusion has been that this proposal, attractive at first sight, would not work and, in failing, would pull down the whole of the settlement of which it formed part. The argument comes back to the position that the most workable policy is one that is based on leaving the German Reich substantially intact, a nation-state among nation-states.

It remains in this final article to establish that this so-called "moderate" policy is no mere *pis aller* but a constructive policy. It is put forward not merely as the empty negative result of establishing that other solutions would not work, but because it seems to offer more hopes than any other of producing a long period of peace.

It will be as well once more to emphasise that what has here been called a "moderate" peace is in no sense a "soft" peace and is not inspired by affection or pity for the Germans. The "moderate" policy has three main elements. First, there should be a period, not exceeding five years in length, of penal servitude for the German people, the conditions of which would be as sharp as anyone desires. Secondly, the only restriction on German national freedom that should extend beyond this five-year penal period should be complete disarmament. Thirdly, with this exception, there should be no political or economic disabilities laid upon the German people and, in particular, territorial changes should be kept to the minimum.

At the end of last week's article it was suggested that any constructive policy should meet three requirements—it should not provoke dissension among the Allies; it should eventually be capable of standing of its own strength; and it should meanwhile rule out the possibility of a third German aggression. The moderate policy must now be judged by these tests. Clearly, it does not meet them perfectly, and those who insist on a mechanically perfect, fool-proof device for ensuring eternal peace will have to look elsewhere. They will, in fact, have to look a long way indeed. The unpalatable fact is that the world, even after these horrors, is not ready to make the sacrifices that are necessary to prevent international war. So long as there are sovereign states, the overwhelming probability is that there will continue to be wars. The only ultimate solution is a pooling of sovereignties, the acceptance of a world jurisdiction effectively overruling the wishes of the nation-state. But the peoples of the world, as represented by their politicians—who, after all, are professional experts in public opinion—are still a thousand miles away from being ready for any such surrender. The most that any realist would claim for a policy is that it stands a good chance of securing a long period of peace, and that is all that is here claimed for the "moderate" policy.

It would clearly not be easy to secure Allied unity on its contents. And yet it would not be wholly impossible. Those Governments which clamour for a hard peace would be at least partly satisfied by the proposal of a period of penal servitude, especially if it is combined with long-term disarmament. There is certainly nothing in Russian policy, as hitherto disclosed, that irrevocably rules out the acceptance of such proposals. As for the United States, the "moderate" policy is almost certainly as much as can be secured. It is important not to be misled by American advocacy of the Morgenthau plan. In the form in which it has secured the blessing of the Administration it is essentially a short-term plan, and the President is reported to have warned his colleagues at Yalta that American military forces would not be available for coercive policies in Europe for more than a very few years after the Armistice. When the problem is considered in terms, not of what some American statesmen will say, but of what the Senate will, by two-thirds majority, confirm, it is

almost certain that the United States will not commit itself to any long-term policy going beyond a guarantee of German disarmament, which was what Senator Vandenberg proposed. On this first test, then, the moderate policy comes out, if not well, at least better than any other. It cannot be said for certain that the American fear of specific long-term commitments and the desire of some European states for much more far-reaching commitments would find in the moderate policy an acceptable compromise. But if not, there is no other acceptable compromise. And if this hurdle of preliminary agreement could be surmounted, a simple policy of this nature, with its minimum of long-term promises, would be much easier to maintain, and therefore much less productive of dissension, than any "stronger" and more complex plan.

*

How does the moderate policy stand up to the second test, that of its ability to bring about a new stable equilibrium capable of maintaining itself without the constant application of force? Here again, nothing like perfect success can be guaranteed. But it is perfectly obvious to anyone who stops for a minute to think that there will be no permanent solution of the German problem until the German people become, if not perfectly pacific, at least no more anxious to wage war than the British or the Americans. Perhaps this will never come about; perhaps Lord Vansittart and his friends are right; but in that case there is no alternative to inspissated gloom. So long as there is a possibility of some repair, however remote, of the disastrous fissure in Western society, it is surely the wise object of policy to try to create the conditions in which it may come about. What are those conditions? One school of thought says that the Germans will never love peace until they have been taught the lesson, beyond the possibility of mistaking it, that war does not pay. Another school says that no country that is deprived of freedom will ever accept servitude, however long the odds against it. If the Balkan peoples revolted against the Turk, if the Poles would not lie down under partition, the Germans will never abandon the dream of revenge unless they are given their freedom and equality. Surely both views are right, and if it is at all within the Allies' power to create the conditions for German re-education, a policy that first teaches a very sharp lesson and then holds out hope of re-acceptance into the comity of nations is more likely than any other to serve that purpose.

The lesson should be very sharp. It is so already and there can be very few Germans left even today who have any illusions about the profitability of war. But they have more lessons coming. There is to be a complete occupation of the whole country. Billeting of foreign soldiers, always a very painful thing for any people to bear, will be far worse in the post-RAF state of German housing. There will be humiliating conditions of government, with German officials openly obeying the orders of the Allied military. There will be the sight of stolen wealth going home, and of German wealth following it. If, after the battering the country will have had, the administrative chaos that will follow, and the removal of whatever wealth is portable—if, after all that, the German people are capable of producing anything above a bare level of necessary existence, the surplus will be taken in reparations. It is indeed a vale of tears through which they are to pass and if it does not teach the lesson, nothing will. If, thereafter, the disabilities end and the impositions are withdrawn, the ground will surely be prepared for the growth of a Germany that will fear war and love peace. There will always be the memory of those awful years to discourage any adventures. Every liberty re-won, every comfort re-earned, will be a hostage.

But to the restoration, after the penal period, of German sovereignty, there must necessarily be one exception.

German inequality in armaments must continue. This is essential to meet the third requirement, that any possibility of a third aggression must be ruled out. It must be admitted that insistence on disarmament runs, to some extent, counter to what has just been said. It may be that so long as they suffered from this one disability, even though it were the only one, the Germans would resent their status and refuse to be reconciled to it. That may be true; but it cannot be helped, since it is ludicrous to suppose that the German people could, for a very long time, be trusted with arms, however apparently convincing their conversion. There is no way round this difficulty; but it is an argument for making the prohibition of arms as simple and as little chafing as possible.

Fortunately, this also fits in with the requirements when seen from the Allied side. For, if the policy of German disarmament is to be enforced over the long decades by the democratic peoples, the scheme must be simple and obvious and proof against propaganda. The best way would be to enact a simple and complete prohibition against the manufacture or ownership of guns, aircraft, tracked vehicles, armed or armoured ships, and a few other easily recognisable products of the munitions industries. Anybody can recognise these things, and anybody can understand why they are forbidden.

This would obviate the necessity for any far-reaching policy of controlling German industry. There is a great deal of talk current about the control of German industry, but very little appreciation of the difficulties of carrying it out for more than a very short time. For the penal period, the Control Commission will naturally exercise a considerable degree of control, if only to exact reparations and to police the original disarmament. But to continue control as a permanent policy would raise very difficult problems. Where is the necessary large and skilled staff to come from? What reason is there to believe that three countries with such divergent economic policies as America, Britain and Russia would agree on the purposes, other than the enforcement of disarmament, for which control is to be exerted? And if the policing of disarma-

ment is the purpose, is it not far easier simply to ban a list of weapons, without which no army can fight, than to attempt to interfere throughout the structure of German industry? The difficulty is that, with a few exceptions (which should get special treatment) there are very few industrial processes that are useful in war without being useful in peace. If you ban all industrial processes that might be used for armaments, disarmament means impoverishment—and would therefore not be maintained. It will be far simpler and more effective to impose a rigid ban on certain end-products, enforced by an inspectorate, than to attempt the impossible task of controlling German industry. There should be a simple banned list, and for the rest German industry (with certain exceptions, take such as some of the chemical processes) should, after the penal period, be left free of control. Even this simple system, with its obvious purposes, will impose a sufficient strain on the resolution of the victors. Anything more complex would break down of its own weight. And yet, if guns and tanks, aircraft and U-boats, rockets and bombs are effectively prohibited, Germany will be incapable of making war, be its war potential never so large. If the end-products are prohibited, the potential need not be controlled. And if the end-products cannot be effectively prohibited, the far more difficult and invidious task of controlling the potential certainly cannot be.

This moderate scheme is by no means perfect. It has its difficulties, which have not been shirked in this discussion. But it comes closer than any alternative to being a practicable and workable policy. It does not require that every teaching of history be ignored; it does not assume that human nature has been changed; it does not pretend that the structure of international society is other than it is. It is offered as a practical means of ensuring a long period of peace, at a price in effort or resolution no higher than the democracies, on the evidence of the past, can reasonably be expected to be willing to pay. The test that has been applied throughout is whether it would work; and if it passes that test it is surely the most positive and constructive peace plan that can be imagined.

Sight and Sound

TELEVISION was one of the war's first casualties. When it was faded out, for military reasons, on September 1, 1939, the Alexandra Palace service was nearly three years old, and was experiencing its first growing pains. The difficulties of the experimental period had been safely negotiated. There was no longer any doubt that television of high technical standard and considerable entertainment had come to stay. But within the effective 35-mile radius of Alexandra Palace there were only about 20,000 receivers in use by the public. The time was ripe for expansion in a field in which Great Britain was already in the van. But for the war, television would almost certainly have developed by now into a widely popular source of home entertainment and an industry of some considerable importance to the national economy. Quite soon, it may be hoped, the service will again be established; the Committee on Television, which was appointed in 1943, recently produced its recommendations on how this should be done.* In general, the report proposes that television should resume at the earliest practical moment where it left off.

In Great Britain research in the precise field of television has been held up during the war, and very little technical progress has been achieved; but a very great deal of work has been done on closely related branches of electronics that are of more immediate application to the war, and when these general developments are applied to commercial television, rapid progress should be possible. Within the next decade it is safe to assume that fundamental improvements will be recorded, particularly towards a higher standard of definition or imagery than

the 405-line standard employed in Britain before the war. The new system is expected to approach the standard of definition attained in cinematograph projection, and will probably incorporate colour and stereoscopic effects.

Ought, then, the reopening of the service to be delayed until the trend of new development has clarified and can determine the pattern of new technical equipment and practice? Or should the service be resumed on the basis of the pre-war 405-line system? The reasons that have prompted the committee to recommend the latter course are sound. It is argued that with technical improvements in transmission and reception (many of the pre-war receivers did less than justice to the signals transmitted) standards of efficiency and entertainment will, from the start, be much higher than in 1939; that a long interval without a television service would prove detrimental to its commercial development and make the eventual recruitment of specialised staff extremely difficult; and that resumed operations under the old system would provide further valuable experience in the art and technique of transmission.

At the same time the committee propose that the service should be extended by the establishment of new regional stations—initially, about six in number—through which the London programme could be relayed. Before the war the demand for such an extension was insistent, and in 1938 the Television Advisory Committee suggested the erection of provincial stations in the areas of Birmingham, Huddersfield, Falkirk and Bristol. Regional expansion, it is said, would help to demonstrate to a wide public that television is more than a scientist's plaything and would arouse popular support on a scale that would enable the industry to produce receivers in sufficient quantity to ensure the benefits of quality production.

One of the strongest deterrents of expansion before the war was the public's fear that existing receivers would soon be rendered obsolete by scientific progress. It is clear, therefore, that the proposed regional services would not prove sufficiently attractive unless some guarantee were given that the old system (and the sets made to receive it) would remain operative for a reasonable number of years. The committee, therefore, proposes that, even when the new high-definition system is in force, the old 405-line one will be able to share its programmes—in other words, that the public will have the choice, for some years at least, of viewing with the old receivers or with new and improved models. Since the extension of the provincial service would be gradual and piecemeal there would be time and opportunity to review and amend the plan of campaign in the light of further technical development.

On the all-important subject of research the committee's proposals lie half-way between unification of all interested firms in an associated body, and free-for-all competition. This middle course is but vaguely defined. Under it "television research would be co-ordinated, whilst individual effort would receive all possible encouragement." If this system of research, conducted under the auspices of the Government and co-ordinating the services of the BBC, the Post Office, the Department of Scientific and Industrial Research, the universities and the radio and ancillary industries, could achieve all that the committee has in mind—including the pooling of patents and processes—the future of television in a technical sense would seem to be assured. But similar examples of idealism have not hitherto progressed very far beyond the blueprint stage. Everything possible should certainly be done to prevent the immense opportunities of the television industry from being frittered away by that lack of co-ordination among research workers, technicians and designers which is the normal corollary of misdirected competition.

The committee's proposals on finance recognise that the ultimate aim of a self-supporting service will not be attainable for some years. Television licence fees, at £1 per annum, would at first bring in only about £20,000 from ordinary viewers. In 1939, the share allocated to television out of the BBC's net licence receipts was £450,000 (11 per cent). Since the proposed scheme will cost something like £1,500,000 for capital outlay, and £1,000,000, rising to about £1,750,000 (as the provincial stations are brought into service) for annual expenditure, the old financial arrangements must be overhauled. The balance not met by the new special television licences will have to be drawn either from the BBC's general licence receipts or from direct Government grants. When the new system is introduced it is likely that the cinemas will be anxious to relay items of topical interest to their audiences. If so, the cinemas would be expected to contribute to the costs of the service. If sponsored television

programmes were thought desirable, they might prove another important source of finance. If television should reach a stage at which several programmes are offered simultaneously to all viewers the experimental introduction of television advertising might be given its chance in one of the programmes. Commercial interests would, however, be unwilling to incur large expenditure on such advertising until television reaches a much wider audience than appears probable for some years to come.

If the technical future of television is assured, however, its social and economic implications are hazy and unpredictable. Will television always remain a special form of broadcasting, or will there be a tendency for all broadcast programmes to be televised—that is, for television to absorb its elder brother, as the talkies superseded the silent film? How far will it compete with the cinema? How will it affect public performances and public performers of music, drama and variety? What will be its influence on popular, and school, education? These and many other questions can only be answered satisfactorily by the march of events.

It is likely, though far from certain, that sound broadcasting will eventually be superseded by television. But much will depend on the way in which the studio technique of television develops. If broadcasting were to follow the example of the cinema and make its art so complete an integration of sight and sound that the one is unintelligible without the other, it would lose the very large part of the listening public which now listens only with one ear while engaged on something else. Much though the professional broadcasters deplore the fact, the radio is for many people a pleasant and sometimes instructive background to the daily round and common task. An integrated sight-sound programme—and this would seem to be the target of the technical logic—would certainly need more discriminating and single-minded audiences. The receiver would be "on" for fewer hours per day than the modern radio, but it would receive much more undivided attention. Would the public be prepared to sacrifice its present luxury of inattentiveness? Or could the programmes be arranged so that for some items at least a person might choose either to hear or to hear and see? And how much would this handicap the programme maker? Sound broadcasting has set a fashion in listening that will be hard to dislodge. In most families it is difficult enough to listen habitually to selected programmes without domestic interference. Even in the cinema a bout of coughing or a late arrival can mar one's enjoyment very markedly; how often would the family man find domestic conditions ideal for television reception? There are thus obvious difficulties in an amalgamation of the two services. But, if they stay separate, and television remains (as it almost inevitably must) the less popular of the two, it will either have to be subsidised or to remain poverty-stricken.

A CAPITAL ANNUITY

Have you heard of—

Part capital, part interest . . . £315 per annum guaranteed for twelve years . . . of which, on average, £271 is capital repayment and £44 is taxable interest . . . and, after the twelve years, an annuity of £472 10s. (subject to tax) continuing for life . . . this can all be secured by a male life aged sixty for a present investment of £5,000

163-164, STRAND, LONDON, W.C.2

* "Report of the Television Committee, 1943." HMSO. 8s. 6d.

It has already been suggested in these columns that broadcasting would gain very considerably by decentralisation. At present the service is in some danger of falling into the rigidity and lifelessness of monopoly control. This danger might be averted if the technical limitations of television were allowed to influence the reconstruction of British broadcasting. Television programmes cannot at present be received beyond the horizon of the transmitter, and their range is therefore restricted. But this range (a radius of 40 miles has been predicted) is large enough to include dense urban populations in many parts of Great Britain. Television, therefore, points in the direction of one or more networks of local stations, as opposed to the wide-range medium-wave stations that have been the main reliance of sound broadcasting. Television is, therefore, an additional argument for a much more diversified and competitive broadcasting system than has hitherto existed.

Television, for most people, conjures up a delightful picture of an evening by the fireside with the film of the moment. Would the fact be as exciting as the prospect? How much of the pleasure derived from a visit to the

cinema is gregarious? It may be, as the report points out, that television and the cinema "should prove on the whole mutually helpful." The old fears of the press and the entertainment world about the competition of broadcasting have proved unfounded. Broadcasts of good music have certainly helped to increase the number of concert-goers, and for all the education, talk and variety put out over the radio the attendance at shows and lectures constantly increases. But whether this argument can be pushed so far as to persuade the cinema industry to allow films to be televised early in their life is more doubtful. The cinema may be assisted by television. Or it may not.

Until these questions move beyond the range of speculation into the field of practical consideration they cannot be satisfactorily answered, and there is, therefore, every reason why the structure and organisation of the television service should be made and kept as flexible as possible. The first need is to provide nourishment for swift and healthy growth. The Government can assist by releasing staff and material at the earliest possible moment and by maintaining the closest care of the infant industry during its early years.

Finland's New Start

THE elections to the Finnish Diet, which took place a fortnight ago, have produced a considerable change in the alignment of political forces in Finland. The Democratic League, of which the Communists form the hard core, has scored a striking success, and there has been a general strong swing to the Left, both between the parties and within them. The Agrarians and the Social Democrats, hitherto the two pillars of parliamentary government in Finland, are left in a weakened state. But these changes, substantial though they are in political terms, have not opened the way for any definite solution to the economic problems that defeat in the war has bequeathed to Finland.

A comparison between the party composition of the old and that of the new Diet illustrates the change.

	1939 election	1945 election
Social Democrats	85	50
Agrarians	58	49
Conservatives	25	28
Liberals	6	9
Swedo-Finns	18	15
Democratic League	0	49

The figures of the electoral losses and gains tell only part of the story. The other part is that about 110 members of the new Diet are newcomers to Finnish parliamentary politics; that only 90 of the old deputies have been re-elected and that nearly half of the re-elected deputies belonged to the "peace party" in the old Diet. By choosing "new men" as its representatives the Finnish electorate has clearly disavowed the war policies that were associated with the previous Diet and the old leaders. This is the first conclusion to be drawn from the result of the elections. But the second is that the disavowal of the war party has not gone to the lengths of discrediting the parliamentary regime or even the old parties, although, in one way or another, all of them could be said to share in the responsibility for Finland's participation in the war. Alone among the satellites of the Axis the Finns retained their parliamentary system, though in a muffled condition, during the war; and equally unique among the new co-belligerents on the Allied side, they are now promptly reverting to the normal machinery of democratic government.

But will the democratic machinery be able to work smoothly in the new circumstances? On the eve of the election, the country was in the throes of uneasy tension. The pessimists predicted an immediate Russian intervention; communications between Sweden and Finland had been cut; the rumour went about that the President, Marshal Mannerheim, had retired under Russian pressure; the Prime Minister, Mr Paasikivi, and the Minister of Labour, Mr Vuori, warned the electorate that a failure on its part to choose "new men" might bring about a

critical situation. However, it is not as a result of Russian pressure—at least not directly so—that the chief difficulties to the working of the Parliamentary regime may presently arise. The chief danger may be found to lie in Parliament itself. In the new Diet the forces are almost equally divided between the Right and the Left. Neither the Right nor the Left by itself now seems to be capable of forming a stable Government which would command a solid majority. The Social Democrats and the Communists between them command 99 (or possibly 100) votes. Together with the Swedo-Finns they might form a majority of 115 votes. But the Swedo-Finns are divided; and so are, to an even greater degree, the Social Democrats, among whom the followers of Mr Tanner are at loggerheads with the faction of Mr Fagerholm and Mr Virtanen, the leaders of the "peace opposition" who have remained in the party, unlike the other Socialist dissidents who broke away to form the Democratic League with the Communists. For the same reason, no coalition is plausible between the Social Democrats, the Agrarians, the Liberals and the Conservatives. Any such bloc would handicap the Socialists *vis-à-vis* the Communists; and it would certainly antagonise Russia. The result of the election may therefore be a Parliamentary deadlock, which would demonstrate the weakness of the new alignment of forces and might pave the way for extra-parliamentary government, or even for an anti-parliamentary experiment.

The difficulty can only be overcome by the formation of a broad national coalition and by a new suspension of party politics for some time to come. Paradoxically enough it is the Communists who have now hinted at the possibility or desirability of such a coalition. Mr Aimo Aaltonen, the leader of the Communist Party, whom the armistice has freed from a long term of imprisonment, has stated:

We are willing to co-operate with all democratic groups, not only the Social Democrats but also the Swedo-Finnish Party which will probably be represented in the Government. We do not object to the Agrarians, Liberals and Conservatives joining in this co-operation through uncompromised persons. We have not so far put forward any special demands regarding Mannerheim's position. Our aim is not a Soviet Finland nor even general socialisation, but only the nationalisation of some undertakings and big enterprises. As regards foreign policy, we want the closest possible co-operation not only with Russia but with all democratic countries. This co-operation should be economic and cultural, and we have never considered military union, for instance, with Russia. We do not believe that Russia will make further demands on Finland, but believe and hope that she will somewhat mitigate her demands.

For the leader of a party that has almost overnight

gained a quarter of all the parliamentary mandates this is a remarkably moderate statement. It has gone more than half way to meet the view-point of the Right, which is now anxious to keep the problem of domestic social reform separate from that of foreign policy. It is even more remarkable in view of the fact that the Socialists of Tanner's tendency went to the polls with the watchword of an all-out nationalisation of industry.

Though the issues of nationalisation or sovietisation may not be raised at present, the chances of any broader parliamentary coalition being successful will clearly depend on the degree of economic and social stability in the country. It is in this context that the payment of the reparations, to which Finland is committed under the terms of the armistice, must inevitably loom very large. The amount of the indemnity has been fixed at \$300 million, of which \$175 million is to be paid in machinery and ships, and \$125 million in timber, paper, pre-fabricated timber houses, cable products and so on. Originally, all goods were to be valued for reparation purposes at 1938 values, but more recently the Russians have conceded an increase of 15 per cent over the 1938 level for the first category of machinery and ships and a 10 per cent increase for the other items. Even with this concession, the programme will impose a severe strain on Finnish resources both in foreign and domestic trade. The machines and ships will require imports of raw materials; so will the timber-working machinery, the transport and public utility material in the second category. Imports will have to be paid for by exports, and new capital to enable Finnish industry to carry the load will require large savings. The capacity of the Finnish metal industries, for example, may have to be doubled in a short time.

Finland will have to increase its production and limit its consumption. Will the Finnish Trade Unions be willing to lend their aid in inducing their members to make the necessary efforts? Since a high proportion of Finnish output will have to be exported without payment, Finland

will be compelled to cut short its habitual imports of tobacco, spirit, coffee and textile goods. This inevitably means a considerable lowering of the standard of living compared with the pre-war level. The Finnish Communists' slogans during the elections were "No lowering of the standard of living" and "Let those who bear the responsibility for the war pay the indemnity." Both slogans make no sense. The payment of reparations must entail a lower standard of living under any circumstances; and the punishment of the "guilty men" can in no way add anything to Finland's productive capacity. It might be argued that the nationalisation of industry would perhaps induce the Finnish working classes to reconcile themselves to the temporary lowering of their standard of living and enable Finland to fulfil her obligations towards Russia, though it would be odd if the need to meet a Reparations bill were the decisive motive for a social revolution. But a purely negative policy which is "moderate" in rejecting nationalisation but wholly immoderate in opposing any reduction in the standard of living can hardly give Finland the political stability which she needs.

Finland's economic and social difficulties could be lessened if Finland were to receive credits from abroad. As the proverbially conscientious debtor, who did not default during the Great Depression, Finland may have a chance of raising loans in the United States. What would probably deter foreign creditors is the uncertainty about the country's political future. The result of the recent elections may diminish that uncertainty, but it has probably not dispelled it altogether. Finland may also hope for some relief from a softening of the armistice terms—a hope that may possibly come true if the new Diet initiates a firmly pro-Russian policy. But the opposite is equally possible. If the policy is not satisfactory to Moscow, the armistice terms could easily be interpreted so as to tighten the reparations screw, and this in its turn would cause internal trouble. For the time being, Finland still stands at the cross-roads.

NOTES OF THE WEEK

Lloyd George

There is a touch of tragedy in the fact that the architect of one victory did not quite live to see the next. But then there was a touch of tragedy in the whole of Lord Lloyd George's last two decades of life. For six years he was the head and front of the most powerful government in the world, war-maker, peace-maker and popular leader. Then, displaced by the revolt of small men, he never held office again, and for a man of his consummate political talents that could not be other than wormwood and gall. To this can be traced all the errors of judgment of these last twenty years that surprised his contemporaries and will raise the eyebrows of history.

But it is the Lloyd George of 1906 to 1922 that will live the longest in men's memories. At the peak of his powers, he was followed with almost apocalyptic fervour by the people from whom he sprang. No one, on a platform or in a debate or in an intimate conversation, could more effectively use words to influence actions. Yet words were not all. It is still said by the old hands in Whitehall that "there never was a Minister like L.G."; the minute he entered the front door his energising presence could be felt in every corner of the building. Never have the arts of the popular orator and those of the statesman been more effectively combined.

The comparison with the present Prime Minister is inevitable—though the parallel with Chatham is in many ways closer. Whether Lloyd George was a greater War Minister than either is for history to answer. But he wears the double crown, for if the last war had never happened his fame would still stand high as the leader of the great Radical resurgence of the years between 1906 and 1914. As an Englishman he belongs in the very select company of the eternal names—Elizabeth, Cromwell, Marlborough, Chatham, Pitt, Wellington, Gladstone. But he was not an Englishman. He died where his spirit belonged, in the hills of Snowdonia. And as a Welshman he was the greatest of them all.

Battle of Germany

The crossing of the Rhine by the Allies will rank for ever among the most decisive and certainly the most skillfully conducted battles in history. Artillery barrages, air-bombing, parachute landings, all played their meticulously timed parts and the engineers did prodigies in throwing bridges across a wide and swift river under heavy fire. All along the river, from Wesel to Strasbourg, bridgeheads sprang into being in quick, kaleidoscopic succession, and were linked up at great speed into continuous fronts. Across the river the crust of German resistance has been found to be thin and cracked.

Will Kesselring try to make a stand anywhere in the northern German plain between the Rhine and Berlin, on the Weser or on the Elbe? This seems to be somewhat doubtful in view of the great losses which the *Wehrmacht* has just suffered on the Rhine—a quarter of a million in prisoners alone. The ring of concentric defences around Berlin may perhaps be the last battlefield chosen by the German Command. There they may still hope to prolong the twilight of the gods in the ruins of the German capital and to impose on the attackers all the handicaps of long communication lines over enemy land submerged in terrible chaos. There are also the reported plans of a last stand in the inner bastion of the Alps, but that "bastion" may well be cut off from Northern Germany by Allied thrusts from the southernmost bridgeheads around Mainz and Karlsruhe and by the renewed Russian advance along the Danube.

On the brink of final disaster, the bulk of the *Wehrmacht* still faces the Russians in the east; but the day is not far off when the distinction between eastern and western fronts must become meaningless. They are rapidly becoming the perimeter of a single battlefield covering the rump of the Reich. The end is now obviously very near, and almost the only uncertainty is whether, after all, there will be a surrender by any sort of German government.

No Fraternisation

In a letter to his troops, Field-Marshal Montgomery has set out in great detail the implication of the "No Fraternisation" Order:

In streets, cafés, houses, cinemas, etc., you must keep clear of Germans, man, woman and child, unless you meet them in the course of duty. You must not walk out with them, or shake hands, or visit their houses, or make them gifts or take gifts from them. You must not play games with them, or share any social event with them. In short, you must not fraternise with Germans at all.

Something may be said in favour of such vigorous prohibitions so long as hostilities last. The Field-Marshal's letter, however, suggests that the prohibitions ought to remain in force even after the "cease fire." Otherwise there would be no point in his rather dubious assertion that the neglect to carry out the orders against fraternisation during the occupation of the Rhineland after the last war was responsible for the revival of German imperialism.

To harp on over-simplifications of history in a Commander's address to his soldiers would be out of place. But can it seriously be thought that Field-Marshal Montgomery's "Don'ts" can possibly be enforced after the armistice, especially in the course of a long occupation of Germany? Of all the unrealistic notions that are now current on conditions in post-war Germany, that would be the most fantastic.

Legends in the Gutter

Streams of German refugees from the Russian-occupied provinces in the east were still moving westwards along the roads of central and southern Germany when they met other columns of evacuees moving from the Rhineland in the opposite direction. The pressure of the double mass exodus must have been too strong for the overstrained Nazi administration. After the beginning of the offensive on the Lower Rhine the Nazis were compelled to call off the evacuation of civilians from the Ruhr area and Westphalia. Only a few classes of young and able-bodied men have been ordered to join the "marching groups" that are supposed to fight or to work farther inside the congested and overcrowded Reich. No mention has been made of the Volkssturm in the Ruhr and in Westphalia.

The complete paralysis of transport; the scanty industrial resources of Central Germany, Austria and Western Bohemia, which are all that remain to the Wehrmacht; the appalling condition of the bombed towns; the growing administrative chaos—these things can no longer be passed over in silence by official Nazi spokesmen. Frequent announcements about executions of "cowards" and broadcast appeals to Nazi organisations, and even to civilians, for help in the rounding-up of straggling soldiers and deserters are unflinching pointers to a rapid deterioration in morale. In the last war, it was the home front which, according to the Nazi legend, stabbed the Army in the back. In this war, it looks to the Nazis as if the home front had been stabbed in the back by the Army.

The familiar political apathy of the people has now been made even deeper by sheer physical torpor. Nazi speakers still make a last effort to shake the stunned nation by a violent propaganda campaign about the apocalyptic consequences of defeat and by showering abuse, in the most vulgar idiomatic slang, upon the fainthearted, the weaklings and the traitors. In this last act of their self-destructive struggle the Nazis are dragging the Nibelung myth down to their own level—to the political gutter. The same is happening to the Frederician legend, which was for a time so successfully dangled by Hitler before the eyes of the German people. The hope that a split among the Allies will save National Socialism has gone; the gestures of the great King are no longer aped by the Fuehrer; and only Frederick's angry exclamation, "Dogs, do you want to live for ever?" is now being shouted by Goebbels, Himmler and Ley into the ears of the numbed and mutilated German nation.

Industrial Location

Last week's debate in the House of Commons on the Distribution of Industry Bill, now that it can be seen in perspective, does not provide any encouragement to those who hope, almost against hope, for the emergence of a constructive and constructive policy for the economic development of the country. The President of the Board of Trade

ostentatiously refused to consider the Bill in the wider setting of economic policy as a whole, and Sir John Wardlaw-Milne's attack upon it was so extreme as to be ridiculous.

The only truly constructive approach to the subject came, paradoxically enough, from Sir George Schuster, who moved the rejection of the Bill. It is clear that some of the comments made in *The Economist* last week on the basis of preliminary reports of Sir George's speech did him less than justice. His main point was that a policy of industrial location cannot be applied piecemeal and *ad hoc*; by its nature it involves having a plan of action, which Sir George would have worked out regionally by bodies free from the pressures of politics—though the actual execution must, of course, be the responsibility of the Government. This is a sound enough point of view, even though to move the rejection of the Bill seems an extreme form of giving expression to it.

The Bill, indeed, should become law, since the major objection to it (*pace* the enraged defenders of private enterprise) is that it does too little rather than too much. It is true that to compel a number of light industries to settle in the Special Areas rather than elsewhere is a very small contribution to the economic problems of the country as a whole, and that, as Sir George Schuster said,

to look at the matter simply from the location point of view implies the conception that we must have a certain amount of unemployment in this country, and that we are merely saying "Let us spread that unemployment widely."

But it is also true that something will be needed to spread full employment evenly over the country. Or, again, on the other side of the Bill, it is true that the restrictive powers of the Board of Trade *could* be used in a purely negative way. But some form of control over congested areas is clearly necessary, if only for the strategic reasons that Mr Lyttelton emphasised. The right course is to enact this Bill, and to redouble the pressure for a real economic policy which alone would give it a positive meaning.

Building Budget—Supply

Last week's Commons debate on housing fully justified the decision to set aside two whole days to a discussion of so wide, so vital, and so complex a subject. A White Paper, produced rather hurriedly earlier in the week, had lacked both inspiration and new information. More important, it had failed to set clearly before the country the major issues of policy with which the Government is faced. On one of these, at least, the debate has made up for the deficiencies of the White Paper.

This issue is that of building labour. It has already been emphasised that the supply of labour is the greatest restricting factor on the number of houses, permanent or temporary, that can be quickly put up; and that supply is inevitably limited. But how far the limits can be extended, and by what means, is still the responsibility of the Ministers concerned with housing. On the limits of the labour force for building (as distinct from the limits of the houses that it can build), the following table, digested from Mr Sandys's speech, shows clearly that the relatively small number of 60,000, discharged from the armed forces under Class B as key men for reconstruction, is the one source of supply which could be substantially increased.

SUPPLY OF BUILDING LABOUR.	
Present labour force	337,000
From war employment	215,000
Discharged from Forces	
Class A (age and service)	175,000
Class B (reconstruction priority)	60,000
New entrants	13,000
Total at end of first year	800,000

Compared with the 175,000 men discharged for age and length of service, the 60,000 will be only the top layer of skilled, and often younger, workers. Mr Sandys made it clear that the choice lay between taking only the most essential men, or unbalancing to some extent the demobilisation scheme by giving priority discharge to a much larger number. By fixing the number at 60,000, the Government has decided on the former course, which necessarily puts a narrower limit on the number of houses which can be built. He said that any large increase would create a sense of deep injustice in the Services. That may be so. But there may be an even greater sense of injustice when men and women from the Services return to find so few

houses ready for them. They will not, in any case, find enough, but surely the choice should be put to them and to the country as a whole, fairly and squarely.

Building Budget—Demand

The other side to the question of building labour is its allocation—how is this limited force to be used to the best advantage? The expenditure side of Mr Sandys's budget can again be summarised in a table:—

ALLOCATION OF BUILDING LABOUR	
War damage repairs (i.e., to houses now uninhabitable)	200,000
Six years' arrears of normal repairs	150,000
New house construction	100,000
Other new construction (schools, etc.)	50,000
Average total for first year	500,000

With the allocation for repairs there can be little quarrel. Mr Sandys triumphantly announced that the winter target of "second-stage" repairs, making habitable but war-damaged houses tolerably comfortable, has just been achieved. After this the work of more fundamental repairs will still yield better dividends for the homeless than any possible new construction. One word of warning should, however, be spoken. If 150,000 men are to be directed to "normal" repairs there must be close control to see that they are not wasted on unessential painting and decorating—X must still go shabby if Y is shelterless.

The remaining 100,000 men available for building new houses in the first year will have a double job. Mr Willink's 300,000 permanent houses must be built or building before two years are out. Besides these, the country still expects (though now somewhat cynically) a fair number of temporary houses, and on the temporary programme there is still some confusion. According to Mr Sandys, 10,000 of the 145,000 allocated to England, Wales and Scotland will be out of the factories by June. But a bottleneck, even for this small fraction, threatens where sites are concerned. Even if local authorities find and prepare them, three months will elapse in which tenders are sought and drains dug, before the work of construction begins. This seems unnecessarily long. It may also be this matter of sites which, with the furious demands for pressed steel from other industries, has caused Mr Sandys to confess to being hesitant about starting on Portal houses as late as next spring. The Portal house needs only a third of the labour for construction of that required by other temporary types, and is also cheaper. The housing situation in 1946, when demobilisation will have begun, will be no less grave, and the contribution of the Portal will still be useful.

On the whole, although information is still inadequate, the debate did give evidence that criticism of housing policy is having some effect. The appointment of Sir Frederick Pile, hitherto in command of the anti-aircraft forces, as organiser of the production and erection branch of the Ministry of Works, testifies to a willingness to look outside the usual resources of the Civil Service. The division of the Ministry into four sections, one of which, under the Permanent Secretary, will be responsible for co-ordinating the work of the other three, will be particularly useful in providing continuity at the time of the election, when the political leaders will be tempted to give less time to departmental problems.

French Amendments

The French Government has published its amendments to the Dumbarton Oaks scheme. They show that General de Gaulle has not chosen to enter the stage of the new World Organisation as the champion of small nations against the "dictatorship" of the Great Powers. He has rightly refused to play the somewhat melodramatic rôle which some of the critics of the Dumbarton Oaks scheme had cast for him in advance. If anything, the French amendments go even further than the scheme itself in placing emphasis on the principle that chief responsibility for maintaining peace ought to rest with those who possess the means to maintain it. The French accept the unanimity rule in the voting procedure on the Security Council and recognise that in the existing circumstances the World Organisation cannot decide on military action against the will of one of the permanent members of the Security Council. However, they do not ignore the fact that "the unanimity rule may be a cause

of weakness in an institution"; and they propose therefore to draw a distinction between the Council's recommendations and its decisions. The former should not imply recourse to the use of force; the French Government suggests that recommendations be adopted by a majority, not necessarily a two-thirds majority of the Council's members. The two-thirds majority, involving unanimity of the permanent members, would, however, be required for decisions.

The acceptance of this amendment might, perhaps, meet the objections of those critics who fear that the new League might be committed to moral connivance with aggression on the part of a Great Power. The new League would be able to adopt, by an ordinary majority, "recommendations" directed against the policies of permanent members of the Council. Yet, such "recommendations" would by definition be little more than pious wishes or platonic demonstrations; and it can be argued that they might bring more harm than benefit to the new League.

The French have repeated their objection to that clause in the Dumbarton Oaks scheme which said, "No coercive measure should be applied by virtue of regional arrangement or by regional bodies without the Security Council's authorisation." This might, of course, be interpreted as an invalidation of any alliances which the members of the World Organisation had previously concluded. Would not this provision, the French ask, prevent the Russo-French alliance, for instance, from coming into play in case of an emergency? They, therefore, propose the following amendment:

An exception to this rule should be made when it is a matter of applying emergency measures provided for by the treaties of assistance concluded by members of the organisation and duly notified to the Security Council.

This amendment should ensure the automatic operation of pacts and regional security arrangements.

This French amendment will probably produce a lively debate at San Francisco. It will be opposed by the "idealistic" critics of regional arrangements and by the upholders of the principle of universality. But in all probability the amendment will be accepted. The Russians have stated in advance that they will support it and that they, for their part, see no contradiction between the Dumbarton Oaks

scheme, the Yalta decisions and their alliance with France. They take the automatic working of the military alliances for granted, and to this extent they appear to have abandoned the notions of collective security which were the Russian stock-in-trade during the Geneva period. This hard-boiled and realistic view goes together with an inclination to regard the new League sceptically, as an experiment which may or may not work. If it works, then eventually the regional arrangements may be subordinated to it. But, before they have the evidence of the new League's efficacy—so the Russians argue—they refuse to give up such instruments of strategic security as they have in hand. It is noteworthy that this argument is applied to the Anglo-Soviet Treaty of 1942 as well as to the Russo-French alliance. True, the Anglo-Soviet Treaty provides for the termination of the military alliance after the creation of the new League; but it also makes such termination dependent upon the agreement of the partners in the alliance. If Great Britain and Russia decide to keep the alliance in force then it cannot be rescinded by the new World Organisation. (The Russo-French and the Russo-Czechoslovak Treaties contain no reference at all to the future League.) The new World Organisation is thus being born without the halo of great hopes or brilliant illusions. The parents are not anxious to advertise in advance any miraculous qualities in their child. Soberly and without sentiment they announce that its role in life may be rather prosaic and modest. Will it be too modest to accomplish anything?

Political Trailers

Labour members of the Government were out in force during the week-end sparring for openings at the forthcoming election. The chief interest in such speeches, which must inevitably deal more with principle than practice, is that they provide a foretaste of Labour's plan of campaign. It is becoming clear that the main planks in the platform will be the old stand-by of nationalisation, housing policy, and social insurance. Conservative opposition to the, suggested amendment of the Trade Disputes Act to permit Civil Service unions to affiliate in the TUC may provide another useful support.

At Nottingham, Mr Attlee attempted to define the scope for nationalisation, and he brought in the Mulberry harbours as an ideal pattern of communal non-profit-seeking activity.

We hold that when the stage of monopoly has been reached there is danger to the community, and that private must be replaced by public ownership. . . . Our opponents continue to repeat old phrases about the advantages of competition, although over large areas of economic activity competition has given place to monopoly.

A development of this line of argument would probably be more profitable to the Left than the usual negative defence of controls. The public is certainly more ready at the moment to condemn regimentation than it is to appreciate the fine wartime record of industrial co-operation. If Mr Attlee can find a few more "mulberries" in the war effort—their language is easily comprehended by the ordinary citizen—the theory of nationalisation might be made more palatable and popular.

Government Appointments

The proximity of the general election is producing many signs of restiveness in the House of Commons. Coalition is degenerating into uneasy truce, and may be expected to show further signs of disintegration at any moment. Last week found Labour members unduly sensitive about the appointment of Mr Eden as leader of the delegation to San Francisco; and Mr Churchill was able to avoid further unpleasantness only by taking refuge behind a constitutional technicality. Mr Attlee, the Deputy Prime Minister, holds a courtesy title that has no constitutional authority.

The prickly heat of the political atmosphere is reflected in the list of new Junior Ministers approved last week. The balance of political parties in the Government has to some extent been preserved, though the bias is to the Right. A Conservative, Mr Spencer Summers, succeeds the late Mr Harcourt Johnstone as Secretary to the Department of Overseas Trade, but the Liberals must take consolation for the loss of this important position in the appointment of Mr J. A. de Rothschild to the Ministry of Supply in place of Mr Peat (Conservative). The only Labour appointment is that of Mr Jenkins, who succeeds Mr H. G. Strauss (the

Conservative member who resigned because he was not in full agreement with the Crimea decisions) as Parliamentary Secretary to the Ministry of Town and Country Planning. Two Conservatives, Mr Peat and Flight Lieutenant W. R. D. Perkins, become Parliamentary Secretaries to the new Ministries of National Insurance and Civil Aviation. Thus the most important junior posts in the Administration are bestowed on Conservatives. These new recruits, however, will not have long to prove their worth in the present Government, but they are mostly young men, and may "come again."

Belgian Chamber

The Belgian Chamber and Senate have recently granted "extended" powers to M Van Acker's Government, after the Senate had rejected the Bill on plenary powers in the first days of March. Under the new Act the Government will be free to issue decrees after consultation with the parliamentary commissions. Only decrees failing to command the support of the commissions will come before the parliament. M Van Acker's Cabinet will thus have more freedom of movement than M Pierlot's; but parliamentary opposition can still make itself strongly felt. The opposition is likely to come into play if, for instance, the Government's measures for carrying out the purge appear to be excessive to the parties of the Right. It is the economic condition of the country that seems now, however, to command most attention in the Government, in Parliament, and in the country. The Belgians, like the French, seem to have become tired of the purge.

In one of his recent speeches M Van Acker gave a striking picture of the black market still rampant, of the frequent disappearance of food supplies and of the general inefficiency of the administration. It will be his task to overhaul the administration and to bring the black market under control within the next six months—the period for which the Government has been granted extended powers. The first steps of the new Government have made some departure from the rigidly deflationary policy of its predecessor. The Minister of Agriculture, M Delvaux, has announced a new price policy under which farmers will receive prices 50 per cent higher on the average than hitherto. The rise in prices, however, ought not to affect the cost of living, since the Government will pay subsidies to the producers. M Van Acker has been assured by the trade unions that they will not raise any new demands for increases in wages provided that the cost of living remains stable. Recent weeks have brought some signs of economic improvement. The number of unemployed has fallen by 90,000; and the output of coal has been stepped up slightly.

But the economic plight of Belgium continues. The supply of coal is still so poor that even those textile factories that have received imported raw materials are idle through lack of fuel. It remains to be seen whether the Government, with its powers extended, will be able to break the deadlock in the coal mines.

Land Reforms in Eastern Europe

The semi-feudal land-owning classes of the East European countries of Eastern Europe have been added to the casualties of this war, and of the social upheavals caused by it. Land reforms in Rumania and Hungary have now been initiated more or less along the line of the earlier Polish land reform. There has, in truth, been very little scope for any real reform in Rumania, where most of the large estates were broken up after the last war. But Hungary is quite a different matter. Its colourfully anachronistic landlords could rightly claim to possess the high value of European museum relics. They have survived as a nostalgic reminder of the old Austro-Hungarian Monarchy. Unfortunately, the land-hungry peasants of Hungary have had little understanding for the decorative aspects of the life of their landlords, and, encouraged by the Russians, they have now started to distribute the large estates among themselves. That those estates were technically backward and, in countries of landless peasantry, socially unhealthy, goes without saying. But there should be no romantic illusions that the land reforms by themselves are likely to bring about a higher productivity of agriculture in Eastern Europe. Though the social and political pressure for the distribution of land has probably been irresistible, the land reforms will not put an end to the poverty and distress of the peasants. The new small owners start in most cases from scratch,

without the livestock and the tools needed to till the soil. If Eastern European agriculture as a whole is not reorganised on a co-operative basis after the war, and equipped with agricultural implements, the next chapter in the economic history of the peasantry will be as sombre as the chapter now closed. An ironic touch in the present series of land reforms, carried out under Russian auspices, is that the churches have been exempted from them. In Rumania King Michael and the Royal Family have also been exempted. Marxian historians used to describe the monarchs in feudal and semi-feudal countries as the "crowned representatives of the landlord classes." Whom does King Michael of Rumania represent at present?

Unemployment Insurance

What may be the penultimate report of the Unemployment Insurance Statutory Committee has just been published. The Committee was set up in 1935, under the chairmanship of Sir William Beveridge, to supervise the finances of the Unemployment Fund and to act in general as a standing Royal Commission on matters affecting unemployment insurance. When the new Ministry of National Insurance comes into operation, there will be no room for a separate unemployment insurance fund, and the Committee's functions will automatically be transferred to the new unified authority. This was one of the recommendations of the original Beveridge Report, but it has not yet been decided whether, as Sir William Beveridge proposed, a new Social Insurance Statutory Committee, covering a much wider field than the old Unemployment Committee, will be set up to take its place.

The new Ministry will start life in an exceptionally favourable position. The excess of income over expenditure in the Unemployment Fund at the end of 1944 was £70,271,661, making a net balance in the Fund of £295,013,055. This happy state of affairs is the result of the virtual elimination of unemployment in the war years; as the following table shows:—

EXPENDITURE ON UNEMPLOYMENT BENEFIT 1938 TO 1944 (£'000).

	General	Agricultural	Total
1938	51,662	742	52,404
1939	40,690	831	41,521
1940	25,894	635	26,529
1941	8,874	294	9,168
1942	3,708	166	3,874
1943	2,709	86	2,795
1944	2,889	64	2,953

Though 1944 shows a slight increase over 1943, there is no ground for alarm, for it is mainly due to the increase in benefits under the Unemployment Insurance (Increase of Benefits) Act of 1944, which raised benefits without correspondingly increasing contributions. This Act was intended as an interim measure, pending the entry into operation of the new scheme.

At the end of the war, though there may be an overall labour shortage for some time, temporary unemployment, due to industrial dislocation and the return of men and women from the Services, is bound to increase. The large credit balance in the Fund should be a valuable safeguard against emergencies.

Education Grants

The Ministry of Education have published new draft regulations governing the grants payable to local education authorities as from April 1st, when the new Education Act comes into force. The "main grant," in respect of general educational expenditure, and adjusted to the needs of each area, will be increased by 5 per cent. This increase is made necessary by the Minister's approval of the new salary scales for teachers recommended by the Burnham Committee and will largely relieve the local authorities of the burden of increased expenditure on this account. Main grants will now range from 68 and 65 per cent of "net recognisable expenditure" in the cases of Merthyr Tydfil and Glamorgan to approximately 37 and 34 per cent for Bournemouth and Eastbourne respectively.

"Additional grant" will be paid to local authorities in poorer and sparsely populated areas and will take account of road mileage (in country areas), the product of a penny rate and the number of children under each authority.

To encourage local authorities to push ahead with schemes to improve and extend accommodation for

teachers' training, the grants to authorities maintaining training colleges will be increased to a maximum of £100,000. This grant, payable on a capitation basis, is now extended to local authorities maintaining domestic science colleges. Local authorities will be relieved of all expenditure involved in the training of emergency teachers, the provision of school milk, and the establishment of school canteens (subject to the Minister's approval) and air-raid shelters. Expenditure on meals qualifies for grant at percentage rates ranging from 70 to 95 per cent.

Shorter Notes

According to a Parliamentary answer given last week, the estimated current cost of food subsidies is £225 million per annum. This represents a rise of £7 million per annum since last January, caused by increases in the cost of sugar, tea, milk, cereals and eggs. The £225 million is made up as follows:—Bread, flour and oatmeal, £65 million; meat, £24 million; potatoes, £28 million; eggs, £16 million; sugar, £17 million; milk, £20 million; cheese, £4 million; bacon, £2 million; tea, £3 million; other subsidies (including the National Milk Scheme), £46 million.

The intractability of the communal problem in the British Empire was well illustrated by last week-end's events in Palestine. The High Commissioner asked the Municipal Council of Jerusalem to agree to a system under which the office of mayor would be filled in turn by a Moslem, a Jew and a Christian. Already the Municipal Council is composed of equal numbers of Jews and Arabs, though two British members are now to be appointed. Local government has, therefore, to be undertaken not by the best people but by representatives of the different communities so selected that no one community could say it was placed at a disadvantage vis-à-vis the others. Yet even this system of "government by arithmetic," as the Peel Commission called it, is not acceptable to the biggest community, and the Palestine Arab party called a one-day strike as a result.

The unofficial members of the Nigerian Legislative Council have unanimously supported the Governor's proposals for political and constitutional reform described in *The Economist* of March 10th.

Tired?

Give your digestion
"an evening off"

YOU can't digest a full meal when you're tired. Don't try to, or you're heading for gastric trouble. Instead, drink a cup of Benger's Food. It will soothe your stomach and give your digestion REST and a chance to build up its strength. Benger's provides all the warmth and nourishment you need but in a form you can absorb without strain.

BENGER'S

in REST-THERAPY—
the natural treat-
ment for Indigestion

BENGER'S, today, is as easy to make as a cup of cocoa. From all Chemists and high-class Grocers—The Original Plain Benger's, Malt Flavoured or Cocoa and Malt Flavoured.

Benger's Ltd., Holmes Chapel, Cheshire.

Letters to the Editor

Budgeting for Capital

SIR,—Is there any reason why the existing system of taxing capital at its source in savings, and exempting the proceeds of its sale for consumption, should not be reversed?

The Stock Exchange or Money Market is a place where future incomes are sold for ready money saved out of the current year's harvest, agricultural and industrial. The buyers are heavily taxed; the sellers are tax free. This might seem expedient in a society in desperate need of more subsistence; but as without more capital there would not be enough to feed our huge modern populations capital must have priority even at the cost of tightening our belts to the verge of suicide. Surely, then, if there is to be any exemption it should encourage potential capitalists rather than potential consumers (decapitalists).

If I save a thousand pounds now the Exchequer takes so much of it away from me to spend in destruction and slaughter that what is left to me is not worth investing. But if, having an income, I sell it for ready money to consume, the price I receive is not taxed. This is on the face of it a highly questionable arrangement. As a matter of fact, when I have a thousand to spare, I lend it to the Exchequer in the form of an advance of future income-tax at 1 per cent. And this 1 per cent is free of income-tax! This is a beginning, just as the restriction of trustee investments to approved stocks was a beginning.

To work this out statistically is quite beyond my powers, as I am a man of letters, inept at figures. I can only make a fairly obvious proposal, and ask if not, why not?—Yours faithfully,

G. BERNARD SHAW

Post-war Taxes

SIR,—You state in your article in your issue of March 17th (as corrected in your note of last week's issue) that you regard my assumption of £500 million a year as the post-war defence expenditure as "almost incredibly low."

Now the annual expenditure on the Army, Navy and Air Force averaged just over £110 million a year in the years 1922-34. Allowing for the rise in prices, this is still less than one-third of the figure I assumed for a post-war Budget.

Is it reasonable to suppose that the annual defence expenditure after the war will have to be so much greater than that of the inter-war period in the pre-Hitler era? The German and Japanese navies will have been destroyed, the German army eliminated, and there will be no hostile air force "within striking distance of these shores," or for that matter anywhere in the world. To assume defence expenditure of more than £500 million per annum could only be justified in the period of imminent preparation for another major conflict. But against whom?—Yours faithfully,

Cambridge

NICOLAS KALDOR

[It was the increase in total expenditure, rather than any single constituent of it, that was considered to be too low. But for the sort of defence forces that appear to be assumed in most of the current discussion, £500 million is surely a minimum if they are to be well equipped.—EDITOR.]

UNSCC

SIR,—May I correct some misapprehensions in your article in your issue of March 3rd?

An assumption is made that those National Standards Bodies which are not under Government control are in a position through the UNSCC to pursue a policy not in accordance with the recognised economic policy of their respective Governments. Nothing is further from the facts. So far as the initiation of the UNSCC is concerned, it may definitely be stated that all the Governments of the countries represented have been kept fully informed, and any fear that the UNSCC might act in any way contrary to the policy of the United Nations may, therefore, be considered as ill-founded.

Moreover, it has been generally accepted in most countries that, for industrial standardisation to be successful, it must

be carried out by industry with the full support, but not under the control, of the Government. The National Standards Bodies, most of which are organised by industry, all receive a measure of financial support from their Governments and have Government representatives on their councils, the Government in this way being kept completely in touch with all questions of general policy. In addition, the technical committees enjoy the active co-operation of Government experts from those departments concerned with the work in hand. In particular, this applies throughout the British Commonwealth of Nations and also in the United States of America.

As to the suggestion that an attempt is being made by the "Anglo-Saxon" countries to eliminate metric countries from the activities of the UNSCC, no more need be said than that membership of the UNSCC is open to all the United Nations through their National Standards Bodies, which, alone, are in a position to speak with authority on behalf of their country on the problems to be discussed.

It may perhaps be well to point out that the UNSCC is but the first stage, indeed a transitional stage, which is to lead towards the resumption of full international co-operation in the co-ordination of industrial standards. It has been the intention from the very start that, directly conditions permit, a representative international conference should be called to discuss the future of international standardisation in all its aspects.

The National Standards Bodies of the United Nations, with their valuable experience of international co-operation acquired in the years before the war, may well be trusted to ensure that, in the future as in the past, there will be no departure from the well-established principle that this work, to be effective and beneficial to all concerned, must be based on common consent and carried out through democratic procedure.

No step so far taken by the UNSCC has in any way been "intended solely to serve the trade interests of the exporting countries and not the interest of all the United Nations." As to the separate representation of the British Dominions on the UNSCC, the Statute of Westminster surely provides the answer.—Yours faithfully,

G. MAISTRE,
Secretary-in-charge,
of London Office, UNSCC.

The Anatomy of British Industry

SIR,—Your very interesting article summarising the findings of Mr Leak and Mr Maizels seems to leave room for a misconception. The table listing "commodities output of which was concentrated in one or two firms" must quite clearly contain a number of commodities a large, if not the larger, part of the UK consumption of which was imported in 1935. This struck me when I found flashlamp bulbs and electric accounting, calculating, etc., machines listed in the table. I happen to know that considerable imports of these items, amounting to several times the volume of the United Kingdom's output, were handled by small firms. There must be other similar cases in that table. Messrs Leak and Maizels and you are doubtless aware of this possible misconception, involving the danger of characterising as monopolistic trades which are in fact nothing of the kind. Yet a caution to others may not come amiss.—Yours faithfully,

Reading

O. W. LIPTON

Customs Duties

SIR,—In your opportune and timely article on post-war taxes, with its gentle satire on "the statisticians" who take no account of the service of the debt or the expenditure on insurance, I note with much satisfaction that you are pleading for consumers after the war.

May I point out that a great relief can be afforded them without expense to the revenue by removing from the Customs tariff hundreds of protective duties which serve no useful purpose, but raise prices at home and will obstruct the revival of our import and export trade, which (as all agree) is essential to the restoration of prosperity.—Yours faithfully,

Midhurst

FRANCIS W. HIRST

AMERICAN SURVEY

Free Enterprise

(From a Correspondent in Iowa)

WHEN Republican and conservative Democratic senators got together to keep Mr Henry A. Wallace from being placed in charge of the powerful federal loan agencies, they did it in the name of preserving free enterprise from the meddling of a dangerous radical. When Mr Wallace outlined his ideas of using the vast resources of the government to encourage little businesses and guarantee the abnormal risks of post-war reconversion, he insisted he was for free enterprise. When the National Association of Manufacturers urges a sales tax, the right to sue labour unions, and "protection" of workers from being coerced into unions, it speaks in the name of free enterprise.

Obviously they do not all mean the same thing by the term. Each means by it the sort of things he likes in the present socio-economic system, which in more forthright days was called capitalism. To-day "capitalism" reminds too many people that they own no capital; "private enterprise" sounds too exclusive; "free competition" sounds a little ruthless for these days of oligopoly, trade associations and manifold forms of government protection; "rugged individualism," popular in the '30s, seems too harsh in an era committed to expansion of social services; "individual enterprise" too grotesque in the shadow of mammoth corporations.

So for the last five years free enterprise it has been, with everybody from left wing New Dealers to the stodgiest Republicans whooping it up for the new term. The final cachet came when the monumental *Readers' Guide to Periodical Literature*, found in all self-respecting American public and institutional libraries, put "See Free Enterprise" as the sole entry under "Laissez Faire" and "Private Enterprise."

It might seem odd that the American business community and its apologists should so feel the need of a sugar-coated name for the familiar economic organisation of society, when anti-capitalist forces are so feeble. All Marxist parties together only once (1932) polled more than a million popular votes in a presidential election, and they polled their highest percentage (6.2) of the vote in 1912. Anti-capitalism among intellectuals reached a height in the middle 1930's and has long since receded to normal levels.

Yet the prolonged depression, the "twelve long years" of fumbling for a solution by the Roosevelt Administration, and the huge expansion of government controls and government debt in peace and war, have put business men on the defensive. They and their political allies have been fighting every presidential election since 1932 on the issue of "saving" capitalism and democracy, which they always seek to identify with each other. "Free enterprise" owes much of its appeal as a phrase to its skilful suggestion of this identification.

Primarily, free enterpriser means entrepreneur: one million of the four million farmers, the one million self-employed, the responsible owners or managers of the two million private businesses employing labour. But it also means "a young man going to night school to train himself for a profession . . . a worker taking special training to achieve a skilled status, a man shifting from one job to another in search of a better opportunity"—at least, that is what it means to Mr William B. Benton, the former advertising man who is now Vice-President of the University of Chicago and Chairman of the University's property, Encyclopædia Britannica, Inc., and also vice-chairman of the trustees of the private Committee for Economic Development, which was founded in 1942 to prove that private enterprise by itself can provide full employment.

To some, free enterprise includes the right of a worker to benefit from a labour union contract without paying his subscription to the union, and the right to be promoted without seniority. To some it includes the right to be pro-

tected against cut-throat business or hiring practices; to others, the right to indulge in them. To some it includes lowering barriers to international trade; to others it includes complete protection from foreign competition in the home market.

If the term is so new and so flexible, no wonder it is widely misunderstood. A Gallup sampling poll in 1943 found that only three out of ten of the voting public could give any approximation to an accepted meaning. Many confused it with free trade, free speech, or even "something they give away."

But economic conservatives are systematically spreading the phrase and giving it content. It plays a considerable part in the extensive public relations programme on which the National Association of Manufacturers has embarked since 1934. Members of this powerful organisation number only a few thousand firms, but they employ 75 per cent of the country's manufacturing workers. A number of other trade associations, firms, and advertising agencies devote part of their advertising to promoting free enterprise as they understand it, and individual business men and the business-minded newspapers and magazine press do an enormous amount of public fretting about it.

One astute critic attributed their failure in the proximate goal—of getting Mr Roosevelt out of the Presidency—to their conception of last year's campaign as advertising rather than as drama. By hammering away with increasing emphasis at the slogan that Mr Roosevelt was undermining the free enterprise they wished to save, they turned the public to boredom and snickers instead of the gradually heightening interest a skilled politician seeks to arouse. Certainly, the millionaire "Liberty League" of the 1936 presidential campaign was a complete fizzle. Twelve years of impassioned outbursts for "freedom" and against "dictatorship" and "regimentation" seem completely irrelevant to the majority of voters. They feel freer with jobs than without, with an effective bureaucracy than without. The damage that the New Deal has done to the incentives to activity of large corporations and rich investors is not obvious enough to put over in a slogan.

Nevertheless, the free enterprise campaign has great possibilities in the United States. Here, even more than in most capitalistic lands, there is extreme mobility of the population—between places, between stations in life, between occupations. Only 7 or 8 million out of 60 are technically entrepreneurs, but many, many more aspire to be (one out of eight is an Army survey) or have been; and the large class of black-coated workers tends to take viewpoints from the enterprisers they know or work for. In 1939, after a decade of mass unemployment, 88 per cent of the sample in a Gallup public opinion poll said they considered themselves middle-class when asked whether they were upper, middle or lower. Wage-earners in very large numbers have saved up and gone into farming or small businesses. Still more have skimped to educate their children for better things. A very large fraction of big corporation executives and directors came up from humble stations by their own efforts. Hence much of their truculence towards any interference by government or unions: their own success convinces them that people get their deserts. There is a long-term trend toward a more static society as population growth slows down, unexploited resources dwindle and capital requirements increase—but these factors have been more than counterbalanced lately by the tremendous war boom and may well be for some time by new techniques and by expansion of service industries and professions.

But there is just a possibility that the "free enterprise" slogan may go too far for its present friends. In a pamphlet by Mr Henry M. Wriston, the President of Brown University, which was published by the NAM itself, the

heretical suggestion occurs that corporate enterprise is not genuinely free at all, since directors or managers make their decisions as mere trustees or bureaucrats instead of as enterprisers. This thought has been echoed in some of the labour unions and in some government circles. At present, free enterprise is a stereotype for things as they are, minus a few pet grievances. But it may not always be so. Leftwing New Dealers have a new respect for private initiative and limited government since the inhumanities of totalitarian government became so evident. They have a new respect for the importance of incentives since the failure of peacetime efforts to end mass unemployment. They are quite content to take up the slogan "free enterprise" and seek to give it a content of their own. After the way the conservatives have "plugged" it, they practically have to, in self-defence.

American Notes

The Senate Tells the President

The Senate rarely misses a chance to tell Mr Roosevelt that a large electoral vote does not mean smooth sailing, and that his accomplishment in office largely depends upon his relations with the Legislative body. It had a particularly good chance to do so in the case of Mr Aubrey Williams. Nineteen Democrats, mostly from the south, joined with 33 Republicans to reject the President's nomination of Mr Williams as Rural Electrification Administrator; the vote was 52 to 36. This defeat of the former head of National Youth Administration is part of the price the Administration must pay for Mr Wallace's confirmation. Undoubtedly, the full price will be high and the instalments will be many.

Before rejecting Mr Williams, the Senate's Agriculture Committee gave him many weeks of grilling in one of the best recent examples of how badly the old Congressional rules need overhauling. They attacked Mr Williams for his "racial" views; for his "communism"; for daring to change his mind about the ministry as a career; they attacked him on every vulgar, flimsy ground they could find, for when they got off the plane of prejudice and on to the ground of fact, they could not find a job he had done badly.

Mr Williams has recently been an organiser for the National Farmers' Union, and the Senators were really outraged to discover that he was author of a recent article in the Union's *Journal*, which charged the Republican-Southern Tory coalition with running "almost every decent man out of the government."

Most of them had to admit he had handled from \$500 million to \$600 million of funds for the National Youth Administration both efficiently and effectively. As head of the Rural Electrification Authority he would have had a great deal more to spend when consumer interests can again be considered, for this is the agency that lends money at low interest to finance the cost of serving people in rural areas. Thus far electrical co-operatives have received over 90 per cent of all REA loans, and the unpopularity of co-operatives in conservative circles perhaps explains the fact that the House Appropriations Committee has recommended a one million dollar appropriation for Rural Electrification in place of the \$150 million asked for by the Budget Bureau.

A Navy-Sponsored Monopoly

The flag of free enterprise waved rather hesitantly when Mr Forrestal, Secretary of the Navy, recommended that all overseas communications of the United States be consolidated into one government-supervised, privately-owned corporation. True, Mr Forrestal had come to this conclusion "reluctantly," but it was nevertheless a bomb-shell planted plumb in the middle of a Senate Committee which is investigating post-war international communications.

Mr Forrestal was the first witness, and a particularly significant one, because of the Navy Department's responsibility "for ensuring the military value of the commercial carriers in times of national emergency." The Navy Department, he said, has decided that the future success and security of diplomatic and military affairs may depend so vitally on international communications, that to continue them under private competition can no more be rationalised "than could the administration by private

enterprise of diplomatic and military affairs themselves." "You don't mean that!" said a Senator from Kansas, shocked. Mr Forrestal assured the gentleman from Kansas that he did. He wants to see cable, telegraph, radio and press wireless compulsorily included in the organisation.

It is ironical that the new chairman of the Federal Communications Commission, Mr Paul Porter, disagrees with the Navy Department plan, for his predecessor, Mr James Fly, was working for unification several years ago. Mr Porter wants unification, but no "limited marriage" between government and industry. The private monopoly must work alone, with certain provisions for protecting military interests. Actually it is difficult to see how the government can logically stay out. An equitable distribution of the vast military communications system, when it can be converted to private use, would be impossible.

The trend toward removing competition in the field of overseas communications began in 1936, after years of forcing competition. Then official opinion began to see that competition in foreign fields was not in the public interest and the FCC, under Mr Fly, refused Mackay Radio's circuit to Oslo, which was being served by RCA. In 1943 the Joint Chiefs of Staff, carrying this trend to its logical conclusion, adopted the policy of allowing only one United States company to operate a circuit to each war zone point.

Mr Forrestal detailed at considerable length the advantages to be gained from unification. But to many the key to his statement was in the almost hidden sentence: "The contrast with the smooth functioning of Cable and Wireless, Limited, the British telegraph monopoly, has been revealing."

Hour of Tolerance

New York City's "Little Flower," Mayor Fiorello La Guardia, has never been known for his tact. But his refusal to comply with the Administration's request for a midnight curfew could not be interpreted merely as an exhibition of high spirits. The Mayor called it "the hour of tolerance," and he granted it because the midnight closing, he said, made people take too many too fast, increased illegal liquor sales and created "troublesome" traffic jams. It is true that the curfew produced abuses and inconveniences. But it is also true that the Mayor, never at all timid about reminding New York that there is a war going on, did nothing to help make the curfew work—not even so simple and obvious a thing as trying to get theatres and cinemas to change their hours.

Mr Byrnes, the Director of War Mobilisation, has admitted that he could not force the curfew upon New York City; that its success depended upon the co-operation of local officials. Press and official spokesmen all over the country are exasperated with the big city, and even the New York press, dubious as it has been of the curfew, resents Mr La Guardia's action and the criticism to which he has subjected the city.

One logical explanation of Mr La Guardia's action is a political one. The Mayor, who is a titular (but only titular) Republican, would not have won the last election without Mr Roosevelt's support, and if they were both still in the same camp it is unlikely that Mr La Guardia would confront Mr Roosevelt with so rude a rebuff. For the President has taken a stand on the curfew; he has supported Justice Byrnes and made it clear that the curfew request had his approval. Can it be that Mr Roosevelt plans to revert to the Democratic Party in New York City and let Mr La Guardia, in the elections this autumn, go the way of most Fusionist rivals of Tammany Hall? And is Mr La Guardia using this public issue of curfew, petty as it may seem, as a vehicle for announcing that he intends to fight the party machine?

His "hour of tolerance," however, may not gain public favour for Mr La Guardia, for the American public seems to be tired of official squabbles, and there is little dignity about this one. It cannot be blown into the shape of a crusade, no matter how hard Mr La Guardia puffs. And now the War Production Board and the Office of Price Administration have swept in with sanctions. Under Manpower rulings labour can be taken from establishments which do not close on time; light and gas can be cut off; price ceiling violations in clubs and bars open after midnight can be dealt with very firmly. Surely the Mayor will see that this is no way to set the stage for his most hazardous election campaign.

BACKGROUND TO ACHIEVEMENT

The Cinema

In the metamorphosis of the old time "silent" film into the modern "talkie" BTH has played no unimportant part. Both for the making of films and for their subsequent exhibition, BTH Research has developed a range of technical equipment which represents a considerable contribution to the present perfection

of film presentation. BTH is the only company in the world which manufactures the complete equipment for projection, and for the stage and auditorium lighting. In addition BTH has also collaborated in air-conditioning, heating and ventilation, artistic lighting with Mazda lamps and in other amenities of the modern cinema.

THE BUSINESS WORLD

A Progressive Business

A STUDY of some of the most successful and progressive modern enterprises suggests that the greatest achievements of capitalism are often accomplished in response to a more subtle stimulus than that of the mere expectation of profit—which can, after all, often be secured by restriction and monopoly. The business motive behind capitalist enterprise at its best is not only the craving for pecuniary gain but also that “instinct of craftsmanship” which desires the satisfaction of a job well done. It is not all cant when successful business men invoke the idea of “service to the community,” even though it may often be self-deception. Some of the outstandingly successful enterprises of our time have undoubtedly been animated by a deeper desire than the desire for profits. Capitalism, perhaps, works best, even within its own definitions, when the profit motive is reinforced by something like the “wish to serve.” And, paradoxically, wherever that wish is present, strongly and consistently, profits seem to look after themselves.

Cadbury Brothers, Limited, of Bournville, provide an interesting and, one feels impelled to say, exhilarating example. Their review of the inter-war years, entitled “Industrial Record, 1919-1939” (published by Cadbury Brothers, Limited, Bournville, and distributed by Sir Isaac Pitman and Sons, Limited, London, W.C. 2, 8s. 6d.) shows what a “Policy for Wealth” means in its daily application on the floor of industry. It means continuous effort, unending experimentation, a patient permeation of every detail with critical, imaginative, tenacious thought; it means, above all else, a willingness to take risks.

Cadbury's record of achievement makes fascinating reading, mainly because of its wide scope. There is no single answer to the question “What is efficiency?” There is no short-cut to it. Better equipment? Yes. Scientific management? Yes. Market research, distribution, sales policies, design? Yes, all of these and a lot more. Production, like life itself, has a thousand aspects, none of which is unimportant; and profits, like happiness, come most easily as the by-product of a job done without sparing oneself.

The demand for Cadbury's products—chocolate and confectionery—proved in the inter-war period to be highly elastic; reductions in price led to a more than proportionate increase in sales volume, and therefore to an absolute increase in turnover. Not all trades are in this fortunate position, but most trades, at the same time, know very little about the elasticity of demand for their products until they have tried it out. This Cadbury's have done, as an almost automatic outcome of their fundamental business principle which holds that it is the task of the manufacturer to reduce costs and “that there should be as little hindrance as possible to (the) process of passing on savings in the cost of production to the consumer.” Possessing an unstained record in this respect, they can demand with full conviction that “it should be the responsibility of the Government to watch that combinations either of employees or of employers do not restrict this process for their own sectional advantage.”

The reduction of costs, naturally, is of value to the community only if it is obtained by raising the output per man-hour, and not by depressing wages. In this, Cadbury's can claim conspicuous success. Labour costs per unit of output in the production of milk chocolate fell by 47 per cent between 1924 and 1938, and overhead costs fell by 61 per cent. The combined saving amounted to 56 per cent over this relatively short period of fourteen years. How was it done? The answer is a long story, which cannot be repeated here. It is a story, primarily, of unceasing experimentation, accompanied by numerous failures, and crowned, in the end, by success.

It begins with production planning, which attempts, among other things, to stabilise the rate of production in the face of seasonality of demand and limitations of storage period and space. “It will be apparent that a smoothly working machine . . . is not the growth of a week or a month or a year, but is the result of many years' gradual

adaptation, and of patient trial and error.” Not until a steady flow of production has been ensured is it possible to take the fullest advantage of modern technical progress. Expensive machinery involves crushing overhead costs unless the rate of utilisation is high. New installations of machinery, moreover, raise awkward and difficult questions of factory layout.

When obsolete machines are being replaced, it is often difficult to decide whether the new plant should be housed in new buildings specially designed to receive it, or in existing buildings which, though not entirely suitable, may nevertheless be in perfectly good repair, relatively modern and capable of adaptation to the new purpose with only a small loss of working efficiency. No hard and fast rules can be laid down. In general, Bournville's practice has been to rebuild rather than adapt.

The courage to scrap, indeed, may be considered the hallmark of the dynamic entrepreneur. Cadbury's original factory of 1879 was added to and adapted for a number of years, but when the flow of production through the works became unsatisfactory, a new master-plan for rebuilding was adopted which gave a new foundation to the whole enterprise. Few firms in Britain's older industries have shown a similar readiness to draw a line under the past, and to shun no cost in preparing for the future.

One phase of the rebuilding programme, in particular, may be taken as an illustration of the principles which lay behind it. As the factory had gradually increased in size, the expanding demand for power had been met by the construction of one additional power station after another, so that eventually in 1919 there were six separate power-plants. Most of these were individually efficient units. . . . By 1919, however, there had been great advances in the electrical transmission of power, and improved methods of insulation had facilitated the distribution of steam over long distances. It was therefore decided to replace the old plants and the six smoke stacks by the present central power station with its two chimneys.

This decision proved a great success, and similarly courageous decisions to scrap and rebuild were taken all along. Sawmills for the manufacture of wooden boxes were installed after an intensive study of modern methods, particularly in Scandinavia, by the firm's technicians. But when it became apparent that it was permanently more advantageous to import cut wood-box parts, “the whole sawmill plant, which had cost so much time and money to instal, was disposed of.” In road and canal transport the firm possessed its own equipment, but scrapped it the moment it became apparent that outside contractors could do the job more cheaply. Another example of the need for a flexible attitude towards scrapping and building is furnished by the history of the firm's milk condensing factories. When a change occurred in the supply of surplus milk in certain areas, affecting the economical siting of the factories, there was quick adaptation; five out of nine were scrapped, although they were less than twenty years old.

These are salutary examples of the way in which the best-laid plans may have to be altered and the finest plant and equipment scrapped if a business is to prosper. . . . It is clearly necessary to plough back profits into a progressive business on a really generous scale. . . . In this connection the proposals by the Chancellor of the Exchequer to modify the unrealistic treatment of obsolescence of plant and flexible types of adding and calculating machines.

The fact, however, remains that Cadbury's have carried through their “scrap and rebuild” policy in spite of the discouragements given by the existing Inland Revenue practice.

Efficient production must be backed up by efficient marketing and by an expansionist price policy. Here again the firm has not been hesitant in experiment, and in scrapping installations and methods whenever they were found wanting.

In 1917 the firm installed a full battery of punched card statistical machinery. This produced detailed statistics, but it was found that only a proportion were of real value, and that the system was too rigid. In recent years the statistical service has been improved by adopting the simpler and more flexible types of adding and calculating machines.

There is a cigarette...

even in these days of substitutes, make-do and make-believe, which gives you the unadulterated pleasure of the best Turkish leaf. Of a normal — which is now often so abnormal — size, it is of exceptional virtue. For, in Sobranie Turkish No. 6 is smoking which really satisfies — an aroma which is rich but never heavy, a full flavour which you can really taste and that quality of all the best Turkish leaf — almost complete absence of nicotine. Here then is a cigarette which can cut down your smoking yet give you a satisfaction that you have never known before.

You are going to hear a great deal more about the Philco Group when the war is over than it is possible to reveal at the present time. It is enough to say that this progressive group of industrial electrical manufacturing companies have made their plans—plans for the large-scale production of radio and television receiving and transmitting apparatus, electric motors, generators, switch-gear, refrigerators and electro-mechanical devices of every description. These plans await the signal of victory and the brilliant opportunities of peace. When the time comes, the Philco Group will play an impressive part in supplying the needs and comforts which the patient people of this country so richly deserve.

One of the chief tasks of market research all along has been to find out to what extent the consumer demanded variety, and was prepared to pay for it. Undue variety precludes mass production, since mass production depends on standardisation, both in methods of manufacture and in the product itself. Cadburys' main triumphs in reducing costs were due to increasing standardisation. This development has been reinforced by the state-imposed simplification of wartime, which has reduced the number of lines and packings from 237 to 29, yielding large economies in labour, factory space and paper. But since the war has brought an unavoidable increase in costs from other causes, it is doubtful whether the public yet realises how much it has had to pay for the variety of peace-time.

For instance, the average purchaser can hardly have realised that the cost of the edible ingredients of a $\frac{1}{2}$ -lb. box of, say, "King George," was not much more than the cost of the equal weight of ingredients in a $\frac{1}{2}$ -lb. block of ordinary milk chocolate which sold at exactly one-third of the price.

Whatever the manufacturer does with his costs of production, his influence on the final price to the consumer is limited. One-third of the cost of a block of chocolate is taken in wholesaling and retailing, and another third in the cost of ingredients. Cadburys themselves can influence only one-third of the final price. Their production costs proper, moreover, are little more than one-fifth, 12 per cent being accounted for by manufacturer's transport and selling costs. "It is natural, therefore, to turn to the possibility of economies in the later stages of distribution comparable with those achieved in production and (manufacturer's) selling."

"Distribution in Britain is too costly." This is one of the principal theses demonstrated and argued in this informative study. A reduction in the number of retailers would increase the average turnover of the remaining shops, and thus improve the earnings of the smaller shopkeeper. A great deal more factual knowledge is wanted on this subject. A number of maps in this study demonstrate the irrational and wasteful distribution of retail outlets for confectionery; excessive density in some of the poorest areas, and inadequacy in others. At least half of all shops selling confectionery are shown to be of poor class, many of them badly run and unhygienic. With some 330,000 retail outlets in existence, shops with turnovers of less than £15 or even less than £10 a week are distressingly numerous. In view of the enormous number of retailers, it is all the more desirable that an intolerable multiplication of transactions should be prevented by the efficient intervention of wholesalers.

The firm's policy of a retail price with graded reductions for quantity purchases is designed to secure a good balance between direct retail and wholesale buying. The large re-

tailer buys wholesale quantities at the lower prices. The very small retailer who only buys one "outer" at a time, pays the same or more than if he bought from a wholesaler."

It is a very good thing that efficient manufacturers are becoming increasingly interested in the problem of distribution. Their "instinct of craftsmanship" is offended when they find that their most strenuous efforts at economic production are swamped by excessively costly distribution. Even if Cadburys succeeded in lopping off another half of their manufacturing costs, the consumer, as matters stand to-day, would hardly benefit by more than a 10 per cent reduction in price. It is not quite so certain that a rationalisation of distribution imposed by the manufacturers would be the ideal form. There seem to be strong compulsions in the direction of maintaining excessive margins, which appear to be conclusive even to a firm which, like Cadburys, repudiates that philosophy so strongly in their manufacturing operations. The reader of this book is left wondering why the firm should not simply reduce the selling margin to a level that would remunerate the efficient and drive the inefficient out of business. Is that too brutal for this tender age?

That Cadburys have for a long time been outstanding in all matters concerned with internal industrial relations is too well known to require emphasis here. Their numerous schemes for welfare, education, recruitment, and works amenities are undoubtedly one of the deeper causes of their commercial success. But it is not in this capacity that their record chiefly deserves attention. Not as enlightened employers but as enlightened profit-seekers have they rendered the greatest service to the community. It is true that they have spent their profits wisely; but it is the methods of making them that should be widely studied. Over a period of years they have consistently succeeded in finding ways of putting the factors of production—men, materials and machines—together so as to produce better goods at lower cost. The welfare schemes and the garden villages are subsidiary to that central achievement. If it is done successfully, profits inevitably emerge, whether or not the search for them was the original incentive. It is, therefore, as foolish to condemn "production for profit," where the profit may be merely the sign that the entrepreneur's job has been done successfully, as it is to extol the profit motive as a universal specific for a world where profits may merely be the fruits of monopoly. The essential thing is the degree of economic efficiency attained—the relation of the input of resources to the output of product. The earning of profits through economic efficiency is not only a worthy object of business-men's endeavour, it is the essential object of their existence. Such entrepreneurs can justify capitalism; others, however humanitarian or social-minded, cannot.

Anglo-French Financial Agreement

THE Anglo-French Financial Agreement, signed in Paris on March 27th, provides for the settlement of a multitude of inter-governmental wartime claims and for the resumption of more normal commercial relations between the sterling area and the franc area.

The settlement of outstanding claims has been a complicated business. Britain's list of claims included (a) the cost of the war material delivered to the Turkish Government on behalf of the French Government; (b) the cost of war material furnished to the French Government before July 1, 1940; (c) expenditure on the maintenance of French troops in this country in 1940; (d) the advances made to the French National Committee in accordance with the terms of the agreement of August 7, 1940; (e) supplies furnished by the Allied Armed Forces to the civilian population of Continental France. France's list arose from (a) debts incurred in France by the British Expeditionary Force before June, 1940; (b) the balance in its favour in the Reciprocal Advances Account set up in 1940; (c) war material made available to the Finnish Government in 1940 on behalf of Britain; (d) the balance in the Franco-British Liquidation Account established in July, 1940; (e) the use of French merchant ships and the disposal of cargoes belonging to persons resident in the franc area; (f) the expenditure of the British Armed Forces in the franc area before the entry into force of the new agreement.

For the purpose of settlement the Bank of England, on behalf of the British Government, is to open a sterling account (Account B) in the name of the French Government. The French Government will pay into this account from the credit to be granted to it by the British Government the

sum of £40 million, representing the estimated equivalent of the excess of the sterling monies in the United Kingdom belonging at the date of this agreement to persons resident in Continental France over the franc monies belonging at the same date in Continental France to persons resident in the United Kingdom.

The French Government will also pay into this account the amounts outstanding in respect of Britain's claims listed under (d) and (e). The British Government, in its turn, will pay in sums due to France listed under (d), (e) and (f). Although the final balances under some of the headings remain to be determined, it may be possible that, after the adjustment of the outstanding claims, there will be a balance standing to the credit of France in Account B. The amount of £40 million advanced by the British to the French Government for payment into Account B is to be repaid by the French Government from French funds in this country which are to be requisitioned. In other words, the net excess of British claims over French claims will be adjusted to a figure which, after the requisitioning of the private French funds in this country, will leave the French Government with a credit balance. While the exact amount of this final balance cannot yet be assessed, it is likely to be less than £40 million.

A special arrangement has been made to deal with the transfer to this country of French munition contracts in the United States in June, 1940. The French Government will refund to this country, in dollars, the amount (equivalent to some £40 million) paid by the British Government in execution of the contracts it took over. In return, the British Government will make available to France, free of cost,

war supplies capable of being put to civilian use—such as port, railway and bridging equipment—to the amount of £45 million. In short, there is to be a return to the *status quo* before the contracts were transferred, but with the substitution of civilian goods for the munitions that France would have received under the original contracts. The Anglo-French Financial Agreement of December 12, 1939, is to be abrogated and all the remaining claims are to be waived.

In order to facilitate the resumption of economic intercourse between the sterling and the franc areas Britain is to open a credit of £100 million to France, and France one of frs. 20,000 million (the equivalent of £100 million at the official rate of exchange) to this country. If these ceilings should prove too low, they can be raised after joint consultation. The Bank of England will open an account (Account A) in the name of the French Government, and the Bank of France will open a corresponding account in the name of the British Government. (The £40 million to be paid by the French Government into Account B is to be drawn from its Account A with the Bank of England.) These credit facilities are to be made available for one year, to the end of February, 1946.

Special arrangements have been made to settle any outstanding balance at the end of February, 1946. The balance itself is to be struck in the currency of the creditor Government. Drawings made in the currency of the debtor Government are to be converted into the currency of the creditor Government on the basis of the official rate of exchange in force at the date of each drawing; the rate itself—at present frs. 200 per pound sterling—may only be modified after mutual consultation.

In all probability the French Government will draw more heavily on the British credit than the British Government will draw on the French credit. The French Government is to discharge the net balance in gold up to the equivalent of one-third of the *gross* total of the payments in franc or sterling currencies made during the year from the franc area to the sterling area (these will exclude, of course, payments made out of Account B). Any remaining amount due to the British Government is to be paid by the French Government from the balance, if any, in its Account B. If this balance is insufficient to meet the amount still due to Britain, the remainder is to be carried forward on conditions to be agreed between the two Governments. This procedure can be illustrated by way of an example. On the assumption that the French Government draws on its credit to the extent of £100 million and the British Government to the equivalent of £30 million, the balance due to this country would be £70 million. Of this balance £33½ million would be payable in gold and £36½ million in

sterling from Account B. If the balance in Account B were only £30 million, £6½ million would have to be carried forward.

These, broadly, are the bare bones of the agreement; it bears all the traces of hard bargaining on both sides, carried on in a spirit of good will. If, in the settlement of outstanding debts, the British Government had stuck to the letter of the agreement of December, 1939 (this provided for the sharing of external war expenditure between Britain and France in the ratio of 60 to 40) France would have had to foot a heavy bill indeed. But the decision to make no claim in respect of this external expenditure is justified by the experience of France during four years of occupation and by the desire to assist French recovery. On the remaining claims, the agreement appears to be a fair compromise; Britain gains badly needed dollars and France will obtain badly needed equipment.

The credit arrangement is, of course, only provisional; in the circumstances of to-day this may have been unavoidable. Within its limits it, too, represents a compromise of mutual advantage. As France is likely to be the debtor at the end of the year, Britain will obtain a substantial proportion of the balance in gold, which is a fair application of the principle of the pooling of resources.

The agreement, however, is not an end in itself. Its main importance is that it at last removes the financial obstacles to a revival of the trade between the sterling area and the franc area. Even so, the credit ceiling fixed is by no means high, especially if the early defeat of Germany holds out possibilities of a rising flow of badly needed raw materials, food and equipment to France. Britain, too, may be able to increase its imports, such as iron ore, from French territories, though, at the present official rate of exchange, many French goods that might be imported are too dear. There may be good reasons for delay in the adjustment of exchange rates; as a temporary alternative the French Government might, therefore, subsidise some of its exports to this country to bring their prices down to a level at which Britain could make purchases elsewhere. Apart from the need for an immediate increase in the flow of goods into France, there is the problem of creating the conditions for a permanent expansion in trade and for a close alignment of the economies of the two countries, and, indeed, of those of Western Europe as a whole. These problems should be discussed during the next few months, that is to say before the countries have begun to go their separate ways in the matter of planning new capital expenditure.

Business Notes

Market Stability

Repeatedly, since the first breakthrough at El Alamein, advances of the Allies in East or in West have been greeted by the stock market either with a general marking down of quotations or with stagnation in business or with both. The crossing of the Rhine—and its anticipation—has so far been followed by very little change in the volume of business and by a very general stability of prices. It may be that market conditions will change, but the volume of enquiry is very large, mainly from the general body of investors rather than from large concerns, and the market position is a healthy one. It is, of course, the case that, when falls coincided with military success, they also followed sustained rises, whereas recently the market has been rather painfully struggling to reach once more the peak touched last summer.

But that is not quite the whole story; the past course of prices accounts for a good deal, but the public assessment of the future also plays its part. There are still uncertainties enough, but in recent months some solid progress has been made towards mapping out the post-war plans. The shape of things to come is a little less indistinct and, therefore, rather less disturbing to the investor and the market.

While the general impression created by market prices is one of extreme stability, there have been many individual movements. Most of these are too small to have much definite meaning, but the general rise in European bonds, and particularly in the railway and Seine loans carrying the guarantee of the French Government, has been a thing

apart. The last of these has been considerably assisted by reports of the Anglo-French Financial Agreement signed on Tuesday, and although that document makes no specific mention of the service of the bonds, it may confidently be assumed that there is every intention of resuming it in the

near future. There is, as yet, no indication as to what is to happen to British-held bonds drawn for repayment under the occupation, but it is believed here that the drawings will be cancelled or interest at the full rate met until the date of redemption.

Selling British Goods Overseas

It has come to be recognised that one of the chief requisites for a successful export business (another is competitive prices) is the fullest possible information about the nature and potential size of overseas markets and about the preferences of potential consumers in the matter of design, quality and price. The gathering of information under these two headings has come to be known as market research. Hitherto, the business of exports in this country has been far too much of a hit or miss one; there is no need to restate its deficiencies which are by now widely known. The service provided by the Department of Overseas Trade on general market conditions has been inadequate and, often, out-of-date; research into the potential demand for specific commodities has been confined to a few large concerns.

The service provided by the Department of Overseas Trade is certainly capable of improvement—the review of commercial conditions in the United States published this month merely contains a short and very general description of economic prospects in that country. But the Department could hardly be expected to carry out the detailed and accurate investigations about the nature and size of potential markets that is needed for an effective sales policy. Private initiative, with the support of the DOT, has now attempted to fill the gap. The British Export Trade Research Organisation, sponsored by leading industrialists and advertising agencies already familiar with market research at home, will provide a comprehensive service to members on all the many aspects of general market research. BETRO will be a self-supporting but non-profit-making organisation, deriving its income from subscriptions and from fees for special research. Alongside this new organisation, a group of advertising agents has undertaken to set up a joint overseas advertising service—the British Export Trade Advertising Corporation, Ltd.—to provide exporters with expert advice and facilities for advertising their wares.

The new organisation, as envisaged by its sponsors, should be of valuable assistance to exporters after the war. But although it will undertake specific as well as general research, it can hardly be expected to act as a selling agency for individual exporters or for individual producers. Individual exporters may still have to supplement the service

provided by BETRO by specific research into such matters as the design and quality of individual products. There are still many firms—indeed a majority of firms—that are not able, financially or technically, to carry out their own research individually. This might be done collectively by groups of firms—the export groups formed earlier in the war might form their basis—or it might be done by industries as a whole, as suggested by the cotton trade in the report of the Post-war Cotton Committee.

Industrial Design

The current issue of the *Board of Trade Journal* contains an interesting article by Mr. S. C. Leslie, director of the newly formed Council of Industrial Design. Mr Leslie employs the familiar vicious circle to explain the pre-war mediocrity of so much in British industrial design—the designer designs what the distributor tells the manufacturer he thinks the public wants; and the distributor's judgment is based on what the public has always had to buy. This tale of woe spreads the blame rather too evenly. Similar vicious circles have been broken in some British industries, and in many abroad, where progressive manufacturers have recognised their major responsibility and created their own opportunities.

