Deadlock in Europe

THE year 1945 is opening gloomily for the Allies. Fighting still goes on in Athens. The Lublin Committee has added another twist to the tangled knot of Polish politics by declaring itself the provisional Government of Poland. Across the Atlantic, American criticism of Britain and distrust of Russia show but little sign of abating. Militarily, too, the outlook is disappointing. The Rundstedt offensive has been checked, but that it should have succeeded at all grievously contradicts the high hopes of last summer. The Russians' encirclement of Budapest and advance on Austria are bright lights in an otherwise sombre picture, but they are at a standstill in Poland and in East Prussia.

The two chief factors in the Allied crisis—military deadlock and political disunity—naturally interact on each other. Now, as always, political differences are accentuated by military frustration. In turn, the political differences have helped to create the military situation by giving the Nazis a hope to fight for—the hope that the coalition against them will, after all, collapse. It is therefore rather arbitrary to try to disentangle the two problems. Nevertheless there is no doubt which at this moment is the more pressing. Political failure on the Allies' part would frustrate their victory. But military failure would prevent that victory from ever being won.

Of the military coalition, it can be said first of all that

it is intact and strong. There is no sign of slackening on any front. There is no damaging war weariness, certainly not in bombed and war-scarred Britain. The aim of defeating Germany has in no way been modified, and so vast are the material resources marshalled behind the armies that there can be no question of losing the war. On the other hand, it is obvious that an enormous military opportunity has been lost. The German press now openly admits—and probably exaggerates—the crisis into which Germany was plunged after the break through at Avranches. They admit that their armies were routed and that the way to Germany was wide open. To-day, a firm front has been established along the Siegfried Line in the West and the Vistula in the East. In the West, the Germans have even launched a strong counter-attack. The reasons why they have been able to achieve so remarkable and unwelcome a degree of stabilisation ought to throw some light on the Allies' military deadlock.

It is always easy for the armchair strategist to look back over past campaigning and to point out that here the cardinal error was made or there the real opportunity lost. In detail such criticisms cannot be made without expert knowledge. But it requires no expert military knowledge to see that the opportunity of last autumn was missed either because there were insufficient military reserves in France to turn the German rout into a final

defeat or because the available forces were wrongly used. Equally it does not require expert knowledge to realise that since the summer, with its great defeats and the Generals' conspiracy, the Nazi rulers have discovered some method of rallying an army and a nation which were beginning to crumble to defeat.

There is some evidence to suggest that the opportunity after Avranches was lost primarily because reserves were lacking. It is equally true that the strategy pursued by the High Command since the Normandy battle has not been apparently designed to compensate for lack of weight and numbers by an audacious use of existing resources. The strategy of equal pressure along a very extended front—the strategy of an elephant leaning on an obstacle to crush it—requires the strength of an elephant. Yet Rundstedt's offensive has shown that the Allied front is not being held in massive strength. And if the reserves were insufficient to follow up that first advantage, is it not possible that now, with the Germans reorganised and defending the prepared Siegfried Line, the necessary weight for a new Allied break-through has still to be mustered?

★

The reasons for the stiffening of German resistance are not even a matter of query. Goebbels has persuaded enough Germans that the Grand Alliance will collapse, and that in any case a fight to the finish is better than the kind of peace the Allies will impose. Responsibility for the success of this propaganda rests with the Allies themselves. Their demonstration of disunity this autumn has been sufficient to make the best friends of the Grand Alliance wonder if it can be maintained. At the same time, their policy for Germany has combined an official refusal to state terms with a number of semi-official statements on what the terms will be. The most serious of these is clearly the decision announced, in Paris after General de Gaulle's visit to Moscow that Germany will be stripped of its greatest industrial areas—the Rhineland in the West and Silesia in the East. It requires very little elaboration by Goebbels to convince most Germans that there can be no future for Germany "between Rhine and Oder." Thus the Allies have succeeded at the eleventh hour in giving the Germans a compelling reason for fighting on—the desire to survive. Against such a background, psychological warfare loses all meaning. Indeed, at the moment when, at last, it might have been effective, it serves to strengthen, and not weaken, the enemy's resistance.

One may ask how the Allies have come upon military and political policies which are so painfully frustrating their victory. The most obvious reason for insufficient resources on the Western front can be found in the two Conferences at Quebec. In 1943 President Roosevelt and Mr. Churchill decided to put increased emphasis on the war with Japan, and in 1944 the decision appears to have been taken to wage the two wars simultaneously with equal energy.

Yet the lesson of Hitler's war is surely that in military strategy "one at a time" is the most certain way to success. This diversion of massive forces to the Far East may well have made the difference this autumn between complete victory and the long-drawn-out fighting which seems to threaten now. No amount of remobilisation or reorganisation on the Germans' side could have saved them in the panic days of August. It was the slackening of the Allied blow that gave them their opportunity.

The Allies' responsibility for the restoration of German morale is even more direct. It is now quite obvious that the policy of dismembering Germany has not been reached as a result of sober examination and careful decision. It has arisen as a by-product of the Russo-Polish dispute. If the Russians had displayed less intransigence in their claims on Poland, the folly of "compensation" for Poland in the West up to the line of the Oder would not have been even considered. Yet once dismemberment was put forward for the East, it was inevitable that France should return to the Rhineland project, rejected in 1919. Thus haphazardly, almost by default, terms have been laid down for Germany which will probably leave the Germans fighting to the bloody and bitter end.

There is only one consolation in the reflection that the Allies are largely responsible for their present discomforts. They have at least a chance of repairing them. Here a special obligation rests on Great Britain; for although the responsibility for decisions taken is fully shared, and all three of the major Allies are equally responsible, it is nevertheless true to say that the British Government would not have taken the initiative in committing either of the two cardinal errors. It would not have abandoned the policy of "Germany first" in the order of military priority; and whether or not it would have evolved an effective form of political warfare, it would not have evolved a policy for Germany based on forcible dismemberment. Equally, however, the two policies illustrate the basic weakness of British policy—the negative, or at least concessive, rôle it has played in the working of the Grand Alliance. It is no secret that British participation in the Far East has been vastly increased very largely because of American criticism of the British war effort in the Pacific. It is also obvious that the Russian view of a settlement in Eastern Europe has been accepted in order to preserve good relations with the Soviets; in short, Mr. Churchill's government has conceived its rôle to be that of the honest broker. Its concern has been to see whether proposals and policies are acceptable to its Allies, rather than whether they are suitable and effective in themselves. The desire springs from a very laudable ambition to hold the Alliance together. The present state of the Alliance suggests, however, that the policy has been rewarded with very little success. The present deadlock is a suitable time for considering whether new methods might not now be used.

On the military side, the British Government could suggest a revision of the Quebec priorities and an allotment of greater resources to the Western front. The conjunction of the Rundstedt offensive with Mr. Richard Law's visit to Washington offers a happy opportunity for doing so. If the United States authorities proved unwilling to alter existing programmes, the British Government would at least be justified in redirecting all the resources at its own disposal to the task of defeating Germany.

The political problem is more intractable, for Mr. Churchill appears to have committed himself to the senseless policy of dismemberment evolved in Moscow and Paris. Yet it is an open secret that such a policy runs counter to the most expert thought and advice of the Foreign Office and that—a far more fatal objection—there is no chance of the British people being ready after the immediate passions of wartime have died down, to bear the very heavy burdens of continuing to enforce provisions which deprived—or appeared to deprive—the German people in the long run of the power to live and work. Since this is so, there is a strong case for a public declaration from the British Government, stating that it does not intend to pursue or support a policy which permanently deprives the German people of the possibility of leading a normal political and economic existence. Such a statement would create an entirely new situation in the propaganda war against Germany and would at the same time end the anomalous position whereby the policy of the Alliance is worked out in Moscow and Paris with the British feebly or apologetically confirming decisions in whose making they have had little or no part.

Both policies—the reconcentration on the war with Germany and a statement of British policy towards Germany—demand an unwonted initiative from London. Since the statement on Germany could only be the product of forethought and detailed consideration, it would entail uncustomed and possibly unwelcome thought on first principles in the highest quarters. Yet the gains to be set against this grave disadvantage are great indeed. London would recover a freedom of movement so far observable only in Washington, Moscow and even Paris. Mr. Churchill would be relieved of the rôle of perpetual mediator, go-between and universal aunt. The new method would give some hope of the emergence of a genuine British foreign policy as opposed to the passive and partial acceptance of other people's policies. Finally—and this is the most compelling argument of all—it might, by ending the military and psychological deadlock on the Western front, help decisively to win the war.

Local Government Reform

THE latest in the flow of Reconstruction White Papers is one entitled "Local Government in England and Wales during the Period of Reconstruction" (Cmd. 6579). The subject is not perhaps one to stir the popular imagination. But it is none the less fundamental to very large parts of the programme of reconstruction. Health, Education, Housing, Town Planning are generally regarded as the concerns of national politics. The initiative is taken by the Government and the issues are debated in Parliament. But none of them is in fact executed by the Government; in all of them, the local authorities are the operative bodies. They act within the framework of statute law and subject to more or less tight administrative control by Whitehall, which also provides an annually mounting proportion of the cost of the services. But the local authorities are, nevertheless, by law and even more by custom, independent bodies with powers of discretion. When Parliament has had its say, the difference between success and failure in the reconstruction programme may well turn on the efficiency of the system of local government. And there is reason to doubt whether the system as it now stands is capable of carrying the burdens that are being put upon it. The main subjects of doubt are two. First, for an increasing number of purposes the representative local authority is alleged to be too small in size. And second, the system of local authority finance, based upon property rates, is neither buoyant nor productive enough to give the local authorities the resources they need if they are to maintain their independence.

This is the importance of local government reform. But it does not follow that the subject is an easy or a rewarding one for a Minister to tackle. The pressure for reform is almost entirely confined to a very tiny minority of persons interested in public administration; there are no votes in reform. And on the other hand, there is the most powerful confederacy of interested parties, the local authorities themselves, in the other camp. The county councils, the county boroughs, the municipal boroughs, the urban and rural districts have their interminable differences. But they combine most easily in the negative attitude of resisting change in the *status quo*; and when they combine, they are, as a matter of practical politics, fully as powerful as the usual Minister of Health. It would take the combination of unusual authority and unusual courage to carry through any drastic reform of local government.

It must be said that the combination is not to be found in the present White Paper. It is designedly temporary and while admitting, in the most general terms, the case for a complete review, takes refuge behind the conclusion that it is "not opportune" in the reconstruction period. Indeed, the White Paper makes but a single proposal,

important in its way, but quite minor in the context of the whole system of local administration. For the rest, it is apparently content with the structure of things as they are. It is most emphatic that nothing in the nature of regional organisation is contemplated, and the Regional Commissioners, those *bêtes noires* of all classes of local authority, are to go beyond recall. It does not rule out altogether the transfer of functions from the local authorities to the state—which might be called Local Authority Fear Number Two—but "the Government are opposed to any general policy of centralising services hitherto regarded as essentially local" (a sentence which may turn out to have some hidden ambiguities). These two principles between them mean that, where larger areas are needed for any purpose, Joint Boards and Joint Committees alone remain and the White Paper makes a not very convincing attempt to establish that this expedient may not be so bad as is generally held. Finally, on finance, the White Paper is confident that rates, swollen by rising incomes, and assisted by percentage grants and the Block Grant to provide "a very flexible instrument, capable of adjustment to meet new conditions." The only amendments suggested are the promise of (unspecified) assistance to areas adversely affected by the war, and to poor authorities generally.

The single proposal is for a consolidation and extension of the process of revising the boundaries and status of local authorities. At present, each administrative county carries through a decennial "county review," the results of which are confirmed by an Order of the Minister, while county boroughs extend their areas by Private Bill. The two procedures are quite independent and uncorrelated, and as there are large arrears under either head, there would certainly be confusion in the years after the war if nothing were done. The White Paper proposes to place the whole matter in the hands of a Local Government Boundary Commission, which would have powers—subject to the general instructions and confirmation of the Minister and, in some cases, to the consent of Parliament—to upgrade and downgrade authorities, to amalgamate them and to alter their boundaries. Within the limits set for it, this is a bold proposal, which is not likely to be very popular, especially with the county boroughs, which would lose their present right to approach Parliament direct. But it clearly does not do more than touch the fringe of the main problem. The only changes that are contemplated in the structure of local authorities are a proposal to give the Commission power to amalgamate some of the smaller counties and an interesting suggestion that some of the smaller boroughs of the market-town type might be extended to embrace their surrounding rural districts. There is nothing in either that effectively touches

the two main problems of local government—the size of the average area (for the amalgamation of such counties as Rutland and the Soke of Peterborough would hardly affect the average) and the financial basis of the system. Moreover, the Commission's writ is not to run either in London or in Middlesex, both of which are reserved for separate treatment at a date that is left indefinite (except in the matter of the division of functions between the London County Council and the Metropolitan Borough Councils, which is to be made the subject of an immediate inquiry).

The political realism that has led to this unambitious White Paper can hardly be questioned. But that does not alter the fact that something much more far-reaching is needed if the system of local government is not to act as a brake on the execution of the plans of social progress now maturing. It must perhaps be accepted, though with regret, that nothing can be done about the size of local authorities, since the only practical suggestion—the creation of regional governments—would arouse such a fury of opposition. But something could be done, and should be done, to improve the financial system which, if not reformed, may lead straight to a painful dilemma. Local authorities' expenditure is rising very rapidly, under the double pressure of rising prices and growing statutory obligations. But the rating system could, at the best of times, respond but slowly and inelastically, and at present it is almost immobilised by the virtual breakdown of the system of valuation. The Report of the FitzGerald Com-

mittee, which has recently been published and—more effectively—the work of Professor and Mrs Hicks have shown the tangle that will have to be unravelled before the system can be brought back to life and the independent income of local authorities can be substantially increased. Not only should the methods of valuation be uniform throughout the country, but a considerable part of the rates themselves should be levied at a uniform rate and redistributed among the areas in proportion to their needs. It will take a long time to get into this position, which in many ways will be merely the starting point for the reform of local government. It will be a very great pity if the start of the start is to be indefinitely delayed.

There is one further measure which could be taken at once, and which would considerably relieve the financial crisis of the local authorities. This would be to create the new Medical Service on a national basis, wholly financed from national sources and embracing part or all of the health services which form so large a part of the local authorities' total expenditure. This would have the additional and important merit of meeting the strongest objection that the medical profession has to the Government's proposals.

Even on the unambitious level of a minimum programme, there are thus a number of ways by which progress in local government reform could well be begun almost at once. The Minister of Health might well be asked to revise upwards his estimate of what Parliament and public opinion will accept.

Patent Medicines

THE annual representative meeting of the British Medical Association last month passed unanimously a resolution declaring that

the education of the public on the meretricious claims of patent foods, drinks, medicines, etc., should be intensified immediately.

It is certainly time, now that a national health service is to be established, to consider the place that patent medicines should take in it, for it has been estimated, from an admittedly small survey of civil defence workers in Bristol, the results of which appeared in the *British Medical Journal* of July 17, 1944, that three out of four people in this country are taking drugs without medical advice. If the new medical service is to be really comprehensive, there should, in theory, be no need for self-medication—though it will not be practicable to stop it altogether. Not only will people be able to seek free medical advice whenever they want, but the free supply of drugs will presumably be part of the service, though it is true that the White Paper on the health services dealt with the matter somewhat cursorily. The medical profession is therefore raising the question whether the time has not come to remove the sale of drugs altogether from private enterprise. As a recent leading article in the *British Medical Journal* stated,

It is a little difficult to see how doctors are "to encourage a new attitude to health" if the patent medicine industry continues to spend £3 million a year on advertisements suggesting to people that they are ill and that they can only be cured by proprietary remedies.

And another resolution passed unanimously at the BMA meeting declared that any medical service should include control of the sale of patent medicines.

It is perfectly true that there are sound medical reasons for prohibiting the sale of medicines except against a medical prescription. On the other hand, doctors are, at present, interested parties; so long as they receive fees for medical attendance it is clearly in their business interests that self-medication should cease. If they are agreeable that panel patients should come to them for medical prescriptions in every case where they otherwise would have dosed themselves, doctors are clearly acting from the best of professional motives; but it is a little unfortunate that they should ask for the abolition of the

private trade in patent medicines at the very moment when they are pressing for the retention of private practice in medicine itself.

The chemist's attitude is similarly equivocal. Professionally, he is as interested as the doctor in the abolition of high-cost proprietary remedies and in replacing them by equally effective non-proprietary remedies dispensed according to a doctor's prescription. But the chemist's business interests do not allow him to be entirely disinterested. As a business man, he likes the price-fixed branded article because it yields the highest gross discount. He dislikes it only when it is sold by a retailer other than a chemist. On the initiative of the National Pharmaceutical Union, chemists have formed a friendly scheme which, by agreements with manufacturers, aims at preventing shops other than chemists from trading in proprietary medicines. They thus appear more interested in their own livelihood than in protecting the consumer against worthless but expensive remedies.

What is the attitude of the consumer? He has expressed a wish for a national health service which is to aim, not only at the treatment and cure of disease and at the rehabilitation of the diseased, but at the promotion of "positive health." If this phrase means anything at all, it means that there is a recognisable difference between the absence of illness and good health, and it might be argued that the lack of a proper medical service has encouraged people to swallow patent medicines in order to obtain the good health they cannot seek from their own doctors. This, unfortunately, is very far from the case. If a comprehensive and free medical service were established, would people in pursuit of positive health stop taking patent medicines and visit their doctors instead? If they did and the doctor was a good doctor, he would tell his patient that there was nothing whatsoever the matter with him. If he was also a kind doctor, he might prescribe a bottle which under a national pharmacological service would cost the country a penny or two and would have the same properties as the proprietary medicine costing several shillings. But if he was also a conscientious doctor who thought he ought not to waste even a penny of the taxpayer's money, he would tell his patient to go

away and eat more cabbage à la Ministry. And the patient would be outraged.

The truth is that people do not want to be positively healthy. The suggestion exercised by the patent medicine advertisers falls on receptive ground. People take patent medicines not because they are fatigued, anemic, nervous, overworked and suffering from sleeplessness and headaches, but because they like to think they are. Even when they do not positively enjoy poor health, there is still a superstitious belief that good can be made better by regular doses of medicine. The Ministry of Health has stated that large-scale tests have shown that no advantage is to be obtained by the addition of vitamin concentrates to the normal—wartime—diet of schoolchildren and factory workers. Yet there is more faith in a vitamin tablet than in a Brussels sprout.

Nevertheless, the sale of patent medicines is clearly incompatible with the aims of a comprehensive medical service, and if one of them has to give way it will have to be the former. Probably the most effective method of curtailing the trade would be through the control of advertisements. It is already illegal to advertise alleged remedies for certain specified serious illnesses. There seems no reason why the list should not be extended to cover all complaints including influenza and the common cold, and advertisements for laxatives, which provide the most abused, and probably the most common, form of self-medication, should be prohibited absolutely. The second big group of medicines which can be bought without a medical prescription includes the pain relievers and the cough mixtures. Provided they are not abused and provided they do not remove symptoms of an unsuspected disease—two large provisos—there are not the same objections to them as to the first group. Nor is there any strictly medical objection to the third group—the tonics. Advertisements for these two groups, therefore, need not be prohibited. But they, in common with all proprietary medicines and patent foods, should be submitted to a cost analysis, not only on medical grounds but also because their prices are controlled by very powerful trade associations. It has been authoritatively stated that the true value of the average 1s. 5d. patent medicine is between a penny and twopence, and there is no doubt that advertising is a principal item of cost, amounting to as much as 20 per cent of the retail price. Another expensive item is the wrappings. It is sheer waste to create consumer's demand by such an enormous outlay and then to make him pay for it in the price of the drug; it is equally wasteful to make a drug appear more effective than its properties warrant. Such waste is inconsistent with the principles of one hundred per cent social insurance.

The control of advertisements and a cost analysis would be to the advantage of the better sections of manu-

facturing chemists whose products have a recognised medical value. So far as these are concerned, there is no reason at present why they should only be sold by chemists when other retail distributors might be willing to sell them at a lower price. There will be even less reason when anyone will be entitled to a free medical consultation before he doses himself with a patent medicine, and will be given, if necessary, a prescription for a free drug to be dispensed only at a chemist's shop. Pharmacists will then no longer be able to claim that their expert knowledge is necessary to protect the consumer. On the other hand, these recognised products should not be unduly favoured, and doctors, who at present tend to prescribe them too often, should only do so when cheaper non-proprietary remedies of the same value are not available. The direction laid down in the national formulary of the Panel Committee that

proprietary preparations should not be prescribed unless the practitioner has satisfied himself that the therapeutic object aimed at cannot be obtained by the use of non-proprietary remedies

should be incorporated into any national medical service.

If control of this sort is undertaken, the result will be that any person who is considered by his doctor to be in need of a drug will be given a prescription for a non-proprietary product which will be dispensed by a chemist at the expense of the state or the social insurance fund. In the rare cases where a suitable non-proprietary remedy does not exist, the doctor will give a prescription for a proprietary remedy which again will be dispensed free by a chemist. If a non-proprietary remedy is available but the patient insists on having the proprietary brand, there seems no reason why he should not be given a prescription accordingly, but he would have to pay the chemist for the drug. If the patient does not believe the doctor when he is told that there is nothing the matter with him, or if he does not want to consult a doctor at all, he will be able to buy medicines that do not require a medical prescription at the chemist's or the grocer's or at any other shop. But at least he will be protected against fraud and at least he will not be subjected to constant external pressure to make him into a constipated hypochondriac. Moreover, legal restrictions should be accompanied, as the BMA urged, by the education of the public which the Central Council for Health Education could undertake by more direct methods than it uses at present. There is no doubt that any attempt to control the trade in patent medicines will meet with organised opposition, which will be particularly strong because they figure so largely in the advertising revenue of the daily press. But it is a task that the Ministry of Health, now that it has embarked on a scheme for a national medical service, simply cannot ignore.

NOTES OF THE WEEK

Three-Power Talks Ahead?

A glimmer of hope for better Allied understanding may be found in President Roosevelt's first press conference of 1945, in which he said that he expected to meet Mr Churchill and Marshal Stalin "very soon." This is a considerable improvement on his reply a week or so ago, when he termed the meeting "hypothetical." The urgency of the problems dividing the Coalition has apparently led the statesmen to revise their timetables.

First on the agenda of any conference is, of course, the problem of Poland. Mr Churchill and President Roosevelt need not take too tragically the decision of the Lublin Committee to promote itself to the rank of Provisional Government. Other provisional governments have in their time been launched with a fine parade of democracy only to slip into the limbo of forgotten causes once the need for them had passed. The short-lived regime of Kuusinen in Finland is a fairly recent example. The Lublin decision merely marks another turn of the Russian screw on the Poles, and indirectly on the Western Powers. Significantly, Marshal Stalin has not himself recognised the new Govern-

ment yet, and, even if he did, the matter could probably still be arranged.

Everything will depend on the outcome of the coming Three Power talks. If the British and American leaders go to them with a clear idea of what their own policy ought to be, the unsatisfactory ambiguities of Teheran may be avoided. There is no doubt about the rightness of their decision to continue to support the Polish leaders in London, and the Polish Underground, with its Home Army. They have borne the brunt of resistance in large parts of Poland, and any provisional administration which ignores them cannot fail to betray the independence of Poland. The weakness in the Russians' position is precisely the unrepresentative character of the Committee they have set up.

Unfortunately, neither British nor American statesmanship can do much for Poland so long as the senseless division between the London Poles continues. A pre-condition of a successful settlement of the Polish question is the return of Mr Mikolajczyk to office with a restored coalition of the Peasants and Socialists. Unless this is achieved, neither Mr Churchill nor Mr Roosevelt is likely to make much

MIDLAND BANK LIMITED

four main tasks: the reconversion of industry, with special reference to engineering; the derequisitioning of factory space (a total of 220 million square feet has been requisitioned by the Government during the war) and the allocation of surplus Government factories; the distribution and location of industry and the preparation of continuous factual surveys of their areas' needs and resources; and the deconcentration of industry. Obviously so long as war production continues to have first priority, and there is still an overall shortage of workers for munitions, the supplies of material, and labour available for peacetime production will be very limited. The Board of Trade has, however, made a start by issuing some 600 licences for the production of prototypes to engineering firms, though it does not appear that so far any definite schedule of priorities for civilian production has been drawn up or that firms are being given directives about what they should produce.

Mr Dalton is hoping to introduce legislation this session to give effect to the policy outlined in the Employment White Paper for the location of industry, and the Regional Controllers will play an important part in securing a better distribution of industry in the Development Areas. This will be done mainly by the issue of building permits and the provision of financial and other inducements. It seems that there are plenty of industrialists anxious and willing to set up factories in Development Areas, and that there would be still more if Development Areas were the only places where they could quickly obtain factory space. But the former Depressed Areas lack modern factory buildings, and contain a relatively small proportion of new Government factories, while building materials and labour for building new factories are in very short supply and the demand for surplus Government factories exceeds the supply. Spadework can be done, and is being done, by the Board of Trade, but it is essential that it should have the necessary statutory powers as soon as possible to carry out a location policy.

Nine Months' Revenue and Expenditure

With three months more of the financial year to come—and in spite of pay-as-you-earn it is the crucial three months—the total tax revenue of the country has reached almost two-thirds of the total estimated for the whole of the year. In peacetime, this buoyancy of the revenue would be cause for rejoicing. Now, however, it probably means that inflation is increasing. The increase in income tax receipts over those for the first nine months of 1943-44 amounts to £81.3 million, so that the estimated increase for the whole year of £116.4 million will be far exceeded. Under pay-as-you-earn, this means a considerable rise in wages and other incomes, which in its turn is reflected in the customs and excise receipts. Over the whole year, excise duties were estimated to show a decline of £9.3 million, whereas at present they show an increase of as much as £17.4 million over the corresponding period of 1943-44.

The expenditure side of the accounts tells the same story. A year ago, it looked as if expenditure on the war had stopped rising. But, as the table of Supply expenditure shows, it has resumed its upward trend, and though part of the renewed rise may be due to the removal of goods

from the Lend-Lease list, a much more important factor must be the increased pay for the armed forces and higher wages in general.

Higher Appointments

The Ministry of Labour is proposing to extend its machinery for the placing of administrative, technical, supervisory and professional workers after the war. The report of Lord Hankey's Committee on Higher Appointments, which was set up in July, 1943, has now been published and many of its recommendations have already been put into operation by the Ministry. The report proposes that the scope of the Ministry's Appointments Officers should be widened, but that there should be fewer of them. The Ministry has agreed to reduce the number from 31 to 13. In addition to the placing of applicants, it is recommended that the officers should give general and specific advice on careers and training, with special reference to the needs of ex-Service men and women. There are to be National Standing Advisory Committees representing the principal professions and occupations, and the offices will maintain close co-operation with industry and with other job-finding organisations. The demarcation line between Appointments Offices and Employment Exchanges will be drawn roughly just above the level of foreman and clerk. The service will, it is estimated, place between 200,000 and 300,000 applicants each year, and will cost about £986,000 to operate.

The new organisation, as Lord Hankey had previously stipulated, will not have any monopoly over jobs, and there is no question of its use being compulsory on employers. But the Ministry of Labour hopes that it will provide such satisfactory and efficient service that employers of labour will make full use of it. The success of the scheme will thus depend very largely on the people who are to run it, and on the degree of co-operation that can be reached with university and other appointments organisations. It will certainly have to prove itself a great deal more efficient than the old Central Register. If properly staffed and equipped, an Appointments Department for professional and technical workers might make a very real contribution to the provision of well-qualified technical staffs, who are so vital to the efficiency of British industry. It should be of especial advantage in the resettlement in civil life of demobilised Service men and women whose careers have been interrupted by the war.

Whiter Bread

The Minister of Food's announcement that bread is to become whiter as a result of lowering the degree of wheat extraction to 80 per cent will probably please the general public, which has never taken very kindly to the National Loaf. It will certainly please the millers, who in the past have always opposed a high rate of extraction. Colonel Llewellyn said that this step would not involve any "appreciable" loss of nutriment, while it would make available increased quantities of bran for animal feeding stuffs. Presumably the chief reason for the present decision is the easing of the shipping situation, since it was the need to

restrict bulky imports of wheat that dictated the original decision to raise the extraction rate.

It is true that a lowering of the extraction rate by 2½ per cent does not represent a very big change, but it will be recalled that in October a similar reduction of 2½ per cent was made from the rate of 85 per cent which had been in force since 1941. It is only natural to ask whether the Government intends to do gently, and by stages, what was done with a leap at the end of the last war, when the extraction rate was reduced overnight from about 90 per cent to 76 per cent. The 85 per cent rate was recommended by the Medical Research Council on nutrition grounds. It retains the Vitamin B₁ element which may be deficient in wartime diet.

As soon as food restrictions can be relaxed and alternative foods which are equally nutritious become available, it would be impossible, even if it were desirable, to make the sale of wholemeal flour compulsory to the exclusion of white flour, since this would be regarded as an unwarrantable interference with consumers' choice. There are, however, strong arguments in favour of encouraging by every possible means the maximum consumption of wholemeal flour. Since bread is the largest element in working-class diet, it is desirable that it should be of the highest possible nutritional content. For the time being the Ministry of Food should say, "Thus far and no farther," to any pressure for a further reduction of the extraction rate.

Hitler in Retirement

None of Germany's various leaders—propagandists, generals, gauleiters—seems to have missed the opportunity of making a New Year address to the German people. Year by year, these effusions have grown in length and lost in substance. They offer little guide to the actual state of mind of the German people (which is discussed at length in an article on page 13). This year, however, the addresses have two points of interest. The first is the frankness with which the German leaders admit that they were within a hair's breadth of defeat. Such an admission is, of course, good propaganda, for it underlines the "miracle" of restored resistance and, more, of the return to the offensive.

The other point is the light thrown on Hitler's position. So much talk has gone on during the year about his death or lunacy or even confinement at the orders of Himmler. However, the Fuehrer, after months of silence, actually came to the microphone. He is alive, no more insane than usual, and not dramatically imprisoned. But his message, together with the propaganda barrage thrown up by Goebbels beforehand, explains why the Fuehrer is not in custody. There is no need for it. His talk was full of the German myth, the rebuilding of bigger and better German towns, the failure of the bourgeois world and the new dawn of National Socialist principles. That he must talk about such things at a time of supreme military crisis shows that he is no danger to anyone, least of all to Himmler. He appears to have passed beyond even a remote interference in the strategy of the war and to be now little beyond the focus for the despairing nationalism of the German people.

Re-education in Germany

So far the Allies occupy only a war-devastated fringe of Germany. In dealing with the few small towns and villages—many of them evacuated—which lie behind the firing line, the military authorities have needed to make only local arrangements—the appointment of a mayor, the introduction of a curfew, the definition of military offences and the setting up of military courts to deal with the offenders. It would be impossible from this small local experience to generalise about the Allies' policy for Germany as a whole. Recently, however, representatives of the "Military Government of the Supreme Allied Commander, General Eisenhower" have issued some general directives which have been broadcast over the BBC German News Service. One decree lays it down that the German Labour Front will be dissolved and free trade unions encouraged in its place. This, clearly, is a big step forward out of the official obscurity covering the Allies' intentions for Germany.

A second decree, covering the field of education, is not so satisfactory. True, its negatives are unexceptionable. All

special Nazi schools—for example, the Adolf Hitler Schools and the *Ordensburgen* or Junker Schools where Nazi and Army leaders are trained—will be abolished and for a short time all schools will be closed, to be reopened later with, as it must be presumed, a reorganised teaching staff. The first schools to reopen will be the elementary schools, and teachers must refrain, under heavy penalties, from teaching military science and geography, national socialist philosophy, racialism and criticism of the Allies. Unfortunately, the decree gives no idea how teachers are to be tested and recruited, nor of the positive curriculum they will be allowed to teach. Education cannot be achieved on the basis of negations. In fact, apart from an important undertaking to support religious (confessional) education, the content for the re-education of a new German youth is simply lacking. This fact springs from a deeper uncertainty. No content can be given to German education until the Allies have agreed upon the nature of the future German political regime. In 1944 there is none of the 1918 faith in democratic government. Yet Weimar, for all its weaknesses, was preferable to any other system adopted by the Germans in modern times.

MILK CHOCOLATE & the Nation's Milk Supply

THE contribution of the Milk Chocolate Industry in ensuring Britain's milk supply during these critical war years is not generally realised.

Before the war this industry was using 40 million gallons of milk a year. Cadburys took more than half of this vast quantity. It came from the counties of Hereford, Gloucester, Salop, Stafford, Flint and Denbigh where Cadburys have consistently encouraged dairy farming over a number of years. In these areas they have established four Milk Factories which have greatly assisted in developing milk production. Today these four factories alone collect and distribute sufficient fresh milk for well over a million people.

AMERICAN SURVEY

The Deep South in Wartime

(From a Correspondent in Georgia)

IN common with other regions of the United States, but in many respects with a greater degree of urgency, the Deep South is seriously disturbed about its economic future. Wartime spending has swept the region into high income and high employment. Shipyards, aircraft plants and munition factories have brought industrial employment to heights never reached before. Receipts from farm marketings have increased about 50 per cent each year since 1940, and the farmers are rolling in wealth, compared with their pre-war situation. Retail stores are finding that they can sell almost anything to the long lines of customers passing their counters day after day, lines whose numbers are swelled by the location of many training camps in the area. Remembering the many years of poverty and despair, the Deep South is keenly conscious of the need to retain some measure of this prosperity.

For convenience in discussion, the Deep South may be regarded as consisting of the south-eastern coastal states of Georgia, Florida, Alabama, Mississippi and Louisiana, with Tennessee, which adjoins Alabama and Georgia on the north, thrown in for good measure. This six-state area covers 300,000 square miles and contains 15 million inhabitants. In spite of its size and population, the Deep South in pre-war years had all the characteristics of an economically depressed area. Its people were leaving the region to find employment and opportunity elsewhere, leaving in numbers that constituted, in some places, mass migration. Its chief industries and utilities were more often than not owned by outside capital. It depended for its livelihood largely upon agriculture, but on an agriculture that was concerned primarily with the soil-destroying crops of cotton and tobacco. Its industries were of the low-wage type, largely producing semi-finished manufactures. Illiteracy, disease, malnutrition and high infant mortality were all too prevalent.

In view of the South's depressed pre-war economy, the agricultural and industrial revival that came with the war years was more than welcome. The rise in farm income has, in particular, meant a new lease of life for the Southern farmer. Receipts from farm marketings for the six states of the Deep South were \$675 million for 1940 and \$1,770 million for 1943, a rise of 162 per cent. The corresponding rise for the United States was 131 per cent. In Mississippi alone (perhaps the poorest of the six) receipts from farm marketings rose by 230 per cent. The next highest percentage rise in the group was that of 185 per cent in Alabama.

Gains in industrial employment have been even more striking than have been the gains in agricultural income. The shipping emergency brought an almost entirely new industry to the Deep South. As late as 1939, the six states employed only 5,028 people in the shipbuilding and ship-repairing industry. With the entrance of the United States into the war, shipyards sprang up or expanded at New Orleans, Pascagoula, Mobile, Panama City, Tampa, Miami, Jacksonville, Brunswick and Savannah. By mid-1944, these yards were employing more than 175,000 workers.

Huge plants for the manufacture, assembly and repair of aircraft likewise came into existence with the war. By mid-1944, they were employing some 70,000 workers. Another 70,000 workers were employed by new munition, ordnance and special-purpose war plants. All told, therefore, some 315,000 workers are now employed in the Deep South's shipyards, aircraft plants and munition factories.

The heavy concentration of industrial employment in the shipbuilding, aircraft and munition industries is chiefly responsible for the apprehension with which the Deep South looks upon the approaching end of the war; the fact that the high-income years have not been used to diversify agriculture is much less keenly felt. In the pre-war year of 1939, the entire manufacturing industry of the area employed only 668,689 people. This peace-time employment, more-

over, was provided by hundreds of small plants engaged primarily in light manufacturing. When it is considered that these peace-time employments have themselves expanded in employment during the war years, the prospect of having to deal with more than 300,000 displaced war workers is sobering indeed.

The search for a solution is taking many forms. Business leaders in Louisiana have drafted extraordinarily complete plans for facilitating the reconversion process. Mississippi has revived its Balance-Agriculture-With-Industry plan, whereby, under state supervision, counties and municipalities are permitted to incur bonded indebtedness in order to provide funds for the erection of factory buildings, which in turn are leased to selected operators. A number of state agencies in Alabama are outlining post-war plans that are designed to maintain employment within the state, and in Georgia the State Agricultural and Industrial Board is planning for post-war construction of 743 projects to cost more than \$65 million. State and municipal projects in Florida, according to announcements of the State Planning Board, call for the expenditure of more than \$100 million. In Tennessee, too, the State Planning Commission is engaged in advertising the industrial advantages of the state and in planning public works projects, and further developments are envisaged by the TVA, whose area covers part or all of four out of the six states.

Private agencies are also at work to facilitate the economic upbuilding of the region. Each state within the area has its Committee for Economic Development. These committees are organised primarily to survey post-war needs and to recommend procedures for meeting these needs. Moreover, in several cities in the area, business-promotion corporations are being organised for the purpose of offering subsidy aids of one kind or another to new industrial enterprises. In Birmingham, Alabama, for example, an attempt is being made to set up the Birmingham Industrial Development Corporation. It would be a non-profit organisation, designed to solicit new industries and, if need be, to assist in their financing. The organisation plan involves the accumulation of a promotion fund to be contributed by 1,500 citizens who will subscribe \$100 each.

In Georgia, optimistic hopes for the rebuilding of the state's agriculture are placed in the Calloway Farm Plan. Under this plan, 100 farm corporations will be organised. Each corporation is to have seven stockholders, each of whom will invest \$1,000. From its paid-in capital of \$7,000, a corporation will purchase 100 acres of land at a price not to exceed \$30 an acre; the remaining \$4,000 of the corporation's capital fund is to be spent in building up the land under the direction of an employed farm manager. After the land has been built up, the corporation will borrow from a bank an additional \$3,000 for the purpose of providing machinery and livestock. By the end of October, 1944, 78 of these corporations had been organised and nine of them had purchased farms.

All of this development work is indicative of the Deep South's concern with its post-war future. Underneath this spate of optimistic planning, however, is the deep-founded fear that the region's industrial future is anything but optimistic. By pursuing subsidy ventures, some observers believe the various groups within a community may succeed only in diverting funds and effort into ventures that can exist solely at the expense of already established local enterprises. National policy still is the chief economic determinant of the region's future, they say, and will remain so.

Prodigious governmental spending means high times for the Deep South, but the fear is that, lacking inherent strength of its own, the region will continue to trouble not only itself but the nation with its post-war economic and social problems.

American Notes

Motes and Beams

The leading article in *The Economist* last week appears to have caused quite a stir in the American Press. After so many bitter American attacks on British policy have been so gently received in this country, it is strange to observe the emotions aroused on the other side of the Atlantic by a single attempt to state the British side of the argument. Nevertheless, it is all to the good that the British case is being heard, even if heat is engendered in the first stages of the process. Most of the American comments on the article have, unfortunately, misconstrued its purpose as being to attack American policy. They have missed its real point, which was to enquire to what extent British policy required to be adjusted in the light of the evident trends of American policy. It is also necessary to deny the connection that some American commentators have drawn between the views of *The Economist* and those of the Ministry of Information. Mr Bracken ceased to sit on the Board of the Economist Newspaper, Ltd., on taking office three years ago. And, in any event, by the constitution of the paper, the directors are entirely relieved of any responsibility for the policy of the paper. The Minister (it should be unnecessary to say) had no knowledge of *The Economist's* views before their publication; and *The Economist* has no idea of what the Minister's views may be.

Greek Gift

The demand for a policy of wholehearted responsibility and detailed participation in foreign affairs has been answered from an unexpected quarter. Senator Wheeler has celebrated the New Year with a six-point resolution demanding

the immediate creation of a United Nations' political council to provide for the democratic settlement, in harmony with the principles of the Atlantic Charter, of territorial questions that have arisen in Europe and may arise elsewhere.

Like a bear from his native North West, Senator Wheeler embraces the ideal of collaboration the better to smother it. If there were any doubt about his intentions, it would be dispersed by other points demanding the sovereign equality of all European nations, and, significantly, one providing for a universal Bill of Rights to guarantee, even to individuals living under friendly dictatorships, those freedoms of press, religion, assembly, and speech, guaranteed to Americans in the first ten amendments to the Constitution.

These are counsels of perfection. Senator Wheeler, tongue in cheek, demands all or nothing, in the hope that it will be nothing. To talk of a change of that hardened heart is ludicrous. This is the new isolationist strategy, modelled on the fatal conditions of Senator Lodge. There are more ways of killing a cat than by choking it with cream, but this is the method the isolationists have chosen to adopt. Senator Wheeler's resolution may do something to clarify the issue. Those earnest American internationalists who have allowed the desire for a flawless settlement to become the enemy of any settlement at all may well be shaken by this new recruit, whose adherence makes it abundantly clear that perfectionism points straight to isolation.

Post-Mortem on Dr Gallup

Dr George Gallup, the poll-taker and public opinion analyst, was, in his turn, subjected to examination last week by an unfriendly House Committee investigating aspects of the election campaign. In final pre-election diagnoses of the patient's state of mind, Dr Gallup's poll was the least accurate of the three main polls, giving Mr Roosevelt 51.5 per cent of the popular vote, as opposed to the 53.6 per cent predicted by the *Fortune* poll, and the 52 per cent prophesied by the Crossley poll. The President actually received 53.3 per cent of the total vote, and won 432 electoral votes, instead of the 292 awarded him by Dr Gallup. These divergences are not very great, and all the pollsters may be satisfied with the success of their prophecies. Nor is the right to innocent error in question. It was, rather, the poll-side manner of the doctor that was under review.

What prompted the investigation was the allegation, now conceded by Dr Gallup, that early in the campaign he

knocked 2 per cent off the reports of his investigators, which gave Mr Roosevelt a 53 per cent majority, before publishing the results; and that he failed to make this adjustment public. This liberty with impartial reporting Dr Gallup defends on the ground that he had to make allowance for the likelihood of a light turn-out. But although the 2 per cent subsequently was restored, the Gallup poll continued to predict a very close election until the eve of the poll. In the investigation it was also brought out that the Gallup poll underestimated the President's strength in every state but one of those that polled over a million votes. This miscalculation is attributed by Dr Gallup to the weight of the migrant vote, and to the work of the Political Action Committee; and in his defence it should be noted that none of the polls was nearly as successful in predicting state results as they were in assessing the national trend.

The taking of the national pulse evidently is not quite the exact science Dr Gallup has suggested in the past; like medicine itself, it is as much an art as a science. The Democrats on the Committee also appeared to think that in political, as in medical, diagnosis, the power of suggestion is not to be underrated. There can be no certainty, of course, that the exaggeration of Governor Dewey's chances induced many voters to climb on to a non-existent bandwagon; it might equally have had the opposite effect by alarming many complacent Democrats. But allegations that the Gallup poll served Republican interests might have been avoided if Dr Gallup, in his dilemma, had taken the public more fully into his confidence about the method he was adopting to allow for a light poll.

Return of the Nisei

The Pacific Coast is no longer barred to the Nisei, American-born citizens of Japanese descent. The mass exclusion order, first applied by the Army in March, 1942, has been revoked by the War Department on the grounds that large-scale invasion of the West Coast is no longer likely. In the last two years, the Army also has had the opportunity to make an exhaustive study of these Americans of Japanese

ancestry. Those showing any mark of pro-Japanese sentiment will continue to be excluded on an individual basis. The loyalty of the remainder has already been attested by the willingness of the Army to accept many of their members at first as volunteers and later under Selective Service, and by their war records both in Europe and in the Pacific.

The day after the Army announcement, the Supreme Court handed down a decision to the effect that loyal citizens of Japanese descent have the right to live where they please, and in the words of Justice Murphy, deprecated the "un-constitutional resort to racism" involved in the evacuation and resettlement of the Japanese.

The return of the Nisei to the West Coast from their inland relocation centres may play some part in relieving man-power shortages on the West Coast. But early incidents suggest that the common-sense of the Army, and the constitutional principles of the Supreme Court, may not represent public opinion in the small towns from which most of the Japanese were uprooted. Old antipathies die hard, and even Nisei veterans have found that their wounds and war service do not guarantee a welcome. The Hearst press has found an issue to its liking. The Secretary of the Interior has promised that there will be no "hasty mass movement" back to the West; and Governor Warren, of California, has engaged that the return will be orderly. These grim touches may make many Japanese hesitate before deciding to return to the inflammatory atmosphere of the Pacific Coast.

* * *

Back to Montgomery Ward

Mr Sewell Avery once more plays host to the Army. The President has authorised the Secretary of War to take possession of and to operate plants and facilities of

Montgomery Ward located in seven cities. It is over a year since Mr Avery was bodily removed from his own offices; and in that time there has been no modification of his intransigent attitude toward the union and the direction of the War Labour Board that he should accept a "maintenance of membership" clause. One subsidiary, the Hummer Company, has been continuously operated by the War Department since last May. The Government action appears to have been taken just in time to prevent the spread of the strike in four Detroit outlets to vital war production and, possibly, the denunciation of the no-strike pledge by the Automobile Workers' Union.

Last year's vigorous handling of this persistent employers' strike petered out ignominiously when it was realised how deeply public opinion was against the Administration's case. The present is a more favourable moment to renew the attack. Then it was argued by the critics that the President had no right to take over a company not directly concerned in the war effort. The same thesis is heard this time, but more faintly. The President, in his executive order, underlined not only the crucial point in the war, but the threat that some critical war plants might join the strike.

Mr Roosevelt's further statement that no strikes could be condoned in war-time, whether by employers or employees, while accepted in principle, has prompted commentators to contrast unfavourably with the Montgomery Ward case the success of Mr Petrillo, of the Musicians' Union, who after a two-year campaign recently scored a notable triumph, not only over the manufacture of gramophone records, but over the War Labour Board and the Anti-Trust Division of the Department of Justice. Mr Petrillo's contribution to the war effort is, however, even less crucial than that of Mr Avery.

THE WORLD OVERSEAS

Antwerp, December, 1944

(By a Correspondent recently in Antwerp)

IT is still not easy to understand why the Germans allowed the port of Antwerp to fall into Allied hands intact. It is true that they did not expect the 11th Armoured Division on the afternoon of Monday, September 4th, but the tanks only pushed them north of the Albert Canal, on the northern fringe of the town. For three weeks after that they were in the suburb of Merxem, two miles from the centre of the town and with no physical obstacle between them and the area of the new docks other than a railway embankment. On the west of the town they lined the left bank of the Schelde and could machine-gun and mortar anyone foolish enough to venture on the riverside quays. And even in those three weeks they failed to destroy the main power station of Antwerp, which is in Merxem itself and was in their hands. Since all the dock equipment is electrically operated, even that would have been something of a setback. But they did not. Antwerp, together with its docks and their equipment, is intact. It is about the only port in Western Europe that is.

It is a magnificent port. Apart from the riverside deep-water quays that line the eastern bank of the Schelde, its new dock system covers some ten square miles. These docks lie to the north of the town, downstream from the entrance to the Albert Canal. There are two entrances only, each of which will allow through an ocean-going steamer of 17,500 tons. They will take a length of 450 feet and 30 feet draught. Inside there are some 25 miles of deep-water berthing quays; 500 miles of railway track on the quays and in the marshalling yards; 602 cranes; granaries with a capacity of 600,000 hectolitres; and a range of storage and refrigeration sheds of which one alone, the Entrepot Royal, will hold 110,000 cubic metres. It is said that over a thousand ships of all classes can be berthed at Antwerp at any one time.

But all this information was compiled in 1940, and the

Army and Sea Transport officers who reached the town on September 5th were by no means certain that everything would be quite as it was. The Germans had used the smaller basins for river and canal barge traffic, but few sea-going ships had been up the Schelde since May, 1940. What had become of the labour force? In 1940 it numbered some 18,000 Belgians, of whom 8,000 were skilled stevedores. For that matter what had happened to the Schelde channel itself?

As events turned out, those on shore had just about eight weeks in which to reorganise the port while the troops of the Canadian Army and the Royal Marines cleared the land approaches to the port and the Navy swept the channel. The time was sufficient.

They found that the Belgian authorities had been permitted to do some maintenance work to the dock equipment and had the men available to overhaul it and test its working order. So far as the channel was concerned, the hydrographers followed the minesweepers in and reported that no substantial changes had taken place. Restoring the waterway was largely a matter of checking the buoys and of replacing those that had vanished. In that they were greatly assisted by the former Belgian and Dutch pilots of the river. Over half of them had left in May, 1940, and had joined the Royal Navy. They are now back on pilotage, mostly as lieutenants, RNVR. Inside the docks the principal task was the clearance of the locks and narrow channels of silt.

The Labour Force

The problem of building up the labour force again was solved with the co-operation of the Burgomaster. He called on all former dock workers to register with him. The great majority did so, and there are now available quite as many

labourers as the Allies need. Nor has their physique suffered to an extent that they are unable to work the long hours that dock work demands. But there were various incidental problems. One was bicycle tyres. The area of the docks is so big and so many of the men live outside Antwerp that some transport is essential. The Germans had taken most of the buses and there was little petrol or tyres left for the remainder. The Allies found bicycle tyres and restored the dockers' mobility. Another question was whether it would be essential to provide hot meals for the men during their shift or whether they could manage on a cold snack. The provision of canteens and cooking facilities would have been very difficult at the time, and the men have started work on the basis of a cold snack only.

Next came the problems of wages and conditions. In that the pre-war industrial organisation of Antwerp helped. For example, 62 of the master stevedores are members of the one association or guild, and follow its rulings; this meant not only one agreement to negotiate instead of 62, but also that the Allies would not be concerned in the allocation of work among the individual firms. As a voluntary gesture, the Belgian Government agreed to pay all the expenses, including wages, of operating the port.

The port is a base port for both the British and the American Armies. Each army operates independently, but both have joined in the setting up of a port executive committee to settle matters of major policy. It is presided over by the army commander of the area. The army organisation was ready to take over its part of the work. It had been at work in France since the end of July, and had already reorganised Caen as a port. The major novelty was the problem of Inland Water Transport. IWT had not

previously had to deal with barges carrying some 2,000 tons. But the Germans had left over 500 in the port, and they are now in operation again, manned by Belgians and controlled by the army staff. They are the major means of transport out of the port. Before the war 70 per cent of all goods landed at Antwerp went forward by barge.

To meet the day-to-day problems of the port, the army devised a nerve centre, in operation twenty-four hours a day, to keep track of the movement of all goods landed and of the utilisation of all forms of transport and labour. This centre is invaluable for planning future movements and for dealing with any emergency which would arise were German bombers to be lucky enough to hit an important store or communications point. This nerve centre was first worked out at the 2nd Army roadhead in Normandy and adopted to the local conditions of Antwerp.

To drive round the docks now, to see a gang of Belgian stevedores starting, a little gingerly, on the unloading of an ammunition ship, to see tugs on the river, to see, almost at the dock-gates, the shattered buildings that marked the front line where the Germans were held as late as mid-September, is to realise how much Europe will have cause to bless Antwerp's facilities when post-war supplies flow back down that funnel into Europe.

The port was officially opened with a rather elaborate ceremony on the riverside. As the Commander, RNVR, in charge of sea transport said:

The Belgian authorities wanted a ceremony and I can understand why. The port has been dead for four and a half years and until we came in they were never certain whether it would ever open again. The first siren of a sea-going ship after all that time is something of an event. I feel it so myself.

Germany at War

Siege Politics

IT may seem paradoxical that inside the German Fortress the Nazi regime has achieved its greatest political concentration since the direct attack on the fortress began. It is not easy to explain how a regime and its people can go on fighting against hopeless odds. It cannot even be said that Nazi propaganda has concealed the overwhelming material superiority of the Allies. On the contrary, internal propaganda has emphasised that Germany is fighting against great material superiority, and, indeed, hardly a German can doubt this since it is demonstrated daily by devastating air raids.

The politics of the Nazi regime and the attitude of the German people in this militarily hopeless situation have no precedent in German history, and an analogy based on conditions which led to the collapse of Imperial Germany in 1918 would be misleading. The great military and political crisis of last summer ended with the virtual elimination of the most powerful internal opposition the regime has known during its short history, and its outcome was the final concentration of the regime itself. It looks as if it could only be broken by outright military defeat or by dissension between its leaders.

Politics play no part in the ordinary daily round of the German masses. Man, woman and child they have been turned into unpolitical "experts." They have become soldiers, technicians, skilled, semi-skilled and unskilled workers and administrators. Most of them have lost their family connections. Nor can they be called Bavarians, Austrians, Pomeranians or Westphalians. They are known chiefly by the number of their regiment or unit in the Wehrmacht or their workplace in a factory; social workers are marked by their post in the evacuation scheme, by their position in a public kitchen or in a kindergarten, health centre or hospital.

This strange impersonal and barbaric structure of the German people explains why it was possible to direct men, women and children to dig trenches in East Prussia, in the west and in front of Vienna. The diggers themselves acted *en masse* in the belief that their effort would contribute to save the military situation for the final defence of the Fatherland. Propaganda, on the other hand, converted this mass direction of the people into a spontaneous effort.

in the conduct of the war are being opposed by disunity among the Allied nations. Each of the Allied nations is presented as pursuing the war against Germany for purely national interests. In general terms, the propaganda follows the line that Great Britain is fighting within the coalition a losing battle for maintaining the British Empire against the imperialist expansion of the United States in Africa, the Near East and on the continent of Europe. The crisis in Greece has been explained as a clash between Russian and British interests in the Balkans. The Russian demand for reparations in kind and for millions of German workers for reconstruction work in devastated areas has been shown as Russia's first big step towards dominating the most important material resources of Central Europe. The United States of America is said to aim at becoming a dominant influence on the Continent in order to secure it as a market for American goods. The dispute over oil concessions in Persia was carefully explained as a newly-awakened Russian oil imperialism. In short, the Germans are being told that the three Great Allies, who in Nazi terminology are alien powers to the Continent of Europe, are attempting, under the single aim of eliminating Germany, the strongest continental power, to secure the continent not only as a market, but also as a convenient object of imperialistic exploitation.

As Germans See Us

This propaganda is naturally buttressed by innumerable stories about internal conditions in Great Britain, the United States and Russia. Disunity among the Allied nations is explained as springing from the different internal needs of the three great Allies. This is a favourite topic on the Ger-

man radio and in German newspapers. In fact, the volume of propaganda on conditions in Allied countries and on differences in peace aims is much larger than the reports and propaganda on German internal affairs. Greece and Poland, conditions in France and Belgium, in Finland, Roumania and Bulgaria, serve to drive home to the Germans the two important points which form the basis of the propaganda as a whole. These are, first, that all countries occupied by Russia are immediately being made integral parts of the Russian political and economic regime. Secondly, the countries liberated in the west which return to some form of democratic regime are said to fall at once into the chaotic conditions characteristic of democratic countries before the war.

There is no doubt that the mere fact of complete political concentration gives the leading Nazis a political advantage over the heterogeneous coalition ranged against them as long as this coalition looks on Germany as something that has been perverted by a gang of criminals. The totalitarian regime boasts of many gangster types in high political positions, but it has been born out of very powerful anti-democratic tendencies. Overwhelming material superiority will in the end defeat its armed forces, but unless it is also defeated politically, it may tend to revive.

This has produced the rumours that the Nazi party, resigned to be defeated by material superiority, has been actively preparing to go underground. In fact, all its energies have been directed to staving off defeat, and a political movement cannot go underground without the passive and active assistance of the population. The Nazis themselves have naturally carefully fostered these rumours in their propaganda for foreign consumption. It serves their political purposes, for it maintains the myth of the political invincibility of their regime.

Letters to the Editor

Tourism in Britain

SIR,—Mr Maury Maverick complains of the difficulty Americans experience in getting in to the Houses of Parliament.

As one who has enabled literally thousands of our American Allies to visit the Palace of Westminster, and also to attend debates, may I say that the English Speaking Union brings two parties to listen to debates each sitting day. The various American clubs have tours arranged for them, and there is never a sitting day that I do not average at least thirty US soldiers to listen to debates. Lord Fermoy, Mr Astor and Mr Everard Gates are all tireless in their efforts to do the same job. The Empire Rendezvous have also looked after large numbers, and there is seldom a day when even the Dominions Gallery does not have its quota of American soldiers.

But to give the other side of the picture. It is a little disheartening to take great trouble to get high ranking officers into the distinguished strangers gallery and then

have them not turn up—not even a 'phone message—or to turn up an hour early by special request to show Americans round, with the same result.

That is why I personally only book parties brought by someone responsible for their turning up, and insist on having a fixed hour both morning and afternoon, when they are met either by myself or some colleague, even though we help hundreds who turn up without notice. But Mr Maverick should remember that there is also the security angle in wartime and hosts of unescorted people strolling round the Palace on Sundays, or indeed at any other time, might well give opportunities to an enemy agent that would exceed his wildest hopes.

Except when the Prime Minister makes an important speech, it has almost invariably been possible to get in every man, though it may mean waiting till someone else goes out. I can only assure Mr Maverick that if he was unlucky, thousands have been more fortunate, and we do all in our power to help.—Yours, etc.,

JOCELYN LUCAS

House of Commons

Condition of the People

SIR,—It should, I think, be made plain to your readers that in your article on the Condition of the People, where you say that "the share of the national income represented by wages increased from 38.2 per cent in 1938 to 41.1 per cent (excluding the pay and allowances of the Forces) in 1943," and attribute this statement to the Budget White Paper, the words in brackets apply to 1938 as well as to 1943, though on a strict reading they would not be so understood. The share of wages in the National Income—the income including but the share excluding Forces pay and allowances at both dates—fell from 37.5 in 1938 to 35.6 in 1943; whereas the share of wages—both income and the share excluding Forces pay at both dates—rose as you say from 38.2 in 1938 to 41.1 in 1943. I raise this point because unwary readers may be misled or find an unexplained inconsistency between your figures and those of the White Paper. Either method of calculation is of course legitimate in the appropriate context.—I am, yours faithfully,

G. D. H. COLE

The Scottish Coalfield

THE report on the Scottish coalfield (Cmd. 6575) of the Scottish Coalfields Committee provides an admirable pattern for similar regional coal surveys. The report has taken some time to produce. The Committee, under the chairmanship of Sir David King Murray, KC, was appointed in July 1942, and was instructed to report on "what measures should be taken to enable the fullest use to be made of existing and potential resources." The report deals with the pre-war position and the prospects for Scotland for the next fifty years, and does not shed any light on the pressing current problems of declining coal production. But these are lacunae which can easily be filled in, and they do not detract from the value of the report as a solid, factual contribution towards the solution of the longer-term problem.

The Scottish coalfield comprises a narrow belt, corresponding to Scotland's industrial belt, stretching from the Fife coast to the Ayr coast. Before the last war, Scotland was responsible for 41 million tons out of Great Britain's 264 million tons of output. Production in the interwar period was maintained at a fairly stable level of around 30 million tons, though the number of wage-earners declined from its 1920 peak of 147,323 men to 86,513 in 1939—as is shown in the following table:—

Year	Tons of Coal raised in Great Britain	Tons of Coal raised in Scotland	No. of Wage-earners employed in Scotland
1910	264,435,028	41,335,132	about 135,000
1920	229,532,081	31,525,941	147,323
1930	213,881,824	31,658,700	96,649
1931	219,458,951	29,072,361	88,046
1932	208,735,140	28,804,389	82,358
1933	207,112,245	29,245,341	83,602
1934	220,726,298	31,532,646	83,458
1935	222,248,822	31,346,952	86,630
1936	228,448,356	31,987,177	90,592
1937	240,409,436	30,279,500	90,002
1938	227,015,308	30,528,974	86,513
1939	231,537,947	30,528,974	86,513

Production has fallen sharply during the present war. In 1943 output was no more than 24.7 million tons, with some 83,000 wage-earners. But the Committee bases its recommendations on the assumption that the pre-war level of production can be restored and maintained and that the industry can continue to employ the present labour force. Though overall production was maintained in the interwar period, the relative importance of the various districts underwent a substantial change. The Central Scottish coalfield, of which Lanarkshire is the principal area, was responsible for about 54 per cent of Scotland's total output in 1920; by 1939, the proportion had dropped to 42 per cent. Indeed, Lanarkshire pits, which produced 24 million tons in 1910, produced only 13 millions in 1939, and the Committee estimates that with the complete exhaustion of the western part of the coalfield in twenty years' time, Lanarkshire's output will be down to 6 million tons a year by 1975. By contrast, output from the Fife and Clackmannan, Ayr and Dumfries and the Lothians coalfields has been well maintained and in some cases increased during the interwar period.

The problem of dwindling reserves in the Lanarkshire district—still the largest single production area—is the central theme of Part I of the report. Scotland, as a whole, has ample coal resources amounting to nearly 8,000 million tons, but they are not in the Central coalfield. The solution favoured by the miners' representatives was the extensive de-watering of the flooded tracts in the Lanarkshire coalfield, on the ground that the maintenance of coal production in this area was essential for the prosperity of heavy industry. The majority decided that the position had in no way changed since the Commissioner for the Special Areas concluded in 1936 that the overhead charges for installing a centralised pumping system would be excessive and would add approximately 2s. 6d. per ton to the cost of production. The miners' concern for Lanark-

shire is understandable, since it has always been the most difficult area from the point of view of unemployment. But artificial respiration is no solution, and the coal industry cannot afford to have any additional burdens imposed on its already excessive costs.

It is therefore obvious that other means will have to be found to compensate for the loss of Lanarkshire production. The Committee puts forward a detailed scheme for increasing output from existing collieries outside Lanarkshire, which would eventually produce another 7 million tons a year, and it recommends the sinking of three new large collieries, one in Fife, one in the Lothians and one in Ayrshire, which would take seven to nine years to reach full production, but which might be expected to yield some 2 million tons. On this basis, by 1975, the volume of extra production would amount to about 9 million tons a year.

The Committee recognises that "the fullest use of existing and potential resources" can only be ensured through a systematic and co-ordinated development programme, which the present method of organisation is not likely to produce. Scotland provides as good an example as any area of the need for the co-ordination and reorganisation of the coal industry. As the table below shows, there are still 180 undertakings, most of which operate on a small scale:—

Coalfield	1939 output (in 1,000 tons)	Number of Companies			
		Producing at least 1,000,000 tons per annum	Producing between 100,000 and 1,000,000 tons per annum	Producing less than 100,000 tons per annum	Total
Ayrshire and Dumfriesshire	4,750	1	3	15	19
Fife and Clackmannan	8,200	2	7	8	17
Central (Lanarkshire, etc.)	13,500	2	26	103	131
Lothians	4,050	1	8	5	14
TOTAL	30,500	6	44	131	181

The report comments,

the individualistic history and outlook of the industry has tended, in the past, to a certain amount of development on what might be termed a short-sighted policy, with some projects designed, as would be expected, to serve the ends of individual undertakings, and not always in the wider national interest.

Recently, however, there has been a tendency to concentrate production in the hands of fewer companies. The Committee welcomes this tendency towards unification, and suggests that the Coal Commission, as intended under the 1938 Act, should renew its efforts to secure amalgamations. To assist the Commission and lend a Scottish bias to its proceedings, it proposes the setting up of a Scottish Coal Board. The Board would consist of three technical experts, with an outside chairman, and it would have general powers to direct mining activities, to approve and, where necessary, initiate development plans, to recommend state financial assistance for the carrying out of development, to oversee the closing down of uneconomic undertakings, and to advise and co-ordinate housing and welfare arrangements.

So far, so good, but more detail will have to be known about the proposal. The idea of a small, expert body to survey and plan technical development for the whole coalfield is excellent, though three might seem too small a number to carry out this task effectively. But, what is more important, it is not clear whether the Board would be vested with sufficient authority to carry through an effective development programme, or what pressure it could apply to any mining undertaking which failed to conform to its recommendations. It is in this sense that the reservation of the miner members of the Committee needs to be con-

sidered; in their submission, so long as the industry remains under private ownership, there can be no co-ordinated or long-term planning. It is certainly true that merely to appoint an advisory Coal Board does not present a solution, and might in effect become no more than an appendage to the Ministry of Fuel's existing machinery.

The report does not indicate, except in the most general terms, how the proposed improvements and developments should be financed. The Board, it is stated, would have power to recommend Government assistance for certain plans, but there are no details of the extent of capital investment likely to be required nor of the form which such assistance should take. Parliament would almost certainly need to be assured that the investment was worth while before it committed the country to finance an extensive development programme, and, if, as seems inevitable, the scale of financial assistance were large, it would be entitled to insist on a substantial measure of control over the industry.

A major defect in the report is the very cursory attention it pays to the question of how to raise productivity in the industry, which is still the most pressing need. The Scottish coalfield, as it points out, is fairly highly mechanised, and apart from Lanarkshire, productivity is above the national average. In 1938, 80 per cent of its output was cut, and 58 per cent conveyed, mechanically. Yet output in that year was only 23.3 cwt. per manshift of 7½ hours, compared with 21.26 cwt. per manshift of 8 hours in 1914, when only 23 per cent of the coal was cut by machinery. This result, says the Committee, is disappointing, and calls for an investigation. The further slight increase in mechanisation during the war (by 1943, 2 per cent more was cut and 4 per cent more conveyed by machinery) is even more disappointing in terms of output per manshift, which averaged only 21.15 cwt. over the whole coalfield. Though the Committee admits the need for raising productivity, it does not offer any concrete suggestions; indeed, it still apparently relies on being able to maintain the labour force at its pre-war strength, though, with an intensive and well-ordered application of machinery, especially in the conveyance of coal underground, this would not be necessary. On the basis of evidence from every coal area of the British Isles, it seems unrealistic to imagine that anything like the same number of miners will be available to the industry after the war, and the problem confronting

Scotland, as every other coal district, will be to produce the same amount of coal with fewer men, and at lower cost.

Both the natural trend of production and the deliberate policy envisaged in the report will have the effect of driving the centre of coal production from west to east. This will have deep social effects. It will certainly involve a considerable migration of the mining population, and it is essential that this should be on an ordered basis, and not allowed to leave a trail of derelict mining villages and decaying communities. The Committee, in accordance with its terms of reference, deals at great length with housing and social issues. The problem is twofold—to better the existing conditions, which are described as "deplorable" in many parts of the coalfield, and to provide enough new houses to match the immigration into developing areas. It is estimated that as many as 8,200 houses, 3,000 of which are in Lanarkshire alone, are overcrowded or otherwise unfit for habitation, while another 10,800 houses would have to be provided to enable workers to live nearer their work or to house the additional workers required to raise output from existing collieries—making a total of 19,000 houses to be built over the next 50 years. In addition, 14,500 new houses would have to be built as new sinkings develop. Housing improvements are very necessary, but the scale of the housing programme is contingent on the size of the labour force, and, as already indicated, the Committee seems to allow for a volume of manpower which may be excessive.

In spite of these criticisms, the Scottish Coalfield Report, taken as a whole, is a thorough and conscientious attempt to produce a policy for the efficient utilisation and development of Scotland's coal resources. Its limitations are not wholly of its own making. In the first place, the Scottish coal industry has to be considered in the light of the national policy for Scotland as a "development" area. Secondly, and more important, most of the recommendations involve national issues, which cannot be determined at a regional level. It is valuable, indeed essential, to have regional surveys and regional planning, but they are no substitute for a national policy, and any regional plans must be made to fit into the national framework. The Scottish report, even if it had done nothing else, has served a useful purpose in emphasising the need for a national coal policy. The next steps now lie with the Ministry of Fuel.

Aviation Insurance

ALTHOUGH aviation insurance is the youngest member of the insurance family, it is now over thirty years since the child was born. The first steps were naturally of a hesitant character, but a bolder outlook gradually emerged until eventually protection was offered against the full range of flying risks. It is only during the past fifteen years, however, that substantial development has taken place. In 1929, several leading companies combined with certain Lloyd's interests to establish the British Aviation Insurance Company, a step which was followed in 1935 by the creation of the Aviation and General Insurance Company by a second group of offices. Besides these two specialist companies, business is also transacted by a number of Lloyd's syndicates, the companies and syndicates together constituting the present "London market" for aviation insurance. This market is similar in some respects to the corresponding market for marine insurance and handles considerable overseas business, especially in providing reinsurance against catastrophe hazards. The total dimensions of present operations cannot be gauged, because underwriters at Lloyd's do not publish their figures, but as the premiums of the two specialist companies had by 1943 reached the figure of only £382,000, it is apparent that the scale of transactions is still quite small against the background of insurance as a whole.

With the rapid development of civil aviation that is confidently expected when the war is over, a wider insurance market will certainly be needed, and the lecture recently given to the Insurance Institute of London by Mr L. Murray-Stewart, the underwriter of the Aviation and General, was therefore opportune. The lecture covered in some detail the various kinds of risk incidental to the operation of aircraft, and has been extensively drawn upon in preparing the present article. The risks fall under four main headings: the third-party risk; the risks of damage to the aircraft itself and its loss by fire and theft; personal accident risks; and the various hazards associated with air cargoes.

As regards the third-party risk, a distinction must be drawn between liabilities to passengers and to other persons. The anachronism still persists under English law that the owner of an aircraft is absolutely liable for personal injury or damage to property, a thesis which originates in all probability from the legal doctrine that the owner of land also owns the air above it, so that the aircraft operator necessarily commits a trespass. Some relief is provided for by Part III of the Air Navigation Act of 1936, which, as an offset to compulsory insurance, limits the liability to certain figures, varying with the loaded weight of the aircraft—£10,000 in the case of machines weighing up to 5,000 lb, increasing up to £25,000 for machines weighing over 25,000 lb.—but these provisions have not yet been brought into force. Aircraft operators on overseas routes must, of course, comply with the varying legislation in the countries they traverse. In 1933 an international convention was signed in Rome standardising indemnities on a basis similar to that of the Air Navigation Act, but the convention has not yet been ratified, and Mr Murray-Stewart expresses the hope that before ratification a clause will be deleted which deprives the operator of the benefit of limited liability in the event of his misconduct or that of any of his servants. Undoubtedly an absolute limitation of liability would be valuable in facilitating the provision of full insurance at reasonable cost.

A much heavier risk is that of liability to passengers in view of the possibilities of catastrophe, especially where aircraft are constructed to carry a large number of passengers. Unlike the position with other forms of transport, an accident to an aircraft in motion is more than usually likely to bring death, or serious injury, to all the passengers and crew. Liability under English law being unlimited, operators have hitherto felt that the risk is a greater one than they can carry either directly or through insurance and have sought to "contract out" of it by the insertion of a clause in the conditions of carriage. For international travel,

liability is governed by the terms of the Warsaw Convention of 1929, ratified by the United Kingdom in 1932; this Convention imposes a presumption of liability on the carrier, but limits the indemnity to 125,000 gold French francs for the death of or injury to each passenger, 250 gold French francs per kilogram of registered luggage and goods, and 5,000 gold French francs for each passenger's hand luggage. Insurers invariably rate the passenger hazard on the basis of the seating capacity of the aircraft, with a limit to the indemnity payable in respect of any one passenger.

Under the heading of damage to the aircraft itself are embraced a number of distinct hazards all requiring different treatment. There is a fire hazard attaching while the aircraft is on the ground, with considerable consequences possibilities where several valuable machines are housed in one hangar. The risk of accidental damage while on the ground is greater than might be thought, because aircraft inadequately pegged down are easily torn from their moorings by even a slight wind. Theft risks have not hitherto been heavy on account of the obvious difficulties of disposal. The greatest hazards under this heading are, of course, those of accidental damage whilst in flight and "crashing," and in order to keep the cost of insurance within bounds the operator is usually required to bear himself a proportion, varying between 2 per cent and 10 per cent of the insured value, of each loss. This also serves to give the operator a financial incentive for careful operation.

The third group of risks comprises personal accident insurances, and in 1943 this accounted for no less than 47 per cent of the total premiums of the two specialist aviation offices. The explanation of the substantial volume of business transacted lies in the practice already mentioned whereby air-line operators "contract out" of their liabilities to passengers, who therefore find it necessary to make their own provision against the hazards involved; a further consideration is that ordinary personal accident policies issued in this country by composite companies and underwriters at Lloyd's at present exclude flying hazards. Except where cover is required on recognised airlines the rating of personal accident risks is difficult, because specific details of the pilots, and of the machines in which flights will be taken, can rarely be given. Besides policies for passengers on an annual basis, "coupon" insurances for specific flights on recognised airlines are available, and special forms of cover are issued to pilots and aircrews.

Finally, there is the hazard attaching to air cargoes, a hazard which, surprising perhaps, is less than that of conveyance by other means of transport; the reason lies in the avoidance of handling during trans-shipment and in fewer opportunities for pilferage. Even before the outbreak of war, air carriers were tending to monopolise on

certain routes the transport of gold bullion and were finding an increasing market for other urgent and valuable freights. There has been considerable discussion in insurance circles on the merits of extending to aviation the marine principle of general average, in circumstances where cargo is jettisoned for the common safety; general average is, however, a survival from times when the device of insurance was not available as a means of spreading risks, and it is felt that an extension of the principle to aviation would add considerably to the cost of handling claims with but little corresponding benefit.

These are the risks. What form of organisation will best meet them in the post-war period? One school of thought maintains that the aeroplane being the "motor car of the air" insurance should be provided by the accident departments of composite companies on similar lines to motor insurance. On the other hand, the international character of much of the traffic and the high loss potentialities—necessitating the sharing of risks among a number of insurers—suggest affinities with the marine market; and conflagration hazards on the ground are matters with which the fire departments of the companies are best qualified to deal.

A proposal is at present on foot whereby certain shipping protection and indemnity associations would form an organisation for insuring aviation liability and other risks on mutual principles. It seems questionable, however, whether aviation insurance, at least in its present stage of development, is a fit subject for mutual insurance. Insurance on a mutual basis has merit in certain classes of risk where the experience varies little from year to year; and a high degree of mutuality is almost inescapable in life assurance, where long-term contracts and unforeseeable changes in the trend of interest rates and mortality make it impossible accurately to determine premium rates in advance. It does not appear suitable for aviation insurance, the characteristics of which are necessarily high catastrophe possibilities combined with low loss frequency, so that members of any mutual organisation would find themselves faced with greatly fluctuating assessments and be unable to budget in advance for an important element in their costs of operation.

For the most part, opinion in insurance circles favours the view that aviation insurance should develop independently of the older organisations, and it seems probable that after the war many of the large composite offices will establish aviation departments. In so doing they would be able to draw upon the experience and organisation of the specialist companies in which they are shareholders, and these would also form media for the distribution of risks through reinsurance. Development on these lines would have the advantage of lending to the market an element of stability which would be invaluable in a period of rapid expansion.

Business Notes

The Turn of the Year

The money market's annual ordeal by window-dressing passed off last week with its customary wartime bathos. It is probable that never before has the movement of funds over the turn of the year been so great as it was on this occasion, but the preparations made for the event proved so ample that the final session of the old year on Saturday morning provided little more excitement than a normal working day. The Bank return, which showed that by the previous Wednesday bankers' balances had already been built up to the high figure of £260,673,000, foreshadowed some anti-climax to the progressive tightening of credit as the year climaxed to its close. On Saturday morning credit conditions drew to its close. On Saturday morning credit conditions were no worse than "patchy," and though some market houses had to seek further official assistance by sales of bills to the Bank of England agent, some of the clearing banks were actually buying bills from the market.

The scale of the official assistance to the market can best be appreciated by the fact that towards the end of the old year Messrs Secombe, Marshal and Campion were actually taking February maturities from the market. These official agents normally take the shortest maturities the market has to offer, and by tradition show the greatest reluctance in taking bills having more than fifteen days to run. On this occasion the market's supply of January maturities had been exhausted, and those seeking official assistance were com-

pelled to offer increasingly long maturities. In view of this, the market had anticipated that the authorities would repeat their manoeuvre of a year ago, and operate in reverse, that is, resell in the market some of the longer-dated paper purchased in the old year.

This, however, has as yet been unnecessary. The authorities, who now dictate to the discount market not merely how much they will tender in the aggregate for Treasury bills each week, but how those applications are distributed over the week, saw to it that a substantial quota of new bills was taken up on Tuesday, the first working day of the week. Applications for these particular bills were allotted to the market in full. In addition, the banks paid then for a large part of their £120 million of TDRs due from them this week. As some Australian money was also withdrawn from the market, at the beginning of the week in connection with the redemption of Queensland 3½ per cent stock, the surplus of credit seemed to vanish without resort to the unusual device of official open market sales of bills.

Market Movements

It is too early to say whether the New Year is to bring a revival in stock exchange business and a rise in prices such as is usual in fairly settled times. The old year

closed with a firm undertone in most sections and with British industrial equities a trifle higher on the month, but still appreciably below the August peak. The figures of *The Actuaries' Investment Index*, given on page 30, show a net fall of 0.7 per cent from the peak and those of *The Financial News*, of which a chart appears on the same page, one of 3.3 per cent. The dates do not coincide, but the difference in showing is due almost entirely to the differences in composition.

For the Actuaries' figure, changes on the month are slight and those against the July peak in most cases not substantial. The last half-yearly figure which shows a higher value index is December 1936, comparisons with which are included. The individual differences between the position now and that of eight years ago are substantial, but they owe something to changes in composition over the period. There are few improvements on the period, those in industrial equities being in electrical equipment, cotton, shipping, stores and catering and breweries. Of these, the first, and possibly the last two, reflects secular trends. Cotton and shipping have secured a wartime rise which will only persist if very intricate problems find a happy solution.

It is to be noted that the yield on all sections of fixed interest securities show marked changes. The general showing is that gilt-edged yields and those on preference shares have risen, some very substantially, but every class of debenture stock shows a reduced return. Comparison of price indices suggests that, while the preference share has gone out of favour, as having many of the disadvantages of ordinary shares without the compensation of participation in rising profits, the margin between debentures and gilt-edged has been greatly narrowed.

* * *

Gas and Electricity Supply

The gas and electricity position has now become very serious; indeed, if the present overloading of electricity plant continues, the whole electricity supply system may collapse. The Ministry of Fuel, drawing attention to the critical situation, is warning consumers that unless they exercise strict economy between 8 and 10 in the morning—the danger period—electricity supply may be cut off altogether in some districts. This action has already been taken on two occasions, and it will be repeated if the cold weather continues and if the load at any time exceeds 8,400,000 kilowatts, which is about breaking-point. Seventy per cent of electricity consumption is industrial, and, though domestic economy is essential, it seems that the bulk of the saving will have to come from industry. The Ministry of Production is therefore suggesting to firms that they should stagger working hours, in order to flatten out the peaks in consumption.

The gas position is also critical, but less so, since gas can be stored for brief periods, whereas electricity has to be generated for immediate consumption. With gas, it is a question of evening out daily rather than hourly consumption. In the London area, the Gas, Light and Coke Company is already reducing pressure and thus limiting the amount available for "space heating." Consumption in the London area is now 181 million cubic feet a day, compared with 160 million cubic feet a year ago, but if full pressure were restored it would amount to 195 million cubic feet. In both industries the difficulties are due not to shortage of coal, for there are sufficient stocks available, but to the strain on plant and labour. Electricity plant is operating which would normally be scrapped, and

shortage of labour has prevented repair and maintenance work which would normally have been carried on in the slack summer months. The Gas Light and Coke Company has lost part of its storage capacity, and 10,000 of its peacetime labour force of 25,000 are in the Forces.

This is the first really cold winter since 1941-42, and the Minister of Fuel has often boasted of his luck in the last two years. But it is difficult to avoid the conclusion that the present weather is what might normally be expected in winter, and that to gamble on a third mild winter was tempting Providence. The chickens are returning to roost with a vengeance. It is obviously too late now to introduce fuel rationing, which might have obviated such a situation, and the Ministry will have to rely on appeals for economy, backed by the threat of cutting off supplies or reducing pressure if voluntary savings prove insufficient. What is important now is to avoid interference with vital war production and hardship on such sections of the community as sick people or mothers with young children.

* * *

Steel Merger Adoption

It would be hard to find a greater contrast than that between the behaviour of the shareholders of Baldwins, on the one hand, and of Richard Thomas, on the other, at the meetings called to sanction the merger scheme. The former meeting lasted barely fifteen minutes. There was no opposition and no dissent even from preference shareholders. The latter lasted over three hours, despite the fact that it was apparent from the first that proxies received, and admitted as valid, were overwhelmingly in favour of adoption. It was very soon apparent that the bulk of those present either thought the terms too generous to Baldwins or wished for an adjournment of the meeting so that more time could be had for consideration. There was also a general demand for more facts.

Mr. E. H. Lever, in the chair, ruled a proposal for adjournment, moved by Sir William Firth, out of order and refused to accept any amendment whatsoever of the scheme. He also said that the basis on which the two concerns were valued for fusion was far too complex for it to be possible to present it to the shareholders. This is the familiar fallacy that, because one cannot tell everything, it is better to tell nothing. It is sufficient to point out that, had Mr Lever been attempting to sell the shares in question on a prospectus, he would have been compelled by law to disclose a number of the facts asked for. The attitude of a large number of those shareholders who were present was that they had not appointed the present board and could not replace it. In these circumstances it was not to be expected that they would accept the word of the board that the fusion was in the best interests of the company, especially as it had been emphatically stated that the primary reason for the fusion was to encourage exports. If Richard Thomas shareholders were being asked to make a sacrifice in the national interest they ought at least to be given the fullest information possible and ample time to make sure that everybody had studied the scheme.

The date was an awkward one, and the time allowed for consideration and consultation was, in terms of working days, under a fortnight. It is true that the law demands only seven days' notice, but, on any consideration of reasonable behaviour, it is quite certain that the law ought to be changed, and recommendations to that effect have been laid before the Cohen Committee. It is apparent that, although the fusion was in this case desirable, there has been no adequate consideration of the terms, and the means by which the result was obtained were the reverse of what must be hoped for in other cases. Above all, the complete rejection of the demands for information is indefensible.

* * *

Voting Control

The method of dealing with the Richard Thomas fusion is particularly unfortunate because it strikes a blow at the only means which exist of controlling company directors. It is commonly said that this control is quite illusory and this will be true if, whenever an attempt is made to organise opposition, the directors are allowed to prevent it. In this case proxies had been received in favour of the scheme representing rather over 7 million votes out of a possible total vote of 18 million. Of the seven million some three million represented 10,000 shareholders—about one-third of the total number—with holdings of £500, that is

1,500 shares, and under. That is, one-third of the shareholders, holding one-sixth of the capital, had voted in favour, as had holders of a further 22 per cent of the capital with larger individual holdings.

There is nothing whatever in these figures to show that small holders were enthusiastically in favour of the scheme, or that, had an opportunity been given for the view of the opposition to be stated in detail, the scheme might not have been turned down. Experience suggests that a high proportion of shareholders are unduly trustful, ignorant or lazy. They either do nothing or "sign on the dotted line." It is on the active, critical minority that the country has to rely for such measure of control of directors as is desirable. It is too often the fault of the directors themselves if the criticism is ill-informed and they ought not to be allowed to keep all relevant facts to themselves and so remove any possibility of the formation of reasoned opposition.

In this particular case, the need for a considerate and informative attitude was all the greater in view of the fact that the board had been imposed on the shareholders, while, now that the fusion is accepted, some 37 per cent of the voting rights in the equity shares are in the hands of the Baldwins board. As Mr Lever said, that board cannot do harm to independent Richard Thomas shareholders without harming their own company. But one main point of the Richard Thomas dissidents is that they are doubtful about what opinion they should hold of either the past or the future performance of the Baldwins board. In the circumstances, it is not surprising that the opposition party, on being finally refused an adjournment, walked out of the hall leaving only some 10 to 12 per cent of the number originally present to carry the scheme on a show of hands.

* * *

Cotton Industry Deconcentration

The cotton industry was one of the first, a year ago, to publish a post-war report, and now a committee of three representatives of running mills and three of closed mills, under Sir Raymond Streat's chairmanship, has published a unanimous report on deconcentration. It recommends that all the spinning mills closed under the concentration scheme should be permitted to reopen on the same "appointed date," and that the care and maintenance contribution which has been made by the nucleus mills should be continued for six months after the "appointed date." This contribution should be extended for two further periods of three months each for any mill which has not reached 60 per cent of productive capacity, and, at the Cotton Board's discretion, thereafter for another six months, at half rate.

The closed mills have been maintained more or less in working order, and there is no shortage of raw cotton, so that the fixing of the date for restarting will depend entirely on the labour position. The Committee was understandably opposed to any system of selective opening of mills, and the "appointed date" method will give the appearance, at any rate, of an unhandicapped start. The raising of the starting barrier, however, is unlikely to be the signal for a simultaneous reopening. Cotton operatives now in the Forces and munitions will not all be released at once, and to wait until all were available would be wasteful of the cotton industry's scarcest factor. To get over the difficulty, the report proposes that operatives should be permitted to transfer from one mill to another, or from other industries, as soon as deconcentration begins, whatever the fate of the Essential Work Order. Any drop in output of nucleus mills, the Committee considers, would be quickly made good by the re-opened mills. The right of re-opened mills to a share of returning operatives is safeguarded by a recommendation to restrict nucleus mills from increasing their spindle activity by more than specified percentages for nine months after the appointed date.

On the whole, the report strikes a fair balance between the claims of the closed mills and the obligations of the nucleus mills. The care and maintenance grant is to go on long enough to get the former on their feet, and the nucleus firms will to a certain extent mark time during that period. The main difficulty is how far the deconcentrated mills can attract a share of the labour force, and on this the report is weakest. If labour is in fact not obtained by the *laissez-faire* methods proposed, and no other means is sought by the spinning section as a whole to see that deconcentrated mills do get a new start, the scheme may be insufficient to preserve the principle of equity.

Cotton Machinery Requirements

Another aspect of reconversion in the cotton industry is dealt with in a memorandum on post-war machinery requirements which contains statements on interviews this autumn between the Chairman of the Cotton Board and representatives of makers of spinning, winding and weaving machinery. It is extremely disappointing that the questions put by Sir Raymond Streat did not include one on the prospects of obtaining the modern types of machine on which the raising of production per man-hour and the future efficiency of the cotton industry depend. It came up only parenthetically in the discussions with the winding machine and loom makers, with disappointing results. Sir Raymond asked the textile machinery makers about priority for home orders, pace of supply, prices, and access to imported machinery.

The spinning machinery makers gave the most encouraging answers, but a certain defensiveness was apparent in those from the other sections. Perhaps their attitude is partly explained by the fact that so far they have received few orders. Because of their view that demand for automatic looms, for example, is likely to be small, the loom makers gave no hope of expanding their own plant to produce this improved type of loom. So far one winding machinery firm has arranged to produce American designed machinery.

It seems unlikely that major difficulties will arise on the question of priority for home demand, and Sir Raymond Streat suggested that the Board of Trade should keep some balance between home sales and licences for export. The manufacturers appear to have satisfied Sir Raymond that prices would be fair, and that imports would be admitted without undue remonstrance from home producers. Manufacturers would be assisted by the early booking of orders, and this is being urged on the cotton industry. Pace of supply will depend on the allocation of iron and steel, which has already been slightly increased, and on increased labour. The shortage of foundry workers is being examined by the President of the Board of Trade, and a simplification of machinery licensing procedure has also been promised, and will shortly be announced.

PLANNED BANKING

POST WAR SERVICES for
Industrial, Commercial, Professional, Small
Business and Private Accounts.
Specialised Foreign and Trustee Departments.

During its long experience the Bank has successfully aided those faced with post war difficulties.

So, again, now that reconstruction plans loom large the Bank provides the services which help to solve industrial and commercial problems—no matter how large or how small.

On the basis of inductive reasoning from ascertained facts over the period 1870-1939 the author proceeds to build up a technique for practical investment of all kinds, from long-term holding down to purchases for a few weeks or months only. The work ends with a survey of investment problems and opportunities in the post-war period.

30s. net

Eyre & Spottiswoode

Lancashire Cotton Corporation

The doubts expressed about the preliminary statement of the Lancashire Cotton Corporation on page 874 of *The Economist* of last week are shown to be fully justified by the full accounts for the year to October 31st. Profits, after tax, are given as £495,000, against £659,000, but this time dividends are paid net instead of gross and the actual fall in profits is some £60,000. The same allocations are made as for 1942-43, including £225,000 to depreciation reserve and £100,000 to general reserve, except that deferred repairs receives nil against £100,000. An ordinary dividend of 7½ per cent is paid for the sixth year running; prior to 1938-39, no payments had been made on ordinary stock. Earned for ordinary works out at 11.5, against 10.3 per cent, after treating deferred repairs as an expense. The balance sheet shows stock over £1,000,000 higher, investments over £600,000 lower, and net liquid assets up by nearly £300,000.

The fall in the Corporation's trading profit is apparently due to a smaller turnover caused by the continuing withdrawal of labour from the mills, but the chairman, Sir John Grey, is able to announce that the programme of modernisation of machinery, started shortly before the war and halted because of it, may shortly be resumed.

Sir John Grey treads the well-beaten path of defending the Lancashire cotton trade's efficiency, while pleading for "the fullest assistance in the difficult problem of restarting and restaffing its factories" and claiming that reasonable confidence is necessary over future prospects, especially as regards international trade, before the industry should commit itself to a large outlay on new machinery. Failure to utilise technical improvements is blamed on lack of funds and the inter-war depression in the industry is ascribed as mainly due to "world economic factors outside its control." Finally, unfavourable comparisons drawn from the Platt report are said to be unfair owing to the different type of market catered for. The most depressing aspect of this type of self-defence is the complete failure to realise that the cotton industry can only save itself primarily by its own exertions. It is true enough, as Sir John says, that since the war the price of machinery has risen considerably—but so have labour costs—and that the industry deserves sympathetic help in tackling its reconversion problems. But unless manufacturers show much greater willingness to learn, with appropriate modifications, from American methods, to devote all available resources to an extensive programme of modernising machinery, and to achieve effective co-operation in rationalising units of production, they cannot expect prosperity, or at least sympathetic help toward securing prosperity, in the future.

New Silver Price

The London silver market began last Tuesday to quote bar silver in pence per ounce troy .999 fine instead of in pence per ounce standard, that is, per ounce troy .925 fine. Otherwise the rules of the market remain unchanged. In particular, bars of quality .996, .997, .998 and .999 fineness continue to be good delivery. The main reason for the change in the method of quotation is that of accounting convenience. The previous method of quoting silver .925 fine was a relic of the former standard fineness of British silver coinage, namely, eleven-twelfths or 925/1,000; this

disappeared with the passing of the Coinage Act of 1920, by which the fineness was reduced to 500/1,000. It had thus become an anachronism, and, more serious, an inconvenient anachronism because other important silver markets normally quote silver of .999 fineness. That is the practice of the New York market.

There was a body of opinion in London which favoured quoting the sterling silver price for fine metal, but the view of those who wished to follow the New York practice of quoting silver .999 fine prevailed. An added argument in favour of the course actually chosen is that the bulk of the silver dealt with on the London market is in the form of bars .999 fine. There are very few refineries in the world to-day that fail to attain this high standard of fineness.

The change in the method of quotation which took effect last Tuesday meant an apparent rise from 23½d. to 25½d. in the sterling price. The exact equivalent of the previous quotation of 23½d. for .925 silver in terms of silver .999 fine would be 25.38d. per ounce troy. In effect, therefore, the rounding off of this quotation to 25½d. involved a rise of nearly ½d. in the sterling price. This modernisation of the bullion market's method of quoting silver will probably be followed by other minor amendments and improvements of the rules, all of them designed to help London regain its primary position among the world's bullion markets after the war.

Anglo-Egyptian Finances

A commercial and financial agreement between the British and Egyptian Governments was signed in Cairo this week. The agreement followed the lifting of the Middle East Supply Centre control over all imports into Egypt except for a specified list of bulky or scarce commodities. For these commodities, over which MESC control remains, the programme is to raise imports into Egypt by about 50 per cent. For the rest, import licences will henceforth be granted by the Egyptian Government, though the quantities and types of goods imported must, to a large extent, be determined by the allocation of tonnage by the Anglo-American Shipping Board.

The prospective increase in imports raises the problem of finance, and in particular that of providing the dollars and other hard currencies needed to pay for imports from the countries concerned. Egypt has since the beginning of the war adhered faithfully to the sterling area dollar pool agreement. She has therefore sold her dollar income to the British Government, which in return has made available the dollars and other hard currencies required by Egypt. That arrangement worked satisfactorily as long as Egypt's demand for hard currencies was in effect determined by MESC. Now that this control has been abandoned other arrangements have had to be made. Egypt has been offered a hard currency quota of \$40 million for 1945. This is intended to cover gross requirements, including those for goods still imported under MESC control. As in the past, Egypt's dollar income will continue to be sold to the British Government.

Film Quotas

The war prevented the British film industry from producing enough films to meet the quotas laid down in 1938, and they were reduced in 1941 for the years 1942 to 1944. The renters' quota was 20 per cent for long films and 15 per cent for short films. For exhibitors they were 15 and 12½ per cent respectively. Under present conditions of studio and manpower shortage, it is impossible for the film industry to produce enough films to enable the quotas to be restored this year. An Order has been made, however, to raise the quotas in 1946 for renters to 25 and 22½ per cent, and for exhibitors to 20 and 17½ per cent. Another Order brings into line with current costs the labour costs test for the quota.

British producers have always done well with the documentary type of film, and the Government has helped to encourage it during the war, through the Crown Film Unit. However, the long feature film must be the basis of the industry—at any rate, while cinema programmes continue to be built as they are, and while the present relation between the long and short film quotas is preserved. There can be no more doubt that the quality of British feature films is improving and that they are steadily gaining in popularity. The phrase "It's a British film" has lost the

tone of disparagement it used to have. Disappointment was expressed by many of the speakers in a recent debate in the House of Commons that the quotas for 1945 have not been raised. But to do so would be pointless if it is physically impossible to produce films in the numbers required to fulfil the quota. In any case, good films depend neither on quotas nor on a cost test. What counts is the excellence of script, production, acting and technique. A mere addition to the number of films made would not add to the industry's prosperity or make it more "export-worthy."

One Miners' Union

The National Union of Mineworkers, which formally came into existence on January 1st, begins its career at one of the most critical periods in the history of the mining industry. The miners have lost a great deal of public goodwill in the past few years; the new Union provides them with an opportunity to retrieve it. With a centralised and adequately equipped organisation, it should be in a position to exercise a greater authority over its membership than the old, loose Federation of district associations, and to put forward a unified industrial policy. It is significant that one of its first activities is to be the presentation to the Government of the case for nationalisation.

The union will have a full-time paid president, elected by ballot, and a secretary, and a National Executive, representing the districts, which have now become Area Councils. The Area Councils will continue to deal with purely local negotiations, but responsibility for industrial matters as a whole will rest with the national union. The extent to which the union can be really effective in practice will depend very largely on the willingness of the districts to sink local differences and sacrifice their local autonomy. The size of the ballot vote in favour of the National Union in October suggests that the majority of the miners recognise the logical necessity for consolidation and reorganisation.

GEC Dealings Ban

It is a fitting conclusion to a year, during the whole of which the position in the "grey" market has been almost continuously before the public, that the New Issues Sub-Committee should have refused to permit dealings in the two million new "C" preference shares of £1 of the General Electric Company. It is understood that permission for an issue to shareholders was refused on the ground that it would be tantamount to a public issue and that a free and active market in the shares would result. The company appears to have been "directed" to carry out the operation through Messrs Morgan Grenfell & Co. and it was the brokers of that house, not the brokers of the company, who handled the business. Some five days after the contract for the placing was signed, the Treasury gave permission to deal in the whole issue. Under the contract the shares had been placed with 15 financial institutions and their associates except for 150,000 shares placed with three jobbing firms to enable them to open the market.

The New Issues Sub-Committee, being assured that substantial sales were in contemplation, held that a false market would be established in that a large premium would result which would go to the original allottees and not to the company or the shareholders, as would have been the case under any normal method of issue. This decision has the warmest support in almost every quarter in the City, but it was felt possible that, on appeal, the full Committee for General Purposes might reverse the decision, not because they disagreed with it, but because it is in effect, if not in intention, a vote of censure on the Treasury.

Far from thus bowing to any dictates of high policy the Committee, it is felt, rightly and courageously, took the line that a matter of principle is involved and were of one mind in confirming the Sub-Committee's ban. There will be scant sympathy with the financial houses which are left to hold the bulk of the issue and it should not be impossible to find means of relieving the jobbers concerned of a part at least of the burden which has fallen upon them. It remains to be seen what will be the reaction of the authorities to the new position created, not by any deviation from practice on the part of the Stock Exchange, but by their own refusal to distinguish between the right

to refuse permission to raise new capital and the need to prescribe detailed methods of raising it. If the Treasury can produce reasons for a policy which seems to those with expert knowledge of the subject completely purposeless, no doubt a means will be found to escape from the impasse.

Turner and Newall

The gross profits of the Turner and Newall group for the year ended September 30, 1944, are down by £200,000 to approximately £2½ million, but lower taxation requirements enable net profits, at £546,000, to be, roughly, maintained. The ordinary dividend is unaltered at 12½ per cent and the customary allocation of £100,000 is made to general reserve.

The group's smaller trading profit is stated by the chairman, Mr Shepherd, to be due to rising costs, between which and increased selling prices "there is always a significant time lag." But Turner and Newall is not one of those companies for which the inevitable fall-off in wartime contracts will mean any reduction of turnover. On the contrary, the opportunity is welcomed to divert some part of production to the export trade, which accounted pre-war for one-third of the total production of the group's British factories. The group will also supply materials for the Government's temporary housing scheme, and the parent company has plans for capital expenditure amounting to £1½ million in the first two post-war years, to be financed out of existing resources.

There can be much less quarrel with his plea to the Government to declare and operate a consistent political and economic policy within whose framework private concerns can freely operate. Such optimism is encouraging. It leads Mr Shepherd to point to the successful expansion of the asbestos industry as a striking vindication of private enter-

(Continued on page 26)

REPUBLIC OF CHILE.

Service of the External Debt relating to the year 1944 (Law No. 5580, 31st January, 1935)

The Caja Autonoma de Amortizacion de la Deuda Publica de la Republica de Chile, in accordance with the provisions of Article 6 of the Regulations of Law No. 5580 of 31st January, 1935, approved by Supreme Decree No. 3837 of 24th October, 1938, declares that in the year 1944 it has received the following revenues:—

	U.S. \$
Profits of the Chilean Nitrate & Iodine Sales Corporation	1,729,015.84
Income tax of the Fourth Category and additional tax on the Copper Companies	4,712,672.16
Quota of the duties on petroleum for the Nitrate Industry (Article 7 of Law No. 6155 of 6th January, 1938)	60,289.54
Quota of the duties on petroleum for the Copper Companies (Article 7 of Law No. 6155 of 6th January, 1938)	122,781.10
Total	6,624,758.64

Fifty per cent of this revenue, or the sum of U.S. \$3,312,379.32, will be applied to the payment of interest at the rate of U.S. \$1.126 per hundred dollars nominal capital, U.S. \$0.26461 per hundred Swiss Francs nominal capital and £12s. 6.24d per hundred pounds nominal capital.

By reason of the suspension of exchange operations in most of the foreign markets on account of the war, it has been impossible this year to make the conversions necessary to provide in Swiss francs the sums required for the service of the bonds denominated in that currency. The Caja has accordingly been obliged to state in U.S. Dollars the rate of interest to be paid to the holders of these bonds and to maintain in that currency the funds required to cover such interest payments.

Out of the remaining 50% of the revenue received, bonds have been redeemed to the nominal amount of U.S. \$5,702,500 and £1,400 and have been withdrawn from circulation.

After making the above-mentioned redemptions, the balances of bonds of the External Debt are as follows:—

£27,741,071
U.S. \$157,034,000
Sw. Fcs. 108,662,500

RICHARD THOMAS AND COMPANY, LIMITED

SCHEME APPROVED

MR E. H. LEVER'S SPEECH

A special meeting of the stockholders of Richard Thomas and Company, Limited, was held in London, on the 29th ultimo, to consider the proposed merger with Baldwins, Limited, Mr E. H. Lever, the chairman, presiding.

The chairman, in the course of his speech, said: So far as the principle of the merger is concerned the great weight of opinion and comment has been wholly favourable. A few people have criticised the merger on the ground that as Richard Thomas already owns one of the two strip mills in this country, the only one which manufactures tinplates, it would have been better for the company to have allowed the initiative in the matter of further modernisation to be taken by its competitors. Your directors do not share that view. Apart from the fact that a leading position in any industry carries with it the responsibilities of leadership and that the prosperity of Richard Thomas is bound up with the prosperity of the steel industry as a whole, the position of your company has a certain vulnerability which cannot be ignored.

NEED FOR COLLABORATION

The general economic position of this country and the difficulty of estimating future demand, together with the fact that as a mass production unit a strip mill must be kept fully employed, render it, in our view, very unwise to contemplate the erection of more than one new continuous strip mill for some time to come, and it is almost imperative, therefore, that those engaged in the tinplate and sheet industries should collaborate both technically and financially in its erection.

The proposed fusion in no way changes the friendly relationship between your company and the other firms in the tinplate and sheet trades or the plans for collaboration with them to which I referred at the last annual meeting, nor is it likely to involve any greater financial liability than would have existed in any case. Those critics who allege the contrary ignore the fact that one of the undertakings given by Baldwins is that its cash resources will be used to participate in approved schemes of development.

The next category of criticism is to the effect that it was not necessary for Richard Thomas to take over certain old-type works of Baldwins and that these would be a burden upon the combined undertaking. Critics who take this view seem to forget that as the scheme is in essence an amalgamation, it was necessary that Baldwins should cease to be a manufacturing company and it was not possible, therefore, to select some assets and to reject others. The old-type plants that the critics have in mind form only a small proportion of the total assets acquired, and the fact that the profit-earning capacity of these old-type plants is likely to be limited in duration, and that their capital value is of a wasting character, was taken into account when the terms of the merger were decided.

Another feature of the proposals which has received some criticism is that, as a result of them, a large block of shares will be under single control. Those who advance this criticism would do well to remember that Baldwins, Limited, are accepting the whole of the consideration for their assets in the form of ordinary shares, and their interest in Richard Thomas is, therefore, identical with that of any other shareholder; Baldwins cannot exercise their votes in any way detrimental to shareholders as a whole without them-

selves suffering in like measure, and the ultimate ownership of the Richard Thomas shares allotted to Baldwins rests with the shareholders and not with the directors of the latter company.

"REAL" EARNING POWER

So far as the terms of the merger themselves are concerned, some shareholders have asked for more detailed particulars as to the basis adopted and as to their valuation placed on each category of assets taken over; some critics have gone further and have affirmed that the number of Richard Thomas shares allotted is too high.

It must be apparent that, in view of the complex conditions prevailing as a consequence of the war, the determination of the value of the assets taken over could only to a very limited extent be dealt with on an accounting or mathematical basis. As the purchase price was being satisfied solely in ordinary shares, the major consideration was the relative real earning power of the companies, both present and prospective, and in this determination of earning power several abnormal factors had to be taken into account. Among those factors are the effect on profits of the war-time Government financial arrangements in the iron and steel trade, as to which there is obviously a great deal of misconception, the probable effect of the termination of these arrangements, the distinction between assets whose earning power was likely to be only temporary, and those whose earning power was likely to be permanent, the probable post-war demand of the various categories of products, the relative effect of further modernisation on the profits of the two companies, the relative dependence of each company upon a revival of the export trade, and the probable future price-fixing policy.

Some questions have been asked concerning the proposed new short-term loan. The terms of this loan are governed by conditions laid down by the Treasury, one of which is that the loan must be privately placed. The precise terms as to interest and redemption have not yet been fixed.

QUOTAS

The effect of the merger upon quotas in the tinplate and sheet trades has been called into question. The answer is that in the tinplate trade the pooling arrangements were entirely suspended in December, 1941, when works were closed or requisitioned under the concentration of industries scheme of the Board of Trade. In the sheet trade the revised quota arising from the erection of Ebbw Vale has never been fixed, and so far as they concern us the pooling arrangements are in suspense by agreement.

In the case of both industries it is clearly understood that quota arrangements, if any, must be discussed *de novo* after the war, and clearly no voluntary schemes can be established, with which your company does not agree.

CHANGES IN BOARD

Except for the appointment of the four directors named in the circular, the question of the future constitution of the board is out of order at this meeting. Until the formal termination of control in July next, the appointment of directors will still be in the hands of the control committee. If the proposals are approved, the board will come before you for election in the ordinary way at the next annual general meeting after control has ended.

Before formally moving the first resolu-

tion I should like to sum up the position as I see it. For important reasons which have been explained, your directors have negotiated the proposals which are now before you.

Conditions are such that it is impossible to supply shareholders with enough information to form more than a very general opinion as to the actual terms of the merger, but your directors' view, supported by others competent to judge, is that the terms are fair to both parties.

The scheme is delicately balanced and cannot be varied in any particular without destroying the whole. I am, moreover, advised that no amendments can be accepted.

In this connection it is, I think, proper that you should know that we have received 11,000 valid proxies aggregating approximately 7,450,000 votes, of which 7,109,000 are in favour of the resolutions, and of these approximately 3,000,000 are in respect of nearly 10,000 holdings each of £500 nominal value or under. The scrutiny of the proxies has been entirely in the hands of the auditors of the company, and it has been arranged that they shall equally be scrutineers at this meeting.

Sir William Firth and others opposed the merger and urged adjournment. On the chairman's declining to adjourn the meeting on the ground that there was not sufficient reason, they left the meeting and the resolutions were then carried.

CHAIRMAN'S ATTITUDE TO ADJOURNMENT

The chairman, in response to a request from the Press as to why he declined to adjourn the meeting, subsequently made the following statement:

I declined to adjourn the extraordinary general meeting because the reasons given for the request were inconsistent with the general attitude of Sir William Firth and his supporters. The arguments advanced for the adjournment were that more time was needed to examine the terms, whereas it was the whole principle of the merger that was being called in question.

Why should it be necessary to have more time to examine the terms of a proposal which, in the opinion of its opponents, was essentially unsound? At the meeting, in speech after speech that dealt mainly with personal issues, it was the principle that was the chief target of criticism, but there had been ample time for such criticism to be voiced. The announcement of the proposal itself was made on November 16th, but it was not until December 12th that Sir William Firth wrote to me asking for an interview, not on the matter of principle, which he fully conceded in that letter, but on matters of detail.

A FUTILE SUGGESTION

The position, therefore, was that Sir William Firth was in favour of the principle three weeks after the first announcement and a fortnight before the meeting. To have adjourned the meeting to allow of further examination of terms that could not be further elaborated would, therefore, in my opinion, have been futile and I regarded the request as disingenuous. Sir William Firth complained that his supporters had not had time to consider their position, but if that was so, it was due to his failure to give them a clear lead right at the commencement. Out of some 30,000 shareholders only about 250 people were present at the meeting, and it was clear that of these a majority was sympathetic to Sir William Firth.

I had 11,000 proxies (representing 7,100,000 votes), of which 10,000 were in respect of holdings of £500 each or under, and I was convinced that these sufficiently represented the views of the absent shareholders who were not swayed by emotion. I regarded myself as custodian of the interests of shareholders as a whole, and, for the reasons already given and supported as I was by that overwhelming vote of confidence, I declined to consent to an adjournment.

CARRERAS, LIMITED

LARGER OUTPUT AND SALES

The forty-first annual general meeting of Carreras, Limited, was held, on the 29th ultimo, in London.

Sir Edward Baron (chairman and managing director) said that during the year the hazards and dangers of war had once more imposed themselves upon London. Throughout that difficult phase their staff and workpeople had again rendered splendid service. The directors had had great pleasure in repeating the bonus paid last year of six weeks' wages, plus additional gifts for long service.

As regards the result achieved during the year under review, the decline of £776,000 in the gross trading profit was in no way due to loss of sales or turnover. On the contrary, their output and sales were in excess of the previous year, largely on account of the greatly increased supplies needed by H. M. Forces for issue as rations and for sale through the N.A.A.F.I. canteens, etc. Red Cross parcels for prisoners of war and individual parcels to members of the Forces also made increasing demands upon their resources and, if the home trade was in consequence temporarily restricted, he thought shareholders would endorse the view that it was right and proper that the interests of those who were serving and fighting under such exacting conditions in all parts of the world should come first.

INCREASED COST OF QUALITY LEAF

The main reason for the reduction in profit was the considerably increased cost of leaf tobacco and, as the prices of leaf were regulated by the United States Government, the advancement was quite outside their control. In view of the importance they placed on the use of the highest quality leaf, he was pleased to be able to report that they expected in due course to receive shipments of a fine range of high quality leaf of this year's crop, and, while the cost was likely to be slightly higher than previously, they did not anticipate that their leaf costs during 1945 would increase to the same extent as prevailed in the year under review compared with 1943. To a lesser extent there had been increased costs of other materials, as well as carriage, transport, manufacturing wages and miscellaneous items. Under present conditions one could not foresee an appreciable reduction in any one of those items.

Allowing for taxation and after deducting depreciation, directors' fees and superannuation contributions, there was a net profit of £845,988 as compared with £792,279 in the previous year. That, he thought, was a highly satisfactory achievement.

A CONSERVATIVE POLICY

The directors had decided to continue to pursue a conservative policy as being the wisest and most prudent course. It was, therefore, again proposed to pay a final dividend of 17½ per cent. on all classes of Ordinary shares, making 30 per cent. for the year, and to allocate £100,000 to provision for contingencies, bringing that up to £400,000. No further special allocations were deemed necessary this year, and the amount carried forward would therefore be increased from £326,725 to £458,278.

It would be unwise in these uncertain times to give any forecast of the future. He could only say that their well-known brands were in greater public demand than ever and their prestige had never stood higher. So long as they could maintain their production and improve upon it when more labour was made available to them, they had confidence in the future. He trusted that before they met again, they would have achieved "Victory" and that in due time freedom of action in every phase of life would be restored to them.

The report was adopted.

BRAZILIAN WARRANT COMPANY, LIMITED

DISCRIMINATORY TAXATION

The annual general meeting of this company was held in London, on the 29th ultimo, Mr Arthur Whitworth, the chairman presiding.

The following is an extract from the chairman's statement circulated with the report and accounts: The apparent decline in profits is attributable to a special cause which in the opinion of the directors justifies them in repeating the dividend of a year ago. The business of the company for the year under review and of its subsidiaries was, generally speaking, thoroughly satisfactory, and those conditions have on the whole subsisted during the current year. A marked change has, however, come over the coffee operations of your subsidiary, E. Johnston and Company, Limited, whose merchant activities in coffee have been considerably curtailed due to the ceiling prices fixed by the USA, which have had the inevitable but gradual effect of encouraging producers to increase their prices so that the margins available for the merchant have been eliminated.

The Brazilian authorities have to some extent met this position by allowing a bonus of 10 per cent to producers on sales of the 1944-45 crop, which is given in the form of a certificate which can be converted into cash by the shipper on export of the coffee to which the certificate relates. The National Coffee Department are also releasing coffee to meet the quota allotments of merchants exporting to the USA.

COFFEE PRICES

The damage done to the coffee crops by frost and drought in 1942 and 1943 has been accentuated this year by an almost unprecedented drought which has lasted for six months and over, and the results on the production of coffee in the States of Sao Paulo, Rio and Paraná are estimated to amount to a reduction of as much as 4½ million bags on the average production of the three previous crop years, with a further reduction of one million bags on the 1945-46 crop. Prices of coffee are therefore likely to remain high, and high prices are indeed necessary both for producers and merchants to compensate them for the increased expenses of production and for the increased cost of living. Our most recent advices received at the end of November show that the cost of living continues to rise, the Chamber of Commerce index being 206 compared with 179 in November, 1943, and 100 at the outbreak of the war. We are compelled to meet this position in the remuneration paid to our large staff. I confess to a feeling of great satisfaction that the profits earned seem to be as resilient as they are to these unavoidable charges, particularly when superimposed upon them is the ordinary Brazilian income-tax of 8 per cent. on profits, a supplementary income-tax of 8 per cent. in 1943, now increased to 10 per cent. on profits credited to residents abroad, with an additional 5 per cent. paid when those profits are remitted.

While the Brazilian Government are giving expression to a keen desire for foreign capital and for British capital to assist them in developing their vast resources, it would indeed be an encouragement if these discriminatory taxes on the rewards of such capital were eliminated so that taxation of profits, whether earned from Brazilian or foreign capital, were put on a uniform basis.

We hear a great deal in these days of Anglo-American and Anglo-Brazilian friendship, but friendship taxed in these ways is apt to wear thin. So one-sided is this taxation that I would suggest to the Chancellor of the Exchequer that he need not fear serious international complications if he applied the old proverb, "What is sauce for the goose is sauce for the gander."

The report was adopted.

CHARTERHOUSE INVESTMENT TRUST, LIMITED

INCREASED DIVIDEND

DEVELOPMENT COMPANY'S POSITION AND OUTLOOK

The annual general meeting of the Charterhouse Investment Trust, Limited, was held, on the 28th ultimo, at Winchester House, Old Broad Street, London, E.C.

Capt. H. Nutcombe Hume, M.C., vice-chairman and managing director, presided. The following is an extract from the chairman's statement, which was circulated with the report:—

The directors are glad to be able to lay before stockholders improved trading results for the year just ended.

The increased dividend is rendered possible by the more profitable operations of the Charterhouse Finance Corporation, Limited, which has been able to make a more generous contribution to the trust's profits this year, despite the fact that the control of capital transactions has tended to become more, rather than less, severe as the war moves to its close. Ordinary stockholders will appreciate that the rate of dividend on their holdings is likely to be closely conditioned by the extent of the profitable business which our finance company is allowed to undertake.

FUTURE DEMAND FOR CAPITAL

It seems reasonable to suppose that there will be considerable demand in the not distant future for capital for the re-equipment and development of industry, for the re-establishment of the country's export trade and to preserve a sound standard of life for the people of this country. Equally so, it is reasonable and indeed necessary to have some orderly regulation of capital issues in such conditions. Apart from the Government Departments it may safely be left to such influential institutions as the Bank of England and the London Stock Exchange to see to it that order is maintained and abuses arising from uncontrolled flotations will be eliminated, or at least kept at a minimum. Your group of companies is anxious to use its influence along these lines, but in common with many other well-intentioned financial interests in the country its efforts will largely be nullified if a policy too severely restrictive is pursued by the authorities and if financial freedom is not restored at the earliest possible moment.

THE INDUSTRIAL DEVELOPMENT COMPANY

You will expect to hear that your directors have been giving special attention to the future prospects and activities of Charterhouse Industrial Development Company, Limited, which was formed in 1934 for the purpose of providing for the capital requirements of smaller industrial and commercial undertakings which have not arrived at the stage at which the subscription of public capital could conveniently or properly be invited. Charterhouse Industrial Development Company, Limited—a pioneer in this class of business—can draw upon its ten years' experience and intimate knowledge of this particular type of finance, and it may not be out of place to summarise what that experience has been. The capital of £500,000 is held by this Trust and three powerful outside shareholders. This capital has been receiving dividends of 4 per cent. per annum for the last three years and 3 per cent. per annum in the two previous years, but in the earlier years of the company's history, profits were placed to reserve, for it was recognised that for the sound establishment of a business of this character substantial provision had to be made against possible losses.

It will be seen from the last balance-sheet that the reserve accounts and carry-forward of Industrial Development Company amount together to £97,979. In addition, other reserves of £56,888 have been set up against the investment holdings and

deducted from the cost thereof. These reserves, amounting in total to £154,807, are a considerable source of strength to the company, and while for the time being they may be regarded as free reserves, they are essential to the stability and growing prestige of this undertaking which, in making its investments in developing enterprises, has subscribed in the companies which it is currently financing rather more than 78 per cent. in the form of share capital and under 22 per cent. in the form of loans.

VALUE OF HOLDINGS

The directors believe that stockholders will approve of their decision to set out in the balance-sheet details of the holdings in subsidiary companies and the value at which they stand in the books. Although the current break-up value of the shares in the Monument Property Trust is shown by the balance-sheet of that company to be at least equal to their par value, in view of the fact that no dividends are being paid on either the Preference or Ordinary shares the directors assess their current market value at substantially below that figure. In their opinion, the aggregate value of the investments in subsidiary companies is worth not less than the figure of £981,859 at which they stand in the balance-sheet after deducting the reserve of £200,000, which cannot, therefore, be regarded as a free reserve.

I am reluctant to forecast what is in store for us. I can only say that, given reasonable opportunities to trade, your group of companies should be able to secure its quota of the business offering, particularly when the members of our staff now serving can rejoin the organisation.

The report and accounts were adopted.

S. SMITH AND SONS (ENGLAND), LIMITED

TRIBUTE TO KLG PLUGS

The thirtieth ordinary general meeting of S. Smith and Sons (England), Limited, was held on the 28th ultimo, in London. Mr W. Henderson-Cleland, M.C. (the chairman), said that the net profit for the year amounted to £103,579, practically the same as for the previous year.

He emphasised the important part the

products of S. Smith and Sons (England) had played in the war effort, and in particular quoted from a report of the Society of British Aircraft Constructors giving the history of the progress of the KLG development. In his tribute to the British Sparking Plug, President Roosevelt said: "It has a life from four to five times longer than the standard aeroplane engine spark plug. . . . Since 1943 virtually every US Flying Fortress has taken off from British bases with these plugs in each of its four engines. It would be impossible to estimate how many thousand United States bomber crews may since then have owed their lives to these spark plugs, but the performance record of the plugs speaks for itself."

Three new principles in Sparking Plug design had been developed by KLG, who had received the full co-operation and help from the three great aero engine firms of Rolls, Bristol and Napier, to whom they took the opportunity of tendering thanks. The effect of these improvements had been to treble the lifetime of the sparking plug.

The report and accounts were unanimously adopted and the payment of the following dividends was approved: A final dividend of 10 per cent. (making a total of 17½ per cent. for the period) on the preferred ordinary shares and a dividend equal to 37½ per cent. for the period on the deferred ordinary shares.

ARISTON GOLD MINES (1929), LIMITED

NEW EPT STANDARD

The fourteenth ordinary general meeting of Ariston Gold Mines (1929), Limited, was held, on the 29th ultimo, in London. Mr Francis Allen (the chairman) presided.

The following is an extract from the chairman's statement circulated with the report and accounts for the year ended September 30, 1943:

Tonnage mined during the year was 213,500 compared with 283,400 for the previous year; gold produced realised £578,487 compared with £712,030; mining

costs were £357,814 compared with £421,031.

A NEW ITEM

A new item in the accounts is that of "Gold Coast Mining Industry Concentration Scheme" amounting to £17,563. This is the amount paid or payable by us during the year under review as our contribution towards the care and maintenance of the mines which were closed down under the scheme for the concentration of the West African gold mining industry. Reference was made to this scheme in my review last year, and, as I then stated, we are entitled to set off the amount of our contribution against our liability in respect of United Kingdom taxation.

Members are probably aware that the West African gold mining industry as a whole succeeded in obtaining the maximum permissible addition of 4 per cent for excess profits tax purposes in respect of capital employed in the industry.

The Ariston Company was in a rather special position owing to the conditions prevailing at the mine in pre-war years, but consequent upon the above application the company has obtained a substituted standard for excess profits tax based on the capital actually employed in the pre-war period, and this, coupled with the substantially larger capital employed in the war periods, which carries allowance at the full rate of 12 per cent., results in a total standard for the tax which your directors consider satisfactory.

ORE RESERVES

During the period under review, 213,500 tons of ore of an average grade of 7.28 dwt. were treated at a working cost of 32s. 10d. per ton.

The total ore reserves at September 30, 1943, were 2,628,504 tons of an average value of 6.84 dwt. over a width of 225 in. As expected, they show a decrease as compared with the previous year's figure on account of the great reduction in development, but in the circumstances the decrease, amounting to 140,966 tons, is a modest reduction and gives rise to no anxiety.

The report was adopted.

(Continued from page 23)

prise; but, even were the efficiency of this industry fully proved, such a sweeping induction of the general from one particular would remain unwarrantable. There can be much less quarrel with his plea to the Government to declare and operate a consistent political and economic policy within whose framework private concerns can freely operate.

Electric Kitchen

There are signs that some sections of British industrialists realise the value of putting their products on the market in sufficient quantities to reduce the unit cost, so as to bring them within the means of poorer people. That this is so in the electrical equipment industry is demonstrated by an exhibition opened this week at the London Building Centre of four all-electric kitchens designed to be incorporated into cheap houses and flats. The exhibition has been organised by the British Electrical Development Association, which has also produced a booklet, *Electric Kitchen Plans for Low-cost Post-war Homes*. The layouts suggested do not differ markedly from those shown in the Ministry of Works' demonstration houses at Northolt. Indeed, the measure of agreement on the essentials of a kitchen is a tribute to the research which has been carried out by many bodies on this subject.

EDA's kitchens include cooker, refrigerator, water-heater, space-heater, shadowless lighting, wash-boiler or washing machine, clothes drier, clock, and plug

points for kettle, iron, mixing machine and other accessories. Among the new ideas are the horizontal cooker, with the oven arranged alongside the hob, and the water-heater which will store either a large or smaller quantity of hot water, so saving fuel. Unfortunately, no indication has been given of the probable cost of the kitchens. But it is clear that there is every intention on the part of the electrical equipment producing firms to make such things as refrigerators cheap enough for them to become necessities. The other aspect of cost—running costs—is not the association's problem, but unless electricity can be supplied at lower rates it will continue to be beyond the means of most people in many districts.

Shorter Note

At the adjourned annual meeting of Texas Land and Mortgage Company, it was announced that Mr Denys Lowson and his supporters had, on a poll, obtained 35,081 votes against 26,345 accorded to the o'd board. In these circumstances Mr J. G. Archibald and Mr G. A. Mitchell Junior had stated in their circular that they would resign from the board. In view of the fact that 88 per cent of the available votes, not given to the majority, were cast in their favour and because holders of over one-third of the shares not held by the Lowson group expressly asked them to retain their seats, they had agreed to yield to these suggestions, but without prejudice to their right to alter their decision at any time.

RECORDS and STATISTICS

INDUSTRY AND TRADE

Trade Disputes.—The number of working days lost as a result of trade disputes in November, 1944, was 124,000, compared with 232,000 in October. There were 202 stoppages, compared with 236 in October, involving 44,100 and 62,100 workers respectively. The aggregate number of days lost during the eleven months from January to November, 1944, was 3,648,000, the result of 2,041 stoppages, involving 795,700 workers. The comparable figures for the same period of 1943 were 1,677,000, 1,649 and 528,300.

"The Economist" Sensitive Index.—There was no change in the index during the week ended January 2nd. The complete index (1935=100) was 158.6; crops 135.6; and raw materials 185.5.

"THE ECONOMIST" INDEX OF WHOLESALE PRICES

(1927=100)

	Mar. 31, 1937*	Aug. 30, 1939	Dec. 28, 1943	Dec. 5, 1944	Dec. 19, 1944
Cereals and Meat	93.0	66.9	108.1	107.2	107.9
Other Foods	70.4	61.1	107.3	107.5	107.3

FINANCE AND BANKING

THE MONEY MARKET.—Developments in the money market over the turn of the year and during the present week are discussed in a note on page 19. The Bank return for this week shows some contraction of the structure of credit from the already inflated level reached on Wednesday of last week. Bankers' deposits have fallen by £9,315,000 to £251,358,000. A counterpart to this movement has been the reduction of £4,270,000 in Government securities, representing, in the main, the maturing of bills purchased from the market during the latter part of December. The contraction from the peaks in both items reached over the week-end must have been far greater than the above-mentioned movements. Public deposits show an increase of £11,231,000 to £16,382,000 as a result of the heavy TDR and Treasury bill payments made during the earlier part of the week.

MONEY RATES, LONDON.—The following rates remained unchanged between December 28th and January 4th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, 1%. Discount deposit at call, 1%; at notice, 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between December 28th and January 4th. (Figures in brackets are par of exchange).

United States. \$ (4.86) 4.02½-03½; mail transfers 4.02½-03½. Canada. \$ (4.86) 4.43-47; mail transfers 4.43-47. Switzerland. Francs (25.22) 17.30-40. French Empire. Francs 1971-2001. Syria. p. 8.61-85. Sweden. Krona (18.159) T.T. 16.85-95. Dutch West Indies. Florin (12.11) 7.58-62. Portugal. Escudos (110) 99.80-100.20; mail transfers 99.80-100.30. Panama. \$ 0.02-04; mail transfers 4.02-04. Brazil. 82.8456½ (buying); Uruguay. 7.6597 p. (buying).

Fixed Rates for Payment at Bank of England for Clearing Offices. Spain. Pesetas 44.00. Turkey. Piastres 520. Italy. 71.25 lire.

Market Rates.—The following rates remained unchanged between December 28th and January 4th.

Egypt. Piastres (97½) 97½-1. India. Rupee (18d. per rupee) 17½-18½. Belgian Congo. Francs 1764-1. China. National \$3-3½. Iran. Rl. 128-130.

* Special Accounts are in force for Chile, Peru, Bolivia and Paraguay, for which no rate of exchange is quoted in London.

Governments for Europe

IN three liberated countries, the question of a new government is causing misery among the peoples themselves and division and distrust among the Great Allies. The cases are not strictly comparable, for the methods and intentions of Russia in its relations with Poland and Yugoslavia are different from those which appear to have governed the British approach to Greece. In Greece there was in existence, at the time of the liberation, a government which represented all parties and which owed its existence very largely to British initiatives. Since that time, however, the handling of the Greek crisis has led British policy into a situation which it is much less easy to justify. Liberation is evidently not leading so automatically to democratic self-government as the hopes and aspirations of five years have hitherto assumed. Indeed, it may be leading to the installation of governments that will consolidate their own power by suppressing and proscribing their opponents.

The new Polish "Provisional Government" of Lublin is not, as earlier reports suggested, an exact replica of its predecessor, the Committee of Liberation. The personnel has been reshuffled, and only a few members of the Committee are now in the government. The reshuffle has, if anything, increased the unrepresentative character of

Lublin. All those members of the Committee who played some part in pre-war Polish politics have been dropped. With the exception of the Minister of War, General Rola-Zymierski, and the Minister of Agriculture, a former Peasant deputy, the whole Lublin Cabinet has emerged to power from utter obscurity. Conferences of the Peasant, Socialist and Democratic "parties" were held at Lublin simultaneously with the session of the new so-called "parliament." But all those conferences, meetings and solemn gatherings are remarkable for one thing. They all speak with the same voice. Not a trace of dissension and not a shade of political difference between them could be detected. It is this uncanny unanimity, more than anything else, that makes the foreign observer so highly sceptical about the political identity cards produced at Lublin.

This is not to say that the Lublin Committee may not in time become more representative. Its programme of land reform is popular with the peasants, and now that its fulfilment is being emphatically linked with the Oder frontier, the land hungry men are beginning to see vistas of "empty" German farmsteads on the Western frontier. Military policy may prove another buttress. General Rola-Zymierski has spoken of a Polish officer corps, 50,000

strong, who, it is said, are being trained to take a large part in the occupation and policing of Germany. In view of the experience of Alexander I in Congress Poland, where the cadet schools under Russian command became hotbeds of anti-Russian feeling, this policy may ultimately prove to be shortsighted and mistaken, but in the short run it is designed to create bodies of men with vested interests in the Lublin administration, and it may well succeed in its objects.

The difficulty remains, however, that the degree of support it achieves will not alter the Lublin Government's attitude to those who do not support it. As an American correspondent expressed it in a remarkably laudatory despatch from Lublin,

By taking strong and decisive action, the young . . . Polish Provisional Government appears to have averted the danger of civil war . . . there has been a minimum of conversation and a maximum of action.

The regime is totalitarian in character. There is talk of free elections and the will of the people, but in these conditions the terms are almost devoid of meaning.

The situation in Yugoslavia is more confused. There have been in the past lively hopes that a broad administration under Marshal Tito might steer the country through the difficult period of liberation. It is true that the situation in Serbia has at no time been satisfactory. No Serb politicians of genuine distinction ever joined the National Liberation Movement, and large sections among Mikhalovitch's followers have neither collaborated with the Germans nor accepted Marshal Tito's leadership. Yet Yugoslavia without Serbia is very near to *Hamlet* without the Prince. Recently, too, other misgivings have been raised. The agreement of November 1st between Marshal Tito and Dr Subasitch, the Prime Minister of the Yugoslav Government in London, allows for the establishment of a Regency and arranges the establishment of a Government and the holding of elections. But difficulties in the way of a full acceptance of the agreement have arisen among the Yugoslavs in London, some of whom claim that it leaves no opening for free elections or indeed for the existence of any other party save that of Marshal Tito and the groups supporting him.

The provenance of these reports is suspect, and the criticisms and manoeuvres of the London cliques could be dismissed, were it not for one troublesome fact. Marshal Tito's Committee, like Lublin, is completely unanimous. The Government, its officials, soldiers, assemblies, and spokesmen all say the same things and paint the same picture. To see how far removed this ventriloquial democracy is from anything resembling freedom, one need only compare it with the position in France and Italy. The only regime to produce complete and constant unanimity is a totalitarian regime, and its method is always the same—"a minimum of conversation and a maximum of action."

In Greece, the policy stated by the British Government has been entirely sound—to achieve an interim administration of national unity to act as a trustee for full and fair elections. Even after the outbreak of fighting, the objectives of British policy, clearly stated by the Foreign Secretary in the House of Commons on December 20th, remained unexceptionable—to avoid reprisals once the fighting was over and

to maintain law and order and establish a Greek Government broadly representative of all opinion in Greece, including EAM, and to enable that Government to establish its authority throughout the country.

Hopes were high when Mr Churchill and Mr Eden flew to Athens and grew brighter still when it was announced that a Regency under Archbishop Damaskinos had been set up and that M. Papandreou had resigned. It was widely assumed that a new Government including EAM would take his place.

In the last week, however, events have pursued a confused and contradictory course. At first, it seemed as though General Plastiras were steering straight for prolonged civil war. There was talk of arresting the EAM leaders, and it was disconcerting that General Scobie should have withdrawn his terms for an armistice almost

simultaneously with the ELAS retreat from Athens. On the surface, events appeared to be drifting towards a situation in which the civil war, with British troops or at least British arms on one side only, would spread from Athens to the whole of Greece. Since then, however, General Plastiras has made a much more conciliatory statement, disavowing any intention of starting a prescription and promising reform of the police under British guidance. General Scobie may have decided that a show of firmness is the quickest way of getting an agreement. And he may well be right—the latest news is that EAM has split and that negotiations for a truce are once again under way. Perhaps it is still not too late to achieve a reconciliation which will last for more than a few weeks and open the way to genuine pacification in Greece.

The objective which the British have set but so far failed to achieve in Greece is the objective to be set in every liberated country, Poland and Yugoslavia included. When the three Allied leaders meet to discuss this problem—among the other great problems of the alliance—they cannot plead that they do not know the right method. Nor can they shuffle off responsibility, if they evade it. The aim is quite simply a Government which does not virtually suppress its opponents as the preliminary to an election. Events suggest that the local leaders on the Right and on the Left cannot be trusted to refrain from exploiting the possession of power. It is thus no solution of the problem to choose a faction and back it, as the Russians do in Poland and Yugoslavia, and as the British are in some danger of doing in Greece. Equally it is no solution for the British or the Americans to express their opposition to Russian policy by encouraging the Polish and Yugoslav Governments in London to adopt extreme anti-Russian attitudes. The point is that the backing of one or other side in liberated countries offers no way out from the vicious circle of repression and counter-repression. Nor will it heal the widening breach between the Great Allies.

What, then, can be done? It is not difficult to suggest a theoretical solution of the problem. The British efforts in Greece would suggest that the best method would be for the Great Powers to call, in each liberated country, a conference of all the parties, whose task would be to set up a provisional administration. This Government would be assisted by a Commission of the three (or four) Great Powers, who would ensure the freedom of the elections. Mr Churchill's speeches have hinted at such a solution for Greece, and there is no reason of principle why it should not be applicable to Poland and Yugoslavia as well. But a plan of this sort would be absolutely dependent at every stage on the active goodwill of the Powers. The conference could be wrecked if the Powers did not use all their influence to restrain the local extremists. Without the sincere goodwill of the occupying Power (and there can, in practice, only be one) the tripartite commission could be turned into a farce, a handful of isolated officers from two of the Powers rubber-stamping the actions of the third.

Thus the issue comes back, as all the issues of the peace—Dumbarton Oaks, Bretton Woods, food, relief—come back, to the intentions of the Powers. There can be no agreements and no solutions unless the Big Three are willing both to seek them and to implement them when they are found. Is there any real prospect of willingness in Moscow to meet other countries halfway, to accept any agreement short of passive acceptance of Russian desires? There is an infinity of goodwill in America for methods of freedom and co-operation; but is President Roosevelt's renewed promise of commitment to detailed policy going to secure the counter signature of Congress? If the test is a combination of goodwill in arriving at policies and willingness to assume burdens in implementing them, the intentions of the British Government pass it fairly well. But is the practical application likely to be more effective than it has been in Greece and in Italy? Only the Big Three can dispel these doubts. They will have the opportunity at their forthcoming conference. The precedent of Teheran is not hopeful. But is there any other hope?

Peacetime Mutual Aid

IN the early days of the war, trade between the United States and this country was on a "cash and carry" basis; Britain had to pay in gold or dollars and fetch the goods itself. Then came President Roosevelt's master-stroke of Lend-Lease, an arrangement, one-sided in the first place, under which the "cash nexus" was suspended and even the peacetime principle of mutuality abolished: America gave and Britain took. Out of Lend-Lease developed "Mutual Aid," a two-sided arrangement under which the cash nexus still remained in abeyance, either side contributing to the common purpose as best it could.

The exigencies of war enforced this development. Finance abdicated from its governing position in international economic relations, not only in the sense that goods and services were mutually transferred without settlement being made in money, but even to the extent that money ceased to function (internationally) as an accounting and recording device to ensure that every party received full compensation for what it contributed to the common pool.

It is obvious that the community of economic purpose between the sovereign states of the world is hardly as powerful in peacetime as during war. Does that mean that the conception of mutual aid must be totally abandoned as soon as the guns cease firing and that a complete return must be made to the "cash nexus" of pre-war days? The exigencies of peace and reconstruction are hardly less exacting than those of war, and the principle of "cash and carry" will be found as much of a handicap in getting goods to where they are wanted as it was found to be in war. Shall we have to go through the whole tortuous process again, starting with "cash and carry," advancing to "Lend-Lease" in the form of *ad hoc* credit arrangements, and finally, after costly and heart-breaking delays, arriving at new methods which incorporate at least something of the spirit of Mutual Aid?

It is extraordinary what reluctance is encountered as soon as the suggestion is made that some of the lessons of international trading methods during the war might be applied in peacetime. In questions of internal economic policy some progress of thought has been achieved in recent years in emancipating economic policy from the straitjacket of excessively rigid financial doctrines. In the field of international economics, however, the old outlook is still predominant; and the discussion of practical problems is still impeded by the ballast of assumptions long proved wrong and of an utterly misleading terminology.

"Exchange control," for example, is still unquestioningly assumed to imply "restriction"—no matter how

clearly it may be shown that the restrictive element does not rest in the control but in the scarcity of foreign currencies or gold. The "blocking" of currencies is still looked upon as an evil device for the purposes of fraud or power politics—even though it should be clear for anyone with eyes to see that the fault, dear Brutus, is not in the intentions of the "blockers" but in their inability to do anything else.

If one thing is certain, it is that the reconstruction of the war-devastated Continent cannot be accomplished without outside aid. But what is "aid"? How can anyone—Britain, America, Russia, or any other country—give aid and assistance to the impoverished?

There are two methods: Charity and Co-operation. There is charity in all its forms: delivering foodstuffs, textiles, raw materials, or machinery by way of a grant-in-aid, without asking for any *quid pro quo*, and in that more sophisticated form, the granting of long-term loans without reasonable hope of ultimate repayment.

And there is also Co-operation, a much more potent and lasting form of assistance: mutual aid by reciprocal endeavours to expand mutually advantageous trade. The difference between these two methods is profound and has a parallel in internal economic policy. An unemployed man may be given a dole or a job. His existence may be safeguarded by charity or by the co-operative effort of re-absorbing him into the mutually advantageous process of exchange. Charity means giving without return. Co-operation pays for itself. But to give jobs rather than doles involves breaking some old-established rules: it certainly requires some degree of Government intervention and it probably requires a budget deficit.

To render assistance to other countries through co-operation rather than through charity, equally, demands new methods—methods carried to extreme length in the war-time "Mutual Aid" agreement, but, even in their mildest forms of peacetime application still decried as disreputable and illegitimate.

Take the case of Britain's future trade with Belgium. It is a welcome fact that some new ground, at least, has been broken by the Anglo-Belgian Clearing Agreement. Under this agreement, Britain and Belgium grant each other an "overdraft facility" amounting to £5,000,000. This means that the British Government will pay anything up to £5,000,000 to British exporters, if British exports to Belgium exceed Belgian exports to Britain. Conversely, any excess of Belgian exports to Britain over

British exports to Belgium, up to a maximum of £5,000,000, will be financed by the Belgian Government—a useful scheme, which might be described as a miniature Keynes Plan. And yet, an all too limited scheme.

What if Belgian purchases from Britain should tend to exceed British purchases from Belgium by more than £5,000,000? Any such excess would have to be covered by payment in gold. Now, what is wrong with the scheme is not that the overdraft facilities are limited to £5,000,000. A bigger facility might have been better, but that is not the point. What is wrong is that no constructive, no expansionist method for keeping within such a limit is offered.

What might have been provided is that as soon as (say) Belgium approached the limit of its overdraft facility the British and Belgian Governments would get together and study ways and means by which British purchases from Belgium (or the Belgian Congo) might be expanded. Any expansion of British purchases (which is the same as an expansion of Belgian exports to Britain) would automatically reduce Belgium's debit balance and thus enable Belgium to continue buying from Britain (and the sterling area).

Such a provision would have transformed the Anglo-Belgian clearing into something like a Mutual Aid mechanism and would have opened the road for constructive and expansionist economic collaboration between this country and Belgium. But—it would carry the odium of "discrimination" as at present defined. For Britain could increase its purchases from Belgium only by making what are so misleadingly called special "concessions" to Belgium—exempting certain Belgian goods from tariffs; directing bulk purchases to Belgian goods; giving import permits for certain categories of Belgian goods, while withholding import permits for the same categories of goods of another provenance. And that would be "discrimination." And "discrimination" is a "restrictive device." What is the result?

The result is that as soon as Belgium's purchases threaten to exceed its sales to Britain by more than £5,000,000 the Belgians, rather than lose some of their limited gold reserves, will apply their import controls so as to curtail their purchases from Britain. And what *might* have been the result? The result might have been that as soon as Belgian purchases threatened to exhaust the overdraft facility granted under the clearing, Britain would have increased its purchases in Belgium. In short, for the sake of avoiding "restrictive devices" and "discriminatory methods," equilibrium in Anglo-Belgian trade will be restored, whenever necessary, through the limitation of the purchases of the deficit country, rather than through the planned expansion of the purchases of the surplus country. A restrictionist mechanism has been provided in the place of an expansionist one, for the sake of avoiding "restrictive devices" and as an offering on the altar of the god of "non-discrimination."

The case of Belgium has been taken only as an example. The same basic question will recur with each one of the liberated countries of Europe. If payment for any net balance of trade due to Britain is asked for wholly or largely in gold and dollars, then trade will be closely restricted. If Britain will accept payment in blocked currencies, and take such steps as are practicable to liquidate the blocked accounts by importing European goods, a steadily rising trade should be possible. But that would involve "discrimination." The virtues of unfettered multilateral trade are manifold and familiar. As a generalised proposition, Great Britain cannot dispense with them. But as a specific and temporary proposition, the choice seems to lie between a promising volume of trade financed by unorthodox methods which involve "discriminatory" devices for stimulating an increase, and a very much smaller volume financed through the cash nexus by strictly "non-discriminating" methods. Nor need the unorthodox methods be strictly bilateral. Sterling is in any case available for purchases throughout the whole sterling area, and even beyond this, it should not be difficult to evolve a multilateral system of countries pledged to balance their trade by expansion.

What is the reason behind the reluctance to employ new methods in international trade? Has there ever been any time when Britain could less afford to lose not only such export business as is offering but, what is more, the goodwill of its impoverished neighbours? It must be feared that the reason lies in an unreasoning acceptance of the doctrine of "non-discrimination."

Would not the conclusion of an agreement by, say, Britain and France to balance their trade by expansion lead to some "artificial diversion" of orders away from third parties—specifically from American exporters who would otherwise have supplied these markets? Would it not be an act of hostility, nothing less than the opening shot in an Anglo-American economic war? Such may be the thoughts underlying the hesitation to develop the principles of constructive economic co-operation with Europe. If so they are sadly erroneous thoughts.

That such an arrangement would divert orders from America to Britain is an optical illusion. Those who still believe that the sum total of international trade is a fixed quantum may be deceived by it. But those who have understood that there is nothing fixed in the total of international trade, that expansionism can be international as well as domestic, that two nations can gain without third parties losing anything at all, will not be misled.

The fact of the matter is that America's total exports are not likely to be affected by the volume of trade that passes between Britain and France, or between any other countries. What sets a limit to American exports is the amount of dollars supplied by America to the rest of the world. Dollars are supplied mainly by two processes: by America paying for imports and by America making loans. In any measurable future the world will spend every dollar it can get; it will be the amount of dollars supplied by the United States, rather than unwillingness to buy American goods, that will set a limit to American exports.

The effect of special "mutual aid" arrangements between non-American countries, in other words, cannot possibly redound to the disadvantage of American exports. It can only expand the sum total of world trade, with incalculable benefits to all. Such arrangements, therefore, are a positive and constructive contribution to the problem of rebuilding not only individual countries but the world economy as a whole.

This does not mean that there are no bad forms of discrimination. But there is, or should be, a clear distinction between discrimination which, without increasing the sum total of world trade, merely transfers markets from one supplier to another, and discrimination which creates new trade between the principals without injuring third parties. If the same name and the same condemnation are applied equally to both, then the doctrine of "non-discrimination" becomes one of the greatest barriers to trade expansion that exist—indeed, in present practical circumstances, perhaps the greatest barrier of all. The discrimination condemned by the Atlantic Charter must presumably be of the first kind only, since if the condemnation were extended to the second, it would be inconsistent with the Charter's objectives of securing ample employment and rising standards of life.

To draw a distinction in practice corresponding to the difference in definition is a much more difficult problem. But it should not be insoluble. A method of doing so can be suggested by still another analogy with domestic economics. The basic economic test of any proposed course of action is to ask the question: will it increase national income? Similarly in international affairs, the test should be: will it increase world income? If no, then it is harmful discrimination; if yes, then it is beneficial mutual aid. In pre-war days the practical elaboration of this principle would have been a task to be entrusted to the technicians of the League of Nations. Perhaps the new Social and Economic Council to be set up under the Dumbarton Oaks plan will be equally well equipped for the purpose. An international economic body without a policy for international expansion, would be as dangerous an anachronism as a national government without a policy for full employment.

Wages Councils

MR BEVIN'S Wages Councils Bill, which comes up for its second reading next week, is one of the most important pieces of labour legislation ever laid before Parliament. Its effects, which will be felt by some 15½ million workers, will be more far-reaching even than the Trade Boards Acts of 1909 and 1918, of which it is the successor and logical fulfilment. If it were the last measure to be enacted by the present administration, the Bill would be a fitting swan-song, for in spite of stresses and strains, the wartime Coalition has achieved real progress in the standards of labour. As Minister of Labour, Mr Bevin has certainly had a remarkably free hand, and he has been able to extend the benefits and responsibilities of collective bargaining to a large number of workers in trades and industries, hitherto badly paid and unorganised. While public attention fastened on the Catering Act, other and less spectacular measures have been taken to improve the wages and conditions of nurses, dockers, seamen, fishermen and farm-workers, and to develop health and welfare in industry generally. And now there is this Bill, which seeks to incorporate many of the wartime advances in permanent legislation.

The first two parts of the Bill are straightforward, and deal with the composition and functions of Wages Councils. Wages Councils will be set up by the Minister of Labour on the application of a Joint Industrial Council, or on the joint representations of employers' and trade union organisations, or on the initiative of the Minister himself, where he is satisfied that there is no adequate voluntary machinery for the fixing of wages and conditions. Applications will be referred to a Commission of Enquiry, composed of three independent members and two representatives each of employers and workers; the Commission will be a purely *ad hoc* body, thus differing from the standing Catering Wages Commission.

Wages Councils will be constituted on the same lines as existing Trade Boards, which they are to replace, but they will have wider powers. They will deal with "workers" rather than with a particular "trade"; they can fix "remuneration," including the guaranteed working week, instead of "minimum rates"; they can provide for paid holidays of more than one week (under the Holidays with Pay Act the period is limited to one week) and they can make recommendations on any matter affecting the welfare and conditions of the workers. Their extended powers are in line with later legislation, such as the Road Haulage Wages Act, 1938, and the Catering Wages Act, 1943.

This machinery and procedure may sound rather more elaborate than it will be in practice. Trade Boards have been working smoothly along these lines for the last thirty years, and even the Catering Wages Board, originally so fiercely opposed, has come into operation quite smoothly. There is no reason to fear that the Wages Councils Bill will create a new form of bureaucracy. The only difficulty may be in finding enough "independent" members. People who are qualified and able to serve on Trade Boards, Royal Commissions and Government Committees are limited in number and in consequence liable to be overworked.

There are at present 52 Trade Boards in this country, and the great majority were formed in the early 1920s. They cater for about 1,500,000 workers and cover a variety of occupations, most of which were originally the "home work" trades which lent themselves to sweating. The minima prescribed vary considerably—the women's weekly minimum is 39s. 8d. in retail dressmaking and 41s. in wholesale clothing; in furniture manufacture, the man's rate is 70s. 6d., the woman's 43s. 1d.; in tin box manufacture it is 78s. for a man and 50s. for a woman. The Bill means that from now on, the Keg and Drum Trade Board, the Pin, Hook and Eye and Snap Fastener Trade Board, the Ostrich and Fancy Feather and Artificial Flower Board, and similar bodies, will be dignified with the title "Wages Council" and correspondingly raised in status. The main other groups of workers whose wages are

regulated by statute are agricultural workers, for whom a minimum weekly rate of 70s. has just been awarded; road haulage workers, whose minima vary according to age, grade and district from 68s. to 97s.; and catering workers, for whom minimum wages are now being prescribed.

An important effect of the Wages Councils Bill should thus be to raise the standards of the lowest-paid and least organised sections of the workers. There are still gaps—domestic service is one and is likely to be the first occupation for which the Minister will use his power to establish a Wages Council without first receiving an application and there are still many anomalies in wage levels, such as the disparity between men's and women's rates and the exploitation of juvenile workers, with which the Bill does not attempt to deal. But Mr Bevin's measure should go a long way in the direction of establishing a national minimum standard, and as such, will command wide support.

The Bill, however, goes a great deal farther than this. It should provide a stimulus to collective bargaining and strengthen voluntary negotiating machinery. The logical consequence of turning Trade Boards into Wages Councils will be the establishment of Joint Industrial Councils in these industries. There are now over 90 Joint Industrial Councils, the most effective ones being in the Civil Service and Local Government, docks, flour milling and public utilities, and, since the war, in retail distribution, which normally covers 2,500,000 workers. Moreover, the whole principle of joint industrial consultation has been encouraged during the war, and Joint Production Committees to a large extent perform the consultative functions which it was originally intended should belong to Joint Industrial Councils.

It is the third part of the Wages Councils Bill that is likely to prove controversial. It continues the provisions of the Conditions of Employment and National Arbitration Order 1940 for a period of five years after the cessation of the Order, but with certain modifications, the chief of which is the substitution of the Industrial Court for the National Arbitration Tribunal. It will not apply to workers whose wages are regulated by statutory machinery, but it will affect over 10 million workers, whose wages are determined by voluntary agreement. Employers will be "obliged to observe terms and conditions of employment not less favourable than the recognised terms and conditions in the trade and industry in the district." In other words, an agreement reached voluntarily between the representatives of the employers and unions in any district, and registered as a *bona fide* agreement, will become legally binding on all employers, whether they are parties to the agreement or no. In the event of any question arising, the matter will be referred to the Industrial Court for settlement, and if the Court is satisfied that the employer is not observing the conditions and is aware of them, its award shall be retrospective. It is not proposed to set up an inspectorate to enforce the observance of agreements, and employers will not be liable to prosecution for non-compliance. But the worker will have the right to civil action and this, it is considered, will provide a sufficient safeguard against any attempt on an employer's part to undermine agreed standards.

This provision should have the effect of encouraging and strengthening the organisation of both sides of industry. Trade unions account for about 8 million workers, or approximately half the numbers affected by the Bill. No comparable figures exist for the number of organised employers; in September 1943 there were 1,900 employers' associations dealing with labour conditions and the British Employers' Confederation covers about 75 per cent of the industrial population, so it may be presumed that a higher proportion of employers than of workers is in fact organised. The strengthening of industrial organisation

on both sides is clearly an advantage and makes for orderly negotiation and arbitration. Whether it is so great an advantage that the state should enforce organisation is a wider question. Difficulties have sometimes arisen in wartime arbitration cases where a union is not recognised by the employer as a negotiating body, and one logical development of the provisions in Part III of the Bill may well be a claim by the unions for legal recognition and protection such as is afforded to American unions under the Wagner Labour Relations Act.

But that is looking ahead, and the Bill raises much more immediate considerations. At the end of the war with Germany there is some risk of the whole superstructure of labour control collapsing. The prohibition of the right to strike, the compulsory reference of disputes to arbitration, direction to work, and the general braking effect of public policy on applications for higher wages, will all disappear. If widespread and damaging disputes are not to result, it will be necessary to cling to such footholds as present themselves. Part III of the Bill should exercise a stabilising influence during the critical post-war transition period. At all costs the Government is determined to avoid a repetition of the chaos that followed the last war and is already preparing the oil to pour over troubled industrial waters.

Any proposal to make collective bargaining binding, even on those who have not participated in it, part of the permanent law of the land would need very careful con-

sideration. But as a purely temporary measure, the Wages Councils Bill, together with the demobilisation scheme and other measures, should assist in securing an orderly and smooth passage to peace. A large responsibility will rest on employers of labour to see that wage agreements are scrupulously observed, for failure to do so would be disastrous for industrial co-operation. But a bargain must be two-sided and it will equally be the responsibility of the workers to honour their side of the agreements. This is implicit in the Bill, and responsibility and respect for agreements is one of the cardinal points of Mr Bevin's philosophy.

Compulsory arbitration, for all its shortcomings, has undoubtedly had a stabilising effect in the war years. But once the sanction of compulsory arbitration has been removed, the workers will have to show respect for voluntary machinery. If any large body of workers follow the example of the Tyneside boilermakers in defying the authority of their union and flouting the ruling of the Industrial Court, the whole structure of voluntary conciliation and arbitration machinery would be in danger of collapsing. Legal enforcement is comparatively easy against recalcitrant employers, but very difficult, even in wartime, against recalcitrant workers. It would be manifestly impossible to maintain a system which in fact operated in one direction only. The five years of the Bill's life will be a valuable opportunity for testing whether the workers of the country can in fact show the responsibility which alone would make such a system workable.

Divided China

THE landing on Luzon, the largest of the Philippine Islands, has begun. Great American forces have already established four bridgeheads, and although tough fighting lies ahead, there can be no doubt that the last phase in the recapture of the Philippines has begun and that the end is in sight.

After the Philippines, Formosa; after Formosa, the coasts of China—this seems to be the obvious line of amphibious advance. It may not be long before American armies begin to land in force on the Chinese mainland. The liberation of the country longest occupied by the enemy will have begun. It would be only prudent to take notice of the experience of Europe in this matter of liberation. The freeing of occupied nations so far has brought with it a number of very delicate political problems. In devising their political strategy for the liberation of China, the Allied leaders would be well advised to see if some of the same problems are not likely to recur.

The chief difficulty is obviously the existence in China, as in other occupied countries, of two rival centres of authority. The Chinese Government at Chungking, recognised by all the Allies, is in direct control of Western China and indirectly, between the lines of Japanese occupation, controls large areas in Central and Southern China. The Communist Administration at Yenan controls the province of Shensi and large indeterminate tracts of territory between the areas of Japanese occupation in the north. This was for some considerable time the rough division of their spheres of authority. In the summer and autumn of 1944, however, the Japanese increased their hold on Southern China, taking Hengyang and Kweilin, and the American bases in Fukien and Kiangsi, from the Chungking Government.

Nominally, the Communists accept General Chiang Kai-shek as the leader of a united China. Nominally, the Chungking Government is carrying on negotiations with Yenan to secure a reconciliation. But in fact the two systems, one based on the supremacy of the Kuomintang (that is, the party led by General Chiang Kai-shek), the other on the Communist party, are rival powers and have been for some years in a state of actual or latent civil war. Such is the static position. Once, however, the liberation of China begins, with Allied landings along the coasts and Allied occupation of such key centres as Canton or Shanghai, the present division of power between the Kuomintang and the Communists will be radically altered.

It is almost impossible to forecast what the new frontiers

of authority will be. Clearly, the situation is likely to be one of the greatest confusion. The Kuomintang at least is likely to suffer a sea change once the more populous and developed areas of China are liberated. In recent years, the regime at Chungking has been forced politically to the Right. The liberal and left-wing groups in the Kuomintang were to be found to a great extent in the large towns—Nanking, Shanghai and Canton. The merchants and middle classes formed the backbone of the progressive bourgeois elements. They were supported by a section of the working classes. The Kuomintang's enforced retreat to Chungking in the primitive agrarian west, the collapse of trade with the outside world, the regime's dependence upon internal economic support—all these factors have led to the strengthening of the landlord and warlord elements in the Kuomintang. When the tide turns and the more developed coastal areas are liberated, a very different and more radical Kuomintang may emerge.

Equally, however, the strength of the Communists may be vastly increased. Since in pre-war China the Kuomintang was strong enough to exclude the Communists from the towns, they have been compelled to concentrate upon agrarian problems. The regime at Yenan is not so much Communist as radical-agrarian. The guerrilla areas, too, are predominantly agricultural. The new radicalism is apparently not doctrinaire. The Communists have concentrated on reform of rents and taxes, not on expropriations. In primitive Shensi and in the country districts of Northern China, they seem to have strong support and claim to control and organise some 90 million people. At least 80 per cent of China's peoples are still engaged in agriculture. The appeal of the Communists' radical land programme may thus be very wide. On the other hand, it is impossible to say how great is the Communists' hold on the populations of the coastal towns. In Europe, the experiences of occupation have turned all active spirits towards radicalism and some active spirits towards Communism. The trends in China may be similar, but there is little evidence available on which to judge the extent to which the left wing elements in the Kuomintang on the one hand and the Communists on the other are profiting by the radical mood of the occupied and oppressed Chinese.

Some facts are known. The main division of authority is between the Kuomintang in the west and most of the south and the Communists in the north. The crucial central area along the Yangtse including the towns of Hankow,

Nanking and Shanghai does not fall clearly into either sphere. The province of Chekiang is a stronghold of the Generalissimo's most immediate supporters, and many of the leading personalities in Chungking come from Shanghai and Nanking. In the hinterland of Shanghai, the Kuomintang leader, Ku Chu-tung, has a considerable force of Kuomintang soldiers at his disposal. On the other hand, there are reports that the Communist Fourth Route Army has been reconstituted and is strong and active to the north of the Yangtse in the neighbourhood of Nanking. An Allied landing, designed first to isolate and then to seize Shanghai, might find itself embarrassingly helped by two Chinese forces, which were nevertheless using every available opportunity to exterminate each other. In the south—the obvious coast for the first Allied landings—the situation is only slightly less confused. The Kuomintang structure is strong in this area, and in Canton it was the Left Wing Kuomintang that proved strong enough after 1927 to crush a powerful Communist movement. But what differences may not the Japanese occupation have brought about? There are small but organised Communist forces in the neighbourhood of Canton and some reports suggest that the Communists are firmly established in the island of Hong Kong. Thus there are chances of local strife and confusion in the south as well as in the centre of China.

Nor does the much publicised split between Kuomintang and Communists exhaust the possibilities of division. The puppet government of the late Wang Ching-wei at Nanking has on occasion shown a certain measure of independence. With or without directions from Nanking, it is very likely that in the event of successful Allied landings large sections of the Chinese puppet forces would abandon the distasteful task of supporting the Japanese invader and come over to the side of China and its allies. But the chances are that if such a movement were to take place, puppet forces would adhere to both sides. In the light of Europe's experience with collaborationists and the purge, it is easy to see that the admixture of puppet forces with either or both sides would put the finishing touches to a situation too involved and inextricable for China's allies to have much hope of solving it.

★

In face of this situation—a potential Greece of the Far East, on a vaster and even more damaging scale—what policy ought the Americans and the British to pursue? China's allies suffer from this grave disadvantage, that foreign intervention is always unpopular, and interference, if pressed too far, may end in nothing but violent dislike for those who have done the interfering. Any moves suggesting pressure or intervention have to be undertaken with the utmost discretion. For instance, General Stilwell, in spite of his admirable qualities of initiative and drive, did not fully master the technique of making his intervention palatable and this was probably the chief reason why he became unacceptable to Chungking. It is therefore with the utmost patience and tact that the Allies must press on both sides in China the need for unity. Both Britain and America have powerful arguments with which to reinforce their pressure. The Kuomintang and the Communists need armaments if they are to take a greater part in the defeat of Japan. They need massive help to build up China's postwar economy. Provided the pressure were distributed equally and both sides were urged to make concessions, the offer of Allied aid might be used to induce the Chinese to close their ranks.

Some would argue that American pressure has already helped in this direction. Since the dramatic recall of General Stilwell in October, 1944, the Chungking Government has undergone a considerable reorganisation. The most notoriously reactionary elements—Dr S. S. Kung, who is held responsible for the chaos and inflation in China's finances, and the brothers Chen Li-fu and Chen Kuo-fu, who controlled the authoritarian party and propaganda organisation of the Kuomintang—have been dismissed from office. General Ho Ing-ching, who as War Minister was accused of a policy of conducting an armed blockade against the Communists and an armed truce with the Japanese, was replaced by a young and popular General, Cheng Chen. Mr T. V. Soong, the well-known

representative of liberal Kuomintang opinion, became acting Prime Minister. Finally, in his New Year broadcast, the Generalissimo confirmed these changes. He forecast a radical reorganisation of the often starved and neglected Chinese armies, he blamed the rich for their failure to support the war effort and forecast the summoning of a people's congress to enact a democratic constitution before the end of the war.

Unhappily, it is by no means certain that these reforms in Chungking, welcome as they are in themselves, are necessarily the forerunners of greater Chinese unity. The criticism which compelled General Chiang Kai-shek to make drastic changes came from within. So great had the confusion and instability become in Chungking's economic and military system that the regime had to change or lose all popular support. Thus the new moves are dictated more by the desire to maintain and reinforce power than by any wish to share power in some new administration with the Communists.

The basic difficulty is that neither party is really ready to admit the possibility of a regime made up of many parties. It is noted that although the Generalissimo has dismissed the brothers Chen from the Cabinet, they still control the party organisation, and that General Ho Ing-ching, the late War Minister, is still General Chiang's Chief of Staff. This does not suggest a really profound change. The Communists have a better record in their dealings with their peasants and guerillas, but they are, if anything, more determined than Chungking to maintain power in their own areas and spread it where they can.

It is difficult under these conditions to see how the Allies can avoid the pitfalls into which Britain and Russia have already fallen in Europe. Nobody will deny that a government of national union, representative of all parties, and controlling the whole country, is the only government with which an outside Power may safely deal. What it is difficult to see is how such a government is to be brought into being.

THE COUNTRY BANKER

'... he kept a pack of hounds and dwelt in patriarchal style among his people—hospitable, freehanded and popular. He might be seen at times seated under the great elm... chatting with his neighbours.'

So, in the last century, the country banker inspired and held confidence: the evidence of his worth was plainly to be seen. The rising tide of industrial development with its demand for a service which few private firms could provide caused the virtual disappearance of the country banker, but on the firm foundation which he had created, the Westminster Bank continued to build, so that it is today able to offer a service which, in its scope and complexity, might be a source of some astonishment to those pioneer bankers of other days.

WESTMINSTER BANK LIMITED

NOTES OF THE WEEK

Power Politics

One of the many services to common sense performed by President Roosevelt's message to Congress of last Saturday (which is more fully discussed on page 47) was to bring a little definition into the phrase "power politics," which is often so loosely used.

In the future world [the President said] the misuse of power, as implied in the term "power politics," must not be a controlling factor in international relations.

The President thus defines "power politics" as the misuse of power, and when it is so defined there cannot, of course, be any dissent from the condemnation of it. But very many of the people who hurl the term about in current controversy use it as a condemnation of any policies that take account of the realities of power. To these people, the proper basis of foreign policy, it would seem, is an assumption that nobody will ever again misbehave and that it will never again be necessary to use force in the cause of right. The President has no sympathy with this heresy.

We cannot deny that power is a factor in world politics any more than we can deny its existence as a factor in national politics. But in a democratic world, as in a democratic nation, power must be linked with responsibility and obliged to defend and justify itself within the framework of the general good.

In the world as it stands to-day, this can only mean that power must be lodged in the hands of those Great Powers who are most firmly attached to the principles of law and justice and freedom. If "the misuse of power" is to cease to be "a controlling factor in international relations" that can only be because greater power is in the hands of those who will not abuse it. Without passing judgment on any other Powers, this certainly includes the United States and the British Commonwealth. If this is so, then any attempt by these nations to establish more firmly the bases of their power—whether it be America in the Caribbean or the Pacific or Britain in the Mediterranean and the Indian Ocean—must surely be to the common good. If "power politics" merely means policies that envisage the eventual use of force, then it may merely be a synonym for common prudence and foresight, the absence of which so lamentably contributed to the collapse of the last peace. But if "power politics" continues to be a term of condemnation, and means, as the President says, "the misuse of power," then it should not be applied to the great majority of policies that are so labelled in current discussion.

France and the Big Three

The French Press is venting its disappointment at the Big Three's failure to invite General de Gaulle to take part in the next conference of the chiefs of the great Allied Powers. The mood is understandable, but the Press has helped to exaggerate it by a certain amount of wild talk in recent weeks. When, for instance, propagandists in Paris declare the military events of the last few weeks to show that "the war cannot be won without a powerful French Army" and when they give this as a reason for the cooptation of General de Gaulle to the conference of the Big Three, they are surely lacking in those two great French virtues—realism and logic. There are better grounds for their case than national prestige and *amour propre*.

The case for French participation in the forthcoming conference is strong, if the conference is to discuss or decide—as it may well do—the settlement with Germany. On these issues the French view cannot be ignored; and it is essential that France should be committed to any settlement on which agreement may be reached. The Russians are likely to favour the French demand for participation, because the French Provisional Government has, to all intents and purposes, accepted the territorial schemes proposed by Russia. It is to be hoped that Great Britain and the United States will take a similar view about French participation and avoid giving the French the impression that, in fighting for readmission into the councils of the Great Powers, they will at each stage find the Russians more helpful than their western Allies.

Yet even if General de Gaulle joins the Big Three, France's responsibility for some issues on the agenda—the conduct of the war, for example—will be relatively limited. The best solution is probably to include General de Gaulle in the discussion of all questions in which French consent and participation are vital. As French recovery proceeds, these points will obviously increase in number and variety.

Last Gap in the Blockade

In the last few days the Swiss have protested strongly against a tightening of the Allied blockade. The Americans demand the cessation of Swiss exports to Germany and of all transit traffic between Germany and Italy. Unless these conditions are fulfilled, Switzerland is to be denied facilities for transit traffic in Allied controlled territory. The Swiss declare that their trade with Germany has, since October last, been confined to cash transactions and that their exports to Germany have been strictly balanced with their imports from Germany.

The figures given in an article on page 50 seem to substantiate this claim. Even so, it is very probable that some of the precision instruments which Germany imports from Switzerland are vital to the German war effort; and the Allies are certainly within their rights when they attempt to stop this last gap in the blockade. Nor can the Swiss expect priority on French transport which does not begin to meet the demands either of the Allied armies or of the French civil authorities.

Yet the Swiss ought not to be made to feel that the Allies' demands are unreasonable or that their geographical position is being used to put pressure on them which the Allies have not used in the case of other neutrals. It is a fact that the cutting off of German coal and iron supplies would inflict a heavy strain on the economy of Switzerland. If the stoppage of Swiss exports to Germany is, nevertheless, important enough to justify the new hardships it will entail, the Swiss ought to be given some compensation in the shape of better facilities for trade with Allied and neutral countries. The record of Switzerland has been better than that of other neutrals; and it would be unjust and absurd to penalise Switzerland at a time when the Spanish economic system, for instance, has been considerably relieved.

World Industrial Committees

When the Governing Body of the International Labour Organisation meets in London on January 25th it will be called upon to decide the form and constitution of the international industrial committees which it is proposed to set up in the world's principal industries. The scheme, which originated from the British Government, was adopted in principle at the Philadelphia Conference, and it is now a question of translating it into practice as rapidly as possible.

Eventually, it is intended to set up committees in mining, iron and steel, engineering, building, textiles, transport, docks and distribution, but a start would probably be made with transport and mining. The committees would perform the same kind of functions for their various industries as the Joint Maritime Commission does for shipping, with the important difference that they would be tripartite and not bipartite. Mr Arthur Deakin, of the Transport Workers' Union, has described them as International Joint Industrial Councils. Most of the pressure for their formation comes from the workers' side, and if the International Textile Workers' interpretation of the proposed world textile committee can be taken as typical, the workers will propose that the committees should discuss not only matters relating to conditions and welfare, but the wider aspects of industrial organisation and policy.

The scheme is clearly a good one and overdue. The committees should strengthen the ILO's machinery, act as useful fact-collecting bodies and assist in the difficult post-war restoration of industry. They should do much to raise standards in the least advanced countries, and thus make a practical contribution towards the social purposes of the

Atlantic Charter. For these reasons, the committees ought to be vested with sufficient authority to ensure that their recommendations are accepted and implemented by the Governments. As always, however, with the ILO, the caveat is necessary that these committees should not be allowed to spread their net too wide, or regard themselves as competent to pronounce on all matters of employment policy.

United States of Africa?

An important question of colonial policy was raised by a motion recently introduced into the Kenya Legislative Council by the leader of the elected members. The motion, which was carried—the official members being precluded from voting—urged the British Government to invite the Prime Minister of the Union of South Africa to arrange a conference to include non-official representatives from Kenya

in order to plan and co-ordinate the development of British territories in southern, central, and eastern Africa.

Once again, therefore, imperial regionalism has come to the fore, and in a part of the British Empire which seems to be specially in need of larger, more co-ordinated, administrative units—in short, of what General Smuts once called tidying-up. There can be no doubt that development in Africa should transcend local frontiers—if possible, international frontiers as well. The question is whether it should be planned under the leadership of the European element in Africa. It is this element that has pressed for tidying-up in the political sphere: in Kenya for closer union between the three East African Dependencies; in Southern Rhodesia for the amalgamation of the two Rhodesias and Nyasaland; and in the Union of South Africa for the incorporation of the three High Commission territories. But, as is made clear in a new Fabian pamphlet,* in every case this tidying-up has been opposed by the Africans concerned because of their fear of the Europeans' native policy. They are not likely to be less afraid of development planned under the leadership of South Africa with Southern Rhodesia and the Europeans of Kenya as active participants.

But it is not enough to deny the right of European Africa to plan the development of the continent. The Colonial Office has firmly withstood the proposals for political changes because they would be contrary to the principle of trusteeship. In the sphere of development and welfare, trusteeship demands that British colonial policy should be much more positive. If it can plan and act on the scale envisaged by the Europeans, they will no longer feel so frustrated. The establishment of a Standing Central African Council for the Rhodesias and Nyasaland, with whose work the leading unofficials of the territories will be associated and in which African interests will be represented, is a big step forward. But machinery is not enough. The purposes for which it is to be used should also be clarified.

Capital Levy in Belgium

The Belgian Parliament will soon discuss M. Gutt's project of the levy on war-time profits and capital accumulation, announced on December 22nd. From the latest meetings of the Catholic and Liberal Parliamentary groups it is clear that the Belgian Government has once again come up against strong opposition, this time from the Right Wing. The proposed levy is to be imposed on all real, and not nominal, capital accumulation that has taken place since 1940. The measure appears somewhat drastic. Increases in the value of capital, amounting to less than fifty thousand francs, will not be taxed. Increases between Frs 50,000 and Frs 500,000 are to be taxed on a progressive scale, under which 70-100 per cent of the real accumulation of capital will be confiscated. The whole of war profits over Frs 500,000 would have to be paid out to the Treasury. The project of the levy is rather complicated. Its execution would demand an enormous amount of detailed valuations and calculations in each case of capital accumulation. The opposition in Parliament suggests that the projects should be amended and split up into two measures: one providing for a progressive tax on capital and the other for the confiscation of all profits gained by former collaborators. The amendment would probably complicate matters even further and create innumerable political loopholes. This time M. Pierlot's Government is assured of the support of the Left which sees in the levy a measure of social justice.

* *Four Colonial Questions*. Fabian Research Series, No. 88. 2s.

It is interesting to note that while politically the Pierlot Administration is considered to be to the Right of the French Provisional Government, its social and economic policy has so far been more radical and "leftish" than that of its neighbour. Politically, the Pierlot Administration runs, of course, the risk of arousing very strong opposition alternately from Right and Left. As M. Gutt stated when he introduced the project of the levy "they (the war profiteers) are afraid of this tax more than of imprisonment, because freedom is given back to people, while taxes are not."

The COS and National Insurance

The Charity Organisation Society has issued a statement of its views on the proposed national insurance scheme. In general, it approves of the scheme, particularly for following the structure of the Beveridge report, and its criticisms are for the most part similar to those already made. For instance, though it appreciates the Government's reasons for rejecting the subsistence principle, it suggests a periodic review of rates of benefit by an independent board. It also urges the Beveridge rate of 8s. a week for children's allowances. It points out that allowances in kind to schoolchildren penalise children not attending school, whether because they are too young or are ill or for any other reason, and in many cases this will be when the children need allowances most. The school meals service should nevertheless be available, but the parents should pay for it out of the children's allowance so that children who have dinners at home are not penalised.

More controversial is the suggestion that unemployment benefit should not necessarily be dependent upon the acceptance of training, and that training should be separated from unemployment, should not be administered by the Ministry of Labour, and should be carried out in selected works rather than in Government centres. Since the COS is in close touch with the chief beneficiaries of a national insurance scheme, this proposal deserves attention. It implies that those who have been unemployed, and may be so again, distrust the Ministry of Labour's training centres because of their past experience of them. There can be no doubt that before the war such training as was carried out savoured far more of occupational therapy than of rehabilitation. The men did not believe that it would get them new jobs—nor did it.

In fact, in this case as in all others, the real problem is the maintenance of employment. If there is a demand for labour, it matters less what machinery is set up for training—though it is difficult to see what other Government Department could be responsible for it if not the Ministry of Labour. But if there is nation-wide unemployment all the training in the world will be useless.

Requisitioned Land

For war purposes numerous assets, in the form of buildings and general improvements, have been created at the public expense on requisitioned land. The Government now propose that these assets should be conserved for the Crown through their continued use by public authorities or their value recovered by realisation sales; and for this purpose a Bill—the Requisitioned Land and War Works Bill—has been introduced. The Bill would confer upon the Crown powers to acquire compulsorily "any land on which Government war work has been done or which has been damaged by Government war use."

These temporary powers are needed to bring order into the complicated situation resulting from measures taken

THE BRITISH LINEN BANK

Incorporated by Royal Charter, 1746

Head Office: 38 St. Andrew Square, Edinburgh

200 BRANCHES IN SCOTLAND

LONDON OFFICES.

City Office: 38, Threadneedle Street, E.C.2.
West End Branch: 198, Piccadilly, W.1.

under the Defence Regulations. They relate to the period of derequisitioning and reinstatement. Powers of acquisition will be exercised where it is clearly in the public interest that the use to which such land or works are put should be determined by the Government; where the cost of restoring requisitioned land is considered excessive; and where effective rehabilitation is unlikely under private ownership.

Compensation for land compulsorily acquired—which may include land adjoining requisitioned land—will be fixed, generally speaking, at a figure which will offset the effects of requisitioning: that is, it will offset any increase or diminution of value arising out of any restriction of activity imposed under emergency powers, any improvement wrought on the land and any damage it has suffered. Where compensation payable under the Compensation (Defence) Act of 1939 is inadequate for the rehabilitation of damaged land an additional payment may be made to the person who incurs the cost.

Private interests will be safeguarded by a War Works Commission. Where the Government seek to recoup as much as possible of the public money expended and where terms of acquisition are contested on financial grounds, the last word rests with the Commission. Where, however, the use of land and works is at stake, final jurisdiction rests with the Minister. Where the compulsory purchase of a private dwelling is proposed, an adverse decision by the Commission is always final.

Far more important than any considerations of their eventual ownership is the question of the conversion of these assets to useful peace-time productive purposes. Requisitioned land that has been improved by the provision of communications and capital equipment can, in most cases, be put to profitable use as soon as derequisitioning becomes possible. It is essential, whether the necessary enterprise is to be private or public, that present uncertainties should be speedily and firmly resolved. The powers sought in the Bill should be conferred without delay.

Persian Oil

The Soviet periodical, "The War and the Working Classes," recently made an interesting contribution to the discussion over oil concessions in Persia. The paper alleges that the Russians had not raised any demands for oil concessions in Persia before British and American oil companies had acquired concessions in northern Persia. In other words, the Russians made no move until their Allies attempted to establish themselves in the area at present occupied by Russia, which until 1921 was Russia's sphere of influence, and from which the Russians withdrew in 1921 on condition that no other foreign concessionaires should be admitted there. The Soviet periodical protests against the allegations made in the British and the American Press that it was the Russians who started the dispute in Persia. It is not easy to answer these allegations. Nor is any conclusive evidence available to show that the Russian version of the events is accurate. But the Russian complaint cannot be lightly dismissed. It would perhaps be useful to make it clear to what extent the activities of the oil companies in the Middle East are subordinated to the needs of inter-Allied co-operation. If the commercial principle of the "open door" is accepted, the oil companies are free to extend their activities to those spheres in northern Persia which the Russians believe to be essential to their security. But in that case the Russians would be within their rights if they asked for reciprocity in southern as well as in northern Persia. If, on the contrary, security spheres are to be respected, then the British and American oil companies would probably be better advised to confine their activities to southern Persia, and to refrain from "invading" the Russo-Persian border territories. Sectional interests ought not to be allowed to interfere with the much wider and more fundamental interests of inter-Allied agreement and co-operation.

Sites for Houses

Opening a London exhibition of designs for post-war timber houses on Monday Lord Woolton made a misleading and a dangerous statement. "There is no housing problem in this country," he said, "other than the problem of the shortage of labour." This is manifestly incorrect. One instance is the shortage of plasterboard for repair work; another is the hold-up in the production of the Portal steel house until the end of the war. Even more important is

the shortage of suitable sites on which to build temporary houses, and this difficulty may limit the contribution of the temporary houses to the whole problem of rehousing. In an area such as London the physical difficulties are obvious. The London County Council are to receive 250 temporary houses a week, for which sites will be acquired by degrees as needed. But the danger that the programme will be held up for lack of suitable sites may become progressively greater.

Although bombed areas are large, many are obviously unsuitable and others will need a great deal of work before they can be used. It is only simple arithmetic to compare the number of people that were housed in a block of flats or a row of three or four-storeyed houses with the number that can be housed in the same space in one-storeyed temporary bungalows. An obvious solution is to erect the temporary houses outside the built-up area, but such a policy is handicapped not only by the multiplicity of local authorities but by the present grave lack of co-ordination between housing, industrial location, transport, and other essential services.

The conclusion must be, first of all, that it is necessary to warn people against the easy optimism—encouraged by statements such as Lord Woolton's—which expects wonders from the temporary stopgaps once the labour has been found to erect them. Secondly, much more emphasis and effort must be put into the permanent programme. To cry down the temporary designs because they are unusual or "sub-standard" is to ignore the urgency of the situation. But, if only because they are so expensive of space, they will have to give way in central areas to permanent houses or permanent blocks of two- or three-storeyed flats, which house more people to the acre.

Spring Offensive in Housing

The first three months of 1945 are going to be a critical period in the housing campaign. In Greater London about 60 per cent of "second-stage" repairs, aiming at making damaged houses tolerably comfortable, have still to be completed. There will be more labour available than at the beginning of the winter campaign, but weather conditions may be bad and men may have to be diverted to first-aid repairs on freshly damaged houses and to the main temporary building programme. To achieve the scheduled target for repairing over 719,000 houses by April 1st will be a close race against time.

The first deliveries of temporary houses will be welcomed wherever they appear. If they are delivered and erected at the promised pace, they may also have the effect of putting a discount on sub-standard alternatives. Only a few of the London allocation of 7,578 three-roomed huts, on the familiar Army pattern of the Nissen type, have so far been used by local authorities. The huts bear no comparison, as regards appearance, accommodation or convenience, with the standard temporary bungalows. They have a life of only two years, which, since local authorities cannot be sure of replacing them with permanent houses at the end of that time, is a distinct disadvantage.

Much the same arguments will apply to the proposed import of American war workers' bungalows. Both are sub-standard, and neither will be taken up with any enthusiasm unless the production of the more suitable home-produced bungalows suffers a bad breakdown. The American huts, indeed, may never arrive. Mr Jacob Crane, deputy-director of the US National Housing Agency, pointed out last week that restrictions on labour, materials and transport in the United States may easily limit the export of houses to Britain. Whatever advantage is taken of either alternative, however, their contribution will be necessarily small in relation to an urgent need.

For the spring offensive in housing, the homeless will now rely on the Government to produce the houses and direct the labour, on the local authorities to find and prepare the sites, on building workers to make the best of a desperate situation and, not least, on the gods to provide the weather.

Help for the Home

The Ministry of Labour recently announced an extension of the home helps scheme. Local authorities already have power, as part of their maternity and child welfare arrangements, to provide domestic help for maternity cases. They will in future have power to provide help for households in the following emergencies: when the housewife is ill; when

a wife is called away to visit her husband in hospital, and where there is no one to look after the children; and when several members of a household are ill at the same time. In addition, help may be provided for the elderly infirm. The helps will be supplied by the Ministry of Labour, which will give the work the highest priority, but they will be employed by the local authority and paid at rates to be settled locally, though the rate established by the Hetherington committee for domestic workers in hospitals and in the school meals service—1s. 2d. an hour—will be recommended as a minimum. The authority will recover the cost from the household where its resources permit, but lack of means will not prevent a household from obtaining help.

Too much should not be looked for in this scheme, which is an emergency wartime measure intended to offset the worst possible hardships arising from full mobilisation—though some of its features might be incorporated into a peacetime service for supplementing the work of health visitors, and might be organised in conjunction with the national insurance offices. But the scheme does not mean—nor ought it to mean—that the local authorities and labour exchanges are setting themselves up as domestic employment agencies. They are not providing maids, nursemaids or chams for families that can afford such luxuries.

Once again, it is a case of a national minimum being found—and a very low minimum indeed—but those who want to rise above it must do so on their own responsibility, and through their own exertions. Where, however, even this limited scheme may break down is in the supply of helps to run it, and if, when demobilisation takes place, those who can afford to pay high wages snap up all the domestic help available, there may not be even the minimum help for the families who really need it.

Tradition and Industrial Design

In an interesting appendix to the report on the rebuilding of the House of Commons, Sir Giles Gilbert Scott had this to say on the subject of modern architectural style:

At present we have no traditional style that is characteristic of our times. Modernism looks as if it might develop into such a style but at present it has no tradition behind it, being the product of a revolution rather than of evolution; it throws over everything and starts from nothing. . . . Whether it will develop a quality in, say, fifty or a hundred years, time alone will show.

These conclusions led the architect to suggest late Gothic as the most suitable style for the new Chamber. In the circumstances this solution of a complicated problem is undoubtedly the right one. But as an example to be copied and applied in all aspects of reconstruction it is both unworthy and dangerous and the more so since British industry is already conditioned mentally to take the line of least resistance in a matter so bewildering, apparently, as industrial design.

Thoroughness is a characteristic of British production, a laudable one with a definite market value, but it is often prized far too much for its own sake. Good, "solid" craftsmanship is futile unless it expresses good ideas. The Albert Memorial, the majority of railway stations and the bric-à-brac of the seaside landlady's mantelpiece are all examples of excellent workmanship, but they are ghastly failures when judged from any other angle.

The considerable opposition that has appeared in Lancashire to the recommendations of the Platt Report (the result of an examination of American textile industries) shows that these facts are not yet fully appreciated in industry. The idea that industrial design is dictated entirely by the consumer is a myth that cannot be exploded too violently. The most successful industrial enterprises of the inter-war years were those offering the public not what it had bought habitually but what the adventurous designer and technician had shown to be possible.

Cotton is typical of many industries in that it has allowed itself to be driven into a corner from which it must supply the needs of numerous small and highly specialised markets. But to accept as permanent either the smallness or the specialisation of these markets is defeatist. Good design is more than a new fashion: it is a reflection of progress in scientific thought and technical production. It is high time that the markets of the world were shown that in these matters Britain is not standing still. In fifty years' time industrial design will, no doubt, have acquired some sort of stability. But it would be disastrous if British industry sat back to wait upon the event and took no part in the necessary experi-

ment and research. Growing pains, after all, are a sign of growth.

The New Primate

Dr Geoffrey Fisher, the Bishop of London, has been chosen as the new Archbishop of Canterbury. His appointment has caused little surprise. Dr Fisher was regarded as first in the field of candidates from the outset, although speculation was concerned for some time with the undoubted qualities of leadership of Dr Bell, the Bishop of Chichester. Dr Fisher is a brilliant scholar, an exceptionally able administrator, and a friendly and genial personality. He has succeeded the late Dr Temple once before, as headmaster of Repton, and thus becomes the second successive "headmaster Primate"—a combination which has already well proved its worth. His skill as an administrator was shown in the way in which he patiently piloted through Parliament in the autumn amendment after amendment to the Town and Country Planning Bill in order to protect the position of churches. Dr Fisher has made sympathetic efforts to secure inter-denominational agreements, and he presides over a committee which formulated a basis for co-operation between Anglicans, Free Churchmen and Roman Catholics. Dr Fisher brings to his new task outstanding ability and wide sympathies. The nation will look eagerly to him for a continuation of the religious and social leadership which marked the short Primacy of his predecessor.

A Rural Survey

Valuable cameos of every aspect of rural life have been painted in a "pilot" survey conducted by the Agricultural Economics Research Institute of Oxford of a small rural backwater lying in the South Midlands. Its population has declined by a quarter in the last half-century, yet only a third of its workers are now engaged in agriculture. Many travel daily to factories near the two market towns just outside the area. Village craftsmen have completely disappeared, leaving only a few blacksmiths who have survived by undertaking machinery repairs. An unenlightened policy has tended either to condemn outright the strong old stone houses or else to leave them unadapted to modern needs, so that bad instances of rural slums remain. New houses have been erected in unsightly blocks in the environs instead of on vacant sites in the village proper, yet accommodation in the villages is short. Public services are the worst deficiency. In a district plentifully endowed with water, only a handful of villages have piped water supplies, and sewerage is still primitive.

Behind this disintegration of rural life lie grave deficiencies of public administration. The parish meetings and parish councils have largely ceased to function. To public apathy is added the public's ineffectiveness in making its voice heard. The extension of water supplies and other services is limited by the unwillingness of many parishes and rural district councillors to increase rates which would fall heaviest on themselves.

The basic difficulty in such areas, although the survey only touches on it, is lack of finance. Local rates cannot provide urgently needed public services and housing. It is true, too, that there is unjustifiable opposition to increasing them. Government subsidies are inadequate for more than a piecemeal approach to the problem. Yet this piecemeal approach—laying on water to a hamlet here and erecting a few houses there—greatly increases the final cost and retards progress. Electricity, although it is unsubsidised, is a good example of this process. If all houses in an area could be connected in one operation the cost could be enormously reduced.

Durham

The danger of attracting industry to unsuitable areas is pointed out in a plan prepared for the City of Durham by Mr Thomas Sharp. Durham is an ancient and beautiful city, whose life has long been focused, both architecturally and commercially, on its cathedral and university. It is no more than common sense to say, as the plan does, that the character of such a city should not be transformed without very good reason. The reason which led the city council to support the proposal for a large electric generating station with high chimneys and cooling towers at Durham was the need to provide local employment, and the same reason has led local interests to press for the

city's industrial expansion. But Mr Sharp rightly points out that, even on the commercial level, to destroy or tarnish the city's beauty by converting it into primarily an industrial town would be to lose eventually much of the employment associated with its present important position. For Durham performs the manifold functions of a cultural, ecclesiastical, educational, tourist, administrative, agricultural and market centre.

The plan does not, however, wish to discourage new industry of a medium-heavy or light character, so long as it is confined to a suitably placed factory estate. The real unemployment problem does not lie in Durham itself, whose population it is proposed to limit to 25,000, but in the depressed industrial area of which it is the centre. But prosperity cannot be brought back to this area by industrialising Durham. On the contrary, Durham's own function should surely be to act as a fine and worthy centre for the once more prosperous county which it is hoped to create. This cannot, of course, be done simply by "preserving" the city, fine as it is. Some of its picturesque streets contain bad or overcrowded houses—one type of medievalism for which Durham should have no further use.

Shorter Notes

The Minister of Education announced last week that three of the emergency colleges for the intensive training of teachers would probably be opened in April; and that more than a thousand applications had already been received from men and women anxious to enrol under the new training schemes. This is an encouraging start to a programme that will inevitably prove long and difficult. At the moment education is hampered by acute shortages on every side. The next great problem will probably be to find enough good teachers to teach the intending teachers.

There have been many greater holocausts in London since the Crystal Palace was destroyed by fire in 1936, and visions of general reconstruction have put the boldest dreams of a restored palace somewhat in the shade. But London is not and is unlikely to be so well endowed with

people's palaces that she can afford to neglect an opportunity to create "the healthiest and happiest building that had ever been constructed." It is good news, therefore, that the design of the new building is to be made the subject of open competition. The Crystal Palace, from its Great Exhibition of 1851 to its fiery doom, played an important part in promoting overseas trade. The new building can be even more useful in this respect. It can also provide London with a community centre *par excellence*—a centre combining the functions and attractions of Coney Island and CEMA.

All but the last returns in the Egyptian elections have been received with the hardly surprising result that the Saadists, the Government's party, and the groups supporting them, have a clear majority. The Wafd, which achieved an even more sweeping victory when, in 1942, a Wafd Government conducted the elections, has not even competed in the election—a procedure followed by the Saadists in 1942. The decision is logical. No opposition has ever won an election in Egypt and probably never will. The Government "makes" the elections and the real factor behind the changing balance of power is the King, not the electorate. The elections of 1945 are indistinguishable from the elections of 1942—save for one grave point. The Saadist Party, unlike the Wafd, have a poor record in their relations with Great Britain, and a number of delicate political and economic questions will be ripe for discussion in the next months.

The isolation of Argentina has been underlined this week by the unanimous decision of the governing board of the pan-American Union to defer any decision on the Argentine Government's request for a plenary conference to discuss the Argentine position. The Argentine reply has taken the form of "You can't fire me, I quit." The Government has announced its intention of taking no further part in Pan-American discussions, although it has not formally withdrawn from the body. Meanwhile, the American republics collaborating in the war effort—in other words—all republics except Argentina—are to meet next month.

Letters to the Editor

Farming Efficiency

SIR,—As one intimately connected with farming on a large scale both here and abroad, may I be permitted to comment on your article. The main argument as I take it might be summarised in the following syllogism.

The principal cause of the inefficiency of English agriculture is its lack of capital.

But the public purchase of land is the only fully adequate way of providing this capital.

Therefore, some form of public ownership of land is necessary to remedy its inefficiency.

Now, while one might concede a "transeat" to the major premise, I feel sure that no business man would pass that minor. If English agriculture was a good business proposition the necessary capital would flow to it automatically. In this respect it is the same as any other business, and there is nothing inherent in or peculiar to its nature that would suggest its being an exception to the general rule.

I have yet to meet the really successful farmer whose business is suffering from a dearth of capital, or who has at any time found difficulty in securing more when in need of it. The bad or indifferent farmers do experience real difficulty, but then so do the bad business men. Would any sane man have it otherwise? Good farmers, and they are not unknown in England to-day, despite war-time controls and interference, are successful not because they happen to have ample capital, but because their method of farming is sound. And the converse is equally true. Surely, it would be as great a disservice to the community to tie up the country's capital in a failing industry as it would be to

deny the consuming public the advantage of cheaper food-stuffs from abroad. Both are equally uneconomic.

No one can deny that abundant capital and other measures suggested in your article would be an assistance to agriculture, but before they can be justified it must be shown conclusively that they are means to a cure, and not just ways of alleviating its sufferings. Agriculture will continue to be an ailing industry until we remedy the root causes of its troubles, and these are principally bad practice and bad methods. It can only become prosperous when we have adopted a sound system of farming adapted to the changed conditions of our times; and while this remains at fault other expedients offer small prospect of effecting any definite improvement.—I am, yours faithfully,

Stonyhurst College

F. N. VAVASOUR

[The Economist's suggestion was that the state should provide capital only for land which was first publicly purchased. This would ensure that the provision of new capital was, in fact, accompanied by the elimination of inefficient methods and by the adoption of an appropriate system of farming.—EDITOR.]

SIR,—I have read your article with interest, but with misgiving. I think my criticism must come under two heads. First, much of what you say is true, but it is when you come to put into practice such ideas that you find your difficulties, and all the nationalisation in the world will not help you. For instance, this land is the best sheep land a man can desire. But can you get me a shepherd? Farm workers will not have Sunday work if they can avoid it; so no one takes up shepherding as a profession. With stock Sunday work is unavoidable.

I sell accredited milk, and would like to sell T.T. But can you get me a herdsman? I want a good plough on the lines of the Belgian-made Melotte, but can you get me one? The English makers won't bother themselves to look into the matter, with the result that before the war it was the most popular plough in this district, and deservedly so. If agri-

culture has to put its house in order to please the town, must not the town put their own house in order as well?

Secondly, there is no reasonable chance of promotion for a good agricultural worker. It is a dead-end profession, and the tendency is to eliminate every rung of the ladder except the top and the bottom. I have had good men with me for years, but they have no chance of saving a bit of money and so starting on their own. Interest must be restored to the worker, or the industry will starve for lack of labour, and not of capital.

The real truth is that the matter goes far deeper than you imagine. Large fields, water supply to each, electric power, modern cottages, milking machines—I have done all this and yet I know none really meets the case. The real fact is that the nation has become commercially minded, and it has lost all interest in agriculture. It is a phase through which all civilisations pass, and it leads to disaster. The surer you make life in the town, the more regular the employment, the softer and more glamorous the life, the less will men wish to endure the physical toil of the fields. My tractor driver, a good, hardworking, industrious man, was asked by one of my land girls what he thought about as he sat all day long on his tractor. He replied, "I looks at the bloody earth and I says blast it."—Yours faithfully,

Lichfield

R. A. DYOTT

Provisional Hungarian Government

SIR,—In your December 30th issue you describe the Provisional Hungarian Government formed in Debreczen as "a queer coalition of the local Darlans and the parties of the Left." Do you refer as "Darlan" to General Béla Miklós, a highly respected Hungarian soldier who dared express anti-German views even at the time of Munich? Or to General Vörös, who escaped from a Nazi prison to go over to the Russians and on Horthy's instructions called on the Hungarian Army to join the Red Army and fight the Germans? Or do you reserve this epithet for Count Géza Teleki, only son of the late Count Paul Teleki, who preferred death to condoning the march of the German Army through Hungary in April 1941, and is regarded as

a martyr by Hungarians of all parties? His son, a scientist of note, represents what is best in Hungary's conservative elements.

The Economist betrays lack of information of the real forces operating inside Hungary when it ignores: (1) the deep-rooted constitutional sense of the Hungarian people, who would never respect a government unless it had legal status. The Miklós Government was appointed by the Præsidium of the Provisional National Assembly, temporary repository of Hungary's national sovereignty. Apparently The Economist is also unaware of (2) the long tradition of communal elections in Hungary. In the Russian-liberated parts these were recently held by secret ballot and were a great success. Characteristically they did not return advocates of wild solutions, but men who represent the real wishes of the Hungarian people.

In Hungary, the Soviet Military Authorities have made good Mr Molotov's promise that Russia would not interfere with the internal structure of the countries under her control.—Yours faithfully,

JUDITH LISTOWEL

[The Economist did refer to General Béla Miklós, the Premier of the Hungarian Provisional Government, as a "local Darlan." Lady Listowel has apparently missed the meaning of "Darlanism" or forgotten the rôle played by Admiral Darlan. The French prototype, too, was a "highly respected soldier" and went over to the Allies after he had collaborated with the Germans. However, unlike Horthy, he had not been Hitler's full fighting ally.

Nor is the argument about the Hungarian elections very convincing. The Debreczen National Assembly's "legal status" is a piece of political fiction, if only because no parliamentary election has taken place. That the communal elections were held by secret ballot is highly encouraging; but it would be interesting to know their result and the votes which the parties represented in the Assembly received. On these points The Economist admits "lack of information," because no data on the results of the elections have so far been published. Lady Listowel's "information of the real forces operating in Hungary" seems to show the same gap.—EDITOR.]

AMERICAN SURVEY

Timber and Lumber

(From a Correspondent in Oregon)

ABOUT one-third of all the lumber produced in the United States comes from the two farthest north-west states, Oregon and Washington. Here are the nation's only remaining stands of giant virgin trees from which first-grade plywood and large construction beams are obtained. They are being cut faster than they are growing. After they are gone, what will happen to the lumbering industry, to the users of wood, and to the thousands of people and the scores of cities and villages dependent upon them?

One of the proffered answers is that at the present normal rate of growth and cutting the supply will last a century, so why worry? Statistical estimates supporting this answer are that the present standing supply in the two states is about 800 billion board feet. The cut in normal times is about 9.7 billion board feet annually. Eight hundred billions now plus a hundred years' new growth, divided by, say, ten billions per annum, equals a hundred years' supply, at least.

That answer is a bit too simple. New growth is not necessarily equal in quality to old growth. Peeler logs, for instance, used for plywood, come from trees which are several hundred years old. When a log is peeled down to its first 50 years' growth, it is discarded. And currently this discarded portion is often used for fuel. Moreover, the first-grade clear boards for lumber are cut from the second, third, fourth and fifth centuries of growth—that is, the growth of the trunk after the tree reached, say, a hundred feet in height and all branches up to at least 60 feet had died and fallen off. A Douglas fir tree, which is the dominant type in the Pacific north-west, will reach commercial size in 50 years. But only a small part of it will be top-grade lumber. After two or three cuts of the saw the knots, the remains of the branches which grew when the tree was smaller, are exposed.

Selective Logging

Bigger, older trees are needed. Some of the bigger mills, looking far into the future, believe they have a solution. It is the solution reached in some countries in Europe long ago, but new in this country because it has not previously seemed necessary. The first part of the solution is expressed in two terms, "selective logging" and "sustained yield." They simply mean that in logging, instead of taking out every tree of commercial size, only the oldest, biggest trees are cut. This promotes the growth of younger trees. At stated intervals the area is logged again, thus achieving "sustained yield" from the land.

This seems so simple that the reader may wonder why it has not been established long ago. The answer is equally simple. The timber belt extended from coast to coast without a break, except in the plain area where bison grazed. Timber resources until recent years seemed inexhaustible. And it has been cheaper to log everything good and keep moving into virgin timber than to make provision for new growth.

Now, however, virgin timber is not only less plentiful but more remote. The extinction of some types of pine, cedar and spruce is in sight unless something is done. So selective logging has become at once necessary and feasible. It is cheaper to log selectively near to the mill than to build roads for logging distant areas. Even now some logs are transported by truck as much as 50 miles to a river and then floated 100 miles or more to a mill.

There are a few lumber operations in the Pacific North-west to-day which are organised on a basis of selective logging and perpetual yield. Other operators who do not have sufficient virgin timber in sight for such an arrangement are growing trees as a crop on cutover land. In many cases, they say, selective logging is still too expensive. For them it is best to take out all the merchantable timber, but

leaving some trees for seed, and to grow a new crop of trees for future harvest. It should be understood that when all merchantable trees are removed there frequently are many saplings left from five to 25 years of age.

The tree farmers concentrate on giving new trees a chance. There is a natural cycle of growth in the fir region. As soon as the trees are removed a heavy growth of fern and low shrub quickly appears. Soon young poplar trees appear above the fern. In time the poplars would shade and kill most of the fern and low growth. But before this happens, young fir, hemlock, spruce and cedar appear among the poplar. Their growth is faster than the poplars, and soon they are crowding out the poplars. Stated another way, the ferns provide a nursery for the poplars, and the poplars in turn a nursery for the more valuable timber types if fire does not interfere.

The Fire Hazard

But a fire in the dry ferns in the autumn of the first year after logging may kill the young poplars. Fires in succeeding years may kill other seedlings. There are great areas in the Pacific North-west covered with nothing but fern and shrubs. These areas are useless for anything but trees, and useful trees will have to be started by hand.

The task of the tree farmer is to seed artificially the areas which are not seeded naturally and to keep out the fire. Tree farms range in size from a few thousand up to 130,000 acres. Trees range in age from a year to more than a quarter of a century. Fire trails criss-cross the area along which fire-fighting equipment can be driven. One of these tree farms carries \$100,000 worth of fire-fighting equipment. No harvest from these farms is contemplated for 25 years and no major harvest for 50 to 75 years. That is looking a long way into the future, but such vision is essential if the big lumber companies are to continue making lumber. And they say it will pay.

There are three million acres in tree farms in the states of Oregon and Washington to-day. Plans are afoot to extend the area. One estimate is that ten million acres in successful tree farms will be sufficient to sustain the lumber industry in perpetuity.

This method of maintaining the supply of raw material is one phase of conservation. Another phase, and the one getting the most popular interest, is better utilisation of the material now at hand. One-fourth to one-third of every tree is now left in the woods because it is not economically feasible to bring it out. Another portion of the log varying upwards from 5 per cent is wasted in the mill in the form of sawdust, slabs and bark. Tens of thousands of homes are heated with sawdust and chips. But even greater quantities of these materials are simply burned outside to get rid of them. Yet the stuff is chemically valuable.

By-Products

Probably the most important use of mill waste, other than the burning of sawdust for heating, is the insulating material made from bark. A cork-like material is also being developed from bark, though this is barely beyond the laboratory stage.

Currently, a plant is being constructed, as a war emergency, to manufacture alcohol from wood, the alcohol to be used in the manufacture of synthetic rubber. The process is not cheap. In spite of the fact that the sawdust can be had for the cost of transporting it from a mill, the alcohol will not be competitive at peace-time price with alcohol made from molasses. The maximum yield is about 52 gallons to the ton of dry material. However, it is hoped that with alcohol as a primer for the pump, money will

be obtained to develop markets for other by-products which will make sufficient cut in the price of the alcohol to make it competitive. One of the by-products is a yeast, high in protein, which is potable to livestock. Germany has developed this type of wood use to a high degree under stress of necessity. But in the American Pacific North-west it must be developed under competitive conditions.

Another by-product of alcohol manufacture is lignin, the yield of which is about 600 lb. per ton of sawdust. The chemist can do almost as many wonderful things with lignin as he can with petroleum. But again there is the question of commercial feasibility. Research is essential. The men behind the alcohol plant have high hopes. They anticipate an immediate market for lignin as a competitor with peat moss as a soil conditioner. They say it is vastly superior, but is too valuable potentially for such use. However, such a market will be helpful to pay the cost of developing a market for more valuable uses.

To many observers plastics offer the most promise for the greater use of wood now wasted. A plastic can be made from wood; more immediately challenging is the use of plastic as a binder for sawdust and wood chips.

The writer has seen a material made of 80 per cent planer chips and 20 per cent plastic, which is harder and stronger than wood, which comes polished from a mould with the colour impregnated in it, impervious to moisture and wholly unaffected by ordinary heat and cold. The man who developed this material has visions of sending portable machines into the woods to chew up branches left by the loggers to be made into this material, which appears ideal for furniture. A competitive basis must be established, however, since similar products can be made with sugar cane stalks and other fibrous vegetable material; in fact, a California manufacturer makes coffins from orange pulp and plastic which resemble mahogany.

Keen observers say the real future of the Pacific North-west lies in a combination of specialised agriculture, industrialisation based on hydro-electric power and a shrinking lumber industry. The possibilities in specialised agriculture and in industrialisation are, in fact, fascinating. But they make another story.

American Notes

State of the Union

Traditionally, the President's annual message reports on the state of the American union. This year the President has given the phrase a larger meaning by devoting much of his message to Congress to political and economic relations among the United Nations. At many points he gave the lead, the balance, and the perspective which have been so hard to find in recent weeks. Mr Roosevelt's insistence on the need for unity among the Allies was accompanied by a frank recognition of the differences which are bound to emerge as the problems of peace supplant the simpler demands of war. Admitting concern over such questions as the Polish and Greek issues, Mr Roosevelt in a notable passage warned his listeners of the dangers of demanding perfection:

Let us not forget that the retreat to isolation a quarter of a century ago was started, not by a direct attack against international cooperation, but against the alleged imperfections of the peace. . . . we gave up all hope of gradually achieving a better peace because we had not the courage to fulfill our responsibilities in an admittedly imperfect world.

Of the Atlantic Charter, which internationalists and isolationists alike have chosen to regard as an inflexible yardstick, the President sanely observed that although it is essential to have guiding principles, they do not provide rules of easy application to each and every one of "this war-torn world's tangled situations." Mr Roosevelt urged that the primary aim of creating machinery to maintain peace should not be postponed or prejudiced by possible present errors or the many specific problems of adjustment in liberated Europe. This plea, directed at American doubts and criticism, was accompanied by an affirmation which will be particularly heartening abroad, of American determination

not to shrink from the political responsibilities which follow in the wake of battle.

This was followed by the insistence in the Budget Message that

the war will not be won unless we accept our share of responsibility for the administration of occupied territories and relief and rehabilitation in liberated areas.

The Budget Message was marked by an equal attack on the "malignant effects of economic isolationism." Specifically, Mr Roosevelt recommended the early acceptance of the Bretton Woods proposals for currency stabilisation, and the stimulation of international investment through the creation of an International Bank, the lifting of restrictions on foreign loans, and an increase in the lending power of the Export-Import Bank. His reminder of American opposition to any form of trade restrictions was accompanied by an admission that "we have house-cleaning of our own to do in this regard."

Mr Roosevelt has pledged his Administration to the unflinching use of American influence and power to achieve the principles—both political and economic—to which the United States is devoted. If in their application, the same realism and humanity are shown which marked the President's speech, the United States may well "make better history than ever has been made before."

The Cost of Victory

President Roosevelt's fourth War Budget reflects both current uncertainty about the length of the war and the Administration's belief that victory will not be assured without substantial American contributions to the cost of reconstruction. Receipts in the fiscal year ended June, 1946, are estimated at \$41,255 million, expenditures at \$83,103 million; the public debt is expected to increase by \$40,500 million during this period. Total appropriations are set at \$86,767 million, compared with \$97,200 million for the current year and \$127,956 million for last year. Of this Budget's appropriations, \$73,000 million are tentatively allocated for war purposes, but Mr Roosevelt pointed out that, depending on the course of the war, this figure might fall to \$60,000 million or rise to \$80,000 million. Included in the 84 per cent of the total Budget which is to be spent for war purposes is 16 per cent to provide for Lend-Lease and the costs of reconstruction and rehabilitation, on the assumption that Congress will concur in the belief that both of these are legitimate costs of total war and enduring peace.

Mr Roosevelt rejected as over-optimistic the belief that war costs would decline sharply with the defeat of Germany, and warned that the price of defeating Japan must not be under-rated. This note of caution was further expressed in the belief that there is no prospect of an early decline in taxation, or of the wholesale relaxation of controls. Such recommendations on reconversion policy as the President was prepared to make were concerned with the extension of the Federal Employment Exchanges to promote the return of veterans and war workers to civilian occupations, the strengthening of machinery dealing with labour disputes, and assurances that where plants are no longer needed for war production, they will be speedily transferred to private industry for productive use. After the disappointment of the high hopes of last summer, caution is the key-note.

Universal Service

Once more Mr Roosevelt has demanded a National Service Act to assure the most efficient and democratic use of the nation's manpower resources and to shorten the war. There is an urgent need for 300,000 more men in critical war industries; and the recruitment of these men is made more difficult by the fact that the Service requirements for replacements can no longer be met from the pool of young men under 26 who are classed 1A. Men previously deferred on account of war work will have to be called up and substitutes will have to be found to do their jobs. Mr Brynes has even suggested that agriculture's sacred right to retain its young workers might have to be forgone. These replacements will have to be found by inducing—or compelling—workers to transfer from less essential industries; by recovering some of the approximately 500,000 who left war plants for civilian work last year; and by attracting new labour—mainly women—into industry.

Mr Roosevelt did not put all his eggs in one basket. Two specific proposals were advanced for immediate consideration: the drafting of 20,000 nurses for the Services from the civilian pool of 280,000; and legislation to ensure that the 4 million men physically disqualified for

the Services (the 4 Fs) undertake war work. Judging from the anguished cries of the sports world, which foresees bleak future if the 4 Fs are compelled to go into war work, this may prove a fruitful source of labour. The prospects of national service legislation and of post-war military training are more difficult to assay. The hostility of Congress, and that of organised labour and management, is not shared by the Press, or apparently, by public opinion. It may well be that a determined drive by the Administration would tip the balance. The President in his Message may have intended no more than to go on record in favour of an unexceptionable principle, or to establish bargaining counters with Congress. But if he is determined to fight for universal service, the country may prove to be ready for more than its representatives in Washington.

Rights and Realities

The concept of a "Second Bill of Rights," mainly concerned with economic injustices, which Mr Roosevelt has advanced in the past, reappears in his Messages to Congress. Of these rights the most fundamental is that to a useful and remunerative job; the achievement of better housing, education, medical care and social security plainly hang on maintaining into the peace the full employment which has been achieved during the war by the high and steady level of government demand. Mr Roosevelt suggested two means to this end: a compensating increase in private demand and investment, equal to half as much again as was spent and invested in 1939; and a great increase in foreign trade. Most of the new jobs can be provided by private enterprise, he believes, if the Government "holds open the door of opportunity"—presumably by encouraging competition and eradicating cartels and monopolies—and "sustains demand."

If private enterprise is unequal to the task, the Federal Government must see to it that rights become realities. In part this will be achieved by the extension of social security, health measures and education. But Mr Roosevelt also is thinking in terms of a vast public works programme. Half-way between comes the suggestion that the Government can stimulate private employment by financing peace-time productive expansion as it has financed industrial expansion for war, extending and guaranteeing loans to small business, and to other enterprises, which because of their abnormal risks, may not be able to secure private funds. This is a plan which has an enduring attraction for Mr Roosevelt; he first mentioned it at Chicago last summer.

Blue-prints for this imposing array of public enterprise probably are not very far advanced. But from the practical side, an even greater obstacle is their cost. The short shrift which the last Congress gave to the Kilgore Bill for meeting the human costs of reconversion does not suggest any unbridled enthusiasm for "unnecessary" Federal spending. A vigorous export drive to take up the slack in the domestic market is likely to be much more palatable both to Congress and the country. Mr Roosevelt no doubt is aware of the economic disorder and suspicion which a one-sided approach to freer trade would engender; but he may be tempted to take the easier way to avoid the domestic antagonism which might endanger his hopes for American participation in international machinery to guarantee the peace.

Nine Lives

Like old soldiers in the song, the Committee to Investigate Un-American Activities never dies; but neither does it fade away. Hopes that the Committee would be forgotten, now that Representative Dies, its founder-chairman, has retired, have been disappointed. A coalition of Southern Democrats and Republicans, led by Representative Rankin of Mississippi, has not only revived the Committee, but has succeeded in giving it a permanent place among the House Standing Committees. The vote was 207 to 186, with the majority made up of 137 Republicans and 70 Democrats, and it is possible that the majority might have been larger if it had not been proposed to put the Committee on a permanent footing.

The old Dies Committee was as famous for what its critics alleged to be its own un-American practices as for those it purported to investigate. It is said to have had scant respect for the rules of evidence and was notoriously left-handed. Most of its inquiries were focused upon Communists, fellow-travellers, and liberals, with only token attention paid to the subversive right-wing. How much of the passion and prejudice which marked the old Commit-

tee will be inherited by the new depends on its members. The Administration is said to hope that it can be impartially, or at least innocuously, staffed. This probably is too sanguine. The resurrection of the Committee by the old "unholy alliance" of Southern Democrats and Republicans serves notice on the Administration that the new Democratic majority in the House is no guarantee of smooth sailing on domestic issues. This is the answer of the Conservatives to the bitterly resented campaign activities of the Political Action Committee and the Congress of Industrial Organizations. They are determined that the Democratic left-wing shall not enjoy the fruits of victory in peace; and they are unlikely to allow their new sounding-board to be muted.

The Dripping Tap

Mr Drew Pearson continues his self-appointed career as unofficial printer to the State Department. His newest publication consists of excerpts from an *aide-memoire* on Italian policy delivered to the Department by Lord Halifax. This new leakage was denounced with admirable promptness and vigour by Mr Stettinius, who has redoubled his efforts to locate Mr Pearson's sources of information. The latest revelation is remarkable for several things, not least among them the *insouciance* with which the columnist admonished the Secretary of State that he was "not even warm" in his search for the culprit; and the effrontery

with which, when informed that Mr Stettinius had complained that he had published only partial and misleading extracts, Mr Pearson released the whole of the text. The cream of the joke is, perhaps, the bitterness with which Mr Pearson complains that Lord Halifax saw this particular column two days before publication. Faulty plumbing can work both ways.

This week's revelations are accompanied and supported by a full-fledged rationalisation. Mr Pearson says:

Lord Halifax and Secretary Stettinius appear to question my right to obtain and comment upon public documents affecting the lives of millions. . . . I firmly believe that the fate of millions depends on Woodrow Wilson's enunciated principle of open covenants openly arrived at. We lost the peace after the last war by deserting that principle. We cannot afford to lose another peace.

This is a travesty of what Wilson meant; but it plays ingeniously upon all the fears of "secret diplomacy"—and particularly British secret diplomacy, which is the most sinister of all—which are so deeply ingrained in American thought. The American who is outraged at the thought of Uncle Sam glancing over his shoulder into his private business sees no inconsistency in believing that public business can be transacted in the full glare of a newspaper column. There is no Official Secrets Act in the United States. If the work of the world's Foreign Offices is not to be paralyzed, it may be necessary for Mr Pearson to be taken into the State Department on a full-time basis and for Mr Stettinius to write the column.

THE WORLD OVERSEAS

Socialism in Saskatchewan

(From Our Ottawa Correspondent)

THE new legislature in Saskatchewan, in which the Co-operative Commonwealth Federation Party won predominant control last June, has recently completed its first session. From the new statutes it has enacted it appears to intend to utilise the party's political victory to convert Saskatchewan into a base of socialist activity and propaganda in the rest of Canada. For this role Saskatchewan suffers some serious limitations, for the province is largely agricultural and its population possesses few traditions of socialised enterprises. A writer in the leading CCF periodical, *The Canadian Forum*, remarked that "the CCF is spending too much money on organisation, too little on education." Though this remark was made in reference to the party's defeat in Alberta, it is relevant also to Saskatchewan. Policies of economic self-sufficiency, which have become characteristic of CCF thinking in Canada, will encounter their severest test in Saskatchewan, where prosperity rests upon exports to a greater degree than in almost any other community in the world.

For that reason it is not strange that the proposition, so widely advanced by CCF speakers in the Saskatchewan election campaign, that funds for the support of increased social services would be obtained from the profits of nationalised industry, has almost disappeared after the CCF government has been a few months in office. Instead of socialising the brewing industry, as the public was led to expect, it has indicated that a new "arrangement" with the beer companies will provide added revenues for the public treasury, and it is prepared to rest its case upon "social control" rather than "socialisation." The meaning of these terms, as one hears them used by the CCF, is apt to become confusing. The distribution of beer and liquor has been a government monopoly in Saskatchewan, as in other provinces, for many years, and if the government is obtaining more revenue from it, a strong presumption exists that the customer is chiefly the loser.

The emphasis has quickly shifted in Saskatchewan, under the CCF government, from "socialisation" to "co-operation," though the theory of co-operative enterprises financed, directed, and in some cases owned by a government runs counter to the convictions of many leaders of the co-operative movement, which has in the past enjoyed success in Saskatchewan. In conjunction with the governments of Manitoba and Alberta, the Saskatchewan government has

lent funds to the Canadian Co-operative Implements, Limited, a company planning to engage in the manufacture of farm implements and hardware supplies. A site has been purchased in Moose Jaw, Sask., for launching a government co-operative woollen mill. Another project undertaken as a co-operative, but financed by the province, is a fish-filleting factory.

The new Saskatchewan Trade Union Act accorded recognition to collective bargaining agreements, provided the compulsory check-off for the collection of union dues, stipulated the closed shop and fixed the labour contract period at one year. This is, as its CCF sponsors claim, the most progressive labour legislation in Canada. The compulsory check-off, otherwise known as the principle of union security, is one of the chief objectives of organised labour in Canada at present. In a province with a small industrial population, it will serve chiefly as an example for other provinces. This legislation established the principle of conciliation, which has prevailed in federal labour legislation for

many years. A labour relations board, after the style of the Wagner Act in the United States and comparable legislation in Ontario, will be established to certify bargaining agencies. In order to short-circuit possible litigation, the decisions of the Saskatchewan labour relations board will not be subject to inquiry by the courts, a point which may in due course be tested for its constitutional validity. The Annual Holidays Act, assuring all employees in the province a holiday of two weeks with pay each year, will not apply to the farming community, but will serve as a precedent for other provinces.

The Saskatchewan Legislature created four new departments of co-operation and co-operative development, of labour, of social welfare, and of reconstruction and rehabilitation. The foundation of a scheme for state medicine was contained in the Health Services Act, which established the health services planning commission. The intention here was to create "health regions" in which medical and sanitary staffs would be provided at public expense. The initial move in this direction was to amend the Mental Hygiene Act so that care and treatment may be provided at government expense. The foundation for public ownership may be seen in an amendment to the Natural Resources Act, authorising the expropriation of land and works in the province for the development of business enterprises. Compensation will be paid, with arbitration of disputed cases. The extent to which powers of this kind will be used was not disclosed.

Government participation in mining, fishing and fur marketing was foreshadowed, however, in other legislation. A new Mineral Taxation Act provided a tax of five cents per acre on mineral lands, and the maintenance of a public record of all holdings and valuations of such lands. The purpose here, foreseen by CCF speakers, was to discourage speculative holdings by private interests and to facilitate the government's acquisition of mineral deposits for public development. The chief minerals involved would be coal in southern Saskatchewan and gold in the north. The licensing of fisheries and the opening of a fur marketing agency by the government indicated extensions of public control in these fields. The new government insurance office was designed to handle almost every type of commercial insurance, and, in a separate account, life insurance. All supplies and materials for the use of the government will be purchased through a central agency.

In a revision of debt adjustment legislation, under a new title of the Farm Security Act, the Saskatchewan legislation introduced one new controversial feature into an old problem. The Act defined a crop failure as a season in which income from farm land amounted to less than \$6 per acre sown in grain. In seasons of crop failure, the Act provided, principal payments shall be deferred on a mortgage or agreement of sale, and a deduction shall be made from the principal sum of 4 per cent of it. In cases where the interest payable on the contract is higher than 4 per cent, the deduction would then be at the higher rate. Meanwhile, interest would accrue on the contract on the full sum as though no postponement of payment and no deduction of principal had been allowed. The intention here was to evade the constitutional requirement that jurisdiction over interest comes within the exclusive competence of the Federal Parliament. An interesting legal case is likely to arise out of this legislation; but meanwhile the credit standing of the individual farmer in Saskatchewan has not improved.

The credit standing of the province of Saskatchewan is under fresh study as a result of two developments. In seeking to raise \$1,000,000 in a development loan, the CCF government is offering 3 per cent bonds for sale in the province. This rate is substantially less than the yield of existing Saskatchewan bonds. In the matter of \$17 million in loans to finance seed grain advances in 1938, the province and the Dominion jointly underwrote the obligation. Recently, the Federal Government implemented its guarantee, but the province has taken the position that its obligation will not extend beyond the collection of 50 per cent of these loans from the farmers who received them.

Swiss Foreign Trade

In 1938, the value of Swiss imports amounted to 122 per cent of the value of total exports. In other words Switzerland's economy is dependent on proportionately large imports of raw materials and foodstuffs, and imports regularly exceeded exports. Before the war nearly one quarter of imports came from Germany and one seventh of total exports went to Germany. During the war Switzerland was largely dependent on her foreign trade with Germany and

German-occupied countries. Before the invasion of France trade with overseas countries, which amounted to 4.2 per cent of the total trade before the war, had been reduced to less than 10 per cent of the total trade. During 1944 Switzerland's foreign trade reached a new low level. The following table gives imports and exports in 1944 as percentages of imports and exports during the same periods of 1938:

	Imports	Exports
First Quarter	39.1	49.5
Second "	41.2	53.4
Third "	27.2	24.8

This is an index of volume. It shows that before the invasion Swiss foreign trade, particularly exports, had remained on a relatively high level. The decrease compared with the last pre-war year was on an average some 50 per cent in the first half of 1944 and during 1943. The latest figures show that the decline of exports and imports continued during October and November, 1944.

Imports and exports during the first 11 months of 1944 and 1943 were as follows:

(In million francs and 1,000 metric tons)

	Imports		Exports	
	Value	Volume	Value	Volume
1943	1,593	3,637	1,417	315
1944	1,315	2,569	1,074	289

In other words, imports measured in tons decreased during the first eleven months of 1944 compared with 1943 by 29.5 per cent and exports by 8.5 per cent. The most important point is, however, that this new decrease began in July, 1944. Imports declined steadily. Exports recovered during September and October but reached a new low level in November.

It can be said that at the moment Swiss foreign trade is virtually restricted to trade with Germany and the countries still under German occupation. Without German imports of coal, coke, iron and steel, and chemicals, Swiss industry would suffer a most severe setback and large numbers of industrial workers would become unemployed.

As long as the fighting continued in France and as long as communications were interrupted, the transit traffic of Swiss imports and exports through France to Spanish ports was suspended. Considerable stocks of export commodities for overseas countries accumulated in Switzerland and many trains and lorry loads were sent back from France to Switzerland.

Pressure from the USA

All these were merely technical difficulties arising from the fighting and the destruction of communications in France. But a new note has now been struck in Swiss foreign trade difficulties. The United States of America has been exerting considerable pressure on Switzerland to suspend all trade with Germany. This pressure has obviously been exerted in the same way as it was exerted on Sweden, which led to the suspension of trade between Germany and that country.

There is, however, a difference between Sweden and Switzerland. In 1941, the United States blocked Swiss gold and other assets in the United States. Since that time Swiss exports to the United States have been hampered by the American refusal to pay either in gold or by exports of commodities to Switzerland in exchange for Swiss watches and other precision commodities. Switzerland, on the other hand, refused to take dollar payments, which made its exports less remunerative.

No solution of the deadlock has hitherto been reached. The Swiss complain that the transit of Swiss export goods through France is deliberately blocked by the Allied authorities. In reply to the American demand to stop trade with Germany, Swiss official sources have stated:

1. Switzerland did not allow the transit of war material and weapons through Swiss territory for the German armies in Italy.

2. From October 1, 1944, all Swiss exports of weapons and explosives to Germany have been suspended.

3. In addition, exports of ball-bearings, aircraft accessories, radio, telephone material and other precision goods vital in war have been suspended.

In other words, Swiss sources state that the United States demand is unreasonable; at the same time they declare that Switzerland's economy is completely dependent on German deliveries of coal, steel, chemicals and other raw materials, including oil and petrol.

ARE YOU OVER 17 YEARS OLD?

UNLESS you are over 17, there have been no Black Magic Chocolates since you were 14; and at that age (if we remember aright) chocolates were chocolates and never mind the name.

But if you are over 17, the words "Black Magic" probably strike a chord in your memory.

Let us help a little.

A very plain box—glossy black, with a few white lines on it.

Twelve different kinds of chocolates, in simple paper cups, without any fripperies.

Truffle-and-Nougat, Hazel Cluster, Liquid Cherry, Orange Cream, Strawberry Cup . . . heigh-ho. The girls loved 'em; and the boys took no poor view of them, either.

And now, you say, here it comes—"Come Peace, come Black Magic." But nothing of the sort. There will be a lot of pre-war goods back in the shops before Black Magic; for though we shall move fast, we shall take no short cuts—no half measures, no skimping.

Don't expect to buy Black Magic on Armistice Day; but when you do buy it, it will be as good as ever. We believe it will be better, but that will be for you to say.

Black Magic

ROWNTREE & CO. LTD., YORK

Duty-free Cigarettes for PRISONERS OF WAR and H.M. Forces Overseas

as fixed by The Scotch Whisky Association.

KODAK FILM reports results

Enemy shipping is sighted . . . one of our aircraft attacks . . . off go its rockets . . . straight for the target . . . one up for Coastal Command—or was it? Often there's no time to wait and see. But the 'Kodak' Film in the aero camera will tell—beyond a doubt. To-day photography is busy helping the R.A.F.—helping to make the world a fit place for peace-time snaps again.

KODAK LTD., KODAK HOUSE, KINGSWAY, LONDON, W.C.2

But, sir, you did say BULLY TINS . . .

What the chairman expected to see were the Fuel Efficiency Bulletins on boiler-house economies, to make sure for himself and the Board that everything possible was being done by and for their own firemen. The moral is twofold. Miss Malaprop must write at once for another set (Nos. 1, 2, 9, 10, 20 and 27). And you mustn't let another day pass without satisfying yourself that any fuel-saving job you delegated is being well and truly done.

The underlying formula in many notable cases of fuel economy is Fuel Bulletins plus Fuel Watching. Read the following:—

A LARGE BLOCK OF OFFICES, using fuel only for space heating, consumes little more than half the former annual tonnage as a result of (i) shortening the rates of the Lancashire boilers to maintain the burning rate as nearly as possible at 15 lb. per sq. ft.; (ii) carefully banking the boiler fires at night; (iii) the use of thermostatic control to maintain an even temperature of about 60 deg. F.

HOW THE BULLETINS CAN HELP YOU. The latest specialised knowledge on almost every conceivable fuel subject is at your finger-tips in the Fuel Efficiency Bulletins. If you've mislaid your copies, apply now to the nearest Regional office of the Ministry. Issued by the Ministry of Fuel and Power.

OVER a century's experience of sound construction is behind the making of Milners' Office and Factory Steel Equipment.

Milners' technical experts will be pleased to advise on all matters of storage equipment for industrial purposes.

THE BUSINESS WORLD

Monopoly in Embryo

IT is undeniable that the extensive growth between the wars of restrictive and monopolistic practices has done incalculable harm to British industry by increasing its costs and lowering its output. Agreements to restrict output, to fix prices, or to limit entry into a trade, have been for the most part informal, so that their full extent is unknown, but their effect can be felt only too well, even if it cannot be measured. Formal trade associations have, as a rule, confined their official activities to such wholly laudable aims as the promotion and pooling of technical research and the fostering of co-operation between capital and labour. But, in the circumstances, it is inevitable that many such bodies are open to the suspicion of pursuing other and less-advertised aims. The recent formation of a Hardware Trade Alliance provides a useful opportunity of examining a trade association in its embryonic state. There is no reason to suppose that the Alliance is any worse—or better—than similar bodies. But the frankness with which its promoters have stated their aims provides information which is often unobtainable. The Alliance is also interesting because it aims high in the face of heavy difficulties.

The hardware and ironmongery trade covers a wide field, which includes such products as domestic hardware, builders' ironmongery and various agricultural tools. Its products are sold not only by numerous ironmongers proper, but by multiple and departmental stores, drapers, food stores and bazaars and barrow-men. The number of countable retail outlets is at least 7,500 and possibly as many as 12,000. The bulkiness and variety of the products increases the number of factors (wholesalers) needed to supply small retailers, whose stocks need frequent replacement. The great number and differing interests of the firms and individuals involved must inevitably make it difficult to establish a comprehensive combine, and, *a fortiori*, effectively to control trading conditions. Nevertheless, the Hardware Trade Alliance is a vertical combine, which includes manufacturers, factors, and retailers alike, and whose proposed aims are extensive and ambitious. It is backed by all the main existing hardware associations, such as the National Federation of Ironmongers (with a membership of 2,500 retailers), the National Steel and Hardware Association, and the Federation of Hardware Factors. Many factors and a vociferous section of direct retailers are among the scheme's strongest supporters, but the attitude of the multiple stores is decidedly hostile and that of a great number of small retailers is unknown.

The Hardware Trade Alliance was recently inaugurated, but it has not yet adopted a constitution or elected officials. The draft of a possible constitution was circulated at a meeting of the trade, but the chairman, Mr W. Trevor Heaton, emphasised that it was purely tentative, being designed to show "the kind of ideas we have in mind." The objects of the Alliance, as laid down in this preliminary draft, include the co-ordination of activities of existing organisations in the trade, the improvement of wages and labour conditions, the fostering of research and collection of statistical data, and the provision of a channel through which the trade can approach Government departments. Casually placed in the middle of these unexceptionable objects is one aim which is as comprehensive as it is ominous:—

To establish a code of self-government within the Trade and classify the various types and grades of distributors and to regulate trading terms and conditions.

Speeches by prominent supporters of the Alliance have elucidated the ways in which trading conditions might in practice be regulated. They urge that unrestricted competition should be stopped, and devices such as coupon gift schemes prohibited. The suggestion that the Alliance will act as a price-fixing body has been denied. But it is at any rate hoped that the Alliance will safeguard the position of every section of the trade by establishing some scale of profit margins, which would amount to much the same

thing. The failure to receive adequate assurances on this point has led to strong opposition from multiple stores, who at present place bulk orders for their own lines of non-proprietary goods direct with manufacturers. A system of controlled trade discounts would prevent the stores from obtaining factors' or bulk-purchase terms, and would, inevitably, compel them to raise the price of their goods to the public.

One reason for the formation of the Alliance has been the desire of the hardware trade to speak with a single and authoritative voice in its dealings with the Government. This desire is natural enough. But here also there are proposals to use the Alliance's influence for restrictive purposes. It was suggested last March by Mr Rowley, one of the promoters of the Alliance, that, in appropriate circumstances:—

it could make suitable representation to the Government as to the type and quantity of goods which it was necessary to import, and furthermore, as to the best arrangements for their distribution.

At the inaugural meeting of the Alliance, Mr Fletcher, chairman of the Federation of Hardware Factors, suggested that if only factors were given as attractive a margin by home as by foreign producers, they would react patriotically. It is indeed a strange world where imports are to be reduced by raising the cost of British goods.

If the Hardware Trade Alliance does attempt to control trading terms, it will inevitably be faced with the problem of non-member firms. In dealing with this problem, the equivocal and even contradictory attitude of the promoters

War and Post-war Banking

While the war lasts, the resources of Barclays Bank will be devoted to the fullest possible extent to helping the war effort of the nation.

When the war is ended, the Bank will add its full weight to the forces of restoration. To ease the transition from war-time to peace-time conditions, customers will find the same progressive outlook, the same courtesy and sympathetic understanding of their banking needs and the same high quality of service which have kept the name of Barclays Bank in the forefront of British banking for generations.

The small business man and manufacturer will have the active co-operation of the Bank in solving his financial problems, no less than the large merchant and industrialist.

BARCLAYS BANK
LIMITED

Head Office:

54, LOMBARD STREET, LONDON, E.C.3.

of the Alliance can be seen. They clearly wish to base the Alliance on fair and non-discriminatory principles, but the nature of their aims compels discrimination. Thus, Mr Rowley emphatically denied that any "legitimate distributor" selling at a "legitimate price" would be penalised, but significantly added that in course of time some sort of "most-favoured nation" clause might be evolved between the members of the Alliance. Again, Mr Boulton, chairman of the drafting committee, emphasised that there would be no compulsion to join the Alliance, but added that he doubted whether anyone eventually would be able to afford to be outside the scope of the organisation.

It must be emphasised again that the Hardware Trade Alliance has as yet no constitution and no aims. The intentions or hopes expressed by its supporters in no way commit it. But there can be little doubt in practice that the creation of the Alliance is largely due to the wish to secure an adequate remuneration for every section of the trade by means of restricting competition. The euphemisms with which this policy is cloaked, such as establishing "fair trading" and "legitimate prices"—phrases which continually recur—or "organising orderly methods of distribution," however sincerely felt by their sponsors, cannot disguise the fact that its real effect is to better the trade as a whole at the expense of the consumer, and to protect existing interests in the trade at the expense of new or expanding enterprise. To prevent any reduction of prices being obtained by short-circuiting the distributive process may seem an example of fair trading to the various interests who would otherwise be superseded or undercut, but will look like very unfair trading to the consumer, from whose viewpoint the lower the cost of distribution the better. Indeed, any guarantee of a fixed profit margin to each type of distributor could not fail by itself to raise costs; and its effect has already been indicated in the case of the multiple stores, who very naturally would resent any interference with their right to buy in the cheapest market, or to distribute their goods in the cheapest way. Perhaps worse, the prevention of price-cutting would remove both the stimulus and the means to increased efficiency, by reducing alike the rewards for seeking it and the penalties for ignoring it.

The Hardware Trade Alliance, to repeat, has been cited as an example. The opposition inside and outside the trade may still be sufficient to prevent it from realising its restric-

tive potentialities, and even if it does, the results will not in themselves be disastrous to the national economy. But the climate of thought from which it emerges is a very different matter. "Orderly methods of distribution," "the elimination of unfair competition," "the fixing of reasonable prices," "the establishment of fair trading methods"—all these fine phrases are to be met with daily on the lips of British businessmen. Each application of them by itself means nothing. Taken together, they are the chief reason why the productivity of British industry is falling so lamentably behind that of other countries. Every price margin that is fixed means that some other industry's costs are raised. If a British manufacturer wishes to erect an efficient plant to compete with other countries' producers, he will find that every item of his costs, from the first brick that is laid in the factory wall to the last electric light bulb that is installed in it, costs him more than it need, because of the almost universal spread of the cancer of restrictionism. He is now being put on notice that his hardware will cost him more. But the hardware trade should not be unduly blamed; they are only the latest recruits to a very long procession.

It is no exaggeration, but the simple truth, that no single question, neither Social Security nor Full Employment, will so powerfully influence the standard of living of the British people, and the figure that they cut in the world, as this question of restrictionism. This is not the place to repeat the discussion of the remedies which has often appeared in these columns. Sweeping legal prohibitions on the lines of the American Sherman Act are not appropriate for this country. Nor is it reasonable, at this time of day, to condemn the trade association movement lock, stock and barrel. But there is an overwhelming case for an attempt to control all such restrictive practices as price fixing, market sharing, or limitation of entry, and to permit them, by license, only when a clear case can be made out in the public interest. The failure of the Board of Trade to get the Cabinet's assent to its very modest proposals for anti-monopoly legislation is not encouraging—it is said that the opposition came from a coalition of Big Business with the Trade Unions. The chief hope must be that there will be a renaissance in Parliament of the liberal spirit which places the interest of the community above that of any of its sections, and, joined with it, a clearer and wider understanding of the conditions of industrial efficiency.

Business Notes

French Financial Programme

The financial programme of the French Government is slowly taking shape. Far and away its most important achievement so far is the successful issue of the Liberation Loan. The final results were given this week. The total subscribed was Frs 162,000 million from metropolitan France and Frs 2,500 million from the Empire. The metropolitan total includes Frs 72,000 million subscribed in notes, Frs 53,000 million from bank accounts and Frs 37,000 million by the conversion of Treasury bonds. It has also been announced officially that the note circulation has declined from Frs 640,000 million on October 5th, when it presumably reached its peak, to Frs 572,000 million on December 28, 1944. On this evidence, the loan must be counted a success. There is some criticism in the French press to the effect that the subscriptions came from the patriots and that the notes hoarded by black marketers and collaborators remain undisturbed in their hidden recesses. But as long as they stay hoarded, no damage will be done.

The task of bringing these ill-gotten gains to light will probably be facilitated when the French Government decides to replace the existing Bank of France note issue by the new notes printed in England and the United States on the orders of the de Gaulle administration during the course of 1944. The greater part of this large tonnage of new notes has arrived in France and the conversion operation only awaits the completion of the technical arrangements. These, it should be added, may take a considerable time. It is not the intention of the French Government to make this conversion the occasion for a deflationary operation *à la belge*, but abnormally large individual holdings of notes will receive keen scrutiny. The more ill-gotten boards may never be handed in for conversion and would thus be written off as the old notes lose their legal tender rights. The operation should eliminate the franc notes taken out of France by Germans and collaborators, for

which an active market has developed in neutral centres, where the rates quoted are anything but flattering to the franc and cannot strengthen confidence in the official rates of 200 to the pound and 50 to the dollar. At the end of October, the last date for which rates are available, French bank notes of 5,000 francs were quoted in Zurich at 70 Swiss centimes per 100 francs and notes of 1,000 francs, 85 centimes per 100 francs. Converting these figures at the official Swiss franc-sterling rate, the quotation for 5,000 franc notes would give a cross rate of 2,480 French francs to the pound and that for 1,000 franc notes, a cross rate of 2,040 French francs to the pound. Too much importance should not, however, be attached to these very special rates.

Another item in the French financial programme which is likely to be put into operation soon is the requisitioning of French nationals' foreign assets. The decrees in question are expected towards the end of this month. Little can be lost by this delay or by advertising this measure well in advance because the bulk of the assets in question, being held in Britain and America, are immobilised. The French sterling assets now vested with the Custodian for Enemy Property have been estimated at close on £150 million. Adding to this the substantial amounts held in the United States it is evident that the proposed requisitioning will greatly strengthen the French central reserves of foreign currency.

Opencast Coalmining

Comparisons between British and American productive efficiency are almost invariably depressing, and the comparison made by the Opencast Coal Mission to the United States is no exception. Starting from scratch at the beginning of the war, opencast working has now achieved an annual rate of production of about 12 million tons, and represents a

measure of compensation for the declining output from deep mines. Yet, the Mission concludes, unless Britain is supplied with modern equipment and adequate spares, it will be difficult to maintain increasing production during the next twelve months. According to its report at least a third of the British equipment in use is incapable of further efficient production, unless it is dismantled, rebuilt and equipped with spares. While the average capacity of British machines is under 1 cubic yards, compared with over 8 cubic yards in America, the American method of centralised operation and the "salvage" basis, under which contractors are responsible for the whole preparatory and engineering work, as well as the actual extraction of coal, make for maximum efficiency. The cost of fixed explosives is only 5½d. per lb. in America compared with 1s. 2d. in this country.

It is not surprising, under all the circumstances, that output per manshift should be as high as 18 tons of prepared coal in America. The most disconcerting feature of the report is the statement that the majority of the machines received from America are "old machines, far inferior to those seen on sites in the USA." The Ministry of Works issued a subsequent statement that the US machines were the best available and were sent at considerable sacrifice—in other words, one did not look a gift horse in the mouth. None the less the position is serious and calls for further investigation. Now that this frankly critical report has been published, it is surely time to publish the suppressed report of the US mining Mission to this country. Frankness on both sides would contribute to the general clearing of the air.

Joint Maritime Commission

One of the most active and successful bodies set up by the International Labour Office is its Joint Maritime Commission, which has been meeting in London this week. The Commission, which last met in June, 1942, has decided to approve the International Seafarers' Charter, sponsored by the merchant officers' and seamen's international organisations, with a view eventually to introducing an International Convention at the International Labour Conference.

The Charter has received very wide publicity and support among seamen and officers, and the need for raising the standards of the lowest-paid and least organised seamen is admitted by the Commission. Many of its recommendations, such as its proposals for establishing minimum standards of manning, recruitment, training, accommodation, safety, hours and welfare, could properly be adopted in an international convention. But when it comes to adopting an international minimum wage—the suggested minima are £18 a month for an able seaman and £22 10s. for third mate and fourth engineer—the wisdom and practicability of such a move are open to question. Though it is true, as the Charter points out, that wages are easier to standardise in shipping than in other industries, because seamen perform the same work, spend most of their earnings in foreign currency and do not necessarily work under their own flags, yet it is difficult to envisage a minimum rate of wages applicable equally to the Lascar and to the American seaman.

Welfare in British Ports

The Seamen's Charter refers to conditions on board ship, but it is equally important to improve the provision for seamen while they are on shore, and this could well be taken up by the ILO. Much progress has been made in Britain since Mr Bevin set up a Seamen's Welfare Board in 1940. It is significant, for example, that the number of beds provided in British ports was about doubled between 1938 and 1943. The Committee on Seamen's Welfare under Mr Graham White, appointed by the Ministry of Labour in July, 1943, after reviewing the wartime developments, suggests that permanent welfare machinery should be created.

The committee recommends the setting up of a statutory Merchant Navy Welfare Board, with regional committees, composed of representatives of shipowners' and seamen's organisations, and financed by a levy on the industry. The Government would be absolved of direct responsibility for

seamen's welfare, though it would exercise a general supervision over the Board's activities. The Board would be empowered to review the facilities for accommodation and recreation and to initiate schemes where necessary. It would co-ordinate the work of voluntary organisations, represented on a Standing Joint Advisory Council, and it would keep a register of all seamen's charities and control appeals, so as to avoid overlapping and ensure their *bona-fides*.

Thomas-Baldwins Issue

In conformity with the fusion scheme, Richard Thomas and Baldwins are replacing £2,917,182 4 per cent prior lien debenture stock of Richard Thomas by £2,500,000 3½ per cent loan stock 1945-55. There is no specific security for the new stock, but the company undertakes not to contract debts ranking *pari passu* with or in front of the 3½ per cent stock, except for strictly temporary purposes. The stock is repayable by ten annual instalments, but with power to the borrower to anticipate repayment. The operation will end control in so far as it was vested in holders of the prior lien stock, and control will cease at the end of July next, after a period of seven years. The new stock is one in which few but institutional investors will be interested. It is being placed with Baring Brothers, and the question naturally arises whether they will, in the near future, apply for permission to deal. Except for the different appeal of the security, the position seems to be on all fours with that under the General Electric issue. The market will be rather more restricted in the case of a ten-year stock with an optional repayment at an earlier date, but it is not clear that this difference is sufficient to justify the granting of permission to deal.

It may be asked why the company is using almost £500,000 of its resources in part redemption of the Prior Lien stock. It is, beyond question, in a strong liquid position, but it seems probable that it will require over the coming years all the cash it can find for further modernisation and extension, in particular for its share in the new strip mill and the cold reduction and electrolytic tinning plants which will be required. Since, however, it appears to be a general requirement of the Treasury that conversions should be accompanied by part repayment, whenever the funds are available, the company is no worse off in this respect than any other concern. Whether it is desirable to expedite repayments is a matter of fact to be decided in each particular case, and in this instance the information to reach a conclusion does not exist.

The GEC Ban

With reference to statements which appeared on page 23 of last week's issue, *The Economist* is assured on the best authority that there is no question of either the Capital Issues Committee or the Bank of England having in any way directed the General Electric Company to the brokers or the issuing house which it should employ in making the issue of new preference shares. It is further understood that, in the view of the authorities, the Committee of the Stock Exchange was acting well within its rights in refusing leave to deal, even though no objection had been officially raised. There is, it is said, no question of any conflict.

On the latter point, it is scarcely necessary to state that, if bans on dealings are to be imposed in all similar cases, issuing houses will be prepared to give on any new "placing" even less favourable terms than those recently exacted. On the question of "direction," it is a fact that the belief is now firmly rooted in the minds of many responsible people that every particular of many issues is subject to official influence. It is, perhaps, an inevitable concomitant of control by suggestion that, since it has no visible boundaries, it should be considered to have none in practice.

On the really critical question of why the Treasury should think it necessary to dictate the means of raising money—once the permission to raise it at all has been granted—there is still not an atom of official guidance. This matter is crucial, because it means that British industry, which has already a sufficiency of handicaps to contend with, is being forced to pay more for accommodation, which has official sanction, than is necessary and with benefit only to an arbitrarily selected group of financial institutions. City opinion has seldom been so much of one mind as it is over this matter and there is little chance that it will be satisfied by less than a full explanation, or a reversal of policy.

Expanding Electrical Business

No explanation has been given by the company itself of the great increase in the gross profits of E. K. Cole, which for the year ended June 30, 1944, total £423,124 against £263,401. Both profits and turnover reached record totals. Despite the inevitably heavier incidence of taxation—£245,000 against £142,000—earned for ordinary works out at 120.8 against 70.8 per cent. The ordinary dividend, however, is raised only from 15 to 20 per cent, and over £50,000 is added to carry forward. General reserve and carry forward together thus total £365,000 against a total issued capital of all classes of £636,000. The company's strong position for expanding activities is also shown by the fact that net liquid assets exceed £450,000.

Pre-war, E. K. Cole's main concern was with the radio trade, although it was also interested in the manufacture of bakelite mouldings and in 1937 and 1938 acquired further interests in the manufacture of electrical appliances. Ordinary dividends rose from 20 per cent in 1934 to 30 per cent in 1935 and 40 per cent in 1936, although the company's earnings then suffered severe reductions and did not revive again until 1941-42. The reason for E. K. Cole's renewed prosperity is hard to determine. The extensive demand for the company's products—radio, lamps and electric appliances—should certainly yield substantial dividends as soon as normal production is resumed, but the company is probably still mainly engaged in meeting special wartime orders. E. K. Cole completed during 1943-44 the acquisition of Ensign Lamps, but that company's net profits of £15,167 have not been taken in. A major source of E. K. Cole's high profits may lie, however, in its increasing interest in the manufacture of plastics.

The expanding field of E. K. Cole's activities is illustrated by the Board's proposal to alter the objects of the company. It is suggested that the company should be authorised to trade in radio, radar, television, tele-communications, electrical goods, plastic materials of all types, electric lamps, and a number of new lines such as cabinet-making and metal stamping, glassware, and household goods of all types, as well as carrying on business as manufacturing and consulting engineers. All these activities are likely to prove highly profitable in the post-war period, and the proposed new activities are of a sort which can be combined advantageously with the existing business.

Labour for the Cotton Industry

The cotton industry is likely to suffer from an acute shortage of labour in the immediate post-war period, and it has been stated that at least 17,000 more operatives are needed at once, to meet war requirements and to enable the process of deconcentration to be started. But though an addition to the labour force would help the industry through its immediate troubles, the long-term difficulties will still remain. Cotton, like mining and agriculture, which also suffered severely in the depression years, failed to keep up recruitment during the interwar period and, like these industries, the cotton industry will itself have to take steps to offer such conditions of work and prospects of advancement as will attract new entrants, in a highly competitive labour market.

This was the tenor of an address by Mr. Bevin at a conference with the Cotton Board's Recruitment and Training Committee last week-end. The most practical decision that emerged from the meeting was the establishment of a sub-committee, to deal specifically with the training of new adult labour, including disabled workers, and to provide refresher courses for workers transferred back from other industries.

One of the points raised by Mr. Bevin was the need for the industry to estimate the total labour force it would require after the war. He said that the full number of 175,000 workers who had been withdrawn since the beginning of the war would be needed. This may be so, but

it should be pointed out that, if the cotton industry were to increase its productivity, to make the use of modern plant and machinery universal and to work a double shift system, a smaller labour force, and perhaps a very much smaller labour force, would be needed than before the war.

War Damage Accounts

The accompanying table reproduces the published accounts under the three schemes of war damage compensation since their inception in the spring of 1941. The total deficit up to March, 1944, on the land and buildings scheme was nearly £40 million, and very few major repairs have been undertaken so far. The total of claims outstanding is not yet known, but it may well be in excess of the £200 million fixed as Government liability. The Business Scheme is administered by the Board of Trade, and although it was £50 million in hand in March, 1944, claims to be paid at a date to be specified by the Treasury

WAR DAMAGE RECEIPTS AND PAYMENTS
(£000's)

	Year ended March 31			Total
	1942	1943	1944	
Under Part I of the War Damage Act (Land and Buildings) :—

<i>Receipts :—</i>				
Premiums, less refunds	5,081	4,943	2,799	12,823
Other receipts		9	12	21
	5,081	4,952	2,811	12,844
<i>Payments :—</i>				
War damage payments	8,428	7,417	3,986	19,831
Other payments	139	499	266	904
	8,567	7,916	4,252	20,735
<i>Excess of payments over receipts</i>	3,486	2,964	1,441	7,891

amounted to £48,641,000, while unsettled claims outstanding were estimated at £16 million. Under the Private Chattels scheme, £26,484,000 of claims are to be paid later, and claims outstanding at March 31, 1944, were estimated at £3,500,000.

None of the figures includes claims for damage caused by flying bombs and other new weapons, and it remains to be seen how far they will swell the deficits. The Treasury will probably specify a date after the end of the war for the settlement of the larger part of war damage compensation. It would be well, however, to bear in mind that as reconversion of industry proceeds some businesses might be prevented from acquiring premises or machinery because their only capital is a non-negotiable Treasury promise. The solution might be to allow banks to give credit in suitable cases against war damage compensation.

Banking Profits

The results of the English banks for last year conform closely to the main lines of expectation. Profits are higher—although in some cases by very little—and dividends are in every case unchanged. It is doubtful how far a closer investigation is really useful as an indication of actual earning power, but it may be interesting as a key to the outlook of the managements. It is, therefore, worth noting that the

percentage rise in disclosed profits is only about four-fifths of the secured in 1943, but that it nevertheless amounts to some £365,000 for the seven large and independent English banks. Possibly the most interesting point which emerges from the preliminary statements is the use that is made of profits, for total allocations to reserve funds have jumped from £600,000 to £1,400,000, while provisions for other so-called reserves have fallen from £2,060,000 to £1,660,000. Three banks, the Midland, Lloyds and Martins, are responsible for the change and it would seem that these managements at least believe that the time has come when specific provision for contingencies arising out of the war can be drastically cut. It is of some interest to note that the allocation by Lloyds of £500,000 to reserve is the first for some years and that it raises the fund for the first time above the level from which it was reduced in 1932. Possibly some light on the general view regarding reserves and also on the obscure question of taxation will be shed by the speeches of the bank chairman. Meanwhile, any addition to free reserves is particularly welcome if only on account of the great increase in deposits.

Cheque Clearings Record

For the third consecutive year the total of cheques and bills cleared at the Bankers' Clearing House in 1944 created a new high record. The grand total was £62,644,564,000, representing an increase of £5,537,455,000, or 9.7 per cent, on the figure for 1943, the previous record. On the basis of the clearing bank deposit figures for the first eleven months of the year the expansion in deposits in 1944 is likely to amount to about 15 per cent as compared with 1943. It would, therefore, appear that a small decline occurred last year in the velocity of circulation of credit. This is all the more true because part of the increase in the central clearing was due to the diversion to it as and from July 12, 1943, of certain clearings previously handled by the provincial clearing houses.

	Total for 1944		Changes on 1943.	
	£000's	£000's	Per cent	
Birmingham	90,201	18,582	17.0	
Bradford	94,055	3,088	3.1	
Bristol	34,139	749	2.2	
Hull	30,403	885	2.9	
Leeds	59,912	2,585	4.5	
Leicester	41,451	59	0.1	
Liverpool	264,679	29,040	12.3	
Manchester	170,732	244,776	58.9	
Newcastle	88,596	8,828	11.0	
Nottingham	21,004	1,349	6.0	
Sheffield	47,861	780	1.6	

This diversion was particularly important in the case of Manchester, where the provincial clearing area was so large that cheques had to be sent to the clearing by post. Wherever this was the case the cheques in question were transferred to the central clearing. The combined total of the eleven provincial clearings for 1944 was £943,033,000, a decrease of £224,869,000, or 19.2 per cent, on 1943.

War Borrowings Compared

The *Federal Reserve Bulletin* for November contains specially rich fare—so rich as to appear almost oppressive to those of its readers whose diet of central banking literature is largely made up of the austere Statistical Summary of the Bank of England. Apart from the usual routine features, this issue contains three full-length analytical articles of quite outstanding importance. The first is an estimate of the gold and dollar reserves of the most important countries of the world which was summarised, on the basis of cabled reports, in *The Economist* of December 23rd. The second is a discussion of US international trade prospects which makes the point that the promise and enactment of a full employment policy in the United States would be of great help in getting American farmers and business men to accept the readjustment in tariffs that will be necessary if the United States is to maintain a substantial flow of exports after the war.

The third is a painstaking analysis of war-time borrowing in the United States, the United Kingdom and Canada. In each country the expansion both in the total and the service of the national debts is related to the corresponding figures of national income. In addition, the composition of the increased national debts has been analysed and compared, and some attempt has been made to compare the distribution of ownership of the three national debts.