The Council of Industrial Design hopes to break the circle simultaneously at many points by converting the public and the distributors to a proper appreciation of good design, by educating the designers and by encouraging manufacturers to employ them. This plan is sound and very ambitious; but has the Council the necessary resources to carry it out? If the attack is on too wide a front it may be too weak everywhere to produce the much-needed breakthrough. If so it would be much better to limit operations for the time being, and to concentrate solely on the establishment of efficient Design Centres in as many industries as possible.

It is clearly important that there should be no delay. The prototypes of post-war products are now under consideration, and every successful marriage of art and industry will be a useful contribution to British trading prospects. If Mr Leslie and his colleagues could supplement their excellent long-term programme with a make-shift scheme

capable of producing early results, they would do British industry a most valuable service.

Metropolitan-Cammell Accounts

The report published by Cammell Laird for last year shows only the most trifling changes in trading profit, reached after taxation and depreciation, and in its appropriation. The only movements of note in the balance sheet are a fall from £1,771,017 to £829,692 in stock-in-trade and work in progress, less instalments received, and an equivalent decline in current liabilities. The accounts of English Steel Corporation, included as usual, tell a similar story. In the absence of any statement to shareholders, the feature of the report is the inclusion of the accounts of Metropolitan-Cammell Carriage and Wagon for the first time since 1939. As in the case of the other companies, comparative figures are given for 1943, but there is no disclosure of the results of Metropolitan-Cammell for the intervening years.

The accounts of this company for 1939 and for the past two years are summarised on page 430. The comparison, for what it is worth, shows a sharp fall in earnings against pre-war figures and an expansion of stock and work in progress which is very large indeed. It has always been understood that the size of this particular figure was the reason for withholding the accounts during the war and it may be that the level at the end of last year was not a record. It is to be noted that the bulk of the expansion in work in progress is financed by instalments paid before completion.

Even with the publication of accounts for both the main subsidiaries, the information about the position of the group as a whole is still very sketchy. Profits are, in every case, struck after all the principal deductions, and the main subsidiaries have themselves subsidiaries. Losses, where made, have been fully provided for, but the profits of subsidiaries are only brought into the accounts to the extent that they are to be distributed. While it will always be valuable to have the accounts of the principal components of the group, the need for consolidated profits and balance sheet remains.

'THEY SHALL NOT PASS'

IODINE SAYS 'NO' TO X-RAYS

THE all-seeing eye of the X-ray can penetrate most substances but it cannot get through iodine. Not only is iodine X-ray proof but, because of its exceptional power to penetrate and permeate, it can also make living tissue X-ray proof. That is why, in medicine, certain suspected organs are treated with iodine before an X-ray examination. But for the iodine the rays would go right through the organ and it would not register on the photographic plate.

Can industry profit from this peculiar property of iodine? Can industrial research chemists find ways of using iodine as a contrast medium as they have already found so many other industrial uses for it? Chemists carrying out iodine research are invited to make the fullest use of the Iodine Educational Bureau.

The Bureau has collected every iodine fact which has been published since the element was discovered 133 years ago. This comprehensive collection of technical information, available nowhere else, is at the disposal of any institution or commercial enterprise, free of charge.

Iodine Educational Bureau

DEPT. A, 13 STONE HOUSE, BISHOPS COTE, E.C.2.

PRIMARY PROBLEM IN WARTIME

In every town mothers bring their babies to the Health Centre. Very useful educational work is undertaken—they learn the vital importance of vitamins in their baby's diet.

MORE has been done in this country, during the war years, to ensure the good health of babies than ever before in history. The Ministry of Food and the Ministry of Health have rightly regarded the health and diet of the youth of the nation as their primary problem. Wartime children are priority No. 1.

The Summary Report of the Ministry of Health for 1944 shows that 77 per cent of all mothers in Britain attended ante-natal clinics. The number of first health visits to children under one year represents 96.8 per cent of the total registered births.

Priority allowances of milk, eggs, and vitamin supplements to expectant mothers and to babies are part of the Ministry of Food's programme to ensure that the important protective factors are fully represented in the diet.

Today there is a great extension

of knowledge of vitamins and, to some extent, an increase in their inclusion in the diet of all. The production of national bread and vitaminized margarine, and the increased consumption of vegetables have augmented the *per capita* intake of vitamins. It is generally conceded that this has raised the general level of health standards in Britain despite the exigencies of total war.

Alongside this important forward step in national welfare has been the mass production of synthesized vitamins. In the Roche plants in Britain Vitamin C and Vitamin B1 can be produced by the ton, bringing them economically within the reach of all. These synthesized vitamins are identical with the natural vitamins. This valuable scientific advance opens a new prospect of a nation where no one need lack an abundance of the necessary protective factors.

ROCHE PRODUCTS LIMITED

Tyres and Rubber

The United States War Production Board has announced a reduction in the working week of the tyre manufacturing industry from seven to six days. This measure is a temporary one and is due to the shortage of carbon-black and high-tensacity rayon cords, both of which are indispensable in the production of the larger types of military tyres made chiefly of synthetic rubber. In October last, workers and management in United States tyre factories had pledged themselves to work all-out in order to meet the service demand for tyres. Since then their output of heavy tyres has risen steeply—from 1,217,000 heavy tyres in October, 1944, to 1,770,000 tyres in January, 1945—and has thus outrun the supplies of carbon black and cords. New facilities for these basic materials are in the course of construction and the War Production Board is trying to speed up the completion of this work.

A new difficulty in the tyre production programme is now looming ahead. For the first time since 1941 the Government-owned United States Rubber Reserves Company has just published full figures about the country's crude rubber position, which indicate that, unless supplies can be increased, a critical shortage may arise next autumn or winter. At the end of 1944 United States stocks of crude rubber were down to 93,000 long tons, compared with 139,000 tons a year before and 533,000 tons at the end of 1941. Present stocks are barely enough to permit the maintenance of current tyre production; a further reduction may well entail a slowing down in the rate of manufacture.

It is quite possible, however, that crude rubber stocks will continue to fall. United States consumption of crude rubber has declined from the peak figure of 775,000 long tons in 1941 to 144,000 tons in 1944; a further decline is unlikely, since possible further reductions in the proportion of natural rubber mixed with synthetic rubber will almost certainly be counterbalanced by the increased output of heavy tyres called for by the present production schedules. Last year United States net imports of crude rubber totalled 98,000 long tons—less than one-tenth of the 1941 imports and nearly one-third less than last year's consumption—and it is hard to see how imports can be

materially raised before the revival of shipments from the Far Eastern producing regions. Strictest economy in the use of crude rubber and the completion of the plans for the largest and speediest resumption of shipments from liberated rubber areas are thus a vital necessity.

Exit Large Notes

The withdrawal from circulation of bank-notes of the higher denominations has been proceeding quietly during the past two years and the calling in of notes for £10 and over which will take place on April 30th merely marks the culmination of a policy which was instituted in April, 1943. Since that time no new notes of £10 and upwards have been printed and every opportunity has been taken to withdraw those in circulation. It has, in any case, been the practice of the Bank of England for some years before April, 1943, not to re-issue such of the larger denomination notes as were returned to the Bank but to replace them by fresh ones. The large notes being used for black market and tax evasion transactions, however, rarely passed through the banking system, and in January of this year the Bank of England was empowered to call in all notes of over £5 after a month's notice, which has now been given.

From May 1st notes of £10 and above will cease to be legal tender though they will continue to be exchangeable for Bank notes of lower denominations at the Head Office of the Bank of England or, in the case of branch notes, either at the head office or at the branch concerned. Notes, however, will not be exchangeable through the post. Overseas holders of notes—who come under the general ban on the import of all denominations of Bank notes—will not be affected by the measure though the large notes held abroad will be still further isolated.

It is difficult to assess the total amount of the large notes at present in circulation in this country. No statistics have been available since the beginning of 1939. For 1938 the average of Wednesdays gave an amount of £113 million of notes of £10 and over in circulation, representing no less than 23.2 per cent of the total circulation. A rapid rate of

REFUGE Assurance Company Limited.

Chief Office :
Oxford Street, Manchester, 1.

In 1944, in spite of war difficulties, representatives of the Company provided service, usually at the homes of the policyholders, in respect of **NINE MILLION POLICIES**, making **165,000** maturity payments totalling **£5,000,000** and paying **£3,000,000** in death claims. In addition **1½ million** calls were made to pay National Health Insurance Benefits.

Ordinary Branch : A bonus of **£1%** for each year's premium due and paid since 1938 is being paid on with profit policies becoming claims before 20th March, 1946.

Industrial Branch : Over **£670,000** is allocated to increase the benefits of the majority of existing premium-paying policies.

expansion of notes of £20 and over was particularly noticeable. A similar proportion in April, 1943, would give a total of about £220 million of large notes outstanding. This huge sum, however, is undoubtedly far in excess of the present total outstanding. In 1936, 1937 and, to a lesser extent in 1938 there was a large export of notes to the Continent and, in particular, to France, for the purpose of hoarding. There can have been little such export during war years. When the amount of these hoards at the outbreak of war is subtracted from the total and then allowance is made for the gradual withdrawal of notes during the last two years, it does not seem likely that the Bank will have to replace more than about £50 million of large notes though, obviously, any estimate must be exceedingly rough with so many uncertainties.

Cotton Labour Shortage

A first step has been announced towards increasing the production of cotton yarn, the shortage of which threatens the clothing ration. Four closed mills are to be re-opened. It is believed that they can be staffed mainly by older and immobile operatives—some 1,400 are required—but the Ministry of Labour will, if necessary, arrange for transfers from munition and other factories. If more labour can be attracted by opening more mills this should be done as soon as possible, since it may take some weeks or even months before they can work to full capacity. It is a pity that the process of re-opening some mills was not started earlier to relieve the yarn shortage. The decision appears to have been taken because the Cotton Board's overtime proposal was rejected by the trade unions, but it might well have been taken in conjunction with overtime work.

A debate on the subject of cotton manpower in the House of Commons last week produced little new, except the announcement of a Ministry of Labour committee on double day-shift working. Double shift working will be necessary to take advantage of modern machinery when, in the future, it is installed. It is an important factor in raising PMH in the long run. But the immediate problem is to fill the working mills to capacity, and to find enough labour for the closed mills when the general opening date is fixed. Not only should trained operatives be induced to return to the mills, but juvenile entrants need to be recruited. During the year ended May, 1944, 2,690 juveniles were recruited, compared with only 1,525 the year before. The larger figure is still considerably below requirements. The trouble is that conditions and wages in the mills are unattractive compared with other industries; the industry as a whole declined between the wars, and there is not sufficient confidence among potential operatives that cotton will be a flourishing post-war industry. The long-term shortage can only be met by the success of employers' efforts to make conditions and prospects more attractive. Meanwhile, the labour shortage is acute, and unless it is relieved military and essential civilian requirements may not be met.

More Retail Store Results

Reports of retail store companies for the year 1944 continue to show that, while profit has decidedly improved in

the North of England, it has declined little or not at all as the result of a year of resumed aerial attack on London. The reason for this does not lie in any increase of supplies—indeed the stocks held by most large companies have declined, owing partly, it must be admitted, to the desire to minimise the wartime stocks left on hand when peace returns. But there have been further increases in the price of goods, while selling costs have necessarily been kept low by increasing shortage of labour.

The net trading profit before taxation of Harrods, for the year ended January 31st, at £733,341, shows an increase of some £30,000. This figure is reached after allowing for an increase in the provision for repairs and renewals from £61,943 to £100,954, and even so it is decided to transfer £25,000 against nil to freehold buildings reserve as part of a policy of further strengthening reserves in preparation for the substantial rebuilding which must soon be undertaken. This fact and an increase of £50,000 in taxation provision reduce the cover on the ordinary dividend, which is maintained at 8 per cent, from 14.6 to 13.0 per cent. An opposite movement is shown in the preliminary accounts for the year ended March 24th of Selfridges, whose fall of £26,000 odd in net profit is more than offset by a saving of £55,000 in taxation, for which advance reserves apparently no longer need be accumulated. The different trend in the trading profits of these two companies must be partly accounted for by an increase in the prosperity of Harrods' branches and subsidiaries operating in the North, notably Kendal Milne at Manchester.

The chairman of Harrods, Sir Woodman Burbidge, anticipates that his company's prudent policy of building up reserves—net liquid assets are £1,900,000 odd and general reserve £1,555,436, against total issued capital of £6,215,194—will enable an early increase in ordinary dividend payments. The company's net profits have steadily risen since 1941 when only 4 per cent was paid, but are still well short of the pre-war profits, which covered customary payments of 16 per cent. Sir Woodman puts in a not unexpected plea for an increase in the civilian clothing ration and for early access to the home market in order that manufacturers may try out that inventiveness which, he agrees, is the life blood of the export trade. The natural appeal of such sentiments does not alter the fact that it will be hard to justify more than a moderate increase in civilian consumption during a period of both world-wide scarcity and capital re-equipment.

American National Income

The Department of Commerce's estimates of the national income of the United States in 1944 were published in the February issue of the *Survey of Current Business*. The American official figures customarily use three alternative definitions. The smallest of these is "income payments to individuals," which includes all wages, salaries, rent, interest, dividends, etc., and also transfer payments to individuals, but does not include the undistributed profits of business. It is therefore an incomplete figure, but it has the advantage of being available monthly. Secondly, there is "national income," which is defined in broadly the same way as the "net national income at factor cost" of the British official figures. And thirdly, there is "gross national product," which differs from "national income" mainly in that it includes indirect taxation and provision for the depreciation and replacement of capital. The figures of these three magnitudes for the last four years, by half-years, are given in the following table (the figures are seasonally adjusted annual rates in billions of dollars):—

	Income Payments	National Income	Gross National Product
1941—First half	86.8	89.9	113.1
Second half	98.6	103.8	127.9
Year	92.7	96.9	120.5
1942—First half	110.0	114.6	139.1
Second half	124.7	130.0	163.9
Year	117.3	122.2	151.5
1943—First half	138.9	145.1	183.2
Second half	147.2	153.6	192.3
Year	143.1	149.4	187.8
1944—First half	155.5	159.5	197.4
Second half	158.9	161.7	200.1
Year	156.8	160.7	198.7

Since the middle of 1943 the rate of increase has been com-

paratively slow, and some part of this gradual rise must be ascribed to the inflation of money values rather than to an increase of physical quantities. Nevertheless, that Gross National Product should have risen from a rate of \$113 billion to \$200 billion, or that national income should rise to \$160 billion, would have seemed impossible only four short years ago.

The dominant influence on the national income, as in any country at war, is the level of Government expenditure. This now takes almost exactly half of the Gross National Product, as follows:—

	Government Expenditure		Private Expenditure		Gross National Product
	War	Non-war	Consumption	Capital	
1941—First half	9.5	15.4	71.9	18.5	113.1
Second half	17.5	15.1	77.2	20.2	127.9
Year	13.3	13.2	74.6	19.4	120.5
1942—First half	35.3	12.8	79.2	11.7	139.1
Second half	63.7	12.1	84.5	3.6	163.9
Year	49.5	12.4	81.9	7.7	151.5
1943—First half	80.5	11.8	89.3	1.6	183.2
Second half	84.5	12.8	92.5	2.5	192.3
Year	82.5	12.3	90.9	2.1	187.8
1944—First half	87.4	13.2	95.7	1.2	197.4
Second half	85.2	12.9	99.6	2.3	200.1
Year	86.3	13.0	97.6	1.8	198.7

The notable feature of this table is the continued rise in consumption expenditure; the American economy continues to show the remarkable phenomenon of Government expenditure and consumption—guns and butter—both rising together. There have, of course, been considerable changes within the consumption item: Thus, expenditure on durable consumers' goods, which was at the annual rate of \$9.2 billion in the first half of 1941, fell to \$6.3 billion in the second half of 1942 and has since recovered only to \$6.9 billion, while there has been a steady progression in expenditure on non-durable goods ("consumption" in the most literal sense) from a rate of \$37.8 billion in the first half of 1941 to \$61.4 billion in the second half of 1944. The figure for capital represents gross capital formation, and since 1942 it has been below the level of depreciation and depletion charges.

Durham Coalfield

The report on the Durham coalfield (HMSO, 1s.), which has just been presented to the Minister of Fuel, is the second of a series of regional surveys, which, when completed, will cover all British coalfields. Together with the report of the Reid technical committee, which has appeared too late for comment in this issue of *The Economist*, these surveys will provide the basis for the Government's long-term policy for the industry.

Durham is the largest British coalfield, and just before the war was responsible for about one-seventh of both the national output and the industry's manpower. The investigation is, therefore, of special importance, though it is not so full of detail as the Scottish coalfield report. In fact, the two miner members of the committee, which was presided over by Mr Thomas Hornsby, Regional Fuel Controller, record their protest at the limited terms of reference, which prevented them from discussing the wider questions of structure, ownership and finance.

The area's production and manpower have both declined steadily since before the last war, as the table on page 431 shows. A further table shows the decline in output per worker between 1938 and 1943. A third table shows that the proportion of coal cut by cutting machines remained stationary between 1939 and 1943, though the proportion cut by mechanical picks and not by the old hand hewing methods increased by 11 per cent.

The committee regards large-scale mechanisation and modernisation as the main solution to the production problem. It emphasises especially the need for mechanising underground transport. Some 88 per cent of the miners have no "man-riding" facilities from pit shaft to coal face, and as much as 31 per cent of the output is obtained at faces situated more than 1½ miles from the shaft. The conditions indispensable for successful mechanisation, according to the report, are: full co-operation between management and men, teamwork among the miners, a more flexible wage structure, and the abandonment of restrictive customs and practices.

Durham is an old coalfield. The committee estimates, however, that they amount to 3,000 million tons, or sufficient for 100 years' production if a planned annual rate of 33 million tons is maintained. In a coalfield which has been worked so long and so intensively there are few untapped reserves of workable coal, but the committee holds out hopes of extracting additional supplies from undersea coal and from thin or inferior seams and by an extensive dewatering of the flooded tracts in South-West Durham. But it rightly stresses the need for a more careful utilisation of resources and for developing processing industries and using coal increasingly as a basis for new industry and not merely as material to burn.

The proposals, both for the production and utilisation of coal, will clearly involve enormous capital expenditure, which, the committee considers, can only be found by the Government. Though one coalfield cannot be regarded as typical in such a highly diversified industry, the Durham committee's conclusions are likely to be of equal application to the older, under-mechanised coalfields, and as such a useful guide to future action.

Architects on Housing Production

The Engineering Association declared recently in a memorandum that 200,000 completely factory-made and 100,000 partly factory-made houses could be added each year to the housing programme. Last week a report on housing production drafted by a committee of the Royal Institute of British Architects has appeared. Although it is not intended to answer the engineers, and it is unlikely that the committee saw the Engineering Association report, it is interesting for the views put forward on prefabrication. Prefabrication of component parts, such as doors, fireplaces and so on was widely used before the war, and its expanded use is welcomed by the committee. They consider that there is some small part for the completely prefabricated house to play in production, but it would only be "auxiliary" help. They regard prefabrication as a long-term policy to supplement traditional building methods.

COMPANY MEETINGS

MERCANTILE BANK
OF INDIACONSIDERABLE INCREASE IN
RESOURCESSIR CHARLES INNES'S
STATEMENT

The 52nd annual general meeting of The Mercantile Bank of India, Limited, will be held on Tuesday, the 17th proximo, in London.

The following is an extract from the statement of the chairman (Sir Charles A. Innes, K.C.S.J., C.I.E.) circulated with the report and account:—

The accounts for 1944 are very similar to those of the previous year, the main difference being a further increase of nearly £3 millions in our deposits, due chiefly to the continued large volume of war expenditure in India and Ceylon. On the assets side there is a corresponding rise of nearly £2 millions in our securities and an increase of nearly a million in loans and advances. Bills show a further small decline for reasons explained in previous statements, and no real improvement can be expected in this respect until the shipping position improves and trade is allowed to return to its normal channels.

INCREASED LIQUIDITY

I have been at some pains to compare the balance-sheet for this, the sixth year of the war, with that of 1938, the last pre-war year. In spite of the fact that seven of our branches have been over-run by the Japanese, our resources show a considerable increase. We are much more liquid than in 1938, and our holding of Government Securities has more than doubled. On the other hand a much smaller proportion of our funds is laid out in bills and loans and advances, that is in the finance of industry and trade. Our experience, in fact, is much the same as that of other banks. As the result of the war, we have larger funds at our disposal, but the normal outlets for these funds have been circumscribed partly by the claims of Government finance and partly by the extension of Government trading in the country in which we operate. Moreover we work on much finer margins.

I referred last year to two problems of pressing importance in India, the critical food situation and the danger of inflation. The year has witnessed improvement in both respects. It is true, that food prices still remain inordinately high and that much hardship is caused thereby, but in other respects the situation seems to be pretty well in hand. Rationing has been extended to cover some 42 millions of people, an administrative feat of no mean order; considerable success has attended the grow more food campaign and the Government procurement schemes, and large imports of wheat have been secured. The position will be still better when the shipping position improves and Burma rice is again available in quantity, but the food problem of India is likely to become increasingly important. Not only have the authorities to budget for a rapidly increasing population, but as they recognise themselves, the problem of the under-nourishment of some 30 per cent. of the people must be tackled. As regards the other problem, the Government have succeeded in checking by various measures the spiral of inflation, but as the Finance Member has himself pointed out, the problem of the inflationary gap still remains, nor have the Government succeeded in bringing down prices to any appreciable extent.

FUTURE OUTLOOK FOR INDIA

As regards the future, the first thing we have to remember is that politically we are approaching the end of an epoch. Economically, too, the position will change in an

almost equal degree. India's war effort has been magnificent, but her war expenditure is relatively light. For next year it is estimated at less than a million a day compared with the £13 or £14 millions a day which the war is costing this country. Moreover she has sustained little war damage, and she will emerge from the war with her economic position immensely strengthened. For the first time in her history she will be a creditor country. The war has given a tremendous impetus to her industries, and even more important is the impact of the new ideas which are circulating in India as in other countries. The whole problem of reconstruction and rehabilitation is being studied in all its aspects with the ultimate objective of raising the standard of living of the people as a whole and of ensuring employment for all. It must be a long time before these vast plans can be translated into full effect, but it may be taken as certain that great developments will take place in the immediate post-war years and that as soon as the markets of the world are again open to her, India will make heavy demands on them not only for consumer goods but also for capital equipment. This country should be able to play its part in meeting these demands. It is true that there will be increased competition from the United States of America and that the process of reconverting our industries from war to peace may be a more troublesome job than in the United States owing to the fact that a far greater proportion of our production has been geared to the war effort than has been found necessary in the States. On the other hand our manufacturers have the initial advantages of established connections with India and long familiarity with the Indian market, and already there are signs of fruitful collaboration between Indian industrialists and manufacturers in this country. In this connection one may hope that a satisfactory solution will be reached of the formidable problem of India's large sterling balances in this country.

LANCASHIRE ELECTRIC
LIGHT AND POWER
COMPANY, LIMITEDCONTINUED SATISFACTORY
PROGRESS

The annual general meeting of The Lancashire Electric Light and Power Company, Limited, was held on the 27th instant in London.

Sir Joseph Nall, M.P. (chairman), said that the gross operating revenue in 1944 amounted to £3,301,000 compared with £1,576,000 in 1939, an increase of £1,725,000, whilst the gross operating expenditure in 1944 was £2,516,000, compared with £916,000 in 1939, an increase of £1,600,000. These large increases in revenue and expenditure are, of course, partly due to the increased output for war purposes, but also and indeed largely due to the increased cost of coal and, on the expenditure side, to the alarming decline in the quality of that basic product.

The combined total paid or to be paid in rates and taxation by this company and its subsidiaries in respect of the five years 1940-44 inclusive amounts to £1,735,302.

These not inconsiderable contributions in cash which company-owned public utilities make to the local and national exchequers are conveniently overlooked by those who clamour for the public ownership of these undertakings and income-tax payers of all classes would do well to have this in mind when listening to the plausible pleas of certain politicians.

We have been directed by the central board to extend our Kearsley Station by a further 104,000 kw. capacity and orders for this plant have been placed at a cost of three and a half million pounds. We contemplate considerable extensions to our distribution network as and when labour and materials can be made available.

The report was adopted.

THE SCOTTISH AUSTRALIAN
COMPANY, LIMITED

A DIFFICULT YEAR

The adjourned annual general meeting of the Scottish Australian Company, Limited, was held, on the 27th instant, at the offices of the company, 197 Winchester House, London.

Lt.-Col. Ian Rose-Innes Forbes, D.S.O., J.P., D.L., presided, and in the course of his speech said:—It is with the greatest regret that I find myself in the chair to-day and having to take the place of your chairman and managing director, Mr J. Campbell Inglis. During the sixteen years he was managing director and chairman he devoted his whole time to the business of your company and never spared himself in your interest. We were fortunate in having at the head of affairs for such a long period a man with such a sound brain and so wide a business ability.

The year under review has been, in many respects, a difficult one. You have no doubt read in the newspapers that many areas in New South Wales experienced the worst drought for forty years, and our properties in New South Wales and Southern Queensland suffered severely. Stock losses were much heavier than in the previous year and our lambings less satisfactory. In fact, our stock of sheep on June 30th last was about 76,000 head less than at the corresponding date in the previous year. This inevitably means a considerable reduction in the current year's wool clip. Also, as was to be expected, drought expenses were almost double those of the previous year. These losses will have their repercussion, and I must warn you that we cannot expect anything like as good results during this year.

Drought conditions continued until the beginning of January, and, although we have had beneficial rains since then, much more rain is needed at many of our stations. In view of all this and to provide for the further effects of the drought, as well as for all possible fiscal contingencies, the board consider it prudent to maintain the dividend at 5 per cent. and to increase the carry forward.

HIGH QUALITY OF WOOL MAINTAINED

Our wool clip was some 600 bales less than in the previous year, but the revenue from this source was slightly higher. As you are aware, since the beginning of the war the company's wool has been appraised in Australia and sold out there to the British Government, but we have been able to get samples of our clip home. They have been carefully examined by our brokers, and I am happy to tell you that their reports have been encouraging, and it is evident that the high quality of the company's wool is being maintained.

I should like to say a word about our cattle stations at Austral Downs and Texas. The former has done very well. We have got together a fine shorthorn herd, and sales of stock have realised good prices, and I feel sure that cattle-raising will prove profitable for some years to come. At Texas we have a first-rate herd of Aberdeen Angus cattle.

IMPROVED FARMING REVENUE

Our farming revenue, thanks to a rather larger wheat harvest on our Riverina stations, showed an appreciable improvement. The trading profit amounts to £83,260, as against £83,645 for the previous year, and there is a net profit of £63,038. The board recommend the payment of a dividend of 5 per cent. on the consolidated ordinary stock, together with a payment of a bonus of £3,000 in our currency to the permanent staff in Sydney and on the company's stations, for distribution at the discretion of the advisory board in Sydney. These allocations will absorb £28,000 and leave a sum of £20,883 to be carried forward to next year's account, compared with £17,844 in the previous year.

The report and accounts were unanimously adopted.

REFUGE ASSURANCE COMPANY,
LIMITEDASSETS £88,800,000; INCOME £15,000,000
FURTHER REDUCTION IN COSTS

The eighty-first annual ordinary general meeting of the Refuge Assurance Company, Limited, was held, on the 26th instant, at the chief office of the company, Oxford Street, Manchester.

Mr J. Wilcock Holgate (chairman of the company), in the course of his remarks, said: For over five years the people of this country, in pursuance of the one purpose of exerting the maximum war effort, have submitted themselves voluntarily to a degree of control such as is entirely foreign to their nature; and it is much to be doubted whether they will be content to bear with it one moment longer than is required by the gradual transition from a war to a peace-time economy. To recover the liberties thus temporarily surrendered may not be easy: control develops only too readily into a vested interest which is the more insidious in that it gives rise to "planners" who in effect project control into the future and in whose lexicon the words "private enterprise" have small place. The danger has already been pointed out by leaders in various branches of industry, who emphasise the difference between officialdom bound by rule with no personal interest in results, and producers accustomed to instant decisions and constant adjustment of plans to meet new or changed demands, who must satisfy to survive.

SERVICE

An interesting example of this fundamental difference is provided in our own business in the history of the Post Office scheme of life assurance, which was set up in 1864 and was discontinued in 1928 as being "a mere distraction of Post Office energies which might be better employed." The primary defect of the scheme was its failure to recognise the cardinal feature of the business, that policies, whether they be for £10,000 or £10, are sold rather than bought. Life assurance represents saving rather than expenditure; and savings may be greatly increased by personal approach, as is being evidenced today in the results of regular collections by voluntary workers in connection with the War Savings Campaign. A precisely similar function is carried out by our agency force, who in the first place introduce the idea of life assurance to individual members of the public, and then by regular calls or approach encourage the maintenance in force of the policies. The economic effect of the qualities of foresight and thrift so encouraged is very considerable in the mass, and especially so in the case of the individual; it is a commonplace that one never hears a widow complain because her husband's life was assured, whatever, as a wife, she may have said previously.

STEADY FALL OF COSTS

This service must, of course, be paid for, but it is remarkable how steadily the costs have fallen and how low is the present figure. In the industrial branch of this company the expense ratio is 27.74, the lowest we have hitherto been able to record; and it is only fair to draw your attention to the expert organisation and the extreme care in administration which have alone made possible the progressive improvement shown by the following figures, which has been achieved in spite of the additional expenses arising out of the war and has been accompanied by a material increase in the average earnings of our field force:—

Year	O.B.	I.B.
1936	14.89	34.27
1940	12.60	31.63
1944	11.01	27.74

Another aspect of our business to which

we pay particular attention, and in which we can record a gratifying measure of success, is the reduction in the number of policies falling out of benefit. It may be interesting to you to know that of our existing whole life premium-paying contracts over 55 per cent. have been in force for 10 years and nearly 30 per cent. for more than 20 years. We have actually over 140,000 policies which have been in force for over 50 years; and the thought occurs to me that a business that can boast of such long connections is not only fundamentally sound, as the figures prove, but must also be giving satisfaction to its policyholders. In this connection I might mention that during the past year the death occurred of the last remaining life assured under our old sickness scheme. This policy was taken out in 1866, 78 years ago.

ALLOCATIONS OF SURPLUS

This brings me to another point. The policies in our industrial branch are, in form, non-profit; yet, despite this, allocations of profit have been made annually to the policyholders for many years past, the total amount distributed during the last 10 years being nearly £4,000,000. The amount allocated in respect of 1944 is £673,229, a sum considerably greater than has ever previously been granted. Over the same period of ten years the average annual amount charged to the industrial branch on account of shareholders was £135,330, a very modest amount having regard to the extent of the company's operations, and the very large sums set aside for the benefit of the policyholders.

COMBINED RESULTS

During the year our total premium income increased by £297,042 to £12,313,138. Our total claims were £8,596,435, which included £5,432,809 by way of maturities alone. The aggregate surplus in both branches amounted to £4,365,480, which includes £3,271,370 brought forward from the previous year, and the total assets now stand at £88,858,588, having increased by £3,642,789 during the year. I may here mention that from the outbreak of war to the present time the company, as a result of war conditions, has paid £1,055,513 in death claims on the lives of members of HM Forces and of civilians.

You will be aware that our policies carry certain conditions limiting the company's risk in the event of war. With few exceptions these conditions have been waived up to now as regards pre-war policies, and the full sums assured paid in the cases concerned. It is our hope that circumstances will enable us to continue this concession.

ORDINARY BRANCH

In the ordinary branch the life assurances valued were as follows:—

No. of policies	Sums assured and bonuses	Premiums payable per annum
544,480	£86,175,292	£4,621,557

The number of new policies issued was 30,433, assuring the total sum of £6,061,061, as compared with £6,001,859 in the preceding year. The premium income was greater than in the previous year by £51,607, and the net interest amounted to £1,355,052. The expense ratio was 11.01 as compared with 11.25 in 1943, and the life assurance fund now amounts to £42,965,590, in addition to which there is an investments reserve fund of £2,250,000.

The basis of valuation has been materially strengthened for the life assurances, and was at least as stringent as a net premium

valuation by the A24-29 ultimate table of mortality, with interest at 2½ per cent., with additional provision to meet prospective adverse mortality due to the war. The annuities were valued with interest at 3 per cent., and the resulting surplus was £3,367,698, which included £3,025,420 brought forward from the previous year.

It is proposed to allocate to the shareholders £24,294, to set aside £218,649 for the benefit of policyholders, and to carry forward the increased sum of £3,124,755 to meet any contingencies which may arise out of the present world situation, or to be dealt with subsequently as the board may determine.

Having regard to the continuance of war conditions, we propose to repeat the modified form of bonus distribution to policyholders in the ordinary branch adopted since the outbreak of war, and which takes the form of a bonus on participating policies which become claims by death or survival throughout the 12 months commencing March 20, 1945, at the rate of £1 per cent. on the sum assured in respect of each full year's premium due and paid respectively in the years 1939 to 1944 inclusive. It is proposed also, until further notice, to allow an interim bonus on policies becoming claims by death or survival at the rate of £1 per cent. on the sum assured.

INDUSTRIAL BRANCH

In the industrial branch the policies valued were as follows:—

No. of policies	Sums assured	Office premiums per annum
8,667,067	£138,300,924	£7,478,458

The premium income was greater than that of the previous year by £245,435, and the life assurance fund now amounts to £39,556,312, having increased by £2,743,050, in addition to which there is an investments reserve fund which now amounts to £3,000,000. The expense ratio was 27.74, as against 29.15 in respect of 1943.

The valuation was made on a 2½ per cent. net premium basis, additional provision being embodied to meet prospective adverse mortality due to the war, and the resulting surplus, which included £245,950 brought forward from the previous year, was £997,782. It is proposed to allocate to the shareholders £88,206, to carry forward £236,347, and to set aside £673,229 for the benefit of policyholders to increase temporarily, and in some cases permanently, the amounts payable under certain policies, and in addition to provide a special benefit in respect of those policies under which the lives assured have reached an advanced age. Accordingly, in cases where the life assured attains the age of 90 within the next twelve months, no further premiums will require to be paid, and the policies will become free paid-up policies.

NATIONAL HEALTH INSURANCE

On behalf of the National Amalgamated Approved Society we administer the national health insurance of a membership of 880,000, and during the year payments of benefit were made amounting to £1,169,054.

This company, in common with other industrial assurance organisations, is in cordial agreement with the principles underlying national insurance, and with the objects it is sought to achieve, but all wisdom does not lie with those who originally drew up the scheme, and we feel that the Government proposals do not do justice to the opportunity afforded the Ministry of making use of the services of the approved societies, which have had so many years' experience of health insurance, and which constitute a ready-made agency for the administration of certain of the benefits, and which, most important of all, provide a system whereby individual agents take their services to many houses rather than the people being compelled to go to some Government office.

The report and accounts were adopted.

BRITANNIC ASSURANCE COMPANY, LIMITED

ANOTHER SUCCESSFUL YEAR

MR J. A. JEFFERSON'S SPEECH

Mr J. A. Jefferson, F.I.A., chairman and general manager, presiding at the seventy-ninth ordinary general meeting, after referring to the election of Mr J. Murray Laing as vice-chairman, the retirement from the board of Mr A. M. Patrick, and the proposed election of Mr H. E. Roscoe as a director, said: The company again made splendid progress. During the year several interesting milestones were passed; the company's total income exceeded £9,000,000; the industrial branch premium income exceeded £5,000,000; the ordinary branch premium income exceeded £2,000,000; and for the first time the ordinary branch fund increased by over £1,000,000.

War claims in 1944 amounted to £140,968, compared with £89,677 in 1943, bringing the total since the outbreak of war to £476,659.

ORDINARY BRANCH

The premium income of £2,109,000 shows an increase of £117,000 in the year. The fund, after giving effect to 1944 transfers, amounted to £16,406,000—an increase of £1,091,000. Our new business at £3,582,000, although less than in 1943, was larger than that for 1938. The net rate of interest was £3 6s. 9d. per cent.—a fall of 1s. 2d. per cent.

Death claims at £282,000 were £46,000 more than in 1943. Payments under maturing policies in 1944 at £868,000 were practically the same as in 1943, while surrenders at £40,000 were almost unchanged. Both lapses and surrenders are at a very low level compared with those experienced before the war. The expense rate at 10.61 per cent. showed a substantial drop of 1.11 per cent. from the moderate rate for 1943.

INDUSTRIAL BRANCH

The premium income of £5,126,000 represented an increase of £229,000 over the figure for 1943. The fund, after giving effect to transfers, amounted to £5,554,000, an increase of £1,949,000.

The gross rate of interest earned was 1s. 8d. per cent. less than a year ago, but for a long time I have been warning you to expect reductions. The net rate at £3 14s. 1d. per cent. was 1s. 5d. per cent. more, but this increase is due entirely to the incidence of taxation.

Death claims amounted to £1,354,000 and included £79,000 in respect of bonuses. The amount paid in respect of maturing endowment assurances was £881,000, which represented the substantial increase of £154,000 as compared with a year ago, and included £67,000 for bonuses. Surrenders at £28,000, although showing a slight increase, were again at a very low level.

The expense rate for the year was 26.39 per cent.—a new low record.

"PROPORTIONATE" FREE POLICIES

The expense rate of the industrial branch has been reduced by nearly 9 per cent. in the last ten years alone. So long ago as 1930 we began giving automatic free policies after premiums had been paid for at least two years, although for most policies we were not required by law to grant a free policy until at least five years' premiums had been paid. The directors feel that the time is ripe for a further improvement in our practice, and they decided some months ago to adopt a scheme of automatic free policies after payment of only one year's premiums. They also decided to calculate the amount of such free policies on a simple and generous basis, known as the "proportionate" basis. Thus, the free policy will be that proportion of the full

sum assured which the number of complete years' premiums paid bears to the number of complete years' premiums originally payable under the policy. In other words, each complete year's premiums will provide its full proportion of the original sum assured. For whole life policies the premiums payable under the original policy will be assumed to cease on the attainment of age 85, whether or not they do so under the terms of the policy.

THE ASSETS

The total assets are now £47,546,000, an increase during the year of £3,389,000. Of the total assets, no less than £23,226,000 is invested in British Government securities—nearly one-half of the total.

In 1938 our total assets were £32,272,000, while in 1944 they amounted to £47,546,000, showing an increase of £15,274,000. In 1938 our British Government securities totalled £6,458,000, while in 1944 they amounted to £23,226,000, showing an increase of £16,768,000. The increase in our British Government securities was therefore greater than the increase in our total assets, and the percentage to the total assets rose from 20 per cent. to 48.8 per cent. Even these figures, however, do not show all that has happened, for the increase of £16,768,000 is arrived at after redemptions have been taken into account. The actual amount of money invested in new British Government loans during the war is over £19,000,000. On many occasions before, I have told you of the seriousness of these conditions to an expanding life office, and coupled with high taxation the effects are aggravated.

A valuation of our assets at the end of the year again shows a substantial appreciation over balance-sheet values, but you will see that we still consider it desirable to go on building up our investment reserve funds. We are transferring another £250,000, which will bring these reserves up to £3,000,000.

ANNUAL VALUATION OF POLICY LIABILITIES

This year the stringency of the valuation has been increased by valuing the British Legal industrial branch policies at 2½ per cent. interest by the English Life No. 10 (Males) Table, instead of at 3 per cent. by the English Life No. 8 (Males) Table employed a year ago. We are now able to say that all life assurance contracts in both branches have been valued at 2½ per cent. by the net premium method. In both branches the mortality experience, even including war claims, was within that expected by the mortality tables employed.

BONUS ALLOCATIONS

In the ordinary branch the surplus disclosed was £637,186, inclusive of £250,875 brought forward. In the industrial branch the surplus was £1,151,320, inclusive of £391,952 brought forward.

Out of the ordinary branch surplus the directors have allocated £243,302 to policyholders, which has enabled them to declare a bonus addition to all with-profit policies in force at December 31, 1944, of £1 per £100 sum assured.

Out of the industrial branch surplus the directors have allocated £240,000 to policyholders, which has enabled them to repeat the present bonus scheme for a further year, commencing on April 1, 1945.

Increased balances of £278,360 in the ordinary branch and £448,820 in the industrial branch are being carried forward undivided.

HOOVER, LIMITED

SATISFACTORY PROGRESS

MR C. B. COLSTON ON THE OUTLOOK

The eighth ordinary general meeting of Hoover, Limited, was held, on the 23rd instant, at the registered office of the company, Perivale, Greenford, Middlesex, Mr C. B. Colston (chairman and joint managing director) presiding.

The chairman, in the course of his speech, said: The progress of your company has been very satisfactory. The prices of our equipment continue to be, in many instances, the lowest charged to the Government; in all cases our prices compare very favourably with the average. As to quality, the company's reputation stands higher than ever.

WAR CONTRIBUTION

When war broke out we decided we could make our greatest contribution by concentrating principally on work in which we were specially skilled, the electrical engineering field. Our major effort has been in the manufacture of small rotary transformers; during the war we have made approximately three-quarters of a million. In addition, we have manufactured huge numbers of electrical plugs and sockets, complete wiring installations for many types of aircraft, fractional horsepower motors, blowers, engine speed indicators, engine starters and other electrical equipment.

In other fields we have manufactured many thousands of four-bladed aeroplane Rotol type propellers, bomb carriers, oxygen economisers and regulators, and millions of fuses. Hardly any aircraft of British manufacture leaves the ground without carrying some item of equipment manufactured by your company.

We are operating no less than eight factories. In addition, we have organised ten outworking units, which have employed 1,758 women. Your company was a pioneer in this field. The majority of these women are non-directable and, owing to their domestic responsibilities, could not undertake war work unless it were brought to districts where they resided. In the early days of the war your company showed what an effective part could be played by women without previous experience in engineering. We have employed as many as 6,300, apart from our outworking units.

At the outbreak of war we started our own research department, which has done most valuable work and will be continued. A large proportion of the equipment we have manufactured during the war was either entirely designed or adapted by us.

NEW FACTORY CONTEMPLATED

Active consideration has already been given to changing over to peacetime products, which will be wider in range than before the war. We are negotiating with the Government for a new factory in a Scottish development area for some of our expanding activities. I am confident that the change-over can be tackled with less difficulty than the transfer from peace to war production.

The demand for our products after the war will probably exceed the supply. How long this will last depends largely upon controls.

We face the future with confidence. There will be difficulties in the transition period, but if we are prepared to wage peace with the same determination, energy and unity as we have waged war, we shall find solutions to all our problems and bring this country to a higher level of prosperity than ever before in its history. Your company intends to make every effort to play its part.

The report and accounts were unanimously adopted and a final dividend of 11½ per cent. and a cash bonus of 10 per cent. on the ordinary stock of the company, less income-tax, was approved, making a total distribution for the year of 25 per cent.

ABBEEY NATIONAL BUILDING SOCIETY

POSITION OF GREAT STRENGTH

POST-WAR HOUSING

SIR HAROLD BELLMAN'S REVIEW

The annual general meeting of the Abbey National Building Society was held at the Wigmore Hall, Wigmore Street, W.1, on the 27th instant. Sir Harold Bellman, J.P., LL.D., chairman of the Society, presided. In the course of moving the adoption of the report and accounts, he said:—

Today it is our pleasure to meet for the first time as the Abbey National General Meeting to review our first year's work as a united Society. All of us with any sense of occasion must recognise this as a memorable event. It is clear that all the advantages of amalgamation are likely to be realised sooner or later in practice, and when the disturbing factors due to the war have been eliminated.

The accounts for 1944 may be regarded as an epitome of all that we are and an indication of some of our potentialities for the morrow. For the present, their outstanding characteristic is great strength, which, in this sixth year of war, must be a source of the deepest satisfaction to our members.

Our total assets stand at £80,380,000, of which over £18,500,000 consists of trustee investments and cash. For the future, the accounts provide a striking indication of the resources which we shall have available to assist post-war housing.

BOARD'S LENDING POLICY

The figure for advances of £1,900,000 in 1944 requires explanation against the background of our lending policy. In accepting mortgage securities we have been reasonably and properly selective. We believe this to be an obligation both to those who sought advances and to our members whose funds are employed. By adopting this policy the Society has set its face against any action which might assist, however indirectly, the tendency towards fantastic prices for houses. It is, of course, acknowledged that there is a measure of appreciation of property values over and above the 1939 level which is likely to persist for some considerable period after the war. The Society allows for this in determining its present valuations of property. We welcome the action of the Government in setting up a committee of inquiry into the problem of house selling prices. There can be no doubt that there is a strong case in terms of social justice for a temporary measure of control, but admittedly the devising of a scheme which is administratively practicable may be much less easily decided. It will, of course, be the function of the Government committee to advise on this point. It may be hoped that if a ceiling price is fixed by some agreed addition to the pre-war value, due regard will be paid in determining that addition, to the heavy disabilities under which the house-owner has suffered during the war years. While a decision is awaited, we can only add an emphatic warning against the folly of paying prices utterly out of proportion to real values.

We cannot say too often and too insistently that housing is the most urgent of our peace-time problems. The housing problem is a grave national emergency, which requires a correspondingly constructive and unselfish approach from all of us.

TWO-FOLD HOUSING PROBLEM

In broad outline, the problem is obviously two-fold in character: to provide houses for letting to those who desire to rent, and to provide houses for purchase for those who desire to own. All who know the facts are bound to agree as to the necessity for houses to let. At the same time, however, a properly balanced housing policy requires the provision of houses which are available for sale for those who desire to purchase. The evidence in favour of this view is very substantial. Approx-

mately one house in three in England and Wales is owner-occupied. The war has inevitably resulted in a great deal of unavoidable herding and many would be less than human if they did not, as a reaction, crave for opportunities of self-expression. Furthermore, the home will assume a new significance in the postwar world. Although the fighting may be over, there will be many unsettling forces. Large numbers may, however well things turn out, experience a sense of frustration. Thus the home, and especially the owner-occupied home, will be a valuable centre of moral reintegration amid the prevailing bewilderment. A wise handling of the housing problem can do so much good; a mishandling of it can do incalculable harm.

THE QUESTION OF MOBILITY

Furthermore, home-ownership for those to whom it appeals and to whose circumstances it is suited, will be yet a further element in the programme of social security which public opinion demands of the post war world.

I repeat, however, that provision for home-ownership need not, and should not, be pushed to any extremes, especially in so far as workers may be handicapped in any lack of necessary mobility in seeking work. On the other hand, the necessity for mobility may be over-rated. There are significant signs that work may be carried to the worker hardly less than the worker will need to be transplanted to his work. In the circumstances, it would be little short of catastrophic if, as we believe, many desire to purchase houses and financial facilities are available, public policy should fail to frame a housing policy which makes provision accordingly. In all this, building societies can play yet again a worthwhile part. They have abundant funds for the purpose and a mortgage service expressly designed to meet the needs of the average citizen. While they are primarily concerned to promote home-ownership, they hope and believe that their machinery may be adapted to assist in the provision of houses for letting.

SOCIETY'S ADVANTAGEOUS POSITION

All our thoughts and energies as a society are directed towards our being in the most favourable position to serve these housing needs. We offer two outstanding advantages: we have ample funds, together with (I hope) the safeguard of a corresponding reputation; and a personal service in which the borrower begins and ends as an individual, with his individual problems receiving our individual attention. Our service seeks to treat him and his problems with all the care and attention that are due to him; and this continues not only while the mortgage is being negotiated, but so long as he is a borrowing member.

In addition, we seek to provide a service of the most rigorous simplicity, entirely free from "red tape" and such like entanglements. Thus an Abbey National borrower has the advantages of an institutional reputation in all that concerns his receiving a square deal, and at the same time a personal service providing the maximum of individual consideration. I have no doubt that when the housing history of the next decade is reviewed in retrospect, the Abbey National will not need to make any apology so far as its own contribution is concerned.

The board joined in the congratulations to its deputy chairman, Mr Stanley C. Ramsey, on his appointment to be a Vice-President of the Royal Institute of British Architects. Mr Bruce Wycherley, who shares with me the office of managing director, continues to preside over the deliberations of the Council of the Building Societies Association.

The Abbey National has inherited traditions that are both an inspiration and a challenge, but we hope and believe that we shall be fully equal to them.

Mr Stanley C. Ramsey, F.R.I.B.A., deputy chairman of the Society, in the course of seconding the adoption of the report and accounts, said: The task is to produce the right number of houses in the right places at the right time, and to produce houses that are homes. It is impossible for some forty-seven million people to live together on so small an island as ours, in any degree of comfort and well-being, without a considerable amount of planning. Nowhere is this truer than in the realm of housing. Town-planning is the convenient term we use to denote an arrangement by which we can enjoy in amity and convenience that reasonable degree of good-life which should be the inheritance of all.

Within our means, that is within our reasonable desires, I am convinced we can have good and beautiful homes properly grouped to produce towns and villages which shall be a worth-while contribution to the national wealth and expressive of a great and civilised people, provided always that we have the will to achieve. Public, that is enterprise by the state, and free enterprise, which is individual effort, both have their parts to play. Properly viewed they are complementary and not antagonistic agencies. Indeed, without the full effort by each, on a well devised system of production, it is difficult to see how the national aim of providing four million houses in ten years is to be attained. Ideologies apart, there is an enormous volume of work to be undertaken by the state working through the agency of the local authorities in dealing with the slums, and in the provision of homes for those who, even under a scheme of full employment, will not, for some time it is feared for various reasons, be able to provide homes for themselves without assistance. This, then, is the real dividing line; for where the state stops, there free enterprise must take up the burden.

In the provision of post-war houses new methods should be tried, and what is known as "pre-fabrication" developed with every encouragement. Pre-fabrication of component parts such as doors, windows, fireplaces, kitchen equipment, etc., formed 40 per cent. of the pre-war mass produced house and this method is capable of very great extension.

There are also well-tried systems of pre-fabrication for the complete edifice but there have also been many failures, not necessarily in the field of design. In my opinion, however, pre-fabrication, whether of the parts or of the whole, should be used not as the major solution of the problem but as a contribution. I am convinced that given reasonable facilities our house-builders can produce better houses more speedily, more economically and in greater number than can any untried system which relies mainly on engineering rather than on traditional building methods.

Given one-tenth the drive, and one-tenth the determination that has gone to our war effort, we can achieve a solution of the housing problem, which although without perhaps giving us all that our extreme idealists are crying out for, will give us homes that are commodious, of good quality, and of good design. To this solution we of the building societies can make a very great contribution and ease the financial burden which, of necessity, immediate post-war conditions will impose.

Mr R. Bruce Wycherley, M.C., F.C.I.S. (joint managing director), speaking on behalf of the directors, expressed their appreciation of the further opportunity to serve the society. Paying tribute to the staff, headed by the general managers and the secretary, he said they constituted a closely integrated unit, the excellent team spirit of which was outstanding.

The report and accounts were adopted. The chairman announced that Messrs C. Lovett Gill, F.R.I.B.A., A. C. Hutchins, F.C.A., and F. Morfee Walsh, M.C., F.S.I., had been duly re-elected to the board.

THE NORTHMET POWER COMPANY

SATISFACTORY RESULTS

LARGE INCREASE IN CONSUMERS

At the ordinary general meeting of The Northmet Power Company, held at Caxton Hall, Westminster, S.W. 1, on Tuesday, the 27th instant, Mr G. W. Spencer Hawes, O.B.E., M.I.E.E., who presided, said:

You will be disappointed to learn that our chairman, Lord Ashfield, is unable to preside at this meeting. I am sorry to say that during the week-end he has become indisposed and has asked me to take the chair this morning. I will ask the secretary to read the speech Lord Ashfield has prepared for this occasion.

Before I review the accounts for 1944 I would draw your attention to the statement at the end of the directors' report which summarises the financial results for each of the four years 1940 to 1943.

Stockholders will observe that with the exception of 1942 there was little variation in the financial results for each year of this period. The increase in the net profits for that year was accounted for, as to part, by an increase in the number of units sold and, mainly, by a reduction in the rateable assessment of your undertaking, which while it was secured in that year was retrospective to April 1, 1940. This had the effect of increasing the net profits by £95,000. You will have observed that the depreciation account was strengthened in that year, and in the same year a provision of £100,000 was made towards the war damage contribution to be met by your company.

INCREASED FINANCIAL RESULTS

You will observe from the net revenue account that the financial results of the working for the year 1944 show an increase over those for 1943. Adding the interest and dividends received, there is a total of £927,300, which exceeds that of the previous year by some £66,000. I hope it will be agreed that this is a satisfactory achievement in all the circumstances.

The directors have allocated a further sum of £50,000 to the reserve for war damage contribution, making a total provision of £150,000 for this purpose.

The provision for depreciation is £457,000, this being the calculated amount required to meet the depreciation on the fixed assets of your company and the station company less sinking fund provisions of the latter company.

The sum total of all the items I have mentioned leaves out of the total revenue for the year a balance of £208,991. If to this sum is added the amount of £43,279 brought forward from the previous year, a total of £252,270 is available, which your directors recommend should be appropriated as to £67,873 by the payment of the dividends, less tax, on the 6 per cent. cumulative preference stock and the 4 per cent. cumulative preference stock, and as to £111,988 by the payment of a dividend of 7 per cent., less tax, on the ordinary stock, of which 3 per cent. has already been paid. This dividend of 7 per cent. for the full year is the same rate of dividend as that for each year since and including 1940. If these appropriations are approved, a balance of £72,409 will remain to be carried forward, which is £29,130 more than the amount brought into the accounts from 1943.

BALANCE SHEET ITEMS

I would ask you now to turn to the balance-sheet, from which you will note that capital expenditure in the year under review has increased by £24,985 on the previous year's figures, giving a total capital expenditure to date of over £13,000,000.

The first item under the heading "Current Assets" is investments shown at £2,097,000—an increase of roundly £200,000 over the previous year. This sum represents cash surplus to current requirements, and, with the exception of £20,000,

is invested in Government securities. It will be seen that the market value is in excess of the cost of these investments.

The item "Sundry Debtors" amounts to £1,208,627—an increase of £153,497 over a year ago, which is due to the larger amounts owing to your company for electricity supplied as the result of increased consumption.

The loan account to subsidiary companies amounts to £477,000, of which £419,000 has been loaned to the station company, and this latter sum will shortly be repaid. The balance of £58,000 is loaned to the Bishop's Stortford, Epping and District Gas Company.

Looking at the left-hand side of the balance-sheet, you will see there is no change in the amount of issued share capital. Reserves call for no comment as they have been increased merely to the extent of the annual provisions for redemption of the 5 per cent. mortgages and 4 per cent. and 34 per cent. debenture stocks. The total amount of loan capital now outstanding is less by some £28,000 than the amount outstanding at the end of 1943, due to the purchase and cancellation of debenture stocks during the year.

WAR RECORD

Now that I have dealt in brief outline with the years 1940 to 1943 and reviewed the accounts for 1944 it might, I think, be of interest if I gave you a few figures illustrating the changes in the affairs of your company from the outbreak of war until the present time. I will take first of all the number of consumers. At December 31, 1938, they numbered 263,750 as compared with 338,245 consumers today; an increase of 28 per cent. The number of units supplied to them has risen from 706,059,000 in 1938 to a record total of 1,054,667,000 in 1944—an increase of 348,608,000 or nearly 50 per cent. compared with 1938. In this same period the gross revenue rose from £3,342,000 in 1938 to £5,113,000 in 1944. These figures will indicate that throughout the period of the war to date we have been fortunate in escaping excessive damage by bombing and have kept pace with the necessary demands for electricity supply. Such interruptions as we have had to our supply system have, I am glad to say, been of short duration.

COST OF GENERATION

When one turns to expenses, the cost of generation immediately arises. It needs no words of mine to remind you that the price of coal is the main factor and here there has been a steady increase in price, until today the cost of coal is about 100 per cent. higher than in 1938. Altogether our expenses increased from £2,428,000 in 1938 to £4,268,000 in 1944.

I have already told you that the total capital expenditure of your company was over £13,000,000, and if to this we add the total capital expenditure of the station company the aggregate total exceeds £18,500,000.

A SATISFACTORY RESULT

In conclusion, I feel that I can ask you to approve the report of the directors and the statement of accounts in the belief that you will regard them as satisfactory. We have reached what I hope will be the closing days of the war with our property intact and without grievous damage by bombing to the area itself. Our consumers are, I believe, satisfied with our efforts to meet their demands for a supply of electricity.

The report and accounts were unanimously adopted.

THE BRITISH ALUMINIUM COMPANY, LIMITED

WAR-TIME EXPANSION

Mr R. W. Cooper, O.B.E., M.C., presiding on the 27th instant at the annual meeting of the British Aluminium Company, Limited, said: The company were the pioneers of the electrolytic production of aluminium in Great Britain, and later in Norway, as well as the large-scale utilisation of water-power in the Highlands of Scotland. Aluminium was an almost unknown metal 50 years ago, and the early small-scale efforts of the company were fraught with considerable difficulties. These were gradually surmounted and the foundation laid for the great expansion which has since taken place, and the rise of the company to its present important status among the industries of the country and of those essential to the national interest.

PRODUCTION INCREASED

Since the outbreak of war the internal increase in the production of aluminium was an urgent matter, and this we accomplished as far as possible by completing our Lochaber scheme, increasing our output at Kinlochleven by the utilisation of transmitted power, and by erecting and managing a plant on behalf of the Government where power was obtained from a steam station. We were also associated with two further developments for the production of the metal by the use of transmitted power. With the exception of the Lochaber hydro-electric extension, all these additional producing units had to be closed down last year on account of the coal situation, and there appears to be little likelihood of these plants being restarted.

Continuing, he said that at the outbreak of war they had large stocks of the raw material, bauxite, which was extremely beneficial, as the supply from France stopped in 1940. Very extensive work was done on development of deposits from Empire sources. By far the largest demand was in fabricated form, particularly for aircraft construction, and this had necessitated considerable additions to existing facilities prior to the war. Rolling mills at Milton and Warrington were largely extended and an entirely new rolling mill erected, which was the largest in the country of its kind. In Australia their associated company completed their rolling mill, commencing production in 1941, and large extensions had been carried out.

In India operation began in 1941, and they were now erecting an alumina factory where their adjacent bauxite deposits would be used. Premises near Gerrards Cross had been purchased for conversion into a new central research laboratory, a development of the utmost importance to the company. Their production and fabrication was under strict Government control, and only very limited quantities could be diverted to other purposes. The change over to commercial work would involve many difficulties. Concentrated and vigorous efforts and some exercise of patience would be essential before commensurate benefits could be secured. They had no doubt of the ultimate absorption of the world's output. They hoped that the lightening of industrial taxation would receive early consideration, since under present conditions British industry was severely handicapped with regard to exports.

THE YEAR'S RESULTS

The total profit for the year was £1,049,257, a reduction of £19,680. They had added the same amounts as before to depreciation and reserve accounts, namely, £75,000 and £125,000. The reserves and undivided profits now totalled £6,067,812. They now proposed a final dividend of 7 per cent., making 10 per cent. for the year, leaving an increased balance of £280,691 to be carried forward. They were not yet able to present a consolidated balance-sheet, owing to delay in receiving accounts of overseas subsidiaries and the location of others in enemy occupied territory.

The report was adopted.

BRITISH POWER AND LIGHT CORPORATION

INCREASED SALES REVENUE

DEMAND FOR POWER

The sixteenth ordinary general meeting of British Power and Light Corporation, Limited, was held, on the 22nd instant, at Winchester House, Old Broad Street, E.C. Mr George Wansbrough presided.

The following is the chairman's statement which was circulated with the report and accounts:

Considerations of national security still prevent us discussing fully the work of our subsidiary companies, but the consolidated profit and loss account shows quite clearly the financial result of the year's working. The revenue from the sale of energy has increased by approximately £144,000 to £2,347,780, and cost of energy generated and purchased by £50,000, leaving a gross profit of £1,097,465 against £1,002,795 for the previous year. Against this, provision for taxation at £421,267 shows an increase of approximately £58,400, with the result that the amount available for service of ordinary capital is £101,873 compared with £88,465.

The consolidated balance-sheet shows that expenditure during the year on fixed assets amounted to approximately £46,000, while stock and work-in-progress have increased by some £10,000. On the other side debentures and loans of subsidiary companies are £115,536 less, through the operation of the sinking funds; while sundry creditors are up by £26,400, due mainly to increased liability for taxation.

The demand for electricity in all the areas of our subsidiary companies continues to increase. We sold to consumers rather over 410 million units in 1944 as compared with 145 million units in 1938, an increase of approximately 182 per cent., representing a steady increase of 19 per cent. per annum. The greater part of this substantial increase is due to the increase in power demand, and is a measure of our contribution towards the war effort, for during the whole of the period under review domestic users and ordinary business supplies were thoroughly damped down, a fact well appreciated by household users everywhere.

I am glad to be able to report, as last year, that in spite of increases in the costs of energy purchased, of increases in costs of material, wages, etc., none of our subsidiary companies has found it necessary to increase charges. Notwithstanding the increase of 182 per cent. in the amount of electricity sold and of increases in the costs of almost everything we bought, the increase in our own operating and management expenses (excluding generation) over those for 1938 has been no more than 25 per cent.

All our plant, including transmission and distribution lines and cables, have been fully maintained throughout the war in spite of all difficulties. The war damage sustained has not been important, and in no case did it involve any serious interruption of supply.

POWER RESOURCES INVESTIGATED

It will be remembered at our last annual meeting it was announced that two eminent engineers had been appointed to investigate the further water-power resources of North Wales. Their preliminary investigation was recently completed and their report rendered to us. Your directors have thought it right to submit the report to the Minister of Fuel and Power, the Electricity Commissioners and the Central Electricity Board. In these circumstances it is only possible at the moment to say that the investigation discloses a number of developments the economic possibilities of which merit careful study.

So far as it is possible your directors have given consideration during recent months to probable post-war development.

First there will be arrears to be made good—normal developments which but for the war would in many cases have been carried out long ago. This applies more particularly to commercial, farm and domestic supplies. Our future aim is to ensure that a supply of electricity shall be made available in every village and on every farm within our areas of supply without burden on the other consumers. The rate of progress will necessarily depend upon the available supply of labour and material.

BURDEN OF LOCAL RATES

In connection with the economic development of supplies in rural areas, there is a point of importance to which we think the attention of the authorities should be directed, namely, the burden of local taxation. The total of rates paid by your operating companies last year was over £110,000 and exceeds by 50 per cent. the net dividend paid to the ordinary stockholders. The rates paid in respect of our distribution system average over 1½ per cent. on the capital expenditure involved. Such a burden as this on future extensions removes from the category of being self-supporting a very substantial body of developments which on true economic merits are justified and which ought not to be so penalised.

The Government's proposals for dealing with war damage contributions for public utility undertakings have not yet appeared, but your directors have had regard to this contingency in their recommendations as to disposal of available earnings.

Exacting demands continue to be made on our staff, both permanent and temporary. We are consequently compelled to make increased demands on those members of staff who remain, but efficiency has been maintained at a high level, and all have responded with willing energy to every call made upon them.

The report and accounts were unanimously agreed to.

JOHN WRIGHT AND SONS (VENEERS), LIMITED

POST-WAR RAW MATERIAL OUTLOOK

The ninth annual general meeting of this company was held, on the 23rd instant, in London.

Mr L. C. W. Jenkins, F.C.S. (chairman and managing director), said that he welcomed the opportunity of again expressing his thanks to the staff and workpeople for another year's hard work, to his colleagues for their support, and paid tribute to employees with His Majesty's Forces.

Continuing, he said that production had been maintained at a high level. He referred to his remarks in 1939 and 1940, when he pointed out that the company had been able to swing over to a total war production. In the post-war period, however, it would be necessary for a large part of the plant to revert to production of veneers required for decorative purposes, such as furniture, panels for building, ships, trains, shopfitting, etc., as well as for commercial grade plywood.

An insatiable demand for both types of veneer was anticipated, and to meet that every endeavour must be made to secure an adequate supply of suitable raw material, namely, logs. To that end every effort was being made by the trade to obtain the support of the Government departments concerned, and he was hopeful that the representations would achieve a favourable result.

The result of the ninth year's working showed a profit of £40,741, which compared with £40,217 in 1943. After appropriations and providing for income-tax, there was a balance at credit of profit and loss account of £11,263, and the general reserve was now £45,000.

The report was adopted; a final dividend of 5 per cent., making 7½ per cent. (less tax) for the year, was approved, and the proceedings terminated with a vote of thanks to the chairman.

BORAX CONSOLIDATED

POLICY OF PROMOTING SALES

The forty-seventh ordinary general meeting of Borax Consolidated, Limited, will be held, on the 4th proximo, in London.

The following is an extract from the statement of the chairman, Mr D. Abel Smith, M.C., circulated with the report:—The net profit for the year ended September 30, 1944, amounts to £396,333, a decrease of £2,120 compared with the previous year and we now propose the payment of a final dividend of 3 per cent. on the preferred ordinary stock, which will absorb a further £18,000, and to pay a dividend of 7½ per cent. on the deferred ordinary stock, representing the sum of £97,500, less income-tax. These dividends, subject to the resolution being passed, will bear date April 4, 1945, to come within the past financial year, and will be posted to stockholders as soon after that date as labour shortage will allow. After providing for these payments, amounting, less income-tax, to £88,750, and deducting £40,000 for war contingency reserve, the balance to be carried forward is £281,495, an increase of £20,463 on the previous year.

The main cause of the present increase in price compared with peace times is the high rates of freight, all the crude material produced on and normally shipped to Europe from the Pacific Coast having to be diverted overland to Gulf ports owing to the whole of the shipping on the Pacific Coast being confined to war requirements; the high freights from the Gulf ports to Europe add to this cost. Just as soon as these conditions improve and the freights are reduced, our company will, subject to the Ministry's approval, give its buyers the benefit thereof.

BORAX IN AGRICULTURE

Further proofs have been forthcoming of the importance of Boron in the healthy nutrition of plants. The needs of a starving Europe after liberation will be on a scale to call for an intensive and rational fertiliser programme. To safeguard some of the crops and obtain a maximum yield, it has now been generally recognised that borax or boric acid will have to be included in the fertilisers used.

The United States Potash Company has been engaged throughout the year to its utmost capacity in meeting the increased demand, both for fertiliser and chemical requirements, and with the approval of the United States Government is at present introducing improvements and extensions to meet the continued growing demand. That company holds also the proud record of securing three "E" awards from the U.S. authorities for the excellence of its services, and it is a pleasure to take this opportunity to express how highly we value the way this business has developed under its extremely able management.

LEGAL PROCEEDINGS

You will have noted the reference in the directors' report to the proceedings instituted in the U.S.A. against the company and its subsidiaries for alleged infringements of the Sherman Anti-Trust Laws. As these proceedings are pending, I am necessarily limited in the comments which I can make. All steps are being taken to safeguard the interests of your company, and Mr J. Gertley, one of the managing directors, visited America recently to render every assistance to ensure this end. Our American lawyers, in whom we have every confidence, advise us that we are entitled to expect a favourable decision. In order to contradict rumours, I must stress the point that the Sherman laws do not relate in any way to trading with the enemy and that, in the present proceedings, there is not and there could not be any allegation that this company, or any of its subsidiaries, had been guilty of trading with the enemy. In this country and in America we have assisted to the utmost in the furtherance

of the war effort—in America this has been recognised by the grant of the Army and Navy "E" awards for exceptional work in national defence. The policy of our company has been and will be to develop and increase the uses for and sales of Boron products in every market and by all means, including the employment of mass-production methods to reduce the prices of our products to an economic level within the means of all users. Since the war our industry has been controlled by the Ministry of Supply and our profits have

been restricted to the pre-war level. After the war we are fully prepared to agree to and co-operate in such control as may be considered necessary.

A WORLD-WIDE BUSINESS

Your company is a good example of the enterprise of the last generation, which was responsible for the building-up of invisible exports and the attainment of a fair standard of living. As its history shows, your company was a pioneer in the

industry: it undertook all the risks and difficulties inherent in a comparatively new field of mining, it set up factories and, traded in many foreign countries, and, although it suffered set-backs, it has attained an established position as the largest unit in its industry. To-day, your company's business is world-wide, it contributes annually to this country substantial sums in foreign exchange and it imports a commodity—not found within the British Empire—which is essential both in war and in peace.

(Continued from page 423)

In the long run, prefabricated houses will be needed insofar as they offer scope for bringing down construction costs, but in the short-run they will be needed urgently as a means of alleviating the pressing shortage of dwellings. RIBA has, perhaps, not laid sufficient stress on their short-term rôle, though it is recognised in the report that some prefabrication systems "could be reasonably followed." According to the White Paper on Housing, three-quarters of a million houses are needed so that each family can have its own dwelling, and another half-million to reduce overcrowding. In this context complacency is out of place. Unfortunately, complacency is a criticism that can be laid at many other doors than RIBA's.

Outlook for Paper Companies

The accounts of two large paper manufacturing concerns, the Bowater and the Inveresk groups, show improved results for 1944. Bowater-Lloyd Paper Mills owns the ordinary capital of three large British and a Newfoundland subsidiary, but the group does not publish a consolidated balance-sheet. The Bowater group suffered severely from the restriction of paper supplies at the beginning of the war, and all except one of its British companies were unable to pay even preference dividends until 1943, when substantial arrears were liquidated. Similar amounts have been paid for the year ended September 30, 1944, with smaller aid from dividend reserves, and all companies have now cleared off arrears on first preference stock. Inveresk Paper Company, which suffered less financially from wartime rationing, is able to maintain its ordinary dividend of 6 per cent, whilst securing an increase of some £30,000 in the group's carry forward, as revealed by the consolidated accounts.

Paper rationing of all types remains, however, very strict. The slight improvement in 1944 profits is the result of the increased paper quotas allowed at the end of 1943, which were supplied partly out of stocks, partly out of increased imports, and partly from higher domestic production. Newsprint mills in 1944 were allowed to produce 18½ per cent, instead of 15 per cent, of their normal pre-war output. The gain to manufacturers has been reduced by the fact that costs have risen, while the controlled price has been unchanged at £32 5s. per ton delivered. Until traffic is resumed with Scandinavia, where substantial supplies of pulp and paper have accumulated, the paper outlook remains poor. But the Bowater board clearly anticipate some increase soon in the size of British newspapers, to be met by expanding output of newsprint mills.

Such expansion is contingent on supplies of labour and materials being made available. The ending of munition work at the mills, which has helped to cover their overhead charges during wartime, will add to the difficulties of the transition period. It is clear that no quick recovery is possible for paper manufacturers, but strong liquid resources and the possibility of a bright "mid-future" when the public's hunger for reading-matter can be satisfied, adds lustre to the prospects of the Bowater and Inveresk groups.

Health of Women War Workers

Unlike coal-mining, for which detailed information exists, very little is known about the causes of involuntary absenteeism among factory workers. For this reason, the occasional surveys undertaken by the Industrial Health Research Board of the Medical Research Council are very welcome, and could with advantage be conducted on a wider scale and at more regular intervals. The Board's latest report on the sickness absences of some 20,000 women in five munition factories (producing small arms, fuses, shell

cases, guns and projectiles, and electrical equipment) during the last six months of 1942, provides an interesting (and probably typical) picture of the position in industry generally during the war.

The recorded absences due to sickness represented 7.8 per cent of the total number of days in the period, excluding casual, uncertified absences and cases of pregnancy. 45.3 per cent of the women had no sickness absences, while 14.4 per cent were absent for more than 29 days. The majority of the absences were due to colds and gastric illnesses, but there was a high incidence of "nervous disorders," and a large number of prolonged absences due to "fatigue." The absences of married women, as might be expected, were more numerous and more prolonged than those of single women, which they exceeded by 65 per cent. Though most days were lost in the 30-50 age group, the difference between married and single women was most marked in the under 25 age group. Productive workers lost more days than clerical workers or examiners, and women with long service lost fewer than new recruits.

The report attributes these results mainly to the strain of long hours on unaccustomed or monotonous work, and, in the case of young married women, to the dislocation of normal family life and worry if their husbands were abroad. It does not attempt any suggestions for improving the health, and thereby the output, of women workers, apart from some general recommendations about extending factory medical and canteen services (it points out that most women are indifferent to the importance of a properly balanced diet), but it emphasises the need for keeping accurate and complete records of sickness absences, as a general guide to industrial health. Many of the points raised are obviously being solved by the passage of time—the report relates to 1942. Shorter hours are being worked already, and many women will leave industry when the war is over, and domestic problems will automatically adjust themselves. But this type of study furnishes a useful guide to many problems of women's employment, which will continue even when the war is over.

Shorter Note

In accordance with the recommendation of the Catering Wages Commission, the Minister of Labour has set up a Wages Board to regulate the wages, hours and conditions of workers in public-houses, clubs and other licensed non-residential establishments. About 80,000 establishments will come within the scope of the Board, which is the third to be set up by the Catering Commission.

RECORDS and STATISTICS

GOVERNMENT RETURNS

For the week ended March 24, 1945, total ordinary revenue was £60,563,000, against ordinary expenditure of £109,204,000 and issues to sinking funds of £10,000. Thus, including sinking fund allocations (£15,659,280), the deficit accrued since April 1st is £2,871,628,000 against £2,735,799,000 for the corresponding period a year ago.

Total	604,976	582,173	602,281	11,737	11,094

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £6,083 to £2,850,427, the other operations for the week (no longer shown separately) increased the gross National Debt by £48,895,401 to £22,354 million.

War and Peace

THE last act of the European war is drawing to a close. The British and the American armies in the West have carried their blitzkrieg from the Rhine into the very heart of Germany. Everywhere, from the Westphalian plain to the Bavarian hills, the tides of Allied armour and infantry continue to surge forward. The distance between the western and the eastern fronts is shrinking with great rapidity. The last hour of the Third Reich has struck. The military tasks of the alliance are nearly fulfilled, at least in Europe, but the tasks of peacemaking for the part still lie ahead. They are certain to put Allied diplomacy to a test much more severe than any of the pains of war. Victory over the common enemy inevitably tends to loosen the ties of solidarity that bind allies in the face of mortal danger. On the eve of victory, and even more on the morrow, differences of outlook and interest reassert themselves. Indeed, anything else would be an unnatural defiance of all historical experience. And as if to provide a timely reminder, there has been an outbreak of disagreement and dissension about the San Francisco Conference and the Dumbarton Oaks proposals that it was called to adopt. As the day of the founding conference of the new League draws nearer the amendments to its constitution pile up and ever new claims and demands of the most contradictory character are put on record by its prospective members.

In raising demands, Russia has so far held pride of place. The two features of the Dumbarton Oaks pro-

posals which have excited the greatest opposition among the powers unrepresented there—the dominant rôle assigned to the Great Powers, and the provision by which a Great Power (but a Great Power only) can veto any action against itself—owe more to Russian insistence than to either American or British views. It has been clear for some months that there would be severe opposition, in any general conference, to these clauses of the draft. But in the last few days, two further Russian demands have become known. It is revealed that, at Yalta, Marshal Stalin asked that the Ukrainian and White Russian Republics should be members of the new League, thus giving the Soviet Union three votes in the Assembly. And more recently the Marshal has asked that the Lublin Administration, now established in Warsaw, should represent Poland at San Francisco. The American and British Governments have agreed to support the first proposal (at one time the United States intended to demand three votes for itself, but has since thought better of it), but both have rejected the second.

These two Russian demands have stirred up more dissension than they are intrinsically worth. Multiple representation in the new League's Assembly is almost meaningless in view of the fact that all vital decisions are to be reserved to the Security Council. Similarly, the demand for the admission of the Lublin Government might be regarded as a purely demonstrative gesture, since Russia has pledged itself to the

"broadening" of that administration. But the significance of these Russian demands lies less in their intrinsic merits than in the evidence they provide of a complete lack of any enthusiasm on the part of Russia for the new World Organisation or of any desire to consult its partners' susceptibilities. The lack of enthusiasm has been further underlined by the fact that Mr Gromyko, the Soviet Ambassador to the United States, and not Mr Molotov, the Foreign Commissar, has been appointed to be the head of the Soviet delegation at San Francisco. And, as if the moral were not already clear, the Russians have bluntly stated that for the preservation of peace and for their strategic security they will rely on their bilateral alliances rather than on the new League.

*

In the light of these and similar statements, there can be no doubt about the reluctance with which Russia seems to be joining the world organisation. There is, in fact, an anti-League complex colouring the Russian attitude, which has its origin in Russia's experience with the old League of Nations. Moscow has not forgotten that Russia was the only state against which the most humiliating sanction—expulsion from the League—was applied in Geneva, when so many flagrant aggressions had been treated with mild indulgence. With this Genevan humiliation still freshly in mind, Russia, now victorious and sought-after, is showing an exaggerated anxiety to make her prestige felt at San Francisco. Marshal Stalin says in effect: "If Russia is to join the new League—and she will do so only in order to demonstrate her solidarity with her Allies—she will take care to see that never again shall the League be in a position to put her in the dock and to pass judgment on her conduct." This determination to stop up every possible loophole for attacks on Russia is certainly not a sign of great moral strength. The whole concept of a world organisation would be reduced to the level of farce if every member were equally to refuse to take the risk of finding its conduct, at one time or another, discussed and judged before an international forum. The League should not be regarded as a sort of insurance company against all damage to national reputations. But this does not in the least affect the now manifest fact that the Soviet Government regards the new organisation with suspicion and that other powers are compelled to take its views into consideration.

To those who have followed Russian policy, this attitude is a disappointment perhaps, but not a surprise. But unfortunately there has been an official conspiracy, born more of wishful thinking than of the desire to deceive, to pretend that all was going smoothly with the plans for a new, and better, League. This has been particularly so in the United States. The American people, with their tendency to attach magical properties to paper constitutions, would, in any event, have been predisposed to exaggerate the importance of the formal organisation of world order. But they have also recently been subjected to a high-pressure campaign by the State Department to "sell" the Dumbarton Oaks proposals. The calling of the conference at San Francisco has been represented as the most important decision taken at Yalta and the document to be approved there as the greatest hope for continuing peace and as a discharge of the largest part of America's responsibility to the world. Now suddenly, with only three weeks to go, the American public discovers that the policy to which it has been led to pin such exaggerated hopes is gravely endangered. If the Big Three were united, they would have to face opposition from the smaller powers. And though unremitting efforts have produced complete textual agreement among the Big Three, it is now apparent that their real courses are very divergent.

What is more, it is beginning to look as if the effort to secure Russian agreement—the effort already made and that still to come—may endanger the agreement of American public opinion. President Roosevelt has always been conscious of the mistake that Wilson made in identifying the League of Nations too closely with his own party, and he has included three Republicans in the

American delegation to San Francisco. In theory, he has thus got his opponents to endorse the policy of the Administration. In fact, however, the result is to carry the controversy over the principles of the new League into the ranks of the American delegation. Senator Vandenberg's proposed amendments to the statutes of the World Organisation amount almost to a frontal attack on the Yalta decisions. He proposes that the powers of the Assembly should be strengthened and that "the Security Organisation should be barred from taking any action in support of a situation which either the Security Council or the Assembly considered in need of adjustment." This would virtually invest the Assembly with the power to veto decisions taken by the Security Council. Another of the Senator's amendments runs:

If the Security Council finds that any situation which it shall investigate involves injustice to the peoples concerned it shall recommend appropriate measures of adjustment which may include revision of treaties and of prior international decisions.

No objection in principle can be raised to a clause in the Covenant of the new League providing for the revision of treaties in accordance with international justice. But there can be little doubt that Senator Vandenberg's amendments, if they were to be accepted by the American delegation, would meet with the strongest Russian opposition. The Russians are certain to see in them large marks of interrogation placed upon such "prior international decisions" as the acceptance of the Curzon Line by the Big Three. Still another of Senator Vandenberg's amendments provides for the power of the Assembly to make recommendations on any issues discussed by the Security Council. Undoubtedly, in this, too, the Russians will see simply another loophole which would enable "hostile capitalist powers" to place Russia once again in the dock. The guess may be risked that Russia would possibly prefer to withdraw from the new League altogether rather than agree to such modifications. The course of events at San Francisco may compel the President to choose between the Russians and the Republicans—with the knowledge that the defection of either might cripple the project of the United Nations.

*

This is an unfortunate state of affairs to arise so late in the day. It is easy to see now how it has arisen—from the resolute refusal to face the fact that Russian and American ideas of how to secure peace in the world are radically different, with the British view somewhere in between, but probably much closer to the American. What is not so easy is to see what can now be done about it. Partly because of the mounting difficulties, partly because of the inconvenience of having so many of the world's statesmen in California at such a crucial moment as April 25th promises to be, the suggestion has been made in many quarters in the last few days that the conference should be postponed. All experience certainly shows that large conferences are fruitless unless there is very substantial agreement beforehand, and it is always possible that further negotiations—with some of the smaller powers brought in—might find ways out of the difficulties.

But the mood of the peoples of the world is a factor in the problem and the psychological effect of postponement has to be considered. In Europe, no great harm would be done. The peoples of the Continent have other things to think of, and the British people, while by no means sharing the Russian attitude of suspicion, have evinced no great enthusiasm for Dumbarton Oaks. But in America the story may well be different. The State Department's propaganda might recoil against itself if the great event towards which it has been building up its climax were now to be deferred. It is the President's decision. He alone can judge whether more harm is likely to be done by postponement or by disagreement in full conference—or whether there is still a chance of finding some form of words which can mean wholly divergent things to different people. In the short run, this third course may avoid many embarrassments. In the long run, it may well be very dangerous.

The Reid Report

At last, there is a real report on coal. Not since the Sankey and Samuel reports has there been such a full and penetrating diagnosis of the troubles which have made mining the sick man of British industry as is contained in the Reid report. The committee has approached the coal problem from a severely technical angle, and its findings are those of expert mining engineers. This makes its conclusions the more effective, since the industry is lifted out of the haze of politics which has for so long enveloped it. Not that the committee has found it possible to leave wider issues aside. Though the practical recommendations are on technical lines, the committee is forced to the conclusion that improvements in technique will not avail unless they are accompanied by far-reaching changes in the organisation and structure of the industry:

It is not enough simply to recommend technical changes, which we believe to be fully practicable, when it is evident to us, as mining engineers, that they cannot be satisfactorily carried through by the industry organised as it is today.

The Reid report is in fact as complete an exposure of the technical inefficiency of the coal industry as the Platt report was of the technical inefficiency of the cotton industry, and its criterion is the same as that applied in the Platt report—productivity, measured in terms of output per manshift (OMS). Its findings will come as a surprise to few; to most, they will be a confirmation of long-held suspicions. The Reid committee attributes the inefficiency of the industry largely to the "long individualistic tradition" which has persisted in Britain, and has led the owners to oppose the principle of amalgamation which alone could have made technical changes possible. The leaders of the industry failed to appreciate the need for technical advance or to realise the gravity of the situation that developed after the last war. The employers as a body have been prepared neither to accept the principle of the survival of the fittest nor fully to abandon their traditional individualism. In relation to their own undertakings the short view has too often prevailed. This attitude, together with the fact that British mining engineers have not enjoyed the technical independence allowed to their opposite numbers in Continental countries, has been responsible for a dearth of competent technical staffs with a sufficiently progressive or realistic outlook.

Before the last war, OMS in Great Britain was higher than in practically any coal-producing country except the United States. But productivity barely increased during the interwar years, and is now low compared with that not only of the United States but also of the more comparable Continental producers. From the middle

twenties to the middle thirties, OMS increased by 118 per cent in Holland, by 81 per cent in the Ruhr, and by 54 per cent in Poland, but by only 14 per cent in Britain.

The disparity in productivity between Britain and America can be largely explained by the more favourable physical conditions in the American coalfields. But, contrary to the general belief, there is no such easy excuse for the poor British showing in comparison with the European countries. The Committee states that British conditions, in fact, are more favourable than those of the Ruhr and Holland, though somewhat less favourable than in the mines of Poland and Upper Silesia.

There are other reasons for the inferiority of British OMS, and they are by no means purely technical. The British industry has been "in a perpetual state of financial embarrassment" and the "political uncertainty surrounding its ownership" has been detrimental to the expenditure of money on capital equipment. The dispersed ownership of the British mines, compared with the high degree of integration on the Continent, has prevented the concentration of production on the most efficient units and has made it "difficult, if not impossible, to ensure that the abilities of the best mining engineers are widely available." In addition, the fact that until very recently the mineral itself was in the hands of a number of different royalty owners was a deterrent to orderly extraction. The wave of intensive rationalisation on the Continent in the 1920s by-passed the British industry, with the result that by comparison, British mines are still under-mechanised and uneconomically laid-out and, in particular, that their underground haulage and transport systems are antiquated. What the committee calls "startling proof" of this point is shown in the fact that in the United States, there is one haulage worker for every 50 tons of coal produced, in Holland, one for every 20 to 25 tons, and in Britain one for only every 5 tons. With almost monotonous regularity, the report comments on every aspect of British production: "Efficiency is capable of improvement" . . . "the standard is too low."

*

The technical solutions put forward by the Reid Committee can be summed up in two words—mechanisation and modernisation. This must be applied to all the coal-getting processes from the face to the railway wagon. Twenty per cent of Britain's coal is still hand-gotten and this proportion could "be reduced with advantage." Where geological conditions rule out the introduction of mechanical cutters, pneumatic picks should be used. But it is not in the actual cutting of coal that there is room for the greatest economies. Loading and transport in the mine stand out as the two departments most in need of

ALLIANCE

HEAD OFFICE TEMPORARILY AT KIDBROOKE PARK, FOREST ROW, SUSSEX.

modernisation. The hand filling of cut coal should be reduced, and the committee believes that mechanical loaders and machines which simultaneously cut and load the coal "represent a revolutionary development of mining technique." Locomotive haulage or conveyor transport should be introduced to replace existing haulage practices, which are not only wasteful of manpower but act as a brake on OMS at the face. If these appear to be the most urgent needs the report also gives a long list of other necessary technical reforms in every part of the mine.

The Report does not give a figure of the cost of this technical rationalisation. An Appendix to the Report, however, contains brief particulars of reorganisation schemes drawn up by 13 undertakings in different parts of the country. A straight arithmetical average of the figures for ten of these (not all the data are given for the other three) gives a present OMS of 24 cwt., a prospective OMS of 54 cwt., and a capital cost of 10s. 6d. per annual ton. Not all these schemes might come up to the Committee's requirements, and it is not stated whether the cost is at present or at pre-war prices. But the figure of 10s. 6d. a ton, when applied to the pre-war national output of about 225 million tons, gives a figure of about £120 million as the minimum required to bring the industry up to a satisfactory state of technical efficiency.

Revolutionary technical changes will not be carried out without a change of attitude on the part of those who now manage the mines; and they will not bear fruit without an equally revolutionary psychological change in the miners. On this the Report is as emphatic as it is in condemning the owners' shortcomings. It recognises that the underground miner is "entitled to look for wages at least as high as in other industries demanding an equal degree of skill and efficiency" as well as for satisfactory machinery for settling his grievances; he deserves improved safety and health, and above all the prospects of economic security, and opportunity for education and advancement. But the miner must realise that wages and productivity are complementary, and that until he raises his OMS he will not get what he wants. The miner must co-operate with the management to raise productivity; he must eliminate indiscipline, lightning strikes and absenteeism, and must renounce obsolete practices and customs, which hinder productivity. He must accept the principle of double-shift working, and on this basis he could have a five-day working week of eight hours per shift.

The Reid Committee is not unduly concerned by the prospect of declining manpower, which has been the chief anxiety in wartime. Indeed, the main effect of its recommendations would be to save labour, and though it does not attempt any estimate of the labour force that would eventually be needed, a figure of 400,000 to 500,000 (compared with the 1938 figure of 780,000) is probably about right. With a satisfactory training scheme, and the removal of the stigma attached to the industry, the problem of recruitment would probably disappear.

The committee is perhaps more concerned with the prospect of the inevitable exhaustion of the national coal reserves and the consequent need for their conservation and economic utilisation. "There is no justification . . . for haphazard, wasteful or uncoordinated exploitation of our resources," it states, and it therefore urges that there should be a national plan for the development of the industry. This plan should be drawn up coalfield by coalfield, and not mine by mine, and should provide for the systematic closing down of worked-out mines, the reconstruction of existing pits and new sinkings. This programme, together with the necessary research work and problems ranging from mine drainage to training call for "combined action upon a broad basis."

*

This is an inadequate summary of a report which is not only authoritative in substance, but precise and intelligible in form. Though it is highly informative on a large number of details, it does not in general say anything that was not known or strongly suspected already. The great advantage of this report lies not in any novelty in its findings but in their authority. Henceforward it will

be quite impossible for anybody to maintain that a drastic technical overhaul of the industry is not necessary, and it will be so difficult as to be virtually impossible for anybody to contend that the industry, with its present organisation and management, can carry out the overhaul by itself.

Two things are now plain beyond mistaking. The first is that the industry must be re-arranged in a much smaller number of much larger units—not a mere amalgamation of neighbouring pits, but on a coalfield basis. The Reid Committee thought this conclusion emerged so clearly from the purely technical evidence, apart from any other considerations, that they considered themselves empowered to recommend the creation of a statutory Authority "endowed by Parliament with really effective powers" for the purpose

of ensuring that the industry is merged into units of such sizes as would provide the maximum advantages of planned production, of stimulating the preparation and execution of the broad plans of organisation made by these units, and of conserving the coal resources of the country.

The second fact now clearly established is that, to restore the industry to productive efficiency, a greater sum of capital is required than can be raised by the present industry, or probably by any private agency.

The closing words of the Report are "But there is no time to be lost," and it is now the plain duty of public opinion to insist on action. This can be done the more easily because the Committee has provided the Government with a starting-point for action from which political dogmas are absent. The Committee says amalgamate and rationalise; it does not say anything at all about public or private ownership. It is true that action cannot proceed very far before it runs straight into this question; but this is clearly the only angle of approach by which the obstruction can be cleared. Those whose thinking starts from the dogma of national ownership and proceeds only in search of *post facto* justifications for the dogma will always be a minority, and will always stiffen the backs of the majority by the nature of their advocacy. But if it can be proved that some form of public ownership is technically necessary for efficient production, then the opposition to it, in this pragmatic land, will melt away. And the proof is now very nearly complete. It might conceivably be possible, though only with great difficulty, to bring about the necessary amalgamations by private negotiation; but the provision of the additional capital is a task for the state alone. On the other hand, it also emerges with great clarity from the Reid Report that the political brand of nationalisation, resulting in a cumbersome, top-heavy organisation, bureaucracy-ridden, dominated by the unions and controlled in financial matters by Treasury rules, would be a disaster. The decisive element should be neither financial nor political but technical.

If the angle of approach is from the technical requirements to the appropriate organisation, the sort of structure that will arise will be neither the present nor what is usually meant by nationalisation. It will be something much more like the proposals made in *The Economist* of December 16th last. It was then suggested that reorganisation should be in three stages. First, a technical inquiry should be made (as the Reid Committee now also recommends) to draw the boundaries of a number of mining undertakings, each large enough to be a fully economic unit. Secondly, each of these units should be organised as a single company, in which the existing undertakings should hold ordinary shares. And thirdly, additional capital should be provided by the Government by purchases of further shares. In this way the Government would automatically become the dominant partner and ultimate public control could be combined with business principles of operation.

The Reid Report is by no means the last word on coal. It leaves many questions unanswered—in particular the very difficult question of whether the wide differences in productivity between districts can be reduced, and if not, how they can be reconciled with a national standard wage. But it can be, and should be, the first word in a programme of action

Indian Initiative?

THE Viceroy's arrival in London for a brief visit is an event surrounded with an air of some expectancy. Attempts have been made to suggest that it is the strategic and supply problems of the post-German phase of the war that have inspired such an unusual course, and these matters will no doubt be discussed. But the presence of the Reforms Commissioner in Lord Wavell's suite is enough, even without the atmosphere of speculation, to concentrate attention on political matters. In this country, there is a sanguine feeling that an attempt may be possible to break the deadlock of the last three years; and in India hopes are running very high.

The time is indeed propitious for a new move. Internal and external circumstances have conspired to produce a much better atmosphere. There are plentiful signs that the Indian politicians now regret their rejection of the Cripps offer in 1942. Some part of the stubbornness of Congress three years ago was due to doubts about the outcome of the war and to a belief that England's extremity might be India's opportunity. That picture has now changed and it is clear that, for some time to come, there is no other road to Indian independence than through agreement with Britain. Within India, the tide of opinion is set strongly against revolt and resistance and strongly towards compromise and agreement. Several promising attempts have been made to reach an accommodation between Congress and the Moslem League, relating either to the ultimate constitution of India or to the more short-term problem of seats on the Viceroy's Council in the transition period. Congress Ministers have once again taken office, for the first time since 1939, in two provincial governments. The current popularity of economic plans has painted an enticing vision of what can be done once the political problem is solved. Thus everything points to another effort to achieve independence. But everything also points to the impossibility of finding agreement on the conditions of independence by purely Indian efforts. It is significant that Mr Gandhi and Mr Jinnah should have met and talked, but it is also significant that they should have failed to agree, and that the strenuous and honest attempts of such mediators as Mr Rajagopalachari and Sir Tej Bahadur Sapru should equally have failed to produce an agreed formula.

In all these circumstances, it is not at all surprising that the cry is going up, both in India and in Britain, that the British Government should "take the initiative." Unquestionably, this is one of those moments when an initiative, if it were taken, would stand a more than usual chance of success. It is not unreasonable to suppose that some such reasoning has brought Lord Wavell to London. But what is "an initiative"? An initiative was taken three years ago when the Cripps offer was made and rejected. Should the new initiative be a simple repetition of the same offer? If so, it has been open for acceptance every day since Sir Stafford Cripps left New Delhi. If not, how is the new initiative to differ from the old? These are the questions that have to be answered before any practical proposal can be made. In particular, there are two very large and difficult issues that have to be decided before any progress can be made.

*

The first of these issues relates to the future constitution of India. Until very recent years, it was always assumed, without argument, that an independent India would be a united India, a national state as other states are. There would, of course, be the problem of subordinate units of government, which would probably be solved by the federal device. But the most important organ of sovereignty would be the Government of India. The Act of 1935 wholeheartedly embraced this idea. But in the past ten years it has become apparent that the Moslems of India are in revolt against it. They want a state of their own, which they call Pakistan, and which they claim shall consist of four provinces in the north-west

and two in the north-east. On this issue, Hindus and Moslems—or at least Congress and the Moslem League—are completely at variance. Mr Gandhi and Mr Jinnah, in their recent conversations, could find no accommodation between their views. The Hindus reject any solution which does not provide for the unity of India, the Moslems reject any solution which does not provide for the sovereign independence of Pakistan. Any British Government wishing to take an initiative must first make up its mind what its view is on this issue.

When the question is analysed, it is seen to be, in reality, something considerably less than a straight issue between unity and partition. The Hindu solution would necessarily provide for a very considerable degree of provincial and communal autonomy and in the preliminaries to the Act of 1935 the Hindus accepted, though with much protest, an electoral system which not only gave the Moslems separate electorates but a larger number of seats than they would be entitled to by strict proportion of populations. And it is inconceivable that the Pakistan solution would be embraced without some provision for All-India organs for handling such matters as can hardly be treated otherwise than on a continental basis. Indeed, the real problem, behind the exaggerations of oratory, is not whether there shall be unity in India but how it shall be attained. The Hindus want All-India matters to be settled, subject to safeguards for minority rights, by majority vote; Congress intends that the All-India Government shall be a Congress Government. The Moslems—at least as they are represented by Mr Jinnah—hold that all-India matters should be settled by equal agreement between the two communities.

This is not an easy dispute to settle. The trend of opinion is undoubtedly towards the Moslem solution. This is not because of any desire to achieve one more partition in a world already too much divided, or of any under-rating of the difficulties of drawing a frontier, but because it has gradually become apparent that the more unified solution could hardly work. Unity cannot be imposed by constitution if it does not exist, and whether or not the Moslem minority could, in earlier years, have been brought to accept a unitary solution, it manifestly will not do so to-day. The only result of imposing greater unity than can effectively be brought into operation might be administrative chaos and a further embitterment of inter-communal feeling. The Pakistan solution, though it may be less desirable, seems, at present, more workable. And since politics, in India as elsewhere, is the art of the possible, politicians' minds are turning to the elaboration of schemes for binding two largely independent states, Pakistan and Hindustan, into a single Indian condominium.

Economic arguments, unfortunately, run strongly the other way. Under any economic system, India is a natural unit, and if there is to be something in the nature of economic planning (which appears to be universally conceded) a strong central Government, able both to finance and to administer its plan, is an almost essential requirement. Anything which disturbs the unity of India or which, even within a united India, dissipates power and functions from the centre to the provinces, is a strong disadvantage for economic planning. But to this it can be objected that political chaos and administrative deadlock are even greater obstructions to any form of economic progress, and if these would be the results of an attempt to impose a unitary constitution, the greater political coherence of smaller areas would make their plans more effective, in spite of the economic disadvantages of partition. Moreover, there would be ways of reducing those disadvantages. The proposal, after all, is not for provincial sovereignty and both Hindustan and Pakistan could have strong central governments—perhaps stronger than any All-India Government could be. Hindustan would certainly be a viable unit, and Pakistan might be—the more so if it were not itself divided into two halves in the north-west and the north-east. And, in addition, the prin-

ciple of equality at the centre need not necessarily mean an entirely impotent All-India administration. Currency, defence, communications and customs are the minimum functions that would have to be left to it, and certain general financial and economic functions could no doubt be added. But none of these are more than palliations of the fact that politics and economics point in different directions. Clearly, it will be no easy matter to decide which policy to pursue.

Once this has been decided, the second great issue arises. By what means is the policy to be carried into effect? Here, again, there is a clear choice, although to call it a choice between imposition by the British and agreement among the Indians is an exaggeration. No solution would be imposed without the most earnest endeavours to secure agreement to it, and no policy of leaving it to the Indians to agree would be pursued without a lead, and perhaps even pressure, from the British Government. Nor is it right to talk about a "strong" policy and a "weak" policy, since a policy of setting up a constitution and transferring power to a new government without first securing complete agreement might conceivably, if the British calculations went wrong, mean an abdication to chaos, while the alternative policy of deferring entirely to the agreement of the Indian parties may very well mean the indefinite continuance of British rule.

But a choice there is, nevertheless, and it can perhaps best be defined as the choice between leading events and following them. Sir Zafrulla Khan has recently put forward an ingenious compromise. He proposes that the British Government should give the Indian parties twelve months to agree, in default of which it would promulgate its own solution, which, however, would be open thereafter to amendment by constitutional means. But this is not really a compromise at all, but a variant of the "imposed" policy, since agreement within twelve months is almost inconceivable. There is, in fact, no way of dodging the issue. Is Indian agreement a precondition or not? The risk of acting without agreement is that a perfectly reason-

able solution (if such can be devised) might be sabotaged simply because it was imposed—the objection to the declaration of war in 1939, which led to the breakdown of the Act of 1935, was not that it was wrong but that it was done without agreement. And the risk of waiting for agreement is that it might mean waiting for ever.

All the instincts of British statesmanship will be on the side of proceeding by British decision, if that proves to be the only way by which any progress can be made. But if that is to be the course, it requires the most skilful handling by those who are fully cognisant of all the facts and of all the trends of opinion. It is not a policy that can stand either very close control from the India Office in London or very much pressure from a largely ignorant public opinion in Britain. Such questions as the release of the Congress Working Committee, who are mostly still in prison, will have to be decided by the strictly pragmatic test of whether it would be more likely to help than to hinder the success of the policy embarked upon.

There has been no intention in this article of throwing cold water upon the demand for a new initiative. On the contrary, the Indian problem, so long as it remains a problem, is a serious potential embarrassment to any British Government, and any favourable opportunity such as the present should be seized, if it can be. But the problem is by no means as simple as British politicians and publicists, lifting their eyes for a moment from the urgency of their domestic concerns, are sometimes apt to assume. It involves decisions of high policy which are complex and difficult. Every responsible British citizen should be thinking about these matters. If he has faced the difficulties and thinks he can solve them, let him by all means be given a respectful hearing. If the Government, with its higher responsibilities, can chart a course through the shoals, let it set sail without a moment's delay. But those who clamour for a "new initiative" without saying what that new initiative shall be are merely confusing counsel and bedevilling the issue. They may not be India's worst enemies, but they are certainly India's worst friends.

Budget Hopes

THE financial year closed last Saturday with the highest figures ever attained, or likely to be attained for some time to come. Expenditure is over £6 billion and revenue well over £3 billion. Revenue turned out to be £200 million higher than last year, and expenditure £264 million higher. The deficit is thus £64 million greater—but since the total expenditure is also greater, the proportion of it covered by revenue has actually risen from 52½ to 53½ per cent. The detailed figures, which are given in the accompanying tables, also show very few surprises. There is still a slight tendency towards under-budgeting on both sides of the account—revenue was £136 million, and expenditure £126 million, more than the Budget estimate—but, in all the circumstances, this must be accounted very close planning.

So stereotyped have become the forms of public finance in wartime that the Chancellor of the Exchequer now finds himself in an entirely paradoxical position. The continuance of the war would provide him with many fewer problems than the outbreak of peace. If the war could be relied upon to continue, at the intensity of the past year, for another twelve months, then the Budget to be opened on April 24th could be a pure formality. The expenditure estimates would probably be a little higher, but the existing taxes could also be relied upon to bring in a little more. Everything could be left as it is, and the financial year 1945-46 would probably turn out in very much the same way as 1944-45 has done.

But clearly the war cannot be expected to continue as before. The European war will be over in a few weeks and the Japanese war may not last out the full twelve months. This makes the Chancellor's task very difficult, since his estimates of expenditure will have to depend on

two unknowns—both on the dates at which the two wars end and on the reduction of expenditure that will follow upon the end of each. It will not be possible to estimate save within the broadest limits. But it is not wholly unreasonable to guess where those limits may lie.

Let us suppose, for example, that the course of events is disappointingly slow. Let it be assumed that the European war goes on full tilt until the end of June, and the Japanese war until the end of next March. Let us further assume that the Japanese war by itself is conducted at half the scale of the present combined war, and that European war expenditure is steadily reduced, over the nine months after the end of the fighting, to one-fifth of the present total war expenditure. (There is, of course, a great deal of war expenditure which is not attributable to either war—food subsidies, for example—but for the convenience of this very elastic arithmetic, it can be divided between them.) In the year just ended, in round figures, the war cost £5 billion, and other expenditure amounted to £1 billion. This set of assumptions would work out at a war expenditure in the coming year of £4½ billion. Other expenditure will be higher, because of the rising National Debt and the higher cost of education and other social services. Total expenditure, on this set of assumptions, might be about £5½ billion, or £500 million less than in 1944-45.

An alternative and more optimistic set of assumptions might envisage a complete end to the European war this month, and to the Japanese war by the end of September, and a demobilisation so rapid that war expenditure in the final quarter of the financial year—that is, from January to March, 1946—was reduced to a small fraction of the peak. These assumptions might justify an estimate of total

expenditure of about £4½ billion. The "calculation," as will be seen, is very crude, but the conclusion may not be very far out. Expenditure in the coming year is likely to be at least £500 million less than in the year just ended, but it cannot very well be more than £1,500 million less. The Chancellor will probably have to budget for something between £4½ and £5½ billion, instead of £6 billion, for the whole year, which is not a very large reduction. But the rate of expenditure in the second half of the year may well be much lower.

The end of the war will not be without some direct effects upon the yield of taxation. For example, under Pay-as-you-earn, the return of the troops to civil occupations, where their cash earnings will, on the average, be higher, should be immediately reflected in a rise of income tax receipts. On the other hand, the removal of the extreme pressure of war will probably lead, even with full employment, to some shrinkage of the national income. There will be less overtime and some decline in the total working population. Any release of supplies of consumption goods, however, will raise the yield from customs and excise, and there will doubtless be a rush to re-license laid-up cars. It is difficult to assess the balance of these con-

flicting factors, and any resulting change in the total revenue is likely to be small.

But is it right to assume that there will be no change in the present rates of taxation? As recently as three weeks ago, the opinion was expressed in *The Economist* that "it would take a particularly hardy brand of optimism to foresee the possibility of any relief" from the load of taxation in this year's Budget. But March 17th is now a long time ago; the odds are still against any changes just yet, but it is no longer possible to be quite so certain, and the season of relief is clearly approaching. Within a comparatively short time, the rate of expenditure will be

lower by at least £1 billion. Must the rate of taxation be maintained for another twelve months?

It is no more possible to be dogmatic in answering these questions than it is in estimating the effect that the end of the war will have on public expenditure. Here again, the best way of proceeding may be to set out the two extremes between which policy must find its course. In strict economic logic, a strong case can be made out for permitting no reduction in taxation so long as there is any deficit at all. A time when physical controls are being taken off, when the patriotic urge to save is necessarily weakened, when the obstacles in the way of rising prices are inevitably diminished, is hardly a time for releasing further purchasing power. If, in such circumstances, the deficit is only half as much as it is at present, that may be quite enough to exert a powerful inflationary influence at a time when it can do most damage.

Budgets, however, are made by politicians, not by economists—and never more so than in an election year. There has been a great display of economic logic in the Budget speeches of the past four years, and in the White Papers that have accompanied them. But the Budgets have not, in the last resort, been based on logic, but on something closely resembling a politician's rule of thumb—the rule that if a belligerent Government can cover as much as half of its expenditure out of revenue it is doing pretty well. If the same rule of thumb is preferred over strict principle in the transition period, will the results be any more disastrous than they have been in the war? If expenditure falls by £1,000 million, could not the taxpayer have £500 million to be going on with? There will be very many who will argue in this sense.

A wise Chancellor will no doubt try to steer a course between these two extremes. He might determine to raise by revenue a higher proportion of his total expenditure and still have a few titbits for the taxpayer. Just how austere he will feel it necessary to be cannot, of course, be foreseen. But as soon as total expenditure falls below £4,800 million, provided the revenue proportion is not put at more than two-thirds, there should be some margin for tax reductions. And—to take the other extreme—when expenditure falls as low as £4 billion, and if the proportion is left at last year's figure of 53½ per cent, then taxation could be reduced by over £1 billion, or by about one-third.

No outsider has the detailed knowledge to speculate much further than this, and the answer must await Budget Day. But the discussion can be conveniently concluded by indicating the amounts of money likely to be involved by the changes of taxation that come first to mind. To reduce the standard rate of income tax by one shilling—and the reduced rate *pro rata*—would cost about £140 millions. The cost of an increase of the income tax allowances would depend on the particular adjustments made and is difficult to calculate; but very welcome alleviations could be made for £60 million, making the total income tax relief £200 million. Excess Profits Tax now brings in about £480 million and, if the yield can be regarded as stable—as it probably can for the next year—a reduction of the rate of tax to 75 per cent would cost £120 million. Among the indirect duties, those on beer, spirits and tobacco now bring in something of the order of £750 million. Increases in these duties have not, save in the shortest run, reduced consumption, and reductions in duty by themselves could not be expected to increase it; but on the other hand larger supplies may well be available. A reduction of about one-fifth in the rates of duty—say 1½d. off the price of a pint of beer, and 3½d. off the price of 20 cigarettes—coupled with rising consumption, might reduce revenue by, say, £130 million. The yield of Purchase Tax was £110 million in 1942-43, and £92 million in 1943-44. Larger supplies of goods would put the yield up very sharply. It would not be appropriate to reduce the three rates of duty in an equal proportion, but an average reduction of one-third—say, enough to bring the lowest rate down to 10 per cent, and the highest to 75 per cent—might cost about £50 million. These figures, of course, are illustrative only. The fact that they add up to £500 million may be regarded as purely coincidental.

NOTES OF THE WEEK

When?

This is clearly the last act. The Rhine once crossed, anything in the nature of coherent opposition seems to have largely disappeared. The Allied spearheads are pressing on cautiously, and there is a certain amount of local opposition, but a German Army, in the sense of a single organism fighting under a single strategic direction, has—for the moment at least—ceased to exist. Whether it can be re-created is very doubtful. A stand on the line of the Weser had been talked of, but the river has already been crossed. The Elbe is another possible line, but the Russians are close behind it, and the flight from the Rhine has been so rapid that the mere collection of troops and material might well be impossible. The final collapse is very near.

The only remaining question is when? According to the book, the Germans should have surrendered long ago. That they still hold out at all is a tribute both to the hold of the Nazi police system and to the dull tenacity of the German people. There is very little talk, even in the Nazi propaganda, of fighting back by open military means. Indeed, the main propaganda campaign is now directed to glorifying the Werewolves, who, by definition, have no function in an unconquered Germany.

How serious a nuisance the Werewolves will be to the occupying armies it is not yet possible to say. They have carried out a couple of murders of collaborating burgo-masters, and no doubt there is a great deal of general sabotage. No doubt, too, there are a certain number of fanatical young Nazis who will be willing to fight on indefinitely. But the conditions for a really effective *Maquis* are missing. There will be no outside help for the Werewolves, and no hope of ultimate rescue from outside. And, after the Nazi collapse, it is unlikely that the majority of the German people will give any moral support to the most extreme and fanatical members of the party—unless, indeed, the Allies exercise such a tyranny as to make the people desperate, or unless labour conscription for reparations forces the young men into the hills. It is most unlikely that the Nazis can create an effective Werewolf organisation, but the Allies could.

Arab Union

The pact of Union newly signed between the seven Arabic-speaking states is born of two impulses. The first is emotional: ties of language, blood, tradition and religion have breached the frontiers set up by the Powers after the last war and since fostered by local Arab nationalisms and dynastic quarrels. The second is practical: the Arab states want to end their period of inferiority *vis-à-vis* the west. They want to be, on their own, a factor in world affairs. Their pride of achievement is bound to receive a fillip at San Francisco, where their pact will attract notice as one of the first of the regional arrangements envisaged in the Dumbarton Oaks draft.

It is in many ways a model of Dumbarton Oaks propriety. Its aims—set out in Article 2—are the strengthening of friendship between its members, the co-ordination of their political action, and the safeguarding of their independence. It leaves room for new adherents: presumably for Palestine, the Sudan and Cyrenaica when they are ready. It forbids resort to force for the settlement of disputes and provides full machinery for dealing with these by arbitration and conciliation. Its strongest suit undoubtedly is its provision for the settlement of family differences in private.

Another strong suit is the united front which it enables Arab foreign policy to present to the rest of the world. Its only weakness here is its dependence, for defence, upon a contract with outside forces. Hitherto its separate states have, willy nilly, made such contracts with individual Powers. But several of these treaties require revision as a result of the war and, when they are revised, the Arab Union is likely to prefer a joint arrangement. A topic of debate in the Arab world just now is whether, in future, to contract for defence through the new World Organisation or through a Power or group of Powers immediately interested in the area. The advocates of this latter method argue that it produces faster action in an emergency. If,

as seems likely, their view prevails, the future defence of the Middle East will be conducted on a basis of strong points leased from the Union and shared by the interested Powers.

When dealing with external affairs the Arab Union has plenty of good rallying cries. The handling of internal matters—and particularly the grave social and economic problems which beset the area—offers no such easy path to popularity.

Some of these problems are endemic. The worst is the unbridged gulf which yawns between the rich man—merchant or landowner—and the poor man—peasant or artisan—usually hopelessly in debt to moneylenders. Nowhere except in the Lebanon and parts of Saudi Arabia is there a contented peasantry. Other problems are the result of the war: notably, the unemployment of artisans who have been relatively well paid by the Allies, and the inflation arising from the volume of Allied expenditure throughout years when—for lack of shipping—there has been nothing to buy. In these problems, too, the Arab states will have to contract for outside assistance, both in capital and in expertise.

The Union has begun life to an accompaniment of saluting guns, cheering crowds and beaming statesmen. Whether or no it can climb from the sentimental and flag-wagging plane to become a factor in world politics and prosperity depends partly upon whether it interest of the pashas and merchants who provide most of its politicians, and partly on the degree of western help that is offered. But western help often smacks, in the Arab's eyes, of old-style political tutelage. He may find it easier to accept if it is given to a Union rather than to individual countries. And the western countries, in their turn, may find that their own frustrating jealousies are allayed if their help, both in defence and in economics, is given jointly.

Territorial Trusteeship

That some decision may be taken at San Francisco on the general principles governing the rule of mandated territories is now well established. Mr Stettinius's statement on Tuesday contained the information that the preliminary Conference of the Big Four at Washington will formulate proposals

... for a territorial trusteeship structure as part of the general world organisation ... designed to permit the placing under it of territories mandated after the last war and such territories taken from the enemy in this war as might be agreed on at a later date, and also such territories as might voluntarily be placed under trusteeship.

Significantly, no mention is made of any general international regulation of colonial territories proper. Whatever American opinion of British "imperialism" may be, the State Department is evidently not prepared to play with fire by raising the question at an International Conference. In answer to a Parliamentary question, Mr Churchill gave a firm assurance that matters affecting British colonial territory will not be discussed at San Francisco. Nor, said Mr Stettinius, will there be discussion on the fate of specific territories.

In other words, only the blueprint of an organisation will be worked out, and new checks and safeguards to the mandate system considered. No individual Government will have to accept at San Francisco future responsibility for any particular mandated territory. No individual Government need be committed in advance to submit territory, other than that already held on mandates from the League, to the supervision of an international authority. On general principles, however, it seems likely that there will be considerable pressure for an increase in the power of the world organisation over the mandatory states. One possible improvement is to allow freer and more direct contact between the International Commission and the mandated people themselves. Dr H. V. Evatt, Australian Minister for External Affairs, now in London for the Common-

wealth talks, suggested last week that power should be given to the international authority to take away the trusteeship of mandated territory if maladministration could be proved in a world court. It is on these lines (as a leading article in *The Economist* last week pointed out), rather than on any forced supervision of colonial Powers, leading to a division of authority and a worsening of inter-Allied relations, that the problems of subject and backward peoples can best be tackled.

Austrian Resistance

The Russians have taken Wiener Neustadt and soon they may enter Vienna. It is fairly certain that they will find in Austria a fairly strong Resistance movement on whose co-operation they can count. A recent report from Vienna gives an interesting picture of the political atmosphere in the old Austrian capital. The dominant feature is a revival of Austrian nationalism which expresses itself in popular hatred and distrust of all things German and also, curiously enough, in a new interest in Austria's post-war frontiers. Thus, the programme of the unified Austrian Resistance states:

Austria claims her frontiers of 1933. But she also lays definite claim to the South Tyrol, in so far as this region is not inhabited predominantly by an Italian speaking population. The Austrians are aware that the non-Italian inhabitants of South Tyrol strongly desire return to Austria.

It is noteworthy that the programme which contains this point has been signed by all the anti-Nazi parties, the Monarchists, the Catholics, the Social Democrats, the Communists and the Democratic bloc. The unified Resistance has been active under the somewhat puzzling name "O 5" and has been led by a Provisional Austrian National Committee. In the provinces the resisters are under no central direction. In southern Styria and in Carinthia an organisation led by the Communists and called the Austrian Freedom Front has fought in close association with Marshal Tito's adherents. It will be interesting to see how the entry of the Russians will affect relations between the political parties and the various groups of resisters. The one significant point about the political outlook of the anti-Nazi Austrians is that they have all agreed on a return to the democratic Constitution of 1920 and that they all, including Monarchists and Catholics, have dissociated themselves from the ideas of the Dollfuss regime established in 1934.

Lord Swinton's Powers

Five months after his appointment, Lord Swinton's powers as Minister of Civil Aviation are defined in the Bill presented last week to the House of Commons. It was introduced by Sir Stafford Cripps and should be discussed soon after the recess. The Minister's general duty is described as:

... organising, carrying out and encouraging measures for the development of civil aviation, for the designing, development, and production of civil aircraft, for the promotion of safety and efficiency in the use thereof and for research into questions relating to air navigation.

These powers, though vague, are wide—much wider than those specific duties transferred from the Secretary of State for Air. That the new Minister should have as free a hand as possible when there is so much to do in so short a time is all to the good. There will, however, come a time, most likely after the General Election, when the hierarchy of Ministries and Departments will have to be drastically pruned and regrouped to ensure that the top of the tree remains compact and strong. The Ministry of Civil Aviation may well be affected by this process. Since the publication of the Government plans to associate other transport interests in commercial aviation, there is an even stronger case for co-ordinating the new Ministry with others under a single Ministry of Transport.

Meanwhile, encouraging reports of Lord Swinton's work on South African routes come from Capetown, and, in his absence, Sir Stafford Cripps has had to answer a barrage of questioning from Scottish members, who are chiefly concerned for the future of Prestwick airport. For use as a main civil airport, an additional £6 million to £10 million would have to be spent on extensions, and even then only 200 or 300 people would be employed in place of the wartime 5,000. Clearly, Prestwick, with its fair-weather advantages, can play a most useful part as an alternative airport, but the leading terminus for foreign services must obviously

be close to London. The fears voiced by the Scottish members are rooted in the problems of diversifying employment prospects in Scotland, and can best be quieted, not by the boosting of single projects, but by a comprehensive policy for the location of industry.

The Spanish Scene

The impact of Hitler's defeats has so far not been enough to shatter the dictatorship of General Franco. All is still quiet in the Iberian Peninsula, chiefly because the most energetic elements of the opposition are isolated behind the barbed wire of the concentration camps and the prisons. But the lack of any strong positive purpose on the part of the Republican oppositions has also been responsible for the prolonged existence of the Franco régime. The exiled leaders of the Left, split as they are into innumerable coteries and enmeshed in sectarian quarrels about the past, have so far failed to stimulate any genuine movement against the dictator. After some Republican rumblings in London, Paris and Mexico, and the hopeless escapades of Spanish maquisards from France across the Pyrenees, the attack of the Left against General Franco seems to have fizzled out, at least for the moment.

A new political attack has now been launched from the Right. The Pretender to the throne, Don Juan of Bourbon, has appealed to his former idol, General Franco, to resign and so to pave the way for the restoration of the Monarchy. The Pretender claims to be able to wind up the dictatorship in a bloodless and peaceful way. His appeal has been followed by the resignation of the Duke of Alba from the post of the Caudillo's Ambassador. It remains to be seen whether other Monarchists—and very many of them are entrenched in the Spanish Administration—will follow suit. If they do, they may well create something like a vacuum around the dictator, though it may be doubted whether the Bourbon Monarchy will eventually be able to fill that vacuum.

Meanwhile, General Franco is not sitting back with folded hands. He is valiantly defending his position on the diplomatic front. He has now protested against Japanese maltreat-

BUSINESS ENTERPRISE AFTER THE WAR

Small and medium-sized businesses in all branches of industry and trade must have every opportunity of contributing, by their enterprise and initiative, towards the nation's economic well-being after the war. They must be given full support in developing British trade at home or in overseas markets.

Changes due to war conditions call for a far-sighted policy concerning the financial aid they may need. This Bank, through its branch managers, will therefore be prepared to consider enquiries from promising undertakings, whether old or new, conducted under good management. It will base its consideration of each proposal as much upon the prospective borrower's integrity and business capacity as upon his material resources.

MIDLAND BANK LIMITED

ment of Spanish nationals in the Philippines, and he has announced that Spain will no longer act as the Protecting Power representing Japanese interests *vis-à-vis* the Allies. The Spanish press has suddenly become vociferously pro-American, without, incidentally, relaxing its hostility towards Great Britain. When the Allies have entered Berlin, General Franco may yet make up his mind to declare war on Hitler.

Health Service Discussions

Progress in the discussions between the negotiating committee of the medical profession and the Minister of Health on the national health service has reached a stage where alternative proposals to those of the White Paper have been put forward. These are not to be taken as endorsed by the Government and offered instead of the White Paper, but, if they are acceptable to the medical profession, the Minister of Health will place them before the Government, which will also have to consider the result of his discussions with the representatives of the local authorities and the voluntary hospitals. A special representative meeting of the British Medical Association has been called for the beginning of May, when the medical profession will decide whether it approves the new proposals. In the meantime, they are declared to be confidential and not for publication, but since a copy of them has been sent to every member of the profession, including those in the Services overseas, they may very rapidly become public, even if they are not officially made so.

The gist of the alternative proposals has, in fact, already appeared in the press. From these reports it appears that they deal solely with the administrative structure of the health service. The doctors' most rooted objection to the White Paper scheme was their subordination to local authority control. There was also a fear that the voluntary hospitals would lose their independence and become dependent upon the local authorities. Under the alternative proposals, it seems that the local authorities will be the executive body only in respect of their own hospitals, which they will continue to own, and their own health services. The joint authorities of the White Paper will be abandoned, and planning will be on a regional and on an area basis. Regional councils, based on a university with a medical school, would be expert advisory bodies, whose function would be to supervise and collaborate in the planning of the health services in the areas comprised in each region—this is very reminiscent of the recommendations of the Medical Planning Commission of the BMA in its report of 1942. The areas would replace the proposed joint authorities, and planning bodies would have the statutory duty of preparing a plan for the whole health services of each area. These bodies would have a local authority majority, but the hospital services of each area would be planned in collaboration with the Regional Council by a special body on which the voluntary and local authority hospitals would be equally represented.

It also appears that the Central Medical Board, which under the White Paper scheme would be the employing body of general practitioners, will be dropped if the profession wishes, and that the terms of service and of contract for doctors in the public service would, under the alternative proposals, be based on something very similar to their present relationship, under national health insurance, with the insurance panel committees. Nor would there be any general establishment of health centres until experiments with different kinds of centres had been conducted.

If they are correctly reported, the alternative proposals seem a fairly satisfactory compromise, though a final judgment must be deferred until they are fully disclosed. It has been said that the Government has "given way to the doctors," but it may be pointed out that the object of the new health service is to provide complete medical and hospital facilities for everyone irrespective of means, and that the best administrative structure is one that ensures this object. On the other hand, the emphasis is on every-thing. Now that the Minister of Health seems to be willing to meet the doctors half-way over the administrative structure, the BMA should, for its part, reconsider its attitude over the "100 per cent issue," which according to its own questionnaire is opposed to the views of the profession as a whole. There are signs that such a reconsideration may be taking place.

Labour's Satellites

The Labour Party's ears must have been burning during the week-end: its affairs were under very earnest discussion at Scarborough, Liverpool and Blackpool, where the Co-operative, Common Wealth and Independent Labour Parties held Easter Conferences. All three parties declare themselves willing to accept the lead of their big brother, though they are by no means satisfied with his pace. All three qualify their acceptance by numerous reservations.

In the eyes of the young and vigorous Common Wealth Party, Labour policy already evinces signs of arteriosclerosis; and it was by a very narrow majority that the party reaffirmed its willingness to resume discussions with the Labour Party Executive—if it indicated any desire to advance towards Socialist unity at the next election. This resolution was subsequently redrafted to include statements of Common Wealth's policy to contest seats "in which the actual Labour candidate cannot be regarded as a resolute and determined Socialist" and "where all relevant factors suggest that the Labour Party has no normal chance of winning the seat." In any event, Common Wealth will not support Labour candidates "unless they pledge themselves to oppose a continuation of a coalition with the Conservative Party." The party intends to contest between 30 and 60 constituencies and plans to spend £27,500 on the organisation of the party in 1945.

After a very lively debate the Independent Labour Party decided to return to the fold "on the conditions prevailing in 1931." But the party maintains its right to independent organisation and the right of its MPs to express ILP policy in the House of Commons. A minority of delegates condemned affiliation on the grounds that the Labour Party is likely to support "the openly imperialist struggle in the Far East" and has already accepted a post-war settlement in Europe which is "the negation of international Socialist principles." The Conference adopted another resolution urging the removal of private enterprise from the housing programme and the recruitment of a million and a half new workers in the building industry.

The Co-operative Party rejected a proposal for affiliation with the Labour Party by an overwhelming majority. It was felt that such a move by the party would sign its own death warrant: as a Glasgow delegate put it, "... affiliation would start a heresy, hunt to root out those people in the Co-operative movement to whom the Labour Party objected."

Czechoslovak Federation

On his way to Czechoslovakia, through Moscow, President Benes has appointed a new Czechoslovak Government. The new Premier is M. Zdenek Fierlinger, former Czechoslovak Ambassador in Moscow. M. Fierlinger is a left-wing Socialist with strong pro-Soviet leanings. In advocating close political unity between Czechoslovakia and Russia he has gone farther than President Benes himself. His appointment, therefore, is a sign that Czechoslovak policy is now more definitely within the orbit of Russian influence. This has further been emphasised by the inclusion of Communists in the coalition. Two of the five Vice-Premiers in the new Government are Communists. One of them is M. Gottwald, former member of the Executive of the Communist International, who has lived in Moscow for some years. The Benes Party, that is the National Socialists, the Slovak Right and the Catholics have one Vice-Premier in the new administration.

After his talks with the Soviet leaders in Moscow, President Benes has announced that Czechoslovakia will go to the Peace Conference with its pre-Munich frontiers restored. This presumably means that the Subcarpathian Ukrainians, who a short time ago clamoured for their incorporation in the Soviet Ukraine, have now been told to remain with Czechoslovakia. It also means presumably that at least until the Peace Conference, the Czechs will retain the whole of that part of the Teschen province which was annexed by Poland during the Munich crisis.

But though Czechoslovakia's frontiers have been left unchanged, its political structure is to be radically altered. The new Republic will be decentralised. It will be split up into autonomous Czech, Slovak and Subcarpathian provinces. The Bohemians and the Moravians, too, will receive separate autonomous administrations. This last reform has hardly any serious ethical or political justification; but it follows the pattern of federated and decentralised Yugoslavia under Marshal Tito.

Resurgent Royalism in Greece

A significant feature of the situation in Greece is the revival of political self-confidence among the Royalists. Whatever were the real intentions of the British on the spot, the Greek population has taken it for granted that the British intervention was prompted by the desire to reinstall King George on his throne. The military defeat of the EAM, on the other hand, has certainly entailed political depression on the Left—though it is only now that there is any real evidence of disintegration in the EAM.

General Plastiras' position is by no means clear. He has not the confidence of the Royalists, who have not yet forgiven the sin of his youth, his violent overthrow of the monarchy in 1922. The leader of the royalist Popular Party, M. Tsaldaris, has demanded a quick plebiscite on the issue of the monarchy, undoubtedly because the Royalists expect that the result of a plebiscite now would be the return of the King and the dismissal of General Plastiras.

For the same reason General Plastiras and the Liberals are now opposed to an immediate plebiscite. And to resist the increased pressure from the Royalists, General Plastiras now finds himself compelled to tack to the Left, even though it is against the Left that his military victory has been won. The political outlook in Greece depends largely upon whether this manoeuvre will succeed, and whether the Government can secure some support from the Left. If it can, then General Plastiras may hope to keep some balance between Left and Right, and to establish himself solidly in power. But if there is too much bitterness on the Left for this, then he is more likely to be swept away by the Royalist tide. The EAM—or some parts of it—may therefore perhaps temporarily reconcile themselves to General Plastiras as the lesser evil. Whoever wins the fight—King George or General Plastiras—there is little likelihood that either of them will eventually rule Greece in a democratic spirit.

Neglected Children

Last week's debate in the House of Lords on the problem of homeless and neglected children did not make any very helpful contribution towards a solution. There was some discussion, which was hardly relevant, of the Conservative party's recent proposal that there should be legally qualified and paid chairmen of magistrates' courts. There was a vindication of the London County Council and its treatment of the problem by Lord Latham. There was a plea from Lord Denham for the flogging of parents convicted of cruelty. Lord Munster, replying for the Government, made the obvious remark that the whole problem would be considered by the inter-departmental committee set up for the purpose.

Perhaps the most realistic speech was made by the Bishop of Sheffield, who suggested that the problem was not so much one of neglected children as of negligent and cruel parents, and that while the short-term policy should aim at rescuing the children, in the long-term it has to be decided what should be done with the parents. Sentencing the parents to terms of imprisonment—or to flogging—solves nothing so far as their children are concerned. In fact, their fate, if they are returned to their parents after such a punishment, may well be worse. It was recently announced that the Bath magistrates, with the approval of the Home Office, had sentenced a mother, convicted of neglecting her four-year-old child, to a term of compulsory training in parent craft, at the end of which, if she had benefited by it, her child would be returned to her. For the present it may well be impossible for such a punishment to be meted out in more than a few cases of neglect. But it is a policy worth working for.

Harvest Labour

Mr Hudson has made an urgent appeal for volunteer labour to help with this year's harvest. This year is likely to be the last in which the farm labour problem will be acute. Theoretically, the slowly falling acreage under crops and the probability that demobilisation will commence this summer should ease this year's problem. But Mr Hudson makes his appeal in the double knowledge that "quite a lot" of potatoes and sugar beet rotted in the fields last autumn through lack of labour, and that this year the demands on the United Nations' food reserves will be not less but much greater. Mr Hudson is not exaggerating when he says that

Quite definitely the scale of rations next winter will depend upon what we manage to gather in this summer and autumn. It is unthinkable that any of the food which the country manages to grow this year should be wasted.

School-children are already fully mobilised for harvest work, but Mr Hudson calls for 300,000 adults and older children to attend harvest camps. Help is wanted over a long period, from April to November. Indeed, it is not the corn harvest, but the potato and beet harvest later in the autumn for which labour is most wanted and hardest to get. The Government is reducing the charge for food and accommodation at camps from 28s. to 21s. for the early and late parts of the season. Payment to volunteers is 1s. per hour, which should cover their living costs; but the Government would be well advised to pay the full railway fare of volunteers instead of a small part of it. The vital marginal rôle which volunteers are called on to play in wartime farm economy, as well as their sacrifice in forgoing holidays, entitles them to good conditions and adequate remuneration. There is indeed a strong case for allowing some categories of industrial workers to spend a period on the land which would not count as their normal holidays.

Argentina at War

Last week Argentina, the only absentee from Mexico City, accepted the invitation of the other American nations to sign the final act of their conference. In the same decree it declared war on Germany and Japan.

In order to identify itself with the rest of the American nations and forestall any threat or act against the security of continental America.

Adherence to the Mexico City resolutions pledges Argentina both to abandon and resist from any quarter aggression in the Western Hemisphere. On this score it will be welcomed, not least by Argentina's nearer neighbours. In the recent past there has been uneasiness in Chile and Uruguay over Colonel Peron's militaristic measures. Farther afield, there is a tendency to view with caution this least equivocal of all the Farrell Government's pronouncements in the field of foreign policy and to await results. The *Philadelphia Inquirer* says:

If the declaration of war is to mean nothing more in practice than Argentina's break in diplomatic relations with the Axis months ago its importance is microscopic.

The country's wartime record has been marked by a wide gap between its protestations of American solidarity and its practical refusal to co-operate with the rest of the Americas. Evidence of this inability to participate effectively in the defence plans laid at Rio de Janeiro was made clear two years ago when, reporting on a consultative visit to Argentina, the Emergency Advisory Committee for the Political Defence of the Continent said:

To achieve and maintain this unity (of the Americas) there must necessarily be a common basis of action, the first requisite of which is a clear distinction between friend and foe.

The severance of Argentina's relations with the Axis a year later did not, however, bring the desired unity of action. Within a month of severing relations General Ramirez was supplanted by General Farrell, who later withdrew Argentina's delegate from the Advisory Committee.

The distinction between friend and foe has now been made against protests from Argentina's nationalist faction, which have so far left the Farrell regime intact. Seizure of Axis firms and compulsory registration and immobilisation of enemy nationals have followed Argentina's declaration of war. With Germany itself on the brink of military collapse, the move has come on the stroke of twelve, if not after. The time has passed, too, when Argentina's fleet could have made a practical contribution to the establishment of a South Atlantic convoy system. The Pacific conflict has been circumscribed far from Argentina. Nevertheless, the way has been opened for Argentine participation in peace problems which concern the whole of Latin America. These are political as well as economic, and Argentina's close ties with Spain lend interest to reports that the Farrell Government may move to open relations with Russia, following in Brazil's footsteps. Spain's present regime could draw little comfort from such a significant defection of one of its warmest sympathisers in Latin America.

Bodmin Moor

It is a tribute to the Englishman's love of the countryside that whenever cliff, moor or mountain is threatened with defacement, hue and cry is immediately raised. So

effectively has this been done, in the case of Cornwall's Bodmin Moor, that the Admiralty has abandoned its proposal to use part of the moor as a bombing range. Numerous arguments were put forward. The area is needed for water supplies. Cornwall's fate is her fortune, and the loss of tourist traffic would be serious. The moor is good sheep-grazing land; it contains valuable archaeological remains. The moor is undoubtedly a thing of beauty not to be lightly disturbed. But, true as are these arguments, the Admiralty need a bombing range somewhere, and to almost every proposal similar, if sometimes weaker, objections will be made.

The real problem is one of machinery. It was because there are so many competing claims to the use of land, even in remote areas, that the Ministry of Town and Country Planning was set up two years ago to settle just such questions as this one. Unfortunately, the Ministry has turned out to be merely one more agency, the one specifically concerned with preserving amenities, whose claims must be taken into account.

It is perhaps natural that Service departments are unwilling to allow any final decision to be taken by a very junior department with limited staff, which to date can hardly be distinguished from a rump of the Ministry of Health. It was the importance and the difficulty of co-ordinating land use which led the Barlow and Uthwatt Committees to recommend, or rather assume, the creation of an expert central planning agency with overriding powers. The Government had good reasons for rejecting the idea of a "super ministry." But at least it was to be hoped that the new Ministry would act as a clearing-house for securing agreement, instead of leaving the numerous arms of Government to fight out their claims in public. The Admiralty has yielded on this occasion to public pressure, but the case of Bodmin Moor re-emphasises the need for co-ordinating land use.

Shorter Notes

There will be general satisfaction with the Government announcement about "cease fire" celebrations. The Jeremiahs have been routed. By prescribing a standard "break" the Government have greatly improved the chances of a general and orderly resumption of work after industry has

given "expression to the feeling of common effort that has carried us through the strenuous years of the war."

The announcement grants all workers in Government factories and service a three days' holiday with pay. The first day will be that on which the "cease fire" is officially announced, the second will be the day following, and the third will be a local holiday. Except in the essential services, this example will be followed throughout industry and will, of course, apply to all schools. When the tumult and the shouting are done the nation will return to work refreshed for the continuing struggle with Japan.

Now that the Allied armies are racing across Germany, seemingly faster than the weather itself, is it not time that the ban on weather news, except in the Straits of Dover, was dropped? Mr. Morrison has not waited until the end of the war to abolish the last relics of fire guard duty. Cannot the security authorities show a similar willingness in respect of what have now surely become unnecessary regulations and black-outs?

There is now a mass of Acts and White Papers covering the position, rights and entitlements of servicemen and women in regard to their release and resettlement. The Ministry of Labour, in co-operation with the Service departments, is now distributing a booklet, "Release and Resettlement," to every member of the Forces. It explains in the clearest terms the various Acts and schemes and the services of the Ministry of Labour that will be available. Resettlement advice offices are to be opened in June and will perform for the demobilised the service that citizens have received from the Citizens' Advice Bureaux. The issue of the booklet is to be followed by wireless talks, ABCA discussions and other ways of making its contents widely known and understood throughout the Services.

Road deaths in February showed a distinct fall from the level of February last year and the years before—particularly during darkness, when 113 persons, compared with 232 in February, 1944, lost their lives on the roads. The improvement is probably due in part to better standards of lighting on vehicles and in the streets. The totals for the month were 384 deaths and 7,533 injuries.

AMERICAN SURVEY

Before San Francisco

(By a Correspondent in Ohio)

IN the weeks intervening between the Crimea Conference and the United Nations' meeting at San Francisco, the American people are being exposed to an intensive educational campaign. With the aid of the press, the radio, the cinema and the lecture platforms, Mr. Archibald MacLeish, Assistant Secretary of State, has turned the country into a vast town meeting, to consider Dumbarton Oaks, its present and future. This publicity is needed because of widespread ignorance of the details of the Dumbarton Oaks plan and because no trusteeship for the world's peace can hope to succeed without the informed support of the American nation. It is likewise necessary because of growing public uneasiness over certain implications of the Crimea Conference.

The interlude between Yalta and San Francisco is a period of soul-searching by Americans, especially in the once-isolationist Midwest. Americans are asking themselves, "Just what commitments shall we make in Europe?" The question is sharpened by apprehension over the President's agreement—not yet approved by the Senate—of the Polish settlement at Yalta. At that meeting Mr. Roosevelt did something which Secretary Stettinius had lately said the United States should not do. He undertook to guarantee a new European frontier. Before the Crimea Conference, the most internationally-minded of American commentators were agreed that their government should

not underwrite new boundaries in Europe. Amid the general rejoicing over the fact of agreement—any agreement—at Yalta, that reservation was forgotten. But it is now being recalled by senators, and the old fear of "European entanglements" has begun to creep back into the editorial columns.

This fear does not arise from the agreement to accept the Curzon Line as the approximate frontier between Poland and Russia. Even those who feel that the Poles got a raw deal do not object very loudly to that, perhaps because they cannot suggest any better settlement in eastern Poland. But many Americans, especially in the Midwest, do object to underwriting the western Polish boundary. While that boundary was not traced at Yalta, the "substantial accessions of territory in the north and west" which were promised to Poland are understood on all sides to include most of East Prussia and Upper Silesia. The President agreed to the principle of partition of Germany, which has not yet been accepted by Congress or the country. He approved, and will try to induce the Senate to approve, a radical transfer of territory in one of the cockpits of Europe as part of a peace settlement which the United States must guarantee, by force of arms if need be, for the indefinite future. That does not sit well with the press or the public in the Midwest.

These popular misgivings do not reflect any sympathy

for the Germans. In the Midwest, as elsewhere, Americans generally favour a hard peace—provided it be also a workable peace. The country overwhelmingly endorses the Yalta plan for disarming and occupying the Reich. But it does not feel happy about an arrangement which would cram 70,000,000 or more Germans into a narrower Reich, with every moral inducement to bend their vengeful energies to the task of getting back the lost German provinces. To place under Polish control—and nominal Polish control, at that—the large and traditionally German territory of East Prussia is regarded as bound to intensify the national hatreds which helped bring on the present war. If it be argued that German feelings in the matter should be ignored, on the ground that they would hate even the most considerate of conquerors, many Americans will reply that German feelings are not the immediate point. The point is that Americans fear to assume responsibility for a peace settlement which they believe unworkable, which would produce much bitter controversy and which might be repudiated years hence in the face of a strong challenge.

It is realised, of course, that Germany will be disarmed after this war and made impotent, in a military sense, for perhaps a generation. But there is no confidence that the present alignment of European powers will endure that long in a changing world. In underwriting the indicated Polish boundary in the west, many Americans feel that they would be underwriting another intervention in a future European war.

The current official argument for the Dumbarton Oaks plan tries to distinguish between the functions of Yalta and of San Francisco. The former, it is said, aims at ending the war and establishing a peace. The latter will set up the machinery for preventing a third world war. But the two functions are related in the public mind. It is realised that if the terms of Yalta are unsound, the machinery set up to carry them out will be unworkable.

All this soul-searching on the subject of European commitments is having one useful result. Americans are asking themselves just what new boundaries they should underwrite. Their willingness to make commitments, backed by force, diminishes in direct ratio to the distance of the boundaries from their own Atlantic coastline. In general, they would agree to underwrite the most important boundary of all—the extreme western or United Kingdom boundary. This is true in spite of widespread approval of the Stettinius remark. (Most Americans thought he was referring to new frontiers in eastern and central Europe.) It is true despite the periodic outbursts of Britain-baiting, whether by liberals wrought up over Greece, by isolationist remnants in Congress or by agitated Zionists. Most Americans agree, after very little argument, that the United States entered two world wars under the inexorable pressure of self-interest. Most agree that in the future Britain and the United States must swim or sink together. But Americans are much more reluctant to take on commitments respecting France. Witness the strong sentiment, inside Congress and France, for putting the Ruhr and the Rhineland under international rather than French control. When commitments toward France are accepted, it is less from a conviction of the vital common interest than from a recognition of the strategic kinship in modern war between France and Britain. As one moves eastward across the Continent, American willingness to guarantee new frontiers declines steadily, until, in the states bordering Russia, it vanishes. These fears concerning the future of Poland are, after all, not strange. When so many far-seeing Poles hesitate to assume responsibility for governing East Prussia and Upper Silesia, how can Americans be expected to pledge their military forces indefinitely there?

This rather vague discrimination in the matter of commitments is, of course, far from logical. When Americans regard the British frontier as sacrosanct, they agree in effect to underwrite much of British foreign policy, as the President did in seconding Mr. Churchill's policy on Poland. The great dilemma of Americans, which Yalta sharpened rather than removed, is their unwillingness or inability to make their general commitments specific. They accept responsibilities for helping to preserve world order—in general. But they recoil from specific responsibilities on the Continent of Europe. The attitude of Americans is well intentioned but amorphous. They are overwhelmingly in favour of a world organisation to prevent war. They accept the principle of collective security. But they tend to leave applications of that principle to be worked out later.

American Notes

The President's Assistant Goes

No one would have blamed Mr. James F. Byrnes, Director of War Mobilisation and Reconstruction, if he had resigned simply because he was tired. For almost two years he has occupied one of the most gruelling of all posts, and one of great power. Mr. Byrnes' resignation was made public some hours after his second report to the President and Congress was released. It was well known that he intended to resign on or soon after the end of the war in Europe, but the fact came as a shock, and in the rather nonplussed tone of the first accounts one read suspicion that some well-concealed quarrel might have acted as catalyst. Mr. Roosevelt accepted, without published protest, the resignation of the man who had become known as the "Assistant President," and immediately named Judge Fred M. Vinson, who has been Federal Loan Administrator for only a month, to the job of directing America's reconversion programme alongside her production for the Pacific war.

Mr. Byrnes has inevitably received his full share of criticism. Most recently and most publicly, he was criticised for his "austerity orders." But that was trifling in the context of the job he had to do. A more significant clue might be found in his letter to Mr. Crowley, Foreign Economic Administrator, two weeks ago, creating the Foreign Shipments Committee to examine, against civilian needs, the "capabilities of the United States to export items for the support of the war, other than direct military Lend-Lease commitments." An immediate and certainly unfortunate consequence of this order is believed to be the transatlantic food debate.

There has been serious criticism of Mr. Byrnes by the committee set up by the George Bill (which gave statutory power to the OWMR), representing government, industry, labour and agriculture. Resentful because Mr. Byrnes has not really utilised them in the advisory capacity the Bill intended, they recently passed an exasperated resolution in which they "respectfully requested" the director to notify the Board from time to time of "particular problems upon which he desires the advice of the Board." The Labour members are said to think Mr. Byrnes has vacillated on reconversion, and they cite the recent wave of Detroit strikes as an example of labour's resultant lack of confidence and fear of redundancy. Sections of industry have objected strenuously to the top priorities given to materials destined for the Soviet Union, which they habitually view with suspicion, while their own reconversion orders carried no priority at all. The Army is said to have watched with similar distaste the Lend-Lease shipments of machinery, some of it for Soviet post-war use.

Mr. Byrnes' accomplishment in his vast and unprecedent job of economic planning cannot be judged in terms of who were his critics, for at one time or another they must have included every group. It must be carefully evaluated in terms of mobilisation and reconversion.

The Battle of the Tariff

To a Republican with isolationist tendencies a battle that involves the venerable word "tariff" is something into which he can throw himself with abandon, particularly when Mr. Roosevelt is attached to the word. Mr. Roosevelt, therefore, did not underestimate his opposition last week when he urged Congress to pass the Doughton Bill which extends and broadens the reciprocal trade pacts, authorising reductions up to 50 per cent below the level of January 1, 1945. Under the Trade Agreements Act as it now stands, after three renewals, the maximum reduction is 50 per cent of the 1934 tariff rates.

Mr. Roosevelt rightly considers the lowering of tariffs in the context of what he hopes will be a new era of international co-operation. For that era, he said, the US needs a new "workable kit of tools," including the aviation treaty of Chicago and the Bretton Woods financial plans. He made it clear to Congress that tariffs would be lowered item by item and always on a reciprocal basis. "Great Britain and Canada, our largest peacetime customers, still maintain certain high barriers against theirs," the President told Congress. "Under the Trade Agreement Act as it now stands, we do not have enough to offer these countries to serve as a basis for the further concessions we want from them."

Last time the Act came up for renewal, the Republicans were defeated in their attempt to make each agreement dependent upon Senate ratification. This time, Mr. Doughton, chairman of the House Ways and Means Committee, and Mr. George, chairman of the Senate Finance Committee, expect both Houses to put up the most stubborn fight yet, on fairly straight party lines, with some Democrats swinging over to the Republican side.

This is a critical time for such a battle, for observers sense in both Houses a tendency to withdraw back into Isolationism as though the Gentlemen had breathed a whiff of air from the outside world and found it a trifle heady. Mr. Roosevelt cannot choose his time, for this is his battle for Bretton Woods and Dumbarton Oaks and the coming San Francisco Conference and for the world organisation he hopes will grow out of it. Most important, it is considered to be an inseparable part of the battle for full employment.

* * *

Bretton Woods

The Bretton Woods Bill is not making very rapid progress, and it is reported that the Administration has abandoned its original hope of getting it through before the San Francisco Conference opens. Whether the decision, when it comes, will be favourable or unfavourable is still obscure, though the greatest probability would seem to be that the Bill will be passed with amendments. An impetus in this direction has been given by a report by the eminently respectable Committee for Economic Development, whose reservedly favourable attitude may serve to offset the more downright hostility of the American Bankers' Association.

Both the CED and the ABA, however—and this is a very general attitude—profess more love for the Reconstruction Bank than for the Monetary Fund. The ABA would abolish the Fund entirely, and transfer to the Bank the only function now attributed to the Fund which is thought to be useful—the making of loans to facilitate the stabilisation of currencies. The CED does not go as far as this, but it would restrict the activities of the Fund to currency transactions for the correction of temporary disequilibrium. The bogey, to both organisations, is the possibility that the Fund will be left holding only weak currencies. This is, of course, a necessary consequence of the purpose for which it is created, and the fact that it is urged as an objection shows how far the American business community is from seeing the Fund in the same light in which it appears to other countries. The Bill may be passed by Congress, but there is every indication that Bretton Woods will mean different things in different countries.

More "Dream Spots"

President Roosevelt, refusing to be diverted by various rival groups contending for control over the Missouri River Valley project, has asked Congress for \$4,480,000 for preliminary work and planning, a fund authorised when the Flood Control Act was passed. One set of rivals—the Army Engineers and the Bureau of Reclamation—after engaging in a battle for control over the construction of the great project, finally joined with each other to oppose the proposal for a Missouri Valley Authority on TVA lines. Under their present plans the Army Engineers would deal with flood control, the Reclamation Bureau with reclamation and power development.

Mr. Roosevelt has made no bones about his preference for the TVA type of authority, and in this he is supported even by some sections of the American press that most noisily denounced TVA when it was launched and through its early years. It was Socialism, they said, and it could not work. Whether or not they still think it is Socialism they do not say, but they are now convinced that it works. Scripps Howard papers call it "the dream spot of the world." *Electrical World*, the trade journal of the private electrical industry, has endorsed valley authorities like TVA, which, it says, are "here to stay." The journal takes the stand that private utility operators will be able to co-operate more easily with autonomous authorities like TVA than with authorities directed from Washington.

With this stand the states involved in the Missouri Valley do not agree. They want an MVA, but not one independent of themselves. The legislatures of at least three of them—Montana, North Dakota and Kansas—are all on record as opposing an autonomous TVA-type authority for the valley.

The Missouri legislature has approved a resolution for an inter-state conference to decide what is best for all states involved. The Reclamation Association of Idaho has adopted resolutions favouring the development of water resources through present state and federal agencies. Several of the states are said to favour the joint plans of the Army Engineers Corps and the Reclamation Bureau. The private utilities probably feel they would have more control over the disposal of power if it were not necessary to deal with a self-contained authority which would not necessarily respond to political pressure.

Meanwhile, the MVA Bill has been the centre of a committee dispute, and Senator Murray, of Montana, its author, who wants it placed under the Agriculture Committee, where all previous legislation of this kind has gone and where the atmosphere would be congenial, has been forced to accept a compromise that involves sixty days of consecutive hearings on each of three committees: Commerce, Agriculture, Irrigation and Reclamation.

needs, has thus been fully implemented; and, as the motives of personal gain and competition are ruled out, the sole incentive is the common interest and the pressure of public opinion, neither of which should be underestimated in such a close and compact community. These societies have, in fact, withstood the vicissitudes of booms and depressions, and have even succeeded in bringing up a second generation nurtured in their peculiar creed and tradition.

The Source of the Movement

It would, however, be wrong to regard this movement as a kind of Communist sect with an abstract doctrine of radical collectivism. The *qibbutzim* are the product of special local conditions, and though united in their general features they differ widely in matters of politics, creed and so on. The first spiritual source of the movement may be traced to anarchistic and social reform ideas, which were brought into Palestine by Jewish immigrants at the beginning of the present century, and have led to the formation of a series of small collectives of utopian outlook. But the main cause of the trend to co-operation was the hardships of pioneer settlement in a primitive country; when the settlers shared among themselves whatever they had, they possibly did so more often than not out of sheer necessity.

A new impetus to national service and constructive socialism was brought by the Legion of Labour, formed after the Balfour Declaration, and inspired by the post-war revolutions in Europe. This attempt to create a sort of guild-socialism on a quasi-military basis was, however, doomed to failure, and the settlements established under it would not have survived but for the heavy investment of capital supplied from the Zionist funds. It was this investment which gave them the technical cohesion and the economic superiority that are peculiar to any large-scale unit of production, and which is of special importance in a country of primitive individualist peasantry, with an industry which is predominantly small-scale.

Fully aware of this, the *qibbutzim* have done their best to establish themselves as the most progressive sector of Palestine's rural economy, and the backbone of Jewish agricultural colonisation. They were the first to introduce modern agricultural machinery, making cereal growing profitable; to apply mechanisation to household work; to erect grain silos; to develop rural transport, with a fleet of their own trucks, and so on. They are ahead in cattle-rearing and in fishing, and account for about half of the Jewish output of vegetables, and a third of the milk and the eggs. Moreover, in recent years they have developed a variety of workshops and factories, some of which are among the biggest in their respective trade in the country. They are also eager to accumulate their savings, and their capitalistic attitude has not failed to gain for them in business circles a high reputation for stability.

Present Trends

Thus collective enterprise was at first the prerequisite of large-scale investment, but at present it is becoming ever more dependent upon it. The chief motive force of the movement is now no longer communism in consumption; it is rather co-operation in production, which alone enables the existence of *qibbutzim* of a thousand and more people. In this respect, also, the collective regime obviously has important advantages: the utmost mobility of labour; freedom from trade union restrictions; the reduction of the cost of living by wholesale purchases, and the rational utilisation of goods and services; the pooling together of various complementary industries; and, last but not least, the active participation of the workers. But it has its disadvantages as well, and the rapid expansion of industrial plant in some of the *qibbutzim* has led to the temporary employment of disguised and open forms of hired labour. As a rule, the *qibbutzim* still preserve their puritan tradition, and up to now they have succeeded in reconciling the capitalistic conduct with their association with the General Federation of Jewish Labour; but the possibility that they may be transformed into private concerns with closed membership cannot altogether be disregarded. On the other hand, the impulse to further expansion, inherent in a country of colonisation, puts a brake on this tendency by strengthening the dependence of the *qibbutzim* upon the human and material resources of the Jewish immigration. For the time being, and in the near future, they will continue to propagate in the most vigorous manner economic progress, strict democracy and federative co-operation.

The Ethiopian Budget

[BY A CORRESPONDENT]

FOR the first time the budget of the Government of Ethiopia has been published in the Official Gazette in the form of a proclamation which has the force of law. The budget is for the year ending September 5, 1945; it is in the form of an appropriation of revenue amounting to 38 million Maria Theresa dollars, which is the estimated revenue. The De La Warr mission, which went out to Ethiopia last summer to negotiate a fresh agreement with the Emperor, failed to come to a positive result on the question of the further financial aid which Great Britain should accord to the Emperor. Under the agreement of January, 1942, there was a grant of £1,500,000 in the first year, £1,000,000 in the second, and £500,000 in the third. Under the new agreement of December, 1944, no grant is payable; and the Ethiopian Government depends exclusively on its own resources for the revenue.

The estimates contemplate a great increase in the revenue compared with the preceding years. That is due mainly to an item of 9 million dollars from a new land tax, introduced at the end of 1944, which supplements the old land tax estimated to bring in 2½ million dollars. The other main items of revenue are as follows:—

(Dollars)			
Tithe	2,500,000	Income tax	2,500,000
Market revenue ..	2,100,000	Salt and tobacco	
Customs	7,500,000	monopolies	1,700,000
		Mining	5,000,000

The last item is no doubt mainly derived from gold, which will find its way to America.

The main item of expenditure is for the army and the police. The Imperial armed forces and the Imperial body-guard account together for just on 10 million dollars, and the police for 5½ million. The next largest item is for public works; and of that the major part is for the maintenance of the roads which were the principal Italian legacy. Altogether the public works' budget is 3½ million dollars. Provincial administration accounts for 2½ millions, and education for 1,700,000. The cost of the Ministry of Finance is 2½ millions, and of the Ministry of Justice, including the courts, 1½ million dollars.

MILK CHOCOLATE & the Nation's Milk Supply

THE contribution of the Milk Chocolate Industry in ensuring Britain's milk supply during these critical war years is not generally realised.

Before the war this industry was using 40 million gallons of milk a year. Cadburys took more than half of this vast quantity. It came from the counties of Hereford, Gloucester, Salop, Stafford, Flint and Denbigh where Cadburys have consistently encouraged dairy farming over a number of years. In these areas they have established four Milk Factories which have greatly assisted in developing milk production. Today these four factories alone collect and distribute sufficient fresh milk for well over a million people.

THE WORLD OVERSEAS

Communal Settlement in Palestine

(From Our Jerusalem Correspondent)

OUT of the few tiny groups of Jewish agricultural labourers, which, on the eve of the first World War were trying to run some primitive farms, there have by now developed in Palestine over a hundred well-established villages, with economic, social and cultural services, besides some two dozen training units, waiting for settlement, and a vigorous youth movement. These settlements comprise a population of about 30,000—that is, over 5 per cent of the total Jewish community, but they occupy some 100,000 acres, that is, almost a quarter of the total area in Jewish possession. The capital invested in buildings and other tangible assets total £4.5 million, and the gross income was computed (in 1940-41) at £2.3 million, of which 54 per cent came from agriculture, 29 per cent from manufacturing, and 17 per cent from work for hire. On the other side of the account, costs of production made up 53 per cent of total expenditure, 34 per cent went on human livelihood, 8 per cent on the amortisation of assets, and 5 per cent on interest, while some 15 per cent were booked as profits. These figures are, however, hardly comparable with other statistics, because of the peculiar social structure of these settlements. This is based

on complete collectivism, not only in production, but in consumption as well, so that an individual member has hardly any property of his own except for a few personal belongings. All land and buildings, stock and implements are the common property of the *qibbutz*, the collective of workers. Every member, man and woman alike, has to do the work he is allotted by the secretary for labour. All profits and wages are delivered to the common fund. On the other hand, every member of a family has the right to an equal share in the common supply of goods and services within the village. The dwellings are distributed in proportion to needs; all meals are taken in a common refectory; clothes, shoes, and so on are issued from stock; a nursery, a kindergarten, and a school are maintained for the children; there are recreation rooms and so on! The supply is regulated by the budget, approved by the general meeting of the members, which is the supreme authority in business and in social conditions. But within this general framework every member may have his personal needs accommodated to some extent. The Communist principle that everyone should give according to his means, and receive according to his

Gas Company Prospects

THE security silence imposed on gas company reports during the period when every works was a potential enemy target has now been lifted. The wartime story is still fragmentary—the accounts of most companies for the years 1940 to 1943 inclusive have yet to be published—but the broad outlines of the picture are clear. They reveal an uneven but on the whole reassuring state of affairs. The gas industry, clearly, has played a worthy part in a national war effort in which the rôle of fuel resources of every kind has been decisive. It has significantly increased its total output—gas consumption has risen by 16 per cent since 1938, and the industry has made great and successful efforts to cope with an unlimited wartime demand for by-products like coke, tar, benzol, sulphuric acid, chemicals and fertilisers. The increase in the cubic footage of gas supplied to industry has been greater than the rise in total output; for the black-out, evacuation and the unceasing official exhortation to consumers to economise in domestic fuel have combined to reduce the non-industrial load.

It follows from the industry's quantitative performance that the effects of enemy bombing have generally been much less serious than might well have been expected, since gas production plants are not among the least vulnerable of enemy targets. But in a few instances the burden of war losses—including loss of earning power—has been disproportionately heavy. Most of the major companies in which Stock Exchange investors have their largest stake serve great cities and their surrounding districts. Outside London, aerial bombardment has on occasion been intense but seldom prolonged. Local industry has been extremely active, and though the successful effort to cope with its demands have sometimes involved the bringing in of plant which in normal times would have been classed as uneconomic, the tendency of gas company revenues has actually been upward for the most part. In the London area, however, the story is very different. There, enemy activity has been greatest, the loss of consumers by evacua-

tion and disappearance of homes has been at its maximum, and though the Government has sanctioned a certain raising of tariffs, permission has been sparingly given and has not completely compensated the effect of reduced sales.

Even inside the Greater London area, however, the experience of different companies has been remarkably uneven. The following table, which has been pieced together from information given in chairmen's speeches, and the like, throws an interesting light on the experience, year by year through the war, of three large London companies.

LONDON GAS COMPANIES IN THE "BLITZ"

* 76.7 millions in 1938.

† By value.

Clearly, 1941 was the worst year, and the subsequent improvement in London companies' fortunes, though well maintained, has, physically left gas sales well below the pre-war level. But whereas the Gas Light and Coke Company, after reducing its dividends in 1940 and paying nothing even on its preference stock in 1941, has now regained its pre-war dividend-paying power, a company like Commercial Gas, serving East London areas, has during the greater part of the war been operating at a loss, and, on the threshold of peace, finds itself with a heavy accumulated

deficiency on profit and loss account, and a debt to the Government—wholly through circumstances beyond its own control.

Obviously, the position of certain London enterprises will present a special problem in reconstruction economics after the war, and the case for special Government assistance—of which little in the way of concrete suggestion has yet been forthcoming—may well be strong. On the whole, however, the industry emerges from the war without serious impairment of its financial position, as is suggested by the figures in the table at the foot of page 449, which summarises the experience, in key years during the past decade, of four London and five provincial companies, whose shares are owned directly by investors.

The table shows that, in the period between 1934 and 1939, revenue from sales of gas was on the whole tending to increase, though not at a rapid rate, and, perhaps rather less markedly in London than in some provincial city areas. The trend of revenue from rentals was broadly similar, but residual products were revealing a highly welcome elasticity as revenue-producers. Expenses, however, were rising, and in most instances net earnings available for debenture and stockholders were stable rather than progressive—partly as a result of higher raw material prices, and partly, of course, as a consequence of the statutory tie-up between selling prices, and the return on capital. By the end of 1939, war uncertainties had already induced the directors of some companies to adopt a cautious dividend policy. During the war, labour has been in short supply, coal and wages costs have substantially increased, and tariffs have been officially controlled, though increases have been permitted on a moderate scale. It is the increase in the industrial load, and, particularly, the insatiable demand for residuals—plus, in some instances, reduced calorific value of gas produced—which have contributed so indispensably to the increased wartime gross revenue of the “unblitzed” companies. The curve of expenses has mounted steadily, and the industry has had its due share of the burden of war taxation. Nevertheless, with the exceptions already mentioned, earning power has been well maintained, and though ordinary stockholders are not in all cases receiving full pre-war dividends, the discrepancy (with the same melancholy exceptions) is not really very considerable from an investment point of view. The average yield in gas stocks is 3.31 per cent, but the yields on many gas company ordinary stocks, as shown in the ultimate column in the annexed table, are somewhat above the current average of 4.15 per cent for industrial equities generally, shown by the Actuaries' Index. The explanation can only be a conservative approach by many investors to certain factors in the post-war outlook for the gas industry.

How far this conservatism is due to industrial, and how far to political factors in the balance of probabilities, is a moot point. Certainly, the industry, if left to itself, will have its own formidable difficulties to meet, but they will not, of themselves, be greater than those many other industries are facing. Not all the wartime expansion in the industrial load may be maintained but domestic and lighting demand will revive. Given a national policy of full employment, and the same tendency as before the war towards reduction of costs by improved technical methods, the same progressive “service” policy towards the consumer, and the virtual certainty of further expansion on the by-product and chemical side,

the industry should find it well within its own powers to carry the burden of increased costs and, in the long term, to improve its own earning power, steadily if not spectacularly. What investors have chiefly in mind, probably, is first, the effect of the resumption of competition between the gas and electricity industries and, secondly, the possibility of Government intervention, ranging from severe price regulation (even to the point of “consumer subsidisation”) to, maybe, out-and-out nationalisation.

If the matter even lay between gas and electricity alone, the gas industry could rely, confidently enough, on keeping its niche in the long run, conceding electricity the prospect of faster progress (as the newer industry) and, ultimately receiving a division of territory that would be neither uneconomic nor unprofitable to either party. Already, the main lines are suggesting themselves—electricity in the lighting market, for industrial motive power and, probably, in agriculture of the future, gas for cooking and heating—with one or the other predominant but not exclusive, in its favoured fields. If the electric supply industry could be dissuaded from invading the cooking and heating fields by charging what the gas industry contend are uneconomically, and therefore unfairly, low rates for these purposes, gas would look forward with full confidence. The merger of the National Gas Council and the British Commercial Gas Association, to form a single British Gas Council with one of the ablest men in the industry at its head, will undoubtedly strengthen the industry, technically, on the sales side and politically. As yet, the possibilities of developments like the setting up of regional gas grids and their financial complement, and a more determined use of the amalgamation powers conferred by legislation in the early '30s, have hardly been explored. Nor has electricity, so far, discovered a way of emulating the gas industry's advantages through its ability to store its product and obviate acute peak load problems.

If that were all, investors would probably continue to treat gas company shares, as in pre-war days, as “sound” holdings, from which they expected gradual rather than sensational capital appreciation without loss of sleep meanwhile. Unfortunately (for investors), the political factor can neither be left out of the equation nor evaluated, at the moment, with any real confidence. The industry's structure and organisation are avowedly a matter of Government inquiry, and whatever the eventual official findings may be, questions of future capital ownership seem likely to be inextricably involved with them. Uncertainty goes even further, since 1945 is destined, apparently, to be an election year, and public utility ownership may well figure in the political programme of more than one party. It may even turn out that the difference between Right and Left, on that question, is largely one of stress and approach from the viewpoint of political expediency. To that problem, events alone can give an answer, and until they do, the present differential in the yield on gas equities and other equities—which though not wide is still appreciable—may be expected to continue. Yet, in the long run, if matters came to the point, it may be asked whether investors in gas shares would stand to lose a very great deal by either a fair and reasonable compensation in Government stock for their existing holdings, or by holding junior stock in some future Gas Corporation. That, however, is merely a speculative question, not a prophecy.

Business Notes

Flag Waving

The past week has brought a marked change in the tone of the stock market. The rise in the industrial equity index of the *Financial News* is twice as great as in the preceding month; the movement of the index is shown by a chart on page 459; it is now all but up to the peak of August last. The corresponding fixed-interest index shows little change, but there has been a resumption of the rise in the Funds. The improvement has not been accompanied by any substantial increase in business. The number of bargains received is still only rather over 7,000 for the first working day of each week. But there is rather less complaint of paucity of big order, and the volume of inquiry is substantial.

As was indicated last week, in the context of the general firmness of markets, the rise owes something to the general optimism associated with the approach of victory—the market calls it flag-waving. The buying is not highly selec-

tive and the inquiry covers a very wide field. The fact that the more widely representative *Actuaries' Investment Index* passed its 1944 peak before that of the *Financial News* owes something to the character of the buying as well as to the accident that the end-month dates of the former do not coincide with the highest levels touched. In fact, it is now impossible to obtain even the less marketable stocks at prices which give really attractive yields, and the point has possibly been reached where the next major development ought to be a rise in fixed-interest securities.

A development which will favour this, as well as the general rise in prices, is the reinvestment of the money to be released by the repayment of Australian stocks. It is, perhaps, too early for the general run of investors to be occupied with this problem, but large individual holders and institutions will certainly be taking action, if they have not already done so. A further stimulus to the gilt-edged market may, imaginably, be given in the not distant future

by the substitution of another new stock for the 1½ per cent Exchequer bonds which are beginning to be rather costly to the borrower. A fall in the rate of interest will, of course, tend to raise equities as well as other stocks, but any really sharp improvement must be based upon favourable developments at home. These are largely a matter of Government policy. In particular, the question of the future of EPT is one which calls for urgent consideration.

New Rule on “Placings”

After protracted negotiations with the Treasury and the Bank of England, the new issues sub-committee of the Stock Exchange has evolved a new arrangement for dealing with placings. This was officially announced by the new Council. It was its first communication to the public of major importance and it is difficult to feel that it is a propitious debut. In fact, Sir Robert Pearson, in stressing the loyal co-operation of the Council with the Treasury, was really stating the unwillingness of the House to express its true opinions. There can be no doubt that the average member of the exchange both dislikes the new regulation and fails to see any need for the policy which underlies it.

The regulation is simple. It bans any resale of placed securities until permission to deal has been granted and permission is not to be given until six months after the placing. It is understood that, in normal cases, the consent of the Treasury will not be required before dealings can commence, but there can be no certainty that a fresh ban will not be imposed at the end of six months.

Since the broker who undertakes the placing must be sure that those who take the stock in the first place honour the undertaking not to re-sell, he is required to restrict the distribution to “strong investors, such as institutional investors, trustees and other long term holders.” Placing with individual investors is not banned and there is here a loophole for reasonable treatment, but the intention appears to be restrictive. In fact the method raises the costs of issue for all who have to use it. Those who have had a favourable experience of late and can hope for good times to come, may be able to raise money by issues to shareholders. Others, and in particular the new enterprise, will have to submit to underwriting terms which will be greatly inflated owing to the element of risk arising from having to hold the stock for six months. Further, there will be a distinct tendency for the field over which stock will originally be placed to be limited to those who have an established reputation in this type of business. Both these results are restrictive and, therefore, undesirable.

For none of this can the Stock Exchange be held responsible. Before the war, it was doing its best to limit the use of placings which give, much more than other forms of issue, a differential advantage to professionals in the inner circle to the disadvantage of the genuine investor. The Treasury, however, holds an active market to be anathema and everything must be sacrificed to discouraging an interest in new securities, other than those of the Government. It may be that this attitude is also the explanation of another very regrettable feature of the new ruling.

This is that, at the time of placing, no particulars need be given, such as are required before permission to deal is granted, and that no Exchange Telegraph card need be made available. That is to say no information whatever need be published at that time. The public is to remain in ignorance. The officials of the Stock Exchange would have had to go out of their way to demand the particulars at the time of placing and they cannot, perhaps, be blamed for not doing so. It is to be hoped, however, that they will make sure that the details are fully available to the whole public—not merely to the inner circle—some days before permission to deal is granted so that all may start fair. Or will there be a Treasury objection to that, as calculated to encourage activity in the shares?

Preparing for Reconversion

Within the limits—and they are still severe—of the manpower and materials that can be spared from war production, industrialists are beginning to prepare for the difficult task of reconversion. In July last year the President of the Board of Trade announced that the Government was then prepared to consider the grant of facilities to manufacturers to enable them to carry out experimental and

development work, including the manufacture of prototypes, in preparation for the changeover to peace production. In other words, such preparation still requires Government sanction.

During the past eight months more than 1,300 applications have been received by the Board of Trade, and of these only 13 have been rejected. According to the report on applications published in the *Board of Trade Journal* of March 31st, some of the applications have been refused because the applicants have been behind on their war work and it has been considered that any post-war preparatory work would interfere with war contracts. But as soon as circumstances permit, such applicants are allowed to go ahead. Some raw materials are still exclusively reserved for war production, and the demand for labour is still so pressing that applicants are asked to undertake their approved preparatory work without an increase in their labour force.

As was to be expected, applications have hitherto come mainly from the engineering industries. Applications from road and rail transport equipment manufacturers, and from the domestic appliances, textile machinery, printing, paper and paper-working machinery, electrical machinery, food machinery and machine tool industries head the list. In view of the approaching end of the war, preparations for reconversion should be accelerated as much as possible within the limits of available resources.

French Financial Policy

The Budget Speech delivered by the French Minister of Finance, M. René Pleven, to the Provisional Consultative Assembly on March 29th was the first full-scale ministerial pronouncement on French financial policy. M. Pleven stated the aims that are to guide his policy; and he named the measures that are to be applied immediately. Whatever the final judgment on his speech, it has the overriding merit of clarifying issues that have been overlaid with controversy and of casting aside some of the financial uncertainties that have acted as a brake on the everyday business of production and exchange.

The key-note in M. Pleven's speech was his emphasis on the need to increase production in the short-run and productivity in the long-run. He drove home the lesson that finance cannot achieve these ends, that it can only be a lubricant. An immediate increase in production means the fullest possible utilisation of the country's resources—though increased imports are essential. An increase in productivity means a higher rate of capital investment; the problem is one of the distribution of resources between production for present consumption and production for future consumption.

In the matter of short-term policy, M. Pleven intends to adapt to French conditions the policies successfully

STAGGERED WORKING HOURS INCREASE TRAVEL COMFORT

There is only one way to ease the congestion of rush-hour travel—by spreading arrival and departure times over a longer period. If every other firm in a particular area were to alter working hours by 15 or 30 minutes, rush hour congestion would be greatly eased at Underground stations and adjacent bus stops. Already 600,000 London workers benefit from staggered hours.

adopted by other members of the United Nations—that is to say, to raise production to a maximum, to tax heavily, to initiate a national savings campaign and to ensure greater equality in the distribution of a shrunken volume of consumer goods by means of an efficient rationing system. In his view, the real problem of France is the shortage of supplies rather than the danger of inflation. Mere juggling with finance will not bring forth additional supplies, but additional supplies will assist in the solution of financial difficulties.

In the matter of long-term policy, the Minister of Finance contented himself with a discourse on aims, on the meaning of productivity and on the futility of hoping that this could be achieved simply by a change-over from private to public ownership. Obviously, he thought it wise, at this stage, to begin by focusing attention on the real, physical problem of France and to allow time for discussion; but he undertook to submit detailed plans to the Government before the end of the year. This means, presumably, that they will be ready before the general election, and that they can then be submitted to the test of public opinion.

The Budget of 1945

M. Plevin is faced with an estimated expenditure this year of some Frs. 406,000 million (including Frs. 220,000 million for civilian purposes), against one of Frs. 437,000 million in 1944 and Frs. 443,000 million in 1943. In other words, total expenditure this year is estimated to be almost as high as it was during the occupation, whose cost had to be met by France. Existing taxation is likely to yield Frs. 154,000 million; but additional sources of revenue are estimated to raise total receipts to Frs. 192,000 million, equivalent to 47 per cent of expenditure. In view of the country's economic paralysis, the realisation of this estimate would be no mean achievement; and if M. Plevin were to succeed in meeting the deficit from savings, without recourse to the printing press (nearly a quarter of expenditure between August 31, 1939, and December 31, 1944, was covered by advances from the Banks of France and Algiers), he would have done much towards the restoration of financial order in France.

There is to be a reduction in subsidies on items such as bread and coal; and there are to be higher taxes on tobacco, alcohol and other luxuries. The confiscation of illegal profits is expected to bring in Frs. 12,000 million, but, although Frs. 5,500 million have already been declared subject to confiscation since January 1st, only 60 per cent of the total have been earmarked for this year's budget. Economic recovery and—it is hoped—a greater realisation of their responsibility towards the community by taxpayers, are expected to swell the yield of taxation. There is to be a levy on war-time increases in the property of individuals—details of this will be announced later—payable over four years and estimated to yield between Frs. 100,000 million and Frs. 125,000 million; but as payments will begin in 1946, this levy will not benefit this year's revenue.

Compared with pre-war conceptions and practice, M. Plevin's first budget speech is no more conventional than was Sir Kingsley Wood's. Indeed, his statement of policy is in many respects in line with that pursued by this country in recent years. He rejected the shock tactics favoured by one section of French opinion; for example, the exchange of notes is to be carried out note-for-note, without any blocking. He regards "monetary puncture" as merely a new word for deflation, though he is equally determined to prevent serious inflation. He holds the view that increased supplies of goods and services, allied to high taxation and a national savings campaign, will bring the remedy. M. Plevin may be right, though in many respects his difficulties are much greater than Britain's. The first round in the tussle between the Ministry of Finance and the Ministry of National Economy—the new super-ministry—has thus been won by the former; M. Pierre Mendès-France, Minister of National Economy, is reported to have resigned on April 4th.

Vickers' Accounts

The comments made on page 421 of *The Economist* of last week at the lack of information in the Cammell Laird accounts apply with almost equal force to the report of Vickers. There is, however, this difference between the two pictures, namely, that the principal subsidiary of Vickers, Vickers-Armstrongs, shows an appreciable improvement in earnings. Since its principal income from subsidiaries comes from English Steel, whose payments are

unchanged, the bulk of the increase in revenue, presumably, comes from Vickers-Armstrongs' own works. Insofar as anything can be deduced from the figures of the balance-sheet, it would seem that the activity of this company had passed its zenith at the end of last year, for stock-in-trade, debtors and the advances to finance production, whether from the parent company or from outside the group, were all lower.

In view of the progress of hostilities, it seems very probable that a turning-point has been reached in the history of the group, and it is of interest to inquire how far they are prepared, financially, to meet the period of readjustment and modernisation. This is where a consolidated balance-sheet for the whole group is essential. Without it, and an assurance that the valuation of liquid assets and current liabilities is in close accord with their realisable value, it is impossible to say with any certainty what amount of money is available. The accounts of the two principal subsidiaries for the past three years are summarised on page 458; those of the third, Metropolitan-Cammell, were dealt with on page 430 last week, but to judge the liquid position a comparison with 1939 is, perhaps, more useful.

All that it is possible to do in this matter is to combine the figures of the four companies' balance-sheets. With the caution that only the major part of the investment of any additional moneys available will accrue to shareholders in Vickers—the remainder going to those in Cammell Laird—this should give a reasonably close idea of the amount available to the group, excluding Cammell Laird's own resources. This calculation shows an increase since 1939 of rather over £6,000,000 in net liquid assets, from which are excluded all inter-company items and trade investments. But of this increase almost £2,000,000 has been financed by the redemption of the Metropolitan-Cammell debentures, held before the war by Vickers, by the sale of certain trade investments and by a reduction in the net amount lent to subsidiaries.

There is, thus, a net increase of only some £4,000,000. There is no means of assessing the original value of the fixed assets of the group, but this figure is roughly 35 per cent of the net liquid assets in 1939 and a much smaller percentage—some 20 per cent—of net liquid assets plus net inter-company items. Probably the group has substantial amounts concealed, but, on the basis of the published figures it appears that the accumulated net resources are scarcely sufficient to meet normal requirements. They are certainly not large enough to finance large-scale rehabilitation, such as the chairman suggests is necessary.

New Rolling Mill Plant

The sanction by the Government for the installation of a new £500,000 mill to the Darlington Rolling Mills Company is of twofold interest. Incidentally, the holding company, Darlington and Simpson Rolling Mills, is to take over the whole assets of the subsidiaries and to become an operating concern. The mills are very largely associated with Crittall Manufacturing and with Dorman Long. Sir Valentine Crittall is chairman of the concern, and there was a pre-war agreement that his company should take not less than 75 per cent of its bar metal requirements from the group. The new mill is to be entirely devoted to the production of light sections, such as window-frames, and will in consequence be capable of handling a substantial output, and so making a contribution to one side of the post-war housing plans.

More interesting still is the fact that the new mill, which is said to be of the most modern design, is an entirely British product. If, as is claimed to be the fact, this country has established leadership in this particular field, there should be a very substantial demand for both the products of the mill and for the installation of similar mills both at home and overseas. Such mills are, of course, at their best when on mass production, but they are both more cheaply and more rapidly convertible to meet new demands than the heavier types, so that the demand for them should be very considerable. The interest of Dorman Long in the group is, presumably, as suppliers of the raw material, and Mr A. Dorman is managing director of Darlington and Simpson Rolling Mills.

Floating Debt in March

With an unexpectedly heavy current deficit during the last fortnight of March, probably due to last-minute clearing of accounts before the turn of the financial year, the

amount of debt created during the five weeks to March 31st, at £296 million, was appreciably higher than the £262 million for the corresponding period of last year. Only £34 million, however, against £67 million last year, came from an increase in the floating debt.

This favourable picture, unfortunately, has to be modified in view of the issue of a further £120 million of 3 per cent terminable annuity during the month; there was no corresponding issue last March. The 3 per cent terminable annuity in lumps of £120 million is issued periodically to the National Debt Commissioners for the investment, primarily, of balances accumulating in the Savings Banks. These balances are held in the form of floating debt assets, until they have accumulated sufficiently, so that the issue of a further £120 million of the annuity tends to be offset by a corresponding fall in the floating debt. Ways and Means advances from Public Departments—one of the floating debt assets held—in fact rose £33 million during the month, but this was £21 million less than last year's rise. The "tap" issue of Treasury bills, however, appears to have taken the main weight of the operation, falling £58 million, against a rise of £32 million last year.

As a result, the gap which had to be met by borrowing from the banks on TDR's was considerably larger than last year. The total of TDR's outstanding rose £58 million during the month to the record level of £1,859 million, compared with an expansion of only £13½ million in March last year.

Tungsten

The recent reductions in the Ministry of Supply's buying and selling prices for tungsten ore were a clear indication that the supply position of this product—indispensable in the production of high-speed and other tool steels—has greatly improved. It has been obvious for some time that the satisfactory supply position of tungsten was chiefly due to supplies from new sources. Southern China, which normally accounted for over one-half of world supplies of tungsten, has been isolated since early 1942 and has contributed only small quantities, sent by aeroplane over "the hump," to the war supplies of the United Nations. Moreover, Burma, before the war responsible for four-fifths of Empire supplies (equivalent to one-fifth of world supplies), was occupied by the Japanese before Allied war production had reached its peak. Production of tungsten in Cornwall, the Iberian Peninsula, Australia, some African colonies, Argentina, Bolivia and Peru has recently found much publicity, but these supplies, although impressive, were not large enough to explain the strong supply position of the United Nations, especially as large parts of the Portuguese and Spanish output were during the greater part of the war diverted to Germany, while Argentina absorbed the bulk of its production at home.

The statistics of production in the United States, now released by the Bureau of Mines, go a long way to close the gap in the jig-saw puzzle. In 1939, the tungsten ore output of the United States had reached a far higher level than in the preceding years, but even so it did not exceed 3,889 short tons, with an average content of 60 per cent WO₃. In 1942 United States production approached 10,000 tons; in 1943 it reached 12,045 tons. Last year production continued to rise until the end of April, when the Government took steps to reduce it. Even so, the 1944 output was 10,500 tons.

Hydro-Electric Board's Opponent

The Scottish Power Company is the holding company for a large group of electricity supply undertakings operating in the North of Scotland. Although the group's sales have fallen from 516 million units in 1943 to 468 million units in 1944, they are still 46 per cent above their 1938 level. Despite the rising cost of coal, prices for industrial users and for public lighting have been reduced during 1944, a fact which illustrates the economies gained from expanding demand. The extension of supplies to many rural areas served by the Grampian Company, the group's largest concern, is still in its early stages. In agricultural areas, the only efficient method is to supply a group of farms together, and Mr Shearer, the chairman of Scottish Power, regrets that farmers have not been more co-operative and that they will not make more use of electric power.

The immediate problem is, however, more likely to be one of supply than of demand. Mr Shearer is one of

the few chairmen who do not stint the information which they give about their company's activities and intentions. Unfortunately, his annual speech is marked this time by an unjustified hostility towards the new North of Scotland Hydro-Electric Board, which alone has power to construct new generating stations and which is consequently responsible for all additional supplies needed by private companies. His specific contention is that the Board's first two constructional schemes do not meet the undoubted need for providing a new source of power in the extreme north of the Grampian company's area; but the answer to this is that the Board cannot do everything at once.

Railway Wage Claim

Last November, when the National Union of Railwaymen decided to claim a national minimum wage of £4 10s. a week, negotiations were begun with the other two railway unions, the Amalgamated Society of Locomotive Engineers and Firemen and the Railway Clerks Associations, with a view to putting forward a joint claim. These negotiations did not bear fruit, and the three unions have now put forward separate claims for higher wages and improved conditions in regard to working hours and holidays.

On April 17, 1944, an increase of 5s. a week was granted to all railway workers, in response to a demand for 12s. That increase was estimated to add about £10 million a year to the wages bill. It brought the NUR minimum up to 80s. a week in London, 78s. in industrial centres, and 77s. in rural areas. The latest figures showing the change in earnings compared with before the war relate to March, 1944, and do not, therefore, take into account the last increase in rates. At that time average earnings of adult male workers had risen by 66 per cent compared with March, 1939, and by 40 per cent for youths and boys. The nearest comparable figures for industry as a whole are as follows: July, 1944, an increase of 80 per cent above October, 1938, in men's weekly earnings, and 81 per cent for youths and boys.