In the five fiscal years which ended in 1944, the United States raised \$156,736 million by borrowing as against \$86,942 million by taxation. For the United Kingdom the comparable figures were £11,423 million and £9,769 million and for Canada, \$7,142 million and \$7,336 million. Despite this much greater dependence of the US on borrowing, the national debt last year was no more than 29 per cent greater than the corresponding national income, while in the United Kingdom it was 146 per cent greater, the corresponding figure for Canada being 25 per cent. The exceptionally low average rate of interest at which new debt has been created in the United States is evident from the fact that the relation of annual interest payments to national income in that country has risen from 1.4 to 1.7 per cent only between 1939 and 1944. For the United Kingdom the comparable movement has been from 4.5 to 4.8 per cent, and for Canada, from 3.1 to 2.8 per cent. The computed average rate of interest on the American national debt fell from 2.534 per cent in 1939 to 1.924 per cent in 1944, in the United Kingdom from 3.092 per cent to 2.441 per cent and in Canada from 3.714 to 2.751 per cent. The main reason for these particular differences is the greater reliance of the United States on short term borrowing.

Debt Ownership

Among the more interesting tables given in the article is the following, showing the increase in interest bearing national debt by type of holder in each of the last five fiscal years.

(In millions of currency units indicated)

Type of Holder	Fiscal Year					Total	
	1940	1941	1942	1943	1944	Amount	Per cent.
United States:							
Commercial banks	\$853	\$3,545	\$6,315	\$26,048	\$16,042	\$52,803	33.9
Fed. Reserve Banks	—85	—282	461	4,557	7,699	12,350	7.9
Government agencies	1,184	1,412	2,129	3,700	4,765	13,190	8.5
Other investors	586	2,198	12,865	28,650	33,071	77,370	49.7
Total	\$2,538	\$6,873	\$21,770	\$62,955	\$61,577	\$155,713	100.0
United Kingdom:							
Commercial banks	£150	£550	£330	£600	£400	£2,000	17.8
Bank of England	311	40	186	183	215	935	8.3
Government agencies	250	500	120	10	50	930	7.4
Other investors	56	1,345	2,062	1,827	2,167	7,457	66.4
Total	£767	£2,435	£2,668	£2,620	£2,732	£11,222	100.0
Canada:							
Commercial banks	\$111	\$217	\$117	\$728	\$434	\$1,607	22.6
Bank of Canada	38	328	70	433	317	1,186	16.7
Other investors	238	303	1,578	858	2,030	5,007	70.4
Repatriation	—79	—181	—357	—72	—3	—692	—9.7
Total	\$308	\$667	\$1,408	\$1,947	\$2,778	\$7,108	100.0

This shows how relatively small has been the volume of borrowing from the banks in the United Kingdom. One reason for this is that Britain has financed a large part of its war expenditure by overseas disinvestment, British holders of foreign securities being given the option of exchanging them for Government securities.

Cheaper Antimony

The Ministry of Supply reduced the price on January 1st of antimony metal 99 per cent pure from £120 per ton to £105, and for crude antimony from £100 to £90. The

old rates had been in force for two years, and the reduction is due to lower costs of imports and increased supplies. Before the war, slightly over one-half of world supplies came from the Changsha area in China, which has been isolated for over two years. The United Nations have not been seriously short of antimony, owing to the large stocks in the United States and the stepping-up of production in Latin America, particularly in Mexico and Bolivia. As their production costs are higher than those of China, it is doubtful whether they will be able to retain their strong position after the war.

The main use of antimony has always been as an alloying agent, particularly for lead. Antimonial-lead is normally used chiefly in battery plates, type metal, bearing metals, cable coverings, and so on, and in war-time it goes into shrapnel-balls and bullet cores. The non-metal uses of antimony were small and confined to pigment and enamelling production. Recently, however, antimony has assumed more importance in non-metal industries. For example, in the United States in 1943, 10,329 short tons of primary antimony went into non-metal products and 9,179 into metal products. The chief reason for this extraordinary development is the part played by antimony in flame-proofing tent canvas, tarpaulin and other warlike stores. For the rest of the war, the textile industry is likely to be the largest antimony consumer. Although flame-proofing is unlikely to continue to be, as it now is in the United States, the leading use for antimony after the war, its retention as a standard outlet for antimony may help to raise demand for the metal permanently.

Hyderabad Deccan Purchase

A full statement has now reached this country in the form of a memorandum on the purchase of the shares of the Singareni Collieries from the Hyderabad (Deccan) Company by HEH the Nizam's Government. A comment in *The Economist* of July 22, 1944, at a time when negotiations had not been officially concluded, stated that the price offered gave a value to the Hyderabad shares almost double any recent quotation and suggested that the reason for so generous an offer might lie in an excess of sterling balances. The memorandum makes it clear that the purchase price was not unduly high, judged by the standard of the worth of the collieries to the Nizam's Government. The discrepancy is due to the fact that, while the Hyderabad Company pays UK income tax the local Government does not. It remains to be considered, however, why the Nizam's Government were unwilling or unable to take advantage of the unfortunate position of the Hyderabad Company to obtain the shares of the colliery company at less than their real worth. The answer would appear to be that, owing in part to the difference in the level of taxation, the Singareni shares stood higher in India than they did in London and that certain interests in India were considering a purchase of shares held by the Hyderabad company. Thus, the main cause of the operation was a question of taxation, but it is possible that the existence of a superfluity of sterling in the hands of Indian interests—other than the Nizam's Government, which is understood to have held very little—may have been a contributory factor in determining the price paid.

Machinery Licensing Simplification

A new method of granting licences for the acquisition of machinery is to begin on January 15th. Hitherto, individuals wishing to acquire machines have had to apply direct to the Board of Trade. Under the Machinery, Plant and Appliances (Control) (No. 9) Order (SR & O, 1945, No. 6), the Board is empowered to license machinery manufacturers to supply the home market with specified amounts of machinery. In cases where capacity is still severely limited, and individual acquisition must continue to be controlled, application will in future be made by the manufacturer. In addition, reconditioning is no longer to be controlled. The Order does not include machine tools, which are controlled by the Ministry of Supply, and will need separate consideration.

The new procedure is made possible by the machinery manufacturers' increasing capacity to supply the home market with machinery for non-war production. As this capacity grows, it is important that administrative barriers to increased output should be removed. Machinery, after all, must be available before industries producing consumer goods for the home and export markets can begin their conversion to ordinary industrial production. Lack of

machinery is likely to prove as much a delaying factor as lack of labour and materials. The simplification of licence control will be welcomed by both suppliers and their customers as a primary and essential step towards reconversion, although it must not be forgotten that mere administrative relaxation cannot produce goods without labour and materials.

Ministry of Food, 1944

It would scarcely be an overstatement to say that no year tested the flexibility of the Ministry of Food as much as 1944. Its work was complicated by the calls on food and shipping resources to feed the invasion armies and to build stocks of food for liberated Europe. Other problems were presented by a harvest not as good as in previous years and population movements consequent upon enemy air activity.

In spite of all these difficulties, the Ministry was able to introduce relaxations in some directions. Oranges were made available to ordinary consumers, and lemons appeared for the first time since 1940. Imports of apples improved supplies. Sardines were more plentiful and the invaluable onion was freed from control. The ban on ice-cream was lifted. The preserves and sugar ration was larger on the whole than in previous years. The bacon ration was increased for two months during the summer. Bread became whiter. Extra rations were granted for Christmas. Although ordinary consumers got less milk than in 1943, consumption as a whole increased, and half the supplies went to priority consumers.

The points ration was increased and adjustments within the scheme were usually to the advantage of the consumer, so that traders in difficulties were granted additional points. A new scheme to adjust retailers' points credits to keep them in line with changes in population was begun on January 7, 1945.

The Ministry of Food was able to cope with the extra strain imposed by the invasion. No revolutionary changes in rationing were expected, nor would they have been possible. It is enough that civilian diet should have been kept at the high level of nutrition and quantity achieved. The bonus of additional variety was welcome, but the additions were, perhaps more than warranted by the general war situation. The renewed warnings of a serious shipping position make it more than ever necessary for the Ministry to exercise the utmost caution.

Shorter Notes

The Park Gate Iron and Steel Company propose to write down the ordinary shares from £1 to 10s. each on the ground that the present value of the works, of which Thos. W. Ward have made a formal valuation, does not exceed £1,150,000, whereas they stood in the latest balance sheet at £2,283,000 after depreciation. The writing down is little more than a book-keeping transaction and merely undoes the effect of a scrip bonus of 200 per cent given when the present company was formed in 1919. The writing down is regarded as an essential preliminary to a constructive programme of post-war expansion.

The reduced trading profits of the Lancashire Cotton Corporation for 1943-44 do not reflect the experience over the last year of the industry as a whole. A sample analysis shows that the average profit of 63 spinning mills was £8,490 against £7,959 (for 62 mills), and the average dividend of 101 spinning mills was 11 per cent against 10.38 per cent. Another 13 concerns which combine spinning and weaving show a higher increase in dividend from 6.83 to 7.21 per cent. There is also an increase in the average credit balance of over 100 companies examined, only four of which as against six last year show a debit balance.

The Agricultural Wages Board has proposed that the national minimum wage for male farm-workers over 18 should be increased by 5s. to £3 10s. a week, and overtime rates for men by 1d. an hour. This decision follows the recommendations of a majority of the county agricultural wages committees. The union had asked for a minimum of £4 10s. Although minimum wages for men in agriculture will now be raised to more than twice their pre-war level, they are still low in comparison with other major industries. In addition, the national minimum wage for women farm workers, still kept at 48s., is shockingly low.

COMPANY MEETINGS

FIRST GARDEN CITY, LIMITED

VALUE OF LETCHWORTH IDEALS

SIR ERIC MACFADYEN ON THE FUTURE

The forty-first ordinary general meeting of the First Garden City, Limited, was held, on the 4th instant, at the Great Northern Hotel, King's Cross, London.

Sir Eric Macfadyen, M.A., J.P. (chairman of the company), presided.

The chairman said: Ladies and gentlemen, I am glad to be able on this occasion to put before you a summary comparison of the chief items in the accounts with the corresponding items for 1939, and, in that way, to give you some idea of the development of our business during the war years. Taking the liabilities side of the balance-sheet first—our issued share capital remains at £400,000. Our loan capital, which amounted to £833,598 in 1939, now stands at £1,017,768. The increase is almost wholly accounted for by capital outlays in connection with our public utility undertakings. Sundry creditors at £70,749 compare with £63,295 on account mainly of provision for increased taxation.

A NEW DEPARTURE

The next item in the balance-sheet represents a new departure. Your directors have decided to follow an increasingly common practice in companies' accounts of showing as a liability in the balance-sheet the net cost to the company of the dividend they are recommending in respect of the period covered by the accounts.

To the next item also there was nothing corresponding in 1939. In addition to the statutory income-tax liability as at September 30th we now reserve £22,300 for our estimated net liability for income-tax on profit earned up to date but not assessable until 1945-46. You will, I think, agree that, with taxation at its present level, it is only prudent to set aside this provision.

The insurance fund reserve is now £18,611, as against £14,900, and the depreciation and renewals account is up from £295,926 to £466,130—following the very substantial increase in fixed assets over the five-year period. The valuation surplus account has been reduced by the amount of certain payments under the War Damage Act from £56,427 to £46,212. The contingency reserve has been increased from £7,158 to £27,158. The balance to credit of profit and loss account comes out at £33,420, as compared with £30,087.

DETAILS OF ASSETS

To turn now to the assets, freehold property (in which is included the gas, water and electricity undertakings) at £1,897,217 compares with £1,572,781. The increase, as you will have gathered, is largely in respect of the public utilities. We supplied during the year now under review 587,018,000 gallons of water, 194,587,000 cubic feet of gas and 41,677,085 units of current, against 338,816,000 gallons, 140,046,000 cubic feet and 22,675,992 units in the earlier year. When I tell you that the capacity of the power station has had to be increased by 70 per cent, you will realise that Letchworth has been a busy place.

The only other item on the assets side of the balance-sheet calling for comment is sundry stocks—which have risen from £18,452 to £50,338. Increased volume and higher prices have both contributed to this increase.

MANY ATTRACTIONS

The extension of the town has been temporarily arrested by the cessation of house-building. The town is full; numbers come in daily from the surrounding villages. As Professor Abercrombie observes in the newly published "Greater London Plan, 1944," it has become "the obvious indus-

trial centre for this part of the region" covered by the Plan. Letchworth, of course, is not only a thriving industrial centre. Situated in beautiful country and protected by its agricultural belt, its residential attractions are many.

Our friends of the Urban District Council are anxious to embark upon a housing programme as soon as conditions permit. Jointly with them we are engaged in planning the layout of a substantial extension to the town area. This will be no mere "housing estate" but will constitute a complete and self-contained neighbourhood, although in organic union with the existing town. It is being planned to provide for its own community centre.

POST-WAR REBUILDING

The ideals to which Letchworth was designed to give material shape are of greater significance and value today than ever before. Britain is about to be largely rebuilt. When house-building can be re-started some six years of arrears will have accumulated. To these will have to be added the building up of entire areas which have been flattened out by enemy action, and the replacement of many congested areas in the centres of our big towns. No previous experience of housing programmes can give us any measure of the national effort which will be called for if we are to take full advantage of this unprecedented opportunity.

It is not only a question of numbers of dwellings—a new standard must be set of better equipped, better designed and more spacious houses, where people may have access to the social, recreational and cultural facilities of an up-to-date community; and may live within reasonable distance of their places of work instead of spending half their leisure in daily journeys to and fro.

Letchworth has shown—and has not, of course, provided the only demonstration—that prosperous new towns can be established which can conform to such a standard. With public credit made available there would be no financial obstacle to the building of many Letchworths. Apart from new towns, moreover, there are country towns of moderate size all over England in which new forms of industry, bringing increased population with them, can profitably be domiciled in this age of electric power and motor transport. We shall have ourselves to blame if the old process is repeated of big towns growing ever bigger: their growth involving, at the centre, ever-increasing congestion both of people and of traffic, and, at the circumference, ever-extending sprawl of dull, monotonous suburb.

THE GREEN BELT

In the past house building has been mainly by private enterprise and I imagine it will be so in future, but the responsibility for allocation of the land to be used for the purpose rests with local authorities. Each of these, naturally, extends its own built-up area; creating for itself new rateable values in doing so. Towns extend until they run into each other; and the farm land which used to separate them is smothered with bricks and mortar. Howard puts his finger on the spot with his emphasis on the Green Belt. But if the process of conurbation is to be checked the problem of rehousing our people must be conceived in wider terms than those of the individual local authority. And of such wider conception, on the part of the central government, there is as yet no sign. Great plans like Professor Abercrombie's will remain nothing more than academic exercises if the initiative to put them into effect is not

forthcoming; and the historic opportunity may pass us by. Housing will inevitably be the first priority after this war; in the absence of imaginative planning on a wider scale we may look to see a repetition of the many blunders of the 1920's and 1930's. The report and accounts were adopted and the retiring directors re-elected.

BANK OF MONTREAL

POST-WAR PROSPECTS

The one hundred and twenty-seventh annual meeting of the Bank of Montreal was held, on the 4th ultimo, at Montreal. Mr George W. Spinney, C.M.G., the President, occupied the chair.

The President, in the course of his address, discussed the "real basis of national welfare" and emphasised the need for production on the broadest possible scale and the freest possible exchange of the resultant products within Canada's own borders and beyond them.

Mr Spinney pointed out that the reconversion of industry to civilian production, the re-employment of peace-time pursuits of those now in the Armed Forces and in war work and the restoration of our external trade on a satisfactory basis, would involve problems of tremendous magnitude.

CONFIDENCE IN CANADA'S FUTURE

As to Canada's post-war possibilities, Mr Spinney declared that he was "no pessimist." Canada, he said, would start out into the post-war era with great advantages. He mentioned the nation's better balanced and diversified economy due to the stimulus of war production, adding that "we have been able to accomplish our vast mobilisation of material resources without subjecting our economy to the stresses and our people to the cruel injustices of inflation"; to him it seemed that "our hope of achieving our post-war plans depends in large measure upon maintaining these advantages."

Discussing the post-war relationship between government and individual enterprise, he expressed the view that a supine dependence on government would represent the negation of the qualities most necessary to an enterprising and democratic economy. And, if these costs of government were distributed in such a way that incentives were diminished or corporations were thereby discouraged or deterred from entering into productive undertakings, "then the net result would be a loss to the Canadian people in terms of employment and living standards."

The subject of inner or contingent reserves was discussed at length by Mr Spinney during the course of his address. Declaring that discussions of the matter during the recent decennial revision of the Bank Act of Ottawa had revealed many basic misconceptions, he said the test of experience in all countries had proven that the practice of adding to such reserves when it was possible to do so, in order to "cushion" less favourable periods when loans might unexpectedly become bad and the value of assets might shrink, was the only safe policy to protect the interests of depositors.

TAX ADJUSTMENTS AND EARNINGS

B. C. Gardner, general manager of the bank, in reviewing the accounts, pointed out that, while gross earnings for the past year had shown an increase, net earnings after federal taxes (which amounted to \$3,725,000) were somewhat lower than for the previous year at \$3,194,000 as compared with \$3,303,000. The reduction in net earnings resulted, he said, from the adjustments in taxation. Gross earnings had increased despite a lower average yield on investments and a reduced level of commercial loans.

He enumerated the important changes in the Bank Act and stated that although the new interest limitations will make it difficult to handle some types of personal loans at a profit, the bank would continue to make every effort to meet the credit re-

requirements of worthy borrowers whether transactions were large or small.

It was hoped, he said, that, within reasonable limits and subject to appropriate safeguards, it will be possible to extend credit of a somewhat longer term, particularly in the approaching period of conversion from war-time to peace-time production.

Stating that business activity in the country continued at high levels throughout the past year, Mr Gardner added that the business outlook is influenced by uncertainty as to the extent and nature of war production requirements. It is probable, he said, that in the ensuing twelve months major problems of reconversion of industry from war to civilian output will become an important element in the business picture.

Mr Gardner concluded his address by paying a tribute to the staff and reviewing plans for reabsorption of those employees now on military service; it was planned, he said, to provide for refresher training to all for readjustment to civilian life.

The report and accounts were adopted.

UNION BANK OF AUSTRALIA, LIMITED

STRONG POSITION

The annual general meeting of the Union Bank of Australia, Limited, will be held at 71 Cornhill, London, E.C., on the 29th instant.

The following is an extract from the statement by the chairman, Major General Sir John H. Davidson, K.C.M.G., C.B., D.S.O.: In both the Commonwealth and the Dominion of New Zealand control of banking has continued without change, regulating all such matters as deposits, advances, investment, profits, etc. The trading banks in loyalty doing their utmost to further the war effort have willingly accepted this control, which is very complete in its application, but I regret to observe recent indications, arising more particularly in Australia, of a desire in certain quarters to perpetuate this control as a measure of nationalisation. I trust that both Governments will give the most careful and unbiased consideration to

THE ECONOMIST, January 13, 1945

this subject before introducing legislation. Both Australia and New Zealand, still young countries and undoubtedly, their future progress can best be served by attracting outside population and capital and giving the utmost encouragement to private enterprise in the post-war development of their natural potentialities.

The general trend of the figures disclosed in the balance-sheet last year has continued. The item deposits, bills payable, etc., is more by about £8,000,000 and is reflected in the increase of approximately £7,000,000 in our special war-time deposit with the Commonwealth Bank of Australia, which now stands at £16 million. The position disclosed is particularly liquid and strong, but our earning capacity is obviously limited as a result of Government control exercised over our operations. The net profit amounts to £177,274, which, together with the amount brought forward, makes £340,612 available. The interim dividend of 2½ per cent., less tax, absorbed £71,458 and we have declared a final dividend of 3½ per cent., less tax, leaving £166,487 to be carried forward.

THE ECONOMIST, January 13, 1945

GOVERNMENT RETURNS

For the 6 days ended Jan. 6, 1945, total ordinary revenue was £64,733,000, against ordinary expenditure of £96,094,000 and issues to sinking funds of £128,812. Thus, including sinking fund allocations £10,438,210, the deficit accrued since April 1st is £2,498,555,000 against £2,455,175,000 for the corresponding period a year ago.

A change has been made in the method of showing a excess of Post Office Expenditure over the Post Office revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £123,751 to £3,487,732, the other operations of the week (no longer shown separately) raised the gross National Debt by £31,605,023 to £22,094 million.

(a) From March, 1942, figures are exclusive of men classified as unsuitable for ordinary industrial employment, and women unsuitable for normal full-time employment. Since January, 1943, the figures have been published at quarterly intervals. (b) From January, 1940, includes former Southern and South-Eastern divisions. (c) Includes Southern division before January, 1940. (d) From September, 1939 Grimsby and Lincoln included in North Midlands instead of N.E. England. (e) From December, 1941, High Peak Parliamentary Division of Derbyshire included in North Midlands instead of North-Western England. (f) Ordinary and Self-balancing revenue and expenditure. Annual figures are totals for financial year, beginning in year shown. Monthly figures are cumulative. (g) Average of weekly figures. (h) Annual figures for 1929 and 1932 do not include District Bank.

Export or Die

WHEN a Cabinet Minister finds himself in the difficult position of having to make a speech on a subject of urgent public importance on which His Majesty's Government has nothing to say, he has two alternative courses of action open to him. One is to take one or two little scraps of administrative action and dress them up as major decisions of policy. The other is to indulge in generalised moral exhortation to the public to cultivate a new spirit, to eschew selfish contriving, to be up and doing, and generally to relieve the Government of its awkward responsibilities. When Lord Woolton spoke at Bristol on Saturday last on the subject of exports and industrial policy, he found himself in just such an awkward fix and he decided to play safe: he chose both alternatives at once. There were the titbits: the limit for export credit guarantees is to be raised from £75 to £200 million (by not much more, in fact, than the rise in prices); 800 applications for licences to make prototypes for post-war models have been approved and 512 business men have been allowed to go abroad; the Government is making studies of overseas markets. And there were also the customary beatitudes—the spirit of adventure . . . unity of purpose . . . combined operations . . . initiative . . . enterprise. It is all a little reminiscent of the time when Lord Baldwin tried to win a General Election on the double ground that he could be trusted

and that there was an increase in the production of broccoli in Cornwall.

So many problems are nowadays described (and rightly) as crucial and urgent that it is difficult to establish an order of precedence in the public mind. Yet if there is one matter which, second only to victory, should be regarded as vital to the future welfare of the British community it is the restoration of international trade. Unfortunately, it is currently the fashion among one school of economists to cast some doubt on what should be beyond question. Their argument derives largely from the fact that dry cargo imports into the United Kingdom, which were 55 million tons a year before the war, have been successfully reduced to less than 23 million tons in 1942 and to not much more than 25 million tons in 1944. If this large reduction could be achieved at the same time as a great expansion in almost all forms of industrial activity, surely, it is argued, the country could get along even in peacetime with fewer imports than it had before the war—not perhaps with a saving of 60 per cent as in wartime, but with a saving of 30 per cent?

This argument is wholly fallacious. Of the total reduction in imports, over 10 million tons is accounted for by timber, wood pulp and paper alone. If the country is to have a building programme and a free press, these imports will have to be restored. But in any case weight is the

SALES MANAGEMENT AND SALES CONTROL. Well-known engineering firm supplying equipment and accessories primarily to the motor-car and ancillary industries, requires an outstanding man to act as Sales Manager in the widest sense of the term.
He must be a man of good education, some general engineering background, preferably aged 35 to 40. It is essential, however, that he understands modern management methods, and has had some years successful experience in the control of outside sales staff selling to industrial users.
This is a somewhat unique opportunity for a man who can quickly fit in to our present organisation, but who at the same time has the vision and tact to expand the business into new fields in the early post-war period. The production and financial arrangements are adequate to cover all reasonable requirements.
Applications, giving full particulars of education, age and career to date, will receive immediate consideration in strict confidence, and interviews either in respect of immediate or early post-war appointment will be arranged within the next six weeks.—Box No. 53, THE ECONOMIST, Bretttenham House, Lancaster Place, London, W.C.2.

ACCOUNTANT. Robson, Morrow and Co. are seeking an outstanding man. A Chartered Accountant or equivalent with wide industrial and executive experience, who could be trained in modern management and accounting methods for advisory work of national importance. Four-figure commencing salary and exceptional prospects. Age not over 38. Mark envelope "Application." Full particulars of education, qualifications and experience to Robson, Morrow and Co., Victoria Station House, Victoria Street, London, S.W.1.

IS THIS MAN YOU?

A persuasive speaker in public, a cool, calm thinker, never embarrassed, a good loser, a good mixer, making friends without effort? If not, you need RAPIDISM, the fascinating new course, endorsed by leading psychologists.

of war work done by women in this country express the wish to be enrolled.

Hitherto, these hardships and difficulties have been borne in good humour. Complaints have been the exception rather than the rule. Members of the Government, too, have shown a praiseworthy degree of restraint. But there is a limit to French patience. And that limit is in sight. If there is no visible improvement in the material conditions of life, if unemployment continues to increase, and if there are no adequate opportunities to serve in the common cause, there will be a sense of frustration and a feeling of being neglected. Faced with a growing volume of discontent, the Government's position might be weakened; it will have to explain, and, inevitably, it will tend to divert the public anger to the Allies and blame them for all the difficulties. It is clearly in the common interest that France should not become the neglected Ally.

The exceptional material and moral difficulties of France cannot wholly or even mainly be laid at the Allies' door. But they are in a large measure due to the assumption made by the military experts last summer and autumn that the war against Germany would be over before Christmas. On the basis of this assumption, Allied policy was sound. It was logical to concentrate entirely on the war, even if this meant temporary hardship for the civilian population of France; nor was there any case for training a large French army. But the assumption has proved to be wrong; even if there are good reasons for the hope that the war may be over in a few months, such hopes should not be allowed to form the basis of Allied policy towards France. It would be far wiser to err on the side of pessimism and to base policy on the assumption that the war will continue until the latter part of this year.

Such an assumption would inevitably involve a complete reversal of policy towards France. It would be in the common interest to absorb France more fully into the combined war effort, to bring her as an equal partner into the work of the Combined Board of Great Britain and the United States, on the military as well as on the economic sides. If the principle of equality were accepted, France would play her full part; not only in the formulation of strategy, but also in the allocation of resources. But such a decision could only be taken at the highest level, that is by Mr Churchill and President Roosevelt. Even if this would not immediately solve France's material and moral difficulties, it would go a long way towards avoiding the danger of unrest that is inherent in the present policy; and it would undoubtedly contribute to the common cause.

Promise of Disarmament

THE speech delivered to the United States Senate last week by Senator Vandenberg is a political event of some importance, which deserves close attention in many countries other than the United States itself. Senator Vandenberg is an elder statesman of the Republican Party, and of the greatest influence in its counsels. His attitude in the early months of the war has often been described as "isolationist." The description, however, may be misleading. Senator Vandenberg showed none of the frenetic and masochistic isolationism of a Nye or a Lindbergh; he was rather of the company that needed to be convinced that the United States had more to win than to lose by pouring its blood and treasure into an open war. There is every indication that the Senator's conviction, by the events that culminated in the attack on Pearl Harbour, has been genuine and that his present advocacy of international collaboration is as sincere, even if it is also as moderate and cautious, as his former attitude.

It is an axiom that American foreign policy cannot be without the active consent of both major parties.

But even if the principle of equality were accepted, it would still be necessary to take speedy measures to solve the immediate difficulties created by the shortage of consumer goods and raw materials, and by the rise in unemployment. These, as has often been stated, are largely a matter of transport, that is, of shipping as well as of inland communications. France's shipping tonnage is now less than a third of its former total of 3,000,000 gross tons; and three-quarters of this reduced fleet—including all the best ships—are in the Allied shipping pool, in whose allocation France has no voice. The number of locomotives and goods wagons is barely two-fifths of its pre-war total, and of the reduced volume of rolling stock a large proportion is used for military purposes. The number of lorries and vans has been reduced to half the pre-war total of 480,000 units, and many of them are in barely serviceable condition.

There can, of course, be no question of a sudden and large increase in supplies to France. The French public fully recognises the prior claims of the war. All that they expect is a steadily rising volume of supplies. This need not involve any change in high strategy for any wholesale withdrawal of ships from the Pacific, for example. The ships that are needed could be found by a temporary reduction of imports by the United States and by this country of commodities of which substantial stocks have been accumulated or of which civilian consumption is still at high levels. But since imports into Great Britain have already been cut to the bone and as its stocks are less plentiful than those of America, the United States could reasonably be called upon to make the bigger contribution. But if Great Britain can contribute only pence to America's pounds, that is no argument for waiting upon American action. The British pence should go at once.

The need for easing the material difficulties of France—and of other liberated countries—has been recognised by Great Britain and the United States. The announcement in Washington on Monday that Mr Stettinius, US Secretary of State, and Mr Richard Law, British Minister of State, had agreed on "interim measures" for the increase of supplies to liberated Europe suggests that both countries are alive to the problem. Again, cabled reports from Washington give rise to the hope that the revised French import plan, drawn up in consultation by M. Jean Monnet, by Shaeff, and by British and American Government officials, may at last be put into operation. Finally, the decision of the Provisional French Government to call to the colours certain age groups—no doubt based on promises of American military equipment—has done something towards the avoidance of a sense of frustration. The emphasis should now be on speed—and on graciousness—of performance.

One of the things that went wrong after 1919—indeed, in the ultimate analysis, the chief thing that went wrong—was that the settlement of Versailles was presented as the exclusive handiwork of the Democratic Party and, on those grounds, assailed by the Republicans. President Roosevelt has shown by many signs that he means to avoid this mistake. Any pronouncement by a Republican of Senator Vandenberg's eminence is, therefore, of interest. It helps to indicate how far the Republicans will go, and that, in its turn, helps to show how far the United States will go.

The pith of Senator Vandenberg's speech was a proposal that, irrespective of the fate of the Dumbarton Oaks proposals for the machinery of an international organisation, the United States should enter into a "hard and fast" commitment with its present allies for the specific purpose of preventing any breach, by either Germany or Japan, of the disarmament that is to be enforced upon them when they have finally lost the war. The Senator further proposed that, in the execution of such an alliance, the President for the time being should

be specifically exempted from any obligation to obtain Congressional sanction in advance. He should be as free to implement the agreed policy of enforcing German and Japanese disarmament as he is now free, in wartime, to carry out the strategic plans he forms as Commander-in-Chief. For a Republican Senator during a Democratic Presidency, this is a large concession.

The Vandenberg proposal is of importance for two separate reasons. In the first place, this is one of the very first specific pronouncements that have been made by any practical American politician of standing about future American foreign policy. Hitherto, virtually all the discussion, which has been mountainous in volume, has related to the constitution of the future international authority, the document that is to replace the Covenant of the League. On the side of the Administration, this concern with machinery, as distinct from the policies for which the machinery is to be used, has been virtually exclusive. All attempts to draw a statement of policy from Mr Cordell Hull during his tenure of the Secretaryship of State could produce nothing more than a collection of almost painfully empty generalities. Mr Stettinius has contributed, since his accession, only the negative point that the United States will not guarantee any European frontiers (including, presumably, the British). The silence on policy has been so complete that Mr Roosevelt's recent statement that

We cannot and will not shrink from the political responsibilities which follow in the wake of battle

could be greeted as an advance on what had gone before.

It is not even quite certain, in spite of the educative efforts of a number of publicists and newspapers, whether some of the Democratic leaders appreciate that there is any difference between the constitution of a Security Council and the policy it is to pursue. Senator Connally, the Chairman of the Foreign Relations Committee, reacted to Senator Vandenberg's proposal as if it were an alternative to the Dumbarton Oaks plan and were being set up in rivalry to it. The development of any such rivalry would be a great tragedy. The two are, of course, quite separate and distinct proposals on different planes of action. It would be possible to have a fully constituted Security Council without its members having any idea of the policies for which they were to cast their elaborately calculated votes when it met. Or if the Great Powers were at one on their ideas of the policy to be pursued, it could be put into effect without there being any special machinery at all other than the ordinary diplomatic channels. Or thirdly, and best of all, there could be both a Security Council and a policy for it to apply. Unless this distinction between machinery and policy can be clearly grasped, and firm agreement can be secured under both heads, there is little better prospect of an enduring peace than there was with the League of Nations.

The second point of importance in Senator Vandenberg's initiative, and the one that deserves the closest attention in Great Britain, lies in the nature of the policy it proposes. The senator did not make it explicit that, in proposing an alliance to enforce disarmament, he was ruling out the possibility of an alliance to do anything more. But this is fairly clearly implicit, especially when it is taken with Mr Stettinius's refusal, almost unanimously applauded in America, to guarantee any frontiers. It is a long and a difficult journey from a speech, however well applauded (and Senator Vandenberg's speech has drawn very wide praise in America), to an enacted commitment, and those who are familiar with the present state of American politics would not be prepared to lay any large wagers on the Vandenberg proposal taking final shape. The odds must be regarded as being heavily against anything more far-reaching being accepted. In effect, what the Vandenberg speech and its reception mean is that there is a fair chance of the full weight of American strength being committed to the automatic enforcement of German and Japanese disarmament, but that there is much less chance

of any American promises to support any other policies upon which the present Allies may enter.

Indeed, the argument goes further, partly in explicit terms and partly by necessary implication. Not only would an American commitment to enforce the disarmament of Germany and Japan carry with it no implied support for other policies, it would be likely to be weakened and conceivably even withdrawn if some other policies were developed. Senator Vandenberg made it clear that, in his view, the adoption of his proposal would render unnecessary such examples of "unilateral or bilateral" action as the "partition of Poland" and the Anglo-Soviet and Franco-Soviet treaties. This line of argument obviously could not be carried to the extreme of requiring the other Powers to accept an American guarantee of permanent German and Japanese disarmament as being the sum total of what was necessary to guarantee peace. But every contract entered into by the United States—or by any other country where there is popular control of foreign affairs—inevitably has an unspoken proviso about the good behaviour of the other parties, who must take this into account in making their own calculations. They would probably be wise in assuming that policies which, however much they might offend the perfectionists at the start, nevertheless worked out over the years to the manifest advantage of world peace, would not be held by American opinion to be incompatible with the prompt implementation of a guarantee of disarmament. A good-neighbourly association of the Western European states would, it might be hoped, be one such policy. But policies which will lead over the years to a continued volume of rancorous controversy and which, when passions are stilled, will arouse honest doubts in reasonable men about the justice of the Allied action, will have a disastrous effect on the willingness of the Americans (and, let it be said in all frankness, of other democratic peoples) to honour their pledges with any promptness or enthusiasm.

Such are, beyond question, any annexations to other countries of undeniably German lands, any forced expulsions of German populations, any partitioning of the German homeland, and the imposition of any economic disabilities which have the effect of permanently lowering the German standard of living. A limited and short period of penalties imposed on the German people is a different matter; they will not arouse controversy, save of a historical kind, in 1960. Enforced and unilateral disarmament, such as Senator Vandenberg is now proposing to support, will also pass the test, since there will probably be few American or British voices, even in 1960, to question its necessity or justice. But other policies that are both penal and permanent will raise controversy and breed doubts and disunity. They will provide admirable arguments for all the lazy, the irresolute and the wishful thinkers who want to slough off the heavy burdens of enforcement. The fact that some American political leaders, notably Mr Morgenthau, have identified themselves with proposals for the savage repression of Germany should not be allowed to mislead. These proposals carried with them no promise of firm commitments by the United States to enforce them; and if any such promise were made by the Administration it would be certain to be repudiated by Congress. To indulge in righteous anger is one thing; but to make hard and fast promises of heavy contributions for years to come is quite another.

To those who can see present events in an historical context, the Vandenberg speech should be taken both as a promise and as a warning. It is a promise in that it suggests the possibility of the United States undertaking specific commitments much beyond anything that has ever been done in the past. It is a warning in that it puts a condition of moderation upon the offer. If a moderate and permanently maintainable settlement were against the interests of the other Allies, an attempt to impose it as the price for an American guarantee of German and Japanese disarmament would be properly resented. But since such a settlement is manifestly in line with what British policy always has been and soon will be again, such reinforcement from America should be something for which full gratitude can be expressed.

Domestic Service

BEFORE the war the "servant problem" was an un-failing source of music-hall humour. Quips about the inconstancy and hery independence of a new generation of servants—in much better taste than the wordy parlour-maid anecdotes so popular with the Victorians and Edwardians—drew attention to a serious dislocation in the supply and demand of domestic service. The problem was a new one. In the nineteenth century the supply of servants had always exceeded the demand for them. They were cheap and their status was low.

In the years between the two world wars certain forces tended to preserve the *status quo*. The reduction in the size of the average family, particularly in the size of the average well-to-do family, inevitably reduced the demand for domestic servants. The electrification of houses and the development and mass-production of labour-saving devices tended, similarly, to depress the market for domestic service. But these developments were more than neutralised by contemporary changes directed towards a more equal distribution of the national income. The real wages of the poor improved; the rich were taxed more heavily; and the social consciousness of the nation became more acute. Though the number of wealthy families gradually declined, the number of professional and salaried workers steadily increased. By 1939 there were fewer families that could afford to employ more than one servant, but more families than ever before anxious to engage a part-time help or a maid-of-all-work. The demand for domestic workers (a more accurate name than "servants") has almost certainly increased during the past thirty years.

The supply, on the other hand, has decreased very markedly. Domestic service is a blind-alley occupation, poorly paid, unorganised and often tedious and uncongenial. The modern girl of working-class origin finds work in a shop, office or factory a much more attractive proposition than work in someone else's home.

This reaction is in itself a sign of social progress. But the reaction itself does not eliminate the problem. Domestic service is essential in peace as in war. It is uneconomic only when it is abused—when it allows employers to live in parasitical idleness. A worker who, by performing the daily round and common task of others, sets them free for valuable enterprise is a key-worker with an important rôle in society. Domestic service is essential, too, when it ministers to the needs of the sick, the aged, the incapacitated and the overworked. It has a very necessary function in the division-of-labour system on which the economic life of the community is based.

The history of domestic service during the war is worth recording. In 1940 the supply of domestic workers practically disappeared. There were complaints from mothers of large families, invalids and elderly people, but their problems seemed insignificant among the major problems of mobilisation for total war. The conscription of women and the absorption of many into part-time work (by the middle of 1944 900,000 were engaged on part-time work in industry and 300,000 in part-time civil defence) brought home to a larger part of the population than ever before the fact that domestic work is an important and difficult occupation.

As the war progressed, the shortage of domestic workers among the civilian population spread to the hospitals and became so acute that it could not be ignored by Parliament or the press. The Hetherington Committee was appointed to consider the question of wages in hospitals and similar institutions, and after its recommendations for national minimum rates had been accepted in November, 1943, the Ministry of Labour was able to direct women to such work. The same month, two typical examples of shortages were cited in the House of Commons. At the Harefield Sanatorium, with a patient and staff population of over 1,400, the kitchen staff consisted of an assistant cook and three daily women. At the Hillingdon General Hospital the domestic staff were 40 below establishment.

Nurses everywhere were having to do domestic work in addition to their nursing. Many institutions were closed down.

A year later, another storm broke out. Mr. Bevin's statement on the staffing of hospitals—by this time more London hospitals had been compelled to reduce their beds—showed that the supply of domestic workers had been further disrupted by the flying-bomb attacks and the imperative need to provide hostel accommodation for bombed-out civilians and the army of repair workers. He promised a speedy return to normal conditions, but hinted that the voluntary hospitals could help themselves by improving their personnel management and their methods of staffing. These he described as antiquated.

Mr. Bevin's criticism was important, for the retorts which it drew from the London hospitals reveal the crux of the domestic service problem. The hospitals complained that the Ministry sent them unsuitable people who either could not, or would not, do the work. A matron said that no member of her domestic staff had sufficient intelligence to use an electric scrubbing machine. The secretary of another hospital declared that their applicants began by saying that they could not do any scrubbing and did not want to do heavy polishing. It was said that recruits to the service were of two classes—those who could do the work and mental defectives. The former invariably left after a few days.

For many years now, in Britain, the belief has persisted that domestic work can be done by people who are too dull-minded to do anything else. The mistake has had unfortunate results. The cumulative effects of the war have greatly increased the demand for domestic workers in hostels and hospitals, but the employment exchanges have no classification to guide them in the task of direction.

It may be thought that with the return of a free market after the war the domestic service problem will disappear. Given some form of organisation there is no doubt that the bargaining power of domestic workers should be strong enough to ensure considerable improvement in their working conditions and remuneration, for they will enjoy a sellers' market for several years at least. But this is only one part of the problem. From the point of view of the nation as a whole it is essential that man-power and woman-power should be disposed so that the productivity of each unit is at its maximum. During the war women have made a notable contribution to the war effort. Indeed, nothing has been more remarkable and praiseworthy than the smooth and efficient way in which Britain's "hidden reserve" of labour has been mobilised and set to productive work.

That the harnessing of this extra power has been possible is due very largely to the communal sharing of domestic responsibilities. Canteens, crèches and schools have relieved the housewife of many duties. There has been, too, a welcome improvement in the domesticity of males. Even so, war work has put a very great strain on all married women—a hardship that could not be tolerated under conditions of peace. It is very necessary, therefore, that everything possible should be done to reduce the burden of domestic work for as many women as possible.

There are three parts to the solution. First, domestic work itself should be reduced and lightened. This can be effected by improvements in the design and lay-out of houses, by progress in electrification, by the multiplication and widespread adoption of labour-saving devices, and by the extension of communal services. Secondly, there should be a new attitude, within the family unit, to the duties of household management. It is surely time that the Victorian male's selfish conception of the division of domestic labour was superseded by an arrangement more equalitarian. The new attitude develops very slowly. Suitable propaganda might produce some acceleration.

Thirdly, and perhaps most important, it is necessary to reform the conditions of paid domestic service. The service will not attract the necessary recruits of the right type until people can be persuaded that it is a worthwhile occupation with satisfactory status, opportunities for advancement and reasonable security. In the pre-war years young women and girls would take almost any job in preference to that of a domestic worker. The primary reason was not the low standard of remuneration or the feared lack of freedom—though both were contributory—but the belief that to become a "servant" was to take a definite step downwards in the social scale.

Those who argue that the fault has been with one side or the other—with the employer or the worker—are a hindrance to any improvement. There are no common standards, at least none is known, on which to base generalisations. It has been suggested that a Domestic Worker's Charter is needed—to regulate conditions of employment and the machinery of their implementation. Such a charter would prescribe reasonable hours of work, minimum rates of pay, definite holidays and standards of accommodation. But in an occupation where so many of the standards are subjective, and which is dispersed into so many of the smallest units, there would be formidable difficulties to either in defining or in conferring such a charter. An employer could observe all the formal stipulations and still be a poor employer. And a fully certificated worker, with the wrong personality, could be more nuisance than help in an ordinary home.

Yet it remains true that the suitable training of recruits

could do much towards raising the standard of domestic service. It should be possible to devise courses of instruction that would prepare workers for advancement to higher posts in hostels, hotels, hospitals, and holiday camps. Subjects not always associated with domestic work, such as child care, gardening, motoring, might be included in such courses. Many Government training centres will be maintained after the war. They should provide opportunities for young people to prepare for respectable careers in domestic service and those attaining a prescribed standard of efficiency should be awarded diplomas guaranteeing them the minimum wage.

In the past central and local government authorities and private profit-making and non profit-making bodies have all had some share in the piecemeal organisation of domestic service. Their efforts have been uncoordinated and tentative. A comprehensive plan should be now evolved to cover the domestic service needs of the whole country. For most occupations there is fairly adequate statistical material on which to base schemes of reconstruction. For domestic service there is none; and the planning now needed—which must aim, in the first place, at the readjustment of supply and demand—must be done almost entirely in the dark.

The Ministry of Labour is even now considering a plan by Miss Violet Markham for raising the status of domestic workers and organising the service. It would be well if the scheme could be published so that the problem, which has been submerged for so long, should be brought into the full light of public discussion.

Selection of Pupils

THE great weakness of the present method of selecting pupils for secondary or higher education is that it is highly competitive. The present secondary school curriculum is certainly not suitable for all children, and perhaps not even for the majority of children; but the great social advantages which such schooling confers and the lack of suitable alternatives has produced a scramble for the few free places in secondary schools. The entry examination to secondary schools takes place at the age of 11. Selection at 11 would be far too early even to decide finally what type of further education a pupil should receive. But at present the system, as the Director of Education for Hertfordshire has recently written, is "catastrophic," in the sense that

a child's whole future education (and consequently future career) is decided on the way he or she answers a certain number of relatively simple questions in the basic subjects on one spring morning.*

It is small wonder that the elementary school curriculum is governed by the entry examination to be taken at 11.

But the secondary school curriculum is similarly determined by the School Certificate or matriculation examination to be taken at 16, which acts not merely as a qualifying test for University entrance but as a valuable aid in gaining suitable employment. Thus the present system of education is governed by two examinations, one of which is highly competitive and the other very difficult to many pupils because of the wide range of subjects in which proficiency is required. The resulting forcing and coaching of pupils, the strain on pupils and teachers, and the restriction of the curriculum to examination needs, are well-known facts.

The revulsion against this examination system led the Norwood committee to urge its complete rejection. The committee proposed that children should be given

*"Willingly to School." By John Newsom (SCM Press Ltd. 96 pages. 2s. 6d.). Mr Newsom's book stands out among works on education as much for its sprightly avoidance of the usual sermonical vocabulary as it does for its sound common sense.

Another example of **A CAPITAL ANNUITY**

Part capital, part interest . . . £250 per annum guaranteed for thirteen years . . . of which, on average, £212 is capital repayment and £38 is taxable interest . . . and, after the thirteen years, an annuity of £375 (subject to tax) continuing for life . . . this can all be secured by a female life aged sixty-four for a present investment of £4,000

an appropriate type of secondary education in accordance with the records of their teachers and the wishes of their parents, supplemented, if necessary, by intelligence or other tests. The School Certificate should do no more than indicate the pupil's standard in each individual subject. Eventually, it should be abolished altogether and be replaced by an internal school-leaving examination, set and marked by the pupil's own teachers. Pupils and teachers would thus be released from any slavery to external examinations in either primary or secondary education. Both would be set free to follow their natural bent instead of being forced into a mould. Pupils would be relieved of the intolerable strain of competing in examinations in which large numbers are unsuccessful; and teachers would be able to experiment with their own methods and curricula. As the Norwood report puts it

The time has come when the teaching profession should have the chance to shoulder its own responsibilities and thereby gain its freedom and enhance its prestige.

The picture painted by the Norwood report is in many ways ideal. It envisages a world in which secondary education is provided for all in accordance with their needs and abilities and without the strain and limitations of competitive examination; or in other words it takes as its starting point the equality of secondary education which it is the aim of the Education Act of 1944 to create. But it is just this assumption which is at the least premature. The new Act promises, in due course, to all alike a full secondary schooling up to the age of 16, followed by compulsory part-time education up to 18. This will end the present intolerable system under which secondary education with all its great advantages, is available only to those who can pay for it and to the small minority of elementary pupils—less than 10 per cent—who are awarded it on merit. But the mere extension of secondary education to all will not have the effect of making all types of secondary school equally sought after. On the contrary it may have the initial effect of heightening the already intense competition for what are regarded as the "best" schools; for the argument may run that, since it will be compulsory to stay at school until the age of 16, it is all the more important to employ the time profitably. Thus any differences in the standards reached by the different types of school may be accentuated; and few can doubt that there will in practice be very great differences in standard for at any rate a long time.

During a period of great shortage of teachers and equipment, secondary education will have to be provided for the nine-tenths of children who at present attend only "senior" schools. Many new buildings will be needed most urgently in the case of those "senior" schools which are still housed jointly with elementary schools. The most difficult task will be to find and train enough good teachers to go round. Even when initial difficulties have been overcome, the new secondary schools, whatever they are termed and whatever their curricula, will certainly not enjoy parity of esteem with existing ones unless their staff, accommodation and management are equally good—and even then there may be fences of social preference to surmount. This is the goal which should be tirelessly and urgently worked for. Only through its realisation can each child be given the fairest educational start in life of which he is capable. But the process will inevitably be very slow. The standards set by existing grammar schools are very high and it will be hard work to catch them up. The prestige and opportunities associated with them will perhaps linger still longer.

The Norwood recommendations ignore these facts. In attacking the examination system, they mistake the symptom for the disease. The disease is in fact the limited amount of first-rate secondary and higher education available, which must inevitably give rise to fierce competition. External examinations are not a useless and out-dated nuisance like the human appendix but a fairer way of deciding such competition than any other that has yet been suggested. The crucial external examina-

tions taken at 11 and 16 are conducted with great skill and impartiality by impersonal boards, who are well aware of the danger of pupils passing by means of artificial coaching or "forcing." The alternative method of selection by means of teachers' reports and parents' wishes is both unworkable and unfair where there is any competition. Even if teachers' reports were presented in standardised form and were accepted as reliable, it would be impossible to judge fairly between pupils in different schools because of the different standards and outlook obtaining. The solution of making the Ministry of Education's inspectors responsible for the co-ordination of teachers' reports would be clumsy and would still leave the decision on a personal plane. Parents' wishes are still more unreliable and even in some cases, unfair to their children. A valuable report by a sub-committee of the Essex Education Committee finds that

for every 200 children there are at least seven able to profit from higher (e.g. secondary) education who are withheld by their parents from taking the entrance test.

Such reluctance is of course dictated by economic circumstances, but in any case the aim of democratic education must be to give each pupil the education he himself deserves and wishes. The same report states that out of 306 elementary school heads who were questioned, 218 gave unqualified and 78 qualified approval to the examination system, while with few exceptions the secondary heads also

prefer the present examination system to any combination of intelligence tests and school records.

This is striking confirmation of the necessity of external examinations from the very people who are most affected by their demands and inconveniences.

It is not suggested that present external examinations could not be improved. Their tendency to restrict the freedom of both teachers and pupils by dictating the whole syllabus, thus leaving little time for non-relevant subjects, could be reduced by broadening the scope and increasing the number of individual subjects. Schools could be left much freer to compose their own curricula, without removing the safeguard of an objective external test of the standard reached in the subjects chosen—a test which is valuable for the comparison it draws between schools as well as between pupils. An increasing use should certainly be made of school records, which should be standardised as far as possible, and also of personal interviews and carefully framed intelligence tests. But it must be repeated that school records can only replace external examinations as a method of selection very gradually as the gap between the "worst" and the "best" secondary education narrows.

The present selection of pupils made at the age of 11 is virtually irreversible, apart from the opportunity for a small number of "senior" school pupils to transfer to secondary schools at the age of 13. When the school-leaving age is raised to 16, this selection will still have to be made at 11 or not much more. Since so much depends for each child upon this selection, it is vital that there should be adequate opportunities for the transfer of pupils between different types of secondary school. It is, anyhow, impossible to decide finally at such an early age for what type of secondary education a child is best suited. Many "late developers" only show their ability later than 11 or even 13, and any method of selection inevitably produces a proportion of misfits—for instance, grammar-school pupils who would be happier at a junior technical school. There are, however, great difficulties in the way of frequent transfers. One is the loyalty of the pupil to his existing school and perhaps his teachers' reluctance to lose him; another is the reluctance of teachers and parents to sanction transfer to any type of school that carries less prestige; and others are the technical difficulties and psychological upsets involved in such movements. One possible solution to these difficulties lies in the development of "multilateral" schools, in which all types of secondary education would be carried on side by side and in which

transfer from one branch to another could be easily and smoothly effected by the decision of the teachers concerned. There are of course many other arguments for and against multilateral schools which cannot be discussed here; but the task of fitting the appropriate educational cap on each child points straight in their direction.

To bring all types of secondary education to a common and high level must be a major aim of educational progress in the next few decades. But no one should underestimate the width of the gulf that lies at present between, for instance, the grammar school and the "senior" school from which in practice the new "modern" school must initially evolve. The selection of pupils for different types

of secondary education must be based, eventually, purely and simply upon their own various needs; and these needs can doubtless be ascertained from school records. But, so long as there is a "better" and a "worse" in secondary education, it would be grossly unfair were the selection of pupils for the "better" secondary schools not to take place by open competition, held on as impartial and objective a basis as can be devised. Only when there are not merely secondary schools for all, but the right place in the right school for each child, can the strain and disappointment of competition be replaced by the harmony and continuity of natural educational development.

NOTES OF THE WEEK

Russia Strikes

With the launching of a sevenfold Russian offensive in Poland, Germany is facing the supreme crisis of the war, a crisis in some respects even more threatening than the collapse last September of the German defences in the West. The Russians have before them the open Polish and German plain with no Siegfried Line to cover the German frontier. The Russian armies, whose thrusts have been timed and co-ordinated with clockwork precision, are not likely to outrun their supplies and communication lines for some considerable time. The Soviet High Command has certainly used the long lull on the Polish front to build up a tremendous striking power with vast reserves behind it. The Russians are also reaping the harvest of the Hungarian campaign—the German divisions diverted to the defence of Austria cannot be swung back to support the Wehrmacht in Poland. Only central reserves and some units from the western or Italian front can be switched to the battlefields in the east. But Rundstedt can now rightly claim that his Ardennes offensive, though ostensibly it has failed to achieve any success, has nevertheless averted the immediate danger of co-ordinated Allied offensives on all fronts, a danger which would have spelt certain doom for Germany.

Nobody can yet prophesy whether the Russian offensives by themselves will have enough momentum to give Germany the knock-out blow. The armies of Zhukov, Rokossovsky and Koniev are marching with the slogan: "To Berlin!" The whole of Poland is likely to fall to Russia. So, too, may East Prussia, which is virtually outflanked by the capture of Warsaw; Upper Silesia, too, may be lost, for Marshal Koniev is already knocking at its gates. The best the Germans can still hope for is to hold the Oder line; they can perhaps hope, too, that the Germans' long instilled fear of Russia will produce the courage of despair. If these hopes fail, Berlin's Brandenburger Tor may see before very long the victorious march past of the Red Army.

Truce in Greece

The "cease fire" has sounded in Greece. ELAS forces are withdrawing not only from the Athens area, where they were defeated by British arms, but from Salonika, where they were in complete control. The demarcation line gives the British roughly the same area as that which was effectively occupied by the Germans. ELAS are retiring to the hills where guerilla activities can for a time continue to fight much more strongly armed forces. They have exchanged prisoners of war on an equal basis, which leaves a large balance of ELAS prisoners still in British hands. On the other hand, ELAS have taken hostages away to their own areas. Clearly, the truce is a state of unstable equilibrium only, a breathing space in which to prepare new policies.

The great question before the British Government is what policy will now be pursued. There are broadly two alternatives. One is to regard ELAS and EAM as a defeated and dissolving coalition, without popular support, a band of rebels who tried to conquer the state violently and who, having failed, can now be wiped out by the imperial and republican Greek Government of General Plastiras. Evidence and support for this view are sought in the announcements made by some members of the ELD (the Union of Popular Democrats) that their party has

renounced EAM and its extremist leadership, and in the action of seventeen trade unionists who formally thanked the British Ambassador for the intervention of the British Army. It appears to be the policy of General Plastiras himself, for he has refused an amnesty and promises punishment to the leaders of EAM. He also announced British support for the creation of a large Greek national army. This army is, it is true, to be recruited to fight the Germans, but it is difficult to see how it could do so with at least two-thirds of Greece still under EAM control. It is therefore a fair assumption that its first task would be the "purge" of EAM announced by General Plastiras.

But there is another possible policy for Greece, a radically different one. It is the policy outlined by Mr Eden in the House of Commons on December 20th, and which, until it is contradicted, ought still to be the policy of His Majesty's Government. It is quite simply to use the truce to bring EAM back into the Greek Government on the basis of an agreed settlement of the disarmament problem and an agreed policy on eventual free elections.

The logic behind this policy is the fact that the ELAS forces still control most of Greece and that any policy short of conciliation can only lead to prolonged civil war. It is far from certain that the evidence for the disintegration of EAM is correct. The Athens spokesmen both of ELD and the trade unions are all unknown men. Neither the president nor the secretary of ELD signed the declaration. No news can come from ELAS sources, for the British and American journalists are denied access to ELAS leaders. Finally, although the Plastiras Government may aim at impartiality, and the British military authorities certainly do, last Sunday's demonstrations in Athens should have served as a shrewd reminder that to preserve impartiality in Greece the British must be as watchful of the Right as of the Left. The bulk of the demonstrators were EDES men—the right-wing guerillas—and Monarchists.

If the British Government allow the drift of events to manoeuvre them into accepting the policy of reprisal and repression, they will find themselves fighting as partisans in a renewed civil war. Their only course is to compel negotiation. To a very large extent, the Plastiras Government is of their making. It is dependent upon British arms. It is therefore essential that there should be no departure from the earlier declared policy of the British Government—truce, negotiation, the rebuilding of the coalition, agreement on disarmament and finally free elections.

Lord Swinton Reports

The House of Lords debate on the International Civil Aviation Conference provided a good opportunity for a full official statement of British policy at Chicago. Lord Swinton's report was well received and the wisdom of his appointment endorsed.

The explanation of the point of view supported by delegates from the British Commonwealth and an account of the progress and achievements of the negotiations brought little new information to light. It did serve, however, to bring together in a comprehensive form the substance of the day-to-day reports. Possibly, some fuller explanation might be made, through the medium of press conferences and for the benefit of the American public, of the British argument that, in Lord Swinton's words,

... wasteful, unlimited competition is a breeding ground of waste and ill-will, and the best breeding-ground of subsidies you can have.

The extent to which this reasoning remains entirely unappreciated among the United States public is, in view of the clear lesson provided by pre-war civil air transport, quite surprising. If, as Lord Rothermere suggested, public opinion in America was not really behind some of the policies put forward at Chicago, it might have been even less so if objective information had been more readily available. To remedy this lack is the quickest and surest method of bringing American opinion round to renewed negotiations on the regulation of fifth freedom traffic.

Lord Swinton concluded with the announcement that a permanent Commonwealth Air Council of a consultative character had been established during the discussions at Montreal. The value of such a body, meeting from time to time in different parts of the Commonwealth, is obvious, particularly at the present time, when so much preliminary work needs to be done on routes and methods of joint operation.

On the question of Newfoundland, whose Commission of Government at first reserved its signature to the first two freedoms (thus refusing general permission in advance to foreign aircraft to land, even for refuelling), Lord Swinton's explanation was reassuring. From the American point of view, this move looked at first like a British attempt to control transatlantic airlines, and to use the pawn of the Newfoundland stepping-stone to gain concessions from the United States. That the Commission of Government has now reversed its decision will help towards dispelling American suspicions of Britain's sincerity in advocating full international co-operation in the expansion of civil air transport.

Canadian Elections

The skill with which Mr Mackenzie King surmounted the Parliamentary crisis over conscription in November and December has, it is now clear, won him only a brief respite. Faced with what looked like an irreconcilable quarrel within the ranks of his Cabinet and his party between those who insisted on conscription for overseas service at once and those who would not have it at any price, he contrived to secure a large vote of confidence from the House of Commons at the cost of only two Ministerial resignations (one on each side) and a handful of defections among his followers.

Given time, the Prime Minister might yet heal the breaches, as he has done many times before. But time is the one thing he cannot have, since the present House of Commons must be dissolved in April at the latest. General McNaughton, the new Minister of National Defence, is standing in a by-election for the House of Commons, where he has no seat at present. He is being opposed by the Co-operative Commonwealth Federation (or Socialist Party) whose votes contributed to Mr King's majority last month, and there is apparently doubt whether he will be returned. The Prime Minister has now announced that Parliament will be prorogued at the end of this month, and that further action will depend upon the result of the by-election on February 7th. The clear implication is that if the General is defeated, Parliament will be dissolved at once.

The prophets are finding it unusually difficult to predict what the result of the General Election will be. It seems almost impossible that the Liberals should secure another overall majority. They have been losing ground in almost all the English-speaking provinces, and in Quebec the Government's ambiguous stand on conscription has probably cost them the province's support. It may well be, however, that the Quebec seats will go to a local party,

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so before the date of expiry. If they fail to do so, their subscriptions will be automatically cancelled as soon as that date is passed, and this may mean a gap of many months before the despatch of copies can be resumed.

which would support the Liberals—*faute de mieux*—on all other issues. Whether the Progressive-Conservatives or the CCF will gain the more seats west of Quebec is an open question. And what their policies would be in international and Commonwealth matters is still more unknown. The CCF has strong isolationist, or at least nationalist, elements, and the Conservatives (though not their new Progressive allies) are the traditional loyalists of the imperial connection. Canada is on the verge of Great Power status, and the developments of domestic politics in the next few months will have perceptible effects on world affairs.

Oil Pipelines

The secret of the oil pipelines, which had been well kept, has been revealed this week. Since 1942 many hundreds of miles of pipeline have been laid in England by the Petroleum Board at the cost of the state. The original purpose was to avoid the necessity for tankers to come up the Channel, or into the North Sea, and the first line was laid from western ports to the London area. The second was from the Mersey to a junction with the first line. Thereafter, however, the purpose somewhat changed, and further pipelines were laid to distribute fuel to the bomber stations and to the south coast in preparation for the invasion of France.

The idea of a network of pipelines is not, of course, at all new; it is one of those obvious things, like summer time and universal suffrage, that are never done except in wartime. But having been done, the question of the future use arises. Some of the pipelines—those from the ports to the centres of population—will be as useful in peacetime as in war. Others have been laid to destinations which will be of less importance when there are no active bomber fleets to maintain. Without knowing the exact locations, it is legitimate to suppose that, with relatively slight further expenditure (the whole process is not very costly), a fairly complete network could be developed.

How should this state-owned pipeline be used? Pipelines can be treated as common carriers, handling any oil that is presented to them without admixture. But in this country, where the production and distribution of oil is so highly cartelised, there are really only two solutions. Either the pipelines should be sold to the industry, to be operated by it co-operatively. Or else the public ownership of the pipeline should be made the basis for a considerably wider state intervention in the domestic petroleum industry—that is, in all operations carried on in this country subsequently to the import of the oil, crude or refined—than has hitherto existed. There is more to be said for the latter solution than might appear at first sight. The problem of domestic refining is shot through with the public interest. And the distributive system by which the major companies have competed with each other by costly advertisement campaigns—costly, that is, to the consumer—but not by price or quality, makes as good an abstract case for Socialist reform as any of the familiar textbook examples.

Uneasiness in Japan

The American advance in Luzon and the heavy raids by Super-Fortresses on the Japanese mainland are causing a wave of extreme uneasiness in Japan. The Diet is to meet on January 21st, and it is likely that it will insist upon a change of policy and possibly a change of government as well. This Diet, elected in 1942, although it still contains many of the members from the old Constitutional parties, the Seiyukai and the Minseito, has an extremist element of deputies elected by the semi-totalitarian Imperial Rule Assistance Association. The President of the Association, Admiral Kobayashi, has held conferences with group leaders and local directors, and it is known that the Members of the Diet are pressing for a radical change in policy.

Any changes will certainly be in the direction of more complete economic mobilisation—there are complaints of slackness, of a falling munitions output, and general incompetence—and of more ruthless political action. Japan is still carrying on its politics on a semi-normal constitutional basis. There are no mass arrests or executions. The extremist elements probably think the time has come for a more energetic "rallying" of public opinion. The phase reached by Germany in 1943 is approaching in Japan, and the Japanese are probably looking for a Himmler to stiffen their resistance.

Science in Industry

Last week the scientists of the British Association left their laboratories to discuss "The Place of Science in Industry," and in doing so they made a gesture of good will that the business man ought swiftly to reciprocate.

Before the war, the scientist's rôle in industry was extremely restricted. He was very much the junior partner, and his activities were regarded by most industrialists with a complete lack of enthusiasm. This discord prevailed because science and industry did not understand each other: they spoke different languages. Lacking knowledge even of the rudiments of science, the average business man was unable to grasp the significance of the scientist's work. And the scientist, for his part, seldom tried to speak in the terms of the industrialist—in terms of costs and production. The gap should have been filled by interpreters, by scientists operating at the development level and able to work in harmony with the technicians. But the inadequate provision for scientific education precluded this in most cases. Scientists, pure or applied, were far too rare.

During the war the position has been vastly improved. The tasks of science have been clearly defined and a sense of urgency has inspired the efforts of scientists and industrialists alike. The record of progress outlined in the various speeches at the conference shows how profitable this close partnership can be.

Nothing could contribute more usefully to reconstruction than the perfecting of this partnership. It is surely time that the fine words and promises heard so often during recent years should be translated into facts. The first need is for a great increase in expenditure on scientific training of all kinds—but, above all, on training for industrial research and development work. As Mr W. C. Devereux pointed out to the conference:

There is a lack at present of suitable men for the higher posts in research management and administration. Unless the universities turn out a sufficient number of men qualified to interpret the new knowledge to industry, other countries, particularly the United States, will reap the benefit of the brilliant work being done in our university research laboratories.

The provision of the necessary funds for this purpose is clearly a duty of the state. It is essential, too, that the state's taxation policy should be so devised that industry is encouraged to spend wisely on all branches of research.

There remains the all-important task of reforming the attitude of industry towards science; and it is clearly a reform that must proceed from within. The direction and management of industry should be strengthened by men who combine at least a background of scientific knowledge with their business acumen; and they should be able to consult the expert scientist at every stage of their work. Until these requirements are met, it is impossible for British industry to mobilise and employ all the resources at its command.

The Yugoslav Dilemma

King Peter of Yugoslavia has put on record his objections to the agreement between Premier Subasich and Marshal Tito on the form of the Yugoslav Government. The King vetoes the candidates for the Regency proposed by the Prime Minister and the Commander-in-Chief and insists on his right to appoint the Regents. He also protests against the transfer of "unrestricted legislative power" to the Anti-Fascist Council of National Liberation. It is not very easy to see clearly the rights and wrongs of this dispute. Some reports from Yugoslavia suggest that the monarchy in Yugoslavia is not much more popular than it is in Greece. The victims of Alexander I's dictatorial and pan-Serb regime in pre-war Yugoslavia must have read with some scepticism the King's reference to "the democratic traditions of his forefathers" and to his own constitutional attitude. He is at least open to the suspicion that his democratic scruples may be a cloak for a policy of restoring the centralised Serb hegemony of pre-war years. This certainly is the interpretation put upon his statement by Marshal Tito and presumably by the Russian authorities as well.

Quite apart from the King, however, the objections to the Marshal Tito's regime cannot be dismissed lightly. The King's suspicion that the Subasich-Tito agreement "suggests a transfer of power to a single political group" is shared by non-Royalist politicians. The exiled representatives of the peasant parties, Serb and Croat, have put on record their protests against Marshal Tito's totalitarian practices in words not very different from the King's. As

in other countries, the campaign of hatred waged in Yugoslavia by the Communists against all their political opponents may result in artificial coalitions between the authoritarian Right and the moderate Left; and Allied policy is all too likely to be faced with the unenviable choice between two rival extremisms.

Tory Plan for Housing

The opinions of the Conservative Party on the housing problem make a valuable addition to pre-election literature. The provision of homes, particularly for bombed-out families and demobilised Servicemen, is going to be one of the major issues both of local and national elections, and the methods and principles declared by each party are bound to be critically examined. The latest Conservative reconstruction report, although it claims to be part of a "general survey" of post-war problems, is written with a careful eye on the gallery.

The report adopts a target figure of 750,000 houses, to be built in two years after the end of the war. This compares with 300,000 permanent houses proposed by the Government. The report, correctly, emphasises that, in order to meet the nation's vast housing needs, "non-traditional" methods of construction and pre-fabrication will have to be extensively applied. The Conservative committee was greatly impressed with the results of the Northolt experiment in prefabrication, and urges that it should be extended. It further proposes that local authorities should provide estimates of their immediate housing needs, with a view to compiling a national survey, that architects, townplanners and building craftsmen should be given priority of release from the services, and that all available temporary accommodation in camps and hostels should be utilised.

This is all very necessary in the emergency period. But when it comes to the question of agencies and finance for the longer term, the report is on less firm ground. It is an admirable objective to say that

private enterprise . . . must make up its mind to build houses to let in far greater numbers than heretofore.

but merely to raise the upper limit of the value of houses

An Invitation
THE
PRIME MINISTER
has said:
"We must make exertions to
restore our export trade."

The Midland Bank invites all who are making plans for business with other countries to take advantage now of the Bank's co-operation.

The Overseas Branch of the Bank in London and the Foreign Branches in various provincial centres have a vast fund of information and experience, and through many thousands of banking agents in all parts of the world facilities are available for handling every type of transaction.

The Manager of any of the Bank's 1,800 branches will welcome the opportunity of discussing problems related to foreign trade.

MIDLAND BANK
LIMITED

for which subsidies can be granted will not by itself achieve very much. The report proposes that any house with a floor area not exceeding 1,750 square feet should be subsidised, and that the subsidy should be half the amount by which building costs after the war exceed the 1939 level. No such programme, even with its pious admonition, could possibly induce private enterprise to forgo the attractions of building houses to sell instead of to let. Moreover, a subsidy given on the excess of natural cost over a fixed figure has been proved to be the most wasteful of all methods.

Apart from some useful, though cautious, suggestions—the strengthening of bye-laws controlling sub-lets and the employment of estate managers on housing estates—the contribution of the report to an adequate solution of the complex problem of housing is seriously limited by its unwillingness to contemplate central enough control of the forms of building. If anything is to be learnt from the miserable past of Government housing policy, it is that new methods of administration, no less than new methods of building, can hardly do worse than the old ones.

Ruthenia and the Soviet Union

The occupation of Sub-Carpathian Ruthenia by the Red Army has been followed by demands raised in Kiev for the incorporation of that country into the Soviet Ukraine. When Dr Nemetz, the Czechoslovak Government's delegate, arrived in Ruthenia he found his authority defied by local authorities claiming Ruthenia's right to join the Soviet Union. These claims probably reflect a genuine popular mood. Over two thirds of Ruthenia's 750,000 inhabitants are Ukrainian. Ethnically and socially, the country is far closer to the Bukovina and eastern Galicia than to Bohemia and Moravia. The woodcutters and shepherds of this remote and neglected province live in the utmost poverty, and even before the war they were powerfully attracted by the Soviet Ukraine.

To-day, when all Ukrainian lands are gathered together within the Union and a well-equipped, well-fed and modern Ukrainian Army is on Ruthenian soil, the Ruthenians compare Soviet standards very favourably with their own. Dr Benes' Government may not be anxious to make an issue of recovering Ruthenia (which was annexed by Hungary in 1939), but they can hardly find Russia's methods of raising the matter very reassuring.

Russo-Czech Friendship

The Ruthenian issue may have a wider significance. Although Moscow has officially taken a non-committal attitude and has conveniently relegated the matter to the "independent" Government of Kiev, the Soviet Government is clearly ready to encourage Ruthenian irredentism. This attitude is in sharp contradiction to Russia's pledge to restore Czechoslovakia within its pre-Munich frontiers. It is even hard to reconcile with the much publicised sincerity of Russo-Czech friendship. Has a cloud gathered to disturb the earlier serenity?

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

It is also significant that the Czechoslovak Government has not yet followed the Soviet lead in recognising the Lublin Administration. This omission has certainly caused irritation in Moscow, where it was expected that the Czechs, like the French, would at least establish *de facto* relations with Lublin. Now whether or not the new Russian campaign over Ruthenia is a method of "putting the heat" on Czechoslovakia, it at least underlines the capriciousness and instability of a policy in which the pledge given one year can be rescinded the next. The Czechs have tried very hard to keep in step with Russian policy; and they might have hoped to earn some security against its sudden and bewildering variations.

Argentine Diplomacy

When in the near future the Foreign Ministers of the American republics meet in Mexico City to discuss, among other things, their relations with the one absent republic, Argentina, they will find themselves faced with the difficulty which obstructs the diplomacy of other nations in their dealings with that country. All may well deplore the structure and policy of the Argentine Government. But what, short of war, can be done from outside to change them? The Argentinians have manoeuvred the charges against them on the ground of internal politics. The retiring Foreign Minister, General Peluffo, has on several occasions strenuously denied that Argentina is the enemy of hemisphere collaboration. He argues that his Government has broken with the Axis and would support all genuine measures of hemisphere defence. Thus when he despatched a Note asking for a special Pan-American Conference to consider Argentina's case, he protested against his country's "arbitrary exclusion" from the American community. His government, the Note continued, "will not close its doors to any understanding on an honourable basis."

The sting of the Note lies, however, in the statement that internal measures affecting Argentina's "juridical and institutional regime" cannot be discussed in an international conference. The strategy behind these moves is obvious. Argentina is attempting to gain Latin American sympathy as a supporter of hemisphere solidarity who nevertheless will fight any encroachment on national independence and sovereignty. There can be no doubt that this is potentially a popular line. The difficulty is that it is precisely Argentina's internal policy which seems to offer the gravest threat to the pan-American ideal. The break with the Axis has been formally correct but in letter rather than spirit. And the ban imposed on Axis newspapers has been accompanied by vexatious restrictions on American newspapers and agencies. The nationalism and authoritarianism of the regime are unashamed and under the energetic leadership of Colonel Perron who is now Vice-Premier, War Minister and Secretary for Labour, the Army has been doubled in a year. The Argentine Government has already felt impelled to reassure Chile that it has no warlike intentions, but internal politics belie its words.

Under such conditions, how can the other republics fail to be interested in the "internal" affairs of Argentina? Equally, how can they take any effective action to reduce the threat? From exile, the veteran Argentine socialist leaders, Dr Nicolas Repetto and Dr Alfredo Palacios, have appealed to public opinion, but the Argentinians at the moment are economically prosperous and politically apathetic. They show no signs of "democratic resurgence." Yet if they do not move to change their government, it is hard to see what outside Powers can do.

Winter Generally

It is wise, perhaps, when describing the British climate in print to use the vaguer terminology of geography. But such phrases as "Equable" and "Cool Temperate" are grossly misleading if they are applied to the average winter. The British people find the weather a subject for almost daily lamentation, yet they can seldom be induced to take sensible avoiding action. This fact is not without economic significance, and the moment is opportune for paying it some attention.

The extent to which snow hinders communications is not generally realised. Many main roads in northern England are rendered impassable every year through snow or ice obstruction on their summit sections. In the northern and eastern Pennines there is an average annual hindrance to traffic, on roads at 1,000 feet, of between 30 and 35 days;

and roads are completely blocked by drifts for between seven and ten days. At 1,500 feet in the same regions the average road blockage is 20-30 days. While it is unusual for heavy lorry and rail traffic to be interrupted completely by snow conditions, the same is not true of the business man in his private car. This fact has an important bearing on the relative accessibility of industrial and commercial premises—and consequently on their location. In countries where the severity of winter is predictable, precautions are taken against such interruptions of traffic. In Norway, for example, the summit districts of main roads are protected by drift screens.

Every winter brings unnecessary hardships, sufferings and expense to the British people. Inevitably at this time of year there is a plague of burst water-pipes, caused, no doubt, by the exhibitionism of native plumbing. It is followed (and preceded) by a series of epidemics—of which the common cold is the most notable—caused, or at least encouraged, by the draughtiness of British houses, buses and trains. How much of sickness and absenteeism can be attributed to these national follies it is impossible to say, but it must be considerable. It may not be necessary to insulate British houses with double windows, as in Russia, but very much more thought should be given to methods of excluding draughts.

Meteorologists, it may be added, predict winters of greater severity during the second half of this twentieth century.

Shorter Notes

The following table gives the number of civilian casualties in air-raids since September, 1939:

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940	1,494	1,980	3,474
Sept.-Dec., 1940	22,282	28,522	50,804
Total, 1941	20,863	21,839	42,702
Total, 1942	3,221	4,149	7,370
Total, 1943	2,357	3,462	5,819
Jan.-May, 1944	1,561	2,916	4,473
June-Aug., 1944	5,479	15,934	21,417
September	170	360	530
October	172	416	588
November	716	1,511	2,227
December	367	847	1,214
Totals to date	58,682	81,936	140,618

Those killed in air-raids during December included 111 men, 192 women and 64 children under 16.

The Wages Councils Bill was given its second reading in the House of Commons on Tuesday. To judge by the very nearly unanimous welcome it received from Members of all parties, the Bill should have a smooth passage through Parliament, unless doubts and criticisms are being reserved for the committee stage. None of the opponents of the original Catering Bill spoke in the debate, which was unspectacular.

According to a parliamentary answer, the total (net) amount borrowed by the Government between September 3, 1939, and December 31, 1944, was £13,975 million. The sum was raised as follows:

	£ million
Small savings	3,003
Subscriptions to public issues (other than floating debt) from non-official sources	4,609
Floating debt from non-official sources (including Treasury deposit receipts)	4,347
Tax reserve certificates	760
Extra-budgetary official funds	818
"Other" debt, including borrowings abroad	408
	13,975

In November, 1944, no detention orders were made under Regulation 18B and 18 persons were released. The total number of persons detained under the regulation at the end of November was 76.

Government Training Centres, which have trained over 300,000 industrial recruits, including 100,000 women, since September, 1939, are to be redesigned and expanded to retrain men and women from the fighting Forces, civil defence and munitions factories for civilian occupations. Priority will be given to ex-Service people, especially those who have been disabled. Retraining is bound to play an important part in the plans for industrial reconversion, and in the longer term context of a full employment policy. Although the bulk of training will have to be given in industry itself, it is satisfactory to know that the Ministry of Labour is making a start and that existing facilities will not be wasted.

The following table, which appeared in Hansard of January 16th, gives the total casualties to all ranks of the British Empire forces from September 3, 1939, to November 30, 1944:

	Killed	Missing	Wounded	Prisoners of War	Total Casualties
United Kingdom*	199,497	39,383	235,207	161,020	635,107
Canada	28,046	4,807	39,010	7,128	78,985
Australia	18,915	6,913	34,336	25,597	84,861
New Zealand	8,919	928	17,115	7,153	34,115
South Africa	5,783	599	11,798	10,765	28,943
India	17,415	13,935	45,224	76,023†	152,597
Colonies	4,493	14,015	3,686	6,752	28,946
Total	282,162	80,580	386,374	294,438	1,043,554

* Including men from overseas serving in these forces, in particular from Newfoundland and Southern Rhodesia.

† Including 22,083 officers and other ranks missing but presumed prisoners of war.

A comparison with an earlier return giving casualties for the first four years of war shows that in the succeeding fifteen months, which include nearly six months of operations on the Western Front, total Empire casualties increased by 56 per cent. United Kingdom casualties increased by 64 per cent and Canadian casualties were nearly three times as heavy as in the first four years of war.

MILK CHOCOLATE & the Nation's Milk Supply

THE contribution of the Milk Chocolate Industry in ensuring Britain's milk supply during these critical war years is not generally realised.

Before the war this industry was using 40 million gallons of milk a year. Cadburys took more than half of this vast quantity. It came from the counties of Hereford, Gloucester, Salop, Stafford, Flint and Denbigh where Cadburys have consistently encouraged dairy farming over a number of years. In these areas they have established four Milk Factories which have greatly assisted in developing milk production. Today these four factories alone collect and distribute sufficient fresh milk for well over a million people.

Cadbury means Quality

Letters to the Editor

Foreign Trade and Employment

SIR,—A prevalent confusion about the relation of foreign trade to home employment has found its way into the Government White Paper on Employment Policy (Cmd. 6527) and, more explicitly, into Sir William Beveridge's book on "Full Employment." It consists in the assumption that the significant factor in foreign trade, so far as home employment is concerned, is—not the amount of exports, but the difference between exports and imports, otherwise the foreign balance.

Sir William Beveridge (p. 139) sets out Great Britain's Actual Employment Outlay for 1938 under the headings:

	£ million.
Private consumption outlay	3,510
Private home investment outlay	420
Balance of payments abroad	55
Public outlay from revenue	725
Public outlay from loans	75
	4,675

The difference between this total and the total estimated capacity of £5,175 million gives the Unused Resources figure of £500 million.

Now the negative foreign balance figure of -£55 million is arrived at by deducting from the total outlay that part of it which represents expenditure on imports (since this does give home employment). The resulting figure correctly represents "employment outlay." But the fallacious inference is drawn that the elimination of the negative foreign balance will increase the total employment outlay and bring unused resources into operation, whether it is effected by increasing exports or by reducing imports. This is incorrect, both economically and arithmetically. An increase of £55 million in exports would indeed both eliminate the negative foreign balance and add an additional £55 million to employment outlay. But a reduction of £55 million in imports, while it would eliminate the negative foreign balance, would also reduce the total home outlay by £55 million of the expenditure on imports which is included in it; unused resources would remain at the same level as before and the total of employment outlay would remain unaffected. Which, indeed, is what one would expect of a change in the amount of that outlay which *ex hypothesi* gives no employment at home.

It is true that Sir William Beveridge slips in an assumption that "home outlay of all kinds is maintained without change." But he does not make it clear that this will not be so, in the circumstances given, unless we are to accept the extreme protectionist doctrine that any import shut out is at once replaced by means of an equivalent outlay in home production. Rejecting that doctrine, we can only say that the immediate effect is as stated in the last paragraph, though there may (or may not) be as a secondary effect some stimulus to home production.

The White Paper (p. 17) similarly argues that since expenditure on imports does not give home employment and foreigners' expenditure on exports does, it is the difference between the two (not, as one would expect, the export figure) which should be treated as one of the constituents of total employment expenditure.

The confusion is avoided if the items are set out thus:

- A. Home outlay on home production.
- B. Home outlay on imports.
- C. Foreign outlay on home production (exports).

It is then apparent that A and C are the factors relevant to home employment, not the difference between B and C. B is the measure of the extent to which home outlay is inoperative in producing home employment. A reduction in this item does not necessarily mean more home outlay which is operative; it may merely mean a reduction in the total home outlay. What gives employment at home is outlay on home production whether by us or by foreigners; outlay on foreign products by us gives employment abroad and not at home, but does not reduce home employment.

The danger of this mistaken emphasis on the foreign balance rather than on the export figure is that it leads directly to the conclusion (see p. 209 of Sir William Beveridge's book) that it is to the advantage of a nation from the point of view of employment to have an export surplus, or in other words to sell and not to buy.—Yours faithfully,

Cambridge

MYRA CURTIS

IDAC

SIR,—In view of the article which appeared in your issue of December 16th, I venture to contribute the experience of my own company.

We were engaged for some years prior to the passing of the Import Duties Act in the importation of specialised and intricate machines from Germany. The nature of the particular machine in question, and the small demand, was such that the continental factory sufficed and a second factory elsewhere would have been redundant. We introduced this machine to the particular industry concerned in this country, and about the year 1932 it was becoming recognised as essential to that industry. The cash value of the machine was fairly high and the number required quite small. It would never in days of unrestricted trade have been an economic proposition to start a factory in this country.

In our early dealings with IDAC all was plain sailing, although of course from the first we had to deposit the duties and reclaim them subsequently under licence. This tied up some of our slender capital. In a very short time, however, difficulties were put in our way. In the first instance IDAC accepted that there was no such machine manufactured in this country. In the course of a year or two an English-made machine was said to be in the offing; IDAC then refused licences on the ground that a machine would shortly be forthcoming. We could not get a licence for spare parts. For a time we convinced them that no such machine existed; then a rival machine did appear, but was discarded by the industry. Nevertheless, our licences were withheld, this time on the ground that there existed a machine, and from then onwards we had to pay duties, although always under protest. Actually we had some hundreds of pounds still at issue when the war broke out. IDAC, arbitrary in death as in life, put up the shutters and has not been heard of since. Our deposited cash is still with the Customs.

Prior to the war we began to make ourselves, as far as possible, self-supporting in the manufacture of spare parts. In this we were influenced to some extent by the duties, but the major factor was the high rate of mark exchange. War broke out, and IDAC's contention of a machine being available in this country was proved completely false, and, but for the machines we had imported and for some which we have built since, the whole industry—an important line in native foodstuffs—would have been gravely handicapped. The British-made machine never came to maturity.

IDAC having been an obstructive and uncertain factor to our business for seven years, we are in a position to judge how its activities reacted on a small specialised industry. We met with painstaking and personally disinterested attention from the staff, but being a small isolated industry not attached to a trade association, we could never secure the attention of the higher ranks of IDAC.

However inferior the English-made machine, in the eyes of IDAC so long as it existed, it might eventually be workable, and therefore deserved protection. IDAC never went to the trouble of inspecting the performance of the two machines.

Our IDAC memorial of those years is a row of office files representing many hours of mostly unnecessary work for both parties. The moral, I think, is that no protection should be granted either on mere intention to produce or subsequently without an impartial survey of the quality of the rival products.—Yours faithfully,

DIRECTOR

AMERICAN SURVEY

The New Call-up

The supplementary message on National Service legislation which Mr Roosevelt is sending to Congress this week may indicate how much pressure the Administration is prepared to put upon Congress to secure universal conscription. The Services, which have always favoured such a measure, have announced a sharp stepping-up in the draft, which will force early action in the civilian field if the new production schedules are to be met. During the next six months the Service intake will total 900,000 men, compared with the 480,000 which would have been called up at the current rate. Mr Stimson has denied, though rather ambiguously, the suggestion that the Army, at least, is already beyond its announced goal of 7,700,000 men and that it possesses a "hidden reserve" of 300,000; what he said was that the Army was "under-strength measured in terms of effectiveness." The new 900,000 must be capable of front-line action. To obtain them, it is believed that it will be necessary to cancel the deferments of most men under 30, as the pool of those under 26 is practically exhausted, with the exception of agricultural deferments. It is estimated that about 700,000 new industrial workers will have to be found, though not all of them will be men.

Bills have already been introduced to provide for the drafting of nurses for the Services, and to apply the "work or fight" provision to all men from 18 to 45, the latter sponsored by Representative May and Senator Bailey, of the Military Affairs Committee. In its present form, it would conscript into Service labour battalions men in these age-groups who changed the occupation for which they were deferred, or refused to undertake work of national importance; and they would be deprived of the financial benefits granted to other enlisted men. These sanctions probably will be dropped in favour of civilian penalties; the Services are no more anxious than they were last year to accept, for disciplinary purposes, men unfit for service overseas. Such a change would modify labour opposition, as would the reported agreement to give the Manpower Commission, rather than the military, the authority to assign men to war jobs.

These signs of early action on partial manpower measures are regretted by convinced believers in more general legislation, who fear they may be regarded as adequate substitutes, rather than preliminaries, to a National Service Act. Mr Walter Lippman, for example, argues with some force that the time when universal sanctions will be most needed is when Germany is defeated and strong measures are required to keep men at the war machines. It is not always remembered that the need for substantial armies of occupation will prevent a wholesale release of manpower.

Civilian Supplies

The New Year, which it was confidently expected last summer would bring substantial increases of civilian supplies, has had to be marked by further restrictions. The War Food Administration chose the inappropriate moment of December 24th to announce that 85 per cent of all civilian meat supplies would be rationed, rather than the 37 per cent restricted in December. Outstanding points coupons were cancelled, and some processed foods went back on the ration. Sugar is short; and a cut in the butter ration is forecast. Ration cards are not enough to coax these two from reluctant grocers. In part the dramatic change from the prophesied glut reflects the military disappointment in Europe.

It also reflects a certain happy irresponsibility at rationing headquarters. The Office of Price Administration rather ingenuously explains that meat supplies could not be conserved during 1944 because so much of the meat supply was off the ration. It admits that faulty distribution, particularly east of the Mississippi, kept 76 per cent of the country's consumers short of their proper allocation. A price ceiling on live cattle, for which butchers have gone on strike, has just been granted. The sugar squeeze is partly the result of shipping shortages; but it is not denied that housewives inveigled some 400,000 tons more out of the authorities for home canning than they were entitled to receive.

The "spot authorisation" programme, which it was hoped would alleviate the scarcity of more durable civilian goods like irons, ranges, and vacuum cleaners, is only barely surviving the sudden shortage of materials. In 1944 the total of these authorisations exceeded \$620 million, but they only raised the proportion of non-war goods shipped by manufacturers to 39 per cent of the total as opposed to 38 per cent in 1943. In 1945 this will be reduced to a mere "dribble"; civilian production will not be allowed to rise above that permitted in the last quarter of 1944. Outstanding authorisations are not cancelled; but they will be hard to fill, not so much because of manpower scarcities, as because of the severe cut in allocations of carbon and alloy steel, copper, and other metals.

The Oil Agreement

The Anglo-American Oil Agreement has now been officially withdrawn from the Senate and a substitute document is to be negotiated. This is a substantial victory for the lobbying tactics of the petroleum industry. The Chairman of the Foreign Relations Committee, Senator Connally from Texas, the greatest oil state, has been openly hostile

BANKERS TRUST COMPANY

ALSO
BANKERS TRUSTEE AND EXECUTOR COMPANY LIMITED

to the Agreement from the start, and its formal demise would have occurred before now if the Senator had not received a sharp rap over the knuckles from all the more responsible organs of the press when he revealed his intentions some weeks ago.

What makes the agitation the more remarkable is the fact that the Agreement, as published, was disappointingly innocuous. The consultative body it envisaged seemed to be a very small mouse to emerge from the mountainous labours of a team of no less than four Ministers of the Crown who were sent to Washington in the summer. The overt objection raised by the American petroleum industry was that they saw in the Agreement the shadow of government control over their domestic operations, but it may be that some resentments arising out of the course of the negotiations, which were stormy at times, have also had something to do with it. A new text is said to have been agreed between the industry and the Administration, and is now to be presented to the British. It remains to be seen whether the British Government will be content with a body that can inquire into the disposition of all British-owned oil supplies but into very little of the United States' resources.

The merits of the Agreement apart, it is disappointing to find the first of the post-war schemes to reach the formal stage striking the familiar snag of Senatorial recalcitrance. There are, of course, special circumstances. But will there not be in every case? One experience does not establish a precedent. But does it not legitimately raise a doubt?

* * *

Free Speech in Texas

Once more the Supreme Court has intervened in Texas. Last week, in a 5 to 4 decision, it declared unconstitutional a Texas statute requiring labour organisers to obtain identity cards before being allowed to undertake membership drives. The law was challenged in September, 1943, by Mr R. J. Thomas, vice-president of the Congress of Industrial Organisations, who at a meeting at Pelley, Texas, asked one man to become a member of the Oil Workers' Union, a CIO affiliate. The action of the Supreme Court reverses a decision of the Supreme Court of Texas, which upheld penalties of three days' imprisonment and a \$300 fine imposed on Mr Thomas.

The view of the majority was that, although the State had the right to regulate labour unions in the public interest, this statute abridged the rights of free speech and assembly guaranteed in the Bill of Rights (the first ten amendments to the Constitution). The majority rejected the contention that these rights were left unabridged by the provision that the State authorities could not discriminate between organisers by withholding cards in some cases.

The Supreme Court divided along its established progressive-conservative cleavage, with Chief Justice Stone, and

Justices Roberts, Reed, and Frankfurter dissenting, on the ground that the Court should not "incontinently reject the State's considered view of policy" particularly as the Supreme Court of Texas had found conditions to exist which justified registration of paid organisers.

What these conditions may have been is not specified, but they can hardly have justified imposing on labour organisers a condition not applied to other public speakers, and one so capable of abuse. In recent years there has been a marked tendency to seek from State Governments legislation so hostile to labour that it stood no chance of passage in Washington. This has been particularly true of the Southern States, where organised labour is still weak and prejudice strong. When the Supreme Court insisted last year that Texas might not exclude negroes from voting in the primaries, Texans and other Southerners openly avowed their determination to find a legal loop-hole through which the practice might be continued. The same thing may happen in this case, although Texas, which looks forward to a post-war industrial golden age lubricated by and built upon oil, has little real self-interest in perpetuating the hostility to unions characteristic of the old feudal South.

Shorter Notes

The Senate Foreign Relations Committee has been strengthened by the appointment of three Democrats of enlightened international views. They are Senators Hill and Hatch, of the now-famous B.H. combination, and Senator Lucas, of Illinois. They replace Senators Gillette, Reynolds and Clark. The Republicans have made a less decided break with the isolationist membership of the old Committee by appointing Senators Wiley and Bridges. Their nomination does not, however, affect the general result, which is to give Mr Roosevelt a Foreign Relations Committee sympathetic to ideas of international co-operation rather than the hostile Committee which helped to defeat President Wilson.

The Dies Committee becomes the Hart Committee. Its new Chairman is Representative Edward Hart, of New Jersey, who has connections with the notorious Hague political machine of Jersey City, but who was endorsed by Labour in the election. Other tentative appointments include four Southerners out of the six Democratic seats; and it is reported that the Republicans will send back two members of the old Committee. The new Chairman is said to be equally hostile to Communists and capitalists intent on safeguarding property rights. When to this is added the fact that he voted against the renewal of the Committee, the temptation to hope for a change of heart is almost irresistible.

THE WORLD OVERSEAS

The Russian Zone

SEVERAL months have passed since the Red Army broke into the Danube basin, and brought the whole of south-eastern Europe, with the exception of Greece, under Russian control. Throughout that area Russia's victory has entailed social and political upheavals. The old regimes have collapsed like a house of cards; new governments have sprung up. The impact of the war has shaken the economic structure of the Balkan countries to its foundations.

Under these conditions there must have been important developments in Russia's relations with South-Eastern Europe. Yet it is impossible to say in any detail what they are.

A complete veil of secrecy has fallen over Russian-occupied Europe. Odd hints and pieces of information point to some political tension here and there, and to some extent armed clashes between Russians and local forces. But secrecy has made it almost impossible

to gauge the scope and the importance of the disturbances. Whatever its policy in the occupied countries, the Russian Government is not handicapped by the exacting demands of democratic opinion and parliamentary control. The Russians in Bucharest or Sofia can veto the appointment of ministers without the fear that their government in Moscow will thereby be exposed to searching questions by members of the Supreme Soviet, or to self-righteous criticism from the State Department. While the conflict with the EAM in Greece has deeply stirred opinion in Great Britain and America, the disarming, say, of the Serb Chetniks, or of Maniu's followers in Roumania, has not caused the slightest stir in Moscow.

There is one important difference between the British-American and the Russian zones of operation. Apart from Italy, the British and the American zones are in Allied countries. In the Russian zone only Poland and Jugoslavia

are Allies; the rest are satellite countries that have changed sides in the war. It is obvious that the satellite countries deserve far less consideration than the Allied countries, and that their demands for national sovereignty should be strictly subordinated to the military needs of the Allies.

By a strange paradox, it has been precisely in Allied countries—Poland and Jugoslavia—that Russian policy has so far produced the most acute crises. The conflict between the Russian Command and the Polish Home Army has been quite as sharp as that between General Scobie and ELAS, although the Russian Command has had sufficient military force at its disposal to prevent things in Poland from drifting into an open battle. Detachments of the Polish Home Army—regiments and even whole divisions—have been ruthlessly disarmed, interned and even deported by the Russians, while the Poles have been conscripted for the Polish Armies of General Rola-Zymierski. General Mikhailovitch's Chetniks have been granted an amnesty on condition that they report to Marshal Tito's authorities and lay down their arms. In both countries the administration supported by the Russians is firmly based on Communist nuclei and excludes most of the independent political tendencies.

Satellite Governments

The Soviet-sponsored Governments in the satellite countries—Roumania, Bulgaria and Hungary—seem to be much more broadly based and representative than those of Poland and Jugoslavia. This is even more true of the new Finnish Government. While in Poland the Lublin Government insists on the abolition of the 1935 Constitution, none of the satellite governments in the Soviet sphere has so far embarked upon any constitutional changes. In Roumania and Bulgaria the Russians have been at pains to demonstrate their respect for the monarchies. King Michael of Roumania has received praise from the Roumanian Communists as well as from the Russian members of the Control Commission. In Bulgaria the *coup d'état* of September 9th—a combination of revolution and palace revolt—did not end in the proclamation of a Republic. The old Regents were deposed and new ones—including the Communist Regent Pavlov—have been appointed. Generals who served under Horthy, Antonescu and King Boris head the new Governments. It is, however, true that they are believed to have been opposed to the pro-Axis policies of their former masters. The ruling coalitions nominally include the members of all parties from Right to Left.

Yet it is difficult to say to what extent the representatives of the Right in these Governments can speak on behalf of their traditional following. Quite a number of their followers certainly supported the Axis; and of necessity they are now excluded. This gives a marked predominance to the Left (and inside the Left to the Communists) in the present alignment of forces. The Conservatives and even some politicians of the Centre clearly find it hard to march in step with their Left partners. For example, the Liberal Bratianu and the peasant leader Maniu have withdrawn from the Roumanian Government. In Bulgaria there is friction between the Military League—Zveno—and the National Front. The Roumanian Peasant Party, the National Zaranists, has split into two groups, and only the Left group is now in the Government. Similarly in Bulgaria, Dimitriev, the traditional leader of the Agrarians after Stambuliski's death, seems to be in semi-opposition. To what extent the Left Agrarian groups are really representative of the peasantry cannot be said, since no elections have yet shown the relative strength of the various tendencies.

While the façade of a democratic party system has been set up, the picture behind this façade remains largely unknown. Party controversies are obviously damped by strict military and political censorship, and by a somewhat unreal insistence on national unity. The Russians' task is certainly far from easy. Pro-German and anti-German elements have been closely mixed up in the various Balkan parties and groupings. It is a difficult job to disentangle them and to separate the sheep from the goats; yet some political selection is unavoidable if only for the sake of military security. It is this motive, apart from popular demand, that gives so great an importance to the purge in the Balkan countries. In addition, the party systems in Roumania, Bulgaria, and to a lesser extent in Hungary, were destroyed long ago; even "trustees" more democratically minded than the Russians would probably find it very difficult to re-create genuine democracy under such conditions. And the Russians, obviously, are not so minded.

Russia's immediate policy is dictated by military security. As a rule, this has not favoured free expression of popular will. The Russians are naturally anxious to see "friendly Governments" in the countries under their control. In itself this is a legitimate desire. It implies, however, a dilemma to which no definite solution has yet been found. In South-East Europe the Right has traditionally been anti-Russian because it has been anti-Bolshevik. The Communists' friendship for Russia has borne all the marks of an almost religious zeal, on which the Russians can most safely rely. The question to-day is whether in Roumania or Hungary or Poland a pro-Russian policy can be pursued by non-Communists, or whether the Russians can rely only on the Communists to guarantee friendship with Russia. For the time being the Russians have not found any definite solution of this problem. Their policy is largely empirical and experimental. It attempts to secure Russian influence on a socially conservative basis in one country while destroying that basis in another. It tries to maintain control on occupied territory by using the monarchy and the officers' corps where possible, and by "appealing to the people" when necessary. But everywhere it is guided by old suspicions as much as by new policies.

The new policy demands that the non-Communist elements should be spared and won over; the old suspicions, however, demand newer and bigger purges which tend to upset the political life of the occupied countries.

The dilemma is repeated in almost every sphere. "Efficiency" demands that the old administrative machines should carry on their work and that no attempt should be made to set up Soviets. Yet the old administration is, usually with reason, regarded as unreliable. Officials charged with carrying out the armistice terms in Roumania and Bulgaria have been found to be former associates of the Iron Guard or simply collaborators. A Minister of the Interior in Roumania was caught hiding anti-Russian legionnaires from the Allied Control Commission; when this caused a reshuffle of the Cabinet, Communist influence accordingly increased. Again, members of the new Societies of Friendship with Russia turn out to be the members of the former Societies of Friendship with Germany. The purges become a vicious circle under these conditions. "Military expediency" cannot be non-political.

Economic Problems

In economic matters the problems are no easier. All satellite countries have to pay indemnities out of their shrunken resources. The terms of the indemnities are on the whole ill defined. Whether they are more or less exacting depends on a variable Russian reading of their terms. In Roumania the Russian officers of the Control Commission are engaged in recovering the loot carried away by the Roumanians from Transdnistria and in tracing German property which has, according to the terms of the armistice, to be handed over to the Russians. Industrial equipment, railway trucks, raw materials and cattle are dispatched to the devastated areas of the Southern Ukraine. The Minister of National Economy together with the managers of many industrial establishments have been accused of concealing looted or German property. In the course of this "restitution of property," some of the equipment of the Roumanian oil refineries has also been carried away to Russia. It is hardly possible to say how far the campaign has been kept within the limits of a legitimate restitution of property and how far it has inflicted unjustified damage on Roumania's economy. In Finland, the Russians have

Trusteeships and Executorships Accepted.

interpreted the terms of the indemnity to mean that all reparations in kind are to be valued at 1938 prices. Recently however they have modified the terms by allowing the Finns to fix the prices of goods delivered to the Russians at a level 10 to 15 per cent above that of 1938. The problem of indemnities is bound to weigh heavily upon the political relations of Russia with the vanquished satellites; ruthless exactions will clearly not promote closer friendship.

After the war, Russian policy in South-East Europe faces two alternatives. If the Russians decide to exercise control in such a manner that the national sovereignty of each small state is seriously impaired, then they will be able to rely only on the Communists and ideological *Gleichschaltung* will be the result. If on the other hand they are content to exercise the strong but indirect influence which geography and strength combine to give them, they should be able to avoid direct interference in the domestic concerns of South-East Europe. The evidence so far does not indicate clearly which alternative the Russians will choose.

Eire's Overseas Trade

[FROM OUR DUBLIN CORRESPONDENT]

THE annual estimates of the Balance of International Payments, published in the *Irish Trade Journal*, demonstrate clearly the effects of the war on Irish economic life. Visible imports fell from £43,415,000 in 1939 to £26,082,000 in 1943. As the price of imports practically doubled during the period, the fall in volume was very considerable. Detailed figures of Irish imports are not available, but the recently published statistics of British exports throw some light on the decline of imports of many articles into Eire. For example, if the years 1938 and 1943 are compared, exports to Eire of beverages and cocoa preparations declined from 56,000 to 14,000 barrels, home-made spirits from 229,000 to 63,000 proof gallons, wrought iron from 4,547 to 227 tons, iron and steel and their manufactures from 55,000 to 15,000 tons, and unbleached cotton yarns from 5,095,000 to 1,735,000 lb. Similar decreases took place in almost every other commodity. The reduction of imports of coal, petrol, tea and other articles commonly consumed in large quantities has caused the greatest inconvenience. The reduction in the imports of fertilisers and feeding stuffs has seriously dislocated agricultural production.

Visible exports were £27,480,000 in 1943, compared with £26,892,000 in 1939. As there has been a rise in prices, their volume must have steeply declined. Export prices did not rise so much as import prices. The terms of trade moved against Eire. Among invisible exports, income from investments abroad increased from £13,600,000 to £13,800,000. While emigrants' remittances from the United States and other foreign countries declined from £2,226,000 to £1,639,000, remittances from the United Kingdom increased from £600,000 to £10,950,000. This remarkable increase reflects the emigration of large numbers of Irish workers to Great Britain for war work of various kinds. Total ex-

ports were estimated at £48,775,000 in 1938, and at £61,250,000 in 1943. Total imports in the same years were estimated at £51,511,000 and £36,258,000 respectively. The balance of payments changed from a debit balance of £2,736,000 in 1939 to a credit balance of £24,992,000 in 1943. In fact, the credit balance was probably greater because some exports have been underestimated and others have proved impossible to estimate. The credit balance in 1943 may have exceeded £30 million. Smaller, but substantial, credit balances were experienced in 1941 and 1942.

Large Sterling Assets

Those considerable credit balances naturally increased Eire's external assets. The capital items in the balance of payments are hard to trace with any great accuracy because of the large dealings by Irish residents on the London Stock Exchange of which no records are available. The accumulation of sterling assets can, however, be traced in the public accounts and in the banking statistics. Large increases took place in the sterling holdings of the Post Office Savings Bank Fund, the Saving Certificates Reserve Fund, the National Health Insurance Fund, and other Government funds. Between September, 1939, and June, 1944, British Government securities in the Legal Tender Note Fund of the Central Bank rose from £7,372,000 to £24,132,461. Between the September, 1939, and the June, 1944, quarters, the net sterling assets of the Irish banks increased from £61,357,000 to £123,613,000. Sterling cash and balances with London agents and other banks increased from £8,413,000 to £30,706,000, money at call and short notice in London from £7,583,000 to £19,357,000, and investments in British Government securities from £63,599,000 to £137,930,000. Holdings of sterling securities by private investors also increased by an unknown amount.

The Report of the Banking Commission published in 1938 expressed anxiety at the growing debit balances in the Irish balance of payments. The war has interrupted this trend, but the interruption is only temporary. As soon as peace returns the pre-war trend will almost certainly reappear. The remittances from workers in Great Britain will be reduced as the war-time employment of imported labour declines, and the demand for imports of all kinds will be very intense. It is, of course, realised in Eire that many goods will be in short supply, and that the British war controls will continue to operate. It is hoped, however, that with the gradual return to normality, more and more commodities will be available for export, and that Irish needs will be satisfied. It is not irrelevant that the Irish holdings of sterling have been accumulated in respect of private transactions, and do not represent inter-Governmental debt. There should, therefore, be no question of their being funded or otherwise frozen in any way. It must also be remembered that trading relations between Great Britain and Ireland have always been very close and intimate, and that British business men will be keen on regaining their Irish custom. It may be concluded that the sterling holdings will prove to be a valuable asset after the war as soon as circumstances allow British production to be adapted to peacetime requirements.

Is your drinking water above suspicion?

IF there is any doubt about the matter, STILL MALVERN WATER, the purest natural spring water known, can still be supplied without restriction of area throughout Great Britain.

STILL MALVERN WATER is singularly free from mineral salts which may be harmful, and its medicinal value lies in its essential purity.

THREE NUNS SAVES MONEY

—because of its
SLOW-BURNING CUT

There are two special reasons why 'Three Nuns' Empire Blend Tobacco saves the smoker money. It is scientifically cut to burn slowly, each ounce lasts longer, you smoke fewer ounces a week. It is made from fine leaf which is favoured by the lower duty on Empire Tobacco. To enjoy the fullest pleasure of smoking at a moderate cost, take to 'Three Nuns' Empire Blend.

BACKGROUND TO ACHIEVEMENT

Ships

MANY of the ideas and developments in marine electrification originated with the BTH Company. Complete BTH electric propulsion systems were installed before the war in several famous liners. In others, generating plant large enough to supply a fair-sized town has been installed

for the numerous auxiliary services—heating, ventilating, cooking and for the capstans, davits, derricks, etc., which are themselves driven by BTH electric motors. Mazda lamps are, in many ships, used for all lighting purposes—while BTH electronic devices safeguard the personnel.

Now,
gentlemen,
as regards
the control
of CO₂...

As soon as the expert has had his say, the man best worth listening to on any question of fuel efficiency is the man on the job. Your fuel watchers are the obvious go-betweens, but in backing them up you need to be careful not to discourage anybody who has something useful to suggest.

Team-work that everyone can join in, from the boiler-house sweeper to the chairman himself, is the secret of fuel savings like the following:—

AT A BREWERY two steam engines were taking one quarter of the total steam generated. They were exhausting to atmosphere and apparently it hadn't been realised that 90 per cent. of the heat value of the steam was being wasted. Simple recommendations to enable most of this heat to be recovered for heating water (which is in great

demand) have resulted in a saving of 17 per cent. on the coal bill.

AT AN ENGINEERING WORKS they have remodelled two re-heating furnaces as recommended by Ministry plant surveyors. The result is that weekly fuel consumption has been reduced by 24 per cent. whilst output has increased by nearly 18 per cent.

HOW THESE BULLETINS CAN HELP YOU. The latest specialised knowledge on almost every conceivable fuel subject is at your finger-tips in the Fuel Efficiency Bulletins—advice and help that others could not readily be obtained. If you've mislaid your copies, apply now to the Regional Office of the Ministry.

ISSUED BY THE MINISTRY OF FUEL AND POWER

Just Claim

IN FORTY YEARS the British omnibus companies have, by their initiative and enterprise, developed and perfected a passenger transport system of proven efficiency and elasticity.

This system has stood the test of total war; and stood it well. It has met the needs of the nation by skilful daily organisation, and in times of emergency, by hourly improvisation.

The principle of local management has permitted flexibility of operation which would have been impossible if control had been of a national pattern. Large enough for efficiency, small enough for elasticity, the present organisation of ownership and management of this important part of the country's transport services has proved itself, under the most trying conditions, to be the ideal system from the point of view of service to the community.

THE BUSINESS WORLD

Capital for Reconstruction

THE machinery for financing industrial reconstruction after the war is beginning to take shape. Within the next few days details should become available of two projects designed to fill special categories of the post-war demand for industrial capital. It should be emphasised, at the outset of any discussion on the nature and scope of these specialist institutions, that they, and any others that may follow them, are not at present intended to supplant the open capital market. Rather it is their objective to fill the gaps in that market and to supplement it by handling positions which, in existing and prospective conditions, would lie outside the sphere of the unaided open market. As far as it can be discerned, official policy in this matter is still that a borrower able to raise capital at reasonable terms on his own merits should be encouraged to do so. It should further be emphasised that, whatever machinery may be devised for meeting the capital needs of industry, some form of over-all control of capital issues will be necessary for a period probably covering some years after the war. The demand for new capital to overtake arrears of expenditure on plant and equipment and to embark on new developments, will be such as to require control both of the flow and, within certain limits, of the direction of investment. Unless the money flow of investments is thus equated to the physical capacity of the capital goods industries there would be a scramble to borrow which would undermine the whole of the Government's cheap-money policy—and much else besides.

The first deficiency in the supply of capital is one which is familiar from the discussions of the past dozen years. First authoritatively defined in the Macmillan Report, it is often known as the "Macmillan gap." It covers two separate needs, that for "intermediate credit"—too long for bank credit, too short for the new issue market—and that for "small man" capital—where requirements are not large enough to be handled economically by the new issue market. Many institutions, from merchant bankers to hire-purchase houses, have endeavoured to fill this "Macmillan gap," and the lack of success that has attended their efforts has repeatedly suggested that the gap was, in fact, far smaller than had generally been supposed—on the assumption, of course, that only serious propositions were allowed to rank (there is never a scarcity of demand for credit from rash and unsound borrowers). The belief in the existence of the gap may be far more the result of *ex hypothesi* reasoning than of practical observation. Its smallness may well be due to the fact that British banks, which are not quite so rigidly orthodox as they would like the public to believe, have seldom hesitated to meet the medium-term credit requirements of their good industrial customers. The accommodation has not been specifically granted for a term of years that would rank the operation as a medium-

term investment, but it has, in effect, remained undisturbed for far longer periods than the strict canons of deposit banking would tolerate. Many large British industrial units have been built up from modest beginnings with the help of bank credit, often granted on little security other than the personal qualities of the borrower.

The oft-proven smallness of this gap has, however, proved no argument against making yet another attempt to fill it. This time it is to be done on a more grandiose scale than before, by a special institution whose capital is to be subscribed by all the important deposit banks in Great Britain. It is expected to have a capitalisation of about £20 million. It is divulging no secret to say that the consent of some of the participants was obtained only after considerable persuasion. The new institution will cater primarily for the medium-term to long-term credit needs of the "small man." The case for setting it up is largely a political one: that of proving that finance, and the banks in particular, are not holding back in the tasks of post-war reconstruction and that the needs of the small man are receiving their due consideration. It is a reasonable surmise that the participating banks will not divert to the new specialised institution any large part of the good medium-term credit business now handled by them. All the participating banks have announced their intention of catering for their "small man" clientele after the war, and one may rest assured that those plans stand. There is, therefore, a danger that the new institution may become the proverbial dustbin into which all the less desirable business will be thrown and that, even so, it may find some difficulty in employing the capital resources and borrowing powers with which it will be endowed. It would certainly be unwise to expect a great deal from this first of the two contemplated projects.

The second is the product of a more ambitious and potentially much more significant idea. It is an institution designed to satisfy the long-term capital needs of firms or industries whose requirements should, in the national interest, be satisfied but where the position of the borrower would render an approach to the open market too expensive, or even put it completely out of court. This institution will be owned by a large group of insurance companies, investment trusts and other organisations normally interested in long-term investment, under the leadership of the Bank of England. It will have a substantial share capital—probably in excess of that of the first institution—and in addition, will have borrowing powers of several times the share capital. The deposit banks will probably participate in the financing of this institution, not by taking up

share capital but by providing the resources on which the borrowing powers will be exercised.

It is fascinating to sketch out the rôle which such an institution, launched under such auspices and commanding such resources, might play in the regeneration of the more needy and deserving British industries—coal, cotton, steel, shipbuilding. It would be a larger and more ambitious version of the Bankers' Industrial Development Company, but with the emphasis on development and not on salvage. The BID was called in as a lender of last resort. This new company should seek out its own spheres of activity and not wait until the corpses are brought in. The BID existed largely in the minds of two men. It had no records, no organisation of its own, no real independent entity. Its success was due to the flair with which it chose the right men to handle the particular jobs passed to it. The new institution should be wholly independent, managed by the ablest available executives, having at its command men with high technical, engineering and industrial qualifications such as many American and Continental banks command but who have, at present, no counterparts in the personnel of British banking. Although some of the temporary financing of the new institution would be done by way of the issue of debentures and similar securities, it is possible to visualise it as a link between the vast volume of savings from small investors who require, above all, safety of capital and regularity of income, and the provision of capital for industry in the most desirable form, namely through participation in the equity of the business. Given vision and ability in its management, the new institution should be able to turn over its resources fairly rapidly, helping to rescue old industries and to develop new ones, then, by refinancing

operations, passing each of its investments over to the open market when the success of the project had been assured. Its power to satisfy the capital needs of industry would not, therefore, be measured by the sum total of its resources. It would be a temporary investor, and only in the case of its failures would it have to remain a permanent repository.

The project is hedged by certain difficulties. The industries to be financed would, by definition, be too poor a risk, or too small and obscure, for the open market at the moment of intervention. This might tend to weight the scales against the new corporation's profits, and as a measure of self-protection it might have to refuse to extend its facilities in equity form, but insist on a fixed-interest lien. If so, its usefulness would be limited. The alternative might be a Government guarantee, but there would be obvious and serious objections to such a guarantee. Or, again, within a single industry, such as cotton, there are immense diversities of efficiency. Would not the efficient be penalised by the financial help given on specially favoured terms to the inefficient? There would also be danger of political pressure being brought to bear on the corporation to extend its help in cases where healthy bankruptcy and not salvage is the remedy required by the national interest. Most real of all the dangers is perhaps that of the new institution, being a joint partnership, having the pace of its policy and initiative dictated by the slowest and most cautious of its participants.

It would be wrong, however, to take a crabbed view about such an interesting new initiative. There is an unquestionable opportunity, and if the new institution is given wise and forceful leadership it should be able to surmount the obstacles in its way.

Egypt and the Sterling Area

THE new financial arrangements with Egypt, which are now disclosed in detail in a White Paper (Cmd. 6582), are an instructive example of the manner of co-operation which the sterling area makes possible. As the Egyptian Minister of Finance emphasised,

these arrangements, based as they are on common agreement . . . provide clear evidence of Anglo-Egyptian collaboration and mutual confidence.

The present practice under which Egypt surrenders to the United Kingdom, against payment in sterling, all foreign currencies obtained in its international transactions will remain in force during 1945. As hitherto, the United Kingdom will supply Egypt with sterling area currencies on demand. Currencies outside the sterling area are divided into the two categories of "easy" and "difficult." "Easy" currencies, for instance those of liberated Europe, will be provided without any strict limit, on the understanding "that this latitude will apply only to imports of the real needs of Egypt," but "difficult" currencies

—perhaps the most important of these being United States Dollars, Canadian Dollars, Swiss Francs, Swedish Kronor, and Portuguese Escudos—

cannot be made freely available against sterling.

It is therefore necessary for Egypt, in common with the rest of the sterling area, to continue to limit imports which have to be paid for in these currencies.

The target figure for "difficult" currencies to be made available to Egypt has been fixed, by mutual agreement, at a maximum of approximately £15 million (the Egyptian pound is approximately at par with sterling), which includes a special provision of £3 million for non-recurrent wheat imports owing to harvest failure; £2 million for North American fertilisers, if their delivery can be arranged; and a special contingency reserve of £1,000,000. The Egyptian Government will have the right to demand an upward revision of the target figure in a number of special cases, particularly (a) if prices in the United States should rise by more than 10 per cent (smaller increases are to be met out of the contingency reserve of £1,000,000); or (b) if the prices of major items at present scheduled to come from easy currency areas should prove to be over 10 per cent in excess of the prices ruling in difficult currency areas. A standing joint Anglo-Egyptian Committee is to be set up to examine any problems that might arise in connection with these arrangements. British experts will be made available to the Egyptian Government and

the British Embassy would on request place freely at the disposal of the (Egyptian Import) Licensing Department all

available information regarding supplies, and such other assistance as it might have available or could procure from sources such as the British staff of the Middle East Supply Centre.

Egypt's imports from countries outside the sterling area amounted to £25 million in 1938. This total includes imports from European countries which are not at present open to trade, and also imports from countries outside the sterling area which are now deemed to be "easy." Whether the figure now agreed upon for Egyptian imports from hard currency areas during 1945 represents generous or niggardly treatment of Egypt's claims is impossible to say without fuller knowledge of the sterling area's foreign exchange position than is at present publicly available. The Egyptians, at any rate, appear to be well satisfied with the arrangement. They appear to feel that their urgent requirements have been met by it, and that, in full co-operation with their sterling area partners, they will be able to buy enough within the area to relieve their need for purchases outside. They are safeguarded against being charged excessive prices "inside" by the proviso (above referred to) that in case of the excess being above 10 per cent they all be allotted more hard currency.

On some interpretations of the term, this arrangement could be held to be a "discriminatory" one. Egypt will make every effort to buy as little as possible from some countries, and as much as possible from others. It is therefore not surprising that the Egyptian Minister of Finance found it necessary to emphasise that these arrangements do not prejudice the right of the Egyptian Government to adhere to any such international convention as that of Bretton Woods,

which implies that the arrangements may not be *ipso facto* compatible with Bretton Woods. They are, in fact, permissible only during the "transitional period" lasting from three to five years which the Final Act recognises. But they are certainly incompatible with the system toward which transition is to be made, a system of free convertibility all round without recourse to any "discriminatory" currency arrangements and multiple currency devices.

The words "Sterling Area" do not occur in the Final Act of Bretton Woods, and an uninitiated reader of the document might well conclude that no such thing as a sterling area existed at all. A careful analysis of the text, moreover, makes it clear that, whether or not some form of sterling area is compatible with the system which the Bretton Woods proposals are designed to establish, the particular variety of sterling area exemplified in the Anglo-Egyptian Agreement is excluded. Under the Bretton Woods

system Egypt, for instance could not pool its foreign exchange resources with those of the United Kingdom and other sterling area countries. If dollars became scarce, the sterling area countries could not pool their dollars; and apportion them amongst themselves by agreement; and countries within the area with a surplus of dollars could not restrict their own dollar expenditures so that sterling area countries with a dollar deficit might be able better to maintain theirs. Adjustments of exchange rates could not be made by the sterling area as a group, but only by each country singly, after consultation with the Fund. Nor could the sterling area act as a group in its dealings with the Fund—for instance, by allowing London to act as the common representative, since

each member shall deal with the Fund only through its Treasury, central bank, stabilisation fund or similar fiscal agency and the Fund shall deal only with or through the same agency.

The framers of the Bretton Woods proposals no doubt believed that the existence of an International Monetary Fund as such would make such dollar-rationing arrangements within the sterling area as are exemplified by the new Anglo-Egyptian Agreement unnecessary and even undesirable. The Agreement, therefore, exemplifies very clearly the choice that will have to be made. The special economic ties which connect the United Kingdom with the rest of the sterling area have, if anything, been strengthened by the war. The large sterling balances which these countries have piled up in London, and the large future sales which they hope to be able to make to this country give them a special vested interest in the strength of sterling and, what is the same, in the recovery of British export trade. Is there to be no mechanism through which this special community of interest will be able to express itself? If the sterling area, as it now exists, is to be liquidated in favour of "non-discrimination," what is to take its place?

Worldwide international arrangements have their usefulness, and Bretton Woods is to be welcomed as such. But they are naturally limited in the field they cover to whatever common ground, whatever community of interest, willingness to collaborate, and mutual confidence can be taken to exist between each and all. They must be based on the highest common denominator in these matters, which in a troubled world is a pretty low one. Worldwide international agreements, therefore, by virtue of their comprehensiveness, must necessarily leave unused a large amount of the existing willingness of nations to co-operate, to share, to render mutual aid, to trust each other. They are a positive factor if they merely prescribe a certain minimum of confidence and collaboration for all. But they become a negative and restrictive factor if they attempt to standardise the relationships between each and all, and, instead of prescribing the minimum attainable by all, prescribe the maximum attainable by some. In international, no less than in national, relations there should be room for co-operation on numerous levels. It is not enough to establish an International Authority to bring order into some fields in which individual nations, acting on their own, are unlikely to avoid serious clashes. The task is to foster every type of organisation which transcends the borders of an

individual state, provided it does no harm to the wider purpose. If multilateralism becomes the enemy of regional groupings or other arrangements along the lines of the sterling area, it will not succeed. It will drive nations into the narrowest devices of self-help under the motto of *salvare qui peut*.

These considerations are suggested by a study of the new Anglo-Egyptian agreement. It is, no doubt, merely the first of a series. This agreement, and all those that are to come, will drive home the lesson that everything is not restrictive that looks like a restriction of imports. It is quite true that Egypt will discriminate against the goods and services of hard currency countries and in favour of those of sterling area or easy currency countries. But does this deprive the hard currency countries of any export trade which they might otherwise have done? Not in the least. Had the United Kingdom granted a bigger allocation of hard currency to Egypt, British imports from hard currency countries would have fallen by exactly as much as Egyptian imports would have risen—unless, indeed, it can be argued that the severer shortage of dollars would have led to more intensive, and more successful, British efforts to earn more dollars. The hard currency countries would have gained nothing, while Britain might have lost much. For Egypt, being able to buy more from the former, might easily have bought less from the latter. As compared with the position established by the new agreement, the following changes would have occurred: Britain's imports from America (taken as representing the hard currency countries) would have been smaller and so would have been its sales to Egypt. America's position would have been unaffected, with Egypt buying more and Britain less. Egypt's position would have been only mildly affected: instead of buying in Britain it would buy in America. The total of world trade, in other words, would have been diminished by the reduction of Britain's import/export turnover. Inducing Egypt to discriminate in favour of sterling area goods by limiting the supply of hard currency to her thus leads to an expansion of world trade. Insistence on complete "non-discrimination" would limit the whole machinery of international trade to the pace of its most difficult section—that is, those parts that require difficult currencies.

This is an important lesson which has great significance for the future. It would, indeed, be wrong to go to the extreme of declaring that, by the same argument, a maximum turnover could be obtained by allotting no hard currency to Egypt at all. The sterling area is a voluntary association which is held together by the free agreement of its members. Moreover, on the strictly economic plane, there are limits to the amount of substitution that can be affected as between imports from one area and another. Some of Egypt's import requirements cannot be covered anywhere except in the hard currency area. But the possibilities of substitution are normally much larger than is assumed, and to the extent that they exist, practices that offend against the stricter interpretations of "non-discrimination" are capable of expanding international trade without imposing an appreciable sacrifice on any nation.

Business Notes

Should a Banker Tell?

Reports from Paris suggest that the French Government's order for its nationals to declare their gold and foreign assets has so far met with a poor response. True, holders have up to the end of February to make their returns, but the indications are not promising, for foreign securities and notes continue to change hands at twice to three times—and gold up to more than ten times—the parities indicated by the official rates of exchange.

The holders of these assets are now being threatened with dire penalties, reinforced by the statement that all the assets in question will be revealed to the French Government when the Allied countries, in which they are now deposited, release them. A semi-official statement appearing in the French press suggests that the French Government has made requests to the British and American Governments for the disclosure of all information concerning the French accounts held by banks and other institutions in both countries. The matter thus raised is one of extreme

delicacy. The proposal to exchange information of this kind and, in the process, to breach the traditional secrecy shrouding the relations between a banker and his customers, is not a new one. Discussions on the subject had taken place between the British and French Governments before the war, but had made very little progress. The power to exact the required information in this country is now provided under section 8 of the Defence (Finance) Regulations. The question is whether it should be used to divulge information about transactions which were perfectly legal when they were made and which will now be subjected to measures of retrospective taxation or sequestration.

The powers under section 8 have been used by the British authorities, but always with some hesitation and usually with the greatest justification—as, for example, in pursuing inquiries into the activities of black market operators. It is a far cry from using the powers in this highly selective manner to making a general disclosure of the assets of a large group of foreign nationals, divulging the

affairs of guilty and non-guilty alike. This is a matter in which the British authorities should tread warily, especially if they retain any concern whatever for the future of London as an international banking centre. The supervision of international capital movements after the war may well require mutual exchange of information between governments, but it should be possible for this information to be given in global terms and without infringing the secrecy of the banker's relation with his customer.

Bank of France Return

The weekly return of the Bank of France made a welcome reappearance last week after a suspension of more than five months. The figures just published relate to December 28, 1944. The following table gives the main items in the latest return, comparing the figures with those of May 30, 1940, and, in order to measure the contraction in the monetary and credit circulation during recent weeks, with the highest figures reached since the liberation of Paris:—

	(In million francs)		
	May 30, 1940	Highest July-Dec., 1944	Dec. 28, 1944
Assets:—			
Gold	84,615	84,597	75,151
Advances to State:—	36,700	510,550	451,850
To Treasury	26,700	74,550	15,850
For Occupation Costs ..	—	426,000	426,000
Interest Free	10,000	10,000	10,000
Liabilities:—			
Note Circulation	166,695	649,564	572,510
Current & Deposit Accounts	23,642	49,480	41,706

If the latest figures are compared with those immediately before the German occupation, it will be seen that the considerable expansion in the note circulation approximately matches the advances made by the Bank to the State in order to finance occupation costs. The reduction in the note circulation by some Frs 77,000 million from the peak reached on October 5, 1944, is largely the result of the subscriptions to the Liberation Loan made in the form of previously hoarded notes. The circulation at its peak included Frs 6,982 million of notes evacuated to Britain in 1940 and used by the Allies for various military operations, Frs 4,200 million appropriated by the Free French for the needs of the resistance movement and Frs 5,400 million of so-called Tricolor notes printed in America and used in the initial stages of the invasion of France. These last are to be completely withdrawn at an early date.

The recent reduction in the liability on current and deposit account is also a result of the Liberation Loan issue. So is the fall in the direct advances to the Treasury, the repayment being effected out of the proceeds of this loan. The reduction of Frs 9,446 million in the gold holding is due to the delivery to the National Bank of Belgium of gold equivalent to that deposited by that bank with the Bank of France in 1940 and later delivered to the German authorities with the connivance of the Vichy authorities. The Bank of France has met the debt of honour arising out of this transaction and, under an agreement with the

State, is compensated in the balance sheet by a new item showing an equivalent amount owing by the French Government to the bank. The gold reserve is still valued at the 1940 parity of 176½ francs to the £. Revaluation at the rate of 200 francs would approximately restore the book value of the gold to what it was before the repayment to Belgium.

Payment in Gold

Many of the recent commercial and financial discussions between the British and French Governments have hinged on the extent of France's willingness to pay in gold for part, at least, of its past and accumulating obligations to the sterling area. The hinge has proved extremely stiff, and little progress is as yet to be reported. The French Government wish to place considerable orders for raw materials, foodstuffs and manufactured goods in the sterling area. Assuming that the goods and the required shipping are available, the next problem is that of payment. The French wish to make their payments in sterling, of which they have accumulated certain reserves as a result of British military expenditure in France. These reserves are, moreover, likely to increase as a result of the measures for mobilising French private assets abroad. The British have hitherto insisted that part of the payment for current purchases should be made in gold, and have furthermore suggested that certain earlier debts, notably that arising from the operations of the Reynaud-Simon agreement, should be met in gold.

According to the latest Bank of France return the unencumbered French gold reserve is equal to £427 million. The British case is that some of this reserve should be put into the common pool, and suffer some of the fate that would have overwhelmed it had there been no armistice in 1940, and had the French gold and foreign assets not been frozen by the Allied authorities. Britain, which ran its gold and dollar balances to within a few million of complete extinction when Lend Lease came to the rescue, argues that some of its gold was spent in French as well as British interests, and that a small part of the loss might now be made good from the substantially intact French reserve. The argument is reinforced by the fact that to give France facilities to pay for substantial imports from the sterling area by drawing on sterling balances might be construed as discrimination in favour of France, and against far more substantial holders of "abnormal" sterling. The French counter-argument is that France has suffered both physically and morally far above Britain's measure, and that the whole of the available gold will be needed to finance urgently needed imports from "hard currency" countries after the war. This is clearly a problem that must and will yield to a compromise solution. It is to be hoped that it will be found when M. Plevin makes his expected early visit to this country.

Lifting the Veil

It appears that the effect of a new Order issued by the Ministry of War Transport (SR & O No 1449) is to remove, as from February 1st, the restriction hitherto placed on the publication of accounts by public utility companies engaged in transport. Certain undertakings, mainly those connected with docks, harbours and lighthouses, remain subject to a modified ban, but in most cases even these will be allowed to publish their accounts six months after the end of the year to which they relate. It is already known that a similar relaxation is about to be applied to electricity supply companies, but whether with or without a substantial time-lag has not yet transpired. This further reduction in the statistical blackout is very welcome and is certainly long overdue. It is to be hoped that it will be extended to all those bans on publication of figures which have for so long harassed the investor. In particular, companies should be encouraged to state clearly their EPT position, insofar as it has been determined. It is presumed that utility companies will publish their full accounts for each of the years during which the blackout prevailed.

New Zealand Conversion

The New Zealand Government is offering to holders of £7,580,907 4½ per cent stock repayable March 1st and of £9,657,280 3 per cent stock, to be paid off a month after

that, conversion into a new 3½ per cent stock. The conversion may be accepted in whole or in part. The new stock is issued at 99½ and is finally repayable on September 1, 1965, but with the option to the borrower to repay in whole or in part at any time during the preceding three years on three months' notice. Holders of either old stock who convert will receive interest at the old rate to the time of repayment and a cash payment of 10s. per cent. The offer must be accepted not later than February 24th.

An interesting point about the prospectus is that it contains no reference to any UK Treasury undertaking to provide funds in respect of stock not taken in conversion such as accompanied earlier New Zealand and Commonwealth issues. The Chancellor of the Exchequer explained, however, that the New Zealand Government already holds £2,900,000 of the maturing loans and has arranged that it, or the Reserve Bank of New Zealand, will take up a further £4,500,000. On the basis that it shall only be called upon after this £7,400,000 has been found, the UK Treasury has undertaken to provide up to approximately £10 million if necessary. In view of the fact that New Zealand holds some £36 million of sterling balances, this assistance may seem unnecessary. A substantial running balance is, however, required, while something must be kept in hand for further substantial maturities in January next and November, 1947. It is to be supposed that the call, if any, on the UK Treasury will be small on this occasion.

On the short view, the market believes that the new stock will prove attractive, as it is very difficult to obtain appreciably over 3 per cent on securities of trustee status. The flat yield is some £3 5s. 4d. per cent with a modest profit on redemption, probably in 21 years' time, while it is possible to obtain slightly over 3 per cent on British Government securities with a slightly longer life. Some people may well consider that the increased political risk attaching to a New Zealand stock is not fully covered by an addition to the return, which is now little over 2s. 6d. per cent net, although the margin may be expected to increase owing to a fall in income-tax rates.

A Greek Casualty

One of the minor casualties of the Greek civil clash is the new drachma, introduced with such care and under such high auspices just before the troubles in Athens broke out. There is no suggestion that the injury sustained by the new currency during the Athens fighting is mortal, but the cessation of imports during many critical weeks, and the dearth of consumer goods, have caused the level of drachma prices to rise again with a momentum reminiscent of the previous inflationary period. Those prices, however, are evidence of the temporary scarcity of goods and not of inflation of the new currency. The shortages should be eased fairly rapidly and the extravagant prices now prevailing in Athens for foodstuffs, clothing and other essentials should then come down with a run. The basic problem of the drachma is that of re-establishing some semblance of order in the national finances, restoring tax revenue and providing other means of covering expenditure than the facile printing press. A "strong" Government would probably give priority in its programme. The present Minister of Finance has already announced measures of price control and a contraction of the new note circulation is said to have occurred since the end of hostilities in Athens. The fate of the new currency must rest with the course of political and military developments in Greece. Rapid pacification of the country and the re-establishment of a reasonably efficient fiscal system would revive the new currency from the effects of the harsh treatment to which it was subjected so soon after its birth. If, however, civil war is to continue, it will be difficult to maintain confidence in a currency which, given the fate of its predecessor, must in any event be suspect.

Accountants on Depreciation

After a silence of almost exactly six months, it is very satisfactory that the Council of the Institute of Chartered Accountants should have issued a further series of recommendations. The point covered, one of the most vital, is the proper provision for depreciation of fixed assets. Depreciation is defined in the statement as

that part of the cost of a fixed asset to its owner which is not recoverable when the asset is finally put out of use by him.

Of the three factors involved, original cost, final sale value and length of life, the last two are matters of estimation, but the Institute seems to support the view that reasonable conclusions can be reached. It is, however, evidently aware of the fallibility of human judgment, for the recommendations conclude with the statement:—

Amounts set aside out of profits for obsolescence which cannot be foreseen or for a possible increase in the cost of replacement are matters of financial prudence. Neither can be estimated with any degree of accuracy. They are of the nature of reserves and should be treated as such in the accounts.

So far as obsolescence is concerned, this appears to mean that, if the original guess about the effective life of the asset proves false, a separate provision should be made under a new heading, and this should not be included with depreciation. The result is that the total provision which may be necessary for ensuring the maintenance of productive capacity, in terms of real things and not of money values, is split into three sections. First, a provision to cover the net money cost of the assets spread over a life estimated at the time of its acquisition; secondly, any adjustment to the estimate in the light of experience; and, thirdly, a provision against a rise in replacement cost.

If each of these provisions is, in fact, to be made, and if each is to be separately shown—it is not clear that the recommendations go beyond saying that depreciation, as defined, is to be shown separately—this is a great step forward. It is to be hoped, however, that auditors will not consider it outside their sphere to advise whether allowances for obsolescence and rising replacement cost are adequate. It has to be admitted, however, that the statement reads rather as though they were thinking mainly in terms of maintaining the money capital of a concern, whereas, in the case of any unit of average efficiency on the manufacturing side, it is almost certainly in the public interest that its power to produce, in terms of goods, and to acquire the most efficient means of production, should be the primary objective.

Straight-Line Method

Whatever may be felt about the field covered by the recommendations of the Council, the recommendations themselves are excellent and the Taxation and Financial Relations Committee, which is responsible for the spade work, probably feel that to attempt anything more ambitious would be to invite failure. The recommendations will call for considerable adjustment of ideas over a wide field. This is, perhaps, particularly true of the basic point, that the general method of providing depreciation should be the straight-line method, which is the even spreading over the estimated life of an asset of its net cost. This is in direct conflict with inland revenue practice of allowing a fixed percentage on written down value, but, for a concern with a number of assets acquired at different times, it seems to have little disadvantage, while it has the great recommendation that a low apparent rate of depreciation writes off the assets much more quickly, and that the system as recommended virtually compels the keeping of an assets register, thus ensuring that the details are in fact available to the management.

The Council recommends that depreciation should be applied to all assets, including leaseholds and patents, which become exhausted by the passing of time, but an exception is made of loose tools, jigs and patterns where a method of re-valuation may be more appropriate. It then goes on to state that in the case of companies working wasting assets, such as mines, oil wells and quarries, provision for depreciation and depletion should be made over the estimated life. Where this is not done, the fact should be made clear in the accounts, so that shareholders may realise that dividends are, in part, a return of capital. Finally, they give the opinion that depreciation does not arise in the case of goodwill and freehold land (except in so far as it is acquired for the working of wasting assets), and that any sums provided to reduce the value of these items should be shown separately in the profit and loss account.

In their eighth recommendation, the Council suggested the classification of fixed assets, in existence at the date of the balance-sheet, at cost—in so far as is practicable—and they now add that the aggregate provision for depreciation,

amortisation and depletion should appear as deductions. If all these ideas become general practice—and that cannot be said to be the case with earlier recommendations so far—balance-sheets and profit and loss accounts will be very much more valuable in future. There are still lacking, however, any powers to ensure general adoption and any suggestions for remedying the position where a company has on its books no valuation of individual groups of assets, as, for example, when an affiliate was purchased outright.

Tin Import Prices

According to reports from New York, the United States Government has agreed to raise the buying price for Bolivian tin by 3½ cents to 63½ cents per lb. The new price will cover the remaining period of the current supply agreement, which is due to end on June 30th, and will before that date be extended by a new long-term contract, soon to be negotiated. The increase in the United States buying price is of direct interest to this country, which, like the United States, derives a substantial part of its tin-ore from Bolivia, the largest extra-Pacific tin-producing country, and which, under an arrangement made late in 1941, has agreed not to pay less to Bolivian producers than the United States. The additional 3½ cents per lb granted by the United States will add nearly £20 per long ton to the British buying price of Bolivian tin-ore, which, at the present rate of £355 10s. per long ton f.o.b. South American ports, is already well above the British domestic selling price of £300 per ton delivered at buyer's works. Despite this increase in the cost of imports, it is unlikely that the British selling price for tin will be increased, because at the beginning of last year, when the price was raised by £25 per ton to its present level, an advance in Bolivia's selling price was anticipated. The fact that the British selling price can be kept well below the import cost for Bolivian ore is, of course, due to the fact that British tin producers in Nigeria, as well as in Cornwall, receive much less than £300 per ton.

The increase in the Bolivian price has been expressly granted to stimulate production in Bolivia. As was pointed out on page 752 in *The Economist* on December 2, 1944, Bolivia's tin shipments have been disappointing since 1942, and there is reason to doubt the efficacy of the rise in prices as a means of speeding exports. In any case, the tin supply position of the United Nations is far less critical than was to be expected. Mr Erwin Vogelsang, Director of the Tin Division of the US War Production Board, recently pointed out before the National Metal Congress at Cleveland that by the beginning of 1945 the United States Government would still hold not less than 113,000 tons of tin in its strategic tin reserve. Moreover, he quoted figures from which it can be deduced that the Allies, apart from their extra-Pacific pig tin supplies, have very large supplies of secondary tin at their disposal, which have reduced the gap between demand and supplies to a surprisingly narrow margin.

With the time for an offensive in the South-West Pacific approaching and adequate stocks of tin on hand, there can be little economic justification for increasing the already all too high Bolivian price by another 6 per cent. The United States may see some justification in satisfying Bolivian producers, on whose long-term supplies of ore to North America the continued operation of the Texas-City smelter greatly depends. For this country the dependance of its buying price in Bolivia on the rates paid by the United States is the more regrettable as the Patino group, the sole Bolivian supplier to this country, is permitted to convert three-quarters of its sterling receipts for tin into gold.

The Discount Year

The experience of the discount market during 1944 can be described briefly and in general terms. The resources at the disposal of the market continued to grow, partly as a parallel movement to the continued growth of bank credit, more particularly as a result of the further accumulation of "abnormal" sterling assets by overseas banks, which find it convenient to employ a considerable part of these assets on

There are many men and women in the Services who would welcome a chance of reading this publication. If you would hand it in, unwrapped, unstamped, and unaddressed at my Post Office, it will go to them.

the London money market. The following table shows how these additional resources were employed in the case of the three discount companies whose experience in this matter may safely be assumed to illustrate that of the whole market.

The main expansion in assets has been in bills. This means Treasury bills, for the supply of commercial paper has undergone further decline during the year—a trend illustrated by the fall in rediscounts shown in the balance-sheets which show this item separately. The rise in investments has been moderate. Profits are slightly higher than for 1943. It may be assumed that the bulk of the earnings has

1944	235	197	141	573

again come from the margin between the yield on short-dated bonds, and the rates paid for bond money. The business in Treasury bills provides the bulk of the discount market's turnover, but no more than a small fraction of its earnings.

Celanese Explanation

Apart from the tribute paid by the new chairman to the late Dr Henry Dreyfus, the principal points of interest emerging from the British Celanese meeting were the choice of chairman and his statement concerning profits. The choice has fallen on Mr G. H. Whigham, chairman of Celanese of America from its inception until the early days of the war and chairman of the Canadian company throughout its existence. But he has said that he is only holding the position until a younger man can be found to fill it. On the question of profits, he stated that

Based on the improved EPT standard and after eliminating taxation credits having reference to previous year, the net tax-free profit for the year under review amounts to £468,673; on the same basis and after bringing to credit other sundry tax items, the net tax-free profit for the year ended July 3, 1943, would have amounted to £461,403.

It may be recalled that the accounts for the two years showed an increase from £348,403 to £728,673.

There is no specific reference in the speech to either the preliminary statement or the action of the Stock Exchange Committee. The chairman, however, states that the amount earned on the ordinary capital was 10.58 per cent for 1942-43, and that the directors thought it right that

the ordinary shareholders—having received no dividend for the previous year, and taking into account the fact that, on the adjusted basis, something more than 20 per cent was earned in two years combined—should receive a dividend of 20 per cent.

It is now six weeks since the preliminary announcement, but this seems to be the first recognition by the company of the fact that the dividend was a distribution as much from past profits as from those of 1943-44. If that simple statement had been made six weeks ago a great deal of trouble would have been avoided.

It is an implication of Mr Whigham's statements that earnings on the ordinary capital for 1943-44 were some 10 per cent, but it is not at all clear how this figure is reached. In particular, it is still not clear whether the 20 per cent to be provided for redemption of certificates is to be based on taxed profits or profits before deduction of tax.

Assam Railway Offer

The process of acquiring British-owned assets in India continues, the latest example being the offer by the Indian Government of £1,770,000 for the railway undertaking, and stores carried in connection with it, of the Assam Railways and Trading Company. The written-down expenditure of the company on the railway stood in the latest balance-sheet, that for March 31, 1943, at rather over £1,000,000, and on the basis of that balance-sheet and the suggested

payment, some £1,750,000 net should be available to cover various types of share capital amounting in all to £1,160,000. Rather over half the sum of £1,750,000 is, however, locked up in trading assets while it would be necessary to negotiate special terms for the redemption of the £1,000,000 of loan capital. Further, these figures are of no great value, except as a general guide, since the funds will have to be used in accordance with the Company's Act of Parliament, and there is no information as to what the true tax position will be after the purchase. The capital structure and the varying rights of the four classes of share capital appear to have been based on the supposition that the net liquid assets would suffice to repay all but the most junior class—that is, the "B" shares. There are, however, 50 per cent arrears of dividend due on the "A" shares, which are repayable at 120, and it seems probable that a scheme will have to be prepared for dealing with the position. The directors themselves suggest that the best solution may be to liquidate the present company—presumably paying off the senior classes of capital—and to transfer the trading assets, with a sufficiency of working capital, to a new concern. Nothing can be settled until the tax position is clarified, but the adjustment of the rights of the shareholders promises to raise some interesting points.

The Clothing Ration

While no increase in the clothing ration could be expected, the decision on the new release of coupons must have caused the Board of Trade much thought. During the past year stocks of clothing showed a general decline. Towards the end of the year the outlook was such that arrangements were made to increase the number of workers manufacturing clothing, which, in common with many other civilian industries, had been further reduced to provide additional labour for the invasion preparations.

It may well be that the reinforcement of the clothing labour force has proceeded far enough to justify the release of 24 clothing coupons, which is to take place on February 1st, but the President of the Board of Trade has voiced his own misgivings by carefully not promising a definite date for the second coupon release of the year. It should be August 1st, according to precedent, but Mr Dalton said it may not be possible until September 1st, except for children.

A possible solution to the dilemma of equating demand to supply would have been to release, say, 16 coupons for the next four months even though this would be awkward for those who need to buy garments of high coupon value. It is true that the issue of coupons is no longer the signal for a spurt in buying. Although this may help to tide over the next few months—which are likely to prove the most critical since the clothing ration was introduced—the habit of planning coupon spending that has grown up adds to the undesirability of issuing coupons for an undefined period. It

would seem that the stock and supply situation, which was originally the basis for fixing the size of the ration, has not this time been the decisive factor.

The Future of Shorts

Sir Stafford Cripps has announced the Government's intention of keeping Short Brothers as one of the principal aircraft firms of the country after the war. Sir Frederick Heaton, who was appointed in February, 1943, as managing director, is anxious to return full-time to his own firm, Thomas Tillings, of which he is chairman and managing director, and a new board of directors for Shorts will soon be announced. Sir Stafford thanked Sir Frederick Heaton for his public spiritedness in placing his services at the disposal of the Ministry of Aircraft Production; he pointed out that in twelve months following the introduction of the new management, the firm had increased its output by 69 per cent.

The Government's intervention in the management of Shorts came at a stage when aircraft had overriding priority, and when it was found that Short's resources and organisation were not adequate to meet the requirements of large-scale aircraft production. It went a good deal further than management, however, and took over all the company's shares, vesting them in MAP's nominees. Little is known about the Government's plans for Shorts, but developments will be watched with great interest.

Documentary Films

The documentary film has been the British industry's own special contribution to the business of film making. It is particularly suited to the British industry because it is best produced by small units and its cost is low compared with feature films. The increasing need for the best technical facilities and the use of expensive new equipment, such as Technicolor, has in no way altered the arguments in favour of the small unit. An independent unit may, however, find difficulty in financing and maintaining the most up-to-date equipment. An interesting new organisation—the Film Producers' Guild—has been formed by seven documentary film companies with the object of preserving the essential individuality and freedom of the units and at the same time giving them the advantages of pooled equipment and technicians, and financial integration. Each of the seven companies, Verity Films, Publicity Films, Merton Park Studios, Technique Film Productions, Greenpark Productions, Gryphon Films and Sound Services, will continue to work on its own lines, but with the added benefits of mutual co-operation.

During the last five years the documentary film, which was just emerging from the embryo stage before the war, has been put on its feet. The wide use made of the documentary film by the Government, the Services and the British Council for instruction and propaganda has helped its development. Its future is bright. It has potentialities not only in the field of light and serious entertainment, education and propaganda, but also in commerce. Industrialists are beginning to realise its possibilities for creating a goodwill and as an advertising medium, and particularly as a factor in assisting the export drive. The Film Producers' Guild is likely to play a prominent part in the future development of the documentary film, and the form of organisation it has worked out may set a pattern for other producing units.

Shorter Note

The cotton trade unions, comprising nearly 200,000 operatives, have decided to claim an advance in wages. Since the beginning of the war all cotton operatives have received wages increases amounting to 35 per cent on list rates and flat rate increases of 9s. a week for adults and 5s. a week for juveniles. It is probable that the demand will be dealt with by the Conciliation Board, under the chairmanship of Sir Charles Doughty, K.C. If labour costs rise, spinners and manufacturers will no doubt apply to the Ministry of Supply and the Cotton Controller for revised margins for yarn and cloth. Concern is felt in the industry because spinners and manufacturers have largely sold their production for six months ahead, and it is feared that the time-lag in securing higher prices for materials will adversely affect profits.

BARCLAYS BANK LIMITED

READINESS TO MEET POST-WAR NEEDS

MR. EDWIN FISHER ON CAPITAL FOR INDUSTRY

The fiftieth ordinary general meeting of Barclays Bank Limited will be held on January 24th, at the Head Office, 54, Lombard Street, London, E.C.

The following is an extract of the statement by the Chairman, Mr Edwin Fisher, circulated with the report and accounts:—

As the proceedings at the annual general meeting will again be confined to formal matters, I am addressing a few remarks to the stockholders to accompany the report and accounts in the same way as last year.

We record with sorrow the death in March last of Sir Follett Holt, K.B.E., a valued member of our board. The death of Lord Essendon in June was a severe loss to us. Outstanding in his generation, his undoubted ability and industry raised him to a position of great prominence in the world of shipping, and to the service of his country he brought all the authority of his unique experience.

Mr. Hugh Exton Seeböhm, lately a vice-chairman, has been elected a deputy chairman of the board, and Lieut.-Col. Lord Dudley Gladstone Gordon, D.S.O., and Mr. Ernest Henry Murrant, M.B.E., have been appointed directors. We welcome both as members of the board. Mr. Murrant is no stranger to us, for he worked many years in close association with Lord Essendon and succeeded him as chairman of Furness, Withy and Co., Ltd.

Mr. Norman Shillingford Jones, who has been a general manager since 1931, retired at the end of 1944 after over 44 years in the bank. We are grateful for the exceptional quality of his service, and we wish that he may long enjoy the retirement he has earned so well.

At the close of 1944, our current, deposit and other accounts stood at the record high level of £917,775,560, against £822,499,871 at the end of the previous year. Our cash in hand and with the Bank of England; balances with other British banks and cheques in course of collection; money at call and short notice; bills discounted, and Treasury deposit receipts reached a total at the end of last year of £554,400,650, or 60.4 per cent. of our current, deposit and other accounts. Treasury deposit receipts are £77 million higher than at the end of 1943, and our holdings of Treasury bills and money at call at short notice are also somewhat larger. Our bill portfolio is so spread that a proportion matures each day, while by far the greater part of our holding falls due every month. Substantial amounts of Treasury deposit receipts mature almost daily so that on most days we have several million pounds cash accruing to us from these two sources. In addition, a large part of our money at call and short notice is callable each day and is, therefore, available if necessary to augment our cash resources. Thus our holding of cash is continually refreshed and powerfully reinforced.

The rise in our investments, excluding those in subsidiary banks, from £216,391,769 to £217,340,642, is much smaller than in any year since 1939, but our advances have declined further to £158,998,247 on December 31st last, compared with £160,976,408 at the close of 1943.

YEAR'S PROFIT

The net profit of the bank for the year ended December 31st last, after payment of all charges and after making provision for all bad and doubtful debts and for contingencies, amounted to £1,673,351 11s. 3d., which compares with the figure of £1,584,113 11s. 5d. for 1943. As will be seen from the report, the directors have allocated from the profit £250,000 to contingency account, £250,000 to premises

reserve account (for deferred repairs and reinstatement) and £64,767 to the staff widows' fund, towards annuities for war widows. Interim dividends at the same rates as in 1943 were paid on August 8th last. The directors now recommend the payment of final dividends of 5 per cent., making 10 per cent. for the year, on the "A" stock, and 7 per cent., making 14 per cent. for the year, on the "B" stock and "C" stock, less income tax in each case.

Both Barclays Bank (Dominion, Colonial and Overseas) and Barclays Bank (Canada) showed good results in their latest reports. These banks, linking the Mother Country with many of the other parts of the British Commonwealth and Empire, place our own bank in a specially favourable position to help international trade. With the liberation of France we look forward to a revival of the business of Barclays Bank (France), Ltd.

Month by month during the past year, the gathering crescendo of military success, bringing with it rising hopes that our enemies in Europe would be well on the way to defeat in the not distant future, imparted a growing sense of urgency to the preparation of plans for meeting the post-war situation. The fluid and general discussions upon our many-sided problems, on which I ventured a few remarks a year ago, have very largely settled in the form of official statements of Government intentions and to some extent have crystallised in actual legislation.

Within the limitations imposed by the circumstances, a great deal of thought has also been given by individuals and by organisations to their own particular position. We ourselves have been much preoccupied with measures for achieving a state of readiness to meet the future in such a way that the bank shall not be found wanting in any respect in the fulfilment of its appointed task. Our own problems are naturally somewhat different from those of productive industry, but we also must always be able to adapt ourselves rapidly so that we may have ready the kind of services that are wanted and our organisation adjusted to bring them into play.

POST-WAR PROBLEMS

The need for the small business undertaking to raise medium- or long-term capital, at times a matter of some difficulty before the war, seems likely to be more widely felt with the return of peace, and there is little doubt that the national interest will call for a somewhat broader conception of the place of banking in relation to this need, as well as to the parallel needs of larger concerns. I may say quite categorically that the intention of our own bank is what it has always been in the face of change, namely, to match new wants with new and appropriate services. I would emphasise that our system of local head offices, supervised and controlled by local directors, with district managers and managers, all having intimate local experience and with discretionary powers to deal with every kind of application or commercial proposition, is well adapted to meet this need. In the post-war period the wants of small traders will call for careful consideration, for we recognise how necessary it is to help them to re-establish themselves on sound lines.

RAPID CHANGE-OVER TO PEACE FOOTING ESSENTIAL

After the war, no pains can be spared by the people of this country in their efforts to increase the national output of goods and services. Moreover, it is imperative

that the change-over of industry from a war to a peace footing, presenting admittedly difficult problems, should take place rapidly, so that men, materials and modern machinery may be employed early in producing the goods and providing the services on which our hopes for the future must be based. Our desperate and protracted struggle has obliged us to use up our resources on a grand scale, quite properly regardless of the future and without counting the cost, and we shall set out upon our journey burdened by a heavy load of indebtedness to countries overseas on account of large purchases for which we have been unable to pay by means of exports. We also seek a higher standard of social security and welfare than ever before.

IMPORTANCE OF EXPORTS

In the light of these considerations, our export trade, which has dwindled of necessity under the constricting influence of war, takes on a new and special significance. Our greater dependence upon current effort gives it a high place in the list of priorities, and so we must be ready to produce those goods and services of which other countries stand in need, and be able to provide them at competitive prices, for, ultimately, it is only thus that we can buy what we need and must have from abroad. The problem, both domestic and international, is, and will remain for some time, how to produce enough to satisfy the most urgent and crying need, but in the process of meeting this, markets will be built up and connections re-established. Therefore, it is especially important to develop our export trade along sound lines, and with speed, vigour and imagination. We may be sure that competition will develop strongly. The enormous industrial resources and capacity of the United States, for instance, must find an outlet in markets abroad and, inasmuch as larger sales of American products bring in their train increased purchases, so will that country move towards fulfilling the obligations which rightly attach to a large creditor nation, with all the responsibilities which that position entails. But, in order that we, in this country, may participate to the fullest extent possible, the degree of efficiency and adaptability required in competition is such as will call for high endeavour from us all and the avoidance of any unnecessary restraint upon the production of goods and services. With this very much in mind, we must not forget the handicap imposed on industry by abnormally high taxation.

A great deal of preparatory work has been done towards the solution of our problems, and now the time is approaching when its logical successor, action, becomes the order of the day. But so that Government action may bring full success in the difficult phase of transition upon which we hope soon to enter, not only must it be timely and well-devised, but it must be attended by another and vital element—the ready co-operation of the ordinary citizen of this country, the man in the street. Social security, a better standard of living and all those advantages that we properly desire, depend upon the industry of every one of us.

While the whole national effort has been directed to an end, easily defined and recognisable by all as paramount, everyone has accepted the means: long hours of work and duty, restriction, discomfort, hardship, danger. With the tension finally eased, however, the sense of urgency will inevitably slacken and, unless there is some new unifying motive, a feeling of loss of direction is bound to follow the disappearance of that impelling force, which has held us together in singleness of purpose for more than five years.

Fresh inspiration and incentive there must be, and I believe that an enlightened understanding by the individual of our national problems and our aims, with scope for the proper exercise of individual initiative, forms a basis on which our future prosperity can be firmly established.

MARTINS BANK LIMITED

NEW EXPANSION

EXPORTS KEY TO NATION'S REVIVAL

MR F. A. BATES' REVIEW

The 114th annual meeting of Martins Bank Limited will be held, on the 23rd instant, at the head office, Liverpool.

Mr Fredenck Alan Bates, the chairman, has issued the following statement, which has been circulated to shareholders along with the report and accounts for 1944:—

It is with deep regret that I have to record the death of Mr R. M. Holland-Martin last January. The report makes reference to the valuable services he rendered to the bank, and the many tributes written at the time of his death bore witness to the high regard in which he was held. The directors mourn the loss of a distinguished colleague and loyal friend. I have to announce that Lord Colwyn, with the passing years, does not desire re-election to the board. His long and outstanding service is mentioned in the report, and the board have received the intimation of his forthcoming retirement with sincere feelings of regret. He has our warmest wishes that he may enjoy a leisure richly deserved by his great services not only to the bank but to the state. Since our last annual meeting, Sir N. F. Warren Fisher has been elected to a seat on the board. Lord Margesson and Mr C. J. Holland-Martin, son of the late Mr R. M. Holland-Martin, have joined the London board.

Mr G. O. Papworth, for the past seventeen years chief accountant of the bank, has been appointed assistant general manager (administration),

STAFF ON ACTIVE SERVICE

I again refer to the services of the large number of our staff, men and women, now engaged in every branch of the forces or in other forms of national duty. They continue to distinguish themselves, as shown by the many further decorations bestowed for gallantry or other meritorious service. I send them and their families our sincere congratulations.

To those relatives who have suffered bereavement or are in anxiety on account of missing men or prisoners of war I extend our deepest sympathy.

Recently a letter has been addressed to every member of the staff on national duty, giving assurance of a warm welcome upon return to the bank, and indicating the plans that are being drawn up to facilitate re-entry into its service. From the many replies received, this letter has been the source of much pleasure and encouragement, especially to those who have been away for the long period of four or five years. With further withdrawals from our staff during the year, the strain upon those left with us has become more pronounced. This has particular effect upon the senior men, who have their normal duties increased by the training of temporary staff. Great credit is due to them for the efficiency with which the affairs of the bank continue to be conducted.

To the chief executive officers and the whole staff, permanent and temporary, I therefore tender our thanks. Special praise should be given to our staff in the south, who have stood at their posts in recent particularly trying circumstances, and I include in this commendation those in other districts who have volunteered for relief duty at southern branches.

FUNDS, PROFITS AND RESERVES

The bank's balance sheet shows new expansion. Total assets exceed £221,300,000, customers' deposits and cur-

rent account balances being now in excess of two hundred million pounds at the substantial figure of £204,244,000, an increase of £24,100,000 on the year, the major part of this having been employed in taking up treasury deposit receipts, of which we hold £71,000,000. Investments have increased by £4,744,000 and now stand at £61,000,000. Advances, the third largest item on this side of the balance sheet, show an increase of approximately £1,000,000 as compared with twelve months ago, having kept steady at about the present figure throughout the year.

Our holdings of cash, balances with other banks, market money, treasury bills and treasury deposit receipts amounting to £117,690,000 or 57.45 per cent. of our public liabilities, indicate the continued extreme liquidity of the bank. In addition, there are our large holdings of British Government short-dated securities.

PROFIT AND DIVIDEND

Net profit for the year is £641,295, an increase of £34,595 on the previous year. With the balance brought forward, there is available for distribution £1,073,638. The two dividends of 7½ per cent. each, less tax, require £312,003, leaving an amount of £761,635, which you will observe from the accounts has been allocated as follows: £200,000 has been added to the published reserve, bringing that fund up to £4,000,000; reserve for future contingencies again takes £100,000, and reserve for pensions £50,000. The balance carried forward is £411,635, a decrease of £20,708 on last year, due to the larger amount placed to the published reserve.

In view of forecasts of possible early termination of the war, many national problems of great importance are being pressed forward for immediate settlement. It may be considered inadvisable that all these far-reaching schemes should be taken in hand at the same time, as to attempt that might endanger their success. The general welfare of the country is the main essential, and it will tax the statesmanship of those in authority to proceed in due order. It is proper, however, that thought should be given to the many perplexities that will confront the nation when the war ends, so that we may turn towards fresh enterprises without delay.

OUTLOOK FOR OVERSEAS TRADE

Housing and employment will undoubtedly come first, and in considering the latter it must not be forgotten that this country's position, and indeed existence in anything comparable with our present status, depends upon our overseas trade. We shall require large quantities of imported goods of many kinds, but to pay for these we must export, and it is, therefore, our foreign trade that calls for experienced and untrammelled consideration at the present time. The standards of living and employment can best be improved by the development of that trade. Other nations will be eager to establish markets, and we shall only gain our fair share of world commerce by our preparedness and efficiency, and by the quality, price and suitability of our goods. After the war there will be changed conditions requiring a fresh outlook on our part, but if we adapt ourselves with the same enterprise that built up the commerce and industry of this country, under free and fair competition we need not fear the future. Traders fully appreciate the need for a

vigorous policy and it is therefore appropriate that I should repeat the assurance in my statement of last year of the bank's readiness to grant accommodation to its customers.

BANK'S STRONG POSITION

As you will observe, our balance sheet is very liquid and the bank is in a strong position to undertake such finance (the proper employment of a bank's funds) as soon as proposals can be placed before us. There will be many new opportunities of utilising banking resources in the revival of businesses that have performed languished owing to the paramount national effort. Funds will be required by many organisations in the change-over to peace conditions, for the installation of new machinery, replenishment of normal stocks, and for re-equipment and expansion generally. These are matters we have continually before us, so far as the main war tasks permit. You will, therefore, be glad to know that your own bank looks forward to assisting both the small and the larger trader in the work of restoring the home and foreign trade of the country.

ALEXANDER'S DISCOUNT COMPANY, LIMITED

MR COLIN CAMPBELL'S STATEMENT

The 77th Ordinary General Meeting of Alexander's Discount Company, Limited, will be held at the offices of the company, 24 Lombard Street, London, E.C., on the 24th instant.

The following is the statement by the chairman (Mr Colin F. Campbell) which has been circulated with the report and accounts:—

The year under review has again been uneventful for the discount market. The Bank rate has continued at 2 per cent. for the fifth consecutive year, while rates for money generally have shown no change. The margin of Profit on Bills has been negligible, though it has fallen to the lot of the discount market to carry a much increased volume of Treasury Bills. Short-dated Government Securities, to which we confine ourselves, have also shown little fluctuation throughout the year, and the only new issue involving a definite change in rates has been that of 1½ per cent. Exchequer Bonds brought out in November.

Under the world war conditions which still prevail, it will be some little time before we shall be able to resume our normal business of dealers in bills of exchange, but we take every opportunity that presents itself of renewing and consolidating our financial connections, many of which are of very long standing.

The importance of our export trade is so vital to the prosperity of our country, and is being referred to so continuously both by politicians as well as by those actively engaged in industry, that I have every confidence we shall be able to fulfil the duties assigned to us when foreign trade again becomes possible.

THE YEAR'S RESULTS

The gross profit, after making provision for rebate, taxation and contingencies, is shown in the profit and loss account at £141,250. After deducting current expenses amounting to £45,722, there remains a net profit of £95,528, which, with the Balance of £192,622 brought forward from last year, gives a total of £288,150.

Out of this sum, £5,000 has been transferred to Staff Pension Fund, and interim dividends on the preference and ordinary shares were paid as usual in July, absorbing a net amount of £33,000. It is proposed at the forthcoming meeting to declare

dividends for the final half-year at the rate of 6 per cent. per annum on the Preference Shares and at the rate of 20 per cent. per annum on the ordinary shares, these being the same as in the previous year, and to carry forward £207,150, against £192,622 brought in a year ago.

More than 50 per cent. of the staff are

DISTRICT BANK, LIMITED

SATISFACTORY RESULTS—INCREASED PROFIT

STATEMENT BY THE CHAIRMAN, SIR R. NOTON BARCLAY

The Chairman, Sir R. Noton Barclay, has issued the following statement to the shareholders of District Bank Ltd., prior to the 115th annual meeting to be held on 30th January at the Head Office, Spring Gardens, Manchester:

It is with great regret that I have to record the death of our highly esteemed colleague, Sir Christopher T. Needham, who preceded me as Chairman and held that office for 14 years. Within the last few months we have had pleasure in electing Mr T. Harry Hewlett and Sir Frank Platt to the Board: their ability and experience will be most valuable to us.

BALANCE SHEET AND PROFITS

Trading conditions in 1944 have been very similar to those of the previous year. Following war-time trends, our deposits at £169,736,000 show an increase of £11 millions on the year. Turning to the other side of the balance sheet, it will be observed that the major portion of the increase in deposits has been lent to the Government in the form of Treasury Deposit Receipts which show an increase of £8 millions.

Advances, which are well spread, have touched a new low level and a material increase is hardly likely until there is some relaxation of controls and industry changes over to peace-time production. As this occurs, our lending policy will be shaped towards the rebuilding of our home and overseas trade, ensuring that ample provision is available for both large and small borrowers.

Net profit for the year records an increase of £14,482 as compared with 1943. With the balance brought forward we have £781,516 available, and from this, dividends, being unchanged, absorb an amount similar to that of last year. Other allocations are £100,000 to Pensions and Annuities Fund and £60,000 to Bank Property Account, leaving us in a position to carry forward £361,844 to the next account.

Before turning from my review of the Bank's position I might mention that the facilities provided by our Trustee Department at 57 King Street, Manchester, and at its branches in London, Liverpool, Lancaster and Hanley are being utilised by an ever-increasing number of people who perceive the advantages of appointing a corporate body as Trustee or Executor.

STAFF

In the present phase of the war we can justifiably rejoice in great achievements, but unfortunately the cumulative cost in human lives grows with the approach of final victory, and it is with deep regret that I now have to report that more members of the staff have lost their lives, are missing or are prisoners of war. We mourn the loss of the fallen and extend our deepest sympathy to all bereaved relatives and to those suffering anxiety for their loved ones. While we are proud of those who have been decorated and mentioned in despatches for bravery and daring, we also pay tribute to the many others who serve the nation faithfully and valiantly. With the time approaching when we may look forward to some measure of demobilisation, much care-

still on active service, which has thrown a considerable strain on those remaining to enable the business of the company to be conducted efficiently. It is a matter for great thankfulness that all those who are serving have been spared from any injury, and we extend to them our best wishes for the new year.

ful thought is being devoted to the absorption of the permanent staff into their post-war duties. Arrangements are being made for suitable courses—both theoretical and practical—so that those returning may, within the minimum of time, take their places with full seniority.

The suspension of fireguard duties in the Provinces has afforded some welcome measure of relief to the staff. Unfortunately this does not apply to the staff in the Metropolis, although their burden has been eased, and I take this opportunity of expressing our appreciation of their unfailing devotion and endurance in performing not only their Civil Defence duties but also their daily work at the Bank under conditions known to you all.

Great credit is indeed due to all our staff and to those pensioners who have returned to help us and I thank them for their excellent achievement.

INDUSTRIAL RECOVERY

Once again the exigencies of war-time paper control permit only a restricted review of trade and finance. Briefly, however, I would first refer to the cotton trade and the U.S. Mission Report which has recently thrown an intense spotlight on this industry. Not that there is much in that Report which was not already common knowledge within the industry itself. Output per man-hour, important as this may be, is however only one of the factors calling for consideration, although indeed an essential factor for what is termed the bulk trade if this is to be conducted with success in the coming days. Nevertheless, if the recent controversy arising out of this Report has done nothing else, it has underlined the importance not only of economic production but also of distribution as an essential counterpart in the framework of overseas trade with its demand for vast variety in quality, design and colour. As is natural, producers and distributors are prone to discuss their problems separately, having regard to their own particular functions. However, the time now seems to have arrived for joint discussion by representatives of both sides in order that the industry shall be in a position to maintain its rightful place in post-war expansion of overseas trade.

EXPORTS

Recent discussions in Parliament indicate widespread anxiety for great efforts to be made without delay to ensure conditions favourable to exports and to provide for the necessary speedy re-equipment of industry to meet post-war demand, so that the unpreparedness for peace-time conditions manifested in 1918 shall not be repeated. That the Government is fully alive to this is encouraging, but something definite must be built into the structure which was lacking after the last war if success is to be attained, and in these circumstances it seems inevitable that a continuance of what the Prime Minister termed "severely practical" controls will be required during the transition period.

AGRICULTURE

In agriculture the endeavours to establish a stable and prosperous peace-time existence

will be watched sympathetically by a nation grateful for marvels performed during the war. The continuance over the next four years of the Government's policy of guaranteed prices and markets will provide a means of assistance during the reorganisation period which will be of value to the industry. Such reorganisation may mean the pruning of branches of agriculture economically overgrown through war-time demands, but that is a small price to pay if it leaves strength and vitality for expansion along lines beneficial to both the farmer and the community. A healthy agricultural industry is as necessary to the country in peace as in war, and it is hoped that it will be established on a sound basis.

One cannot but be impressed by the Government's recent White Papers dealing with such questions as social insurance, health services and employment, indicating as they do a determination to provide a better standard of life for the community. Such projects rightly aim high, for improved health and happiness will in themselves provide national assets of the greatest value. On the other hand it is a sound maxim that plans for the distribution of the fruit should not anticipate too far ahead the gathering of the harvest, and we should therefore guard against charges upon the nation outrunning the increase in our national income. Nor, particularly under present circumstances, must we allow undue taxation or an inequitable balance between wages and prices to interfere with industrial development and the recovery of our position, especially in overseas markets. So largely is our future bound up with foreign trade that it is indeed reassuring to note the Bretton Woods monetary proposals indicate progress towards a new commercial era and to the fulfilment of hopes engendered by the Atlantic Charter.

ALLIED BAKERIES, LIMITED

OUTPUT MAINTAINED

The annual meeting of Allied Bakeries Limited was held on 17th instant, in London.

Mr W. Garfield Weston, M.P., the chairman, said that in the fifth year under war conditions their trading subsidiaries had maintained their output and sales, but the continuance of the restrictions on ingredients and deliveries had made impossible any great progress. In the balance sheet investments in subsidiary companies had increased by £167,443 without any increase in issued capital. A new item of £175,000 appeared in respect of tax reserve certificates. There was a decrease of £83,476 in amounts due to vendors in respect of acquisition of shares.

They had in mind the need to provide for post-war requirements of plant, buildings, etc., and for the extension of activities by provision of new bakeries and had appropriated £50,000 to general reserve, which now stood at £150,000. The total liquid assets at £2,363,987 exceeded current liabilities by £351,748, compared with £356,708 last year. That must be considered satisfactory, especially as considerable outlays had been made in investments and on capital account without any increase in the amount of issued share capital.

The board was fully alive to the need for scientific progress in their factories, and a scheme was in course of preparation with a view to the provision of a first-class laboratory as soon as conditions permitted. Their aim was to augment their present staff with the ablest chemists they could find and to fit out their new laboratory with the most up-to-date scientific and research equipment obtainable.

He could not conclude without paying tribute to the directors, executives and all the employees of the subsidiary operating companies for their continued whole-hearted co-operation, loyalty and support during the past year.

The report was adopted.

E. K. COLE, LIMITED

RECORD TURNOVER AND PROFIT

SUCCESS OF "EKCO" EQUIPMENT

The annual general meeting of E. K. Cole, Ltd., was held, on 16th instant, at Aston Clinton, Bucks.

Mr W. S. Verrills, chairman and joint managing director, in the course of his speech, said: Gentlemen, the accounts for the financial year ended September 30, 1944, reflect substantial progress in the activities of your company. The trading profit for the year under review is £423,124, as compared with £263,401 for the previous year. The net profit, after providing for all expenses, including depreciation but before deducting taxation, amounts to £383,165. Liability to taxation on the profits for the year ended September 30, 1944, including income-tax, Schedule "D," 1945-46, has been amply provided for by the transfer of £245,000 to taxation reserve. The higher trading profit by no means adequately indicates the considerably greater output from the company's factories—which has been achieved with increased efficiency, enabling us to fix even lower prices.

GENERAL RESERVE £300,000

We have decided to carry £50,000 to general reserve, which now, therefore, stands at £300,000, which represents nearly one and a-half times our total issued ordinary stock. This does not take into account the unappropriated profits carried forward, amounting to £65,598. Our net liquid assets, again not including Ensign Lamps, Ltd., amount to £445,384, showing an increase of £26,500 on last year.

In view of our satisfactory progress the directors decided during the year that it was proper for the company to revert to its previous policy of paying interim dividends, and an interim payment of 8 per cent. actual, less income-tax, was distributed on the ordinary stock in August last. The directors now recommend that a final dividend of 12 per cent. actual, less income tax, be declared, making a total of 20 per cent. actual, less income-tax, for the year.

RADIO'S VITAL ROLE IN WAR EFFORT

There has been no phase of the war, either defensive or offensive, in which radio, in one form or another has not played a vital rôle. The most intensive effort has been required of the radio industry, and your company, in war as in peace, has played a leading part. Tribute is due to the supply Ministries and other Government departments for their co-ordination of industrial effort and to the Government research development departments for the fundamental research work which, with the co-operation of the radio industry, has enabled Britain to secure a world lead in the field of radio-communication and radio-communication.

The full story of how important this lead has been to the successful prosecution of the war has yet to be told, but it must already be clear that truly remarkable radio devices have been used by all branches of the services, and have played a conspicuous part in every major operation.

As typical of the wide and varied uses of radiolocation and radio-communication equipment can be instanced: The accurate placing of our limited fighter force in the Battle of Britain, as a result of advance radiolocation of the enemy's approach; the co-ordination of search-lights with anti-aircraft guns during the bombing attacks on our cities; the part played in Fighter Command's successes during the day and night raids; invaluable aid in the battle against U-boats, and widespread use by the Army. In addition to meeting the heavy demands of our

forces, the industry has been able to give considerable assistance to our allies.

Ekco radio equipment has been used in most types of aircraft, including the Lancaster, Halifax, Flying Fortress, Tempest, Typhoon, Spitfire, Mosquito, Beaufighter, and Sunderland, and in our battleships, destroyers, submarines, and patrolling craft. Commandos and artillerymen have carried Ekco pack sets and portable transmitter-receivers. Ekco radio gear has been installed in tanks, Bren-gun carriers, and radio-communication vehicles, and is much in evidence in ground radio installations at airfields and control headquarters.

I am proud to say that Ekco radio equipment has earned a high reputation both in the supply Ministries and the operational services. During the past year the radio and television division has also joined in the co-operative effort between the radio industry and the Board of Trade in the manufacture and distribution of the company's quota of the "civilian war-time receiver."

Your board of directors and management recognise that the change-over from war to peace when it comes may be fraught with more difficulties and problems than the change from peace to war. Therefore, certain flexible and broad lines of policy have been framed and plans formulated which, I confidently hope, will enable your company to contend with such vicissitudes and to retain the position enjoyed for many years as one of the leaders of the industry.

The achievements of your company before and during the war warrant quiet confidence for continued success in the post-war era, especially so when I stress the importance of the civilian applications of technical advances which have been made during the war in radio, lighting, and plastics, in which your company has substantial interests.

INTERESTS BROADENED

Our radio interests have broadened to cover not only broadcast and television receivers but also telecommunication and public address equipment and electronic devices. Our lighting division, which incorporates Ensign Lamps, Limited, has a substantial and encouraging output of electric lamps; a well-established and important place in the electric lamps and fittings industry, and the opportunity to participate in the remarkable possibilities for expansion inherent in the rapid advancement being made in the revolutionary fluorescent lighting of the future. Our joint managing director, Mr E. K. Cole, has just returned from a visit to the U.S.A., which was undertaken in connection with the development of our expanding interests.

Our plastics division is firmly established, has an appreciable turnover, and your company is recognised as one of the principal plastics moulders in the country. The wide field which has been covered by our plastics engineering section has brought our name to the notice of most users of plastic products. Post-war demand from the building, motor car, aircraft, radio and household appliances industries must be apparent to all.

The household appliances division, which before the war was making steady headway with "thermovent" convection heaters, washing machines, etc., will become re-invigorated with the advent of European peace.

The "Special Products" Division has been formed to concentrate on the specialised research, development, manufacture, and distribution of those products which in the early stages do not lend themselves so readily to mass production methods. Telecommunication equipment, electronic devices and instruments, electro-medical

apparatus, measuring instruments, and the like come within this category. I cannot forecast an immediate and wide market for such apparatus, nevertheless a steadily expanding demand may be hoped for.

RESEARCH AND DEVELOPMENT

Our research and development division has earned repeated commendations from Ministerial departments for its contribution to the co-ordinated research and development work undertaken by certain sections of the radio industry, co-operating with the Government Research and Development Department in the fields of radio-communication and radiolocation, or "radar." Shareholders have good reason to be proud of their company's own "back-room boys" who, I hope, will be available soon to apply their extended knowledge and experience to providing industry and the general public with better Ekco products at ever-decreasing prices.

During the past year the administrative control of the company has been reorganised to preserve and enhance that flexibility and devolution of responsibility necessary to cope energetically with the problems and take advantage of the opportunities which will arise in the post-war period.

RE-ORIENTATION OF ADMINISTRATION

The lighting division, the plastics division, the "special products" division, and the household appliances division are natural developments from the basic radio division and have been placed under separate responsible managements. This reorientation of administrative control should allow each division reasonable scope for a measure of independent development and progress along its own particular lines. Your directors envisage the possibility that at some later stage in your company's development it may become advantageous for E. K. Cole, Limited, as parent company, to form the divisions into separate subsidiary companies. Should this be considered advisable, the present arrangements will enable the changes to be carried out smoothly. Such evolution of a group of divisions or companies with ancillary and interlocking interests represents your directors' conception of the commercial soundness and permanence of such combinations.

Your directors are mindful of the fact that before the war the radio industry as a whole, with the exception of one or two of the longer established companies, gave comparatively little or no attention to the development of export markets. Realising that in the national interest, for the welfare of industry as a whole, as well as in your own company's interest, post-war export trade must be developed to the utmost, your management intends to devote much of its energy to this end.

CONTROL AFTER THE WAR

This leads me to add my views on the question of Government control after the war. In my opinion, the word "control" is used too often and too loosely and in such a manner that the remarkable co-operation and co-ordination of effort achieved by the Government with and among particular industries are also labelled "controls."

Neither the radio industry nor any other industry could have achieved the staggering figures of output with such little friction as revealed in the Government's White Paper issued recently on Britain's war effort without governmental co-operation and co-ordinated planning. I consider that the basic controls over materials and labour should be relinquished gradually, as and when the prior requirements of the nation and liberated Europe become satisfied.

Nevertheless, I contend that Government co-operation with and co-ordination of industry from which obvious advantages and benefits have been and can be obtained should be continued, developed and strengthened.

The report and accounts were adopted.

FINANCE AND BANKING

THE MONEY MARKET.—Conditions in the money market this week have been exceptionally quiet and uneventful. The expansion of credit over the turn of the year is taking longer than usual to correct itself. This week's Bank return shows that bankers' deposits have fallen by a further £8,069,000 but this still leaves them at the exceptionally high level of £214,102,000. A probable explanation of the persistence of the seasonal inflation of credit is to be found in the fact that the open market operations of the special buyer towards the end of 1944 had largely to be concentrated on longer dated bills than are usually taken by this quarter. These purchases have been neutralised by subsequent resales only to a very small extent, such open market operations "in reverse" being only apparent on one day of January. The inflation of credit will, therefore, tend to persist until the securities thus bought finally mature. A reflux of £11,269,000 of notes from circulation further helped to explain the ease prevailing in the money market during the past week.

MONEY RATES, LONDON.—The following rates remained unchanged between January 11th and January 18th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 40 days, 1½%; 3 months, 1½%; 4 months, 1½%; 6 months, 1½%; Treasury Bills: 2 months, 1½%; 3 months, 1½%; Day-to-day money, 1½%. Short Loans, 1½%. Bank deposit rates, 1%. Discount deposit at call, 1%; at notice, 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between January 11th and January 18th. (Figures in brackets are par of exchange).

INDUSTRY AND TRADE

Retail Trade.—The index of the average value of daily retail sales (1942 = 100) was 109 in November, 1944, according to the Board of Trade Journal for January 13th, representing a rise of 3 points above October and 6 points above the average of the preceding twelve months. The apparel index dropped 6 points from October to 106, that for household goods rose 7 points to 96, non-food merchandise as a whole moved from 108 to 113 and food from 105 to 106. A table in this page gives the detailed percentages changes last November, compared with the year before.

Building Studies.—The latest reports to be issued in the Post-war Building Studies series, published for the Ministry of Works by HM Stationery Office, are *The Lighting of Buildings*, No. 12, price 2s. 6d.; *Walls, Floors and Roofs*, No. 15, 9d., and *Business Buildings*, No. 16, 1s. The series contains the considered views of experts appointed by the Ministry of Works, and is of great value to all concerned with preparations for building after the war.

Monthly Agricultural Report.—Before the war the Ministry of Agriculture issued monthly crop reports on crop conditions and prospects. For reasons of security the information has been withheld since the beginning of the war, but it has now been decided to resume the service. The first report deals with conditions on January 1st.

"The Economist" Sensitive Index.—There was no change in the complete index (1935 = 100) or in the raw materials index, which stood at 158.6 and 185.5 respectively during the week ended January 16th. Owing to a rise in the price of Canadian wheat, the crops index rose by one-tenth of a point on January 10th to 135.7.

GOVERNMENT RETURNS

For the week ended Jan. 13, 1945, total ordinary revenue was £106,910,000, against ordinary expenditure of £108,948,000 and issues to sinking funds of £280,000. Thus, including sinking fund allocations £10,718,210, the deficit accrued since April 1st is £2,500,873,000 against £2,437,735,000 for the corresponding period a year ago.

Total	604,979	456,326	474,319	10,976	11,068

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £86,316 to £3,401,416, the other operations for the week (no longer shown separately) raised the gross National Debt by £2,342,470 to £22,097 million.

terest due 1st March next, the BALANCES of the several accounts
in the above-mentioned Stock will be STRUCK on the night of the
1st February, and that on and after the 2nd February the Stock
will be transferable ex dividend.

For Barclays Bank (Dominion, Colonial, and Overseas),
C. G. ALCOCK, Manager.

Circus Place, London Wall, E.C.4.

SALES MANAGEMENT AND SALES CONTROL. Well-known
engineering firm supplying equipment and accessories
primarily to the motor-car and ancillary industries, requires an
outstanding man to act as Sales Manager in the widest sense of
the term.

He must be a man of good education, some general engineering
background, preferably aged 35 to 40. It is essential, however,
that he understands modern management methods, and has had
some years successful experience in the control of outside sales
staff selling to industrial users.

This is a somewhat unique opportunity for a man who can
quickly fit in to our present organisation, but who at the same time
has the vision and tact to expand the business into new fields in
the early post-war period. The production and financial arrange-
ments are adequate to cover all reasonable requirements.

Applications, giving full particulars of education, age and career
to date, will receive immediate consideration in strict confidence,
and interviews either in respect of immediate or early post-war
appointment will be arranged within the next six weeks.—Box
No. 58, THE ECONOMIST, Brettenham House, Lancaster Place,
London, W.C.2.

ACCOUNTANT. Robson, Morrow and Co. are seeking an out-
standing man. A Chartered Accountant or one with wide
industrial and executive experience, who could be trans-
ferred to modern management and accounting methods for advisory
work of national importance. Four-figure commencing salary and
exceptional prospects. Age not over 38. Mark envelope "Applica-
tion."—Full particulars of education, qualifications and ex-
perience to Robson, Morrow and Co., Victoria Station House,
Victoria Street, London, S.W.1.

IS THIS MAN YOU?

A persuasive speaker in public, a cool, calm thinker, never
embarrassed, a good loser, a good mixer, making friends
without effort? If not, you need **RAPIDISM**, the fascinating
new course, endorsed by leading psychologists.

Write now for free booklet to: THE RAPIDISM INSTITUTE,
6715 TUITION HOUSE, London, S.W.19.

Export or Die

WHEN a Cabinet Minister finds himself in the
difficult position of having to make a speech on
a subject of urgent public importance on which His
Majesty's Government has nothing to say, he has two
alternative courses of action open to him. One is to take
one or two little scraps of administrative action and dress
them up as major decisions of policy. The other is to
indulge in generalised moral exhortation to the public
to cultivate a new spirit, to eschew selfish contriving,
to be up and doing, and generally to relieve the Govern-
ment of its awkward responsibilities. When Lord Woolton
spoke at Bristol on Saturday last on the subject of exports
and industrial policy, he found himself in just such an
awkward fix and he decided to play safe: he chose both
alternatives at once. There were the titbits: the limit for
export credit guarantees is to be raised from £75 to
£300 million (by not much more, in fact, than the
rise in prices); 800 applications for licences to make
prototypes for post-war models have been approved and
512 business men have been allowed to go abroad;
the Government is making studies of overseas markets.
And there were also the customary beatitudes—the spirit
of adventure . . . unity of purpose . . . combined opera-
tions . . . initiative . . . enterprise. It is all a little reminiscent
of the time when Lord Baldwin tried to win a General
Election on the double ground that he could be trusted

and that there was an increase in the production of
broccoli in Cornwall.

So many problems are nowadays described (and
rightly) as crucial and urgent that it is difficult to estab-
lish an order of precedence in the public mind. Yet if
there is one matter which, second only to victory, should
be regarded as vital to the future welfare of the British
community it is the restoration of international trade. Un-
fortunately, it is currently the fashion among one school
of economists to cast some doubt on what should be
beyond question. Their argument derives largely from the
fact that dry cargo imports into the United Kingdom,
which were 55 million tons a year before the war, have
been successfully reduced to less than 23 million tons in
1942 and to not much more than 25 million tons in
1944. If this large reduction could be achieved at the
same time as a great expansion in almost all forms of
industrial activity, surely, it is argued, the country could
get along even in peacetime with fewer imports than it
had before the war—not perhaps with a saving of 60 per
cent as in wartime, but with a saving of 30 per cent.

This argument is wholly fallacious. Of the total reduc-
tion in imports, over 10 million tons is accounted for by
timber, wood pulp and paper alone. If the country has
have a building programme and a free press, these imports
will have to be restored. But in any case what is the

wrong criterion for peacetime, when the limiting factor on British imports is the ability to pay for them, and the right way to add up the various categories of goods is therefore by their value rather than their weight. If wartime imports are listed by their values, but in such a way as to ignore mere changes of price-level (that is, in technical terms, if they are valued throughout at 1935 prices), then the aggregate in 1943 is discovered to be as much as 79 per cent of the pre-war figure, even after munitions are excluded. With all the restrictions and shortages of wartime, it proved possible to dispense with only 21 per cent of the pre-war imports. When the timber and paper are restored, when citrus fruit is once more imported, when the other necessary relaxations of returning peace are carried out, it is doubtful whether the country will find it possible to dispense with more than one-tenth of its pre-war imports. Broadly speaking, there are no unnecessary imports.

There is no escape from the necessity of finding means to import as much as before. Any failure will lead to permanent restrictions on a wide range of activities. Moreover, it so happens that a restriction of imports would hurt precisely those forms of consumption that it is the object of public policy to encourage. Lord Keynes once remarked that in this country the poor lived on imports and the rich lived on the poor. A very large part of the consumption of the well-to-do consists, directly or indirectly, of British labour, and would not necessarily be affected by a breakdown in imports. It is the basic consumption of the masses of the people that would be prejudiced. Cheap imported food might, in a long time and with great effort, be partly replaced by home-grown food—though at a higher cost. Lack of raw materials would inescapably limit the activity of industry. Nothing else, in fact, could do so much damage at once to the three ideals of a higher standard of living, full employment and greater equality in welfare.

The Government is certainly aware of the problem and has frequently given expression to its concern, not least in the White Paper on Employment Policy. But to judge by all the available indications, the Government has not decided upon any specific means of meeting its responsibilities in the matter. It may have a policy for exports, but if so it is being kept under lock and key. Not long ago one of the most important industries in the country found itself, for the first time in many years, with a little of its product to spare after meeting all war requirements and therefore in a position to make a first beginning with the restoration of its export trade. It sought guidance on whether this would be welcome to the authorities; on whether exports in finished or unfinished form were best, and to which countries; and on the foreign exchange considerations. It was told, in substance, to find its own answers. The Government is apparently disposed to think that its duty is done when it has lifted the export prohibitions, as has recently happened (to take one example) with cutlery. For the rest, as Lord Woolton said, it is for industry to take the initiative. *Laissez faire* is re-enthroned in this province of economic policy, however rigorously it may still be banned from the rest.

Like most economic problems of the transition from war to peace, the problem of exports divides itself into two sharply contrasting phases, those of the short run, when there will be a universal seller's market, and of the longer years thereafter. In the short run there will be little difficulty in selling goods either at home or abroad. The difficulties will all be those of supply. When he is free to choose between them, almost any manufacturer will prefer to sell in the home market, where turnover is much quicker and there are fewer annoyances of language, shipping, credit and trade. The duty of the Government in this period is to restrain those industries which are most important for the development of the export trade (by no means always those to which the export trade is most important) from too exclusive an attendance to the clamorous demands of the consumer on the doorstep.

For this task, the mere removal of prohibitions is almost

useless, and even the grant of materials is a very weak weapon. One of the clear lessons of the war is that the according of priorities is likely to be ineffective, unless it is reinforced by a much more comprehensive machinery of allocation. A priority for materials for export will not work unless there is a demand for materials for export, and the home market may well be so attractive that there will not be an adequate spontaneous willingness to ask for materials or labour for supplying foreign markets. What is needed for exports in this transition phase is, therefore, much the same as what was needed during the transition from peace to war—a job of mobilisation, of creating the demand to which the supply can be made to respond. A total of visible exports 50 per cent larger than before the war will require between one-fifth and one-quarter of the output of industry; it is a smaller task than the war programme, but not so much smaller as to be of a different kind. The Government can best discharge its responsibility by drawing up, at least in outline, a programme of exports for these first few years, by seeing that the necessary productive capacity is allocated to it, and—only thirdly and consequentially—seeing that the firms concerned have an effective priority for labour and materials. It is a job on the lines to which the supply departments have become accustomed; where it differs from their wartime tasks it is smaller and, on the whole, easier.

In the longer run, when the world-wide insistence of demand disappears and sellers once more find the competitive going hard, the picture changes. Since, by definition, there will no longer be universal scarcities, the machinery of priority and allocation will no longer work. Then, in fact, will be the time to hand the job more completely back to private enterprise. But that does not mean that there will be no need for Government leadership and assistance, or that there will be no points of general policy emerging which only the Government can settle. For example, it is already clear that the dominant factor will be the price of British goods relatively to those of other nations. British costs and prices were high before the war, and they are much higher now. British labour has grown accustomed to a standard of living that it was hard to justify by its comparative productivity even before the war when it was sustained by the overseas income and other invisible exports of the country. Moreover, British industry has reinforced this tendency by its addition to restrictive practices and high margins. During the war, ideas about standards of living have perceptibly risen, cartelism has been strengthened, and the country's competitive position has worsened. It is at least probable that, unless corrective steps are taken, British goods will again be expensive in the world's markets.

What is it proposed to do about this? Exchange depreciation is a game that many can play. Schachtian strong-arm tactics, exploiting the attractiveness of the British market to force expensive British goods on those countries that sell here, will work only until the victims find means of escaping. Open export subsidies would give rise to a world-wide outcry and world-wide retaliation. Indirect subsidies—the cartels recouping their export losses out of higher prices to the British consumer—are even more obnoxious. There is only one permanent solution—through such a great increase in productive efficiency as will reconcile high wages with low selling prices.

Thus the export crisis leads back, as almost all economic arguments do, to the basic economic problem of the day—the economic efficiency of the productive machinery of the country. This is fundamental to all the fine dreams that are now so much in the public mind. On many issues, inaction is the result of deadlock in the Cabinet between Right and Left. But on this, the representatives in the Government of Big Business and of the Trade Unions are at one in blocking any approach to action, even of the timidiest. An informed public opinion has removed mountains of obstruction before now. It will be badly needed in the months to come if the country is not to live indefinitely under the threat of a siege economy.

The Owners' Plan for Coal

IN May, 1944, the Mining Association appointed Mr Robert Foot as their chairman, and asked him to prepare a report on the future of the coal industry, because they wanted the impact of a fresh mind on problems which had grown sick and stale. Mr Foot, after touring the coalfields and studying the history of the industry during the last twenty-five years, has now produced his plan. It is a personal report, committing no one but the author, and the owners are being asked to reach a decision about it within the next few months. Mr Foot certainly shows a welcome change from the attitude of mind so often associated with mine-owners; he does not indulge in recrimination, he does not seek to blame all the industry's troubles on the miners, for whom he has a warm sympathy. It is an honest attempt by an honest man to solve a difficult problem and the fact that it in no way solves the problem does not detract from the sincerity of the attempt. Mr Foot is a natural optimist, and he believes that, with good will on both sides, the industry can regain prosperity.

If the owners and the men's leaders could really sit round a table and discuss matters as if they were partners in a joint enterprise, it might easily make all the difference in the world,

he writes, and much of his report is devoted to appeals for co-operation. Indeed, it might be described as a sermon, with the text chosen from the Book of Samuel, though the music of Sankey has been rejected.

There is much in Mr Foot's report which will be generally accepted, and has been accepted before by the countless commissions and committees which have investigated the coal problem. The twenty principles for the organisation, operation and standards of the industry, upon which the report is based, are unexceptionable and many of its proposals are constructive. No one, for example, will dispute Mr Foot's definition of the threefold problem confronting the industry as being to give the miner continuity of employment and a good standard of living, to give capital a reasonable return and to give the consumer full supplies of coal at an economic price. From the three sides he asks for flexibility, enterprise and patience respectively. The kernel of the problem, he states, is that "wages should stay high, but the only way in which high wages can be supported permanently is by increasing the output and reducing the price."

The central thesis of Mr Foot's report is that the industry must be organised on the basis of National Service (the very phrase that was used in the Government's White Paper of June, 1942) and that the colliery owners must accept their responsibilities in the sense of trustee-

ship, taking a national, and not a local or sectional, view. The coal itself, as he points out, now belongs to the state, and the colliery owners should regard themselves as the nation's tenants. Mr Foot rejects outright, as was to be expected, any form of state control or ownership of the mines, and urges instead self-government for the industry. He is strongly critical of the present form of Government control, and hopes that it will be "liquidated" at the earliest opportunity and the full authority restored to managements.

Mr Foot is a firm believer in private enterprise and maintains that mining, more than any other industry, offers scope for individual initiative. He argues that for an industry to be run on the basis of national service does not in the least conflict with its remaining in private ownership and control. This is perfectly true. But it does not follow that every privately-owned industry is so conducted as to serve the public interest, and past experience provides plenty of occasion for doubting whether there is likely to be, in the particular case of the coal industry, such a confluence of public and private interest as Mr Foot supposes. He argues that the present owners can be trusted with control "provided they are prepared to accept the drastic kind of reorganisation which I feel the difficulties and seriousness of the present situation make imperative." But are they? They have in the past been given abundant opportunities for reorganisation and are indeed under a pledge to effect it. But the results have been of the smallest, and wartime experience has reinforced the view that some external catalyst is needed. It is no answer to argue, as Mr Foot does, that the difficulties of the industry during the interwar period were not its own fault, but were due to circumstances outside its control. *Qui s'excuse, s'accuse*. Even if the industry were completely free from outside intervention, it would still be at the mercy of external economic factors, and whether through bad luck or bad management, it is apparently helpless to put its own house in order. Mr Foot is very critical of the Labour Party and the miners' leaders who have harped on nationalisation as the only salvation for the industry and made capital out of its misfortunes. It is true that there has been a lot of loose talk on the Left about nationalisation, without any attempt to discover what its consequences would be; but political capital can equally be made out of the dogmas of private enterprise. To make a moral issue of ownership, on either side, is beside the point; what matters is not so much who owns the coal industry as how it is operated. Mr Foot bases his case largely on psychological arguments. But when it comes to psychological arguments, there is no doubt that the miners have got the greater weight on their side.

War-time conditions have proved the advantages of appointing the "Royal Exchange" as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

Head Office at the Royal Exchange, London

This does not mean that Mr Foot neglects the technical side. On the contrary, he agrees that "output per man-shift is the ultimate test" and that concentrated efforts to raise it must be made. That "the industry should be brought to and progressively maintained in the highest state of efficiency" is one of his basic principles. He puts forward proposals for making the best possible technical advice available throughout the industry, for surveying each individual undertaking with a view to improving its performance, and for the introduction of modern methods of labour management. All these are vitally necessary; but the question that is before the public—and which Mr Foot does not convincingly answer—is whether, without a drastic reorganisation of the financial and economic structure of the industry, any real technical progress can be achieved by such methods alone.

*

The basic problem of the industry is a matter of coal-getting. But Mr Foot, equally with the Labour Party, seems to approach it mainly as a matter of committee-forming. The main proposal in his report concerns the establishment of a Central Coal Board. This Board would consist of fifteen members, in addition to a full-time Chairman, who would be appointed by the Mining Association. It would be

drawn entirely from within the industry and should be composed of men of high standing and good reputation . . . who can be relied upon to approach their responsibilities in a statesmanlike way.

It is implied in this proposal, though not explicitly stated, that appointments would be made by the Mining Association, and would be confined to colliery owners, with the exception of two members, who are to have started life in the pit and worked their way up. There would be no representatives of the Government, of the miners' union, or of consuming interests. Though the miners would be kept informed and consulted through their national, district and pit consultation machinery, they would not be allowed any decisive voice in the policy or conduct of the industry. The same procedure would be followed in the District Boards.

The Central Board would work according to a definite constitution, provided presumably by the Mining Association, for Mr Foot explicitly states that he is not proposing any new statutory measures. The Board would prepare detailed annual reports to the Minister of Fuel for presentation to the Government and Parliament, and this, it would appear, would be the limit of its responsibility to Parliament. Each colliery undertaking would retain its autonomy, but would be generally responsible to the Board, which would co-ordinate their activities. The Board would have power to provide any capital needed for modernisation and equipment, to raise or to guarantee loans, and to give any security over and above that which could be provided by any individual undertaking. It would be responsible for deciding on the basis of the district surveys which pits should be helped financially and which pits should be closed, though this step should not be taken until proper arrangements had been made for the absorption of the miners elsewhere. The Board would be empowered to raise a levy on the industry for meeting the cost of its schemes.

The Board would be generally responsible for selling arrangements in the industry, and with the aim of eliminating "inter-district and inter-colliery competition" Mr Foot suggests the continuation of the district distribution schemes set up under the 1930 Act, with a national organisation for exports. Anticipating criticism that this might lead to "some anti-consumer monopoly and so-called cartel" he points out that this has been Government policy for fourteen years and that even if price competition were eliminated, competition in quality would be retained. This somewhat disingenuous argument will not allay anxiety about the creation of a monopolistic selling organisation, with powers to fix prices. If prices are to be fixed, they should be fixed by an impartial body and not by the industry itself. Moreover, one of the effects of the quota sales system introduced in 1930 was to place a premium on inefficiency.

One of Mr. Foot's guiding principles is "the closer

integration of the industry" and he agrees that, in theory, the number of undertakings should be reduced. He admits that the total of 40 to 50 undertakings, estimated by the Tory Reform Committee as the ultimate goal, might be desirable. But he does not go so far as the Tory Reform Committee in advocating compulsory amalgamations or in proposing a time-limit during which the owners would have to put their intentions into effect. In fact he flatly rejects the idea of compulsory amalgamation as impracticable and likely to do

incalculable harm and to delay rather than expedite greater efficiency.

Instead, he hopes that amalgamations will come about naturally and by agreement, though he provides for compulsion to be exercised by the Coal Commission where an undertaking fails, or is unable, to conform with the decisions of the Central Board. It is true, as he points out, that the mere size of an undertaking is not necessarily the criterion of efficiency—there are many small efficiently managed undertakings in this country. But it is equally true that without a complete community of financial interest among the pits of a district, any technical rationalisation of production is next to impossible.

Mr Foot's desire to improve the miners' conditions and standards of living is wholly laudable. He was struck during his tour by the inadequate housing and dismal aspect of many mining villages, and he was continually reminded of the reluctance of colliers to send their sons down the pits, while nearly all the Bevin boys he met told him that they wanted to leave as soon as possible. His aims are that the wages of underground workers should be maintained at a level which will give them "pride of place amongst industrial workers" and so to improve the facilities for education and training that every entrant to the industry, whatever his background, should have an opportunity, "if he has character, guts and ability" to rise to the highest place in the industry. In other words, every pit boy should have a director's cheque-book in his knapsack. The miners will no doubt welcome Mr Foot's proposals on wages and welfare, but it is doubtful whether they would be satisfied with a scheme which gave them so little direct responsibility for the industry, much less, indeed, than they have had under the wartime control scheme, which is based on tripartite responsibility of Government, owners and miners.

*

But all these reforms will cost a great deal of money, and Mr Foot is remarkably uncommunicative on the subject of finance. He admits that large-scale modernisation and mechanisation will have to take place, though he does not commit himself to any figure for capital expenditure; he wants the miner to have high wages, the owner to have fair profits; and he wants these things without increasing the price of coal to industrial and domestic users. The report assumes that the Central Board will be able to raise sufficient capital without appealing to the Government, and that where the volume of private investment is not sufficient, the gap can be covered by a levy on the industry. How can this be done without increasing the price of coal? With increases in wages and operating costs, the price of coal has approximately doubled since the war began, and the Coal Charges Account has added 12s. per ton to the price of coal, for strictly wartime purposes, without any expenditure on development work. Mr Foot would abolish the Coal Charges Account, but his own levy might be almost as heavy if his Central Board was to do as much as he wants it to do. This would be a direct addition to the price of coal. What is perhaps more important, it would continue the vicious principle of laying the expense of reforming the industry on the costs of production of the efficient mines.

For all his good intentions and for all his condemnation of the present system of private responsibility and official control, it is difficult to resist the conclusion that Mr Foot's scheme would result in almost precisely the present state of affairs. There would be no effective movement towards closer integration—for at this time of day it is

simply impossible to believe that voluntary methods plus an appeal to the Coal Commission will achieve anything. There would be no drastic re-equipment—because the capital does not exist within the industry and cannot be raised on market terms. There would be no improvement in the labour position—because the men would regard the scheme as reactionary. All that would exist would be a certain amount of subsidising poor pits, but mainly from the consumer by means of a monopolistic selling organisation. This would differ from the present state of affairs only by the fact that it would be operated entirely by the mine-owners without any Government control—and also, no doubt, by the fact that there would be a formal proclamation of National Service.

Middle Eastern Unity

THE war has receded a long way from the Middle East and on every side there are signs of preparation for the coming peace. The Arab states have met together in preliminary conference to discuss the establishment of an Arab League. The Middle East Supply Centre has virtually ceased its control over imports and exports. Its American co-director, Mr James Landis, has returned to America. A number of American business delegations are touring the Middle East to establish contacts for post-war trade. Business men and commercial delegations from Egypt and Turkey have gone to the United States. From the British side, however, there is so far not very much evidence of a new orientation.

Yet the area is vital to British interests. There is no question of a British withdrawal after the war. On the other hand Middle Eastern problems are such that a policy of drift would carry Britain to nothing but disaster. The old tutelary and mandatory relationship will not last on its own momentum. Self-government for Palestine cannot be postponed indefinitely. In Egypt, nationalism has risen to a marked degree during the war and is causing the local British community some anxiety. The other Arab countries are likely to conform to the same pattern. Either the association of Britain with the Middle East must seem to the advantage of the states involved or it will lead to friction and deadlock and dangerous possibilities of conflict with other Great Powers.

There is no reason why Great Britain should not succeed in establishing a new relationship. There is no fundamental clash of interest. Britain is powerful enough to support the security of smaller nations, not powerful enough to threaten it. The political need of the Middle East—unity—and its economic need—industrial development and rising living standards—are aims which this country can both applaud and help to achieve. The two aims are really inseparable. If Iraq, Lebanon, Syria, Palestine, Transjordan, Saudi Arabia, Egypt and the Yemen are to pursue their prosperity in division and competition, the result will be a repetition of such pre-war follies as the customs war between Syria and Lebanon or the tariff barriers between Palestine and its neighbours. Without unity there will be no prosperity; and prosperity is the surest bond of unity.

There is undoubtedly an impetus towards unity in the Arab world itself. The result of the preliminary conference on Arab unity held in Alexandria last October went further than many people expected. The protocol signed at the time by Iraq, Syria, Lebanon, Transjordan and Egypt and since signed by Saudi Arabia and the Yemen proposes the establishment of a League of Arab States. Its Council would co-ordinate the external policies of the members, protect their independence, arbitrate between them on request and in general "concern itself . . . with the affairs and interests of the Arab countries." At the same time six Commissions were set up to prepare plans for closer co-operation in economic and financial affairs—tariffs, currency, agriculture, trade, industrial development and communications. The procedure proposed was that when these Commissions were ready to report, the

The plain truth is that the industry is past self-help. To say this is not, of course, to plead for nationalisation as usually envisaged. To do what the Labour Party and the miners' union want would make matters rather worse than Mr Foot's proposals. The outlines of a technical and non-political solution have on more than one occasion been discussed in *The Economist*, and this is not the place to repeat them. But it is the place to insist that only one fact has been clearly established by Mr Foot's report: that neither the owners nor the miners can put the industry on its feet, neither separately nor together. The state, the Government, the public, will have to abandon the role of neutral umpire and evolve their own plan. They should have done so twenty-five years ago; and if they do not want to be altogether too late they will have to hurry.

Preparatory Committee would meet again and summon a general Arab Congress.

Elaborate constitution-drawing and commission-forming do not of themselves bring any plan to political birth. Although the aspiration to unity and co-operation is present in the Arab world, it is still too largely negative. It represents the union of Arab states against the outer world rather than their desire to co-operate for positive purposes. Thus if their aspiration is to become reality, the outside world—in this case principally Great Britain—will have to assist them in two ways, by removing the grievances which give them spurious unity, and by substituting for negative defensive unity a genuine co-operation based on common interests and common policy.

*

The first move naturally turns on Palestine. The situation there has deteriorated. The attempted assassination of Sir Harold McMichael and the murder of Lord Moyne are sensational examples of the kind of terrorism that has broken out among the younger and wilder Jews. If the White Paper of 1939, promising the Arabs an end to Jewish immigration, were to be withdrawn, the terrorism would probably arise as fiercely on the Arab side. Without some new initiative, which can only come from the British side, the Palestine problem will be as bitter and insoluble as the Indian deadlock—and as damaging to British prestige. The solution that increasingly commends itself to uncommitted opinion outside Palestine—though it is perhaps too reasonable and moderate to get much of a hearing in the inflamed atmosphere of Palestine itself—is that which has been outlined on a number of occasions in *The Economist*. Its essence is the restoration of the old greater Syria by uniting Lebanon, Syria, Transjordan and parts of Palestine in an Arab state or federation, and the establishment of an independent Jewish state in the remainder of Palestine. This would not meet the full Jewish claim for all Palestine, but it would give them control over immigration in a larger area than any envisaged in the various partition schemes.

Such a policy could not, however, be achieved by political means alone. It would be necessary by the offer of loans and suitable capital development to convince the Arabs, particularly the Palestinian Arabs, that life in Greater Syria offered them opportunities and prospects which their present divided existence does not provide. This point is part of the larger problem of underpinning Arab unity with stronger economic foundations, but in the matter of securing Arab acquiescence to a partitioned Palestine, it might be necessary to provide very special inducements.

The larger objective—that of expanding the economic prosperity of the Middle East as a whole—is in the long run the determining factor in the success or failure of British policy. There are two sides to the problem—the willingness of the Arab states themselves to act together and the degree of help they will receive from the outside world. Capital development in the Middle East must depend very largely on Britain, the United States, and

to a lesser extent France. It is too early to say whether the Commissions established by the Alexandria Conference will accomplish much, but a start has already been made elsewhere in this field. Under the auspices of the Middle East Supply Centre, a series of regional conferences has been held at Cairo over the last two years to discuss such matters as finance and agriculture. After the conference on agriculture, a Middle East Agricultural Council was set up to oversee policy and to work out joint plans for irrigation, research, technical development and education. The delegates at these conferences discussed their problems on a factual basis and had at their disposal a very efficient secretariat provided by the MESC. It can be argued that these conferences have already made Arab co-operation a fact and only need more vigorous encouragement to succeed.

The form which outside help to the Middle East may take is still uncertain. On his return to America, Mr Landis remarked that

the time is obviously drawing near when private trade is coming into its own in the Middle East.

This is probably true, yet on the Arab side a great deal of Governmental action is certain to continue. The merchant community is too undeveloped to undertake the industrialisation and agricultural improvement of the various countries. The pattern is likely to resemble the situation in Turkey, where large investments and loans are negotiated by state agencies. If the British and the American Governments on their side were prepared to work together, they could use their loans to ensure a balanced regional development in the Middle East instead of individual and haphazard investment state by state. Such a policy would not imply the exclusion of private investment and enterprise. On the contrary, it would give it a prosperous framework within which to operate.

Ideally, then, the policy for the British Government to pursue would be to establish in the Middle East a Governmental agency with a strong secretariat of experts and technicians who could on the one hand assist all local Arab councils and conferences in the formulation of joint policies and on the other advise the British Government

on the desirability and advisability of various loans. The policy would be strengthened if the American Government were to establish a similar agency. In fact such agencies already exist in the British and American staffs of the Middle East Supply Centre. It would, however, be inadvisable to carry the Centre on in its present form. It will never quite live down the odium of its first two years when its chief work was to restrict imports and interfere with the trade policy of non-belligerent states. Nevertheless, the staff, the experts and the experience could be kept together under a new name to carry on the advisory tasks which the Centre has also done with great success. It would also be necessary for the Minister Resident to recover the drive and energy which characterised Mr. Casey's period in office.

The crying need for a policy in the Middle East is undoubted. Nor can it be denied that possibilities for a constructive approach exist. Unhappily, the present state of British machinery for dealing with the Middle East makes it almost certain that no thought-out policy will be adopted. For who is to do the thinking-out? No one Minister or department is responsible for the whole area. In the Foreign Office, the area is divided between the Egyptian Department and the Southern Department, and the Economic Department has some responsibility. The India Office also has some say, while the Colonial Office is responsible for policy in Palestine. Only during the war has a single ministry—in this case the Ministry of War Transport—had anything like a general oversight of the area as a whole. The first need is therefore the creation of a Middle Eastern Service, controlled by a Middle Eastern Department in the Foreign Office, to which a co-ordinating responsibility is transferred for the whole area. Now, when departmental reorganisation is being carried out in Downing Street, is the time for this essential step to be taken. Good machinery does not guarantee good policy, but bad machinery can frustrate the formulation of policy, good or bad. Unless this reorganisation at the Foreign Office is achieved, Britain is condemned to drift and uncertainty in the Middle East with all the disasters they will entail.

NOTES OF THE WEEK

Across the Frontiers

The great Russian offensive shows no sign of slackening. Every day brings new salvos of triumph from Moscow as the Red Army gallops unchecked across the great plain between the Vistula and the Oder. Russian armour has already cracked wide open the defences of East Prussia and Silesia; Oppeln has been taken, and the fall of Breslau, key to the entire province, seems imminent. In the extreme south, in Slovakia, a new offensive under Marshal Malinovsky has opened successfully, and threatens to complete the encirclement of the rich industrial basin. Success is infectious among Stalin's marshals.

It is hardly possible that the advance can continue at such a breathtaking speed. With an additional two hundred miles between them and their nearest bases, the Russians' supply problems must now be extremely difficult. A pause for consolidation seems inevitable. It may be that the Germans decided from the first to make their stand nearer to their own frontiers. So far the Russians have claimed only small numbers of prisoners, but this may mean that large German forces have been left behind by the Russian advance, and now await treatment. What is certain is that the Germans must now, or never, make the stand to save Berlin.

Mr Churchill and His Critics

The outstanding point of the Prime Minister's speech in last week's debate was the vigour with which he assailed the critics of his Greek policy. He had never known a Government, he said, which had been so maligned and traduced as had the present British Government by organs of the press.

How can we wonder at the attitude of hostile and indifferent newspapers in the United States when we have here in this

country witnessed such melancholy exhibitions as that provided by some of our most time-honoured and responsible journals?

He further complained that a hard task was being rendered vastly more difficult by "a spirit of gay, reckless, unbridled partisanship."

These are hard words. They have some justification. In some parts of the British press there has been altogether too much jumping to conclusions without evidence, too much readiness to impute motives, too much anxiety to give the benefit of the doubt to anybody but His Majesty's Government. But if the kettle is black, how about the pot? Have Mr Churchill's speeches been conciliatory or careful of their facts or conspicuously fair-minded? Have they avoided all gaiety, all recklessness, all partisanship? Quite on the contrary; they have been so couched as to give offence to many people who are willing to trust the Government's policy. Last Thursday's speech was another of the familiar sort, full of ferocious denunciations of EAM and ELAS, contemptuous of the part they played against the Germans, relying on the false suggestion that the practice of atrocities is something new or one-sided in Greek policy.

Fortunately, the Government's policy has not been so bad as Mr Churchill would have us believe. Nor have the actual proposals of the critics, stripped of the ideological bombast, been very far out of line with what the Government has done. In the first of the series of Greek debates, as Percy Harris reminded the House, the critics of the Government pressed for three things—the visit of a responsible Minister to Athens, the establishment of a Regency, and the negotiation of a truce. In the four weeks that have elapsed, all three desires have been met, and if the world believes that the Government has yielded to pressure, this must be put down to the impression of defiant recalcitrance

made by Mr Churchill's own speeches. The further demand put forward by the critics last week, that there should be an amnesty, was largely met in the course of the debate by the statement that General Plastiras had agreed to prosecute only those who were guilty of legal, as distinct from political, offences. It is a very great pity that the violence of largely artificial party passions, on both sides, should so vastly exaggerate the real differences of view on British policy in liberated countries that exist in this country.

The position in Greece is easier. But it is hardly satisfactory yet. ELAS has released the hostages—the sticking point of the recent negotiations—but the truce is nevertheless uneasy and genuine reconciliation is still to seek. It is difficult to tell from the news despatches, all of which come through a single bottle-neck, how much there is in Mr Eden's assertion that the constituent parties of EAM are "flaking away." But clearly no equilibrium can be stable until all those parties which represent substantial sections of the Greek people, and which are prepared for a constitutional collaboration, have been given at least the opportunity of readmission to the Government. It may well be, as Mr Churchill said, that the Communists will not be admitted by the other parties. But the rest of EAM, either separately or together, will have to be brought back into the fold if the British Government is to escape the dangers of being committed to the support of a minority Government in Greece.

The Liberation of Poland

Warsaw is free. A Polish administration is established among its ruins. This news would have been received in the free world with overwhelming delight and gratitude, if a shadow of further servitude did not hang over the tragic city. The men who directed its heroic struggle for two months last summer, and who command the loyalty of a great well-organised Home Army throughout Poland, are not represented in the new administration. On the contrary, the local leaders go in danger of proscription, and hundreds of Poles who fought the Germans for five years have been liberated only to be deported. If anything can be done, even at this late hour, to avert the tragedy, and to guarantee that the new Government of Poland shall indeed be independent, it should be the first item on the agenda at the forthcoming meeting of the Great Powers. If they cannot achieve a compromise, then clearly the war for Poland will end as it began, in disaster.

Is there material for a compromise? It would seem so. On the Russian side is the fact of possession. The Lublin Poles are in Warsaw. The Polish armies which obey them are fighting with the Red Army in the liberation of Poland. Land reform and the transfer of German territory to Polish sovereignty are promises which will draw support fairly quickly. The Lublin Poles are not fully representative. They can become much more so. The London Poles labour under the disadvantage that their two most trusted leaders are out of the Government. Nevertheless, Mr Mikolajczyk and Mr Romer, to mention no others, are still "London Poles," and their position in Poland is strong. Together with the members of the present London Government, they command enough fervent support in Poland to make the task of Russia and its chosen administration infinitely more costly and hazardous if they remain in opposition. Thus the Lublin Poles have possession and growing popularity to offer, the London Poles loyalty and established support.

The three Great Powers, too, have something to offer. Since the Russian recognition of Lublin, Russia, on the one hand, and Britain and America have a stake of prestige and, in the latter case, honour in the Polish dispute. One factor barring a solution is the question of saving face. For either side at this stage to give ground without a *quid pro quo* would strain still further the overstrained alliance. There seems to be only one solution which meets the needs both of the Big Three and the Poles. If simultaneously Russia, Britain and the United States could unrecognise their respective governments and construct a provisional government out of the most acceptable members of both, under the leadership of Mr Mikolajczyk, then at one stroke the most dangerous cause of friction would have been removed, and a reasonably representative Polish Government established.

King Peter Acts

In the debate of January 18th Mr Churchill gave a forthright warning to King Peter of Yugoslavia. The great Allies, he said, had agreed on a fusion of the Royal Govern-

ment with Tito's Administration at Belgrade. They had approved the Tito-Subasitch communiqué announcing the form the fusion would take. It was true that King Peter had made reservations, but

It is a matter of days within which a decision must be reached upon this matter, and if we were so unfortunate as not to be able to obtain the consent of King Peter, the matter would have, in fact, to go ahead, his assent being presumed.

King Peter has paid no attention to this warning. On the contrary, he has taken the one step that could prevent the "matter" from going ahead. He has dismissed Dr Subasitch and his Government. If Dr Subasitch or any members of his Government go to Belgrade it will be as private citizens.

It is difficult to see what King Peter gains by this gesture. His mistrust of the methods Marshal Tito may use to pack the Provisional Government are, on the whole, justified. The probable absence from it of any leading Serb must be a standing challenge and irritation to a Karageorgevitch. But the difficulty is that his dismissal of Dr Subasitch ends even the slender chance that some moderating influence might make itself felt in Belgrade.

It is true that neither the King nor his Serb advisers are particularly moderate, but the mere admission into the Tito Government of men from outside Yugoslavia and the mere knowledge that what they said could command a hearing in Britain and America would have made some fissure in the totalitarian façade. That opportunity has been thrown away. Mr Churchill has made it clear that the King is most unlikely to receive even moral support. Any other kind of support is ruled out by the Grand Alliance and by geography. Thus it is hard not to think that the end of the story may be regrettable and unfortunate for a monarch who, whatever the faults of his predecessors or of his present advisers, deserved very well of this country by bringing Yugoslavia into the war in 1941.

A Lost Opportunity

In the House of Commons on Tuesday an attempt to introduce a new clause into the Representation of the People Bill—a clause to provide local authorities with opportunities to experiment in their elections with a system of Proportional Representation—was defeated by a large majority. The provisions of the new clause seemed so reasonable and moderate that one must ascribe its rejection either to the narrow self-interest of the two main political parties or to obtuseness conjured up by the very term Proportional Representation.

It may be sensible to sit tight when new steps would modify a basic principle of government—and the adoption of PR in Parliamentary elections might have that effect—but where the seat is becoming increasingly uncomfortable it is not unduly reckless to explore the possibilities of movement. And that is precisely what the supporters of the scheme had in mind. It would have given local authorities permissive powers to experiment, for a limited period

of six years, with a system that could do very little harm and might do much good. As Sir William Beveridge said:

... it would increase the power of the voter and therefore his interest in elections. It would also help to improve the quality of candidates.

The argument against PR in Parliamentary elections is that a strong Government with a firm majority is to be preferred as an aim to the mathematically exact reproduction of the electorate. But the argument does not in the least apply to local authorities, which, though they have parties, rarely operate on a strictly party basis—if only because they are nowadays so tightly circumscribed by the central government. The greatest need of municipal government, by universal consent, is to get more good men and women into it, regardless of party. It is hard to believe that the experiment of PR, to be tried only where the local authorities wanted it, would not have a stimulating effect.

Twenty-six years have passed since the Speaker's Conference recommended the introduction of PR in large boroughs and the Alternative Vote elsewhere. The resumption of electoral activity would provide an excellent opportunity to give these recommendations a belated try-out under local conditions. It is regrettable that the opportunity will be missed because of gross self-seeking by the two larger parties.

The Cost of Assistance

Supplementary civil estimates for the current financial year include an amount of £1,980,000 for supplementary pensions, bringing the final estimate for the year to £56,910,000. Thus, supplementary pensions, which are given through the Assistance Board after a needs test, have now become the largest item of the national pensions bill. It completely dwarfs the amounts paid by the state under the contributory pensions scheme, for which the estimate this year is only £22,525,000, and now exceeds the amount estimated for non-contributory old age pensions, paid on proof of need, which is £56,000,000.

It is also worth comparing the present estimate for supplementary pensions with the amounts paid when they were first introduced. When the Bill transferring the burden of needy pensioners from the rates to the Exchequer was debated in Parliament, it was stated that local authorities would be relieved of about £5,000,000 (of which £1,000,000 was already provided by the Exchequer). But it was expected that the Exchequer would have to pay out more than the local authorities, because of the reluctance of pensioners to go on the rates, and the amount actually spent in the eight months of 1940-41 during which supplementary pensions were in force was £15½ million. The following year it was £27,380,000, in 1942-43 it was £37,523,000, and for 1943-44 the final estimate—the amount spent is not yet available—was £46,250,000.

This history of supplementary pensions is of more than academic interest. Social security, under the Government's proposals, will consist of national insurance plus national assistance; in other words, those who, like the needy pensioners, are unable to maintain themselves and their dependants out of their insurance benefits will be able to obtain additional help from the state instead of going on the rates. The lesson of the growth of supplementary pensions is that when "national assistance" is substituted for "public assistance," the cost rises enormously, partly because of constant parliamentary pressure to make the state's interpretation of need more generous, but mainly because of the needy's preference for national assistance to the rates or charity. The local authorities used to give additional relief to about 275,000 pensioners. When supplementary pensions were introduced, about a million applications were accepted. Last September, the Assistance Board was paying supplementary pensions in respect of some 1,550,000 persons, excluding widows under 60 with children, who became eligible for them in September, 1943, and the supplementary estimate for this year is necessary because the number of applicants is greater than was expected. The cost of social security, as distinct from national insurance, will evidently be extremely difficult to estimate for any time ahead.

Opening the Burma Road

British, Indian and Chinese forces have cleared the Lado Road down to its junction with the old Burma Road.

Now the land route into China is open again and convoys full of heavy military equipment are already on their way to Chungking. This news, received from Lord Louis Mountbatten's headquarters on January 23, has tremendous symbolic significance for the Far Eastern war. At the time of Britain's greatest weakness, in 1940, the British Government was compelled to close the Burma Road. In 1942, British forces lost control of it after a gruelling campaign.

It is fitting that the British Fourteenth Army, together with the Indian Division, should have played so large a part in clearing North Burma. A long score has been wiped out and an old debt paid. The Chinese soldiers who actually cleared Bhamo and made possible the opening of the road have an even longer score to settle, and many observers, arguing from their skill and success when equipped with modern weapons, believe that the opening of the Burma Road is the prelude to the creation of a great Chinese land army, capable of playing a decisive part in the Japanese war. It is, however, possible to read too much into the military significance of the reopened road. Although it has been cleared on the Burma side, the great Chinese-American base at Kunming is under some threat from Japanese forces operating from the Hankow-Canton railway. Their advance beyond Kweilin has been halted, but winter is hardly a campaigning season in the Chinese highland.

With the spring, a new threat may develop to the Burma Road from Chinese territory. It is probable that under any circumstances the amount of equipment and supplies that can be sent to China along the road could furnish only a relatively small army. Such an army would naturally be an invaluable subsidiary to the main attacks, but their direction appears to be already set—from the sea. Thus, although the freeing of the Burma Road is likely to attract most attention, it may be that the capture of Akyab and the island of Ramree on the Burma coast is equally important. Control of the coasts ultimately gives control of Rangoon. From there it is a step to Singapore. With that base re-established, the Allied navies will be able to assemble even more massive fleets against Japan.

Terms for Hungary

On January 20th, Marshal Voroshilov signed the Hungarian Armistice on behalf of the United Nations. Its terms are moderate, for it follows the generous armistices drawn up for Finland, Bulgaria and Roumania. Since the Provisional Government has agreed to switch all its resources to fighting the Germans, the indemnities Hungary must pay have been reduced to the figure of £75 million, of which two-thirds will go to Russia and one-third to Czechoslovakia and Yugoslavia. The territorial settlement is also reasonable. The Hungarians are to evacuate any territory they have occupied during the war, and they renounce their territorial gains under the two "Vienna awards." These were the two instruments by which Hitler in 1938 and 1940 gave Hungary territory at the expense of Czechoslovakia and Roumania.

The leniency of all the armistices imposed on Germany's satellites has led some defenders of the Allies' policy of unconditional surrender to argue that the Germans' fear of terms they have not heard is groundless. As Mr Churchill put it in the debate of January 18th:

Several countries have already surrendered unconditionally to the victorious Allies. . . Already there is a tolerable life appointed for their peoples.

This argument misses the fundamental difference between the armistices with Germany's satellites and the settlement with Germany itself. The satellites in a sense purchased more favourable treatment by undertaking in greater or less degree to switch their resources from a war on Germany's side to war against Germany. Germany has no such hope, and those who press for a statement of terms—which is not, as Mr Churchill again suggested, the equivalent of a negotiated peace—have had in mind throughout the stiffening effect on German morale of nameless fears and terror. The Prime Minister, however, went a little way towards meeting this difficulty when, in the debate, he said:

We demand unconditional surrender, but you well know how strict are the moral limits within which our action is confined. We are no extirpators of nations or butchers of peoples. Abandon your resistance unconditionally. We remain bound by our customs and our nature.

The Medical Schools

Most of the recommendations made by the Goodenough Committee on Medical Schools, whose report was published last July, are matters that concern the universities, the medical schools, the hospital authorities and the General Medical Council rather than the Government. But they also involve considerable additional expenditure, both in respect of new equipment and accommodation and of increased grants to students and the introduction of proper salary scales for the teaching staff of a hospital, whether whole-time or part-time. The Committee estimated that to meet recurrent expenditure on undergraduate and post-graduate education the university medical schools will need (at pre-war values) between £1,750,000 and £2,500,000 more a year, and that capital expenditure would cost not less than £5,000,000.

In the House of Commons last week, the Minister of Health stated that the Government accepts the principle that increased grants from public funds should be distributed by the University Grants Committee to the medical schools, post-graduate schools and institutes and teaching hospitals. The amount of the grants, whether for capital or recurrent expenditure, will be determined in the light of the recommendations of the University Grants Committee and the general financial position prevailing, but the Government accepts the recommendation of the Goodenough Committee that any grants to medical schools should be conditional upon their admitting a reasonable proportion of students of both sexes. Shortage of accommodation will still be a barrier to the admission of women—as well as of men—but at least they will not be refused wholesale because of their sex.

Mr Willink stated that the acceptance of the principle of increased grants will also depend on the revision of the medical curriculum. The General Medical Council has already taken the initiative in this matter, which will be a difficult and in some respects painful procedure, but if ever the overloaded and badly balanced medical curriculum is to be revised it should be now, before the establishment of a national medical service leads to a considerable increase in the number of medical students.

Civil Servants in Exile

The wartime exile of civil servants is by no means at an end. Evacuated departments will be able to return to London only very slowly, and initially they will be housed on its far outskirts. Meanwhile, the new Ministry of National Insurance is to be set up, not in London, but in Newcastle-upon-Tyne. These decisions have been forced on the Government more by the acute shortage of accommodation in London than by any deliberate policy of decentralisation.

The undoubted need to relieve the congestion of central London calls for the removal of offices as well as factories. But, in the main, offices cannot be resettled in depressed areas as easily as factories. The choice of headquarters is comparatively immaterial to some Government departments—the Ministry of National Insurance is perhaps a case in point. The exile of the Post Office Savings Bank and the Ministry of Pensions, whose stay in the provinces will anyhow be protracted, could be made permanent. The efficiency of most Government departments and private firms, however, depends, in different degrees, upon quick and personal contact one with another, so that their removal must in any case be limited to areas within daily travelling reach of central London.

For private firms, the difficulty is that there are no means of deciding which offices should move, and it is not practical politics, even were it desirable, to use compulsion. In any case, there will for a long time be less room than before the war in the centre of London. But it is not enough, and it may in some cases be a mistake, for the Government to set an example by merely delaying the return of its own departments. Instead, it should indicate its intention to decentralise some departments permanently, and not be afraid to recall other departments if reconstruction needs require. It should encourage those firms who care to move out by assuring them accommodation in suitable reception areas and by improving communications, especially the telephone service.

ATS Overseas

Wednesday's debate on the compulsory posting of ATS overseas was the occasion of some stormy protests against the new War Office ruling, announced before the Christmas

recess. The opposition was relatively small and oddly assorted, but vociferous. It objected primarily on the grounds that adequate safeguards for the physical and moral welfare of ATS sent overseas had not been provided.

Sir James Grigg gave a sound defence on the grounds of manpower needs and the long-standing mandate for full conscription of women. Volunteers for overseas service would not at present, he said, fill more than a quarter of Army requirements. This fact alone should have been enough to compel agreement, however unwilling. Having accepted the conscription of women in the first place, there is no logic in allowing them, if a national need exists, to choose where they will and will not go.

For this reason, the Government reply was possibly more than necessarily conciliatory. To quiet parental fears, important reservations have been attached to the conscription rule. If more ATS are needed in India or elsewhere, the Government has every right to cancel some of its concessions, and to exercise its mandate to the limit.

Those who press for preferential treatment for ATS which is not strictly based on the physical difference between men and women do a real disservice to the claim for equal legal and economic rights for women. Moreover, it is ridiculous to suggest, as did one MP, that because this country has already exercised its powers of conscription for women more widely than any other, it should now hold back and even abandon those powers. This was not the principle that brought the Government and the country through 1940 and 1941, and it cannot be accepted in 1945. By all accounts, the ATS themselves would not greatly appreciate a stay-at-home campaign in their favour. After the long record they have made of monotony, hard work and danger shared with the Army without complaint for more than five years, this is no time to paint the ATS in pastel shades, suffering womanish qualms in foreign lands.

The Law of Negligence

Gradually the littered arena of English law relating to compensation for injury is being tidied. It is not an easy task, nor is it helped by the number of semi-inde-

No. 5—GOLD COAST

THE territory now known as the Gold Coast has an area of 92,000 square miles, with a population of nearly 4,000,000.

Towards the end of the Fifteenth Century European trading centres were established here—Portuguese, Dutch, British and Danish. The British settlers finally displaced the others but it was not until 1821 that the British Government began to take a hand in local affairs.

The gold, ivory and spices, which first attracted European traders, have yielded first place to cocoa, which now forms the Colony's principal export and constitutes about half the world's production. It is grown almost entirely by native peasant farmers. The Colony is also an important producer of gold, manganese and diamonds.

The average annual value of its external trade 1935/39 exceeded £17,000,000.

The Bank has branches at Accra, Sekondi, Takoradi, Tarkwa, Dunkwa, Kumasi and Koforidua. Those concerned with trade in Africa, the Mediterranean or the West Indies, are invited to communicate with:—

BARCLAYS BANK
(DOMINION, COLONIAL & OVERSEAS)

LONDON, E.C.3

pendent authorities and committees engaged on the job. There are the Home Office, the Lord Chancellor and the Law Revision Committee, and the yet to be completed Ministry of National Insurance adorning the background. With commendable speed, Sir Walter Monckton's Departmental Committee on Alternative Remedies, appointed only last July, has now made an interim report (Cmd. 6580).

The title of the report is, to the layman, on the obscure side. It is a reference to the position in which a workman, injured by an accident arising out of and in the course of his employment, finds himself when he begins to think about compensation. He can claim compensation under the Workmen's Compensation Act, without having to prove that his employer was negligent. But if he can prove his employer was negligent he can sue under the Common Law for damages and frequently can recover more, in lump sum form, than his weekly compensation is worth. But he cannot recover both compensation and damages. He must elect which to take. Hence the lawyers say he has alternative remedies.

The next complication arises from the activities of the Law Revision Committee, which have resulted in the Law Reform (Contributory Negligence) Bill, given a second reading in the House of Lords this week. This Bill alters the general law relating to claims based on negligence. At present, if a claimant was himself negligent in the circumstances that led up to the accident he cannot recover damages, although the negligence of the defendant may have been much greater than his. That rule does not hold good in the Admiralty Court, in respect of collisions at sea. There the Court can estimate the relative degrees of negligence and award a claimant a proportion of the total damages he would normally receive. It is now proposed that the general law of negligence shall be altered to conform to the Admiralty Court practice, a straightforward and satisfactory step.

But the alteration of the general law of negligence might have an adverse effect in the particular case of a workman injured by an accident. He may sue for damages, the court may hold him partially to blame but award him a reduced figure of damages, smaller than the value of his established compensation rights. But he has recovered some damages and, therefore, cannot claim compensation, not even the proportion needed to make up the difference. Hence the activities of the Departmental Committee. Their report recommends that the new alteration to the law of negligence shall not apply to actions brought by workmen against their employer. It is not a very satisfactory answer. It suggests that in removing one anomaly Parliament shall create another, but, since it is probably impossible to find enough Parliamentary time, and, maybe, interest, to clean up the whole problem, it may be better than any other temporary solution. One of the troubles is that the law lags so far behind the existing circumstances. It ignores the basic changes introduced by the existence of compulsory insurance into so many of the fields from which actions for negligence arise. Piecemeal improvements are not to be despised, but they are not very satisfactory.

Beware of the Cow?

Improvements in the supply and distribution of milk have played an important part in maintaining the wartime health of the British people. But the quality of the milk so fairly distributed is a matter of acute controversy. The long-standing dispute about pasteurisation is very disconcerting to the general public. Mr and Mrs Everyman are easily and dreadfully misled by the germinal language of the disputants—so much so that they begin to classify milk, with "edible fungi," as something to be consumed only at considerable risk. They are already bewildered by the various gradings of milk. In addition to "Pasteurised," there are "TT" and "Accredited." "TT" (Tuberculin Tested) milk is drawn from disease-free cattle. It is officially "safe" milk—that is, safe from bovine tuberculosis—but it is not necessarily "clean." Yet, although there is no guarantee that it will not transmit infections other than tuberculosis, the conditions under which it is normally produced, and the fact that tuberculous-free cattle are healthy cattle, almost rule out the possibility of contamination. "Accredited" (formerly "Grade A") is milk drawn from healthy-looking cattle and bottled. Medical opinion regards this milk with disfavour. It is neither safe nor clean. Pasteurisation involves some reduction of the vitamin C content, but it is considered by the experts to be at present the only practicable

way of ensuring that milk is both safe and clean when it reaches the consumer. Other nutritive qualities in the milk remain unimpaired and its flavour "as detectable by the average person" is unchanged.

On the other hand, pasteurisation needs skilled workers and careful supervision, and neither can be always guaranteed, especially in wartime. Mothers, therefore, are advised to boil all milk for young children. It may be argued that if milk for those who form the great majority of potential sufferers from bovine TB is boiled, pasteurisation is unnecessary. The answer to this is, first, that pasteurisation prevents other infections which harm adults, and, secondly, that all mothers cannot be relied upon to boil their children's milk.

The consumption of clean, safe milk is thus a matter of double locks on doors. Since the ideal of the provision of nothing but TT milk, cleanly distributed, cannot be achieved for some time—though far more vigorous steps should be taken to this end than were taken before the war—the only really effective barrier against infection is boiling. But since boiling may be forgotten or disliked, and is in any case hardly practicable in such cases as milk-in-schools, the Yale lock of pasteurisation enormously reduces the risk.

Shorter Notes

The Registrar-General's return for the September quarter of 1944 gives no sign that the rising trend of the birth-rate is yet coming to an end. A rate of 17.6 per thousand is the highest for any third quarter since 1926, and 44,843 more births were registered in the first nine months of last year than in the same period of 1943. The infant mortality for the quarter was 40 per 1,000; the general death-rate 10.3 per 1,000, compared with 9.4 for the third quarter of 1943. 82,302 marriages were recorded. This is only just over half the number recorded in the same quarter last year. It compares badly with the 191,426 marriages recorded in the same period of 1942. So sharp a decline in the number of new marriages must sooner or later show itself in a downward trend of the birth-rate.

The main task facing the 94th Session of the Governing Body of the International Labour Office, which met on Thursday, is to set up the international industrial committees proposed at Philadelphia. In addition, considerable interest and some anxiety will be shown in the ILO's future international status, which is left vague by the Dumbarton Oaks proposals. Other subjects on the agenda are the summoning of regional conferences—including the possibility of calling a general conference which would give special attention to Europe's problems and the question of the ILO's return home to Geneva.

The decision to allow an increase in the wartime numbers of women undergraduates at Oxford University is a purely temporary measure, but a permanent increase is overdue and badly needed. The limited accommodation for women produces excessive competition, with the obvious result that the entry examination into women's colleges is harder than that into some men's colleges. This discrimination between the sexes extends to privileges as well as numbers. In the intellectual field, at least, women should be assured of equality.

AMERICAN SURVEY

Wallace and Jones

ONE of the famous stories of that wittiest of Vice-Presidents, Thomas R. Marshall, concerns a poor woman who had two sons. One of them ran away to sea, the other became Vice-President; and that was the last heard of either. The same cannot be said of Mr Henry Wallace, for whom a new home has been found at the Department of Commerce. Indeed, one of the biggest political rows of the decade is blowing up over the ousting of Mr Jesse Jones and the confirmation of Mr Wallace's appointment by the Senate.

The crux of the matter is not so much the Secretaryship of Commerce, as control of the Federal Loan Administration and its many subsidiaries. The Reconstruction Finance Corporation and its subordinate agencies possess lending authorisations totalling about \$50 billion. It was the direction of this vast, semi-independent financial empire which made Mr Jones so powerful a figure; and it is the transfer of this authority to Mr Wallace which is being so hotly contested in the Senate. Mr Wallace believes that the control of the financial agencies is the key to the creation of an expanding economy and the maintenance of full employment which he has so deeply at heart. The choice is between two men whose mutual detestation has been one of the abiding features of the Roosevelt Administration.

Mr Jones, who since 1932 has been the chief representative in the Administration of conservative finance and, now that Mr Hull has retired, of the Southern Democrats, has made no secret of his resentment at being displaced; and this has been influenced by the fact that his successor is Mr Wallace, with whom he has been at odds since the dispute over the Board of Economic Warfare two years ago; and by Mr Roosevelt's extraordinary statement that Mr Wallace's campaign services entitle him to almost any post which he (Mr Wallace) believes he can satisfactorily discharge. To this Mr Jones has vigorously dissented, protesting against putting at the head of the Department of Commerce and the government lending agencies "a man inexperienced in business and finance."

Of Mr Wallace's integrity, his vision, and his humanity, as well as his great services to the Administration, there can be no doubt. To question whether he is the man best suited to succeed Mr Jones implies no defence of the excessive banker's caution that Mr Jones has shown, or of his bias in favour of big business and finance. (The *Herald Tribune's* printer's error, in which he was referred to as Mr Jesse James will have delighted the liberals who view Mr Jones as a twentieth century descendant of earlier buccaners.) But if the paramount aim of the Administration is, as has so often been said, to preserve domestic peace, there can be no two views of the political ineptitude of Mr Wallace's appointment and the way it has been engineered. The profound alarm with which the business community has always regarded Mr Wallace's reputation as an open-handed visionary may be excessive, but it is likely to strangle at birth that promise of amicable co-operation between business and government to which Mr Wallace has hopefully referred.

In Congress, the Southern Democrats are up in arms, in defence both of Mr Jones and their political philosophy. Senator George has introduced a bill to divorce control of the Federal Loan Administration from the Department of Commerce. Such a move, if it were not vetoed by the President, or were carried over his veto, would deprive Mr Wallace of most of his prospective powers.

In keeping "slightly left of centre" Mr Roosevelt has often described a zig-zag course. It is only a month since the outcry over the "reactionary" appointments to the State Department; and Mr Wallace himself has taken a good many knocks in the interest of moderation. It is difficult to believe, however, that the payment of political debts incurred at Chicago to Mr Wallace, and during the campaign to the Congress of Industrial Organisations, need have reopened, not only the long-standing feud between

Mr Jones and Mr Wallace, but the old breach between the right and left wings of the Democratic party. Even if Mr Wallace is confirmed in his new powers—which is by no means certain—his freedom of action will be limited by the reinforcement that his appointment has given to the alliance between the conservative Democrats and the Republicans, which has always been the bane of a progressive domestic programme. Foreign affairs will get scant attention on Capitol Hill for the next few weeks, but a breathing-space on this front is hardly worth the re-opening of old wounds and domestic dissension.

American Notes

Men and Machinery

Senator Vandenberg's proposals for the disarmament of the Axis have achieved an immediate popularity which even he seems hardly to have expected. His own prestige has been enhanced to such an extent that he is now being seriously mentioned for the Republican Presidential nomination in 1948. Moderate Republicans—that is, those outside the Nye-McCormick orbit—have been delighted at a solution appearing to marry realism to the Atlantic Charter; and Senator Connally's request for a moratorium on political discussion should not be taken to mean that the Administration is unfriendly. The general sense is that the Vandenberg plan has strengthened President Roosevelt's hand in

preparation for his next meeting with Mr Churchill and Marshal Stalin.

The "political moratorium" has in any event, been violated by Senator Connally himself, who has proposed, probably with the blessing of the Administration, an interim political council to deal with contentious foreign issues in the period before the final settlement. Its powers would be only advisory, but Senator Connally suggested that, had it been in existence before the Greek crisis, bloodshed might have been avoided. This semi-official suggestion is only one of a number advanced in the United States to devise further machinery for effective consultation and agreed action among the Big Three. Others include quarterly meetings of the Foreign Secretaries and the creation of a Combined Political Board similar to the Combined Chiefs of Staff in Washington.

All these plans are reassuring signs of a desire to keep the Big Three in step on the political level and to see that the United States accepts its full political responsibilities. The adoption of any one of them might have the healthy effect of persuading American opinion that the United States was indeed a party to political decisions rather than merely an alarmed spectator. Whether any such device would be any more effective than the European Advisory Commission is another matter. The analogy with the military is misleading. The Chiefs of Staff are professionals set certain goals and enjoying a freedom to find their own technical solutions. For a similar political body to enjoy comparable freedom would involve a delegation of authority which neither Mr Churchill, Marshal Stalin, nor President Roosevelt has shown any real willingness to concede.

Work or Fight

Mr Roosevelt's request, in a letter to Congressman May, Chairman of the House Military Affairs Committee, for immediate action to draft the 4-Fs, or, as provided in the Bailey-May Bill, men from 18 to 45, into war industry, seems to sound the doom of more general legislation. Mr Roosevelt enclosed a supporting letter from Admiral King and General Marshall, and he begged the Military Affairs Committee not to be tempted to delay by an accelerated movement into war work in the past fortnight which might be reversed if Congress failed to show that, at last, it meant business.

The Bailey-May measure has now been amended to substitute civilian penalties for the military sanction of conscription to the Services. Jail sentences up to five years and fines up to \$10,000 now take the place of conscription into Service labour battalions. The power of direction has been lodged in the hands of Mr Byrnes and the Manpower Commission rather than in those of the military.

Even so, the only break in the united opposition to national service of labour, industry, and the farmers has come from the Farm Bureau Federation; and that only on the understanding that farm labour would continue to be protected. The most damaging attack on the need for civilian conscription has been that launched on the efficiency of the Services by a novel combination of labour and the National Association of Manufacturers. The allegation is that the Services are themselves largely responsible for shortages because of faulty scheduling, unnecessary changes in design, lack of co-ordination, and ignorance of their own inventories. Investigators for the Congress of Industrial Organisations have testified that in case after case of so-called shortages they have been able to prove the existence of surpluses unknown to the Services.

Such testimony has led the *Washington Post* to comment:

Power is no substitute for efficiency . . . and it is efficiency that produces the goods.

This excuse for delay is reinforced by the Russian successes. The Russian capacity to do the fighting may have the effect of weakening the case for Americans to be drafted into war work. It may be a close race between the advocates of national service and Marshal Stalin's armies.

Austerity Inaugural

Mr Roosevelt's fourth inauguration took place last week on the south portico of the White House with a minimum of the usual ceremony. Mr Roosevelt himself spoke only very briefly, on the hard-learned lesson of the war that Americans must live as citizens of a world community, not like ostriches or dogs-in-the-manger; that, as Emerson said, "the only way to have a friend is to be one."

The ceremony was no less moving for the absence of the customary spectacle on the Capitol steps, or for an austerity which was felt to be in keeping with the heavy burdens of the Presidency in wartime and the economic and political responsibilities of the future. No observer could have been led by the brevity and simplicity of the occasion to forget how crucial these next four years will be in the creation of that just and durable peace to which Mr Roosevelt dedicated the nation.

Behind the lack of ceremonial, the fewness of the spectators, the wartime austerities of chicken salad and unbuttered rolls, there was, too, a neat Presidential retort to Senator Byrd, the chief mouthpiece of the economy bloc in Congress. Senator Byrd, head of the Congressional Inaugural Committee, injected a sour note into post-election rejoicing by announcing that a top figure of \$25,000 had been set on inauguration expenses, a substantial cut from the more than \$50,000 of previous Roosevelt ceremonies.

The President lost no time in exposing Senator Byrd's reckless extravagance. With obvious relish, Mr Roosevelt outlined a simple ceremony, to take place at the White House, attended by only a limited number of guests. No new reviewing stands would be needed; a couple of old ones would do for the press and photographers. There would be no banquet, but only a buffet lunch at the White House. The whole cost would amount to \$2,000, a mere fraction of Senator Byrd's allocation. At his press conference Mr Roosevelt played out the novel role of penny-pincher with zest. But the "back-door inaugural" proposed half-mockingly in November proves to have been more in harmony with the times than the usual pomp and parade.

Reforming Congress

It is becoming a platitude that the procedure and organisation of Congress are almost divinely designed to obstruct and enfeeble the making and carrying out of policy. The most recent recommendations to modernise the national Legislature come from an industrial engineer, Mr Heller, after an eight months' study for the National Planning Association. Mr Heller's proposals fall under four main heads: the reform of the abuses of the committee system, by which Congress is largely governed; better pay for Congressmen and provision for more adequate staffs; a trend away from detailed to broader legislation; and the tightening of party control over members, to achieve something more closely resembling the authority and responsibility of the British system.

There is much to be said for all four recommendations; but, unfortunately, that which is likely to have the most popularity with Congressmen is least likely to be accepted by the country. A Bill to increase Congressional salaries in the last Congress—christened "Bundles for Congress"—aroused such immediate public ridicule that it was buried with almost indecent haste. The most pressing needs unquestionably are a reduction in the number of standing committees (now 33 in the Senate and 47 in the House); the abolition of the seniority rule, in the appointment of committee chairmen; and the elimination of the overlapping jurisdictions which waste so much of the time, not only of Congressmen, but of witnesses drawn from Government and business.

Much more contentious is the proposal to restrict free voting in the interests of greater party cohesion and authority; and to strengthen the fragile bonds between the Administration and Congress by experimenting with a question-time for Cabinet Ministers and the heads of agencies. The authority of the Administration would be enhanced by tighter party control, but this is hardly a popular line to advance with a body so notoriously disposed to see dictatorial tendencies in the White House. Nor is the comparison with British political practice altogether sound. In a country so large and so diverse as the United States, parties are inescapably compounded of diverse, and often of mutually contradictory elements, which would make an attempt to exact strict party loyalty on contentious issues a signal for the dissolution of the parties themselves. This is particularly true of the Democratic Party, which constantly shows signs of breaking into two.

This does not mean that the case of Congress is hopeless. Already the Democrats are showing a healthy disregard for strict application of the seniority rule. But habit, vested interest, and jealous guarding of Congressional privileges make any broad and formal reform remote.

THE WORLD OVERSEAS

Pagus Silingus

EXACTLY four years ago, in January, 1941, Hermann Goering appointed Gauleiter Bracht head of the newly-created Gau—Upper Silesia. This Gau had been formed by the unification of German Upper Silesia and Polish and Czech Silesia. In the Middle Ages this territory, together with Lower Silesia, was known as *Pagus Silingus*, or the Gau of the Silingi, the name given by the Romans to the inhabitants.

The most ambitious Nazi experiment, in a typical borderland of Central and East Europe, now seems to be nearing its end. The northern part of so-called Greater Upper Silesia has become a battlefield, but the main part of the industrial area of the Gau is still in German hands. In Upper Silesia the first coalmine of the Continent was sunk in the middle of the eighteenth century; it was there that the first steam-engine was installed for pumping water from the mines, and there that coke was first used in a blast furnace for making iron. The Upper Silesian coal and steel industry is thus older than the industry in the Ruhr area, although during the second half of the nineteenth century the Rhine-Ruhr industry developed at a much quicker and greater pace. The Rhine-Ruhr area was situated advantageously, but Upper Silesia was in a dead corner of Europe, with no nearby markets for industrial goods.

Before 1914 the greater part of Upper Silesia belonged to Imperial Germany. Tsarist Russia was hardly interested in the industrial development of the eastern end, the Dabrowa and Sosnowiec area, whereas the Olsa territory, which belonged to Austria-Hungary, had a considerable number of both heavy and light industries. The peace settlement after the last war awarded the greater part of the area to Poland. The Olsa and Hlucin territories were incorporated in Czechoslovakia, but were for the most part lost to Poland after the Munich agreement of 1938.

Greater Upper Silesia, as constituted by the Nazis in 1941, was actually formed out of seven different districts. It extended over roughly 8,000 square miles with a population of at least 4½ million. The northern border ran across the German province of Silesia, a few miles to the north of Oppeln. In the south it extended right to the Polish-Slovak frontier. The western border was the old German frontier, but Moravska-Ostrava and Teschen (Tessin) were included. The eastern frontier ran along a straight line from the river Warta to the west of Czesochowa and Cracow down to the Polish-Slovak border.

Within this area there are the richest coal deposits of the whole Continent, exceeding even the estimated coal resources of the Ruhr. The zinc ore deposits are among

the largest in the world, but the iron ore resources are small and of inferior quality.

The history of the Nazi Gau, Greater Upper Silesia, varied with the fortunes of war. The administrative unification was preceded by the economic integration of the different parts. The large German concerns which operated in the German part of West Upper Silesia picked up the threads that were severed after 1918. From the Czech side Czech concerns, also in German hands, extended their operations right into the central industrial district roughly marked by the six towns—Gleiwitz, Hindenburg, Beuthen

Upper Silesia has been Germany's war-time power plant in the East. Map shows its relation to Germany, Czechoslovakia and Poland.

on the German side, and Katowice, Chorzow and Sosnowiec in Poland. In and around these towns lived 1.8 million people, or 41 per cent of the total inhabitants of Greater Upper Silesia. The central industrial district is similar to the Ruhr area proper covered by the towns Duisburg-Hamborn-Oberhausen, Essen, Gelsenkirchen, Bochum and Dortmund. But the six towns of Upper Silesia are smaller; the largest of them, Katowice, had roughly 150,000 inhabitants before the war. Next in importance to this central industrial district is the Olsa territory.

tory, with the towns of Moravska-Ostrava, Karwin, Teschen and Trinitz.