Retail Trade in 1944

Retail turnover in 1944 was at a higher level than in any other year of the war. Apparel sales recovered from the abnormally low level of 1943 to which they fell owing to the incidence of coupon releases. Despite the low record of the household goods index there were, in fact, more articles (except furniture) sold in these departments than in the year before; simplification and standardisation assisted in bringing down prices. The index for non-food merchandise is, of course, influenced greatly by the apparel departments. The increase in food and perishables sales to some extent reflects an easing food situation, and only to a small extent a rise in price (the food component of the

RETAIL SALES (1942=100)

	Apparel	Household Goods	Non-Food Merchandise	Food and Perishables	Total	Stocks (at Cost) End of Year Compared with Previous Year	
						Food and Perishables	Other Merchandise
1939	98	115	100	96	97	+23.6	+11.6
1940	106	112	105	98	101	+25.3	+5.8
1941	97	103	98	97	98	-1.7	+10.0
1942	100	100	100	100	100	+15.8	-3.8
1943	88	89	93	102	98	-1.5	-13.9
1944	102	87	101	107	105	-11.0	-15.8

Ministry of Labour's cost of living index (1914 = 100) rose only by two points from 1943, to 268). The accompanying table compares sales in the main categories from 1939, thus giving a comparative view of the war years. (It should be borne in mind that prices have been relatively stable since 1942, although there was a steady rise until then.)

The last two columns in the table, showing changes in food and other stocks compared with the preceding year, do not bring out the marked fall in stocks of individual groups of goods during 1944. According to the *Board of Trade Journal*, total stocks each month of 1944 were between 9 and 19 per cent below the previous year's level. In non-food merchandise the variation was 11 to 20 per cent. Only

(Continued on page 458)

BANK OF SCOTLAND

250th ANNIVERSARY

FURTHER GROWTH OF BUSINESS

LORD ELPHINSTONE ON THE OUTLOOK

The annual general meeting of the proprietors of the Bank of Scotland was held within the head office, Edinburgh, on the 3rd instant. The Rt. Honourable Lord Elphinstone, K.T., Governor of the Bank, presided.

In submitting the directors' report, the chairman said:—Ladies and gentlemen, I assume that as usual we may hold as read the report by the court of directors of the affairs of the bank as at February 28th last, a copy of which you have no doubt received.

THE BOARD

To fill a vacancy on the board, the directors, by virtue of the powers contained in the bank's constitution, invited Mr William Watson, chartered accountant, to become an ordinary director. I am glad to say that he agreed to accept office and you will be asked to re-elect him to-day.

During the past year two of our extraordinary directors—The Earl of Haddington, M.C., and Lord Balfour of Burleigh—have, for personal reasons, relinquished office. We congratulate Lord Balfour of Burleigh on his appointment to the board of Lloyds Bank, Limited.

BANK'S 250th ANNIVERSARY

On July 17, 1695, the Scots Parliament passed the Act which established the Bank of Scotland. Accordingly this year we attain our 250th Anniversary. We are thus junior by only a year to the Bank of England. Two and a half centuries is a long time to have been in business, and it is with some pride and no little satisfaction, that I present to you to-day a statement which, I think, affords proof of the value of a consistently careful and prudent policy, and of strict adherence to those well established principles upon which the banking system of this country has been built, and upon which indeed its high reputation rests.

EXPANDING BUSINESS

The business of banking operates upon a narrow margin of profit and it is from the utilisation of resources placed in its hands by depositors and stockholders that it derives the bulk of its income. In keeping with the expanding war-time economy, our funds have again increased and thus the balance sheet continues to reflect the abnormal monetary conditions of these days. During the year deposits have expanded by £94 millions and are now over £714 millions. These figures have to some extent been swollen by lodgements of a temporary nature. Our note circulation has passed the £10 million mark—nearly three times the pre-war figure. I would again appeal to those who may be disposed to keep by them—in their safes, their tills, or their pockets—a greater quantity of cash than is really necessary, to return surplus notes to the bank or to invest them in support of the National Savings movement.

The increased resources placed at our disposal have their counterpart in the expansion to investments and treasury receipts. As you can see, we have continued to respond to the calls of the Government for financial support. The

market value of our investments is in excess of the balance sheet figure.

ADVANCES

Advances and loans, although slightly higher than a year ago, are still much below normal and far short of what we would like to see.

Until industry changes over to peacetime production, and empty shelves in warehouses and shops can be replenished, it is unlikely that banking advances will show any material increase. Needless to say, we look forward to meeting all legitimate demands of our borrowing customers. Technically, the bank is in an extremely liquid position and is well able to play its part in the post-war economy of the country. All known bad and doubtful debts have been provided for.

Bank's Premises and Heritable Property.—The figure at which the properties of the bank stand in our books is much under the actual value. The properties have been maintained in good condition—so far as that is possible under present circumstances—and suitable provision has been made against the cost of renovations and improvements.

RESULTS FOR THE YEAR

For the reason already given the nett profits have increased by £10,000 to	£259,542
Add the balance brought forward from last year	159,161
Together	£418,703
Deduct:—	
Added to Reserve Fund	£75,000
Transferred to Trustees for Officers' Pension Fund	30,000
Transferred to Bank of Scotland Widows' Fund	10,000
Dividend at 12 per cent. per annum less Income Tax	144,000
	259,000
Leaving to be carried forward	£159,703

As mentioned in the report to the proprietors, the directors recommend that, to mark the 250th anniversary of the constitution of the bank, a dividend for the part half-year of 7 per cent. (as compared with 6 per cent. this time last year) be paid. For the same reason the directors have set aside a special donation of £10,000 to the Staff Widows' Fund.

CO-OPERATION BY ALL FOR PEACE-TIME PROSPERITY

The establishment of a sound peacetime prosperity through the rehabilitation of industry will call for the exercise of wisdom and patience, as well as a full appreciation in all quarters of the compelling need for the highest efficiency in our productive capacity. It cannot be too

often repeated and stressed that full employment, social security, and indeed our whole future as an industrial nation depends upon our being able to recover and expand our vital export trade. This in turn will rest upon our ability to produce efficiently in a competitive world. Given an atmosphere of mutual faith and confidence among responsible leaders—political, industrial and labour—and an honest desire by all sections to co-operate, we should be able to maintain a high level of prosperity and a good standard of life for everyone. Concurrent with this, it is essential that the savings habit, so successfully encouraged during the war years, be continued and even intensified.

FINANCE FOR INDUSTRY

Along with the other banks we have identified ourselves with the two new Corporations—Finance Corporation for Industry, Limited, and Industrial and Commercial Finance Corporation, Limited—which have for their object the provision of medium and long-term assistance in the restoration or re-conversion of industry in those cases where ordinary bank loans or advances would not be appropriate or suitable. In the reconstruction period the need for such finance accommodation may be imperative, and in committing themselves to support the new Corporations the banks have given proof of their willingness to bear their full share. The banks can be relied upon to assist industry prudently and fairly to the utmost of their resources.

Mr H. L. Usher, C.A., who has been one of the bank's auditors for the past 39 years, has indicated that, for reasons of health, he does not seek re-election. The board desire to place on record their high appreciation of his valuable services over a notably long period.

TRIBUTE TO STAFF

On behalf of the court of directors, I would again express appreciation of the services rendered during the past year by all our staff—permanent and temporary alike—and particularly in London, where, under most trying conditions, the conduct of our staffs has been beyond praise. Those absent on National Service now number 623, and once more our good wishes go out to all of them. The problems of the re-instatement of our serving men and women in their post-war duties are having careful consideration, and we look forward to their early return.

We mourn the loss of 17 additional members of the staff in the country's service and a further two are still reported "missing." Our Roll of Honour now contains 40 names. Prisoners of war number 14, and to them and to all bereaved or anxious relatives and friends we extend our sympathy.

THE RESOLUTION

I now have pleasure in moving that the report and balance-sheet, as submitted, be adopted, and that a dividend for the past half-year of 7 per cent., less income-tax, be now declared payable on 16th current, making with the dividend paid in October last, 12 per cent. for the year, less income-tax.

The motion was agreed to.

The Lord Elphinstone, K.T., and the Lord Henry Scott were unanimously re-elected governor and deputy-governor respectively for the current year.

Mr William Whitelaw, LL.D., Mr John Parker Watson, W.S., and Mr William Watson, C.A., were re-elected ordinary directors.

Mr R. Arthur Morrison, C.A., and Mr Graham Aitchison Usher, C.A., were appointed to conduct the audit of the bank's books for the current year, and a vote of thanks to the chairman terminated the meeting.

CLYDE VALLEY ELECTRICAL POWER COMPANY

A GREAT EFFORT

MR ROBERT ROBERTSON'S ADDRESS

The annual general meeting of the Clyde Valley Electrical Power Company was held at Glasgow on the 27th ultimo.

Mr Robert Robertson, LL.D., the chairman, said: Ladies and gentlemen, the restrictions on the issue of accounts by utility undertakings necessitated by the war have been relaxed to some extent. Accordingly we have been able to put before you full accounts of the operations of the company for the year 1944. The scarcity of paper has compelled some limitation of detail, but sufficient information is contained in the accounts to enable you to get a clear understanding of the operations during the year.

A CONSIDERABLE CONTRIBUTION

Some time ago I stated that when the contribution to the war effort made by the power companies came to be known, the public would realise the important part they had played, and I think you will agree that the contribution of our company has been considerable.

In order that you may have a picture of the company's operations since the commencement of the war, I propose to take as a basis of comparison the year 1938. Our generating stations have been extended and the plant has been increased by 120,000 kw. since 1938, of which 90,000 kw. has been installed since the commencement of the war. We now have 257,500 kw. of steam generating plant and with the hydro-electric capacity of 15,500 kw. of our associate company, the Lanarkshire Hydro-Electric Power Company gives a total of 273,000 kw. of installed capacity. The steam plant has been operated at a very high output, particularly the more modern plant, and has maintained a very high standard of effective capacity and efficiency, despite the considerable deterioration in the coal quality and the difficulty of obtaining adequate labour.

EXTENSION OF DISTRIBUTION

Our hydro-electric plant has proved of very great value, and its installation has shown the wisdom and foresight of those who during the past thirty years have pressed for the development of the water resources of the country. It has operated at the very high average annual load factor of 57 per cent., and since the commencement of 1939 has saved over 300,000 tons of coal.

During the same period we have extended our distribution network by 816 miles. This extension is equivalent to 31 per cent. of the whole distribution network provided over the thirty-three years from 1905 to 1938.

Consumers' connected plant has risen from 400,000 kw. in 1938 to 650,000 kw. in 1944. The maximum demand of the company's consumers in December, 1938, was 143,260 kw. and in December, 1944, 234,410 kw., an increase of 64 per cent. The number of units sold to our consumers shows a substantial increase. The comparable figures are as follows:—

1938	464,000,000
1939	529,000,000
1940	685,000,000
1941	821,000,000
1942	931,000,000
1943	993,000,000
1944	980,000,000

The sales in 1943, in which we had our highest consumption, were 114 per cent. above those in 1938. The year 1944 shows a slight recession from the previous year, which is attributable to the restriction in

use of electrical energy imposed on industry, which was practically offset by the general growth of the demand.

THE ACCOUNTS

From the revenue account you will see that the revenue for 1944 was £3,128,378, which is 133 per cent. over that of 1938. The price of fuel, which is the main item in generation costs, was 19s. 5d. per ton in 1938 and was 38s. 3d. per ton in 1944, while the quality has seriously deteriorated. The price to-day I may say is 41s. 5d.

The net revenue account shows the balance available each year and the respective appropriations. The contributions to contingency fund have been maintained on a scale similar to that prevailing in previous years. The amount at the credit of the contingency fund is now £4,000,000. Provision has also been made from profits to date for liability for Government taxation incurred but not yet imposed. The item for special superannuation contribution has been caused by an increase in the liability of the fund occasioned by increases in salaries.

It is interesting to note that the liability for local rating by this company and its associated companies for the current year of assessment amounts to £266,000, which is in excess of the dividend paid to the Ordinary stockholders. It will be realised that the payments which we make under this head are substantial and have a considerable effect on the economy of the various rating areas in which we operate.

WAR DAMAGE

During the war our undertaking was not subjected to the same sustained aerial bombardment as in some other areas, but on occasions these attacks were severe. The damage sustained by the power stations was superficial, but on several occasions they, and, in particular, Yoker power station, had very narrow escapes. During the Clydebank and Dalmuir attacks serious and extensive damage was caused to the distribution system, and in one night more than thirty sub-stations were put out of action, ranging from complete destruction to repairable damage. Over twenty main extra high pressure feeder lines were severed, most of them in several places. Power consumers with a connected capacity of 63,000 kw. were isolated. Low tension networks extending over an area of 40 square miles suffered concentrated damage and in many places were buried beneath the debris of the destroyed buildings.

I am proud to say that by nightfall of each day of the attacks every power consumer was reconnected and supply made available. In the case of the domestic consumers the majority were reconnected with equal rapidity, and as regards the remainder supply was available before the premises were ready for occupancy. This achievement was due to the detailed arrangements carefully organised in anticipation of attack and to the wholehearted efforts of all concerned. Lack of space precludes me from referring to many cases of individual self-sacrifice when personal interests were completely set aside and the public need made the only consideration.

DOMESTIC SUPPLIES

The general extension of domestic supplies was stopped at the commencement of the war except in cases of urgency or necessity. Accordingly the number of domestic consumers has not increased commensurately with pre-war years. On the other

hand, the average consumption of the individual consumer has risen very considerably. As you know, urgent appeals for economy in the use of all classes of fuel have been made by the Minister of Fuel and Power from time to time and we are satisfied that in the main our domestic consumers have responded to these appeals, but the scarcity of other types of fuel, coupled with the necessity to cut down domestic work in order to release workers for war industry, has brought about an increased demand.

We are satisfied that when restrictions are removed, this demand will continue to increase as there is a growing appreciation by the domestic consumer of the advantages of electricity over all other types of fuel. In addition we understand that about 200,000 of the new houses which are so urgently required will be situated in our area.

ALL-ELECTRIC NEW HOUSES

Already a number of progressive local authorities have decided to make these new houses all-electric. We are, however, under a serious handicap in promoting this type of service because many local authorities who are responsible for the equipment of the houses in their respective areas own the gas undertakings and prefer to provide gas cookers without regard to the wishes of their prospective tenants and in some cases to put difficulties in the way of those who prefer to use electricity.

It is to the credit of some local authorities that although owning a gas undertaking they have decided to instal electric cookers in many of the new houses. They recognise that although electric cookers are of recent development, they possess advantages over any other type, and the majority of users have indicated their preference for an electric cooker. We look forward to a great increase in the demand for electrically operated labour-saving devices so soon as restrictions are relaxed. The housewife has every right to enjoy the benefit of improved conditions and electricity can immeasurably ease her burdens.

THE OUTLOOK

There is a possibility that temporarily at least the power demand may fall as the demand of industry at the high intensity which has characterised the war years is unlikely to continue. The extent of that possible decline cannot yet be foreseen or whether it will be met by the influx of new industry to our area, but we hope that after a temporary period the loss of power load will be compensated at least in part by the development of the demand of the domestic consumer.

Our charges for electricity supply to domestic consumers continue to be attractive and have not been increased since the commencement of the war notwithstanding the very heavy increases in operating costs of all kinds. Electricity must be about the only item in the household budget which has not risen in price.

So far there has been no indication of any policy on the part of the Government regarding the future of the electricity supply industry. The danger is still existent that the power companies, notwithstanding that their splendid services before and during the war fully warrant their continuance, may be nationalised either directly or indirectly in the guise of the establishment of Regional Boards.

In conclusion I repeat the warning that the stockholders and the public at large should be fully on their guard against any proposals of that nature, which can only be to the public detriment.

I now have pleasure in moving the adoption of the directors' report, balance-sheet and accounts and that in terms of the directors' recommendations provision be made for the dividend on the 6 per cent. Cumulative First Preference Stock for six months to 30th April, 1945, and that a final dividend be paid of 5 per cent. on the Ordinary stock, making 8 per cent. for the year, subject to tax.

The resolution was carried.

SCOTTISH POWER COMPANY, LIMITED

GROWING DEMAND FOR SUPPLIES

MR WILLIAM SHEARER'S REVIEW

The thirty-fifth ordinary general meeting of this company was held in Edinburgh on the 29th ultimo.

The chairman, Mr William Shearer, presided, and in the course of his remarks said: All our plants, hydro electric and steam, functioned satisfactorily during the year, enabling us not only to meet all demands within our areas of supply from Service Departments, factories and works directly engaged in the prosecution of the war, but also to satisfy the requirements of our general consumers.

Since the commencement of the war new connections by Government direction have been restricted to supplies essential to the war effort and to those given in cases of extreme hardship. These restrictions have apparently been misconstrued in certain quarters. In this connection I was interested to read the report of a recent speech by the chairman of the new Hydro Electric Board, in which he was explaining the immediate plans and proposals of the board, which have excited much comment and not a little criticism in the Highlands and elsewhere.

Lord Airlie is reported to have stated that in the area of the Grampian Company "new consumers are being turned away daily owing to shortage of power." In order to remove any misapprehension I must state emphatically that I know of no case of an application for a supply of electricity being refused where it was possible for us to obtain the necessary priority for material from the Government department concerned.

PROBLEM OF ADDITIONAL SUPPLIES

The promoters of the Hydro Board's schemes frequently refer to the duty which lies upon them to afford bulk supplies to authorised undertakers, among whom the Grampian Company takes a foremost place. As we are now prohibited from establishing any new generating works ourselves, it is clear that in course of time the Grampian Company will be entirely dependent on the resources of the Hydro Board for such additional supplies as we will require to meet the demands of our consumers. As to when these additional supplies will be required is at the present time problematical in view of the uncertainty of the extent to which wartime load may be shed, and of the difficulty of making any reasonably accurate estimate of requirements during the inevitable period of transition.

Our conception of the proper method of dealing with immediate requirements and of ensuring the efficient development of supplies in the Grampian Company's areas was confirmed by the Cooper Committee in their report.

The Tummel-Garry project of the Hydro Board, to which I will refer later, is meantime *sub judice*, but by reason of its location does not appear to meet the considerations which I have emphasised. It is possible, however, that the Hydro Board have other plans in view to deal with the situation. Meantime we have not been consulted as to when or where the demands we may have to make to enable us to serve the community may be met, and in any event it would appear that the Hydro Board cannot for a number of years meet any such demands if made.

The future outlook, therefore, in regard to additional supplies as and when required, and the cost thereof, is by no means free of anxiety, as we are no longer able to exercise that "healthy and vigorous" initiative in regard to the generation of hydro power which we have consistently applied in the development of our business.

HYDRO-ELECTRIC BOARD'S SCHEMES

Since our last meeting the Hydro Board have published two constructional schemes, and the brief references which I shall make to them are intended only to indicate the

extent to which our interests are or may be affected.

Constructional scheme No. 1 lies entirely outside our areas of supply, and our interest is therefore indirect and remote.

Constructional scheme No. 2 similarly comprises a major project based on the use of the waters of the rivers Tummel and Garry and a minor project at Gairloch.

Distribution schemes have also been published affecting the same areas in the vicinity of the minor developments. The minor projects and developments are stated to be completely uneconomical.

The Tummel-Garry project lies within the 1922 area of supply of the Grampian Company, and is designed to take advantage of the water control we have established at great cost in our extensive catchment areas. By all the laws of equity the very substantial benefit which will accrue to the Hydro Board through our works and operations should be recognised if the development is proceeded with. This aspect of the scheme is receiving our consideration in addition to various other matters which would affect us.

Excluding special supplies to authorised undertakers and the Central Electricity Board, the average price obtained during the year 1944 from our general business, which includes power, domestic, shops and agricultural supplies, was as low as 1.3d. per unit. Including special supplies, the average price was slightly under 1d. per unit.

These figures completely refute the accusations frequently levelled against us that we are exploiting the Highlands and using their natural water resources in order to supply electricity in the southern areas. Our uninformed critics, however, may have changed their view in the knowledge that the development of the water-power resources of the Highlands and the supply of electricity in these sparsely populated districts by the new Hydro Board will depend almost entirely on profits—if one may dare to whisper such a word in referring to a "non-profit earning" organisation—profits anticipated from export to the south, unless of course in the meantime the tax-payer is called upon to foot the bill. In other words, those critics may, somewhat reluctantly perhaps, have come to the conclusion that the devil they knew is probably not much more objectionable than the devil they are only beginning to know.

REDUCTION IN CHARGES

Further reductions in the rates of supply to power users in industrial areas served by our selected stations were carried into effect during 1944, and our tariff for public lighting supplies were also reduced.

All our agreements with industrial users, except within the areas of the Grampian Company, contain a coal clause which provides for an increase in the unit charge in ratio to the rise in the cost of fuel above a basic figure. The reduction in the rates of supply to these consumers includes a concession of between 8 per cent. and 9 per cent. on the special fuel charges which, I believe, is much appreciated by those engaged in industry.

NATIONALISATION

I will not detain you by elaborating my views on the question of nationalisation.

I will content myself to-day by suggesting that if any of you are inclined to be influenced by the opinions of those political theorists and bureaucratic monopolists who are so eager to create to their own specification a new world for other people to live in and who are always so vociferous in times of national emergency, you should think well before giving any support to their policies.

If these gentlemen should ever achieve their ambition, the shackles that would be placed upon us would have such a deadening effect that in the course of a generation or two this great country of ours would descend into the category of a second or third rate Power.

The report and accounts were adopted.

GREYHOUND RACING ASSOCIATION TRUST, LIMITED

RECORD OPERATING PROFIT

MR F. S. GENTLE ON TAXATION

The seventeenth ordinary general meeting of the Greyhound Racing Association Trust, Ltd., was held, on the 29th ultimo, in London.

Mr Francis S. Gentle (chairman and managing director), who presided, in the course of his speech, said: You will have seen, although the operating profit before charging taxation of the main subsidiary, the Greyhound Racing Association, Ltd., is nearly £578,000—a record—that the dividend is restricted to 42s. 6d. for 1944, and that the profit of the trust is £232,653, which is about the same as for last year. It will be appreciated that so long as the group is liable to excess profits tax at the present rate, and no unusual factors arise, profits are necessarily limited.

No dividends are receivable from Stamford Bridge Stadium, Ltd., or New Cross Greyhounds, Ltd. In the former case operating conditions were, as in 1943, still difficult, as apart from the general restriction on meetings, the use of the stadium for football prevented its use for greyhound racing for more than one meeting every two weeks during eight months of the year, it being possible to hold only 38 meetings during 1944; and in the latter the whole of the profits were absorbed by taxation.

TAXATION PROVISION

The charges for taxation in the group, including entertainments duty, total £734,300, which is an increase of £208,000 over the 1943 figure, and equivalent to £2,000 every day of the year. The provisions for taxation are sufficient to cover the estimated tax liability on all accounting periods up to December 31, 1944, the provision in New Cross Greyhounds, Limited, vision in New Cross Greyhounds, Limited, accounts having now been brought into line with the other members of the group. I would remind you, however, that the computations for excess profits tax have not yet been agreed.

As to dividends, your directors recommend that the ordinary dividend be maintained at 20 per cent., although this will mean that the amount available for transfer to general reserve and increased carry-forward will be reduced to £27,250, compared with £31,000 in 1943. With the proposed allocation general reserve now stands at £555,000. The total dividends for the year absorb £158,000 gross, the same as last year, and we have paid during this period, and hope to continue to pay, the preference dividends on their due dates, the 31st January and the 31st July.

CONFIDENCE IN THE FUTURE

Although we have come through five years of war without such damage as would prevent us operating we must still bear in mind that the damage or destruction of vital parts of our tracks might result in a serious fall in the company's income and at the present time the possibility of replacements would be very remote so that in considering the payment of interim dividends your board must have regard to the situation as it then is, in order to maintain the financial position which we have so carefully built up.

We all hope and believe that the end of the war in Europe is near, and that the difficulties which we have faced for nearly six years will to some extent be mitigated in the near future. For our part, we feel that during the war years we have provided relaxation for both Service men and industrial workers, and have been enabled to make a very substantial contribution to the national effort by so doing, and in the large payments we have made to the Revenue. We trust therefore, that the goodwill of your company has been fully maintained, if not strengthened, and so we are entitled, I hope, to view the future with confidence.

The report and accounts were adopted.

CO-OPERATIVE PERMANENT BUILDING SOCIETY

DR ALBERT MANSBRIDGE'S ADDRESS

The annual general meeting of the society was held in London on the 28th ultimo.

The President (Dr Albert Mansbridge, C.H.), in the course of his address, said: I stated at the Diamond Jubilee meeting of the society on March 9th, 1944, that the plans of the Government have not been made clear in regard to the housing of the people. I am disappointed that I have to say the same to-day.

There are several Ministries more or less responsible.

Diverse estimates have been made of the millions of new houses which must be built within the next five, ten or twenty years. It is estimated that the building industry in 1935 cost £600,000,000 and that during the first twenty years after the war, there will have to be at least £8,000,000,000 expended on housing.

I need not deal other than generally with the remarkable results achieved by the society during the year.

Confidence in both the financial stability and the just efficiency of the society is clearly revealed by the results obtained in 1944. A few typical figures of 1944 as compared with 1943 may be quoted to justify this statement. Advances on mortgage increased by £1,300,000. Redemptions were numerous, but, even so, the total mortgage assets increased by £140,000. As for the share capital, it rose by £2½ millions, while the number of accounts is now rapidly reaching the two hundred thousand mark, having risen by 4,300. The reserves and carry-forward have increased by £103,000, now standing at £1,705,000.

When it is noted that the average due on each mortgage is £406 and the present values of house property are remembered, it will be seen that the society is as safe for investors as anything in human affairs can possibly be.

There has been marked development in the housing society movement. For example, in the south-west of England a Co-operative housing society has been established. There are other examples too numerous to mention. In general, a housing society acting complementary to a Local Authority may consist of a body of local citizens, and be reinforced by Co-operative and other societies recognised and aided by the local authorities, who are empowered to give financial support. Such societies either purchase and administer properties, or create new estates in rural or suburban areas, utilising efficient local contractors for replanning and remodelling. Such societies are recognised and authorised by the Housing Act, 1936, Section 188, and are usually registered under the Industrial and Provident Societies Act, with the maximum interest rate of 5 per cent. They are in no sense to be regarded as profit-making concerns. At present the whole question of subsidies is under consideration. Subsidies, or some alternative, will be required if the houses are to be let at rentals which can be paid by ordinary working men and women.

The report and accounts were unanimously adopted.

BALANCE SHEET 1944

Liabilities.	
Due to Shareholders	£27,348,571
Due to Depositors	8,067,490
Other Liabilities	74,488
Sundry Creditors	21,071
Reserves	1,705,500
	£37,217,120
Assets.	
Due on Mortgage	£27,645,990
Sundry Debtors	84,552
Cash and Investments	9,486,578
	£37,217,120

BEIRA RAILWAY COMPANY, LIMITED

INCREASED GROSS REVENUE

The forty-fourth ordinary general meeting of the Beira Railway Company, Limited, was held, on the 28th ultimo, at 10 Old Broad Street, London, E.C., Mr Arthur E. Hadley, C.B.E., chairman of the company, presiding.

The following is the statement by the chairman circulated with the report and accounts:—The working of the line for the year ended September 30, 1944, resulted in a gross revenue of £971,166, an increase of £130,969 as compared with the previous year. Expenditure at £501,158 was £26,250 higher, and net revenue increased by £104,719.

As stated in the report the increase in the revenue was due to a satisfactory increase in import traffic, as well as the re-introduction of an allowance in excess of a strict mileage proportion in the division of through rates on certain special traffics. This allowance will be continued during the current financial year.

The profit for the year, after a provision for taxation increased by £25,000 is £86,420, adding to which the undivided balance from last year—£33,371—makes a total of £119,791.

Your directors propose that a dividend of 2s. per share, less tax at 5s. 4d. in the £, be paid, absorbing £77,000 net, leaving to be carried forward the sum of £42,791.

With respect to the current financial year, we have so far received traffic receipts for three months—October, 1944, to December, 1944, which are practically the same as last year, net earnings for this period amounting to £114,151, as compared with £115,126 in the previous year.

The report and accounts were unanimously adopted.

BRITISH ROPES, LIMITED

A GREAT WAR RECORD

The annual general meeting of British Ropes, Limited, was held, on the 28th ultimo, at Leeds.

Mr Herbert Smith (the chairman) said that the profit recorded for the year, before income-tax, had risen from £355,741 in 1943 to £440,890 for the year under review. Some idea of their contribution to the national effort by the production of high-grade rope for war purposes would be stated. The company had carried by far the largest individual share in roping the Navy, Army and Air Force, while their export fibre, wire and wire rope knowledge had been sought by most supply departments of the Government. The company's products had played no small part in equipping and servicing the many industries by whose unparalleled efforts a steady and ever-widening stream of essential war materials had flowed from these islands to every theatre of war. Their more direct contribution through the Service Departments towards the successful prosecution of the war had been even more considerable. Every phase of operations had resulted in a new and more pressing demand on the company.

Apart from the normal requirements of the Navy, they had undertaken the manufacture of huge quantities of various types of boom defence nets, anti-submarine and anti-torpedo devices, thousands of miles of steel wire rope for use against the submarine menace and large quantities for mine-sweeping. Towing ropes for army vehicles and tanks and vital connections in the "Mulberry" dock were all part of their production programme. Their machines had run continuously on aircraft cords, cables for rocket flares, for the balloon barrage and for the rocket guns.

With regard to exports, they believed that there would be large quantities of their products needed almost all over the world. They did not fear competition from any country for the world's markets.

The report was adopted.

BRITISH TYRE AND RUBBER COMPANY, LIMITED

SATISFACTORY TRADING PROFIT

The annual general meeting of British Tyre and Rubber Company, Limited, was held, on the 28th ultimo, at Caxton Hall, S.W.

Sir Walrond Sinclair, K.B.E. (the chairman), said that the trading profit before providing taxation, compared favourably with the previous year and was very satisfactory, particularly as the year had constituted a testing period such as they had never before encountered.

At the beginning of the year the technicians of the rubber industry were almost exclusively engaged in endeavouring to substitute synthetic rubber for the natural product. It became most imperative during the year that they should expand the rate of conversion to synthetic in a large way. He was pleased to report that they did not fail the national requirements, and the fact that the trading results compared favourably with those of the preceding year represented a very solid achievement. All their subsidiary companies were successfully fulfilling their allotted tasks, and they had never had to report a trading loss by any of them. The balance sheet now submitted disclosed a sound position. It had been built up steadily over a number of years and, moreover, it did not contain any intangible assets. Their liquid resources were substantial and their stocks equally satisfactory.

They were now faced with an outlook displaying many perplexities, but they had solid grounds for reasonable confidence and expectations of steady and prosperous trading. In more than one direction they had commenced arrangements for an expansion programme so as to be ready for the early post-war period.

The report was unanimously adopted.

H. P. SAUCE, LIMITED

ANOTHER SUCCESSFUL YEAR

The twentieth annual general meeting of the shareholders of H.P. Sauce, Limited, was held, on the 28th ultimo, at the Queens Hotel, Birmingham. Sir Patrick Hannon, M.P. (Chairman of the company) presided.

Having referred with regret to the loss which the company had sustained by the death of the managing director, Mr Cyril Owen, and the appointment of Mr R. G. Bayliss to succeed him in that office, the chairman in the course of his speech said:

The balance sheet will, I am confident, be accepted as evidence of stability. Our position after the appropriation of our profit, of which we invite your approval to-day, is wholly satisfactory. Profits for the year are sufficient to provide another substantial allocation to reserve fund, which now stands at £740,000, and we have decided that having paid a dividend of 30 per cent. on the ordinary shares for the past 15 years, to recommend an increase in the dividend to the extent of a 5 per cent. bonus. This will make our total distribution 35 per cent. on our ordinary shares.

It will be observed that the increase of profit has not been wholly absorbed by taxation, and thus the net profit for the year, after provision has been made for depreciation and taxation of profits up to date, is £158,257, an advance of nearly £4,000 on the net result of the previous year. The comparison of the balance sheets of 1943 and 1944 show that our investments including Tax Reserve Certificates have increased by £120,164. Sundry debtors and cash have decreased by £60,619. There is little change in the provision for sundry creditors and current taxation.

The market value of investments in trustee securities at the 31st December, 1944, was £1,069,351, which was £95,446 in excess of book value.

The report and accounts were unanimously adopted.

S.S. CARS, LIMITED

Change Name to

JAGUAR CARS, LIMITED

The eleventh ordinary general meeting and an extraordinary general meeting were held at Coventry, on the 23rd ultimo.

Mr William Lyons, the chairman, said: The new factories which we have built at our own expense during the war will, as they are released from war production, be equipped for engine, chassis and body manufacture. As a typical product of British quality, our cars have found a ready market in countries throughout the world. There are few countries where we were not represented by first-class distributors and dealers.

We are greatly encouraged by the forecast of requirements which we are receiving from our overseas distributors and dealers, and our post-war plans provide for an increase in export of five times the pre-war volume, and for extensive research in the world's markets in order that we may still further improve our knowledge of their demands.

As you know, since 1935, our cars have been sold under the name of JAGUAR, and have become widely known by that name throughout the world.

Your board have felt for some time that it would be better to adopt the same name for

the company as for its product as, by so doing, any possible confusion would be eliminated, and the dissipation of publicity over two names avoided, and—unlike SS—the name JAGUAR is distinctive and cannot be connected or confused with any similar foreign name.

The special resolution changing the name of the company to JAGUAR CARS LIMITED was duly passed.

LONDON AND LOMOND INVESTMENT TRUST LIMITED

REVENUE AGAIN SATISFACTORY

The fourteenth ordinary general meeting of London and Lomond Investment Trust, Limited, was held, on the 28th ultimo, in London.

The Hon. W. B. L. Barrington, the chairman, presided.

The following is taken from the statement by the chairman circulated with the report and accounts: The total revenue for the year is again satisfactory and amounted to £80,575, as compared with £78,497 in the previous year.

After deduction of expenses of management, interest, income tax and dividends on preference stocks there remains £17,348,

equivalent to 13.77 per cent. on the ordinary stock.

The sum of £5,000 has been transferred to general reserve, bringing it up to £105,000, and the directors now recommend payment of a final dividend of 7 per cent., making a total of 10 per cent. for the year as compared with 8 per cent. last year. The directors feel that the increased distribution recommended is fully justified by the results. They are, however, of opinion that it may be advisable to stabilise the ordinary stock dividend at this level for a few years, although the question will of course be subject to review from time to time. Meanwhile they will take into consideration raising the rate of the interim dividend on this stock in order to reduce the disparity between the interim and final dividends.

As disclosed in the balance-sheet the market value of the investments was £385,190 in excess of the figure at which they are stated in the balance-sheet. The total surplus is as follows:—

Appreciation in value of investments	£385,190
Capital reserve	165,869
General reserve	105,000
Carry forward	6,944
	£663,003

Each £100 of ordinary stock, therefore, was represented at January 31, 1945, by net assets of approximately £376.

(Continued from page 453)

household piece-goods showed any increase compared with 1943.

Unfortunately an index number of stocks is only calculated for certain sections of apparel, and the Board of Trade Journal gives no total. The following table, taken from the Journal, gives the yearly figures of stocks:—

(1942=100)

	Dress Materials	Women's Wear	Men's and Boys' Wear	Boots and Shoes
1943	99	107	110	79
1944	75	86	93	75

These figures bring out clearly the reason for traders' anxiety that stocks are running to a dangerously low level, and the fear that unless they can be replenished before the autumn, the maintenance of the clothes ration at the present rate may not be possible.

Shorter Notes

Following an agreement between the Greek and British Governments, the Bank of Greece announces that all British "military pounds" circulating in Greece will be withdrawn. Between April 16th and May 31st, the Bank of Greece will exchange these pounds at the official rate of 600 drachmas to the pound sterling. After May 31st, the "military pounds" will no longer be accepted for payments, nor will they be exchangeable against drachmas.

At the tender for this week's issue of £110 million of Treasury Bills, the Discount Market raised its bid to £99 15s. 0d. for the 91-day bills against £99 14s. 11d. for the 92-day bills of the previous week. As last year at the corresponding tender, the market maintained its bid at £99 14s. 11d., the move caught a number of outside competitors napping. The higher bid gives a discount of only 20s. 0.05d. per cent, and the market was, therefore, the more disappointed to receive an allocation as low as 30 per cent. The reason for the small allocation to the market was not to be found in larger tenders from outside competitors—the pool of application was virtually unchanged—but must have been due to a substantially heavier allotment to special customers at £99 15s. 1d. This explains the drop of 1.8d. in the average rate of discount to 19s. 10.06d., the lowest average rate since the month before the war.

The directors of Cunard Steam Ship are able to record for 1944 a fresh improvement in profit after all charges, and a higher net preference dividends, from £312,127 to £312,131, the highest figure in the recent history of the company. The ordinary dividend, resumed a year ago with a

payment of 6 per cent, is now raised to 7½ per cent by a final payment of 5 per cent. As was the case a year ago, an interim of 2½ per cent is also recommended. The earnings represent some 11.4 per cent on the ordinary, against 8.8 per cent for 1943. The £1 shares, which rose 2s. to 25s. 9d. on the announcement, yield 6 per cent.

Company Results

FINANCE AND BANKING

THE MONEY MARKET.—The new issue of T.D.Rs. this week at £150 million was double the level of the previous week, but nominal maturities were £80 millions higher than the week before at £120 millions. As a result of fairly heavy prior encashments, however, the amount of "fresh" money required came to about £55 millions, some £15 millions more than the previous week. This considerable withdrawal of credit did not cause much trouble. Tax payments are on the decline after the turn of the financial year and, more important, the large balances gathered for window-dressing operations at the end of March provided a surplus of credit to be drawn on. Thus, though the Bank Return shows a decline of £31.0 million to £187.9 million in the level of Bankers' Deposits, credit remained quite comfortable, though the banks were not particularly anxious to increase their bill portfolios. The tender for Treasury Bills, which produced the lowest average rate of discount of the war, is discussed in a note on page 458.

MONEY RATES, LONDON.—The following rates remained unchanged between March 22nd and April 5th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½%; 6 months, 1½%; Treasury Bills: 2 months, 1½%; 3 months, 1½%; Day-to-day money, 1½%. Short Loans, 1½%. Bank deposit rates, 1%. Discount deposit at call 1½% at notice, 1½%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between March 22nd and April 5th. (Figures in brackets are par of exchange).

United States. \$ (4.862) 4.021-031; mail transfers 4.021-031. Canada. \$ (4.862) 4.43-47; mail transfers 4.43-47. Switzerland. Francs (25.224) 17.30-40. French Empire. Francs 1936-2004. Syria. p. 8-81-85. Sweden. Krona (18.169) T.T. 16-85-95. Dutch West Indies. Florin (18.11) 7.58-83. Portugal. Escudos (110) 99-80-100-20; mail transfers 99-80-100-30. Panama. 44-02-04; mail transfers 4-02-04. Brazil. 83.8456½ (buying). Uruguay. 7.6597 p. (buying).

Fixed Rates for Payment at Bank of England for Clearing Offices. Spain. Pesetas 44.00. Turkey. Piastres 520. Italy. 71.25 lire.

Market Rates.—The following rates remained unchanged between March 22nd and April 5th.

Egypt. Piastres (97½) 97½. India. Rupee (184 per rupee) 173-18½. Belgian Congo. Francs 176-1. China. National \$3-3. Iran. R.L. 128-130.

Special Accounts are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London.

(Continuation on page 462)

GOVERNMENT RETURNS

For the week ended March 31, 1945, total ordinary revenue was £86,121,000, against ordinary expenditure of £149,930,000 and issues to sinking funds of £285,752. Thus, including sinking fund allocations £15,945,032, the deficit accrued since April 1st is £2,835,723,000 against £2,765,319,000 for the corresponding period a year ago.

Total	604,979	589,905	617,444	96,881	151,630	

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £349,580 to £2,500,847, the other operations for the week (no longer shown separately) increased the gross National Debt by £62,513,333 to £22,416 million.

Every description of Banking Service undertaken.

THE COUNCIL OF INDUSTRIAL DESIGN invite applications

(1) A Senior Administrative post. Applicants should have administrative experience in, or in connection with, business or industry and some knowledge of industrial design. The Council has no openings for designers as such. Starting salary according to qualifications £800-£1,000 a year and war bonus (at present £80 for men and £48 for women).

(2) A Librarian and Intelligence Officer to organise a library and the flow of information about Industrial Design from Home and Overseas. Salary according to qualifications from £450-£700 a year and war bonus.

Both posts will be in London. Applications, in writing, should state date of birth, full details of qualifications and experience, including a list of posts held to date, and should be addressed to the Establishment Officer, Room 710, I.C. House, Millbank, S.W. 1.

PERSONNEL FUNCTION OF MANAGEMENT

PERSONNEL.—Urwick, Orr and Partners, Limited, 7, Park Lane, London, W.1, is about to increase that section of its business engaged in advising industrial and other organisations on the development of Personnel Policy, the organisation of appropriate Personnel Departments and the training of Staff in the application of accepted principles.

Candidates for appointment should possess suitable academic qualifications, as well as a fairly broad knowledge and experience of different aspects of Management, including considerable experience as Personnel Management. Age should, preferably, lie between 33 and 37 years.

Initial remuneration would depend on qualifications, experience and proved capacity, but would be not less than £1,000 per annum. Prospects unusually good. Applications, which will be treated in strict confidence, should state age, positions held, and present salary level.

PERSONAL

T.T.T. Magnums cigarettes are the perfect smoke for the sensitive palate. Obtainable from WHITMORE & BAYLEY, 92, Wigmore Street, W.1. Established 1823. 100, 13/4; 500, 65/6; 1,000, 130/-. Post Free. Sample flat 50 for 6/8.

Odour of Dissolution

TWO political speeches, one Labour and one Conservative, have hastened the end of the Coalition Government, if not of this ten-year-old Parliament. In Mr Greenwood's words, "The fight is on," and what the Prime Minister called the odour of dissolution is in the air. Mr Bevin, at Leeds on Saturday, felt it incumbent on him to reply both to the mildly partisan passages in the Prime Minister's speech to the Conservative Conference a few weeks ago and also to the rumour that he himself was a candidate for office in a post-election coalition. There were certainly no qualifications about his attack on the Conservative Party, particularly for their pre-war record, or any lack of precision in his profession of party loyalty. Mr Bevin does not like being cast for the role of Ramsay MacDonald. On Monday Mr Bracken retorted in kind from the Conservative side. "Fears and doubts of our future," he said, "seem to hag-ride the Socialists towards a lop-sided totalitarianism."

It is so long since the days of party politics that phrases like this have caused a minor sensation. The cooler heads on both sides are counselling moderation, but it is perfectly clear that a Government whose members are verbally assaulting each other in this fashion cannot last very long, and when the Government goes, the Parliament will go soon after. The time-table hitherto agreed may now perhaps be speeded up. There may not be a clear-cut end to the German war, and if the next few weeks do not bring a definite end to the fighting, the Cabinet

might possibly break up without it. And the probability is now that the General Election will follow fairly quickly on the resignations of the Labour and Liberal Ministers.

It is also becoming clearer what the issues will be on which the parties will choose to fight. One will be that the Conservatives brought the war on by their folly or worse. "They thought they could buy Hitler and his gang," said Mr Bevin on Saturday. "Big Business was ready to do a deal with them." And the Tory kettle will call the Labour pot black. The second issue will be "public ownership" versus "free enterprise."

The Economist has consistently argued in favour of a return to party government, not, indeed, because of any positive benefits that the existing parties are likely to confer on the country, but because of the paralytic impotence of a coalition to reach decisions save on uncontroversial issues such as the winning of a war. But if anything could reverse the argument it would be the spectacle of the parties drawing up to do battle on a couple of controversies which, in so far as they are not misleading, are irrelevant. Neither party's record is clean in the pre-war years. If the Tories had more leaders who were lamentably wrong, they also had more who were right. The contributions of the Labour Party to the great debate of those years, if they were not wicked, were certainly silly, and if pasts are to be raked up, it would be difficult to beat for foolishness the Labour vote against conscription after Hitler was in Prague. What matters is not who failed to

prevent the present war, but who will succeed in preventing the next. That is the task of foreign policy, and the leaders of both sides have been singularly barren of any constructive ideas on the subject—with the sole exception of the Prime Minister's "Council of Europe" speech, from which he has now apparently departed.

As for the economic argument, any elector in his senses knows by now that neither "public ownership" nor "free enterprise" by itself is any good. The task of the next decade or two is to evolve techniques by which they can be combined so as to reinforce each other and not merely, as so often hitherto, for mutual frustration. It would be

a very sound rule of thumb to write off every politician who advocates either "public ownership" by itself or "free enterprise" by itself as a fraud and a charlatan—save for the fact that that would involve writing off almost the whole of the two largest parties.

If the election is coming soon, it is not too early for the party leaders to begin to put some constructive ideas before the electorate—if they have any. By all the indications, sloganising and mudslinging and the general antics of the party circus will not carry much conviction to the voters this year. But it does not look as if very much more is going to be offered.

Russia and Japan

THE approaching end of the campaign in Europe is beginning to produce a new alignment of forces in Asia. Russia is emerging from her enforced passivity in the Far East and assuming an active role. On April 5th Mr Molotov denounced the Russo-Japanese Neutrality Pact of 1941. The Pact has stood Russia in good stead, freeing her from the fear of a war on two fronts. It had to be denounced this month, as otherwise it would automatically have continued for a further five years. Even now, it is technically in force for another year. The choice of moment to denounce it may, therefore, be less significant than appears at first sight. But the method of denunciation, together with the publicity given to it, are certainly suggestive. Mr Molotov's statement to the Japanese Ambassador was worded in such a way as to allow the most elastic interpretation. He did not explicitly declare the Treaty to be null and void; and to this extent it may still be regarded as binding. But he charged Japan with "lending assistance to Germany in her war against the USSR" which may imply that, in the Russian view, a breach of the Pact has already been committed by Japan, and that Russia no longer considers herself pledged to remain neutral. Which of these interpretations turns out to be the correct one will be dictated by practical consideration of Russia's own interests rather than by legalistic scruples.

What are the practical considerations? Generally speaking, war—like peace—tends to be indivisible. The ties of Russia's alliance with the United States and Great Britain are too manifold and many-sided to allow for her continued neutrality. It is difficult to conceive a situation in which the Big Three should jointly shape a post-war European settlement and discard the partnership at the boundaries of Asia. The partnership has already, to some extent, been carried into the Middle East. It would be very surprising indeed if it were not extended from the Middle to the Far East. Russia's own interests would not permit a division of spheres so eccentric as to deprive her of the benefits which she can expect from the alliance in the Pacific theatre of war.

In the last decade or so before the war, Russia's influence in Asia was steadily receding. In the critical years of the German invasion it seemed to be reduced almost to insignificance. But the historical tendency of Russian expansion towards the Pacific has certainly not disappeared. For Czarist Russia this was the line of least resistance, the easiest direction of expansion. Revolutionary Russia, for different motives, was equally closely interested in Asia. The only country in which the Soviet influence ever became strong enough to induce the Government to work in close co-operation with official Soviet advisers was China in the early stages of the Kuomintang regime. Contemporary Russia has not abandoned the patterns of the old pre-revolutionary and nationalist tradition so much as added to them something of its original Leninist outlook. Marshal Stalin's desire to win back for Russia the influence and the position lost by the Czars is very likely to assert itself in the Far East with the same vigour and determination as in Europe.

The defeat of Japan will give Russia a brilliant opportunity of re-gaining the patrimony lost 40 years ago when

Russia, defeated by Japan, signed the Treaty of Portsmouth. The reversal of that Treaty is probably Russia's diplomatic programme in the Far East. This would mean the return of Port Arthur and of Southern Sakhalin to Russia; the replacement of Japanese influence by Russian in Korea and Manchuria; the recovery of the Chinese Eastern Railway, connecting Vladivostok with eastern Siberia, which was sold to Japan in 1935; and the extension of the Russian protectorate from Outer to Inner Mongolia. These, in all probability, are the first four items on the programme. They are important enough by themselves to induce Russia to intervene in the Pacific war. But there are still larger stakes. Russia will certainly be anxious to have her say in the Chinese settlement. Until quite recently, the Russian attitude towards China was one of studious aloofness and indifference. From the time of the conclusion of the Neutrality Pact with Japan, the traditional expressions of solidarity with China were carefully avoided. Nor have Russian spokesmen in recent years spoken their mind about the conflict between Chungking and Yen-an, which threatens to split China into two hostile camps. Quite recently there was a change of attitude. Russian interest in China has been revived; and the Russian press is beginning to take sides with Yen-an against Chungking.

When the Far Eastern chances are weighed in Moscow, the burdens and the cost of a new war are certainly set against the possible gains and prizes. The tremendous devastation and blood letting suffered by Russia in the German war make it impossible for the Soviet leaders to take lightly the prospect of more fighting in the Far East. Nor would a war against Japan be as popular among the people—whose mood cannot be ignored even in Russia—as the war against Germany. The claims of a Far Eastern campaign on Russia's resources and manpower would compete with the most urgent demands of economic reconstruction. And though it might be a short war, it might also be a long one, especially on the mainland. The Japanese are strongly entrenched in China and Manchuria; and their quick expulsion cannot be taken for granted.

The certainty that there will be some Russian activity in the Far East is thus much clearer than the form it will take. Russia might bring only diplomatic pressure to bear upon Japan. She might conceivably act as the mediator between the Allies and Japan (just as the United States acted as mediator between Russia and Japan in 1905). She might perhaps persuade Japan to surrender by the mere threat of throwing her forces into the fight. Alternatively, she might put Siberian bases at the disposal of her Allies. And finally she might choose to engage the Japanese in a fully fledged war on the mainland.

The choice of method will clearly depend on political developments inside Japan. Will the Japanese be realistic enough to surrender before defeat, now so certain, devastates their home islands and shatters the foundations of their national life? Or will they, like their Nazi allies, fight to the bitter end and commit national harakiri? The change of Government in Japan which took place simultaneously with the denunciation of the Neutrality Pact in Moscow is, like all Japanese political moves,

difficult to interpret with any certainty. But it seems to point to a confusion of policies in Tokyo. It reflects a state of uneasy balance between the various political groupings, the militarist extremists and desperadoes, the pseudo-Liberals and quasi-Liberals, the dubious pro-Russians who are wholly anti-British and anti-American, and the equally dubious moderates with the reputation of being pro-American. The new Premier, Admiral Suzuki, is a representative of that spurious Japanese liberalism which has allowed itself so often to be exploited as a smoke-screen for militarism and has been so easily swept aside, when the time came, by the secret military juntas. (He himself was gravely wounded during the Young Officers' revolt in 1936.) Admiral Toyoda, the new Minister of Munitions, belongs to the same category. He was Foreign Minister in the early stages of the Washington talks whose eventual failure led up to the attack on Pearl Harbour; and, to judge from the testimony of Mr Grew, the former American Ambassador in Tokyo, he ought to be regarded as something like the potential leader of a pro-American "peace party." The Foreign Minister in the new Cabinet, however, is Togo, who held the same post after the decision had been taken for war and when the negotiations were being continued simply as a blind; he had previously been regarded as "the most acceptable representative of Japan in Moscow." The militarist extremists are represented by General Minami, the President of the quasi-totalitarian Party, and by several other military leaders.

Thus, this odd Cabinet seems to include some potential Japanese Badoglios who might, in some circumstances, be prepared to negotiate a surrender. But it is doubtful whether the situation is really ripe for them to act. The new Government will try to mark time, to fight on and, at the same time, to keep several doors ajar through which to escape from disaster. Suzuki and Toyoda may hope to be able to talk, if need be, to the State Department, while Togo deals with the Narkomindel. The chief diplomatic rôle has for the time being undoubtedly been assigned to Togo. The Japanese probably still think that they need not throw up the sponge, if Russia can be kept neutral for a few months longer. True, the Americans have come dangerously near to the home islands. But to the Japanese the occupation of the Yokinawa islands may look no worse than the occupation of the Channel Islands looked to the British in 1940. The chief battle—the invasion of Japan—is still ahead. The American bases are far off; and the home islands are certain to be strongly defended. Meanwhile—so the Japanese may hope—they may benefit from political windfalls. The post-war chaos in Europe may produce disunity among the Allies and help Japan to obtain a negotiated peace. Should this hope fail, and should Russia, after all, cease to be neutral, then the "moderates" may still come to the fore and wage a "peace offensive"—provided, of course, that the fanatical

believers in national harakiri and the terrorists from the secret Army associations do not upset the plans by last-minute assassinations of the "moderate" leaders.

It is obviously in the Allied interest to speed up the end of the Pacific war. The German example shows that the enemy's harakiri does not make matters easier for the victorious Allies but more difficult. It leaves a legacy of economic chaos and social unsettlement, a very shaky ground for any peace settlement. A Japanese fight to the bitter end, without any central Government being ready to capitulate, might well mean that, even after the conquest of the islands, the war would still go on in Manchuria, Korea and China. This, in its turn, might create grave political problems in China, where the Russians would work through the Communist administration of Yen-an, while the Americans and probably also the British would support Chungking. A dangerous inter-Allied rivalry, of which Europe has already seen some examples, may develop also in Asia. And, perhaps even more dangerous, the Pacific war would overshadow the peace settlement in Europe, where decisions would continue to be taken under the pressure of military expediency rather than on the merits of the issues.

The Allies ought certainly to do what they can to create the conditions for Japan's surrender and to strengthen the hands of the potential peace party against the militarist faction in Tokyo. An attempt to achieve this may, of course, fail because of the explosive and incalculable character of Japanese politics and because of the political timidity or cowardice of the quasi-Liberals. But even so, it should be worth while to define conditions of unconditional surrender in a way that would help the Japanese to reconcile themselves to defeat.

The margin of the possible Allied concessions must of necessity be very narrow. There can be no abatement of the decision that Japan should be deprived of all her colonial possessions and dependencies. Nor can the demand for complete disarmament be waived, even though this condition alone may be enough to drive the army fanatics into despair and to make them terrorise the more moderate elements. But the Japanese ought to know that through timely surrender they can save the homeland from a long Allied occupation, preserve at least some of their industries and be given a chance to resume normal peaceful economic relations with the outside world. No one who realistically contemplates the practical problems of enforcing a settlement in the Far East can doubt that these terms will, in fact, be granted to the Japanese. To those Japanese who are still unable to abandon the dreams of the Great East Asia Co-Prosperity Sphere this may not be a sufficiently attractive prospect. But to the great mass of the Japanese people and to a section of its ruling class it may offer a welcome opportunity to avoid national suicide. It would be foolish of the Allies to base their policy on the belief that the instinct of self-preservation is altogether absent from the Japanese mentality.

Have you heard of—

French Economic Policy

THE contents of M. René Pleven's Budget speech on March 29th made it clear that the Provisional Government had decided in his favour the long dispute with M. Pierre Mendès-France, who duly resigned from the Ministry of National Economy on April 4th. M. Pleven is to combine this office with the Ministry of Finance. This episode not merely clarifies the kind of financial policy the French Government is likely to pursue, at least until public opinion can be tested by a general election, but it also marks the end of an experiment in Government whereby a super-ministry was to initiate financial and economic policy and to co-ordinate the activities of other ministries dealing with economic affairs.

As an experiment in government, the grouping of a number of departments under a new super-ministry was almost doomed to fail. The scheme was conceived by members of the Provisional Government before the liberation of France and, like many other plans, it looked neat on paper but has proved unworkable in spite of the French penchant for logical solutions. As experience in this country has shown, a new ministry, set up to control established departments, inevitably encounters friction because it can only establish its own authority by diminishing that of other departments; M. Mendès-France soon discovered that, in spite of the full paper powers given to him by the constitution of his Ministry, other departments tended to resist encroachment. A super-ministry of the kind envisaged can therefore only establish its authority if its Minister possesses an outstanding personality and a first-class staff; but since established departments are usually unwilling to part with their most experienced administrators, a new ministry is never likely to gather a strong team, at any rate initially. M. Mendès-France has been imprisoned by his own logic; rather than accept the more modest rôle of a chairman and an energiser—as is Lord Woolton's in this country—he preferred to resign. He wanted all or nothing.

This does not mean, of course, that a co-ordinating ministry, charged with the initiation and supervision of economic and financial policy, will never work. It can; but only if the ministry is the natural co-ordinating department, and this is inevitably the department that holds the purse strings, that is to say, the Treasury in Britain and the Ministry of Finance in France. The strength of the Ministry of Finance is not merely derived from its control over revenue and expenditure but also from the *esprit de corps* of the *Inspecteurs des Finances*, who hold many key positions in Ministries other than the Ministry of Finance and, by reason of their training, generally retain, if not necessarily allegiance to their former department, a common outlook upon financial and economic problems. In a sense, the taking over of the Ministry of National Economy by the Minister of Finance is, therefore, a natural development or, rather, it means a return to the *status quo*, for the nucleus of the new ministry was formerly a department of the Ministry of Finance.

The resignation of M. Mendès-France, however, is not merely a reflection of the difficulties he encountered in the attempt to establish his authority. It is also a reflection of a clash of views about policy and about the methods that should be pursued to lead the country out of its present difficulties. M. Mendès-France brought back from Algiers detailed schemes for the control and direction of the French economy. Like his conception of a super-ministry, his schemes were logical and symmetrical. He wanted to start with a clean slate. As he is reported to have stated at a press conference on April 5th, he wished to take advantage of the present stagnation of the economic life of the country to carry out a series of cleansing operations, especially in the monetary sphere, in order to enable the country to start from a sound and healthy basis. He had prepared plans for radical reforms. In particular, he wished to put an end to inflation by monetary operations. His policy included the exchange of banknotes and the

temporary blocking of all but small amounts—frs. 5,000 a head (£25 at the official rate of exchange and less in purchasing power) was the figure mentioned—the ruthless confiscation of illegal profits, and a capital levy. In sum, he was in favour of shock tactics against the threat of inflation.

The Minister of Finance, whose views have prevailed, professes the same zeal for economic recovery—indeed, it would be absurd not to—but he prefers to rely upon more orthodox methods. In his Budget speech M. Pleven laid down the principles of short-term as well as of long-term policy. In the short run, his aim will be to mobilise the country's resources to the fullest possible extent, to tax heavily and to initiate an energetic savings campaign as a means to resist inflation. One of the running sores of the French fiscal apparatus has been wholesale tax evasion by the public. M. Pleven declared his intention of tackling this problem vigorously, not merely by exhortation but by direct action. He has sought and obtained the promise of the British, American and Belgian Governments to give him information about French assets in these countries; he is to tighten up the apparatus of internal tax collection. Illegal profits are to be confiscated; of the expected yield of frs. 12,000 million, frs. 5,500 million have already been declared subject to seizure. He intends to impose a levy on wartime increments of personal property, payable over the next three years and expected to yield frs. 100,000 to 125,000 million; the details of this levy have not yet been announced. If he succeeds in doing all these things efficiently, he will have gone a long way towards financial rehabilitation. M. Pleven's long-term policy is to be designed to raise the productivity of France, and he promised to submit to the Government this year detailed plans concerning the financial methods to be employed in the pursuit of his aim.

M. Mendès-France has been criticised for putting forward theoretical proposals. But it remains to be seen whether M. Pleven's will be any more successful in translating themselves from paper into reality. Many French Ministers of Finance in the past have promised to end tax evasion. A campaign to induce the public to invest their savings in Government paper is not a policy whose success can be confidently predicted—the less so in the conditions that now prevail in France. A plan to improve productivity is an admirable object; but in the best of circumstances it will not take effect for many years. M. Pleven is unquestionably right in thinking that the fundamental immediate problem is to increase the supply of goods; but that does not mean that M. Mendès-France's more financial approach is wholly divorced from the needs of the moment. There is a grave risk of progressive inflation of a purely monetary sort, irrespective of the volume of supplies, and M. Pleven's policies will have to be applied with a promptness and effectiveness that has not been customary in French fiscal practice if they are successfully to confront this danger. Next door, in Belgium, a successful step in monetary deflation has substantially eased the pressure of money on supplies and it is impossible not to sympathise with M. Mendès-France's desire to do likewise in France.

But Belgium is not France, and this may well be the crux of the matter. Draconian measures require a strong and coherent administrative machine, and this does not exist at present in France. Even if M. Mendès-France's reasoning had been perfect, even if he had met no opposition within the Government, he would still have had the most formidable difficulties to contend with in trying to get a tight grip upon the national economy. Not the least of these difficulties would have been the traditional unwillingness of the agricultural community either to put much financial trust in the politicians of Paris or to deliver supplies of foodstuffs against currency that may be blocked. It may very well have been considerations of this order that decided the issue in favour of M. Pleven. But, if so, that is tantamount to saying, not that his policies

are good, but that they are the best that are possible in difficult circumstances.

But whatever the merits of the two different approaches, the fact is that the country remains in the throes of serious financial and economic difficulties. Fundamentally, the short-term problem is one of supplies. The degree of success he is likely to achieve in his attempt to arrest inflation depends largely on his ability to absorb excess incomes by taxation and an active loan policy. True, the latest increase in wage rates is an adjustment of the wages structure that has probably been made necessary by the uneven application of the increase granted last September and, in a sense, a means of restoring something like the former relationship between town and country. (The hourly rate of an unskilled worker in Paris is to be raised from frs. 15 to 20—that is, from 1s. 6d. to 2s. at the official rate of exchange—with proportionately lesser increases for skilled workers.) But this will inevitably mean higher costs and, incidentally, it emphasises still further the artificiality of present official rates of exchange. And, in the absence

NOTES OF THE WEEK

The German Strip

The Nazis have now lost one-half of Germany. An area roughly equal to three times what is left is still under German occupation in Denmark, Norway, Austria, Czechoslovakia, Italy and Yugoslavia. The German territory in central Europe has become a narrow strip, and from west to east Allied armies near Magdeburg have to cover not more than 120 miles, as the crow flies, to join forces with the Russians at Frankfurt east of Berlin. Outside this narrow strip of territory there are still German pockets in the Ruhr, in French Atlantic ports, in Courland in Russia, near Danzig, and on a number of islands in the Aegean Sea. Inside the strip the military and civilian administration of the Nazis continues to function haphazardly.

Nazi propaganda from the centre, which is still maintained for internal as well as for foreign consumption, suggests very different conditions in different parts of Germany. In some provinces, the administration is still intact; in others, the entire population has been simply turned over to the regional military commander. Some groups of the *Wehrmacht* have become autonomous in all supply matters, others have turned into groups of stragglers. Soldiers in training camps and in training units for officers and NCOs have often transformed themselves into field units. But the Nazi party as a centralised body of privileged men and women still functions after the territorial losses. Here and there, *Gauleiters* have been left behind in pockets of resistance in order to preserve prestige, but as a rule party officials have moved faster than the advancing Allied armies.

There is evidently a quite definite intention to preserve the party intact, or at least to keep a skeleton in existence at the centre. Formerly, civilian administrative offices and party offices could not, in theory, be held by one person, but in practice this rule was frequently waived in the lower grades. Recently, however, it was again decreed that the party office of *Kreisleiter* (District leader) and the office of *Landrat*, that is the head of the smallest administrative district, should not be held by one person. The object of this decree, as of former similar decrees, is to give the party officials more freedom from direct administration. The party officials, the *Gauleiters* and *Kreisleiters*, as well as the local party leaders, have been engaged for some time in organising the *Volkssturm* battalions. In other words, the situation has forced the party leaders to be as mobile as possible, which looks as if the party and its organisation are thought to be more important than the civil administration.

Displaced Persons

The problem of "displaced persons," the official term for foreign workers, deported persons and prisoners of war employed on forced labour in Germany, is rapidly becoming a major concern of the Allied troops occupying Germany. The first authoritative statement on the problem was made by Brigadier-General R. Mickelsen, head of the Displaced Persons, Refugees and Welfare Branch of the Allied Military Government. He estimates the total number of displaced persons at about 7,000,000, but this figure

of an expansion in supplies, the pressure for higher wages and farm prices may be expected to continue. M. Pleven still has to justify his policy by results.

Moreover, it will have to do so in a political atmosphere which cannot fail to be prejudiced by the outcome of the affair. However practical the real reasons that decided the issue, it is regarded by the Left, in the light of their hopes of sweeping social changes, as a victory for the Right. It is true that the mood of the majority of the French people, as it is gradually being revealed, is against any consistent policy of revolutionary change; but this will not lessen the disappointment of the Left, who were confident, so recently, of being in the majority. Nor will it prevent them from attacking M. Pleven's Liberalism as outright reaction. Even the Right in 1945 is a long way to the Left of where the Centre was in 1938. But there are still differences deep enough to provide plenty of obstructions. The basic problem of French economic policy, now as before, is to organise a sufficient body of support for the policy of the majority to make it effective.

excludes prisoners of war and civilians confined in camps. Twenty per cent are women and 5 to 10 per cent children, mainly orphans. This is a reduction on the unofficial estimates, which put the total number of displaced persons and prisoners of war at about 14 million. In fact, the rare German statements on the subject suggest that foreign labour in Germany never exceeded 8,000,000 persons. Allied armies have so far collected a total of 800,000 displaced persons, including 100,000 in France and another 100,000 in Germany west of the Rhine. This is about half the total which the Allies expected to find west of the Rhine, and it appears that the Germans marched many of the foreign workers back with them in their retreat.

The situation has now changed. The number of displaced persons found in occupied Germany is mounting rapidly. In ever greater numbers they are leaving farms and factories and are trying to find their way home. Frenchmen, Belgians and Dutchmen know their destinations, but the majority are Russians and Poles, who wander directionless. The Allied authorities are attempting to stop this involuntary vagrancy, but the problem seems impossible to solve at the moment. Ultimately, the displaced persons will have to stay until a concerted plan for repatriation can be carried out, but this is hardly possible until the whole of Germany is occupied. Thousands of transit camps will be necessary, and the repatriation itself will be a major administrative problem. The long-expected upheaval has thus come about. The first joys of liberation at long last cannot hide the tragedies of the greatest dispersal in history. To help these millions will tax to the utmost the administrative ability of the Allied Military Government and UNRRA.

Machinery of Government

Two new Bills have been laid before Parliament this week. The reason for the Statutory Orders (Special Procedure) Bill is the large number of Statutory Orders, made under reconstruction legislation, which require to be submitted to Parliament. Under it, there will be a period of 14 days during which any MP can move the annulment of a Statutory Order. If, at the end of this time, the Order has not been annulled, all objections and amendments to it will be referred to a Joint Select Committee of both Houses. The Committee's decision will be final, unless the Minister asks Parliament to reconsider it. The new procedure can, initially, only be applied to Orders made under new legislation, except that it will apply to those made under the Town and Country Planning Act, 1944. But, after five years, if its working proves successful, it can be used to replace provisional Orders made under other existing Acts.

It is clear that the Bill puts important responsibilities upon the proposed Select Committee, although it reserves to Parliament a preliminary right of annulment, which is likely in practice to be sparingly used. The Bill strikes a good balance between the needs of Executive speed and Parliamentary supervision, and is a satisfactory step towards solving the problem of delegated legislation.

Local Areas

The second Bill sets up the promised Local Government Boundary Commission, which is to consist of five members. The significant point about this Bill is that it leaves all important decisions to be taken later by the Minister of Health or the Commission itself. In theory, the Commission can unite, divide, and redraw the areas of local authorities in any way it pleases. The "general directions" which will guide it are to be issued by the Minister, subject to Parliamentary approval, but they are not to be debated by Parliament. The Commission's major decisions will be scrutinised by Parliament, presumably under the proposed new procedure. But the very latitude of the powers conferred by the Bill and the complete silence about how they will be exercised is in this case less an indication of the dangers of delegated legislation than of the probability that no serious reform will be attempted.

The County of London is excluded from consideration by the Boundary Commission. The reason given is that a separate commission will later be set up to consider the special position of the metropolitan boroughs. Nothing, however, could be more symptomatic of a defeatist attitude towards local government reform than this decision to separate the problems of the L.C.C. from those of the rest of Greater London, which the Commission will consider. The L.C.C. area has hardly altered since 1855. It contained in 1939 less than half, and in the future will contain a smaller proportion, of the population of the Metropolitan Police District, which is itself a conservative area to take as representing Greater London. Contained in the Police District are two whole counties, large parts of three other counties, three county boroughs, and well over fifty boroughs and urban districts.

Clearly it is the reorganisation of London's major authorities which should be considered first, and such consideration cannot ignore the possibilities of a Greater London Council or an enlarged L.C.C. The provision that no local authority in Middlesex may apply for county borough status is a recognition that the creation of further major authorities is impossible. The two proposed commissions can between them, in fact, do no more than re-group some of London's minor authorities. It would be better to abandon any pretence at immediate action in London, and to ask the separate commission to make recommendations about the whole region.

House Repairs

The main grounds of criticism in Tuesday's debate on the repair of war-damaged houses were that, in advertising the success of the winter repairs programme, the Government had given too rose-coloured a picture of the condition of London. Any chance impression that repairs had been completed would, some Members feared, bring evacuees prematurely back to London and despatch workers prematurely to the provinces whence they came.

Mr Sandys's reply gave ample evidence that the task of repairs in London is far from finished. Although 800,000 damaged houses have been made tolerably comfortable since September, between 250,000 and 300,000 still remain to be done. In addition, there are 40,000 houses which are more severely damaged and will need more extensive repairs. Some are slums and not worth working on, but Mr Sandys evidently hopes to complete the rest by the end of the summer. By contrast, in the whole of England and Wales there are only 10,000 severely damaged but repairable houses still not tackled. It must surely be obvious, in the light of such facts, that there can be no question of allowing workers to leave London at least until the autumn. The present labour force of 143,000 (of whom 121,000 have been drawn to London since last year) is apparently regarded as a peak, and numbers can be expected to decline next winter, when the last phase of the repairs programme—that of internal redecoration—may be begun. Between then and now one of the aims of the London Repairs Committee should be to make sure, with the full co-operation of the police, that labour so urgently needed for homes should not be wasted on private decoration obtained by back-door methods. For, no matter how many warnings and appeals are made, evacuees cannot be depended on to stay away from London. Unless every possible repair is done during the summer, the Government will bear at least some responsibility for the housing situation in London next winter.

Municipal Elections in France

The date of the first municipal elections in France, fixed for the end of this month, is close at hand; and the French are now discussing whether the elections ought to be postponed or not. One objection against holding them now is that the prisoners of war and deportees are just starting to return from Germany and that it might be better to wait until they are all back. As it will take several months before the repatriation is finished this would mean that the first formal, though incomplete, census of French public opinion after liberation would have to be postponed for a further period.

On the whole, the Left is for postponement. It expects to win many votes among repatriated Frenchmen and fears that the vote of the women, which will be cast for the first time in French history, may swing the balance in favour of the Right. This fear may or may not be justified; but it is certainly bad policy and poor tactics to build a political argument on any such fear. The women have been enfranchised by common agreement; and the consequences of this, pleasant or unpleasant, have to be faced by all parties. The absence of prisoners and deportees is a much more weighty argument. But France is not going to the polls to elect a Constituent Assembly that would pass fundamental reforms of national importance. Municipal elections will not end the constitutional interregnum, but they will give some approximate idea about the state of public opinion. Without any such idea France is and will continue to be in the dark about her own political condition. And so will the world outside.

On balance, therefore, the argument for the holding of elections seems to be more convincing than the objections to it. But whatever the result of the vote, it will mirror only very dimly the relative strength of the chief political tendencies. In municipal elections local sympathies and animosities rather than views on issues of national importance swing the balance of the vote.

Liberation in Sight

The liberation of Holland, held up last autumn, is again in progress, and it may not be long before the whole of Holland is freed. Holland was conquered by invasion from the east and by the action of German parachutists. Final liberation again comes from the east, and parachutists have again played an important part. Around Enschede, Hengelo and Almelo, there has been relatively little damage. Canadian troops, advancing along the railway to Groningen, have linked up with the parachutists dropped near Meppel, and the German garrison in Holland, estimated at 80,000 men, including a great many administrative units, will have great difficulty in escaping.

But the joys of liberation have again been diminished by the Germans' action in flooding the country. Flooding has actually cut the northern province of Friesland in half. Another flooded area is the Geld-Vallei which leads to Amersfoort. It is quite possible that the German troops will retreat from east to west into the area of Amsterdam, the Hague and Rotterdam, each of which is surrounded by flooded country, and they may try to hold these three towns as they are still holding some of the French ports.

Conditions in southern Holland, which was liberated last autumn, have hardly changed, and the food situation is still precarious. But in western Holland, especially in the Amsterdam, Utrecht and Rotterdam areas, conditions seem to have gone from bad to worse; and every day's fighting produces further deterioration.

Teachers and the Act

The annual conference of the National Union of Teachers has provided an opportunity for teachers to express anxiety for the future of the Butler Act. The presidential address gave warning against a "wave of cynicism" on the progress of reform from statute book to classroom. A resolution followed, demanding that the leaving age be raised to 15 before a year is out and that teachers and buildings should be provided for the purpose. Such sentiments are admirable, and it is right that teachers should be on guard against any whittling away of the progress that has already been achieved, on paper, in the Act.

At the same time, the buoyant enthusiasm of their claims appears to lack the ballast of fact. No attempt was made

at the conference to explain how the desired ends could, in concrete terms, be achieved. To take buildings alone, the situation at the moment is that schools have to be rebuilt and extended to provide for the equivalent of about 640,000 pupils—if damaged schools are to be rebuilt and room made for children up to the age of 15. Between now and next April, there will be, according to the Minister of Works, an average of 50,000 workers available for schools, hospitals and other public buildings. It seems unlikely that so small a labour force would be equal to the task. Even the panacea of prefabrication can, apparently, give little help; the cost to local authorities would be prohibitive and the same difficulties of finding the extensive sites would be bound to crop up. There has, at any rate, been no sign of planning in this direction from either the NUT or the Ministry of Education.

Consequently, it is possible to disagree with the teachers when they claim that anything less than their demands will bring shame on the whole country, without in the least belittling their motives. Scepticism over an optimistic programme need not, in present circumstances, be confused with cynicism for the final ideal. Later, when the labour budget is not so tight, there will be every justification for violent criticism if the Ministry fails to show a pretty turn of speed in practical reform. But, for the present, it is better not to overstate the case.

Meanwhile, an announcement has been made of re-organisation within the Ministry of Education "to facilitate administration under the Act." The department is to be divided into four distinct branches (besides the Welsh department and the medical branch) which will be concerned respectively with schools, further education, the supply and training of teachers, and information, research and public relations.

The Case of the Missing Poles

The Russo-Polish drama has been enriched by an episode worthy of a detective story. Last week, the Polish Government in London officially announced that its representatives in Poland and the leaders of the political parties had disappeared after an interview with a high Soviet officer, Colonel-General Ivanov, and that they "had given no sign of life" ever since. The Polish communiqué was so worded as to suggest, in a rather vague manner, that the Polish leaders had been either shot or imprisoned by the Russians.

However, this suggestion was soon contradicted by a report that the "missing" Polish personalities had arrived in Moscow to negotiate with the Russians on the formation of a new Provisional Government in Poland. The substance of the report seems to have been generally accepted as true, but the British Government has disclaimed any knowledge of the incident.

If it is true that Mr Molotov is attempting to reach a bilateral agreement with the authorised representatives of all Polish parties, then the Russian procedure is very odd indeed. The Crimean Conference entrusted the task of setting up a new Polish Government (or of "broadening" the Warsaw Administration) to a Commission of Three, on which Mr Molotov sits with the British and American Ambassadors. A Russian attempt to reach a direct agreement with the Poles may be prompted by understandable motives. The Russians may wish to demonstrate that they can come to terms with their neighbour without any pressure from the other Allied Powers. Even so, one might ask what purpose has been served by the long deliberations over the Polish issue at Yalta if the decisions agreed upon by the Big Three are so spectacularly obviated by the Russians. The hope may, however, still be entertained that if the Russians reach agreement with the Poles in bilateral negotiations they will submit its terms to the Allied Commission for approval. The purpose of the inter-Allied discussions about Poland is, after all, to bring about agreement between the Poles and the Russians. But perhaps another melodramatic incident, with an E. Phillips Oppenheim touch, will obscure the prospects of a Polish settlement once again.

Exit Plastiras

The violent Royalist campaign against General Plastiras has led the Greek Regent, Archbishop Damaskinos, to dismiss the General and to appoint Admiral Voulgaris as

Prime Minister. The campaign against Plastiras reached a climax last week, when the Greek press published a letter written by the General in 1941, from which one might deduce that his attitude towards the Axis was then slightly ambiguous. The content of that letter had been well known before and its publication now was hardly more than a pretext. The real motive for the change in the Government was given quite frankly by the Greek Regent when he declared that the speeding up of the plebiscite—a demand now raised by Royalists and opposed by parties of the Centre and Left—ought to be the chief task of the new Government.

Admiral Voulgaris's political career had been relatively uneventful before he took over the command of the Greek Navy during the anti-Royalist revolt in the Middle East last year. He suppressed the revolt and came to be hated by the Left. His Government is composed of Royalists and Republicans in equal numbers. A Republican of a moderate Right wing complexion holds the Ministry of the Interior, while a Royalist has taken over the Ministry of Information—an invaluable instrument of propaganda in the pre-plebiscite campaign.

The political tension in Greece is visibly increasing. The EAM has issued several protests against the terror applied to its members. It has also repeatedly accused the Administration of violating the Varkiza agreement, under which the Left Wing guerillas laid down arms. But ELAS is now almost certainly unable to stage a revolt against the Government. Plots and *coups d'état* are now more likely to be hatched among those Royalist extremists who are bent on forcing the pace of the Restoration.

However, the new conflicts in Greece may well lead to serious, and not merely internal, troubles. In Greek Macedonia, the EAM tends to look for help to the Bulgarian Fatherland Front, in which the Communists play an important role, and also to Marshal Tito's movement across the Yugoslav frontier. The Macedonian EAM may well play with the idea of Macedonian separatism. The idea has never been quite abandoned, even after Bulgaria's surrender to the Allies; and the autonomous Macedonia within the framework of Marshal Tito's federated Yugoslavia may have some attraction for dissatisfied elements

LOOKING AHEAD

THE Post-War World will need business initiative, foresight and courage. The services of Westminster Bank are at the disposal of all those who are, or will be, engaged in the great task of reconstruction and expansion both at home and overseas. CREDIT facilities will be readily available to meet the requirements of all classes of trustworthy borrowers.

WESTMINSTER BANK LIMITED

HEAD OFFICE

41 LOTHBURY, E.C.2

in Greek Macedonia. Significantly enough, the protests and the grievances of the Greek Macedonian Left are being given wide publicity in Soviet propaganda, which has now broken the silence it maintained during the Greek civil war.

Requisitioning in Bournemouth

A housing incident at Bournemouth has attracted a great deal of notice in the press. A number of tenants of furnished flats were served with eviction notices by their landlords, presumably because they could get higher rents from holiday-makers. On receiving representations from the Mayor of Bournemouth, the Minister of Health intervened and granted the local authority special requisitioning powers to take over the premises. This was actually the first case of its kind, though a case at Leeds about two years ago provided some kind of precedent for the Minister's action. But in view of the scarcity of holiday accommodation it would not be surprising if other seaside resorts underwent the same experience, and Bournemouth's local authority has set a valuable example.

Requisitioning powers were granted to the Minister of Health under the wartime Defence Regulations, and therefore they have no application to normal peacetime conditions. They were originally intended to apply to the requisitioning of accommodation for special categories of people, such as the bombed-out and homeless, but were recently extended to cover more general purposes. Tenants of furnished lettings have no redress against the threat of eviction, being bound only by their terms of contract, though they can, of course, complain to local authorities or lodge a prosecution in the event of extortionate rent being charged. Under the Rent Restrictions Acts, standard rent is defined for unfurnished lettings, but not in respect of furnished lettings.

The whole position seems very unsatisfactory, and it is to be hoped that it will be cleared up by the Ridley Rent Control Committee, whose Report is due to be published within a fortnight. The Ridley Committee has wide terms of reference, which include rent control of furnished as well as unfurnished premises. Previous Rent Committees have been baffled by this problem as they have found it impossible to apply common rent standards to furnished premises. In view of the shortage of all classes of accommodation it will be unfortunate if means to prevent profiteering of the Bournemouth description cannot be found.

Abnormal Earnings

The Select Committee on National Expenditure, that faithful watchdog of the public purse, has turned its attention to the abnormal earnings of certain workers on Government contracts. In its third report of the session it gives some startling examples, which have been made much of in the press. Women dilutees in an aircraft repair firm, earning the "rate for the job" after training, averaged £15 12s. 8d. for weeks in which a full week was worked, one woman averaging as much as £24 8s. 6d. In the week before Easter 1944, twelve dockers engaged in unloading Government stores at a northern port averaged £38 16s. 10d., while one man reached the high figure of £46 17s. 9d. In a third case, a dispute arose over the timing of an operation in an aircraft factory, which was referred to arbitration. Though the test of hours actually taken produced an average of 33½ hours per aircraft, the arbitrator awarded 135 hours as "fair and equitable."

Such instances are admittedly exceptional, as the Ministry of Labour's biennial survey of industrial earnings shows. The dockworkers' average in a week in July, 1944, was £6 8s. 8d., and that of aircraft workers was £7 19s. 11d. However, as the Select Committee points out, the existence of pockets of highly-paid workers may cause a sense of grievance among the overwhelming number of less fortunate workers, as well as leading to inflated costs of production. Further, there will be an inevitable drop in earnings when war contracts terminate and the abnormal conditions, such as overtime and holiday work, disappear and workers revert to base rates. This is bound to lead to industrial trouble.

But what is more to the point than instances of abnormal earnings, which will adjust themselves at the end of the war, are the Committee's criticisms of the slow working of the negotiating machinery. It took from August, 1941,

(when the Ministry of Aircraft Production originally complained of the high costs of production of the aircraft repair firm referred to above), until April, 1944, to secure agreement to reduce the rates. The Committee therefore suggests that piece rates fixed before production starts should be provisional and subject to review in the light of experience, and, further, that the Government department concerned should take the initiative in securing revisions and not wait for employers or workers to move. Finally, it appeals for the co-operation of both parties by speeding up negotiations and by observing agreements once they are reached.

The Select Committee's report, though it confines itself to the detailed cases, emphasises the need for an examination of the whole problem of wages and negotiating machinery, which has been evaded by the Government throughout the war, and will not now become easier to deal with in an atmosphere of reviving party politics.

School Meals

Draft regulations have been made, which, in accordance with Section 49 of the Education Act of 1944, impose a duty on local education authorities to provide a school meals service within their areas. When family allowances are established, dinner and milk in schools will be free for all children, and some light on what these allowances in kind will be worth is given by the regulations. The charge payable by the parents in the meantime is not to exceed the cost of food, but the minimum charge will probably be 4d. for a dinner in a primary or secondary school and 3d. in a nursery school, on the assumption that a suitable meal will cost at least these amounts in food alone. Thus for a child over five the provision of meals, five days a week, will be 1s. 8d. a week for forty weeks in a year, or £3 6s. 8d. a year. Milk is to be provided to the extent of not less than one-third of a pint daily, but the amount eventually envisaged is two-thirds of a pint. The present retail price of two-thirds of a pint of milk is 3d., which gives an additional 1s. 3d. a week for forty weeks, or £2 10s. a year. If local authorities arrange for meals and milk to be provided in the holidays, the value of these allowances in kind will be correspondingly greater.

The total of 2s. 11d. a week for milk and meals is the value of the allowances to the family. The cost to the nation is far greater because of the very high overheads. In the family allowances debate Sir William Beveridge quoted a figure of £20 million for overheads to provide meals costing, in food, £40 million. It is not clear how much of this is non-recurrent capital expenditure, but even so the running costs must be very high. The draft regulations prescribe that an authority should provide a fully qualified school meals organiser, and adequate staff, other than teachers, for preparing and serving the meals and for washing-up, whose salaries and wages will presumably have to be paid during the holidays.

There is thus every justification for the regulation calling attention to the need for economy. On the other hand, it cannot be too strongly emphasised that the purchase of poor food is not an economy and that this regulation is not inconsistent with another regulation laying down that the meals are to be decently cooked and served and the dietary well-balanced and varied. Nowhere perhaps is English cooking seen at its worst than in institutions, and now that a national meals service is to be inaugurated, it may be hoped that adults' memories of watery cabbage and stodgy puddings, provided in endless monotony for their school dinners, will not be revived.

Argentine Record

This week's recognition of the Argentine Government by the other twenty American republics was accompanied by the British Government's decision to resume diplomatic relations with Argentina. Similar moves have been made by France, Canada and Holland. This concerted resumption of relations is the outcome of Argentina's declaration of war against Germany and Japan and its adherence to the Act of Chapultepec.

General Farrell was the third President to assume office in the Argentine military regime which ousted the Castillo Government in June, 1943. Six months later, when the seizure of power by a Bolivian nationalist junta revealed the danger of Axis support for Latin American revolutionary forces, the remaining republics, working through their Committee for Political Defence, evolved and put into practice the principle of non-recognition. For the duration of the war it was agreed that Governments established by force

should not be recognised prior to proof of their adherence to inter-American defence pledges. By June, 1944, Bolivia was considered to have met this test and its revolutionary Government was recognised. Meantime, in Argentina, there appeared to be a conflict within the ranks of the military clique over the desirability of a break with the Axis, and the break, when it came, brought the downfall of General Ramirez, who had succeeded General Rawson three days after the original coup. He was supplanted by General Farrell, and Colonel Peron, mainspring of the military clique, emerged as Vice-President. Under his open leadership Fascist tendencies became more pronounced, and recognition was withdrawn by almost all the remaining republics. The United States Ambassador was withdrawn, and the British Ambassador was also recalled "to avoid misunderstanding." Argentina was left with practically no diplomatic representatives of the United Nations.

It is with the same Government that relations are now being resumed. President Farrell's recent declarations, officially interpreted as "a re-orientation of policy," conform to the formula of "hemispheric solidarity." But before the new policy will satisfy the Argentine democratic opposition, now being led by exiles in Montevideo, it will have to be reflected in domestic affairs.

Strike in Sweden

An important strike, involving half the workers employed in the Swedish mining and metal industries, is still unsettled and is likely to have important repercussions in the political and social development of the country after the war. The 125,000 workers concerned have been out on strike since February 5th, ostensibly over a wages dispute. Real wages, it is true, are lower than before the war, in spite of higher employment, but this is because the trade unions had agreed with the government to help in keeping down the high cost of manufacturing substitutes to replace imports. Moreover, economic causes have been reinforced by changes in the political background. Trade unions have grown much stronger during the war—in 1944 they numbered a membership of 1,030,000 out of a total population of only 6,500,000. They have also come more under the influence of the political Left. As in the Riksdag, the representation of the Communists has increased, and their influence has been particularly strong in the Metalworkers' Union concerned in the present strike.

The breakdown of negotiations which preceded the strike caused particular disappointment in Sweden, where a pioneer system of voluntary arbitration was established long before the last war and where, since 1928, special arbitration courts have been set up under state control. The present strike is one of the most important in recent Swedish history, and, while unemployment over the last ten years has been high (at one time 20 per cent of trade union membership), the arbitration system, so far as strikes and lock-outs are concerned, has until now worked well and there has been a fairly steady decline in the number of workers involved each year.

The strike is only one indication of the growing importance of the trade union movement in Sweden. In politics, the demands of the movement may well lead to comprehensive legislation to unify sickness and unemployment insurance, which at present are organised on a local and voluntary basis, into a compulsory national system. A Bill for the provision of state-financed family allowances is also in preparation. Other points in the trade union programme, published last spring, demand a policy of free international trade, full employment and the nationalisation of industry. The latter is particularly urged in the case of the iron-mining industry in the north, which in any case would come under full state ownership by 1947. The implications of such a policy are particularly important in the light of existing commitments on the national exchequer. The country is committed to large-scale expenditure on Scandinavian relief, and the heavy defence programme will not be completed until 1947. In addition, much wartime capital investment will become superfluous with the resumption of trade. It remains to be seen whether the trade union movement and its political supporters will be able to gain acceptance of a large additional expenditure on social projects as soon as they would wish.

Speaking Your Mind

In a world in which freedom is beset, suffering more from those who claim to be its friends than from those

who are avowedly hostile, any small assertion of your right to speak your mind is especially welcome. Particularly when you find that you can even speak freely about a solicitor.

A man wished to become tenant of a house and innocently thought that a reference from a solicitor would be of assistance in attaining that end. But it happened that the landlord and the solicitor were known to each other, and, when the prospective tenant produced the reference, the landlord gave tongue remarkably freely. "You have got one (meaning a reference) from that — X. It is quite worthless. His very calling as a solicitor makes him write whatever suits his client best. Damn it, he would sue his grandmother for 7s. 6d." One can well believe that the prospective tenant was both surprised and mortified at this outburst. Harsh words such as these naturally reached the solicitor's ears and an action for slander against the landlord resulted. But the solicitor's action was dismissed and the Court of Appeal has upheld the decision.

The laws of defamation in this country are in a curious state. If you write and publish defamatory words of anyone you may be sued whether the words cause any damage to the person of whom you write or not. But if you confine your defamation to speech (which is slander), for the injured party to recover damages he must show that he has suffered some actual damage or, amongst other things, prove that the words were defamatory of him in the way of his profession. In other words, you may say that a solicitor cheats at golf but not that he juggles with his client's money. No one can say that our present laws of defamation are satisfactory, but we are becoming so mealy-mouthed in the expression of our views that any reminder of the little freedom we possess is something of a ray of sunshine.

Shorter Notes

On Tuesday, Mr Churchill issued the following table showing casualties to all ranks of the British Commonwealth and Empire Forces up to February 28, 1945:—

	Killed and Died of Wounds	Missing	Wounded	Prisoners of War	Total
United Kingdom*	216,287	30,967	255,142	183,242	685,638
Canada	31,439	4,163	45,251	8,367	89,220
Australia	19,430	6,955	35,595	25,276	87,256
New Zealand	9,334	934	17,978	8,501	36,747
South Africa	6,059	512	12,632	14,629	33,803
India	19,420	13,327	51,038	79,701	163,486
Colonies	5,044	14,014	4,840	6,754	30,652
Total British Empire..	306,984	70,872	422,476	326,470	1,126,802

*Including men from overseas serving in these forces. †Including, except for Australia and the Colonies, those repatriated or who have escaped.