The coal mining and heavy iron and steel industries in all parts of Upper Silesia never lost their semi-feudal character. The Prussians started modern industry there in the eighteenth century, largely as a state-owned industry. Later, the feudal landowners, the Pless, Schaffgottsch, Henckel von Donnersmarck and Giesche families, went into industry and immediately began developing it on a large scale. The various concerns provided department stores and recreation centres for their workers; moreover, the latter were allowed to go on working the small plot of land which they had formerly as peasants rented from the landowners—all of which meant that relations between the owners and the workers remained almost patriarchal.

When Germany occupied the whole of Upper Silesia, the area produced roughly 65 million tons of coal, 2½ million tons of steel, 10 per cent of the total world output of zinc ore and a relatively small volume of lead ore. Compared with that produced in the Ruhr area, the small output of steel may be surprising. In fact, this is the area's industrial weak spot. One reason for it is that Upper Silesian coal is not good coking coal. Blast furnaces must, therefore, be kept small, and until recently their average capacity remained less than half of the capacity of a blast furnace in the Ruhr area. By the inclusion of the Ostrava-Karwin coal basin, which contains a high quality coking coal, this problem was solved to a certain extent. The second reason for the relatively small iron and steel output is the lack of adequate iron ore resources. Without considerable imports of Scandinavian or Ukrainian iron ore, the supply position is extremely strained.

The coal-mining industry, however, has many advantages over the Ruhr area, the most outstanding being the absence of fire damp. The average seam has a thickness of from eight to ten feet; at some places seams up to a thickness of sixty feet are being mined. Even before 1914, coal-cutting machines and electric trains were used underground, and under German occupation many technical improvements have been introduced, such as the combined cutter and loader called the "Armoured Joan."

The total output of the coal area in 1944 probably amounted to as much as 90 or even 100 million tons, which would mean that Greater Upper Silesia produced roughly

one-third of the total coal and brown coal output of Germany. Upper Silesian coal is excellent for the production of gas and for use in industry. A dense gas and electricity grid, reaching as far as Breslau, depends on Upper Silesian coal. Chemical industries based on coal have been highly developed in the area; and from the beginning of the war the Nazis have built their largest synthetic oil plants in Upper Silesia, and the present capacity is at least one-sixth of the total synthetic oil capacity of Germany and Czechoslovakia. Abundant resources of limestone have enabled them to expand the cement industry during the war, with the result that last year roughly 20 per cent of Germany's total cement output came from Upper Silesia.

The story of the iron and steel industry is different. The lack of coking coal and iron ore has hampered iron production. The Nazis hoped that the iron and steel industry could be expanded rapidly by the import of iron ore from the occupied Ukraine. But it is clear that the last stocks of Ukrainian ore were consumed at the beginning of 1944, and since then only the low grade ore from the area itself or from other parts of Germany have been available. The steel works depended on scrap, which was never plentiful in Upper Silesia, owing to the absence of engineering industries for which the Ruhr area is famous.

Before the retreat from Russia, and before the heavy bombing of the Ruhr area, the Nazis hoped that they could build an entirely new engineering industry, in addition to the old-established heavy engineering plants manufacturing rails, locomotives, railway trucks, passenger coaches and tram cars. The loss of Russian resources and the bombing of the Ruhr involved a change in plans; and since 1942-43 Greater Upper Silesia has served as a reception area for a number of engineering plants from the Ruhr.

Even before the war there was a distinct tendency to develop all kinds of engineering plants in the small German part of Upper Silesia. But markets for these products were still too far away to make them a profitable investment. The planned economy of the Nazis could disregard the costs of long transport routes; and war economy has naturally ignored production costs completely. It cannot be doubted, therefore, that during the last two years Upper Silesia has developed numerous new industries. Apart from new chemical plants, large factories for all kinds of war material have sprung up all over the area, usually being situated away from inhabited places and well camouflaged by forests and hills.

The industrial area of Upper Silesia is, for the most part, hilly country. Forests provide sufficient cover from air observation, and there is no doubt that the most vital war factories have been built underground.

Over the whole area of Greater Upper Silesia, agriculture and industry were well balanced. In spite of the rapid industrialisation, Upper Silesia remained almost self-sufficient in foodstuffs, and Nazi agricultural policy tried to increase food production by encouraging miners to work larger plots of lands. Miners were frequently awarded land in recognition for long service in the mines.

The entire loss of Upper Silesia would be a very severe blow to Germany's war industry. The railways and industries of Eastern Germany, including East Prussia, depend on Silesian coal. The loss of synthetic oil would be considerable. Supplies of heavy chemical products, especially fertilisers, would become extremely small. It is hardly possible that Germany could continue military resistance for a long time in Eastern Germany without the production of this area. East Prussia was defended by the Nazis because of its military value as a bastion in the flanks of the Russian advance in central Poland. Upper Silesia will have to be defended as the Nazis' main industrial bastion in the east.

Danish Contrasts

For Denmark, 1944 was a year of strikes and sabotage, which continued even after hopes of an early liberation had been disappointed. Active opposition to the German occupation had developed slowly, mainly because, during the first years of the occupation, the Nazis barely touched the traditional political parties and trade unions. There seems to be no doubt that even now—that is, after nearly five years of occupation—the resistance movement is mainly directed at the punishment of Danish collaborators. The Nazis themselves have not yet given up all hope of making the Danish people adherents of the Nazi *Weltanschauung*; and it is worth noting, in this respect, that at the beginning

of the year a new "Danish Anti-Communist Association" was formed for the purpose of countering the growing resistance movement. It might be said that Nazi policy aims at widening traditional political differences, whereas the resistance movement is striving to build up an effective national unity against the occupation.

It may seem strange at first sight that, in spite of political unrest, widespread strikes and sabotage, economic activities last year were maintained almost at the level of 1943. The following table shows, for instance, that there was hardly any change in the cereal harvest:

(In 1,000 metric tons)		
	1943	1944
Wheat	180	280
Rye	510	420
Barley	1,290	1,250
Oats	1,030	990
Total	3,010	2,940

Shortly before the war, the production of these four cereals was roughly two-thirds of the 1944 yield. The potato and sugar-beet crops, on the other hand, have not increased. The main effort of the Danish farmers has aimed at increasing the acreage under root crops in order to replace the animal feeding-stuffs formerly imported from overseas.

The famous Danish livestock industry has suffered severely from the shortage of imported feeding-stuffs. In rough annual averages compared with the last year before the war, the cattle population has fallen by 10 per cent, poultry by 60 per cent and pigs by 33 per cent. During the five years of occupation, agricultural policy has concentrated on maintaining the cattle population. But, as is shown by the following census figures taken in the month of June in each year, the pig population has increased since 1942, when their numbers had fallen to one-third of the pre-war figure:

NUMBER OF PIGS (000's omitted)		
	1943	1944
June, 1940	3,218	1,940
" 1942	1,141	1,999

But the fact that little change occurred between 1943 and 1944 shows that a further increase in livestock production in Denmark is very unlikely as long as the country remains cut off from imports of animal feeding-stuffs. During 1944 the milk and butter production increased slightly compared with 1943. The production of bacon, however, is reported to have increased in 1944 compared with 1943 by roughly 20 per cent. These are undoubtedly record yields under conditions of occupation. The arable land is fully utilised, and production is likely to fall during the present agricultural season.

Since the liberation of France and Belgium and the suspension of trade with Finland and Sweden, Germany has completely monopolised Danish foreign trade. Up to the summer of 1944, Germany's share in Denmark's total imports and exports amounted to roughly 75 per cent. Imports and exports were as follows:

(In million kr.)		
	Imports	Exports
1942	1,205	1,038
1943	1,225	1,298
1944	1,155	1,340

The figures reveal that the value of imports remained unchanged during 1942 and 1943, but declined in 1944, when Germany's ability to deliver coal, coke, iron and steel and fertilisers was severely taxed. Exports, on the other hand, show a steady increase, and, moreover, during 1944 went almost exclusively to Germany. Apart from agricultural products grown in Western Poland and Czechoslovakia, Danish agriculture is the last non-German source of food-stuffs available for Germany.

Although no detailed figures are available, there is no doubt that during 1944 the export of industrial products to Germany decreased. More and more of Danish labour and materials was used for substitute production. The cutting of peat fell slightly below the record figure of 6,000,000 tons reached in 1943, and no increase has been reported in the mining of an inferior type of brown coal. Yet it is claimed that almost 50 per cent of fuel consumption consists of peat and brown coal. No petrol has been available for motor transport, and a considerable number of lorries have been converted for the use of generator gas.

Some time ago more than 20,000 lorries, roughly half the lorries on the roads before the war, were run on gas.

The most general measure of Denmark's forced contribution to Germany's war economy is the rise in the clearing

credit held by the Danish Central Bank. The account now stands at roughly Kr. 2,700 million, which means an increase during 1944 of Kr. 784 million. In addition to this clearing credit, which is composed of the export surplus and the payment for services and remittances of Danish workers employed in Germany, Denmark pays steadily growing costs of occupation. These costs, which are shown under the item Sundry Debtors in the returns of the Central Bank, must have risen by the end of 1944 to roughly Kr. 4,500 million. It would not be far out to estimate Germany's debt to Denmark at roughly Kr. 7,000 million, which is six times the value of Denmark's total exports in 1944.

This debt, together with the influence of wartime economic conditions, accounts for the increase in the banknotes in circulation. At the end of 1944 the note circulation had reached the record figure of Kr. 1,658 million, compared with Kr. 1,439 million at the end of 1943 and Kr. 600 million at the end of 1939. In contrast to this expansion of the note circulation, wholesale prices seem to have been fairly well stabilised. The official wholesale price index (1939 = 100) stood at 195 for the year 1943, and had only increased at the beginning of last autumn to 198. This, of course, gives an optimistic description of the actual price situation, but it also indicates that the price-control measures, which are coupled with wage stops, are still effective, in spite of the political unrest.

The most interesting measures evolved in Denmark for curbing excessive financial liquidity are the freezing of a certain amount of the deposits held by commercial banks and the account of so-called unemployed money held by the Central Bank. This account is the accumulation of the greater part of the state loans issued under the occupation. The loans are greatly under-subscribed by the public, and the commercial banks as a rule make up the balance. Danish business men naturally find ways of escaping these measures. For instance, money formerly paid in to banks for deposit has instead been paid into savings banks, which allow interest at 4 per cent. This has recently been checked, however, as the authorities have extended from three to six months the period after which money in savings banks can be withdrawn.

"Why I read The Yorkshire Post"

"To begin with, I like the paper. It seems to me to have everything. I like its sincerity, its honesty, and its sense of fair play. I don't mind betting that business men everywhere would get a clearer vision of things by reading The Yorkshire Post regularly. Take politics. While upholding its own political viewpoint, it is also fair to the other fellow's points of view. And that's more

than you can say about many newspapers. Take finance. You'll always find full reports of local trade meetings, not summaries. And in post-war matters—amid the babel of voices planning Brave New Worlds, its realistic outlook helps a plain man like me to understand what our post-war tasks and opportunities are really likely to be."

"This must be
pre-war whisky"

"You're not far wrong. It's White Horse, and the White Horse you get today, when you're lucky, was growing old when this war was young. A whisky as good as this takes years to come to maturity."

"When you come to think of it, it's pretty good to get whisky at all in the sixth year of war, but to be able now and then to get a whisky like this — well, that's marvellous."

"I agree, it says a lot for the forethought of the distillers who in years of plenty always provided for the future."

"All the best."

WHITE HORSE

CLOSE-UP OF A VITAMIN

Above is a photomicrograph of Vitamin C (l-ascorbic acid), a colourless, water-soluble, crystalline substance, magnified about thirty times. The first gramme of this vitamin ever to be synthesized (1933) cost hundreds of pounds to produce. Now, in the Roche plants, it is made by the ton at an economic cost. To this remarkable achievement in synthetical chemistry, many brave men already owe their lives. At Tobruk, our men, deprived of the natural sources of Vitamin C, received synthesized Vitamin C in tablet form to make good the loss. Synthesized Vitamin C is, of course, the very same thing as Vitamin C found in nature.

ROCHE PRODUCTS LIMITED

To-day these hands have Victory in their grasp. To their inborn skill the nation owes its priceless air supremacy. To-morrow this same skill, heightened by five years' devotion to the nation's cause, will turn to the making of the future's finest cars.

SINGER MOTORS LTD COVENTRY & BIRMINGHAM

You are going to hear a great deal more about the Philco Group when the war is over than it is possible to reveal at the present time. It is enough to say that this progressive group of industrial electrical manufacturing companies have made their plans—plans for the large-scale production of radio and television receiving and transmitting apparatus, electric motors, generators, switch-gear, refrigerators and electro-mechanical devices of every description. These plans await the signal of victory and the brilliant opportunities of peace. When the time comes, the Philco Group will play an impressive part in supplying the needs and comforts which the patient people of this country so richly deserve.

THE BUSINESS WORLD

The Banking Year

THE searchers after new ideas on the development of British banking will find most ungrateful material in the latest annual statements of the joint-stock bank chairmen. It is unfortunate that, owing to the timing of these addresses, they could make no specific references to the two new financial institutions in the establishment and operations of which the banks in this country are participating. These two ventures, of which more details are given on page 120, represents something like a revolution in British banking principles and practice and would have provided far more promising matter for the dissertations of the bankers than that with which the bulk of their recent statements was concerned. The only suggestion of a reference to the new institutions was that of Mr Edwin Fisher, of Barclays Bank, who pointed out that "there is little doubt that the national interest will call for a somewhat broader conception of the place of banking in relation to need for the small business undertaking to raise medium—or long term capital as well as to the parallel needs of larger concerns." He commended both institutions in some *impromptu* remarks made at the actual meeting of shareholders held last Wednesday.

If there is a single thread running through all the statements it is the concern of the bankers with the future of their loans and advances, that is, with the genuine commercial banking business on which their growth and much of their justification rests, but which they have seen inexorably disappearing in the five years of war. In August, 1939, the clearing banks' loans and advances represented 43.8 per cent of their deposit liabilities. That figure already showed a considerable drop on the 50 per cent ratio that was normally maintained during the 1920's and early 1930's, but the earlier decline has been eclipsed by war developments, which have sent the proportion tumbling down to around 16 per cent. It is evident that most of the bankers continue to hope for a post war revival in this item. Mr R. E. Beckett, of the Westminster Bank, puts his finger on one of the factors in this war-time decline of advances when he refers to the system of progress payments by which the Government pays its contractors instalments for work done. Mr Colin Campbell, of the National Provincial Bank, defines another when he remarks that one of the conditions for a revival in bank advances is the disappearance of Government purchases of commodities and raw materials, now financed without recourse to the banking system other than the banks' direct lending to the Government to cover the gap between current revenue and expenditure. Sir R. Norton Barclay, of the District Bank, seems to see one of the reasons for the decline of advances in the extension of war time controls and envisages no material increase in these advances until there is some relaxation of such controls and until industry changes over to peace-time production.

Whatever their diagnosis of the decline in advances, the bankers are quite confident of their ability to satisfy any increase in the demand for such accommodation. Most of them announce with a mixture of pride and regret that their balance sheets reveal an abnormally liquid position and that the resources will be available in full measure to meet any increase in the demand for bank loans and advances. Mr F. A. Bates, of Martin's Bank, states that his bank will be "in a strong position to grant accommodation to its customers" and adds that "there will be many new opportunities of utilising banking resources in the revival of businesses that have perforce languished owing to the paramount war effort."

Some increase in advances, there will no doubt be. The Government's gradual withdrawal of the system of progress payments, by which working capital of contractors and

their sub-contractors may well be provided to the tune of £150 million to £200 million, is in itself bound to cause a substantial increase in the industrial demand for bank credit. If this increase occurs, how are the resources to be liberated? It is not sufficient to point out that the banks have an ample supply of liquid assets. The true liquidity of these assets is not so much a function of virtues inherent in them as of the debt and credit policy of the authorities. Lord Wardington, of Lloyds' Bank, faces up to this problem. He points to the mass of Treasury Deposit Receipts, now by far the largest single item in the banks' balance sheets, as the ideal asset for mobilising resources, since they have a currency of six months and considerable maturities fall due each week. But, he adds, if the Treasury make corresponding demands for renewals, no fresh cash will be available for industry from that source. It is true, that TDR's are rediscountable at the Bank of England, but apart from any other objections to such rediscounting, it would be extremely costly, since the banks would be lending to the Government at 1½ per cent and borrowing on the same security at 2 per cent. An alternative method would be for the banks to sell securities but, as Lord Wardington points out, "it would not be desirable for all banks to be realising investments at the same time." If they were to attempt to do so, the authorities would rapidly find the appropriate answer. The counter to such selling is already in being in the form of minimum prices for gilt edged which would immediately freeze the market in the event of any widespread revaluation. If, therefore, the Government adheres to an expansionist programme after the war it is probable that any increase in the demand

for bank loans will have to be satisfied by a further increase in the volume of credit. This could be achieved either by the provision of additional bank cash through appropriate open market operations or by direct borrowing from the Bank of England by the Government, or by inducing the banks to work to lower cash ratios than those now maintained (both in reality and in the shop window). There is another possible, but not very likely, alternative solution to the problem, namely that of maintaining the volume of national savings after the war, anchoring its appeal to the cause of economic reconstruction and using part of the proceeds to repay floating debt. This would allow TDR's to be paid off and thus liberate resources to allow the banks to increase their direct advances to industry and to make their contributions to the loan capital of the new Finance Corporation for Industry (it is understood that the banks' deposits maintained with this company will be included under loans and advances).

The accompanying table, giving the principal balance-sheet items for the "big seven" at the end of each of the last three years, shows how small a proportion of the general expansion in bank credit is represented by the recovery in advances during 1944. The ground regained by this item last year did not make up the loss in 1943. If details could, again be given of the distribution of bank advances, it would probably be found that, within the much smaller aggregate total, a greater proportion of this accommodation is now being given to "personal" borrowers than before

the war. Mr Stanley Christopherson, of the Midland Bank, states that his bank has already provided a considerable number and amount of advances for small traders in accordance with the policy, adopted a year ago, of encouraging such business. The banks still give priority in their advances to the needs of war industries, but given the extent to which the requirements of war industries are catered for by the Government, it is permissible to suppose that the injunctions on the banks to make no loans save those that directly serve the war effort have recently been interpreted rather less severely than they were in 1939, when the rule was first propounded, and in the immediately following years.

As will be seen from the appended table, the net profits of the "big seven" show a further expansion for 1944. Bankers are not prone to discourse on this subject. Lord Wardington admits that the expenses of Lloyds Bank have risen during the year, but it is only Mr Christopherson who gives any new specific information on a matter about which bankers as a whole have been far too secretive. Mr Christopherson states categorically that the Midland Bank has not yet incurred any liability for EPT. This, he hastens to add is not because banks are enabled to evade the tax liabilities that fall on other business enterprises.

In explanation, Mr Christopherson makes some interesting observations. In the first place, he points out that the average rate of interest allowed on the whole mass of bank

deposits, whether on deposit or current account, has declined less since the inception of the "cheap money" policy in 1932 than has the average rate charged on the total of bank advances. In the second place, it would appear from the Midland Bank's experience that the diminution in earnings due to the decline in advances since the outbreak of the war has been no more than offset by the additional income from the enlarged holding of investments. The income from the other pre-war items among the earning assets is about the same and the sole net addition to the bank's earnings, therefore, arises from TDR's on which 1½ per cent is earned. Against this must be set increased interest outgoings, smaller earnings from ancillary services, particularly from those connected with external trade, and largely increased expenses on staff, security arrangements, war damage, etc. From the balance of earnings the banks have had to fortify themselves against risks of capital losses from bad debts and depreciation of investments—in which connection, Mr Christopherson does not rule out the probability of some "business casualties" in the transition from a war to a peace economy.

All this interesting and instructive discussion of the factors affecting bank profits should, with benefit to all concerned, be rounded off by an explanation of the paradox that while all banks show earnings so greatly above those of the EPT standard years, they have, for the most part, avoided paying that tax so far.

French Financial Policy

UNOFFICIAL reports last week-end suggested that M. Mendès-France, Minister of National Economy in the French Provisional Government, had resigned as a result of differences of opinion over financial policy with M. René Pléven, Minister of Finance. Although M. Mendès-France immediately denied these rumours, it is an open secret that there is anything but complete harmony between the two Ministries.

There are, in fact, two reasons for the clash of views. The first, which is inevitable, is that the Ministry of National Economy has been superimposed upon all the other departments dealing with economic affairs, including the Ministry of Finance. Since the new Ministry can only gain authority by diminishing that of the other departments, friction is unavoidable. The second cause of friction can be traced to differences of opinion over financial policy.

The powers and functions of the Ministry of National Economy, defined in a Decree published on December 7th, are far-reaching. The new Ministry is not merely designed to co-ordinate the other departments but to formulate and direct the economic policy of France in the widest sense.

The decree provides, first, for the establishment of an inter-ministerial committee charged with the formulation of broad economic policy, domestic as well as foreign. This committee includes the heads of ten Departments concerned with economic affairs; it is presided over by General de Gaulle, and its vice-president is the Minister of National Economy.

Within the framework of general policy, the Minister of National Economy is responsible for the formulation and execution of a detailed economic plan. He is to direct and supervise the activities of the Ministries of Industrial Production, Agriculture, Food and Reconstruction, and he is to co-ordinate the economic policy of all the other Ministries. As a means to this end, the Minister of National Economy must approve all the decrees and regulations issued by the various departments concerning matters of economic policy. The kind of decrees and regulations that have to be submitted to him are carefully set out in a long list.

Although the President of the Provisional Government is nominally the head of the inter-ministerial committee, his main function is probably that of securing cohesion and of reconciling differences of opinion between its members; for all practical purposes its head is the Minister of National Economy. His powers are so wide that he is, in effect, in a position to direct domestic and foreign economic policy in every detail—at least on paper. In theory, this centralisation of initiative and control should enable the French Government not merely to plan the shape of the national economy in every detail, but also to ensure speed and efficiency in execution. It represents a strictly logical approach to a solution of the difficulty of giving cohesion, strength

and drive to the direction of a modern economy. But the question is whether the machine will work in practice.

Experience in this country has shown the difficulty of effectively grouping a number of departments under a super-ministry. The Ministry of Production, valuable though its work has been as a co-ordinating department, has never been able to impose its will upon the three supply departments, as was originally intended. Wisely, for many reasons, the Minister of Reconstruction has been given the more modest task of providing liaison between the various economic departments and of acting as a kind of energiser. The difficulties of super-ministries have usually been threefold. First, a super-minister inevitably diminishes the authority of the ministers he is to control, a tendency that may adversely affect the work of the other departments; secondly, the departments that are to come under the authority of a super-minister inevitably tend to resist encroachment, a tendency that makes for friction; thirdly, a super-minister, to establish his authority, must not merely possess an altogether outstanding personality, but also a highly competent staff, and since the other departments are naturally reluctant to give up their most competent officers, a competent staff is difficult to come by.

The French Ministry of National Economy, inevitably, is encountering some of these difficulties. The Ministry of Finance, and the whole corps of *Inspecteurs des Finances*, are not likely to yield without a struggle. One could hardly imagine the British Treasury knuckling under to a super-ministry. The analogy may not be very close, but it is sufficiently close to illustrate one of the problems of the new ministry.

The difficulty is all the greater because the Ministry of Finance does not always see eye to eye with the Ministry of National Economy on matters of financial policy. The immediate trouble appears to have arisen, not so much over matters of long-term policy, as over the clearing-up of the financial aftermath of occupation and over prices and wages policy.

The details of the conflict of views are not available. But it is well-known that the Ministry of National Economy favoured speedy action after liberation on the lines of the plans prepared in Algiers which bore a strong similarity to the Belgian policy, and which were partially applied by the French themselves in Corsica. The proposed measures include a census of wealth, the confiscation of illegal profits and a capital levy, and the method was to be drastic and ruthless. The Ministry of Finance is no less anxious than the Ministry of National Economy to 'clear up the aftermath of occupation, but it seems to favour a more conventional approach rather than shock tactics.

Again, the Ministry of National Economy favours stringent control of prices and wages. It is said to have opposed

the recent decision to raise the salaries of civil servants that is estimated to involve an expenditure of some frs 20,000 million. It must be remembered, however, that industrial workers were granted a 40 per cent increase in wage rates almost immediately after the liberation, and that, by comparison with 1939, farm prices are still relatively higher than wages. It was difficult in these circumstances to resist an improvement in the remuneration of civil servants. The Ministry of Finance has supported the increase in salaries, but, taking a leaf from British policy, it simultaneously introduced a system of deferred tax credits that could be extended to all incomes. In its budgetary policy, too, the Ministry of Finance is proceeding on British lines, that is of combining severe taxation with an active loan and savings policy. But its task this year will not be easy; it is faced with a prospective expenditure of some frs 400,000 million and a revenue which, in view of the low level of employment and business activity, may barely reach frs 150,000 million, in spite of the most drastic taxation.

The Liberation Loan, as a first step, has been successful in reducing the volume of purchasing power; further steps are contemplated, including the seizure of illegal profits, carefully defined by a recent decree. The interest on the national debt—amounting to frs 28,000 million in 1944—is

to be reduced by frs 1,500 million by the conversion of two loans of 4 per cent and one of 4½ per cent on to a 3 per cent basis. Moreover, the Ministry of Finance has succeeded in maintaining its policy of cheap money, in spite of the inflation in the prices of goods and services. To adjust the volume of purchasing power to the meagre supply of goods at current official prices, according to some formula, seems impracticable.

Fundamentally, the real difficulties of France are physical rather than financial—that is to say they arise from the extreme shortage of goods, from the anaemia of French industries and from the lack of adequate communications. These difficulties cannot be solved by financial measures. Even in normal times, it is a vice of the modern age that it thinks too much in terms of finance and not enough in terms of the physical realities of wealth production. It is not for the British to give advice to the French on the conduct of their own affairs. But perhaps it is permissible, from one ally to another, to express the hope that doctrinaire attitudes will not be allowed to impede the solution of practical tasks. Any liberated country is short of time, and of effective administrative machinery, and the cohesive force of informed public opinion is also inevitably lacking. It would be a pity if finance, which could be a lubricant, became an abrasive.

Investment Calculus

INVESTMENT considered as an applied science is an essentially modern concept. Until the middle twenties, investment was at best a matter of art, guided by a sixth sense and a respectful cocking of the eye towards Threadneedle Street on Thursday mornings. Since then, serious investors have sought a new rational approach to its problems and serious advisers have attempted to satisfy them. The literature of the subject is still comparatively small, and the latest work on the subject* deserves celebration for two special reasons: its author is a pioneer of scientific investment; and he first blazed the trail towards rational investment principles in these columns between 1928 and 1938.

A couple of decades is too short a period to unfold eternal verities, even about quantities and forces which can be accurately measured. In the field of investment, measurement is still only partial, and the imponderables can still exert massive and disconcerting stresses on the market. Hence, the artists and backers of hunches sometimes prove brilliantly right, while the scientific approach may go hideously wrong. To accept this situation as inevitable is to deny the application of reason to investment at a time when it was never more urgently needed. It is Mr Parkinson's task to show that changes in Stock Exchange values—particularly of ordinary shares—tend to be governed by regularity of pattern; according to the long, medium and short term texts in which these changes are studied. His method is frankly inductive (he suggests, perhaps a little pessimistically, that no other method will ever be applicable to the problem); he studies the behaviour of ordinary shares, relates it to the movements of other economic series, and seeks to isolate probabilities and principles which the investor can apply, knowing, at least, that they have worked in the past, to the problem of guessing the future.

Investors who seek the rational course of action must be prepared to work their passage. This book conducts them, with painstaking demonstration of detail, through an examination of the economic factors which produce—or, at least, act in conformity with—measurable fluctuations in equity share values in each of the three phases. It discusses the association of the secular rise in ordinary share values with the disconcerting fluctuations of the credit cycle. It breaks down the market cycle, in turn, into its constituent bull and bear phases. And, finally, it offers some suggestions—necessarily more tentative in character—on the identification of short-run market fluctuations, through a chart-reading technique. These movements, in their differing scope, are subjected to continual comparison with economic series which are appropriate, or, as sometimes happens, are merely available, for the period of study. Thus, the record of ordinary shares from 1870 to 1939 becomes, in Mr Parkinson's hands, a reflection of the rising national income of the country, measured, for want of a better comprehensive indicator, by such series as trade, consumption of tea and tobacco, production of coal and pig iron, and railway traffic.

again, it is not the principles of action which are so baffling, but the tentative character of many of the economic series on which, in default of anything better, the business and market forecaster is compelled to rest his judgments. *The Economist Business Activity Index*, which Mr Parkinson uses so effectively in his re-examination of ordinary share movements since 1924, is certainly not free from such limitations. In retrospect, it appears to have told something like the truth, at or near the right time, about the cycle of 1929-37. Its relationship with the market behaviour of equity shares is chronologically a good enough fit. Yet movements in the index which later marked historical turning points—the peak of 1929 or the trough of 1931—probably looked tentative enough at the time, and remained unconfirmed sufficiently long to expose any medium-term investor to the risk of considerable movements in share prices.

Even for cyclical studies, the sources are not as adequate as they should be. There are, in this country, no statistical series that serve as capital activity forecasters, like unfilled steel orders, and our information about building activity even in normal times is lamentably small. Although Mr Parkinson has made ingenious use of the statistical material available, he would be the last person to regard it as adequate. The post-war investor will be unfortunate if he is not better provided with essential data. He requires a much more accurate measurement of Stock Exchange dealings. He requires quicker and fuller statistics, particularly on movements of stocks of commodities—which may well prove to be one of the first indices to be influenced by cyclical changes—and on the trends of production, consumption and capital construction. The speed and accuracy of the punched card and the calculating machine have been proved in the modern factory; they need to be applied to the gathering of economic statistics. When this has been done, many market influences which now can only be inferred from a trend will be known as facts.

A number of respectable investment canons may be shaken by this book. It is surprising, for example, to find interest rates and commodity prices treated as "distracting" influences in the formation of long-term share values, yet the charts present a plausible case for this suggestion, even though it is opposed to the classical deductive view of these forces in the credit cycle. Readers will find a clear summary of "chart-reading," or Dow theory rendered into English, which should persuade many of them to buy chart paper, and perhaps shares too, when they have played the short-term market as a hobby. There is, again, the suggestion that industrial debentures may provide a better hedging medium in depressed periods than the conven-

tional gilt-edged. And the maxim for successful investment is not to beat the market, but to follow, promptly and faithfully, what it does—though not what it says.

What are the consequences and the morals of these and innumerable other precepts which Mr Parkinson lays down? First, investment in equity shares is an expression of risk-taking in industry—in Lord Keynes's words, "The social object of skilled investment should be to defeat the dark forces of time and ignorance which envelop our future." On the private objectives of investment, it will be recalled, Lord Keynes was a pessimist; it was a game of conventional valuation, having no long-term validity; market expertise was concerned solely in estimating in advance what average opinion anticipated average opinion on share values to be. The zest of making money quickly was, in his view, more attractive than the arduous and thankless task of seeking a socially advantageous investment policy. These thoughts were formulated in the bitter aftermath of the Wall Street crash and depression in the early thirties. Mr Parkinson, in the sixth year of war, shows that it is possible to reconcile the two views; that markets may be peevish and irrational, and in the short run are what operators make them; yet in the end, and normally at no great distance, they are brought into conformity with basic economic trends and expectations. The "mood" of the market is the great imponderable and at cyclical extremes it may temporarily overcome the forces of reason. Spectacular events—leaving the gold standard, or converting War Loan—may become for a time dominant causal influences, after cyclical factors pointing in the same direction fail for months to move the market.

Investment at a point of time is continuously complicated by the spread of economic fact and opinion through time, yet the problem must be solved if industry is to obtain resources in a free capital market and if the investor is to succeed in maintaining his capital intact. Perhaps the major post-war economic problem will be the provision of abundant capital to industry which, even before its wartime exhaustion, had too little. The paradoxical situation may occur of a rising national income coupled with an inadequate supply of private savings for industrial investment, for, in contrast to the situation in past periods of rapid capital accumulation, there are new institutional factors—such as the more equal distribution of incomes and a rigid taxation system—which may affect the individual's propensity to save. His savings provide only part of the new industrial capital required, but they can, perhaps, be more easily misapplied than institutional savings. It will be an important function of a rational investment policy to assist in the overthrow of the dark forces, and in the rehabilitation of British industry to a new level of productive efficiency and profit.

Business Notes

Finance for Industry

Official details have been given this week of the two financial institutions the nature and scope of which were discussed in general terms on page 83 of *The Economist* last week. The larger of the two is to be known as the Finance Corporation for Industry. It will be jointly owned by a large group of insurance companies, trust companies and the Bank of England in the proportion of 40, 30 and 30 per cent respectively. The capital will amount to £25 million, but it is not intended to call up more than 2 per cent of this in the first instance. The bulk of the corporation's resources will be provided by the exercise of its borrowing powers of £100 million. This will, in the main, be provided by deposits from the clearing and Scottish banks. The purpose of the FCI in the words of the Chancellor of the Exchequer, is

the provision of temporary or longer period finance for industrial businesses of the country with a view to their quick rehabilitation and development in the national interest, thereby assisting in the maintenance and increase of employment.

The FCI, it is stated, will take no initiative in reorganising industry; its primary purpose will be to provide finance. In doing so it will not be specifically debarred from taking up participations in the equity of the businesses it finances, but the general intention is that its help should be temporary and given by way of liened fixed interest

loans. The only official indications given so far of the nature of its accommodation is that it should only be made where the circumstances make normal banking accommodation inappropriate, where a market issue cannot through some temporary cause be made or where the amount required, or the extent and character of the necessary enquiries puts the operation outside the scope of the normal capital issue channels.

The FCI will be formally independent of the authorities. The influence of the Bank of England will be limited to that which it will exercise as the largest individual shareholder. The board of the company will be elected by the shareholders in the normal way and will consist of persons of wide business experience who will be assisted by an Industrial Advisory Panel. One of the directors will be a "scientist." The blue prints of the new institution are promising. Whether they are eventually translated into effective reality will depend wholly on the quality of the men chosen for the job. The tools to be placed at their disposal are almost all that could be desired.

Capital for the Small Man

The second of the proposed financial institutions is to be formed in order to supply medium and long-term capital for small and medium sized businesses in amounts,

say, from £5,900 to £200,000. Amounts below this range can usually be procured in the ordinary way from bankers, while larger loans become the province of the new issue market cum Stock Exchange. The Industrial and Commercial Finance Corporation, as it will be called, will have a capital of £15 million. Of this £500,000 will be taken up as a "token subscription" by the Bank of England and the balance will be subscribed by the clearing and Scottish banks roughly in proportion to their deposit liabilities.

There will be eight directors, the chairman being appointed by the Bank of England. Provision has been made for the constitution of an advisory panel; representatives of the member banks will use this body, if required to do so, in order to pass on information in their possession to the ICFC. In Scottish affairs, the board will be assisted by a Scottish Committee. In addition to its capital, ICFC will have borrowing powers of £30 million which will be exercised by means of loans and advances from the member banks pro-rata to their shareholdings.

The ICFC will not carry on a banking business. It will provide medium and long term credit and not grant revolving or self-liquidating advances. Since much of the business open to the ICFC would in the normal course appeal to the banks and as most of the business will be introduced through the banks, it is difficult to visualise very great scope for its activities. A useful line of propositions may, however, come to it from concerns which have been closed as a result of concentration during the war, whose connections with their previous bankers have been severed and which will require fairly long term capital to reinstate themselves.

Price Reverse

As was expected, the New Year opened with a burst of reinvestment demand, which raised the index of industrial ordinary shares, compiled by *The Financial News*, by over two points to 115.0, against the early August peak of 116.9. This rise has, however, been followed by a burst of

profit-taking, which, within a week, brought the index down to the end-October level. Those who pin their faith on the Dow Jones theory have thus scored a point. The latest peak is definitely lower than its predecessor. They are now confidently forecasting a fall to a new trough—not necessarily at once—which will be below the September dip to 107.6. All that can be said on that point is that, with the index down to 111.5, a slackening of the pace of fall was followed by a very tentative upward movement, mainly in post-war recovery shares.

Weakness has gone hand in hand with a considerable increase in the number of bargains received. Further, neither the weakness nor the expansion in business has been restricted to industrial equities. Fixed-interest stocks have continued firm and Far Eastern investments have been strong, otherwise almost every section shows falls. The decline is popularly associated with such indications as exist that the end of the war in Europe may be rather nearer than was supposed, and also with the fact that it is again Russia which is scoring the advances, while the territorial gains in the West are relatively insignificant. It seems that this feeling is now a matter of some importance, but it is difficult to believe that the fall produced by military developments would have been substantial but for the technical position. Broadly speaking, prices had been rising since mid-September. There had been a very sharp acceleration of the upward movement and a temporary reverse was to be expected.

Actually, there has been continuous buying by the public on each fall, and a moderate change in emphasis may well lead to a quite considerable recovery in quotations. Whether this occurs or not in the longer run must depend in large measure on the assessment of the political risk attaching to industrial equities. If companies are to be left reasonably free to make profits and decide on their use, subject only to income-tax payments of a non-discriminatory nature, the forces making for a rising national income will also ensure a rise in the general level of equities. If profits are to be rigidly controlled, some means of stimulating efficiency will have to be found to replace the profit motive.

Stock Exchange Requirements

The latest development in the process of tightening up requirements, which has been carried on by the Stock Exchange over a period of years, is the recasting of Section 10 of Appendix 34 A. This defines the undertaking which must be given by every company when applying for permission to deal. There are a number of minor changes and the requirement that, when a company has subsidiaries, a consolidated balance-sheet and profit and loss account must be circulated to shareholders is now officially incorporated, while there is a new requirement to inform the Share and Loan Department of "any proposed change in the general character or nature of the company's business." This last arises from the practice, which has become common, of entering new fields and only announcing the fact after a protracted delay. It will be generally agreed that shareholders have a right to be informed on such matters.

Another new item concerns drawings of stock. If the instrument constituting the stock does not lay down the units in which it is to be drawn, companies are required to consult the Stock Exchange if they wish to make drawings in units larger than £100. It appears that some companies, possibly to save labour, have drawn in very large units, with the result that substantial holdings have been completely paid off. When the stock in question stands at an appreciable premium, this is a considerable loss to the holder. It is not expected that there will be any difficulty in securing the general adoption of this requirement.

The most important part of the rulings is the new subsection (12) which requires a company to notify the Share and Loan Department immediately the board meeting has been held to consider the same, concerning

all dividends and/or cash bonuses recommended or declared; short particulars of any issue of new capital whether it be issued as a bonus or by way of right to shareholders or debenture holders; the net profit figures for the year (with comparison with previous year) even if this calls for the qualification that such profit figures are provisional or subject to audit; and any other information necessary to enable the shareholders to appraise the position of the Company and to avoid the establishment of a false market in the shares.

The italics are ours. This provision will be particularly welcome. No one wishes unduly to embarrass directors, but shareholders have a right to demand from them that their statements shall present a fair and reasonably complete view of the position. The section lays this duty upon them, and the decision whether they have fulfilled it or not will very largely depend on the results flowing from their statements. These requirements cannot be made retroactive, but the fact that many companies apply for permission to deal in small blocks of new shares every few years will mean that their effect will spread fairly rapidly.

Third Quarters' Profits

The computed gross profits of 494 companies which reported during the third quarter of last year show an increase of 13.8 per cent in total profits, after EPT and depreciation, but before tax, over the figures of three years earlier. (The statistics, in their usual form, are given on page 134.) More interesting, the increase as against the figures of a year ago is 7 per cent. The amounts distributed to holders of the equity are up by 17.7 per cent on the

three years, and by 5.6 per cent against last year. This rise took place despite the fact that the proportion of total computed profits allocated to free reserves and other allocations of the nature of savings rose on the year from 20.0 per cent to 22.3 per cent. It is not to be supposed that this rise in profits, appreciable as it is, marks any real change in the earning power of the companies concerned. It is in all probability a combination of the definite settlement of EPT standards, and a belief that a larger proportion of actual earnings can, or should, be disclosed. As is shown by Table VI, by far the most important section of industry represented in these companies are breweries and distilleries, but these contributed very little to the increase in profits. Most sections made some contributions, but, on the basis of reported net profits, oil and building materials show falls, while on the basis of computed gross profits these groups and, in addition, entertainment companies and manufacturers of textiles and motors all suffered a decline in earnings. The big rises were secured by land companies, coal, iron and steel, shipping, food and shops and stores.

US—Mexican Oil Settlement

The aftermath of the expropriation of the American oil companies in Mexico on March 18, 1938, by the Government of that country is now virtually cleared up. Details of the joint compensation award of April 17, 1942, were published in Mexico on January 15th. According to a cabled report, Mexico agreed to pay the United States \$23,996,000 plus interest at three per cent a year from the date of the expropriation; by the end of September, 1943, the total amounted to \$27,982,000. As \$9,000,000 had been deposited beforehand, the amount still owing at the end of September, 1943, was \$18,982,000. This balance was to be paid in five annual instalments from 1943 to 1947. The amount paid in compensation is only a fraction of the claims formulated by the American companies, but they were induced to accept it by the American Department of State, presumably for political reasons. No settlement, however, has yet been reached in respect of the properties of British companies that were expropriated simultaneously with those of the American firms; the British embargo on oil imports from Mexico is still in force. The time has surely come for a fresh attempt at a settlement. True, the Mexican Government, by its high-handed action, has committed a breach of the code of behaviour in international relations; but the past policy of the oil companies, too, is not completely free from criticism. But prolonged intransigence is in nobody's interest, and least of all in the British.

Certificates for Artisans

The prospect of a declining birthrate, the need for greater industrial efficiency and the proposed education of young people in their employer's time, have combined to induce industrialists to pay increasing attention to the recruitment and training of young workers. This has been evident in a number of industries, and in some trades where conditions compare unfavourably with the rest, improvements are being contemplated. The fear of a labour shortage is leading to competition to catch the worker while he is young.

The retail motor and repair industry is the first in the field to arrange for a definite course of training, based upon a five-year apprenticeship, and culminating in a certificate guaranteeing that the holder has attained a certain standard. Theoretical training will be given in technical colleges and it is the first time in the history of education that the assistance of the education authorities has been sought for industrial training at the artisan level. The scheme, many details of which remain to be settled, has been agreed by the Ministries of Education and Labour with the National Joint Industrial Council for the Motor Vehicle and Repairing Trade. It is felt by the sponsors that the setting of a recognised standard of competence will have a beneficial effect upon the maintenance of road transport vehicles, which, in turn, would increase the efficiency of transport and minimise road accidents.

The efforts of the industry to improve the education and efficiency of its workers are laudable and welcome. The aim is to confer on the artisan a status similar to that which a properly qualified professional worker has in his own profession. The raising of standards of craftsmanship will contribute to a higher standard of living. The

dangers of schemes involving the granting of certificates must, however, be recognised. They might lead to inflexibility both in recruitment and mobility of labour from one industry to another. Widespread certification sooner or later leads to the proposal that no one should be permitted to trade unless he is certificated. Too much rigidity in an industry would in the long run benefit neither itself nor the rest of the community, and it could do harm. But the best method of combating these restrictive rigidities is, no doubt, by direct attack and not by withholding support from schemes to improve the standard of technical education.

Approach to Mechanisation

Addressing the National Joint Industrial Council for the Motor Vehicle Retail and Repairing Trade, last week, Mr Bevin welcomed their proposals to raise the status of their workers. He advocated the principle that technical knowledge should be imparted as widely as possible, and that the number of workers called "labourers" should be reduced to the minimum. When full employment is assured, there is no fear that the teaching of his knowledge to others will lose the skilled worker his job.

Mr Bevin sounded a note of warning to employers. He cited a case of an employers' association, which, when faced with a new machine that could do the work of seven men, wished to cut pay to the unskilled rate, even though it was only a matter of 3d. an hour. As he rightly said, this attitude is a barrier to progress. On the other hand, the tendency on the workers' side to wish employers to keep on seven men when fewer would do, is another factor which mitigates against the use of labour-saving machinery.

A change of attitude is wanted on both sides. The employer should realise that he can afford to pay higher wages when machinery raises productivity, and the trade unions that it is to the general advantage that a given amount of work should be done with the minimum amount of labour. Probably the trade unions would be ready enough to fall in line if they were fully convinced that there is to be full employment. What is wanted on both sides is the hope for the future that can be expressed in an expansionist policy leading to the fulfilment of the export programme, and the raising of standards of living.

"Wealth from Waste"

An exhibition with the imposing title "Wealth from Waste" is being held in London until February 3rd, to show industrialists the part played in the war effort by the salvaging of waste materials arising in the course of production. The cutting down of imports to less than half the pre-war volume has made normal industrial waste a luxury that cannot be afforded. Throughout the war the aim has been "more from less," and it would be no false claim to say that it has been achieved.

There is no doubt that in ordinary industrial use much material was needlessly wasted. Research time has been devoted to salvaging and saving methods, with good effect; in some cases, entirely new uses for waste materials have been discovered. For example, sawdust is now considered not waste, but raw material. Obviously a great many of the new processes can be applied in peacetime, but there is a certain danger in believing that lessons of war can be learned like a multiplication table. Waste is always a bad thing, but it is relative. The reconversion of leather scrap or the recovery of tin from used cans may be necessary in wartime, but in peacetime new material may be cheaper.

All this is not to decry in any way or to discourage the fine work that has been done and which is portrayed by the Ministry of Supply's Department of Salvage and Recovery at its exhibition. War needs are still exacting enough, as those of the early peace years will be, to justify an increase in the number of Industrial Salvage Groups, of which there are so far 300, covering 10,000 firms.

Lublin Currency

The first financial measures taken by the Lublin administration aim at bringing into some order the monetary chaos prevailing in the Soviet-held parts of Poland. A new National Bank of Poland has been set up with a temporary seat at Lublin. On January 5th a decree was issued, under which the so-called "Cracow zloty" (the currency created

by the German authorities) is now being withdrawn from circulation and exchanged for new Treasury notes. On December 13th, it was decreed that the rouble, too, must be exchanged for zlotys. Data on the volume of the currencies in circulation are not available. The Lublin Minister of Finance has merely stated that the Germans have issued "tens of milliards" of zlotys, and that the depreciation of money has reached a stage in which barter has become almost the only form of trade transactions. The Cracow zlotys deposited with the banks are blocked. Private individuals are allowed to withdraw only 500 zlotys a month, while employers, public and private, can withdraw higher sums according to a scale comprising seven categories of depositors.

What is somewhat puzzling is that the rate of exchange between the valueless Cracow zloty and the Lublin zloty has been fixed at one to one. Even more puzzling is the rate of exchange between the rouble and the zloty, which has also been fixed at one to one. No doubt this rate of exchange, at which the zloty is fantastically over-valued, must have caused a flight from the zloty and mass purchases of roubles. The time during which roubles may be exchanged for zlotys is one month. In 1939 the Russians in eastern Poland ordered a sudden withdrawal of the rouble, leaving the inhabitants with almost no time for the exchange of their money. The monetary coup was then a measure of expropriation. This time no such coup has been effected. The extremely "generous" rate of exchange between the rouble and the zloty is clearly meant to be a political gesture designed to impress favourably the Poles.

Rubber Problems

For the first time since its formation, the Rubber Study Group, set up last year by the Governments of the United States, the United Kingdom and Holland, has been called to a full meeting in Washington. The meeting, which will last for several days, was scheduled to start this week and will co-ordinate the work so far done by sub-committees of the group in this country and the United States. The study group was formed after the dissolution of the

G.E.C. In war or peace - at the service of the Empire

The design, construction and installation of every type of electric lift for passenger and goods services, either manually operated or automatic, formed, before the war, an important activity of the G.E.C., the largest British electrical manufacturing organization in the Empire. Installations of EXPRESS-S.M.S. lifts can be seen in commercial buildings, factories, hospitals, on board ship, etc. in all parts of the world.

During the war the factories of the G.E.C., of which the Express Lift Co. Ltd. is a subsidiary, have been engaged wholly on war production. Considerable technical advances of the utmost importance in lift design have however, been made as a result of ever-changing conditions and requirements, and new equipment standardized to a high degree, will be available after the war to all concerned with schemes of reconstruction.

Electrification Schemes

G.E.C. Electrification Schemes have been applied to all industries, including: Aircraft Factories; Chemical Works; Collieries; Food Factories; Gold Mines; Iron, Steel and Copper Works; Locomotive and Railway Carriage and Wagon Works; Motor Car Works; Oil Refineries; Ships and Shipyards; Textile Mills; etc.

G.E.C. - always in the forefront of electrical progress

International Rubber Regulation Committee; but it has no regulatory tasks and is, indeed, expressly barred from working out plans for the regulation of the international rubber trade. No executive moves can thus be expected from the Washington meeting, but, with the time for a reconquest of the Eastern rubber-producing areas approaching and the United States synthetic rubber industry heading towards full production, the post-war rubber problems are becoming more acute and the committee will obviously find a full and important agenda.

Meanwhile the immediate rubber position is causing much difficulty. As the Combined Raw Materials Board pointed out in an appeal for rubber economy on November 26th last, the Allied stocks of crude rubber have fallen to the lowest level since the start of the war and are below the safety limit. Since that appeal was made the US War Production Board has issued a statement that natural rubber requirements for the tyre production programme in the first quarter of this year will be larger than prospective receipts from new production, so that stocks will have to be depleted further.

Production in Ceylon, the largest producing country still under Allied control, has recently fallen below the quota, so that the premium prices for the current quarter have been reduced. In Latin America, too, the current rate of production remains disappointing, so that hopes for an improvement in supplies are centred on the re-occupation of producing regions now controlled by Japan. Detailed plans for the resumption of rubber production and shipments in the Far East have been prepared by the Allies and can be put into effect without unnecessary delay.

More Synthetic Rubber

Meanwhile, supplies of synthetic rubber are rapidly rising, and are assisting the United Nations to bridge the gap till a return to more normal conditions. The United States, according to a statement by Mr Jesse Jones, former

Secretary of Commerce, now has a potential output of 1,000,000 tons synthetic rubber per annum. Actual production last year totalled 763,000 short tons, a quantity which met requirements of both the United States and this country to the full. The United States in 1944 consumed 710,000 tons of rubber, of which four-fifths was synthetic. This quantity was 221,000 tons more than in 1943, when synthetic rubber covered just over one-third of consumption. During 1944 the technique of employing synthetic rubber has been continuously improved and the amounts of crude rubber needed for admixture purposes are gradually contracting.

This will ease the problems caused by the scarcity of crude rubber, but it causes difficulties of a new kind. The larger the percentage of synthetic rubber in tyres, the greater is the heat generated. In large sizes of tyres, as needed for heavy trucks or aeroplanes, and made largely of synthetic rubber, the heat is so great that cotton cord does not resist it and high-tenacity rayon cord has to be employed. In spite of a vast expansion in rayon production in the past two years, the amount of rayon available for the making of tyre-cord is inadequate, and, in his review of the United States tyre production outlook in the first quarter of 1945, Mr J. A. King, chairman of the US War Production Board, indeed, pointed out that the supply of high-tenacity rayon cord probably is the most serious bottleneck in the tyre programme.

Farmers' Change of Heart?

The draft policy report of the National Farmers' Union has been discussed by its county branches. Negotiations are now taking place with the Scottish and Ulster Farmers' Unions, so that the report, when it is published, may speak for all United Kingdom farmers. For the N.F.U.'s new policy to have any hope of acceptance, it will need to be very much more realistic than the claims put forward by the same body in 1943. These asked for a permanent increase in the tillage acreage (excluding all leys) of about 60 per cent over the pre-war level, and small increases in the numbers of livestock; or, in other words, the N.F.U. not only wanted a permanently inflated agriculture, but wished to expend, almost exclusively, the most costly type of farming.

The N.F.U.'s last declaration of policy bore the stamp of the large arable farmers of East Anglia, but the considerable influence of this group has been reduced by recent changes within the organisation. It is not in the interest of all farmers to press for the maintenance of a large arable acreage, whose high cost in subsidies might not only reduce the assistance available to other types of farming but might disillusion the public with agriculture in general. The N.F.U.'s new secretary, Mr Knowles, who is known to give full weight to the needs of livestock production, may lead the way to a more rational policy. Addressing its general meeting this week, he claimed that

There is less inclination to nurse the belief that agriculture looks to its own affairs without studying their reaction on the general, social and economic structure.

It is greatly to be hoped that the N.F.U.'s new report will prove, in retrospect, Mr Knowles' statement. At present such proof is totally lacking. The N.F.U.'s past record unfortunately suggests not only that agriculture looks solely to its own affairs, but that it does so partially and short-sightedly.

Housing Sites

Last week Mr Willink gave the news that housing authorities have drawn up programmes covering 250,000 out of the 300,000 permanent houses to be produced in the first two post-war years. Housing authorities now possess 24,000 acres, or about half the sites needed for their immediate two-year programme. The acquisition of further sites will be helped by the right of all housing authorities under the Town and Country Planning Act, 1944, to purchase land compulsorily without holding a local inquiry.

This picture is not discouraging, but omnibus figures are sometimes misleading. Some local authorities are well behind with their purchase of sites, and their difficulties in making further purchases may be great. Much of the land already in the hands of the housing authorities was bought before the war, and a fraction of it has already

been laid out and partially developed. This means that the first instalment of permanent houses will have to be put on sites chosen under pre-war conditions, which will not often be the best place for them in the changed circumstances of to-day.

It is unlikely that any appreciable part of the two-year permanent housing programme can now be planned in accordance with industrial needs—or, indeed, with any need other than that of erecting the houses speedily. Half the sites are already bought, the other half must be bought shortly, and no legislation governing the location of industry has yet been introduced. How much this fact matters depends upon the district in question. In the case of the County of London, the need to select sites, almost in a vacuum, somewhere outside the built-up area, is a bad augury for the planned decentralisation envisaged in Professor Abercrombie's London plans.

Stock Exchange Capital

It would appear that the claims made for relief from taxation for Stock Exchange capital in a Note which appeared on page 873 of *The Economist* of December 30th exceed the hopes of those concerned. They would be content with the assurance of a reasonable basis for the valuation of holdings in a Stock Exchange company for the purposes of death duties. The conversion of Stock Exchange partnerships into companies with unlimited liability was sanctioned by the Committee in pre-war days, subject to certain conditions being fulfilled. Of these the most important in this connection is that the shares in the company can only be held by a natural person who is himself a member of the Stock Exchange. Consequently, a deceased estate would be forced to sell. There could thus be no question of the estate receiving a continuing dividend from a holding.

The contention advanced by the jobbers who put forward a case for consideration is that no goodwill exists in the business of the individual jobber, and a very considerable experience of the practice of brokers in such matters suggests that this generalisation is, broadly speaking, correct. Even temporary absence on war service has caused a transfer of custom, despite a desire not to make the absent member suffer. If this is conceded, then the claim of the jobbers in question that the proper valuation of shares in a Stock Exchange company—shares with a very limited market and carrying unlimited liability—is not what they, plus the labour of their owner, have produced in income in the past, but their share in the net assets of the undertaking. It would probably be conceded that if a higher price were paid to buy them back from a deceased estate, that would be the proper valuation. But it seems to be generally held that nothing more than the net asset value would be paid out; while it might at times be difficult to ensure even that. It would seem that, in very large measure, these arguments are applicable also to broking firms.

The matter is of some urgency, at least as applied to jobbers, for a large number of members, now long past retiring age, are only awaiting the return of younger members to take a rest. If the existing conditions continue to prevail, they may well take the bulk of their money with them, and this will mean a further deterioration in a position already rendered unsatisfactory by the impossibility of accumulating reserves to keep pace with the rising level of security values. In some markets, notably that for Government securities, there has been an unexpected heavy dearth roll, unconnected with enemy activity, over the past decade which makes early action all the more desirable.

Woolworth's Better Profits

Woolworth's preliminary statement for the year ended December 31, 1944, shows that profits have risen by the considerable sum of £666,000 to £5,869,645. Provision for taxation to date, at £3,059,803, is up by only £300,000 odd. Earned for ordinary, before deducting provision for future taxation, which is cautiously raised from £300,000 to £450,000, but after charging allocations of £250,000 to buildings reserve and £110,000 to staff benevolent fund,

works out at 61.3 against 52.1 per cent. The final dividend is raised by 5 per cent., giving a total distribution of 45 against 40 per cent.

These results mark the first break in a history of falling wartime profits, and are in some respects puzzling. The 1944 profits apparently include no EPT refund, as did the 1943. The chairman, Mr W. L. Stephenson, last year explained the considerable fall in stock shown in the 1943 balance-sheet by declaring the board's intention to eliminate all doubtful stock and to carry into peacetime a minimum of wartime productions. The board's intentions at the beginning of the year and the interruptions caused by renewed aerial attacks on Southern England during the year are evidence for expecting a lower rather than a higher turnover for 1944. But, whatever has in fact happened to Woolworth's 1944 turnover, there is reason to suppose that the money value of its sales has increased in common with that of retail stores in general. Low prices, which formed the foundation of Woolworth's peacetime prosperity, are much less important under conditions of acute "commodity hunger," and can be progressively increased. The wartime prosperity of a retail store depends much more upon its ability to provide, at any price, goods in especially short supply or currently wanted for some particular reason. This requires ingenuity and elasticity in varying bulk orders and in developing new lines. Woolworth's increased prosperity, may result from a display of these qualities.

The price of Woolworth's 5s. ordinary shares has risen, on the preliminary announcement, by the comparatively modest sum of 1s. 9d. to 69s. 9d., at which the yield is £3 5s. 6d. The further explanation of the company's increased profits, which can be expected in the full accounts, will be awaited with interest.

Chambers of Commerce Report

Annual reports for 1944 from the Chambers of Commerce of Leeds and Manchester provide a record of the problems that exercised the minds of business men during the year. It was inevitable that their discussions should centre on Government policy, either declared or awaited. Difficulties arising from the war and war production, the main lines of which had long been settled, were happily few and took up less of the Chambers' time than post-war reconstruction.

The shape of post-war problems and policy became clearer during the year, and much of the field was mapped in legislation and white papers. Government pronouncements covered a good deal of ground: full employment, education, social security, demobilisation and many other topics in which the Chambers were interested.

Probably the most vital question before the Chambers has been that of post-war exports. The Chambers did valuable work in putting forward demands for relaxation in the lend lease terms, which has now taken place. The reasons for the need to increase exports after the war appear to be sufficiently well recognised, but it is not always evident that the same is true of the means to the end. It is disappointing to find only scant mention, for example, of the parallel need to increase the productivity of labour. It is to be hoped that 1945 will see closer attention paid by industrialists to the vital problem of increased mechanisation to increase PMH.

Shorter Note

The radio industry shares with the aircraft industry the distinction of having expanded during the war to many times its previous size. Mr F. B. Duncan, speaking at the inaugural luncheon last week of the Radio Industry Council, of which he is chairman, said that in 1942 the industry was two and a half times its 1939 size. Heavy service demands for all types of radio equipment, including radio-location gear, have been met. Mr Duncan spoke of an invention, the details of which are still on the secret list, used in radiolocation, which after the war will be applied in other ways, for example, to an anti-collision device to be used on ships and aircraft. The new council is a federation of the four associations which cover the radio and electronic industries, and has been formed to co-ordinate their work.

* On cold dreary days, you'll welcome the warmth and cheeriness of Bovril. It helps to ward off chills. It stimulates you and gives a feeling of well-being. The war has changed many familiar things, but the high quality of Bovril remains the same.

MIDLAND BANK LIMITED

ASSISTANCE FOR INDUSTRY

MR S. CHRISTOPHERSON ON FUTURE PROBLEMS

The ordinary general meeting of the Midland Bank Limited will be held on the 30th instant, at the head office, Poultry, London, E.C.

I feel some further attempt may usefully be made to remove deep-rooted misunderstandings about banking costs and profits. One still hears it said, for instance, that the war-time increase in deposits represents "costless credit," or funds which, apart from the cash retained to meet customers' day-to-day requirements, the banks have been able to utilise to their own profit without any countervailing outlay. This is far from the truth. The new deposits differ not one whit from the old in that they are debts from the banks to their customers, to whom the bank is responsible for the immediate availability of the money. The very fact that the Government maintains the economic life of the country at maximum intensity increases the routine work of the banks and the all-round cost of conducting it. It is a mistake, moreover, to suppose that the increased deposits involve the banks in no additional charge for interest. Over the whole mass of bank deposits, whether on deposit or current account, the average rate of interest allowed, to judge from our own experience, has declined less, since the inception of the "cheap money" policy in 1932, than has the average rate charged on the total of bank advances.

Since the outbreak of war the volume of advances has declined substantially, and the resultant diminution in earnings has been no more than offset by the additional income from enlarged holdings of investments. The income from the other pre-war items among the earning assets is about the same, and the sole net addition arises from the new asset, Treasury Deposit Receipts, which yield a rate of 1½ per cent per annum. Against this must be set the interest outgoings on new deposits and the fact that the banks are earning less from ancillary services in connection more especially with international trade, while their expenses have been largely increased on account of staff, special war-time security arrangements for the benefit of customers, war damage and other maintenance items.

DUTY OF THE BANKS

The first duty of the banks, in disposing of the surplus of gross income over expenses, is to keep themselves fully fortified against risks of capital loss, whether by bad debts or depreciation of investments. This is the primary obligation arising from their custody of the funds belonging to millions of customers large and small. The post-war period of adjustment to a peace economy may well bring with it some business casualties, and a bank can hardly be said to be performing full banking functions if it fails to accept reasonable commercial risks. We have repeatedly stated our readiness to look upon character with ability as the foundation of credit-worthiness.

Some people, however, while they approve in principle of this procedure, seem to suppose that the banks can allocate their profits on a scale, and with so much freedom from official restraint, that enables them to evade tax liabilities such as fall to other business undertakings. This again is a complete delusion. As the Treasury itself indicated some months ago, the Inland Revenue authorities have access to all the relative facts and figures about the internal accounts of the banks. It can definitely be said that no profit which the law designates, under the authority of Parliament, as subject to tax escapes its due weight thereof. In our own case, we have not yet incurred any liability to E.P.T.

The profits eventually available for distribution are spread over a wide range of ownership. In this Bank we have about 78,000 shareholders, many of them, such as those acting as trustees, representing more than one individual; the average holding of paid-up capital thus works out at about £195, and the average annual dividend received at £31 less tax. Over 40,000 of the shareholders own less than £100 of paid-up capital each; three out of every four own £200 of paid-up capital or less; and fewer than 2,000 of them, or about one in forty, hold more than £1,000 each.

NATION'S TASK AND NATIONAL ASSETS

During the past year much progress has been made, both on the side of Government and of business, with the preparation of plans for the restoration of a healthy flow of peace-time trade and enterprise. No one, by now, minimizes the difficulty of the task of transition; yet we ought not to allow ourselves to be overawed by what at first sight are alarming statements about the magnitude and consequences of our war effort. Some months ago, for example, Members of Parliament were advised to "steel themselves" for an official sum of "the cost of the war up to date"; it came to £24,000 millions. What does this figure mean? We shall do well to visualize it, not as a mass of liabilities (though indeed it does leave behind it a massive accumulation of debt), but as a cumulative measure of the flow of money over a given point—the point at which it issues from the Exchequer. The bulk of the flow passes through in wages and salaries and pay of the Forces, business profits and other payments for services rendered; and from all these personal incomes a large part is forcibly withdrawn to the Exchequer in taxes. A further large share passes back to the Exchequer on loan, being thus transformed into debts due from the community as a whole to millions of individual capitalists (there are 18½ million depositors in the Post Office Savings Bank alone) within the community. The rest goes in current consumption, curtailed as it is by rationing and other restrictions. The diminution of the volume and lowering of the quality of consumption is a partial measure of the current real cost of the war, paid as we go along.

I shall perhaps be reminded that the nation's stock of capital in the form of houses, factories, machinery and other assets has been heavily reduced through enemy action, deferred replacement and other factors. Even here, however, we must not lose sight of the large number of Government factories erected, the modernization of equipment in war industries, and the great improvement in the tools of agriculture, of all of which a large part may be carried over in full utility to meet the needs of peace.

RESTORATION OF PHYSICAL CAPITAL

The restoration of our physical capital is a task that lies in our own hands, and it is my view that, if we tackle the job wholeheartedly, it can be accomplished in a comparatively short time. For be it noted, for our assurance, that we have learned something in this war more valuable than anything we have aspired to in previous national crises. We have risen to the demands of the emergency with a degree of unity in purpose and in action never before attained. I have yet to be told why the task of rebuilding Britain should provide less of an inspiration to united, enthusiastic effort than the task of defeating the assaults of unscrupulous enemies.

I firmly believe, moreover, that once the nature of the problem is widely understood,

the same inherent qualities will be vigorously applied to righting our international position, suddenly upset as it has been by the unstinted contribution of everything we have to the attainment of victory. It is true that our course will be influenced strongly by the policies of other countries, particularly the great trading nations among the Allies; and if agreement can be reached on the broad principles of international commerce our task will be so much the more readily accomplished. The self-interest of every country in the world requires a strong and prosperous Britain; but even should collaboration lag, let us remember that Britain's relations with self-governing Dominions and other parts of the Empire provide the unshaken foundation for a combined effort at post-war reconstruction. Furthermore, the primacy of Britain as a market for many of the world's principal products and her reputation for high standards of quality and workmanship are ready to hand as powerful instruments for re-establishing her commercial leadership.

QUALITIES OF LEADERSHIP

As I read the story of this nation, the driving-power of that leadership is to be found in the twin qualities of integrity and enterprise, expressed in a thousand ways throughout the ever-widening range of adventure in industry and trade. These things remain; they cannot be wrested from us by any enemy or by any combination of misfortunes; they have risen triumphant over both, again and again. The success attained in our war economy is in part the result of integrity in business, in public administration and in workmanship. In the differing circumstances of reconstruction these same qualities will be forthcoming, and as controls are relaxed and removed the field will be opened up for a resurgence of that spirit of personal enterprise which will win us back our position in international business relations and reassert our leadership in world affairs.

To set out upon a course that leads beyond reconstruction to advancement—and this at a time when our main preoccupation must still be with the task of waging war—is an act of supreme and warrantable faith in the spirit of the British people. Greater social security, improved standards of living, more leisure, better education—all these can be fitted in to the pattern of our aspirations for a happier society; but the plans depend for their fulfilment on personal morality rather than material conditions—their mainspring is the quality of the individual and his sense of duty to the whole community.

SINGleness OF PURPOSE NEEDED

Elaborate planning will be of little use unless as individuals we show the same concern for the general good, the same singleness of purpose, as have inspired the war effort of the nation. On the international plane, too, the governing factors are moral. Hot Springs, Dumbarton Oaks, Bretton Woods—each falls into its rightful place and can serve its final purpose, in the welfare of mankind, only if the machinery is operated by individuals whose qualities of mind and character are cast in the same mould of integrity and enterprise. Understandings on right and wrong in international affairs cannot be defined and carried into practice in legalistic terms, with measured, pre-determined rights and penalties—they have their roots in mutual trust and understanding of each other's difficulties; they find their expression in honourable observance of the spirit rather than the letter.

For our part, the real, the traditional assets are still there to be used: the spirit of adventure and enterprise in undertakings; the courage and vigour to carry them out; and the efficiency and integrity to make them succeed—these are the real benefits of partnership of employees and employers. The quality required to overcome difficulties in industry and commerce both at home and abroad are simple—they are vision, initiative and hard, honest work from everyone.

LLOYDS BANK, LIMITED

POSITION OF EXTREME LIQUIDITY

ASSISTANCE FOR EXPORTERS

LORD WARDINGTON ON FUTURE PROBLEMS

The annual general meeting of Lloyds Bank Limited will be held on the 2nd proximo at the head office, 71 Lombard Street, London, E.C.

The following is extracted from the statement by the chairman, the Rt. Hon. Lord Wardington, circulated with the report and accounts:—

Our profit at £1,655,000 is £140,000 more than last year, and must I think be regarded as eminently satisfactory. It is the natural outcome of our increased figures. The total of our current, deposit and other accounts is the highest in the history of the bank, and is £91,000,000 more than it was last year. It finds its counterpart in the rise in our Treasury deposit receipts. Practically the whole of our increase in deposits has been lent to the Government in the form of Treasury deposit receipts. These, as members know, give a gross return of 1½ per cent., and as a large part of our increase in deposits is interest bearing, the advantage from a profit earning point of view is not great. It must also be remembered that our expenses have risen during the year.

The other changes in our balance sheet figures are not of great importance with the exception of our holding in Treasury bills, which is £6,000,000 down. Our cash is naturally up, and stands at 11.4 per cent. to our deposit liabilities. Investments are £12,000,000 less than they were last year, and loans and advances are also £8,000,000 less, and bear the lowest percentage to our deposits which we have ever seen, the figure being only 12.7 per cent.

HOLDING OF TREASURY DEPOSIT RECEIPTS

The outstanding feature of the balance sheet is the large proportion of our assets invested in Treasury deposit receipts. This represents over 38.4 per cent. of the deposits. It forms much the largest item in our assets, while loans and advances, which used to have pride of place in this respect, are now a very poor third. The question naturally arises as to what will happen when, after the war, the expected demand for loans to assist in the conversion of industry from a war-time basis to one of peace takes place.

Treasury deposit receipts have a currency of six months, and from a banking point of view are an ideal investment, as every week considerable amounts mature: but if at the same time the Treasury make corresponding demands for renewals, no fresh cash from that source will be available for lending to industry. It is true that, if necessary, they are discountable at the Bank of England, but to lend to the Government at 1½ per cent. and borrow at 2 per cent. can hardly be considered an economical proposition. An alternative method would be to realise investments, and a large proportion of these are short term bonds, but they do not mature with the same regularity as Treasury deposit receipts, and it would not be desirable for all banks to be realising investments at the same time.

LOANS FOR INDUSTRY

At present we are in a most unusual position of extreme liquidity, our liquid assets being no less than 61.3 per cent. You will remember that last year I stated that we should in consequence be in a position to lend money to industry in considerable volume and to be more liberal in our qualifying conditions as to repayment, without, however, departing from sound banking principles. This was interpreted in some quarters as indicating an intention on the part of the bank of following the continental practice of investing in industry, even

to the extent of obtaining a controlling interest of share capital.

This, of course, is the last thing I had in mind, and I merely meant to emphasise our liquid position and to show our willingness and ability to assist in the financial arrangements necessary for a return to peace-time conditions; but if the Treasury wish us to maintain the present proportion of Treasury deposit receipts in the years immediately following the war, or even to increase them, our capacity for meeting the demands of industry will be to that extent impaired. But of course it is always possible for the Government, who in these matters have sole control, to broaden the credit basis in order that it may synchronise with any legitimate expansionist programme.

EXPORT TRADE

Much thought has been given to post-war problems, though definite conclusions are rendered difficult by the necessity for not relaxing the war-time effort. One of the most important is the prospect of our export trade, a matter to which I referred last year. It has been the subject of debates in both Houses of Parliament, of many speeches and of a still greater number of articles. I make no excuse for again emphasising its importance, for it is fundamental to the life of this country, and our social and economic well-being hinges upon the recovery and expansion of the export trade. Nearly all our trade, internal and external, depends on our being able to pay for raw materials we do not possess; moreover, we also have to import a large proportion of our food. To enable us to do this, exports, both visible and invisible—and bear in mind that the latter have been seriously reduced by sale of foreign investments and loss of shipping—are an absolute necessity, and we must recover our power to export, not only to our pre-war limits, but on a much extended scale.

The Government can do much to help, and a good deal of preparatory work has already been done. The reorganised Department of Overseas Trade, under the Foreign Office, should be able to tender useful advice, to give timely notice of impending contracts and of developments likely to provide openings for trade. The endeavours of our representatives at Bretton Woods to find a substitute for the inelastic gold standard is a case in point. So far there has been no agreed conclusion on this technical and complex subject, but some solution must be found to secure those engaged in international trade against undue fluctuations in monetary values. Something, too, can be done by Government in protecting our valuable invisible exports in the shape of overseas investments. There are not merely the concern of the private investor—the income therefrom should assist materially in paying for essential imports—and too often such investments have not received fair treatment.

TRIBUTE TO AMERICAN ASSISTANCE

The prospects of our export trade have been recently brightened by the new arrangement in regard to lend-lease. Our gratitude for the sympathetic help and encouragement we have received from the U.S.A. cannot be exaggerated or ever forgotten. It is as lively as it is enduring, but I sometimes think we are not paying them a compliment when we treat them as if they were so thin-skinned that they take offence at any action on our part which might be described as competitive. They know that we have been their best customers, and that in order to buy from them our export trade must be prosperous and to some extent competitive. After all, competition does not exclude co-operation,

and America is fully aware that the prosperity of one depends on the prosperity of all and that she will suffer if we are poor. America knows that we have subordinated everything to the supreme object of winning the war, that we have devoted ourselves to this purpose to an extent unknown in any country, resulting almost in the extinction of our export trade. Hitherto, the official attitude over here has given industry a sense of frustration, and I cannot help feeling that our excessive tenderness towards America is calculated to create on the other side of the Atlantic an impression of unreality.

LABOUR'S PART

Industry has many problems to face in making post-war preparations, and it is disconcerting if all tentative plans in this direction and exhortations to be ready are met by inhibitions and restrictions of all kinds. A clearer indication of Government policy is necessary to clarify the uncertainties which confront our exporters.

Labour also has its part to play in restoring our export trade. Under the stimulus of war and with a whole-hearted realisation of the immensity of our common effort, it has, with some few exceptions, responded magnificently. Never has the country as a whole been so unanimous in its determination to work for a happy issue to our life struggle. When our victory over Germany is complete, and still more after the defeat of Japan, there may be a natural tendency to relax. But labour, as quickly as anyone else, has set itself against the mistakes we have made in the past, and the wise amongst them will realise that the difficult post-war period will be no time for striving for shorter hours or restrictions on output. After all we have gone through this may sound a hard gospel, but if we are to maintain our position in the world we shall all have to work harder than ever.

THE BANK'S EXPORT INDEX

Lastly, we come to the part which the banks can play in restoring our export trade. They are willing and anxious to give all financial assistance in their power, but there are other ways in which they can help. This bank, in order to assist its exporter customers, has for many years maintained records of commodities produced by them so that, subject to their approval, information may be supplied in response to enquiries from overseas through our associated banks, agents and correspondents. This Exports Index has recently been revised, and is serving a useful purpose in putting customers who are exporters in touch with enquirers.

A kindred service is provided by the bank in gathering from its correspondents abroad information as to the needs of overseas importers, which would materially aid our exporter customers in planning for post-war trade. In this connection, our Associated Bank, the Bank of London and South America, Limited, has already produced a valuable handbook dealing with trade requirements and potentialities in the South American countries, and it is hoped that similar information relating to other areas will soon be available.

EXPORT OFFICIALS AVAILABLE

The bank's assistance in providing information and guidance on the mechanism of such business, on shipping and documentary arrangements and on licences and currency problems, is available through our well-equipped Colonial and Foreign Department, expert officials from which can, in special circumstances, visit our branches to confer with customers who need their advice and guidance.

In concluding these remarks, I am sure the members would like to join with me and the board of directors in expressing our highest appreciation of the work of the staff during the past year, which has brought about such good results. We also remember those of our number who are serving in the Armed Forces, extending our sympathy to the families of those who have given their lives for the country and to those who have relatives who are prisoners of war.

WESTMINSTER BANK, LIMITED

HIGHLY SATISFACTORY PROGRESS

ASSISTANCE FOR INDUSTRY

THE HON. RUPERT E. BECKETT ON POST-WAR NEEDS

The annual ordinary general meeting of the Westminster Bank Limited will be held on January 31st, at 41, Lothbury, London, E.C.

The following is a summary of the statement by the chairman, the Hon. Rupert E. Beckett, circulated with the report and accounts:—

Our deposits and other accounts show an increase on the year of approximately £57 million, and this augmentation of our liabilities is reflected in a corresponding expansion on the assets side, mainly in our quick assets. Cash holdings have increased by £11 million, call money by £8 million, bills by £8 million, Treasury deposit receipts by £18 million and investments by close upon £5 million. Our loans and advances, although showing an increase of £7½ million at 31st December last, decreased, on the year's average, by £2.3 million. After providing for all taxation (including national defence contribution), the year's profit, at £1,366,907, exceeds that of 1943 by a little over £19,000.

DIVIDEND REPEATED

The directors have decided to pay the same dividends of 18 per cent. on the partly-paid shares and 12½ per cent. on the stock (both less tax). The other allocations are the usual £300,000 to officers' pension fund, and this year £300,000, instead of £250,000, to bank premises reinstatement and rebuilding account. This leaves the sum to be carried forward to the next account at £535,285, which is some £10,000 less than the figure brought in. The accounts of the Westminster Bank show a further increase in deposits and a concomitant increase in liquidity, with the natural consequence that the profits remain relatively stable. The progress of this healthy business continues to be highly satisfactory.

Our foreign auxiliary, overwhelmed by war in 1940, has, thanks to the success of the Allied Forces, now been delivered and I am happy to be able to report that all its branches have been freed.

CHANGED DISTRIBUTION OF ASSETS

Before the war the deposits of the clearing banks amounted to £2,245 millions, and at the end of November, 1944, the total had almost doubled at £4,398 millions. The changed distribution of the assets of the London Clearing Banks is reflected in figures extracted from their monthly statements. These changes in the distribution of bank assets are a direct consequence of the war. Arising from the war-time increase in the credit base, the swollen deposit resources of the banks are spread primarily between their assets items of investments and Treasury deposit receipts. Bank investments consist, of course, of Government securities. The November, 1944, monthly statement of the London Clearing Bankers shows that Treasury deposit receipts represent no less than 35.1 per cent of their deposit liabilities. The amount employed by the banks in Treasury deposit receipts is on an ascending scale, for by their issue the Government are enabled to borrow, from the banks, that margin of credit which is considered surplus to the community's requirements. The volume of credit available is determined by H.M. Treasury, and the increase in the credit structure during the war is the result of the Government's war expenditure. The decline in bank advances from £984 millions in 1939 to £738 millions is noteworthy.

War time brings about a complete re-orientation of our trade and industry, for the whole community has to concentrate its activities exclusively on the national effort. Some export trade is, of course, being transacted, but the vast bulk of the nation's output is to meet our own and our Allies' war

needs, with the majority of producers engaged directly or indirectly for the Government, as their sole customer and debtor. For them, their pre-war procedure is thus considerably simplified. They have the readiest market for their goods; it is huge and well-nigh insatiable, and provides the fullest outlet for all they can produce. This development is inevitable in a closed and controlled war economy, and producers, with their single assured customer, viz. the State, have no longer to encounter the forces of home and foreign competition.

HELP FOR GREAT AND SMALL FIRMS

The banks have given the readiest financial assistance to great and small firms alike, providing the means to enable the fullest expansion of production, to meet the huge demand, even in cases where a firm's own resources would not normally have justified it. The overriding consideration with the banks has been their desire to stand behind the nation and cooperate with the Government in its stupendous war effort. The provision of additional and extraordinary financial requirements has been facilitated by the system of progress payments, under which the Government pays its contractors instalments for work done. Expenditure on the war effort has thereby become in a large measure self-liquidating, and the provision by the banks of this type of finance is in strict accord with British banking tradition even if it is, and indeed must be, on an enlarged scale.

It should be observed, however, that coincidentally there has been a progressive liquidation of the nation's stocks of peace-time goods without replenishment, and this accounts, in large measure, for the reduction in the banks' advances during the war. It is a general world-wide wartime phenomenon. With the whole industrial machine still working for the war effort it is nevertheless opportune, in view of the approach of the end of the war in Europe, to make preparations for the transition from war employment to peace employment. No nation can undergo the ordeal of war, and especially of this war, without impoverishment and economic exhaustion, and those well-meaning people who imagine that we shall, as a nation, emerge better equipped and ready for a triumphal entry into a New World will, I fear, be badly shocked by the realities of international devastation and dislocation.

ADJUSTMENT TO PEACE CONDITIONS

Industries and businesses, both big and little, whose normal activities have been diverted and adapted wholly or in part to purposes of war, will need adjustment to, and equipment for, the resumption and extension of their peace-time activities. Not only have we had to hold in abeyance all the work that would normally have been fulfilled during the years of war—in itself a colossal accumulation—but we shall also have to repair all that has been broken down and destroyed during the war years in every department of our social and national life. In short, we have three tasks to combine in one. To catch up the arrears; to restore the war-time damage; and to reconstruct anew. The immensity of the task will be apparent to everyone, and when we remember that the same tasks confront all the nations of Europe and elsewhere, it will be seen that work to the maximum extent, and with the greatest energy and concentration, is ahead for many years.

We as a nation will be concerned to rebuild internally, and also externally, for our dependence upon export trade has been if anything brought home to us with added emphasis during the war. Our internal and external trade are indeed vitally related to each other, but our internal programme and

needs must not distract our attention from the development of our export trade on an unprecedented scale. In many cases, not only have we to make up the leeway of development in the war years, but we have entirely to modernise equipment which has failed to keep pace with research. In this respect some other nations may have marched ahead of us, and in the fierce competition we shall encounter in the post-war years it behoves us to be at least as well equipped as any of them.

GREAT DEMANDS ANTICIPATED

The need for the import of raw materials which can only be paid for by exports, the necessity for the simultaneous provision of large quantities of consumption goods, and the re-equipment of industry, will occasion great demands on the supply alike of finance, materials, and labour. Almost every manufacturer will have to re-equip and re-tool; every wholesaler and retailer with empty shelves will need to re-stock. In the aggregate, financial requirements must run to enormous sums, and one of the major post-war tasks will be to attract the savings of the nation, which have during the past 5½ years been devoted to the Government financing of the war, to these particular purposes.

In pre-war years 50 per cent of the resources of clearing banks were employed by way of advances in direct assistance to industry. The ratio of advances to deposits was already only 43.8 per cent in August, 1939, and in the latest figures it has fallen sharply to 16.8 per cent: in other words, it is now less than one-third of what it was in former years. The funds that have thus been left unused by industry have gone partly into investments, but to a far greater extent into Treasury deposit receipts, the total of which is already nearly £1,550 million. This forms a reservoir from which may be drawn the large funds that will become necessary when the war ceases and the whole process of national reconstruction begins.

GRADUAL BUT ASSURED PROGRESS

The banks will naturally facilitate the changeover from the Government to industry as their prime debtor, but in all spheres of our national activity post-war progress will of necessity be gradual though assured. Finance and credit must march in step with this development.

The accumulated war-time savings of the nation, in so far as they remain in the hands of the banks and become available by the retirement of Treasury deposit receipts will, through the intermediary of the banking system, be devoted to the provision of finance for the furtherance of desirable schemes of industrial development, for essential re-equipment and for the export trade. Other savings of the nation will be available for direct investment in the provision of finance for these essential objects. It is hoped that by one or other of these means the financial requirements of industry and business will be provided for, but it is relevant to remark that unless British industry can be reasonably assured of normal profits—and by this is meant not taxed retainable profits—no development in the machinery for the provision of finance can have any chance of success.

But finance is less likely to be a limiting factor than the availability of material and labour which, in the immediate post-war world, will largely be needed for the building and reconditioning of houses and their re-equipment, and for the provision of much needed consumption goods.

ADEQUACY OF BANKING SYSTEM

The impact of war demonstrated the adequacy of the preparations made by the banking system for the maintenance of all essential banking services and for the complete mobilization of banking activities for the support and furtherance of the national war effort. Peace, when it comes, will find the preparations of the banking system to deal with the problems and difficulties of the post-war period fully sufficient.

NATIONAL PROVINCIAL BANK LIMITED

CONSIDERABLE EXPANSION OF FIGURES

HELP FOR SMALL BUSINESSES

MR COLIN F. CAMPBELL ON POST-WAR TRADING

The 112th annual general meeting of The National Provincial Bank Limited will be held at the head office, 15, Bishopsgate, London, E.C., on the 30th instant.

The following is the statement by the chairman, Mr Colin Campbell, which has been circulated to shareholders with the report and balance sheet as at 31st December, 1944.

The only change I have to report during the year in the constitution of the Board of Directors is the election of Mr D. F. Anderson, who has a wide knowledge of Shipping and whom I welcome, as I am sure he will give valuable service to the bank.

MANAGEMENT AND STAFF

The work of the management and staff again calls for special mention. Normal releases to the forces of the younger members of our staff have continued and we have found it increasingly difficult to replace them, thus adding to the already heavy burden borne by the personnel remaining with us. This position became particularly acute in the London area during the flying bomb attacks, and we were obliged to appeal to our country branches for volunteers to assist in the metropolitan area. The response was immediate, and I am glad to take this opportunity of expressing my appreciation of the splendid spirit of co-operation shown by all concerned.

Despite our difficulties, I think I can again say without hesitation that the efficiency of the work of the Bank and the service to the public have been well maintained, and our thanks are due to the managers and staff for their continued loyal and unstinted service. We are grateful, too, to the managers and staff who have so willingly remained in the active service of the Bank beyond pensionable age to help us in these difficult years.

MEN WITH THE SERVICES AND CASUALTIES

The shareholders will, I know, be interested to hear that we now have nearly 5,000 members of our staff serving in H. M. Forces, apart from those directed into industry. Further decorations have been awarded, and it is pleasing also to hear of the many promotions which have been gained. Our good wishes go out once more to all serving members of our staff with the hope that their return is appreciably nearer.

Inevitably the number who have made the supreme sacrifice continues to grow, the total is now just short of 200, and our deepest sympathy is extended to their relatives. We forget neither the families of those posted as "missing," nor of those who are prisoners of war in Germany and the Far East, and we sincerely hope that their anxiety will soon be relieved by the receipt of reassuring news. We are very conscious, too, of the hardships suffered by our staff remaining in the Channel Islands, which we trust may shortly be ameliorated.

STATEMENT OF ACCOUNTS

During the year which has just ended there has been considerable expansion in our Balance Sheet figures. Current, deposit and other accounts have been increased by £68,569,660 to the figure of £589,911,939. A satisfactory liquid position has been maintained. Against our liabilities we show cash items, short money and bills amounting to £40,551,042, with Treasury Deposit Receipts of £214,000,000, and investments, mostly British Government securities of reasonably short life, amounting to £133,776,403. The advances made by the

Bank have increased during the year from £108,687,467 to £114,502,138, but, of course, the proportion of this figure to deposits is much reduced compared with pre-war days. When trade returns to its normal peace-time channels, and the necessity for the financing by His Majesty's Government of purchases of commodities and raw materials has disappeared, we shall hope to see the Bank's power to assist its customers reflected in a substantial increase in the item of advances.

RESULT OF YEAR'S OPERATIONS

The year's trading has resulted in our showing a net profit of £1,270,670 5s. 4d., as compared with £1,256,394 19s. 5d. for the year 1943. We have brought into the accounts from the previous year a sum of £609,614 1s. 0d., so that the amount available aggregates £1,880,284 6s. 4d. An interim dividend has already been paid, and a final dividend at the same rate will require a total sum for the year of £710,956 4s. 0d.

The allocations proposed are as follows:—To bank premises account £100,000, to pension fund £150,000 and to war contingencies fund £250,000, leaving to be carried forward to the next account a sum of £669,328 2s. 4d.

TRUSTEE DEPARTMENT

It is some time since I made reference to the activities of the Bank's trustee department, and I do so now because the very considerable increase in the business of this department has proved beyond doubt that it is providing a valuable service to our customers, and indeed to others, which is much appreciated.

There is definite evidence that the public are becoming increasingly conscious of the desirability of appointing a corporate trustee, and notwithstanding the problems we have to meet in the way of providing a staff for this fast growing feature of the Bank's business, I am glad to be able to say that the standard maintained is of the highest, and the department is well-equipped to deal with the anticipated further demands upon its services. When the war is over we hope to provide for the public extended facilities by opening trustee branches in several new centres.

ASSOCIATION WITH INDUSTRY

A year ago in the short statement sent to the shareholders, I alluded to the help which the Bank is always ready to afford to the small trader and man of moderate means and good reputation. From such sources in the past many sound businesses have developed. We look forward to an extension of opportunities in this direction.

Our business has close and far-reaching association with the great industries of this country, including agriculture, in which enterprise and skilful management have done so much to enable the huge burden of war production to be successfully borne. Both coal and cotton have been subjected to much criticism during the year, which we hope will lead to a still greater degree of efficiency in these all-important trades. If this country is to maintain its position and materially develop its resources, these great basic industries must also be able to rely on receiving full financial support.

NEED FOR TRADE FREEDOM

Probably no subject has occupied the thoughts of all political parties and industrialists more than that of ensuring full employment after the war, upon which in

large measure rests the prosperity of British trade generally. With some of the proposals placed before the public, bankers would be in full agreement, such, for instance, as the control over foreign exchange, over the import of luxuries and the distribution of food; but I am convinced that this prosperity will be best served by the utmost freedom being given to those engaged in business who, by long experience, understand the problems connected with their particular trade, whether at home or overseas.

It is from this angle that the prolonged discussions, culminating in the Bretton Woods proposals, have to be considered. Definite progress has been made showing that other nations are willing to consider wide cooperation in a real effort to avoid the restrictive methods which came into force after the last war. No doubt further discussions will take place before any final agreement is reached on this most difficult and important subject.

AT THE SERVICE OF THE CREDIT-WORTHY

In the meantime, the development of banking methods is continuous and its services are at the disposal of all credit-worthy people, so that with the distribution of the wealth of the country spread over an infinitely greater proportion of the population than was the case in pre-war days, it is to be hoped that many who were not in the habit of taking advantage of banking services will do so and by this means will help forward the much larger volume of trade that will be necessary. It cannot be emphasised too forcibly that for many years to come this country will be facing the world as a debtor instead of a creditor nation, so that a large increase in the volume and value of our exports is essential to the maintenance of the standard of life at present enjoyed.

In this connection, the problems of social insurance have also their bearing. The men and women of working age—which is a limited number when we exclude those who are beyond work, and the children—will have a heavy task before them. These burdens can be borne only on the assumption that full employment is assured and that the markets of the world are free to receive the results of their work in the form of manufactured products.

GREATER COMPETITION COMING

The skill of our workpeople is admitted throughout the world, but we must expect to be faced with greater competition both from the Dominions as well as from foreign countries than has been experienced hitherto.

There must of necessity be collaboration and closer association between Government and industry than has existed in the past. This should be beneficial to the welfare of the country generally as well as to those directly engaged in industry, provided that the initiative and the drive associated with private enterprise are not discouraged, for it was these qualities that gave the country such a commanding position in the past.

EFFECT OF HIGH TAXATION

Taxation at a high level brings in its train many disadvantages, not the least of which is the drawing off from trade of profits which should be available for replacement, development and research. The sooner some of this burden can be lifted the better for all, because it is clear that the highest degree of efficiency will be necessary if we are to maintain our position as a world power.

The difficulties which have arisen in Europe in those countries which have been released from the bondage of German occupation show very clearly the dire effect of Fascist domination. It will be for us to demonstrate, as the end of the war approaches, the immense advantages of our free institutions and method of approach to new developments.

WILLIAMS DEACON'S BANK LIMITED

SATISFACTORY RESULTS—INCREASED PROFIT

POST-WAR PROBLEMS

MR G. P. DEWHURST'S STATEMENT

In place of his usual annual address, the following statement has been circulated by Mr G. P. Dewhurst, chairman of Williams Deacon's Bank Limited, in advance of the annual general meeting held on the 25th instant.

CHANGES ON THE BOARD

From the report in your hands you will see that during the past year the board has lost through resignation the valued services of Sir William Whyte, and I should like, in your name, to assure him that we have highly appreciated the knowledge and experience which he has made so readily available in the direction of the bank during the past eleven years. It is with regret that we lose his services as a director.

To fill the vacancy on the board thus created, the directors have appointed Mr John McArthur Thomson.

Mr Thomson is no stranger to us here. Coming from the Royal Bank of Scotland, London, to become assistant general manager of this bank in 1936, he filled from 1938 the position of general manager with conspicuous success and only relinquished that appointment last April to become cashier and general manager of the Royal Bank of Scotland. We wish him every success in his new position and are glad to feel that we still have him with us as a member of the board.

NEW GENERAL MANAGER

To succeed Mr Thomson we have appointed Mr John Humphreys King as general manager of the bank.

Mr King has had, prior to becoming an assistant general manager in 1939, a varied experience in different capacities on the staff of the bank, and we have the fullest confidence that he will fill his new position with distinction and I take this opportunity of offering him our best wishes together with the assurance of our wholehearted support.

You will also notice from the report that we have appointed Mr George Jagger as an assistant general manager and we feel sure that he will do full justice to this appointment.

Before referring to the accounts, I would like to offer the board's congratulations to our colleague, Sir Ernest E. Bird, on the honour of knighthood which was recently conferred on him in the Birthday Honours List.

STAFF WITH THE SERVICES

Also, before going further, I feel I should recall to your thoughts our ever-present anxiety regarding those members of the staff who are now serving with His Majesty's Forces. They now number 524, and I regret to say that 18 have been killed in action, two have died on active service and 11 are prisoners of war. To the relatives and friends of those who have given their lives for their country we take this opportunity of offering our sincerest sympathy, which we also extend to the relatives of those who are prisoners of war.

I would also wish, at this stage, to assure all those members of the permanent staff who are serving with the Forces that a warm welcome awaits them on their return from service—a prospect which the recent victories of Allied arms seem to have brought appreciably nearer—and that everything possible will be done to facilitate the speedy resumption of their banking duties.

BALANCE SHEET ITEMS

Turning now to the figures of the balance sheet, you will see from the report in your hands that deposits at £80,471,000 again appear at a record figure, showing an increase of over 8 per cent. as compared with last year.

Whilst the introduction of tax reserve certificates three years ago must have considerably retarded the rate of increase in bank deposits, the tendency would now appear to be weakening for we find that the increase in the total of such certificates has started to lag while the rate of increase in bank deposits is again on the up-grade, suggesting that the amount of certificates outstanding is approaching its ceiling and that caution is being observed in estimating the tax liability of a few years ahead.

The only other change of note on this side of the sheet is an increase of £47,000 in acceptances and credits opened on customers' account.

ASSETS

Turning to the assets—the liquid position of the bank is strikingly apparent.

Including Treasury deposit receipts, the quick assets show an increase of over £5,000,000 as compared with last year and represent nearly 55 per cent. of our deposits.

Our holding of British Government securities has also been increased by £1,600,000. On the other hand, in contrast to last year's experience, advances to customers are less by £565,000.

I feel the figures I have given, while stressing the liquid position of the bank, will enable us to play our full part in the reinstatement and re-equipment of industry during the transition period from war to peace. I will enlarge upon this later.

PROFIT AND DIVIDEND

Turning now to the figures of profit and loss, our net profit, after making the usual provisions, appears at £211,774 17s. 9d., as compared with £201,844 12s. 4d., or an increase of £9,930. This profit, with a balance of £151,932 17s. 6d. brought forward from last year, gives us a total of £363,707 15s. 3d. now to be dealt with.

After transferring £100,000 to staff pension fund, additional to the usual annual contribution, and £30,000 to property maintenance reserve, we are in a position to pay dividends at the rate of 12½ per cent. on both our "A" and "B" shares and carry forward to next year's account £116,520 5s. 3d. as against £151,932 17s. 6d. brought in.

Before leaving the results of the year's trading which, I submit, may be looked upon as satisfactory, I would wish to refer firstly to the steady increase in the number of our connections during the year and secondly to the number of our customers who, we find, are appreciating the advantages of utilising the services of our trustee departments.

POST-WAR PROBLEMS OF COTTON INDUSTRY

The areas served by this bank have, of course, rendered immense services to the war effort and although the whole energies of the cotton industry are still harnessed to the needs of supply for the prosecution of the war, I think if we take stock of the vast achievements of the Allied Armies and the substantial progress that has been made both in the East and the West, the trade as a whole is fully justified, as far as present circumstances permit, in laying its plans for meeting its post-war problems with a view to the recovery of lost markets and the entry into new ones. The difficulties facing the industry are many and various, but not to my mind insuperable if the Government and individuals alike play their respective parts.

Looking at the present improved state of the financial structure of the trade, the necessary finance for expenditure on research, re-equipment and new machinery should be in some measure available from internal resources, though here taxation

relief and a more liberal allowance for depreciation on wasting assets would play an important part.

Again, where entry into markets abroad is dependent on the negotiation of trade treaties by the Government, obviously such commercial arrangements must entail more direct contacts between merchants here and overseas markets and an intensive study on the spot of the needs and requirements of their customers abroad.

PRIORITY ALLOCATION FOR MACHINERY, MATERIALS AND MAN POWER

Then, too, spinners and manufacturers may fairly expect that a priority in allocation for their requirements of machinery and materials will be granted them without undue delay.

And last, but not least, is the question of man power, and how best can labour, after so long a period of service elsewhere, be attracted back to the mills.

Improvement in working conditions and amenities on a scale at least comparable with those provided in other industries has already been taken in hand and will doubtless play a very important part, but labour from the Forces and munition works must be allowed to resume its old employment at the earliest possible moment consistent with the wartime needs of the country.

If employers and operatives alike will show in this transition stage between war and peace which awaits us, the same energy and determination that they have thrown into their war effort, I submit they have a right, in matters beyond their control, to expect a corresponding measure of support and encouragement from the Government.

ENGINEERING INDUSTRY

As to the engineering industry, the part played by both the heavy and light branches has been of a notable character and the technical progress made during the war, coupled to the proved efficiency of so many of its units, will, I have every hope, enable it to respond adequately to the heavy demands which will be made on it during the reconstruction period.

Both the above-named great industries—and space alone prevents my reference to several others—will have an important part to play in the restoration of our export trade, so vital an element in our national economy, and the high degree of liquidity disclosed by our figures will enable this bank to extend support in full measure towards the furtherance of that object.

IMPORTANCE OF EXPORT TRADE

The transitional stage of change from war production to peace production will require in many cases somewhat careful navigation and although that period must obviously be accompanied by an intense demand for goods of every kind we should not, as a nation, I submit, allow our long-term view to be thereby clouded. In the long run international competition will return and—I speak in the simplest terms—we have, as a nation, to meet it with diminished assets and increased liabilities, so that I make no excuse for emphasising that the future of our export trade was never more important. In fact it can be said that in face of our worsened financial position, due to the fact that we have had to fight the war without reckoning the cost, we shall have to rely as never before on the proven skill of our craftsmen and operatives and on the abilities of our manufacturers and merchants to provide commodities at a price acceptable to the world buyer. This skill and those abilities have not failed us in the past nor should they, given proper support, be found wanting in the future.

As I have indicated above, this bank is prepared to extend its support in full measure to our customers during the periods of reconstruction and transition and I may, perhaps, be allowed to say that I do not forget either those ex-Servicemen who will be anxious to re-start businesses abandoned in the national interest or all those small-scale enterprises which contribute so much to the health and balance of a national economy.

NATIONAL DISCOUNT COMPANY, LIMITED

FURTHER INCREASE IN TURNOVER

SIR SIGISMUND MENDEL'S REVIEW

The annual ordinary general meeting of the National Discount Company, Limited, was held, on the 24th instant, at 35, Cornhill, London, E.C.

Sir Sigismund F. Mendl, KBE, the chairman, presided.

The following is the chairman's statement circulated with the report and accounts for the year ending December 31, 1944:

I again do not propose to make a speech at the annual general meeting to be held on January 24, 1945. I am therefore sending to the shareholders a short statement, together with the balance-sheet and profit and loss account.

MARKET FEATURES

The discount market during 1944 has very few features on which I need dwell. The small margin of profit between interest and discount remains, as in the past war years, at a very minute figure, and had it not been for our expanding operations in the short-bond market, we should certainly not be able to give as good a showing as is contained in the accounts now submitted.

There has been a further increase in the company's turnover. Deposits have risen by £9 million to the total of £81 million. This increase is reflected in a corresponding rise in investments and bills and short-dated bonds discounted. The total of bills re-discounted is no longer included in the bills discounted and short-dated securities figure as before, and is now shown as a contingent liability. The reserve, which was reduced by £576,667 10s. to £1,000,000 in accordance with the resolution submitted and approved at the last general meeting for the capitalisation of this amount and paying up £2 10s. per share on each of the 230,667 issued "B" shares, has been increased to £1,100,000 by the transfer of £100,000 from the profits for the year.

PROFIT AND DIVIDEND

The profit and loss account shows that after making provision for rebate, taxation and contingencies, the gross profit for the year is £251,633. After deducting expenses and directors' remuneration totalling £55,265, there remains a net profit of £196,368 which, with the balance of £223,854 brought forward from last year, gives a total of £420,222. From this sum £100,000 has been transferred to the reserve, as mentioned above.

Interim dividends were paid in July amounting to £42,300, and it will be proposed, at the forthcoming meeting to pay a dividend of 2s. 6d., less tax, on the "A" shares, making 10 per cent. for the year, and 7s. 6d., less tax, on the "B" shares, making 13 per cent. for the year, which is equivalent to the rate per cent. paid before the shares were increased to £5 paid up, and to carry forward to the next account the sum of £224,089 against £223,854 brought in.

TRIBUTE TO MR MONTAGU NORMAN

The discount market received with great regret the announcement during the year of the resignation of Mr Montagu Norman from the position of Governor of the Bank of England, which post he had held for a record period. Mr Norman's kindly interest in the operations of the discount market had always been most marked, and it is only fitting that those connected with it should express their appreciation and gratitude for his many conspicuous services to the City and financial business generally, and wish him many peaceful years in which to enjoy a rest from his strenuous labours. Regarding his successor, Lord Catto, we

are happy in the thought that this responsible position is occupied by one so eminently qualified to appreciate the difficult problems that will arise during the post-war era.

My usual observations with regard to the able manner in which the company's affairs have been conducted by Mr Bate and his colleagues in the manager's room have more than ordinary application to their successful operations during 1944, aided by the loyal co-operation of a much depleted staff.

The report and accounts were unanimously adopted.

MARTINS BANK LIMITED

ANNUAL GENERAL MEETING

The one hundred and fourteenth annual general meeting of Martins Bank Limited was held on Tuesday, 23rd January, at the head office, Liverpool, Mr Frederick Alan Bates, M.C., A.F.C., D.L., chairman, presiding.

The chairman said that in accordance with war-time practice he had issued a statement in place of the remarks he would normally have made at this meeting, and there was nothing he desired to add to that statement. He proposed the adoption of the report and accounts and confirmation of the payment of a final dividend of 7½ per cent., making, with the interim dividend paid in July, 15 per cent. for the year.

Mr A. Harold Bibby, D.S.O., D.L., a deputy chairman, seconded and the motion was carried unanimously.

Mr Herbert Barlow proposed and Mr J. W. Holt seconded the re-election of Mr A. H. Bibby, Mr R. V. Buxton, and Sir N. F. Warren Fisher, as directors. The resolution was unanimously approved.

On the motion of Mr D. A. Sutcliffe, seconded by Mr A. Bryce Muir, the auditors were reappointed.

Mr W. B. B. Stoddart proposed a vote of thanks to the chairman, expressing appreciation of the shareholders at the results laid before them.

The chairman in acknowledgment paid tribute to the service of the officers and staff, from the chief general manager to the junior members, whose efforts made possible the success of the bank and its service to the public.

Mr J. N. Furniss, director and chief general manager, returned thanks for the warm expressions of appreciation, which were particularly gratifying in view of depleted staff, and the continuing expansion of business both in value and in the number of transactions.

BARCLAYS BANK LIMITED

ANNUAL MEETING OF STOCKHOLDERS

The fiftieth ordinary general meeting of Barclays Bank Limited was held, on the 24th instant, at the head office of the bank, 54 Lombard Street, London, E.C. 3.

Mr Edwin Fisher (the chairman) presided.

Mr P. J. Diboll (the secretary) read the formal notice convening the meeting and the report of the auditors.

With the concurrence of the stockholders present, the report and accounts and also the statement by the chairman, which had been previously circulated, were taken as read.

In the course of his remarks the chairman said that the jubilee of the bank's incorporation as a limited company would fall in July next year. Their predecessors had started business in Lombard Street some 250 years ago. On the allocation from profits of £64,767 to the staff widows' fund, Mr Fisher mentioned that, as a special matter, the board had decided that the bank should carry the greater part of

the burden of the payment of annuities to widows of men who had lost their lives in the war. They were glad that it had been possible to do this, instead of leaving the whole of the liability to fall upon the resources of the fund, and he felt sure the stockholders would agree with their decision. Continuing, he referred to the 45 decorations and awards which had been bestowed upon members of the staff serving with the Forces and particularly to the award of the Victoria Cross to Major William Philip Sidney, who had been attached to the bank's Pall Mall local head office. Lieutenant Gerard Ross Norton, of the staff of Barclays Bank (Dominion, Colonial and Overseas), had also gained that incomparable honour. He expressed his warm appreciation of the services of Mr Norman Jones, a general manager, who retired at the end of 1944.

The chairman then moved:—
"That the report of the directors produced, together with the annexed statement of the company's accounts as at December 31, 1944, duly audited, be received, approved and adopted, and that a final dividend of 5 per cent., making 10 per cent. for the year, on the "A" stock, and a final dividend of 7 per cent., making 14 per cent. for the year, on the "B" and "C" stock respectively, less income tax in each case, be declared, payable on the 8th proximo, to the stockholders registered in the books of the company on December 31st last."

Sir William M. Goodenough, Bt. (deputy chairman), seconded the motion, which was carried.

The retiring directors were re-elected and the auditors, Messrs Price, Waterhouse and Company and Messrs. Kemp, Chatteris and Company, were reappointed for the ensuing year.

A vote of thanks to the staff and a vote of thanks to the chairman for presiding at the meeting were unanimously accorded, and the proceedings terminated.

RADIO RENTALS, LIMITED

INCREASED DEMAND

The eighth annual general meeting of Radio Rentals, Limited, was held, on the 24th instant, in London, Mr H. F. Hunt (the chairman) presiding.

The following is an extract from the chairman's statement circulated with the accounts:—The fifth year of the war proved to be one of extra difficulties, more especially as your company had most of its premises and the majority of its subscribers in "Southern England" where the enemy's attacks were concentrated. The company's instruments have stood up remarkably well to treatment that was not visualised when they were designed, which speaks well for the good workmanship in their construction, and we are glad to say the losses were negligible.

The trading profit at £111,178 compares with £112,658 last year, and after conservatively providing no less than £87,403 for taxation, there is a net profit for the year of £23,775 as compared with £23,116 last year. Your board, in recommending a final dividend of 15 per cent., making a total of 20 per cent. for the year, are proposing to increase the carry forward by £10,000 to £54,003. The balance sheet shows the strong financial position of the company.

The demand we are now experiencing appears to increase at an even greater rate than that at which the supply diminishes, and it is possible that we shall not receive a sufficient number of new sets this year to enable us to maintain the gross rental income and so offset the effect of the reducing rentals which we charge our subscribers. Our proportion of the "War-time Civilian Receivers" has not been delivered to the dates expected, but we anticipate early deliveries, thus enabling us to supply the would-be subscribers who have placed deposits with the company to be included in our priority waiting lists.

The report was adopted.

RIO DE JANEIRO FLOUR MILLS AND GRANARIES, LIMITED

The fifty-ninth annual general meeting of this company was held, on the 23rd instant, in London.

Mr S. C. Sheppard (chairman) said that the board's recommendation of a final dividend of 1s. per £1 unit of stock, less tax at 10s., making the total dividend for the year 8 per cent., less tax, was amply covered and left the carry-forward increased by £3,236 to £60,088. The past year had been full of difficulties, for not only had there been a stricter control than ever in the selling prices of all the company's products, but transport conditions had become more and more restricted both by land and sea.

The following cable had recently been received from the general managers in Rio:—"Trading conditions continue satisfactory with good demand for all products are hopeful of obtaining some improvement in local controlled prices shortly." The report and accounts were adopted and the dividend recommendation approved.

ASSAM RAILWAYS AND TRADING COMPANY, LIMITED

SALE OF RAILWAY UNDERTAKING

The annual general meeting of the Assam Railways and Trading Company, Limited, was held, on the 23rd instant, at

Winchester House, Old Broad Street, London, E.C.

Mr E. A. A. Joseph (the chairman), who presided, said that as they had not yet received the accounts for the past year it would be necessary to adjourn the meeting. Shareholders would receive notification of the adjourned meeting together with the report and accounts.

An extraordinary general meeting was then held to consider a resolution authorising the directors to sell to the Government of India for £1,770,000 the company's railway undertaking with the colliery line extension and all stocks and stores, and to negotiate terms with the debenture stockholders for the repayment of their stock.

The resolution, after some congratulatory remarks by shareholders and after the chairman had replied to a few questions, was carried *nem. con.*

FINANCE AND BANKING

THE MONEY MARKET.—Conditions in the money market have suddenly become more stringent this week. Heavy revenue payments have been the main factor at work, and their effect has been supplemented by calling of loans by the clearing banks which have been making up for their January statements. At the same time, the position has been eased by the fact that no TDR payments were called for this week. No TDR payments were made in the corresponding week six months ago, but owing to an overlap the small amount of £5,000,000 actually matured this week. Treasury bill payments were £10 million in excess

(Continued on page 135)

GOVERNMENT RETURNS

For the week ended Jan. 20, 1945, total ordinary revenue was £116,948,000, against ordinary expenditure of £109,450,000 and issues to sinking funds of £400,000. Thus, including sinking fund allocations £11,118,210, the deficit accrued since April 1st is £2,500,401,000 against £2,433,112,000 for the corresponding period a year ago.

Total	604,979	467,047	486,164	11,378	11,824

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £1,746 to £3,553,162, the other operations for the week (no longer shown separately) reduced the gross National Debt by £24,098 to £22,097 million (amended).

THE ECONOMIST PROFIT FIGURES

The defects of company accounts and the complications of income-tax make it impossible to present statistics of profits in a simple, standardised form. The following definitions may assist the reader:—

(a) **Gross and Net Profits.**—Gross profits are profits before payment of standard income-tax (but after such other taxes as EPT and NDC). Net profits are profits after tax. In many cases, figures of gross profits can be calculated only by adding back what appear to be the appropriate amounts of tax to the net figures published.

(b) **Accounting Period and Reporting Period.**—Company reports are published some time after the end of the period in which the profits were earned. The figures can be grouped by the quarter in which they are published (i.e., by the reporting period) or by the quarter in which the company's financial year ends (i.e., by the accounting period).

(c) **Old Basis and New Basis.**—On the old basis the net profit consisted of preference and ordinary dividends as published, whether gross or net, plus actual allocations to free reserves. Total profit was the largest figure of the profit and loss account, excluding capital profits and transfers from reserves. The figure was struck before depreciation if that was disclosed. On the new basis no net profit figure is provided. It can be obtained by deducting from the gross the appropriate rate of tax. The gross profit is the gross total of interest and dividends plus additions to free reserves and other savings, both grossed up at the stated rate of tax.

Before the Conference

THE meeting of the three Heads of State will soon take place. Mr Harry Hopkins, the President's personal precursor, is already making straight his ways in London, Paris and Rome. Any day now, secret planes, laden with incognito, will leave for unknown destinations. The world's triumvirate will again meet face to face to determine the last stages of the war and the first steps of the peace.

The troubled year since Teheran has brought forth enough political problems to occupy the attention of a series of conferences. The Americans are known to be disturbed at the conduct of both British and Russian policy in liberated territory. The short-term dependence of Britain and Russia on America's economic resources offers an opportunity for forceful diplomacy—at great risk to long-term harmony. It is not certain, however, whether American dissatisfaction takes the form of a threatened withdrawal from Europe or of insistence on a larger hand in its problems. The other Allies can justly ask Mr Roosevelt to clarify this fateful point.

On this matter alone, it would be possible to draft a long and packed agenda. Yet it is questionable whether it will in fact occupy the centre of the discussions. It may well be that the actual subject-matter of the conference is being decided not in the Chancelleries of the nations, but on the battlefields of Pomerania and Brandenburg. Russian armies are already fighting on German soil. Their forces are

advancing on Berlin. It is not impossible that before the Big Three meet, the German capital will have fallen.

What then? Can the Russians, in control of such a key centre, shelve any longer the problem of the administration of occupied German territory? There will be no obvious precedent to follow. Every other enemy country has produced in the hour of defeat a government ready to collaborate with the Allies against the Germans. It is most unlikely, especially after the purge of July, that Germany can now throw up an acceptable administration ready to collaborate against the Nazis. Equally it is inconceivable that the Russians or their Allies should attempt to govern Germany without the aid of any sort of German administrative structure. What can they use to fill this gap?

There is little evidence to suggest that these urgent problems of government have already been thought out and settled on the basis of joint agreement. The European Commission may have evolved armistice terms. It is believed to have mapped out the different spheres of occupation for the three armies. But agreement on the future administration of occupied Germany is still to seek. Only if the Conference meets soon enough and works fast enough, can it still reach an agreed solution. The compulsion of time suggests that the German problem will stand at the head of the Allied agenda and that its urgency may exclude everything else.

It is practically impossible to guess along what lines a solution will be sought. Impenetrable mystery hangs over the intentions of the Foreign Office and the State Department. The hope is that the darkness covers thought and planning, and not their absence. Officially the Russians, too, have so far been silent, but they have given some hint of a policy in the use they have made and are making of their Free German Committee. Some German regiments are serving in the Russian advance, chiefly, it seems, as a sort of Pioneer Corps. If the Russians do intend to make use of their prisoners as the nucleus of an administration, are the Americans and the British satisfied with the Russian choice? Have they candidates of their own? Do they intend to suggest the inclusion of soldiers or émigrés of their own choosing? If so, they would seem to be singularly ill prepared for such a policy. It is doubtful whether any serious attempt has even been made to sift non-Nazis from Nazis in the prison camps.

Thus the British and Americans may be faced with three possibilities. They could recognise the Russian administration. Alternatively they could carry on without an administration in their own zone—a policy which would invite the most invidious comparisons. Or, again, they could set up one or two separate administrations in their own areas. This is, perhaps, the intention—a sort of dismemberment by default. Yet it may be questioned whether decisions by default are the surest way of securing a rounded and consistent policy.

If Germany is the centre of the Allied discussions—and it is hard to see how it can be otherwise—it is surely essential to reconsider the decision not to invite the French to the Conference. There is really no excuse for the omission. There can be no settlement in Western Germany with which France is not associated. When General de Gaulle said that French troops expected to occupy the length of the Rhine, he was expressing more than a national aspiration. He was reminding his British and American Allies of a pertinent fact. They talk confidently to-day of an occupation which is to last years, even decades. Yet nothing in the attitude of their soldiers suggests that a long period of garrisoning will be anything but a prolonged penance. The same difficulties do not arise with the French army. The fact that it may be negligible to-day is no reason for dismissing it as negligible in five or ten years' time. Staying power is a

vital factor in a peace settlement when it is a question of maintaining troops in Western Germany. The French have almost certainly more staying power on the Rhine than the Americans—or the British. No plan drawn up without their acquiescence can be counted complete.

Some critics of French policy since General de Gaulle's visit to Moscow support the veto on French participation for the reason that French policy for Germany is a bad policy and that in any case the French representative would simply follow the Russian lead. It is true that the French have given their support to the so-called Rhine-Oder "solution" of the German problem, but they will not be argued out of it by being excluded from international discussion of the question. Moreover to exclude them from a Big Three Conference on these grounds makes no sense at all, for there is all too much evidence to suggest that the Russian, American and British Governments are all committed to the same fatal policy. As for the fear of French reinforcement of Russian policy, if indeed this is an evil, then it is far more likely to come about if the French believe that President Roosevelt has excluded them from the Conference of the Great Powers and that Mr Churchill has made little or no effort on their behalf.

Of the three Great Powers, it is Britain's interests that will be most damaged if France is absent from the Council table. There is unhappily little realisation in this country of the fateful and overriding necessity of Anglo-French understanding. It is no exaggeration to say that in the post-war world—whether the problem be Germany or the Mediterranean or the colonies or economic recovery—the British and the French will stand or fall together. There is still in France a great store of unexpended good will for this country. But the capital is not without limit. The days will eat away the precious store if no gesture or act is made to underline British friendship. The known and eminently reasonable desire of the French to attend the Conference gave and still gives the British Government an opportunity to show its friendship and to express in the most open and forcible form its conviction that in future it can settle no European problem without the co-operation of France. Faced with so categorical an attitude it is not likely that either the Americans or the Russians would raise further objections. The opportunity has nearly slipped away, yet if, even at this eleventh hour, it could be seized, it might open a new chapter in the closer political and economic association between Britain and France.

How Many Houses?

THE national housing programme is in danger of being lost from view in a cloud of half-truths and half-policies, of doubled demands and quadrupled expectations. The subject is complex and difficult to serve up in capsule form, and it is also powerfully charged with politics. But it is not so difficult or so dangerous that it could not be explained and set in its proper perspective if the task were approached with care and candour. As things are, the public is being fed with some curious notions which, if they are not soon authoritatively scotched, will bedevil the subject for years to come. Thus there is a very simple and obvious explanation of the fact that no effective beginning has been made with the urgent matter of the Portal house—namely, that no effective end has been made with the still more urgent matter of the German war. But between the political opposition and the grand confederacy of interests who, for various reasons, fear the steel house, the impression has been given that the delay has been due to administrative bungling and that, as a result, the Portal house is dead. Or, again, Ministers who rightly emphasise the high priority that is accorded to housing in post-armistice plans conspire with the starry-eyed dreamers to convince the public that a million new houses will spring out of the ground before the sound of battle dies away. Lord Woolton tried to correct this impression in his speech at Wolver-

hampton last week; but it will take more than one speech to stop the spate of wishful thinking.

The truth appears to be that the post-war house-building programme is being very carefully prepared, and also that it is not quite ready. How carefully it is being prepared is very clearly and instructively set out in a new book by Sir Ernest Simon.* A very great deal of care has been given to questions of design, construction, materials and fittings and to the training of building labour. No less than 23 technical committees have sat and there are few corners of the whole building process that are not vastly better illuminated today than they have ever been before. A great deal of attention has also been given to where the houses should be built. But for all these technical preparations, the major decisions of policy are still to be made. How many houses are to be built? Of what sorts? By whom? And at whose expense? The delay in answering these vital questions may be due to the division of authority between the Ministry of Works and the Ministry of Health. But they have to be answered before the programme can start.

* "Rebuilding Britain—A Twenty-Year Plan." By Sir Ernest Simon. Gollancz. 256 pages. 6s. net. Sir Ernest's book is encyclopaedic in the information it contains—in fact, it is the only place where all the recent developments (including some that have not yet happened) can be easily surveyed.

The complexity of the problem is quickly revealed by even the simplest attempt to analyse it into its parts. As Sir Ernest Simon points out, there is need for a manpower plan, a building plan and a materials plan, as well as a policy for town planning. The word "plan" is used advisedly, for in each case the clearest necessity exists for some form of central direction. The manpower of the industry is now scattered and needs to be swiftly collected—though not in such numbers as merely to create an unemployment problem a few years later. The chief hope of building the necessary numbers of houses without putting a crippling burden on the state finances is by organised flow of materials and mass production of components. All these call for central direction; and on all of them Lord Woolton had encouraging things to say. But perhaps the biggest need for planning is in the planning of demand, for with a costly piece of consumer's capital like a house, completely unregulated demand may result in the most violent fluctuations. Indeed, as the experience of Scotland between the wars has shown, it is possible for there to be a heavy demand for houses without its calling into existence an equivalent supply.

But this is not an end to the complexities. For as the recent report of the Conservative Housing Sub-Committee* pointed out, there are, in housing, not the familiar two phases but three. There is the first emergency phase of repairing the damage done during the war, catching up arrears and providing a roof of some sort for every family. Then there is the intermediate programme of bringing the quality of housing up to a minimum standard by removing the twin evils of the slums and overcrowding. And finally there is the phase of replacing houses that, without being either insanitary or overcrowded, are nevertheless obsolete or obsolescent.

Much of the present discussion is led astray by the fact that, after the last war, these three phases, if they existed separately at all, called with equal urgency for large numbers of houses. The demand, whether measured by social need or by money demand, did not grow any less as the years passed—on the contrary, it seemed to grow more intense, and the peak was not reached until very nearly twenty years after the Armistice.

This time conditions are, in this respect, different. It is true that the immediate demand for houses is even more urgent this time than last owing to the much greater amount of air-raid damage. The Conservative Report estimates the accumulated deficit of houses in England and Wales, including the most urgent instalment of slum replacement and also a number of dwellings to house the five-year increase in the number of families, at 960,000. However great the pressure, however bold the

experimentation, there is no possibility of building this number of houses in less than four or five years at the very least. It is not a matter of greater or less Ministerial energy and competence, or of greater or less willingness to spend money, but, as Lord Woolton pointed out, of hard material facts such as the recruitment of labour and the re-starting of production of materials and components. Any politicians who imply the contrary are merely indulging in vote-catching. Clearly, until this first million houses have been built, until there is a dwelling for every family, they deserve all reasonable priority.

The second phase will be largely one of clearing the slums. Sir Ernest Simon detects a great rise in the national definition of a "slum"—which is technically a dwelling unfit for human habitation—and on the very scanty basis of evidence from two large cities alone concludes that one-third of all the houses in the country are now slums. This will take a great deal of swallowing. No doubt one house in three is of inferior quality. No doubt one house in three could with advantage be replaced. But to call them all slums is, by inference, to confer on their replacement an urgency almost equivalent to that of meeting the immediate shortage of the post-war years. It is to insist that the replacement of 4,000,000 houses is so important that it must take precedence over most, if not all, other objects of economic policy. This would be an immensely costly undertaking. On Sir Ernest's own minimum estimates, this programme would cost £240 million a year, of which £100 million would have to be found in subsidies. Moreover, these figures depend on two very large assumptions, namely that the general level of prices after the war will only be 30 per cent above pre-war, and that economies in methods of construction can save as much as £100 a house. The £240 million of total cost needs to be set alongside the fact that the total net investment of the British community on all forms of capital—industrial and social, productive and unproductive, machinery, transport and all forms of building—was only £305 million in 1938 at the prices of that year. And the £100 million of cost to the state has to be set alongside the very heavy burdens that have already been accepted.

In either case, the job can be done; it is within the physical bounds of possibility. But the question to ask is whether the replacement of one-third of the houses of the country within ten years is a matter of such urgency that it must have allocated to it such a very high proportion of the capital resources or of the taxable capacity of the country. And when this question is asked, the only answer can be No. To say that replacement of the "slums" at this rate cannot be afforded is not to say that there is any shortage of money; it is to say that there are plenty of other and at least equally urgent things for which manpower and materials will be needed.

Unfortunately, the Government, at the prompting of a Committee of which Sir Ernest Simon was chairman, have accepted the policy of expanding the permanent size of the

building industry to a total of 1,250,000 men. A labour force of this size means about 400,000 houses a year. At this rate, the Armistice deficiency of a million would quickly disappear, and even if the preposterous figure of 4,000,000 slum houses be accepted and the determination made to wipe them off at heavy cost in public money, they would keep the industry busy for only another ten years. By that time, every house in the replacement of which public money could on any pretext be spent would have disappeared. From that time onwards—say from about 1960—the volume of building would depend on the amount of spontaneous, unsubsidised replacement plus such small amounts as are required owing to changes in the location of industry. Sir Ernest himself admits that unsubsidised replacement is a very difficult economic operation. It will always better pay the owners of existing houses to reduce their price or rent by just enough to undercut the new house than to abandon their assets by pulling them down or letting them stand empty. No more than a trickle of spontaneous replacement has ever existed in the past, and though that is no argument against its happening in the future, the onset of a decline in the population is hardly likely to provide propitious circumstances. It will certainly not produce circumstances in which the whole country can be entirely re-built every thirty years.

In short, the Government's cardinal error has been to decide on such a very large inflation of the building industry. It cannot influence the crisis years 1945-50, because the amount of building—or at least of traditional building—that can be done in those years will be the same whatever the ultimate target. In the intermediate period 1950-60, an industry of 1,250,000 could only be sustained by an outpouring of public money and by giving building a priority over all other forms of investment, such as, for example, the very badly needed industrial re-equipment of the country. And the longer the demand were thus artificially sustained, the more complete would be the collapse, and the larger the unemployment among trained and guaranteed workers, in about 15 years' time. The present policy thus ensures a serious misapplication

of capital resources in one decade and a mass of building unemployment in the next.

It would be far better to concentrate on a much more moderately-sized permanent industry and to admit, what is in any case the fact, that the only hope of meeting more than half the primary deficiency of a million houses within five years is to produce most of them by non-traditional methods—that is, outside the building industry. The Conservative Report is entirely right in laying strong emphasis on this. Factory-made houses have to meet a formidable confederacy of vested interests—the builders who fear a permanent rival, the engineers who have other uses for the steel, and a vast number of perfectionists who, consciously or not, take the view that no house at all is better than an imperfect house. But they are the chief hope for the crisis years.

The first step to wisdom is, therefore, to reverse the decision to inflate the industry to 1,250,000. A more reasonable average size for the industry would be about 900,000 men (though even this may be on the large side). And since, as Sir Ernest Simon now agrees, some expansion and contraction of the building industry must be allowed for as an anti-depression measure, the permanent garrison of the industry should not be more than about 700,000. To keep even these numbers employed would require a large subsidised replacement programme, which should be divided into two parts. The worst houses, the real slums, should be cleared by a steady programme, while the less urgent cases, the near-slums, should be held in reserve for clearance as an anti-depression measure. The total number of houses built in the decade 1950-60 would doubtless be fewer than Sir Ernest Simon's 4,000,000. But they would be enough to meet all really urgent needs; and they would leave some demand for houses over to sustain the industry in its very difficult decade of the 1960s.

If this is the size and shape of the programme, the other major issue to be settled is the financial means by which it is to be carried out—in other words, the form of subsidy required. This must be left for a second article.

The Second Austrian Republic

WITH Budapest virtually in Russian hands, the battle for Austria will not be long delayed. The Russians have already appealed to the Austrian people to form Committees of National Liberation and to strike at the rear of the German forces. The immediate effects of such appeals may not be great; but they show that political warfare is playing a part in the fight for Austria. The basis of this appeal is the view that Austria is a subjugated country, and not part of the Reich. Such an approach first appeared in the declaration on Austrian independence issued on November 1, 1943, by the Three Powers at the first Moscow Conference. Unfortunately there is little evidence to show whether or not the general principle of independence has been translated into specific plans. If Austria is not to be treated as a province of Germany, will the military occupation of the country be of short duration? Will an independent Austrian administration be set up soon after liberation? If so, on which political groups do the Allies intend to base it? Have any attempts been made to bring together the representatives of the Austrian political groups in exile and to discuss with them the regime which is to be established in Vienna?

To a large extent these decisions will tend to be taken by the Power which first occupies Austria. The present military situation suggests that Russia will be that Power; and that the Russians may, therefore, assume the chief responsibility for the Austrian settlement. Yet earlier reports spoke of an agreement between the major Allied Powers on a joint occupation of the country. Whatever the present strategic circumstances, a joint occupation seems to be the more likely solution. Austria's position at the cross roads of Europe will certainly compel all the major Powers to interest themselves in its fate. The only sound solution would, therefore, be a joint agreement in

advance among the Allies on the shape the settlement will take.

The Allies' declaration that the restoration of Austrian independence is one of their war aims does not alter the fact that on the morrow of liberation Austria will have none of the attributes of sovereignty. No change of Government similar to those which have taken place in Budapest, Sofia, Bucharest or Rome can take place in Vienna; there can be no continuity of Government either with the Nazi administration or the old independent Austrian Government which preceded it.

This negative aspect of the problem—the lack of government—is obvious and raises no great controversy. It is much more difficult to answer the positive question: what sort of government can be installed in Vienna? Like most continental exiles, the Austrians are discussing which of their governments was the last legitimate and constitutional government. Austria's sovereignty was extinguished in March, 1938, when the Germans entered Vienna. On the face of it, the restoration of Austria's independence ought to mean a plain return to the *status quo* of 1938. Right Wing and Conservative opinion in Austria, in so far as it has not followed the Nazis, will certainly stand for this solution. On the Left the view has been advanced that a return to 1938 will not do. The Austrian Socialists regard the "Dollfuss interval" or the "Clerico-Fascist" system that prevailed in Austria from 1933 to 1938 as anti-constitutional and illegitimate. They demand a return to the *status quo* of 1933, in other words, to parliamentary democracy based on the constitution of 1920. From a strictly formal and legal viewpoint, Allied diplomacy may be inclined to go back to 1938 and to link up the threads of Austrian independence at the point at which they were actually severed. In spite of its failures

and eventual bankruptcy, the Dollfuss regime did preserve Austria's formal independence until 1938. On the morrow of liberation, however, the controversy will certainly sound like futile constitutional hair-splitting.

The system which, under Dollfuss and Schuschnigg, lasted from 1933 to 1938, was based on a relative balance of forces between the Nazis and the Socialists. The Nazis were still too weak to gain power, while the Socialists were no longer strong enough to exert the dominating influence which was theirs under the democratic Republic. This gave the Heimwehr the chance to gain authoritarian control over the country and to drive both Nazis and Socialists into a somewhat unreal underground. The Heimwehr has long since been swept away; and to a large extent it has been absorbed by the Nazis. The alignment of political forces on the morrow of Austria's liberation will be very different from its last days of independence in 1937 and 1938. The Austrian Socialists are probably not over-optimistic when they hope for an ascendancy of the Left, at least immediately after the war. Whatever the legal subtleties of the issue the popular mood in liberated Austria will probably demand a return to the democratic forms of the pre-Dollfuss period. It is for this reason, too, that the Monarchist plan to restore the Austrian throne to the Habsburgs seems quite hopeless.

But what will an ascendancy of the Left mean in liberated Austria? Before the *Anschluss*—the union of Austria with Germany—the Austrian Labour movement was only very slightly affected by the split between the Socialists and the Communists—the Communists were a tiny sect and the Socialists spoke for the whole of the Labour movement. The fact that they were defeated by the Heimwehr in February, 1934, probably did not diminish their moral standing with the Austrian working classes; on the contrary, the fight itself, which contrasted so sharply with the sad passivity and capitulation of the German Left, surrounded the party of Otto Bauer and Julius Deutsch with a halo of heroism. The new prospect of strong Russian influence in Austria may, however, make it more difficult for the Socialists to take the lead. Their differences with the Communists may become more serious; although the Austrian Socialists were counted among the Left in the second International, they always insisted on their political independence *vis-à-vis* Moscow. In exile the controversy between Communists and Socialists has grown bitter, with the Communists laying stronger emphasis on Austrian nationalist feeling and coalescing with the Monarchists against the Socialists. In liberated Austria such a coalition may, perhaps, turn the balance against a revived Social Democratic Party.

Other reasons, too, will make the return to the *status quo* extremely difficult. The Austrian administration has been thoroughly nazified; and it will be a formidable task to reverse that process. In a recent statement on the second Austrian Republic,* the Socialists outlined their programme for a purge in Austria's administration and economy. The problem that arises here is how to eliminate Nazi influence from the life of the second Republic and yet maintain the Republic's democratic character. Can a strong and influential body of opinion be put beyond the political pale without detriment to the working of a democratic system? On the other hand, can any democratic system be made to work at all, if the cadres of the Nazi movements—and they are by no means a small minority—are not rendered harmless? The dilemma is not confined to Austria; it is admittedly a European problem. It has already caused much trouble in the liberated Allied countries; and in the sharpest and most tragic form it will arise in Germany itself.

These are some of the problems that will exist immediately after liberation. In the long run, however, the really fundamental question is whether Austria will finally be content with the restoration of its independence. Will the

* *Die Zweite Republik Österreich*. By Karl Czernetz, Oscar Pollak and W. Rosenzweig. London, 1944. Price 1s. 6d.

demand for an *Anschluss* not be raised again in the future? May it not in time disrupt the second Austrian Republic, as it disrupted the first? Immediately after the war the question may not be very urgent. The first reaction to the experience of Nazi rule and government from Berlin will, in all probability, be a strengthening of Austrian national feeling as opposed to pan-Germanism. Strong opportunist motives will also induce Austrians to opt for separation from Germany. As an independent State, Austria can at least formally disclaim responsibility for Germany's record in the war. It would clearly be inconsistent on the part of the Allies to regard the Austrians as having been a subjugated nation and also to demand reparations or indemnities from them. Austrian politicians who would otherwise perhaps be inclined to be rather sceptical about "Austrian nationhood" may, therefore, still regard independence as a convenient protection against the rigours of the peace settlement.

But the issue transcends opportunist and temporary calculations. The demand for the *Anschluss* is much older than the Nazis; it is likely to survive their collapse. Throughout the nineteenth century it was the Progressives, Liberals and Socialists who preached union with Germany, a union that was then obstructed by dynastic interests in the various German-speaking countries. After the collapse of the Habsburg monarchy in 1918, the Socialists were the flag-bearers of the *Anschluss*—the Socialist Otto Bauer framed the resolution for an *Anschluss* at the first session of the Austrian Constituent Assembly in 1919. It was only when the *Anschluss* came to mean the absorption of Austria into a nazified Germany, that the Austrian Left opted for independence.

At present, uncompromising advocacy of Austrian separatism comes from the Monarchists and the Communists, while the Catholics and the Socialists seem more cautious in their approach to Austrian "nationhood." Socialists in particular seem to be confused on the issue. Their most prominent leader, Fritz Adler, has in commenting on the Allied statements on Austria's independence made some strong reservations. His view is that Austria ought to be granted the right of self-determination, which is the right to choose between *Anschluss* and independence. Other Socialists, headed by Oscar Pollak, seem to have accepted the gift of independence without reserve, but not without misgiving. It would certainly be a mistake to expect that, when the memories of the war and of Nazi rule have faded, a non-Nazi Germany will offer no attractions to Austria.

Sooner or later the Austrians will find that economically and politically they cannot stand alone. A customs union, if not a federation, between Austria and its Danubian neighbours—Hungary, Yugoslavia, Czechoslovakia—might be a possible alternative to a new *Anschluss*. It might revive in a republican form an economic unit that existed under the Habsburgs. But, so far, Russian policy has vetoed projects of Eastern European and Danubian regional federations; and Allied policy seems to have tacitly accepted this veto. Yet the "Neither-*Anschluss*-nor-Federation" attitude offers no positive and constructive solution to the Austrian problem.

In the years between the wars the lack of a practical solution to this dilemma made Austria a storm centre of European politics. As long as the former Central Powers lay prostrate after the defeat of 1918 the Western Powers insisted on the letter and the spirit of every provision and prohibition made in the peace treaties. Mild and peaceful attempts by Austria to enter into a customs union with Germany were effectively resisted and frustrated. Yet, when the *Anschluss* was achieved by force, Allied policy was paralysed and helpless. Will these mistakes be repeated after this war? Sovereignty, without a larger political and economic framework, can be a strait-jacket in which the Austrians find not independence but strangulation. The Allies have the chance in 1945 of rectifying the false settlement of 1919. But the evidence at the moment suggests that they will repeat it.

NOTES OF THE WEEK

The German Retreat

In the three weeks since their break through on January 12th, the Russians have freed western Poland, overrun the German provinces east of the Oder, and in certain areas are already across the river. It is doubtful at the time of writing whether Marshal Zhukov's powerful drive on Berlin can be halted. The speed and depth of the Russian attack have been such that it cannot have failed to create the wildest disorder and confusion. Even though details are lacking, it is known that a tremendous trek of German civilians is taking place. The pre-war population of East Prussia, Pomerania and Silesia to the east of the Oder amounted to about seven and a half millions. To this must be added the Germans who lived in Western Poland and those who were evacuated to eastern Germany during the bombing of the western provinces. The figure before the Russian attack may have been as much as 10 million.

It does not seem that the men have been removed. Boys and old men, workers and civil servants have almost to the last man taken their place in the fighting fronts. Soldiers from rear establishments of the Wehrmacht, the police, men of the *Volkssturm* battalions, and the so-called *Landwacht* are being widely used for defence. Big towns like Breslau and Königsberg have been changed into military strong points, closely invested by Russian armies.

It is obvious that the mass evacuation of the provinces east of the Oder has created severe congestion in Berlin and other places in central Germany. The direction of foodstuffs to new areas of consumption, the need for rush transports of military reserves and supplies must have created extreme difficulties, the extent and importance of which can only be guessed at this moment. So far no panic has been reported. Gauleiters in their capacity of regional Defence Commissars and other regional and local Nazi Party officials seem to have acted with ruthless speed and efficiency in clearing refugees off the roads and trains in order to make room for military transports. Civil servants who tried to leave their posts have been publicly executed, and there is no doubt that special police with considerable experience in these matters have so far been able to prevent chaos and panic. But the margin between order and collapse must be narrow, and will grow narrower at each Russian advance.

Swan Song?

What a poor creature after all is this Hitler. And how bankrupt the political concepts underlying National Socialism. On January 30th, the twelfth anniversary of his advent to power, Hitler and his Reich faced the supreme crisis of their existence. Such crises commonly bring out what is deepest and truest in a regime. In 1940, Mr Churchill's eloquence put new heart into embattled Britain. We would fight them on the fields and on the hills and on the beaches, he said, evoking in every Englishman the determined pugnacity born of profound patriotism. In 1941, during the Battle of Moscow, Marshal Stalin, remaining in the threatened city, spoke with confidence of Russia's inexhaustible reserves and prophesied in the teeth of defeat "Therefore our army must win and will win. The German army must be defeated and will be defeated."

Hitler at the microphone on January 30, 1945, had nothing to say about the fighting. The titanic struggle in the east was barely mentioned. He had no word of confidence to give the Reich. His only theme, apart from the stalest repetition of all the old Nazi folklore—Jewry, the stab in the back and so forth—was the threat of Bolshevism.

The bourgeois world is completely unable to put up an effective resistance against bolshevism... the democracies will not be able to rid themselves of the evil spirits they have called from Asia's steppes.

For positive encouragement he offered his people the choice between a fight to the death or death for surrendering. Negative and destructive to the last, National Socialism in its final epitaph offers its people bogies, nightmares, terrorism and sudden death.

Free Generals

The Russian sponsored Free German Movement is still something of a puzzle. Originally it emerged from the

obscurity of exiled Communist circles in Moscow, and its rôle was confined to making routine propaganda in German over the Russian wireless. The flag of Free Germany was then still supposed to be red.

A new glamour accrued to the Free German Committee when, after the victory of Stalingrad, its leadership of "proletarian poets" was pushed into the background by generals from the Wehrmacht, authentic, true blue Junkers with General von Seydlitz at their head. Two more colours were added to the red flag of the Free Germans, and soon the Imperial black, white and red and Imperial emblems adorned the Free Germans' gatherings, held a stone's throw from the Kremlin. Their appeals to the Germans were more and more addressed to Conservative and Nationalist sentiment in the Reich. Little attempt was made to revive memories of the old German Labour Movement. The Free Germans have not called on the mighty names of Karl Marx and Friedrich Engels, who with Lenin are now almost regarded as the Russian forbears of Marshal Stalin.

With the recent accession of Marshal von Paulus, the Committee undoubtedly acquired a more serious standing, and a few weeks ago it was able to issue a Manifesto to the German people with the impressive signatures of fifty German generals. Even so, the Committee has so far been little more than a body of propagandists. Only recently have rumours appeared to the effect that a Provisional German Government under Marshal von Paulus is about to be set up and that regiments of German prisoners of war organised into a Pioneer Corps have been advancing westwards in the wake of the victorious Russian armies. It is quite probable that the Free Germans will now be assigned some political tasks wider and more responsible than straight propaganda. The Kaiser has gone, Hitler seems to be going—will the generals stay once again?

Confused Evidence from Greece

The issues in Greece have not so far been disentangled either by Sir Walter Citrine's mission or by the publication of the Government's White Paper (Cmd. 6592) on the Situation in Greece. Both Sir Walter and the Government give convincing proof of the existence of atrocities, which the critics of the Government's policy have at no time denied. The White Paper states that the responsibility for the Civil War rests with the Communists, who, long before the fighting, were conducting a reign of terror in Greece, and who have now lost the support of any other Left Wing political group.

Here, however, the evidence of Sir Walter Citrine does not tally with that of the Government. When he visited EAM headquarters at Levadia, he found there the established trade union leaders, M. Kalomiris and M. Theos, the Socialist leader, M. Stratis, and M. Marolis, the former secretary of the railway workers' union. These men denounced M. Dimitriou and the other trade union leaders appointed by the Plastiras Government as puppets and Metaxists; they also denied categorically that either the Socialist Party or the ELD (Union of Popular Democrats) had broken away from EAM.

The situation is clearly not as simple as Mr Leeper's telegrams suggest. At all costs, there must be no question of the British supporting a Government of the Right from which the genuine popular forces of the country—and of the Resistance—are excluded. Mr Leeper admitted that "Red Terror easily leads to a White Terror," and, ominously, reports now come from Athens of the mutiny of the Right Wing parties under Monarchist leadership. The Regent may be a guarantee of impartiality, but clearly, as Mr Leeper himself suggests, the British Government must exercise the utmost pressure to secure liberal treatment of the Left. The best step the Greek Government could now take would be to prove the truth of its statements on the break-up of EAM by including in the administration the moderate Socialist and Democratic leaders who are reported to have split away.

Air Policy Debate

The Government's policy for civil aviation is gradually getting under way. A lively debate in the Commons last Friday looked back with general approval to the achievements of Lord Swinton at Chicago and at Montreal. Even more, the House looked forward to the further tasks before the new Minister. A working separation of civil aviation matters from the Air Ministry is already in existence. The final divorce will come with a formal Bill, soon to be introduced. Except for the very necessary appointment of a competent Under-Secretary to speak for Lord Swinton in the Commons, the stage is set for a rapid attack on the fields of Government policy so far undefined.

Much the most debated question is that of the new *dramatis personae* of civil air transport. On this, Sir Stafford Cripps promised the House, Lord Swinton was now working, and a report of his progress would soon be submitted. His decision is not an easy one with so many different opinions to reconcile. In the new national organisation, BOAC may well suffer a sea-change and may be obliged to relinquish some of its exclusive rights. A compromise solution is clearly probable. The transition period requires some central control and organisation to take over where purely military transport leaves off. At the same time, the over-riding need to expand British air services to every part of the world makes it impossible to refuse the offer of shipping and railway interests to operate overseas routes without subsidy. Neither private enterprise nor a chosen instrument can therefore be given an exclusive right in the immediate post-war development of civil air transport.

More important than the content of the plan, which in any case must come up for review as conditions become more settled, is the speed with which it is submitted, discussed, and put into operation. Lord Swinton's reported determination to allow no criterion save that of efficiency and service to the public in his choice of policy is encouraging. There will undoubtedly be, as there has been in the past, considerable pressure (particularly in the House of Lords) exerted by shipping and railway interests, for example, to get more than a fair share of the cake. The new Minister may have a hard time resisting these and other pressures, and it is good to hear that he is determined to do so.

OTA

The White Paper (Cmd. 6589) on the work accomplished by the Occupied Territories Authority from 1941 to 1943 gives the impression of good and remarkably inexpensive stewardship. Administering British and Italian Somaliland, Eritrea, Cyrenaica and Tripolitania all the time and Ethiopia and Madagascar for part of it has cost the British taxpayer a deficit of only £3,500,000. The reason is probably that nothing more than a day-to-day administration was attempted, the officials relying on local stores and supplies and foodstuffs, working only those enterprises which contributed directly to subsistence and undertaking none of the development schemes which eat up capital. Even so, it seems remarkably cheap.

It cannot be said that the Report points to lessons or experience which will be useful elsewhere. In the main, it is concerned with the administration of Italian colonies. In Italian Somaliland and Cyrenaica, the Civil Affairs officers were able to work to some extent through the local Arab tribal structure and the customary of British colonial practice of indirect rule has been employed. In Eritrea and Tripolitania, however, the problem could not be solved in these terms. The population tended to be concentrated in large towns, the Italian administrative machinery broke down, yet an important Italian colony remained. These colonists were removed from Italian East Africa—some 46,000 of them; in Tripolitania they remain. In Eritrea and Tripolitania, therefore, OTA has had to provide a new administration, helped in the case of Tripolitania by the natives, the Italians and the Jewish community alike.

If the Report throws no light on other experiments in occupation, it at least brings to the fore some troublesome questions of future policy. The economic advantage to East Africa, if Ethiopia, Eritrea and the Somalilands are administered as one area, stands out clearly in the Report. Abyssinian independence bars such a unity, unless it can be achieved through some loose federation. On the Mediterranean coast the chief problem is the poverty of the Italian colonies and their dependence upon outside supplies. Is any Power except Italy interested enough to make them a going concern? And this leads to the final problem.

What is the future of all these Italian colonies? The Senussi in Cyrenaica have been promised that the Italians will not return. The fate of the other colonies has yet to be decided, but the decision cannot be indefinitely delayed.

* * *

More Money for the Colonies

The promise in the King's Speech that more money would be granted for colonial development has been fulfilled in a new Colonial Development and Welfare Bill presented to Parliament this week. At present, £5,000,000 is made available each year, but if—as has been the case—the amount is underspent, the balance has to be returned to the Treasury. Under the new proposals, a total sum of £120 million is to be made available over the ten-year-period ending March 31, 1956; the annual ceiling will be £17,500,000, but if it is not reached, the balance will be carried forward instead of returned. This will enable the colonies to undertake long-term development schemes instead of confining themselves to small projects whose cost can be clearly estimated in advance. Moreover, the annual grant for research has been raised from £500,000 to £1,000,000.

The new Bill is thus a considerable improvement on its predecessor. But the old doubts about the efficacy of this sort of fund in raising the colonies' standard of living remain. From the point of view of welfare—for building schools and hospitals—it is excellent. But for achieving a big expansion in colonial wealth something more positive is needed than a fund which is passively drawn upon as occasion arises. A way still has to be found by which the right of colonies to work out their own development can be combined with the positive application of capital on a large scale and over wide areas covering, if necessary, more than one colony.

Another difficult question is the maintenance of the schemes that are carried out. The grants are for capital expenditure, and the colonies are expected to maintain the works, once built, out of their own resources. It is true that permanent subsidising of colonial expenditure is in-

THE WISDOM OF MAKING A WILL

Unless you make a will the provision for your dependents may be different from that which you had intended. Several reasons, including unwillingness to place the responsibility of executorship upon the shoulders of an intimate friend or relative, who may pre-decease you, may have caused you to defer completing plans for the future.

No need exists for further delay, since you can appoint this Company as executor and/or trustee, either solely or jointly with your wife or husband, a relative, or a friend, and thus be assured of continuity of administration and of security. You are invited to ask any branch manager of the Bank for particulars of this service. Alternatively, you may apply to one of the Company's own offices at the following points:

Head Office: Poultry, London, E.C. 2.
Branches: 70 Pall Mall, London, S.W. 1,
and in Bangor, Birmingham, Bournemouth, Brighton, Bristol, Carlisle, Hull, Leeds, Leicester, Liverpool, Manchester, Newcastle-on-Tyne, Nottingham, Oswestry, Sheffield, Swansea and Torquay.

MIDLAND BANK
EXECUTOR & TRUSTEE COMPANY
LIMITED

compatible with an advance towards responsible government, but what is the use of providing the colonies with schools and hospitals if they cannot support enough teachers and doctors? A possible solution would lie, as *The Economist* has advocated before, in transferring the cost of the salaries and pensions of the unified colonial service to the Imperial Exchequer. This reform would set free considerable resources for local needs, and the establishment of the new Colonial Development and Welfare Fund would be a suitable occasion for putting it into effect.

War Crimes Dispute

It is really rather unfair that Mr Herbert Pell should have managed to persuade some sections of the American press that dirty work is afoot in the Allied War Crimes Commission. The statements he has made since Congress refused to renew the appropriation for his expenses suggest that he has been fighting an uphill fight to bring the German Gestapo to justice for their crimes against Jews, Liberals and Christians and has been foiled by British and American officials who, one must infer, wish the murderers of these innocent Germans to go unscathed.

The real point at issue is not, however, the intentions, sinister or otherwise, of the Foreign Office and the State Department. It is the actual terms of reference laid down for the War Crimes Commission. The declaration made at Moscow in November, 1943, established its agenda—to examine the evidence against German officers and officials guilty of crimes against the peoples whose countries they have occupied. Where such a crime can be proved, the guilty Germans are to be extradited back to the scene of their crime and there tried according to the laws of the land. It was recognised, however, that such a procedure would not cover Hitler, Goering, Himmler and other guilty leaders. It was therefore laid down in the same declaration that

those criminals whose offences have no particular geographical location will be punished by a joint decision of the Governments of the Allies.

It is thus clear that the category of crime Mr Peel wishes to deal with—offences committed by Germans against Germans in Germany—does not fall within the Commission's prescribed terms of reference. The right course for Mr Pell should therefore be to agitate for a new Commission or for wider terms for this Commission. It helps neither Allied understanding nor the cause of justice to suggest instead that somebody, somewhere and for some reason is out to condone German crime.

Jugoslav Reconciliation

The conflict between King Peter of Yugoslavia and Marshal Tito seems to have been patched up by the re-appointment of Dr Subasitch to the post of Prime Minister and by the King's recommendation that the new government put into effect the Subasitch-Tito agreement. King Peter has not altogether withdrawn his objections to the agreement; but he has decided not to raise them in a categorical form which would make co-operation between the Royal Government and the National Committee of Liberation impossible. He has also handed over his powers to a Regency Council whose members are still to be appointed. Whether the agreement will really ease the tension in Yugoslavia will now depend on Marshal Tito's willingness gradually to dismantle the single party system which he has built up under the strains and stresses of the war. The economic and political plight of Yugoslavia is so desperate that all parties should now feel the obligation to put first things first and concentrate their efforts on the immense tasks of reconstruction.

An Industrial Health Service

One of the most controversial statements in the White Paper on the health services is the definition of "comprehensive," which, in the Government's proposals, covers all kinds of personal health treatment, but excludes both the school medical service and the industrial health service. The exclusion was possibly dictated by administrative expediency—by the wish to avoid overloading the Ministry of Health before the minimum of a personal health service was properly established—but, whatever the reason, it is hardly logical for the state to provide a health service for people at home, and to ignore them while they are at work, or, if

a national industrial health service is set up, to make it responsible to a different Government department. As the Social and Preventive Medicine Committee of the Royal College of Physicians points out in a second interim report, the general practitioners, who will be in the front line of the proposed national health service, will also be the main body of the industrial health service, and difficulties would be bound to arise if they came under two separate departments.

The Committee outlines a plan for an industrial health service which would be comprehensive indeed, for it would include not only the 250,000 establishments covered by the Factories Act of 1937, but mines and quarries, offices and shops, hotels and catering organisations, transport services, and even agriculture and fisheries—"in fact, any place of work except when that work is done at home." The aims of such a service show clearly that there would be no overlapping between it and the personal health service. It would promote the general health of the worker by providing a good working environment, and fitting the worker into that environment; prevent occupational disease; assist in the prevention of injuries; organise and supervise a service for the emergency treatment of injured and sick workers at their place of work; take an active part in the rehabilitation and resettlement of disabled workers; undertake health education among the workers; and promote research and investigation.

The difficulty about putting this ambitious scheme into force is the enormous staff it would require. For instance, there are at present about 200 whole-time and 700 part-time works doctors, almost all of the former being attached to the big factories employing over a thousand workers. But in peacetime, as the Committee points out, more than half the workpeople of the country are employed in factories with less than 250 operatives, and if they, together with all other workers, are to be provided with adequate medical supervision, there will have to be an enormous increase in the number of works doctors. Moreover, to suggest that these should for the most part be general practitioners, with special training in industrial medicine, who would work part-time in the industrial service, is no solution, for it is generally recognised that there will be barely enough GPs to staff the personal health service alone.

To begin with, therefore, it might be as well to concentrate on a few of the essentials of an industrial health service. It should certainly form part of the national health service, because a single administration would economise manpower by allowing more elasticity in the different parts of the service, and also—a simple but important point—by reducing the number of forms and certificates a doctor would have to fill in. Secondly, since there are already the beginnings of a national scheme of rehabilitation and resettlement, it should be extended and expanded as quickly as possible. Thirdly, research into occupational disease and its prevention should be undertaken on a wide scale, and a beginning should be made with the placing of workers in jobs suited to their aptitudes. Even if the more general aims of an industrial health service have to wait until there are enough doctors to staff it adequately, much could be done at present which would bring a large reward in improved industrial efficiency.

The ILO Meets

The governing body of the International Labour Organisation reached several conclusions in the course of its meeting which came to an end on Wednesday. Perhaps the most important and practical of these was the decision to set up immediately seven international industrial committees, on a tripartite basis, for the transport, mining, iron and steel, engineering, textiles, oil and building industries. The principle of industrial committees had been agreed at Philadelphia in April, 1944, and the task of the governing body was to prepare the details of the machinery, and to decide on whether they should be bipartite or tripartite. The employers, who wanted them to be purely employer-worker bodies, found themselves outvoted by 21 to 8. If these committees are to have any practical value, it is obviously desirable that Government representatives should be included, in order to hold the balance between the two sides, and to lend greater weight and authority to their work.

As usual with ILO meetings, the main interest of the proceedings centred upon the constitution and future of the organisation itself. Sir John Forbes-Watson, the British employers' delegate, threw a few carefully chosen stones into the millpond of complacency, when he urged the ILO to face facts, and not to try to run before it could walk. He

illustrated his point about the lack of responsibility on the part of certain members by the fact that out of 67 conventions drawn up between 1919 and 1939, 50 per cent of all the countries had ratified fewer than five conventions, while Great Britain, with 34 ratifications to its credit, topped the list.

His proposal that the adoption of certain minimum standards should become a condition of admission to the ILO deserves careful consideration. But any tendency to make the ILO an exclusive club for the higher standard countries would defeat the objects for which the organisation was formed, and there is much sense in the workers' argument that the fact of membership of the ILO represents a powerful lever for enforcing minimum standards on recalcitrant or reactionary governments. What is needed, if the ILO is to perform the very large tasks which it is setting itself, is a policy which will suit at the same time the hard-headed realism of the Forbes-Watson school, and the aspirations of the South American workers, expressed at the governing body's meeting by Senor Lombardo Toledano, the Mexican labour leader.

World Labour in Conference

World labour is having a busy time. On the heels of the ILO governing body, the International Federation of Trade Unions met on Thursday, and next week the postponed World Trade Union Congress is taking place. This Congress will be the most important gathering of world labour ever held, and will represent over 40 million organised trade unionists. It will include delegates from all the Allied countries, and several neutrals, while the British Empire will be strongly represented. Countries which will not be represented include Italy, Finland, Spain and Greece, while the American Federation of Labour has refused to attend, because of the presence of CIO and Soviet trade union delegations.

Both the IFTU and the World Congress will be primarily concerned with the restoration and reorganisation of the international trade union movement, but there will be differences in their approach to the problem. The IFTU, in which the AFL is powerfully represented, is likely to press for a reconstruction of the present organisation, which excludes the Russians and the CIO, while opinion at the World Congress will be overwhelmingly in favour of an entirely new worldwide organisation, in which presumably Britain, Russia and the CIO, by virtue of their membership, would play leading parts. The fact that the British TUC is a member both of the IFTU and of the World Congress, and that its formal relations in America are with the AFL but not with the CIO, will place a certain strain on the diplomacy of British trade union leaders.

The reconstruction of the international trade union movement is not a remote problem, but one of burning topicality. The restoration of free and democratic trade unions in liberated countries is a complicated matter, as Sir Walter Citrine is finding out in Greece. It is obviously desirable that the world organisation should be as comprehensive as possible, and the greater its organisational strength, the better its position will be to assist the development of trade unions in weaker countries. Within the general framework, special committees, such as the revived Anglo-French trade union committee, which has just completed its first meeting, can do much to promote trade unionism, but they are no substitute for a vigorous world organisation.

The Great Freeze

Major Lloyd George obviously could not be blamed for the weather, the coldest for 50 years, nor for the conversion of the whole countryside into a Breughel landscape. Railway locomotives were frozen up, Welsh ports became un navigable, many pits had to close down, and many miners were snowbound, horses could not be used for deliveries because of the icy roads, and patches of fog added to transport difficulties—these facts might properly be described as "circumstances outside the control" of the Ministry.

Now that the Great Thaw seems to be setting in, the difficulties of transport may automatically be solved, and Major Lloyd George can breathe again. But the fact remains that the long spell of exceptionally cold weather and the shortage of labour endangered the whole structure of distribution.

It is useless to repeat now that a system of fuel rationing, introduced in 1942, and operated during the two last relatively mild winters, might have saved the situation, but it seems equally pointless to exhort people to save coal to-day, when so many people have no coal to save. The position is particularly acute in the London area, which has been the most heavily bombed, and where 400,000 homes, because they have no storage space, rely on their coal merchant's weekly visit for their hundredweight of coal. The merchants who are responsible for distribution find it more possible to deliver in bulk to hotels, offices and so on, rather than small lots, and the result is gross inequality.

What is surely needed is an immediate plan for the pooling and zoning of supplies, under which the Government would control all the coal coming into London (or provincial centres), would organise the pooling of transport and manpower, enlisting soldiers, civil defence workers and, if necessary, the Home Guard, on an emergency basis, and arrange a system of registration for coal from its dumps, so that the limited supplies would be more fairly distributed among the civilian population.

Gas and electricity consumption is in a rather different category, and both can be controlled at source. Electricity consumption has increased by 50 per cent over pre-war, and gas consumption by about 13-14 per cent, and it is clear that both domestic and industrial users should exercise maximum economy. Firms have been asked by the Minister of Production to cut down their consumption by 10 per cent, but if voluntary appeals fail, Mr Lyttelton has said that directions will be issued and prosecutions for non-compliance would be instituted. So far, war production has not suffered, and this must clearly have first priority. But it is important that as far as possible cuts of electricity and gas should be exercised in as equitable a manner as possible, and avoid minimum interference with hospitals and similar institutions.

Chinese WPB

The opening of the Ledo Road should bring some relief to the difficult supply situation in Free China. It is hoped that the Calcutta-Kunming pipe line will soon be in use as well. Together they will to a small extent compensate for the loss of 80 per cent of China's industrial resources and communications. Hitherto the best that could be done to supplement the thin resources of free territory was to import about 30,000 tons of goods a month by plane over the hump from India. Even so, the supplies very often remained at Kunming for weeks before they could be distributed. Free China has only 6,000 lorries, most of them three years old.

More could in the past have been done with the mineral reserves and industrial resources in free territory, but the financial confusion and incompetence of Chungking prevented full use being made even of the resources which were available. Now, however, there is hope that a new mobilisation of effort will double and treble production in the course of the year. On his return to China in November, Mr Donald Nelson persuaded the Chungking Government to set up a War Production Board, and in liaison with the High Command, this new board worked out a firm ordinance plan for the Chinese armies. It arranged for a loan of ten billions in Chinese national currency from four big banks, and accepted an American technical mission of six experts, five on iron and steel, one on alcohol. These men are spending three months touring the industrial plants and advising on improvements and costing.

All this new activity may lead to better supplies, more efficient armies in the field, and to a growth of confidence and enthusiasm among Chungking's followers. At the same time, it will give the United States a growing stake in the stability and prosperity of the Chungking regime. As Mr Nelson put it in his Report to the President—

The success of China's venture in planned war production, if properly followed up through American Government and business channels, will make for close post-war economic relations between China and the United States.

Newfoundland's Future

There has been so much constitutional progress in the dependent Empire during the war years that the position of Newfoundland is particularly disappointing. When it lost its Dominion status, in 1933, the Imperial Government gave a pledge that responsible government would be restored as

soon as the island was self-supporting again and provided that the people of Newfoundland requested it. During the war the island has become, financially, self-supporting in the sense that, in addition to paying its way, it has also lent some £2,000,000 free of interest to Great Britain. But not only have the Newfoundlanders not requested a return to responsible government, they are apparently quite apathetic about their future.

At various times in the last two years the Government has been asked in Parliament for a statement on the future of the island, particularly after the goodwill mission of three Members in the summer of 1943. Last May, Lord Cranborne stated that machinery would be set up in readiness to enable the Newfoundlanders, as soon as the German war was over, to express their views on the sort of government they want, and the Newfoundland members of the Commission of Government came over to discuss the matter with him in the summer. This week, however, Lord Cranborne gave a most disappointing progress report. He said that the continuance of the war in Europe had made a readjustment of the timetable necessary, and he was unable to say even what sort of machinery will be set up.

It is quite true that Newfoundland's present prosperity is artificial, being based on wartime conditions, and that, as Lord Cranborne said, its economic prospects after the war cannot at present be assessed. It is also true that when Newfoundlanders express an opinion at all, they are virtually unanimous in not wanting a return to the sort of government they had before 1933. But Lord Ammon, one of the members of the goodwill mission, also found "a vague but healthy desire for some form of increased representation."* The political apathy and the unpopularity of the present Commission of Government arise largely from the latter's complete dissociation from the people. It has done some excellent things, and, according to Lord Cranborne, it is going ahead with reconstruction schemes, for which it has ample funds. But it is difficult not to feel that a stronger attempt should be made to give the Newfoundlanders better representation in it and in its work.

Agriculture and Shipping

Mr Tom Williams, Joint Parliamentary Secretary to the Ministry of Agriculture, speaking at Liverpool on Tuesday, reconciled the interests of agriculture and shipping in a totally unconvincing way. The claim that higher agricultural wages would help shipping by raising the demand for imports is true only if such a pledge does not involve an equal or greater loss of purchasing power by the rest of the community. But Mr Williams's worst mistake was his apparent identification of a prosperous agriculture, which is certainly desirable, with a large agriculture, which is equally certainly not—least of all from the viewpoint of shipping interests.

His argument for an enlarged agriculture is based on a defeatist attitude towards export trade. In contrast shipping prosperity rests on a high level of exports; any policy failing to recognise this and seeking relief from export problems by working for self-sufficiency in Britain does the shipping industry real disservice. Perhaps realising this awkward implication, Mr Williams attempted to prove as well that the margin between home and overseas food prices will not be large. Two of the measures he suggested—guaranteed markets and "reasonable" prices—will do nothing to narrow it. Nor will this margin be narrowed by the suggested possibility that overseas agricultural producers and workers will insist on higher remuneration for their efforts; for similar claims have already led to the wartime doubling of farm wages, and it is generally and rightly agreed that their present level should be at least maintained after the war. The best that can be hoped from this factor is that its effects here and overseas will cancel out.

* "Newfoundland. The Forgotten Island." By Lord Ammon. Fabian Publications, Limited. 1s. net.

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so before the date of expiry. If they fail to do so, their subscriptions will be automatically cancelled as soon as that date is passed, and this may mean a gap of many months before the despatch of copies can be resumed.

Scientific Research in India

Not the least important obstacle to a planned economic development for India will be the dearth of sufficient trained people to guide industrial and agricultural progress. Factories, machines and irrigation works will not by themselves provide the means to raise the country's national income. Besides the training of skilled workers to operate mechanised production, there will be the much more difficult problem of organising scientific research on a large enough scale.

A report by Professor A. V. Hill to the Government of India makes practical suggestions as to where and in what way existing research facilities and organisations, in medicine, agriculture, industry, natural resources, engineering and defence, can profitably be expanded. Throughout his report the author is emphatic on the inadequacy of existing Indian research and the enormous field waiting for development. A comprehensive report of this kind will be of real value in the planning of Indian reconstruction.

Whether Professor Hill's less specific proposals for the finance and central organisation of extended research work are readily adaptable to smooth running under the constitution of independent India is less certain. In such circumstances, scientific research would need more than ever to preserve a degree of independence from political pressures and conflicts. Professor Hill's suggestion for a special Minister responsible for six expert Boards of Research is not, for these reasons, entirely satisfactory. Nor is his urgent plea for funds from independent sources likely to make any real contribution to the problem. Further consideration of possible safeguards will be necessary—in which Indian research organisations should take a leading part—if the best possible value is to be gained from Professor Hill's important proposals.

Planning Pubs

By way of appendix to the Town and Country Planning Bill, the Licensing Planning (Temporary Provisions) Bill, read for the second time last week, has the object of including public houses in the replanning of blitzed areas. This is to be done by special licensing planning committees—representing both the local authorities and licensing justices—which will have the responsibility of deciding on the number and location of pubs in their area. Normally, the area will be a single licensing district, but in special cases areas will be combined under the same committee, to include, for instance, overspill areas to which people from badly damaged and congested districts will move.

The principle of combining the functions and responsibilities of licensing justices and local authorities is clearly indisputable where blitzed areas are being rebuilt. The justices could hardly construct a plan, by themselves, for new and existing pubs which would fit into the general scheme of reconstruction evolved by the local authority. The general scheme, however, could easily fall foul of the justices in its replanning of pubs, and protracted negotiations might be necessary to resolve the deadlock.

How far this association of authority could be extended all over the country might well be reviewed before the 5-year reconstruction period, for which the Bill is designed, comes to an end. The Solicitor-General was at pains to explain the democratic safeguards on the power of the new committees. The 50 per cent representation (through the local authority) on the committee, and the obligation to hold a local inquiry into persistent objections to its decisions certainly give the public far greater control over the distribution of pubs, and the standards set for them than they ever had under the licensing justices. The principle of the new Bill, if it is wisely applied, may well mark a new development in social history. Since pubs have come so largely under the distant control of large brewers, the influence of the local customer on the amenities of his (or her) pub has become less. The development of the public house as a local club in districts too small for the more highbrow community-centre, will depend, in blitzed towns at least, on the energy with which rights, old and new, are exercised by the people themselves.

Vital Statistics—Correction

A Shorter Note last week gave in error the number of marriages in 1942 as 191,426. This figure relates to the number of newly-married people; the corrected figure should be 95,713. The argument of the Note still holds good, since the marriage-rate for the third quarter of 1943 was still 76.408 lower than the average for the third quarter of 1938-43.

Letters to the Editor

Persian Oil

SIR,—A report of recent discussions over oil concessions in Iran which appeared in your issue of January 13th refers to what by now has become a legend which seems to have gained credence in certain quarters and is more or less accepted as a fact, i.e., the question of British and American interests endeavouring to acquire oil concessions in northern Iran during the course of last year and the contemplated acquiescence on the part of the Iranian Government to these requests.

The truth of the matter, however, is that since the outbreak of war no negotiations have been concluded, or even virtually concluded, by the Iranian Government with British and American interests for oil concessions in Iran, and that in no circumstances have the British and American interests separately or jointly asked for any concessions in northern Iran. Early last year proposals were submitted by certain British and American interests for concessions in the Persian Gulf regions and the Iranian coast of the Arabian Sea, these having no connection whatsoever with northern Iran. The proposals were nevertheless rejected by the Iranian Government.—Yours faithfully,

A. H. HAMZAVI,

Press Attaché, Ambassade Impériale de l'Iran

Domestic Service

SIR,—Your survey of the problem of organising domestic service leaves out of account the views and responsibilities of one important party to the future Charter—that is, the employer or, in home terms, the housewife.

If, previously, she employed a servant to cook or clean or both, her war experiences have taught her a new respect for the drawbacks of domestic service, notably for its monotony: same hour, same grease, same muddy vegetables. In compensation for them, she will be ready to hand out the pay and amenities you mention. But wartime practice has also taught her how to measure the rate and efficiency of the service she gets in return. She has become a knowledgeable judge, since there is no job she has not done herself. She has also become wholly versatile, and will expect equal versatility, during working hours, from her single, well-paid helper.

If all housewives were to convert their war experience into intolerance of bad work for good pay, they could soon work up the Charter into a code of status. Gilt-edged proficiency certificates with room for employers' endorsements, to be given upon the request of the holder, would become documents of meaning and value.

But, for the few employers who see the logic of sticking out for quality, there are thousands who would give anything—money, sunny bed-sitting room, fare to Blackpool—despite broken crockery and watery cabbage, in return for shuffling off tomorrow's washing up.

These are the saboteurs of the Charter. One of Miss Markham's formidable tasks is to wake them to the need for employers' standards if the worker is to take pride in her status. Here, as well as among undomestic males, is a field for "suitable propaganda."—Yours faithfully,

London, W.

ELIZABETH NEAME

Winter Generally

SIR,—The Government has spent large sums, and the more enlightened members of the medical profession have exercised much ingenuity, in a campaign to instruct the public as to the infectivity of the "common cold," influenza, throat infections, etc. It is therefore depressing to find you stating your belief that "draughts" are the causative factor, or, at least, a cause of these work-destroying illnesses.

Draughts cause discomfort and loss of heat, but are not and cannot be the cause of infectious diseases.

The worst offenders in keeping alive this popular misconception are the more ignorant and thoughtless doctors, who still, parrot-like, repeat the heresy daily to their patients.—Yours faithfully,

Harley Street, W. 1.

SURGEON

Unconditional Surrender

SIR,—For the first time, Mr Churchill, in the recent Commons debate, made the point that the interpretation of the term unconditional surrender, in its application to the defeat of Germany, would be conditioned by the nature of the British peoples who, he said, were not monsters but moral beings. If those responsible for the formula of unconditional surrender have always meant this, they have failed to say so plainly before. Instead, an all-devouring spectre of relentlessness has stalked the battlefields of Europe, and, to the German people, the issue has appeared as annihilation for the Fatherland versus annihilation of the Fatherland. In such an issue there is only one honourable choice for a military race and so, in the face of the apparent inevitableness of victory for the United Nations, a prolongation of the hopeless fighting.

The purpose of the United Nations' struggle is the establishment of peace and not the creation of a potential for revenge. Their sacrifice has already been made; to seek compensation for that sacrifice would destroy its moral value. Perhaps, therefore, the Big Three, at their next meeting or sooner, could be persuaded to make a definite address to Germany on the lines of Mr Churchill's qualification of unconditional surrender, and to couple with it a Christian offer of freedom for the German people from dishonour or reprisals in return for an immediate cessation of hostilities.

What greater victory could there be than the establishment of a lasting peace?—Yours faithfully,

Trinity College, Dublin

A. PAKENHAM-WALSH

Monopoly in Embryo.

SIR,—I have read with considerable interest your excellent article under the above heading. But you suggest that it is only the multiple stores who are putting up any strong opposition, whereas, in fact, the department stores have from the outset been most emphatic in their condemnation of the proposals which, although not openly expressed, undoubtedly form the basis of the Hardware Trade Alliance.

Any such scheme of price or margin fixing can only result in the raising of prices to the consumer—and that is entirely contrary to the policy of departmental stores, who, by their system of bulk purchasing from manufacturers and by efficient distribution, have brought about a substantial increase in the purchasing power of the consumer. No sensible person could possibly wish to put a brake upon these progressive activities.—Yours faithfully,

London, E.C. 1.

ERIC M. GAMAGE,

Chairman, A. W. Gamage, Ltd.

Patent Medicines

SIR,—May I point out that the Chemists' Friends Scheme to which you refer in the article in your issue of January 6th has a dual purpose (a) the restriction of sales of medicines to the persons specially trained for handling medicines, and (b) the examination by a Standards Committee of all articles placed on the list, with a view to preventing misleading claims or "fear" propaganda in regard to those articles and the examination of each article pharmaceutically to make certain that it is worth while as a medicine, and that the price is reasonable. It is not a price-fixing scheme.

The public is, therefore, being protected in this scheme against worthless but expensive medicines. In fact, many articles are refused and others have to be improved in some respect or other before they can now be accepted.

The Standards Committee is slowly but surely raising the standards for these proprietary medicines.

May I point out that the technical knowledge of the chemist is of value to the public, because there are many cases where a friendly word can be given by the chemist to the prospective buyer of an advertised medicine which does result in the customer seeking necessary medical advice instead of wasting money on a medicine which cannot possibly have the desired effect whatever the advertisements may promise. He can only do this when he knows his

customer because advertisements often warn the public against advice of this kind.

Chemists have nothing to fear from your proposals for the control of advertisements and a cost analysis of proprietary medicines, because the margin of retail profit on these articles is one which has already been examined by a Government Committee and found to be reasonable.

May I add that the public expects a pharmaceutical service and the qualification for the service is, comparatively speaking, on a high level. Is it unreasonable that those who enter the calling should take such steps as are available to them, to prevent as far as possible encroachments by all and sundry? There can be no monopoly because of the intensive competition amongst chemists themselves and between them and the multiple firms, co-ops, &c.—Yours faithfully,
G. A. MALLINSON,
Secretary, The National Pharmaceutical Union.

The Coal Industry

SIR,—Any analysis of the coal industry must necessarily involve generalisation, and a generalised truth can never be much more than half a truth. Even the facts of the case are relative; the low rate of output of the British miner, compared with the American miner, cannot be dissociated from the physical conditions of the seams in the two countries and the ratio of the coal extracted—extremely high in British practice—to that left underground and lost for all time. Machinery is not a universal panacea for the output problem. In some of the large South Yorkshire collieries, where capital has never been short and the technical management has always been of the best, coal-cutting machines have actually been taken out, as higher rates of output have been obtained without them. American-type machines would be useless in these conditions because of the heavy roof pressures, which necessitate the close spacing of supports. Machines are being developed by British manufacturers to meet these conditions, but the difficulties are formidable. Furthermore, it is one thing to provide machines but quite another to get men to use them effectively; the American miner regards a machine as an instrument for reducing his manual labour and increasing his standard of living; the British miner is apt to regard a machine as an instrument for putting his workmate out

of a job. This difference in attitude has far-reaching effects.

The main emphasis of your contributor's proposed solution to the troubles of the coal industry appears to be placed on amalgamation. But even when the amalgamations have been effected on the basis of mutual agreement between the collieries themselves, the benefits have proved more theoretical than real, and the economic benefits of enforced amalgamations are, to say the least, extremely problematical.

My own experience, which began as a pick-and-shovel miner and has subsequently embraced that of a machine miner, assistant colliery manager and HM Inspector of Mines, leads me to believe the falling coal output to be chiefly due to the present system of control and to the fact that the miner, who is a hero in adversity, is a fool in prosperity. Theoretically the Government is in control of coal production through the Ministry of Fuel and Power. But the mines to-day are operated under the virtual control of the miners themselves. Failure in coal production is not floundering on a mere dualism in control, which is alleged to be shared between the Ministry and the colliery owners, but rather on a multi-willed control exerted by thousands of individual miners, each of whom has the power to temper his efforts to suit his own convenience.

War necessities have put an immense premium on the services of the miner, and this premium has given him a sense of power. He has chosen to wield this power with all the obstructive energy of a spoilt child. Consequently, one sees no prospect whatever of an increased output until economic forces come into operation with the effectiveness of a stern father.

Your contributor refers to the disproportionate number of men employed on the underground haulage systems compared with coal getting; this is perfectly true, but he does not give the reason. In every other important mining country except Great Britain, electric trolley locomotives are used for haulage; but here cumbersome rope haulages have to be used, because the Safety Regulations—the most onerous to operate in the world—prohibit the use of the necessary trolley wires.

Having offered these criticisms, may I say how heartily I can endorse so much of your contributor's analysis and constructive suggestions?—Yours faithfully,

Westminster, S.W. 1

HAROLD STOREY

AMERICAN SURVEY

PMH Again—An American View

(From a Correspondent in New England)

LORD KEYNES'S mission to Washington in December, and the announcement of a new phase in Lend-Lease that ensued, served notice on the American people that a new stage in Anglo-American economic relations is beginning. They are left wondering whether all aspects of it are likely to be pleasant.

Although Lend-Lease is presumed to have been the central theme of the Keynes mission, it was not Lend-Lease that disturbed the American mind. In the first place it would be hard to find, even on the busiest street corner, a half-dozen Americans who ever presumed that the Lend-Lease account would be balanced in monetary payments. Most Americans hold the view that their Allies hurled the Lend-Lease weapons at the common enemy, and are grateful for the service. As to machine tools and a few items not hurled, no serious problem is likely to arise.

The problem that is really, and progressively, troubling Americans is the impression that Britain is presently like a bird with a broken wing, and that she is more interested in getting protection so she can limp around with the broken wing than she is in healing it; while Americans, with their usual impetuosity to make a million overnight, are looking for a lusty and healthy partner in putting two motorcars in every European barn and a chicken in every Zulu's pot.

The broken wing is, of course, the present state of British industry.

It is true that few Americans have given careful study to Sir Frank Platt's textile mission report; nor have they, of course, read the unpublished report on British coal-mining

made by the special American mission. But the average American has seen and heard enough to plant the impression that British production methods are less than half as efficient as American practices.

The popular impression is that a Tory class holds, largely through inheritance, the bulk of British industry and that as a consequence British industry suffers from absentee ownership, generally incompetent management, and uninspired labour forces.

The picture is somehow reminiscent of America's own New England, which in the years following the last war lost many of its larger textile mills and other industries, while American Colonel Blimps lounged in their Boston Clubs and talked about the high quality of their products. Having no protection from the Southern textile mills, or from the Middle Western machine goods makers, New Englanders finally besirred themselves, found new methods and new products and are now emerging from the war in a stronger position than seemed possible a decade ago.

It is now being openly suggested in the United States that what Britain really desires in the way of post-war help is some sort of agreement under which producers in the two countries will divide up markets and hold up prices. In America that spells cartels, and there is no deadlier word.

This impression is certainly a vivid barrier to winning any effective American help in protecting the British status quo. Few Americans (outside of Chicago) dream of going off in a huff if Britain will not play the American

brand of ball. But the consideration that Britons may wish to ponder at this moment is that there is undeniably a substantial bank of friendship towards Britain accumulated in the U.S. Americans generally understand the hardships that the British people have undergone. And if technical and material aid were requested in putting British industry on a truly world-competing basis it would very likely be forthcoming.

It is undeniable that many Americans would see their own interest well served by a resurgent British industry. For, as in late years they have come to see America's military future closely linked to that of Britain's, just so they see America's economic future coupled with that of Britain.

There has been a lot of hard thinking in America—and a lot of hard propagandising—about world trade, and the conclusion is now held by a safe majority that it was cartels, subsidies, tariffs, bartering and governments trading with other governments which generated much of the economic friction preceding the war. So there is a conviction that only by progressively removing those trade restrictions (within the United States as well as without) and energetically trading with the rest of the world can (a) prosperity be attained at home, (b) living standards be improved throughout the world, and (c) an effective blow be struck for peace.

Thus this current trend of thinking contains the elements of a crusade—and is not, therefore, to be underestimated. Further, Americans feel that their influence and the volume of their trade alone cannot effect such a pattern in the world as a whole. But they believe that with the full co-operation of the British Commonwealth of Nations the world can be attracted to such a design. A concomitant of this American dream is the belief that there is no saturation point to the amount of Anglo-American goods that might be consumed in a prosperous world.

To this end, it is seen as an American advantage to have a strong and competitive British economy, one with coal mines producing coal under terms of man-hours comparable with the United States, and with steel and other prices thereby lowered to competitive levels, with textile mills able to produce the low-count "bread and butter" fabrics, and with industry generally in tip-top shape. It is the American contention that during the war it has been demonstrated to Britain that America can help along this line, and a request for such help would certainly meet with far greater American enthusiasm than the present weak overtures for protection from competition, trade agreements, cartels and what not.

Such is early 1945 American opinion. President Roosevelt has had a large part in shaping it. He is not one, as the record indicates, to get very far ahead, or behind, of public thinking. Those presently shaping Britain's approach might usefully ponder what they are heading into.

American Notes

The American Mood

Mr Roosevelt's authority in the field of foreign negotiation has been strengthened not only by the Vandenberg plan, but by a letter from the sixteen new Senators assuring him of their support for an international security organisation. This is in contrast with the famous "round robin" of Senators opposed to the League 26 years ago, which rung the knell of Wilson's hopes. The freshmen Senators went on to urge that America's allies should be assured by all reasonable means that the United States intends to share in the responsibility and direction of the settlement of the war and the maintenance of peace; and that the United States should

arrange to participate affirmatively in all decisions affecting the establishment of law and order in the liberated or enemy countries.

The signers, who included ten Democrats and six Republicans, ranged from Senator Fulbright to Senator Capehart, of Indiana, a reputed isolationist.

Some hint of the direction in which the President's influence will be exerted at the meeting of the Big Three is contained in a dispatch from London by Mr Raymond Daniell to the *New York Times* giving an "authoritative preview" of the U.S. attitude. Gossip in the American press has linked this with the visit of Mr Harry Hopkins, whose rapid transit of the capitals of Europe has been a modern version of "Pippa Passes," except that Mr Hopkins' theme song does not appear to have been "God's in his Heaven, All's right with the world." For the veiled authority

invoked by Mr Daniell was represented as saying that the American people are in a mood in which the actions of their Allies could bring them into wholehearted co-operation for maintaining peace, or could create a new and more rigid American isolationism. In Rome Mr Hopkins has indicated that the United States would tolerate no totalitarianism in the liberated countries, "whatever the tag." As the posters say, "You have been warned."

It is undeniably true that the attitude of many politicians and commentators in the United States is that participation in a world security scheme is a gift which America will make to the world if it is pleased and will withhold if it is displeased. America still thinks of itself as the New World, able to opt in or opt out of the affairs of humanity as it pleases. To this degree Isolation still colours much American thinking.

However strong the desire to secure American participation, it is doubtful whether the mood of America constitutes as decisive a big stick as the Administration appears to believe. The promise of collaboration loses something of its value when it is held so lightly that it can be withdrawn as a matter of discipline; and it is not certain that the gulf between American collaboration, tinged with Olympian detachment, and American isolation, conditioned by the inevitable entanglements of self-interest and V-bombs, is as wide as Mr Hopkins might wish his hearers to believe. Any move by the United States towards constructive participation in the affairs of the world is, of course, to be welcomed and encouraged. But it would have to be more sharply defined, and backed by something more tangible than the manifesto of the freshman Senators, before it would be likely to be recognised as a bargaining weapon by, say, Marshal Stalin.

A Bill of Divorcement

In some quarters it is said that by his nomination of Mr Wallace to succeed Mr Jesse Jones, the President hoped to precipitate and clarify the issue of post-war employment policy and to reaffirm his adherence to those social objectives which were soft-pedalled in the pre-election months. If so, he has had a speedy and discouraging re-

TO BUSINESS MEN WHO CABLE IN WARTIME

By carrying out these three simple rules you will save yourself unnecessary bother, help to increase the efficiency of the service, free the Empire's tele-communication lines for vital war traffic.

1 When you dictate a cable by telephone listen carefully while it is being read back to you. Casual checking leads to errors which have to be corrected by more cables.

2 Allow your correspondents ample time to reply before enquiring about your cables. Remember that Government cables must be given priority over others in war.

3 Don't mislay cables sent to you. This causes your correspondents to cable for a reply and thus congests the Empire's circuits with unnecessary traffic.

sponse in the vote of the Senate Commerce Committee to reject Mr Wallace by 14-5; and in its decision, by 15-4, to adopt Senator George's Bill to divorce from the Department of Commerce the control of the lending agencies which were joined to it by Executive Order in 1942. It is within Mr Roosevelt's power to veto the George Bill; and the coalition of Republicans and Conservative Democrats probably would not be able to override the veto. But if this were to happen, Mr Wallace's appointment would be unlikely to be confirmed, despite the pressure which his supporters are bringing to bear upon the Senate. The position seems to be that Mr Wallace's hopes of becoming Secretary of Commerce hinge upon that office being divorced from the financial authority which Mr Jones enjoyed and which Mr Wallace covets.

The lending agencies grouped under the Federal Loan Administration include the Reconstruction Finance Corporation, War Damage, Metals Reserve Company, Defense Supplies, Rubber Reserve Company, and the Export-Import Bank. Loans outstanding total about \$40 billion. Of this, according to an interview with Mr Jones, the RFC has about \$20 billion invested in war plants and facilities, including \$3 to \$4 billion in raw and critical materials. Mr Jones expressed particular alarm about the policies Mr Wallace might adopt when the war plants cease operating and "fall back into RFC's lap."

The mere mention of the agencies grouped around the RFC indicates the width and force of their impact, not only on the domestic economy but on foreign economic policy. They constitute a very nearly ideal instrument for carrying out an integrated policy for full employment and foreign reconstruction. This instrument is now in the process of being broken up. Not only are the financial agencies likely to be divorced from the Department of Commerce, but Congress has been led to realise, and to view with alarm, the immensity of the powers it had delegated. There is a move underfoot to institute rigorous Congressional supervision of the RFC and its subsidiaries.

The Personal Element

Mr Walter Lippmann believes that Mr Wallace really will be in a stronger position if he is not burdened with the details of financial administration. He argues that the job essentially is one of persuasion and of securing co-operation both from business and the other Government agencies involved. This is a view with which Mr Wallace and his supporters cannot agree, though there is much sound sense in the point that the maintenance of full employment is not merely a matter of unlimited spending in Washington. What is incontestable is that if Mr Wallace secures control of the financial powers of the Government, it will only be after a bitter struggle which will leave the opposition irreconcilable and determined to take its revenge, particularly when appropriation bills for the agencies appear before Congress.

The danger of criticising Mr Wallace's appointment lies in the support it seems to imply for the unreconstructed school of thought to which Mr Jones belongs and the wholly false antithesis between "social objectives" and "soundness" that eminent banker has revived. With Mr Wallace's sympathies, and his responsiveness to the realities of the problem there can be no quarrel. The present conflict is embittered by considerations both of personality and party politics. One wonders whether much of this inflammation of opinion might not have been avoided had the President selected a less contentious, though no less progressive, figure than Mr Wallace for this particular post. A man like Mr Henry Kaiser, who is sympathetic to the employment programme of the Administration, and who has a fabulous record in war production, would not have aroused the wrath of the Conservatives. Even if Mr Roosevelt was determined to have Mr Wallace, greater pains to conceal the fact that this was a "political pay off" to Mr Wallace and the left-wing of the party, and a political rebuff to Mr Jones and the Conservative Democrats who staged last summer's short-lived revolt, might have avoided what may become a serious set-back to the Administration. The coupling of a directed policy for full employment with

There are many men and women in the Services who would welcome a chance of reading this publication. If you would hand it in, unwrapped, unstamped, and unaddressed at any Post Office, it will go to them.

the name of Henry Wallace may prove to be the undoing of both, and it is not impossible that the split in the coalition which elected Mr Roosevelt may spread from the domestic to the foreign sphere.

National Service

Even such a limited national service measure as the Bailey-May Bill, which would apply only to men from 18 to 45, is running into snags. Senator Mead, who took Mr Truman's place as head of the Senate War Investigation Committee, has endorsed the view that what is needed is not more compulsory powers, but better use of existing manpower in war plants. Senator Mead instanced conditions at the Norfolk Navy Yard, where he revealed that his Committee had found hoarded labour and "enforced loafing."

Farm interests presumably will reconsider their support of the Bill unless the House reverses its Military Affairs Committee's action on the Tydings amendment. The Committee defeated a move to direct Selective Service to regard agriculture as a critical industry and to preserve the generous conditions now prescribed for the detriment of farm labour.

An even greater threat arises from the determination of the Republicans and Southern Democrats to insist, as a condition of the Bill's passage, on the inclusion of an "open shop" amendment. This provision, which was fought over in committee, would require that no man may be forced to join a union when he is directed into an industrial job. The view of the Administration is that such an amendment would violate union contracts already in existence.

It is said that workers all over the country are moving into war jobs in anticipation of the teeth in the new measure. These have now been revised to give local draft boards discretion to punish recalcitrants either by ordering their call-up—if they are physically fit—or by prescribing fines or imprisonment. But if the Bill is held up either by the farm interests or the opponents of the closed shop, workers, on second thoughts, may decide that its bark is worse—or at least more immediate—than its bite.

Montgomery Ward Again

The Administration has incurred another rebuff in its handling of the Montgomery Ward case. A Federal Court Judge in Chicago has declared illegal its seizure of the company's properties. It will be remembered that the conflict between the company and the Government arose from the long-continued refusal of Montgomery Ward to incorporate a "maintenance-of-membership" clause in its contract with a union belonging to the Congress of Industrial Organisations. Last year's Army seizure fizzled out; but it was renewed a month ago when strikes at the company's establishments threatened to spread to war industries in Detroit.

Judge Sullivan has held that the President is without power to order such a seizure either under the War Labour Disputes Act or under his authority as Commander-in-Chief; and he has upheld the contention of the company that it is not a war plant within the meaning of the anti-strike act. He apparently was not impressed by the contention that *bona fide* war work might be interrupted through sympathy strikes. The judge went further in dissenting from the Attorney-General's view of the vast reservoir of power inherent in the President's rôle as Commander-in-Chief, denying that his war-time powers gave him unlimited authority.

Mr Sewell Avery, Montgomery Ward's chairman, has declared this a "great day for Labour." Like many other employers, Mr Avery has a great tenderness for the constitutional right of employees to refuse to join labour unions. But not even Mr Avery can make it a great day for the War Labour Board. The decision will encourage employers' hostility to the directives of the Board, particularly where they prescribe "maintenance-of-membership" agreements with unions. Judge Sullivan pointed out in his decision that the powers of the WLB were purely advisory. The Administration has not been unaware of the desirability of strengthening the authority of the Board; Mr Byrnes made such a suggestion in a report early this month. But to accomplish this would require action by Congress, where anti-closed shop sentiment is strong. Conservative feeling is inflamed against the rebirth of the New Deal.

Astronomic

There was a time when a man could come into Austin Reed's and choose a pair of Flexway worsted trousers from a range of nine shades, each shade in thirty different fittings and with nine lengths of leg. And not only trousers. Every item of masculine attire was there in the same prodigious variety. That particular brand of the spice of life will be back again—maybe sooner than we think.

The Austin Reed Service will be there

THE BUSINESS WORLD

The Reallocation of Labour

THE process of total mobilisation for war in this country, though slow and painful, was steady, and the recent absence of complaints about the working of the production machine, which was under constant fire throughout 1942, is as great a tribute, although a negative one, to its success, as the very tangible figures of output quoted in the White Paper on the War Effort. Important lessons were learned during the process of mobilisation, and the authorities are determined to see that they are applied in the even more critical period that will attend demobilisation. The first is the need for close and constant consultation with the representatives of employers and workers. The second is the importance of maintaining close contact in planning and operation between all the departments concerned, both at headquarters and at the regional level. The third lesson is the need for the sympathetic and human handling of labour. Raw materials, machine tools and factory space, can be treated as administrative problems, but the allocation of men and women to the jobs where they will be utilised to the maximum advantage is far more complex.

It is too early at this stage to talk about "demobilisation" or even "reconversion," for production for military requirements necessarily has overriding priority, and there is little margin of industrial capacity which can be released for non-military purposes. But the margin is growing, and the con-

tinual changes in the production programme mean that increasing supplies of labour are becoming available for other types of production. The procedure for transferring and reallocating the workers who are released as a result of programme changes—who, to use the horrible official phrase, become "redundant"—is carefully thought out by the departments, and most especially by the Ministry of Labour, upon which the main brunt of action falls.

It is worth describing how these programme changes are effected in practice, for they provide a useful pattern of the operation of a planned wartime economy. Strategic decisions reached by inter-Allied conferences at the highest level have to be translated into terms of production. A decision, for instance, to increase the weight of the offensive against Japan will require a greater output of certain types of jungle and tropical equipment, and a corresponding reorientation of production; or it might be decided that a particular type of weapon had reached saturation point, and this would entail a drastic curtailment of its production. Productive resources, especially manpower, have to be highly flexible, to accord with strategic requirements. All this may sound very obvious, but it is perhaps not sufficiently realised by the individual men and women in the workshop that their efforts are the direct result of decisions at the very highest level, which have seeped down through a series of departments, or that the conclusions reached at Teheran have their effect on life at Tadcaster.

be described as the counterpart, at the regional level, of the Programmes Review Committee at the top.

The final cog in the machine is the Employment Exchange, which has the task of placing workers in new employment. For workers who are transferred nearer their homes, the Exchange arranges the details of the transfer, leaving the Exchange in the home area to do the actual placing.

In selecting individuals for release, the Ministry of Labour pursues certain guiding principles, which have been laid down in the White Paper on the Reallocation of manpower between civilian employments. Wherever possible, the aim is to secure volunteers, but in cases of redundancy the first to be removed are men below 35 years of age, who are needed for the Forces, and who will make an important contribution towards the 250,000 men still required by the Army. Workers who have been away from home for three years or more are given priority of release, if they can be re-employed in their home areas. The three-year rule, however, is not sacrosanct, and workers whose skill is urgently required in industries where the labour force has run down, or which are scheduled as priorities, such as cotton, are encouraged to volunteer. Then a certain number of workers may be selected to fill vacancies in work of high priority. Should there not be enough releases covered by these categories, the remainder will be nominated by the employers in accordance with industrial agreements. At every stage in the proceedings, human factors are taken into account, and insistence is laid on the point that no list of redundant workers, prepared by the management, will be accepted by the Ministry of Labour, unless it has been agreed with the workers' representatives.

The worker has the right of appeal against transference, but it would seem that comparatively few workers exercise their right. In one case, involving the transfer of 1,800 workers, 50 appeals were lodged, three of which were upheld. In another factory, about 6,000 workers have been released since 1943, always in agreement with the workers' representatives and under a special procedure whereby such factors as length of service with the firm, ability and time-keeping record are taken into account. In every case, it can be stated, the smoothness of the transfer is in direct relation to the degree of consultation with the workers.

The machinery for the reallocation of labour has obviously been worked out very carefully on paper, and, so far, it seems to be working remarkably smoothly. A great deal depends on the initial planning of programme cuts, so that they fall in areas where labour can readily be absorbed. In the Midlands district, for example, there is a perpetual shortage of labour, and "redundancy" in the sense that a worker is likely to be unemployed for any length of time is not anticipated. The average length of time in the Midlands which a redundant worker spends before re-absorption is said to be only three to four days, and at one factory 900 workers who became redundant were all re-settled within ten days. In one district, out of 70,000 workers on the books of an Employment Exchange, only 25 men were unemployed (most of whom were classified as "unemployable"), while no women were out of work. The Midlands has been a large importer of labour, but so far few of the imported workers have returned to their home areas, and the majority have simply been transferred to other work in the district. The position will obviously be less easy in regions, such as the Development Areas, where there is less diversification of employment, and where industry is not so highly concentrated as in the Midlands.

Apart from the purely physical difficulties of reallocation, there are many human and personal problems, which the machine, however well oiled, cannot solve, though it may minimise friction. The Ministry of Labour is subjected to what may be termed a three-way pull; there is its own desire to concentrate mobile workers in the most essential sectors of war production, and to leave the older and immobile workers and part-time workers where they are, while the individual firm naturally seeks to keep the workers who are most efficient, irrespective of their mobility, and the workers themselves prefer to work in their own trade near their homes. The views of workers and employers may conflict, and it is sometimes alleged by the workers that the employers try to get rid of active shop stewards, though both sides may unite to resist the Ministry's pressure.

The greatest difficulty in reallocation, however, arises from the point of view of the transferred worker, who finds that he is being sent from a highly-paid to a less well paid occupation. Many workers in the Midlands are earning on

the average £10 to £12 a week, in munitions factories, for work involving no very high degree of skill, and they naturally resist transference to jobs which may be more arduous and are worth £6 to £7 a week, or less. The cotton industry, for instance, has a high priority, but in addition to wage differentiations, many ex-cotton operatives who have grown accustomed to working in modern, well-lit and well-equipped Royal Ordnance Factories or munition works, may find conditions and welfare arrangements in cotton mills very primitive by contrast.

The testing time for the machinery will come when any large-scale transfers of labour are contemplated. So long as the period between two jobs is short, comparatively few difficulties need arise. But if redundancy were to lead to any prolongation of unemployment, the difference between the level of munitions earnings and unemployment benefit would be so wide, that trouble might occur. It is this fear of prolonged unemployment, which many people have experienced at least twice in their life-times, that is causing considerable concern among the workers who find that their labour is no longer required on war orders, a concern which no amount of humane administration can allay. So far, operations have been on a limited scale, and the transfers have been mainly from one type of war production to another. The progressive slowing down of war contracts as the war draws to its close will involve more substantial reallocations both in quantity and quality.

The Board of Trade will largely be responsible for the reconversion of industry, and as Mr Dalton has stated, the chairmanship of the Regional Boards is likely to pass from the hands of the Ministry of Production to the Board's Controllers. Their task will be a formidable one, and it is essential that they show resilience and co-operate with other departments, particularly the Ministry of Labour, when the time comes for the enlargement of their activities. So far, there have been few concrete signs of planning for the switch-over, apart from certain rather vague generalisations about exports and housing priorities. It is satisfactory to know that the machinery is there, and is working reasonably well in the initial period of change, but it would be more reassuring to know that there is also a detailed policy for the later stages.

THE NATIONAL BANK LIMITED

Established 1835

MEMBER OF THE LONDON BANKERS' CLEARING HOUSE

CAPITAL SUBSCRIBED	£7,500,000
CAPITAL PAID-UP	£1,500,000
RESERVE FUND	£1,210,000

The National Bank offers a comprehensive Banking Service covering every modern requirement.

The following figures will give some indication of the Bank's steady progress through the years—an achievement attained without the aid of amalgamation:

Year	Number of Offices	Deposits
1850	47	£1,192,000
1900	100	£11,253,000
1944	265	£55,017,179

AGENTS AND CORRESPONDENTS ALL OVER THE WORLD

From the level of War Cabinet or Chiefs of Staff, a programme change is passed on to the Production Directorate of the Supply Department concerned, which decides where the increase or reductions in production shall fall. These changes are then examined by the Programmes Review Committee, which consists of representatives of the department concerned in the change, the Ministry of Production, the Ministry of Labour, and the Board of Trade. In this review, the chief concern of the Ministry of Production is to secure that industrial resources are properly used, and that the type of capacity released is suitable for other important war uses. The Ministry of Labour tries to ensure that cuts are made in their "scarlet" areas, where labour is in short supply, and where redundant workers can rapidly be absorbed into other production. The Board of Trade at this stage is very much in the position of Lazarus at Dives' table, waiting for the crumbs of labour which could be used for civilian production.

The Programmes Review Committee transmits its decisions to the Ministry of Production's Regional Boards for execution. It is their function to check the estimates made in Whitehall by their knowledge of the local state of affairs, and to inform the firms which are affected by the changes in production. Very great importance is attached to the need for giving the fullest possible explanation of the reasons for the changes to the workers' representatives, and ensuring their co-operation; the Joint Production Committee machinery provides an admirable channel for this purpose. Workers who understand the position are far less likely to object to transference than those who are merely informed that they must change their jobs, without being told why.

The actual release and re-allocation of labour is effected through the Ministry of Labour's District Manpower Boards. They send their Labour Supply Inspectors to visit the firms where cuts are to be made, and after consultation with both sides, to draw up a time-table for releases. In most cases these inspectors have been on the job for some years, and have earned the confidence of managements and workers alike; this is extremely necessary, for it is upon them that the difficult personal negotiations fall. Each week the Regional Board's Labour Supply Committee meets to review the releases and requirements. Its functions might

American Farm Prosperity

(By Our New York Correspondent)

AGRICULTURE in this country has completed another amazing year. Its prosperity, as in the years preceding, is exerting a great influence upon the American economy and contains significant implications for the future. Though less than 20 per cent of the working population of the country is engaged in agriculture, the influence upon the economy is far greater than such a fraction indicates.

Agricultural production in 1944 has been very large. The following table compares it with earlier periods, according to recent official estimates:

	1944 as a % of:		
	1935-39 Average	1942	1943
Total food crops	132	106	114
Total food and livestock	141	112	102
Total food production	138	110	105
Total agricultural production	131	106	102

This record of very high production during the war years—an extraordinarily long period of time for continuously high output—has been in marked contrast with the previous war. During that period, both 1916 and 1917 brought short crops, and production rose only by something like 5 per cent from the average of pre-war years. Not a little of the economic contrast between the two wars—and probably in post-war consequences—will lie in the difference in the abundance of American agricultural output.

This production record has been accomplished with a diminishing labour force. The total number of persons employed in agriculture in 1943 was estimated at 8,300,000, as compared with 9,200,000 in 1939; the pull of urban war production jobs and of the armed forces accounts for the decline. Mechanical facilities have also declined, as new equipment has either been out of production, or produced in very limited amounts, while the stock of tools on farms at the beginning of the war has certainly deteriorated. The record output has been partly accomplished by greater efficiency and partly by unusually favourable weather.

This production record has made high levels of consumption possible, and this has presumably contributed not a little to the successful maintenance of industrial output needed for the conduct of the war. Civilian food consumption in the United States this year is estimated to be about as high as last year and some 7 per cent or more in excess of the average for 1935-39 on a *per capita* basis. The difference between the moderate increase in civilian consumption and the 38 per cent rise in production over the 1935-39 period has provided the large supplies which have gone to the armed forces, to Lend-Lease, and to relief. The "shortages" encountered by civilians occur only in a few individual items, or in certain localities, or as a consequence of trying to consume in amounts even more greatly in excess of pre-war levels.

Incomes and Debts

The high production, accompanied by a firm, or rising, price level, has meant very considerable agricultural prosperity. Farm income is at record levels, which, distributed over a smaller agricultural population, has meant very large *per capita* incomes relative to the past. The following table shows the significant items.

	FARM PRICES AND COSTS (1909-14=100)			
	Year 1940	Jan., 1943	Sept., 1943	Sept., 1944
Prices received by farmers	100	181	193	192
Prices paid by farmers, including taxes and interest	125	156	164	170
Parity ratio	80	116	118	114

Thus the volume of production, combined with price control, has kept the prices received by farmers virtually stable for a considerable time, though at a level nearly

double that of pre-war. The items which farmers buy have, however, continued a slow rise. The ratio of prices received to prices paid (a ratio equal to that of the five years preceding the last war, widely known as "parity," is the avowed objective of national policy) remains favourable to the farmers, though showing a slight decline during recent months.

This prosperous condition of American agriculture has resulted in rising farm land prices, which on July 1, 1944, were estimated to be 42 per cent above the average for 1935-39—and much higher in some regions. The volume of farm land sales in the 12 months ended last spring was the highest on record, exceeding the 1919 peak by some 10 per cent, though there has been some slackening of the volume of sales during the summer. Farms taken over in distress by institutions and by individual creditors during the depression have been substantially re-sold under these conditions.

Prosperity has permitted an almost continuous reduction in farm debt, even though some of the newly-bought farms are reported to be heavily mortgaged. Total farm indebtedness at the beginning of the year was less than \$6 billion, which was a decline of about \$1 billion in four years. Thus far, therefore, agricultural prosperity—or boom—does not appear to have affected the financial structure of the country to any significant degree.

Post-war Prospect

For some time fears were generally held that the latter stages of the war and the immediate peacetime years would be marked by a sizeable inflation of agricultural prices and values because of the prospective demand by consumers and the large cash accumulations available to finance it. While this fear is still held by some, apprehensions of the opposite order have been growing. The enormous production is now being increasingly seen as constituting a threat of major proportions to the post-war price and income level of the farmers. Both the domestic and the foreign market are now rather generally expected to shrink, while increased labour supply, more adequate machinery, and technological advances are seen as sustaining and perhaps tending to increase output—unless another prolonged cycle of adverse weather such as occurred in the thirties should recur.

A series of defences have accordingly been erected and more are now being demanded. According to a summary by the National City Bank: "Some 40 farm commodities have price supports in one form or another for the 1944 crops, and about 20 are also assured of price support after the war; and six 'basic crops' will be supported indefinitely and some 14 'war crops' for at least two full crop years after both wars are over. The post-war commitment is to support prices at 90 per cent of parity and during the war the commitments are substantially higher." A study by the Interstate Commerce Commission estimates that about 64 per cent of farm income arises from the group of commodities protected by provisions for support for two full years after the war. And in addition, the Surplus Property Act, which has just become law, permits the Government to sell farm commodities for export at prices below the domestic level with the Government taking the loss—in other words, dumping. These statutory measures already enacted were supplemented during the Presidential campaign by categorical declarations by both contestants and parties to the effect that agriculture would be kept prosperous.

The portent of this situation for the future is obviously very great. Unless the cornucopian output of agriculture can be absorbed at or close to present prices and without major agricultural readjustment, there is the very real threat of attempts by the United States to "dump" abroad and to engage in new large payments to farmers at the cost of what will be probably a strained budget at home. And yet whether even "full employment" will provide a demand large enough to absorb the output at home seems questionable.

Business Notes

Flexible Control of Machine Tools

On February 1st the Machine Tool Control initiated an interesting experiment in flexible control. In future, prospective buyers of metal-working machine tools will no longer require a purchase certificate before placing an order and manufacturers will be free to accept orders. Moreover, a free market is to be restored by the suspension of statutory price control. This relaxation of control, however, is subject to these conditions:

First, the Machine Tool Control will continue to require detailed information from manufacturers about the acceptance and completion of orders. The Control will thus be in a position to keep an eye on the industry, on changes in output and in the volume of orders on hand.

Secondly, a limited number of types will remain subject to full control, that is to say manufacturers will only be able to accept orders for them on approval by the Control. The only, though important, difference from previous practice is that the application for a certificate will have to be made by the manufacturer instead of by the prospective purchaser.

Thirdly, the Machine Tool Control will retain full powers of control under the Control of Machine Tools (No. 1) Order. It will thus be in a position to restore full control over orders and prices or, alternatively, to relax control still further. It will be able to reduce, or add to, the list of tools that can only be supplied upon the approval of applications made by manufacturers.

In short, the Machine Tool Control is making an attempt at combining a measure of supervision with as much freedom as possible in the market for new machine tools. It is an experiment that, if successful, may well be of wider application.

Post-War Problems

The machine tool industry is not one that can be left to itself completely even after the war. (During the war the industry supplied 73 per cent of British needs; of the remainder, 14½ per cent were purchased for cash in the United States and 12½ per cent were supplied on Lend-Lease terms.) It will have to play a key rôle in the modernisation of Great Britain's productive processes, and it should contribute substantially to the expansion in the export trade; both are vital British needs. The industry should, therefore, be brought to the highest possible degree of efficiency as a matter of public interest.

If the Government were to disinterest itself completely at the end of the war, the industry would be faced with the prospect of a declining and fluctuating demand, arising from the existence of large numbers of second-hand tools that cannot be immediately absorbed. It would be subject to financial losses and hazards that might seriously prejudice its future.

The Government, in fact, will probably be compelled to take a hand in the financing of the surplus until it is liquidated. This does not mean that the addition to this surplus by the Government's purchase, for \$31,500,000, of 58,000 machine tools supplied by the United States on Lend-Lease terms was bad business. On the contrary, the pool of tools that will be available after the war will assist greatly in the replacement of worn-out tools and in the modernisation of industry. A proportion of them may also be available for export to countries that are badly short of tools—it would be interesting to know whether there are any restrictions on the disposal of the machines originally supplied on Lend-Lease terms.

The financing of surpluses is one way in which the Government can protect the machine tool industry from post-war hazards. But the protection of the industry is not an end in itself; it should be a means to the end of achieving that degree of efficiency through technical rationalisation that is commensurate with its key position. Presumably, the Government, in its plans for the financing and disposal of surpluses, will leave the industry in no doubt about this condition.

Bankers and Industrial Finance

Some reference to the two new industrial finance companies was made at most of the banks' annual general meetings held this week. In each case a warm welcome was extended to the two new institutions, but stress was placed on the fact that they will merely supplement the existing capital market, and will not entrench in any way on the business that would normally be transacted by the banks. Apart from these generalities which were common to all the references to the new institutions, a few of the bankers chose to be more specific. The most interesting comment on the smaller of the two companies, the Industrial and Commercial Finance Corporation, which is to be owned and financed by the clearing banks, was made at the Midland Bank meeting, where it was suggested by Mr Sadd that its facilities to small or medium-sized businesses might in some cases take the form of participations in share capital. The larger institution, the Finance Corporation for Industry, was described by Mr Sadd as "designed for industrial reconstruction and rehabilitation on the grand scale."

At Lloyds Bank meeting, Lord Wardington admitted that in committing themselves to long-term participation in the new institutions, the banks were departing in some measure from principles that had carried British banking unscathed through many crises and depressions. But he justified the breach with tradition on a number of grounds. The first was that it would be "so small." The maximum participation of the banks in both institutions would only increase the ratio of advances to deposits by 3 per cent, and would hardly affect the position of extreme liquidity of the British banking system. Lord Wardington also advanced the argument that the special needs for capital after the war would call for special measures. However small or imaginary the "Macmillan gap" might have been in the years before the war, there could be little doubt that in the reconstruction period there would be an increased and more imperative demand for medium and long-term finance. If the banks were to play any part in meeting that demand, the extent of their commitments of this nature should not be left to conjecture but openly displayed, as it would be in the balance-sheets of the new companies. Lord Wardington also made the point that the successful working of the companies would depend on the quality of their management.

Oil Refining in Britain

On Wednesday Lady Apsley asked the Minister of Fuel and Power in the House of Commons if it had been decided, in order to economise foreign exchange and on strategic grounds, to establish an oil-refinery industry in this country after the war. Major Lloyd George replied that "a substantial oil refinery industry already exists in this country," and that "the question of post-war expansion is kept under review."

If anything, Lady Apsley did not sufficiently emphasise the importance of the issue. On the economic side, the issue is not merely one of economising foreign exchange, but whether Great Britain is to participate on a large scale in an industry whose by-products form the basis of an important and growing chemical industry, and one in which productivity is relatively high.

But if Lady Apsley understated her case, the reply of the Minister of Fuel and Power was unencouraging. In referring to the existence of a *substantial* refinery industry he might easily give the impression, by implication, that Great Britain already has a solid footing in the industry, and that there is nothing to get excited about. Great Britain's refinery capacity had remained almost unchanged during the pre-war decade at about 2½ million tons per annum; three-fifths of its output before the war, moreover, consisted of asphalt and fuel oil. Consumption of oil products, on the other hand, rose from about 8 million tons to more than 11 million during the pre-war decade. A good deal of the existing refining capacity, moreover, is hardly in line with modern practice. Major Lloyd George was making light of an issue that is of vital importance to the future of this country.

Tinplate Proposals

A statement which Mr Hugh Dalton was to have made on a visit to South Wales carries one short step forward the story of the organisation of the tinplate industry in that area. It is now officially stated that the new hot strip mill is to be erected at Port Talbot and at least one new cold reduction plant is expected to be situated at Llanelly. It is further stated that Richard Thomas-Baldwins and Guest, Keen and Nettlefolds—already associated with Baldwins-Britton Ferry and the Llanelly Steel Company—are to collaborate in the erection of the hot strip mill. It is apparently intended that the considerable number of small owners of old hand tinplate mills shall, in part at least, amalgamate to run some or all of the new cold reduction plants required to deal with the output of the hot strip mill. No complaint can necessarily be made to the siting of the factories so far suggested, but it is less clear that the method of setting up the new section of the industry is satisfactory.

It is evident that the industry is to be highly cartelised, and it seems that many of those who will be associated in the management of some of the units at least will be precisely those people who have allowed the industry to reach a state in which it is completely incapable of production of a quality or at a price which is reasonable in the context of present-day technique. The sole exception to this generalisation is that the new plant of Richard Thomas at Ebbw Vale—the main credit for which must lie with Sir William Firth—was at the time of its erection reasonably up to date, although much handicapped on costs both by its site—changed at the instance of the Government—and by the insistence of labour on the employment of an unnecessarily large personnel.

While in the matter of siting there is improvement, it seems only too probable that other causes of unnecessarily high prices will exist, not the least of which may be the compensation to be paid to firms whose plant is put out of business. The principle of compensation as the price of agreement seems likely to play a large part in the organisation of post-war industry. It is difficult to see how this can fail to raise prices above what they would otherwise be, and, if the country considers this desirable for non-economic reasons, it is entitled to be fully informed of the amounts of compensation paid.

Shortage of Hard Fibres

The Government-owned United States Commercial Company, following an arrangement with the provisional Philippine Government, has begun a drive to ship hard-hemp from the Philippine areas in American hands in the largest quantities and with the greatest speed possible. Before the war, Philippine exports of hard-hemp, chiefly Manila-hemp, were between 150,000 and 200,000 tons, but it is unlikely that more than a fraction of this amount can be exported for some time. Under Japanese occupation some plantations have been used for other agricultural produce, others neglected, and all of them were short of equipment—a particularly serious matter, for hard-hemp plantations require more equipment in the way of field railways and leaf-crushing and fibre-extraction plants than any other plantation industry. The Ministry of Supply's East African sisal bulk purchase agreement, to go on for two years after the end of the Japanese war, suggests that Philippine shipments will not adequately solve the supply problem.

Hard-hemp needed for marine tows, cordage and similar essential products, is one of the few raw materials of which the United Nations are critically short. East African production now exceeds the pre-war peak of 130,000 tons per annum, and in Mexico, Henequén hemp production has been encouraging. Experiments in some African areas and Central America have occasionally been successful, but their contribution to supplies is so far small. Unfortunately, American plans for hard-hemp production have proved over-ambitious, and the 1943 acreage fell short by 24,300 acres of the programme to plant 300,000 acres for fibre and 50,000 for seed. In 1944 it was reduced to 73,600 acres, and the scheme has now been virtually discontinued.

Current production of hard-hemp at the disposal of the United Nations is well below pre-war supplies. Apart from Philippine sources, some 90,000 tons of sisal a year used to come from the Dutch East Indies. Current demand for hard-hemp for war purposes is probably larger than the largest pre-war commercial demand, so that a substantial margin between supplies and requirements has to be faced.

North-East Development

The views of industry on the Government's White Paper on Employment Policy are of very great interest, particularly when they come from a Development Area, because the proposals for the location of industry form an important part of the White Paper. A memorandum issued this week by the Northern Industrial Group is one such example of "trying it on the dog." The Group, which consists of employers and trade union representatives, in their individual capacity, was formed in 1943, in order to promote industrial development in the North-east region, to co-ordinate local planning activities and to provide the Government with the information to assist them in the formulation of any plans for the area. It is an adjunct of a much wider body, the North-East Development Association, which includes representatives of local authorities, Chambers of Commerce and Development Boards, as well as of industry.

The Group's memorandum welcomes the recognition of Government responsibility for the former Special Areas, but seeks guidance and clarification on a number of points left vague in the White Paper. For example, it asks what the Government's intentions are in regard to the transfer of labour; whether measures are proposed for helping industries secure markets overseas; what is the scope of the "negative licensing" by which it is proposed to influence the location of industry, and to what extent assistance will be available for financing public works schemes to improve the amenities and communications of the area. Among the specific recommendations put forward are proposals that a single agency should be set up to act on behalf of the Government in the letting or management of Government factories and buildings, while a regional organisation, on a wider basis than the Production Regional Board, should deal with the reconversion of industry. The greatest stress, however, is laid on the need for new factory building. For historical and other reasons, the North East area has very few modern factories, and as a first step towards its development, the Group urges that building labour and materials should be released to make good the deficiencies, and should if necessary be given priority over the housing programme.

It may be that the answers to many of the Group's queries will have to wait until Mr Dalton introduces his promised legislation for the Development Areas. But it is to be hoped that there will be no undue delay. The problems of the North East are fundamentally the same as those of Scotland or South Wales, and the concern for the future of the former Special Areas is very understandable.

An Austin Surprise

A particularly striking case of the rather more liberal policy which a number of boards are showing with regard to equity dividends is provided by the Austin Motor Company. After paying 10 per cent in each of the four complete war years, the directors announced a payment of the same dividend and a cash bonus of equal amount in respect of the year to July last. For the preceding year the company had paid EPT for the first time, and the earnings for the ordinary and "A" shares were 53.3 per cent before charging £200,000 for deferred repairs. On the same basis the average earnings for the four war years were 49.1 per cent, or slightly under 20 per cent after charging this item. In the four years to July, 1938, the yearly dividend, on substantially the same capital, was 50 per cent, and the average equity earnings 71.5 per cent. The capital of the company is highly geared, and the amount necessary to pay the difference in dividend comparatively modest. That earnings have been so low of late appear to be due to special appropriations out of taxed earnings.

The board had already announced that the accounts for 1943-44 would not be presented until those for the current year are available, and no statement of profits accompanied the dividend announcement. In conformity with the requirements of the Stock Exchange Committee, profit figures should have been provided, and in the circumstances the jobbers in this market suspended dealings until such time as the profit statement was produced. The action was unofficial, and this may explain why one or more of the provincial exchanges continued dealings. All substantial business was, however, suspended until afternoon when the company produced a statement.

This explained that there was every probability that profits would bear EPT in 1943-44, and that the net sum would be little different from that of the preceding year. It was further

disclosed that the net amount available for dividends and reserves would exceed £150,000. No comparative figure for 1942-43 was given, and it is not clear whether this compares with £127,000 or with a debit of £73,000. The jobbers, however, considered the statement sufficiently informative to permit the resumption of business. Business was done on the basis of 32s. 6d. for the "A" shares at which the yield on the increased distribution is slightly over 3 per cent subject to tax.

Towards Rubber Regulation

A statement on the discussions of the International Rubber Study Group in Washington last week shows that, despite the fact that it is prevented from preparing regulation plans, its deliberations can lead to no other conclusion than that a rubber regulation scheme will be inescapable. The Group estimates that within three or four years after the liberation of the Far Eastern producing area, world production of crude rubber may rise to 1½ million tons a year, compared with the peak output of 1.6 million tons in 1941. Synthetic production was less than 100,000 tons at the outbreak of war, and the Group estimates it may reach 1.3 million tons by the end of the war.

On the other hand, the Group puts world consumption of both crude and synthetic rubber at 1½ million tons, even on the assumption of a high rate of industrial activity, and including "banked-up demand." This figure is some 300,000 tons above the record consumption of 1941. Unless new uses for rubber are discovered, regulation will be essential until the long-term upward trend of rubber consumption (about which the Study Group is optimistic) catches up with supply. A temporary control scheme may, therefore, be necessary. Any such scheme should not only be of definite and short duration, with a sliding scale to ensure its gradual relaxation, but be operated by an international Government agency, and not by the producers themselves.

Milk and Beef

Milk production is, naturally and rightly, much more important than beef production in this country. The profitability of dairying has depended traditionally quite as much upon the accessibility as upon the suitability of any land, with the result that farms in the vicinity of large urban centres have been able to engage in much more intensive milk production. This fact also explains why good beef is grown only in areas which are inaccessible to the milk market. In other areas, beef is mainly obtainable—sometimes as a side-line—from dual purpose herds.

The widespread breeding of dual-purpose cattle, a practice which is found in few other countries, has been severely criticised recently in a paper read to the Farmers' Club by Mr Everall, who claims that this practice is one of the reasons for the low quality of British commercial cattle. There can be little doubt that the most profitable alternative to a dual-purpose herd is a single-purpose dairy herd; and the rising demand for milk may anyhow effect some transition in this direction. More British milk must mean less British beef, but farmers in comparatively remote areas might find that, if prices become adjusted in favour of quality, it was better to concentrate simply on growing good beef.

But neither milk nor beef will improve in quality without deliberate Government action. It is only too true that the British farmer has shown in the past a regrettable lack of interest in British pedigree stock, which has often been sold to overseas producers. Mr Hudson has recently taken positive measures to upgrade the standard of British herds. But the most effective way to improve the quality of British milk and beef is through further readjusting of subsidies in favour of products of guaranteed high quality and, in the case of milk, safety. Such a policy cannot, of course, be carried out while the war lasts, and its use in peacetime is limited by the necessity of keeping down prices.

The New Herring Industry Board

The Herring Industry Act of August, 1944, reconstituted the Herring Industry Board, and gave it new and wider powers over the industry, including the granting of loans, the purchase of boats and equipment for charter to fishermen, and the promotion of refrigeration and of the processing of herrings. The Act was in a sense a piece

of post-war rehabilitation, but it was understood that work would be begun before the war ended towards carrying out part of its provisions. The Board itself was appointed in August and it has discussed with the departments concerned plans for the 1945 fishing season, as well as long-term schemes.

An Order (SR and O, 1945, No. 74), just published, defines the Board's immediate powers and restores some provisions of the Herring Industry Acts, 1935 and 1938. Wartime regulations of the Ministry of Food and of the departments concerned with fisheries make it necessary to qualify the Board's functions relating, for example, to the regulation of production and distribution. While the Defence Regulations continue in force, anything the Board does in these matters will be subject to the consent of the departments concerned with fisheries. Where the wartime functions of the Ministries prevent the immediate restoration of the Board's powers, the Board is gaining valuable experience for the future by working in association with the Ministries.

The immediate tasks before the Board include the preparation of schemes to buy boats for charter and to make loans to returning fishermen. Research into herring preservation by freezing, and into boat design, is expected to begin this year. The history of the herring industry between the wars is a long lesson that prosperity can only be won back if the measures on the agenda of the Herring Industry Board are energetically carried out. The Board's activities will be welcomed by all concerned in the industry.

Precious Potatoes

Potatoes have been looked upon as an "insurance" crop during the war. Whatever other foods might be scarce, there would always be enough potatoes to ease pangs of hunger. That was the official policy. Potatoes are the only food in which this country is completely self-supporting. Their acreage has more than doubled since the war began; consumption has risen steadily, from a pre-war average of 3.40 lb. per head per week to 5.25 lb. in 1943. Last year consumption was nearly 3 lb. per head per week higher than in the United States.

The last potato crop was not as good as in previous years, in quantity or quality; but the greater part of the blame for the present shortage can be put, according to the Government, on the weather. As in the case of fuel, the Government does not appear to have provided for such an abnormally cold winter. At any rate, supplies may be expected to improve with the weather.

Wherever the fault lies, the Ministry of Food, which was successful in persuading people to eat more potatoes instead of bread and flour, now has to reverse the process. One of the recipes in the recent "Food Facts," headed "Potatoes are Precious," is for the odd-sounding "popover," which not only requires flour, but has to be baked in an oven, thereby using more fuel. Since the potato shortage involves an additional consumption of flour, it might have been better not to lower the extraction rate of flour early last month.

Diamond Group and Sherman Act

Nine companies producing and selling some 95 per cent of the world output of diamonds, are to be charged before the US district court of New York under the Sherman Anti-Trust Act and the Wilson Tariff Act. The charge is "conspiring to restrain and monopolise the foreign trade of the United States in gem and industrial diamonds" and special stress is laid on the effect of an alleged restraint of business in industrial diamonds upon the war effort. This is not a new claim and the diamond group has already stated more than once that it does not restrict supplies and

— 35/- per cent per annum —

is the present Interim Bonus rate on Whole Life policies. The rate on Endowment Assurances ranges from 25/- per annum for maturity age 50, to 35/- per annum for maturity age 70.

that the price structure for industrial diamonds is very moderate.

It is possible to advance arguments in favour of maintaining the value of gem stones in the interest of those who hold them, but it is very doubtful whether this can be held to serve the general interest, which ought to be the deciding factor. It is quite certain that industrial diamonds ought to be freely available at prices which give no more than a reasonable return. The assessment of what is a reasonable return may present substantial difficulties to the extent that industrial and gem stones are produced from the same deposits. It will be interesting to see what evidence the diamond group can produce, but even if the case is carried against them it is difficult to see how any action taken by one country, even by so large a consumer as the USA, can be fully effective unless other countries co-operate—and of such co-operation there is little or no evidence.

Larger Notes to Go

The authorities' war on Bank of England notes of the larger denominations—£10 and upward—has been taken a step farther by an Order in Council, which extends to the Bank of England the power to recall all its notes. This power is now only held in respect of 10s. and £1 notes, and this by virtue of the Currency and Bank Notes Act of 1928. The Act gives the Bank of England the power to recall these notes which, not less than one month after the issue of the required notice, would cease to be legal tender (though they would remain the liability of the Bank of England). That power has not been exercised yet, but was taken as a normal precautionary measure.

It is unlikely, however, that last week's Order in Council would have been issued for no more than precautionary purposes. It will be recalled that in April, 1943, the Bank of England decided to suspend the issue of new notes of £10 and upward. This provides some indication about the way in which the new powers of the Bank are likely to be exercised. It is probable that when they become effective, the appropriate notice will be issued recalling notes of these higher denominations. There are many reasons why the authorities dislike these heavy-weight notes. The most important, as was stated by the Chancellor of the Exchequer this week, is that they provide a most convenient weapon in the hands of the evader of the exchange control regulations. Their potential for evil in this respect would be greatly increased if, after the war, the attempt were to be made to combine a maintenance of exchange control with a relaxation of postal censorship.

Subsidiary objects of the new regulation would be to reduce the ready acceptability, and, ultimately, the supply of large notes which have been doing much useful service to black market operators and income-tax evaders.

A final result of the recall of these larger notes will be to isolate still further the substantial quantities of such notes now held abroad. The desirability of this isolation is all the greater since recent years have seen numerous and, in some cases, passable attempts to forge large Bank of England notes. Protection against these forgeries will certainly be strengthened by depriving all notes of £10 and over of their legal tender attributes. It is unlikely that notes of £5 will be recalled in this way. They have become an essential part

of the circulation and the disappearance of their legal tender quality would inconvenience traders and farmers whose transactions are quite legitimately and, by virtue of long tradition, settled in cash.

"Limitations of Actions"

One of the legal problems brought by this, and every prolonged, war is that of dealing with the isolation of potential parties to legal actions, either because they are enemies or reside in territories divided by war. In this country the Limitations Act of 1939 prescribes a period of six years as the maximum within which actions must be brought if founded on simple contract or tort. As the war has passed its fifth anniversary the rights of would-be claimants are thus becoming imperilled.

This subject was referred to a Committee of Limitations and Bills of Exchange appointed by the Lord Chancellor; the Committee's recommendations have been published this week. The most important of these is that in the case of a cause of action to which one or other of the parties has at any time since September 3, 1939, been an enemy, or resided in enemy or enemy-occupied territory, the statutory period of limitation should be suspended during the time when that party continued to be such an enemy and twelve months thereafter. Otherwise the Committee recommend no general suspension of the periods of limitation or any amendment to the Bill of Exchange Act or other enactments relating to negotiable instruments, though some changes in the law may be necessary as a result of the Peace Treaty that will come later.

At the end of the last war the problem of the suspension of periods of limitation as between enemies was dealt with by the Versailles Treaty, which suspended all such limitations and decreed that they begin to run again at the earliest three months after the coming into force of the treaty. The problem has been greatly aggravated in this war by the extent of enemy occupation of Allied territories no less than by the longer duration of the war. Hence the need for new legislation.

Floating Debt in January

The monthly debt statement covering the four weeks ended January 27, 1945, shows that the net amount of £5,672,000 was raised by the creation of debt, other than for capital expenditure issues. Since the "tap" loans and other longer term issues brought in £172,502,000 during this period, the floating debt was compressed by £166,830,000.

Repayment of floating debt normally occurs at this period of the financial year when tax revenue is particularly heavy, but the size of last month's contraction is due not so much to the revenue factor as to a special operation of the National Debt Commissioners. This was one of the periodic investments of £120 million of funds held for account of the savings banks by the purchase of 3 per cent terminable annuities. As savings bank funds accumulate they are normally made available to the Government by ways and means advances pending their more permanent investment. Thus the £120 million subscription to 3 per cent terminable annuities is, on this occasion, accompanied by a fall of £98,440,000 in ways and means advances by public departments. During this period the Treasury also repaid the £59,250,000 of ways and means advances which were shown to be outstanding from the Bank of England on December 30, 1944. Treasury Deposit Receipts brought in a gross figure of £200 million, against which £195 million were redeemed. Of this last total, £34,500,000 was paid off before maturity to cover subscriptions to new Government issues.

The Cost of Living Index

The Ministry of Labour has recently republished in pamphlet form a note on its method of calculating the cost of living index. Since there is considerable pressure on the Government, especially from trade unions, to bring the index up to date, it is useful to restate the basis of its compilation.

The cost of living index was first introduced in the early stages of the last war, in order to "measure the average increase in the cost of maintaining unchanged the 1914 standard of living of the working-classes . . . irrespective

of whether or no such standard was adequate." It was based on the budgets of 1,944 urban working-class families collected by the Board of Trade in 1904, and weighted according to the proportions in expenditure going on the different items. Relatively few changes took place in the standard of living between 1904 and 1914; the Sumner Committee on the cost of living suggested in 1918 that the 1904 budgets could be regarded as sufficiently representative for 1914.

The index includes five main items: food, rent, clothing, fuel and light, and "other items." The weights for each group are as follows: food, 7½; rent, 2; clothing, 1½; fuel and light, 1; "other items," ½. The percentage increase ascertained for food prices is multiplied by 7½, that for rent by 2, and so on. The total of these calculations is divided by 12½ (the sum of the "weights"), and the effect is to obtain approximately the average percentage increase since 1914 in the cost of maintaining the standards of that date.

The present cost of living index stands at 102 per cent above the level of 1914 (the rise in food alone is 68 per cent), and, as Sir John Anderson recently stated in reply to a Parliamentary question, the total annual cost of subsidies needed to keep it at this level is about £218 million.

Even before the war it was recognised that the list of items and the weights in the index needed to be revised to correspond with changes in the standard of living. The Ministry of Labour conducted an inquiry into the expenditure of more than 10,000 households in 1937-8, which showed the proportionate changes in workers' expenditure between the different items in the index, and confirmed that a new scale of "weights" was required.

	Present Cost of Living Index	Ministry of Labour Budgets 1937-8
Rent and rates	16	13
Fuel	8	7½
Food	60	40
Clothing	12	9½
Other items	4	30
	100	100

The change in the proportion of expenditure on "other items," which includes such things as household equipment, tobacco, newspapers and entertainment, illustrates in striking fashion the unrepresentative character of the present index.

Action on the basis of the 1937-8 inquiry was postponed because of the war. It is true that prices and conditions now prevailing cannot in any way be regarded as normal, and it may legitimately be argued that with present restrictions on personal spending and shortages of consumer goods the present index is actually more representative than one based on 1937-8 consumption would be. Further, a revision now might place undue pressure on overworked staffs. But it is essential that the earliest possible opportunity should be taken to replace the 40-year-old index by one more representative of current working-class consumption.

Marine Insurance Review

The address by Mr C. E. P. Taylor, chairman of the Institute of London Underwriters, at the annual meeting on January 16th, contained an interesting review of developments in marine insurance during the past year and about the prospect. Dealing first with hull insurances, Mr Taylor expressed the view that the decision taken in the autumn to renew without alteration the present "understandings" was a wise one. The "understandings," it will be recalled, have the effect of stabilising rates at 37½ per cent above pre-war levels, with higher charges based on a sliding scale for risks showing an unfavourable experience over a period of three years. Mr Taylor was, therefore, in effect supporting the case against any reduction in rates at present, the reason he gave being the uncertain outlook as regards repair costs; another feature is that until the large amount of damage at present unrepaired has been reduced to normal proportions it is impossible for underwriters to determine whether present rates contain a margin or not. Speaking personally and not for the market, however, Mr Taylor thought that ship-owners might reasonably expect an adjustment in rates as soon as conditions return to normal.

As regards cargo insurances, Mr Taylor said that the combined marine surcharges—the surcharges which combine additional charges for the increased marine perils of wartime navigation with those for cover against transshipment, deviation and other risks provided for under wartime extension clauses—have afforded very considerable reductions to merchants and that the current schedule represents the maximum reductions which can be granted consistent with sound underwriting. In this connection he referred to the unfortunate recurrence of the theft and pilferage conditions which prevailed during and after the last war and reminded underwriters that the experience was at its worst immediately after the 1914-1918 conflict.

Two other points in Mr Taylor's address call for mention. First, he took the opportunity to deplore a suggestion made by two members of the marine market that British insurers should refuse to issue policies in currencies other than sterling; he emphasized, and rightly so, that to attract business the market must meet the needs of overseas policyholders as regards the currency to be used. Secondly, he suggested that rates should be quoted *net* and not subject to a discount of 10 per cent, as is the present practice. Certainly any measure which will simplify the calculation of premiums without involving any disadvantages is well worth the consideration of underwriters.

Shorter Notes

The Cotton Spinning Employers and the Operative Spinners' Amalgamation have been discussing the reorganisation of the structure of mule spinning wages for nearly two years. Agreement was reached last week. Big-piecers are to get an extra 10s. a week at 23 years of age, and little-piecers, cross-piecers and extra-piecers 11s. 6d. a week extra at 19 years. By raising wages, the employers hope to attract more labour, particularly juvenile labour, to the mills. Meanwhile the claim of all the cotton trade unions for a general wage rise is still under discussion.

The eleven clearing banks have now published their year-end balance-sheets. (A detailed statement for each bank, together with an analysis of the combined figures are given on pages 164 and 166.) The general trend of the figures was reviewed in *The Economist* last week on page 117, when figures for the "big seven" were available. The most interesting point brought out by the aggregate figures is the unusually high level of the cash ratio attained at the end of the year. A figure of 11 per cent has not been seen in the clearing bank statements since the end of 1940, and compares with a ratio of 10.47 per cent for the aggregate end of 1943 balance sheets. It would seem as though the banks had slightly overdone their windowdressing at the end of last year. The magnitude of these operations will only be measurable with the appearance of the till money data in the current month's Bank of England statistical summary. The high published cash ratio for the end of December, however, suggests that the windowdressing prior to the turn of 1944 must have been abnormally large.

CANADIAN CAR AND FOUNDRY COMPANY, LIMITED

Canadian Car and Foundry Company Limited reports good year. Financial statement year ending September 30, 1944, shows net profit available for Dividends of \$1,130,306 compared with \$832,241 previous year.

Common Stock earned \$1.52 compared with 68 cents in 1943. In addition 1944 refundable portion of excess profits tax equals 83 cents a share. Bank loan of \$3,500,000 was eliminated and net working capital increased by \$750,000 now totalling \$6,700,000.

President Victor M. Drury reports favourable prospects for capacity operations during 1945 in both Car Equipment and Aircraft Divisions. He comments: "Orders for railway equipment on the books, the great majority for export, will continue to keep Car and Steel Foundry Plants fully employed to the end of 1945."

COMPANY MEETINGS

MIDLAND BANK LIMITED

ANNUAL MEETING OF SHAREHOLDERS

The ordinary general meeting of shareholders of the Midland Bank Limited was held, on the 30th ultimo, at the head office, Poultry, London, E.C.2. Mr Stanley Christopherson (the chairman) presided.

The Chairman moved, and Sir Albert G. Stern (director) seconded, the adoption of the report of the directors and the audited statement of accounts for the year ended December 31, 1944, and the motion was carried unanimously.

Resolutions were carried authorising the payment on February 1st of a dividend of 8 per cent. actual, less income-tax, for the half-year to December 31st last; re-electing Sir H. Cassie Holden, Bt., and Lt.-Colonel Sir Albert G. Stern, K.B.E., C.M.G., as directors, and re-appointing Messrs Whinney, Smith and Whinney as auditors for the ensuing year.

On the motion of the Chairman, seconded by Lord Wigram (director), the meeting expressed its deepest sympathy with the relatives of those members of the staff who, during the past year, whilst serving in H.M. Forces, had lost their lives or been posted as missing or become prisoners, and of the civilian members of the staff who had lost their lives by enemy action, and recorded with deep regret the loss the bank had sustained.

THE TWO NEW COMPANIES

Asked for some indication of the bank's attitude towards the two post-war industrial finance companies the formation of which was recently announced, Mr C. T. A. Sadd (vice-chairman) said the bank had from the very outset welcomed the suggestion that steps should be taken, in co-operation with other parts of the financial system, to make good any gap that might exist in methods of providing post-war finance.

Continuing, he said both the proposed institutions are concerned essentially with the provision of middle- or long-term funds, and both therefore cover parts of the field which could hardly be brought within the range of direct bank advances. We are confident that these schemes should do great service for British industry and trade. With the full and unanimous approval of the directors we have pledged our whole-hearted support to the proposals and our continued co-operation in carrying them out; and we shall continue to give the most progressive and broad-minded consideration to all proposals coming to us for accommodation properly to be provided by a commercial bank, especially where through enterprise allied with integrity and good prospects they seem likely to contribute to the healthy expansion of industry and trade.

TRIBUTE TO LORD NORMAN

Before closing the meeting, the chairman referred to the change of leadership in the country's financial affairs. The position of the Governor of the Bank of England is, he said, unique. It was through him that the wishes of the Government were made known and through him that they made their ready response, in practical terms, to the guidance thus given in the interests of the country's business. Lord Norman had filled this position of vast responsibility with a distinction that provided constant evidence of great character and power of intellect, and the meeting agreed to send him a message of hope that he would long enjoy the happiness in retirement he had so richly earned.

The Chairman was also authorised to assure Lord Catto of the admiration felt for the outstanding qualities—not least that characteristic mixture of common sense and genius—that had brought him to his eminent position in the affairs of the nation and of the firm confidence and warmth of good-will with which the news of his appointment had been welcomed.

LLOYDS BANK LIMITED

POST-WAR FINANCING OF INDUSTRY

LORD WARDINGTON'S STATEMENT

The eighty-seventh ordinary general meeting of this bank was held, on the 2nd instant, at the head office, 71, Lombard Street, London.

The Chairman, the Rt. Hon. Lord Wardington, said: At the time when my annual address went into the printers' hands I was not in a position to make any reference to two important schemes for the post-war financing of industry which have since received the approval of His Majesty's Government as indicated by the Chancellor of the Exchequer in Parliament on January 23rd.

LONG TERM CREDIT FOR INDUSTRY

The announcement by the Chancellor of the Exchequer with regard to the second of the two new companies which it is proposed to form—The Industrial and Commercial Finance Corporation, Limited—stated so precisely its capital structure and borrowing powers, its purpose and function, the nature of the business it will carry on and the manner in which it will be controlled and managed, that I need not go over that ground again. You will, however, expect me to say something about the reasons and principles which have guided us in our discussions on this subject and have decided us to commit your bank to a participation in the new undertaking.

Let me say at once that in setting aside a portion of our funds for the provision of long-term credit for industry we have never for a moment forgotten our paramount duty to our shareholders and depositors of maintaining a sufficient liquidity in our assets. That is not a fetish which we set up and worship without reason. It is the strong foundation of the British banking system. One has only to recall the effect of the economic depression of 1929 and the following years to realise what a complete and convincing vindication it afforded of the inherent stability and strength of British banking policy. British banking was thoroughly and severely tested and by no means succeeded in isolating itself from the results of the depression, but at least we avoided the crippling losses which would undoubtedly have been sustained under the Continental banking system and, with the aid of our strong reserves, weathered a long and severe storm.

DECISION JUSTIFIED

But it may be objected that we are departing in some measure from these sound principles in committing our bank to a long-term participation in our new institution. This, of course, is partly true, but we believe it to be fully justifiable on several grounds, though only within certain limits.

In the first place, the amount of our participation is so small in relation to our total assets as hardly to affect the position of extreme liquidity to which I have already referred in my printed speech. If we took our maximum participation in the share capital of, and of loans to, the Industrial and Commercial Finance Corporation, Limited, our proportion of advances to our deposits would only be increased by slightly less than 3 per cent. It is also pertinent to remember that, even under the strictest application of banking principles when our advances are granted on a payable or demand basis, they frequently extend in practice over considerable periods. Nor, if viewed in relation to our capital, reserve and inner reserves need the amount cause us the slightest anxiety. There may indeed be some who feel that the capital and borrowing powers of the company might well have been larger, but on the other hand experience may show that we have, in fact, over-estimated rather than under-estimated the maximum possible demands for this type of business.

In the second place, whatever views may

be held about the reality or importance of the Macmillan gap in the years before the war, there can be little doubt that in the reconstruction period there will be an increased and more imperative demand for medium and long-term finance. This demand must be met if the business of our country is to prosper. Not only must the demand be met, but it must be seen to be met. It is, moreover, highly desirable in my opinion that the extent to which medium and long-term advances are being provided out of short-term banking deposits should not be left to conjecture but openly displayed. This will be clearly shown in the balance-sheets of the companies. Those are two important reasons for launching the new company to supplement the work of other institutions in fulfilling this national need. With its large resources and strong financial sponsorship the new institution gives public assurance that, within the range which its operations are intended to cover, no business which has economic justification and which is well managed and credit-worthy need find its rehabilitation and further progress hampered for want of the necessary financial resources.

MANAGEMENT OF THE COMPANY

Let me add this—that the successful working of the company must depend upon its management. We hope that it will attract the services of an enlightened and experienced board of directors who will administer the funds which we shall place at their disposal, not rashly or in too adventurous a spirit, still less with too strict a regard for absolute safety, but with as much measure of imagination and judgment as will fulfil the objects for which the company has been founded.

The first company to which the Chancellor referred—The Finance Corporation for Industry, Limited—will be complementary to our own company, and is intended to facilitate the provision of capital for large businesses in the post-war period. The credit which this company will make available to industry is of a type which we should normally afford to our customers by way of temporary accommodation pending a public issue of stock. However, until the time arrives when the investment market can be freely opened to new commercial issues, it is perhaps as well that a specialised institution for this class of business should have been brought into existence under such strong auspices. You will, I am sure, agree with me that a financial institution with a capital of £25 millions, called or callable, subscribed by the Bank of England, a group of leading insurance companies and another group of leading investment trust companies must be regarded as a borrower of the highest rank. The only question to bankers, therefore, is, would an application for a loan be considered worthy of approval? Accordingly, we have had no hesitation in joining with the other clearing and Scottish banks in giving an assurance that when the company is in a position to transact business it can approach the banks with the knowledge that they will provide within reasonable limits the loan facilities which it will require. That is the extent of our commitment in connection with this company.

THE SMALL BORROWER

These two companies, it will be observed, cover the whole range of medium and long-term advances to industry, with the exception of those borrowers whose requirements are less than £5,000. They will be catered for by their own bankers in the same spirit which has animated the foundation of the two new institutions. In my address last year I made some reference to the part which the banks would be anxious to play in the great tasks facing the

country, and stated our intention of being more elastic in our view as to what constitutes a legitimate banking loan. We, in this bank, have already taken practical steps to this end by enlarging the discretionary powers of our managers and by the instructions we have laid down for the guidance of our advance department.

There is one other small matter to which I had not intended to refer, but as it appears still to excite the curiosity of some sections of the public, and as other bank chairmen have mentioned it either by inference, or directly, it may be of interest to state that we are some way remote from any liability for Excess Profits Tax.

As I explained in my address to you two years ago, it is an interesting amusement to try and calculate the possible liability of banks to Excess Profits Tax, but not altogether a profitable one, as without knowing the amount of the standard profit, or the many adjustments required by the tax authorities, it is quite hopeless to make anything but a more or less intelligent guess.

The report and accounts were adopted and the usual business transacted.

TECALEMIT, LIMITED

MANAGING DIRECTOR'S STATEMENT

The tenth annual general meeting of Tecalemit, Limited, was held in London on the 31st ultimo.

The managing director, Mr W. J. Parolow, said:

Ladies and Gentlemen: Your chairman, Mr S. G. Gates, C.B.E., is at present in America engaged on the furtherance of the Company's business, and he expects to proceed to Australia to visit our plant there. At his request, therefore, I am submitting to you the directors' report and statement of accounts for the year ended July 31, 1944.

Before coming to the other business of the meeting I should like to introduce to you the two new directors whom the board co-opted during the past year and who now offer themselves for election in conformity with the Company's Articles of Association. Mr E. G. Taylor, who has been on the sales side of the company's business for seventeen years, is proposed as sales director. And Mr C. S. Le Clair, who has filled the post of chief engineer for the last seven years, is proposed for the position of technical director. Both gentlemen have demonstrated their ability in high executive positions and will unquestionably prove valuable additions to the board.

During the year under review both our London and Scottish factories operated by the Coventry Repetition Company, Limited, have been working to full capacity. Measured in terms of volume their output over this period has been at least the equivalent of the previous year's output, but the continued upward trend of operating costs combined with downward price revision of certain Government contracts, has resulted in a reduced gross profit. Net profit, however, has shown a slight increase at £97,958, as against £91,055.

The board recommends to the meeting the payment of a final dividend of 12 per cent. on the increased capital.

QUESTION OF NEW FRESH WORKING CAPITAL

Until the past year the company had acquired no fresh working capital for nearly ten years. As you may remember the chairman stating at the fifth ordinary general meeting, the question of making an offer of some of our unissued shares for subscription by shareholders was already under consideration in 1939, but was frustrated by the outbreak of war. Since then the company's activities have further expanded, rendering the provision of additional working capital even more necessary. Accordingly, application was made to the Capital Issues Committee early last year for leave to issue the balance of the company's authorised but unissued capital, amounting to 629,000 shares of 5s. each.

This application was granted in part only—to the extent of 342,750 shares, which were offered to shareholders at a price of 15s. per share, realising a total of £514,125. Despite this accretion of fresh capital, it is the board's view that your company is still somewhat under-capitalised for its activities, and this position may have to be rectified by a further issue of capital as and when leave is granted or ceases to be necessary. Meanwhile, the board recommends that the nominal capital of the company be increased from £500,000 to £750,000.

In accordance with the practice recently adopted by very many companies, the company's shares have been converted into stock. It is hoped by this means to eliminate much unnecessary clerical work.

BALANCE SHEET ITEMS

I now turn to the balance sheet. The issue of capital above referred to resulted in a share premium account of £171,375. From this we have written off the cost of the issue (£9,576), the premium on shares acquired in the Coventry Repetition Company (£20,000), and A.R.P. expenditure (£1,799). The balance of £140,000 has been carried to a capital reserve account.

The item freehold land and buildings has risen from £149,495 to £174,800. This is due to the exercise by the company during the year under review of its option to purchase the freehold land and factory buildings situated immediately opposite the company's main factory. This property, previously held by us on lease, occupies an area of approximately 80,000 sq. ft. with its frontage on the Great West Road. A substantial portion of it is yet unbuilt on.

Provision for taxation of £420,000 represents, as it did in last year's accounts, an estimate calculated to cover excess profits tax for the company and its subsidiary as well as income tax on profits earned up to July 31, 1944.

FRENCH AND UNITED STATES INTERESTS

The chairman has recently been to France and has visited the two factories operated by Tecalemit S.A. at Puteaux and Orly, in the neighbourhood of Paris. Both these factories have been fortunate enough to escape damage in the course of hostilities. Production is at present hampered by lack of electric power and raw materials, but we have every hope of eventually receiving a return from this investment which, in the uncertainty following the fall of France, we deemed it prudent to write down to the nominal figure of one pound.

During the last two months the chairman and Mr Le Clair have also visited the United States and have had an opportunity of studying the most recent developments in that country in the many fields in which your company is interested. In this connection, I am glad to say that we are assured of a continuance of our long-standing arrangement with the Stewart Warner Corporation of Chicago (Makers of Alemit equipment) under which the two companies exchange patents and technical information.

I shall not attempt to assess the company's peacetime prospects, but I will mention one fact which encourages the board to face the future with sober confidence. Our wartime products so closely resemble our peacetime standards that when the change-over becomes necessary it should be achieved without an appreciable pause.

TRIBUTE TO STAFF

The plant did not sustain any damage from the flying-bomb attacks, but I am sorry to say that a number of our employees lost their families or their homes in them. Nevertheless, despite danger, discomfort and fatigue they maintained an unflinching standard of production throughout the year. I am sure you will wish to join the board in expressing our admiration of their courage and endurance.

The report and accounts were unanimously adopted.

LIEBIG'S EXTRACT OF MEAT COMPANY, LIMITED

INCREASED TURNOVER

The 80th ordinary general meeting of this company was held on the 30th ultimo in London, Mr Kenneth M. Carlisle (chairman and managing director) presiding.

The following is an extract from the chairman's statement circulated with the accounts:—The figure of profit carried to appropriation account is £401,173 in comparison with £274,031 in the previous year and, after transfer of £195,000 to taxation provision account, there remains a net balance of £206,173 against a comparable figure last year of £163,820. This year's profit of £206,173, with the addition of £178,499 brought forward from last year, leaves available for distribution a total of £384,672.

DIVIDEND POLICY

After payment of the preference interest and of the interim dividend paid in July last, it is proposed now to pay a final dividend free of income-tax of 6s. per £5 unit of ordinary stock, which, together with the interim dividend, will make a total of 8s., free of tax, per unit, the same as in the previous year. At the same time the carry forward will be raised to £199,672.

I indicated in 1940 that there was little likelihood, so far as could be foreseen, having regard to increasing demands of taxation and to the ceiling placed on profits through the operation of the Excess Profits Tax, that there could be any improvement in the rate of dividend so long as the conditions created by the war continued. Our policy has been during the war years to maintain the gross dividend at a stable rate, approximating to that ruling during the year when our standard for Excess Profits Tax purposes was established, and to appropriate whatever surplus there might be towards strengthening the resources of the company, having in mind the eventual necessity for deferred repairs, renewals, and re-equipment of plant which, when they can be undertaken after the cessation of hostilities, will be pressing, extensive and costly. Actually we have done rather better than foreseen, for the present rate of dividend is equivalent to 16 per cent. gross, whereas the 11 per cent. paid for the year 1936-37, with the income-tax then in force, equivalent to 14½ per cent.

Besides the heavy outlay on repairs, renewals and re-equipment which will have to be undertaken, there will be the rehabilitation of our Continental subsidiary companies which has to be borne closely in mind. These subsidiaries have in the past played an important part in our sales organisation, and it will be our aim and object to see that their businesses are once more set on their feet with as little delay as possible in order that the trade in their products, to which considerable popularity and goodwill are attached, may be recovered.

TRADING CONDITIONS

In the United Kingdom the year has again been favourable for trade in our proprietary products, and the volume of turnover, which has still further expanded, has been limited only by the availability of supplies. Conditions in our South American factories have been rather less propitious owing to a decline in the number of cattle available for slaughter, and the consequent increase in price which invariably accompanies heavy demand upon a market deficient in supplies.

Our farming companies have again enjoyed a prosperous year and have benefited from the considerable increase in the price of all grades and varieties of livestock; all the subsidiary companies engaged in livestock husbandry finished the year with balances well on the right side.

In Kenya and Rhodesia our plants were fully engaged to the extent of the cattle available and both subsidiary companies had a favourable year's trading to record.