Casualties through enemy action suffered by merchant seamen and civilians during the same period are as follows:

MERCHANT SEAMEN	
Deaths (including deaths presumed in missing ships)	30,179
Internees	3,982
Total	34,161

CIVILIAN CASUALTIES IN THE UNITED KINGDOM	
Killed (including missing, believed killed)	59,793
Injured and detained in hospital	84,749
Total	144,542

Letters to the Editor

The Problem of Germany

SIR,—While it seems certain, as you mention in the last of this interesting series of articles, that "there can be very few Germans left, even to-day, who have any illusions about the profitability of war," many may still connect unprofitability only with the losing of wars—an obvious truth, always maintained. Modern methods, however, make winning a war unprofitable too; indeed, the victorious side may "lose" more than the vanquished. (The short duration, and the very definite objective, of the wars for the unification of Germany have probably helped to cloud this fact for its people.) Since wars are begun with the idea of being won, it might be useful to emphasise this aspect; and for this, Allied losses—for instance, casualties, persons displaced, homes destroyed, living standards reduced and art treasures ruined—in other words, the sufferings of the victors, might, if vividly depicted in posters, pictures and charts, play an important part in reorientating the German people.—Yours faithfully,
ROLF LOWENSTEIN
London, N.W. 2

SIR,—A careful study of your four articles leaves one at least of your readers persuaded that your vision of a permanently disarmed Germany, content to remember the disasters of 1945, and to forget that in 1914 and 1940 she was within an ace of being the master of Europe, is unduly optimistic, not to say midsummer madness. You cannot permanently disarm a vigorous and intelligent people of seventy millions. Judged by your own tests, the alternative, which you at first somewhat contemptuously rejected, is at least more hopeful.

We are all prejudiced in favour of a united Germany. We were all brought up to admire Bismarck's work, even if we criticised some of his methods. We all half-admired the consummate skill of Hitler's evil genius. We see now the result. Germany has been merged in Prussia. Prussia, not Germany, is the real, perhaps the implacable, enemy.

Our first business is to disarm Germany. So far we are all agreed. I leave aside all question of punishment. I have no notion how we can effectively punish Hitler and Himmler and the enormous mass of their followers. We don't want martyrs, and we cannot shoot a quarter of a million proved criminals. We can for a time occupy Germany; we can proscribe tanks and planes. But seventy million Germans, keenly indignant, will still be there; and physics and chemistry will laugh at our omniscience. Surely then to divide Germany into seven or eight independent states—Prussia, Bavaria, Austria, Saxony, Württemberg, Baden, Hanover and Westphalia—and to police them for five years, would be no harder than to police the undivided Reich; would give far more openings for tact and generosity; would be no more likely to offend the feelings and interests of the great powers; would be far easier to maintain for the time and far more likely to strike root.

It is quite true that Prussia, even without Silesia and Westphalia, or Hanover, and the stolen parts of Saxony, would still be far the most powerful state. She would not be the richest, and her power of attraction would be far less. Beside, these neighbours would each start with traditions and a history, and might well develop a healthy and, if tactfully treated, a friendly life of its own.

That way at least peace seems possible; the other way war seems certain. You do not claim that your own scheme is perfect. I plead that before it is too late the alternative should be fairly considered.—Yours faithfully,
Cowbridge, Glamorgan

G. L. BRUCE

The Budget

SIR,—I wish I could see any hope of your forecast of reduced taxation being realised on April 24th; but, if it cannot be, there are some modest proposals I might put forward. First, lower EPT to 80 per cent, which is the true yield even now, because 20 per cent has to be given back after the war for capital expenditure. Secondly, lower the rate of income-tax on the first £165 of "taxable income" to 5s. Thirdly, abolish the duties on sugar and "bacon and veal," which bring in no real revenue, being more than counterbalanced by subsidies. After this, a

Chancellor might turn his attention to the purchase tax and the beer duty. On the other hand, he ought to lower the point of total exemption for single persons to £80; at present it is £110, though married men begin to pay at £141.

I might add that post-war credits are not "Revenue," but compulsory, interest-free Loans. Also, that the table giving the various National Debt totals has a note—"National Savings Certificates are shown at issue price, exclusive of accrued interest."—Yours faithfully,
Cambridge

J. E. ALLEN

The Reid Report

SIR,—At the end of your interesting article (in *The Economist* of April 7th), you suggest that, in supplying the capital necessary for the reconstruction of the coal industry, the Government would acquire a majority of shares in mining concerns, and so bring about a kind of nationalisation without tears.

This suggestion is highly ingenious, but what real advantages does it offer? The regrouping of the industry into managerial units, which are appropriate to technical conditions, must precede new investment, and powers of compulsion will be required to secure the regrouping. Powers of compulsion might also be necessary to make the mining companies accept the capital which would destroy their independence. Therefore, this proposal does not seem likely to meet with less hostility on the part of mineowners, or less political difficulties, than more straightforward methods of nationalisation.

Nor does the proposal suggest any real solution of the problem of reorganising the industry. Either the Government owns less than 50 per cent of the shares in a particular concern, in which case it has merely put public money at the disposal of that concern without public responsibility; or it owns more than 50 per cent of the shares, in which case it is faced with all the problems which would arise under nationalisation, such as the problem of deciding the principles on which directors should be chosen, and the policy to be pursued in respect of production and prices, with the additional problem of deciding what regard should be paid to the interests of the minority of private shareholders. It certainly does not seem to be the appropriate way to secure "business principles of operation."

Nor does the proposal seem to present any technical advantages. Indeed, it would be absurd to be obliged to allocate capital between different concerns in such a way as to secure 51 per cent of the shares in each, instead of in the way which is most efficacious in raising the efficiency of the industry.

Finally, when "there is no time to be lost," such a long-drawn process of acquiring control over the industry scarcely seems equal to the occasion.—Yours faithfully,
JOAN ROBINSON
Cambridge

A Progressive Business

SIR,—Your most interesting article raises a point which leads far beyond the problems of the sweets industry. Many manufacturers and trade associations are in the habit of complaining about the excessive costs of retail distribution, but at the same time add to these costs by granting most liberal gross profit margins to retailers. As you rightly suggest, they should have it in their power to reduce the number of retail outlets by squeezing out less efficient retailers through allowing smaller gross profit margins. But it is not, as you seem to imply, "tenderness" which prevents manufacturers from doing so. Under a system of retail price-competition the problem of margins would not arise. The less efficient retailer would not be able to make a profit at the lower prices the more efficient one would be content with, and would have to become either more efficient or leave business. Where, however, the price of consumers' goods is fixed or maintained by manufacturers and trade associations, and where thereby the more efficient trader is prevented from passing on to the consumer his lower distributive costs, a very different position arises.

The interest of manufacturers is no longer concentrated

on supplying retailers who can sell most cheaply and thereby attracting most customers. Instead of this, it is simply the maximum turnover of the rank and file of traders which absorbs their interest, and as the fixed-price branded article (apart from quantity bonuses) requires uniformity of the gross profit margin, this margin has to be fixed according to the less efficient, if not the least efficient, retailer. Under this system manufacturers may still compete individually in margins in order to attract retailers; or else they may come to an agreement about a uniform level of the discount. In the latter case the gross profit margin is driven upwards, for too small a margin would simply help outsiders of the combine to underbid its members by granting more liberal discounts. The high margins conceded to retailers by manufacturers are simply the compensation granted for disallowing retail price competition. Speaking from the pedestal of national economy manufacturers are apt to deplore high distributive costs and the multiplicity of retail outlets, but their restrictive price policy debars them from taking the necessary steps to meet the evil.—Yours faithfully,
HERMANN LEVY
Richmond, Surrey

Post-War Taxes

SIR,—Referring to your comments on Purchase Tax, there might be some measure of agreement as to its continuance, for a reasonable time, on purely luxury goods; but certainly not either in its present cumbersome and expensive form or, so far as its maximum incidence is concerned, on the present arbitrarily selected range of goods. What sense of justice is there, for example, in imposing the full rate (100 per cent) on all articles made of leather, including handbags and document cases—articles for everyday use in which leather, as opposed to other materials, is an economy?

But one of the most serious effects of the present method of application is the adverse effect upon our export trade with America. The incidence of Purchase Tax, including the "uplift" on the manufacturer's price which the Customs authorities deem necessary to bring the basis up to the wholesale level, and which, in some cases, is as high as 25 per cent (involving a maximum tax of 125 per cent on the producer's price) is, under USA law, necessarily taken into account by the American Customs authorities in computing the value for import duty. It is known that this

effect of the chosen method of application was pointed out to the British Government, not only by British exporting interests but also by the American authorities, before the tax was introduced; but advice was ignored. The result is that so long as Purchase Tax is applied, by the present method, at the wholesale level, it will be obstructive to any efforts to increase exports to the USA in the very lines which we are best qualified to sell there.—Yours faithfully,
JOHN W. WATERER
Clerkenwell, E.C.1

Peacetime Nurseries

SIR,—I was glad to observe from your issue of March 17th that you realise the need for day nurseries after the war, but you suggest that they will be wanted only for children under two. That is not the case, and they will be required for all children under school age.

Satisfactory nursery schools cannot be created overnight merely by changing the name of a nursery, excluding children under two, and taking away the matron now in charge. Nursery schools depend for their value entirely on the specially trained nursery school teachers in charge. These teachers are in very short supply, the training is three years, and the development of the nursery school service, if it is to be worthy of the name, must necessarily be slow. Day nurseries must therefore continue to be required during the transition years for this reason alone; while their value as a means of mitigating the distress which must inevitably accompany the acute housing shortage can hardly be over-estimated.

Taking the long-term view, nursery schools, as an educational service, must depend for their success on the regular daily attendance of the children. Day nurseries, apart from that such a daily service will be available to all mothers, or that all mothers will desire it. Day nurseries, apart from their use for mothers at work or in emergency, can provide that occasional relief and help for mothers which is so necessary. They provide for the welfare of the children through the welfare of the mother; and so far from taking away their responsibilities, put the mothers in a position to carry out those responsibilities.—Yours faithfully,
C. H. NATHAN
Chairman, National Society of Children's Nurseries
London, W. 1

AMERICAN SURVEY

Preview at Mexico City

(From an American Correspondent)

THREE main points agreed on at the Mexico City Inter-American conference (of 20 American countries, for Argentina was not present), deserve the most careful attention. First: the Act of Chapultepec and its relation to the United Nations charter. Second: the action concerning Argentina. Third: economic resolutions which recognise the responsibility of the United States for Latin American economies.

The argument whether the Act of Chapultepec conflicts with the Dumbarton Oaks proposals amounts to this: May regional organisations settle conflicts without the Security Council taking a hand until the conflict spills over beyond regional limits? Senator Austin interprets the word "international," used in the Dumbarton Oaks proposals to describe the nature of disputes to be taken cognisance of by the Security Council, to mean disputes involving countries other than those within a regional organisation such as the Inter-American system. *Pravda's* attack on Mr Walter Lippmann's idea of an Atlantic Community demonstrates that the Russian line sticks to Mr Litvinov's principle that peace is indivisible. Speaking privately, Señor Lombardo Toledano, the Mexican labour leader and president of the CTAL (the Confederation of Latin American Workers), condemned the Act of Chapultepec for its exclusiveness. The Latin American countries evidently favour the principle that regional disputes be

settled within the regional organisation. They proved the point at Mexico City by rejuvenating and vastly increasing the effectiveness of the Pan American Union; with this shot in the arm, what had become a repository for ratified treaties and dreary statistical tables takes on new meaning as a secretariat of the regional inter-American system. The San Francisco conference will have to clarify the point whether all disputes require the intervention of the Security Council and whether the unanimous decision of the permanent members (implying the veto of any one of them) is required in the settlement of regional disputes.

The question seemed somehow academic at Mexico City. Delegates and many correspondents felt that since the Dumbarton Oaks proposals were described as "exploratory" only, and the Act of Chapultepec is a concrete expression of what the American nations desire, this concrete formulation of a co-operative procedure should be accepted as taking precedence. But the point becomes the more important the more apparent it becomes that the Dumbarton Oaks proposals are only ostensibly exploratory, and in fact represent the final take-it-or-leave-it decisions of the sponsoring Big Four.

The statement on Argentina adopted at the end of the conference plants the last post in a fencing-in of Argentine aggression. It is polite and was drafted by the Latin

American nations, but it contains a non-appeasement core in its invitation to Argentina to subscribe to decisions of Mexico City and take steps to join the United Nations.* Despite the insistence on non-appeasement, the fencing-in of Argentina, as set at present, is a mechanical means of solving a dilemma between the Farrell government and the rest of America. And the dilemma is not mechanical, but moral and political. Mechanical solutions are fine if they are effective. The test of this one is whether the Farrell government falls within a short time after the San Francisco conference is over. If it does not fall, then the moral and political issue involved becomes doubly peremptory. It is whether, in the light of past experience, the system of mass control nowadays called Fascism shall be permitted to grow unmolested in Argentina. Facing up to that moral and political issue will require courage, and unfortunately that human virtue is scarce beyond its purely physical manifestations on the battlefields.

That the moral issue of Farrell-Peron Fascism was not faced at Mexico City is partly ascribed to the reluctance of Senators Connally and Austin (both advisers to the American delegation) to have the primary question of the use of force in international affairs brought up on a test case of secondary importance. Both Senators preferred to fight the battle on the Senate floor for the principle's primary application—on the issue of the ratification of the United Nations charter. Thereafter, once the principle is approved, it can be applied to Argentina. The Act of Chapultepec, however, is mandatory in Part I, par. 4: "That in case . . . there may be reason to believe that an aggression is being prepared by any state whatsoever . . . the states shall consult, etc., and take preventive or coercive action as the case warrants." Courage, of course, would again be required to recognise that the aggression was being prepared.

The mass of resolutions and recommendations on economic matters adopted at the Mexico City conference demonstrates as never before the implicit responsibility of the United States for the livelihood and sometimes the well-

* This was written before the Argentine declaration of war and the recognition of the Argentine Government by Washington and London.—EDITOR.

being of Latin America. This can best be shown by a few quotations taken from Resolution XXI on "Economic Adjustments of the Hemisphere During the Transition Period." In the preamble a paragraph states: "The international trade of the majority of the American nations is based upon the export of certain basic products which determine their purchasing power in foreign markets, the ability to meet their foreign financial obligations and in general their economic stability."

The saving word here is "majority," for this certainly does not apply to the United States; it does apply to all Latin America. The preamble adduces also that during the war "many American nations changed and intensified their ordinary and permanent production," as though this were detrimental. The resolution states in Par. 2 (a) that when purchases are reduced on basic products and strategic materials (those which were intensified), then the purchasing country or countries (the United States) "shall adopt through bilateral agreements measures designed to minimise, during the transition period, the adverse consequences to the economy of the countries concerned by an orderly adjustment of the procurement contracts or by other suitable means." Note the mandatory "shall adopt." This resolution declares stockpiling should be kept to a minimum "in order to avoid the damaging effect of such surpluses on future production and on the level of prices of such materials." This means that price is to remain the controlling factor in production, that despite all past experience of the effects of unsupplied necessity, transactions are to be geared to price. Even US military security is subordinated to price. The responsibility for this clause is not entirely that of the Latin American nations.

The documents concerning economics adopted at Mexico City do not contain binding commitments on the part of the United States. But while legally they could be rejected, the effect on hemisphere relationships would be disastrous if the United States were not to live up to its legally vague but implicit undertakings. In January, 1942, Mr Sumner Welles declared at Rio de Janeiro that Latin American nations would fare equally with the people of the US. They have in general fared somewhat better. The Mexico City speech of Mr Will Clayton, Assistant Secretary of State

in charge of economic affairs, was a review of this past US performance: in purchasing raw materials at fair prices, in supplying consumers' goods as shipping was available, in cushioning economies through Export-Import Bank financing etc. And while Mr Clayton's speech contained five references to the absence of congressional authorisation for firm commitments, his recital indicated that the past performance of the US Government is an earnest of its future intentions. Because of his speech, it was possible for the United States to avoid binding undertakings to supply the capital goods which Latin America desires to buy post-war; nevertheless the commitment was made by implication in paragraph 4 of Resolution XX on "Economic Controls in Wartime and the Transition Period."

American Notes

Another Lewis Victory

Mr John L. Lewis reached an agreement with the soft coal operators a few hours after the Government took over control of the mines. The new contract grants an average increase of \$1.30 a day to each miner. The approval of the War Labor Board is almost certain.

No matter how the WLB justifies this increase within the framework of the elastic Little Steel formula, it is quite obvious that in reality the coal leader has broken the formula or made it meaningless. His victory will have a profound effect on the gentler tactics which the CIO leadership in particular have practised during the war. And now, with victory in Europe in sight and a good proportion of industry apparently on the verge of reconversion, the demands of the workers will grow irresistible. For if it is true that 30 per cent of the resources now being used in war production will be transferred to the civilian economy, they will insist that the no-strike pledge, to which they have been reasonably loyal during the war, is no longer necessary for the winning of the war.

The increase is understood to add about \$150 million a year to the cost of producing coal, and it is not known yet whether the operators have insisted that all of the increase be reflected in coal prices. When Mr William H. Davis took over the post of Director of Economic Stabilisation he indicated that he would not be bound by the policies of his predecessor, Mr Fred M. Vinson. "Any Economic Stabiliser has got to make his own decisions," Mr Davis said then, and here is a large one to make.

Mr Lewis had moulded the habits of the mine workers too well. They had voted overwhelmingly to strike if their demands were not met by April 1st, and 80,000 men in the soft coal pits actually went out, although Mr Lewis had instructed them to stay at their jobs during a 30-day extension period to which he had agreed. Ironically, this was one of his few concessions to the country's war effort.

Mr Lewis abandoned his demands for a royalty of 10 cents a ton on all coal mined and for the right to organise foremen. The increase, averaging \$1.30 a day, has been secured by giving time-and-a-half for everything over seven hours; by an increase in vacation pay from \$50 to \$75; and by a paid 15-minute lunch period. The contract, which can be re-opened after March 1, 1946, stipulates that no strikes shall be called while it remains in force.

International Votes

American public opinion, always mercurial, has been living through a series of convulsions over the San Francisco Conference. But in the last week it has sobered down somewhat, largely as a result of Mr Stettinius' announcement that the United States will not ask for three votes in the General Assembly of the World Organisation. His assurance that the conference would not be postponed and a Soviet broadcast strongly supporting the Conference and its aims helped to dissipate misgivings.

A healthy by-product of the storm was that it gave the President an opportunity to make a grand and dramatic concession to his opposition. Senator Vandenberg, who apparently is the accepted leader of the Republican members of the delegation, came out unequivocally for one vote and no more than one for any nation. The *Herald-Tribune* gave him credit for "restoring Mr Roosevelt's perspective." He displayed rather unexpected grace in his concession that, regardless of personal convictions, the delegation was "morally bound" by the President's pledge to Marshal Stalin, to support the Soviet request for one vote for the Ukraine and one for White Russia. On all other matters

the delegation, when unanimity is lacking, will reach decisions by majority vote.

The excitement over the voting powers in the General Assembly was finally thrust into the background by the appropriately timed Russian denunciation of the neutrality pact with Japan. Comment on this ranged so far and wide that editors and broadcasters had to be urged, for military reasons, to be moderate in speculation. All but the most extreme diehards welcomed the Soviet pronouncement and drew the logical conclusion that the Soviet Union intends to take an active part in the shaping of the future of East Asia.

The American delegation to San Francisco has been meeting all this week, trying to find areas of agreement. The most controversial subject is probably Senator Vandenberg's proposal that the Assembly have authority to revise any settlements made during the course of the war. The Senator has been remarkably preoccupied with a Poland that would welcome home General Bor and General Anders and it is safe to assume that his eye is focused specifically on the political decisions taken since 1939 on Russia's western frontier. The Senator is undoubtedly sincere in his attachment to international justice. But he is a politician and the support of the electors of Michigan is at least as important to him as Russian membership of a new organisation—which is unlikely to be secured if the Conference adopts his amendments.

Victory and Reconversion

Mr James Byrnes' report, submitted just before he resigned from the Directorship of the Office of War Mobilisation and Reconversion, gave the American public some reason to be jubilant. Mr Byrnes' report reviewed the whole complex US war economy and its needs; it covered lend-lease and foreign relief now and after victory, taxes, transportation, manpower, food, foreign trade and loans, cartels, and even school lunches. But its significance lay in its concentration on the partial reconversion period between the defeat of Germany and the final defeat of Japan.

It foreshadowed more pots and pans and automobiles and refrigerators and even a small increase in the petrol ration soon after "V-E Day." It promised the abolition of the hateful austerity measures; it provided for a reconversion programme to go into effect alongside production for the war against Japan, which would release \$18 billion worth of metals and other materials for civilian production; it predicted that 30 per cent of the country's resources now used for war production would be freed for civilian use within nine months of the end of the war in Europe. The report explained in considerable detail how production controls would be relaxed to encourage private industry to reconvert with the greatest efficiency and speed: it gave warning of a brief period of mild unemployment before the drop in war production is balanced by the re-establishment of peacetime manufacturing and before civilian customers have substituted their own buying power for the Government's.

If the average American, reading the OWMR report, was not too dazzled by the vision of a new refrigerator to read further, he would have found that Mr Byrnes recommended a continuation of price and wage controls during the partial reconversion period, and the maintenance of high individual and excess profits taxes. Wages, he believes, should rise as productivity inevitably will when new war techniques are applied to civilian production.

Mr Byrnes is, perhaps, somewhat over-optimistic in his estimates of how much reconversion is possible while equipping the fighting forces for an all-out Pacific war. Mr J. A. Krug, who, as Chairman of the War Production Board, is very much involved in carrying out the country's reconversion, has announced that the OWMR report reflects the policy of the WPB. But an atmosphere of caution is to be detected in his statement and he stresses rather more than necessary the fact that the proposed programme must be considered tentative, that it would be continuously revised to fit the needs of a constantly changing war situation.

The Senate and Manpower

The Senate, brushing aside Mr Roosevelt's strongly worded appeal, has rejected, by a vote of 46 to 29, the compromise manpower Bill which had been drafted by a combined House-Senate Conference and had previously been passed by the House. Senator Johnson, one of the authors of the compromise legislation, blamed the Byrnes Mobilisation and Reconversion report, with its emphasis on recon-

ALL PLANES ARE TRANSPORTS

Aircraft are so varied that the one common denominator of all planes is often overlooked. A plane is first of all a carrier, as functional as a steamship, automobile, train or truck.

The plane is transportation, the life blood of commerce and trade. The plane gives a faster, broader distribution of goods. Fastest of all carriers, it gives you access to the world. It takes the trouble

out of travel. It turns long distance mail into local letters. Improved standards of living, a higher national economic status, will owe much to air transport, just as the present owes much to the steamship, railroad, and automobile.

Aircraft engine power makes these gains possible. Just as Wright power first made flight possible, so Wright Cyclone engines today power world-wide air transport. Their ability to fly great loads at low costs explains their choice for leading commercial and military planes.

version, for the death of the Bill. He exaggerated, of course, for the Bill, which combined the strong features of the House and Senate Bills, was never given much chance in the Senate. This was manpower legislation with some teeth in it and the Senate was not prepared to take it. When Senator Johnson himself lined up in the opposition any chance the Bill might have had disappeared.

The Bill would have given the government power to enforce ceilings on the number of workers any plant could employ and would have compelled workers to stay in essential jobs, with penalties of fines up to \$10,000 or imprisonment.

The Senators have given many reasons for resisting manpower legislation: the war production record, which on the face of it is certainly creditable; strong opposition from management and right-wing labour; the belief that strong legislation could be avoided by the device of giving the War Manpower Commission statutory authority; the revelations by Senator Mead's Special Committee to investigate the National Defence Programme that, while the Army and Navy were pressing for National Service legislation, their own Navy yards and arsenals, with high labour priorities, were guilty of shocking labour hoarding; and the blind conviction of men like Senator Morse, that there never was a manpower shortage. When Mr Byrnes placed before the Senators the spectre of peacetime controls, their case against manpower legislation was complete.

The Senators sent the bill back to conference and probable oblivion. Now the War Manpower Commission, which recently announced a need for 350,000 workers in essential industry within the next six months, must shift for itself.

Pacific Bases

A clash between the State Department and the Navy may be the result of a speech by Admiral Ernest J. King, the Commander-in-Chief, strongly advocating that the United States retain control of the Pacific bases won during the war and paid for by "the sacrifice of American blood," and that these bases be given meaning by a strong post-war

fleet "ready for action." How long, he asked, can the United States afford to continue a cycle of fighting and building and winning and giving away?

No one can quarrel with a belief that the United States must have bases for security, and it would be ridiculous to propose destroying the great naval power built up during the war. But other American voices are recalling, as Admiral King did not, that America's Allies also are interested in how Pacific security is organised. Australian blood mingled with American in the Solomons and New Guinea; the contribution the Filipinos have made certainly gives them priority interest in the future defence of their islands. The French, who contributed New Caledonia as a base under the Gaullist movement, to which the US Government was not even friendly at the time, have not lost interest in that possession.

There has also been a tendency to question the timing of the Admiral's pronouncement, immediately before the San Francisco Conference, where the American delegation will support the State Department policy that captured Pacific bases should be incorporated into a structure of international trusteeship. In terms of security, this means that the United States could build and maintain bases on strategically and tactically placed islands, certainly not on every captured atoll and island harbour, and that the United States would be responsible, in the control of these islands, to an international body. America can hardly depart from the trusteeship principle for itself and sponsor it for others, and it will undoubtedly utilise bases as a means of demonstrating faith in the international organisation.

It is quite clear, then, that the Navy view is at variance with the theories of the State Department, and the fact that the President supports the trusteeship principle does not mean that the Navy Department is incapable of embarrassing the State Department. Public opinion listens to the professional soldiers and sailors, and Navy spokesmen could conceivably gain enough public support for their attitude to make an issue of it—perhaps more of an issue than is really involved in the practical difference between possession and trusteeship.

ABRIDGED REPORT

CANADIAN PACIFIC RAILWAY COMPANY

(Incorporated in Canada with Limited Liability)

SIXTY-FOURTH ANNUAL REPORT FOR THE YEAR ENDED DECEMBER 31, 1944

The results of the year's operations were marked by increased gross earnings and lowered net income. Labour costs rose sharply as a result of the wage award granted by the National War Labour Board, while traffic rates remained at their low, pre-war levels. Working expenses, with taxes, took a larger proportion of the gross earnings than in any year since the completion of the Company's transcontinental line. The fifth year of the war in Europe, with its decisive attacks upon the enemy, placed additional burdens and exacting responsibilities on transportation agencies. The Company was called upon to handle an unprecedented volume of traffic, ton miles of freight carried and passenger miles transported exceeding those in the previous record year, 1943, by approximately 10%. That this was accomplished notwithstanding the problems created by war-time conditions—shortages of manpower, equipment and materials as well as restrictions of various types—gives evidence of efficient discharge by the Company of its share of the responsibilities.

INCOME ACCOUNT

Gross Earnings	\$318,871,034
Working Expenses (including taxes)	275,711,370
Net Earnings	\$43,159,664
Other Income	13,371,315
Fixed Charges	\$55,530,979
Net Income	20,831,149
Dividends:	
Preference Stock—2% paid August 1, 1944	\$2,521,391
2% payable February 1, 1945	2,521,391
Ordinary Stock—2% paid December 1, 1944	\$5,042,782
	6,700,000
Balance transferred to Profit and Loss Account	\$22,957,048

PROFIT AND LOSS ACCOUNT

Profit and Loss Balance December 31, 1943	\$231,234,218
Dividend of 2 per cent. on the Ordinary Stock, declared from the earnings of the year 1943, paid March 31, 1944	6,700,000
Balance of Income Account for the year ended December 31, 1944	\$22,957,048
Amount received from Grace Northern Railway Company for release from obligations under joint section agreement	4,500,000
Portion of steamship insurance recoveries representing compensation for increased cost of tonnage replacement	1,045,235
DEBIT:	
Net exchange charge in respect of steamship insurance recoveries and expenditures for new steamships	\$643,254
Provision for depreciation—Net Credit	678,239
Profit and Loss Balance December 31, 1944, as per Balance Sheet	\$251,715,008

(The final dividend of 3 per cent. on the Ordinary Stock for the year 1944 which was declared subsequent to the end of the year and is payable March 31, 1945, amounting to \$10,000,000, is not deducted from the Profit and Loss balance shown above.)

The results of railway operations compare as follows:

	1944	1943	Increase or decrease
Gross Earnings	\$318,871,034	\$297,107,791	\$21,763,243
Working Expenses (including taxes)	275,711,370	247,896,224	27,815,146
Net Earnings	\$43,159,664	\$49,211,567	-\$6,051,903
Expense ratios:			
Including taxes	86.46%	83.44%	3.02
Excluding taxes	78.92%	75.82%	3.10

Gross Earnings were 7.3% greater than in 1943, establishing the sixth successive annual increase. Earnings from freight, passenger, mail and sleeping and dining car services were larger than in any prior year of the Company's operations.

The Pennsylvania Railroad

INCOME :	INCOME STATEMENT	Comparison with 1943
Operating Revenues—Freight, Passenger, Mail, Express, etc.	\$1,010,015,912	I \$30,242,757
Other Income—chiefly dividends and interest on securities owned	39,272,649	D 3,230,869
Total	1,049,288,561	I 27,011,888

EXPENSES :		
Operating Expenses	736,318,745	I 72,808,034
Taxes	152,838,409	D 27,567,082
Equipment and Joint Facility Rents	11,886,692	I 3,576,150
Other charges—chiefly rentals paid for leased roads and interest on the Company's debt	83,524,284	D 1,107,161
Total	984,568,130	I 47,708,941
Net Income	64,720,431	D 20,698,053

DISPOSITION OF NET INCOME :		
Appropriations to sinking and other funds, etc.	3,244,558	I 1,320,439
Retirement of Debt—Penna. R.R. Co.	18,767,970	I 1,456,970
Dividend 5% (\$2.50 per share)	32,819,385	
Transferred to credit of Profit and Loss	9,788,518	D 23,475,462

Business continued at a very high level during 1944, the volume being the largest in the Company's history. Operating revenues for the first time in almost one hundred years of operation amounted to over one billion dollars.

While operating revenues increased \$30,242,757, due to the greater volume of traffic, this was more than offset by an increase of \$72,808,034 in operating expenses, caused principally by the full effect of the wage increases referred to in the 1943 report, increased costs of material and fuel, and the cost of handling the larger volume of business. Taxes remained abnormally high. As a result, Net Income of \$64,720,431 was \$20,698,053 less than in 1943, and \$36,748,362 less than in 1942. Notwithstanding this fact, the dividend paid in 1944 was maintained at the same rate paid in 1943 and 1942, or 5% (\$2.50 per share).

All taxes required 15.2 cents out of each dollar of operating revenue, the equivalent of 23.3% upon the capital stock, or \$11.63 per share. The extent of the tax bill in 1944 is well indicated by the fact that taxes took about 70 cents out of every dollar left after paying operating expenses and other charges.

The Board takes pleasure in acknowledging the continued loyalty and efficiency of the employees, who have supported the war effort in full, and co-operated wholeheartedly and effectively with the management.

A remarkable job has been done by these employees—continuously now for five years—and it is to the lasting credit of these men and women who staff and operate the railroad that they have never failed to meet their responsibilities in all the problems that have confronted the railroad.

The Capital Stock of the Company at the close of the year was owned by 213,121 stockholders, an increase of 3,503 compared with December 31, 1943, with an average holding of 61.8 shares.

M. W. CLEMENT, President.

THE BUSINESS WORLD

Art and Industry

INDUSTRIAL design has recently been afforded an improved measure of publicity. The term itself has become thoroughly respectable. It no longer denotes an odd pocket of dilettantism in the rarefied atmosphere of fine arts, but a vital factor in the British drive for increased productivity and expanding exports. This is substantial progress. But design, like so many aspects of industrial reconstruction, is more easily and more readily discussed on the plane of academic principle than at the ground or factory level. In spite of recent blandishments, there are many industrialists who remain sceptical.

This is not surprising. The business man is not easily converted by rhetoric. He is more interested in brass tacks. He wants to know much more about industrial design—considered as a specialised service—before he will give it his blessing. He wants to know what it will cost, what it will do to his sales, and how it will affect his technical organisation and production programme. And, at the moment, there is no authority fully capable of advising him. To fill this gap will be the first task of the new Council of Industrial Design, and a promising start has been made with plans to set up Design Centres for each industry. These centres, as Mr S. C. Leslie, director of the Council, has said—

will study the design problems of particular industries, disseminate in the industry information about design from all over the world, undertake market research from the design aspect and seek to achieve a more practical and effective working link between industry and the educational system.

The industrialist is handicapped in his appreciation of good design by his environment. Insularity and an undue reverence for tradition deprive many British manufacturers of the stimulating influence of contemporary development abroad. Good design will win disciples very easily once it is allowed more practical expression. At present there is not enough of it to advertise itself, and strong propaganda is needed to stir an unresponsive audience.

In particular, industry needs more useful information on the lines of that given by Mr F. A. Mercer, editor of *Art and Industry*, in a paper read before the Royal Society of Arts, on Wednesday. Mr Mercer, like Mr John Gloag, regards the designer as a technician. This title implies no usurpation of the functions of the engineer, or of any other industrial expert—with whom the designer must work in close collaboration—but it indicates the very practical and scientific nature of his work. Where the functions of expert engineer and expert designer are combined in one person, the collaboration is, of course, perfect. Sir Geoffrey de Havilland, designer of the Mosquito fighter-bomber, Mr B. N. Wallis, designer of the Wellington, and Mr Charles Holden, are conspicuous examples of this happy breed.

But the majority of engineers are not, as Mr Mercer says, "consciously concerned with aesthetic appearance as an essential." This is apparent in the report recently presented to the Scottish Council for Industry, which criticised the poor standard of design in Scottish industrial products; and in the Board of Trade (Council for Art and Industry) report on Design and the Designer in the Light Metal Trades, presented in 1940 and published early this year, where it is stated that manufacturers of hearth furniture in Birmingham "will not employ full-time specialist designers because they believe they cannot afford it," and because they are preoccupied with considerations of technical performance and commercial policy.

In Great Britain the profession of industrial design seems to be adopting the pattern that has proved so successful in America. The expert is becoming a "design consultant," prepared to tackle the design problems of a wide range of industrial products. Design consultant units such as those set up by Mr John Gloag, of Pritchard, Wood and Partners, by Advertising Services Guild (Design Research Unit), under the direction of Dr Herbert Read, and by Sir William Crawford, are similar in scope and function to the American organisations directed by Loewy, Teague, Bel Geddes, Dreyfuss and Arens. This development—from designer to

consultant—is not dictated by the scarcity of first-class designers, though that is acute in Britain, but arises from the special operational advantages which the consultant system affords. Since a design panel usually includes architects, engineers and even economists, the treatment of its problems is thorough.

Some British design consultants, operating in a somewhat narrower field, work individually. Some work on a circuit, devoting a period, a month or more every year, to each of their clients. Others work to individual commissions. The consultant, whether a group or an individual, has many advantages over the internal or resident factory designer.

He is unhindered by internal politics . . . and is unaffected by precedent or prejudice. He is a free spirit brought in for one purpose only—the solution of the problem—and having no other interest . . . he is able to consider the problem dispassionately . . . he brings to the problem his experience and knowledge acquired in working on problems—sometimes similar, sometimes dissimilar but correlative—in other trades. While the producer . . . and his salaried designer may not be aware that solutions have been found in other industries that are directly applicable to his own problem; the consultant can frequently bring them to his notice.

The consultant is not the "styler" of popular imagination. He does much more than add "appearance" to industrial products. His essential equipment, more important than his drawing-board and T-square, is his technical and commercial data. He must be familiar with the defects and virtues of previous and competing models, the price-field in which his designs will sell, the technical performance of his materials and the details of productive processes. He will bow to the engineer in technical matters, but overrides him on questions of design. And at each stage of his work the consultant is assisted by his staff of salaried specialists. The Loewy organisation in America, for example, employs 162 designers and technicians, including architects, stress engineers and specialists in plastics, mechanics, lighting, marketing and business psychology.

By American standards design fees in Britain are extremely low. No fixed rates of remuneration have been or are likely to be established. But whether specialist design services are engaged for ten or a thousand guineas, the design cost per unit of output is small. There are numerous examples from American and British industrial experience to prove that good design more than pays for itself.

For his fee—and this may be arranged on a royalty basis, as a retainer or a fixed sum—the designer undertakes to prepare designs and supervise their development to the production stage. After consultation with the manufacturer's technical organisation he surveys production facilities and market conditions, and on the basis of his analyses produces his first rough sketches. These are examined and revised until agreement is reached. Next a model or a mock-up (full-scale model) is produced and given a careful testing. Then comes preparation of blue-prints, preliminary production and a final trial before quantity production is begun. There are no hard and fast rules in this procedure, but it should be clear from this outline that the manufacturer who "goes in for" design does not sign away any part of his control or enterprise. Nor does he loose upon his factory the unpractical aesthete of fiction.

Design is an important factor in at least half of the British output of industrial goods. It should enter into the production of every article created in volume by machinery, into manufactured articles of every description, every material and every purpose. It is sometimes supposed that the adoption of specialist industrial design involves standardisation in production, and this faulty reasoning causes many manufacturers whose interests are best served by production in variety to ignore the design services at his command. This is a serious mistake. Variety production, by definition, depends for its success very largely upon its design quality. If market conditions dictate a system of varied small-scale production there should be more, not less work for the designer; and it is courting disaster to practise false economy in a field where design is clearly the dominant selling factor.

A Pottery Plan

A GREAT deal of attention has been paid over many years to the large and prominent industries of this country: coal, electricity, transport, iron and steel, cotton textiles—these have been extensively studied and discussed. Many valuable reports are available about them. But add them all together, and it is clear that they account only for a small part of total industrial activity. There are innumerable small industries, each with its own problems, which, in the aggregate, will make or unmake the prosperity of this country. The pottery industry is a case in point. What is to be the future of such an industry? Economic policy during the war has had profound effects upon its manpower position, its equipment and methods. Is "reconversion" to be left exclusively to the same "automatic market forces" which have ruled it in the past? Is "transition" to be nothing more than a return to the conditions of 1939?

These conditions were anything but satisfactory. They had been unsatisfactory for a long time. As far back as 1915, the Report on the Pottery Industry, published by the United States Department of Commerce, quoted a leading English manufacturer as saying: "I firmly believe that in the whole of the Staffordshire district over 60 per cent of the potteries ought to be scrapped and modern works put up." With a few notable exceptions—Wedgwood's new factory at Barlaston being the most prominent—the inter-war period has seen little scrapping and reconstruction, although such new factories as were put up clearly demonstrated the possibilities of development. Staffordshire's competitors in the United States, in Germany, Czechoslovakia and Japan forged ahead with new methods, but the industry in Britain remained more or less stationary. The pottery industry is one more example of the familiar truth that it is a far more strenuous undertaking to modernise an old industry than to build something modern from scratch.

There exists, therefore, a reconstruction problem in the pottery industry every bit as important and in many respects even more difficult than reconstruction of those other sectors of the British economy that are more in the public eye. This is not an industry which is likely to reach a satisfactory state by being left alone. There is a general case for intervention by public authority. The nature of the intervention is a matter of the greatest concern to the 80,000 men and women workers attached to the industry, whose life is so closely tied up with the fortunes of pottery manufacture in this country. About 67,000 of them live in the Staffordshire district—pottery is one of the most localised of British industries—and have little chance of suitable alternative occupation if the pottery industry fails them. Lack of contact with other industries has contributed to the survival of old customs and methods, and the comparative absence of opportunities for alternative work has helped to depress pottery wages and conditions.

It is this general background, with its special problems and conditions, which has led the National Society of Pottery Workers to devote their serious attention to the future of their industry and to publish a report on "Reconstruction in the Pottery Industry" (Co-operative Printing Society, Ltd., New Mount Street, Manchester, 4. Price 6d.). They have produced an interesting and in many respects remarkable document. There is here none of the "sectional approach" which has so often marred the usefulness of trade union publications. Throughout the report the industry is seen and treated as but one element in the whole economic organisation of the country, with responsibilities not only to its own workers, but also—and prominently—to the general consuming public. Nor is the report marred by the all-too-frequent tendency to present nothing but a choice of extremes—"either nationalisation or nothing can be done"—which would have been particularly unhelpful in this case. The Society does indeed insist that the problems of the industry

cannot be finally solved until the industry has been nationalised, until public ownership has been substituted for private ownership. . . . But this is a long-term view. In the immediate future, there is very little prospect of nationalisation. . . . In the meantime what is needed is a short-term policy bringing about as much advance as possible in the industry, under a system of public controls.

"Public control," however, tends as much to become a

parrot cry as "nationalisation," and the value of this report lies in the fact that it carries the matter further: into a detailed discussion of the methods most suitable in this particular case. The "Plan for Reconstruction" is to rest on three principal supports, with a number of subsidiary tiers. First, there ought to be an expert body, to be known as the Pottery Board, consisting of an independent chairman and representatives from both sides of industry, to be appointed by the Board of Trade. It is to be an advisory body pure and simple, without statutory powers of any kind, but with the function of advising on questions of price-fixing and entry into the industry, on research, design, publicity, statistics and matters of this kind. Second, there ought to be a Licensing Scheme, operated by the Board of Trade. This could be evolved

by adapting the present system of control, whereby, under a Concentration Scheme, factories which are to continue production must hold a nucleus certificate. This is, in fact, a licence to manufacture, granted by the Board of Trade.

To say this, however, is misleading, for though the method of the wartime control would be adopted, the aim would be quite different. For one thing, it would not be a restrictive control; the number of licences would not be limited. "We are not," says the Report,

advocating licensing with any intention of preventing new firms from coming into the industry; our aim is to set definite standards of efficiency and working conditions which must be kept up.

The conditions of licensing should therefore include:

- (1) Conformity with the Lead and Dust Regulations, the Factory Acts, and any standards that may be laid down by the Government.
- (2) The obligation to observe the agreements in regard to rates of wages and conditions of work made between the Manufacturers' Federation and the National Society of Pottery Workers or any other Union concerned with the workers employed by pottery manufacturers.
- (3) Conformity with an agreed scheme of apprenticeship for the industry.
- (4) The obligation to provide whatever figures and statistics may be required relating to the general conduct of the industry.

This list of conditions would not involve the licensing authority in any unmanageable problems of detailed industrial planning. The type of "control" here advocated is well established in this country and is in conformity with the view that the functions of Government, first and foremost, should be to make laws, applicable equally to all, and to ensure their enforcement. The method of licensing is no more than a rational and effective method of ensuring compliance with the law.

Third, there ought to be Government price control. Again, this problem is seen in its general setting, and the Society holds that

government control of maximum selling prices in the home market is clearly one control that will have to stay after the war, to prevent inflation, and to maintain full employment.

Whether this is equally true for all goods and services and the period of time for which it might be true need not here be discussed. Few would disagree with the thesis that price control should continue to operate at least during the next few years until the exceptional pressure of consumers' demand has somewhat abated. But what about minimum price-control, which, as Mr Dalton said in his statement on the Cotton Board Committee's proposals, "may easily lead to restriction rather than expansion of output, and to the perpetuation of inefficient and old-fashioned methods"? This is a vexed question, and the grave dangers inherent in minimum price fixing must be set against the equally grave dangers of ruthless price-cutting which "in the past has been a continual menace to the wages of pottery workers, as well as holding back the modernisation of the industry." The case for minimum prices can hardly be regarded as fully established—even though pottery, like cotton, is one of the industries where it is at its strongest. But the Pottery Workers have at least grasped one point of capital importance which eluded the Cotton Board. They insist that the function of price-fixing cannot be satisfactorily fulfilled by the industry itself—not even by a joint body comprising employers, employees and the Government—but must rest entirely with the Board of Trade. The precise method by which prices are to be determined should be laid down in advance; there should be the fullest investigation of costs and continuous review

and adjustment. For this purpose, it is suggested, standardised accounting is essential.

This treatment of the complicated issue of price policy is markedly in advance of almost anything that has so far been heard from employers' or workers' organisations in other industries. There is here no suggestion of "self-government in industry"—that plausible and dangerous conception which leads straight into the Corporative State. Such schemes—"based on the demand that the majority of industrialists in any industry should have power to compel the remainder to follow an organised programme"—are wisely rejected, even if they provide for Trade Union representation.

Workers' and employers' organisations, with their fundamentally divergent views about the future of industry, cannot exercise real joint control; and this kind of sectional control would obviously make nonsense of any attempt at national planning.

Industrial Boards can supply information and tender advice, "but the actual decisions [on matters of public policy] must rest with the appropriate Government departments." If Democracy is to be combined with any kind of industrial planning, the "planners" must be subject to some form of democratic control. It is pleasant to note that the inherent difficulty of any such arrangement has been frankly faced by the Society:—

There is of course the danger of "bureaucracy"—not just in the sense in which this term of abuse is often used, to mean any Government interference with private enterprise; but in the sense of controls irresponsibly and undemocratically administered. . . . But that is a matter for political pressure, as well as pressure from the Trade Unions within each industry, to see whether the controls are democratically administered, in the general interests of the community.

It would be unfair to expect the authors of this report to go further in solving what is undoubtedly the fundamental politico-economic problem of our time. Only day-to-day experiment in practical conditions can finally resolve these weighty issues.

The Society is naturally very much interested in industrial health questions, and it so happens that in the Potteries the improvement of health conditions and the improvement of efficiency go hand in hand. Thus by insisting on the enforcement of new Lead and Dust Regulations and of the (hitherto dormant) Factories Act of 1937, the workers can claim to be just as much pushing the cause of industrial efficiency as that of health. "Lead has killed its thousands, dust its tens of thousands," as a highly placed medical officer said in a recent speech. The danger of lead poisoning has been largely overcome by Government action, but dust diseases, and, above all, silicosis, are still a major problem. It is precisely the same conditions that make for ill-health in the potteries which make also for low output per man-hour. An energetic health policy would be a powerful assistance to a policy of physical reconstruction for higher productivity. The Dust-Tile Committee, set up in 1939 under Sir Wilfrid Garret, recognised that improvements "that we were sure would be for the benefit of the industry as well as for the health of the workers . . . would require considerable expenditure of time and money to bring about," and that some of their recommendations "cannot be adopted even in some large works without a complete new layout of shops and presses, and may be quite impossible in many small works." The enforcement of the existing laws and some new Health Regulations, therefore, would by themselves enforce some degree of reconstruction and modernisation in the industry, including the adoption of new processes, the amalgamation of firms, and some planning of industrial location for the area as a whole. For these purposes, the Society feel, financial assistance should be forthcoming from the Government to any such factory owners as will carry out effective modernisation.

The main elements of the reconstruction plan are thus (1) the setting up of an Advisory Board; (2) the continuation of licensing through the Board of Trade in accordance with new aims and objects; and (3) the continuation of Government price control. But there are also a number of important subsidiary proposals, some of which are essential to the working of the above. Only a few can be enumerated here.

The proposed new Apprenticeship Scheme, a drastic simplification of the immensely complicated wage structure, the "guaranteed week," equality of status for women, and a number of proposals of welfare, works committees, and related matters, form the rest—and the more conventional (though equally intelligent) part of the report. The width

of practical vision here noticeable, perhaps for the first time in a document coming from one of the smaller trade unions, is perhaps best exemplified by the hard thought that has been devoted to questions normally outside the interests of workers' organisations, such as the problems of standardisation and distribution.

It would be less than candid to suggest that the Report is a complete answer to the basic problem of the industry, its low productivity. Here, again, the parallel with the cotton industry applies: unless productivity per worker can be drastically increased, good working conditions and industrial prosperity will not be possible. Some of the Pottery Workers' recommendations point in the direction of increased productivity. Their licensing proposals are designed to effect a "slum clearance" of the worst factories; but this would do comparatively little for the average efficiency of the industry. They propose financial assistance for firms willing to rebuild, but this might be almost completely ineffective in the absence of such a mixture of compulsion and incentive as would be provided by high profits in the modern factories and heavy losses in the old ones. The minimum prices recommended in the Report might prevent the latter, while the increase in costs resulting from a 40-hour guaranteed week—which the Report also advocates—might prevent the former. Even the cause of health would be promoted more successfully by an effort to increase PMH, and so attract the capital for replacing unhealthy factories, than by the introduction of a 40-hour week in the old squalor. The fact has to be faced, of course, that an increase in output per man-hour would result in a reduction in the labour force needed by the industry, even on the most optimistic view of the prospects of export trade. Independent calculation has put this reduction at between 30 and 40 per cent in twenty years. That the Pottery Workers are not oblivious to this is shown by their anxiety that the economic structure of the Potteries should be broadened by attracting new industries to the region.

The Pottery Workers might be invited to prepare a second report addressed, in the same spirit of constructive realism, to this basic problem. How can PMH in the pottery industry be increased? If they can answer that, everything else will follow much more easily.

LEGAL & GENERAL WHOLE LIFE AND ENDOWMENT POLICIES

both participating and non-participating

INCLUDE WAR RISKS WITHIN THE UNITED KINGDOM

so long as the life assured remains
a civilian.

Duty in the Civil Defence Services and the
Home Guard as at present constituted is
included in the cover.

The Society is prepared also to consider War
Risks both at home and abroad in respect
of non-civilian lives, each proposal being
considered on its merits.

Business Notes

Markets and Politics

The improvement in equity prices, which began on the eve of the Easter holiday, had carried the index of *The Financial News* (July 1st, 1935=100) to 116.8 on Monday of this week. That is, it had all but attained the wartime peak of 116.9 touched on August 9, 1944. On Monday, too, the number of bargains received passed the 9,000 mark for the first time since the new system was instituted. But that was a definite peak, at least for the time being. On Tuesday business was still very active for that day, but sellers predominated and there were falls in virtually every section of the market, from gilt-edged to speculative mines. Only some overseas stocks—notably Argentine railway prior charges—continued to rise. In view of the many uncertainties of the immediate outlook, many people have been surprised at the timing of the revival in activity, and last week it was attributed to "flag waving." Now one of the many uncertainties has come to the fore in an acute form: there has been an outbreak of party politics and the air is full of rumours that an election may be almost imminent.

Elections are always very disturbing to the stock market, and on this occasion the period of suspense inseparable from such events is to be substantially protracted. It is very far from clear that the period during which the nerves of the investor will be subjected to the shocks involved in the more fervid type of election address will be equally extended, but the atmosphere has, for the moment at least, become too emotional for there to be any certainty as to the outlook.

The fact that the reverse has come at the moment when it seemed probable that a new peak would be stabilised will give the "chartists" fresh ammunition for their arguments that equities already stand too high. It may well be that a really fervid election campaign will give those who have their resources in liquid form some opportunities to get in well below present prices. But, unless the political risk is to be taken to include a rigid and continuing limitation upon profits and distributions, many industrial equities ought, as supplies increase, to climb well above their present levels.

Disposal of US Aircraft

A survey of present and future methods for the disposal of surplus American military aircraft, based on official information, discloses that one quarter of total expenditure on munitions has gone into aircraft. Indeed, aircraft will constitute the biggest block of surpluses at the end of the war. Some 260,000 aircraft have been produced (of these 48,000 have been transferred to other countries) and nearly 34,000 machines have been declared surplus during the past five months because of "obsolescence or war weariness." Three-quarters of these surplus aircraft have been declared "hazardous for general use" and, therefore, are hardly saleable except as scrap. Moreover, the number fit for use consists mainly of military types; the need is chiefly for transports.

So far the number of serviceable medium transport aircraft declared surplus is only 175; of these 58 have been allocated to non-American airlines. Applications from foreign countries are carefully tested on the basis of needs by the Surplus Property Board's Aviation Division, the Air Transport Division of the Foreign Economic Administration, the Civil Aeronautics Board and the State Department. At the end of the war the number of surplus transports is expected to show a rapid increase; some estimates put the potential surplus as high as 8,000 units. Supplies, in fact, are likely to be ample for immediate needs; before the war less than 360 passenger and cargo-carrying aircraft were needed for commercial purposes in the United States and some 600 units in the rest of the world. But surplus military transports can hardly form the basis of the world's air fleet of the future.

Railway Pool Accounts

The estimates of the pooled receipts and expenditure of the main-line railways and LPTB for 1944, published

by the Ministry of War Transport as a White Paper (Cmd 6619), shows a further increase in gross receipts under both passengers and freight. As was the case last year, the increases, actual and relative, are larger under the former head, but the rate of expansion has fallen. Thus, whereas total gross receipts showed a rise of 11.1 per cent a year ago, this time the figure is 3.3 per cent up. Unfortunately, the experience with regard to expenditure is the reverse, the increase being 10.7 per cent against 8.1 per cent. The result is a fall in net railway receipts, and in net pooled revenue, for the first time since the outbreak of war. The following table shows all the items for each of the past three years and the percentage increase of each over the corresponding 1939 equivalent. The figure taken is not the total for that year but a notional figure based on the account for the first four months of the war.

	Amounts (£'000,000)			Percent. of 1939*		
	1942	1943	1944	1942	1943	1944
Receipts: Passenger.....	163.5	186.3	194.6	180	205	214
Freight.....	176.7	190.9	196.1	146	158	162
Miscellaneous.....	3.3	4.5	5.7	191	261	218
Total.....	343.5	381.7	396.4	161	179	185
Expenditure.....	251.7	272.2	301.2	144	156	173
Net receipts.....	91.8	109.4	95.2	237	282	241
Other expenditure (net).....	2.6	3.9	2.9	280	390	290
Net revenue of pool.....	89.1	105.6	90.3	215	254	218
Expense ratio (%).....	73.3	71.3	76.4	89.6	87.4	93.4

* Based on figures for September 1st to December 31st

It will be seen that, despite the huge increase in traffic and the highly abnormal conditions of passenger travel, the expense ratio is fast approaching the level ruling at the end of 1939. Even so, the net receipts are 2.4 times those of that period. In the above figures expenditure includes maintenance and renewals at a standard rate. Actually, arrears of maintenance accumulated even more rapidly in 1944 than in any earlier year. They now amount to £122,906,000, excluding interest of £2,854,000. The addition during 1944 was £32,322,000, excluding £1,201,000 for interest.

Mining Taxation

The committee appointed by the mining interests of this country, under the chairmanship of Lord Geddes, to investigate the question of mining taxation, has now reported. It is a pity, but perhaps inevitable, that the report should have been prepared before the contents of the recently published Income Tax Bill were available. As it is, the committee admits that the bill is a large step in the right direction, but it is not clear how far it meets their requirements under certain heads, and it is a pity that they are unable to give any guidance on this point. There are, however, two matters on which the bill clearly gives no relief, namely, depletion of mineral deposits and double taxation.

The latter point is outside the scope of the Income Tax Bill, and there was at one time hope that an arrangement for reciprocal treatment might be reached between this country and the USA. Nothing has been disclosed of any progress which may have been made towards that end, and the position still is that, except in those areas where the provisions of Dominion Income Tax Relief are fully effective, enterprise operating overseas, but owned in this country, has to bear a double burden which must gravely restrict its expansion even if it does not lead to positive contraction.

The question of allowing depletion of ore reserves to be written off out of untaxed profits is a thorny one. The argument advanced by the committee is simple. They maintain that a mine buys its raw material, that is the ore, in one lump, whereas the manufacturing firm buys it from month to month. That, they say, does not make it any the less a cost of carrying on the business. With some minor qualifications, that seems a reasonable argument. Whether it is or

not, such relief has been granted by both the USA and Canada and, if there is competition between them and ourselves for the exploitation of overseas mining rights, they are likely to secure the contract. The fact that to grant the relief in this country would involve a re-assessment of the inland revenue's ideas of what constitutes capital and what revenue—or alternatively of giving relief for exhaustion of capital—ought not to be an effective bar to action.

The Committee gives figures which suggest that, on the basis of the average of 1936-38, mining enterprises registered in, financed from, directed or advised by London contributed rather over 1 per cent of the national income and 4½ per cent of the gross foreign exchange receipts of this country. The exact amount of these contributions is, however, of less importance than the fact that, under a more enlightened system of taxation, they could presumably be somewhat increased. The effect of relief may, in fact, mean an increase in tax revenue from the industry as a whole.

Wool Supplies

Empire raw wool trade discussions are due to start in London next week. The immediate outlook has been clarified by the Government's recent decision to continue to purchase Empire wool surpluses up to the end of the wool season following the termination of the Japanese war. But the longer prospect holds out many urgent problems.

In the years immediately preceding 1939, the annual world wool clip fluctuated between 3,600 and just under 4,000 million lbs. Since 1939, however, new supplies have been regularly above the 4,000 million lb. level, and this increased production, coupled with reduced world consumption due to the blockade, to lack of shipping and to shortage of man-power and plant in the Allied consuming countries, has led to heavy stock accumulations. Wool, in fact, is one of the few commodities that will not be in short supply at the end of the war. Total world stocks at the end of this season, on June 30, 1945, are expected to be from 3,000 to 3,500 million lbs., a figure roughly equal to world consumption in one normal pre-war year, and nearly twice as large as the annual world wool shipment.

In the first post-war decade the international meat shortage may lead to an increase in the world's sheep population and consequently force up wool production still further; but wool growers will also have to contend with greater competition from staple-fibre and other processed textile fibres. The demand for wool may expand; at the same time, with much wool-processing machinery out of operation in Europe and the Far East, the immediate unloading of the surplus on to the market would depress prices without ensuring its absorption; there is, in fact, much to be said for a policy of regulated disposals. The British Empire in pre-war years accounted for some two-thirds of world wool shipments, and now holds the great bulk of the world surplus. It appears not unlikely that the London discussions will prove the forerunner of a world wool conference.

Wool Research

Both the raw material and manufacturing sections of the wool industry are alive to the need for research to meet intensified competition from other textile fibres. Australia alone proposes to spend at the rate of £600,000 a year. According to a report of the director of research of the Wool Industries Research Association, good progress has recently been made in this country in securing the cooperation of the wool textile and related industries in a scheme of intensified research activities, to be financed by a statutory levy. Investigation is to cover a wide field and is designed to ensure improved quality as well as a higher degree of efficiency in the manufacturing processes.

The publication of the Platt report on comparative costs of production of cotton textiles in Britain and in the United States has not been without effect upon the British wool textile trade. The director of research has this to say:

It is not enough to consider that odd improvements in detail of our mechanical equipment will re-establish the industry in a sound competitive position. Our processes must be reviewed in the light of labour costs and labour availability as well as mechanical efficiency if all factors which affect productivity are to be properly assessed. There are at least three necessary lines of approach: (1) research on engineering subjects, materials, motions, lubrication, vibration; (2) design of machines; (3) study of operating efficiency.

The growing recognition of the importance of PMH as the key to industrial progress is of good augury. The old-established textile trades have long been among the leading export trades; Britain cannot afford to lose these sources of foreign exchange after the war.

Comparative Food Consumption

The second report of the Combined Food Board on Food Consumption Levels in the United States, Canada and the United Kingdom in 1944 would have been of the utmost value had it been available last month, when discussion raged over the American proposal to cut meat shipments to the United Kingdom. This report, the CFB's second (the first was published a year ago), is the most authoritative survey of civilian consumption in the three countries. The essential facts are contained in the table below, and they speak for themselves.

A study of the table makes it clear which of the countries can best afford to reduce consumption to contribute to the feeding of Europe. It is a pity that similar figures are not available for other countries, particularly food-producing countries. There was at one time a proposal that a survey should be made on the same lines for Australia, but there has been no report of progress.

It is only on a basis of knowledge of the level of consumption and production that a fairer world distribution of food can be made. One of the main reasons for differences in consumption between the United Nations has hitherto been transport. Although shipping will not be unlimited after

Estimated supplies of food moving into civilian consumption in pounds per capita per year, by food groups, pre-war, 1943 and 1944

* Total for human consumption. Excludes sugar and sirup used for industrial purposes, e.g., tobacco, etc. Includes sugar and sirup duplicated elsewhere in canned fruits, canned vegetables, condensed milk, and cereal breakfast foods, as well as sugar and sirup used in brewing and distilling.

the defeat of Germany, certainly it will be relatively easier, and therefore less of a deterrent to the more adequate feeding of Europe.

Winter Milk

Once again farmers have increased the production of winter milk, this time in the face of additional difficulties of weather and shortages of home-grown feeding-stuffs, particularly hay. The winter milk campaign started in the winter of 1941-2, and at this stage it is worth comparing the production of that winter with the one just ended. Output was 461 million gallons between October, 1941, and March, 1942, and 535 million gallons for 1944-5, an increase of about 16 per cent. The main reason for the increase is the switch to autumn calving, which produces more milk in winter while in no way diminishing the summer output. There have been other contributory factors. More farms, particularly in the West, are selling milk, less milk is used on the farms for such purposes as calf-rearing, and there is more efficient management of herds.

For the future, when autumn calving is wholly accomplished, it is from higher yields through better stock and more efficient management that increased production must be looked for. The health of herds is an outstandingly important factor for output. As was pointed out in the House of Lords' debate last Wednesday, some 200 million gallons a year are lost through bovine diseases. As a contribution to efficiency, an official Mission is going to study methods of milk production and marketing in the United States and Canada. Its studies should provide farmers with invaluable information about North American methods. It should do for milk production what the Platt Report has done for cotton.

Stock Exchange Finance

The accounts of the Stock Exchange, London, for 1944-45, the last to be prepared by the Trustees and Managers, are the first to be officially presented to the press. Mr H. L. Uring Clark, to whom this duty fell, not only explained the accounts in detail but provided the material for a comparison of the position and prospects now and at the end of the last war. During that period 13½ per cent tax free was paid to the proprietors, absorbing the whole net revenue and necessitating a draft of £20,857 on the carry forward. In the six years just ended, after remitting subscriptions to members and clerks in the Forces of £659,747, revenue was £667,667. Of this rather over half went in taxation, £100,000 gross in paying a dividend and £230,994 in provisions and additions to free reserves.

After 1918-19, there was a sharp increase in subscriptions and entrance fees and net revenue rose from £26,000 in that year to £191,000 in 1919-20, to fall to an average of £153,000 in the four years to 1923-24. Under the then existing Clause 81 of the Deed of Settlement, not more than 10 per cent of net profit could be reserved for capital purposes and the dividends paid in the quinquennium averaged almost 24 per cent less tax. In 1938 this clause was amended and the new committee of the Council is free to do as it wishes. Further, in 1918-19 the number of members was 3,987 and that of proprietors 2,342, while at present the position is partially reversed, for there are now 3,710 proprietors and 3,558 members, excluding 137 who are enjoying a sabbatical year.

Probably, after this war, the revival of active membership will be less rapid than in 1918-20, but, whether it is

or not, there is no intention of paying large dividends. The objects are likely to be, first, to get all the shares into the hands of members, and, secondly, possibly as a necessary concomitant of acquiring a charter, to get rid of them altogether. In any case, one of the problems calling for early action is an increase in facilities, and that means better utilisation of the Stock Exchange site by a gradual rebuilding. With a new building, and net revenue pledged to improvements, instead of 90 per cent to dividends, very substantial possibilities would probably open up, but that is a field of speculation and must so remain for a considerable period. Some improvements in service certainly ought not to await that time.

Co-operative Trade Trends

The Co-operative Union, in company with the Retail Distributors' Association, the Drapers' Chamber of Trade, the Multiple Shops Federation and the British Furniture Trades Joint Committee, contributes figures which are aggregated into the retail trade statistics, published monthly in the *Board of Trade Journal*. In an article in the *Co-operative Review* for March, the co-operative component of the index is compared with the national index for the years 1941 to 1944. Unfortunately, there is no means of judging what proportion of the total trade is done by the co-operatives. However, the trend of co-operative sales can be compared with the trend of national sales, and the extent

to which the co-operatives are increasing their turnover at the expense of other traders can, to a limited degree, be measured. These other traders, of course, are the department stores and multiple shops; very few independent traders contribute to the Board of Trade figures.

The accompanying table tells the story for the main categories of goods sold by co-operative societies. The last column covers all types of retail goods, including, for example, furniture. It can be seen that co-operative total turnover during the years increased faster than national turnover. The co-operatives gained mainly in the food departments. In apparel the trend was behind national sales, except in boots and shoes. The explanation for the lag may lie in the large proportion of utility clothes sold by the co-operatives.

On the whole, the figures show that the co-operatives have been increasing their turnover during the war years in comparison with department stores and multiple shops. Possibly, some trade has also been won from independent shops. But the main reason for the relative increase is probably the larger spending power of co-operative members during the war.

Exit Texas Land

What looks like the last scene in the history of the Texas Land and Mortgage Company was opened at the beginning of the week by a circular to shareholders from the new chairman, Mr Denys Lowson, proposing that the company be wound up voluntarily. Since the Lowson interests held, and presumably still hold, a controlling interest, there is little doubt that the meeting, convened for May 3rd, will sanction the proposal. The logic behind this decision is not very clearly set out in the circular and the accompanying memorandum. The majority directors do

not wish to shoulder the responsibility of holding many of the investments, and they suggest that, were the concern converted into an investment trust, substantial changes would be necessary, and this would mean that a large part of the capital appreciation which has accrued would be taken away in taxation. The concern is a finance company, and tax, it will be realised, is payable on realised capital profits.

This seems to be an argument for carrying on the business until such time as the full rigours of EPT are relaxed, but the majority directors appear to believe that there is no prospect of any such relaxation. The minority directors hold the opposite view, and suggest that there is little or nothing wrong with the existing portfolio and that dividends could be paid of 15 per cent and upwards—last year's payment was 13 per cent—while still making considerable transfers to reserve. There is here a very definite difference of opinion, and it is difficult to accept that of Mr Lowson. Before doing so, one is entitled to ask, first, what he intends to do with the money obtained from the liquidation which he could not do with it while it remained the property of Texas Land shareholders, and, second, where the other shareholders are to find an alternative investment giving a better return, or indeed one as good.

Even if he is right in assuming that on many of the securities neither increases in dividends or capital appreciation can be expected, his argument that they will fall in value if there is a rise in interest rates or a recession in business activity is of very general application, and a loss which in this case is cushioned by EPT, if that tax is to persist—can only be avoided by becoming entirely liquid.

The Minority Interest

It is difficult to escape the conclusion that underlying the difference of opinion there is a clash of interest. Many of the minority shareholders in the company have had their holdings for a long period of years. The majority holders acquired the bulk of theirs in the summer and autumn of 1943, at, it is believed, an average price well under £5½. The gross break-up value of the company is placed at something between £10 and as many guineas, of which almost 50s per share will be lost to the shareholders in the taxation. This leaves a net break-up of, say, £7½. The majority holders may well think that a capital profit of around 50 per cent in two years is very satisfactory and find it easy to abandon the similar sum which goes to the inland revenue. The attitude of those who have held the shares as a revenue-yielding investment is very different. They may be excused for feeling, as some at least of them do, that it is an unfortunate state of affairs that they should be deprived of an investment which seemed to them good merely to put money into the pockets of a group who have never done anything for them or the company.

There is, however, nothing in the law as it stands to-day which recognises that a minority has any rights in such a matter. Had there been a law compelling disclosure of beneficial ownership and an obligation upon directors to disclose what was going on, shareholders might have been prevented from parting with their shares to a group whose intentions were unknown. As it is, no effective action was possible until it was too late. The best that can be said of the episode is that, in this case, the minority are fortunate in that they do at least get the same terms as the majority. Too often their fate is worse than that. Also they obtain better terms than those who had insufficient trust in the future of the company to resist offers to buy at what now look like very low prices.

The Banks' Investments

The return of the eleven clearing banks for March shows that the total of deposits has now recovered from the seasonal drop of £57.3 million in February, when both revenue and savings were at a high level. The combined total of £4,459 million is still a little below the £4,462 million of January, but the difference is almost wholly accounted for by a reduction in transit items. The major part of the rise in deposits is reflected in the expansion of £42½ million to the record level of £1,681 million in the aggregate of Treasury Deposit Receipts. There has also been an interesting rise of £11 million in advances. Though this falls below the £19½ million increase of March last year, it brings the total back to within £2 million of the peak of £772 million attained in that month.

The banks' investments are down £7 million on the month, and have now fallen £39 million from their record of £1,192 million in November. Before the rapid war-time expansion of credit, an increase in advances was customarily associated with a corresponding fall in investments and the rise in advances since November could explain a considerable portion of the drop in investments over that period. The probability of a summer savings campaign involving heavy subscriptions from the banks may also have exerted pressure towards greater liquidity—though the fall in investments over the corresponding period of last year was £8½ million smaller despite the proximity of the "Salute the Soldier Campaign." There is, however, a further possibility. The present market strength of "longs" may have induced the banks to sell some of their stock in preparation for a new issue of "National War Bonds" or some analogous Victory Bond.

Other items in the return show no significant change. There has been a falling off of money at call, but this has been more than compensated for by a rise in the banks' bill portfolios. Primarily as a result of the increase in TDR's, the ratio of liquid assets to deposits has now risen as high as 55.5 per cent, about 5 per cent higher than at this time last year. The proportion of TDR's to deposits is now 37.7 per cent.

Canadian Note Circulation

A feature in Canadian banking is the enormous rise in the note circulation since 1939. The accompanying table, extracted from the annual report of the Bank of Canada, reveals the size of the expansion. The rise in the combined total of notes in circulation and bank deposits was less spectacular; it expanded from \$2,775 million on August 31, 1939, to \$6,075 million at the end of 1944. The decline in the volume of chartered bank notes is a reflection of the provisions of the Bank Act of 1934; these prescribed a reduction in the maximum amount of chartered bank notes from 100 per cent of their "unimpaired" paid-up

ACTIVE NOTE CIRCULATION
(In Millions of Dollars)

End Year	Bank of Canada Notes	Chartered Bank Notes	Total
1935	59.1	111.0	170.1
1939	162.2	84.6	246.8
1940	261.6	79.8	341.4
1941	379.6	70.6	450.2
1942	572.5	60.3	632.8
1943	751.5	42.2	793.7
1944	896.6	33.0	929.6

capital on the date of the establishment of the Bank of Canada to 25 per cent of this figure on January 1, 1945. The Bank Act of 1944 provides that after January 1, 1945, no chartered bank shall issue or re-issue its own notes for circulation in Canada; after January 1, 1950, the liability of the banks for their notes then outstanding are to be transferred to the Bank of Canada in return for the payment of a like sum to the Bank of Canada. In other words, the transfer of issuing power to the Bank of Canada has been completed; the transfer of outstanding notes is to be completed after a further period of five years.

Canadian Pacific

The detailed accounts of Canadian Pacific Railway for 1944 underline and explain the great increase in railway working expenses, which have risen both relatively and absolutely in relation to railway gross earnings. The expense ratio, before tax, is, in fact, up from 72.8 to 78.9 per cent, its highest level ever. Out of an increase of \$35 million odd in working expenses, higher wage costs account for \$20 million odd. The cost of the 1944 wages award appears to amount to about \$10.7 million, but included in the 1944 wage bill is a further \$4 million paid retroactively in respect of 1943, which will not be repeated. The cost of materials has also risen. Individual expense items show very heavy increases in transportation expenses, which have risen 16.5 per cent, and maintenance, which is up by 16.7 per cent.

It is estimated that average wage rates have risen altogether since June 1, 1941, by about 25 per cent. Since that date no increase in freight or passenger rates has been allowed by the Wartime Prices and Trade Board. It follows that the annual rise in costs can only be covered by still greater expansion in the volume of traffic and in utilisation of

equipment. Further gains under both heads during 1944, although insufficient to match the rise in costs, were nevertheless remarkable. Passenger earnings rose by 100 per cent, and freight earnings by 7.0 per cent. There was a notable increase of traffic in agricultural products, due to increased opportunities for export to Europe. Earnings from grain, for instance, were a third higher. Heavy agricultural traffic is likely to continue, and perhaps increase during 1945, but, generally speaking, the volume of traffic has probably at last reached its peak. There will be a danger of further decline in railway earnings, unless increased rates are authorised or the rise in costs is rigidly checked. The "windfall" nature of some credit items in the 1944 net income, as now disclosed, stresses the extent to which the company's prosperity is dependent on its railway earnings.

The Miners and Technical Efficiency

Although the National Union of Mineworkers' plan for coal is not expected until some time next month, the miners' general view of the future of the industry is well known. In formulating their detailed plans, they would be well advised to adopt the line put forward by Mr Arthur Horner in his presidential address to the South Wales Miners' Federation last week. This was, incidentally, the last meeting of the Federation, which, after 47 years of separate existence, is being merged into the National Union of Mineworkers.

Mr Horner stressed the need for improving the technical efficiency of the industry and raising the production per man-shift, which would "make possible the continuous improvement of the existing wage standards of mine workers." "Concentration," he said, "which is only possible by the application of modern methods of machine mining, must become the order of the day." He dismissed the familiar argument that British conditions did not lend themselves to mechanisation and expressed confidence that suitable machinery could be devised for British mines. He urged the need for the planned development of the industry with the ordered transfer to other employment of men whose labour was no longer required in the mines, and the introduction of conditions which would make mining attractive to new recruits.

Speaking as a miner, and for mine workers, Mr Horner has, it seems, reached the same conclusions as the mining engineers represented on the Reid Committee. It remains to be seen whether the miners as a whole will be prepared to accept these conclusions and co-operate to give them effect.

Sudan Plantations Assets

Since the concessions of Sudan Plantations and its subsidiary, Kassala Cotton, which expire in 1950, are not to be renewed, the former company has drawn up its 1944 balance-sheet so as to show the full value of its assets. Fixed assets, which are to be taken over by the Sudan Government at cost, amount to £1,632,000. In addition, there are net liquid assets of £3,946,000, and these two items amount to £5,578,000, which compares with issued share capital and premium on issue of £4,179,000. There will in addition be a handsome capital profit on the book value of the Kassala Cotton holding and something further from the liquidation of Parana Plantations, which contributed £311,000 last year to reserves. In the circumstances it is clear that the company will be free to distribute forthwith any funds it may earn and payments should be generous. The minimum break-up value appears to be about the current price of 46s. 3d. ex dividend, and yield at that price is £4 6s. 6d.

The trading profits for the year 1944, at £613,970, are down by £157,000, but taxation, owing partly to an EPT refund of £82,000, requires £198,000 less. It is scarcely surprising that the directors have decided not to augment general reserve further. As a result, it is possible to pay a dividend of 20 per cent against 12 per cent, leaving carry forward approximately unchanged. The company will receive proceeds from six more cotton crops, and the crop now being harvested should be above the average.

It is pointed out that dividend payments over the last 15 years have averaged only slightly over 5 per cent, partly as the result of accumulating reserves in the hope, now disappointed, of financing further agricultural development in the Sudan. The "sincerity and efficiency" displayed by Sudan Plantations and Kassala have been praised by the

Sudan Government, who hope that many of the companies' officials will continue in the Government's employ. It is, in fact, clear that the Government's action has been decided by political considerations, plus the ease of financing new developments with the aid of accumulated sterling reserves.

Post Office Reorganisation

The Post Office has drawn up its proposals for reorganisation after the war, and these have been under the consideration of the Union of Post Office Workers since February. Meanwhile, the union had been preparing its own report for submission to its members; it was published last Saturday. Both sets of proposals deal in great detail with the grading of workers. There is a good deal of agreement between the two on this subject; perhaps the main divergence is on the question whether there should be one or two grades in sorting-office duties. The union prefers one and the Department two. The general approach of the two reports is not dissimilar in regard to recruitment as well, although it appears that the Union has been more mindful of the effect of the Education Act on the recruitment age and a higher standard of education.

The union has a good deal to say on opportunities for promotion, on the need for equal pay for equal work, on longer holidays, and on the shortening of the wage scale so that the maximum rate is reached in the middle twenties instead of in the early thirties, and on the 40-hour week.

The UPOW has done pioneer work among Civil Service unions, and possibly among industrial unions, in producing a report in such detail as theirs, dealing with the reorganisation of their work from every point of view. It is an example which might well be followed. The report is to be presented at the Union's annual conference next month, and if adopted will form the basis of the union's discussions with the Department.

Shorter Notes

In apparent contravention of the latest ruling of the Stock Exchange Council, Stewarts and Lloyds have announced no profit figure in declaring their dividend on the deferred ordinary capital. The dividend is at the rate of 12½ per cent, paid for many years past, and the directors state that after allowing for taxation, trading profits show little change. There is, however, expected to be an increase in available profit owing to the inclusion of a full year's dividend from Stanton Ironworks. It is a pity that the company cannot synchronise the preparation of full accounts with its preliminary announcement, but this statement is, in the peculiar circumstances of the time and of the iron and steel industry, as informative as would be the publication of partial figures.

The Mining Association has appointed as Director of Education and Training in the coal industry, Dr R. W. Revans, present Deputy Chief Education Officer for the County of Essex, thus following the precedent created by the appointment of Mr Robert Foot of bringing new blood into the owners' counsels. This is certainly a welcome appointment; it is indeed overdue. Whatever the final form of ownership and control is decided upon, the industry will need a Director of Education and Training.

The report of the committee set up in July, 1944, to examine "the effect of the hydrocarbon oil duties on the supply of raw materials to, and the development of, the chemical industry in this country" was published on Thursday, too late for detailed comment. The committee was impressed by the "magnitude of the prospects now before the synthetic organic chemical industry of the world." It holds the view that the influence of the hydrocarbon duties on the prospective expansion of the chemical industry is likely to be far greater than in the past and, hence, that it is "urgently necessary that the industry should be relieved of this encumbrance."

ARE YOU OVER 17 YEARS OLD?

UNLESS you are over 17, there have been no Black Magic Chocolates since you were 14; and at that age (if we remember aright) chocolates were chocolates and never mind the name.

But if you are over 17, the words "Black Magic" probably strike a chord in your memory.

Let us help a little.

A very plain box—glossy black, with a few white lines on it.

Twelve different kinds of chocolates, in simple paper cups, without any fripperies.

Truffle-and-Nougat, Hazel Cluster, Liquid Cherry, Orange Cream, Strawberry Cup . . . heigh-ho. The girls loved 'em; and the boys took no poor view of them, either.

And now, you say, here it comes—"Come Peace, come Black Magic." But nothing of the sort. There will be a lot of pre-war goods back in the shops before Black Magic; for though we shall move fast, we shall take no short cuts—no half measures, no skimping.

Don't expect to buy Black Magic on Armistice Day; but when you do buy it, it will be as good as ever. We believe it will be better, but that will be for you to say.

Black Magic

Fuel Efficiency Bulletin No. 38

"The Maintenance of Industrial Boiler Plant" offers under one cover much useful information. It not only lists many common and uncommon maintenance problems, but describes how to deal with them. It is a handbook for the man on the job—it is up to management to see he gets the tools and facilities.

THIS BULLETIN has been prepared from the practical experience of Regional Fuel Efficiency Committees. The following is just one example of what scope for economy they have found:—

A LARGE INDUSTRIAL PLANT consuming about 800 tons of coal per week. As a result of

air infiltration, the CO₂ value was only 3.5—5 per cent. Fan power had to be stepped up to maintain draught, actually causing boiler vibration. Elimination of air leaks and short circuiting, together with improvements to lagging and firing standards, resulted in a 30 per cent. saving in fuel and also better steaming conditions.

Additional copies of the Fuel Efficiency Bulletins and Fuel Watchers' badges can be obtained from the Regional Offices of the Ministry of Fuel and Power.

THE PRUDENTIAL ASSURANCE COMPANY LIMITED

ANOTHER SUCCESSFUL YEAR

SIR GEORGE L. BARSTOW'S REVIEW

The ninety-sixth annual general meeting of the Prudential Assurance Company was held, on the 4th instant, at 142 Holborn Bars, London.

Sir George L. Barstow, K.C.B., chairman of the company, in the course of his remarks, said:—I begin by drawing your attention to the magnitude of the life sums assured and bonuses in force, which exceed £700,000,000 in the industrial branch and £300,000,000 in the ordinary branch, or over £1,000,000,000 in all. This figure is an impressive measure of the responsibility borne by your company.

ORDINARY BRANCH

In the ordinary branch the premiums were £16,963,752, an increase of £1,101,991 as compared with the preceding year. The net new sums assured, including group life and overseas business, but not group pension business, exceeded £25,800,000.

The home net new business sums assured amounted to over £13,700,000, the decrease of about £2,300,000 being due largely to the fact that, owing to the claims of National Service, no members of our staff in this country are now engaged solely in the procurement of new business. We have little doubt that when we are once more on a normal footing we shall be able to record substantial progress in this important section of our business.

The net new sums assured written overseas exceeded £12,000,000 and constitutes a record figure not only in total but also for most of the territories where we operate. This augurs well for the future of our overseas business and reflects great credit on our overseas staff, who also are not free from wartime problems.

The surplus in the ordinary branch, including £324,133 brought forward from last year, is £2,697,169. The allocation of this amount is set out in the directors' report.

The directors have declared a reversionary bonus at the rate of £1 per £100 sum assured in respect of participating policies in force on 31st December, 1940, which were also in force on March 1st, 1945. They have also declared a bonus in respect of those participating policies which become claims by death or maturity of endowment during 1945 at the rate of £1 per £100 sum assured for each 31st December on which such policies were in force subsequent to 31st December, 1940.

INDUSTRIAL BRANCH

In the industrial branch the premiums were £28,950,411 as compared with £27,737,864 for the previous year. The death claims were £9,101,346 and the claims by maturity of endowment were £8,498,238. The cash surrenders were £552,127, thus continuing at the relatively low level of recent years.

The expenses of this branch amounted to 23.87 per cent. of the premiums, a reduction of 1.04 per cent. The collection of the weekly and monthly premiums, the payment of claims and other transactions and incidental services are carried out at the homes of the people. The cost of all such service is included in the expenses.

The surplus in the industrial branch, including £433,818 brought forward from the previous year, is £5,626,895, an increase of £666,410 as compared with the preceding year. The allocation of this sum is set out in the directors' report.

The directors have declared a reversionary bonus at the rate of 16s. per £100 sum assured under participating policies issued by the Prudential before 1st January, 1941, which were also premium paying policies on 1st March, 1945. In

addition a bonus will be paid on claims by death or maturity during the year 1945 at the rate of 16s. per £100 sum assured for each 31st December on which the policy was in force subsequent to 31st December, 1940. This latter bonus will apply to such policies issued up to the end of 1944 provided one year's premiums have been paid.

Since the initiation of the profit sharing scheme a sum of £63,518,575 has been allotted for provision of bonuses to the industrial branch policyholders. The bonus paid on claims in this branch during the year 1944 amounted to £3,055,564 representing, on the average, an addition of about 20 per cent. to the amount that would otherwise have been payable.

BRANCH CONTINGENCY FUNDS

After full consideration the directors have decided to make no transfer this year to the Ordinary and Industrial Branch Contingency Funds, as they consider that these are ample for their purpose. On the other hand, the outlook is not yet such as to enable the directors to consider their total or partial release.

GENERAL BRANCH

In the general branch the premiums received were £3,038,885, about one-third of which was in respect of our overseas business. This total represents an increase of £159,159 to which every section, with the exception of the Marine, has contributed.

The considerable reduction in premium income in the marine account is mainly due to the reduced rates of premium charged for war risks.

With the exception of employers' liability, all sections of the general branch have contributed to the surplus. Underwriting results generally have been satisfactory.

The surplus in the general branch, including £190,186 brought forward from last year, is £453,680. Details of the disposal of this surplus are given in the directors' report.

In the interests of the future of this branch, the strength of the reserves has been increased by transferring £100,000 from the surplus to the additional reserve fund. £75,000 has also been transferred to the investment reserve fund, which sum has then been applied to writing down investments in this branch.

NATIONAL INSURANCE

Shareholders may wish me to comment on the Government's National Insurance Scheme which was published in the White Paper of September last. Let me say at once that we commend in principle the object which the scheme is designed to secure.

The principle employed is the provision of uniform benefits provided by compulsory and universal payments consisting partly of per capita contributions borne by insured persons and their employers and partly of taxation borne by all taxpayers. The compulsory contributions differ in essence very little from taxation, and the scheme can, therefore, be briefly described as a partial re-distribution of the national income for the benefit of those least able to protect themselves. The scheme is a development of the tendency to State assistance which has steadily grown in the past few decades.

Voluntary insurance as transacted by insurance offices is, on the other hand, founded on the principle of self help, individual benefits being assured by payment of individual premiums—each person insuring according to his choice, his needs and his means.

The two principles are not necessarily incompatible in the sense that the adoption of one implies the abandonment of the other. It would in my view be a real disaster to the industrial classes and to the community generally if any extension of a State scheme were ever to cripple the activities of the voluntary agencies for self-help. We are glad to note that no such extension is in mind for, in the words of the White Paper, "There still remains the individual's opportunity to achieve for himself in sickness, old age and other conditions of difficulty a standard of comfort and amenity which it is no part of a compulsory scheme of social insurance to provide."

The Government White Paper (Part 2) contained details of the plans for dealing with compensation for industrial injuries as part of the National Insurance Scheme, and it seems evident that Workmen's Compensation Insurance will cease to be transacted by the companies. Whilst this business has never produced more than a modest profit, it has contributed its quota towards the maintenance of our general organisation. Its prospective loss must, therefore, be a matter of some concern.

A development of the White Paper was the appointment of a committee to consider the whole question of common law rights in any case where a National Insurance payment for injury or sickness might be due. The report of this committee is awaited with much interest as it is realised that its recommendations may have an important bearing on all forms of third party insurance.

INVESTMENTS

The investment of our funds during the year 1944 followed a course very similar to that of recent war years, and resulted in a further large increase in our holding of British Government securities. The Government tap loans continue to absorb not only all our new money—that is to say the sum of nearly £16,000,000 by which our funds have grown during the year—but also a considerable portion of the money falling due for reinvestment on account of repayments and sales of securities. The consequence is that our holding of British Government securities and Government guaranteed securities now stands at £196,988,000, more than £22,000,000 in excess of last year's total, and represents nearly 47 per cent. of our assets. Since the outbreak of war we have subscribed no less than £132,000,000 to the War Loans issued in this country, and nearly £4,500,000 to War Loans issued elsewhere within the Empire.

The continued investment of so great a part of our resources in British Government securities as well as the conversion of other investments to lower nominal rates of interest must, of course, affect adversely the yields on our funds. This tendency towards lower yields has been to some extent obscured by the effect of the allocations which we have made in recent years to the Ordinary Branch and Industrial Branch Contingency Funds, the interest on which accrues to the benefit of the Life Funds, although the Branch Contingency Funds do not themselves form part of the Life Funds. This factor, together with a slight improvement in the return from certain classes of investments, has resulted in an increase in the net yield by 4d. per cent. to £3 12s. 1d. per cent. in the Ordinary Branch and by 1s. per cent. to £3 13s. 11d. per cent. in the Industrial Branch.

The year 1944 has been marked by a further increase in the market value of our Stock Exchange investments which, taken as a whole, stand in our books at a figure which is appreciably below their market value. In cases where there is no market quotation I am satisfied that a conservative basis of valuation has been adopted. We also have in our investment reserve funds, which now stand at £8,850,000, a further margin of security against possible future depreciation.

The report and accounts were unanimously adopted.

VICKERS, LIMITED

OUTSTANDING WAR SERVICE

MR A. A. JAMIESON'S REVIEW

The annual general meeting of Vickers Limited was held on the 4th instant, Mr A. A. Jamieson (chairman) presiding.

The Chairman stated in the course of his speech:—The issue of the White Paper on statistics relating to the war effort enables me to give further information than I have heretofore been permitted to do.

I think I can say that ours is a good record of a great British institution, and I underline "British institution" because the stock of your company is held by no less than 55,000 individual members of the public.

At the outbreak of war our group employed just over 95,000 persons. During the war we reached a peak of 170,000 in 1943, and at the end of last year the number was 145,500.

Nearly 20,000 of our former employees have joined H.M. Forces.

Our salary and wages bill for the period 1939—1944 was in excess of 214 million pounds.

In our shipyards we have built 188 ships, including the battleship "King George V" and the aircraft carriers "Illustrious," "Victorious" and "Indomitable."

THE IMMORTAL "SPITFIRE"

Our contribution to the aircraft industry, both before and during the war, is well known. Our "Wellington" bomber, and our "Spitfire" of immortal fame, need no words of praise from me, but I am proud to tell you to-day that we have constructed over 28,000 new aircraft and repaired over 9,000 in addition.

We have had the satisfaction of seeing the development work we put into our "Valentine" tank before the war fit it to play an important part in some of the war's most critical days. We have manufactured over 6,200 tanks and many other vehicles.

We are also proud of the part we played in the design and production of those great 12,000 lb. bombs, which have penetrated the U-boat pens, and sank the "Tirpitz," and of their big brethren the 22,000 pounders; and also of our part in the destruction of the Mohne and Eder dams.

We have produced over 14,000 guns of various types for the Navy and over 150,000 guns for the other Services, and our ammunition production has been on a great scale. We have supplied the primary armament for the battleships and cruisers completed for the British Navy during the war, and have manufactured and erected on site the heavy Coast Defence Artillery guarding the Straits of Dover.

But the fact in which we all of us may feel legitimate pride is that, so far as lay in our power, we were at our action stations on 3rd September, 1939, ready and prepared, and have been there ever since. During that time it has been our unceasing effort to "Give them the tools" and nobly have the Services used those tools.

EXPANSION OF MANUFACTURING CAPACITY

Stockholders are aware that during the years 1935 to 1939 the manufacturing companies in the group had undertaken great schemes of modernisation and extension of their plants. Such schemes undertaken with courageous foresight and carried through at a cost of over £6,000,000 enabled your companies to embark effectively upon the pre-war rearmament programme, and to carry a heavy burden during the early period of the war. It should be added that in addition to these extensions and improvements to the group's own manufacturing equipment, Vickers-Armstrongs in 1937 leased and arranged for the re-equipment of the extensive works at Scottwood, which were formerly owned by Sir W. G. Armstrong, Whitworth & Co. Limited.

To meet the greatly increased demands on your group by the Supply Departments following the outbreak of war, it was, as you will appreciate, necessary to effect a further large increase in manufacturing capacity. This was achieved in various ways, notably the following:—

(a) By extension to our own plants at our own expense.

(b) By carrying out extensions in our own works under Government schemes. These are of two classes:—

(i) Where we contribute towards the cost and retain ownership.

(ii) Where the Government bear the full cost and retain ownership.

(c) By undertaking the construction, equipping and management of Government owned shadow factories.

(d) By full scale employment of sub-contractors.

Dispersal of Manufacture.—During 1940 and 1941, when our factories were among the special targets for enemy bombing, dispersal of manufacture on an extensive scale was carried out. The extent of this dispersal may be gathered from the fact that at one period Vickers-Armstrongs alone, in addition to its own works, was carrying on operations in 350 premises of varying size and character scattered up and down the country.

OUTPUT

The products of your group are so numerous and varied that it will only be possible for me to-day to give you comments on certain of the activities of the group companies and statistics relating to the output of some of the more important items of production during the period from September, 1939, to December, 1944. I hope that when the war is over we may be able to put before you a more complete picture of our accomplishments, but I believe that the comments and figures I now give you will be an indication of the vitally important part which your group has taken in the war effort, and will also be a source of satisfaction to our employees whose skill and untiring energy have made this possible.

TECHNICAL ASSISTANCE, ETC.

Technical information and assistance to British and other Governments and other companies.—In my review in 1940 I told you that to assist in the Defence Programme expansion we were giving technical information and assistance to other companies which were entering the field of armament production. During the war we have continued to do so to an ever increasing extent, and sub-contracting on a large scale would have been ineffective without this assistance, but it imposed a great strain upon our staff.

We have gladly extended our efforts in this direction by supplying similar information to the Dominion Governments, notably Canada and Australia, and to a lesser extent to the United States of America, and many of our employees have temporarily proceeded overseas to give technical aid and advice.

Employees loaned to Government Departments.—Many requests have been received during the war period from Government Departments for the loan of specialist personnel of all grades. It has been the policy of your Board to render every possible assistance to the national effort, and accordingly such requests have been met without reserve. The temporary absence of these employees has in many cases added considerably to the burden of the managements, but the additional load has been cheerfully and successfully borne.

WELFARE OF EMPLOYEES

General Welfare.—Every endeavour has been made to cater for the welfare of our employees. In particular, medical services have been greatly developed, and in the large works full-time medical officers have been appointed; canteen facilities and equipment have been brought up to date, although in many cases the numbers of employees taking advantage of these facilities are disappointingly small.

Financial assistance to victims of air raids.—In September, 1940, having in mind the possibility of hardship arising amongst our employees from enemy action against this country, the Boards of the group companies set aside sums amounting in all to £132,500 as funds out of which assistance could be afforded in appropriate cases. Up to 31st December last grants out of such funds amounting to over £31,000 were made to employees who had suffered personal injury or loss. It is with sorrow that I have to report that the figure of casualties includes 230 employees who have lost their lives. It has been found that the immediate help which the local managements have thus been able to render to the victims has been most welcome and greatly appreciated.

POST-WAR PREPARATIONS AND PROSPECTS

Stockholders realise that two most important and urgent matters demand the attention of the managements of your companies as soon as possible after the war. These are, firstly, the rehabilitation and repair of buildings and plant, and secondly, the reorganisation of layouts to make them suitable and efficient for post-war manufacture.

As regards the first, it will be necessary, as I have already said, for the companies in the group to face large expenditure under this heading. During the war period every effort has been made to maintain buildings and plant in as satisfactory a condition as labour and available materials have permitted, but these limitations have been severe and much in the way of deferred repairs remains to be done before we will be satisfied that our pre-war standard of maintenance has been achieved.

As to the reorganisation of works and plant, this is a subject which is engaging the careful attention of your Board and managements, and authorisation has already been given for expenditure in certain directions where it is apparent that suitable work will be available very shortly after the cessation of hostilities. But there are a great many other directions where future prospects are still most uncertain, and at this stage it is impossible to go further than to say that the following are the general principles which we have decided to follow. Our equipment, skill and knowledge, besides being suitable for armament work, will be utilised in the future, as in the past, for many commercial purposes in shipbuilding, aviation, engineering, alloy steel, and carriage and wagon building. As a general rule, therefore, we propose to confine ourselves to those branches of industry in which our equipment and experience justifies us in assuming that we can take and maintain a leading place. We shall also develop energetically those other activities in which we have had an interest for many years, and we shall continue to consider new developments which might provide suitable and profitable products, but we do not intend to try to invade fields for which neither our equipment nor our knowledge qualify us.

This being our general policy, we are proceeding vigorously with the equipment of a new centralised research department for the engineering side of our business, and we have set up and are proceeding with the equipment of a similar department for aviation.

The report and accounts were unanimously adopted and a final dividend of 6 per cent. less tax, making 10 per cent. for the year, was declared on the Ordinary Stock.

HADFIELDS, LIMITED

PROBLEMS CONFRONTING THE STEEL TRADE

REPUTATION FOR QUALITY AND SERVICE

The fifty-seventh ordinary general meeting of Hadfields, Limited, was held, on the 30th instant, at Sheffield.

Sir Peter B. Brown, M.Inst.C.E., J.P. (Chairman and managing director), in the course of his speech, said: Throughout the year frequent changes in the type and amount of the Government requirements have been experienced. At one time the output of our electric and open hearth melting departments was reduced to less than 50 per cent. of the same period in 1942, but this only lasted for a few weeks, and the position has since improved materially.

CHANGING CONDITIONS

It is difficult to describe in a few words the disorganisation which takes place in a factory such as ours when the demand is suddenly cut off. The melting shops first feel the effect, then almost immediately subsequent processes such as rolling, forging and machining, where many more workers are employed than in the melting departments, are likewise disorganised and men are thrown out of work. As soon as this comes to the knowledge of the Man-Power Board and the Ministry of Labour they promptly transfer the surplus men to some branch of the Fighting Services or to other factories up and down the country. When further orders come to hand it is almost impossible to obtain additional workers, and generally those who enter our service have to be trained before they become competent.

Government controls are of course necessary during special emergencies, but the most irksome are those that prevent us from quickly adapting ourselves to changing conditions and making full use of our plant and facilities. Naturally the workers affected feel disturbed when their employment and home life are upset and many protests and even suggestions of victimisation have to be dealt with by the managers and foremen. Speaking generally, however, Sheffield is fortunate in this respect compared with many other districts.

It is a great satisfaction to us all to know that victory is now assured and that before long we may be able to direct our efforts to peaceful occupations free from the many controls and handicaps under which we have been working for nearly six years.

Referring to the balance-sheet, the current assets cover the current liabilities more than three times—actually there is the substantial margin of no less than £2,038,067. The net trading profit for the year is £200,443, slightly higher than last year, due to a large extent to the reduction of the war damage insurance payments.

GOVERNMENT ATTITUDE TOWARDS INDUSTRY

Since our last meeting the Chancellor of the Exchequer has encouraged British manufacturers by the various statements he has made assuring us of the Government's determination to foster industry in post-war years to a much greater extent than heretofore. We have been promised largely increased grants for education, research work, assistance towards the installation and renewal of plant and machinery, and the encouragement of improvement in manufacturing methods. You probably know that a Bill is at present before the House of Commons to supplement these promises. We fortunately now have a Cabinet that is convinced that these measures are necessary if our country is to hold a satisfactory position in the home and foreign markets.

The Government's scheme for the improvement of our social services following the lines of the Beveridge Report has met with general approval and in all probability will become law in the near future. When the question is raised as to how all these extra charges are to be met at a time when many millions of pounds will be required to repair the ravages of war, we are told that this can be done by improving the efficiency of our productive and sales organisations. Much more than that, however, will be required; we must awaken the sense of individual responsibility among all classes of the community, and I sincerely hope that we shall succeed in doing so without having the necessity forced upon us by a long period of depression such as we experienced after the last world war.

THE COAL SITUATION

The steel trade in which we are primarily interested starts with a heavy handicap brought about by the enormous increase in the price of coal that has taken place during the last few years. We are all aware that the condition of the coal industry is far from being a happy one. Several new and helpful suggestions have been made by Mr Foot in his Plan for Coal and are now being considered by that industry. Many iron and steel companies are deeply interested in coal mining as they control no less than 25 per cent. to 30 per cent. of the total output of coal in the country.

The first reaction of the National Union of Mineworkers expressed by their president, Mr Wm. Lawther, is that nothing short of complete nationalisation of the coal mines can be accepted by the miners. It will be very unfortunate if they persist in this attitude because such an important step is not likely to be taken until after a general election in which the matter can be put fully to the country and every voter given an opportunity of expressing his opinion. It is to be hoped that the miners will be prepared to defer their claims for nationalisation of the mines until after the war is over and the country has had time to get into its stride.

It is very satisfactory to note in the reports of the various international discussions now being held on post-war problems and means for maintaining world peace, that full recognition is being given to the necessity for the reduction of tariffs and the stabilising of exchanges. We are not likely to forget that practically all our overseas investments and export trade have had to be sacrificed during the war. To recover these, all the ability of our business experts, merchants, agents, bankers, manufacturers, scientists, artisans, will be required in a grand united effort equal in enthusiasm to the supreme effort made by them in the war years.

As to the future of our company, I think we are likely to be fully employed for a few years after the war in supplying the immediate needs of the home and overseas markets. We are in a better position than ever to undertake the manufacture of a great variety of work. We have an excellent reputation for quality and service. Our financial position is stronger than ever and I feel confident that we should be able more than to hold our own in the future.

The report and accounts were adopted, and the proposed final dividend on the ordinary stock at the rate of 1s. 6d. per unit (15 per cent.), less tax, making the total ordinary dividend for the year 1944 2s. 3d. per unit (22½ per cent.), less tax, was approved.

KEMSLEY NEWSPAPERS, LIMITED

CHAIRMAN'S REVIEW

The twenty-first ordinary general meeting of this Company was held, on the 5th instant, at Kemsley House, London, Lord Kemsley, chairman, presiding.

The Secretary, Mr J. H. Oldham, F.C.I.S., read the notice convening the meeting, and Mr A. E. Jones (Messrs Price, Waterhouse and Company, the auditors) read the report of his firm.

The Chairman, in the course of his speech, said:

PROFITS INCREASED

The accounts show that the profits on trading, including dividends, etc., at £1,126,192 are in excess of those of the previous year by an amount of £12,391. These profits have not been affected by the transfers to the contingency reserves which your directors have made to cover the estimated liability to income tax on profits earned to December 31st last, these being transferred out of undistributed profits.

This year your Board has decided to follow an accounting practice which is likely to become general, and to make provision for the liability to income tax which will be assessed upon profits earned to December 31, 1944.

The amount of sundry trade creditors and provision for taxation, accrued charges, contingencies, etc., has increased by £367,232. This relates entirely to the increases in the reserve for taxation and in the contingency reserve already mentioned.

On the other side of the balance sheet "Debtenture stock in an associated Company," which last year was £62,846, has been redeemed.

It will be noticed that the total of cash, British Government securities and tax reserve certificates is in excess of £1,600,000. In this connection it should be appreciated that in making comparisons with last year's figures the half-year's Debtenture interest and Preference dividend amounting approximately to £65,000 have this year been paid, and the amount of Four per cent. First Mortgage debtenture stock outstanding has been reduced by the amount of purchases during the year—namely, £158,753.

I may now interpose a reference to THE DAILY SKETCH War Relief Fund, under the chairmanship of Lady Kemsley, and the similar funds associated with our provincial newspapers. They have continued their activities throughout the year with the help of a band of devoted workers and many thousands of our readers. The value of the gifts distributed has now risen to more than a million and a half pounds.

"SUNDAY TIMES"

In the case of the SUNDAY TIMES I can tell you that while our present figure of over 450,000 copies per issue is the highest in the history of the paper, only the restriction on newsprint prevents this figure from being greatly exceeded, a tribute surely to the editorial qualities which maintain this journal in a position unique in Sunday journalism.

The success of our provincial papers is, I believe, the result of our policy of giving the readers their own local newspaper, alert to local interests and requirements, responsible in their judgments and observing the highest standards of decency in the evaluation of news. Augmenting these editorial qualities, we give a service of war news for which I am proud to pay tribute to our own reporters who to-day share all the risks and discomforts of the fighting man. Their dispatches from fighting zones have maintained the highest standards of journalism, and have given our papers a unique editorial influence and won for them a respect which augurs well for our future relationship with the public.

On the motion of the Chairman, seconded by the Hon. Lionel Berry, M.P., Deputy Chairman, the directors' report and accounts were adopted.

LONDON ASSOCIATED ELECTRICITY UNDERTAKINGS

LORD LYTTON'S REVIEW

The annual meeting of this Company was held, on the 12th instant, in London.

In moving the adoption of the report and accounts for the year, the Earl of Lytton, chairman of the company, said: The years 1941 to 1943 were most anxious and difficult. Sales of units fell from 432 millions in 1938 to 303 millions in 1943, a reduction of 129 millions, or 30 per cent. The number of consumers fell from 86,000 to 53,000, or 39 per cent. Consequent loss of revenue was met as far as possible by increases in tariffs in 1940 and again in 1943. Notwithstanding the strictest economies, the increased charges did not meet the loss of revenue. The cost per unit was greatly increased owing to the fixed charges (in the case of generating costs, 40 per cent. of the total) falling on a much smaller output and to progressive increases in the price of coal. In 1938 it was 21s. 2d. per ton; in 1944 it was 45s. 4d., an increase of 116 per cent.

The company was not compensated by an increase of load from war factories to offset the loss of commercial and domestic load. The pre-war load of 178,000 kws. fell to 111,000 kws., or 37½ per cent.

For 1942 and 1943 a readjustment of sinking fund contributions was granted by the Electricity Commissioners, subject to the funds being restored to normal at the earliest opportunity and payment of dividends being subject to the Commissioners' consent until this had been done.

Bulk supply stations were damaged on 55 occasions; 139 transformer chambers were damaged; 1,424 cables were put out of action. The amount of war damage is estimated at £500,000.

Supplies given by C.S.E. to consumers who needed them were never interrupted for more than short periods, and the London Power Company never failed to supply constituent companies and the Central Electricity Board.

THE YEAR 1944

1944 showed a recovery over the preceding year. Units sold increased to 348 millions, and the number of consumers to 76,684. Revenue increased by £487,000. This enabled full contributions to sinking funds to be made for that year, and the balance of revenue, together with carry-forward from the preceding year, was sufficient for the deductions made from the sinking funds in the two previous years to be repaid, thus restoring them to normal and recovering freedom of action in the future.

The balance sheet shows a very liquid position. Cash in hand and loan to subsidiaries at short notice total £1½ million. No. 2 reserve fund stands at £20,000. There has been no increase in capital issued. The dividend paid on ordinary capital was 3 per cent. for 1944. Balance carried forward is £1,790.

L.A.E.U.

Dividends received from Central London Electricity amount to £215,175, as compared with £226,824 last year. The reduction is due to the restoration of sinking funds to normal. The directors propose to transfer £24,000 from stockholders' reserve account, and recommend a dividend of 4 per cent. Stockholders' reserve account stands at £35,000.

As soon as circumstances permit, which the directors hope will not be long, prices to consumers will be reduced and statutory demands on ordinary stock restored.

The report and accounts for the year were adopted.

HALIFAX BUILDING SOCIETY

BRIG.-GEN. SIR EDWARD N. WHITLEY'S ADDRESS

The ninety-second annual general meeting of this society was held, on the 9th instant, in Halifax, Brig.-Gen. Sir Edward N. Whitley, K.C.B., C.M.G., D.S.O., D.L. (President of the society) presiding.

The chairman, in the course of his speech, said: The total assets of the society have increased this year by £3,583,743 and amount to £132,817,792; liquid funds have increased by £5,997,192 to £53,769,579, and mortgage assets have been reduced by £2,379,030 to the sum of £78,452,412.

Reserve funds stand at the same figure of £5,750,000. The amount carried forward is increased by £293,717 to £925,468, the total reserves and undivided profits amounting to £6,675,468.

EFFECT OF CONCESSIONS ON INTEREST FROM BORROWERS

Turning to the profit and loss account it will be seen that the amount of interest from borrowers has substantially declined. Partly this is due to the more rapid repayment of borrowed money. It is, however, to a considerable extent caused by the two important decisions to which I referred last year. You will remember that I then said that the Board had decided that in cases of loans on residential properties, where a value payment is to be made in pursuance of the War Damage Acts or where a cost of works payment is to be made and the property has been rendered uninhabitable for more than six months, the society would until further notice reduce the rate of interest on the amount payable under the mortgage to 2½ per cent. The gross cost to the society of this concession up to the end of the last financial year has been roughly £95,000. The other concession was a reduction to 4½ per cent. in the rate of interest charged to our then existing borrowers in respect of house properties. The cost has been substantial but we have evidence that the policy of the Board in these two matters has met with widespread approval.

We have had to maintain severe restrictions on the intake of new investments whilst at the same time giving as good an investment service as possible to our depositors and members.

We have lent on mortgage, chiefly of small properties, over £8½ million as compared with a little over £3 million in 1943 and a little over £2 million in 1942. The average amount per mortgage advance in the year under review was £618.

EXTRAVAGANT PRICES FOR HOUSES WITH VACANT POSSESSION

Your Directors are much concerned with regard to the extravagant prices which are being paid in most towns for houses with vacant possession, and have tried to avoid any action on their part which would tend to raise the price obtainable for a house beyond a sum which provides a fair and reasonable increase on its cost. With that end in view, instead of simply following the market price at the moment, we limit the advance on each house to a figure based on the pre-war value as well as on the present value.

Your directors are taking a great interest in alternative methods of construction of permanent houses.

Whilst the first houses to be built will no doubt be for letting and many of them erected by Local Authorities, it is important that in the provision of houses private enterprise should be encouraged from the earliest possible date because only those houses which are built by private enterprise will be available for purchase by those who want their own homes.

BRITISH INSULATED CABLES LIMITED

A GREAT WAR EFFORT

SIR ALEXANDER ROGER'S REVIEW

The annual general meeting of British Insulated Cables Limited will be held, on the 19th instant, in Liverpool.

The following is an extract from the statement of the chairman, Sir Alexander Roger, K.C.I.E., circulated with the report:—

Mainly as a result of changes in war-time demands during 1944, there have been further alterations in the types of our turnover and a relatively small decrease in total. These features, coupled with higher costs, have left trading profit lower by £43,054. As interest and dividends from subsidiary and general investments have increased by £19,159, the total profit for the year is down, on balance, by £23,895. After providing for a final distribution on the Ordinary capital at the same rates as for some years, there is left available £19,383, which, added to the balance brought forward from 1943, leaves £409,867 to be carried forward.

WIDELY DIVERSIFIED DEMANDS FROM THE SERVICES

Modern warfare involves the use of electricity to an ever-increasing degree, and vast quantities of such main products of your company as cables, insulated conductors, wires and various electrical components are required. Our production of cables and insulated conductors has been enormous, and for such widely diversified uses as in tele-communications, ships, aircraft, tanks and all other mechanical vehicles; in the equipment of munition plants and airfields, and in the maintenance and extension of essential electricity supply services. In addition to our ordinary construction department, we have maintained in this country a service organisation for the repair of cables and transmission lines damaged by enemy action.

From time to time we have also been called upon to meet new and changing Government demands, as, for example, in the days of the magnetic mine, when it became evident that only a full-scale introduction of de-gaussing cables would serve to protect our vital shipping, and when with the same object in view large quantities of a special type of buoyant cable were urgently required. In both cases the company went into immediate production and all the demands made upon it were met. I can now also inform you that the company supplied, at short notice, cable installations for the now famous Mulberry Ports.

ENORMOUS PRODUCTION OF INSULATED WIRES, CONDENSERS, ETC.

Our production of insulated wires has been astronomical; in five years approximately 18,000,000 miles have been supplied to the Services for use in electrical apparatus, instruments, mines and even dam-busters. The company has achieved an equally impressive output of condensers and other components for radio, telephone and telegraph equipment, aircraft navigating instruments, anti-submarine devices and mines; of moulded plastic products for service equipment; and of electric welding machines and magnetic moulding machines for munition factories. We have also produced large quantities of shell and bomb cases and a variety of shell bands, fuses and primers.

We shall continue to devote our maximum energies to work essential to the successful prosecution of the war, but with the prospect of an early victory, particularly in Europe, we are giving an increasing amount of thought to the post-war era. Plans cannot be finalised until uncertainty is removed, in particular as to the degree of controls in the future.

THE CUNARD STEAM SHIP COMPANY, LIMITED

SHIPBUILDING POSITION IMPROVED

SIR PERCY E. BATES'S REVIEW

The eighth ordinary general meeting of the Cunard Steam Ship Company, Limited, will be held at Cunard Building, Liverpool, on the 25th instant.

Sir Percy E. Bates, Bart., G.B.E. has issued the following statement, which has been forwarded to stockholders along with the report and accounts:—

In the profit and loss account, receipts for the year show little change, the small improvement being due to the clearing-up of some outstanding matters of earlier date. It is on the expenditure side where the main points of difference occur. While the taxation position is still obscure, it has not been thought necessary to make further special provision for taxation. This item absorbed £100,000 in 1943.

PENSION FUND

The other principal point arises out of the pension fund. The directors for some time past have had under consideration the position of the superannuation fund which was established in 1901, with a view to the possibility of restoring to some extent the reduction in pension benefits which began to operate in 1932.

At that time, which was prior to the merger of Cunard and White Star Atlantic interests, the company was forced to discontinue the supplementary annual payments that had been made to the fund since 1919 consequent upon the deficiency which had been disclosed in the Actuary's report. The effect of this was substantially to reduce the benefits to future annuitants. It also became necessary for the members to increase their annual contributions to the fund. The board felt that, in association with the board of the Cunard White Star, the time had arrived to bring about a partial reinstatement of the pension benefits. This has been done at a cost of £235,000. Of this sum £135,000 has been provided by the Cunard Company in the transfer to the superannuation fund of the actuarial surplus remaining in the widows' and children's benefit fund which was closed to new business in June, 1935. The remaining £100,000 has been provided in cash jointly by the Cunard Company and Cunard White Star in the correct actuarial proportion of £35,460 and £64,540 respectively.

PROFIT AND LOSS ACCOUNT

The profit and loss account has been charged with the £35,460 paid to the pension fund, but has been relieved of the necessity to repeat last year's special taxation provision of £100,000 and these are the main reasons for the improved balance of profit at £383,881 as compared with £312,127 for 1943.

BALANCE SHEET ITEMS

In the balance sheet on the credit side, the valuation of shares in subsidiary companies remains unchanged at £13,925,225. I repeat I think it is a safe figure. Our own ships and properties have borne their usual depreciation. The increase in "Loan and Balances due from Subsidiary Companies" reflects current business. Shares in other companies remain at £114,346, though the return at 3.45 per cent. is temporarily somewhat lower. Debtors, etc., are slightly higher, owing to the increase in our shipping business.

On the debit side the figures are unchanged down to the item "Deposits with the Company." The deposit by the Superannuation Fund has again been reduced by £50,000. Widows' and Children's Fund figure shows the effect of the transfer of the actuarial surplus (£135,000) to the trustees of the Superannuation Fund. Employees'

Savings Fund has been reduced by withdrawals and the total of the deposits of these various funds has been brought down from £434,520 to £240,047.

Creditors, etc., are decidedly higher at £896,368, partly because shipping operations have increased during the year and partly because at the date of the accounts the figure temporarily included the £135,000 being transferred from the Widows' and Children's Fund to the Superannuation Fund. This sum has since been paid by the company to the Superannuation Fund's trustees in cash.

Loans due to subsidiary companies remain unchanged; the lenders are 100 per cent. subsidiaries.

THE DIVIDEND

The final dividend we propose will absorb £139,256 10s. 6d., and if this is approved by the general meeting the carry-forward will be £305,829 14s. 3d., comparing with £198,332 13s. 6d. last year.

The company is now in a position to make a start at repaying indebtedness to His Majesty's Government, and the board has given formal notice to repay £100,000 of the Second Mortgage Debenture Stock on May 5, 1945.

QUESTION OF COMBINED BALANCE SHEET

I ought to mention that during the year further thought was given by the board to the question of producing a combined balance sheet for the group. By way of experiment, for some months we "combined" some of our domestic board financial returns, but after a few months we returned to our older practice. We came to the conclusion that the "combined" figures in our domestic returns were either misleading or at best meaningless. We shall continue to consider the subject, but my present opinion is that to "combine" figures of a 62 per cent. subsidiary with those of 100 per cent. subsidiaries will produce in a balance sheet a result quite as meaningless as it did in the board's domestic returns.

SHIPBUILDING POSITION

Since last year the shipbuilding position has changed greatly for the better and there are prospects that our companies will have more freedom to build their own types of ships. Estimated prices, however, are high and it has not been easy to secure firm prices even within wide limits of variation. I hope these difficulties may be overcome, or met in one way or another, as if they are not the shipbuilding programme of our group is bound to be limited by their existence.

As regards the air, our associates the Cunard White Star have been in touch with the Minister of Civil Aviation and also with the chairman of the B.O.A.C. I hope that the result may be satisfactory to the B.O.A.C. and to themselves. The situation is too fluid to warrant further comment at present. Perhaps I might add that on the North Atlantic the air should be directly complementary rather than competitive with the sea, and I think it will create its own travel numbers.

NO RELAXATION UNTIL JAPAN IS FINISHED

At the time of writing, the European half of our war seems to be drawing to a close, but we are already engaged heavily in the Asiatic half. That we shall switch all our effort to this other half is of course certain, for any other policy would mean that we would be doing less than we ought to be doing. That a cessation of hostilities in

Europe will mark the end of a phase is certain, but the next phase, though different, will still require all our energy and in more practical terms will, I think, still require the continuance of the present system of controls, Government trading and Government traffic. I look for no relaxation of the present system until after we have finished with Japan. To talk of our prospects in the post-war future is still very premature. One thing is quite certain; far too many rosy expectations have been allowed to grow. There is no pleasant loafing Saturday afternoon waiting just round the corner. On the contrary, we shall have to think hard and work hard just at a time when everybody's feelings will cry out for rest and relief. It is not, however, a future to shrink from, but one to accept as a challenge, and I look forward with confidence to the day when we and our associates can again go all out to book passengers and cargo ourselves.

As regards our company and its associates, all I need say is that I believe they are in good shape and in good heart. That this is possible is due to the untiring efforts of our sea and shore staffs, which have endured yet another year of war, loyally and whole-heartedly doing their duty.

SAN FRANCISCO MINES OF MEXICO, LIMITED

The thirty-second ordinary general meeting of this company was held, on the 5th instant in London, Mr. Cyrus T. Pott, the chairman, presiding.

The following is an extract from the chairman's statement which was circulated with the report and accounts, and was taken as read:—

In my statement last year I included a note of warning regarding the wide and rapid fluctuations in profitability of our business; the year 1943-44 now under review is an example. Compared with last year, our operating profit has been reduced from £734,000 to £314,000, or by over 55 per cent., and our net profit from £237,000 to £86,000, or by nearly 65 per cent. This reduction was mainly due to three causes—suspension of operations during most of June and July as a result of a strike of workmen, extensive flooding in September, and an unfavourable change in Mexican income-tax legislation.

ORE RESERVES

Had it not been for these three adverse factors we should have been able to place before you another satisfactory year. Our underground development continues to be encouraging and our ore reserves at September 30th, calculated on a new but more conservative basis, again exceeding 3,000,000 tons. Our mining and metallurgical results have further improved, while our costs, in spite of rising supply prices and higher wages, would have compared favourably with the previous year but for the strike and the flood.

Taking all trends and factors into consideration, I am inclined to think that prospects for the post-war marketing of our production are favourable. We certainly need some encouragement to set off the many onerous conditions with which operators have to contend in Mexico, where taxation is as great as anywhere else in the world. We now have some £2,000,000 tied up in unliquidated concentrates, which is substantially in excess of normal, and we are faced with the possibility that further funds may be required to carry over our unliquidated production until the railroad difficulties are overcome. Since the end of the year, large amounts have been paid for taxes. It is accordingly essential that we should conserve our remaining cash resources.

It is for this reason that the directors recommend that the dividend for the year should be limited to 6d. per unit, involving a distribution of £25,710, after allowing for British income-tax. Out of the remaining profits the directors have placed the sum of £50,000 to reserve for exploration and development.

The report and accounts were unanimously adopted.

ASSOCIATED ELECTRICAL INDUSTRIES, LIMITED

INCREASED PROFIT—STRONG POSITION

The forty-fifth annual general meeting of this company was held, on the 5th instant, in London, Lt.-Col. Sir John R. Chancellor, G.C.M.G., G.C.V.O., D.S.O., presiding.

The chairman, in the course of his speech, said: The proprietors will have noted with satisfaction the strength of the balance sheet, and particularly of the consolidated balance sheet.

The profit for the year was £703,400, that is after making full provision at current rates for all taxation payable in respect of the profits earned up to the 31st December, 1944. This compares with £695,266 for the previous year, an increase of £8,134. After charging £235,857, against £235,295, for depreciation of plant, etc., the net profit was £467,543, an increase of £7,248.

To the net profit of £467,543 has to be added £301,309, being the balance brought forward from the previous year, making a total amount to be dealt with of £768,852.

In regard to the provision for depreciation, as the proprietors will be aware, the accounts before you relate mainly to the Metropolitan-Vickers Electrical Company, and the provision of £235,857 for depreciation is in respect of that company. Depreciation provided by all the companies in the associated group (including the British Thomson-Houston Company's liberal provision) total £552,058.

Your directors felt that the special reserve account should be increased by a further appropriation from profits of £150,000, making this reserve account £650,000.

After providing for dividends on Preference stock £52,306, there remains £566,546. Your directors recommend a dividend on the Ordinary stock of 10 per cent. per annum, less tax, leaving a balance to be carried forward of £320,454, as compared with £301,309 brought in from the previous year.

RECORD OUTPUT

The output from the various factories of the group was greater than in any previous year, while the orders now in hand also constitute a record.

Practically the whole of our manufacturing facilities have been employed on Government work, either for various forms of war equipment by direct contracts or for electrical apparatus ordered under priorities sanctioned by the Government.

There are now over 65,000 persons employed by the A.E.I. group of companies, of whom approximately 42 per cent. are women.

We anticipate that for some time to come there will be no lack of orders and that we shall be fully employed on our normal products after the war comes to an end.

EQUIPMENT FOR THE FIGHTING SERVICES

So far back as 1936 the Metropolitan-Vickers Company began to assist the

Government in the development and manufacture of various forms of equipment for the fighting Services. Since then the scope and volume of that work has steadily grown. Full accounts of our contributions to the defence and war programme and of the achievements in this direction cannot yet be given, but it is now permissible to indicate the wide range that this work has covered.

The most notable of that company's contributions have been in connection with the development and manufacture of Radar equipment, automatic pilots, gun mountings and controls and aircraft. Some idea of the magnitude of this work can be gauged by the fact that during the period indicated it has been found necessary to increase our manufacturing floor space by more than 50 per cent.

The report and accounts were unanimously adopted.

AUTOMATIC TELEPHONE AND ELECTRIC COMPANY, LIMITED

"GEORGE" AND OTHER AIRCRAFT EQUIPMENT

The 25th ordinary general meeting of the Automatic Telephone and Electric Company, Limited, will be held at Liverpool on the 19th instant.

The following is an extract from the statement of the chairman, Sir Alexander Roger, K.C.I.E., circulated with the report:—The profit on trading is £279,206, compared with £255,437, and net profit is £226,678, compared with £212,312. The directors recommend a final dividend of 7 per cent. on the ordinary stock, making 10 per cent. for the year, plus a cash bonus of 2½ per cent., and a dividend of 10 per cent. on the deferred stock and shares plus a bonus of 2½ per cent., all subject to tax.

You will have noticed during February the release of details regarding the Distant Reading Compass which, by combining the advantages of the gyroscope with those of the magnetic compass needle, has provided a degree of reliability and adaptability under operational conditions which has proved a tremendous factor in the success of bombing. This amazing aid to air navigation was designed for mass production by your company. Among other items are the Automatic Pilot known affectionately as "George," aircraft radio, Piezo Crystals, aircraft wiring and many other forms of electrical equipment.

Due to E.P.T. the sum available for dividends and reserves has not increased to any great extent. This is symptomatic of British industry and illustrates the heavy financial burdens which have to be carried. I, with chairmen of other companies, have been expressing the urgency of a re-examination of our taxation structure if British industry is not to find itself at a financial disadvantage vis-à-vis its overseas competitors. Investors in industrial concerns, in addition to being themselves more heavily taxed, have not generally speaking drawn increased dividends commensurate with the rate by which wages have increased.

JAMES W. COOK AND COMPANY, LIMITED

Presiding, on the 5th instant, at the annual meeting of this Company, held in London, Mr W. J. Clarke, chairman and managing director, said he was glad to be able to present accounts showing another year of profitable trading. Their chief road haulage concerns were taken over under the Ministry of War Transport scheme for haulage, and the profit figure had not yet been finally settled. Subject to the limitations imposed by an acute shortage of labour, they had been very busy right through the year at their wharves in London with a constant flow of traffic inwards.

They had been busy also with their lighters on the Thames and Humber throughout the year, and while they were glad to know that some of their craft were converted for use on "D" day, yet they would be very glad to have the use of them back again under their own control.

The road transport industry had served and was serving the community more and more so splendidly that he could not understand the genuineness of the attacks appearing in the Press from time to time against it. It would be a sorry day for the country if unjust legislation ever treated the industry unfairly.

The report was unanimously adopted, and a final dividend of 7½ per cent., making 10 per cent. for the year, together with a bonus of 2½ per cent., was declared.

JOHN BARKER AND COMPANY, LIMITED

DEARTH OF SUPPLIES

The fifty-second ordinary general meeting of this company was held on the 11th instant at Kensington.

Mr Trevor A. Bowen, D.L.N.P. (chairman and joint managing director), said that trading conditions throughout the year under review had continued to be very trying, especially in regard to the acute shortage of staff. The imposition of fixed and ceiling prices had seriously affected the rate and the amount of gross profit and, but for the firm rein upon overheads and expenses in general, the net profit might have been considerably less.

With regard to the immediate future, it became increasingly evident that the main problem must centre largely not around the question of selling goods, but on the grave difficulty of replacing diminishing supplies. The authorities should expedite the release of raw materials and essential labour if the interests of the home market were to be met, and the hoped for recovery of export trade set going.

The final result of the year's trading was a profit, before charging taxation, of £589,835 as against £550,626, an increase of £39,209. The directors recommend a dividend of 10 per cent. on the ordinary shares, less tax.

The report was adopted.

FINANCE AND BANKING

THE MONEY MARKET.—After raising the market bid a penny in the previous week, discount houses reverted to £99 14s. 11d. in tendering for this week's £110 million of Treasury Bills. A higher rate of discount was secured only at the cost of seeing the market quota drop from 30 per cent. to 20 per cent., a result partly attributable to the rise of £10 million in total applications. The banks' obligations for TDR's were also down on the week with the new issue of £120 million involving about £35 million of "fresh" money. This proved rather more difficult to find than had been anticipated and, at the beginning of the week, credit was anything but easy. The Discount Market managed to scrape through, however, without any assistance from the Special Buyer, and by Wednesday, Bankers' Deposits as shown in the Bank Return, had recovered to within £3½ million of the level of the Wednesday before.

A rather larger demand for bills by the banks was encountered this week. A fair business in May maturities was reported and some early Junes also changed hands. The Bank Return also shows that the peak of note requirements for Easter has now been passed. There was a net return of £1.6 million of notes last week. This, however, is little more than half the amount returned in the week following Easter last year and, unless the withdrawal of the notes of the larger denominations at the end

of the month exerts a strong downward pressure, a further increase in the fiduciary issue cannot be long delayed.

MONEY RATES, LONDON.—The following rates remained unchanged between April 5th and April 12th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, 1%. Discount deposit at call 1½%: at notice, 2%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between April 5th and April 12th. (Figures in brackets are par of exchange).

United States. \$ (4/8½) 4/02½-03½; mail transfers 4/02½-03½. Canada. \$ (4/8½) 4/43-47; mail transfers 4/43-47½. Switzerland. Francs (25/22½) 17/30-40. French Empire. Francs 1939-200½. ROYAL BANK OF CANADA

DIVIDEND NO. 231

Notice is hereby given that a DIVIDEND of 1½ per cent., being at the rate of 6 per cent. per annum, upon the paid-up Capital Stock of the Bank has been declared for the three months ending 31st May, 1945, and will be PAYABLE at the Bank and its branches on and after 1st June, 1945, to shareholders of record 30th April, 1945.

By Order of the Board,

E. B. MCINERNEY, London Manager.
6 Lothbury, London, E.C. 2. 12th April, 1945.

MARKET-RESEARCH. Economist, early thirties, with experience in market-research and knowledge of continental languages (including German and some French) seeks appointment.—Box 64, The Economist, Brettenham House, Lancaster Place, London, W.C. 2.

EXPORT MARKETS. British Belting and Asbestos, Ltd., established 1822, manufacturers of asbestos textiles packing and jointing, friction fabrics for automotive and industrial applications, and machinery belting, with extensive and long-established connections throughout the world, invite applications from British manufacturers of allied but non-competitive products with a view to co-operation in the sale of their goods abroad. This invitation should be of particular interest to firms who wish to enter the Export market for the first time or to improve their existing selling organisation overseas. All replies will be treated confidentially. Replies to: Export Manager, British Belting and Asbestos, Ltd., Scandinavia Mills, Cleckheaton, Yorkshire.

EXPORT. British business man, accomplished linguist, with extensive experience introduction Engineering, Technical and Non-Technical products in 60 personally travelled markets and first-class credentials, offers consulting or executive service to concern or group requiring practical aid in developing Export arrangements and connections.—Write Box 63, The Economist, Brettenham House, Lancaster Place, London, W.C. 2.

GOVERNMENT RETURNS

For the week ended April 7, 1945, total ordinary revenue was £39,178,000, against ordinary expenditure of £98,164,000 and issues to sinking funds of £76,993. Thus, including sinking fund allocations £76,993, the deficit accrued since April 1st is £59,063,000 against £60,665,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £710,018 to £3,210,865, the other operations for the week (no longer shown separately) increased the gross National Debt by £61,093,727 to £22,477 million.

Trade Disputes.—The number of working days lost in February was 60,000, compared with 104,000 in January, and 273,000 in February, 1944. There were 153 stoppages compared with 178 in January and 250 the year before. The number of workpeople involved was 26,800 in February compared with 32,600 in January and 105,300 in February, 1944.

"The Economist" Sensitive Price Index.—A slight rise in the price of wheat on April 5th raised the index (1935 = 100) from 161.3 to 161.4. The crops index, however, remained unchanged at 140.3, and raw materials at 185.5. There was no other change in the week ended April 10th.

H. J. FLEWITT, Secretary.Offices: Cunard Building, Liverpool.
12th April, 1945.

THE ARGENTINE MARKET

A PARTNER of Berg and Co., one of the leading Advertising
Agents and Business Consultants in the Argentine, is at present
in England, and within the limits of his service duties would be
glad to call on firms interested in this market. Berg and Co.
has been handling the advertising of important British concerns
in the Argentine for many years, and is at the disposal of firms
who are considering entering this market or increasing their
present activities. Please write E. A. Rumbold, River Plate
Volunteers Committee, 7, Finsbury Circus, London, E.C.1, or
direct to Berg and Co., Avenida de Mayo, 1480, Buenos Aires,
Argentine.THE HISTORY OF A BUSINESS, especially on the occasion
of an anniversary, interests shareholders, associates, em-
ployees and, frequently, a wider public. Research into archives
and subsequent literary treatment require expert handling.
Write Box 62, The Economist, Brettenham House, Lancaster
Place, London, W.C.2.MARKETING MANAGER required for important executive
position with large nationally known firm of Chocolate
Manufacturers in Southern England. Permanent appointment
with unlimited prospects for the right man, whose past record
will show he has the following qualifications: wide knowledge
and experience of advertising and sales promotion, market
research and assessment, forward sales budgeting. Ability to
plan and develop distribution channels, to create and expand
consumer demand, to forecast general economic conditions and
their effect on sales. Write, giving full details of experience and
salary expected, to Box 6A, The Economist, Brettenham House,
Lancaster Place, London, W.C.2.

Two Presidents

IT would be difficult to find hyperbole strong enough
to exaggerate the sense of loss felt all over the free
world at the sudden news of President Roosevelt's death.
Never before for a statesman of another country and
rarely for one of our own leaders have the outward
pomp of ceremonial mourning and also the inward and
personal lamentation of the public been more universal
and heartfelt. In part, this has been a tribute of gratitude
to one who was a very present help in trouble. No English-
man who lived through those twelve dreadful months
from June 1940 to June 1941 is ever likely to forget how
completely the nation's hope for ultimate victory rested on
that buoyant figure in the White House, and how, stage
by stage, the hopes found response in action.

But gratitude for past favours, even in so recent a
crisis, would not by itself explain a feeling of bewildered
loss in the present. As Strachey wrote of Queen Victoria's
death, "it appeared as if some monstrous reversal of the
course of nature" had taken place. Mr Roosevelt had not
been in the White House for 63 years, but it costs an effort
of memory to set the mind back to the time of President
Hoover. "An indissoluble part of the whole scheme of
things" has gone, and one is left wondering what is going
to happen now. We have learnt, in Mr Roosevelt's years
in office, to appreciate how much of our own safety and

welfare depend upon the American colossus. To the
average Englishman, it is a friendly monster, but an
erratic and unpredictable one. Mr Roosevelt had mastered
the art of managing the unmanageable. Through all the
shoals of American politics, with constant tacking in the
varying winds, blown sometimes a long way off course
—nevertheless, this master pilot had demonstrated his
ability to bring the vessel into port, sometimes only just
in time, it is true, often with much argument among the
crew, but never failing. With him at the head of affairs,
it was possible to feel sure that, in the end, sound policy
would prevail. Now that he is gone, one of the few
elements of assurance in an uncertain world has gone with
him.

After all that has been written of him in the past week,
it would be foolish to try to say anything new or different.
He had his defects; he was too good a politician to be a
skilful administrator, and too good a fighter to conciliate
the nation into complete unity behind his leadership. But
when everything that can be said against him is said to
the full, he remains a very great man and a very great
President. Bismarck once remarked (with some insulting
addenda) that a special providence seemed to watch over
the United States of America, and there is certainly some-
thing remarkable about the regularity with which the

great crises of the Republic not only produce the man but find him ready waiting in office. Washington in the crisis of the nation's birth, Lincoln in the agony of its civil war, Wilson in the first great adventure into world politics, Franklin Roosevelt in the double crisis of depression and war—it is a noble quartette, and the last name is not the least. Indeed, the most striking thing about Franklin Roosevelt was the sense of great purpose that hung about him. It was no accident that found him taking office on the very day the banks closed, or that found him steadily leading the nation to a firm view of its obligations in a world crisis. Friends of the Roosevelt family relate that in the early 1920s, when he had first been ignominiously defeated in his Vice-Presidential candidacy and then been stricken with infantile paralysis, when nothing seemed to be in front of him but the life of an invalid country gentleman, that even then, from his wheel-chair, he prophesied that another great crisis was coming for America and the world, a crisis that could be surmounted only by a strong President pursuing a firm liberal policy, and that he, Franklin Roosevelt the cripple, was to be the man. He died with his purpose unachieved; but the trumpets that sounded for him as he passed over were those of the victory that brings his purpose within reach.

The eyes of the world are now on President Truman. By one of those extraordinary accidents that can happen only in America, there succeeds to the world's best-known man one of the world's least-known men. Although, as has been said, only a single heart-beat separates every Vice-President from the greatest office in the world, his qualifications for holding that office rarely, if ever, enter into the reasons that the nominating convention has for its choice. Vice-Presidents are chosen as political make-weights to collect a few votes or (more often) to avoid losing them, and they are almost always obscure figures when they are suddenly thrust into the limelight. Only one of them has ever gone on to make a President of the front rank, but also only one of them has been a failure. Mr Truman's career provides even less evidence than usual on which a view can be taken of his probable course in the White House. Unlike Mr Roosevelt's first Vice-President, Mr Garner, he is not a politician of long experience. Unlike Mr Roosevelt's second Vice-President, Mr Wallace, he is not a man to whom definite opinions have attached themselves. His Senatorial record is "regular," but there is little to show whether his votes for Mr Roosevelt's policies were given out of loyalty or out of conviction. To judge by his friends, his views, on economic and social questions at least, are slightly to the Right of Mr Roosevelt's. He is, in short, a man of the dead centre.

President Truman starts with the maximum of goodwill. In part this is the natural sympathy with an unassuming man on whom gigantic responsibilities are suddenly thrust. But the same sympathy would not have been accorded, at least on Capitol Hill, had it been Mr Wallace and not Mr Truman who succeeded. Mr Truman has the advantages of a man who, until a few weeks ago, was a respected member of the Senate. He starts with the confidence of Congress. But this very advantage may be a handicap. A President who would pursue positive policies is bound, almost by constitutional definition, to come into conflict with the jealousies of Congress, which always (and never more than now) considers itself a co-equal in framing the policies of the Government. The continued goodwill of Congress can, indeed, be purchased, but at a heavy price, and the President who, in the effort to retain its favours, makes himself the passive object of Congressional pressures, rather than their author and master, runs the risk of finding himself entirely deprived of the initiative. This is likely to emerge most clearly in the realm of economic policy. Mr Roosevelt has already had to depart a long way from the earlier objectives of the New Deal as part of the price to be paid for a high degree of unity in foreign policy, and it was an open question whether he would be able, in the reconstruction period, to reinstate a deliberate policy of economic management against the opposition of half of his own

party and the whole of the Republicans. The prospects of a consistent economic policy must now inevitably be rated lower. In fact, the greatest danger of the next four years is not a departure from Mr Roosevelt's policies, the new President's reaffirmation of which has been emphatic and sincere, but their slow decline into ineffectiveness.

In determining whether this danger will be avoided, much will obviously depend on Mr Truman's choice of persons. Mr Roosevelt's Cabinet was the Cabinet of a strong-minded and very experienced President, and if a less self-assured and seasoned man sits in the White House, a very different team is required. Nowhere are the different requirements more obvious than at the State Department, where Mr Stettinius—it is not said to his discredit—executed a policy which the President himself supervised in detail. It is already known that Mr Truman's main reliance in foreign affairs will be on Mr James Byrnes, though it is not yet known whether he will succeed Mr Stettinius in formal office or be interposed between him and Mr Truman as an unofficial Assistant President.

Mr Byrnes has been an intimate collaborator of Mr Roosevelt, though his special province has been in economic stabilisation on the home front. Perhaps the main significance of his new responsibilities lies in the fact that he replaces Mr Harry Hopkins who, without any formal office, has in fact acted as Mr Roosevelt's most intimate adviser on foreign affairs. The services that Mr Hopkins has rendered to the cause of the United Nations will some day be seen in their true dimensions. He has been a particularly good friend of the British Government, not only as a ready channel to the seat of authority but as a sympathetic pleader of their cause.

Mr Byrnes is a man of judgment and experience; the sincerity of his attachment to Mr Roosevelt's policies is unquestioned, and his influence on the foreign policy of the United States will be liberal and far-sighted. But it is impossible not to fear that his substitution for Mr Hopkins in the intimate counsels of the President will be a reinforcement to the more nationalist trend of American policy that has already been in evidence in recent months. It is not without significance, for example, that the recent dispute over the distribution of meat supplies largely resolves itself, at the highest level, into a contest between Mr Hopkins, arguing for more meat for Europe, and Mr Byrnes, arguing for more meat for America. This tendency may well be reinforced by the greater independence that the Army may be expected to enjoy. The Army, in the American system, is responsible to its Commander-in-Chief, the President, but not—or at least not so much as the British Army—to the civilian government as a whole. With a less forceful control from the top, the Army is likely to feel more free to pursue its own policies within what it considers to be its own sphere, which impinges on foreign policy at innumerable points.

These are some of the apprehensions that the change of President awakens in this country. To voice them thus frankly may be thought an injustice to President Truman, an attempt to judge him before the evidence is presented. But to have no apprehensions would be an injustice to President Roosevelt, an attempt to pretend that after twelve years of a great Presidency, his passing makes no difference. The American system places heavy premium on opposition and dissension and large obstacles in the way of effective policy-making. The centrifugal force are so strong that it needs a very masterful hand to keep them in check and it is only natural that the removal of so strong a hand should lead, over the months, to certain diffusion of purpose—the more so since Mr Roosevelt's death coincided so closely with the disappearance in victory of the greatest reason for unity. It is no irony to Mr Truman to suppose that he is a good or any President. The gulf between the normal flow of affairs and the purposeful course into which they have been directed by inspired leadership is a measure of the loss that America and the wider world have sustained.

Subsidy Policy

ONE important matter to which the Chancellor of the Exchequer will certainly address himself in his Budget speech on Tuesday is the mounting volume of subsidies in aid of the price of food and other constituents of the cost of living. The annual burden of these subsidies has risen from £70 million in 1940 and £140 million in 1941, when the stabilisation of the cost of living was adopted as a deliberate policy, to £190 million in 1943 and to a present figure of about £225 million, or fully a quarter of the whole pre-war Budget. There can be no question of abandoning the policy at this moment; the Government is pledged to the contrary—on the significant condition that they have "the vital co-operation of all sections of the people"—and the pledge covers the period of transition as well as the war itself. But that does not mean that the policy raises no questions or doubts about the limits within which it can be pursued. Nor does it inhibit enquiry into the longer-term prospect. Will it ever be possible to get rid of these subsidies? And if not, how do they complicate the fiscal outlook?

The amount of information that has been made public about these subsidies is tantalisingly small. In 1943, when their cost was £190 million and the cost of living index stood at 29 per cent above pre-war, the Chancellor said that their removal would raise it to 45 per cent above 1939. The official index is now 30½ per cent above the pre-war figure, and a simple proportion sum would seem to indicate that, but for the subsidies, the cost of living would now be about 50 per cent above pre-war—that is, about 15 per cent above the present level. For forming a judgment on the policy the probable future trend of these figures is more important than their present level. Some rises in the unsubsidised constituents of the cost of living index are to be expected. There is some tendency for the cost of clothing to rise. Rents cannot for ever be kept down to the 1939 level when everything else has gone up, and the report of the Ridley Committee, which is expected almost at once, may be the signal for an increase. It might well be that, without any change in the subsidy policy, the index will by the end of this year have risen to the 35 per cent above the pre-war level that is the upper limit of the present permitted range.

As for the articles that are now subsidised, there are conflicting influences at work. On the one hand, the end of the war would mean a substantial reduction in freights on imported foodstuffs and the disappearance of war risks insurance. On the other hand, the latest increase in agricultural wages, reflected in the prices paid for home-grown food, will require an increase in subsidy payments. Moreover, the cost of American food, obtained on Lend-Lease terms, has been entered for accounting purposes at the prices of 1941, which are well below the present market level in America and an increased subsidy will be necessary when this food has once again to be paid for at market price. Again, it is reasonable to hope that larger supplies of the subsidised foodstuffs will soon be available, which will involve higher payments. Only those in possession of the full facts can put quantitative magnitudes on these various factors. The net result, however, may well be that, on the basis of factors already visible, apart from any others that have not yet materialised, the total cost of subsidies in 1945 will be as much above 1944 as 1944 itself was above 1943—that is, that there will be a further increase of about £35 million, or more if (as is not unlikely) there is a rise in world food prices, now kept down only by purchasing controls that may well be too rigorous to be maintained in peace-time. This would mean that, in the absence of subsidies, the cost of living would rise to nearly 60 per cent above 1939. Clearly, this rapid upward progression cannot be allowed to continue indefinitely, and some difficult decisions will have to be taken. Even if no pledge had been given, it would be very foolish to abandon the policy

of stabilisation now. To judge by the experience of the last war, as well as by ordinary observation, the danger of inflation will be greater in the first twelve months after the end of the German war than in any other period. This will be a time when purchasing power will be pressing against supplies with an impatient intensity. There will, in any case, be a movement for wage increases. The patriotic restraint on the trade unions will inevitably be weakened. Overtime and bonus payments will be falling, and the unions will think it natural to ask for such increases in basic rates of wages as will prevent any fall in what the Americans so graphically describe as "take-home pay." If at this time there were to be a removal of subsidies and a rise, from this cause alone, of about one-fifth in the cost of living, the impetus to the inflationary spiral of wages and prices might be disastrously large. The cost of the subsidies cannot be ignored; but an addition of £250 million to the deficit is likely, in this period, to be much less harmful than the addition of the same figure to consumers' costs.

This does not, however, mean that the Chancellor can afford to sign a blank cheque. Nobody can now say how powerful the other impulses to inflation will be; but they may obviously be strong. Sir John Anderson has made the limits of the policy very clear.

When wage costs . . . as far as not offset by increased output, . . . have raised the actual cost of vital commodities, and when it is known to the whole country that costs of production are being still further increased by increases of wages, the stabilisation policy would become an altogether artificial affair if we were to attempt to mask these developments by making arbitrary reductions in the prices of other articles in order to maintain the level of the cost-of-living index unchanged.

The path of wisdom may be to fix an upper limit to the total cost of the subsidies that will be provided—say at the present figure of £225 million or a little higher—and to allow any further increases in wages or other costs to have their normal effect on retail prices. This would be desirable, not merely from the financial point of view, but for wider reasons. The trade unions cannot be expected to exercise due responsibility if the idea gets about that higher wages will be paid out of the bottomless public purse instead of by the ordinary consumer. The effect of allowing any such notion to become prevalent can be very clearly seen in agriculture and it is essential that the normal sequence of economic cause and effect should be restored in that industry rather than that make-believe should be extended to others.

To argue that the subsidies should be retained during the transitional period is to bow to expediency. In the longer run, a more deliberate policy will have to be evolved. This, unfortunately, is not an easy task because of the complex of varying purposes that are served by the present subsidies. At least four distinct objects can be distinguished. First, there is the desire to keep prices to the British consumer below the level that would be dictated by conditions in the world market. The justification of an attempt to do so in wartime is that the heavy freights and insurance charges and the high prices of food in the countries of origin are temporary phenomena, which will disappear when the war is over. Any attempt to maintain a permanent disparity would introduce an unnecessary distortion into the economic structure. If the internal and external price levels are out of adjustment, the appropriate remedy is a movement of the rate of exchange.

The second object is to pay the British farmer higher prices than the British consumer is deemed to be able to afford. This undoubtedly accounts for the greater part of the total cost of subsidies. Approximately two-thirds of the total of £225 million is now probably required in

connection with domestic production. That does not necessarily imply that "farmers' subsidies" cost as much as £150 million. It is not easy in wartime, when there is no free market to serve as a standard, to define when a payment is a subsidy to the producer and when it is a subsidy to the consumer, but the cost of recouping the British farmer for the difference between his present prices and the prices at which foodstuffs will be available on the world market—when a world market exists once again—will probably continue to be very heavy. That there should be a policy of assistance to the British farmer is now generally agreed, and it is certainly preferable that the cost of the assistance should be borne by the general Budget than that it should be added to the retail cost of food. But it would need very serious consideration indeed before it could be decided, as a permanent policy, to provide subsidies for the industry amounting to anything like the present cost. And in any case, any sums provided for this purpose should appear on the Ministry of Agriculture's Vote, not as part of a general subsidy programme.

The third purpose of subsidies is to stimulate some forms of consumption at the expense of others. The clearest example of this is the milk scheme, which, in part, antedates the war and obviously is not pursued solely for cost-of-living reasons. Such a policy has many theoretical attractions. It could be argued that even the present inflated total of subsidies costs only about one-fifth of the yield of indirect taxation. Why should not these taxes, when the time for post-war reductions comes, be kept at a level slightly higher than would otherwise be determined, in order to pay for a nutrition policy, thus making luxuries pay for assistance to necessities? The difficulty about this argument is that, like so many, it assumes that there will be a lot of taxable capacity to spare in post-war Britain. The point of diminishing returns in the yield of indirect taxation is much lower in peacetime than in wartime, and if the Chancellor of the Exchequer has not only to find large sums for keeping

the prices paid to the British farmer above the market level but further large sums for keeping some of the prices paid by the consumer below the market level, his task may be impossible. Some nutrition policy there should be, but in the next few years it cannot be very large.

The last purpose of the subsidies is, pragmatically, the most important—to obviate a sudden and damaging rise in wage-rates. It is hardly possible that this could become a permanent policy. For one thing, it would be progressively more expensive, since it encourages employers and employees to combine against the Exchequer. And for another, it is unlikely that the unions would for long be content with such a very artificial definition as is involved in any policy based on the present official index of the cost of living. On the other hand, it will always be an awkward thing to abandon the policy. There is a double justification for waiting upon events. Nobody yet knows what will happen to prices in general, and it is always possible that they might fall back to the level of those that are now subsidised. And, though all times will be awkward, none could be worse than the present. But it will not be possible to wait indefinitely, at a cost of £225 million or more a year. Eventually the cost of living will have to be allowed gradually to find its own level in relation to wages and other prices.

The conclusion reached by this analysis is thus not very encouraging to the Chancellor of the Exchequer, even in his long-term calculations. It is probable that quite large sums will have to be spent on subsidies in respect of food. The permanent needs, however, do not arise from the necessities of price stabilisation which gave birth to the policy but rather from agricultural and nutrition policy. It would be a great gain to clear thinking if these two parts of the general expenditure now lumped together as "subsidies" could be separated out and shown under their proper heads. It would then at least be possible to form an accurate idea of the dimensions of the problem.

San Francisco

ON Wednesday next, April 25th, the representatives of forty-six nations will assemble at San Francisco to lay the foundations of a new World Organisation. The proposed statutes of the World Organisation are known. They were embodied in the Dumbarton Oaks scheme, and at Yalta the Big Three agreed on the voting procedure in the Security Council, on which no agreement had been reached at Dumbarton Oaks. Since it was published, the scheme for the new World Organisation has been submitted to a lively and world-wide discussion, in which the views of its defenders and of its critics have crystallized. The debates at San Francisco will crown the discussion; and, if all goes well, they will end in the foundation of the new World Organisation.

The striking thing about the Dumbarton Oaks scheme is how studiously it avoids all reference to its predecessor. Even its name has been abolished. The new body will be a World Organisation or a General International Organisation or, alternatively, the United Nations; but not—God forbid—a League of Nations. Its statutes are a Charter and not a Covenant. It is as if the memory of the old League and of its failures had haunted the authors of the Dumbarton Oaks scheme and as if they had been almost superstitiously anxious to avoid the repetition of fatal names lest it should bring misfortune upon their creation. Yet, whatever the terminological changes and the modifications of machinery the new Organisation is at best likely to be a reproduction of the old League with some of its good points and most of its weaknesses.

The League was a loose international organisation of sovereign states. The World Organisation will hardly differ from its predecessor in this respect. The Dumbarton Oaks scheme provides neither for a federation nor for a

confederation but merely for a League of its member states, none of which is asked to forgo any of the essential attributes of national sovereignty. This is the fundamental fact that is bound to determine the outlook of the Organisation and to limit its freedom of action. The old League pretended to be able to settle the quarrels of Great Powers, but it could not do so in fact; the new League does not even pretend—it is a greater difference in appearance than in fact. So long as the Great Powers do not quarrel, the new Organisation will be able to prevent minor wars, to smooth out conflicts between its members and to perform quite a lot of that useful work which the agencies of the old League used to perform. It is perhaps better that these limitations should be realised right from the beginning; and that those dangerous illusions of a millenium of peace that stood at the cradle of the old League should not greet the birth of the new League. Unfortunately, this is not universally recognised. Lord Templewood tabled a motion in the House of Lords on Tuesday in the following terms:

That the San Francisco Conference provides an unique opportunity for laying the foundations of a system of international peace, for re-establishing the moral and material standards of civilised life, and for safeguarding the individual liberties of the common man without which he will be unable to live his life free from fear and want.

Having set his sights sky-high, Lord Templewood went on bitterly to complain that the Dumbarton Oaks scheme did not meet his expectations. Lord Darnley drove even deeper into Dreamland when he called for nothing less than "a new kind of peace charter which would abolish the status quo created by the last war and by this war and all wars in the past" when he, in other words, prayed

for a miraculous obliteration of all the miseries of History by the San Francisco Conference. These are, of course, only some of the extreme essays in Utopia. But it is necessary to realise that even much less naive aspirations such as Mr Attlee's hope for "a universal, flexible and enduring organisation for peace," are in the long run more likely than not to be frustrated by an organisation based on the unrestrained sovereignty of its members. Unquestionably, there could be many much better schemes of international organisation than that drawn up at Dumbarton Oaks. But none of them would be practical in present circumstances, since none of them would be accepted by the major allies. Even if Great Britain were prepared to surrender its sovereignty, practical policy must allow for the attitudes of America and Russia, the one combining generalised idealism with insistence on unimpaired sovereignty, the other combining cynical realism with the same insistence. It is some close variant of Dumbarton Oaks or nothing.

The differences between the old League and the new do not arise from any change in the underlying principle, common to both of them, of respect for national sovereignty, but from the changing interpretation of sovereignty as applied to great and small states. There is an unresolved conflict between equality in law and inequality in fact, between equality in status and inequality in power. From this conflict flow most of the arguments about the proposed Charter, and the major embarrassments of the Conference will come from the same source. On the one hand, the new Charter, like the old Covenant, proclaims the "sovereign equality" of all nations. Nor is this simply lip-service; the principle does enshrine something that is basic to the democratic faith. But on the other hand, when it comes to the enforcement of peace by military means, it simply is not possible to proceed on a basis of equality. After the first world war, the extreme inequality of nations was still partly obscured; it was still possible to believe in that version of "collective security" which held that a number of small powers could be the collective masters of one great power. The world had not experienced anything like the wholesale slaughter of the sovereignties of small and medium nations by one conqueror that has been seen in the past few years.

It would be unrealistic in the extreme to write the clauses of the new Charter that deal with the use of force as if nothing had happened since 1919. But though sovereignty has been assaulted all over the world, it has never been willingly surrendered. The doctrine still holds, and the San Francisco Conference itself, assembled to ratify the new inequality of power, is perforce held on a basis of equality of status. It is, no doubt, illogical to say that sovereignty, which by definition is total and all-embracing, is equal when some matters are under consideration but unequal in other respects. But that is the

state the world is in to-day. The smaller powers who are so much up in arms against the inequalities of the scheme will find at San Francisco that the choice is between an illogical scheme or no scheme at all. In theory, the Conference is free to modify the Dumbarton Oaks proposals in any way it may decide. This may be the real attitude of the American and British Governments. But it is at least doubtful whether the Soviet Government is equally willing to accept amendments. The Russians have so far tended to treat the Dumbarton Oaks scheme and the Yalta decisions as something that the other nations must approach on a "take it or leave it" basis.

*

Most of the discussion has turned on the provision in the Dumbarton Oaks scheme for a veto on sanctions. But, contrary to the prevalent belief, the authors of Dumbarton Oaks did not invent the veto. It is in the League Covenant, and in a far wider form since, under the Covenant, any state, great or small, could veto the application of sanctions. The only way in which the new scheme extends the veto right is that a Great Power is now to be able to veto sanctions against itself. In every other respect, the veto power is more restricted. Nobody would contend that an extension of the right of veto to the small nations, that is, a return to the Geneva practice, would be an improvement on the Dumbarton Oaks scheme. On the other hand, the abolition of all right of veto, even for the Great Powers and the submission of each Great Power to any verdicts directed against it would require a much greater willingness to renounce national sovereignty than any Power shows at present. It is not as if the conduct of a Great Power cannot be impeached before the world forum. The Security Council is free to recommend action short of sanctions, even against a Great Power which is a party to a dispute, by a majority of 7 votes out of 11; and the Great Power that is a party to the dispute cannot vote in its own case. The right of veto comes into play only when a dispute has reached the stage when sanctions are proposed. The preponderance of the Great Powers in the Security Council is therefore not quite so complete as the critics say. But the fact remains that it is strong enough to protect any Great Power against sanctions, while the small states must submit to all verdicts and sanctions agreed upon by a majority of the Security Council. This is the great grievance of the small nations. But the rigour of this provision may be mitigated by the fact that the majority which is entitled to decide on sanctions against a small nation must apparently include the votes of the permanent members of the Security Council. In other words, sanctions against a small nation cannot be adopted unless they have the approval of all the Great Powers plus two small or medium powers. For a small power to engage in aggression without the patronage of a Great Power is a very rare event—and an act of folly that deserves the sharpest rebuke.

My Trustee

There is an intimacy and confidence expressed in this phrase. Can a corporate body create the same atmosphere? The answer is that it does and with the added advantage that it concentrates on every duty a specialised experience and that it ensures continuity of management from beginning to end.

The Royal Exchange Assurance will be pleased to act as the Executor and Trustee of your will, either alone or under a joint appointment with your personal Trustee. Your own solicitor can be retained. The fees are moderate and full particulars can be obtained from the Manager of the Trustee Department.

ROYAL EXCHANGE ASSURANCE,
Royal Exchange, London, E.C.3.

In the discussion on the Dumbarton Oaks scheme the whole limelight has been turned on the Security Council. The rôle and the functions of the General Assembly, of the International Court of Justice and of the Economic and Social Council have aroused much less passionate controversy. This is partly to be explained by the fact that all these agencies of the World Organisation will, in effect, exist in the shadow of the Security Council; and that their rôles will be secondary. The picture of the General Assembly is still rather shadowy, as befits the embodiment of the unreal principle of the "sovereign equality" of all nations, where each member (from Nicaragua and Siam to the Ukraine and White Russia?) has an equal vote. But equality in the Assembly looks very much like equality in impotence. The Assembly may discuss and consider a very wide range of subjects, more often than not only on the recommendation of the Security Council. "The General Assembly should not on its own initiative make recommendations on any matter relating to the maintenance of international peace and security which is being dealt with by the Security Council." The rare occasions on which the Assembly is to exercise some more real functions are the elections of non-permanent members to the Security Council and of the judges of the International Court of Justice. Another Cinderella of the Dumbarton Oaks scheme is the Economic and Social Council, whose functions are rather ill defined. In this body too, the principle of "sovereign equality" reigns supreme, which may well mean that the Council will have little scope for real action. It is not clear whether such international Agencies as the Monetary

Fund or the Bank for Reconstruction will in any way be linked up with the Council. These are some of the loose ends of the Dumbarton Oaks scheme which may perhaps be gradually tied up later on.

It is difficult not to yield to cynicism in contemplating the proposed new world organisation. The old League Covenant had a famous "gap" which the lawyers strove hard to close; but the new League is full of the most obvious gaps. Yet the cynicism is misplaced if it is directed against the scheme, when its proper object is the present state of international relations—the Russians have a saying: "Do not smash the mirror because it shows that your face is ugly." The Dumbarton Oaks scheme is a painstaking attempt to capture, and set down in formal procedures, just as much willingness to accept the rule of international law as in fact exists. It is pitifully small, but nothing larger would be likely to pass the scrutiny of the Kremlin and the Capitol. And it is surely better to have the attainable formally enregistered than that another gulf should be dug between what appears on paper and what exists in fact. There is something to be said for the suggestion that the Charter should have appended to it something in the nature of a Code of Conduct for the nations, which, without having any binding force, would stand as an indication of the goal to which formal procedures might gradually advance.

The San Francisco Conference will not be an easy one to steer to success. But there are real gains to be derived from success, limited though they may be. And failure would be a confession that there can be no mitigation of the international anarchy.

NOTES OF THE WEEK

The Concentration Camps

The Allied armies, as they advance into Germany, are uncovering the horrors of the concentration camps. The correspondents are doing their duty in reporting the grisly details, and the citizen, if he wishes to do his duty, will read them. The concentration camps should not be forgotten. They are a reminder that, great though Hitler's crimes against the nations may be, his most mortal sin was his offences against the dignity of mankind. They are a reminder that the Nazi pest is dangerous not only, or even mainly, because it leads to aggression and to war, but because it destroys among individual men and women the rights of freedom and justice and mutual respect which alone distinguish the human race from the higher animals. This is the unpardonable treason. This is why the Nazi spirit must be stamped out at its every appearance, like the plague-bearing rat it is.

It would be wrong to hold the whole German people fully to blame for the horrors of the concentration camp. But it would be even more wrong to hold them wholly blameless. There ~~is~~ ^{must} be a deep-rooted moral sickness in a people that could find enough members to do such dirty work, in a people that dictatorship or no, would tolerate such things, in a people whose senses were so indelicate that they can now profess ignorance of what for twelve years has been stinking to high heaven in their midst. It is reported that, in one place, the British medical officer conscribed the civil population to tend the survivors, to bury the butchered, and to scrub the camp clean. The German people will have to spend many years on their knees before the stains are scrubbed out.

Splitting the Strip

It is difficult to keep accurate count of the towns and districts captured and overrun by Allied armies in the west and east of Germany. One by one the carefully hidden secrets of the German interior are being revealed by the advancing armies. The oilfields around Hanover and at Osterdorf, near Vienna, have been captured. The heart of the chemical industry and brown coal mines around Halle-Merseburg and Leipzig has been laid open. It seems only a matter of time until the north and the south of the German strip will be separated by a junction of the British-American armies and the Russians, whose long-expected offensive across the Oder east of Berlin has been opened.

To mark the beginning of the new Russian offensive, Hitler addressed the soldiers of the Wehrmacht in an order of the day which again reveals the curious belief that by some magic the Wehrmacht will be able to hold its present positions in the east. The magical element, from which so much is expected, is no longer a secret weapon or the intuition of the Fuehrer, but an idea—the idea of *défense à outrance*, which now dominates the actions of the Nazi leaders. They have, indeed, been driven to this last fierce desperation by the lack of alternatives. They cannot surrender, nor can the nature of their regime tolerate any element of political opposition ready and able to surrender.

Preparations have obviously been made to continue some military resistance even after the German strip has been split in two. The north—that is, the Baltic coast, Denmark and Norway—will fall to the northern administration; and southern Germany, with remnants of Austria, Czechoslovakia, and northern Italy, will be under a separate military and civil command. The Nazi leaders apparently believe that the centralised control of the Nazi party can be maintained in each of these fragments. Small bands of soldiers and party members could keep the Nazi party alive and functioning in a number of redoubts for some time. It is hoped that the armies of occupation will be fully engaged in the administration of the disordered country, and that in the end the task will be beyond their powers. The idea of *défense à outrance* extends beyond the possibility of total, if temporary, military defeat, for which articles in the Nazi press have been preparing the people. The emphasis is on the political aspect of a Nazi party "in being," and if this threat to the future is to be crushed, it will require more than purely military activity from the victors.

The Vacuum

Meanwhile the extraordinary spectacle of sheer passive surrender, of surrender without any political purpose, continues wherever Allied armies overrun new areas. Sometimes the surrender comes about without fighting and sometimes after very heavy fighting. The Nazi leaders are trying desperately to prevent capitulation without orders from above. Individual soldiers are being hanged and shot for any signs of desertion. Mayors of towns and military commanders are being formally tried by special courts if they attempt to surrender. The case of Major-General Lasch, the military commander of Königsberg, who sur-

rendered the garrison to the Russians, is of particular significance. He is in Russian hands and had to be tried and condemned in his absence; but his whole *Sippe* or clan is to be held responsible. Even in simple cases of desertion from the army the same decision has been made by the special courts. Even in their last hours the Nazis relax nothing of their barbarism.

The problems of Germany's defeat are mounting. The material destruction in most parts of western Germany seems beyond description, and so far the attitude of the people seems to be a mystery to the average war correspondent. The whole range of human emotions, or no emotions at all, have been observed by different correspondents in different parts of Germany and sometimes at the same place; but the most important thing correspondents thought to find is lacking, and that is some political reaction. There is no precedent for the defeat and breakdown of a totalitarian regime, and the consequences will only gradually reveal themselves. Economic breakdown threatens to be complete, since there is no work in the factories and the imported labour force is abandoning the farms. For the moment, occupied Germany is a political, economic and social vacuum. What will rush in to fill it, God only knows.

Ilya Ehrenburg's "Deviation"

An odd journalistic controversy, not devoid of a wider political significance, recently developed in the Russian press. The head of the Party Propaganda Department, Mr Georgi Alexandrov, rebuked Mr Ilya Ehrenburg for what would in this country be described as a Vansittartite view on the treatment of defeated Germany. Mr Alexandrov quoted against Mr Ehrenburg Marshal Stalin's words of February, 1942:

It would be ludicrous to identify Hitler's clique with the German people and with the German State. The experience of history shows that Hitlers come and go, but the German people and the German State remain.

It is true that these words have not been frequently quoted in Russia in the last two years or so; and Mr Ehrenburg might have pleaded in his defence that until quite recently his identification of the whole German people with National Socialism seemed to have the stamp of official approval. But, in Russia, matters of high policy, such as this, are not usually left to the individual tastes and inclinations of free-lance writers. The polemical statement by the Chief of the Party Propaganda Department ought, therefore, to be read as a partial "correction" of official policy.

Russian policy towards Germany has been dominated by the conception of a Carthaginian peace; and the whole of Russian propaganda has been directed towards making that sort of peace popular. The notion that the whole German people has been responsible for the misdeeds of the Nazis has been part of the moral and political justification for that attitude. Is it conceivable that Russian views on the right policy for Germany are now being revised? A statement in *Pravda* may perhaps be too slender evidence for any definite deductions. The immediate motive for the ostentatious "correction" may have been military expediency. (It may have also been the desire to remove the unfavourable impression created abroad by Mr Ehrenburg's rather temperamental charges against the Western Allies for their alleged leniency towards Germany.) But there has been more than a grain of truth in Mr Ehrenburg's assertion that the relatively stiffer fight of the Wehrmacht in the East than in the West has been due to the fact that the Germans' fear of Russia has been stronger than their fear of the Western Allies; and that this has been caused by the memory of the Nazi atrocities in Eastern Europe unparalleled elsewhere. Yet the Russian day-to-day campaign for a "harsh peace" has also done something to fan the Germans' fear. The controversy between *Pravda* and *Red Star* shows that this is now being realised in Moscow.

That the campaign for an extremely hard peace has led Russian policy into something of an *impasse* has been clear for some time past. It has been reflected in the contradictions of Russian propaganda. To give only one illustration—the Soviet Government has called upon the Germans in East Prussia and in the other Russian-occupied provinces of the Reich to stay put and has promised just treatment to those who obey. But propaganda in Russian and Polish has never ceased to harp on the need for evicting the Germans from East Prussia. The difference between the two attitudes, the one for Russian and Polish and the other for German

consumption, is untenable in the long run; eventually, one or the other will have to be abandoned. The fact that Marshal Stalin's distinction between the German people and the Nazis has now been so emphatically recalled to the mind of the Russian public is certainly a straw in the wind. It suggests that Russian opinion may perhaps still be brought round towards a peace that would be built on foundations more stable than the passions of war and the memory of atrocities. If so, then the Allies may be better able than they have been hitherto to make a joint attempt to create a moderate but a workable peace settlement.

Political Winds

The first by-elections to be held on an up-to-date register have now been decided. By rights, they should be the first accurate indications of the great unknown, the views of the electorate. But simply to record that in each case a Government seat was lost would be grossly misleading. In the Scottish Universities, Sir John Boyd Orr owed his victory to his eminence and personality rather than to any deliberate rejection of the official candidate. In Motherwell, a Scottish Nationalist was returned over the Labour candidate (who had the official blessing) by a narrow majority. But Motherwell is an erratic constituency—it once returned a Communist—and somewhat susceptible to novelty. There is perhaps a warning to the Scottish Labour Party in the fact that a pronouncedly working-class district can prefer Scottish Nationalism to orthodox Labour, but its relevance to the main political situation is only marginal. Indeed, it is a little difficult to believe that Labour need be very frightened, as the spectacle of Communist voters lining up to support the impeccably capitalist projects of the aristocratic promoters of Prestwick Airport has too many elements of humour in it to be very long enduring.

There was an interesting sequel to the Motherwell election when Dr McIntyre, the victor, was unable to take his seat in the House of Commons because, being the only representative of his party, he refused to be presented by two sponsors. The rule of the House is clear and ancient; it could be waived only by vote of the House, and the House, advised by the Prime Minister, refused to waive it. It is also true that Dr McIntyre's action will strike most people, in Scotland as well as in England, as unnecessarily theatrical. Nevertheless, it is wrong that a man who has unquestionably been elected should be denied his seat on a technicality. This particular, not very creditable, incident was closed on Wednesday when Dr McIntyre allowed himself to be sponsored "under protest" by two Scottish Labour MPs. But the House would be well advised to reconsider its Standing Order to prevent the same thing happening in the future.

Another interesting minor political development has been the appointment as Joint Parliamentary Under-Secretary of State for Air of Mr Quintin Hogg. Mr Hogg was one of the founders and has been one of the chief spokesmen of

1563

1831

GREAT TRADITIONS.

Although the history of Martins Bank goes back to the earliest days of Banking, its methods to-day are modern and up-to-date and combine the best features of the old-time Banker with the wide range of service of the Joint Stock Bank.

Both will be willingly placed at the disposal of customers by the Bank's many Branch Managers.

MARTINS BANK
LIMITED

the Tory Reform Committee. It is interesting to observe that the Prime Minister thinks it advisable to invite him into the Trappist silence of junior office. It is still more interesting to observe that a Tory Reformer can be attracted by such an invitation. If other such invitations were to be extended and accepted, that would be an end of the Tory Reform Committee.

All-Party Foreign Affairs

Mr Bevin's week-end speech of three weeks ago attracted so much attention because of its polemical passages that comparatively little attention was paid to the suggestion contained in it that foreign policy should henceforward be treated as an all-party matter. It has, however, subsequently been picked up by correspondence in *The Times*. When a party leader, who in the same speech repudiates the idea of a continued coalition, makes such a suggestion it should not be allowed to fall on barren ground. Unfortunately, as a general proposition, there would be many difficulties in the way. No doubt foreign affairs, like military affairs or economic policy or anything else, would be more expertly pursued if they could be removed from the pressure of party politics. But they cannot; and merely to insist on an all-party body to decide controversial matters may be to replace all policy by dilute compromise. Foreign policy, among other things, has suffered from this in the past. So long as international relations are prominently before the public, the Opposition cannot afford to neglect every opportunity of attacking the Government on such issues as they present.

But to this general statement there is an exception. It is legitimate to hope that, for the years of the peacemaking, foreign policy will not be controversial, or at least not controversial between the parties, and it is essential that every party should both make its contribution to the settlement and be committed to it. A single-party Peace Delegation would be as dangerous in this country as in the United States. Even though a permanent Foreign Affairs Committee of all parties, on the lines of the Committee of Imperial Defence, may be impossible, some arrangement of the sort is both possible and highly desirable for the lifetime of the next Parliament should there be, as seems probable, a reversion to one-party Government. It might be as well for the party leaders to consider whether this could not be done before they break up and mount the hustings.

Tito and D'Annunzio

It seems that Marshal Tito envies the laurels that once rested on the head of D'Annunzio, the filibustering conqueror of Fiume in 1919. The Yugoslav leader has now staked out a claim to Trieste and the Istrian Peninsula. The Istrian Peninsula is inhabited mainly by Slovenes, and its incorporation in Yugoslavia is commonly accepted. Trieste is a different matter, for the city is almost wholly Italian. When Mussolini was fostering Italian expansion in south-eastern Europe, Trieste provided a jumping-off ground for Italian penetration into Yugoslavia. That the Yugoslavs of all political shades now view with uneasiness the prospect of Trieste remaining in Italian hands is, therefore, quite natural. But handing the city to Yugoslavia would hardly solve the problem, for Trieste would then become a cause of grave friction between the two countries. The establishment of an autonomous Free City of Trieste might be better policy. It would enable the Italian population to preserve its national life and culture. Moreover, it would enable the port to be used for the trade of southern and central Europe, on which the prosperity of Trieste depended before the first world war.

Whatever the merits and demerits of the Yugoslav claims, it is very unfortunate that frontier demands should be put forward with so much vehemence and nationalist fervour now, instead of being postponed until the Peace Conference. A possible explanation for the haste with which the Provisional Yugoslav Government has put on record its demand for Trieste is the predominance in Yugoslav policy, at present, of the Croats and the Slovenes over the Serbs. The Serbs have traditionally been more closely concerned with Yugoslavia's eastern frontier, and especially with their access to Salonika, which Marshal Tito has this week declared, in Moscow, not to be an urgent question "at present." The Slovenes and the Croats have been much more anxious to secure favourable frontiers on the

Adriatic coast. But it is also probably more than a coincidence that Marshal Tito has asked for Trieste on the morrow of the conclusion in Moscow of the Russian-Yugoslav treaty of alliance. His claim probably has the backing of the Russian Government, which may regard Trieste as an Adriatic outpost of the future great Slav bloc that will look to Russia for leadership.

The campaign for the inclusion of Trieste in Yugoslavia has caused some special trouble to the Italian Communists. Their leader, Signor Togliatti, must find it very hard to resist a demand that comes from Marshal Tito and may possibly have Russian backing. But he must also find it very hard to accede to a demand that of necessity hurts Italian national sentiment. The conflict of allegiances has already resulted in some queer political evolutions. At first the Italian Communists seemed wholeheartedly to support Marshal Tito's demand in defiance of Italian nationalist feeling, which expressed itself in demonstrations for the retention of Trieste by Italy. Now, Signor Togliatti is advocating the cession of the city to the Yugoslavs, not as a virtue, but as a dire necessity to which defeated Italy should submit. It is doubtful whether Italian public opinion will readily accept his argument. Trieste may yet become a formidable stumbling-block for Signor Togliatti's party.

Mr Foot Amends his Plan

Mr Foot has gone some way to meet the criticisms of his Plan for Coal without deviating from his general principles. In a Supplement he proposes certain amendments which would have the effect of limiting the powers of the Central Board, which, it was originally intended, should be the sole and final arbiter in the industry's affairs. The Board, he now suggests, should be selected by an electoral body, representing every coalfield, and undertakings, instead of having to accept its decisions as irrevocable and binding, should have the right of appeal to an independent Arbitral Tribunal to be set up by Parliament. The Board's powers to raise capital would be limited initially, and could only be increased with the approval of the Tribunal.

The Tribunal would deal with complaints from consumers about the operation of selling schemes, from mine-workers about matters not covered by the conciliation machinery and from the Coal Commission if coal were not being mined with due regard to its conservation. It would, in fact, largely supersede the Coal Commission, and would become the final authority for sanctioning amalgamation or absorption schemes. Mr Foot proposes to extend the range of cases in which compulsory amalgamation could be effected to cover undertakings whose separate entity would impede the efficient development of a coal area. In his original scheme, amalgamations could only be enforced in cases where undertakings were unable or unwilling to comply with the Central Board's decisions.

The mine-owners, it seems, are in a great hurry to complete their scheme for reorganisation before the proposals of the Government or the miners' union have been published. The establishment of an independent Tribunal would admittedly provide a safeguard against exploitation by one side of the industry. But Mr Foot's amendments do not really alter the original criticisms of his plan. He rejects the suggestion that the Board should include non-owner representatives, on the ground that the inevitable conflict of interests would only lead to delay and indecision. But surely, if the industry is to be run in the national interest, it is essential that the range of responsibility should be widened. Mr Foot's argument that he is not envisaging any more monopolistic powers than were established under the 1930 Act, though literally true, is not convincing, for there is an increasing volume of opinion in favour of revising the restrictive system of fixing prices and output established under that Act.

More fundamentally, Mr Foot's plan, even with its amendments, does not provide any guarantee that the proposed reorganisation would, in fact, fulfil his principle that the industry should "be brought to and progressively maintained in the highest state of efficiency." The blunt truth is that no one, outside the ranks of the coalowners themselves, has the slightest confidence in their willingness or ability to do more than tinker with the problem. The Reid Report showed that

nothing less than a thorough organisational and financial reform, as well as a technical revolution, would suffice. Mr Foot has expressed himself in complete agreement with much of the Reid Report, but not, it would seem, with its solution.

Russo-Polish Anti-climax

On Tuesday morning, the Soviet Government announced that it continued to insist on the representation of Poland by the Lublin Government at the San Francisco Conference. This announcement has come as an anti-climax to the reports concerning negotiations with the "missing" Polish leaders about the formation of a new Provisional Government. It has also come as an anti-climax to the announcement on Sunday last that Mr Molotov, and not Mr Gromyko, would head the Soviet delegation to San Francisco. The renewed Soviet demand for the admission of the Lublin Government to the Conference suggests that a serious hitch may have occurred in the reported negotiations with the Poles, or that the negotiations may have broken down. Otherwise, the Russians would have certainly preferred to claim admission for a reconstituted Government which would have a chance of being recognised by the Big Three.

What is really happening in Poland? It is really time that the veil of secrecy was lifted and that Allied observers and journalists were free to enter Poland and report on the happenings there. In theory, the Russians may be quite right in their dealings with the Poles. It may even be admitted, for the sake of argument, that the mood of the people in Poland is such that it favours the setting up of a single party system and the transformation of Poland into a Soviet Republic. If this is the case, why should Allied correspondents not be allowed to witness the changes and to describe them from their personal experience? During the Bolshevik revolution in Russia foreign journalists were allowed more than a glimpse of the great upheaval; and some correspondents were sufficiently broad-minded and sober to bear unbiased witness to the events. The persistent refusal to admit foreign correspondents into Poland unavoidably lends colour to the suspicion that an unpopular régime is being forced upon Poland willy-nilly.

The Polish issue will again be discussed by the Allied Foreign Secretaries when they meet at San Francisco and in Washington. Pending their discussions, the Prime Minister has decided to postpone the statement on Poland that he had intended to make in the House of Commons on Thursday. It is to be hoped that in the forthcoming discussions the mistake made at Yalta will not be repeated; and that the Allied Foreign Secretaries will not again patch up real differences with unreal formulas which will start a new and interminable dispute over their interpretation. Even clear-cut disagreement may be preferable to the continuation of diplomatic manoeuvres over the Polish issue which look more and more like an undignified game of hide and seek.

Requisitioned Land

The process of piloting the Requisitioned Land and War Works Bill through its committee stage is taking much time and skill. The Government has wisely abandoned its intention that the Treasury should appoint the War Works Commission, whose tasks will include adjudication between private owners and the various departments; and has substituted appointment by the Crown, acting, of course, on the Prime Minister's advice. The function of the Commission is judicial in the sense that it must strike a balance between numerous private and public claims to land, and it is obviously important that it should be completely impartial.

One of the most disturbing features of the Bill is the number of cases in which the Commission can be ignored or overruled by Government departments acting separately; and for this reason there is much to be said for giving it stronger powers, while allowing the departments to be represented on it.

The chief opposition is directed against the Government's powers to acquire requisitioned commons and public open spaces, even though these powers have now been narrowed to land on which there are war works of a substantial nature. An amendment to compel acquisition to

take place by provisional orders, which require Parliamentary confirmation, received almost unanimous support. Such safeguards are clearly excessive when only a minor footpath or small area of common is at stake, and Sir John Anderson has promised that there will be few major cases in which acquisition is demanded. If this is so, there seems no reason for refusing a Parliamentary safeguard which could be confined to major cases. A large area of common land is in fact at stake, and the bare assurance given by the Government that 90 or 95 per cent of it will not be taken is insufficient guarantee.

What the Government does not realise is that the public, after bitter experience, simply does not trust any Government department in any matter relating to requisitioning or compensation. A particularly scandalous case—though not one that would be covered by the Bill—is revealed in a letter in the correspondence columns of Thursday's *Times*. The buildings of St. Paul's School, used by the War Office for an essential purpose until D-Day, have now been "sub-let" for other official purposes, although the evacuated school is at the end of its tether. This is typical—any official purpose is automatically preferred to any unofficial purpose—and it is monstrous.

Where is UNRRA?

The problem of Displaced Persons grows with every few miles of the Allied advance into Germany. Millions of Frenchmen, Belgians, Poles and Russians are breaking out from the labour camps into which they have been put by Nazi press gangs. Many of them, especially the eastern slave labourers, are in a deplorable condition—starved, ragged, verminous and ill. Frenchmen, Belgians and Dutch seize all available means of transport and crowd the roads leading home. The return of these does not present great difficulties, although they have to be put in quarantine before they can enter their countries. It is the eastern slave workers who are the real problem. Not only are they more exhausted and starved than the displaced of the western countries, but they are also still separated from their countries by the fighting lines. Moreover, their sudden exodus from the German farms on which they worked threatens German agriculture with disaster. Nevertheless, it would be psychologically wrong and practically impossible to compel them to remain at work in the places where they have been kept by German force. The work on German farmlands must now be done by German labour itself; and a compulsory call-up of the German population for agriculture will be necessary if famine is to be averted.

The eastern workers, who may not be able to return home for some months, should be organised into camps, placed under some sort of discipline, voluntary if possible, and given food and clothing. Otherwise, they will scatter over Germany, spreading disease and living on loot. Unfortunately, all reports from Germany state that the personnel of Allied Military Government is altogether inadequate to cope with this enormous task. Is it really impossible that AMG should immediately share with UNRRA the responsibility for looking after the displaced persons? UNRRA has so far been virtually unemployed in Western Europe,

as well as elsewhere. The public has often been told that its chief job will be to take care of the displaced persons; yet at the most critical moment the displaced persons, as the human wrecks from the Nazi labour camps are named in the official jargon, are left to take care of themselves. Is it to be understood that, as has happened elsewhere, UNRRA will not move in for another six months or as long as the areas in question remain a theatre of war? If AMG and UNRRA are allowed to persist in their mutual jealousy and suspicion, bureaucracy could indeed be convicted of mocking at human misery. The desire of the military commanders to have complete and undivided control over the areas behind the fighting lines is quite legitimate and understandable. But chaos and confusion behind the lines are certain to become greater and more dangerous if the relief organisations do not move in to help the displaced persons than if they do.

Education for Agriculture

It is a main principle of the Education Act that children should receive training fitted to their needs. At the Secondary level the principle will be implemented, first, by guiding each child into the most appropriate of the three types of school—Grammar, Modern or Technical; and, secondly, by adapting school curricula so that maximum use can be made of regional and local educational opportunities. Thus it is recognised that for selected pupils' technical education in the country districts should include some pre-vocational training for agriculture. At present, over the country as a whole, rural children are without opportunities for technical education parallel to those afforded to children in urban areas, and any policy to improve agricultural efficiency is incomplete if it does not provide for the removal of this inequality.

The first report of the Joint Advisory Committee on Agricultural Education makes various suggestions for dealing with the matter. Wisely, it does not plump for vocational training as such, but supplements the "rural bias" which should colour education in all country schools with a "pre-agricultural" course of three years for selected students above the age of thirteen. Its curriculum would consist of subjects "taught in any school which claims to give a good general education"—though some of them would be governed in scope and approach by the vocational aim. In other words, there would be no attempt to push vocational subjects at the expense of subjects of educational value. It would, indeed, be the negation of equal educational opportunity to tie a child to the land by training him for nothing else. Such training would prove so unattractive to the more able and intelligent students that agriculture would almost certainly lose their services.

It is suggested that the subjects of the course fall into two groups:

subjects of more general cultural value the teaching of which is unaffected or at most only slightly coloured by the vocational aim of the curriculum, and subjects such as mathematics, science and practical work, in which the selection of material for study is largely governed by the vocational aim.

and that subjects in the first group, including English, history, geography, music and art, should be allowed time comparable with the allowance made for them in the grammar school. This pre-agricultural course should be open to girls, since women "play an important part in the economic side of country life."