TURNER AND NEWALL, LIMITED

HISTORY OF OPERATIONS

MR W. W. F. SHEPHERD'S STATEMENT

The annual general meeting of Turner and Newall, Limited, was held on Thursday, the 25th ultimo, in Manchester, Mr W. W. F. Shepherd, the chairman of the company, presiding.

The secretary, Mr John L. Collins, read the notice convening the meeting and the report of the auditors, Messrs Deloitte, Plender, Griffiths and Company.

A statement by the chairman had previously been circulated to the stockholders with the directors' report and balance-sheet.

TRIBUTE TO SIR SAMUEL TURNER

Mr Shepherd's statement began by referring to Sir Samuel Turner in the following manner:

On behalf of the board I wish to take this opportunity of paying a special tribute to the outstanding achievements of Sir Samuel Turner during his long career with this company and its predecessors. Sir Samuel, who, as you are aware, retired from the chairmanship of your board on September 30th last, joined the then family-owned business of Turner Brothers in 1896, and from then until the present time has been continuously engaged, first in learning the business, and later in applying his knowledge and great gifts to the development of its activities and the building up of its strength. To him, in outstanding degree, belongs the credit for the formation and consistent progress of the Turner and Newall Group, and while he would be the first to point out that others have contributed substantially, your board are convinced that Sir Samuel's vision, courage and leadership are largely responsible for the eminently satisfactory position of your undertaking to-day. It is typical of his outlook that, while still in full health and vigour, he has chosen to relinquish the lead to a younger man; but it is a matter of deep satisfaction to your board that he remains with us as deputy-chairman, and that his experience and mature judgment will still be available in our deliberations. If, at this point, I may for a moment be permitted a personal note, I would like to say that I am honoured to have been elected to succeed Sir Samuel as chairman. I have collaborated closely with him during the past 17 years, and venture to hope that I may prove to be a worthy successor.

The chairman's statement next dealt with the accounts of the company at some length and with the company's operations during the year under review both at home and abroad, and then referred to the recommendations by the board as to the final dividend of 8½ per cent. on the ordinary stock, after which the statement continued as follows:

Much has recently been said and written as to the alleged failure of private enterprise during this century, and particularly in the period between the two great wars. It is probable, therefore, that you will be interested to have a brief report on the history of our own operations during this period.

GROWTH OF UNDERTAKING

At the beginning of this century, the then relatively small asbestos trade of this country was largely in the hands of German and Italian importers, and British manufacture of asbestos products existed on only a minor scale. To-day your organisation alone (and we have many competitors) owns 13 factories in the United Kingdom, three in the United States of America, and three in India, in addition to the African and Canadian mines which are the source of our basic raw material.

Forty-five years ago the employees of the businesses which now comprise your or-

ganisation numbered only a few hundreds. To-day they number about 30,000. It will, I think, at once be agreed that apart from the industrial progress which is indicated by these figures, a social contribution of major importance has been achieved in the provision of employment for such a large number of workers.

The next point which suggests itself for enquiry is who, apart from our employees, has benefited financially as a result of our operations? The answer is found in the fact that there are about 23,000 stockholders on our registers and the over-all average holding of the company's stock is under £300 per person or, if the preference and ordinary stock are taken separately, the average preference stock holding is £794, while the average holding of ordinary stock is £254 per person. The Government, however, in times of peace as well as war, is by far the largest single participant in our earnings.

Our stockholders are the owners of an enterprise which has been built up from small beginnings over the period of the past forty-five years, and has experienced its greatest period of growth during the past twenty-five years.

The function of our business is to supply some of the vital requirements of other industries, principally the engineering, building and shipbuilding industries, and in so doing we have provided an adequate living for 30,000 employees and their dependants, and also a reasonable investment return for 23,000 others. Your undertaking is managed under the direction of a board whose members, with one exception, are engaged in its operation on a whole time basis, and you may be interested to know that the average age of your board is 53.

A SATISFACTORY RECORD

A record such as that which I have just summarised, while it does not for a moment give rise to any feeling of complacency in your board, is nevertheless one which I think we can regard with satisfaction. It is individualist enterprise, harming no one, and contributing substantially to useful social purposes. It surely demonstrates that if this company may be regarded as typical of the best of British industry, there can be little inherently wrong with the system of private enterprise coupled with joint stock ownership.

In the abnormal conditions obtaining to-day I could not reasonably be expected to be "specific in prophecy." I can, however, say with confidence that if in the post-war period our Government will openly declare and operate a consistent political and economic policy, and then leave us to manage our own affairs within the framework of such policy, we may well hope and expect to continue the progress of the past twenty-five years. Meantime, the necessity for continued effort in relation to the prosecution of the war remains, and we shall not spare ourselves in our efforts to maintain our own contribution at the high level of the war years as a whole. At the same time we are actively preparing to participate, as suppliers of materials, in the Government's new temporary housing scheme, for the purposes of which substantial quantities of several of our products will be required.

EXPANSION SCHEMES

Our planning for the post-war future continues, and we already have under detailed consideration expansion schemes which will entail expenditure exceeding one and a half million pounds on capital account within the first two years after the end of hostilities. We anticipate being able to

finance these schemes quite comfortably from the company's existing resources, and no new issue of capital is contemplated in connection therewith.

Generally, the post-war future looks bright, and given freedom for your board to exercise its own judgment and implement its decisions quickly without too much reference to Government departments, our progress is assured.

In conclusion, may I, on behalf of the board and also on your behalf, express to the officials and employees of our various undertakings at home and overseas our thanks for their effective efforts during the past year, and our hope that, before many months have passed, a cessation of hostilities in Europe will make it possible for their activities to be carried on under less harassing conditions?

The usual resolutions were then passed approving and adopting the report and accounts and the payment of the ordinary dividend as recommended, following which the retiring directors and the auditors of the company were re-elected.

R. A. LISTER AND COMPANY, LIMITED

MR PERCY LISTER'S SPEECH

SOME POST-WAR PROBLEMS

The annual meeting of R. A. Lister and Company, Limited, was held, on the 30th ultimo, at Dursley. Mr Percy Lister, the chairman, presided.

In his address to shareholders Mr. Lister said: We have included this year a consolidated balance-sheet in a new form, together with a consolidated profits statement. These statements show the sound financial position of your undertaking and reflect the conservative financial policy pursued by your board for many years.

From the consolidated profits statement of your company and its wholly-owned subsidiaries you will see the extent of your company's tax contribution to the Exchequer. Such taxation can be borne in wartime, but it will have to be readjusted at an early date if the reconversion of our industries from war to peace production is to be done efficiently and employees are to look forward with confidence to full employment.

ORDERS FILLED BY COMPETITORS

Your companies enjoyed in pre-war days a world-wide demand for their products, and it is on this account that we realise the extent of the disruption created by our "total war" effort, in which orders for your companies' products have had to be filled by competitors so as to permit the largest possible number of Lister and Blackstone products being available to meet the ever-growing demand for them by the Services.

With the coming of peace we shall spare no effort to rebuild on the connections and experience obtained at very considerable cost over a long period of years. Given freedom from bureaucratic controls and reasonable aids to trade by the Government, British exporting industries will make the requisite efforts to resuscitate our export markets, in many of which the prestige of Britain and the demand for things British were never greater.

In the consolidated figures referred to no account has been taken of your wholly-owned subsidiaries in France and Belgium, but from information received from the resident executives in Paris and Brussels we have good reason to believe that despite enemy occupation your interests have been safeguarded.

During the war your company has opened three sub-factories, in which part-time married women workers are employed. They have been so located as to permit a large number of workers with families and homes to make their contribution to war production, a contribution which would

have been otherwise wholly impracticable, and the greatest credit is due both to those responsible for organising this novel and excellent scheme and to the enthusiastic workers in the sub-factories.

DISPOSAL OF WAR STORES OVERSEAS

The problems which will confront us with the coming of peace are, of necessity, frequently under consideration, but no planners for post-war trade can ignore these problems presented by the disposal of Government surplus stores and equipment. Mechanised warfare has created an enormous volume of products, the unco-ordinated disposal of which could seriously imperil not only plans for full employment, but also the stability of many of our industrial undertakings.

The world-wide nature of the war will make the disposal of these surplus stores and equipment abroad a more important factor than the more easily controlled disposals at home, and it is to be hoped that, with the Dominions and our American friends, a co-ordinated solution to this important problem may be found which will embrace and protect future employment as the predominating consideration.

THANKS TO STAFF

In conclusion, it affords me the greatest pleasure to express my sincere thanks to the executive officials, staffs and employees, not only in our factories, but in all our subsidiary and associated companies, and to our sub-contractors, who have played their part in producing these satisfactory results despite increasing difficulties of an unprecedented nature.

I now have pleasure in moving the adoption of accounts and the appropriation of profits in accordance with the directors' recommendations, as set out in their report. The report and accounts were adopted.

and the payment of a final dividend on the ordinary shares of 5 per cent., plus a bonus of 6 per cent., making, with the interim dividend of 5 per cent. already paid, 16 per cent. for the year, less tax, was approved.

STEEL BARREL SCAMMELLS AND ASSOCIATED ENGINEERS, LIMITED

FURTHER EXPANSION

The eighth annual general meeting of this company was held, on the 26th ultimo, in London, Mr H. R. Hood Barrs (chairman and managing director) presiding.

The following is an extract from the chairman's statement circulated with the accounts:—The directors have approved and paid an interim dividend of 6 per cent., and they now propose a final dividend of 9 per cent., together with a bonus of 5 per cent., making a total of 20 per cent. for the year.

The strong financial position of the group justifies the directors in recommending the payment of this bonus.

The combined net profits of the three subsidiary companies, the Steel Barrel Company, Limited, G. Scammell and Nephew, Limited, and Carrimore Six Wheelers, Limited, amount to £91,432. This shows a further expansion and a steady advance on the profits of the previous year.

Peace production is the question that is foremost at the present time. Some partial return to more normal trading conditions will obviously become necessary during the stage which appears likely to occur between the cessation of the European war and the end of the Pacific war. Employment must be available for men returning from the Forces. In the opinion of your directors, there will be no suffi-

cient volume of employment until "controls" in their varied forms have been swept away. The present throttling control of bureaucracy provides no basis of business, nor can there be that degree of expansion or profitable production necessary to provide the openings for employment that will be needed.

The report was adopted.

THE NATIONAL BANK, LIMITED

ANNUAL GENERAL MEETING

The 110th annual general meeting of the proprietors of the National Bank was held, on the 27th ultimo, at the head office, 13, Old Broad Street, London, E.C. Mr Michael J. Cooke, the chairman, presided.

The secretary read the formal notice convening the meeting and the report of the auditors.

The report and accounts, which had been previously circulated, were—with the approval of the proprietors present—taken as read, and the chairman reviewed the figures of the balance-sheet and referred to the payment of the dividend at the rate of 10 per cent. per annum and the transfer of £10,000 to both the reserve and the premises accounts, which left £47,904 carried forward.

The chairman moved: "That the report and balance-sheet to December 31, 1944, be adopted by the meeting and entered on the minutes."

Sir Thomas F. Molony, Bt., seconded the motion, which was carried unanimously.

The retiring directors, Mr M. J. Babington Smith, Mr James Dwyer and Mr Richard J. Maume, were re-elected, and the auditors, Messrs Peat, Marwick, Mitchell and Company and Messrs Stokes Brothers and Pim, were reappointed.

INDUSTRY AND TRADE

Trade Disputes.—The number of working days lost as a result of trade disputes in December, 1944, was 64,000, compared with 125,000 in November. There were 153 stoppages, compared with 214 in November, involving 32,200 and 47,400 workers respectively. The aggregate number of days lost during 1944 was 3,710,000, the result of 2,185 stoppages, involving 825,000 workers. The comparable figures for 1943 were 1,810,000, 1,785 and 559,000.

"The Economist" Sensitive Index.—There was no change in the index during the week ended January 30th. The complete index (1935 = 100) was 158.6; crops 135.7; and raw materials 185.5.

INSURANCE

"The Economist" Insurance Share Index.—This index is calculated on the basis of an investment of £1,000 in each of 23 representative securities in 1913. Insurance shares in general show but little change over the last half of 1944, the fall in September and October having been made good by the end of the year. Among composite offices the number of gains is about the same as the declines, but specialist life offices continue their upward trend in values. The reason for this may be that shares of specialist life offices fell more heavily than those of composite companies in the dark days and have therefore more ground to recover; their values are still below mid-1939 prices, although the index records an all-over gain of 5 per cent.

FINANCE AND BANKING

THE MONEY MARKET.—Credit remains in good supply. This week saw a considerable turnover of funds in the money market, end-January making up, the turn of the month and heavy tax transfers contributing to the movement. Credit conditions, however, were eased by some net repayment of floating debt. Treasury bill maturities were £10,000,000 in excess of payments (though some of the maturing bills were held by official quarters), while the T.D.R. payments of £20,000,000 were some £5,000,000 smaller than the effective maturities. It seems probable that the Exchequer needs were somewhat underestimated and that ways and means borrowing from the Bank was required over the end of the month. The Bank return shows a rise of £10,685,000 in Government securities. This is taken up on the other side of the return by a rise of £7,001,000 in bankers' deposits, which thus rise to the high level of £215,066,000 and by a net expansion of £1,935,000 in the note circulation.

MONEY RATES, LONDON.—The following rates remained unchanged between January 25th and February 1st:—
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%; Treasury Bills: 2 months, 1½%; 3 months, 1½%; Day-to-day money, 1½-1½%. Short Loans, 1½-1½%. Bank deposit rates, 1%. Discount deposit at call, 1%; at notice, 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between January 25th and February 1st. (Figures in brackets are par of exchange).

GOVERNMENT RETURNS

For the week ended Jan. 27, 1945, total ordinary revenue was £140,090,000, against ordinary expenditure of £111,993,000 and issues to sinking funds of £250,000. Thus, including sinking fund allocations £11,368,210, the deficit accrued since April 1st is £2,472,553,000 against £2,403,976,000 for the corresponding period a year ago.

Total	6302,764	4791,247	4976,236	114,201	114,593

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £16,932 to £3,236,230, the other operations for the week (no longer shown separately) reduced the gross National Debt by £3,021,153 to £22,069 million.

Every description of Banking Service undertaken

SALES MANAGEMENT AND SALES CONTROL. Well-known engineering firm supplying equipment and accessories primarily to the motor-car and ancillary industries, requires an outstanding man to act as Sales Manager in the widest sense of the term.

He must be a man of good education, some general engineering background, preferably aged 35 to 40. It is essential, however, that he understands modern management methods, and has had some years successful experience in the control of outside sales staff selling to industrial users.

This is a somewhat unique opportunity for a man who can quickly fit in to our present organisation, but who at the same time has the vision and tact to expand the business into new fields in the early post-war period. The production and financial arrangements are adequate to cover all reasonable requirements.

Applications, giving full particulars of education, age and career to date, will receive immediate consideration in strict confidence, and interviews will be arranged within the next six weeks.—Box No. 53, THE ECONOMIST, Brettenham House, Lancaster Place, London, W.C.2.

Economic Entente

M. RENE PLEVEN, the French Minister of Finance, spent only two days in London last week. But there is no reason to interpret the brevity of the visit as a sign of any lack of success. On the contrary, the statements made in Paris by M. Pléven and in the House of Commons by Sir John Anderson, show that both parties are very pleased with the progress made towards a solution of all outstanding financial problems between the two countries. This is good news, for there had seemed for some weeks to be a possibility that an irritating dispute of a purely financial nature would obstruct the approach to matters of much more fundamental concern.

The most urgent needs of France are not financial, but economic and psychological. The Bank of France is rich in gold, but France is starving. There is a shortage of raw materials of all kinds, industry is limping and in the land of good fare the people are hungry. At the root of all the difficulties are shortages of transport. France needs locomotives, lorries and tyres almost more than the goods to carry. With its transport-nerve cut, the country lies like a paralysed body, struggling to make the limbs respond to the will.

This is not a condition in which the British nation can afford to see its oldest and closest ally. And it is the feeling that their plight is not considered in London and

Washington to be a matter of the first importance that is particularly galling to the French. There is no need to rehearse the history of the last five years to appreciate that French susceptibilities are tender and their emotions near the surface. Their financial sufferings may perhaps have been smaller than those of their British allies; but who can weigh gold in the balance against the moral calamities that France has had to endure? So long as the French consider themselves neglected and disregarded, they will continue to cling to their reserve of gold which, large though it may be by the standards of penury to which the British Treasury has had to accustom itself, is pitifully small when set alongside the needs of a ravaged and disheartened country.

This is not, then, a moment to talk of money, however justified the British case. It is a time for making a great effort to bind up the economic wounds and soothe the nerves of France. It is becoming increasingly apparent that the immediate and proximate responsibility for this rests more fully on Great Britain than was at first realised. It is true that the only store of plenty among the United Nations is in America, whose resources vastly exceed those of this still beleaguered island. But America is on the other side of the Atlantic. Ships are again the great bottleneck; and the U-boats are once again on the prowl. In grimly

literal truth Britain and France are in the same boat. To an extent that may be large or small the two countries are competitors for the same ships. This being so, can it possibly be held that while the maintenance of a certain standard of civil consumption in Great Britain is a military necessity, there are no standards below which France can be allowed to fall without danger to the structure and purposes of the Grand Alliance?

The limits to what can be done can only be set by those who are fully informed. But something assuredly can be done, and even small quantities would make a difference. This can be seen from the numbers of ships about which M. Jean Monnet has been negotiating in Washington—six in January and ten in February. Is the British import programme so rigorously reduced to rock bottom that some help of this order of magnitude could not be made available? The stocks of imported foodstuffs and raw materials in this country are known to be quite sizeable. To draw upon them while the worst of the war might yet be to come would obviously have been foolish and has always been sternly resisted. But are they quite so vital to-day that a small dividend could not be paid out of them? As for transport, which underlies so much else, it is no doubt impossible to spare any locomotives or rolling stock. But the British Army in Great Britain would not seem, to the lay observer, to be so desperately short of motor transport that a few thousand lorries could not be collected for France. What is needed is the pressure of an urgent imperative, which has hitherto been lacking. It is the sort of job at which Lord Beaverbrook excels, and which he might well find to his taste. Whatever can be done should be done quickly and done generously and gracefully. And where nothing can be done, a full and frank explanation of the reasons should be given, since it should never be forgotten that the aim to be pursued is twofold, moral as well as material. The effort should be directed towards France in the first place; but the needs of Belgium are only one degree less acute, and Holland will, before long, have needs more intense than either of the other two.

When such an emergency programme has been put in hand with all necessary energy, and when the French people can see some tangible signs of sympathetic attention to their calamities—then will be the time to take up formal negotiations. And when that time comes, it may well be found that the financial obstacles which have been in the way in recent weeks will be more easily removed. Britain and France are in some degree complementary, if not in resources at least in needs. The French needs are

physical and economic, and badly though the British economy may be suffering from overstrain, it still has, in comparison with the French, all the advantages that a going concern has over a semi-dismantled one. On the other hand, Britain's chief needs, and they are grievous, are in the field of international finance, in which France is still comparatively well off. There is thus a great opportunity for mutual help. If minds can be diverted from arguments about the rights and wrongs of the past, from the sterile comparison of sufferings endured, from the relative deserts of to-day, and turned to the tasks to be accomplished to-morrow, it ought not to be difficult to find a satisfactory balance between the economic and the financial.

There is, after all, plenty to do. At every point, British and French interests touch. The colonial empires of the two countries march with each other all over the world and, in the delicate problems of readjusting primitive economies after the distortions of the war are removed, it would hardly be possible for either Britain or France to proceed except in consultation with each other and with the Dutch and Belgians. Civil aviation is another matter in which similarity of interests has already shown itself. Both countries are committed to policies of full employment; both will wish to attain the object by very similar means; and both will need to take into account the effect of their trade with each other. Thus even without trenching upon the political and strategic fields, in which the community of interest is still more obvious, there is a long agenda for Anglo-French cooperation. The structure of joint consultative committees, which existed in the first year of the war and by which each Ministry in London kept in constant touch with its opposite number in Paris, should be re-established as soon as possible, so that these matters can be fully discussed on the expert level without the disturbing intervention of high politics.

From the first day of the war British financial policy has set itself the goal of never impeding but always assisting the development of the war effort. In that cause enormous sacrifices have been made, and colossal burdens cheerfully borne, by the present generation and difficult legacies have been left to the uncertain future. The restoration of France has always been one of the major aims of British policy, and the time has now come to give it its proper place in the war effort. If, for a little while longer, finance serves as the handmaid of policy, and if thereby a firm economic *entente* can be established, the price will not be too high. It is a matter for the greatest satisfaction that the two Treasuries can view their relations in the same broad-minded spirit.

Housing Subsidies

AN article last week suggested that the post-war building programme is being planned on far too large a scale. The decision has been taken to train 1½ million workers and, in effect, guarantee them steady work. After the most generous allowance has been made for repairs and non-residential building, this probably means an output, after the first transitional years, of some 400,000 houses a year.

This is far too large a figure. Nothing, of course, could be too large for the first few years—say from now to 1950—but the output of those years depends on the speed with which the flow of materials can be organised, labour can be demobilised and the efficiency of the industry can be gradually worked up. It will not be affected by the dimensions of the long-term programme.

From 1950 onwards, on the other hand, 400,000 houses a year is a fantastically large amount. It is large by reference to the national income, since it would absorb the greater part of the national savings and squeeze out other objectives, such as the re-equipment of domestic industry and the rebuilding of foreign reserves which, when the first housing crisis is over, will be of greater importance. Moreover, it is large even in a narrowly housing context, since a rate of 400,000 houses a year can only be kept going for

as short a period as ten years by classifying one-third of the houses of the country as slums and clearing them by expensive subsidies. And how a collapse thereafter could be averted, none of the hardy prophets has yet explained.

In all this there is, however, an assumption that may, perhaps, puzzle the reader. Why does it have to be assumed that the only demand for houses would be a subsidised demand? Were not hundreds of thousands of houses built in the 1930s without subsidy, and will not this demand continue? To some extent, of course it will; there will always be some unsubsidised building. But there are several reasons for believing that it will be small in the post-war years. Unsubsidised building, though still large, was beginning to fall off before the war. Moreover, the causes that brought about the great burst of the 1930s were almost exhausted. The greater part of this building, as is notorious, was for the rehousing of the middle class and of the best-paid wage-earners, and it was mainly due to the coincidence of three factors:

(a) The rise to the maximum of the number of separate families, corresponding, with a time-lag of some 30 years, to the peak in the number of births in 1903.

(b) A desire on the part of these classes to move from the inner districts of towns to the outskirts, brought

about by the much greater mobility of public transport.

(c) The great rise in the real value of salaries and wages, arising from the fall during the Great Depression of the cost of food and raw materials, and coinciding with a fall in the cost of building and in interest rates, thus giving people the margin of income to make their desire to move effective.

All three factors are now reaching an end. The number of families is probably at, or very near, its peak and will soon start to fall. By 1950, when nearly a million houses, traditional and non-traditional, may have been built, virtually all those families which can afford to re-house themselves without a subsidy will have done so. And it is so probable as to be almost certain that the cost of building will have risen by more than the average rise in salaries— which have risen during the war by much less than wages.

For these reasons, it can be taken for granted that the flow of unsubsidised demand for houses will be very much smaller after the war than before. It might possibly be partly revived later on by some other fortuitous combination of circumstances—a great rise in salaries, a great improvement in the standards or housing and a reduction in building costs—but this is remote, and in any case the days of the 1930s, when very nearly 300,000 unsubsidised houses were built in a single year, will never return until the birth rate is restored to its level at the turn of the century. If anything like 400,000 houses a year are to be built, the overwhelming proportion will have to be on subsidy.

*

What is more, it will need to be a large subsidy. The basic reason for a subsidy is that the ordinary wage-earner has never been able, and is not now able, to afford to pay the economic rent of a new house. Or perhaps it would be more accurate to say that he is always sufficiently pressed for money to prefer an old house, however unsightly or inconvenient or even unhealthy, provided it is cheap, to a more expensive new house, however attractive. If the standards to which new houses are built would only stay still, while the average level of wages slowly rises, this gap might in due course be closed. There must be very few wage-earners today who would not gladly pay the full economic rent of a new house built to the standards that were considered satisfactory in the 1890s. But the standards do not stand still. Towards the end of the last war, the Tudor Walters Report recommended new standards of housing which, although, as Sir Ernest Simon says, they "had not even been dreamt of in pre-war days," became the pattern for most of the building in the years between the wars. To improve the housing of the people is a very desirable thing. But the raising of standards nevertheless produced the result that a very large proportion of the houses built in the interwar years either had to be subsidised or were occupied by people other than the ordinary wage-earner for whom they were intended.

Now the same process is being repeated. The Dudley Committee has recommended a new standard which is almost as much of an advance on the Tudor Walters standard as that was on the standards of 1910. The Tudor Walters house has a floor area of about 750 square feet; the Dudley house is to have an area of about 900 square feet with an outbuilding of 90 square feet. In money terms the effect of the recommendations is to increase the cost of the typical house by just short of 40 per cent. There is not the slightest doubt that the Dudley improvements ought to be embodied in working-class housing. But that does not alter the fact that—if they are accepted, as they seem to be, by tacit consent—they once more push the cost of a new house out of the grasp of the unassisted wage-earner. Nor is this an end of the matter. A further committee has been sitting under the chairmanship of Professor Sir Alfred Egerton to consider standards of heating and ventilation. Its report has not yet been published, but from public addresses made by its members, the drift is clear. The Egerton Report will recommend almost revolutionary changes in the standard of heating hitherto accepted in this country. Re-design of heating appliances may make it possible to get more heat for less current expense—but only at the cost of a still further addition to the capital cost of a new house.

Moreover, there is still another factor to be borne in mind. The cost of building has shot up during the war. This is partly due, no doubt, to the general disturbances of wartime. But it is also officially ascribed, in part, to the effects of the innovation of a guaranteed week. When the week's pay is assured, and employment is good, it is only human nature to relax effort. The guaranteed week is to stay, and so are conditions of full employment. It would therefore seem likely that standards of efficiency, the restoration of which would in any case take time, may never be fully recaptured. There is plenty of scope, as is often pointed out, for the reduction of costs by technical reorganisation, more particularly by the mass pre-fabrication of standard components. But all that can be achieved by these means may be required to offset the rise in costs due to lower human efficiency. It may well be that the cost of building—the cost per square foot—will be permanently higher relatively to the incomes of those who are to live in the houses. This has a double effect on the cost of housing subsidies. It increases the amount of subsidy for each house. And, by choking off all forms of unsubsidised building, residential and non-residential alike, it makes a larger number of subsidised houses necessary, if the industry is to be kept employed.

Thus the subsidy agony is piled on. First, in order to maintain the total pre-war output of about 360,000 houses a year, many more of them would have to be built on subsidy. But secondly, since it has been decided to guarantee work to a building industry nearly half as large again as in those years, an even larger total of houses will have to be built, the addition being entirely on subsidy. Thirdly, they are to be larger and better equipped houses. And fourthly, the cost of building may well be permanently higher, relatively to working-class incomes. What the final cost is likely to be is very hard to say, but when Sir Ernest Simon puts it at £100 million a year he is certainly being too conservative. Even in terms of money, which it is not very fashionable to consider as a limitation, the sums involved may be impossibly large. And in terms of real resources, it would appear that the country has been committed, by a series of single unrelated steps, each no doubt reasonable in its narrow context, to an enormous mortgage on the national savings which will obstruct the development of a properly balanced economic policy.

*

How far it is possible to retrace steps is a matter for the candour and courage of the politicians. But it is perfectly plain that every possible means will have to be taken to see that the fullest possible value is secured from every penny of subsidy. The method of subsidy will have to be chosen which secures the maximum of social objective for the minimum of expenditure.

In the past, far too little attention has been paid to this aspect of the matter. Subsidies have been given at flat rates for any house that met quite simple conditions, though in the later years, when the main subsidy was for slum clearance, there was an attempt to ensure that the new houses built on subsidy were used for the intended purpose. Flat-rate subsidies, however, are inevitably wasteful, since part of the money—and often a large part—goes to people for whom the help was not intended and who do not need it. And when the flat-rate subsidy is based upon the difference between actual costs of building and some stable assumed figure of tenants' ability to pay, the actual costs merely sky-rocket, as was proved by the Addison houses of the early 1920s.

A further defect of flat-rate subsidies is that they do not necessarily produce the types of houses that are most badly needed. The overwhelming majority of the subsidised houses built by private enterprise between the wars were sold. It is true that the finance of the sale through the building societies often approximated the conditions to those of tenancy—except that the occupier was much more permanently tied to his house than he would have been if he had been a simple tenant. And secondly, far too many of the houses built, by local authorities and private enterprise alike, assumed that the two-child family

was a maximum. Any subsidy programme should provide a fair number of larger houses to let.

In principle and in theory, there is a great deal to be said for paying the subsidy to the tenant and according to his circumstances rather than on the house and according to its costs. This would achieve the double advantage of providing for those who cannot afford to pay full economic rents and of leaving the costs of building under the pressure of a free market. The practical application of the principle is much more difficult. But it might be sound policy to allocate some of the money available for housing subsidies for application from the tenant's end.

In the main, however, subsidies are likely to continue to be given on the house. The chief requirement here would seem to be to get away from the simple flat rate. The subsidy should clearly vary with the size of the house as well as with its location, and an additional subsidy might be given as an inducement where the houses are to be let. Or again, if there are desirable improvements in the equipment of houses—such as better heating—the best way to deal with them is to offer a additional subsidy to cover part—but only part—of their cost.

A complex system of subsidies such as this clearly could not be applied in a purely haphazard fashion, open to all comers. Indeed, the facts of the case point straight to the necessity for imposing on each housing authority the duty of compiling a housing plan for its district. The plan should take account of the ascertainable needs on the one

hand and of the town planning requirements and building capacity on the other. It should provide for the proportions of houses of different sizes and types, and subsidy should be payable in that area only in accordance with the plan. But within the plan, the subsidy should be payable to the local authority itself and to private enterprise.

The subsidy programme also needs to pay particular attention to what in the long run will be the decisive factor in the whole complex—the level of building costs. One of the chief hopes for reducing costs is the possibility of mass-producing standard components. But mass-production requires mass demand, which might not be spontaneously forthcoming. The amount of subsidy should in any case be calculated on the assumption that the cheapest standard components are used. But a further incentive might be necessary, and if so the advisability should be considered of making the use of these fittings a condition of subsidy—or alternatively of making a “free issue” of them, reducing the cash subsidy to correspond.

None of these suggestions is put forward with any dogmatism—indeed, dogmatism would be out of place in an area that has been so little explored. But the exploration is itself a matter of urgency. The housing programme looks like absorbing so large a segment of the national savings that it may well dominate the economic conjuncture for years to come. It is essential that the financial methods to be pursued should be most carefully considered and widely discussed before they are decided.

The Road to Berlin

“EVERY bundle of straw, every transport of recruits . . . all that reaches me, is, or becomes, a favour on the part of my enemies, or a proof of their negligence, for they could, as a matter of fact, take everything. Here in Silesia, every fortress stands at the disposal of the enemy. Stettin, Küstrin and Berlin itself are open to the Russians to deal with at their pleasure. . . . If fortune continues to treat me so mercilessly, I shall undoubtedly succumb. Only she can deliver me from my present situation.”

These words are quoted not from Hitler but from Frederick the Great. They were written in 1761, in the last weeks of the Seven Years' War after the Pomeranian fortress and harbour of Kolberg had fallen to the Russians. Geography does not change, the “historical gaps” and routes of advance are still where they were two centuries ago. And history, too, has, it seems, a peculiar liking for refrains, although they tend to recur in very oddly assorted symphonies. Take, for example, the following plan of a campaign on the Oder, in Pomerania and in Brandenburg, drawn up for a Russian commander-in-chief. The plan consists of eight points:

1. Strike offensively in Pomerania and Brandenburg;
2. The quicker the campaign starts the better;
3. Speed up the seizure of Kolberg;
4. Persuade our allies to besiege Stettin and give them all assistance in seizing it;
5. Operate on the river Oder only so as to cover that siege;
6. If a general peace is not concluded in the meantime, it will be necessary to take up winter quarters on the river Oder;
7. Go all out for Berlin, if time and circumstances allow;
8. Conceal all this from the enemy so that he does not know the direct line of our operations until the beginning of the campaign.

These words were not addressed by Marshal Stalin to Marshal Zhukov some time in 1944; they were written by the Czarina Elizabeth to her General-in-Chief, Count William Fermor, on December 20, 1758.

There are some differences, of course. In the Seven Years' War the Russians did not chase their enemy back from the Volga. They struck from their bases and “magazines” situated along the Vistula and from the fortress of Poznan. Poland was then still an independent kingdom and in the Seven Years' War she was nominally neutral. But the country was ruled by Russian protégés, the Saxon Electors, who were also Kings of Poland (in those days Lublin was apparently situated in Saxony); the Russian Government secured the right to establish military

bases in Poland as well as the right of passage for its troops. Almost at the beginning of the war East Prussia was easily conquered by the Russians. General Fermor took in his stride the Insterburg gap and the road along the river Pregel to Königsberg. To the west of the Polish frontier, not one but three armies opposed the forces of Frederick the Great. The Swedes were in Pomerania and besieged Stettin. The Austrians advanced and retreated across Silesia; and the Russians pressed forward from Meseritz, Schwerin, Züllichau and Crossen towards Küstrin and Frankfurt. None of the battles fought here was really decisive—it was a special feature of the armies engaged in that war that they were unable to exploit their victories and to pursue a beaten foe—but the greatest battles of the war were fought around Frankfurt and in the marshes at the confluence of the Warthe and the Oder, so often mentioned in recent Russian communiqués.

The Russian successes were incomparably more spectacular than those of their allies. Throughout the war the Czarina vented her impatience on the “slowness and bungling” of her allies. To the land powers the maritime war between Frederick's ally England and Elizabeth's ally France was then almost as remote as the Pacific War is to-day to the continental nations, and perhaps even to the Russians themselves; France was repeatedly accused by St. Petersburg of unduly dispersing its forces in overseas and colonial campaigns.

Suspicious of her allies and looking askance on most of their military and diplomatic moves, the Czarina was nevertheless determined to preserve the unity of the Coalition. The victories of the Russian armies effectively cemented that unity. When the war started the Russian forces were definitely inferior to those of the Prussian king. Like Marshal Stalin in the first years of this war, Elizabeth changed her “Generals-in-Chief” several times. Marshal Aprakin was replaced by Fermor, Fermor by Saltikov, and Saltikov by Buturlin. Two of the most prominent commanders, Marshal Aprakin and General Todleben, charged with treason and intelligence with the enemy, were court-martialled. But though Russian military leadership was inferior to the Prussian, the endurance of the Russian soldier was unrivalled. And towards the end of the war Elizabeth's generals were probably already equal in skill to the generals of Frederick the Great. Such brilliant Russian commanders as Chernishev, Rumiantsev and Suvorov won their fame in the battles on the Oder. (Most prominent among their opponents was the dreaded

Prussian Cavalry General von Seydlitz, in all probability an ancestor of the present leader of the Free Germans in Moscow.)

*

Nevertheless, the political and diplomatic conflicts within the anti-Prussian coalition produced occasional tension between the allies. On this Frederick staked most of his hopes. In most of the wars bringing Russia into Central Europe territorial claims have come to the fore. The Seven Years' War was no exception. Elizabeth claimed Ducal Prussia—as East Prussia was then called—for herself. She also advocated the return of Silesia to Austria, and the “compensation of devastated Poland with Magdeburg and Lusatia.” Parts of Pomerania were to go to Sweden. All these territorial changes added up to as “harsh” a peace as possible for the House of Brandenburg. Elizabeth's demands met with French, Austrian and British opposition. As recently as 1943 a Russian historian described the motives of that opposition in these terms:

insincerity and not rarely open hostility . . . the endeavour . . . to take chestnuts out of the fire with other people's fingers and to achieve the weakening not only of the enemy but also of the ally.

With the polemical fervour that characterises Russian historical research the historian goes on to argue that the peace of 1762 was unstable because Russia's claims, dictated by security, had not been satisfied.

This interpretation is certainly one-sided. Frederick the Great was, in fact, saved by a sudden reversal of Russian policy that followed upon the death of Elizabeth on January 5, 1762. Her successor, the insane Peter III, an ardent admirer of the Prussian King, concluded peace with Prussia on the king's own terms. The pro-German tendency at the Court, which had been suppressed by Elizabeth, reasserted itself. Two years later the new Empress Catherine II concluded an alliance with Prussia, which was soon sealed by the three partitions of Poland. No wonder that Nazi propagandists have often recalled this “miracle of the House of Brandenburg” and held out to the German people the hope that a similar miracle might still occur.

*

It is noteworthy that interest in the political and military history of the Seven Years' War has strongly revived in Russia as well as Germany. The Russian Government made a gesture of boundless optimism and confidence when, with the German armies standing on the Don and the Volga, they gave Russian historians the assignment of collecting and publishing official documents on the victorious Russian campaigns between 1756 and 1762 and the capitulation of Berlin to the Russians in 1760.* These documents include the reports of the Russian commanders on the German lands they occupied. The East Prussians

* “Razgrom russkimi voyskami Prussi” (1756-1762) issued by the State Publishers (OGIZ) for the Management of Archives of the Commissariat of Home Affairs (NKVD).

adopted an extremely meek and even docile attitude towards their conquerors. The Mayor and the notables of Königsberg “humbly asked the Czarina for her protection and for the preservation of their privileges.” The civil servants took without protest an oath of allegiance to their new Sovereign; and Königsberg greeted the victory of the Russians with the ringing of bells and with festivities. This mood is very strikingly reflected in the application submitted to the Empress by Immanuel Kant in which the philosopher, with the greatest humility and docility, begged the Empress to appoint him to the post of an ordinary Professor of Logic and Metaphysics at the Königsberg University, and assured the Russian Sovereign of “his readiness to die for her in deepest devotion as her most faithful slave.”

It is true that the occupation of “Ducal Prussia” was long and peaceful and the province therefore fared better than the other German provinces which were ravaged by fluctuating and protracted campaigns. Even so, Frederick the Great never forgave the East Prussians for their submissiveness and contemptuously called them the most foolish people among his subjects.

The Russian historian of 1943 describes the conduct of the Russian armies of occupation in the following words:

The Russian soldier was as brave as he was self-restrained. He inflicted no violence on conquered Berlin and he played the role of the defender of law and order. He energetically suppressed the inclination towards looting on the part of the Austrians and the Saxons, who, using the fruits of his victories, began to loot and to devastate the outskirts of the conquered capital.

The verdict of non-Russian historians on this point is not so uniformly favourable. Whatever the historical truth, the appreciation of the Russian historian is interesting as a hint for the future. Marshal Zhukov's soldiers are being asked to admire and imitate the self-restrained “defender of law and order” of 1760.

The Seven Years' War was the first of the great modern wars fought by Prussia on two fronts; and the familiar German fear of such a war can be traced back to the years 1756 to 1762. Frederick the Great decided never again to take up arms against “the bears of the Holy Roman Empire,” as he called the Russians. For one hundred and fifty years, from 1762 to 1914, Prussia was to remain at peace with Russia—with the exception of a brief period during the Napoleonic War when the Prussian state was Napoleon's unwilling satellite.

The Seven Years' War also gave Russia a predominant influence in Central Europe which lasted many decades. Some years after the conclusion of the Russo-Prussian peace, Catherine the Great was acting as arbiter between the German States in their feud over the Bavarian Succession; and the Russian influence in internal German affairs was to remain very strong until the 1848 Revolutions—the “Spring of the Peoples.” On this point, too, history may well repeat itself.

NOTES OF THE WEEK

How Happy Could I be with Either

In a recent broadcast, General de Gaulle told the French people that

We desire to make an alliance with England—*brave vieille Angleterre*—as soon as she consents to what to us is vital with regard to Germany and as soon as we have eliminated between us certain vestiges of an out-dated rivalry in this or that part of the world.

In Great Britain, too, the desire for closer association is strong. The problem is to surmount the obstacles and conditions set in the way. The German question is international, and is presumably under discussion at the meeting of the Big Three. The "vestiges of an out-dated rivalry" are, however, a more purely Anglo-French affair, and chief among them is the position of France in the Levant.

In 1941 the French National Committee guaranteed Syrian and Lebanese independence and undertook to withdraw their Mandate. In November, 1943, they astonished the Arab world—and their British Allies—by arresting the Lebanese President and Prime Minister of the first formally independent Lebanese government. Under British and Arab pressure, the prisoners were subsequently released, but this could not eradicate the suspicions the French action had aroused. The Syrians and Lebanese were confirmed in their fear that the French offer of independence was only formal. Recently these fears have been strengthened. On January 25th, General de Gaulle announced his intention of preserving France's "preponderant position" in the Levant. This was followed, on February 2nd, by a statement from M. Bidault that France would "maintain order" in Syria and Lebanon and had adequate forces for the task.

The British position is delicate. Their interest in Arab friendship is only second to their desire for close understanding with the French. In 1941, an accident of history brought British forces into Syria and Lebanon to liberate the territory from Vichy. The fact that the first full declarations of independence followed British intervention has made the British, willy nilly, the guarantor of Syrian and Lebanese independence. It is thus that they are considered by the peoples themselves. Yet the French repudiate this fact and point to Britain's position in Palestine. "Why," they ask, "should we withdraw from a special position if you British maintain yours?"

Macheath's unfortunate dilemma appears to confront the British—to be happy with one at the cost of offending the other. Yet it is essential to British interests that the discord should be resolved. The only solution lies through a wider approach to the problems of the Levant. Both Britain and France must ultimately withdraw from positions of dominance. They can, and should, encourage Arab union and establish treaty relationships with the whole area. Then it would be possible for joint Anglo-French-Arab military and naval bases to be established and for the French to work beside the British in some expanded economic and financial structure designed to succeed the Middle East Supply Centre and apply the economic assistance of the West to the whole sphere. Only on this imaginative scale can both French friendship and Arab independence be preserved.

M. Pierlot Resigns

On Wednesday M. Pierlot, the Belgian Prime Minister, resigned from office without waiting for a formal vote of "no confidence" in Parliament. The discussions which preceded his resignation made it perfectly clear that his Government no longer commanded the support of the Liberals and the Socialists, who formed part of the governmental coalition, and of the Communists, who were outside it. M. Pierlot emerged victorious from the conflict between his Government and the Resistance last November, but even then it was clear that his position was precarious. The opposition failed to overthrow him in Parliament because it was not yet strong enough to produce an alternative Government. But two further months of a grave

economic crisis, accompanied by administrative inefficiency and corruption, have discredited M. Pierlot's Government irretrievably. In all probability no other Government could work under such conditions without complete loss of face. In addition, the Ardennes battle contributed to a further deterioration in Belgian conditions. The coal mines did not receive the pit-props which would otherwise have been available; and the continued lack of coal has caused a vicious circle of economic disorganisation which the Government has been unable to break.

Allied supplies have been arriving only in a trickle; and quite a lot of that trickle has been disappearing from the channels of official distribution into the black market. Last week Belgium was astir with excitement because of the disappearance of a big Allied shipload of chocolate. The chocolate bars, it was said, were broken during transit, and they were supposed to have been sent for remelting. Mysteriously enough, the chocolate failed to reappear from the melting pot; apparently it was connected with the black market by a secret conduit pipe. The episode—trivial in itself—hastened the downfall of M. Pierlot's Government.

Belgium is now confronted with the problem which arose during the November crisis, although it is being restated in milder form: ought the Belgium Government to be based primarily on the pre-war alignment of Parliamentary forces or ought it to base itself more closely on the resistance groups which were active in the country during the occupation? In practice the choice is one between a coalition of the Catholic Right with the Liberals and Socialists and a coalition between the Liberals and Socialists and the Communists. The Catholic Party, or at least its Right Wing, has made it clear that it rejects any co-operation with the Communists. In Liberal and Socialist ranks the inclination to co-operate with the Communists is now much stronger than it was during the November conflict.

The Liberal Party

To judge by the sessions of its Assembly held last week, the Liberal Party is certainly full of renewed vigour. Moreover, it appears to have recaptured a policy, defined for it by Sir William Beveridge. It is true that there was a motion of protest against this new "radical" policy, but it received only four votes—many fewer than would certainly be given to dissident motions in the other parties. The speech of the Party's new President, Lady Violet Bonham-Carter, was full of brave words about "going over to the attack," and it is certainly clear that the Party will play a bigger part at the General Election than at one time seemed likely.

But just what sort of part it will be is still difficult to say. That there is a very large body of opinion in what can roughly be called the Beveridge position—for social organisation and experimentation within the limits set by a free society—is beyond question. But the extent to which this body of opinion will seek to achieve its objects through the Liberal Party is rather more open to doubt. What the Party can do is to provide every opportunity for the electorate to cast Liberal votes by putting up a very large number of candidates. This it is going to do—some estimates say as many as 400 candidates will be in the field.

But here another uncertainty enters in. The British electoral system—as the Liberals never tire of pointing out—acts very unfairly towards the smallest of three parties. At the General Election of 1929, when they put up 512 candidates, the Liberals got 23½ per cent of the votes cast, but only 59 seats out of 615. In 1935, there were only 161 candidates and the vote received fell to 6½ per cent of the total. Actually, the votes polled per candidate did not show much fall—from 10,350 in 1929 to 8,970 in 1935—so that the sponsoring of more candidates might automatically restore the total of votes received. But even if it were now to revive to the 1929 level—about the furthest limit that can be assigned to optimism—there is no assurance that the number of seats won would be any larger than in that

year. These 59 seats, however, held the balance in the 1929 Parliament and might well do so in that of 1945.

Even more obscure is the likely effect that the intervention of 400 Liberal candidates would have in the constituencies that they did not win. In policy, the Liberal Party is closer to the Labour Party than to the Tories—the Assembly sufficiently emphasised that fact—and it might therefore be supposed that most Liberals, in the absence of a Liberal candidate, would vote Labour—and therefore that Liberal intervention would hurt Labour. If this turns out to be the case, Labour will have only itself, and its rigid refusal of all offers of alliance, to blame. But things are by no means certain to turn out this way. If the Liberals are to win votes in 1945 that were given to one of the larger parties in 1935, where will they come from? Surely, in overwhelming measure from those who were beguiled into following Lord Baldwin in 1935. Moreover, it is not only the source from which Liberal votes are drawn that matters, but also the constituencies in which they are cast. After two lost elections, most of the Labour seats are now in distinctively Labour areas, where Liberals—often driven by local politics—tend to prefer the Tories. It is doubtful whether the intervention of a Liberal would have the result of handing many of the present Labour seats to the Tories. But would it prevent Labour from attaining its hopes of capturing some of the present Tory seats? That is the question upon which the result of the election may well turn. If a guess must be hazarded, it would be that a large number of Liberal candidates will hurt the Tories more than Labour. But it might well be the other way round—and only electoral reform can remove the element of pure chance.

Canadian Politics

While the British Liberal Party is going over to the attack, the Canadian Liberal Party (one of the most successful to bear the name in any country) is on the retreat. The by-election in Grey North, an Ontario constituency, on which the Prime Minister had deliberately placed the greatest significance, has led to the defeat of the Minister of National Defence, General McNaughton, by the Progressive Conservative candidate. A candidate of the Co-operative Commonwealth Federation ran third and received enough votes to make the issue obscure. The CCF members of the House of Commons voted last December in favour of Mr Mackenzie King's compromise on the conscription issue, and it is therefore true to say that a majority of the electors of Grey North approved that compromise. But what is of more immediate moment is that they could not be persuaded, in a constituency of the Government's own choosing, to trust the Liberal Party to administer the compromise. Mr Mackenzie King as good as promised, before the election, that if it went against him Parliament would be dissolved at once—it has to be dissolved before April 17th in any case—and this will now presumably happen.

If what was at issue at Grey North was the reaction to the conscription issue of one of the parties to the controversy, the English-speaking Ontarians, what will be chiefly at stake in the General Election will be the attitude of the other party, the French Canadians of Quebec. Hitherto, they have been very loyal, in Federal politics, to the Liberal Party, and the 65 seats of Quebec have been the solid foundation of that party's strength. If it can win them again, it may still be the largest party in the new House of Commons—though it is so much on the retreat in the other provinces that it can hardly hope for another overall majority. Alternatively, Quebec may send to Ottawa a body of members, in one or more local parties, who will prefer a Liberal Government to either the Conservatives, the traditional enemies of Quebec, or the CCF, which was until recently under the ban of the Catholic hierarchy. This might also serve to keep Mr Mackenzie King in office.

To add to the confusion, it is by no means certain which of the Opposition parties will win most seats from the Liberals outside Quebec. The Progressive Conservatives have been making the running on the conscription issue, but the CCF has shown remarkable strength in recent provincial elections. In short, there are not three but four elements in the situation—the English-speaking Liberals, the French Canadians, the Progressive Conservatives and the CCF—and it would defy the skill of the prophet to place them in the order of magnitude in which they will emerge from the election.

Workers of the World Unite?

The world Trade Union Congress opened in style on Tuesday when London's County Hall was converted into a temporary cosmopolis. Multi-lingual, multi-coloured, multi-racial trade unionists from every corner of the globe—including, for the first time, representatives from British colonies—have asserabed to discuss the problems of international labour in war and peace. The Congress seems to reflect at the trade union level the likely alignment of powers when the peace conference takes place. The proceedings naturally tend to be dominated by the Big Three which have the largest membership and the most active organisations. Britain, Russia and the United States (represented by the Congress of Industrial Organisations) have nominated the three Presidents; the three Vice-Presidents come from France, China and the Latin American Confederation of Labour. The smaller nations, though vocal, are definitely in the back seat.

After the superficial harmony of the opening session, which was largely formal, the storm blew up at the end of the second day, on the report of the Standing Orders Committee. Sir Walter Citrine, in a speech of controlled fury, opposed the Committee's recommendations to invite enemy countries and to admit the representative of the Lublin trade unions (whose credentials had been flown from Moscow)—both of which proposals had been turned down by the British TUC in December. He also opposed the procedure of voting suggested by the Standing Orders Committee, on the ground that the Conference had been convened on the understanding that it would be consultative only, and not bind any country to a decision.

This is the kernel of the problem which will arise in sharper form when the Conference comes to discuss international trade union organisation. The world movements are agreed on the items "furtherance of the Allied war effort" and peace terms for Germany. But the division on organisation is fundamental. The British are still deeply attached to the American Federation of Labour, which has refused to sit with the Russians and the CIO. The British want a restoration of the present International Federation of Trade Unions. The Russians, the CIO, the French and South Americans want an entirely new International to emerge from the Conference. Next week's proceedings will show whether the conflict, which is at bottom one between the "reformist" and "revolutionary" unions, can resolve itself dialectically.

Manila Falls

The Americans' triumphant advance across the Co-prosperity Sphere continues, gathering momentum with each new conquest. Manila, capital of the Philippines, has fallen within four weeks of the first American landings on the Lingayen beaches. This phenomenal speed may be due in part to the fact that the Japanese appear to have used up most of their reserves in the fighting for Leyte, but it is

MARTINS BANK

LIMITED

OVERSEAS BUSINESS

Martins Bank is fully equipped to help traders and others in transacting all classes of Home and Overseas business, and to act as correspondents in the United Kingdom for banks abroad.

London District Head Office: 68 LOMBARD ST., E.C.3
 Head Office: WATER ST., LIVERPOOL 2
 Total Assets £221,000,000

chiefly due to the overwhelming superiority enjoyed by the Americans, particularly on the sea and in the air.

It should not be long now before the admirable harbour at Manila is ready to serve as a base for an even greater amphibious operation, the landing on the coasts of China. Recently Admiral Nimitz said that American forces are ready, if necessary, to land directly on Japan itself.

I don't know if Japan expects to take the finish in the homeland, but I feel that the only safe plan is to assume that eventually we shall have to invade. We shall continue to move in the direction of Japan, and we are optimistic of our ability to do this.

There are probably still several more stepping stones to be taken on the way to Japan, but the speed and success of the Luzon fighting open up new possibilities everywhere in the Pacific war.

Nor will the Americans be compelled to carry the whole load. British battle fleets are now in action and although their first activity will no doubt be to secure Singapore, they inevitably draw away from the defence of Japan men, ships and plans which the Americans might otherwise have had to engage.

A Government for Poland

The Lublin Government is busy extending its administrative authority to East Prussia and Silesia. So far, no decision appears to have been taken on the future administration of occupied Pomerania and Brandenburg, but the "Study Section" of the Lublin Department for the Western Areas has now put out a plan claiming a frontier 30 miles to the west of the Oder, so that the river may be a waterway for Silesia. In any case, they add, all this territory is "old Slav land."

In spite of these preparations, the fate both of the Lublin Government and of the areas they claim may still be hanging in the balance. It is not certain that President Roosevelt has committed himself as far as Mr Churchill on the future eastern frontiers of Germany, and neither the President nor the Prime Minister is likely to swallow Lublin without a stiff struggle.

There are, of course, possibilities for compromise. The controversy is now not so much between a Government in London and one in Lublin or Warsaw; the point at issue is the alternative of totalitarian, unanimous and single party rule or a free cooperation of different parties. Lublin, like Marshal Tito, stands for the Single Party state and the tyranny it involves. As long as neither Poland nor Yugoslavia was liberated, it fell to the governments in this country to keep alive the representative principle (which they did with fluctuating success). Now that the countries are free, the task is not to uphold the London governments so much as to secure the full representation of the liberated peoples and their parties.

There is much to commend the suggestion that a Council—a republican agency—representative of the Right, the Left and the Peasants, should be set up in Poland and form a provisional government of the most suitable men from London, Lublin and the old Polish parties. But such a solution is likely only if the President and Prime Minister in their discussions with Marshal Stalin use their utmost energy to secure a compromise.

Towards Agreement in Greece?

The negotiations between the Greek Government and EAM are running more smoothly than some of the preliminaries—the dispute, for instance, on the composition of the EAM delegation—suggested. There was at first some hesitation over the amnesty. The EAM leaders asked for a general amnesty, while the Government maintained their view that no amnesty could be given to cover crimes under the penal code. EAM finally gave way on this to prevent, as they said, a deadlock which might lead to more fighting. They have also agreed to the disarming of ELAS.

All this is satisfactory, but obviously everything depends upon the way in which the agreement is carried out. General Plastiras is left with an amnesty which he can interpret generously or illiberally as he chooses. If his methods are generous, there is some chance that the rank and file of EAM's followers in the score of districts controlled by EAM will lay down their arms. In recent Greek history terms agreed to and accepted by leaders in conference have not always been accepted locally. The chance of disarmament itself depends on the Government's moderate interpretation of the amnesty.

Disarmament is only a preliminary to pacification. Once EAM has no more force to maintain its position, will the parties represented in it secure fair treatment in the matter of elections? It is difficult to dissociate this problem from the question of widening the bases of the Plastiras Government. At present, it is composed of six members of the Centre and Right. Unless it is reinforced from the parties of the Left, it is difficult to see how it can resist the pressure of the strengthened and self-confident Right (who are seeking unity and not "mutiny" as a misprint suggested in *The Economist* last week).

British troops have fought to prevent the predominance of the Left. The British Government has as urgent and compelling a duty to prevent the preponderance of the Right. Only a Government to which representatives of EAM have been admitted is likely to hold the balance. It is therefore not enough for the British authorities to bless the present negotiations: They must use all their vigilance to see that the amnesty is genuine, that the Government is widened and that fair preparations are made for the elections.

Citrine on Greece

The full report of the trade Union Delegation on Greece has now been published. In substance it repeats the press reports which have already appeared in this country. On the issue of trade unionism, the delegation found itself in a situation of some confusion. It could not altogether accept the claims of the Hadjidemitiou Group, appointed by the Plastiras Government. Sir Walter and his delegation therefore took steps to get into touch with those former members of the Greek Trade Union movement whom they already knew—M. Kalomiris, Stratis and Theos, all supporters of EAM. Under British auspices, a meeting between the two groups took place and a formal statement of agreement was drawn up on the holding of free trade union elections and, by implication, of EAM participation in them. As Sir Walter's Report made clear, once EAM has made its peace with the Government, it will be able, under the Agreement, to participate in trade union affairs.

The Citrine Report does not pretend to give much political information.

We did not see representatives of political parties. . . . We did not wish to be drawn into the vortex of Greek politics. We did not regard it as any part of our mission to endeavour to investigate whatever political difficulties may have arisen in Greece.

It follows that their information, drawn almost entirely from the British authorities and the Greek Government, does not do much more than confirm the fact of atrocities and the dislike of the British troops for the methods of fighting common to guerilla and civil war.

Public Relations Officers

Discussions about the future of the Ministry of Information and the Government's Public Relations Officers become more lively as the war draws to an end. There are now, according to a statement made in the House of Commons last week, 1,187 persons employed in public relations work. Of these only 606 are in civil departments, the rest being attached to the Services. The most modest department is still the Treasury, with only one public relations officer.

There are critics who condemn the system of Government publicity, on the ground that it cramps journalistic enterprise, and may lead to undesirable personal publicity for the Minister. It is true that the system is open to abuse, and that, especially in peace-time, the party in power could make political use of such convenient publicity machinery. But it is obviously essential to maintain some kind of machinery for liaison with the press, and provided there are adequate safeguards against possible abuses, public relations sections, attached to Government departments, can perform valuable functions, in peace as in war.

This is broadly the view taken by PEP in its latest broadsheet on "Government Information Services." PEP has some useful suggestions to make. Instead of Public Relations, the offices should be called Information Departments, with the corresponding emphasis on information rather than advertisement which this change of title implies. They should be staffed by small, highly qualified staffs, under a director who could be a civil servant. Their work should be co-ordinated by a Central Publicity Department

(attached to the Treasury or the Cabinet Offices), which would take over much of the work of the Ministry of Information in regard to film production, publications, exhibitions and national publicity. The news department of the Foreign Office should be enlarged, and should provide "background" information as well as news hand-outs. The interpretation of public opinion to the Government, now left largely to Members of Parliament or dealt with for specific subjects by the Wartime Social Survey of the MoI, should be the responsibility of an independent social research organisation under the aegis of the Lord President of the Council.

Whatever the precise form of machinery which is evolved for the Government's publicity and information services—and some solution along the lines suggested by PEP would seem desirable—it is important in the public interest, as well as in the interests of the men and women employed in public relations departments, that some decision should be reached soon.

Bombay Instalment

The first part of the Bombay Plan—a statement of aims for the economic development of India by eight leading Indian industrialists—has been followed by an appendix, or second part, concerned with the place of the State in a planned economy. Far from rejecting government controls, the authors believe that

... unless the community is endowed with powers for restraining the activities of individuals seeking their own aggrandisement regardless of public welfare and for promoting the main objectives of economic progress, no plan of economic development will succeed in raising the general standard of living or promoting the common good.

This is an important statement of creed, coming from the kings of an acquisitive society. Even though it is balanced by an equally firm belief in the contribution to be made by capitalist enterprise and initiative, it is indicative of a remarkably radical turn (from whatever motive) in educated Indian thought. It leads the authors of the Bombay Plan to suggest a system of controls—for production, distribution, investment and foreign exchange—which would be similar to those imposed during the war but more competently administered and co-ordinated. Where outside control is ineffective, the state must take over ownership, at least for the period of planning. State control is also accepted for public utilities, basic industries and state-financed enterprises important to public welfare or security.

The summary reports of the second Bombay instalment so far received suggest that the industrialists' advocacy of state ownership is yet more thorough where agricultural interests are concerned. Outright state-ownership, extinguishing the landlord's claim and the entire Zamindari system are to be achieved, first by yearly payments and then by lump sum compensation. This would enable the state to pursue the object of reducing agricultural man-power by increasing productivity, and would thus help to achieve the major objective of full employment and higher living standards. The fundamental queries already set against the Bombay Plan (see *The Economist*, June 17th, 1944, p. 804) are still unanswered. One concerns the volume of capital necessary to achieve the results of the plan, and is primarily a technical, economic and financial problem. The other, with which the Plan never attempted to deal, concerns the political and social conditions necessary for over-riding all economic planning. The easy assumption that there will be an Indian government, responsible, national and efficient, is the biggest "if" of all. Without it, and without the confidence of Indians behind it, the Plan may turn out to be yet another valuable blue-print.

Water Everywhere

It is not likely that the Water Bill, which was presented to Parliament by the Minister of Health last week, will produce any violent controversy, although its provisions are clearly important and may be regarded as a move towards the nationalisation of the water "industry." The Englishman does not easily get excited on water.

The Bill centralises, under the Minister of Health, the duty of promoting the provision of adequate water supplies and the conservation of water resources for England and

Wales; the Minister will be advised by the Central Advisory Water Committee, which is to be reconstituted as a statutory body. Where necessary, amalgamations among the thousand or more water undertakings throughout the country will be encouraged or enforced in the interests of technical or managerial efficiency. The Minister is given power himself to take over, or to transfer to county councils, the functions of undertakings failing to provide adequate services. Equally important are the special steps that will be taken to control and protect resources, surface and underground, against misuse by waste or pollution.

These reforms are long overdue. In the domestic (urban) sphere, water is so cheap (a week's supply for the average household costs about as much as a glass of beer) that it is taken for granted. But the increased efficiency of the water industry would bring about benefits to industry and agriculture. The uneconomic scramble for catchment areas in the Pennines, the Lakes and Wales during the past sixty years has already caused serious problems of distribution in the North and Midlands. Sooner or later these problems must be resolved by large-scale interlinking of areas. Water is one of the few raw materials in abundant supply in Britain; it is a matter of real importance that the maximum use should be made of this natural advantage.

Many country-dwellers will be heartened by a proposal requiring all local authorities to ensure that every house is supplied with piped water. But everything will depend on the interpretation of the qualifying "whenever practicable."

Tesin, Teschen, Cieszyn

The Munich agreement of 1938 awarded to Poland the Czech Olsa territory with the whole town of Tesin, which is Teschen in German and Cieszyn in Polish. The town of Moravska-Ostrava (Maehrisch-Ostrau in German) remained Czech. By this award Czechoslovakia lost 45 per cent of its coal output and other important industries. The Nazis incorporated the Olsa district, also known as Olsa-

Making the most of the NATION'S MILK

IN winter the supply of fresh milk falls, but in summer there is a surplus. This surplus can be conserved in a number of ways, one of which is to make Milk Chocolate. Cadburys Milk Chocolate retains the valuable milk solids (fat, protein and lactose). Only the water which comprises roughly 87 per cent. of the milk bulk is eliminated.

Milk Chocolate is a compact and highly concentrated food easily kept and transported and requiring no elaborate packaging. It retains the full food value of the milk almost indefinitely without special storage or canning.

Cadbury means Quality

Silesia, and the adjacent Hultschin district, which before 1914 belonged to Germany under the name of Hultschiner Laendchen, into the Gau of Greater Upper Silesia. A few days after the great Russian offensives had begun, the provisional Polish Government in Lublin delineated the western frontiers of Poland as follows:

Bytom (Beuthen), Zabrze (Hindenburg), Gliwice (Gleitwitz), Opole (Oppeln), Wroclaw (Breslau), Lignice (Liegnitz), Frankfurt-on-the-Oder and Szczecin (Stettin) will belong to Poland as will East and West Prussia, the Poznan (Posen) district and all Pomerania. This has been fixed by our Allies. The frontier will run through Moravska-Ostrava and along the river Opava (Oppa) via Neisse and Glatz to reach the river Oder at Frankfurt and will follow the Oder via Kostrzyn (Kuestrin) as far as Szczecin (Stettin).

This is a somewhat ambiguous statement, as the accompanying map illustrates. The line of the river Opava, if it is carried northwards from Morava-Ostrava, merely gives the whole of the Silesian district to the east to Poland. If, however, the frontier is carried southwards along the Opava, following the shaded line on the map, then the Lublin Government is in fact claiming from Czechoslovakia an area greater even than the territories ceded at Munich.

It is difficult to say which of the two interpretations represents the real views of Lublin. It is very probable that they have at different times supported both views. For some weeks, the Government of Dr Benes failed to recognise Lublin as the Provisional Government of Poland. During that period, the Russians allowed the Ruthenians to

raise their demand to be separated from Czechoslovakia and joined to the Soviet Union. At the same time, the Lublin Government's statement was published and a number of reports suggested that the idea of the Opava frontier to the south of Morava-Ostrava was being used as an instrument of pressure on the Czech frontier.

Now, however, Dr Benes has recognised Lublin. The Ruthenian question has been ostentatiously dropped by Moscow. One may, therefore, assume that the threat of an Opava frontier the length of that river has also been dropped.

It is hardly surprising that the danger of dispute should have arisen over Teschen. The tri-lingual triangle between Poland, Czechoslovakia and Germany has been a bone of contention for centuries. Inability to agree over Teschen was one of the causes of the break-down of the Czech-Slovak discussions on federation in 1941 and 1942. A mere change in political alignments will not finally settle these disputed lands. Like many other European areas, no settlement is possible so long as it is conceived in purely nationalistic terms.

Land Bill Opposition

It is clear that considerable amendments to the Requisitioned Land and War Works Bill must be made before Parliament will accept it. The Bill enables the Government to acquire compulsorily any land which has been temporarily requisitioned for war works under emergency powers. Broadly speaking, the Government will wish to acquire two types of land (a) land which it will continue to use itself for defence or other purposes, such as aerodromes, and (b) land whose value is less than would be the cost of restoring it to its normal condition. There can be no quarrel with the main purpose of the Bill. The two reasons for acquisition, national defence and the avoidance of unnecessary financial loss, are both eminently reasonable. But doubts are rightly felt about both the way in which the land is to be acquired, and the use to which it will then be put.

The compensation payable aims to offset all changes in land value due to war works. The intention is apparently to pay 1939 prices, plus such extra compensation for owner-occupiers as is allowed under the Town and Country Planning Act, 1944. This procedure is not only unfair, but ridiculous. The avowed aim of the Bill is to decide whether land will cost more to restore than it is worth; but whereas its worth will be judged by 1939 standards, or, in other words, considerably undervalued, the cost of restoring the land will be calculated at its highly inflated 1944 level.

It is also unfortunate that the Commission which will judge Government claims in default of agreement is to be appointed exclusively by the Treasury. Even an adverse decision of the Commission can be overruled where land is wanted for the Government's own use, and the acquisition of factories need not be referred to it at all. Dwelling-houses cannot be compulsorily acquired at all, except in widely phrased special circumstances. These provisions are less than fair to owners. Since their land was seized under exceptional powers, granted only in virtue of the war, they should at least have recourse to an independent tribunal; and compensation should explicitly take into account the omnibus increase in land values.

Right and Left Hands

The fears that are being expressed about the use to which compulsorily acquired land will be put reflect the belief, which is certainly not without justification, that the Government's right hand does not know what its left is doing. The left hand is in this case the Treasury, who, it is feared, will resell land to the highest bidder, independent of planning considerations. Crown land is, moreover, technically free from town planning control. The right hand is the various Ministries concerned with the planning of land, whose correct use they are endeavouring to secure at a not inconsiderable cost to public funds.

Theoretically, the more land the state owns, the easier planning becomes. But this is only so if purchase and disposal of land takes place in full accordance with planning considerations. For this reason the Commission should include representatives of the planning departments concerned. Further, land which the Government intends to resell should be offered first, on agreed terms, to the local authorities concerned; and it should in any case only be sold subject to such restrictions on its use as effective planning requires. These restrictions would need to be agreed with local authorities.

A much-publicised case in point of the present Bill's dangers is the position of requisitioned commons and open spaces, and blocked-up footpaths. Clearly it would be unreasonable to alter the shape of an essential aerodrome in order to restore a common; but it would be a very different matter if the common was resold for private use for financial reasons. Therefore, the Government should be obliged to restore all public open spaces which it does not require for its own use. If in any particular case this obligation is unnecessary or unduly burdensome, the onus of proof should lie with the Government. Further, where open spaces are not restored, an attempt should be made to provide an equivalent area of open space elsewhere. These two obligations are no more than common justice.

Loans to Russia

It is known that the Russian Government has made approaches to both the British and the American Governments to secure long-term credits for the reconstruction of

Russia. The Russians certainly have a claim on Western aid and any project likely to keep them in regular and co-operative contact with the outside world has a political value which might be held to outweigh most economic drawbacks. In principle, therefore, the Russian initiative is one to which both the British and American Governments can give an honest welcome.

The difficulties lie rather in the scale and financial nature of assistance the Russians are proposing. Reports speak of a twenty-year credit of some £750 million from Great Britain and of £1,500 million from the United States. This may well reflect the reality of Russian needs, but it is not in keeping with economic and political realities in the West.

Great Britain must export, but not simply for the sake of doing so. It will be difficult enough, in the early years, to get out a large enough volume of exports to pay for the necessary imports without diverting any of them to credit transactions which do not serve that purpose. A large volume of exports to Russia on credit in these years would involve Britain in a direct and immediate loss of foreign exchange. A large credit transaction—indeed, even a small transaction that is wholly on credit—is therefore beyond the economic capacity of this country. It is to be hoped, however, that counter proposals were made to the Russians. If the alternative to no credits is no trade, it would obviously be worth the while of both countries to meet each other half-way. For example, Russian imports from Great Britain might be financed partly by credits and partly by goods and partly by payments of Russian gold. If by this means some trade was done that would otherwise not be undertaken, the British exchange position would be improved. But exports without any current return either in goods or in gold are a luxury the country simply cannot afford.

The problem in the United States is not so much economic as political. The sum proposed by the Russians far exceeds the credit-giving capacity of any of the Government agencies. New appropriations would be necessary and it is doubtful whether Congress in its present mood would agree to so large a loan without attaching political conditions to it. The course of wisdom would seem both in the American and British negotiations for the Russians to put forward a maximum and a minimum programme and to be prepared to bargain between the two extremes. An attitude of "take it or leave it" will advance nobody's interests, least of all the Russians'.

War Service Gratuities

The Government's plans for getting men and women back into civilian life have now been completed by Sir John Anderson's statement on gratuities for war service. The demobilisation scheme, the reinstatement in civil employment legislation, and the provisions for vocational training have made their contribution of law and machinery to the resettlement scheme. Now, the expected lump-sum gratuities are to be added to the 56 days' paid leave after discharge, free civilian outfits, and the post-war credits which have accumulated since January, 1942.

The whole comprehensive scheme, costing £500 million, plus £200 million for the gratuities, will be described in a single document, soon to be issued by the Government. The war service gratuities are to be based on length of service, whether at home or abroad, and on the highest rank held for six months or more. They are to be tax-free, and paid through the Post Office Savings Bank.

The scheme is relatively simple and fair enough to raise no major grumbles. The main difference between it and its 1918 counterpart is that a rather higher rate is to be paid to other ranks, and a much lower one to officers. A second difference is that a distinction will not be drawn, as in the Canadian scheme, for instance, between service at home and service abroad. Because conditions of foreign service vary so widely, and because the great majority of British soldiers will have been overseas before the war is finished, the Government's solution (to tack on to the final leave an extra day for each month of foreign service) is probably the best.

No alarm need be felt for the inflationary effect of these lump sum payments. The cost, compared with war expenditure, is very small, and the danger of aiding inflation equally small. The main danger, as after the last war, will be for the "demobs" themselves. Perhaps the gullibility of the modern soldier is less than that of his father, but some warning, if possible through Government and Service publicity machinery, should be given to unwary soldiers eager to make the best out of their gratuities, and liable to fall into the hands of the "sound little investment" mer-

chants. The habit, fostered during the war, of asking information and advice from disinterested organisations is one which the soldier will find useful when celebrations and expenditure on civilian essentials leaves something over from his gratuity.

Sunday Cinemas and Children

The Surrey County Council has chosen an unfortunate moment to impose its ban on the admission of children to Sunday cinema shows. Conditions in this sixth winter of the war are such that the people—the ban will clearly affect parents and guardians almost as much as the children—are surely entitled to any relaxation, entertainment and warmth that is easily provided. Cinemas showing adults' films may not be the ideal source of entertainment for the young on Sundays (or on any other day, for that matter), but when better alternative accommodation is so restricted—and cannot, at the moment, be improved—it is both unkind and unwise to shut the doors of the entertainment world to children.

Surrey is not the only authority prompted by sabbatarian zeal; as *Kinematograph Weekly* reports:

Manchester has been operating a "gentleman's agreement," designed to co-operate in excluding children on Sundays. It has worked well on the whole, no complaint of its infraction having been recorded. The Council of Churches, however, now seeks to make the terms mutually agreed upon a condition of licence.

If the object of such bans and restrictions is to persuade more children to attend the Sunday schools, any success achieved must be set against the positive harm done to the unconverted.

It is one of the most difficult of parental duties (one clearly recognised in the new Education Act) to decide how much and what kind of religious instruction the children should receive. But, though it is difficult, it is best left to the parent. The work of the Churches is never, in the long run, assisted by measures, positive or negative, that are based on compulsion.

Plan for Bath

Bath, despite its areas of "blitz" and "blight," offers possibilities for imaginative town planning which do not first require the wide and so far unobtainable powers of control needed by larger and more congested cities. These possibilities have been eagerly seized in a very detailed plan prepared for a joint planning committee, and covering about 21,000 acres with a pre-war population of 78,500. The plan does not run into the difficulties created in many areas by the multiplicity of planning authorities; and although extensive new building is called for, requiring the addition of 8,000 more houses to the existing 20,000, there is ample space in which to put them, and no large-scale decentralisation is necessary.

Bath has been town-planned before, in the eighteenth century, and the aim of the new plan is to preserve the Georgian squares and terraces, while transferring traffic and shopping activities elsewhere. New by-pass extensions will divert all through traffic from Georgian Bath, and the city's heart will be cleared of much local traffic by a central ring road. But the plan aims to create as well as to preserve; notably in its proposals for a spacious new health centre, for the development of the Royal Crescent as the new civic centre, for the construction of a large recreation centre facing the river Avon, and for the opening up and rebuilding of a wide riverside stretch. An interesting feature is the suggestion of a suitable site for Government offices, in the hope that some department may be permanently transferred to Bath.

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so before the date of expiry. If they fail to do so, their subscriptions will be automatically cancelled as soon as that date is passed, and this may mean a gap of many months before the despatch of copies can be resumed.

AMERICAN SURVEY

International Surrealism

(From Our Washington Correspondent)

REALISM carried beyond its logical conclusion becomes surrealism. To the man in the street its products are mostly horrid things to contemplate. Current surrealist sketches of America's major Allies are now on sale, under various mastheads, at all American news-stands.

The Russians are depicted as having just about established the conditions for isolationism in the grand manner of the American nineteenth century. Russia proper becomes a glorified American Middle West, similarly compounded of unmeasured natural resources and unbounded confidence in the efficiency of the Russian system to make them produce. This central area is now adequately buffered—as the Middle West was by the states of the two seaboard—by a widening fringe of countries to hold off—and make contact with—the rest of the world. Three concentric circles create an illusion of federalism and independence: the foreign policy of the sixteen member republics of the USSR; the foreign and domestic policies of the fringe states just outside the USSR; and the domestic policy of the Communist parties of the states beyond that area. But there is a centre of centres, the directing core of this totality, whose attention is concentrated on the new Middle West, and whose manipulations of the outer circles have that interest alone in view.

The picture of England is drawn in historical perspective, with the outline of the British Isles superimposed over the outline of France between the wars (and titled *Sécurité d'abord!*) Radiating from it are political lines of alliance which also serve a double purpose as the framework of a system of cartels. The colours are the colours of twilight, green predominating.

The picture of the United States is of a mechanical man seen in cross-section, pistons in excellent order, with butter as a lubricant. The cross-section view makes it impossible to tell in what direction the figure is facing. One arm (is it the right?) has its fist covered by a crusader's casque.

How do these pictures compare with the output of the life class?

So far as the United States is concerned, the current fashion of being "realistic" has caused the living actors who are taking a number of the American stock parts to indulge in a certain amount of exchange of costumes. During World War I the Democratic President was an idealist. The Republican opposition announced itself realists. The idealist failed. To-day's Democratic President accordingly professes himself a realist, who recognises that the Atlantic Charter and the Decalogue have their places, but so has sin. The opposition has correspondingly no choice but to become idealist, suggesting that the President is willing to continue as captain of the team after having raised no objection to the removal of all goal-posts from the field. Senator Vandenberg turns to constructive measures. Senators Wheeler and Wiley busily propose lofty sentiments in resolution form.

It is true that the country is receiving little overall leadership toward even such objectives as a realist might permit himself; and the public is coming to the conclusion that in a world compounded of unilateral action and failure to act, Dumbarton Oaks is an uninteresting document. It is true that the isolationist group can itself propose the unattainable this time with no less confidence than last time that it will fail. It is true that cynicism grows when people are encouraged to believe that little or nothing good is possible.

Yet there are certain facts, mostly in the inchoate realm of forces that have not yet found their way into the channels of policy, which contradict the assumption that the United States will again play turtle.

This time the United States does not intend to disarm. The demand for bases, coming mainly from ex-isolationist quarters, may be the expression of as unilateral a mood as has lately been instanced elsewhere, but at least takes American policy beyond the limits of the continental

United States. Moreover, while the proposals recently advanced by the Services for universal military training are meeting various types of objection, the opposition does not feature the major basis on which the similar proposals failed after World War I, namely, that the country does not need reserves. One of the most considered attacks on the Bills so far introduced is that universal training must be only a part of a broad plan of scientific and industrial mobilisation if the country's war-preparedness is to be kept up to date.

Another force toward world action is the productive potential of an economy which has added \$20 billion worth of factories (book value) to a pre-war total valued at \$50 billion, and is committed to a programme of finding jobs. Here, too, future circumstances may afford an opportunity for a change of costumes in the economic act roughly comparable to the change of political costumes that has already taken place. It may now seem ludicrous, but it is not impossible, that isolationist Republicans, confronted by Democratic proposals for raising world living standards, would go on a slumming expedition and discover the American lower third.

But, on the whole, the pressure to explore the possibility of exporting as a cure for unemployment is likely to be irresistible, and present-day Americans know that exporting means importing. One section of the community learnt the lesson from the foreign bonds with which the walls of financial clubs were papered in the depression years. The farmers learnt a similar lesson of the limitations of purely monetary exchanges from the famous parity formula for farm prices, and Labour from the cost-of-living formula for wages. This argument, too, leads straight to a readiness to co-operate with other nations.

Neither of these major differences between the American position in 1918 and to-day—neither the unwillingness to disarm nor the anxiety to export—necessarily forecasts a foreign policy that is either integrated with those of other nations or close-knit in itself. But they do not add up to American withdrawal.

American Notes

A Budget for Full Employment

In his testimony before the Senate Commerce Committee two weeks ago, Mr Wallace very ably propounded his faith in an expanding economy of high production and high wages, and took his stand firmly on the "economic bill of rights" which the President suggested a year ago. Mr Wallace said frankly that if confirmed he would use his powers boldly "in the interests of the American people," to raise the economic sights and to advance the interests of small business, labour, the farmer and the consumer as against the giant corporation.

To attain a goal of a national income of \$170 billion providing 60 million jobs, Mr Wallace endorsed the Eberstadt theory of government-guarantee of private loans to stimulate investment in new plants and facilities, particularly by small business, from which he felt some 5 million more jobs might flow. He urged the trebling of foreign trade to provide another 3 million, with emphasis on a high level of imports as well as exports. Public works to provide jobs when the total falls below 57 million, he suggested, should be carried out by private enterprise paying prevailing wage rates.

This is hardly a revolutionary programme. Many of its proposals are accepted government policy in other countries, and it is all to the good to have the issues put before the American people. Mr Wallace also referred sympathetically to Senator Murray's Full Employment Bill, "to make free enterprise work." Its core is the proposal for a

"National Production and Job Budget." At the opening of each regular session of Congress the President would present an estimate of the total of investment and expenditure from all sources: consumers, business, local and State governments, as well as the Federal government. This budget would be considered balanced when the total was sufficient to guarantee full employment; when it was inadequate, the President would be required to submit plans for balancing it by further Federal spending.

The concept of a budget to be balanced by further spending, rather than by the more orthodox method, is congenial to New Deal thinking. But the method of that balancing is crucial if it is not to unsettle one sector of the economy while stabilising another. In the United States, the prospect of large-scale government spending is more than likely to provoke another "sit-down strike" by private capital, which might reach dimensions sufficient to unbalance any Manpower Budget. The purpose of Senator Murray's Bill is admirable. The British Government is already committed to a similar proposal. But even given the most perfect policy, it is debatable whether at this stage the less highly developed administrative machine in the United States would be equal to the new strain.

National Service

A coalition of Republican and Democratic conservatives has been responsible for the speedy passage of the Bailey-May Manpower Bill in the House by a vote of 246 to 165. The opposition was made up largely of Congressmen particularly sensitive to labour and farm votes in their constituencies. They made determined, and very nearly successful, attempts either to postpone consideration of the Bill, to amend it, or to substitute for it more effective use of the manpower ceilings ordered by the War Manpower Commission.

The Bill is now before the Military Affairs Committee of the Senate, which will hold secret hearings this week from representatives of the Services, labour, and industry. As it stands, the Bill provides for the freezing of men from 18 to 45 in agriculture or essential war industry, and, if appeals for volunteers fail, for the direction of others into designated industries, although the men involved are allowed to volunteer for the Services instead; and are to be given considerable latitude in choosing individual employers. Final penalties for disobedience include heavy fines, gaol sentences or, where appropriate, induction into the Services.

There is said to be substantial opposition to the Bill in the Senate; and some doubt is expressed whether it will ever emerge from the Committee pigeon-hole. This may be unduly pessimistic, in view of the extent to which the testimony of the Services outweighed the objections of industry and labour in the House. Nor, unless the Senate modifies its penalties, is the Bill inadequate to provide from the pool of 18 million men affected the 900,000 needed by the Services and the 300,000 required in war industry.

The Wallace Appointment

The Senate has postponed confirmation of Mr Wallace's appointment as Secretary of Commerce until March. The probability now is that he will be confirmed, in view of Mr Roosevelt's indication that he will approve the George Bill divorcing the lending agencies from the Department of Commerce. The Bill was passed in the Senate by a vote of 74 to 12, and has been approved by the House Banking Committee after the defeat of several amendments designed further to restrict the President's authority as it affected the transfer of other financial agencies. As the fight developed in the Senate it became the prime aim of the Administration to secure a vote on the George Bill before Mr Wallace's appointment came up, while the anti-Wallace die-hards attempted to deal with the confirmation first in the hopes of eliminating Mr Wallace altogether. From this manoeuvre the Administration forces emerged victorious, but only by a hair's breadth, by one vote in fact.

How free Mr Wallace will be in his new post to work out his policies for full employment, high wages, and an expanding economy turns on the persistence and nature of Congressional intervention, and the character of the man appointed to head the financial agencies. This second appointment will provide some clue to the President's determination to carry on the fight.

The attack of Mr Wallace by "the interests" has added to the stature he gained last summer by his modesty, good

sense, and loyalty during the election campaign. Not only has he emerged as the unrivalled leader of the progressive planners, but even his critics have been impressed by the clarity and forcefulness of his professions of faith and the adroitness with which he parried his hostile questioners on the Senate Commerce Committee. Mr Wallace's eventual confirmation may owe something to the calculation of the Democratic Conservatives that to exclude him entirely from high office would make a martyr of him and formidably increase his strength in the country by 1948.

The Shadow of 1946

Party politics never take a holiday. Both Democrats and Republicans have been publicly tuning up their machines. Already the tip of the shadow of 1946 lies on the grass. The Democrats have confirmed Mr Hannegan, the party chairman, and have voted to continue the fellowship with the Political Action Committee which served them so well in 1944. The Republicans, undaunted by a fourth major defeat, have maintained a striking discipline, and at their party meeting showed no disposition to sacrifice scapegoats. Whatever undercurrent of dissatisfaction may exist with Governor Dewey, Mr Brownell, his manager, and "eastern domination of the party" failed to make public headway. There was, however, significant acclaim for the statecraft of Senator Vandenberg, who has just delivered a second powerful speech advocating collective security.

Rumblings against the "bankruptcy" of Republican party policy and the practice of combining with conservative and agrarian Southern Democrats have been overshadowed, in any event, by the Senate struggle between the liberal and conservative elements for the control of the Democratic party. Senator Byrd emerged as the leader of the right wing, which is determined to eliminate Mr Wallace as a Presidential candidate in 1948 by demonstrating that he would split the party. In a speech last week Mr Wallace insisted that he, and his liberal supporters, would not be pushed "into the futility of a third party"; that they could achieve their objectives within the framework of the Democratic party.

It is obvious Republican strategy to sit back and enjoy the dissension in the rival camp. They know they need have no fear that the Democrats can ever outbid them for the safe, conservative vote outside the southern states; some of their greatest victories have been scored against Right-wing Democratic candidates like Mr John W. Davis in 1924 and Governor Smith in 1928. The conservative Democrats are neglecting the beam for the mote in concentrating on liquidating Mr Wallace on the rather naive assumption that a Democratic Administration is a permanent Washington feature.

The Cost of Clothing

Clothing prices have been the bad boy of the cost of living indexes, and the clothing shortage, particularly in low-priced lines, is of long standing. The main complaint has been the natural tendency of manufacturers to "up-grade" their products, so that while there is a famine in cheaper women's and children's clothing and piece-goods, supplies of more expensive articles have increased. The current textile shortage has aggravated the problem.

To meet the situation the Office of Price Administration and the War Production Board recently announced that 75 per cent of all civilian fabrics will be used for essential garments, and manufacturers of low-cost clothing will get priorities, based on their output in 1943. Frills and "fancy-ing up" will be eliminated on the principle that if coats are cut according to the cloth, there will be enough for everyone. Prices are to be rolled back to the levels of the first half of 1943, which on the average will mean a reduction of some 6 to 7 per cent.

All this is to the good, although in justice it must be pointed out that the War Production Board has already done a great deal, through the use of allocation and production directives, to increase the output of children's clothing. That the apparent shortage continues is due in part to more babies, but also to the fact that parents of babies and children normally dressed in hand-me-downs can now afford to buy complete new wardrobes. As long as there is no clothing ration—and the recent scare, which created a temporary shopping spree, seems to have had no foundation—the authorities will have a thankless task to keep the shops filled at a time when money is burning holes in so many pockets.

THE WORLD OVERSEAS

République du Silence?

POLITICAL life in France has not yet achieved a balance after the unsettlement of occupation and the *bouleversement* of liberation. The acute economic misery, described in recent issues of *The Economist*, has put the Provisional Government and the endurance of the whole French people to a very severe test. Communications between Paris and the provinces are still not fully restored, and in consequence the Government has no effective control of the country. Only very few of its measures have been carried out on a national scale, and the Provisional Government is still confronted with the task of making its authority real throughout the country. That France, deprived of sufficient food and heating and with growing unemployment in the towns, has endured so tragic a winter without any major social or political disturbances must in itself be regarded as a considerable political achievement.

Nevertheless, there are elements of tension and political crises in almost every field, and it is possible that the tension will come more strongly into the open with the approach of spring when physical hardships no longer absorb the energies of ordinary people. It is against this background that the need for economic relief for France is so important and urgent. Equally urgent is also the need for tackling some of the major social and political problems which are still largely unsolved. Among these must be placed the purge of the collaborators and the establishment of the Government's authority on a more solid footing.

The Government has now decided to bring the purge to an early conclusion. It has been decreed that for the central administration it should be terminated by February 15th and for local administrations by March 15th. All trials of collaborators, in which the charges are grave enough to allow for death sentences, are to be finished by May 1st. The Government's determination to bring the purge to a close within this short term has sprung from the conviction, which is undoubtedly justified, that there can be no stability in the administration so long as civil servants may suddenly find themselves charged with collaboration.

The Communist Attitude

It is true that the Government runs the risk that so quick and radical an end to the purge will expose it to new criticisms and that it may be accused of having spared the collaborators. But that risk has now been removed, at least partly, by the support which the Government has recently received from the Communist Party, hitherto the greatest single political group in semi-opposition to General de Gaulle. The fact that two Communist Ministers have sat on the Provisional Government ever since it was formed at Algiers has not prevented the Communist Party from adopting an ambiguous attitude towards the Government. Last October the Communist Party backed the *Milices Patriotiques* against the Government when the Militias were asked to lay down their arms and to disband. Communist influence was then strong enough to frustrate the Government's move. The *Milices Patriotiques*, re-named *Gardes Civiques Républicaines*, have survived until now, and as a sort of private police they have exerted control over some outlying Departments. Similarly, the Communist Party used its influence to keep in being the dualism of authority expressed in the rivalry between the Prefects, the local municipal councils and the Committees of Liberation in the provinces.

This policy has now been somewhat sensationally reversed. On January 22nd, the Secretary-General of the Party, M. Maurice Thorez, outlined the main points of the new Communist policy in a speech to the party's Central Committee. M. Thorez, who had only recently returned from Moscow, appealed rather poignantly to his followers to shelve revolutionary social aspirations, at least until after the war. He summed up the present Communist policy as follows: 1, "Everything for the war against Germany"; 2, France must rebuild a great army, at least a million strong;

3, the stepping up of war production is the Communist's first duty; 4, French democracy must be revived; and 5, the Communist Party must carry out its "national mission."

The meaning of those general principles became clear when they were translated into specific terms. An army a million strong—M. Thorez pointed out—cannot exist without a large cadre of officers. Those officers who were misled into following Pétain must, therefore, be re-admitted into service and be allowed to redeem their national honour. The stepping up of war production demands that the Communists should "rule out lazy and facile solutions." M. Thorez' appeals sounded almost like a paraphrase of General de Gaulle's earlier messages to the French people. He declared that the regular courts are the only authorities entitled to judge and inflict justice on the collaborators; that the army and the regular police are the only bodies entitled to carry arms; that the *Milices Patriotiques* have played out their rôle; and that the Committees of Liberation ought no longer to overlap with the regular administrative organs, or to obstruct their functioning.

The French press, especially of the Centre and the Right, welcomed M. Thorez' speech as showing political wisdom and statesmanship. Few politicians or journalists have had any illusions about the motive behind this radical reversal of Communist policy. Between October and January General de Gaulle went to Moscow, and the Russo-French alliance was concluded. As has so often happened before, the internal policies of the Communist Party are dominated by considerations of foreign policy. An analogous change of policy took place almost ten years ago, when Laval returned from Moscow with the Russo-French alliance and the Communists in the Chamber of Deputies, for the first time in their parliamentary career, voted for defence credits.

Whatever the motive of M. Thorez' recent statement, it will certainly not fail to influence the political outlook in France, though it remains an open question how stable and permanent that influence is going to be. The Committees of Liberation, the *Milices Patriotiques* and the *Franc-Tireurs-et-Partisans* are for the most part certain to take their cue from the Secretary-General of the CP; and their complete surrender to the Provisional Government ought to make it much easier now for General de Gaulle to place his Government on a solid footing.

Opposition to de Gaulle

Nevertheless, M. Thorez' magic wand cannot lay all the natural tension and discontent. It must have been something of an unpleasant surprise for General de Gaulle that, just after he had received help from the CP, his own followers of the resistance days grouped around the daily paper *Combat*, for the first time openly turned on him their polemical guns; and the criticisms of *Combat* were soon echoed by the Socialist *Populaire*. *Combat* represents a special trend in Gaullism. It pays to the General all the tributes which he has deserved; it also recognises his moral authority. But it is increasingly critical of what it regards as the social conservatism of the Provisional Government and of its lack of definite policy. Whether *Combat* has really any positive programme to offer to the idealistic and radical resisters, of which it seems to be the spokesman, it is perhaps still too early to say. But its criticisms have had a touch of genuine freshness and sincerity, which form some contrast with the somewhat stale and threadbare slogans repeated as a matter of routine by other movements, including some of the pre-war parties.

That *Combat* is not alone in its criticisms has been proved by last week's Congress of the *Mouvement de la Libération Nationale* (MLN), which adopted a very similar attitude. One of the chief issues discussed at this Congress was the fusion proposal made by the other great body of resistance, the Communist-influenced *Front National*. An overwhelming majority of the MLN delegates turned down the proposal. Some of the delegates suspected that it was nothing but an attempt by the CP to create the *Parti Unique*. The

Communists are now indeed extremely fusion-minded. They have proposed a merger with the Socialist Party, with the Christian Trade Unions as well as with the MLN. Nearly the whole French press has replied to these proposals, which hardly represent anything more serious than one of the seasonal CP "campaigns for unity."

The offers and the refusals to fuse have, however, yielded no reply to the question of the future of the Resistance movements. The national conferences of the MLN and of the *Front National* have confidently declared that they will not be reduced to the status of the ex-Servicemen's organisations after the last war, and that they do not regard themselves as mere bodies of veterans having no say in France's political affairs. But it is difficult to see in what way the resistance can really continue to play a political rôle. Its branches were organised on a purely local basis, and embraced people of the most divergent social and political outlook. In this lay the strength of the Resistance in the years of the underground struggle. But in this lies also its present weakness. The extreme diversity of its composition inevitably hampers it in working out its social and political programmes. Except for the Communists—and even this is not certain—the pull of the pre-war parties still seems to be relatively weak, but the Resistance has not proved capable of taking their place. The result is a tense political stalemate, silently presided over by General de Gaulle.—"La République du silence."

The German Rump

LAST year's Allied offensive in the west and the new Russian winter offensive have reduced Germany to its heartland between the Rhine and the Oder. In the west, the outposts of the Rhine-Ruhr industrial area are in or immediately behind the front and in the east, except for Olsa-Silesia, the Upper Silesian industrial district is lost. Roughly one-fifth of the area of the so-called Old Reich is occupied or will be occupied when the Russians have reached the Oder line in its entire length. Yet the early conquests of the Nazi regime were large enough to leave this Rump Germany in control, at the moment, of almost the whole of Central Europe, from the northern Italian plain and northern Yugoslavia to the western Baltic and Norway.

It can reasonably be doubted whether the Nazi authorities themselves are able to form a clear picture of the losses in men, materials, and resources sustained during the Russian offensive. The eastern provinces and the incorporated Polish districts produced considerable agricultural surpluses, especially of grain, potatoes and sugar beet. Large stocks of potatoes must have been left behind. Sugar factories in the Polish corridor, in the Poznan district and in Silesia were at the height of the season and the innumerable food factories were engaged in processing last year's harvest. It is, therefore, not surprising that the first result of the loss of territory in the east is a reduction in food rations. The food cards, originally issued for the eight weeks' period from February 5th to April 1st, will have to last for nine weeks, which means a reduction of roughly 10 per cent.

In addition to the actual loss of food stocks and food-producing provinces, the Nazis face the very difficult problem of reorganising the distribution of foodstuffs. Germany had been divided into carefully balanced transport zones for each foodstuff. This system has now been thrown out of gear. Large towns in Central Germany received a sudden influx of evacuees. The railways have been overburdened with military transport, and wide stretches of the network of canals and rivers cannot be used at the moment because of weather conditions.

Industrial Losses

The picture is virtually the same for industrial resources and productive capacity. After the loss of most of Upper Silesia, Germany's annual coal and brown coal output will be below 200 million tons. With it goes a considerable production of synthetic oil, zinc, lead and chemical products, not to speak of armament factories. The losses, however, cannot be estimated in definite figures or even in approximate percentages. Compared with production in Great Britain and in the United States, Germany's present output seems small and totally inadequate for replacing the losses and for equipping huge armies. Yet such comparisons are misleading. For a long time Germany has not manufactured appreciable numbers of heavy bombers, which in Great Britain and the United States absorb a large amount of

materials and labour. There is hardly any shipbuilding in Germany, except for U-boats and small craft. Canal barges are almost entirely made of concrete. Lastly, Germany has virtually stopped the manufacture of goods for civilian consumption.

During this war labour shortages have provided the greatest difficulties for all the belligerents. Paradoxically enough, at the end of the war Germany's labour situation will be easier. After the first three weeks of the Russian offensive, the loss of territory and productive capacity is far greater than the loss of population. The male population in the lost provinces stopped working and was at once enlisted in the Volkssturm battalions. Women and children, who are now on their way from the east to central and south Germany, can be immediately re-employed, either on the land or in factories. Considerable numbers of foreign workers appear to have managed to stay behind, but the bulk of prisoners of war and civilian workers seem to have been evacuated, and some seven, or even eight, million prisoners and foreign workers will still be employed in the Rump. Their efficiency is rated low, but in mere numbers they probably exceed Germany's total losses in killed, prisoners and permanently disabled.

The whole territory still under German control, from Tromsø in Norway to Bologna in Italy, is inhabited by perhaps some 120 million people, including prisoners of war and foreign workers. Roughly two-thirds of them speak the German language. The new industrial area in Central Germany, the Sudetenland, Bohemia and Moravia, and Austria, have become the industrial heart of what is left of the New Order in Europe, which, however, cannot live for any length of time without the coal and steel of the Ruhr-Rhine area and the agricultural surplus of the lost eastern provinces. It is true that natural resources, productive capacity, manpower and distances have, time and again in this war, proved deceptive. Rivers and mountains and, above all, the seasons, have not prevented military campaigns. The resources still available to Germany are inadequate compared with the resources of the United Nations, and the question now is what use Nazi Germany will try to make of these inadequate means for prolonging the war. There is no precedent for the present situation. Last autumn, the Nazis had before them the relatively simple problem of stabilising the western front along the German frontier against Allied armies which were numerically hardly stronger than their own.

Mounting the Counter-Offensive

The Russian offensive, carrying the whole front direct to the Oder line, has created an entirely different problem. First of all, the Russian armies are decidedly superior in numbers. Once the break-through was achieved, the speed of the advance was accelerated by the dense network of roads. The rivers, lakes and swamps, common to eastern Germany and western Poland, were therefore no obstacle. Under these conditions, a mere stabilisation of the fighting on a new front along the Oder line cannot be more than a temporary halt, if it can be achieved at all. The superiority of the Russian armies will remain, and inevitable losses will in proportion certainly not be greater than the German losses. The Nazis therefore face the problem of making a counter-offensive on a large scale with the immediate object of crippling the offensive power of the Russian armies.

The undertone of the Nazis' alarmist propaganda reveals that they are well aware of the problem. The reorganisation of a broken army, the temporary stabilisation of the fighting and preparations for a counter-offensive have already begun in the political field, while actual defence is left to improvisation. Propaganda suggests that Volkssturm battalions have everywhere taken a conspicuous part in the fighting. Men have been sent to the front direct from the factories. Wehrmacht units have carried on resistance in pockets in the rear of advancing Russian armies until they were able to rejoin other units in prepared positions. Behind this propaganda, which has never before used so many superlatives in describing the plight of refugees and the danger to the Reich, the reorganisation of the armies is undoubtedly progressing. Political opposition from generals and other officers, which provided the danger-point last summer, seems to be absent; in fact, after the purge of last year, effective opposition hardly seems likely at the moment. So far, the Allies' policy of unconditional surrender appears to have resulted in an "Unconditional Defence."

THE BUSINESS WORLD

The Banks' Capital

IF there is one thing certain about the two new institutions, Finance Corporation for Industry and the Industrial and Commercial Finance Corporation, it is that the lion's share of any accommodation they may ultimately make available for the succour and post-war expansion of British industry will be provided by the joint-stock banks. If and when the capital and loan powers of these institutions are extended to the ultimate limits their founders have laid down, they will have total resources of £170 million—comprising £40 million of share capital and £130 million of "borrowing powers," of which the commercial banks will have provided £144½ million—i.e., £14½ million of share capital, and all the loans and deposits. Indeed, if it is intended to leave a considerable part of the share capital of the FCI only partly paid for any appreciable time, it will be true to say that the finance, as distinct from the control, of the plan for industrial rehabilitation, which these two corporations are designed to embody, will come almost entirely from bank funds; it will be a bankers' effort. Even if the amount eventually demanded of the banks were less than the maximum, and reached, say, only £100 million, the acceptance of such an engagement would give fresh point to the suggestion, heard from time to time since the war, that the banks should increase their own issued capital. The banks themselves hold that view, and many of them have already made the necessary application to the Capital Issues Committee, only to be told that they do not occupy a very high place in the priority of would-be applicants for new capital.

It is doubtless true that, in proportion to the total amounts which the banks employ in one way or another in their business, the addition of another one or a couple of hundred millions for any purpose is not exactly a major matter. Equally, there may be force in the contention that, even now, the banks make more medium-term and even long-term advances to their customers than the text-books suggest. After all, the steepness of the downtrend of advances—their most profitable type of business for fifteen years now—has discouraged any over-austere insistence on the rules. But this is the first time that the banks' acceptance of a definite commitment to undertake a species of industrial finance going well beyond the limits of traditional British banking policy has been widely advertised to the public.

Psychology, we are repeatedly told, plays a larger part in banking than in almost any other kind of business. Has it not been urged, before the Cohen Committee, that the banks must retain the public's confidence, even to the extent

of withholding information of their actual working profits, and the way they deal with them, lest full knowledge should give a misleading impression? Whatever prejudices the public may choose to hold must be honoured as the price of its confidence. And one of these prejudices is that, as far as possible, when the banks lend "long," they should borrow as long as possible. Undoubtedly, many people would feel, rightly or wrongly, that the banks had made the right gesture if, having undertaken these new commitments, they were to issue fresh capital, non-returnable to subscribers so long as the banks remained in business—all the more so since, at nominal values, the banks' paid-up capitals look, to non-expert critics, singularly small in relation to their total liabilities. For example, the Big Five have an issued capital of only £65 million, out of £4,139 million of balance-sheet liabilities, and on the plane of the present argument it is the psychology of the general public which counts. The very low ratio of capital to liabilities that now prevails is largely a result of wartime finance and the swelling of all financial figures to which it has given rise. But even before the war the capital ratio of the English joint-stock banks was very low, by any test. The stability of the capital account while the balance-sheet totals have risen has been the chief explanation of the way in which the banks have contrived to combine cheap money with fairly satisfactory profits.

The exact rôle which "capital" plays in modern banking is difficult to define. The "joint stock" which a century or more ago differentiated the forebears of many of the great banking corporations of to-day from their "family" rivals, now represents almost a microscopic part of the banks' total "working capital." Moreover, in the old days, the capital account was an additional security for the depositor, since it defined the proportions in which unfortunate subscribers could be compelled to contribute, to the limit of their fortunes, in the event of failure. But with the spread of limited liability, this function has long disappeared. The capital account still provides a basis for the arithmetic of the annual share-out of banking profits and a directory of investors entitled to dividend. As dividend rates on bank shares (apart from certain "maximum dividend" issues) range from 12 to 18 per cent, non-technical people (including some of fairly advanced political views) are apt to draw the misleading (or at least illogical) conclusion that banking profits are distinctly generous. Bank shares, however, having long been established as favourite long-term holdings of conservative investors, are dealt in on the Stock Exchange at prices ranging from three to five times their nominal value, and give present purchasers a percentage income return lower,

rather than higher, than that obtainable on the best of "gilt-edged" industrial equities.

The amount, status, market price and dividend yield of all the shares issued by the Big Five (whose total has not changed since the war) are shown in Table II below:

TABLE II—SHARES, 1939 AND 1944

Share Subscription and Denomination	Total Amount			Dividend (1944)	Present Price	Yield
	Authorised	Issued	Called-up			
	£	£	£	%		%
Midland—						
£12, £2 10s. paid...	34,428,948	34,428,948	7,172,697½	16	10/8	3.74
£2 10s. fully paid...	5,000,000	4,804,192½	4,804,192½		11/7	3.44
£1 fully paid...	5,771,052	3,181,731	3,181,731		95/6	3.35
Lloyds—						
"A" £5, £1 paid...	72,500,000	71,864,780	14,372,956	12	63/-	3.81
"B" £1 (stock)...	1,500,000	1,457,296	1,437,296	5	29/-	3.45
Barclays—						
"A" £4 (stock)...	5,700,000	3,430,356	3,430,356	10	57/6	3.48
"B" £1 (stock)...	14,300,000	11,760,811	11,760,811	14	82/-	3.41
"C" £1 (stock)...		667,050	667,050			
National Provincial—						
"A" £5, 14s. paid...	3,000,000	3,000,000	420,000		55/6	3.78
"B" £5, £1 paid...	48,000,000	39,447,080	7,889,416	15	78/-	3.84
£3, fully paid...	9,000,000	1,170,000	1,170,000		90/-	3.33
Westminster—						
£4, £1 paid...	30,000,000	28,283,960	7,070,990	18	95/6	3.77
£1 (stock)...	3,000,000	2,249,167	2,249,167	12½	75/-	3.33

None of the banks has anything but equity capital. Maximum dividend stocks like Lloyds "B," Barclays "A" and Westminster £1 fully-paid rank equally with other issues by the banks concerned up to their contractual dividend limit. Much the greater part of the banks' capital, however, is in partly-paid shares which have no theoretical dividend ceiling. Of the Big Five, only Barclays has an issued capital which is fully-paid; among the other banks, though fully-paid equity shares figure in the list, the larger issues usually take the form of shares with an uncalled liability of anything from four to seven times the amount paid up. And, as the table shows, the market still exacts a premium for this risk, expressed in terms of a higher yield at existing prices.

If the banks decided to increase their effective capital, a call on partly-paid shares would offer the first obvious line of attack. Thereafter, the banks might increase their issued capitals up to the "authorised" amounts on which they have already paid capital duty and then, if necessary, seek new capital-raising powers. The extent to which individual members of the Big Five might raise new capital within the limits of their present powers is indicated in Table III, to which figures of disclosed reserves have been appended.

TABLE III—CAPITAL (CALLED UP AND CALLABLE) AND RESERVES, DECEMBER 31, 1944

Bank	Total Capital			Called-up Capital as per cent. of		Declared Reserve	Reserve as per cent. of Called-up Capital
	Authorised	Issued	Called-up	Authorised Capital	Issued Capital		
	£	£	£	%	%	£	%
Midland	45,200,000	42,914,871½	15,158,621	33.5	35.7	14,110,609	93.0
Lloyds	74,000,000	73,302,076	15,810,552	21.4	21.6	10,500,000	66.4
Barclays	20,000,000	15,858,217	15,858,217	79.3	100.0	11,250,000	71.0
Nat. Prov.	60,000,000	43,617,080	9,479,416	15.8	21.7	9,479,416	100.0
Westminster	33,000,000	30,533,127	9,320,157	28.2	30.5	9,320,157	100.0

Certainly, if the banks desired new capital, they could raise very substantial amounts (given Treasury permission,

of course) without going beyond their existing powers. Lloyds and the National Provincial could increase their present capital nearly fivefold and the Midland and the Westminster approximately threefold merely by calling up unpaid amounts on their partly-paid shares. Barclays, though its capital is fully-paid, could increase the total by one-fourth without going beyond its "authorised" limit.

Admittedly, it has not, in recent years, been the banks' practice to increase their "internal" resources by raising new capital, but by making additions out of earnings to published reserves. These are maintained by the National Provincial and the Westminster at a total identical with called-up capital. The present proportion of reserve to capital varies with the other three members of the Big Five, from 66 per cent in the case of Lloyds to 93 per cent in that of the Midland. Even, therefore, if published reserves were raised to 100 per cent of present capital in all cases, the accretion to total "internal" resources would not be considerable. The process, further, would take an appreciable time; for, to judge by their current practice, the banks prefer contingency accounts, with their elasticity and confidentiality, to published reserves as a repository for ploughed-back earnings.

What is the case for increasing the banks' capital if and when the authorities agree? The main argument, it may be urged, is that while the banks' proposed commitments to the FCI and the ICFC, with their attendant publicity, may represent only a small addition in themselves to their engagements under all headings, they come at a time when total capital and reserves have been allowed to fall to a much lower ratio of total liabilities than the orthodoxy of British banking has hitherto regarded as desirable. As Table I on page 184 shows, bank liabilities (and assets) have approximately doubled since 1933, the first complete year in the cheap money era, but there has been nothing like an equivalent increase in capital and reserves.

Up to the beginning of the war, although capital and reserves had not increased commensurately with the expansion in banking business, all the Big Five had succeeded in maintaining the "customary" ratio of around 5 per cent of total liabilities. But since 1939 the ratio has been nearly halved, and it is now under 3 per cent. An infusion of new capital would provide only a minor addition to the banks' total resources—though it would bear a more sizeable proportion to their longer-term engagements. Its main purpose would be to sustain public confidence by restoring a former relationship which was rightly regarded as having psychological value.

Such a decision might have another beneficial effect within the field of public relations. The addition to total earning power made by the new capital would be small, and some reduction in present dividend rates would be an inevitable consequence. That, however, would be no bad thing if it helped to spike the guns of some of the banks' more biased political critics and made it harder for the average citizen to draw misleading conclusions about the profitability of banking business. If and when the normal procedure of the capital market were again permissible, the banks could issue fresh capital to existing shareholders (or call up unpaid amounts in part or whole) in such a way that the reduction in overall rates of dividend was accompanied by a small bonus in the terms of issue, by way of transferable rights. All issues could be made at a premium; the visible reserves of the Banks would thus be raised by the amount of the premium. The idea certainly deserves serious consideration.

TABLE I—LIABILITIES, DECEMBER 31, 1933, 1939 AND 1944

Bank	Capital and Reserves		Profit Balance, etc.		Acceptances, Endorsements, etc.		Current, Deposit and Other Accounts		Total Liabilities
	Amount	Per cent. of Liabilities	Amount	Per cent. of Liabilities	Amount	Per cent. of Liabilities	Amount	Per cent. of Liabilities

* Notes, in circulation in the Isle of Man, totalling £15,187, £13,858 and £18,998 at the three dates, respectively, have been omitted.
(a) Including provision for contingencies, *inter alia*.

Cohen Committee Evidence

THE Cohen Committee, appointed in June, 1943, to consider what major amendments are desirable in the Companies Act, concluded the examination of unofficial witnesses some two months ago and is now drafting its report. In the course of 26 sittings approximately 100 witnesses were questioned on the subject matter of some 50 written memoranda. Of the total number of witnesses some three-quarters represented 30 odd institutions, official bodies, or associations. The bulk of the remainder were members of the legal profession, but two companies, "Shell" and ICI, gave evidence, as did the editors of *The Economist* and *The Financial News*.

The terms of reference of the Committee concluded with the instruction:

and, in particular, to review the requirements prescribed in regard to the formation and affairs of companies and the safeguards afforded for investors and for the public interest.

In the view of *The Economist*, the concluding phrase, here placed in italics, is the crucial point of the whole instruction to the Committee, and it is from this standpoint that the evidence tendered should be considered.

It is a regrettable fact, but one symptomatic of the general outlook on economic problems, that almost all the witnesses disregarded this phrase altogether or, if they did not, spoke as though it meant the interest of some section of the public not specifically mentioned in the terms of reference. There were exceptions, but they were few. There are a number of cases where the representatives of institutions made

suggestions which were in the public interest, even although they might be troublesome to the institutions themselves. Much of the evidence was of a detailed and technical character, often very valuable in itself, but with no bearing on the larger questions involved. Perhaps even more was designed to continue the *status quo* because to change it would remove from established concerns an advantage which they at present possess. Thus the banker, the investment trust manager and the issuing house are against virtually every suggestion for increasing the amount of information given to the public. The banker can get the facts if he wants them, and it is the business of the investment managers to acquire such information as they can in advance of the public. Similarly it is contended that any detailed information about company results, or even the publication of the earnings of some companies, would be harmful because, when the profits were high, competition would be encouraged. Sometimes, to clinch the argument, it is suggested that the competition would be foreign. Fortunately, some of the private individuals giving evidence were able to tell the Committee, from a wide experience, that there was very little ground for supposing that competitors would wait until the publication of accounts to discover the main outlines of the position of any firm in which they were interested. It is, obviously, impossible, in advance of the publication of their report, to know the views of the Committee on these points.

The Economist, both in its written and oral evidence to the Cohen Committee, and in the series of articles which it published in the spring and summer of 1942, set out to demonstrate that a reform of company affairs is necessary in the interest of the public as a whole. Most of the reforms sought will benefit certain sectional interests, but they are not sought for that reason and, if the sectional interests conflict with the public interest, the latter must prevail. This is, of course, subject to equal treatment being accorded as between individual members of the sectional interest and to the general principle that legislation shall not be retroactive.

LEGAL & GENERAL WHOLE LIFE AND ENDOWMENT POLICIES

both participating and non-participating

INCLUDE WAR RISKS WITHIN THE UNITED KINGDOM

so long as the life assured remains
a civilian.

Duty in the Civil Defence Services and the
Home Guard as at present constituted is
included in the cover.

The Society is prepared also to consider War
Risks both at home and abroad in respect
of non-civilian lives, each proposal being
considered on its merits.

Life Assurance is more necessary to-day than
ever before—ask for full particulars now

LEGAL & GENERAL ASSURANCE SOCIETY LIMITED

Chief Administration:
ALDWYCH HOUSE, ALDWYCH, LONDON,
W.C.2

Branches in all principal Towns
Established 1826 Assets exceed £87,000,000
General Manager: Vernon E. Boys

A very simple instance will suffice to demonstrate the principle. Let it be admitted that to disclose the profits of the XYZ Co. will lead to an increase in competition and a fall in the company's profits. This can only come about by an increase in the supply of the products concerned and a fall in their price per unit. That is to say, new savings will be directed into a channel where the return to be obtained is above the average. Under conditions of free competition, they will continue to flow into that channel until the return is average and, when that point is reached, prices will be as low as is reasonably possible with a substantial benefit to the consumer. Further, the presence of competition will have driven some of the producers to effect economies in costs, so further benefiting the general public.

Under a system of purely private enterprise, the desirability of having some means of securing a rational distribution of new savings would be a sufficient reason for seeking increased publicity for company affairs. But no one seriously supposes that there will be no state intervention in the post-war years. To quote from the memorandum of evidence submitted by *The Economist*:

One of the most important ways in which the Government can inform itself about the economic condition of the country is through the records provided by company finance, which are also indispensable as registering the effects of Government policy.

It is no answer to this argument to contend, as some witnesses did, that the Government would want more information than could be disclosed in published accounts, and that the proper way of obtaining it is through the Census of Production or through trade organisations. The methods are not mutually exclusive. But any special investigation involves time and labour and form filling. The great advantage of financial accounts is that every firm compiles them in any case. The Government would not require to ask for information in any more detail than is already supplied to the management in any well-conducted business, and the purely financial particulars to be assembled from properly presented company accounts provide a manageable amount of data which would be very useful in the formulation of general economic policy, as well as to individual investors and their advisers.

With these objects in view, *The Economist* in its evidence concentrated its attention largely upon securing really informative accounts compiled in a standard form, and expressed the view that the law should

define . . . such terms as depreciation, reserves, re-investment of profits and the like, so that they may be used by economic policy.

There is so far no indication of the action that the Cohen Committee may take in this matter, but it is interesting to consider the attitude of the Institute of Chartered Accountants. On the one hand, as pointed out in *The Economist*, this body is proceeding to a series of definitions which, if less than perfect, is a very valuable foundation and deserves legal backing as a first approximation to a solution of the problem. On the other hand, the Institute objects, almost violently, to standardisation.

There appears to be a misunderstanding, or at least a difference, in the use of words. What is required is, first, that definitions should be agreed for all items appearing in published (and for that matter unpublished) accounts; second, that, whatever the scope of the information, unlike things should not be added together in an omnibus item—with an exception for items too small to be significant; and, third, that a small number of prescribed forms should be laid down with the object of ensuring that the figures, defined as prescribed, should be intelligibly assembled. It is difficult to see what the accountants can find objectionable in such a programme.

As for the extent of the information required, *The Economist* suggested a much extended statement of turnover and costs from all public companies and all private companies controlled by public companies. This should include full trading, profit-and-loss and appreciation accounts which would disclose the cost to the company of each of the main constituents of its expenses.

With the possible exception of some very large concerns, which ought to submit accounts for each main branch of their activity, it seems desirable to judge the efficiency of the management by the results secured from the whole complex of operations under its control. But the shareholder, and at least equally the public and the Government, are

entitled to know the main divisions of expenditure—what is spent on wages, materials, power; how much it costs to sell the product and to administer the concern. The total remuneration of directors, on the one hand, and of principal officers, on the other, ought to be disclosed, though there is no reason why the total income of individuals should be stated, since it serves little purpose other than curiosity. At the same time, contracts which involve the company in substantial payments to retiring directors and officers ought to be disclosed.

While leaning with special emphasis on the need for an improved profit-and-loss account and a more informative balance-sheet, the evidence of *The Economist* stated a case for increased information on all aspects of company affairs. In particular, directors—and auditors so far as their duties extend—should on all such occasions as reconstructions, new issues and amalgamations be required to give a summary of the position of the company as they see it, disarming all the major elements which they have under consideration. Further, much more accurate information should be available about the nature of a company's activities.

Several witnesses, questioned about the value of increased information, replied that there was no general demand for it or that shareholders do not make use of the facilities which already exist or are incapable of understanding even the simplest form of accounts. As for the questions of general demand and the ignorance of shareholders, it may be admitted that there is some truth in both contentions. (It has frequently been argued that there should be a permanent body devoted to representing shareholders.) But it is relevant to point out that there was no "general demand" for universal education among the illiterate. It

is the duty of the authorities to see that the information is available. Once it is there, it is beyond question that the investor and the general body of brokers, bankers and other advisers, including the press, will use it.

To sum up, the provision of adequate information will increase the rational element in industrial investment and enable savings to be directed where they will most benefit the community, what is "benefit" being decided by the free choice of consumers through the machinery of the market. It will also enable the public at large—or such members as are interested—to exercise a general oversight over the doings of those in control of industrial units. To leave those in charge of a business—even when, as is now rare in large concerns, they are the owners of the capital employed—wholly without any check on their activities until collapse impends is against the interests of the public, the workers and the investors who own the capital. Moreover, it is also against the interest of the management itself, since the impersonal stimulant (or deterrent) of full publicity is likely to be much less distasteful than direct Government intervention, which in many cases is the alternative.

It is only the blindest businessman who nowadays does not recognise the inevitability of a growing volume of contact between industry and the Government, representing the community. These contacts can be relatively loose and general, the Government concerning itself in the main with the economic climate and leaving individual business to conduct their own affairs, or it can be detailed and rigid. Much fuller publicity for the operations of industry is an essential element in the first alternative—whether as a means of collecting data on which general policy can be based or as a method of observing the results. Those businessmen, or their professional advisers, who, by blocking the way to fuller publicity, make the more liberal solution more difficult, are digging the graves of their order.

Business Notes

Disclosure of French Assets

The recent visit of M René Pléven, the French Finance Minister, to London has had one concrete result: an agreement by which the British and French Governments will keep each other informed on the property held by French and British subjects in Britain and France respectively. Sir John Anderson, referring to this agreement in the House of Commons this week, stressed the importance which the French Government attach to the enforcement of measures taken by them for the purpose of controlling French foreign assets and ensuring that they are used in the best interests of the country. The agreement reached between the two Governments is one "in principle" only, and its operation must await the mutual reinstatement of property interests interrupted by the war.

Although the agreement places a mutual obligation on the two parties, it will obviously prove largely one-sided in its early operation, since there are few British assets hidden in France. The information on French assets in Great Britain will be given by the Custodian for Enemy Property, who is in possession of all the data; it will not be divulged directly by the British banks with which the assets are maintained. It is understood that the US authorities are making the same facilities available to the French Government.

The breach of confidence that the disclosure of individual—as distinct from global—bank accounts and security holdings involves is regrettable. It should certainly not become a precedent if London's position as an international banking centre is not to be prejudiced. This is not to condone the activities of those who would evade the exchange regulations and taxes of their own countries. But, in principle, the tracing and punishing of offenders is a matter for the Government of the country in which the offence has been committed. An exception in the particular case of France at this precise moment may have seemed justified to the British Government. To the financial community it provides a most unfortunate precedent.

Bretton Woods Under Fire

The US Congress will next week begin its consideration of legislative proposals to give effect to the Bretton Woods agreement. Part of the preparatory lobbying by opposition interests is a long and detailed criticism of the Bretton

Woods proposals by the American Bankers' Association. Although the bankers do not wish to reject the scheme altogether—since they see in it a promising forerunner of other useful attempts at international co-operation—the amendments they suggest would in effect take all the reality out of the Bretton Woods Final Act.

The bankers' criticisms are familiar. They argue that the International Monetary Fund would merely be an inflationary agency, and would hamper the cause of real adjustments (balanced budgets, stabilisation of currencies, etc.) that must underpin any internationally stable system. Therefore, they would sweep away altogether the International Monetary Fund part of the scheme, but would give the Reconstruction Bank power to make loans for the specific purpose of currency stabilisation. They stress, quite rightly, that the world other than the United States will emerge from this war with large gold and US dollar reserves, and that for sound borrowers in need of dollars the capital market in the United States will extend a warm welcome. They specify the recent loan arranged for the Netherlands Government, and repeat the familiar invitation to Great Britain to come and fill its needs in the American market. In order to make approach to that market easier, they recommend the repeal of the Johnson Act which now bars the door to defaulters on 1914-18 war debts.

It may, perhaps, be unkind to take these views of the Association's Economic Policy Commission as reflecting the general body of banking opinion in the United States. They cannot, however, be dismissed as wholly unrepresentative. The bankers, forgetting the 1920's, are evidently convinced that the task of providing the world with the required supply of short-term dollar credits in the difficult post-war period, can be safely left to them. They appreciate none of the abnormalities of that period, they fail to realise the importance of providing a centre where international monetary policies can be discussed and co-ordinated. They would presumably leave that co-ordination to the automatic working of a system in which the dollar, once more a full gold currency, would be the anchor to which other currencies would be tied. Nothing could be more remote than this from the expansionist (or in American banking language, "inflationist") theme of the Bretton Woods proposals.

The Black Market

From time to time, the black market, particularly in food and drink, provides a news item. So much has been written lately, that the Minister of Food has made a statement on the subject. It is good to hear from him that the quantity of food disposed of illegally is only a small percentage of the total supply, and that the Ministry's organisation for catching offenders has the situation in hand.

The right soil for a black market is composed of two elements. One is the smallness of the basic minimum provided by official ration, and the other is the willingness of the ordinary consumer to resort to illegal methods of supplementing it. While the British ration represents a marked reduction in consumption compared with before the war, it is nonetheless a reasonable, if uninteresting, minimum. Again, there is a strong British tradition that the Government is backed up by the people. It would patently be absurd to pretend that this attitude is that of the entire population, but it is that of the vast majority.

The few who do take part in the black market, in whatever capacity, cannot be condoned. Their participation should be punished ruthlessly whenever it is discovered. And, it should be remembered, it is consumers themselves who can deal the deadliest blow to the black market by setting their faces with the utmost determination against any illegal food transaction, however small and insignificant it may appear.

Supplies of Industrial Diamonds

The anti-trust action against the diamond monopoly, initiated by the United States Department of Justice late last month, appears to be aimed at the monopolistic control of industrial diamonds rather than against that of gem diamonds, which came into existence with the agreement between the South African Diamond Producers' Association and the Government of South Africa in 1932. During the inter-war period, the output of industrial diamonds generally exceeded the demand for them—they are produced jointly, though in varying proportions, with gem stones. There was then no apparent restriction on sales and both diamond producers and their syndicate had to carry heavy stocks.

When war broke out, the diamond industry voluntarily agreed to supply the growing needs of the Allied war industries at pre-war prices. This promise appears to have been fulfilled. True, world production of diamonds—some four-fifths of which are industrial diamonds—fell, according to the US Bureau of Mines, from a peak of 13,013,000 metric carats in 1940 to the war-time "low" of 8,140,000 carats in 1943. Stocks of "industrial" accumulated before the war, however, prevented a shortage of supplies, although consumption rose by leaps and bounds. There were private complaints in the United States last year that the quality of the available industrial diamonds was deteriorating. This has been confirmed by the official US Bureau of Mines in its latest annual diamond review, but the Bureau added that "research and experience prove that the grades available are satisfactory substitutes." Meanwhile there is evidence that, on the instance of the Combined Raw Materials Board, production of industrial diamonds was increased in 1944. Increases in production have been reported in British West, South-West and South Africa, but so far reliable production figures for these areas are not available. The Belgian Congo, the largest supplier of industrial diamonds, however, produced in 1944, according to official Belgian sources, some 7,000,000 carats, against 5,900,000 carats in 1943, and is striving to produce 10,000,000 carats in 1945.

A shortage of supplies in the near future appears thus out of question, and Mr S. W. Hofman, the chief of the United States War Production Board's Diamond Division,

recently pointed out that adequate supplies will be available in the first half of this year to meet the increased demand, and that new supply arrangements would be discussed around the middle of 1945. It is thus doubtful whether there is enough evidence of monopolistic restraints of trade in industrial diamonds. It is, of course, conceivable that the monopolistic powers of the industry may be abused after the war. The demand for industrial diamonds has now risen to a rate at which the output of gem stones may be inconveniently high, unless the proportions in which they are produced can be readily adjusted. For a number of years, however, producers and their syndicate will find themselves in a strong position to absorb any over-production of gem stones, for their stocks have been largely liquidated during the war.