The report will help local authorities to prepare their schemes under the new order, but its suggestions are wide enough to ensure enough variety in agricultural education to make the next ten years a period of experiment.

The Alternative Health Proposals

The "alternative proposals" for the administrative structure of the national health service are causing more controversy than the original White Paper itself. Dr Edith Summerskill has called them a complete capitulation to the medical "old corps" and a negation of the White Paper which she described as an ugly confidence trick. Yet there is nothing outrageous in the fact that modifications of the original proposals have been discussed. As the Minister of Health pointed out in a reply to Dr Summerskill in the House of Commons last week, the White Paper stated quite clearly that its proposals were not final but were put forward for discussion before legislation was drafted. If the White Paper proposals were to be regarded as inviolable,

it would indeed be a waste of time for the Minister to have all these discussions, not only with the doctors but with dentists, hospitals and local authorities as well. Mr Willink also made it quite clear that the Government is not committed to the alternative proposals put before the representatives of all these bodies. It has not even considered them.

Whether the alternative proposals put before the doctor would be a negation of the White Paper if they are accepted by the Government cannot be decided until they are fully revealed. Great play has been made of the report that the general establishment of health centres would be postponed until experiments with different types of health centres in different areas had been carried out. But health centres are not a fundamental part of a national health service. The principle underlying such a service is that full medical, hospital and rehabilitation services should be available to everyone irrespective of their means, and the criterion for judging the alternative proposals should be whether they would promote this objective more successfully than the administrative structure of the White Paper. It should also be remembered that the White Paper itself said that organisation should be regarded solely as the means and "never for one moment as the end."

Milk Production

A Note in *The Economist* last week (page 484) gave figures showing how successful the campaign to increase winter milk production has been. Last week's debate in the House of Lords, however, disclosed the need for a further very big increase in production after the war, both in winter and summer, if milk consumption in this country is to be raised from the pre-war level of under half a pint per person a day to one pint, or at least to three-quarters of a pint, with more for mothers and children. Present production is about 1,500 million gallons a year. To achieve an average consumption of 0.8 of a pint a day, compared with 0.58 at present, would, according to Lord Moran, need an increase of 75 per cent in winter production and 30 per cent in summer production. Of this increase, 60 per cent would have to come from an addition to dairy herds, but 40 per cent could come from improved yields if the necessary effort were made.

It is a lamentable fact, as was made clear in the debate, that British milk production is inefficient compared with that of other countries—even if allowance is made for differences in natural conditions. The average yield per cow before the war, according to figures cited by Lord Bledisloe, was 530 to 540 gallons a year, compared with 770 gallons in Holland. Only France among the Western European countries had a lower yield than Britain. Another illustrative figure is the lactation life of the cow, which should be seven years, but in this country is, on an average, under four. Moreover, large quantities of milk are lost by cattle disease. Mastitis, it was said, accounts for an annual loss of 40 million gallons a year; contagious abortion for another 40 million; and delayed infertility and sterility for about 120 million. The annual loss of 200 million gallons—an estimate only, but one which was not refuted—is about one-eighth of total production, and a great deal of it is avoidable.

It is quite true that steps have been taken to control these diseases. The Duke of Norfolk mentioned the voluntary scheme introduced in the summer of 1942 under which cows are placed on a veterinary surgeon's panel and examined four times a year. But only about 300,000 cows and heifers out of a total dairy herd of some 3,200,000 cows have come under the scheme. The reason may probably be, as the Duke claimed, the shortage of vets, but is there any evidence that the dairy farmers as a whole welcome the scheme and are clamouring for more vets?

Milk is the only branch of agriculture in which British farmers have a naturally protected home market. Such protection places an obligation on them—and on the Ministry of Agriculture—to raise the low standards of British dairy farming.

City Plan under Review

A memorandum published by the Chartered Surveyors' Institution this week brings once more to the public mind the suspended state of metropolitan planning. The institution is concerned with the principles and details of the

City of London Plan, published by a committee of the Corporation last July. The original plan was limited enough—limited by the implicit assumption that, with the cost of radical reconstruction beyond the City's means, there would be no other way out than by sticking to piecemeal improvement. Its latest critics are, if anything, even more firmly determined that the shape of the new City (at least a quarter will have to be rebuilt) shall be dictated primarily by its function, present and future, as a commercial centre. As such the cost of reconstruction rules out as impracticable "a City of boulevards and vistas." The main criterion is to be the replacement of at least as many workers in this congested space as before the wartime exodus.

Nevertheless, the memorandum does serve to emphasise the cumulative effect of letting things slide in matters of town planning. It is quite clear that the first delay was caused by the dilatory introduction of the Town and Country Planning Act. That, in itself, encouraged procrastination among the local authorities, and may have tempted them to put off decisions which should have been taken long ago.

In the case of the City, the "danger" of further commerce making its permanent home outside may not be so calamitous as the surveyors imagine. But other results of procrastination are just as much to be feared, and it must be hoped that some new development as regards the Plan is not far off. It is, perhaps, still not too late for the Government to consider how much responsibility it could assume for the cost of reconstructing a national asset and source of pride.

Shorter Notes

The date of the Canadian General Election has now been fixed for June 11th, a week after the provincial election in Ontario, where the Progressive Conservative Government, which took office with a minority after last year's election, is appealing to the electorate. The result of this trial run in the largest Province may affect the wider issue. An article by our Ottawa Correspondent on the prospects of the Canadian parties appears on page 514.

The following table, perhaps a complete version for the whole of the war, gives the number of civilian casualties in air-raids since September, 1939:—

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,981	3,475
Sept.-Dec., 1940.....	22,273	28,548	50,821
Total, 1941.....	20,881	21,841	42,722
Total, 1942.....	3,236	4,150	7,386
Total, 1943.....	2,372	3,450	5,822
Jan.-May, 1944.....	1,563	2,916	4,479
June-Aug., 1944.....	5,479	15,934	21,413
Sept.-Dec., 1944.....	1,425	3,134	4,559
January, 1945.....	585	1,629	2,214
February, 1945.....	483	1,152	1,635
March, 1945.....	792	1,426	2,218

Totals to date.... 60,583 86,161 146,744
Those killed in air-raids during March included 315 men, 386 women and 91 children under 16.

AMERICAN SURVEY

Housing Policy

(From a Correspondent in Massachusetts)

ON two planks in the post-war platform there is unanimous agreement, so long as they are stated in general terms. The first is to build a great many more houses than ever before, and at a steadier rate; even moderately full employment cannot be expected without a healthy building industry stabilised at a high production level. All kinds of proposals have been made, but the National Housing Agency's estimate of 1,260,000 new non-farm dwellings per year on the average for a decade is a conservative, well-documented and widely accepted figure. This is one-third more than were produced in the highest boom year, 1925, and more than double the number being built just before the war. Proportioned to population, it would equal 400,000 new homes per year for England and Wales.

The other objective is to get rid of slums and urban blight. The existence of an enormous volume of bad housing is now generally recognised, thanks to the nationwide surveys of the depression years and the Housing Census of 1940. All surveys tend to indicate that one-quarter to one-third of all homes are seriously sub-standard, with the proportion much higher in the south and somewhat lower in the north and west. Such analysis has been familiar to Britons for generations, but the distinction in the American mind between the terms "slum" and "blight" should be explained in order to clarify some current arguments over policy.

A "slum" is recognised here, as elsewhere, to be primarily a social problem. To attack this problem the US Housing Act was passed in 1937, belatedly following English precedents. Under this Act about 120,000 low-income families were rehoused and a considerable number of slums eliminated, but the die-hard property interests had not quite resigned themselves to it before the war.

The connotation of "blighted area," however, is economic. Such an area may or may not include outright slums. The important fact about it is that it is getting more and more unprofitable: to owners, to lending institutions, and to the city as a financial entity. Property values and assessments are declining, vacancies and tax delinquencies are mounting, and the whole district is dead to

improvement or new investment by traditional small-scale private means.

This situation, which affects to greater or less degree a good half of the corporate area of the larger American cities, is the natural result of two trends which, although universal in Western civilisation, have appeared in the United States in acute form. One is urban land speculation, with its exploitive congestion and irrational dwellings that become undesirable as soon as something newer and steeper is available. The other is the mass-migration to the suburbs which, facilitated by the automobile and galvanised by the dreariness at the centre, has been rapidly emptying the cities of practically everyone who could afford to get out.

The inevitable result of these trends—stagnation and eventual bankruptcy of the central city—was blurred as long as urban areas were growing. But between 1930 and 1940 many of the older cities lost population for the first time, even while their metropolitan areas were still for the time being increasing. Practically all central districts declined, even in such boom towns as Los Angeles. At long last the property owners and financial institutions and city fathers began to get frightened.

The result is the Urban Redevelopment Movement, whose prime purpose is to "save" the old city centres in a strictly economic or even financial sense. Various measures are sought, both State and Federal, to facilitate large-scale land acquisition and to subsidise, in one form or another, the difference between the frozen paper value of blighted property and its "use-value" for profitable new enterprise. In other words, a bailing-out process to permit a fresh start.

There are healthy and potentially fruitful elements in this movement, and such *bona fide* Liberals as Alvin Hansen and the late Alfred Bettmann have tried to steer it toward broader and more constructive goals. But most of its political force and leadership comes from the individuals and organisations, notably the National Association of Real Estate Boards, who are the most violent opponents of not only of low-rent public housing, but also of any positive improvement in the present wasteful speculative character of private building operations.

These forces are opposed to continuation of the war-born National Housing Agency, which has brought together the numerous national agencies in the field, including the Federal Housing Administration, which insures private mortgages, and the Federal Public Housing Authority, which administers the US Housing Act, and has turned out half a million units of emergency public housing for war workers. At the same time other similarly powerful groups insist that a comprehensive programme of housing and civic reconstruction requires a permanent and greatly strengthened NHA, with responsibilities broadened to include the whole civic picture.

In sum, therefore, the reasons for wanting to build a lot of houses to get rid of urban decay are sometimes conflicting. And the fact that most of the people actively interested are lined up in two armed camps tends to delay recognition of the very nature of some of these problems that each side wants to attack.

Thirteen million homes cannot be built in ten years unless they can be disposed of. And they cannot be disposed of without a mechanism that ensures a universally effective housing market. Nor can vast sections of the cities be reconstructed no matter how much the tax-payers are willing to hand out for land subsidies, nor complete communities built on new land unless new homes can be provided within reach of all kinds and classes of people. There is the greatest weakness in the housing mechanism as it exists to-day. Private enterprise, even with Federal mortgage insurance, has never reached much below the richest third of the population, and its effective market has often been even smaller. And public housing, as long as it is confined by law to the "lowest income group" and families from outright slums, cannot go above the bottom third. The middle group is entirely outside the market: they cannot afford the private product; they are ineligible for the public.

A good example of this group is the automobile workers. Their jobs are as stable as anybody's, and they get fairly good pay. They do not need a subsidy. But they do need efficiently produced homes, financed at 2 or 2½ per cent, on cheap land, without speculative profits. The United Automobile Workers of America, the active CIO union, is interesting itself in this problem, and is applying to it the experience gained in quarrels with Henry Ford and with the Government over housing in war-time. The eventual solution will probably come about through the demands and activities of such groups. But it will be a tough fight. For, whether it is done by public initiative, by co-operatives, or by some new form of private enterprise, it will be a serious threat to the wasteful practices of the shoe-string speculative builders and traditional real estate brokers and investors who dominate the National Association of Real Estate Boards and the Federal Housing Administration—much more of a threat than the most heavily subsidised slum rehousing.

Another point of weakness is the lack of any guiding concept of the form and function of a modern urban area. Obviously it is no use tackling slums without rehousing their inhabitants. This lesson has begun to be learned. But it is just as useless to tackle economic blight without dealing with the entire metropolitan region as a single organic entity. Indeed, guiding and controlling exterior development is probably far more important at this stage than any direct attack on the centre. There is in this country no live Garden City movement to state the alternative to "Urban Redevelopment" and thus clarify the conditions on which central reconstruction can be successful.

No strong overall leadership has yet emerged capable of transforming all this heterogeneous and often antagonistic concern for building and employment for houses and cities into a positive force and unified programme. Thus far the National Housing Agency, instead of making the bold effort to divide its enemies and inspire its friends, that is probably its only chance for survival, has mainly tried to keep its neck under cover. For some recent Senate hearings on post-war housing, NHA prepared admirable tables demonstrating exhaustively the nature and scope of the housing problem, but never stated the obvious conclusions. And the National Committee on Housing, the only private organisation that has tried to cover the whole field, is bogged down under the illusion that having a board of directors representing all the extremes is equivalent to having a comprehensive programme.

Meanwhile, private building and financial groups are still drawing much of their leadership from irresponsible and

anti-social elements, although many of them—materials producers and contractors, for instance, and investment bankers—should be open to broader ideas, solely in self-interest.

The chief constructive proposals at the moment are coming from the National Public Housing Conference, representing local housing authorities, the labour federations, and Liberals in general. Amendments to the US Housing Act sponsored by NPHC will shortly be introduced, designed (1) to provide annual subsidies for about 450,000 units of low-rent public housing; (2) to improve financial mechanisms so that long-term capital will be available from private sources at around 2 per cent; (3) to extend the programme to low-income families in rural areas, with suitable changes, including the right to eventual purchase of the house, and (4) to provide funds and powers to permit local authorities to acquire slums and blighted areas for redevelopment at "use-value" by private as well as public agencies.

This is all sound as far as it goes, and there are signs that the Senate, at least, may regard it with favour. It is not a comprehensive programme in that it does not tackle either the middle-income group or the broader and deeper questions of land-use and city form. But probably under all the circumstances it is about the best that could conceivably be got through Congress in this session. And even a partial victory for a partial programme would have a good effect on the morale of progressive forces.

American Notes

President Truman

Mr Truman has compared his political position with the geographical position of his native state of Missouri—in the centre of the country. Perhaps that is what makes it difficult to evaluate him. Nothing in his record or his character stands out as different from the average.

Until 1934, his political experience was entirely confined to Missouri, where he never achieved the prominence of the Governorship. He was attached to the cause of the notorious Boss Pendergast, of Kansas City, but no accusation of dishonesty has ever been brought against him personally. It was through Pendergast's patronage that he was elected to the Senate in 1934. In Washington, he did not emerge into any prominence until he was appointed as chairman of a committee set up by the Senate to investigate the war production programme and related matters. The Committee worked hard; it contrived to select subjects for investigation that were in the public eye without playing to the gallery, and it was on the basis of the esteem won by this work that Mr Truman received the Vice-Presidential nomination last summer.

His voting record in the Senate shows very few divergences from strict party loyalty. There are some signs of incomplete agreement with the more extreme New Dealers: thus, he voted against imposing a flat limitation of war-time incomes to \$25,000, and he wanted to incorporate a provision in a Tax Bill permitting corporations to set aside, tax free, a portion of war-time profits to offset conversion costs. But he is by no means a conservative on labour matters: he voted against the Smith-Connally anti-strike bill and in favour of the Wagner Labour Relations Act and the Wages and Hours Act. On foreign affairs, his record is perfect in support of Mr Roosevelt.

Since taking office, Mr Truman has given specific endorsement to the bills now before Congress to ratify the Bretton Woods Agreements and to extend the Reciprocal Trade Agreements programme. To get both of these passed unamended will be a test of his powers of persuasion over his former colleagues.

The Succession

The Vice-Presidency of the United States is a constitutional curiosity; no other constitution has created an office of such actual impotence and potential power. In the earlier years of the republic, the Vice-President was the man who got the second largest vote for President. This at least secured that he should be a man of eminence, and both John Adams and Thomas Jefferson served as Vice-President before being elected to the higher office. But even in those days the Vice-President had no duties assigned to him other than that of presiding over the

Senate. Since the system was changed to provide for the election of a single "ticket" for both offices, the Vice-Presidential nominee has almost always been a politician of quite minor status, chosen as a make-weight to the Presidential candidature.

The Vice-President has never been in any sense an Assistant President. Usually he has been excluded from the conduct of affairs and left to be the chief social lion of Washington dinner-parties. It was an innovation on President Harding's part to invite Vice-President Coolidge to attend Cabinet meetings, and Vice-President Wallace was the only one of the whole line who was ever given an administrative job to do.

One of the minor obscurities of the Constitution, is whether, on the Presidency becoming vacant, the Vice-President succeeds to the office as well as to its "powers and duties," which is all that the Constitution specifies. The first Vice-President to succeed was John Tyler in 1841, and for a day or two he apparently held that he was only Acting President. But he changed his mind, and ever since, a Vice-President, on succeeding, has taken the Presidential oath and been treated in every way as President.

No new Vice-President is appointed. For the first century of the Constitution, the further succession devolved upon the President of the Senate (that is, the Senator voted into the chair by his colleagues in the absence of a Vice-President) and on the Speaker of the House of Representatives, in that order. But this arrangement had many defects, especially the fact that the President of the Senate might be of the opposition party. In 1886, accordingly, the law was changed, and the succession was devolved on the members of the Cabinet in order of the seniority of their departments, the Secretaries of State, of the Treasury and of War being the first three.

Seven who Succeeded

Mr Roosevelt was the seventh President to die in office. Seven times, therefore, accident has propelled into the White House a man who was never selected to wield such great powers, and was qualified to do so, if at all, only by accident. Surprisingly, the record is not discreditable. One President of close to the highest rank, Theodore Roosevelt, reached the White House by that route. One, it is true, was impeached, which is a signal mark of political failure, but historians have been more inclined to blame the black passions of the Reconstruction Era than the faults of Andrew Johnson's policy. With this possible exception, none of the Vice-Presidents has been as disastrous as such duly elected Presidents as Buchanan, Grant or Harding.

One peculiarity of history is that, with a single exception, Vice-Presidents who have succeeded have done so very early in their term of office. John Tyler was the little-considered appendage of the ticket that was elected on the slogan of "Tippecanoe and Tyler too," but old General Harrison barely survived his inauguration. Millard Fillmore also succeeded in 1850 to an elderly general, Zachary Taylor, who did not long survive the unaccustomed ardours of politics. Both Tyler and Fillmore were Presidents of whom, if history records anything, no one remembers it.

Andrew Johnson was the tragic man whom John Wilkes

Booth's bullet made President. He had been chosen as a Southern loyalist to "balance the ticket," and it was hardly to be expected that he would be able to ride the stormy seas of bitterness left behind by the Civil War. Chester A. Arthur is the leading example of a machine politician who redeems himself in office. He was a protégé of the great New York sportsman Roscoe Conkling, and, as Collector of the Port of New York, had made himself notorious even in that corrupt age. Once in the White House, however, after the assassination of Garfield in 1881, he astonished the world by pushing through the first instalment of civil service reform.

Theodore Roosevelt, who succeeded the murdered McKinley, was the first Vice-President to secure re-election to a second term in the White House. Calvin Coolidge, who succeeded Harding, followed this precedent—perhaps the only point in which he resembled the first Roosevelt. Mr Truman will thus find good and recent precedent if he wishes to be the Democratic nominee in 1948. Indeed, it would be necessary to go back to 1884 to find a case of a President, serving his first term, being refused the nomination by his own party. Moreover, both Theodore Roosevelt and Coolidge held that their first term, being incomplete, did not disqualify them from a second re-election. Roosevelt tried, and failed, to secure the Republican nomination in 1912 and ran as a Progressive. Coolidge's careful formula, "I do not choose to run for President in 1928" is now generally assumed to have meant that he was willing to be drafted.

The New Deal

When Mr Roosevelt some months ago signed a Bill to abolish the Civilian Conservation Corps, there were many who pronounced the obituary of the New Deal. It is true that in the third of his Administrations, from 1940 onwards, very little new was added to the reforming achievements of the preceding eight years. But that the New Deal has profoundly and permanently changed the face of government in America can be seen by the briefest glance at the established institutions which did not exist when Mr Roosevelt took office.

It is something of a shock, for example, to remember that in Mr Hoover's day not only were there not the first beginnings of a system of national social insurance, but the Federal Government was still struggling to preserve the doctrine that unemployment relief was the concern of the states and cities alone. The structure of social security in the United States is still less complete than in this country, but it has gone a long way since 1933.

The achievements of the New Deal in building dams and in regional plans such as the TVA are well known, and by definition, permanent. Housing is another field that had not previously been explored by the Federal Government, but is now well covered. Labour relations, Stock Exchange control, agricultural assistance—all these, and many less important matters, if they are not entirely new, can never revert to their previous status.

If the New Deal seems to some eyes to be dead, it is only because such a very large part of it is now taken completely for granted.

THE WORLD OVERSEAS

• The Canadian Parties

(From Our Ottawa Correspondent)

WHEN the Canadian voters go to the polls this summer they will have an exceptionally wide choice of parties. Unfortunately, the current pattern favours the election of regional groups rather than a clear-cut majority for one party, with truly national support, such as would be especially desirable for a strong post-war government. It is not unlikely that the election will result in a stalemate. The situation is, however, too obscure for confident prophecy.

The Liberals under Mr Mackenzie King were elected in 1935 and in 1940 with overwhelming support (170-180 seats out of a total of 245) and appeared for a time almost certain of coming back to power again with a comfortable majority. The Gallup poll has, however, recorded a serious slump in their popular support. Last June, the traditional Liberal stronghold of Saskatchewan deserted the party and elected a CCF (Co-operative Commonwealth Federation) provincial administration. The critical by-election in Grey North in February was lost by the Government when an obscure ex-Liberal insurance agent defeated the popular Minister of National Defence and former chief of the Canadian army, General A. G. L. McNaughton. Finally, the province of Quebec, which assured Mr Mackenzie King's election in 1921, saved him from disaster in 1925, re-elected him in 1926, and gave him 60 out of 65 seats in 1935 and again in 1940, appears likely to turn its back on Liberals, Conservatives and CCF alike, as a result of the reinforcement crisis last November and the enactment of compulsory overseas service.

If it were possible to divine the mood of the Quebec elector, the task of forecasting Canadian political trends would be much simpler. The Conservatives hope that the defeat of the Provincial Premier, Adélard Godbout, last year and the election of Maurice Duplessis, Union Nationale, is a favourable sign; and John Bracken, the Conservative leader, has been cultivating the rural ridings of Quebec assiduously. The CCF, too, has hopes that it can exploit the defection of the province from its ancient loyalties. Then there are separatists, isolationists and independents of various complexions, all bidding for support in that province.

Quebec and the Liberals

Quebec swung solidly Liberal in the conscription election of 1917, and, except for the split which placed the Right Hon. R. B. Bennett (now Lord Bennett) into power in 1930, the province has stayed loyal to Sir Wilfred Laurier and his political protégé, Mr Mackenzie King, ever since. By remaining at the head of a government which, against its solemn pledges, introduced compulsory overseas conscription in 1944, Mr Mackenzie King has unquestionably forfeited this solid loyalty. But a defection from him

does not mean that the Laurier Liberalism of Quebec will turn to Conservative or Socialist parties. It is far more likely that the French Canadians will nominate Independent Liberals and, in general, elect them in preference to any other choice. Allowing for the likelihood that the Conservatives will win most of the English-speaking Montreal ridings and the English-speaking part of the eastern townships; that the CCF will make some headway in the industrial areas; that the Labour-Progressives and the Social Credit members will win a seat or two, it would still appear that the majority of the Quebec seats in the forthcoming election will be won by Mackenzie King Liberals or by Independent "Laurier" Liberals, who would co-operate with Mr Mackenzie King in the House of Commons. This may be too optimistic an estimate from the Liberal viewpoint; if it does materialise, the Liberals have much the best chance of forming the next government, though they may lack a clear majority; if, however, Quebec does turn away from Liberalism, orthodox or independent, then the Liberal prospects are practically hopeless. Mr Mackenzie King, in short, cannot hope under current political moods to find enough members to form a government unless he can hold a substantial vote in Quebec.

Mr Bracken's Chances

Nor is the Conservative case any better. There has been absolutely nothing to indicate that Mr John Bracken and his Progressive Conservatives will pick up any worth-while support in the Maritime East or west of Ontario. In British Columbia the CCF and Liberals are strong, and the Conservatives are weak. In Alberta, the Social Credit machine is hitting "on all six" and should deliver most of the federal seats to its own party; the remainder, if any, are likely to be CCF or Liberal. Saskatchewan is a fight between the Liberals and the CCF with the Conservatives nowhere; Manitoba offers a slightly better prospect, and Mr Bracken will himself run there. As for the Maritimes, the most recent provincial election was a serious blow to Conservative hopes. If this summary is sound, Mr Bracken must find a government essentially from the 65 Quebec seats and the 82 in Ontario. But Quebec dissidents are hardly likely to throw over Mr Mackenzie King because of overseas conscription, only to vote for a party which itself hedged cautiously on the subject for years but in 1944 came all out for it.

If the general election is held while the reinforcement issue is still alive, as it was in Grey North in February, Mr Bracken might do well in Ontario. He might capture the majority of seats. But even if the most generous estimate of his gains in that province is made, it is difficult to find anything like a hundred Conservative seats in the whole of Canada. And a clear majority requires 123.

What of the Co-operative Commonwealth Confederation? It swept the province of Saskatchewan last June and built high hopes on the triumph. But it ran a bad third in the by-election of Grey North. Its socialistic creed is not likely to make much headway among the inhabitants of French Canada. Its fortunes depend considerably on the basic issues of the coming election. Its trump card to date is a promise to take steps to prevent mass unemployment, such as that of the recent depression, which it blames on the capitalistic system. If "pie in the sky" or the promise of a "brave new world" of public ownership constitutes the real issue, the CCF may do very well in Ontario and the West. But the task of winning 123 seats west of Montreal is truly formidable, for if Alberta, which has its own special brand of radicalism, is omitted, there are only 137 such seats to bid for. Thus, without an utterly unexpected invasion in force of Quebec and the Maritimes by the CCF,

its chances of forming a majority in the new House are virtually nil.

The Smaller Parties

These three parties are the main contenders. There will be the Social Credit party, contesting all the 17 Alberta seats and a few others on the prairie; the Labour-Progressive (Communist) party, which has already announced its intention of running 70 or 75 candidates; the *Bloc Populaire* in Quebec; and several brands of Quebec Independents. None of these can hope to do more than elect a small block of members. To the extent that they are successful, they make the task of forming a government by one of the three major parties all the more difficult.

This realisation that, to use the slogan of 1935, the Canadian elector faces the choice of "King or Chaos" (or its variant forms, "Bracken or Chaos" or "Coldwell or Chaos") may in the end play a powerful part in deciding the issue. The resurgents in Quebec may come to see that desertion of Mr Mackenzie King might sentence Canada to a unstable government, or threaten to place in power imperialist or socialist parties with which they have little sympathy. It is not inconceivable that such considerations may draw a large number of wandering Quebec Liberals back to the fold.

Banking Trends in Eire

[FROM OUR DUBLIN CORRESPONDENT]

THE monetary circulation in Eire continues to increase. In December, 1944, it amounted to £39,593,839, compared with £36,059,640 in December, 1943, and with £32,011,659 in December, 1942. Of the total circulation £33,063,303 consists of legal tender notes, which are fully covered by the gold and sterling assets. The income-earning assets in the legal tender note fund have grown to £28,010,396 from £9,079,209 in 1940. This increase is the result partly of the general expansion of the circulation, and partly of the substitution of legal tender notes for bank notes which are being gradually withdrawn. The increase in the circulation reflects the increase in the agricultural price level, and in the cost of living, and black market and smuggling activities. There is no evidence that currency is being hoarded.

The deposits of the commercial banks have continued their upward trend, reaching to a new high level of £263,125,413 in December, 1944. Of this total £189,348,962 was in Eire, the balance being in Northern Ireland and Great Britain. This increase in deposits is the result of the lack of investment opportunities owing to the shortage of raw materials. The balance of payments has become very favourable since the outbreak of war, and the accumulation of sterling has shown itself in the expanded deposits in the banks and in the Post Office Savings Bank. The increase in deposits reflects the idleness of money in Eire, and is entirely unlike the increase in Great Britain, which reflects the enormous expansion of public expenditure based largely on borrowing from the banks. There is nothing "inflationary" about the increase in the Irish monetary circulation and bank deposits.

The banks' profits have not risen at the same rate as their deposits. The net profits of all the Irish banks in 1944 amounted to £1,159,587, an increase of £22,512 over 1943, but a decrease of £25,579 compared with 1939. Expenses of administration have risen during the war years. Many of the smaller branches must find it hard to pay their way. In recent times there has been a movement towards a reduction in the number of branches in country towns, many of which are unquestionably "over-banked." Staff salaries have been increased after considerable friction and bad feeling between the directors and staffs. The proportion of deposits on which interest is paid is much higher in Ireland than in England. No official figure is published, but it can be safely estimated at upwards of 75 per cent. The Irish banks are to a large extent savings banks whose customers expect to be paid interest on their deposits.

A Comparison of Assets

As against the influences that have tended to keep down profits, there are certain favourable factors on the assets side of the banks' balance-sheets. Owing to the relatively low degree of liquidity which is justified by the nature of their business, they carry a much larger proportion of high-

yielding assets than the English banks. The following comparison between the distribution of bank assets in Ireland and England is illuminating on this point:—

PERCENTAGE RATIO OF ASSETS TO DEPOSITS (INCLUDING IN IRELAND, NOTES)

	IRELAND	ENGLAND Composite Figures of the "Big Five," Dec. 31, 1944
	September Quarter, 1944	
Cash	17.0	11.0
Money at call and short notice	7.6	3.8
Bills	1.2	3.3
T.D.Rs.	...	38.2
Investments	56.4	24.3
Advances	23.8	17.1

The only really liquid assets in the Irish banks are cash and money at call. The bills are practically all in respect of private transactions, only a very small proportion being Treasury bills. One feature of the Irish balance-sheets that deserves mention is the small extent to which the Irish Government is indebted to the banks. There is no Irish floating debt, and the total Irish Government securities amount only to £8,372,593. This is in striking contrast with conditions in England where the Government has become by far the largest borrower from the banks. Another interesting contrast is to be found in the relation between the capital and the deposits of the banks. The capital and reserves of the "Big Five" amount to £120,386,000, and their deposits to £3,930,000, a ratio of 1 to 32. In Ireland the corresponding figures (including notes) are £17,822,622 and £268,272,478, a ratio of 1 to 15. The paid-up capital of the Irish banks amounts to £8,262,248, and their reserves to £9,560,374. Except in the case of the Bank of Ireland, there are large uncalled liabilities on the shares. In many respects Irish banking to-day is more in line with what used to be regarded as the sound traditions of British banking than are the British banks themselves, which have tended to become more and more the agents for financing Government deficits.

Conserving THE FOOD VALUE of our Milk

FRESH DAIRY MILK consists of two elements—water, which averages 87%, and 'MILK SOLIDS' (fat, protein and milk sugar). As the chart shows, Cadbury's Milk Chocolate retains all the MILK SOLIDS of all the milk used, and only the water is eliminated. It is easily kept and transported and requires no elaborate packaging. It retains the full food value of the milk almost indefinitely without special storage or canning.

The Bank undertakes general banking business and with its numerous branches offers special facilities in Canada, Newfoundland and the United States.

THE BUSINESS WORLD

The Demand for Electricity

THE annual report of the Central Electricity Board for 1944, published this week, rounds off the story of its wartime experience begun in the reports for 1940-43, which were released in a batch two months ago and discussed in *The Economist* of February 17th. In the main, it confirms the impression that the conception of the electricity grid was not only good economics, but also good strategy. It made possible the dispersal of war factories, and it guaranteed a continuity of supply, despite local breakdowns. The loss of output capacity through enemy action was less than had been feared; it never exceeded 400,000 kilowatts at any one time—equivalent to about 4 per cent of installed capacity at "selected" generating stations. With a touch of humour, the report points out that during the four months from August to November, 1940, no fewer than 456 faults in transmission lines were caused by escaped barrage balloons, against 126 faults caused by bombs. Encouraging though the wartime record of the grid has been, the feature of the report, perhaps, is the light it sheds upon the future.

In peace-time, the success of the CEB depends mainly on its ability to forecast the demand for electricity from public supply stations with some accuracy four years ahead—this is the time taken to translate extension schemes into practice. If it over-estimates demand, the resulting surplus generating capacity will raise costs; if it under-estimates the rate of expansion, the resulting shortage of capacity would give rise to no little public wrath. In practice, of course, the Board can allow itself a margin of error in estimation, for, within limits, it can adjust the dates of retirement of old plant. In the past its estimates have been fairly accurate; by the end of 1938 the capital saved through a reduction in reserve generating capacity already amounted to £22 million—equivalent to nearly three-quarters of the capital spent on the grid, on its extensions and reinforcements.

In its latest estimates of the probable expansion in demand during the next four years—that is, up to the winter of 1948-49—the Board takes an optimistic view of demand. In the early part of 1944, it budgeted for 3,394,200 kilowatts of new generating capacity; if all this is additional to the 11,254,000 kilowatts installed at the end of 1944, it would mean an addition of 30 per cent, equal, proportionately, to the increase during 1940-44. The period for which the Board has had to prepare its estimates is a peculiarly difficult one, for it broadly coincides with the period of transition from a war to a peace economy. The assumptions on which the Board's programme has been based are, therefore, of special interest. The assumptions made were:

- (i) That the war in Europe would terminate in the autumn of 1944 and the war in the Far East in the autumn of 1946; in that two-year interval partial demobilisation would occur with gradually accelerating cuts in the production of war material;
- (ii) That "blackout" restrictions would be removed immediately on the termination of the war in Europe, and that the continuance of "summer time" throughout the winter would cease in 1947;
- (iii) That civilian rationing, control of raw materials and the direction of labour would continue on a gradually reducing

scale until 1948, thus permitting of a gradual expansion of production for civilian purposes as war production declined and demobilisation proceeded;

(iv) That about three-quarters of the new industrial capacity created for war purposes would be converted to peace-time use and new housing would be provided for the consequent employed population;

(v) That financial control would be maintained sufficiently to prevent any post-war boom, inflation and consequential subsequent depression;

(vi) That from 1948 onwards, the declared Government policy of full employment would be successfully achieved, and major variations in trade conditions from year to year consequently avoided;

(vii) That the international trade position of the country would be stabilised;

(viii) That a gradual improvement of the internal standard of living would be achieved;

(ix) That no artificial restriction would be placed upon the development of the public electricity supply industry in any of the markets which it served; and

(x) That the large scale re-housing programme announced by the Government would be realised with a consequent rapid increase in the number of electricity consumers connected.

COST AND CONSUMPTION OF COAL AT STEAM-RAISING STATIONS.

If the first part of the CEB's first assumption has gone awry, the Board has erred in good company. The assumption that about three-quarters of the new industrial capacity created for war purposes is likely to be converted to peace-time use seems somewhat high, though not necessarily erroneous. But the last six assumptions (with the exception of assumption (ix)) are large ones—they illustrate the kind of difficulties many business men are up against in planning for the future. (Incidentally, it is difficult to interpret assumption (vii); what does a stabilised trade position mean?)

In the form in which these are stated, many of these assumptions seem to be too optimistic, perhaps even naive, and since the CEB has refrained from publishing the relative values attached to each of them, they cannot be criticised in detail. But they should probably be regarded as determining the maximum demand that the Board is likely to have to meet rather than as cold-blooded prophecies. Moreover, the Board's global estimate of additional needs of generating capacity is not necessarily wide of the mark, even if some of the assumptions should prove to be fallacious. There are a number of powerful factors that will make for a continued expansion in the demand for electricity during the next four years. One of these is the enormous rise in the price of coal in recent years, shown by the accompanying chart. Since coal forms a relatively small proportion in the total cost of electricity because of the high cost of plant and transmission, the steep rise in its price will have the effect of bringing down the cost of electricity in relation to more direct methods of consuming coal. (During the year ended March, 1940, fuel represented 18 per cent of the revenue obtained from the sale of electricity to consumers; the present proportion appears to be some 25-30 per cent.) If the price of electricity were to remain virtually unchanged, with coal costs twice as much as before the war, this would be a potent force in speeding up the process of electrification in the home as well as in industry. True, new electrical

equipment will also be more expensive than before the war; but during the next four years—and, indeed, longer—average overheads will be kept down by the weight of the plant and gear already in existence. But there are other factors probably included in assumption (ix), such as a continued transfer of consumers from private to public supplies, and—though this may not be a decisive influence in the near future—an increase in the capital equipment of British industry which is the chief consumer of electricity. (During the year ended March, 1938, 54.1 per cent of total sales of electricity was used as power by industry, 6 per cent in traction, 39.9 per cent in lighting, heating and cooking.) On a longer view, the prospect for electricity is un-

Insurance in France

SINCE the liberation of France a delegation representing British insurers has visited Paris, and a French Mission has also been in London. During these very cordial exchanges, a good deal of information has been accumulated here concerning the problems confronting French companies during the occupation years and the methods adopted for dealing with them, with the result that the rather vague outline of events previously visible can now be sketched in in considerable, although as yet incomplete, detail. The picture is in general a sombre one, the colour being chiefly provided by the remarkably successful efforts of the French industry to prevent German penetration in the domestic insurance structure. Very serious difficulties arose first through heavy increases in many departments in the cost of settling claims, secondly through a marked rise in working expenses, and thirdly through the disequilibrium produced by the sudden, enforced withdrawal of British participation in the direct and reinsurance markets. The purpose of the present article is to describe as fully as space permits the measures taken to deal with each of these problems and to sum up the situation as it exists to-day.

Of the four main departments of insurance—fire, accident, marine and life—that most severely affected by higher claims costs is undoubtedly fire. To some extent, the influences working in this direction have been similar to those experienced in Great Britain and the United States: concentration of hazards owing to accumulation of stocks at central locations, abnormal pressure on employees and machinery, and increases in values not adequately offset by corresponding adjustments of sums assured and premiums. These influences have been reinforced by other considerations arising directly from the occupation, such as carelessness on the part of troops occupying billets, acts of incendiarism against the property of collaborationists and black-market operators, and—especially from 1942 onwards—sabotage by the resistance movement of property of military importance. French companies were unable, because of price legislation, to introduce rate increases to meet these additional hazards, but rates were in fact steadily improved by a regime of "market discipline" and the application of uniform tariffs. As regards sabotage losses, a law was passed creating a common fund by means of a 15 per cent surcharge on all fire insurance policies, the insurer being indemnified from this fund to the extent of 50 per cent of sabotage losses arising prior to July 1, 1942, and 95 per cent of subsequent losses. These measures have been in the nature of partial palliatives only, and the general indications are that underwriting losses throughout the occupation years were exceptionally heavy.

In accident insurance, companies were able to benefit from rate increases introduced by a decree of December 16, 1942, these including a 50 per cent rise in motor insurance charges. Only in burglary insurance, where rate adjustments were not permitted, were losses high, due to shortage of supplies and acts of robbery by the occupying troops. The fall in income from motor insurance was offset by higher workmen's compensation premiums, and it seems unlikely that the losses of accident insurers, taking the business as a whole, have been severe. In the marine department, the volume of transactions was reduced by the blockade to very small proportions, but such business as there was seems to have been profitable. Life companies have maintained a high level of activity, due to an abundance of cash in the hands of the public and the lack of normal avenues for spending; rates on new policies have tended to rise, owing to the downward movement in interest income. War risks under life policies have been covered at a single additional charge of 1 per cent of the sum assured and compulsorily reinsured in a Pool created by legislation; the

doubtedly one of steady and, probably, fairly rapid expansion, a prospect, incidentally, from which electricity shares stand to benefit. The grid, after having passed its final economic and strategic tests, has become an indispensable part of the British electricity supply system. Within a few years, the CEB can begin to convert its capital—most of which has been borrowed at 4½ and 5 per cent—to a lower rate of interest. The resulting saving in interest will be useful; but, apart from the technical functions of the grid, the main pre-occupation of the CEB must be to ensure a fine balance between the demand for electricity and generating capacity, and the highest possible technical efficiency of generation and transmission.

additional charge is of a provisional nature and will be adjusted on final assessment of the liabilities of the Pool.

All departments of insurance were affected by the rise in operating expenses. An important factor was the necessity to engage new and unskilled employees to replace those who were prisoners of war, yet to whom the companies continued to pay allowances during captivity; this difficulty was accentuated when deportations of French workpeople to Germany began. The division of France into occupied and unoccupied zones also made for additional expense by necessitating the creation of two head offices for each company. Apart from these two special influences, there was also, of course, the general rise in salaries and prices. Measures to combat the upward trend consisted of the elimination of competitive practices, simplification of procedure for handling business and reduction of commission to intermediaries, but in the circumstances of the time these could not be more than partial correctives.

The third important problem with which French insurers had to deal was the loss of stability brought about in fire and marine insurance by the suspension of direct-writing and reinsurance activities of British companies and underwriters at Lloyd's, whose participation in the French market was before the war substantial. This question is intimately

War and Post-war Banking

While the war lasts, the resources of Barclays Bank will be devoted to the fullest possible extent to helping the war effort of the nation.

When the war is ended, the Bank will add its full weight to the forces of restoration. To ease the transition from war-time to peace-time conditions, customers will find the same progressive outlook, the same courtesy and sympathetic understanding of their banking needs and the same high quality of service which have kept the name of Barclays Bank in the forefront of British banking for generations.

The small business man and manufacturer will have the active co-operation of the Bank in solving his financial problems, no less than the large merchant and industrialist.

BARCLAYS BANK
LIMITED

Head Office:

54, LOMBARD STREET, LONDON, E.C.3.

linked with the largely successful efforts made to protect both French and British interests against the incursions of the German offices. As regards fire insurance, steps were immediately taken for the formation of an association of automatic obligatory co-insurers for the handling of large risks, but this was vetoed by the Germans, who naturally saw in it a threat to their own intentions; nevertheless, the French companies were able by co-ordination of their efforts to utilise to the maximum their own resources, and thus minimise their dependence on German reinsurance support. In the case of marine insurance, reinsurance facilities against both ordinary marine perils and war risks were provided by the state, but this reinsurance was superseded, as regards ordinary risks by the formation in August, 1941, of a compulsory Pool of non-marine insurers; here, again, German penetration was kept at a minimum. German companies entering France for direct operations had, moreover, to comply with deposit legislation. It is thought that the security thus afforded will suffice to cover all the liabilities of German companies at the time of liberation in respect of both direct and reinsurance operations; in this respect the situation left by the German expulsion is very much better than that in Belgium or Holland.

What was the fate of British pre-war interests in the French insurance market? Covers placed in London, which included both direct insurances and reinsurances, were, of course, regarded as cancelled. Many policyholders also replaced insurances negotiated through the branch and agency organisations of British insurers in France, but others continued to keep these policies going. The French authorities immediately appointed provisional administrators of these businesses; the administrators were heads of firms accustomed to supply trustees in bankruptcy, and as they were in general without technical insurance knowledge the ordinary day-to-day work continued to be performed by the British insurers' representatives under their direction. This step was taken by the French before the Germans actively intervened in the French economy, and the Germans found it expedient to recognise the appointments, later nominating their own *Verwalter* to exercise a power of supervision only over the acts of the French administrators. Under a law of September 12, 1940, British insurers could contract no new engagements, but policies issued by "controlled" insurers—that is to say, insurers who had made the deposits required to transact life, workmen's compensation and motor business—could be maintained in force; other classes of policy could also be continued, but the policyholder had the right of suspension. A later law of August 27, 1941, withdrew the right of suspension if sufficient guarantees could be furnished for the fulfilment of current contracts. In practice, virtually the whole of British insurers' business was at that time reinsured in full with German and Italian companies, the British policies, however, remaining in force. The German companies hoped in course of time to replace the 100 per cent guarantee of British contracts by their own direct policies, but in this they failed. The volume of business which British insurers' representatives thus continued to handle was small—probably not more than a tenth of pre-war commitments—but the measures taken did enable them to keep their goodwill and organisation largely intact.

In the immediate future, the support and understanding of British insurers will be essential to the maintenance of a strong and healthy market in France. French companies have shown every desire to assist their British *confères* to re-establish their former portfolios. British insurers, for their part, have been almost unanimous in their willingness to step in and meet the needs of the French situation, although it must be admitted that the immediate outlook is far from promising. Reinsurance treaties have already been negotiated and direct operations are being started again as the necessary legal formalities are fulfilled. British insurers have also promised their support of the French rating structure, and it is recognised that, for some years at least, a rather strict discipline must be enforced in order that the financial position of French companies shall not be jeopardised.

It cannot be denied that there are elements in the present French situation which British insurers find distasteful. The trend towards increasing control of insurance undertakings is, perhaps, to some extent a continuation of tendencies already in evidence before the war; but British insurers feel that control and regimentation should be kept within limits. It had, for example, been hoped that the Pool providing for compulsory reinsurance of marine risks with non-marine companies—to which reference has earlier been made—would have been wound-up as soon as the circumstances which brought it into being had ceased to exist, but it seems that the present intention is to continue the Pool, an intention dictated by the desire to develop a larger French marine market and influenced, there can be little doubt, by the purely fortuitous circumstance that the results have so far been profitable. A continuance of such results can hardly be expected, and it is undoubtedly bad policy to compel non-marine companies to participate in a sphere of operations for which they are not equipped and the results of which might conceivably impair the security of their ordinary policyholders. There should be other and sounder ways of retaining for French companies a larger share of premiums on French hulls and cargoes while enjoying the benefits, at times of heavy experience, of the international distribution of risks.

Another measure which British insurers find uncongenial is the Algiers Ordinance of March, 1944. This involves a degree of state penetration beyond anything introduced in Metropolitan France. It creates an *Office des Assurances Privées* having the responsibility for supervision of private insurance while also engaging in business for its own account, and to which private insurers may be compelled to cede 5 per cent of their acceptances. The potential evils of a situation of this kind need not be elaborated. Another feature is the requirement that each insurer must control all its French Colonial affairs from a single office located in one of the Colonies—a rule with which British insurers have found it impossible to comply. It must be hoped that in the near future state supervision will be either transferred to the individual territories concerned or centralised in Paris and that state insurance will be confined to those fields for which it is best suited. The friendly relations already established give grounds for the belief that these and other matters will be adjusted in a spirit of understanding so that the co-operation already initiated may be maintained and extended.

Business Notes

Hydrocarbon Oil Duties

The Hydrocarbon Oil Duties Committee has taken a broad and enlightened view in its report (Cmd. 6615), published last week, despite its restricted terms of reference. It was asked to report upon the effect of the hydrocarbon oil duties on the development of the chemical industry in this country, and upon the extent to which any change in these duties would affect industries engaged in the production of similar products from coal. Hydrocarbons are essential industrial raw materials which, paradoxically, are heavily taxed. The *ad valorem* incidence of the light hydrocarbon oil duty at the pre-1938 level of 8d per gallon was of the order of 200 per cent.

The Committee is fully alive to the fact that the synthetic organic chemical industry of the world stands at the opening of a period of great expansion. Chemicals are forming increasingly basic raw materials of many major industries, such as synthetic rubber, synthetic textiles and plastics. The Committee also recognises that coal and oil are largely

complementary as a basis of the growing organic chemical industry. In its view it is, therefore, imperative that basic and intermediate raw materials should be made abundantly available, and that the industry should be free to choose the best material for each particular process or synthesis, guided only by scientific and technical considerations. It emphasises the danger that, if the present position is maintained, fiscal, rather than technical, considerations will dictate the future course of development, even possibly to the extent of stifling entirely certain lines of progress.

The Committee, therefore, recommends that the chemical industry should be able to obtain its imported raw materials free of duty and its home-produced materials at the price of imported ones. Although the use of hydrocarbon oils as solvents is outside its terms of reference, the Committee thought fit to draw attention to the growing use of solvents as raw materials in industry. Finally, the Committee made it clear that the reduction in the price of the raw materials of the chemical industry may not be enough. The most im-

portant raw materials of the oil-based section of the chemical industry consist of gaseous hydrocarbons, some of which are virtually untransportable, while others can be imported only at a cost exceeding the cost of their production in this country from imported oil. This raises the whole issue of whether it would be advantageous for this country to establish a petroleum refining industry which would furnish gaseous hydrocarbons as by-products. This, again, is a matter beyond the Committee's terms of reference. But if Britain is to take an active part in the development of the oil-based chemical industry, it is hardly one that can be left in abeyance.

Cablemakers' Merger

For many years it has been a matter of doubt how far competition was fully effective among the members of the cablemakers' group in this country. There was certainly a large measure of co-operation in all matters relating to research and some co-ordination of price policy. Recently there have been reports of a merger of interests, and these are now confirmed by the news that British Insulated Cables and Callender's Cable and Construction Company are to amalgamate. The step is taken as being likely to improve the group's position in the export trade and to assist in ensuring stability of employment. The products are largely similar and some economies of production ought to emerge, although this point is not specifically mentioned. The firms are two of the largest in the cable industry, but there remain others of comparable size.

The basis of the merger has been determined by four distinguished chartered accountants, and it is relatively simple, although not quite in accord with market valuations over a period of years. Each company has two classes of cumulative preference capital, of which the senior will be exchanged into a 6 per cent first cumulative preference in the new concern and the junior into a 5½ per cent second cumulative preference. The basis of exchange is such that the income from each shareholding will be maintained, but there is no mention in the preliminary statement as to what allowance, if any, is to be made for the fact that this will mean an appreciable increase in the capital of preference holders in Callender's. It will be noted that, although both old companies are to be liquidated, no advantage is taken of this opportunity to reduce the high rate of interest paid on the preference capital or to make the new capital redeemable.

If any question is to arise, it will be over the terms offered for the equity. Ten-year averages show the following picture for the two concerns:

	Paid on Ordy.	Earned on Ordy.	Mean yearly price. s. d.	Current quota- tion. s.
British Insulated*	20	29.8	95 6	114
Callender's	17	35.3	78 9	117

*There was a capital bonus of 20 per cent. in 1937 for which no adjustment has been made.

This would seem to suggest better terms for the former, but British Insulated receive £30 ordinary in the new concern for every £10 now held, while Callender's receive £27 and retain the full interest in Callenders Trust. That company is to receive in exchange for certain of its investments the equivalent of almost a further £2 for every £10 in the ordinary capital of Callender's, so that, if the remaining assets of the trust are substantial, there is little difference in the terms for the ordinaries of the amalgamating companies.

Coal Charges Account

The Government has now published in White Paper form (Cmd 6617) a historical and factual review of the operation of the Coal Charges Account since its establishment in June, 1942. The whole question of coal finances was examined in an article in *The Economist* of December 23, 1944, and the White Paper completes the statistical picture and brings it up to date.

The Account is fed by a levy on all coal mined and payments are made out of it to individual undertakings to meet the cost of various measures taken during the war. The levy has been progressively raised from the initial amount of 7d. per ton in June, 1942, to 12s. in August, 1944. The payments out of the Account have exceeded its receipts; the deficiency at the end of 1944 amounted to £25,722,157, or 1s. 1.5d. per ton. The great bulk of the Account has, of course, been devoted to meeting increases in wages. The

White Paper shows that, while the total costs of coal production increased by 108 per cent over 1939, wages alone rose by 126 per cent and other costs by 73 per cent. Between June, 1942, and December, 1944, the cost of wage additions borne by the Account amounted to 3s. 9d. per ton, compared with 2s. 9d. per ton for price allowances, 3½d. per ton for assistance to necessitous undertakings, 1½d. for guaranteed "Bevin" wage, and 4½d. for other items, including transport services, improvements in miners' housing and the cost of running hostels, workmen's compensation payments and administrative expenses.

The report gives some indication of the extent to which the more prosperous districts have been subsidising the poorer districts. Thus Leicestershire, Warwickshire and South Derbyshire in 1944 contributed 3s. 7d., 2s. 7d., and 2s. 4d. respectively to the Account, whereas South Wales recovered 7s. 11d., Durham 3s. 9d., and Lancashire and Cheshire 3s. 4d. This national pooling of district costs has, undoubtedly, been one of the most important features of the scheme, and some measures to cope with the situation it reflects will have to be incorporated in any permanent reorganisation of the industry.

Another interesting fact which is disclosed is that up to the end of 1944, a sum of £2,522,000 was expended in capital assistance to colliery undertakings. Of this, £1,509,000 is represented by mining machinery for the American method of working; the machinery is owned by the Government, but leased to the undertakings on the basis of 15 per cent per annum for underground and 12½ per cent for surface plant. The future disposal of these machines has not been decided, but they clearly represent the beginnings of State investment in the industry.

The Coal Charges Account is to continue until April, 1948, when the mining wages agreement concluded last year is due to expire, unless of course a decision on the ownership and financial structure of the industry is taken in the interim. The Account has been an indispensable wartime arrangement, but whether it ought to continue without modification in peacetime is open to doubt. Though some form of national pooling such as it provides may be essential, the Account as at present organised tends to preserve the inefficient undertakings, which would normally be expected to disappear. Presumably the scheme will be modified if the technical and financial reorganisation, area by area, contemplated by the Reid committee, is carried through.

Stability of Building Employment

The National Joint Council for the Building Industry has just concluded a national agreement on the payment of wages, which should have an important effect on the stabilisation of employment in the industry after the war. Before the Essential Work Orders were introduced, building operatives had little security of employment, and frequently suffered loss of wages through bad weather conditions, irregularity in delivery of materials and similar circumstances, while the employers lost the advantages of continuous operation and maximum output. The Council has now agreed to introduce a system of payment, whereby any operative whose work has been interrupted as a result of bad weather shall be paid at his current hourly rate for half the time lost during the period when work was stopped, and shall receive payment, however many hours he actually worked, for a guaranteed minimum of 32 hours in any one week.

This means in effect that the principle of the guaranteed weekly minimum wage laid down in the Essential Work Order is to be carried into the post-war period. Though there has been a great deal of discussion about the application of this principle after the war, the building industry is actually the first to put it into practice, and has thus provided a valuable precedent for other industries where casual conditions of employment obtain. The successful operation of this agreement, which has been incorporated in the industry's working rules, depends largely on the extent to which continuity in the delivery of supplies can be maintained, and on the provision of protection against bad weather. It also clearly calls for the maximum co-operation of all concerned in the industry.

The wartime record of industrial relations in building has been exceptionally good, and largely owing to the smooth working of the industry's conciliation machinery, the amount of time lost through disputes has been negligible. But building, more than any other single industry perhaps, will enter into a critical phase at the end of hostilities, with the return of men from the Services and the influx

of new entrants. For some time, demand for labour will exceed the supply, and thus place building operatives in a strong bargaining position. It is all to the good that the Joint Industrial Council should have taken measures well in advance to promote stability. It should be recognised, however, that the maintenance of the guaranteed week will add to costs. This is no argument against it, but it reinforces the need for greater efficiency in building.

Gilt-Edged and TDR's

In commenting on the monthly return of the eleven clearing banks last week, attention was drawn to the fall of nearly £40 million in the aggregate of investments from the peak level reached last November. It appears that there have been further substantial sales by the banks this week. On Monday the gilt-edged market suddenly lost its resilience and prices were marked down by anything up to three-sixteenths, a fall that may be attributed, in the main, to relatively heavy selling by the banks. On Tuesday falls up to one-eighth were recorded, but on Wednesday and Thursday prices were fairly stable at the lower level.

While the general factors discussed last week—a desire to lighten books while the market for “longs” remained strong; the probability of a Victory savings campaign in which the banks would be expected to invest heavily; the rise in advances—were still operating, the proximate cause of the selling this week lay elsewhere. The banks this week had obligations for £150 million of new Treasury Deposit Receipts, against nominal maturities of £120 million. As a result of prior encashments to meet subscriptions to Government issues, the actual amount of “fresh” money which this entailed amounted to between £55 million and £60 million. The extent of this call came as a shock to the money market. Indeed, certain banks are understood even to have made representations to the authorities that the amount was too high.

The Treasury, however, stuck to the original figure and the banks had to look around for the requisite balances. As one of the large banks was undertaking its monthly making up operations on Tuesday, while credit had been little more than adequate at the end of last week, discount houses rather expected that this would entail such a shortage of credit that the bank's agent would have to intervene with special buying of bills. Even though it was realised that the banks would have much less in the way of tax payments now that the financial year has turned, the call was still considered unusually heavy. Up to the time of going to press, however, credit has remained comfortable, and it seems that the banks have circumvented their difficulty in meeting the TDR call by selling some of their investments rather than by running down further their bill holdings. A further factor, which may help to account for the lightness of money is the demand of the market for the maturing Australian stocks. In this connection, it is to be noted that the Commonwealth Bank has called substantial sums.

British Exports to America

In a letter published in *The Economist* of April 14th, Mr John W. Waterer pointed to the hindrance in the way of British exports to the United States arising from the fact that Purchase Tax is taken into account by the American customs authorities in computing their value for import duty. The basis of assessment has been a matter of some controversy in the United States. To begin with, the American customs authorities, indeed, added British Purchase tax on customs authorities, in deed, added British Purchase Tax in computing the value of goods as a basis for the assessment of duties.

As long ago as January 14, 1944, the United States Customs Court decided, however, that the Purchase Tax should be disregarded in the assessment of duties. But this decision was not final. In fact, the American Government decided to appeal against the judgment to the Appellate Division of the Customs Court. This Court has now upheld the original judgment. Unless the American Government takes further action—it has 60 days in which to appeal—one of the obstacles in the way of British exports to America will thus have been finally removed.

War Damage to Patentees

The Departmental Committee, appointed a year ago to report on various aspects of the Patents and Designs

Acts, was particularly requested to give early consideration to questions of legal proceedings arising out of them. This may explain why the Committee's first interim report deals with an aspect of the matter which seems of little importance, although, if its importance is granted, the need for early action is self-evident. The point in question is the easing of legal process in those cases where a patentee, who, as such, has suffered loss or damage owing to the war, seeks an extension of the life of the patent under the Rules of the Supreme Court. All ten members of the Committee agree in finding the present procedure—application to the court by originating summons—unnecessarily cumbersome and, one may infer, wasteful of time and money.

The Committee is therefore unanimous in recommending a modification, and in suggesting that the Rules Committee of the Supreme Court be invited to modify the Rules relating to advertisement. With two dissentients, Messrs James Mould and John Venning, they further recommend giving the Comptroller jurisdiction so that the patentee may have the option of applying either to him or to the court, but with the right of appeal from his decision. The dissident members feel that this recommendation violates the principle that judicial functions should be conferred on executive officers only in cases of overriding necessity or expediency. This seems to suggest that these members have some doubts about the importance of action. It is, indeed, a little difficult to see why, from all the many injustices which have arisen from the war—many of them harmful to the national effort—this one should be singled out for special attention. That it has been tends to strengthen the view that monopoly is held in great regard in high places.

Stock Exchange Reform in South Africa

The full text of the Bill regulating stockbroking in the Union of South Africa is not yet available in this country, but a very full summary suggests that the measure is calculated to effect a very marked reform. Its three main provisions are the licensing of both stock exchanges and individual brokers who are members of no exchange, the fixing of margins and insistence upon the auditing of brokers' accounts. Most of the other provisions are ancillary to these, including limitation of the right to lend against securities.

So far as the general licensing provisions are concerned, they will mean, in effect, that there will be no immediate challenge to the quasi-monopoly of the Johannesburg Stock Exchange, but this is only because there is, with one possible exception, no effective demand for another exchange. They also mean that the “outside broker,” as the term is understood here, will cease to exist. Since all licences are granted for one year only, the Minister will be able to maintain a very tight control. The control is, however, limited to seeing that the requirements of the bill are fulfilled and the opportunities for arbitrary action appear to be reduced to a minimum. In the case of the stock exchange licence, the rules of the exchange have to be approved by the Minister and may not be altered without his consent.

In the matter of audit, a panel of auditors will be compiled by the Minister, and it is to be hoped that admission to the panel will be made reasonably easy for small concerns of good reputation. Forms of accounts are prescribed and a detailed auditors' certificate, but not the accounts themselves, must be sent, to the Minister in the case of brokers not members of an exchange, and to the committee of their exchange for other brokers. In the past it has been usual in the Union, as throughout North America, for large sections of the population to gamble on the stock exchange on very narrow margins. The new bill lays down that the minimum margin in future shall be 40 per cent in cash or, in effect, two-thirds cover in securities. As already mentioned, the right to lend against security will be limited to those holding a licence.

The general effect of the regulations, if they become law in their original form, will be to create by Government action in the Union a state of affairs very similar to that which has been painfully evolved by agreement among brokers in this country. The new bill evidently owes a great deal to the recommendations of Mr H. B. Turle, who was specially asked to advise the Government on this matter and on the control of unit trusts. Mr Turle has for some fifteen years been a member of the London exchange

and has also long experience of conditions in Bombay, where speculation is even more rabid than in South Africa.

A Raw Cotton Cartel?

The meetings of the International Cotton Advisory Committee, which opened at Washington on April 2nd, and, after an adjournment to await the arrival of the Brazilian delegation, were resumed last week, have ended in a half-hearted compromise. The Committee was formed by the raw cotton producing countries in September, 1939, on the initiative of the U.S. Government,

to observe and keep in close touch with developments in the world cotton situation and to suggest to the various Governments concerned as and when advisable any measures it considers suitable and practicable for the achievement of ultimate international collaboration in the solution of the world cotton problems.

After three meetings in April and October, 1940, and in April, 1941, the Committee had not met until this month and, for all practical purposes, it had been regarded as dead. Its revival by the US Government, following the adoption last autumn of its cotton export subsidy programme, was presumably due to the desire of the United States to explore the prospect for the formation of an international raw cotton cartel. The Committee itself, being a purely consultative body, could not have made any binding decisions, but if its discussions had shown a fair measure of agreement it could have recommended the convocation of a world conference to adopt its draft plan. Difficulties appear to have arisen, for the Washington conference merely decided to recommend that a special study group should be formed to formulate proposals for international collaboration in the disposal of the world cotton surpluses, which the conference regarded “as preferable to any form of unilateral action on the part of the individual exporting nations.”

The absence of definite recommendation appears to have its basis in two facts. First, the cotton-importing countries were not represented at Washington; without their collaboration no rational world scheme is possible. Secondly, the interests of the various cotton producing countries in any possible “cartel” are not necessarily similar. The United States, by sponsoring international collaboration, which in practice can only be workable on the basis of an export quota scheme, intends to regain part of its lost markets, and the cartel project, prepared last year by its Department of Agriculture, consequently suggested that the export quotas of the various surplus countries should be based on the position as it existed in the thirties. Producers in other countries would sacrifice much by accepting a scheme which is not founded on the present position. They have made much headway—at the expense of the United States—during the past ten years and they hold to-day the greater part of the world's raw cotton stocks. Before an international agreement can be arranged, the various producing areas must be able to come to terms about the basic period for their quotas, and it is revealing that the Washington conference has not led to an agreement.

Meanwhile, the deliberations of the conference have made it clear to all cotton producing areas that they are facing serious difficulties. A report, adopted by the meeting on April 12th, made it clear that raw cotton supplies this season exceed 51 million bales, while prospective world consumption in 1944-45 will only be about 24 million bales. The exportable surpluses of the producing countries on August 1st next will be 19,500,000 bales, which compares with “normal exports” of about 13 million per season. During the current season, however, world exports are expected to total no more than 3,500,000 to 4,000,000 bales, and the conference anticipated that, despite an improvement, shipments in 1945-46 will remain far below normal. As surpluses are still tending to increase, it was only natural that the conference decided that the possibility of international collaboration in the disposal of world surpluses should be further explored by the proposed study group.

World Cotton Textiles

Brazil is making an important contribution to the world supply of cotton textiles. Altogether, Brazil expects to export 500 million yards during the next twelve months. The Combined Production and Resources Board have just announced that arrangements have been made for liberated areas, chiefly

in the Far East, to receive from Brazil 80 million yards of cotton fabrics. UNRRA is to receive 90 million yards for distribution, French North Africa 60 million, and another 60 million is to go to other export markets. The remaining 200 million yards will cover commercial commitments made before the CPRB Textile Committee went to Rio de Janeiro.

Production for export of such a quantity of textiles will strain the capacity of Brazilian mills, much of whose equip-

COTTON PIECE GOODS: PRODUCTION AND EXPORTS
Million Sq. Yards

	1937		1942	
	Production	Export	Production	Export
United Kingdom	3,806	1,921	1,850	485
United States	9,321	236	12,000	450
India	5,548	120	5,800	940
Brazil	900	7	1,400	250

ment is out of date. Negotiations for modernising and increasing their looms have been proceeding for some time with American manufacturers of cotton spinning machinery. Brazil probably has the world's largest stocks of good quality cotton; manufacturing capacity is the bottle-neck in the supply of needy areas.

Brazil has become an important cotton manufacturing centre. Its growth, in relation to the leading cotton industries, is illustrated in the accompanying table. Even before the war Brazil was able to supply home demand, and the increased production has been almost entirely exported. It is estimated that Brazil's production of cotton piece-goods in 1943 roughly equalled Lancashire's.

French-Swedish Financial Agreement?

In the course of a broadcast on April 7th, the French Minister of Finance and National Economy, M. René Pleven, announced the forthcoming visit of a French Commercial Mission to Sweden. The object of this Mission is

Throughout the world the name of **MILNERS** is a synonym for **SECURITY**. The same sound craftsmanship which has made **MILNERS' SAFES** and **STRONG-ROOMS** so universally respected is embodied in **MILNERS' STEEL EQUIPMENT**, which is designed to promote office and factory efficiency. When peace returns **MILNERS' organisation** will be ready to resume its world-wide service, using past experience to ensure efficient designs for the future.

MILNERS SAFE CO. LTD., 21, HAMPSTEAD LANE,
LONDON, N.6 Telephone: MOUntview 6655.

to negotiate a financial agreement with Sweden in line with the agreements already concluded with Belgium and Switzerland.

The initiative taken by the French Government is a reflection of its desire to re-establish commercial and financial relations with other countries as quickly as possible. Even more than those of Great Britain, French exports to Sweden are likely to be severely limited, at any rate in the near future. France, on the other hand, is anxious to purchase in Sweden timber and timber products, machinery and other commodities. Britain has only recently concluded a financial agreement with Sweden; it will be interesting to see the terms on which France and Sweden will agree to resume economic relations.

Consolidated Accounts

It is usual to look to Sir Percy Bates for some striking views on the shipping position. This year, in his statement to shareholders of the Cunard Steam Ship Company, he limits his remarks to a statement that the right to build what one wishes is largely restored, but that prices are so high and so uncertain that building programmes must be limited. He has, however, raised a considerable storm in another matter: that of the consolidated balance-sheet.

This is a matter of very substantial importance, far transcending the interests of the Cunard group. He says:

For some months we "combined" some of our domestic board financial returns, but after a few months we returned to our older practice. We came to the conclusion that the "combined" figures in our domestic returns were either misleading or at best meaningless. We shall continue to consider the subject, but my present opinion is that to "combine" figures of a 62 per cent subsidiary with those of 100 per cent subsidiaries will produce in a balance sheet a result quite as meaningless as it did in the board's domestic returns.

There is no information about the nature of the domestic returns, and it can readily be conceded that, if the old procedure was to have a detailed statement of the position of the parent and each of the subsidiaries, that would yield a more exact result than a consolidation. But that would not justify the expressions used. Further, if it did, Sir Percy would have advanced an argument for publication of the full accounts of all subsidiaries, and their subsidiaries *ad infinitum*.

That is, on a strictly accounting or mathematical basis, possibly, the only real solution. But it may be doubted whether it is really necessary. If the public has any direct holding whatever in the loan or share capital of a subsidiary, its accounts should be published. If it has not, it is a matter of interest to know how any important subsidiary is doing, but it is not of vital importance to the shareholders of the holding company. Furthermore, the decisions of those responsible for policy will—or should be—the same whether they hold 100 per cent or 72 per cent. So far as the accounts are concerned, the gross figure in a consolidated profit and loss account will be the same in either case, and fluctuations in the fortunes of the partially held subsidiaries will be reflected in variations in the amount going to outside holders.

A number of witnesses before the Cohen Committee, including the Stock Exchange and the Institute of Chartered Accountants, recommended the adoption of consolidated accounts, and the former body accepts them as a basis for granting permission to deal. Neither of these bodies believes that they are more than a workable compromise, but neither would advocate them if it did not believe that their intelligent use is helpful. It is common for directors to state that anything less than fully detailed accounts is misleading. That is true enough, but, provided the limitations of any given accounts are realised—and they are usually evident enough—the more information they contain the less completely misleading

they are likely to prove. In particular, the accounts of a holding company with no figures for operating subsidiaries are usually quite uninformative and may be grossly misleading. Consolidation, reasonably applied, offers a fair compromise solution.

ICI Earnings

The preliminary statement of Imperial Chemical Industries for 1944 shows a rise in profits, after tax, obsolescence and depreciation, from £6,685,345 to £6,972,988. This is the highest figure since 1939 and, if the balance is struck before obsolescence and depreciation, which has taken £2,500,000 in each of the past two years, a new high level of earnings is revealed. Doubtless this fact reflects an increase in the capital employed and, it would seem, a substantial one. The improvement brings no immediate benefit to shareholders, whose dividend is maintained at the usual figure of 8 per cent by a final of 5 per cent. On this occasion the bulk of the money not required to meet dividends is absorbed in providing an additional £1,000,000 for obsolescence and depreciation, whereas a year ago £774,210 was placed to war contingencies reserve and £100,000 carried to war personnel reserve. It is doubtful how far any of these provisions can be regarded as free reserves or how far they are essentially expenses of the business. All that is reasonably certain is that there is little chance that they, or other reserves, will be used to increase the dividend. At the present price of 39s. 9d., ex dividend, the £1 units of ordinary stock yield some £4 os. 6d. per cent, a return which suggests certainty of income rather than the expectation of increased dividends or capital appreciation.

Peace and Prosperity

At the annual general meeting of the Federation of British Industries on April 11th, Sir George Nelson, the retiring president, made his farewell speech. He took as his theme "Peace and Prosperity." Although he confined himself largely to an expression of aims, Sir George Nelson emphasised a number of points which have had little room in previous speeches of this kind.

Sir George Nelson emphasised that in an industrial community for greater efficiency; and he recognised the fact that other countries will develop new industries which may be in competition with existing British industries. Encouragingly, he expressed the view that in the long run "the more our customers develop their own economy, the more will they be able and willing to buy from us." He recognises that the nature of British exports will change and that this will hurt certain established interests, but he accepts this trend as inescapable if Britain is to increase the volume of its exports as a whole.

Sir George Nelson emphasised that in an industrial community both workers and managers have duties as well as rights. It is the responsibility of employers to ensure that their equipment is the best possible, that research is not neglected, and that initiative is displayed and risks are taken to maintain British industry in the forefront. But enterprise and initiative must be encouraged by an adequate reward for success. Addressing himself to labour, he emphasised the need for accepting new methods and processes of production as a means to an increase in efficiency. As a reward, workers in their turn will derive higher earnings from an increased output per head.

Sir George Nelson, in fact, expressed the right aims. It remains for the industrial community to translate them into practice.

Royal Insurance Capital

The directors of the Royal Insurance Company, Limited, announced that it had been decided to recommend to the annual general meeting to be held on May 30th that the sum of £2,099,973 15s. be applied out of the undivided profits of the company in discharge of the amount uncalled on all issued shares, thereby extinguishing the whole of the outstanding liability; the 5,599,930 £1 shares would then be converted into stock in £1 units. In order to finance this operation, which involves finding 7s. 6d. for each £1 share, the directors will presumably utilise part of the funds standing at credit of profit and loss account, which at the end of 1943 amounted to £2,700,127. The financial position of the Royal is strong, with free reserves—apart from the profit and loss balance—totalling £10,100,000, and the present recommendation clearly reflects the conviction

of the directors that the risk of a call on the shareholders is so remote that it can be ignored. Other insurance companies, notably the London and Lancashire and General Accident, have in recent years used undivided profits for the purpose of paying up a larger proportion of their capital. The Royal has, however, been something of a pioneer in this matter. In 1882 the shares were of £20, of which £3 was paid up, including £1 from profits. In 1919 they were £10 shares with £2 paid, but whether the additional 10s. a share had been called or provided from reserves is not clear. Since then the process of splitting and paying up out of profits has continued until now the whole of the callable capital has been paid up out of reserves.

War Risks at Sea

A change of some importance has just been made in the insurance of war risks at sea. A fresh scale of rates has been issued by Lloyd's underwriters and companies, and for the first time their rates on cargo to and from the United Kingdom are gross, the same as those of the Government. As these new rates are subject to discount, the change means that it is now cheaper to insure war risks at Lloyd's or with a company than to insure them with the Government. Except on rare occasions, the market rates for cross voyages (voyages to and from places other than the United Kingdom) have always been cheaper than the Government's; but the United Kingdom rates in the market have been maintained at a higher level, and in practice the Government has had all this business. Henceforth, it would naturally go to the market, but for one fact. The Government office may give cover against war risks between the warehouse and the ship in the United Kingdom, but underwriters and companies are prevented from giving this cover by Section 10 of the War Risks Insurance Act, Part 2, which makes it illegal for any one but the Government to insure against war damage any persons carrying on business in the United Kingdom as sellers of goods. This Act, combined with two market agreements, has made it impossible for underwriters to cover the risk in transit between warehouse and dock—and the impossibility remains. Merchants therefore have to choose between losing the advantage of the cheaper market war rate at sea and losing cover for their goods on land. It is rather a futile dilemma; and the Government would be doing a useful and sensible thing if they agreed to accept the transit risk on land as a separate insurance, and allow the merchant to cover the sea war risk in the market.

Ice-Cream

Not long ago the House of Commons was talking about "putting a ceiling on carpets"; now there are hints of another strange phenomenon—a black market in ice-cream. The summery weather and the good news have combined to put many Londoners into something like festive mood, and the demand for ice-cream, a traditional expression of the holiday spirit, has been brisk. In this sellers' market some vendors are charging exorbitantly for sub-standard wares and are taking profits, it is alleged, as high as 700 per cent.

Reputable manufacturers and various Food Control Committees are anxious that the racket should be eliminated by the control of maximum prices and the imposition of a standard fat content. Austerity ice-cream should contain about 14 per cent of fats, and sugar, margarine, milk powder, dried eggs or egg yolk, gelatine and flavouring. Sub-standard ices contain twice as much hydrogen as oxygen, but little else.

If prices are not controlled, or unless ingredients are released in larger quantities, the April prices of 6d. or 1s. per tub, cornet or wafer will soar throughout the summer and will mar many a holiday. The Ministry of Food should handle this popular concoction as it handled that composite item, the common sausage—by defining its contents and controlling its price.

Shorter Notes

The statement in a note of page 484 of last week's issue that the payment to the proprietors of the Stock Exchange during the last war was 13½ per cent, tax free, should have read £13½ per share, tax free. The shares were then well under the present figure of £36 paid. If the percentage return seems high, it must be remembered that the shares carry an unlimited liability. As a result, in part, of the new policy now publicly announced, the shares have fallen some 20 points in recent weeks to just over £100.

The British Federation of Commodity and Allied Trade Associations has submitted to the Chancellor of the Exchequer a memorandum on the ill-effects of surtax in relation to partnerships, sole traders and certain controlled private limited companies. Relief from surtax is sought on certain sums placed to reserve. The arguments in favour of such relief are essentially the same as those to which reference was recently made in *The Economist* in the case of Stock Exchange firms. But in this wider context they have added weight, because a continuance of existing arrangements is already causing a substantial loss of foreign exchange. While the exact extent of relief may be a matter of argument, there is no doubt that, if relief is not granted, sections of enterprise will be driven to adopt the public company organisation, with great loss of flexibility and, probably, income from overseas and no gain to the revenue, as against granting relief to the existing partnerships.

UNION CORPORATION LIMITED

(Incorporated in the Union of South Africa.)

ABRIDGED REPORT OF THE DIRECTORS FOR YEAR 1944.

The Accounts are drawn up in Union of South Africa currency. United Kingdom currency being taken at par.

The profit is £701,344 5s. 6d., plus £115,002 13s. 3d. brought forward, making a total of £817,306 18s. 9d. The Directors have placed £75,000 0s. 0d. to the credit of Exploration Reserve Account. A final dividend of 5s. 6d. U.K. currency per share was declared absorbing at par £423,500 0s. 0d., making, with the interim dividend of 2s. 6d. per share a total distribution of 8s. 0d., or £816,000 0s. 0d. for the year, and leaving £128,506 18s. 9d. to be carried forward.

Holdings of Shares, Debentures and other securities have been taken into the Accounts at cost or under, but in no case above the market price of December 31st last, or, where no market price exists, above the Directors' valuation. At present market prices, these holdings show a very substantial surplus over the amount at which they stand in the Balance Sheet. The Directors, as on other occasions, have thought it expedient to provide for contingencies by reducing the book cost of certain holdings both below cost and below market price.

GOLD INTERESTS.

A summary of the operating results for the past year of the companies in the Witwatersrand in which the Corporation is largely concerned is given in the Report.

OTHER INTERESTS.

BAY HALL TRUST.—The dividend for 1944 was 7½ per cent., against 7 per cent.

BRITISH ENKA.—Progress and profits were again well maintained. CONSOLIDATED AFRICAN SELECTION TRUST.—Diamond sales have continued on a substantial scale and the Company paid 1s. per Ordinary Stock unit free of tax.

RHODESIA.—Roan Antelope again passed its dividend. Mufulira paid 1s. 6d. per share and Rhodesian Selection Trust paid 5d. per share. SAN FRANCISCO MINES OF MEXICO.—The year's results were adversely affected by a workmen's strike and by exceptional rainfall. In addition a serious shortage of railway trucks led to large stocks of concentrates being accumulated at the mine. The net profit for the year to 30th September, 1944, after charging taxation and reserve for Exploration, amounted to £36,404, against £186,561. In view of the need to conserve the Company's cash resources, the dividend was limited to 6d. per stock unit.

SELECTION TRUST.—For the year ended March 31st, 1944, this Company paid a dividend of 1s. 0d. per Ordinary Stock unit, against 10½d. SOUTH AFRICAN PULP AND PAPER INDUSTRIES.—After providing for taxation and depreciation the net profit amounted to £100,862 and a dividend of 9d. per share has been declared.

ULTRAMAR COMPANY.—163,168 shares were offered to shareholders at 2s. 6d. per share in August last under the guarantee of a group which included the Corporation. As a result, the Corporation has increased its interest in this company by way of its subscription rights and guarantee.

THE STANDARD LIFE ASSURANCE COMPANY

INCREASED PREMIUM INCOME

LARGE SUPPORT FOR GOVERNMENT LOANS

The one hundred and nineteenth annual general meeting of the Standard Life Assurance Company was held in Edinburgh on the 17th instant, with Mr James C. Campbell in the chair.

In the course of his speech the Chairman said:—

Our new business, whilst rather lower than last year, exceeds £3,000,000 and represents a satisfactory figure for wartime when, it must be remembered, we have practically no outside staff available to place the benefits of life assurance before the public. This year the premium income has increased again; it is now for the first time considerably over £3,000,000, and this is a matter for satisfaction. The ratio of expenses and commission to premium income shows a reduction again this year at 9.5 per cent., and we may, I think, feel satisfied with our net rate of interest at £3 19s. 4d. per cent. All our new money available for investment in this country and a substantial proportion of the money resulting from the maturity of existing investments is invested in new British Government Securities, and we now have over £16,000,000 of British Government Securities standing in our balance sheet. Since the commencement of the war we have invested over £12,000,000 in this type of security. Once again our Canadian branch has also invested substantially during the year in the New War Loans issued by the Canadian Government. This policy of supporting the war effort by investment in Government Securities is obviously the only one for our company to adopt in the present emergency because our whole organisation must do all it can to support the war effort.

Our total assets now stand in the balance sheet at £41,300,000 as compared with £39,200,000 a year ago. Whilst this substantial increase in our assets must, in the present circumstances, have the effect of reducing gradually the net rate of interest earned over our whole funds, it must be remembered that the premiums which we are receiving under our new contracts are consistent with the present lower standard of rates of interest. The directors have investigated the values of the company's assets very thoroughly and are able to state that the actual value is in excess of the figure at which they stand in the balance sheet.

IMPORTANCE OF SAVING

At this time, and in the situation in which we now find ourselves, it is natural to look forward, and I think we may do so hopefully. With the cessation of organised fighting in Europe a large part of the country's enormous daily expenditure on weapons of war will also cease. This does not mean that the need for saving by our people will have passed; we will still have a great part to play in the destruction of Japan as a war potential and, in any case, it is obvious that for many years the nation will be faced with vast outlays in connection with resettlement, reconstruction, social services and the maintenance of the considerable armed forces which we shall require in many parts of the world. Further, goods which have been so scarce during the war cannot immediately become plentiful, so that a large proportion of the increased national income must be diverted to savings if financial dangers are to be averted.

If saving is to be necessary on this scale in the post-war world there will be an

ever-widening and developing sphere of usefulness for our company. So far the stress upon the individual has been to place his savings in the hands of the Government largely by way of direct investment or through such thrift institutions as the Post Office Savings Bank or the great Trustee Savings Banks. Whilst even during the war a large amount of the savings of the public has been invested in Government Securities through the medium of the Life Assurance Companies, in the future I trust that it will be possible to leave to the individual a greater degree of selection and discrimination so that he may carry out his savings programme to a greater extent through the medium of life assurance, so gaining the double advantage of assisting the National effort in war and peace and of providing protection for his dependants and for himself in his old age. Your Directors are now actively engaged in making postwar plans so that we may be ready for the great extension to which we look forward. It will be our endeavour to show that although the Standard is old in years it has retained a full measure of the vigour and enterprise which has distinguished its administration in the past and we shall seek to extend, improve and adapt to prevailing conditions, the services which we render, and to bring home to the people the duty and privilege of providing for their own future and the future of those who are entitled to look to them for protection. The Standard provides upon the mutual principle the means of making this provision in such variety as to meet the peculiar needs of each individual case.

PENSION SCHEMES

It is the declared intention of the Government to institute a State Scheme for pensions and other services and we, who from the nature of our business appreciate the value of such an arrangement, welcome it as a step in the right direction and as a measure which must help the public generally to realise the wisdom of extending and supplementing the State Scheme by their own efforts. In a matter of this kind it is only reasonable and sensible to expect the Government to provide the benefits on a subsistence level and it is upon the individual, if he values his dignity and freedom, that the duty lies to supplement these so far as may be in his power by the exercise of the homely but highly necessary virtues of prudence and thrift. That these virtues have by no means become unfashionable is happily demonstrated by the large number of our members and by the fact that some 700 companies have seen fit to arrange with us schemes of Pension and Life Assurance, providing benefits and security for their thousands of employees.

I feel that I should like to draw your attention at this time to the service which we render in connection with Pension and Life Assurance Schemes. There can be no doubt that employers are realising to an ever-increasing extent the value of these schemes for the welfare of their employees. Such arrangements do much to promote feelings of loyalty and satisfaction amongst employees and tend to make the more reliable type of employee remain with his company. The advantage of this from the point of view of the employer is obvious; contented employees, who feel that their employer is treating them well and is assisting them to make provision for their future,

are an asset which any employer must appreciate highly. The fact that these schemes have been instituted jointly by the employer and employee to meet their particular circumstances—not devised for them by a Government department—undoubtedly provides elasticity and creates an atmosphere which would not be present were the schemes a compulsory part of their national life. They are, of course, supplementary to the Government scheme which is in existence just now and to any expansion of that scheme which may be introduced in the future. It is possible that adjustments to our schemes may have to be made under the new conditions which may prevail later on but all of them are so constructed as to be easily adjustable and in any case it is very doubtful whether many changes will in fact be required.

I am proud to say that with one or two other offices in this country we have been pioneers in this matter of Pension and Life Assurance Schemes and you will be glad to know that we are continually receiving from employers and trustees, who have entrusted their schemes to us, assurances of their satisfaction with the manner in which their schemes are being administered and with the service which they are receiving even from our depleted staff in wartime. There can be no doubt that there is every prospect of a great expansion of our business in this direction and we shall do everything in our power to improve the nature of these schemes and to adjust their benefits as may be required. We are providing life assurance and pension benefits at an extremely low rate of expense to many thousands of persons in this country and I very much hope that in the near future many more employers will seek our assistance in this matter.

I now move the formal adoption of the Report, Revenue Accounts and Balance Sheet submitted.

BONUS DECLARATION

Mr Harry Bell, O.B.E., in seconding this motion, said:—

"The members of the Standard are accustomed to hearing good news from their chairman at the annual meeting. Last year we were told the result of an actuarial investigation covering the five years from 1938 to 1943, and we learnt with pleasure that, after making the fullest and most stringent provisions for all liabilities, it had been found possible to declare a bonus for the whole period at the rate of 30/- per cent. per annum compound. That the Standard should have emerged so successfully from the test of five years of war was a matter of great satisfaction, though not of surprise to all its policyholders. The complete confidence in the future of the company held by the directors was shown by their decision to declare an interim bonus at the same rate; and this decision still stands to-day and encourages us to look forward to the next declaration with equal confidence. Comparatively speaking, the results which we have heard to-day may not appear exciting but on closer examination it becomes evident that all the factors of success are still present. Increasing funds, a steadily expanding premium income, a reduced expense ratio and a high net rate of interest, all these encourage us to hope that the present quinquennium will be no less successful than the last.

We have heard with the greatest interest what has been said regarding plans for the post-war period. Salaried workers in particular in view of the high rate of Income-Tax, are realising more and more the benefits of insurance and I am sure that we all welcome the spirit of initiative and of well-founded optimism which these plans display. We share with the directors their firm belief that in the days of peace there will be much valuable work to be done by mutual companies like the Standard for the benefit of its members in all parts of the world.

The Report was unanimously adopted.

CADBURY BROTHERS LIMITED

USE OF MILK IN CHOCOLATE MAKING

A STABILISING FACTOR

MR L. J. CADBURY'S VIEWS

The forty-sixth annual general meeting of Cadbury Brothers, Limited, was held, on the 9th instant, at Bournville, Birmingham.

Mr L. J. Cadbury, the chairman, having referred to a number of topics affecting the cocoa and chocolate industry, said: "The industry, like many others producing consumer goods, has continued to be subject to restrictions on raw materials and output, and to schemes of rationing, concentration and zoning. They have been operated under the control of the Ministry of Food acting in collaboration with the industry through the War Time Association which has been set up during the war for the purpose.

The cocoa plant of the country has been used to the full in meeting the increased demands of the civilian population and the large supplies required by the British and American Forces. Civilian chocolate consumption has been limited by the 3-oz. ration, which is 40 per cent. of the pre-war figure. In addition, however, the industry has produced special rations for the British and American Forces and supplies for N.A.A.F.I., and has also just completed a very large supply of vitaminised chocolate for liberated Europe.

LABOUR AND CONCENTRATION

Although the total production of the industry is only about one-third less than it was before the war, its labour force has been reduced by two-thirds. The labour thus released has been transferred to the Services and to other industries and has been made available either voluntarily or under two "concentration schemes." It was a provision of these schemes that the labour force of every firm should be restricted to a maximum of five persons per ton per week, but lower figures were fixed for individual firms; in fact, Bournville's figure is less than three per ton per week.

A concentration scheme designed to produce the maximum production efficiency in the industry would clearly have concentrated production in those factories with the lowest labour per ton factor. Owing to the fact that some of the largest and most efficient factories were situated in the most important munitions areas, this course was not followed, and the Ministry of Labour asked that production should be transferred from them to easier labour areas.

The somewhat ironically called "concentration schemes" resulted not in concentration at all, but actually in dispersal, and consequently they did not produce the maximum labour saving. The Bournville factory, the largest production unit in the country, was affected more than any other. We accepted these arrangements in the critical years of the war to help the labour position in Birmingham's munitions industries. The position, however, is not the same to-day; there is, in fact, evidence that some workers transferred to war production are being used by the companies to which they have been directed for peacetime production.

At the time of the concentration schemes the Government promised that, as soon as the position permitted, transferred workers would be returned to their former occupations. I hope that, in justice to the transferred workers and in fairness to the firms concerned, as well as for the sake of industrial efficiency, the Government will implement their promise and that very

soon we shall at any rate be able to manufacture our share of the industry's total production in our own factory.

MANUFACTURE OF MUNITIONS

Besides releasing workers for service in other munitions factories we have, through our associated company, Bournville Utilities, Limited, carried out a variety of munitions contracts at Bournville and at our Battersea depot in London. These contracts have included gas mask assembly, machine tool construction, aeroplane tanks and parts, jerricans, and A.A. ammunition. At one time Bournville Utilities employed over 2,000 workers on these products.

Large parts of the Bournville factory have also been used by other firms for munitions production, and our Blackpole factory has been entirely taken over by the Government.

WEST AFRICAN COCOA CONTROL

The Secretary of State has recently announced his decision not to proceed during the season 1945-46 with the scheme for the marketing of West African cocoa. We believe that this decision is largely due to the strong opposition which the Government's White Paper has aroused from merchants and intermediaries both here and in America.

Bournville is the largest single consumer of raw cocoa in this country, and we also have a very large trading interest in West Africa. In common with other British manufacturers, we have expressed our willingness to accept the scheme outlined in the White Paper provided it is accompanied by safeguards designed to ensure that there shall be a free supply of cocoa to this country at prices fair to the producer and the consumer. We welcomed the statement contained in the White Paper that it would not be in the interest of producers or consumers to revert after the war to pre-war marketing conditions. We know from a long and close connection with West Africa that there are many things connected with the marketing of raw cocoa which should be corrected. We also know how difficult it is to make a change, and that, whatever new scheme is suggested, there are bound to be objectors not only in the cocoa consumer countries but also in West Africa.

CONDITIONS ON GOLD COAST

It is not the first time that attempts have been made to improve marketing conditions in the Gold Coast. The buyers of cocoa, merchant firms and merchant manufacturer firms made an attempt to remove abuses by means of the buying agreement of 1937; that agreement failed as, in the opinion of many, it deserved to fail. The Nowell Commission made certain recommendations after their examination of the situation in 1938, but they did not find a clear way out. We think it would be little short of a calamity if advantage were not taken of the present unique opportunity of improving marketing conditions.

We are glad to note that the Secretary of State has confirmed his intention to make a grant for the purposes of research out of the profits made during the war from the sales of raw cocoa. We have ourselves been able to render some practical assistance to the investigations which are being made into the causes of the Swollen Shoot and Sahlbergella diseases which are

affecting the growing of cocoa on the Gold Coast.

USE OF MILK

Milk chocolate was in pre-war days our major product. In 1939 we produced over 1,000 tons per week, and in that year handled nearly 27,000,000 gallons of milk at our milk factories in Shropshire, Gloucestershire, Herefordshire and Denbighshire. Our development of the milk chocolate industry resulted in a considerable addition to the total liquid milk production of the country.

At the present time the use of full cream milk for milk chocolate is prohibited except in respect of the small quantities of surplus milk in the summer flush season. Our milk factories are now being used in connection with liquid milk supplies and in one case for butter making.

We agree that the first use of the limited milk supplies should be for liquid consumption, but in normal times there is a summer excess which our process of manufacture enables us to take off the market at the flush season and convert it into semi-manufactured chocolate for use throughout the year. That factor is, we believe, a help to the farmers. We realise that milk and milk products are bound to be grievously short in the first years after the war, and we must make our manufacturing plans accordingly. We feel, however, that the use of milk in our products must be in accord with any reasonable agricultural outlook in this country.

The need of the farming community is to have stability of outlook not only for the disposal of their goods, but more particularly for the prices they expect to receive.

This industry can give stability of outlook both with regard to price and progressive manufacturer use of milk. We doubt if any other industry could give the same assurance. We realise how difficult it is in the present state of uncertainty for the Ministry of Food or the Ministry of Agriculture to give any assurance for the future, but we look forward with confidence to the time when we shall be able to claim a share of milk for manufacturing purposes in proportion to our pre-war consumption. There must come a time—we hope very soon—when once again the Dominions will send to this country their surplus production of milk products; when they do, the milk situation will be altered.

LOCATION OF INDUSTRY

The City of Birmingham is possibly one of those places which will be affected by the "Distribution of Industry Bill." I agree that we must not see a return of chronic unemployment in what used to be known as the "distressed areas," and that it is necessary to put new production there.

But it is one thing to encourage new enterprise to these areas, quite another to force industries to transfer from their existing location by embargoes on their natural development. It would be a mistake, for instance, if factories in the Birmingham area, with the intention of driving them elsewhere, were deliberately handicapped in the post-war period from carrying out their normal programmes of rebuilding and re-equipment. The loss of industrial efficiency in the Midlands would far outweigh any possible gain in other parts of the country.

PUBLICATION OF "INDUSTRIAL RECORD"

We have recently published a book "Industrial Record, 1919-39." Its object is to give a factual account of this firm's experience between the wars. We hope it will prove a useful contribution to the discussions now taking place in post-war industrial problems. It has had a very favourable reception and has already drawn considerable comment from a number of readers.

The report and accounts were adopted.

MINING ASSOCIATION OF GREAT BRITAIN

ADDRESS BY MR ROBERT FOOT

The ninety-first annual general meeting of the Mining Association of Great Britain was held in London on the 12th instant.

In the course of his speech to the meeting, Mr Robert Foot, the chairman of the Association, referred to the recently published report of the Technical Committee under the chairmanship of Mr Charles Carlrow Reid, and said:

I am not competent to deal with the purely technical aspects of this most able document, which must prove to be of the greatest value to the industry in the work of technical reconstruction, but I am encouraged to note that in their broad approach to the problem there is such a large measure of agreement between their conclusions and my own.

Both my report and that of the Reid Committee are based on the continuance of private ownership. At a Press conference preparatory to the publication of the Technical Committee's report, Mr Charles Reid, the chairman, said the Committee did not believe that public ownership would solve the problems of the industry.

The Reid Committee conclude that the technical changes they regarded as essential "cannot be satisfactorily carried through by the industry organised as it is to-day." In my own report I refer to the drastic kind of reorganisation which I feel the difficulties and seriousness of the present situation make imperative.

Both reports stress the importance of stability for the workers. The Reid Committee state that the wages of underground workers should be at least as high as in other industries demanding an equal degree of skill and effort. I had included among my twenty principles that "the earnings of those underground should be maintained at a level in each district that will give them the pride of place amongst industrial workers." And they say, as I say, that this pride of place can only be maintained if the miners will give a full and fair day's work.

I laid it down as one of my principles that the industry should, through the initiative of the Central and District Boards, "give every support and encouragement to the closer integration of the industry into a smaller number of units by voluntary agreements, and to compulsory amalgamations and absorptions" in special circumstances.

A CENTRAL AUTHORITY

Finally, both recommend the establishment of a Central Authority to ensure that their recommendations are carried into effect. But here the methods of the two reports diverge.

The Reid Committee insist that it is "a cardinal necessity" that the Authority which they propose should be "endowed by Parliament with really effective powers" to ensure that "the industry is merged into units of such sizes as would provide the maximum advantages of planned production," etc.

It has been somewhat hastily assumed in certain quarters—the hope being perhaps the parent of the assumption—that the Authority envisaged by the Reid Committee is of the nature of a Public Utility Corporation. There is, however, nothing in their report itself to justify this. The Committee express no views as to the constitution of the Authority, but only that it must be established by Statute and empowered by Parliament with certain powers. Like the Reid Committee, I envisage a comprehensive treatment of the production process in each area. While, however, I am in favour of the application of compulsion to the amalgamation in certain types of cases, I do not believe in the universal

programme of compulsory amalgamations by areas which they propose.

The second divergence of method is in relation to the surveys to be undertaken. In my report I state that the only way of finding out what is required to be done and how much money it will cost is by taking each colliery and surveying its requirements and so building up the total sum, and it was my intention that this work should be begun on existing collieries at the earliest possible moment. The Reid Committee, on the other hand, propose that the survey should not be begun until the areas to be covered by the new units to be formed in accordance with their recommendation for amalgamation have been delimited and the mergers effected.

THE TIME FACTOR

Now this delimitation of suitable areas for the new units, and the effect of compulsory mergers—with recourse either to the extremely complicated and slow machinery already existing for enforcing such compulsion, or to new legislation yet to be passed by a Parliament already overcrowded with urgent legislation—will occupy much time before the essential surveys can even be begun. And, as the Reid Committee so properly insist in the last words of their report, "there is no time to be lost."

On the other hand, the Central Board recommended in my Plan for Coal can be brought into existence by the colliery owners themselves almost at once; the essential surveys can be begun forthwith, undertakings being encouraged to take the initiative themselves, and voluntary amalgamations and absorptions can proceed simultaneously. Nor, under this procedure, is it to be contemplated that the planning would be unco-ordinated, individualistic or "parochial." Far from it. The plans would be co-ordinated by the District and the Central Boards.

CRITICISMS CONSIDERED

Here I propose to turn to the criticisms of my own Plan for Coal. It does not appear to be generally realised that, quite apart from the provision made in Principle X of my Plan for close and permanent consultation with the mineworkers by means of a Joint National Committee, District Committees and Pit Production Committees, there is already in existence complete machinery, culminating in the National Appeal Tribunal under the chairmanship of Lord Porter, for dealing with any claim or grievance put forward by the mineworkers relating to wages or conditions of work.

Similarly as regards consumers, there are already in existence Committees of Investigation and a Central Appeal Tribunal to which consumers can appeal if they feel themselves aggrieved by an action taken under the selling arrangements established under the Coal Mines Act, 1930.

Access to such tribunals is, I submit, a far more effective and practical protection to the various interests concerned than minority representation on a board.

NEW PROPOSALS

Nevertheless, I believe it is possible consistently with these conceptions to suggest measures for meeting the several material criticisms that have been made, and I have formulated certain proposals directed to this end. These I am about to communicate to the industry for consideration (and to issue, for the information of the public and the Press), together with the draft constitution of the Central Board and my proposals for bringing that Board into existence forthwith.

S. HUBBARD LIMITED

CONTRIBUTION TO WAR EFFORT

The twenty-first annual general meeting of S. Hubbard, Ltd., was held, on the 17th instant, in London, Mr. Geoffrey O. Hubbard, vice-chairman and joint managing director, presiding.

The following is an extract from the vice-chairman's statement circulated with the accounts:—It is again possible to submit to the shareholders a very satisfactory account of the year's working. The profit from manufacturing and trading for 1944, after providing a reserve of £12,500 against stocks, amounts to £101,196. After providing for directors' fees, interest on bank overdraft, depreciation and deferred repairs, there remains a balance, being the profit for the year 1944, of £81,143. The proposed dividend for 1944 on the ordinary shares is at the rate of 10 per cent., less income tax.

During the war we have been pioneers of fabricated and shaped felt parts for the aircraft, motor and engineering industries. Felt, either treated or untreated, has been used in many ways in replacement of rubber. We have produced felt to meet many varied technical requirements—for example, felt rock hard or sponge soft or proofed to resist petrol, oil, water, acids, etc., also resilient packaging felt to resist tropical conditions.

We have also produced large quantities of felt hoods to be made up into different types of headgear for the armed Forces and for use by the Civil Defence and public utility services. More recently we have been helping to meet the requirements of the Government for hats for men to be demobilised from the Navy, Army and Air Force.

Much careful consideration has been given to post-war planning, so that the company may be in a position to surmount the difficulties of the transitional period. The report was adopted.

B. MORRIS AND SONS, LIMITED

BETTER PROSPECTS

The annual general meeting of B. Morris & Sons, Limited, was held on the 18th instant, in London.

Mr. Arthur J. May (chairman and managing director), in the course of his speech, said: The stock is higher by £3,184, and there is a saving on the insurance of £661, due to cheaper War Damage rates. Taxes absorb £4,743, an increase of £1,739. Creditors show an increase of £4,245 which consists chiefly of taxes due. These have since been paid, and at present our creditors are negligible. The balance of profit, £9,359, is £1,009 less than the previous year.

In connection with this I must point out that during recent years we have had the advantage of cheaper materials and the increase on the duties on the tobacco provided a certain amount of increment, which did not operate in 1944.

This is the first year for some time in which we have had no changes in the duties, and apart from higher cost of leaf, had we not experienced abnormal difficulties in the last six months of the year, the final result would have been much better, and it is only due to the tenacity and devotion of our workers and staff that we made a substantial profit on the year's working.

We are experiencing great demands for all our manufactures, especially Morris's Silk Cut Cigarettes, and this year has commenced very well, so, providing trade continues at its present level, we hope to make considerable progress during 1945. Your company is in a very sound condition financially, and when the labour position improves we should be able to take advantage of the better trading conditions when the war is ended.

The report was adopted.

UNITED GLASS BOTTLE MANUFACTURERS, LIMITED

PROFITS AND DISTRIBUTION MAINTAINED

SOUND AND SATISFACTORY POSITION

SIR WALROND SINCLAIR'S SPEECH

The thirty-second ordinary general meeting of the United Glass Bottle Manufacturers, Limited, was held, on the 12th instant, at 8, Leicester Street, W.C. 2, the chairman, Sir Walrond A. F. Sinclair, K.B.E., presiding.

The chairman said: Ladies and gentlemen, I desire to express the deep sorrow which your board have to refer to the death in June last of the Lord Herbert Scott, C.M.G., D.S.O., D.L., who had been a director for the past twelve years. His loss has been keenly felt, not only because of the sound judgment he brought to bear on the affairs of your company but because his genial personality made him a friend as well as a colleague.

At the close of the year, Mr T. C. Moorshead, joint managing director, expressed his desire to retire from active management, after having been associated with the company for some twenty-six years, the last twenty as a member of the board. I am sure you will desire to be associated with your directors in an expression of deep appreciation for all that he has done for the company, together with our best wishes in his well-earned retirement. Mr H. J. Judd, formerly joint managing director, has been appointed managing director of the company, effective from Jan. 1 last. Mr Judd's standing in the industry needs no emphasis from me, for he is justly recognised as one of its leaders and the directors feel that his new appointment will serve to strengthen still further the administrative efficiency of your company.

TRADING CONDITIONS

You will doubtless recall that when addressing you a year ago I concluded my remarks by informing you that the turnover was then being maintained, with costs showing a tendency to rise, but that, providing the general position did not deteriorate, we had reason to hope that we should be able to submit another satisfactory account a year hence. While conditions throughout industry generally continued difficult, we unfortunately ran into a period during the year when our production was considerably dislocated by circumstances which demand the utmost from us to meet a serious emergency. Despite the strain and deep anxiety involved, we were enabled through our widespread organisation to effectively deal with the situation with the minimum disturbance.

Shortage of labour, coupled with an acute fuel position, added to our difficulties in maintaining a sufficient output to meet the heavy Government requirements and at the same time to allow a reasonable quota distribution to our regular customers, to whom we wish to express our sincere gratitude for the forbearance and co-operation extended to us during this trying time.

THE YEAR'S RESULTS

Having regard to the many handicaps under which manufacture and distribution were carried on, the reduction in volume, turnover and trading profit which naturally followed, the credit balance of the trading account was to all intents and purposes identical with that of the previous year. The available balance, after making the normal provisions for depreciation and other reserves, together with the lower contribution necessary by way of provision for excess profits tax, leaves the net profit a little higher, a result which, I submit, can be regarded in the circumstances as most satisfactory. It is interesting to note

that the net return received from trade and other investments was again approximately 4½ per cent., or the equivalent of 9 per cent. gross.

Provision for income tax and the amount set aside for pensions and group life assurances are likewise a little higher. Shareholders will, I hope, regard this annual charge as a desirable investment for the benefit of those who contribute so much to the success of our undertaking. After providing for the preference dividend and repeating the distribution on the ordinary capital at 12 per cent., less tax, for the eighth successive year, the transfers to general reserve, the contingency reserve, together with the allocation to the debenture redemption reserve, total in all the sum of £97,880, compared with £99,909 a year ago, thus continuing a policy of prudence which will, I hope, meet with your full approval, particularly having regard to the substantial outlay on plant equipment which will be necessary, as soon as circumstances permit.

SURPLUS OF CURRENT ASSETS

Turning to the balance-sheet, it will be noted that the net surplus of current assets amount to £2,444,053, against current liabilities and provisions of £1,379,936. I think you will agree that these figures disclose a sound and satisfactory position.

Our export trade during the year, I regret to say, has been severely limited by curtailed production on the one hand and lack of shipping facilities on the other. As a matter of fact, our export sales actually show a decrease of 30 per cent. compared with those of the previous year. Most of our manufacture continues to be earmarked for Government priority, but we are looking forward to easier conditions during the current year, when plans which we have now well in hand will, we hope, enable us to make the necessary drive to recover and possibly expand our export business.

SOUND REASONS FOR CONFIDENCE

As for the future generally, I must obviously refrain from indulging in prophecy, but you will be glad to know that, notwithstanding certain difficulties still existing, the trading indications for the first three months of the current year can be considered satisfactory, and there seems to be sound reasons for confidence that this company will continue to give satisfactory service, both to its customers and shareholders, in the years that lie ahead, for we have the pre-requisite in liquid resources, technical skill, administrative efficiency, an effective organisation, and a loyal and enthusiastic body of workers.

In conclusion I should like on your behalf as well as that of my colleagues and myself to express thanks to our managing director, Mr H. J. Judd, to the administrative side at the head office, the managers and their staffs at the respective factories, and to each and every employee of the company for their devoted and untiring efforts, only too frequently carried out at considerable personal risk throughout a difficult period. You will wish to join with my colleagues and myself in an expression of good wishes to those of our many employees serving with His Majesty's Forces, and to express the sincere hope that they will be able to return to us before the occasion of our next annual meeting.

The report and accounts were unanimously adopted.

MIDLAND EMPLOYERS' MUTUAL ASSURANCE, LIMITED

POSITION WELL MAINTAINED

ASSETS NOW EXCEED £6,200,000

The forty-sixth annual general meeting of the Midland Employers' Mutual Assurance, Limited, was held, on the 17th instant, at 16, Waterloo Street, Birmingham 2.

Lieut.-Colonel J. Beaumont Neilson, C.M.G., D.S.O., C.A., presided. The chairman's speech, which had been circulated with the report and accounts, was taken as read, and was as follows:—

Having regard to the continued difficulty of travel, and the conditions prevailing at the present time, I propose to follow the procedure of recent years and circulate in advance of the meeting to be held on April 17, 1945, the remarks which normally I should have made at that meeting. The proceedings will therefore be of a formal character.

BALANCE-SHEET AND ACCOUNTS

The premium income for the year 1944 at £3,216,642 shows only a slight decrease on the record of the previous year and reflects the level of aggregate wages paid. I am glad to be able to report a further increase in the number of policyholders.

LOW EXPENSES OF MANAGEMENT

The expenses of management amounted to £242,694, or 7.5 per cent. of the premium income. This low ratio is particularly satisfactory when it is borne in mind that allowances have continued to be made to members of the staff serving with the Forces. Commission at £158,314 is substantially in the same ratio as previously.

LARGE INCREASE IN CLAIMS PAYMENTS

Expenditure on claims amounted to £1,931,154, an increase of £259,671, and the claims reserve at £3,957,693 has increased by £800,014. These increases on claims account are due to the additional cost arising as a result of the Workmen's Compensation (Temporary Increases) Act, 1943, which only came into operation on November 29, 1943, and also the continuous upward trend in numbers and in the cost of Common Law claims. The latter claims were a material factor in the year under review.

The number of accidents reported during 1944 continued to run at a high level although below that of 1943.

The assets of the company as at December 31, 1944, totalled £6,214,878, as compared with £5,302,062 at the end of 1943. The company's holdings of British Government securities increased by £1,105,807.

EFFECT OF PROPOSED NEW LEGISLATION

You will recall that in my review of the year 1943 I referred to pending Government proposals regarding Workmen's Compensation. The White Paper on the subject (Social Insurance, Part II, Workmen's Compensation), issued in September last, proposes that the provision for disablement or loss of life from industrial injury shall be administered by a Ministry of National Insurance, both employers and employees contributing to the cost. Legislation is now being drafted and the necessary Bills will be presented to Parliament in the near future. The question of Common Law liability is now being considered by a Committee presided over by Sir Walter Monckton, K.C.

EXTENSION OF OBJECTS

On the assumption that legislation may follow the lines of the White Paper, your directors thought it proper to widen the activities of the company, and to this end they sought, and obtained, the consent of the members, and later that of the Court, to an extension of the company's objects as set out in its memorandum. Full par-

STAFF

Particulars of the extended objects have already been furnished to you, but I would remind you that these include all classes of fire, life and accident insurance, but excluding marine. It is hoped that we shall shortly be in a position to accept business in these departments.

The staff, including a large percentage of temporary employees, both male and female, have during the past year carried out their duties in a very satisfactory manner and thus contributed to the smooth

working of the company. Once again the thanks of the members are due to the general manager for his able conduct of the affairs of the company.

The accounts having been unanimously adopted, the meeting closed with a vote of thanks to the chairman.

FINANCE AND BANKING

THE MONEY MARKET.—A record for applications was established at the tender for the £110 million of Treasury Bills for this week. The total of £244,370,000 was over £9 million higher than the previous week's applications, but the quota of bills allotted to the discount market, though still very low at 24 per cent., was 4 per cent. higher than a week before. Apparently, some of the outside competitors who had been misled by the discount houses' raising of the bid to £99 15s. at the beginning of the month into bidding at this figure for the previous week's tender, reverted to £99 14s. 11d. last week. Allotments to special customers were also probably lower. As a result of this scaling down of the bids, the average rate of discount rose to 20s. 2.88d., the highest since November, 1943. The TDR call at the high level of £150 million involved about £50 million of "fresh" money. The discount market, however, had a comfortable week partly as a result of sales of investments by the banks—discussed on page 520. The Bank Return shows

that Bankers' Deposits rose £6.7 million on the week to £191.5 million, despite the immobilisation of considerable balances in Public Deposits which are £8.7 million up at the high level of £18.9 million. A rise of £12.5 million in Government securities seems to betoken an increase in ways and means advances to the Government, despite the heavy total of Public Deposits.

MONEY RATES, LONDON.—The following rates remained unchanged between April 12th and April 19th:— Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%. Treasury Bills: 2 months, 1-1½%; 3 months, 1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, 1%. Discount deposit at call 1½% at notice, 1½%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between April 12th and April 19th. (Figures in brackets are par of exchange).

INDUSTRY AND TRADE

Oils and Seeds.—There are indications of increased interest in oilseeds. After a small trade in linseed for the United Kingdom, Indian shippers' quotations have hardened and demand seems to have fallen away. Exports of linseed are still prohibited by the Argentine Government, but the outlook has improved following the declaration of war against the Axis. Shipping with the United States has been resumed and it is reported that the Committee acting on behalf of the United Nations have undertaken negotiations for the supply of various oilseeds and vegetable oils by the South American Republics. Both the United States and India report favourable weather conditions. The oil supply position in the United States is increasingly difficult, and so far as linseed oil is concerned no improvement can be expected, unless imports of seed can be arranged, until the new domestic crop is ready about next August. Intensive efforts are being made by the American War Food Administration to induce farmers to put a greater acreage under linseed, failing which United States crushers will be under the necessity of importing at least 250,000 tons to supplement home production to supply normal consumption requirements. Crushing mills and refineries in the United Kingdom are fairly busy, chiefly on material from British West Africa.

"The Economist" Sensitive Index.—There was no change in index during the week ended April 17th. The complete index (1935 = 100) was 161.4; crops, 140.3, and raw materials 185.5.

GOVERNMENT RETURNS

For the week ended April 14, 1945, total ordinary revenue was £42,844,000, against ordinary expenditure of £83,944,000 and issues to sinking funds of £30,000. Thus, including sinking fund allocations of £106,993, the deficit accrued since April 1st is £100,193,000 against £135,117,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Service" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £556,178 to £2,654,687, the other operations for the week (no longer shown separately) increased the gross National Debt by £40,755,563 to £22,502 million after allowing for £16 million of sinking funds in 1944-45.

An Interim Budget

FOR the second time in succession, Sir John Anderson's Budget introduces no significant changes in the level of taxation. But this year's "no change" Budget differs from last year's in that it is professedly of an interim character. The Chancellor confessed his inability to make the usually close estimates of prospective expenditure, and he gave what almost amounted to a promise of a Supplementary Budget later in the year. For the time being he put the vote of credit—that is, the war expenditure, the variable element in the total—at £4,500 million, compared with £5,125 million actually spent in the year just ended. This makes a total estimated expenditure of just over £5,500 million. In some estimates presented in *The Economist* three weeks ago, this same figure of £5,500 million was given as the upper end of the probable range, based upon the less favourable of the alternative sets of assumptions about the date of the end of the two wars and the speed of the subsequent demobilisation. The Chancellor made it clear that he also regarded the figure as a maximum, and that the actual total might well be smaller. The lower end of the possible range estimated here was £4,500 million, and though this is not outside the range of possibility, it is unlikely that so severe a reduction of expenditure will actually be achieved in a period the middle of which is now less than six months away. What can be said with some assurance is that the maintenance

for a full year of the present level of taxation would produce a deficit smaller than last year's by at least £525 million, and perhaps more, and that the Chancellor's reference to the necessity of reducing the burden of taxation as soon as possible gives hope that some part of the relief will be passed on to the taxpayer later in the year. It is far too early to jump to conclusions about the precise degree of reduction in any particular tax. But, after so many weary years, the taxpayer is at last and at least given some encouragement to hopefulness.

With so few changes in the general framework of the public finances, the contents of the Budget proper—that is, the alterations of taxation—call for very little comment. The decision to exempt from duty hydrocarbon oils used, as chemical raw materials, and the overhaul of the arrangements by which industrial alcohol is exempted from the duties on potable spirits, are small changes of chiefly technical interest. The concessions to small businesses in respect of EPT are of rather more importance, and will be very welcome to those whom they affect. But they are quite minor in their financial aspect, since they do not affect any business with an EPT standard of £12,000 or more a year. The most important taxation item that the Chancellor had to announce was the conclusion of two treaties with the United States on the subject of double taxation. These treaties are examined in more detail in a Note on

a later page. Unless there are undisclosed traps in a highly technical matter, the elimination of double taxation appears to be gratifyingly complete. This will be a great help to many varieties of business, especially, as the Chancellor said, to those engaged in the export of goods and services. If the treaties with the United States can be supplemented by treaties on similar lines with the Dominions and with other foreign countries, Sir John Anderson will have a substantial achievement to his credit.

Only one of the taxation changes deserves to attract any criticism. This is the decision to graduate the new motor vehicle duties by small steps, the rate increasing for every 100 cubic centimetres of capacity of the engine. The effect of this is to continue to throw the heavy weight of the system of taxation in favour of the production in this country of cars too small to find a ready market overseas. It is true that a majority of the motor trade favours this principle, since it gives them added protection in the home market, which is their chief concern. But there is enough support in the trade for the alternative view to have justified the Chancellor in taking it, and a wider graduation—for example, a flat tax on all cars up to, say, 1,500 c.c.—would have given some encouragement to the mass production of more normal cars. It is a grave disappointment to find the Chancellor bowing to the majority of a trade—not even to the whole of the vested interest—when public policy seems to point so clearly in the opposite direction. Sir John Anderson should at least be invited to state his reasons at length.

The uncertainties of the coming year gave Sir John Anderson no scope for the detailed "economic budgeting" which has been the practice of recent years. But this year's Budget speech was more definite and more insistent than any before on the necessity for basing fiscal policy on the fullest ascertainment of the facts about the whole national economy. The annual White Paper, which is considerably enlarged this year, has become an indispensable instrument of policy, and the Chancellor carried this revolution in thought one step further by insisting on the necessity for a continuous census of production; he might well have added an equally continuous census of distribution and the service industries.

The fact that the country now stands at the peak of expenditure, which makes forward budgeting so difficult, provides an excellent opportunity for retrospect over the war years. The Chancellor gave some of the summary figures. In five and a half years, expenditure has totalled £27,400 million, and of this amount no less than 49 per cent has been raised out of current revenue. The sums put at the disposal of the Government in taxes and in savings have amounted to 42 per cent of the whole of the personal income of the community during the period.

These are financial figures; the incidence of the real burden of the war can be demonstrated by a few figures taken from the White Paper. The following table shows the main constituents of the gross national expenditure in 1938 and in 1944. Unfortunately, the official figures are considerably affected by the fall in the value of money that has occurred over the six years; a third column has, therefore, been added to give a rough estimate of the 1944 figures as they would appear had there been no rise in prices; these figures are printed in italics to indicate that they are not official estimates.

THE NATIONAL FINANCES

Next week's issue of *The Economist* will include a Special Section containing (1) a summary of the Budget White Paper, (2) a commentary on the figures, (3) the National Income tables in full and (4) a collection of tables on the Revenue, Expenditure, the National Debt, etc. In view of this special section next week, the customary Budgetary Statistics have been omitted this week, but an article summarising the Budget Speech appears on page 539 and Notes dealing with other Budget items on page 556.

	1938	1944	1944 at 1938 prices
Public Expenditure:—			
War	358	4,678	3,400
Other	581	501	365
Private Expenditure:—			
Consumption	4,153	5,216	3,480
Maintenance, replacement and increase of domestic capital	660	329	220
Overseas investment or disinvestment	-70	-655	-435
Gross National Product	5,682	10,069	7,030

The expenditure on war has risen between the first and last columns by 3,042 million pounds of 1938 purchasing power. This can, therefore, be taken as the cost of the war in 1944. The sources from which, by comparison with 1938, this cost was derived can be set out as follows—

	£ mn. at 1938 prices	%
From reduction in consumption	673	22
From increase in production	1,348	44
From reduction in non-war public expenditure	216	7
From reduction in provision for domestic capital	440	14
From increase in drafts on overseas capital	365	12
Cost of war in 1944	3,042	100

It is on the basis of ascertained facts about the recent past such as these that the planning of economic policy for the future must proceed. Over a quarter of the cost of the war in 1944, and a higher proportion over the whole period, has been met at the expense of the national capital, at home and overseas. At home, the destruction of capital, the failure to maintain equipment and the consumption of stocks of all kinds not only tend to limit the productivity of industry but also make it necessary to devote an increased part of the national output to re-equipment. Mr Spearman did well, in the debate that followed the Chancellor's speech, to emphasise the difficulty of accommodating all the claims within the limits of what will be available and the necessity for a policy of careful husbandry. As Sir John Anderson himself said, "we shall have little margin for avoidable mistakes or for frequent and dramatic reversals of fundamental policy."

Not all the apparatus of solid fact that is needed for the construction of policy is yet in existence. Sir George Schuster, pursuing his admirable course of insisting that industrial productivity lies at the root of all economic progress, invited the Chancellor to put before the country "a definite programme of the tasks that must be carried out," based on factual surveys of the main part of the industrial structure. And as part of such a re-examination there should be "an independent review of the effects of our system of taxation on industrial enterprise." These are wise suggestions. Brave words about the careful planning of policy will be empty without the essential foundation of fact.

The same technique of overall review and exposition might very well be applied to the external economic position of the country, which the Chancellor described as "our main immediate cause for anxiety." The restrictions on the liberty of action of economic policy imposed by the country's transition from creditor status to something very close to debtor status are likely to be very real. The facts of this situation are, in general, familiar to the experts—though the Chancellor added some new ones, particularly on the responsibility of the Middle East and India for the great rise in sterling indebtedness. But the facts and their implications have never been sufficiently appreciated either by the general public in this country and still less by foreign countries, themselves enriched by the war. When the time comes for a full disclosure of facts, the Chancellor might consider the advisability of drawing up a precise balance sheet, in Budget fashion, of income and outgo in overseas transactions, and of devoting a Budget speech to the subject. For many years to come, the national economy and the standard of living that can be provided for the people will be almost as fully dependent on these external facts as, for nearly six years, they have been upon the necessity of waging war.

Verge of Chaos

THE fall of Berlin may well have great emotional significance for the Germans. The loss of a capital city must always be a symbol of defeat. Otherwise the fact that Berlin was the seat of Government and centre of administration for the entire Reich has little meaning today, for there is no longer a functioning central government, and the administrative machine has completely collapsed. In these last weeks since the great advances from the Rhine and the Oder began, the world has witnessed a drama unprecedented in history—the suicide of a state. Total in all things, the Nazis intend to leave behind them a total vacuum, and it appears that they are succeeding.

This is, however, only half their legacy. The other is ruin, destruction and disease. Even where towns and villages have survived intact, the mass exodus of the foreign workers is bringing work on the farms to a standstill at the vital time of spring sowing. The exchange of goods and food between different areas has broken down and it may be doubted, now that the strict Nazi rationing system has collapsed, whether much food will leave the farms. Transport everywhere is held up by the destruction of bridges and rolling-stock. In the bombed cities—most of which lie in the area of British and American occupation—the devastation and disorganisation reach their highest pitch. Even with their present population, drastically reduced by evacuation, they lack every essential of an ordinary human existence. And what is to be done when the congested central areas in Germany are conquered and the evacuees drift back? How and where can they be fed, settled, or sheltered?—it is useless to speak of housing.

Few occupying armies can ever have been faced with an administrative problem of this magnitude. They cannot shirk it. Their own interests demand that disease and famine should be checked. The urgent needs of Western Europe make an early restoration of the German coalfields essential. And expediency apart, no peace can be built on a foundation of chaos in the heart of Europe.

All this is obvious. What is much less obvious is the machinery through which some kind of order is to be re-established. No statement of policy has yet been made by any of the three occupying Powers. It does not seem that they have established in advance agreed methods and procedures. In Russian-occupied territory, correspondents have so far had little opportunity of observing the methods that are actually being applied. In the British and American zones, there is little difficulty in the way of reporting, but so far no very clear picture has emerged. One or two facts are, however, clear. Whatever the intentions of the Supreme Commander, the adminis-

tration of Germany is not a matter which the officers of AMG can handle alone. Neither America nor Britain, nor least of all France, has the manpower to take over the entire administration of forty to fifty million people. The Japanese war and reconstruction at home will claim many of the ablest men, and even if—as is very necessary—some of them are now transferred from direction of the war to the administration of occupied territory, they will be defeated by lack of competent staff. Numerically alone, a purely military administration is impossible.

The Allies must, therefore, from the beginning of their occupation rely on some sort of German administration. The line of least resistance is naturally to maintain the cadres left by the Nazis, in so far as they can be brought together again. The remnants of the Nazi administration will have the experience and technical knowledge. In many places there will seem at first to be nobody else, and, since in many quarters the distinction between Nazi and German is felt to be an illusion, all Germans being equally implicated in the Nazis' guilt, there may seem to be few objections to a policy of using what is left of the old administration.

Yet such a policy is dangerous and could be fatal. The Nazis will leave behind them some sort of organisation for resistance and sabotage. It would be folly to maintain in the actual administration men who might be ready to give the saboteurs active support. And even apart from this immediate question of expediency, the larger reasons of pacification demand that the Nazi system should disappear and a tolerable system of government take its place.

Unhappily the British and the Americans have complicated their task in finding new men and new administrators by their "non-political" approach. Officially, at least, their statesmen appear to have little use for any alternative systems of government for the Germans, and by strenuously identifying Nazism with the entire German people, they create among themselves at least the idea that either there is no such thing as a non-Nazi German, or that there is nothing to choose between the two. On such a basis, the task of building a non-Nazi administration is by definition impossible.

A very different approach has been adopted by the Russians, who have more reason than either the British or the Americans to condemn the behaviour of millions of Germans, Nazis and non-Nazis alike. The recent dispute between Ilya Ehrenburg and the head of the Propaganda Department of the Central Committee of the Communist Party suggests that Marshal Stalin's words

it would be ludicrous to identify Hitler's clique with the German people or with the German state

CAPITAL ANNUITIES

Extract from the Chairman's speech, March 22nd, 1945:—

"... The scheme was only introduced in June but by the end of the year Considerations amounted to £247,000 and by now they exceed £400,000. Your Society is thus maintaining its reputation as a specialist in annuity business."

EQUITY & LAW LIFE ASSURANCE SOCIETY

163-164, STRAND, LONDON, W.C.2

represent one of the deciding factors in Russian policy towards Germany. The scanty evidence from Russian-occupied territory bears this out. It seems that teams of Germans have been selected from the members of the Free German Movement—technicians, priests and pastors, party members—to work in the localities from which they originally came. The existence of these teams seems to have enabled the Russians to dismiss Nazi administrators forthwith. Meanwhile the new German officials are said to be receiving help from the Red Army, particularly on the farms. The Russians even speak of "resisting Germans" inside such Nazi-held pockets as Breslau, where there is apparently a German clandestine newspaper. The Russians do not by this attitude commit themselves to any one policy towards Germany as a whole. But they do not add to their problems of administration by refusing to seek whatever help there may be available. It is only in the West that the Allies appear so upset by the prospect of being deceived by bad Germans masquerading as good Germans or so little confident in the attractions of the idea of freedom and legality for which they stand that they may be in danger of reinstating a Nazi or near-Nazi administration by sheer default.

It is time the British and the Americans took a leaf out of the Russian book. The non-Nazis may not spring up on either hand. It is likely that they can be fully established only by patient testing and searching. This process at least should begin. A first and obvious task is to sift the prisoner of war camps. It is an ugly fact that many of them, even in this country, are perfectly organised Nazi communities where non-Nazis face the most unpleasant penalties, going as far as execution, for non-conformism. Some German prisoners—a very few—have been selected for propaganda broadcasting. The time has come to sift the millions thoroughly not only for technicians and miners and agricultural workers but for men of non-Nazi convictions who are prepared to accept responsibility.

Rent Control

THERE is probably no single subject affecting the lives of every citizen in this country which is so complicated and so little understood as rent. The legislation governing rent control is so tangled that it is nearly as baffling to the lawyer as to the layman. Lord Justice MacKinnon recently spoke of having to "grope his way through that chaos of verbal darkness." There have been nine Rent Restriction Acts since 1920, and no fewer than five Committees of Inquiry into their operation have been appointed. But in spite of all recommendations that the law should be simplified, nothing has been done in this direction. The Ridley Committee, which has just presented its report to the Minister of Health* has done a valuable public service in once again drawing attention to the anomalies and complexities of the legislation. The Committee appeals for a consolidation of the existing Acts into a single Statute:

It is urgently necessary that the present chaos of over-lapping Statutes should be replaced by a single comprehensive Act in which the whole law relating to rent control should be clearly set out.

It also proposes that the Minister of Health should issue a short and intelligible layman's guide, so that landlords and tenants alike may know their rights and obligations.

The Inter-departmental Committee on Rent Control was appointed in November, 1943, under the chairmanship of Lord Ridley "to review the question of rent control, including the working of the Rent Restrictions Acts, and to advise whether any, and if so what, changes are necessary." The report begins with a survey of the position at the beginning of the war, when the Rent and Mortgage Interest (Restrictions) Act, 1939, was passed, thus reversing the process of decontrol which had been going on steadily since 1933. The purpose of rent restric-

In Germany itself the only sure way to begin to re-discover the non-Nazis is to attempt to uncover the submerged pre-Nazi Germany of Weimar. In Italy, after twenty years of Fascism, some traces of the pre-Fascist parties and organisations remained. In Germany, where totalitarianism was complete, the traces may be fewer, but there will surely be some. The churches, their charitable organisations and clubs, have preserved a vestigial existence. Trade unionists can certainly be found, possibly even traces of trade union structure. Finally, there are probably men who played a part in the old political parties who are ready to reopen a party headquarters and begin the task of organising their neighbours for political discussion and action. In the Rhineland there used to be very strong currents of religious, political and trade union activity. Much has gone, but whatever remains should be nursed and encouraged back to life. It will then be possible to bring back old leaders or try out new ones. Nurseries for politics will have been set up. These will be genuine alternatives to a Nazi system.

It may be that AMG is already working on directives of this kind. It may be that an approximation is already being attempted between the Russian approach and the apparently more negative methods of the Western Allies. But, if this is the case, there has been singularly little evidence of it, and the people at home in Britain and America are still entirely ignorant of the principles upon which Allied occupation policy is based. On the greater issues such as the future of Germany, dismemberment, or disarmament and on the smaller—the choice of a mayor or the appointment of a police official—confusion or silence reigns. Yet decisions are presumably being taken. Day to day issues are being decided. A policy is in fact emerging in the usual manner of British foreign policy—by a series of *ad hoc* decisions which finally by weight and cohesion constitute a commitment. But to what the British people will stand committed, nobody, not even His Majesty's Government, really knows.

tion, as defined in the report, is to prevent "undue rises in rent, which might be caused by housing shortages, by limiting the rent a landlord may legally recover from a tenant, while at the same time giving the tenant security of tenure." This rent is known as the standard rent and is fixed by reference to the rent that was actually being paid on August 3, 1914, for "old control" houses (that is houses which have been controlled continuously since 1920) or September 1, 1939, for "new control" houses (that is houses which were controlled for the first time under the 1939 Act or had control re-imposed under that Act).

The effect of the 1939 Act was to bring under control the vast majority of the 13 million houses in the United Kingdom, whose rateable value did not exceed certain prescribed limits—£100 in the London area, £90 in Scotland, and £75 elsewhere. The 13 million houses can be divided into four main groups:

1. About 4 million small houses built before 1919, which have been continuously controlled since that date, although the permissible rent has been raised to 40 per cent above the standard (i.e., 1914) rent. Their average rent excluding rates in 1939 was about 6s. a week, or 9s. in London.

2. About 4½ million small houses built before 1919, which were controlled for a period, but decontrolled before 1939 and re-controlled in that year at the rents then prevailing. Their rents vary widely, but the average, excluding rates, is probably about 30 per cent above the previously controlled rent (or 50 per cent in London), this increased rent being the present controlled rent.

3. Over 3 million houses built by private enterprise between 1919 and 1939, which had never been controlled until 1939. When let, their rents are considerably higher than those in the other groups, but the majority are owner-occupied.

4. About 1½ million houses built by local authorities

since 1919, whose rents are at the discretion of the authorities and are not subject to any control under the Acts. Their average rent in 1939, excluding rates, was about 7s. per week, or 10s. 6d. in London.

The net effect of the 1939 Act, it will be realised, has been that similar houses have widely different standard rents, because they happen to have been let at different dates.

Nobody in his senses would disagree with the Committee's first conclusion, which is that rent control should be continued for so long as there is a housing shortage, in order that tenants may be protected against the extortion of "scarcity" rents. The Committee considers that it may be necessary to continue control for ten years, but recommends that the situation should be reviewed after a few years so that control could be relaxed, especially over the higher rated houses, if circumstances permit. No change in the present rateable limits prescribed in the 1939 Act is proposed.

There was some controversy among the signatories about whether rent control should be applied to new houses built or converted into flats by private enterprise after the war. Two Socialist members of the Committee, in a reservation, contend that in view of the prospect of continued housing shortage, safeguards in the form of rent control should be applied to new houses as well as to those already controlled. This point promises to be the Labour party's main criticism of the report, which it has otherwise welcomed. It is perfectly true, as the Labour members argued, that safeguards will be necessary, but the majority view was that private enterprise builders will be granted subsidies by the Exchequer under conditions which should provide sufficient safeguards, while the allocation of building labour and materials will provide another form of control. This argument, however, is open to doubt. A more valid objection against the imposition of rent control on new houses is that it would act as an impediment to building at a time when every inducement is needed. As the Ministry of Health's Central Advisory Committee on Housing pointed out in a recent report on Private Enterprise Building, private builders have been far more prone in the past to build for sale than for letting. Anything that would obstruct a reversal of this tendency would be very unfortunate. It is better to have the houses, even if they are let at high rents, than not to have them at all.

The Labour members also dissented from the majority view that houses built by local authorities should continue to be free from control and urged that these should likewise be brought under any new Act. Here again, the point that local authorities are already subject to certain conditions under the Housing Acts and are obliged periodically to review their rents might seem sufficient to justify their exclusion from the control provisions of the Acts. It does, however, seem slightly anomalous that Housing Associations, which in many cases are to be financed by local authorities to act as their agents, should receive different treatment. On the whole, the Labour members seem to be right on this point, and all houses within the value limit, however owned, should be brought within the Acts. Two further recommendations about the scope of control should be noted. The committee evades the difficult issue of the rents of "tied" cottages, which applies mainly to agricultural labourers, and proposes no change in the existing system which excludes "service occupation" from rent control. Sooner or later, however, this system, which is meeting with increasing opposition, will have to be reviewed. It might be possible, in the special circumstances of these cottages, to control the rents charged without giving the tenant the security of tenure that usually goes with rent control, and which is the chief objection to their inclusion. There will be general satisfaction at the recommendation to bring furnished, as well as unfurnished, lettings under control. Previous committees have failed to find any formula for determining the "standard" rent of furnished premises and recently there has been considerable evidence of exploitation of war workers and servicemen's families who were obliged to take furnished rooms.

One of the committee's most sensible recommendations is that local authorities should compile and maintain registers of the rents of all houses to which the Restriction Acts apply, so as to provide a basis for determining legal rents. Pending a decision on what is the legal rent, the rent payable at the date of the publication of the report would become the registered rent. The registers would be open to public inspection and any costs incurred by local authorities would be reimbursed by the Exchequer. It seems indeed surprising that such a system of registration should not have been adopted long ago. Without such a register, the committee's central proposal for the establishment of Rent Tribunals, whose function would be to determine "fair" rents, would be difficult to apply. The idea of rent tribunals is not new, but has never been regarded as practicable hitherto. In Scotland, however, rent tribunals under the Rent of Furnished Houses Control (Scotland) Act, 1943, have been operating smoothly and effectively. As the Report states, "The incidence of the Rent Restrictions Acts is so uneven that no simple formula can be devised which can be universally applied, so as to produce fair rents." These tribunals would have the task of adjusting the rents of controlled houses, on the basis of a systematic review of all registered rents, and of eliminating the anomalies created by the passage of the 1939 Act. There is ample evidence to show that exactly similar houses in the same street and of the same rateable value have different rents. The tribunals, which would have wide and simple terms of reference, would deal with the most urgent cases first.

There would be 198 tribunals in England and Wales and 30 in Scotland, and they would, it is suggested, consist of 2 to 4 members, with a chairman. None of the members need necessarily be people with legal training, so long as they had experience of public affairs and access to expert advice. The chairman would be full-time; but the members would be part-time and would be paid sessional fees. At the outset they would be expected to sit three days a week, and might hear about 1,000 cases in the first year, though the work would naturally diminish as the most pressing anomalies were removed. The difficulty will be, as always in setting up independent bodies, to find enough people with the necessary qualifications and the time to devote to the very complex tasks of rent determination. There is a growing tendency, as the sphere of state control extends, to throw more and more responsibility upon independent bodies, and, like a stage army, the same people tend to go round and round.

A more serious defect in the scheme, however, is the failure to give the tribunals any guidance on how a "fair" rent should be determined. Does this mean "fair" in relation to the general level of rents in the neighbourhood? There is a wide disparity in rents geographically and occupationally. The existence of a number of tribunals in different areas may tend to perpetuate these inequalities—though it is suggested that neighbouring tribunals should confer with each other—unless they can have reference to some kind of national standard. The report appears to assume, without actually stating, that this review of anomalies would have the general effect of raising the lower rents, rather than of reducing the higher ones, and there is some rather inconclusive quotation of increases in the cost of repairs which is apparently intended to be relevant to this point. But there is no assurance at all that the tribunals would all think alike; the mess that valuation for rating has got into shows what astonishing variations can emerge from the actions of a number of independent bodies, even when they are expert and guided by supposedly precise principles.

The committee rejected the suggestion put forward by the property owners that there should be a general increase (the figure of 25 per cent has been mentioned) in the level of controlled rents. Curiously, neither the advocates of this increase nor the committee itself seems to have paid any attention to the major justification for it. The property owners talked about the cost of repairs, but the real basis is that the value of money has fallen, and almost certainly permanently fallen, since 1939. To hold this one form of

* Report of the Inter-Departmental Committee on Rent Control. Cmd. 6621. 1s. net.

real property down to its pre-war money value would be inequitable in theory and would produce an artificial position in fact. The committee would have been better advised to grant a flat increase straight away, instead of waiting three years, as they propose. If the increase were as little as 25 per cent, it would be safely below the rise in the general price level, while it would relieve the tribunals, at one stroke, of the greater part of their burden, and make the tribunal system much more feasible. The committee's main objection is the existence of a number of "new control" houses, whose controlled rents are fixed at the very high figure at which they were first let after September 1, 1939. But these could easily be excluded from the increase by a proviso that the controlled rent should in no case be more than a stated proportion—125 or 150 per cent—of the net annual valuation for rates.

Save for this criticism, the Report (which contains a number of other matters upon which it is impossible to comment here) is a useful one, which should be embodied

in legislation. But it would be as well to be quite clear about the objects of legislation, which should be to deal temporarily with a temporary problem. Rent control may be a necessity while the shortage of houses lasts, but it is not permanently desirable. There is some tendency on the Left to argue as if any measure that keeps rents down is good, and any that permits an increase is bad, irrespective either of the principles of fairness between landlord and tenant or of the probable effects on the number of houses built. For thirty years there has been a shortage of houses, but supply will have caught up with demand within a few years from now—almost certainly in less than the ten years envisaged by the committee. When that happens, rent control should go completely. If, at that time, there are still families so poor that they cannot afford to pay an economic rent, the remedy will be to alleviate their poverty, not to put the burden of supporting them on to their landlords. In this, as in other respects, a solution of the housing problem is more likely to be obstructed than assisted by sentimental remedies.

The Yen-an Regime

THE Chinese delegation to San Francisco includes, among other personalities, Mr Tung Pi-wu, one of the leaders of the Chinese Communist Party. This is a reminder of the growing importance which the so-called Yen-an regime is acquiring in the political life of China. Mr Tung Pi-wu's party controls large stretches of Chinese territory as well as important military forces over which Marshal Chiang Kai-shek exercises no direct or indirect control. The chief base of the so-called Yen-an regime lies in the provinces of Shensi, Kansu, Ninghsia and Shansi. Yet although the town of Yen-an has given its name to the regime, the main strength of Chinese Communism does not lie in that area. The population of the Communist-controlled provinces around Yen-an does not amount to much more than one and a half million. Yen-an is only the most solidly organised base of Marshal Chiang Kai-shek's rivals. The Chinese Communist Party controls fifteen or sixteen similar bases behind the Japanese lines. They are scattered over enormous distances from southern Manchuria in the north to Hainan Island in the south. According to Russian and Yen-an sources, the total population of the Communist-controlled area is 88 to 90 million people. More conservative American estimates put the figure at 50 to 60 million. The boundaries of the Yen-an-controlled areas fluctuate. Every now and then Japanese incursions reduce their size and partisan activities expand them; and this may account for the differences in the estimates.

It is probably too early yet to speak of any fully-fledged Yen-an administration. Yen-an is the centre of political and military leadership; but it is not the seat of any government. So far, the Chinese Communists have not set up any central administrative authority. Formally, they still recognise the central Kuomintang Government in Chungking. This may, of course, change. If hostility between Chungking and Yen-an grows more acute, Yen-an may come to speak with the voice of a rival government. Apart from political motives, which may prevent Yen-an at present from delivering the final challenge to Chungking, the material conditions for the setting up of any central administration in Yen-an do not exist. The fifteen "bases" scattered over vast distances and sandwiched between Japanese-held territories can hardly be ruled centrally. Decentralised local government is the familiar feature of any guerilla regime. In China this is strengthened by a deep-rooted tradition of provincialism and particularism. In addition, the Yen-an regime is essentially inspired by the ideal of a radical agrarian democracy. The horizon of this type of society tends to be confined to the boundaries of a village or of a few villages and it regards with suspicion, if not hostility, any patterns of centralised government that may spell a predominance of the town over the countryside.

It would, thus, be erroneous to speak of a Communist

regime, in the European sense, being established in China. Genuine Communist ideas had struck pretty deep roots in the political soil of coastal China, especially in the heyday of the alliance between the Kuomintang and Communism in the middle of the twenties. But ever since the break between the two, Communism has been thrown back into the rural areas, where it has transformed itself into an agrarian movement of a kind for which many antecedents can be found in China's history. In this metamorphosis, Communism has shown great vitality and astonishing powers of regeneration. It has also undergone a curious social and political evolution. In the early twenties the Chinese Communists preached "proletarian dictatorship" and Socialism for China. True, even then they thought that the social and economic structure of their country was not ripe for an economy based on public ownership. But, in harmony with Lenin's teachings and with the resolutions of the Second Congress of the Comintern, which took place in 1920, they hoped that China, like all other backward or colonial countries, would soon be "towed" towards Socialism by a Socialist Europe—these were the days when Moscow hoped for an immediate victory of the Soviets in western Europe. The frustration of these hopes led to a revision of the programme for the Chinese Revolution in 1925. An anti-feudal and not an anti-capitalist revolution was, now foreshadowed. The chief plank became the abolition of landlordism and the unification of China through a radical suppression of provincialism. It was on the basis of this programme that the Chinese Communist Party was affiliated to the Kuomintang between 1925 and 1927. The Yen-an regime represents a new phase in which the Communists preach and practise a gradual reformation of the feudal agrarian structure rather than its revolutionary abolition.

This emerges clearly from the agrarian reforms that have been carried out in the Communist provinces of China. The main issue in all Chinese agrarian policy is rent for land. About 60 per cent of the Chinese peasants are still tenants or part-owners. Share-cropping is almost the universal form of land rent. Forty, fifty and at times even sixty per cent of the crop goes to the landlord, who is at the same time the merchant and the usurer of the countryside. The peasantry is usually heavily in debt, which means that a further considerable percentage of the crops goes to the local lord in the shape of interest. In the first two years of the Chinese-Japanese war the Eighth Route Army acted as the expropriator of the landlords. Later on, the agrarian upheaval was stopped; and in Yen-an's present policy the most important point is the limitation of the land rent to 37 per cent of the crop. Expropriation of landlords and the distribution of their land among tenants is prohibited.

Only when the landlords are collaborators or supporters of the puppet regime of Nanking is their property con-

fiscated. It is quite possible that this provision is also used against landlords who show their allegiance to Chungking too openly. But such reports from the Yen-an areas as are available suggest that a great majority of the local landlords have willy-nilly reconciled themselves to the Yen-an regime; and that they play quite a prominent part in it. The maximum limit of a 37 per cent rent in kind is a very moderate reform indeed. It also figures in the official programme of the Kuomintang, though so far Chungking has not enforced it in the provinces under its control. It is therefore—paradoxically enough—on the basis of an essentially feudal economy, the rigours of which it tends to mitigate, that the "Communist" regime of Yen-an is operating. Yet although the system of share-cropping has been left intact, the struggle against the influence of the landlords has been carried into other fields. The organisation of co-operative network of rural credit has reduced usury. The political influence of the landlords has also been reduced by the fact that they have been deprived of their traditional control over the police and the courts.

Another interesting development is that the pressure of military necessity has compelled Chinese Communism to act as the godparent of a native industrial bourgeoisie. The strength of the Eighth Route Army is now said to be 500,000 men. The irregular partisans are reported to number 800,000 men. In addition, there are the numerous detachments of the militias who have replaced the old police. Even if the reports exaggerate the real strength of the military formations, the demand for arms must be very pressing indeed. "Communist" China is under a double blockade, by the Japanese and by Chungking—and Chungking would, in any case, be unable to supply munitions to the partisans and to the Eighth Route Army because its own forces are only very poorly armed and equipped. A primitive armament industry, as well as textile and footwear industries, have had to be improvised in completely agricultural areas where no industrial classes existed before. The feudal land-rent has provided the economic basis on which the growth of industry has taken place. Yen-an has exempted from taxation all land-rent that is turned into industrial capital. True, this transformation of land-rent into industrial capital has been greatly hampered by lack of material resources as well as by the fact that the circulation of money is still very underdeveloped in rural China. But these difficulties have been partly overcome, possibly with the help of supplies from Soviet Russia, which came in quite regularly during some

periods and were discontinued at others. There has also been a remarkable expansion in the local output of industrial raw materials, especially of cotton. Incidentally, the little use made of money payments has had some advantages in a period when fantastic inflation is rampant in the whole of China. Industrial wages are paid in kind, chiefly in millet, the staple food in some of the Yen-an provinces. The social position of the industrialists is being deliberately boosted in order to encourage industrial enterprise. Industrial investment by landlords is hailed as an act of patriotism. Yen-an propagandists contrast this policy with that of Chungking, which has failed to improve the supply position of the Chinese armies; and they point out that the high taxes which Chungking imposes on industrial earnings have been a brake on industrialisation and have compelled Chungking helplessly to look for supplies from abroad. They say, too, that the growth of native industries has been hampered by the customs that are still levied on trade between province and province. Such survivals of particularism have been done away with in the Communist-controlled areas.

Here again, Yen-an propagandists are likely to exaggerate the achievement. But there is little doubt that the Spartan military-agrarian regime of Yen-an has done well in organising resistance to the Japanese; and non-Communist observers have also underlined quite a number of its impressive features. The policy of Yen-an may thus eventually appeal to large sections of the Chinese peasantry and even of the middle classes more strongly than that of Chungking, if the obstinate influence of reactionary landlordism in the leading bodies of the Kuomintang is not broken. The possibilities of a very deep schism are quite unmistakable. The leaders of Yen-an would be enormously strengthened if Russian influence were openly given in support of their regime. The decisive question for China's outlook will be the political and social alignment of forces in the industrial and commercial centres on the coast. It is possible that, as an essentially agrarian movement, Yen-an will not strongly appeal to the urban population in these regions. But it is more probable that the liberation of the coastal provinces will be followed by a revival of Communist influence in its old strongholds, such as Shanghai and Canton, and by some sort of a link-up between the urban Labour movements and the Communist-led peasantry. After more than thirty years of social strife and political convulsions, China is not yet sailing into a haven of social peace.

The Budget Speech

THE war years have seen some departure from the traditional form of the Budget speech. Formerly it consisted of an account of the results of the past financial year, an estimate of expenditure in the current year, a statement of how far revenue on the existing basis of taxation would go to meet it, and, finally, the proposed changes in taxation.

This year, Sir John Anderson began, it is true, with the customary account of the past year. Total expenditure was £6,063 million, which was £126 million more than his estimate. The Votes of Credit amounted to £5,125 million instead of £5,000 million owing to expenditure on war damage which was excluded from the Budget estimate. On the other hand revenue was also higher than the estimate. Inland revenue reached £2,029 million, and customs and excise, at £1,076 million, were higher than the estimate by £38 million. The beer duty brought in nearly £20 million more than the estimate and the duty on aviation spirit, which was imported on Government account, a similar increase. The Budget deficit was £2,825 million, or £11 million less than the estimate. But the proportion of total expenditure met out of revenue was 53 per cent, a higher figure than in any previous war year. The deficit and also the repayment of 5 per cent Conversion Loan, 1944-64, were covered by the usual forms of borrowing, but as more was borrowed from extra-budgetary funds, borrowing by addition to the floating debt accounted for 37 per cent of the total, against 39 per cent in 1943-44.

Summing up five and a-half years of war finance, Sir John stated that total expenditure was £27,400 million, of which £13,300 million, or 49 per cent, was met out of revenue.

The deficit, debt repayments and other capital transactions were met as to 22 per cent by small savings, 33 per cent by the sale of other war loans to the public, 31 per cent by floating debt, 6 per cent from various extra-budgetary funds, and 8 per cent from other sources. During the war period the community has been deprived, through taxation and savings, of 42 per cent of its personal income.

The Chancellor then went on to describe certain adjustments in taxation. With the end of the German war, and the resumption of private import trade, the duties now lifted from an extensive range of goods predominantly imported for Government purposes will be restored. Secondly, in accordance with the recommendations of Sir Amos Ayre's Committee, imported hydro-carbon oils used as raw materials for chemical synthesis will be freed from duty, with corresponding allowances for indigenous oils used in these processes. Thirdly, as a corollary to the modernisation of the Excise Law, which will be introduced in the Finance Bill, certain allowances to distillers will be repealed. Fourthly, the hop duty will be renewed on its expiry next August. Fifthly, there will be some modification in the exemption of educational entertainments from entertainments duty. Sixthly, Sir John spoke of the change in the motor vehicle duty, which is mentioned in the leading article. He then referred to the success of pay-as-you-earn, which has been in force for a full year. The number of persons liable to pay tax as they earn is 12 million and about 1 million employers are concerned. The total amount collected under PAYE was £540 million in 1944-45, an increase of about £100 million over the corresponding yield in 1943-44, which

reflects the higher earnings. Of the total, £250 million was paid by manual wage-earners, an increase in yield of about £50 million. The seventh change in present taxation is to be a further relief for small businesses in respect of EPT. Finally, Sir John described the Double Taxation Treaty with the United States, which is discussed fully elsewhere (page 555).

Sir John then devoted, like most of his predecessors in office, a considerable part of his speech to the position of the National Debt. But unlike them, he was mainly concerned with the external debt resulting from war expenditure overseas—"it is our overseas financial position which is our main immediate cause for anxiety." Local cash expenditures, exclusive of food and raw material, "in the fields and bases of operational lines of communication in Asia and Africa"—apart altogether from expenditure in the Americas and Europe—are estimated at £584 million in 1942, £689 million in 1943, and £716 million in 1944. The total is roughly identical with Britain's total disinvestment throughout the world in the same period. It follows, therefore, that the British balance of payments with all parts of the world other than Asia and Africa has been in equilibrium for the past three years. After referring to the effects of Lend-Lease and mutual aid on international transactions, the Chancellor estimated that Britain's total overseas liabilities will finally exceed £4,000 million without taking into account the assets that have been sold.

How this indebtedness is to be met will have to be settled by international agreement, but Sir John stated clearly that it could not be treated as an ordinary commercial debt. Nevertheless, Britain will still have a formidable problem in paying for imports, and for the first three years after the war he foresaw "a very heavy deficit on current account." There will thus be a very urgent need both to expand exports and to enforce a strict economy in external cash expenditure. There will still be heavy obligations in the maintenance of world security, but "We must see to it that our position and power in the world are represented by effective strength which we know we can maintain physically and financially." There will also be obligations in respect of reconstruction in overseas dependencies. But, beyond these two pressing needs, all external expenditure will have to be severely limited.

NOTES OF THE WEEK

Berlin Encircled

Berlin is encircled by the forces of Zhukov and Koniev, and the battle for the capital is being waged in its long and wide streets, now mostly reduced to ruins. Inside the Russian ring—so the Nazis say—Hitler and Goebbels direct the battle. This may or may not be true. If the Fuehrer had any hope that the Nazis after defeat might still be able to wage any real underground struggle, he would certainly prefer to join his Werewolves. But it may also be that the Fuehrer, or at least one of his dummies, must die heroically in order that the Fuehrer legend should survive. Hitler's personal fate has, of course, no importance for the immediate course of military events. The link-up between the Russians and the Western Allies from Berlin down to the Czech frontier is imminent. When this is effected the remainder of the German forces will be pressed into two pockets. The northern pocket will extend from Stettin to Bremen with Hamburg in the middle. The southern pocket will include Bohemia and the somewhat mythical Southern Redoubt. How quickly these two pockets will be liquidated can be a matter of speculation only. The fall of Berlin and the junction between the Russian and the Western Allies at the centre of the front will bring the battle of Germany, symbolically as well as practically, to a close. The millennium of National Socialism is ending in unparalleled pandemonium. Hitler has been beaten, but his genius of destruction will mock at the victors for many years after the sound of the battle has died away.

Before San Francisco

The San Francisco Conference on world security opens under an unlucky star. Its preface was the signature of a Twenty-Year Alliance between Russia and the Lublin Poles.

After referring to the Budget White Paper, Sir John then dealt with the internal debt. But unlike nineteenth century Chancellors, he was not concerned with its size or with methods of reducing it, though he pointed out that after the war it will be twenty-five times as great as it was in 1815. He emphasised instead that the interest on the debt, expressed as a percentage of the nation's taxable income, will be no higher after this war than it was in 1918 or in 1815, and he was chiefly concerned with the need to maintain low interest rates in peacetime.

Sir John then dealt briefly with the cost of living, giving a warning against increases in wage rates that are not accompanied by an increase in productive efficiency. He then came to what was formerly the most eagerly awaited part of the Budget speech—the prospects for the current year. He had already, however, said that this will probably be merely an interim Budget, and at the present stage of both wars he could not give anything but tentative estimates of war expenditure. The fixed debt charge is estimated to be £50 million higher at £465 million, and the civil supply votes are £68 million higher, mainly because of the Education Act reforms, and the training schemes for demobilised and disabled ex-servicemen. War expenditure is tentatively estimated at £4,500 million, making total expenditure about £500 million lower than in 1944-45. True to tradition, Sir John then estimated the yield of the existing taxes. Income-tax is estimated at £1,350 million, an increase of £33 million, but the excess profits tax is estimated to decline by £10 million, owing to the changes made in last year's Finance Act. Customs and excise are estimated to yield £54 million more, and total revenue is put at £3,265 million, giving an estimated deficit of £2,300 million, some £525 million less than the deficit in 1944-45.

Since the Chancellor had already dealt with the minor changes in taxation, there could be little excitement at this stage of his speech. The assumption that there would be no change, either up or down, in the main body of taxes proved correct. The only comfort for the taxpayer lies in his emphasis, towards the end of his speech, that this is only an interim Budget, and that

It is of the first importance that when the compelling incentive of working for victory is no longer present, there should be an early alleviation of the existing heavy obstacles to the normal incentives to work.

The alliance itself is simply a repetition of the treaties already signed with Czechoslovakia and Yugoslavia. The non-Russian signatories in this case, however, represent a Government recognised by neither Britain nor the United States. It is clear that the Russians do not intend to interpret the Yalta formula as anything but a recognition of Lublin as the existing Polish Government. There may be some reshuffling of portfolios. There will almost certainly be nothing approaching the genuine reorganisation which the Western Powers—and ordinary democratic principles—demand.

Thus, by a long process of attrition, the Russians have imposed on a small neighbour a government of their choosing. What conclusion can all small Powers assembled at San Francisco draw from this procedure? Is it a reassuring illustration of the use to which the Great Powers may put their preponderance? What security do the Dumbarton Oaks proposals or the Yalta voting agreement give that such procedures will not become the rule?

This is the rather discouraging background of the Conference. It is clear that none of the Small or Middle Powers wish to upset the negotiations. All see in Great Power unity the best hope of peace. Yet they cannot be very heartened by the evidence of how little weight a small Power plays in the balance of policy of a great neighbour.

Labour's Election Programme

The Labour Party has issued its election programme well in advance of the other political parties. Much of it simply re-states, in rather cautious terms, well-established Labour principles and policies, which might have been taken from any Labour manifesto during the past twenty years. This is perhaps inevitable, for Labour policy is shaped at the Party's annual conferences, and any declaration which did not reflect conference decisions would be severely criticised.

There may, in fact, be some criticism when this document comes up for discussion at the Whitsun Conference. To judge from the tone of some of the resolutions put down on the Agenda, many delegates will say that the Executive's declaration does not go far enough, and will call for a more immediate introduction of Socialism than the instalment system now proposed. The present programme, perhaps wisely, confines itself to the transfer to public ownership of fuel and power, inland transport, iron and steel, and the Bank of England. Though it would work towards land nationalisation, this step would not be taken immediately, but, following the lines of the Uthwatt Report, the State and local authorities would be given wider powers of acquisition. As if to anticipate accusations of "bureaucracy," the reform of the Civil Service is given high priority.

This is dreadfully *vieux jeu*. Twenty-five years ago, no doubt, the proposal to nationalise the basic industries was revolutionary and exciting. Nowadays all save the most simple-minded will want to know what it means. What sort of industrial policy would these nationalised industries pursue? Would they go out for productive efficiency and low prices, or would they seek still more secure protection? If the former, how would they obtain the resources to modernise themselves? What would be their labour policy—ever higher wages for ever shorter hours, or a real attempt to secure high earnings through high productivity? How would a nationalised Bank of England differ from the present Bank—and would the differences be good or bad? What steps would be taken to guard against the loss of managerial efficiency which could be expected *prima facie* from public ownership? To none of these essential questions does the Labour Party provide any answer. Yet without answers, even those who are well disposed towards a Socialist policy are unable to form a judgment whether a Labour Government would be a blessing or a disaster.

In spite of the publication of Labour's programme, the political atmosphere is less taut now than it was a fortnight ago, when the Bevin-Bracken controversy flared up. Talk of a June election has subsided. Perhaps Mr Churchill's admonition against premature victory celebration had a chastening effect. The week-end speeches by Mr Ascheton, Sir William Beveridge and Mr Shinwell for their respective parties were less "eve of the poll," though no less acrimonious. But surely Mr Ascheton could find better arguments against Socialism than to say that Karl Marx was a German? So was Queen Victoria.

Two Barriers

In a speech delivered after the signing of the Russo-Polish Treaty of Alliance, Marshal Stalin stated:

There is no doubt that if this barrier from the east is completed by a barrier from the west erected by our Western Allies, German aggression will be nipped in the bud, and will not be able to develop easily. . . . This is why I do not doubt that our Allies in the west will welcome our Treaty.

The "barrier in the east," to which Marshal Stalin referred, has been set up not only by the Russo-Polish alliance, but by the signing of alliances with Czechoslovakia and Yugoslavia as well. Former satellites—Rumania, Hungary and Bulgaria—also form part of it. The Russo-Polish Treaty completes, in fact, the creation of a solid eastern bloc which stretches from the Baltic to the Adriatic.

What does the "barrier in the west" mean in this context? Some time ago, all British and French discussion on the subject of a Western Union was met with rather acrimonious comment in Russia. The idea of a Western Union was criticised as a pernicious attempt to set up rival spheres of influence, and the Communist parties in western Europe were bitterly opposed to it.

Marshal Stalin's statement may perhaps be read as a hint that the Soviet Government at least would no longer look askance at the creation of something like an Allied bloc in the west. Does this mean that the Communist parties in France and Belgium, too, would drop their opposition? The question is perhaps not of the highest practical significance, since the chief obstacle to a western bloc so far has been not so much Russia's disapproval as the lack of initiative on the part of the Western Governments. If, however, Russia were now to withdraw all opposition to a western union, this fact would certainly create more favourable conditions for a new and more determined approach to the problem.

Men With a Load of Mischief?

Marshal Pétain has left Germany and is on his way to France. King Leopold of the Belgians is also reported to be on his way home. It is difficult to say whether or not these famous "hostages" actually escaped. The word seems too dramatic to describe their orderly and leisurely progress across the German frontier into Switzerland. On the other hand, it seems unlikely that Hitler would have voluntarily thrown away such valuable counters in a possible bargain for survival. The most likely explanation is the collapse of authority and administration in Germany. The hostages found themselves in a position to drift about, and drifted to Switzerland.

Their return must create some serious political difficulties in Belgium and France. There is virtually no opposition to the monarchy in Belgium, but King Leopold's position is ambiguous. The fact that many of his immediate entourage and the father of his second wife were collaborators tells against him. Nor was his remarriage popular. Many Belgians would prefer the continuance of the now generally popular Regency.

In France the difficulties are much more grave. It would be foolish to underestimate the continuing strength of Vichyism in France. In the army in particular an important section of the officer corps did at one time give their loyalty to Pétain, and approved the mystique of his *état français*. Many of them left him only when the Germans, by occupying all France, took away Pétain's last pretence of independence. Equally, however, Pétainism is for the Resistance and for the Left generally the symbol of the France that betrayed them to the Nazis. Thus the alignment of forces which must be caused by Pétain's public trial may well split France as profoundly as did the Dreyfus case—and along very similar lines. General de Gaulle is suspected on the Left of reinsuring his position by a lenient attitude towards Pétainism. He will need all his political skill to avoid identifying himself with one or other side in France's great and tragic debate.

Planning Indian Industry

One more stage has been reached in the definition of a policy for industrial development to be pursued by the Government of India. A statement was issued from New Delhi early this week setting out the intentions of the Government towards Indian industry and outlining the methods by which its declared objects are to be achieved. These objects were first stated in the famous Second Report of Sir Ardeshir Dalal's Reconstruction Committee, of which the present statement is a natural development. In brief, they were to raise living standards and to ensure a more equitable distribution, between regions as well as between classes, of the wealth of the country.

Such ambitions involve not only rapid industrialisation, but also a measure of control to co-ordinate development and to dictate priorities which otherwise could only be decided by the slower and more wasteful methods of competition. The present statement is a provisional indication of how much control will—or rather may—be necessary. It is by no means complete, but it will give Indian industry some idea of where it stands and what it can expect from the Government. Thus, armaments, public utilities and railways are to continue under State ownership; electric power will become, primarily, a concern of the State; other basic industries are listed (including

THE BRITISH LINEN BANK

Incorporated by Royal Charter, 1746

Head Office: 38 St. Andrew Square, Edinburgh

200 BRANCHES IN SCOTLAND

LONDON OFFICES:

City Office: 38, Threadneedle Street, E.C.2.
West End Branch: 198, Piccadilly, W.1.

iron and steel, chemicals, dyes, and most kinds of transport vehicles which may be nationalised if capital from private sources is not enough for rapid expansion. Responsibility for some twenty of these basic industries is therefore to be immediately transferred from the Provincial Governments to the Centre. These include iron, steel, coal, prime movers, transport vehicles, ship-building, cement, textiles, and electric power. For the rest of Indian industry, Government responsibility will be extended to co-ordinating power and transport, encouraging research, and offering loans and subsidies where they are considered necessary to overall development. Added to more general controls over investment, working conditions, profits, and the concentration of industry, the statement gives the impression of a big step towards a socialised economy.

That it will not, in fact, be regarded as the radical (politically speaking) change which it appears is obvious by comparison with the not dissimilar Bombay Plan brought out by leading industrialists. The support for its plans which the Government evidently hopes to enlist will owe little to Marx and a great deal to Indian poverty and to the prospect of improvement opened up by wartime development. Apart from the Parsees and the higher Hindu castes, support will also come from those of other castes and other communities to whom a wider field of State enterprise will mean a greater chance of individual participation in economic development.

Sweden Stays Neutral

One of the worst and most pointless agonies of this war is the suffering of those areas which the Nazis have selected for prolonging their resistance far beyond the hour of total defeat. It is possible that Norway is to be such a tragic bastion. It is not yet certain whether German troops will continue to fight after total collapse in Germany, but if they do Norway offers an ideal redoubt. Only a descent of Allied arms on a massive scale could end the fighting quickly, and it would be difficult to achieve such an assault from the sea alone.

It was therefore natural that the Norwegians should have formally requested the Swedish Government to state their readiness to intervene if necessary. It is also equally natural that the Swedish Government confined in its action by the Foreign Affairs Committee of the Swedish Riksdag, should refuse. The Germans are not so totally powerless that Sweden's entry into the war could be achieved without risk, and it has been clear throughout the war years that the Swedish people are behind their Government in seeking to be no braver than any other unattacked neutral, great or small.

There is, in this world of devastation, an economic argument in favour of keeping at least one industrial system intact to work immediately for post-war reconstruction. The Swedes point out this material justification of their passivity. Indeed, if, after this war, they were to use their resources without stint to restore the Norwegian economy before seeking any competitive advantages for themselves, they would only be doing justice to their much-tried neighbour. The Norwegians are, however, sceptical of these future "benefits," and are naturally deeply disappointed that Nordic solidarity does not mean more active intervention now.

New Finnish Government

The recent Finnish elections were a marked success for the Left. Their result is now the formation of a coalition of Agrarians, Social Democrats and Communists. Between them, the three parties possess three-quarters of the parliamentary votes. Since the Swedo-Finns and the Liberals are also in the Government and only the Conservatives have been left out (with 28 votes in the Diet), M. Paasikivi's new Government may be described as a Government of national unity. The next question is how long the coalition will be able to maintain its unity. Inside the Government, the Left has the ascendancy. It holds ten ministries out of eighteen.

There are many men and women in the Services who would welcome a chance of reading this publication. If you would send it in, unwrapped, unstamped, and unaddressed at any Post Office, it will go to them.

Mr Leino, a Communist leader, is Minister of the Interior; and Mr Pekkala, who was leader of the anti-war group in the Social Democratic party, has taken over the Ministry of Defence. The two appointments foreshadow a radical purge of the army and police. The Ministry of Justice has gone to the Agrarians, who will probably try to mitigate the severity of the purge. At least six Ministries are double-headed—that is directed by two Ministers at the same time. Thus, there are two Ministers of Foreign Affairs: M. Svento, a left Socialist, and M. Euckell, who, like M. Paasikivi, belongs to no political grouping. There are also two Ministers of Finance—one a Liberal, the other a Social Democrat.

Building Apprentices

The Building Apprenticeship and Training Council, which is responsible for advising the Minister of Works on all matters relating to the recruitment, education and training of juveniles in the industry, has had occasion in its second report to increase its estimate of the number of apprentices required for the industry. Instead of the original figure of 15,000-20,000 apprentices a year given in the Council's report last year, a total annual intake of 25,000 apprentices, starting from now, is considered necessary, in order to offset the wastage on the force of 625,000 craftsmen, to reach the standard of 125,000 apprentices within five years, and temporarily to increase the present proportion of one apprentice to four craftsmen.

One of the main functions of the Council has been to keep a complete register of all youths who have entered the industry as apprentices. The returns show the rather disturbing fact that of 63,976 youths in training, no fewer than 51,892, or 80 per cent, have no written apprenticeship agreement. The Council stresses the importance of written agreements and accepted minimum standards to safeguard the position of apprentices.

A scheme for training put forward by the Council has now been accepted by the Government. It will mean that apprentices will learn their craft on actual building operations, such as the rebuilding of war-damaged houses. Local authorities and building employers are urged to co-operate in this scheme, which would not only provide the necessary practical training, but would help to offset the immediate shortage of building labour. The main difficulty in any education and training scheme will be the dearth of trained teachers, but the Council hopes that the Local Education Authorities will co-operate with the industry in extending pre-employment courses and part-time courses for building recruits.

It is obviously essential that a high standard of apprenticeship should be maintained, and that youths entering the building industry should be given the maximum degree of practical training. Though the immediate housing shortage after the war may tend to obscure the importance of long-term planning for building needs, it would be lamentable if the training provided for the next generation of building craftsmen were to be in any way skimmed. The Apprenticeship Council is quite right in insisting on the observance of proper standards, and the local Joint Apprenticeship Committees can play an important part in securing their enforcement.

In Holland

Canadian troops have almost cleared the northern part of Holland, leaving only the western provinces to be liberated. This may take time. The Germans have been carrying out a series of flooding operations, beginning with the blowing up of the Zuider Zee dyke south of the western end of the causeway which links western Holland and Friesland. In addition, more flooding has been carried out in the provinces of Utrecht and North and South Holland. The pattern of the flooding suggests the German intention of making a prolonged defence west of the so-called Grebbe line running from Amersfoort to Wageningen on the Waal. Additional floodings show that the area of Amsterdam and Rotterdam will be turned into separate island fortresses.

So far there has been no flooding with salt water, and it is unlikely that the Germans will blow up the dykes near Den Helder, where a breach would allow salt water to cover the low-lying land. Even so, it is hardly possible to exaggerate the disastrous effects of the large-scale flood-

ing that is now taking place in western Holland. The flooding itself is slow, but once it is completed, valuable land will be lost. From a purely military viewpoint the method is in the long run useless. If sufficient material and forces are available, the fortress islands now surrounded by water can be reduced. Thus all the Germans can expect from resistance in a number of inland pockets in western Holland and on the string of Dutch and German Frisian islands running along the North Sea coast of Holland and Germany is simply disorganisation, destruction and chaos—a policy which will react on Germany like a boomerang. In the short run, the more Holland must be supplied from outside resources, the less food will be available for the Germans with their lowest of all priorities. In the long run, it will be difficult to object to the Dutch claim for German territory to replace the flooded lands.

The Dutch people in these German pockets of resistance are being reduced to starvation. Food rations are extremely low and totally inadequate for active existence. Conditions in the newly liberated areas are uneven. In the area east of the river IJssel the peasants were able to supplement the small food rations by their own produce. Farther to the west, however, the milk shortage, for example, is extreme. The Germans had carried away most of the cattle.

Meanwhile, active preparations have been made for relieving the general food shortage. Stocks of food have been assembled in Antwerp. Relief and medical organisations are ready to move in. No lack of personnel and auxiliary workers has been reported. The greatest difficulty will be (as in other liberated countries) the lack of transport, particularly lorries.

The End of Civil Defence?

The end of the black-out has not, as used to be thought probable, coincided with the end of the war, but it puts an end to any pretence that this country is likely to be raided by piloted aircraft. Moreover, the complete absence of any form of attack on this country since the last days of March must surely mean the approaching end of civil defence.

Civil defence, or ARP as it was then called, dates from long before the war, from the anxious pre-Munich days of September, 1938, when gas masks were doled out to the whole population and Londoners began digging air-raid shelters. War was then thought of, by the general public, almost solely in terms of air-raids. It was estimated that some 100,000 casualties would be caused in the first three weeks of war, and on the outbreak of war 190,000 hospital beds were actually made available for the injured. In the event, the 100,000 total for casualties was not reached until the summer of 1942, and the story of the civil defence service reflects the contrast between imaginary air-raids and the real thing.

The adaptability of the ordinary citizen to air-raid conditions and the resistance of the human body to bombs have been one of the astonishing discoveries of the war. When air-raids actually began, the civil defence service was found to be over-weighted in its casualty sections. It was not first-aid workers who were most wanted, nor even ambulance drivers and stretcher bearers, still less decontamination squads. It was buildings which suffered most, and it was firemen who were in greatest demand, and then perhaps rescue workers to extract sometimes the dead, but often the living, from beneath a pile of rubble. Instead of hospital beds and mortuaries, it was rest centres and kitchens that were needed.

No one will mourn the passing of civil defence, but the members of the service have earned the country's gratitude for a job that involved long years of tedious inaction but short spells of considerable danger. Moreover, it may leave a legacy. The Regional Commissioners will go, but not the memory that to achieve efficiency civil defence had to break down local boundaries. The future of the National Fire Service is still in doubt, but even if it reverts to its local status, there will surely be some standardisation, so that the story of Devon nozzles not fitting Cornish hoses will not be repeated. The Emergency Hospital Scheme might become the nucleus of a national hospital and specialist Service. In addition, there are more intangible bequests—local self-help and the effects of evacuation, which,

among other things, revealed the fearful conditions of the slums. Civil defence will leave its mark on English social history.

Handicapped Children

The draft regulations on the provision to be made by local authorities for the education of handicapped children are clear and comprehensive. In addition to the children for whom provision had to be made under the Education Act of 1921, two new categories have been added—children suffering from speech defects and maladjusted children. The inclusion of maladjusted children is a sign of the times. It reflects the present popular interest in the fate of all those children who, for one reason or another—inherent defect of personality or parental neglect—need special care and attention. Another improvement on the earlier Act is the dropping of the term "mental defective." No child who is educable in a school will be so stigmatised, and the category of educationally subnormal pupils will include not only those formerly ascertained as educable mental defectives, but also children who are backward by reason of conditions other than "limited ability."

No hard-and-fast rules are laid down for the educational provision for all these handicapped children, except that it must be adequate. Special schools will be required for the blind and deaf and for some epileptics, but the partially sighted and the partially deaf, as well as the delicate, the diabetic, the educationally sub-normal and the maladjusted can be taught in ordinary schools provided they are given special treatment. This would include, for instance, in the case of the partially sighted and partially deaf, a favourable position in the classroom. For the educationally subnormal it would involve special tuition in small groups, and for the maladjusted such educational treatment as might be recommended by an educational psychologist. Where, however, the children have to attend special schools, which in many cases will be away from their homes, the regulations cover the provision and inspection of boarding-out arrangements.

All in all, the regulations appear to ensure that all children in any way physically or mentally handicapped will receive an education fitted to their needs. Particularly welcome is the recognition that no fixed line should be drawn between the handicapped and the non-handicapped. The handicapped can often attend ordinary schools with ordinary children and, provided they are there given special attention, can grow into ordinary citizens, leading ordinary, useful lives.

The Future of CEMA

Most wartime organisations are destined to disappear with the end of hostilities. Ought this to be the fate of the Council for the Encouragement of Music and the Arts? The Council was formed expressly to keep alive the arts of peace—to feed the minds of those banished by war conditions into the backwoods of culture. And it has done an

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

excellent job. The report of its fifth year's work, published last week, offers striking statistical proof of the rapid increase in demand for CEMA activities in all branches of music, drama and art. During the year 1944 the Council's Exchequer grant was increased by £60,000 to £175,000, but

the demand for financial help for worth-while enterprises all over the country rises at a pace out of all proportion to the growth of income.

In 1944, 7,662 concerts were given in factories, village halls, hostels and huts—3,169 in the factories alone. Under CEMA's auspices, 722 symphony concerts were held, 50 exhibitions were circulated, and repertory drama was promoted successfully throughout the country.

CEMA is not without its failures; and on occasion it has been severely criticised in Parliament and the press. But it is generally agreed that its talented administrators have not only preserved, but improved the standards of art and appreciation during the war. How far CEMA's success can be continued into the days of peace it is impossible to say. There would probably be some reduction in the amount and intensity of the voluntary work done on its behalf; and the wider attractions available in peacetime would probably mean smaller audiences for CEMA. As the report states:

It is too early to say whether these emergency functions can be made use of in a post-war world or whether any such development will be possible or even officially allowed.

In Great Britain there is much opposition—from the minority of people who are vitally interested in the question—to the concept of Government paternalism in the arts. But CEMA's record has proved that official encouragement can do much to foster popular appreciation; and without any danger of authoritarianism. There should be room for CEMA and every other purveyor of arts in the postwar years.

The City's Last Chance

The latest critic of the City of London Plan is the Royal Academy Planning Committee, which has itself put forward bold and interesting proposals for metropolitan redevelopment. The charge that

A City conceived in the main as a collection of money-earning offices is likely not only to become dull, uninspired, and wanting in dignity, but . . . could not properly fulfil the very purpose for which it is intended

is surely indisputable. The very cautiousness of the City Plan may well defeat its purpose. As is now pointed out, if land is acquired only for widening roads, the values of the adjoining sites are raised without the City securing the benefit of its own actions. But why stop at the adjoining sites? Much, probably most, of the City could surely be defined as a "blitzed area," and could be rebuilt under public ownership and with close public supervision of the design and grouping of all buildings.

Above all the basic problems of city planning are those of congestion—congestion of commerce and congestion of traffic. Neither can be effectively tackled without the other. A city of crowded offices can be neither spacious nor comfortable. The City Plan leaves the awkward and cramped siting of railway termini untouched, and even its proposed ring road would add to the congestion at several existing crossings. Continued congestion cannot make for business efficiency. The Royal Academy architects are perhaps better economists than the City planners.

Financial caution could not be more ill-placed than in this particular instance. If necessary it would pay the nation to find part of the cost of creating a worthy centre for its capital. But it is absurd that the wealthiest planning authority for its size in the country should be also the most niggardly. The rateable value of the City is astronomical. Help might even be obtained from that mysterious fund, something like the Biblical widow's cruse, which is known as the "City's

cash." It is time that the City's looks matched its pomp. In fairness to the City, it must be said that it has asked for criticism of its plan. In fairness to London and the nation, the City should speedily act on this criticism.

Cramped Quarters

How to scrimp and save extra space for our overcrowded MPs has been the hard task of a Joint Select Committee of Lords and Commons. Their report makes plain that for some time rooms in the Palace of Westminster are not going to be enough to go round. It is a situation with which fellow-Londoners will have ready sympathy, particularly as it has inevitably worsened since the destruction of parts of the Palace by enemy action.

The Committee's answer to the problem is threefold: the first step is to re-allocate existing rooms to better advantage—evicting stored books and partially evicting (at his own wish) the Speaker and some other officers from their flats. The second step recommended by the Committee is the purchase of extra space in Abingdon Street and Bridge Street to take the worst of the overflow. Finally—and this will be the next step before the new House of Commons is rebuilt in six or seven years' time—it is proposed that the extra wing, designed by Sir Charles Barry with the rest of the Palace but never yet constructed, should be built as soon as other more urgent demands on the building trade have been met. This would cost about £2,100,000, but would provide another 237 rooms for the use of Parliament. Meanwhile, a Sessional Committee of Members is recommended to advise the Speaker on the allocation of such space, as there is.

In general, the Report contains many useful suggestions for the domestic arrangements of the legislature. The extended wing is the only proposal which will require more careful thought and here it might be considered whether the Barry plans could not be structurally and ornamentally modernised, without clashing with the rest of the Palace, in much the same way as those of Sir Giles Gilbert Scott have improved on the old House of Commons.

Shorter Notes

Suggestions that a memorial to President Roosevelt should consist of an endowment for research into the causes of infantile paralysis, and facilities for the treatment of sufferers, give special interest to the news of a particularly bad epidemic of infantile paralysis in the island of Mauritius. It broke out at the beginning of March, and affected every district. By the end of the month 870 cases had been notified. Medical and nursing help has been provided by the governments of the East African Dependencies, and Professor Seddon, Nuffield Professor of Orthopaedics at Oxford University, has gone to the island. The Medical Research Council has sent someone to undertake research into the outbreak. Great sympathy will be felt for the inhabitants of this little-known dependency, who were barely recovering from the effects of two severe cyclones when this new disaster struck them.

Strong and lengthy criticism of individual clauses of the Requisitioned Land and War Works Bill, still being discussed by the Commons in Committee, continues to result in Government concessions and promises of further reconsideration. Most important is Sir John Anderson's promise to amend the clause under which the Board of Trade can dispose of requisitioned factories without reference to the proposed War Works Commission. It is certainly hard to see what the Commission is there for if it can be frequently by-passed. The slow and difficult progress of the Bill inevitably leads to the suspicions that simpler machinery and clearer drafting would have reduced both time and muddle. Indeed, these long debates on a comparatively minor matter, while urgent problems of reconstruction continue to be ignored, are a sad comment on the twilight of Coalition Government.

Surrey County Council decided this week to lift the ban on children attending Sunday cinema performances.

AMERICAN SURVEY

Black Markets

(From Our New York Correspondent)

EVEN with the energy and ability that produce three or more figures for most facts, American statisticians still suffer from the primary infirmity of their profession: inability to statistify the novel. And since a tenet of the profession is that the collection of figures and the collection of facts are synonymous, any development which cannot be discussed in Arabic numerals seems implicitly understood not to exist, even though, to use an expression attributed to Veblen, it is sufficiently obvious to be visible to the naked eye. Thus it is, presumably, that one hears on every hand that black markets have grown to considerable size in this country, but sees detailed tabular analyses of distribution in both official and unofficial publications, which balance to the decimal point in accounting for every good and service, but with not one item or figure to indicate the existence of what is everywhere remarked. This disparity of the record of the war period as it is being written and as it is being experienced presumably will not bother the future analyst, since only the undying numerologic literature will be available to him and its tables will balance just as do the statistics of the prohibition period to 1933, without any figure to cover what to any reasonably observant stroller in any city and many hamlets was at least as plain as a carloading or a kilowatt-hour.

Even though not subject to statistification, the existence of the black market can be inferred, in addition to common knowledge, by the huge mass of currency in circulation and its continuous rise beyond any relation to payrolls or price indexes. It would probably be revealed if there were an attempt to square certain tax revenue items with production. It is suggested by the combination of almost ostentatious unavailability of some items such as gasoline and cigarettes in normal channels and the visibly high consumption of those same items: lend-lease and the wicked foreigners can hardly account for all of the shortages.

The devices used by the black marketer are ingenious and doubtless as numerous as those whose greed overcomes their honesty and patriotism—a number, unhappily, not microscopic.

The New Bootleggers

One practice recently exposed by the inspectors of the Federal Food and Drug Administration is that of cutting butter portions short and selling the excess in the black market without coupons at prices exceeding the ceiling. The wartime meat business has fantastic aspects. Sometimes the original source of black market meat is actual rustling of cattle from the ranges; more frequently supplies are obtained through cash purchases from the farmer on the spot, thus eliminating all record of the transaction and by-passing the normal channels of distribution, which are subject to rationing controls. At retail, this meat is most frequently sold by the customer's regular butcher without requiring ration coupons. The butcher also may sell meat from legitimate sources to certain favoured customers without coupons; the deficit in coupons which he must turn in to secure a new supply is made up by overcharging (in coupons) the unwary, careless or ignorant.

A somewhat similar technique is used in retail petrol sales. Petrol is rationed in units of four or five gallons, depending on the value currently assigned to each type of coupon by the OPA. Under OPA rules, if a customer's petrol tank will hold only 3.2 gallons, the petrol station attendant collects a coupon for four gallons. These small excesses may be used to eke out the rations of preferred customers who are short on coupons. The predominant method of obtaining bootleg petrol, however, is said to be through the use of counterfeit or stolen coupons by retailers to obtain supplies over and above their legitimate quotas from wholesalers. A small trickle of coupons is obtained also from used car dealers who collect the seller's petrol ration books at the time they buy his car. Until last

summer the black market operator carried out such operations with relative impunity; the banks—which handle deposits of ration coupons and credit them to each dealer's ration account, against which he draws when replenishing his stock—were able to check only about 3 per cent of the envelopes deposited. Some envelopes were filled with counterfeit and stolen coupons, and even pieces of plain white paper cut to size, in the hope that they would not be opened for inspection. Last summer the OPA established regional Verification Centres to thwart such practices through 100 per cent checking.