Future of Steel

Sir Alexander Dunbar, chairman of the English Steel Corporation sketched the post-war setting in which he expects the iron and steel industry to operate in an address delivered in Sheffield on January 30th. He suggested that Government intervention in industry is inevitable and that, if the industry is to be allowed to run its own affairs within the limits of national policy, it must be able to show that it is competent to do so. Sir Alexander said that plans for the rehabilitation of the industry had already been formulated, but he did not divulge their nature.

Like many generalisations, Sir Alexander's statement is unexceptionable. There is no reason why, within the framework of national policy, the steel industry should not be allowed to run its own affairs, especially if it demonstrates its competence to do so. There is some indication that he expects it to be able to operate within wide limits, for he is said to have expressed the view, for example, that trade agreements between Governments in pre-war days were not nearly so beneficial to this country as international cartels—such as the steel cartels—arranged between industrialists. In the matter of competence, again, much will depend on the nature of the plans drawn up by the industry for its rehabilitation and on the manner in which these are carried out. So long as these plans are withheld from the public it is impossible to judge their adequacy; there is no reason why the Government should not permit their publication in outline in the same way as it has permitted the publication of the plans of the cotton and other industries. There is far too much secrecy about steel.

Aims of the Cotton Industry

In a recent address to the Oldham and District Textile Society, the chairman of the Cotton Board, Sir Raymond Streat, outlined a policy for the cotton industry. First, in his view, is the need for the "right outlook" in the industry. Next, Sir Raymond was concerned with organisation; the Cotton Board, employers, trade associations and trade unions should all be brought to a "concert pitch of efficiency and vigour"; further, there is need for groupings within the industry, horizontally or vertically. Thirdly, Sir Raymond urged a "thorough-going reform of labour arrangements." Fourthly, the relationship between production and distribution must be put on a basis that will ensure greater efficiency in both branches. Fifthly, Government policy should be designed to encourage the re-equipment and modernisation of the industry, and, lastly, it should give the industry a "fair chance of trading at a profit."

Sir Raymond's six-point policy is essentially a statement of aims. It would be interesting to know how far the industry has already gone in preparing detailed plans for their fulfilment.

Cotton Yarn and Cloth Contracts

It was recently reported that the cotton trades unions were preparing to apply for higher wages. The possibility of an increase in labour costs without any corresponding advance in controlled prices for yarn and cloth led almost to a standstill in business in Manchester. As a result, Sir Frank Platt, the Cotton Controller, wrote last week to spinners, doublers and manufacturers, pointing out that hitherto, whenever the Minister of Supply had made a new Order changing controlled prices for yarn and cloth, a clause had been inserted permitting the completion of

existing contracts at the controlled prices ruling when the contracts were booked. Sir Frank continued:

I intend on any future occasion when the Minister decides to change the controlled prices to recommend that such safeguarding clause shall be omitted so that as soon as the new Order comes into force the new prices will be the only ones at which controlled goods can change hands, whatever contracts may have been made beforehand.

This action by the Controller has caused a good deal of comment, but it is recognised that something had to be done, for most spinners and manufacturers have sold their output six months ahead. The Controller has emphasised that he does not contemplate a provision in contracts that the price shall be changed solely by reason of a change in costs, but only if and when a new Order is made. He has been advised that it is no protection to producers to make contracts submit to a "wage variation clause," and, in fact, the use of such a clause might be considered a breach of existing Orders. The way is now clear for business to be resumed, and it is expected that many contracts will shortly be placed in yarn and cloth to cover the export allocations for the first quarter of the year.

National Bank of Belgium

On January 11, 1945, the National Bank of Belgium made up the first return of its position since the liberation of the country. The delay in resuming the returns was partly due to the outstanding differences between the Belgian and French central banks regarding the Belgian gold handed over to the Germans by the Bank of France during the occupation. When that difference was settled by complete restitution to Belgium of an equivalent amount of gold, the way was clear for the publication of the first return. The main items, together with comparable data from the last return to be published before the German occupation of Brussels, are given in the following table:

	(In million Belgian francs)	May 9, 1940	Jan. 11, 1945
Gold and foreign exchange.....		23,248	33,067
Bills and advances.....		4,944	2,970
Advances to State.....		29,776	32,531
Notes.....			42,713
Current Accounts.....			5
Treasury.....		3	
Private.....		902	3,546

The gold reserve has been revalued at the new parity of Frs. 49,318.082 per kilo, which produced a surplus of Frs. 10,493 million. This item is held temporarily to the credit of a special Treasury account, and will be applied to the reduction of the National Bank's advances to the State as soon as the new Belgian franc parity receives legal sanction.

Of the total advances to the State, the main sub-items are Frs. 11,447 million lent during the occupation (in the main to finance German occupation costs), Frs. 1,276 million lent to the Government while in London (of which Frs. 1,000 million was actually spent in Belgium), Frs. 6,558 million advances to the State made since the liberation and Frs. 8,657 million advances representing the counterpart of Belgian currency made available to the Allied troops during their operations on Belgian territory.

The latest note circulation, Frs. 42,712 million, compares with a figure of about Frs. 100,000 million just before the violent contraction effected through the exchange of notes. Of the latest circulation, Frs. 28,500 million results from the exchange of old notes—the initial conversion of Frs. 2,000 per head producing Frs. 14,500 million, a further Frs. 13,000 million being the product of the second release made a fortnight after the first, and the balance of about Frs. 1,000 million being released for meeting special cases of individual hardship, such as help to the "bombed-out." The balance of the latest note circulation is in the main the product of advances made by the National Bank to the State, the principal item being advances to provide Belgian currency required by the Allied armies. It is the expenditure of the Allied troops in Belgium which, since the liberation, has provided the main expansionist element in the circulation, and, since the volume of consumer goods available for the Belgian population has fallen rather than increased during this period, it is this expenditure which must bear

the responsibility for the resurgence of the black market and for other inflationary symptoms which, it had been hoped, the original deflationary purge would banish for good.

As the troops move from Belgium into Germany, this pressure on the circulation and the price system will tend to disappear, and as foodstuffs and materials come into the country, it should be possible to proceed to further releases of blocked deposits representing the old notes. Even with this unexpected spanner thrown in the works of the currency deflation, the feat of cutting the note circulation by more than half represents a real achievement. But for this measure and the parallel blocking of bank accounts, the price situation in Belgium today would be far more out of hand than it is. There is now reasonable assurance that as goods begin to flow into the country, the exchange value of the Belgian franc will be safeguarded—not, it should be added, through any deflation of wages, prices and the national income, but through stabilisation of these items at approximately the levels at which they were found at the time of the liberation and by adjustment of the circulating medium to that prevailing level.

UK-Belgian Trade

Three new Trading with the Enemy Orders published at the close of last week have removed the Trading with the Enemy regulations which previously blocked trading and financial relations between the United Kingdom and Belgium. The orders, which became effective on the first of this month, free all new monies and other assets deposited here by Belgian nationals from the claims of the Custodian for Enemy Property. Belgian assets previously vested with the Custodian are not automatically freed, but the responsibility for freeing them now rests with the Belgian authorities, whose responsibility it is to see that the assets in question are free from enemy taint. When satisfied on this point, they make the necessary request to the Custodian, who since the agreement of last October has automatically released the assets. Until the beginning of

NORANDA MINES LIMITED

DIVIDEND NOTICE

Notice is hereby given that an interim dividend of One Dollar (\$1.00) per share, payable in Canadian funds, has been declared by the Directors of Noranda Mines Limited, payable March 15, 1945, to shareholders of record at the close of business, February 15, 1945.

By Order of the Board,
Toronto, J. R. BRADFIELD, Secretary.
January 31, 1945.

this month, anyone going to Belgium had to take notes to meet expenses. From now on banking facilities will be available. Commercial transactions have also been freed, though they remain subject to other British regulations, such as the grant of export and import licences and to the more acute physical restrictions due to the shortages of goods and shipping. Payments between the sterling and the Belgian franc area will remain subject to the British exchange control regulations and to the parallel restrictions to free convertibility applied in Belgium since the liberation.

These various measures represent the first freeing of financial and commercial relations between the United Kingdom and a liberated country. They are of exceptional interest and significance for that reason. The machinery is now ready to handle and finance the commerce that will begin to flow between the sterling and Belgian franc areas as soon as the existing physical obstacles to such trade are removed.

Local Loan Rates

Last week's debate on the second reading of the Local Loans Bill was chiefly of interest for the explanation by the Financial Secretary to the Treasury of the manner in which the Local Loans Fund would operate. There would be three departments concerned with the applications for loans. The sanction of the Ministry of Health would be necessary in order to ensure that the object of the loan was a desirable one. The Capital Issues Committee would be concerned with the question of priorities—seeing to it, for example, that a loan to build a new Town Hall was not sanctioned when there was still desperate need for new working-class houses. Thirdly, the Public Works Loans Board would be concerned with the question of the security for the loan.

The initial scale of rates for loans raised through the local loans fund, which it is intended to charge, is as follows: for periods not exceeding five years, 2 per cent; for five to ten year loans, 2½ per cent; up to fifteen years, 2¾ per cent; up to thirty years, 3 per cent; upward of thirty years, 3½ per cent. These are almost precisely the rates at which the Government is borrowing at the present time. An additional charge of 4s. per cent will be made over the loans as a whole in order to cover expenses of administration.

Life Office Investments

Some interesting data on the investment policy of British life insurance offices during the war years is to be found in a paper read recently before the Insurance Institute of London by Mr L. Brown, FIA, of the Prudential Assurance Company. Mr Brown has analysed the distribution of assets of twelve large companies for the years 1938, 1940 and 1943. Two major features emerge. The first, and by far the more important, is the growth in the offices' gilt-edged holdings by £173 million to £412 million at the end of 1943. At this level these holdings represent 39.08 per cent of total assets, compared with only 26.56 per cent at the end of 1938. The second feature is the growth in the item "stock and shares," which has risen from £149 million in 1938 to £158 million in 1943, although the total at the latter date equalled only 14.99 per cent of total assets, compared with 16.57 per cent in 1938. Approximately 55 per

cent of the 1943 total is in ordinary shares, whilst about 60 per cent of the increase in the combined item during the five years is in this class.

Both the rises in gilt-edged holdings and in equities are regarded by Mr Brown as an inevitable accompaniment of war-time finance and a closed economy. He would not seem to be a wholehearted equity fan. Discussing the trend in industrial finance to replace prior charges by ordinary shares, he says:

Generally speaking, the extension of such a trend is not likely to meet with the approval of life companies, who can have little desire at the present time to increase their holdings of equities at the expense of their investments in good fixed interest prior charges.

He is also at pains to point out that the increases in holdings of equities "principally reflect an effort to replace, in part, the high yielding securities which have been redeemed."

When it comes to a discussion of investment prospects, however, it would appear to be the gilt-edged outlook which is chiefly exercising the offices; since gilt-edged securities now form a large proportion of assets, this is hardly surprising. Mr Brown did not positively declare his expectation that interest rates will rise when physical controls are relaxed. But it is in that direction that his thoughts are moving. For he says:

Should it arise that we have to face a depreciation of market values owing to a substantial change in the general level of interest rates, I feel that, if the problem is sufficiently acute, it will be necessary to weigh carefully the desirability of ignoring current market prices for redeemable gilt-edged securities.

Anticipating the charge that such a policy would be similar to that of the nudist monarch who pretended to be fully clothed, Mr Brown points out that the alternative would be to "withhold from the current generation of policy-holders an equitable share of the emerging surplus by way of bonus." In practice, the extent of the problem, if it arises, will depend on the extent to which the offices have lent long in a war which has, generally speaking, been financed short. But on this matter no figures are available.

Argentine Rail Improvement?

The payment by two Argentine railway companies of a further full year's debenture arrears may be partly attributed to the recent special and temporary exchange concessions. The two debenture stocks in question are the Buenos Ayres and Pacific 4½ per cent and the Argentine Great Western 5 per cent, and payment on them has now been brought up to January 1, 1941, and April 1, 1941, respectively. But the fact that these payments caught the market by surprise indicates that the railways may be anticipating some increase in their earnings. Weekly receipts show considerable increases over the comparable figures for last year; but any major improvement must depend on checking the rise in costs; these have so far risen with almost equal rapidity. Fuel forms a major item of cost, and there are hopes that the end of the war may bring reductions in its present high price.

At the same time, the news that the Argentine Government is to impose a post-war system of import control will be received by the railways with mixed feelings. Argentina's gold and foreign exchange holdings at present total 3,800 million pesos but the intended industrial expansion will cost considerably more than this. The main purpose of import control must be to give priority to all types of capital equipment. This might suggest that the import needs of British-owned railways will receive early and special consideration, since most of their rolling-stock is very old and much of it is likely to be, in a short time, almost unusable. However, everything depends on whether the Argentine Government will permit the railways to charge adequate rates, or will otherwise help them, to make such replacement; and on the terms and conditions under which replacement is allowed.

British-American Tobacco

The net profits of British-American Tobacco Company for the year ended September 30, 1944, after deducting all expenses and taxation, are about 2½ per cent higher at £3,404,027 against £3,321,735. The ordinary dividend is maintained at 10.84 per cent, tax free, absorbing

£2,573,757, and general reserve receives £250,000 against nil. The ordinary dividend is covered by earnings of 11.9 per cent, tax free, against 11.5 per cent, tax free.

Net liquid assets, excluding inter-company items and employees' benevolent fund, are down by some £2,500,000, from £13,305,004 to £10,786,480. The most significant changes in the balance-sheet are an increase of over £3 million in debtors and £700,000 in stock, offset by a fall of over £3 million in Government securities and tax reserve certificates and £900,000 in cash. This shift of emphasis may indicate preparations for post-war trade.

The absence both of a consolidated balance-sheet and of any detailed profit-and-loss account figures makes it almost impossible to know what year-by-year changes take place in BAT's position. BAT controls numerous subsidiary companies, doing business all over the world in the production and sale of tobacco, from whom its revenue is largely derived. Only the dividends actually received from these subsidiaries are shown in the net profits, and their undistributed profits, which may be very considerable, are not shown. The balance-sheet shows investments in subsidiary and associated companies at over £34 million, which includes assets of £10 million odd in enemy and enemy-occupied territory; nevertheless, the auditors state that these investment possess, in the aggregate, a value largely in excess of the figures shown in the balance-sheet. This information, and the strong free reserves of over £5 million which BAT itself possesses, do at least indicate the very strong position of the group. It is likely that the end of the war will open up wider markets to BAT.

Miners' Welfare

The Miners' Welfare Commission is planning to put into operation, as soon as possible, the programme which was interrupted by the war. The building of pithead baths is a first priority in this programme, for, as the Commission points out in a report "Miners' Welfare Looks Forward,"

the provision of adequate welfare facilities at the pithead must influence not only the miner's opinion of his working environment, but his general social status and outlook, and also the attitude of boys towards entering the industry.

At the present time, out of about 1000 collieries, 362 collieries employing about two-thirds of the labour force, provide baths. The Commission aims to complete the programme within ten years of the general resumption of building. It also plans to extend the building of canteens, which are financed out of the Baths Fund, and suggests that where desirable, collieries should provide laundries at the pithead.

As part of its general scheme for improving amenities and making living, as well as working, conditions, more attractive, the Commission is urging its district committees to establish clubs, centres and playing-fields, and in cooperation with local education authorities to arrange for classes and discussion groups. Education is one of the foremost of the Commission's activities. Up to December 31, 1943, £1.1 million had been spent in grants for educational purposes—school buildings and equipment, scholarships and safety instruction.

Miners' Welfare is financed by a levy on output which

now stands at 1d. per ton. The continued decline in output is having adverse effects on the state of the Fund, and may mean that the Commission will have to "go slow" in its schemes. This would be very regrettable, and it may be that supplementary means of financing these very important welfare measures will have to be found.

Report to Foreign Bondholders

The latest report of the Council of Foreign Bondholders confirms that the Council has made representations (acting in regard to Germany in harmony with the Committee of British Long and Medium-Term Creditors of Germany) to the Government urging it to do its utmost to ensure that the arrangements made with enemy governments should give full consideration to the claims for service of pre-war foreign loans. Public long-term loans to enemy and enemy-occupied governments, states and municipalities normally coming within the scope of the Council's activities are estimated at £400 million.

The very size of this figure, together with the detailed record of the Council's individual successes and failures during 1944, indicate that despite the redemptions and requisitionings of overseas debt which the war has brought, the Council will have plenty of scope for its activities in the future. The trend of recent thought, indeed, has been in the direction of broadening the scope of the Council to include company investments in foreign countries and to strengthen the official backing for the wider organisation. In the recent debate in the House of Commons on overseas investments, Mr Richard Law, Minister of State, took the view that existing boards of directors already provided sufficient representation and protection for investors' interests. That view overlooks the cases, which are becoming increasingly frequent, where intervention by a foreign Government, generally on political grounds, renders both an investment unprofitable and the directors of the company concerned quite powerless. In such cases, it is hard to believe that representation and protest by a central body with official backing would not be more effective than the present set-up.

Shorter Notes

The revenue, after taxation, of the London, Midland and Scottish Railway Company for the year 1944 amounts to £15,679,000, against £15,672,000 for 1943. The ordinary dividend is maintained at 2.5 per cent, and war-time contingencies are again allocated £400,000. The preliminary figures indicate little change in the company's position compared with last year.

Regrettably, owing to an error, one sentence in Mr Gates's speech at the annual meeting of Tecalemit, Limited, was incorrectly reported in *The Economist* of February 3rd. The sentence in question should have read: "During the year under review both our London and Scottish factories and the factories operated by the Coventry Repetition Company, Limited, have been working to full capacity," etc., etc.

BAY HALL TRUST LIMITED.

Summary of the Directors' Report for the year ended 31st December, 1944, and of the accompanying Statement by the Chairman, Sir Charles Hambro, K.B.E., M.C.

DIRECTORS' REPORT:

The gross revenue amounted to £121,418. After charging Debenture Interest, Income Tax, Directors' Fees, Management and General Expenses amounting to £31,964 the net profit is £89,454. Adding £103,772 brought forward, the total available for appropriation is £193,226 and a dividend of 7½ per cent is recommended which will absorb £76,035 and leave £117,191 to be carried forward.

At market prices on December 31st, 1944 (or where no market price existed at valuations by the Directors at that date amounting to £305,010), the Share and Debenture Holdings and British Government Securities had an aggregate value of £2,675,596, as compared with their book value of £1,974,099.

CHAIRMAN'S STATEMENT:

The net profit of £89,454 compares with £84,725 for 1943, an increase of £4,729. The allowance for Dominion Relief amounts to 4s. 4d. in the pound, so that the net income tax to be deducted on the 7½ per cent dividend now recommended will be at the rate of 5s. 8d., and the dividend is, therefore, equivalent to about 10.7 per cent, less tax at the standard rate of 10s. 0d. At the end of 1944, the value of our investments showed an indicated appreciation of £701,497 over book cost. Over 96 per cent of the investments, including British Government Securities, taken at the valuations at December 31st last, are situated in United Kingdom, South Africa, and other parts of the British Commonwealth. Similarly measured, but excluding British Government Securities, about 91 per cent of the investments are in Ordinary stocks and shares and the balance in fixed interest bearing securities.

Copies of the full Report and Accounts can be obtained on application at the office of the Company, Princes House, 95 Gresham Street, E.C.2.

COMPANY MEETINGS

BIGNELL'S, LIMITED

MR ARTHUR J. BIGNELL'S STATEMENT

The eighth annual ordinary general meeting of Bignell's, Limited, was held, on the 2nd instant, in Rushden, Mr Arthur J. Bignell, chairman and managing director, presiding.

The following is an extract from the chairman's statement, circulated with the report and accounts.

The trading profit for the year amounted to £6,423 17s. 1d., which, after charging directors' fees, depreciation, war damage insurance and estimated liability for excess profits tax, resulted in a net profit of £15,707 16s. 11d.

The directors recommend that a final dividend of 5 per cent, less income-tax, be paid on the ordinary shares, making with the interim dividend already paid 8 per cent. for the year.

You will observe that of the total trading profit of £66,423 17s. 1d. earned during the year, no less than £45,000 is absorbed by taxation. It is, however, hoped that in the earlier post-war period reduction in taxation will enable the shareholders to share to a larger extent in the prosperity of the company.

As far as war-time restrictions will allow, and in spite of the many difficulties familiar throughout the trade, your directors have given much time and thought to the supply of good civilian footwear to our customers, so that when more normal conditions prevail the company will be in a position to satisfy the anticipated demand for its products.

Your directors also have plans well in hand for the development of our export trade, and every endeavour will be made to increase this promising branch of the company's business.

The report and accounts were adopted.

ORIENT STEAM
NAVIGATION COMPANY,
LIMITEDMR IRVINE C. GEDDES'S
STATEMENT

The forty-fifth ordinary general meeting of this company was held, on the 6th instant, in London, Mr Irvine C. Geddes, the chairman, presiding.

The following is an extract from the chairman's statement which was circulated with the report: The operating profit is £298,383—a decline of £36,748 as compared with the previous year, which is partly accounted for by our having had the benefit of the earnings of two of the lost steamers during a period in the year ended June, 1943. We have written off £150,000 for depreciation and transferred £50,000 to the pension reserve which now stands at £250,000. We propose the same dividend as for last year. As compared with the balance-sheet of the previous year, there is a decline of £1,578,787 in debtors; this is accounted for by the receipt during the year of outstanding insurance money for lost steamers. There is a corresponding rise of £1,456,423 in investments.

The war story told by the accounts is clear; the company has lost ships and the insurance recoveries have been invested in Government securities.

The problem of restoring the fleet to provide for the carriage of passengers and cargo to and from Australia faces us with growing urgency. For example, will the nations of the world follow an expansionist policy in world trade; what is the future of air transport; how long will taxation remain at the present level and will it continue to be penal on the higher range of incomes? Lastly, will the high cost of ships and their operation create a restrictive barrier to travel?

The report and accounts were adopted, and the dividend of 5 per cent, free of tax, approved.

GOSSARD, LIMITED

STEADY IMPROVEMENTS IN ALL SECTIONS

MR. B. M. LINDSAY FYNN'S REVIEW

The annual general meeting of Gossard, Limited, was held, on the 2nd instant, at the offices of the company, 168 Regent Street, London.

Mr B. M. Lindsay Fynn, F.C.A. (the chairman), presided.

The Chairman said: Gentlemen,—I would like to remind you that as a leading British high-class corset business we did not find the year just closed too easy. Since the outbreak of war we have also acquired the goodwill and business of two other well-known corsets—the Royal Worcester and Bon Ton—which, it is true, cater for a somewhat less exclusive market. Even those acquisitions have not helped us greatly as yet, for restrictions on both the quantity and type of the corsets and foundation garments that we have been allowed to make have been severe, although we see the first signs of relaxations.

INCREASED SALES

Our sales, both in volume and value, showed a substantial increase on the previous year, although our corset output was further restricted and our export sales fell again, owing to the difficulty of obtaining export licences. Nevertheless, a large share of the entire corset export trade of the country was handled by your company, and we have not failed to point out how urgent it is that we should be allowed not merely to export, but also to export an article that will do credit to this country.

I would like to see Britain enter into negotiations without delay with the Empire countries and with Scandinavia, Denmark, Holland, Belgium, France, and Switzerland with a view to the formation of a West European Customs Union. I think such a free trade area is essential if Britain and the countries mentioned are to have sufficient home markets available to them to enable them to compete after the war with businesses enjoying as their home markets Russia and the U.S.A.

Our production costs expressed as a percentage of the selling price, again rose slightly during the year, as, despite the fact that we have used more expensive corset materials and have granted wage increases, our selling prices remained unchanged. We believe, however, that our goodwill has still further improved.

Our subsidiary and associated companies, with the exception of one that has not traded during the year, have made profits. This is particularly gratifying in the case of one company which had been very severely "blitzed" and which, indeed, suffered again in the early part of the financial year. This improvement in the trading of our subsidiaries still continues.

BALANCE-SHEET

I will now direct your attention to the balance-sheet, where every effort has been made to present to you as clear a picture as possible. You will notice that the preference share redemption reserve now amounts to £34,022 and the total of the reserves and undistributed profit amounts to a total of £86,255, against an issued ordinary capital of £145,000.

Our current liabilities, including provision for N.D.C. and for income-tax, 1944-45, amount to only £56,781, against current assets of £162,694. The strength of the company's liquid position is therefore evident.

The fixed assets which appear in the balance-sheet at £16,179, have recently been revalued, and we are advised that a fair and reasonable valuation for them amounts to £50,764. The provisions that we had made in earlier years for losses in subsidiaries have now been deducted from the trade investments to which they relate and the net figure shown.

OFFER TO PREFERENCE SHAREHOLDERS

The directors have for some years had under consideration the increasing weight of the preference share redemption fund, which equals already an ordinary dividend of nearly 6 per cent. per annum and which increases every year. This redemption fund is not liked by the company, nor is it, I understand, liked by the preference shareholders, as they find their shares in increasing numbers compulsorily acquired for redemption at a time when it is extremely difficult for them to purchase equivalent securities on reasonable terms.

Your directors propose to call for redemption as soon as possible the existing 6 per cent. preference shares, and to replace them by an equal number of 5½ per cent. preference shares. The present preference shareholders will have the right either to exchange their 6 per cent. shares for the new 5½ per cent. shares, plus a cash capital payment of 1s. 6d. per share, or else to receive 23s. per share in redemption. Any new shares not so taken in exchange will be subscribed by the Ocean Trust Company, Limited. Treasury consent to this operation has been obtained. The sinking fund for the new shares will be at the rate of 1 per cent. on the amount of the shares issued, including any redeemed, and this, we are convinced, will be fair both to the company and to the preference shareholders; it will equal a dividend of about 1 per cent. on our present ordinary capital.

DIVIDEND OF 12 PER CENT.

The earnings for the year, after deducting N.D.C. and the preference dividend, but without making allowance for the preference redemption fund or income-tax, were equal to about 27 per cent. on the ordinary shares. As a result of this, and bearing in mind the slow but steady improvement in all sections of the business of the company and its subsidiaries, the board now feel that shareholders are entitled to more generous treatment than has hitherto been practicable in the war year. They declared, therefore, an interim dividend of 4 per cent. on the ordinary shares and recommend a final dividend of 8 per cent., making a total of 12 per cent. for the year.

While it is, of course, impossible to foresee accurately the future course of events, the board have at the moment no reason to feel that this dividend cannot reasonably be maintained in the future.

I can assure you that the results under review and the directors' recommendations would not have been practicable had it not been for the fine work performed by all the company's executives and workpeople, and I know you will join with me in conveying to them our appreciation of their efforts during a difficult year.

The report and accounts were unanimously adopted.

The proceedings terminated with a vote of thanks to the chairman, directors, and the staff, moved by Major E. Beddington Behrens.

LONDON AND RHODESIAN
MINING AND LAND
COMPANY, LIMITED

The adjourned ordinary general meeting of this company was held, on the 8th instant, in London, the Right Hon. Viscount Elibank, the chairman, presiding.

The following is an extract from the chairman's circulated statement: The net profit of £86,153 compares with £86,136 for the previous year. The profits from our gold mining interests in Southern Rhodesia continue to be deleteriously affected by the existing high level of war taxation and by

the scarcity of labour and skilled supervision. Influenced by the growing decline in the number of operating gold mines and in mining revenue, the Government of Southern Rhodesia have recently appointed a Royal Commission to inquire into the disabilities under which the industry is suffering.

The sales of cattle were again satisfactory in numbers and in prices.

The report was adopted.

POWER SECURITIES
CORPORATION, LIMITED

MR WM. SHEARER'S STATEMENT

The twenty-second annual general meeting of this company will be held at Winchester House, Old Broad Street, London, E.C., on the 14th instant.

The following is an extract from the statement by Mr William Shearer (chairman and managing director) which has been circulated with the report and accounts: The accounts for the year 1944 show approximately the same results as those of the previous year, and call for no detailed comment.

Among other works of national importance which engaged our attention in the year under review was the construction of certain units of what is known as the "Mulberry" project. While no profit is likely to accrue in respect of this work, carried out under extremely difficult conditions, it is gratifying to record that we were able to make some contribution to the

execution of the works involved in this brilliantly conceived project, which played so vital and successful a part in the invasion of the Continent of Europe.

I feel confident that a great opportunity for the development of electrical and civil engineering projects in various parts of the world is open to British enterprise, notwithstanding the fact that powerful foreign competitors are already in the field in strength. But undue and unnecessarily prolonged restrictions and the unsettling effect of certain so-called "planning" for the sake of "planning" will certainly retard and if allowed to prevail may extinguish, the hope of the nation's recovery after hostilities are concluded.

In the post-war period, not only a continuance of wise leadership, but the utmost application and the most strenuous endeavours on the part of all engaged in industry and commerce will be required to restore to health and vigour the battered and shattered economic life of the country. To this end "regimentation" must cease and liberty to adventure and create must prevail.

JUTE INDUSTRIES,
LIMITED

INCREASED PROFIT

The twenty-fourth annual general meeting of stockholders of Jute Industries Limited will be held in the board room of the Association of Jute Spinners and Manufacturers, 5 Cowgate, Dundee, on the 15th instant.

The following is the statement by the chairman which has been circulated with the report and accounts:—

Trading profit, interest, dividends and transfer fees, at £130,736 4s. 10d., exceeds the previous year's figure by £23,932 18s. 5d.

The sum of £60,000 has been transferred to reserve for depreciation and obsolescence, and £35,000 has been added to the provision for deferred repairs.

After meeting a dividend of 4 per cent., less income-tax, on the preference stock, there remains, with the amount brought forward from last account, a sum of £41,160 11s. 9d. to be carried to next account.

Following on prolonged negotiations with the Inland Revenue authorities, a capital and profits standard for excess profits tax, with the exception of a few details, has been agreed. The directors consider the standard satisfactory, and they are advised that the provision made against this liability, as well as for income-tax and national defence contribution, is more than sufficient to meet the probable total of assessments on profits up to September 30, 1944.

At the extraordinary general meeting held on February 24th last year the issued preference and ordinary shares of the company were duly converted into stock.

The sale of the company's interest in the Camperdown Pressing Company, Limited, closes a long association, the company having been registered in 1882. The concern ceased to be a useful asset, and the sum obtained for the shares can, in the opinion of the directors, be used to better advantage. The proceeds are meantime invested in Government securities.

FINANCE AND BANKING

THE MONEY MARKET.—Credit has become progressively more stringent this week. The weight of tax payments has been the main drain on market resources which, in addition, (Continued on page 195)

GOVERNMENT RETURNS

For the week ended Feb. 3, 1945, total ordinary revenue was £125,039,000, against ordinary expenditure of £148,528,000, and issues to sinking funds of £20,000. Thus, including sinking fund allocations £11,388,210, the deficit accrued since April 1st is £2,496,061,000 against £2,402,845,000 for the corresponding period a year ago.

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After increasing Exchequer balances by £179,034 to £3,415,264, the other operations for the week (no longer shown separately) increased the gross National Debt by £11,857,059 to £22,081 million.

INDUSTRY AND TRADE

Cotton Goods for Far East.—The Cotton Board have announced that provision has been made by the Board of Trade for a cotton piece goods allocation for Period I, 1945, for British Far Eastern territories. In view of the urgency with which supplies are required, the allocation will be used for the replacement of stocks. The actual distribution in the territories concerned will be under military control. The Cotton Board, therefore, have asked merchants to offer stocks for this purpose.

the types of goods being, amongst others, printed shirtings, khaki drills, dyed poplins, printed dress fabrics, cambrics, zephyrs and coloured woven shirtings. The goods must be delivered within the next ten weeks. It is reported that supplies are very short in Far Eastern markets and the authorities are anxious to arrange for exports as quickly as possible.

Property in Liberated Countries.—The Trading with the Enemy Department have made arrangements with the Belgian, Netherlands and Norwegian authorities for settling personal and commercial debts and claims outstanding between United Kingdom residents and those in the countries concerned. The removal of legal obstacles arising from the war to settlement will be considered.

"The Economist" Sensitive Index.—There was no change in the index during the week ended February 6th. The complete index (1935 = 100) was 158.6; crops 135.7; and raw materials 185.5.

**RATIONING MAKES
EXTRA VITAMIN SUPPLY ESSENTIAL**

THE BODY MUST HAVE ENOUGH vitamins A and D if it is to remain healthy. Before rationing most of us got sufficient of these in our ordinary meals, but wartime diets tend to reduce the vitamin value of our food. A daily dose of Crookes' provides sufficient 'anti-infective' vitamin A to enable you to resist colds and influenza; it provides, too, the correct amount of 'sunshine' vitamin D to keep adults healthy and to allow children to grow up with strong bones and sound teeth.

CROOKES' HALIBUT OIL

OBTAINABLE ONLY FROM CHEMISTS

Capsules—per carton of 100—8/6. Liquid—per phial—enough for 16 days 2/.

Musical Evening

"UNDERNEATH the gaslight's glitter," the Victorians loved an interlude of music. Uncle Albert would sing songs of Araby, and in return might be given permission to smoke.

Without singing our own praises unduly, we may mention that Rothman cigarettes were already famous at that time. Today our Navy Cut Medium

are an outstanding blend at 11/- a hundred (postage 3d. extra). We shall be happy to supply you at any Rothman shop, or direct by post from headquarters. Rothmans Ltd. (Folio ET 12), 5 Pall Mall, London, S.W.1.

THREE NUNS SAVES MONEY

—because of its
SLOW-BURNING CUT

There are two special reasons why 'Three Nuns' Empire Blend Tobacco saves the smoker money. It is scientifically cut to burn slowly, each ounce lasts longer, you smoke fewer ounces a week. It is made from fine leaf which is favoured by the lower duty on Empire Tobacco. To enjoy the fullest pleasure of smoking at a moderate cost, take to 'Three Nuns' Empire Blend.

PRIMARY PROBLEM IN WARTIME

In every town mothers bring their babies to the Health Centre. Very useful educational work is undertaken — they learn the vital importance of vitamins in their baby's diet.

MORE has been done in this country, during the war years, to ensure the good health of babies than ever before in history. The Ministry of Food and the Ministry of Health have rightly regarded the health and diet of the youth of the nation as their primary problem. Wartime children are priority No. 1.

The Summary Report of the Ministry of Health for 1944 shows that 77 per cent of all mothers in Britain attended ante-natal clinics. The number of first health visits to children under one year represents 96.8 per cent of the total registered births.

Priority allowances of milk, eggs, and vitamin supplements to expectant mothers and to babies are part of the Ministry of Food's programme to ensure that the important protective factors are fully represented in the diet.

Today there is a great extension

of knowledge of vitamins and, to some extent, an increase in their inclusion in the diet of all. The production of national bread and vitaminized margarine, and the increased consumption of vegetables have augmented the per capita intake of vitamins. It is generally conceded that this has raised the general level of health standards in Britain despite the exigencies of total war.

Alongside this important forward step in national welfare has been the mass production of synthesized vitamins. In the Roche plants in Britain Vitamin C and Vitamin B1 can be produced by the ton, bringing them economically within the reach of all. These synthesized vitamins are identical with the natural vitamins. This valuable scientific advance opens a new prospect of a nation where no one need lack an abundance of the necessary protective factors.

THE CO-OPERATIVE WHOLESALE SOCIETY, LIMITED. proposes to extend its MARKET and ECONOMIC RESEARCH ORGANISATION.

The scope is wide, embracing the study of commercial, industrial and political developments affecting all aspects of the Society's operations, as well as general marketing problems, relationships with Retail Co-operative Societies, and Consumer Research.

Vacancies will arise for: (1) SENIOR RESEARCH ASSISTANTS. (2) SPECIAL LIBRARIAN. (3) AREA TRADE RESEARCH OFFICERS.—Applicants should have such a knowledge of the problems of retailing as would enable them to discuss intelligently the development of co-operative trade with Retail Societies.

A background of general training in economics or social science, knowledge of the organisation of the Co-operative Movement, and sympathy with its aims are highly desirable qualifications. Applications—stating age, education, experience and other qualifications, salary required, and indicating when the candidate will be available—should be addressed to the Secretary and Executive Officer, C.W.S., Limited, 1, Balloon Street, Manchester 4, endorsed "Market Research."

MARKETING Research Specialist required for Distribution Division of Relief Organisation. To study economic channels of distribution of all types of produce (wholesale and retail trade, producers, etc.). To appraise such channels and make recommendations for the purpose of putting them into operation. Previous experience of this type of work. Location of work—London. Salary £1,000 to £1,300 per annum. Applications in writing (no interviews), stating date of birth, full details of qualifications and experience (including a list in chronological order of posts held) and quoting R.S.225, should be addressed to the Ministry of Labour and National Service, Appointments Department, A.3(A), Sardinia Street, Kingsway, London, W.C.2.

MARKS AND SPENCER LIMITED. Research Department, London, requires a Man or Woman with a good educational background, as a Reader of Commercial, Industrial and Technical Journals and National Press for extraction of information of interest. Knowledge of economics an advantage. The position is progressive, with opportunities for advancement. Suitable position for disabled ex-Servicemen. Commencing salary £350 to £500 p.a., according to qualifications.—Applications, stating age, training and experience, should be made in writing, to F. C. R., 2 Baker Street, London, W.1.

Conference in the Crimea

THE statement issued at the end of the Crimea Conference is the clearest and most explicit yet issued after any meeting of leaders of the United Nations. It compares favourably with the document produced by the Teheran Conference, in which only very general principles were enunciated and specific agreements related only to minor questions such as the guarantee of independence given to Persia.

It is true that the full scope of the discussions will only become known little by little, either by the carrying of decisions into practice or by more immediate unofficial leakages. It was in this way that the world came to realise the full scope of the Teheran meeting. Similarly, in commenting on the Crimea decisions, it is well to remember that much has not been published and that, particularly in the matter of interpretation, the unpublished results may have greater importance than the avowed and publicly agreed statements.

In some ways, the Crimea Conference appears to have reversed the decisions taken at Teheran. There, the three leaders agreed to different zones of influence, or at least of leadership in action. This entailed Russian dominance in Finland, Poland, Roumania, Hungary, and possibly Czechoslovakia, and predominant but not exclusive Russian influence in Yugoslavia. Greece fell to the lot of

Britain, Italy to Britain with some American participation. The events in Poland, Yugoslavia, Greece, and Italy in the last year have underlined how unsatisfactorily this division is working. For instance, it is quite impossible for the other Great Powers to disinterest themselves in the problem of Poland. The new Declaration accordingly appears to propose new procedures.

The Three Powers reaffirm the right, guaranteed in the Atlantic Charter to all peoples, to choose their own form of government. Therefore

to foster the conditions in which the liberated peoples may exercise these rights, the three Governments will jointly assist the peoples . . . in Europe . . . to establish conditions of peace . . . to form interim Governmental authorities broadly representative of all democratic elements in the population . . . to facilitate where necessary the holding of . . . elections.

Thus the Great Powers' responsibility covers all phases of liberation and, if the emphasis is laid on the joint nature of their responsibility, there should be an end once and for all to the "spheres" established at Teheran.

This decision will, no doubt, be hailed in the American Press as a victory won by the President over British and Russian policies, with their desire for exclusive spheres. If to regard it in this way will make the policy of American

intervention in Europe more popular and more enduring, it would be foolish to cavil. But if British diplomacy has not, in fact, been bending every effort to induce the United States to undertake constructive responsibilities in Europe it has been failing in its duty. There is no need to speak of victories; but every action that links American policy to Europe is an advantage for Britain.

In two instances—Poland and Yugoslavia—the agreement goes beyond general principles and lays down the methods by which joint responsibility will be exercised. The Tito-Subasitch Agreement is to be implemented and extended to bring in former members of the old Yugoslav Parliament, provided they are not compromised with the enemy. In Poland

the Provisional Government which is now functioning in Poland should . . . be reorganised on a broader democratic basis, with the inclusion of democratic leaders from Poland itself and from Poles abroad.

The Russian Foreign Commissar and the British and American Ambassadors in Moscow are to consult with the Lublin Government and make recommendations on its reorganisation. Once this broader Polish administration has been established, Britain and America are to recognise it as the Provisional Government of Poland.

It is too early to say how great an advance these decisions mark on the previous and unhappy state of affairs in Eastern Europe. Everything turns on the interpretation given in practice to such terms as "democratic," "free and unfettered elections," "democratic and non-Nazi parties," "not compromised by collaboration with the enemy." If these words mean what they say, and what British and Americans understand them to mean, then clearly a great advance has been made. To this only the execution of these plans can give a final answer. Democracy is a word so misused as to be almost devoid of meaning. Most elections these days, even the plebiscites of the dictators, are "free and unfettered." There is, however, one sure test. If the governments established under the Crimea Declaration and the communities they administer show healthy signs of dispute, differences of opinion, and genuine independence of political approach, it will be safe to say "Amen" to the present proposals.

Their effectiveness depends in its turn upon the precise meaning attached to the phrase "joint control" or "joint responsibility." If it is genuine, if the Three Powers are really to consult with each other, if Commissions of Control are really to be more than rubber-stamping machines for the policy of the dominant Power in each area, then a new phase will open in Europe far more hopeful and propitious than the last. But this again can be proved only by events.

In the sphere of post-war collaboration for peace and security the Crimea Conference goes rather further than Teheran. Since November, 1943, the Great Powers have conferred together at Dumbarton Oaks on the future organisation of peace. In the new Declaration they announce not only their support for the decisions reached so far but also a solution for the one outstanding problem—the question of voting procedure in the Security Council. The solution itself is not to be divulged until France and China have been consulted. They are to be associated with the Big Three as convenors of the Conference at San Francisco on April 25th. Thus on April 25th the Big Three will presumably become the Big Five.

The procedures proposed at Dumbarton Oaks, however complete and however fully agreed upon, will remain simply the machinery of international collaboration. The actual concerting of policy, particularly of Great Power policy, remains the central problem of world security. The Crimea announcement that in future the Foreign Secretaries of the three Great Powers will meet at regular intervals for consultations is a more significant announcement than the more general statement on the machinery of world peace. It only remains for the French Foreign Minister to be invited, and an effective "European Commission" will have been established at a sufficiently high level to ensure results.

On the most important topic of all, the settlement with Germany, the published agreement does not add very much to what is already known. The zones of occupation are mentioned but not defined. A Central Control Commission in Berlin will work under the Supreme Commanders of the Three Powers. France is to receive a zone and join the Control Commission. For the rest, nothing is said about the composition of a future German administration, while the actual list of terms to be imposed—after unconditional surrender—upon Germany is in parts so ambiguous that it is difficult to say whether the peace proposed is hard or soft or even whether the Allies have postponed or taken firm decisions.

The destruction of German militarism and of the German General Staff appears for the first time beside the annihilation of Nazism. The punishment of war criminals is reaffirmed. For the first time it is officially suggested that the Germans can eventually win "a decent life . . . and a place in the comity of nations." The ambiguities concern the economic and territorial settlement. The Declaration states that the Allies will

eliminate or control all German industry that could be used for military production.

Interpreted harshly, this could mean the total destruction of German heavy industry; leniently understood, it could mean a measure of Allied supervision—admittedly difficult—over a functioning German industrial system. The Declaration further establishes a Reparations Commission in Moscow and demands that

Germany be obliged to make compensation for the damage in kind to the greatest extent possible.

Everything turns here on the two phrases "in kind" and "the greatest extent possible." Does "in kind" include forced labour, and the dismantling of existing German factories, or alternatively, the export from Germany of reconstruction goods made by German workers at home? Does "the greatest extent possible" mean simply physical limits—the amount of industrial equipment and foodstuffs that can be taken and the transport available to carry them—or does it include some conception of a minimum standard of life for the Germans? And, since it cannot be a policy of indefinite duration, what time limit is envisaged? No verdict can be passed on the terms as they stand. The interpretation is all.

Territorial changes are only touched upon indirectly. There is no mention of the future status of the Ruhr and the Rhineland, and the compensation to be given to Poland for the loss of the lands East of the Curzon Line is defined merely as "substantial accessions of territory in the north and west." These territories are not further specified and the final decision is to await the peace conference. Thus it looks as though the final territorial settlement with Germany had been postponed. Like the economic clauses, the territorial arrangements may be severe or they may be lenient. The Crimea Declaration gives no firm indication of the Great Powers' plans, either because they wish to keep them secret or because they have not yet finally formulated them.

If a summary is attempted of so wide and comprehensive a declaration, it can perhaps best be given in the suggestion that, save in one matter, the Crimea Conference is a simple endorsement or logical development of the policy of Teheran. The exception is the assumption of joint responsibility for liberated Europe, which, properly interpreted and fully applied, opens a door to a far more genuine and fruitful collaboration than any achieved so far. The problem for the next months is whether the Powers, having opened this door, will be ready to walk through it to the new fields of collaboration beyond. Time and their policy will show this. The Crimea Declaration, like the Dumbarton Oaks plan, is primarily concerned with the machinery of international relations. The content of policy is still to be decided in London, Washington and Moscow. It is on these decisions of policy, by each Government in its own capital, that the weight of public opinion should now be brought to bear.

Industrial Relations

THE problem of industrial relations casts a shadow of doubt over every aspect of reconstruction. Without effective co-operation between management and workers the stupendous war effort of the British people would have been impossible; without relations at least as good the effort of industrial reconversion and recovery will be in jeopardy.

The basic principle of joint consultation is incontestable. That every worker should feel himself to be, in a fundamental sense, a partner in industry rather than the servant of an employer may be considered an additional element of social security. It is obviously important that the worker should be free, and feel free, to make complaints and to urge reforms without fear of dismissal or victimisation. The principle is identical with that of political representation—namely, that employees should have the right to be represented by members of their own choosing.

The practical worth of joint consultation is also undeniable. Management can often be greatly strengthened when it draws regularly upon the pooled knowledge and experience of the workers; and this fact is in itself a powerful stimulus to increased efficiency in every branch of production. Major R. A. C. Radcliffe, a member of the Welfare Department of the War Office, has shown that the collaborative spirit in the British Army owes much to the fact that men are not merely told what to do but why they are to do it.

It not only enables them to give intelligent co-operation, but also makes them feel that their leaders are treating them as intelligent and reliable human beings in whom full confidence can safely be placed.

These notions are not new; they formed the basis of the recommendations put forward by the famous Whitley Committee in 1917. These included the formation, in well-organised industries, of Joint Industrial Councils and the appointment of Works Committees representative of management and workers in industrial concerns. In four years 73 Joint Industrial Councils were set up. In June, 1944, JICs were working successfully and widely—in Government Service, Local Authority Service, Fishing, Mining, various branches of Engineering, Building, Textiles and in many other trades and industries.

The Whitley JICs had much wider terms of reference than their counterparts of today. They were urged to meet for the consideration of such matters as the better utilisation of the practical knowledge and experience of workpeople, the settlement of the general principles governing conditions of employment, the methods of fixing and adjusting earnings, technical education and research, processes, and industrial law. These recommendations were not accepted universally by federated employers. Even

another war has not convinced every employer of the need for joint consultation; and in some trades labour itself is still uneasy and suspicious.

The Works Committees or Works Councils were less successful. For this there were three reasons. First, the councils received little support from organised labour. The trade unions regarded them with scepticism, chiefly because the entire initiative in their constitution rested with the employer. Secondly, they were extremely limited in the scope of their activities. They dealt only with welfare (in its narrowest sense) and working conditions and excluded discussion of terms and conditions of employment, and any subject related to the industrial or economic policy of the firm. And, thirdly, the councils afforded no representation, as a rule, to office staff, draughtsmen and technicians.

*

The principle of joint industrial consultation has been greatly strengthened during the war, and the establishment of joint production committees in the engineering and other industries is one of the most important wartime developments. In 1942, engineering employers and unions agreed on a model Constitution for JPCs, which they recommended should be set up in all federated firms. This constitution is not, however, a rigid formula; it can be adapted to the conditions of individual factories. The terms of reference of JPCs " . . . to consult and advise on matters relating to production and increased efficiency . . . in order that maximum output may be obtained " are very wide—so wide, indeed, that they often lead to a difference of interpretation which may itself be a cause of friction.

A great deal depends on the calibre and the sense of responsibility of the workers' representatives who are elected annually—all the workers in the factory may vote, but only union members may serve on the committee. Some workers' representatives are regarded by their fellows in the workshop as "bosses' stooges" because they sit round a table with the management; others tend to use the committee as an opportunity for airing grievances. Then there are some managements which resent the intrusion of the workers into production matters, and tend to regard with suspicion any suggestions they may put forward. The success of JPCs, it cannot be too strongly emphasised, is in direct relation to the extent to which both sides are prepared to co-operate.

One weakness of the committees is the absence of representation of office staff, draughtsmen and technicians, and a constant source of friction is the rivalry between foremen and shop stewards, who are frequently elected to office.

Have you heard of —

A CAPITAL ANNUITY

Part capital, part interest . . . £315 per annum guaranteed for twelve years . . . of which, on average, £271 is capital repayment and £44 is taxable interest . . . and, after the twelve years, an annuity of £472 10s. (subject to tax) continuing for life . . . this can all be secured by a male life aged sixty for a present investment of £5,000

EQUITY & LAW LIFE ASSURANCE SOCIETY

LINCOLN'S INN FIELDS

Temporarily removed to

163-164, STRAND, LONDON, W.C.2

JPCs are due to terminate at the end of the war, and many employers clearly do not wish to regard either the committees or the agreements as permanent. On the other hand the Trades Union Congress, at Blackpool in 1944, passed a resolution in favour of the continuation of joint production committees in the postwar period. In spite of all the difficulties, JPCs have done valuable work. With all their imperfections they remain the most promising of all developments in the sphere of industrial relations and the core of achievement around which postwar improvements should grow.

★

The problems of industry as they relate to labour are so differentiated that plans for industrial consultation should proceed upwards from the ground floor and should develop from the practical experience of workers and managers at the factory level. If the state assumed the overriding function of drafting schemes of joint consultation in industrial management its powers would be used to impose either a rigid pattern that could be made to harmonize with local needs only with very great difficulty, or a pattern so generalised and amorphous that it would produce only negative results. The basis of good industrial relations rests on satisfactory co-operation in the industrial unit, the factory; but, quite obviously, this must be supplemented by joint consultation at the national level. Only by this dual approach can local experience and progress be pooled and made to contribute to the formulation of common standards.

Dualism in joint consultation leads to the important question whether compulsory powers should be vested in the higher joint consultative bodies. The late Dr Walpole, a man of considerable experience and authority in this subject, recommended most strongly that the "National Councils" should be advisory and not executive—on the incontestable grounds that executive authority should be reserved for individuals and bodies that can be held accountable by the community. His councils would not dictate, but indicate the lines on which joint consultation should proceed at all levels.

Critics of the principle of joint consultation argue that in peacetime there is a fundamental conflict of interests between employers and employees which precludes any genuinely harmonious co-operation. And the justification for this view is said to be that employers are concerned only with profit-making and employees with the preservation of the market value of their services. But these objectives are perfectly legitimate and reasonable, and pursued in a fair and efficient manner they are quite compatible. Profitability measures the success of industrial enterprise and determines the reward of owner and worker alike; and the market value of labour depends, in the long run, on its efficiency. It is only when this interrelation is unappreciated that the pursuit of profits or high wages becomes narrowly partisan and restrictive.

It is certainly true that fear of unemployment has a marked disciplinary effect upon labour; and it is reasonable, therefore, to suppose that under conditions of full employment envisaged after the war industrial indiscipline will become more prominent. Yet it would be a dreadful confession of weakness, or of blunted sensibility, to suggest that discipline must come before employment. As Sir William Beveridge has written:

A civilised community must find alternatives to starvation for preservation of industrial discipline and efficiency. But a free community cannot look for those alternatives by increasing the list of forbidden actions and making new crimes.

The problems of industrial relations likely to develop under conditions of full employment make the widespread adoption and improvement of joint consultation vitally necessary.

In so difficult a field and with so little practical experience for a guide any scheme for the reconstruction of joint consultation must be tentative and elastic. Among recent proposals those put forward by an independent industrial group—"men and women who have made a special study of joint consultation"—are particularly

interesting. The group confines its attention to the local level, since "acceptance of the principles of employee representation throughout industry and commerce on a voluntary basis would determine higher levels of organised representation." It recommends that:

1. All employees in an undertaking should have the right of elected representation under secret ballot, with the exception of executive or management staff.
2. Only members of a trade union should represent employees, but all employees should participate in the election of representatives.
3. The dignity, privileges and safeguards of democratic assembly in political government should apply to all Joint Consultative Councils.
4. Any subject affecting, directly or indirectly, the interests of all engaged in the undertaking may be discussed by the JCCs, since every activity in the organisation is concerned with production.
5. Any information requested by the management or employee representatives or both should be provided by the board of directors.
6. Management and employees should be represented on all JCCs and sub-committees on a basis of equality—that is, in equal numbers.
7. In addition to the main JCC there should be sub-committees appointed by the main body to deal with specific subjects such as production, welfare and safety, or to guarantee adequate representation to all employees in all departments; and such representation in large undertakings should be granted by departmental councils with one managerial or supervisory representative and one employee representative for every fifty employees.
8. Any representation at higher levels—district, regional or national—should be by members of the JCCs representing both management and employees. Employers' federations and trade unions should also be represented at these levels.
9. Managerial and employee representatives, in equal numbers, acting in an advisory and consultative capacity, should meet periodically with the board of directors to discuss any matter of mutual interest.
10. In addition to the chairman of the main JCC appointed by the board of directors there should be a vice-chairman appointed by the employee representatives, and joint secretaries representing management and employees.

These proposals, radical though they seem when compared with the present state of industrial government, represent what will probably be the minimum demands of labour in many industries after the war. National acceptance of them, the group says, "would hasten political evolution which is based on an understanding of the forces at work in maintaining natural economic solvency and high standards of living."

This analogy with "political evolution" suggests the easiest line of attack upon the proposals. Political evolution in recent times has concentrated power increasingly into the hands of the central authority, for the growing complexity of social and economic life makes strong and unified control essential. The recent history of industry offers a close parallel—it, too, has grown and become more complex. The strong and efficient direction which every industrial unit needs might be impossible to attain if control were vested in too many hands, or if it had to listen to too much advice.

It would be foolish to overlook the limitations of joint consultation. It can be of immense value in almost every sphere of industrial activity, but it cannot, under private enterprise or any other efficient system of organisation, replace the central direction of policy. Industry, like government, needs its "inner cabinets" of key-men. But the direction of British industry before the war was all too often lamentably unprogressive and smug. Advice, whether it came from the scientist, the designer or the worker, was too often waved aside as interference. But this war has shown what wonders can be accomplished by efficient co-operation; and the industrialist, if he is wise, will endeavour to retain and enlarge every one of his new contacts.

Middle Eastern Dilemma

THE difficulties which have arisen over the position of France in the Levant are not new. Ever since the French took over the Mandate for Syria and Lebanon in 1920, these countries have been in more or less constant revolt against their authority. The French recognised this fact when in 1936 they negotiated a treaty which was to substitute independence and alliance with France for the former mandatory position. The French Chamber, however, refused to ratify the Treaty and the war began with Syria and Lebanon still under full French control.

In 1940, after a week's vacillation, the French Commander in the Levant opted for Vichy. In 1941, during the Raschid Ali revolt in Iraq, the French High Commissioner, General Dentz, allowed the Germans to use Syrian airfields. A British and Free French force entered Syria and after severe fighting established Free French control. General Catroux, on September 26, 1944, proclaimed the independence of Syria; he guaranteed the Syrians' right to assume the attributes of sovereignty in domestic affairs, to appoint and receive diplomatic representatives and to control their own armed forces. Similar declarations were made in the Lebanon. In both cases, however, the French connected

the achievement of independence with the signing of a treaty with France—"your independence and sovereignty will be guaranteed by a treaty in which our mutual relations will be defined."

Since that time the French have adopted with increasing firmness the attitude that in 1941 they made the grant of independence conditional upon the signing of a treaty of alliance which would guarantee a special position to France. Both the Syrians and the Lebanese deny this interpretation. They argue that the grant of independence was unconditional and that they are free to accept or to refuse an alliance with France.

This clash of opinion has already led to one crisis, in November 1943, when the French arrested the newly elected Lebanese Government for passing domestic legislation to which the French objected. This particular crisis was surmounted, but no compromise has yet been found to reconcile the two divergent views of the status of the two republics. The Syrians are demanding to be given the promised control over their armed forces and insisting that the French forces shall be withdrawn. The French reply that no change of this kind can be made unless the Syrians and Lebanese sign the treaty of alliance. Meanwhile, both General de Gaulle and the French Foreign Minister have declared France's determination to carry the responsibility for keeping order in Syria and Lebanon and of maintaining sufficient forces to do so. Demonstrations have occurred in Damascus; the Syrians and Lebanese publicly denounce the French attitude; and the present deadlock seems likely from day to day to degenerate into violence.

The conflict is not only the concern of the French and the Arabs. The British also are involved, partly because they, like France, have special interests in the Middle East, but mainly because their guarantee of Syrian and Lebanese independence, given in 1941, has encouraged the Syrians and Lebanese to look to them as protectors. It is true that in an exchange of letters with General de Gaulle in 1941 Mr Oliver Lyttelton, then Minister of State in Cairo, declared that

We have no desire to encroach in any way upon the position of France. Both Free France and Great Britain are pledged to the independence of Syria and the Lebanon. When this essential step has been taken and without prejudice to it, we freely admit that France should have the predominant position in Syria and Lebanon over any other European power.

The fact remains that, in this present crisis, the Arab world looks to the British to support Syrian and Lebanese independence, while the French would regard any such intervention as a British imperialist plot to oust them from the Levant, usurp their "predominant position" and, with accustomed hypocrisy, to denounce a French policy in Syria and Lebanon which is no less restrictive of those countries' independence than British policy

in Iraq or Egypt, and considerably closer to granting full self-government than British policy next door in Palestine.

Added colour and bitterness have undoubtedly been given to this view by the behaviour of some British representatives in the Levant, who appear to have gone out of their way to exasperate French opinion and in doing so, have raised unduly high Arab hopes of British intervention. Intervention

is indeed the policy which these men tacitly advocate. They see Great Britain as the champion of the Arab cause, expelling the "unwanted French" and setting up an Arab Union in grateful treaty relations with Great Britain.

This view is quite extraordinarily naive. It neglects an aspect of British foreign policy which is even more important than friendship with the Arabs. Friendship with France is an indispensable condition of effective British diplomacy, and General de Gaulle has made it very clear that an open clash over Syria would prejudice general relations between France and Britain. It also gives a totally false picture of the real British position in the Middle East. For the moment, in contrast to French policy, British policy has some Arab backing, but it is only ten years ago that the Arabs in Palestine were fighting the British and the problem over which they fought—the future of Jewish immigration—is still unsettled. Nor

can it be said with certainty whether the treaties which give Britain a "predominant position" in Egypt and Iraq will not become in the course of a few years as great an obstacle to Anglo-Arab friendship as is the treaty proposed by the French to-day. Fundamentally Britain and France face the same problem—how to reconcile the Arab world to their continued presence in the Levant.

To state this fact is not to condone the blunders of French diplomacy in this crisis nor to underestimate its disastrous effect on Arab confidence. But it is a plea that the British should abandon any thought of complacent superiority in their attitude to France. On balance, they have perhaps managed their relations with the Levant more skilfully, but the problem of Palestine is a reminder of how narrow and precarious that balance may be. Is the conclusion, then, that the British Government, desirous of French friendship and conscious of the ambiguities in its own policy, should disinterest itself in Syria and Lebanon and fully recognise France's pre-eminent position? It can be argued that such a policy would conciliate the French and that, if the possibility of British backing were withdrawn, the Syrians and the Lebanese would sign the proposed treaty with France and accept a status similar to that of Iraq. On the other hand, such a policy would disappoint the Syrians and the Lebanese, estrange the Arab world and leave the Near East in a state of turmoil and disunity. Ought the British therefore to oppose the French and lend full moral support to the Syrians and the Lebanese?

It is difficult to decide which of these two alternatives would do more damage to fundamental British interests. The dilemma is so unattractive that one might well imagine the British Government moving heaven and earth to find a third possibility. There is little sign of it. Since Mr Eden's statement in support of Arab Union in 1941, no inkling of British policy has come from high quarters. There is no evidence that the Foreign Office is hard at work to establish the common interest of Britain and France in the Levant and to formulate a policy which might embrace them. There is no sign of a new approach to France, designed to discuss frankly the problems of the Middle East as a whole and to establish as a point

of departure the basic fact that neither Power can fruitfully stay in the Middle East in the face of a hostile Arab world; that both Powers have to find a method of proving to the Arabs that the presence of their troops and their economic activity is in the interests of the whole area.

Such a policy is not impossible. Its first step would be to put the weight of British and French diplomacy behind Arab Union—the association or federation of Iraq, Syria, Lebanon, Palestine, Transjordan, Egypt, Saudi Arabia and the Yemen. The next would be to negotiate with the whole Union a treaty of alliance with the British and French Empires. The third would be, within the framework of this alliance, to negotiate agreements on particular interests—for instance, the establishment of joint military, naval and air bases or the setting up of a Middle Eastern Economic Council to carry on the work started by the Middle East Supply Centre and to canalise British and French and if possible American capital into enterprises which foster economic unity and rising living standards throughout the Arab Union. Such a policy would have a chance of reconciling the Arabs to the continued presence of the British and the French in the Levant and to the free acceptance of such transitional arrangements as are necessary. At the same time, it would represent not a retreat on the part of France—or Britain—but an advance to a new and tenable position in keeping with the developments and demands of security and co-operation in the Arab world.

There may be a temptation in this country to dismiss this wider approach on the grounds that the French would not consent to such a policy. The truth is rather that the British have shown no signs of initiating it. As in so many other spheres of diplomacy, the attitude of the British seems to be to drift along, deflected now this way, now that, by the energy of one official or the apathy of another. The total effect is a rather unsteady maintenance of the *status quo*. But it is precisely the *status quo* which from the point of view of either French or Arab friendship is untenable. It is thus an overwhelming British interest to reshape British policy, to widen the whole approach to the Middle East and propose a framework within which French prestige, Arab independence and British strategic interests can be alike preserved.

NOTES OF THE WEEK

Peace in Greece

On Monday last the Greek Government and EAM signed an agreement which brought the civil war in Greece to a definite conclusion. As often happens after wars between nations (but rarely after civil wars) the peace terms appear to be more moderate and sensible than were the armistice terms. The Athens agreement provides for the preservation of democratic liberties, the cessation of martial law, the release of hostages, and an amnesty for EAM. A national army is to be raised, there is to be a purge of collaborators and Metaxists from the Administration, and finally provision is made for free elections and a plebiscite on the future of the monarchy.

The British Government and their representatives in Greece have obviously made a decisive effort to prevent the conflict from degenerating into a war *à outrance* and to achieve a compromise. For this they deserve praise and gratitude. But this is not to say that the critics at home have been wholly wrong, since their pressure has certainly played an important rôle in modifying British policy in Greece and directing it towards a peaceful outcome.

It may be too much to hope that all will now be calm in Greece, and that the rôle of the British as impartial arbiters on the spot has come to an end. The aftermath of civil war is bitter; tempers still run high; the memories of mutual atrocities are vivid, and the temptation to wreak vengeance on the defeated and therefore the weaker side can still linger on for some time. The British arbiter on the spot and his critics at home must still watch vigilantly to see that the new peace in Greece is fairly carried out.

Polish Dilemma

The first Polish reactions to the Crimea decisions have not been uniform. M. Arciszewski's Government has adopted a rigidly legalistic attitude, and has refused to recognise the Big Three's statement on Poland. The opposition grouped around M. Mikolajczyk has not yet stated its views; but it is very likely that it will try to negotiate on the composition of the new Provisional Government in Poland. But to the Government as well as to the opposition the apparent award of Lvov to Russia has come as a shock.

M. Arciszewski's Government has raised three major objections to the Yalta agreement. It recalls its exclusive legal and constitutional title, though in the Polish Government, as in most exiled Governments, the thread of constitutional continuity has been severed more than once. More decisive than formal legality is the fact that, with the departure of the Peasant Party and of sections of the Socialist and Christian Democratic Parties, the Government has lost most of its representative character. The second objection raised by M. Arciszewski is that the Poles have been given no say in the decisions made concerning the future of their country. This is, unfortunately, true. But the "irreconcilables" who have formed the present Polish Administration in exile are at least partly to be blamed for this; they overthrew M. Mikolajczyk's Government precisely at a moment when it had reached a decisive point in its negotiations with Moscow, and their own negative attitude then made further negotiations impossible.

Finally, the assertion, made by M. Arciszewski, that no free expression of the popular will can be secured by a

Government created in Poland while the country remains under the sole occupation of the Soviet forces is rather begging the question. This assertion implies the demand either that British and American forces should be sent to Poland or that the Russian troops should immediately withdraw. If these implications are made explicit, it is impossible not to see the impasse to which they lead. For this reason, the objections will carry little weight.

It is likely, therefore, that the groups of M. Mikolajczyk, M. Grabski and the opposition Socialists will be the only ones to respond positively to the Crimea decisions. It is, however, on the political parties in Poland that the real emphasis should now be laid. At least two important questions arise in this connection. Will the "reconstruction" of the Administration in Poland be such as to leave them free scope? Only if this question receives a positive answer in practice will there be any hope for a real broadening of the Administration. And from whom is the new Provisional Government to derive its authority? From the Lublin "President," M. Bierut? It would clearly be suicidal for the Polish democratic parties to agree to this. Even if M. Bierut were to accept them now on the most generous terms, he would still be free to dismiss them later on and eventually to establish a single party system.

If the Crimea agreement has any practical meaning at all, it should entail a broadening of the Administration from top to bottom. A collective temporary Presidency—something like a Council of Regency—could be established which would guarantee the new Provisional Government against a coup from any single party. It is on this point that all Polish negotiations will now presumably turn. The Polish demand for such guarantees ought to have the fullest possible support of the Allied Commission in Moscow.

Land Bill Explained—

Tuesday's debate on the Requisitioned Land and War Works Bill brought out its highly complicated and technical character. Sir John Anderson had first to explain how the Bill would work in practice, and members rightly felt that time and anxiety would have been saved if a White Paper or ministerial statement had accompanied the Bill's presentation. Sir John said that the war works in question had cost some £700 million, that most of this expenditure was irrecoverable, and that the greater part of the requisitioned land would be returned to its owners; but that the Government was entitled to the use or disposal of valuable assets, such as factories and hostels, which it had itself built.

This clear and incontestable case does not alter the fact that the Government is asking for a blank cheque in its acquisition and use of requisitioned land and the Government in this context means the various Ministries and Service departments which have requisitioned land. The Board of Trade, for instance, can dispose of requisitioned factories without appeal being possible to the proposed Commission. It is this fact which invalidates Sir John Anderson's plea that inter-departmental machinery is unnecessary and is inconsistent with joint ministerial responsibility. His one major concession was that not only landowners but interested bodies, such as the Commons Preservation Society and local authorities, should have the right of appeal to the Commission. This helps to secure that land should not be unnecessarily acquired, but it does not secure that requisitioned land is put to its best advantage.

—But Not Justified

Sir John Anderson emphasised that the appeal Commission, although appointed by the Treasury, would be independent of it, that it would possess considerable powers *vis-à-vis* the Government, and that it would take into account the whole complex of amenity and planning interests, which he was prepared to see more specifically stated in the Bill. But to strengthen the Commission will not make it more representative; and wider drafting will not compensate for inadequate machinery.

Machinery must be devised to correlate the intentions of the various departments which have requisitioned land with the needs of national and local land planning. An example of what may happen otherwise is the recent pro-

posal of the Admiralty to sell a training camp for use as a holiday camp, in defiance of the local planning scheme. The Commission, whose main rôle is to adjudicate between owners and the Treasury, is ill-suited to harmonise this chorus of national and local interests. Its powers are limited, and final decision in many cases is, doubtless rightly, reserved to the ministerial level. Sir John Anderson suggested that Parliament should be able to intervene at this level. But the real need is administrative. Final decisions that are taken solely by the individual departments responsible for requisitions will produce unfortunate results.

The House did not divide against the second reading. But members were far from convinced that the machinery of the Bill would work in the national interest. There will clearly be heavy pressure at the committee stage for substantial amendments to be accepted.

World Labour Meets

It is, perhaps, more than an accident that the World Trade Union Conference should have coincided with the meeting of the Big Three, and that the views of the British, American and Russian labour leaders on the treatment of Germany after the war should have echoed so faithfully the policy of Mr Churchill, Mr Roosevelt and Marshal Stalin. Close comparison between the Yalta declaration and the trade union leaders' speeches shows that on all important points of principle, Governments and Labour are at one, though for the British TUC, Sir Walter Citrine stressed the point that German labour should not be employed on reparations under slave conditions, which would undermine the standards of trade unions everywhere.

Does this mean that trade union movements, at any rate in the "big three" nations, have become merely the ventriloquist's dummies of their Governments, the rubber stamps of official policy? The outsider might be forgiven for placing this interpretation on the proceedings at County Hall. The announcement of Labour's peace aims, three days before

THE COUNTRY BANKER

"... he kept a pack of hounds and dwelt in patriarchal style among his people—hospitable, frehanded and popular. He might be seen at times seated under the great elm... chatting with his neighbours."

So, in the last century, the country banker inspired and held confidence: the evidence of his worth was plainly to be seen. The rising tide of industrial development with its demand for a service which few private firms could provide caused the virtual disappearance of the country banker, but on the firm foundation which he had created, the Westminster Bank continued to build, so that it is today able to offer a service which, in its scope and complexity, might be a source of some astonishment to those pioneer bankers of other days.

remand homes. They may be delinquents, they may be prostitutes or they may merely be suffering from parental neglect. The juvenile court magistrates urged strongly, in evidence before the committee, that there should be more segregation, in particular, of girls with sexual experience. This, however, the committee was unable to accept—largely for practical reasons, but also because it is against the spirit of the 1933 Act, which aimed at treating the young, offenders and non-offenders alike, according to their needs rather than their deeds. Segregation may well be bad for the offenders and delinquents, who are thereby encouraged to consider themselves a class apart. This is the argument that underlay the Act and influenced the present Report. But is it not still more important that the non-offender, the child who is merely neglected, should not be perverted? The committee makes some sound recommendations for segregation in certain cases, and suggests that children under eight should be sent to a different institution, preferably a nursery home. But the question of the working and administration of the 1933 Act is one that might well be given careful consideration by the Advisory Council on the Treatment of Offenders.

The Colonial Debate

The second reading of the new Colonial Development and Welfare Bill, which was debated in the House of Commons on Wednesday of last week, aroused very little criticism. Taken by itself, the measure is, in fact, unexceptionable. The only two possible criticisms are those anticipated by the Colonial Secretary—that the money to be voted is not now enough or that in the future, in leaner times for Britain, it will be too much. Since it is difficult to envisage a time when the British taxpayer will be more hardly pressed than he is at present, it is only the first criticism that is relevant. Colonel Stanley did not pretend that £120 million is enough for what he called

the sole and permanent support of all the social requirements of the whole of the Colonial Empire. . . . In the long run [he went on] the social standards of a country must depend upon its own resources, must depend upon the skill and energy of its own people, and the wise and full use which they make of their internal wealth.

Here, again, the principle is unexceptionable. But it does not solve the problem of how means can be found to develop and enrich the colonies so that adequate social standards can be maintained. It is doubtful whether the new Colonial Development and Welfare Fund, even if used to the full, can do this. The colonies will need to draw on other sources for assistance. The private investor from outside would be welcomed, provided that a reasonable dividend and reasonable security would content him and if he came into the territory "as a partner and not as a master."

The Colonial Secretary also discussed the possibility of private investment inside the colonies. The difficulty here is that the resources of the colonial capitalist are likely to exceed his capabilities for wise investment and management. To solve this problem Colonel Stanley mentioned the possibility of colonial development companies, with capital and managerial experience provided by the colonial governments, which would enter into partnership with the outside investor and gradually pass over their own functions to the private investor inside the colony. This is a novel suggestion which needs careful consideration. In the meantime, the best way of enabling the colonial peoples to take an active part in their own development is by furthering their education—in all its aspects. If the new Fund concentrated on this alone, it would almost certainly reap a larger dividend than if it scatters its resources on a large number of smaller projects.

University Grants

The increased aid to British Universities, announced by Sir John Anderson in the House of Commons on Tuesday, will be a relatively small burden on the Budget but a most fruitful investment for the community. That some major increase in Government assistance would be vitally necessary for post-war development has long been obvious. The intake of students, alone, may increase to double pre-war numbers in the first five years after the European victory. Men and women now in national service will return in thousands to take up or complete their higher

education. By 1920, 13,000 Service students had entered British universities; this time, the number is likely to be at least twice that figure. In five years' time, the results of the Butler Act should also be making a more permanent addition to the pressure of new students.

This pressure of applicants, together with the rise in prices, will greatly increase the running costs of the Universities. In addition to this, they have to face a three-fold need for capital expenditure—to cope with the increased enrolment; to overtake what will be perhaps eight years' arrears of normal building and re-equipping; and to shoulder the new responsibilities in the technical field which, by common consent, will have to be undertaken after the war.

The only source from which money can be obtained in the necessary amounts is the Exchequer, and the Chancellor's announcement shows that the Government is disposed to respond generously. In each of the next two financial years, the present annual Vote to the University Grants Committee of £2,149,000 is to be increased by £2,000,000 for general purposes, by £1,000,000 for developments in the medical schools, by £500,000 for the teaching hospitals and by a token grant for capital purposes of £250,000, making a total of £5,900,000. Moreover, the Chancellor made it clear that this is only a beginning and that the grants would be further reviewed in two years' time. In particular, the Government accepted the estimate that the capital needs of the Universities would amount to about £18,750,000 for general purposes and £10 million for the medical schools, both sums calculated at pre-war prices. When building once more becomes possible, the capital grant will have to be greatly increased.

It is very satisfactory that so large an increase should be made in such good time, and without any strings attached to it in the shape of stricter control over the Universities than is now exercised by the UGC. One word of warning may not, however, be out of place. The mood of the times is to lay particular stress on the development of the technological side of university education. Not only public funds flow freely for these purposes, but private funds also, as witness the munificent gifts that Lord Nuffield has made to Oxford for medical purposes and the equally praiseworthy gift of £435,000 that the Shell group is making to Cambridge for a school of chemical engineering (very badly needed in this country). All this is very right and proper and long overdue. But a university, it should not be forgotten, is a university, and the less obviously "useful" faculties deserve their share, since they contribute quite as much as the natural sciences to the output of balanced and well-stocked minds, which, in the last analysis, is the most useful service of all.

De Gaulle and Descartes

It is not an easy thing to define what is and what is not constitutional in France to-day. The Consultative Assembly invalidated the Constitution of 1875 when the Assembly was still at Algiers. Is this invalidation still valid? Since the Consultative Assembly had, as its name implies, no legislative power, was it entitled to adopt so sweeping a legislative decision? On the other hand, no return to the Constitution of 1875 is practically possible, since this would mean the revival of the Chamber and Senate of 1940 which abdicated in favour of Pétain. Last week a hundred of these former members assembled in Paris and asked the Provisional Government to allow them to stand as candidates in the next elections. The 100 deputies had all voted for Pétain. Some of them now argue that as no legal prosecution has been opened against them, they still are, according to the 1875 Constitution, members of a non-existent Parliament.

The truth is that France is in a sort of extra-constitutional interregnum in which references to 1875 are meaningless. When the Right argues that no sweeping social changes—such as the nationalisation of industry—can be taken now because the Government has no constitutional authority, the Left reply that the constitutional issue is completely bogus. It could be used to paralyse the Government and prevent it from taking any action; yet it exists and acts. If it can mobilise a class for the army, it can surely mobilise property for the national effort.

In the controversy both sides have produced excellent logical and legal arguments to support their case—argu-

ments which show that the tradition of Descartes is not yet dead in France. Even so, the dispute is somewhat unreal; and General de Gaulle does not seem to be inclined to resolve it in a spirit of abstract logical consistency. His Government represents a practical mixture of the constitutional and the extra-constitutional. It is certainly unorthodox enough to refuse the constitutional claims of such fragments of Vichy or of 1875 as may still survive; but its orthodoxy is strong enough to induce it to postpone radical social reforms until the election of a new Constituent Assembly.

Argentina Changes Step

The Argentine Government has accepted an invitation by the Pan-American Union to all its members to participate in an economic and technical conference at Washington on June 15th. The agenda covers improved living conditions based on maximum production and employment, the effective distribution of commodities and equality of opportunity in access to markets and raw materials,

as contemplated by such instruments as the Atlantic Charter, and the conclusions of the conference on food and agriculture at Hot Springs.

Discussion promises to embrace much that will already have been covered at the Mexico City Conference opening next Wednesday. It will proceed at an almost equally high level, since the Pan-American Union has expressed the hope that Governments will be represented by those of their Ministers who are charged with the formulation of economic policy.

Argentina was not represented at Hot Springs; it will not be present to defend its isolation at Mexico City; and it announced last month that, until its request for a meeting of Foreign Ministers to consider its position was granted, it would not participate in further conferences of the Pan-American Union. In the shifting sands of its inter-American relations, its latest move—to accept the invitation to Washington—is a step that narrows the political breach between Argentina and the rest of the Americas. The deliberations at Mexico City, where its non-cooperation in the widest field of American endeavour is to be discussed, may well be reflected at the later conference, where Argentina is presumably disposed to discuss economic co-operation.

No Sense of Humour

War nerves are no respecters of persons; their latest victims, apparently, are the variety artists, whose Federation has pledged itself to avoid representation on any "bill" containing the names of enemy aliens for at least ten years after the war. This show of rugged but humourless patriotism reflects little credit on the Federation, which is attempting to usurp the public's right to decide who shall try to make it laugh or cry.

Quite apart from the futility of attempting any precise definition of the term "ex-enemy alien"—which alone could make the ban workable—this heavy-handed victimisation sets a deplorable example. The ban on German humorists will not prove very serious once the star performers of the Reich Propaganda Bureau have been compulsorily retired; and one may suppose that the public has seen and heard quite enough of Japanese juggling and trickery for many years. But it does seem somewhat ungenerous to draw the line at those who have provided the variety world with its stock-in-trade of gags for five years. Ten years is a long time—even in the life of a music hall joke.

Shorter Notes

The Family Allowances Bill follows closely the provisions set out in the Government's White Paper on Social Security. For each child after the first a weekly allowance of 5s. will be paid. The Bill does not answer the question whether this meagre grant will be further reduced by its inclusion in assessments for income-tax. Even if it is tax free, the grant is inadequate, and neither Parliament nor the public ought to accept this as the last word on children's allowances.

The impending introduction of a bill to nationalise Australia's inter-state air lines is causing considerable controversy, and it is clear that the air line operators are

prepared to make every possible effort to defeat the Government's object. The Acting Prime Minister, Mr. Forde, has been challenged to make public the findings of an inter-departmental report on civil aviation. Mr. A. B. Corbett, the former Director-General of Civil Aviation, and chairman of the committee, has declared that nationalisation would bring disaster; and it is understood that the Committee's report favoured instead the creation of a public utility company similar to BOAC.

The following table gives the number of civilian casualties in air-raids since September, 1939:

	Killed	Injured and Detained in Hospital	Total Serious Casualties
Sept., 1939-Aug., 1940.	1,494	1,980	3,474
Sept.-Dec., 1940.....	22,282	28,522	50,804
Total, 1941.....	20,863	21,839	42,702
Total, 1942.....	3,221	4,149	7,370
Total, 1943.....	2,357	3,462	5,819
Jan.-May, 1944.....	1,561	2,916	4,473
June-Aug., 1944.....	5,479	15,934	21,417
Sept.-Dec., 1944.....	1,425	3,134	4,559
January, 1945.....	585	1,629	2,214
Totals to date.....	59,308	83,581	142,889

Those killed in air-raids during January included 198 men, 293 women and 94 children under 16. The figures for the three periods of 1944 included in the table may still be subject to some revision.

The Sunday cinema ban for children imposed by the Surrey County Council (and criticised in last week's *Economist*) is not to go unchallenged. The Cinematograph Exhibitors' Association have decided to institute proceedings on the ground that it is an unreasonable condition to impose upon the licence.

The Committee stage of the Road Transport Lighting (Cycles) Bill has been temporarily held up. A motion to report progress until the Law Reform (Contributory Negligence) Bill, at present before the Lords, should have established the undiminished responsibility of the motorist to avoid cyclists, lit or unlit, was accepted by the Attorney-General. The legalities of motorist-cyclist collisions are necessarily involved, and will continue to carry the possibility of injustice so long as cyclists are not provided with special tracks and encouraged to use them.

In selecting a new principal, Somerville College, Oxford, has decided firmly that it prefers a woman of affairs to a pure scholar. The controversy is an old one—much older than women's colleges—and on the appointment of Dr. Janet Vaughan, Somerville is evidently prepared to risk the standard protest that men and women of affairs have too many outside interests to make a full-time job of their headship. Dr. Vaughan's interests are certainly varied, and she will bring a rich experience to her new work. She has managed to combine marriage with medical research and is a member of several medical committees, the Nuffield Foundation and the Royal Commission on Equal Pay.

Letters to the Editor

The Coal Industry

SIR,—The anxiously awaited report by Mr Robert Foot contains some valuable matter; unfortunately, it offers no practical solution of the ills which have so long pursued the coal industry. It is all to the good that he should have so clearly stated that the coal now belongs to the nation, a fact which perhaps the public insufficiently realises and one which it is hoped will sink into the minds of the directors of colliery companies.

The amazing part of the report is that Mr Foot rests content to expect reformation of the industry by cajoling owners in possession and relying on admonition. No hand is held out to labour so as to secure the essential co-operation of the trade unions. The omission is all the more remarkable seeing that it must be anticipated that the Government will have to find funds for the reorganisation of much of the industry. It is incredible that public money should be used for this purpose without the full co-operation of the trade unions in respect of any supervision which may be required.

Mr Foot very rightly stresses the paramount need for making the industry more completely efficient. Some progressive owners have been much hampered in the past by the fixing of quotas which in times of low consumption have spread the total demand over the inefficient and efficient alike, thus preventing efficient producers from obtaining that full degree of production essential to the procuring of low costs, which affords opportunities for reduction of prices to the consumer and makes light the charge for high wages. Further, if efficient producers are thus cramped, though they can struggle to improve their equipment, there is but little encouragement for expansion, which always offers further opportunities for reducing cost of production.

Other industries, through rationalised efficiency, have been brought out of distress. Where there are such wide differences of efficiency, as in the coal industry, the first step is to give the maximum of freedom to efficient producers whether large or small. However, it is probable that post-war, for a period, every ton of coal that can be raised will be required to meet the swollen demands for the home and export trades. The problem to be faced is how can a policy be devised which both secures this result and gives freedom to efficient producers to progress. The time for platitudes is past. The Minister of Fuel has long since exhausted the possibilities of persuasion and admonition. Practical measures have to be taken.

May I submit that the solution lies in the differential treatment of groups of the industry based on their relative efficiency—broadly speaking, the segregation of the efficient from the inefficient.

The first requirement is for a factual examination of the costs and economic conditions of the collieries so that they

can be thus classified. I would suggest that the Minister of Fuel should appoint a Council for this purpose, as small as practicable, but consisting of members equally representing the coal owners and the trade unions. Information as to costs and economic factors should be made available to them so that they could segregate the industry into three classes, namely, those with the maximum efficiency being placed in the first class; those with a fair, but lesser, degree of efficiency in the second class; and those with a minimum degree of efficiency in the third class. With all the facts before them, it should be possible to draw datum lines above or below which the respective colliery undertakings could be placed.

Every encouragement should be given to the first class to expand, and most of these could probably finance their own requirements for this purpose. Expansion and modernisation of equipment in the second class would be justified to the extent that the Council anticipated a period of adequate demand to justify the expenditure. In the third class would be placed those who under competitive conditions would fall by the way, whose production should be absorbed by the more efficient producers so as to help maintain their output and keep down their costs and selling prices.

An essential requirement would be that selling prices should be based on the performance of the efficient producers in the first class, so as to reduce the price to the consumer both in the home and export markets. The result of this policy would be that the trading accounts of those in the second class might show little or no profit, and that the inefficient in the third class would definitely make a loss. How is this situation to be met? It is suggested that any losses thus incurred should be made good by the Government during the period that the demand required the raising of coal from inefficient pits so that it could be satisfied. The Council referred to should appoint engineer supervisors to check the management of all collieries which it is anticipated will make no profit or a loss. Authority could be given to efficient producers to associate for the purpose of fixing prices provided an independent prices survey committee of a representative character, including trade union and consumers' representatives, was appointed to check the same. Thus could efficient producers be left free to progress, to the advantage of all concerned, and the inefficient nursed over a period during which the total demand required that their collieries should be worked to secure an adequate supply.

These suggestions are not submitted as a solution of the difficulties of the industry, but as an indication of where to make a start. State ownership is not advocated. It sounds simple and omnipotent, but affords the minimum prospects for the securing of efficiency, and will tend to increase discord rather than provide harmony in the industry. Under these proposals trade unions would be entitled to adequate representation on the council and any committees appointed.

Provision is made to cover an anticipated period of demand in excess of efficient productive capacity. This would provide an opportunity for working out the organisation required to meet the needs of the period when failing demand will sooner or later come about, requiring the gradual closing of uneconomic collieries and the transfer of their labour to more prosperous districts. Thus could the State harness the benefits of proven efficient production and provide for inefficient production so long as its tonnage is a national necessity.—Yours faithfully,

Sandy, Bedfordshire

P. MALCOLM STEWART

Selection of Pupils

SIR,—Your article of January 20th underlines the grave weakness of selecting for secondary education in all its varieties children of 11 or 13 by competitive test, but ends by assuming that this must continue for all children for some decades.

Your contributor does not, however, comment on the

corollary of this assumption, which seems to me of not less importance. In short, it is that the new Education Act deprives the poor man of the right to pay for the education of his child, and may in practice deprive him of an effective say in the form of state schooling to which the child will be subjected.

This issue of the poor man and his right to assist if he is willing in the education of his child has, I think, been confused by talk of the privilege of parents who can afford to pay fees at the expense of those who cannot. The real issue is, I believe, both wider and deeper.

It is right to give the bright children all possible opportunity. I do, however, question whether it is in the true interests of education, rightly conceived, to declare that as between two less developed children, say, one from a drunkard's home and the other the child of a conscientious workmate anxious to help his child, the first shall go to school A and the second to school B because the first scrapes through a test which trips the other. By steeply scaling fees to income for a proportion of school places in each type of school, it should be possible, without establishing any position of privilege for the better-off parents, to leave some right of selection to parents who do not agree with the Authority's decisions.

So thinking, I decided to test my opinion by reference to such facts as I had available.

I left an old-established North Country grammar school—not in this county—at the outbreak of the last war. Perhaps a third of the 180 boys had scholarships. The remainder paid, I believe, £15 a year. Apart from 10 per cent at one end and 15 per cent at the other—who were not all scholarship holders—the boys came from very similar homes. In many cases a scholarship holder and a fee-payer came from the same home. I think at least 60 per cent of the boys had at some time attended elementary schools. Their fathers were tradesmen, farmers, the smaller professional men, foremen, etc. After excluding those who entered a family business or passed on to other schools, two classes which might be presumed to be specially favoured in after life, I find I can remember 98 boys who survived the war, and of whom I know something more than is disclosed by the school register. Forty held scholarships and 58 did not. They are now between 45 and 55 years old, and this is what they had become prior to 1939:

	Scholarship Boys	Non-Scholarship Boys		Scholarship Boys	Non-Scholarship Boys
Senior Service Appointments	1	11	Graduate and Elementary Teachers	13	7
Doctors and Dentists	2	10	Clerkships, Banks, Civil Service, Insurance, etc.	12	5
University and Research	1	3	Farming	—	3
Musicians	1	1	Retailing, Wholesaling and Miscellaneous	4	6
Accountants and Solicitors	6	5			
Engineers, Civil and Mechanical	—	5			
H.M. Inspector of Schools	—	2		40	58

Of these 98 boys, 30 graduated, 10 scholarship and 20 non-scholarship boys. Four scholarship and four fee-paying boys took open scholarships at their universities. These 30 graduates had become prior to 1939:

	Scholarship Boys	Non-Scholarship Boys		Scholarship Boys	Non-Scholarship Boys
Doctors	2	6	Industrial Director	—	1
Research & University	1	3	H.M. Inspector of Schools	—	2
Musicians	1	1	Teaching and Holy Orders	5	3
Services	1	3			
Engineering	—	2			

To my knowledge a number of the fee-paying parents kept these children at school at considerable personal sacrifice, for in those days families were large. There was no wide divergence in the parents of each group. The same varieties exist in both lists. The boys were more steeply graded in ability in the non-scholarship list. Some were low in their forms and would have shaped poorly in any competitive test up to 16 or so.

To me it seems that the non-scholarship boys' record is strikingly the more impressive and virile in both tables, owing, I suggest, to the selfless acceptance of responsibility by the parents and the influence of that acceptance on the home background. Part of the success of the Scottish village schools of the 19th century—which were also fee-paying—is generally attributed to the same influence.—Yours faithfully,

J. S. NICOLL

Staveley, Kendal

The Cost of Assistance

SIR,—The Note of the Week in your issue for January 27, 1945, needs some qualification if misunderstandings are to be avoided.

You compare a figure of £56,910,000, being the total cost of supplementary "needs" pensions for the current financial year, to pensioners at ages over 65 (men) or 60 (women), with a figure of £22,525,000, stated to be "paid by the state under the contributory pensions scheme," and with a figure of £56,000,000 which is stated to consist of "non-contributory old-age pensions paid on proof of need."

In fact, the figure of £56 million relates as to about £45 million to pensions payable after age 70, without means test, to those who had previously been entitled to (a) contributory pensions between 65 and 70 or (b) widows' pensions under age 70 because their husbands were insurable under the contributory pensions scheme. In the elegant shorthand of Whitehall, the two classes are known succinctly as "by virtue" pensions. Only the balance of £10 to £11 million relates to non-contributory pensions granted, subject to a means test, under the original scheme of 1908, to those who have no title to a "by virtue" pension under the contributory scheme of 1925.

I may add, by way of elucidation, that the figure of £22,525,000 is at present fixed and consists of two parts: (a) a sum of £21,000,000 per annum payable into the Treasury Pensions Account until 1946—a device for stabilising the burden on the Exchequer of the growing annual excess of contributory pensions between 65 and 70 and widows' pensions over the relative contributions currently collected—and (b) £1,525,000 per annum payable under the voluntary state scheme of contributory pensions introduced in 1937. The sum of £21,000,000, in fact, includes provision for the concessions granted in 1929 to certain members of the dying class of "pre-Act" widows, i.e., widows who became such prior to the introduction of the contributory pensions scheme in 1925.

Thus, the figures of £22,525,000 and £56,000,000 are hardly comparable with the figure of £56,910,000 for supplementary pensions.—Yours faithfully,

F. A. A. MENZLER

Reform Club, S.W. 1

[The argument of the Note—that the history of supplementary pensions shows how difficult it will be to estimate the cost of social security—is not affected by this correction.—EDITOR.]

Tradition and Industrial Design

SIR,—I would like, if I may, to comment on your excellent notes under this head. For hundreds of years design developed steadily because architects and designers solved their problems in a straightforward way, *always taking into account and using to the full the skill, equipment and materials available*. They were, I repeat, solving a problem before designing in a style. Work which is done in this way to-day, bearing in mind the vast changes wrought by the machine both in manufacture and transport, is, surely, the traditional work of our time. It is using age-old principles, but not age-old forms, and is, therefore, rooted in tradition. If a competent designer is responsible for it, it will have style. Whether it is the modern style I care not. Such things will be added unto us.

It may well be as you say, Sir, it is right to rebuild the House of Commons in late Gothic style. As part of a larger group of buildings it is difficult to envisage a breakaway. But one has an uneasy feeling that to pack behind a façade of this sort all the complicated apparatus necessary in such a building savours of window-dressing. Maybe this gives it a peculiar fitness for its purpose. I do not know. But I am disturbed by a haunting echo of Lethaby's words about, I

GORDON RUSSELL

Second Austrian Republic

SIR,—Your article in your issue of February 3rd is an admirably well-balanced statement. Will you permit me to amplify it?

The Austrian drama of the last two and a half decades was primarily influenced by economics. Even the tendency of the Austrian Socialists to approve, or instigate, an *Anschluss* originated in their fear of losing the nation's power to produce and consume; together with its commercial relations in Central Europe. There was never much love for Germany in Austria, and especially not for Prussia. The disruption of an economically sound pattern, such as the old Austrian-Hungarian Empire constituted, was followed by autarkic principles, as a result of which each of the newly created states glorified its patriotism and nationalism. Austria was left with Hobson's choice.

It was not the demand for an *Anschluss*—as you suggested in your article—which brought about the disruption of the First Austrian Republic; it was the economic isolation, which enfeebled Austria politically and rendered her helpless. Even so, the economic margin, though small, was big enough to keep the country in the front rank with those who could claim a very high general education for their people and exemplary social services.

The dissension among Austrians may, after all, not be so deep as appears, since the Austrians have the same capability of tolerance, when it comes to action, that is so characteristic of the British nation.

I therefore consider Austria to be perfect material for the federative solution in Central Europe, which should be the aim of every nation now in process of regaining freedom. An independent Austria—indeed not only by name, but by facts of constitution—could be the nucleus of a

growth of economic solidarity in Central Europe generally.

Austria's political dissension will find a quick solution if broad, work and social institutions give the people of the country a chance to act according to their guts.—Yours faithfully,

JULIUS MEINL,

Chairman of the Austrian Democratic Union

Patents Reform

SIR,—In the public discussion of the pending revision of the Patents and Designs Acts most voices seem to have favoured imposition of a general "Licence of Right" and held this to be a crucial point in the demand for a reform. It would, therefore, seem proper to mention that this view is by no means shared by all and to recall the recent dispute on the same grounds between the ICI and Boots which was widely debated in the press.

In opposition to a general "Licence of Right" it was argued that:

(1) A general licence of right would be a gross injustice to the inventor because it would be hard to find anybody willing to risk time and money on costly spade work when after being successful any unimaginative competitor could step in and upset all calculations in exchange for a small royalty at 10s. in the £ inland revenue.

(2) The reform would foster a wide use of secret processes with an atmosphere of secretiveness and suspicion in its train, leaving the public in ignorance of progress.

(3) In this country the path of an inventor is already so strewn with thorns that a deterioration of his position would lead to further stagnation at a time when vital interests of the country demand the greatest encouragement of creative inventiveness.

May I add that the achilles-tendon of the present Patents and Designs Act is undoubtedly the cumbersome and consequently enormously costly patent litigation. The result is that no average inventor or industrialist can afford to defend a patent before the court and therefore, that the value of a British patent has in practice little relation to the worth of the invention but is almost completely ruled by the strength of the financial power behind it.—Yours truly,

O. J. BRUNN, M.Inst.B.E.

Stoke Park, Bucks

AMERICAN SURVEY

Repealing the Poll Tax

Governor Arnall, of Georgia, is receiving congratulations for his success in persuading the state legislature to repeal the poll tax, which in half a dozen southern states disfranchises not only negroes, but even larger numbers of poor whites. Governor Arnall's victory is in striking contrast to the friction and resentment which have been stirred up in the south by attempts to outlaw the poll tax by Federal statute or judicial decision; and it tends to support the contention that the south is prepared to do its own house-cleaning.

This is not quite the resounding liberal achievement it appears at first sight. Governor Arnall did not advocate allowing negroes to vote; indeed, he assured the state legislators that there was no danger of negro participation so long as Georgia retained a "white primary system." His main argument seems to have been that there was some risk of Georgia's representation in Congress or the Electoral College being reduced if she persisted in disfranchising many of her citizens. The Governor's motives may well have been mixed. In extending the vote to Georgia's poor whites he may expect to reinforce his own political standing as against the more conservative figures in his own state machine.

This widening of the franchise is itself a step forward. Its effect on the position of the negro is more problematical. The issue now becomes purely racial, rather than one of economic distinctions; and any further action will be the more bitterly contested. At the same time, this narrowing of the issue to one of racial intimidation may be an essential preliminary to the further goal of extending the rights of citizenship to the negro. Despite the decision of the Supreme Court last year, insisting on the right of negroes to vote in state primaries—which, under the one-party system in the South are far more decisive than the official elections—there is a field in which battle has only just been joined.

Taming the Cartel

It would be an exaggeration to say that the Foreign Trade Council has kind things to say for the cartel; but at least its recent report recognises that the cartel is a feature of foreign economic life, which must be reckoned with if American exporters are to compete with foreign businesses on an equal footing.

Having taken this initial hurdle, the Council makes four recommendations for taming the cartel. These are that Congress should require the confidential filing of international business agreements; that Congress should set up standards of foreign economic policy to measure the "reasonableness" of such restraints of trade as may be contained in these international agreements; that it should allow American firms to enter into such agreements provided they do not result in unreasonable restraint of trade inside the United States; and that the State Department should be authorised to give conditional and revocable approval to such understandings arrived at by private firms.

These proposals only touch the surface of the difficulties to be encountered when Congress attempts to prescribe the exact degree of restraint of trade which is to be allowed. But at least they constitute a more hopeful and realistic approach than the belief, so often voiced in the United States, that non-recognition is a cure for economic as well as political sore spots. Anti-cartel feeling is too deeply rooted in the United States to give way overnight to a policy of accommodation. But it is plainly unrealistic for the United States to insist, in the face of resistance or indifference from all other countries, on refashioning the world economic structure in the image of the Sherman Act; and it is a hopeful sign that in moderate quarters the proposals of the Council are welcomed as pointing the way to a solution of the international cartel problem as it affects the United States.

Murder at the Yard

Inspector Lestrade often swallowed his pride in calling on Mr Sherlock Holmes. But never in that long partnership was he forced to confess to being stumped by a crime that had taken place inside the Yard itself. It is in a position as humiliating as this that the mystery man of Washington, General Donovan, finds himself. The General had drawn up for the President a highly secret memorandum on that most hushed of all subjects, the organisation of Intelligence work. Please note, Watson, that fifteen copies only were taken. Presumably, in view of the importance of the subject, they were all marked to persons of consequence.

Yet this document, emanating from an office wrapped in secrecy, and dealing with a matter retailed only in whispers, has been published in full on the front pages of the McCormick-Patterson newspapers, the press most hostile to the Administration. This is Washington's most enthralling "Whodunit?" "There is a force at work here, Watson, which has its agents in every corner of our city..." Several million readers are now regaled with the plans to co-ordinate the secret services and intelligence units in order to deal with the problems of the peace; and the McCormick press is free to make hay with the slogan of a "New Deal Gestapo."

Once upon a time President Cleveland was asked if he thought a certain secret well kept. "I find the White House cat knew all about it," he said, with a tired smile. The leaks of Drew Pearson are small potatoes compared with this latest burst, which recalls the earlier unhappy results of journalistic enterprise on the part of the *Chicago Tribune*. One cannot help wondering how many more water mains are to be pierced before the United States Congress passes an Official Secrets Act to protect itself and its Allies. Is freedom to blab essential to democracy?

* * *

Connecticut Politics

The appointment of Admiral Thomas Hart to succeed the late Francis B. Moloney (Democrat) as Senator from Connecticut brings a salty tang and a nautical roll to the Senate for the first time in many years. Generals in American politics are common; Admirals are as rare as angels' visits. But Admiral Hart's selection resolves a stalemate in Connecticut state politics.

In some states, when a United States Senator dies, a special election is held; in others the Governor appoints a successor to fill out his term of office. Connecticut belongs to the first group, but both Republicans and Democrats deplored the necessity of holding an election in war-time, which would cost something like a quarter of a million dollars, and, in view of the delay in polling Servicemen, might not be decided for several months. The logical alternative was to pass a Bill authorising the Governor to make an appointment, but this apparently simple solution posed a dilemma.

The complexities of Connecticut politics include a Republican Governor, a Democratic Lieutenant-Governor, a Democratic Senate, and a Republican House. Governor Baldwin, a Wilkie Republican with strong views on American participation in world affairs, would have relished the ampler stage of the Senate; but had he appointed himself to the Senate and resigned the Governorship, he would have been succeeded by his Democratic Lieutenant, a change of which the Republican state machine took a poor view. On the other hand, the Democratic Senate was reluctant to give the Governor the power of appointment unless he would choose a distinguished Democrat.

After much coming and going, the Gordian knot was cut. The enabling Act was passed, and Governor Baldwin placated his evenly-balanced legislature by appointing a Republican as uncontentious as the Admiral, a figure steeped in salt water, rather than dyed in the wool. This elaborate balancing-act is one more example of the perennial capacity of the American political system to baffle the simple-minded Briton. Nor should any American who has mastered such intricacies find it difficult to understand why Earl Winterton is the Father of the House of Commons and is not in the Lords.

* * *

The Kaiser Empire

A battle seems to be in the making over the future of steel capacity in the west. The contenders are the United States Steel Corporation and Mr Henry Kaiser; the prizes the Kaiser steel mill at Fontana, California, and the

Government plant at Provo, Utah, which has been operated during the war by U.S. Steel. These two modern plants represent something more than possible units in the Kaiser industrial empire, which has been one of the prodigies of the war, and is already laying its plans for the post-war period.

In itself, the project of an integrated control on the West Coast of ship repair yards, steel, magnesium, steamship lines, aircraft, building materials, cement, and possibly automobiles, all turned out in the most modern plants, is something to dazzle the imagination. According to reports, the Kaiser Company will seek to retain three of the shipyards it now operates for the Maritime Commission. It has already applied for a share of post-war Pacific shipping; and this access to cheap water-borne transportation will serve the other Kaiser interests in building materials and consumers' goods. Most of these plants are Government-financed; the pinch may come when Mr Kaiser must substitute private for federal credit.

But there is no doubt that sentiment West of the Rockies is deeply concerned in the survival of this industrial Paul Bunyan. The Western States are determined to safeguard the industrialisation and prosperity bred of the war; they are profoundly suspicious of the intentions of Eastern industry. Their representatives are particularly sensitive about the future of the new steel plants, which they regard as the corner-stone of Western industry. They fear, rightly or wrongly, that if these are acquired by eastern interests, they may be shut down to keep up profits of the old-established plants in the East; and that at the very least they will not be operated with a main eye to Western prosperity.

There are doubts about the peace-time economic soundness of both the Geneva and Fontana plants. The eleven Far Western states have now the capacity to turn out more than a million tons of steel in excess of their peace-time requirements; these may be lifted if industrialisation goes on and substitutes are found for shipbuilding and aircraft, but this is uncertain, as are outlets to China, Japan and Russia. In any event, the cost of reconversion to peace-time products is put high, in the case of the Geneva plant at \$40 million. What is certain is that the decision will be taken on political, as well as purely economic considerations, and that Western politicians will give high priority to the preservation of the Kaiser organisation, with its promise of jobs for Westerners. It may also prove to be not wholly without significance that Mr Kaiser is an outspoken supporter of the Roosevelt Administration in general, and of Mr Henry Wallace in particular.

Shorter Notes

The May-Bailey "work or fight" Bill is making dishearteningly slow progress. Opposition both inside and outside the Senate appears to be growing, and it is far from certain that some extension of regulations already in force will not be substituted for the bill. The interested lobbies representing labour, the farmer, and industry, have made fatal use of revelations about the misuse of manpower and overproduction of certain categories of war goods.

*

The gulf between practical politics and large schemes of federal guarantees of full employment was emphasised this week when the House cut from \$75 million to \$5 million an appropriation to help states and localities plan a reserve of public works for the first year after the war. Plans for expenditure on the state and local level already completed total only \$1 billion.

THE BUSINESS WORLD

The Electricity Grid

THE creation of the electric grid sanctioned by the Electricity (Supply) Act, 1926, was one of those rare acts of economic statesmanship which, like the repeal of the Corn Laws, cut clean through the tangle of tradition and established practice. Its conception can be traced largely to the recognition of the deficiencies in the organisation of the electricity supply industry as a whole during the last war. The purpose of interlinking the public generating stations was twofold. First, it held out promises of financial economies through a reduction in the proportion of reserve capacity; secondly, it was held to guarantee continuity of supply in war in case of a breakdown of individual generating stations. Moreover, by coincidence rather than foresight, the grid has been a successful experiment in a new technique of economic control in that it interposed the public authority as a wholesaler between the private producer and the private distributor of electric power.

The grid, it need hardly be said, has been a big success; it has fulfilled both aims. By the end of 1938 the capital saved by way of the reduction in reserve generating capacity already amounted to £22 million—equivalent to nearly three-quarters of the capital spent on the construction of the grid, on its extensions and reinforcements. Equally, it has proved an effective guarantee against the breakdown of local supplies caused by the bombing of generating plant and by other causes. Little has been known hitherto about the details of its wartime experience, for the publication of the annual reports of the Central Electricity Board (which is responsible for the operation of the grid) and of the Electricity Commissioners was suspended at the outbreak of war. The ban has now been lifted; the reports of the CEB for the four years 1940-43 were released this week. The reports confirm, inevitably, that the main object of the CEB since 1939 has been to meet the growing demand for electricity with regularity and with as little additional plant as possible.

Despite the enforced black-out and a sustained economy drive, the consumption of electric power continued its rapid expansion throughout the war. Output at public generating stations rose by 40 per cent, from 26,400 million units in 1939 to 37,000 million units in 1943. The detailed analysis of the distribution of consumption, usually given in the annual reports of the Electricity Commissioners, has not yet been published. But there can be little doubt that the expansion in demand has come mainly from industry; further transfers from private to public supply may also have been an important factor.

The two main problems of the CEB were the provision of additional capacity commensurate with the mounting demand and the day-to-day maintenance of supplies.

For technical reasons, arrangements for plant extensions have to be made at least three to four years ahead if the risk of the plant not being in commission when required is to be avoided. Fortunately, the CEB had budgeted for a continuation of the marked upward trend in demand experienced during the 'thirties; when war came extensions were thus already in train. During the summer of 1939, the CEB formulated a programme of extensions that were required to be in commission in 1942 to meet the estimated peacetime load in that year. When war was declared, contracts for part of the additional plant had already been placed. A re-examination of prospective demand in war suggested that this was likely to be "substantially below the peacetime estimate"; hence, the CEB decided to postpone the placing of the remaining contracts. Early in 1940, however, it reversed its views and decided to go ahead with the postponed part of the 1942 programme. In the same year it made arrangements for the provision of additional generating capacity expected to

be needed for 1943 and took preliminary steps for the erection of new stations for 1944. In addition, the Government, for reasons of security, called for the construction of additional transmission lines and for the provision of reserve plant in existing and new generating stations. The transmission lines were financed from a special fund—the Electricity (Civil Defence) Fund—and they are to be absorbed into the grid, at appropriate valuations, when demand justifies that course after the war; similarly, the grid has been relieved of the burden of the capital charges on reserve plant so long as it remains surplus to peacetime needs.

In 1941, the views of the CEB about future needs began to conflict with those of the Government. The Production Executive took the view that the CEB's generating plant programmes for 1943 and 1944 were not necessary to the war effort and could be justified only by peacetime needs; consequently, it withdrew the priorities previously granted for plant extensions and persisted in its decision upon renewed applications by the CEB. In 1942, the Minister of Production, who had assumed the functions of the Production Executive, authorised a third of the CEB's programme for 1944, and, in the following year, he approved the issue by the Board of directions for the construction of further additional plant. In all, the capacity of the selected stations was raised during 1940-43 by 2,326,656 kilowatts to 10,984,656 kilowatts, an increase of 27 per cent.

The conflict of views was inevitable. The CEB has been concerned with the need for providing an adequate volume of supplies and anxious not to risk a deficiency; the Government has been guided by the overriding need for munitions and was in duty bound to cut the CEB's programmes to the bone. The CEB had to operate at times with a slim margin and must have had a good many headaches in its effort to maintain day-to-day supplies, even before the crisis of January, 1945. True, comparison of the 40 per cent increase in generation with a 27 per cent expansion in generating capacity gives an exaggerated picture of the Board's difficulties. As a result of the black-out and the longer hours of work in factories the demand for electricity was more evenly distributed during the day and the load factor on the grid (that is, average demand as a percentage of peak demand) rose from 36 per cent in 1938 to 50 per cent in 1942; an increase in peak demand in 1943 brought it down to 48 per cent in that year. But this advantage was partly offset by bigger maintenance difficulties and more frequent breakdowns of plant; in the winter of 1943-44 some 18.6 per cent of capacity was out of commission, against a pre-war average of about 6 per cent. Difficulties of maintenance and the supply of inferior and variable qualities of coal led to a slight loss in average thermal efficiency amounting, by comparison with 1939, to 3 per cent in 1941-42 and 1 per cent in 1943.

After the war, the success of the CEB will again depend mainly on its ability to forecast the demand for electric power with some accuracy four years ahead. For some time it has had to concern itself with the problems of the peace and, in particular, with the probable trend of demand. Indeed, last November it announced details of its post-war expansion programme, which provides for the installation of an additional 3,000,000 kilowatts by the winter of 1948, at an estimated cost of £90,000,000. The Board, in fact, is budgeting for a continuation of the rapid expansion in demand, though part of the projected new plant may presumably be used to replace part of the 2,000,000 kilowatts of existing machinery that will be more than 20 years old by the winter of 1947 (20 years is regarded as the average life of generating plant).

If it were not for the fact that the CEB's pre-war estimates of demand have generally been near the mark, its

post-war programme might, perhaps, be regarded as somewhat optimistic. There are a number of considerations that must have shaped its picture of a fairly rapid growth of demand. Domestic demand for lighting and heating will probably continue to grow, if only because of the heavy projected building programme. Industrial demand is more difficult to forecast; here the CEB may have been guided by the Government's decision to assume responsibility for the maintenance of a high and stable level of employment

The American Railroads

(From Our New York Correspondent)

ONE of the notable contributions to America's war effort has been made by the railroads of the country. Class I Railroads (that is, all save the minor lines) have successfully handled increases over 1940 levels of 99.6 per cent in freight traffic and of 304 per cent in passenger travel, with practically no increase in operating equipment.

RAILWAYS OF CLASS I IN THE UNITED STATES

Year	Revenue Ton Miles	Revenue Passenger Miles
1939	333,438	22,651
1940	373,253	23,762
1941	475,072	29,350
1942	637,984	53,658
1943	727,075	87,820
1944*	745,000	96,000
% Change 1940-1944	+99.6%	+304%

* Estimated.

No new passenger cars have been constructed for civilian use during the war period, and the supply of freight cars has increased by only 7 per cent, of locomotives by 1 per cent. And for many years prior to the war the financial condition of most roads was so poor that not much equipment was bought, so that a high percentage of the rolling stock is quite aged. Yet the present state of rail services is remarkably good.

This sharply increased physical volume of traffic has its financial counterpart in a 244 per cent increase in the net income of Class I railroads since 1940. Net income of Class I carriers was \$189 million in 1940, and may well reach an estimated total of \$650 million in 1944. This increase has been further reflected in rising prices of railroad securities, and more particularly in the speculative obligations of railroads undergoing reorganisation. In mid-December medium and lower grade rail bonds were 35 per cent above 1940 levels; common stock prices were up 59 per cent. A considerable rise has occurred recently, as the markets have been anticipating a longer war than was generally expected a few months ago and consequently a longer period of high traffic. In fact, the market appears to believe there is a good chance these war-time changes represent a financial revival of the railways, which may last for some years, from the bankrupt or poverty-stricken condition so prevalent for many years prior to the war.

Gross rail earnings have risen steadily since 1939, and probably will reach an all-time peak in 1944. They have risen as a result of the phenomenal increase in traffic. Freight volume has been swollen not only by the increased supply of goods to be transported, but by diversion of business from other forms of transportation, such as shift-ings of oil transport from submarine-menaced coastwise tankers, and also by longer average hauls. Only to a relatively minor extent are these increases in earnings associated with higher rates. A 4.7 per cent increase in freight rates was suspended in May, 1943. Passenger traffic has risen with increased consumer incomes and curtailed use of automobiles. Although passenger rates are 10 per cent above 1940, season-ticket rates are unaffected and special rates for the armed Forces offset the increase.

But net earnings made their high in 1942, and have failed to follow gross earnings in 1943 and 1944, chiefly because wages and prices of supplies have increased at a faster rate than revenues. According to the testimony of Dr J. H. Parmelee, Director of the Bureau of Railway Economics of the Association of American Railroads, before the Interstate Commerce Commission, straight time wages for all railroad employees have increased 25.6 per cent over

and by its own views of the rate of increase in the mechanisation of industry. Again, it may be expecting a continuing transfer from private to public supply. Railway main-line electrification might be an important factor, but probably not during the period covered by the new extension programme. If the Board's estimates of the demand for electricity are as close to the truth as they were before the war, the post-war prospect for industry would seem to be encouraging.

the average rate in effect in 1940. In combination with the cost of newly granted vacations with pay and the rising price of materials, this has added \$1,150 million to annual railroad operating costs. The operating efficiency of the railroads, particularly heavier train loading, has increased steadily during the war, but apparently has not sufficed to offset factors operating to increase unit costs. Increased payroll and Federal income taxes added another \$876 million to deductions from gross earnings by 1943, but have tended to level off and decline in 1944.

Net income (after charges) of Class I Railroads has also dropped since 1942, though standing well above 1940 levels. This slump reflects the fall in net operating income and has occurred despite a continuing but slow reduction in fixed charges as a result of debt retirement, reorganisation and some refunding to lower interest rates.

Increased wartime earnings have also been utilised to build up a comfortable position in cash and working capital. Since the end of 1940 cash held by Class I Steam Railways has increased by 82 per cent, working capital by 106 per cent; cash totalled \$1,138 million, and working capital \$1,723 million on September 30, 1944. Despite the striking increase it seems probable that this position is not excessively favourable in view of larger current expenses for payrolls

War and Post-war Banking

While the war lasts, the resources of Barclays Bank will be devoted to the fullest possible extent to helping the war effort of the nation.

When the war is ended, the Bank will add its full weight to the forces of restoration. To ease the transition from war-time to peace-time conditions, customers will find the same progressive outlook, the same courtesy and sympathetic understanding of their banking needs and the same high quality of service which have kept the name of Barclays Bank in the forefront of British banking for generations.

The small business man and manufacturer will have the active co-operation of the Bank in solving his financial problems, no less than the large merchant and industrialist.

and materials. Funds also must be accumulated to meet large funded debt maturities in 1945-7, to make up maintenance postponed, despite heavy wartime wear and tear, because of shortages of labour and materials, and to introduce needed improvements in service.

Unless it can be assumed that labour will relinquish its gains, or that operating efficiency and labour productivity will make even more sensational strides than those of the war period, the post-war outlook for rail transport hinges chiefly on the volume of traffic reasonably to be anticipated and the rate at which traffic will move.

Several estimates have recently been made, translating into financial terms various possible levels of post-war traffic, assuming current price and rate levels and pre-war efficiency. They show striking agreement in concluding that, should rail traffic fall to 1940 levels, Class I Railways as a whole will show sizeable deficits after debt charges, in contrast to an actual net income of \$189 million in 1940. Even on 1941 volume, the rail roads in the aggregate would only just about make enough to service their debts. Thus if rates and costs and efficiency remain unchanged, a traffic level somewhat above 1941 would appear to be necessary to provide any earnings for the equity holder—or to provide a secure enough earnings margin to permit the borrowing of the substantial funds needed for modernisation. A recently published study by the Interstate Commerce Commission indicates that the most likely volume will approximate the 1941 level. The chief determinant of volume will be the level of production the United States is able to maintain in the reconversion period and the post-war beyond.

The possibilities of higher rates to provide adequate railroad earning power will be limited by the competitive situation, even though the Interstate Commerce Commission indicated, in extending in mid-December, the period for which freight rate increases were suspended, that these

increases might be allowed to become effective, should the financial condition of the roads warrant it. During the thirties the roads suffered from a diversion of traffic to other forms of transportation. Their vulnerability to such development will be determined by comparative costs. Since other forms of transportation are now subject to regulation, some feel that the roads will be more advantageously situated than during the pre-war period.

Prospects for reducing expenses are also limited. Deferred maintenance will have to be made up. While some debt has been retired, even the most optimistic estimate of the reduction in fixed charges to be achieved thereby has been about \$155 million, out of the \$635 million total in 1940. The prospects for reduction in labour rates do not appear substantial, and any marked savings in costs of materials would probably come about only if a general deflation occurred—in which event gross income would be at a low level. The only other possibility for unit cost reduction would seem to lie in gains in labour productivity and in operating efficiency. Some gains in labour efficiency might be achieved by revision of certain labour practices; perhaps greater operating efficiency will be possible with more modern equipment and terminal facilities, consolidations of service and elimination of unproductive services. The obstacles to such innovations are large: the poor credit position of many carriers; the opposition of labour and officials fearing displacement through consolidation, of towns facing abandonment of services, etc. And furthermore, it is difficult to improve efficiency on a declining volume.

In short, the railroads of this country face an uncertain and precarious future with many problems of readjustment. Like many other lines of business, their welfare will depend upon the country's success in attaining and maintaining prosperity in peacetime. But the level of prosperity will apparently need to be high to make the financial position of the railways secure.

Business Notes

Crimea and the Markets

The stock markets were firm after the issue of the Crimea communiqué. That, which reads like a reporter's cliché, records what is perhaps the most significant piece of market behaviour for many weeks. After the Allied advance last summer, every piece of news which seemed to argue an early end to the war and reminded the markets of transitional difficulties to come, tended to put share prices down. The inverse relation between good news and prices was becoming proverbial. Now comes the best news of all—short of the actual end of hostilities—and prices rise in a most inconsistent way. Certainly, those who try to rationalise market events sometimes have an unenviable task.

The truth seems to be that the public have steadily supported the market all the time, but the volume of their dealings has been, and still is, relatively limited. Professional and institutional investors, part of whose duty it is to reason why, have been a much more uncertain marginal influence in prices. Their objective is not necessarily identical with that of the private investor, to whom a share is a "good" share if its capital value is likely to be higher in x years' time than to-day, even if it falls temporarily in the interim. To the professional the last qualification is substantial. Why should he come in now if he can buy more cheaply later? There has been something like a stalemate in recent weeks, when professional interests were holding off and there was no special factor to capture "the public's" imagination and

raise the total business done above a distinctly mediocre level.

If the harder tone, after the Crimea communiqué, were maintained for, say, a fortnight, a considerable and welcome broadening of business might be fairly confidently expected. At the moment, it might be wise not to read too much into this week's showing. A vague, generalised feeling of satisfaction with an announcement of high immediate news value will not of itself bring "the public" into the market in larger numbers for more than a limited time, unless some more solid and compelling influence replaces the inevitable first glow of satisfaction. If it does not, the "others" will not come in; if it does, they will stay out at their peril. On the whole, it may be more dangerous, in the immediate future, to be a bear than a bull. But it may be more dangerous still to have heavy commitments open.

PMH in Cotton

The disquieting report on comparative productivity in the British and American cotton industries, made last October by the Platt Cotton Textile Mission that had studied production methods in the United States, has stirred the industry in this country into action. On February 9th the Cotton Board Committee on post-war problems resolved that "they should forthwith invite offers from the industry to make a mill or mills available for practical tests" in the application of new methods and machinery.

Experiments must have the approval of a committee to be appointed by the Cotton Board. Representatives of the Federation of Master Cotton Spinners' Associations and of the two trade unions in the spinning section will sit in equal numbers on the committee; members of the textile machinery industry and of the Shirley Institute are to be invited to collaborate in the experiments. Departures may be made from trade practices, provided these do not involve a reduction in the earnings of operatives and on condition that they may appeal to the committee; when the tests have been completed the former practices are to be resumed unless the employers and trade unions agree to the permanent adoption of changes.

The decision of the industry to try out new methods in

the spinning section—similar plans are in preparation in the manufacturing branch—proves the value of technical investigations into foreign practice—and of the publication of the findings, however unpleasant they may be.

Franco-British Financial Negotiations

Reports from Paris, which appear to be well founded, have purported to give a clearer definition of the practical results obtained in the recent Franco-British financial negotiations. The only admission made on this side is that the talks led to an agreement "in principle" about mutual disclosure of information regarding the assets held by nationals of each country in the other country. The storm of protest which followed the Chancellor's announcement of this agreement has perhaps helped to modify and restrict its translation from "principle" to practice. It is now understood that the agreement to disclose is not a continuing one. It will apply only to assets which have had to be disclosed by the banks to the Custodian for Enemy Property, and when the Custodian ceases to have French assets vested with him, disclosure will automatically cease. This does not cleanse the agreement of all taint, but it removes some of the worst fears that had been entertained about its scope and ultimate effect.

According to the Paris reports, the financial talks covered three other subjects. The first was the freeing of sterling and franc assets of French and British nationals respectively. This problem has been the subject of almost continuous conversations since the liberation of Paris, and fairly early developments may be expected. It is reasonable to suppose that they will be on the lines of the recent freeing of commercial and financial relations between the UK and Belgium—that is, the freeing of balances arising from future trade but without prejudice to the disposition of pre-existing balances. The second concerns a Franco-British debt of which very little has hitherto been heard. It arises from the Blochaine-Waley agreement (these being the French and British signatories) signed just prior to the Franco-German armistice. By this agreement Britain took over delivery of goods—mainly war materials—from the United States which the French Government had paid for to the tune of over \$150 million. The original payment was made by the British into a blocked account to the credit of the French Government. The suggestion is that Britain should deliver to the French Government other items to an equivalent amount against debits to this dollar account.

The third item on the agenda would seem to have been the fate of the Reynaud-Simon agreement, under which the British and French Governments fixed the proportions, namely, 60:40, in which their external war expenditure should be shared and set up clearing machinery to settle French expenditure in the sterling area and British expenditure in the franc area. The clearing account is reputed to have shown a balance of some £50,000,000 in favour of Britain at the time of the French collapse. The reports from Paris talk of a "cancellation of the Reynaud-Simon agreement." If this is meant to refer both to the clearing balance and to the provisions for sharing the joint costs of the war, it would clearly be very far-reaching.

Stock Exchange Council

There is more than formal significance in an over-riding rule which has been passed this week by the Stock Exchange Committee for General Purposes, following the addition of a new clause, 108A, to the Stock Exchange Deed of Settlement. On March 25, the committee will cease to have a legal existence and the Stock Exchange Council will come into being. Consequentially, certain rules now in the book will be put in abeyance, certain references to the committee or the managers will have the word the council substituted and a blanket provision will give the council the powers with which the decision of the proprietors and the amended trust deed have already vested it.

The reformers have been only just in time. The new regime which will end dual control of the Stock Exchange—by committee and managers—in name and (it may be hoped) pave the way for its ultimate disappearance in fact, will come into force just as the European War, by all appearances, is nearing its end. Before the Stock Exchange year 1945-46 is over, many of the younger members, now serving with the Forces, will probably have returned and the necessity to consult them before taking the final plunge,

and getting rid of dual control once for all, will no longer be a valid shield for conservatism.

Meanwhile, much has been gained, even by the present half-way measure. The Stock Exchange will have a live chairman, who can approach the authorities as the head of a great national institution rather than as a pupil visiting the headmaster's study with expectations pleasurable or otherwise. Given the present position in the matter of capital issues, permission to deal and the grey market, for example, it is easy to read potentially interesting possibilities into the new relationship. Within the Stock Exchange's own walls, the main beneficial consequences of the new order will be psychological. The representatives of the proprietors, who administer the affairs of the Stock Exchange as a property, will work together with the representatives of the members, who deal on its floor. And once co-operation and joint understanding have the inevitability of established routine, the battle for unified control will be over.

Permanent or Temporary Houses

Discussions about the relative merits of permanent and temporary houses tacitly assume that there is a choice between them. There is indeed a choice; it is not between constructing an equal number of both with a given volume of resources, but between a given number of permanent houses and a bigger number of temporary houses.

These discussions, surely, are academic. The total number of additional dwellings needed to provide every family with a separate home has been estimated at around one million units. The number that is likely to be needed to meet the most urgent requirements after demobilisation is probably not less than half a million. The shortage will be so acute after the war that, for a time at least, the emphasis may well be on numbers rather than on types. Any dwelling that fulfils the essential requirements of a home will be better than no home.

The number of permanent houses "of traditional construction" that could be built within two years has been officially estimated at about 300,000 units. If this estimate is a reasonable one, the case for supplementing them with temporary factory-constructed dwellings is surely unanswerable. Even two years is a long time to wait for members of the Forces who wish to set up homes.

The Need for Cheap Light Metals

One of the most significant factors in war-time industrial progress is the improvement in the technique of using the light metals aluminium and magnesium. It is an improvement that will find wide and growing application in peace. The world's total output of aluminium in 1943, at more than 2,000,000 tons, was more than treble that of 1939, and that of magnesium, at more than 250,000 tons, showed an even bigger expansion.

If the metal-using industries in this country are not to be handicapped from the start by comparison with those in other countries, they must be able to secure the two light metals at a price no higher than those paid for them by

LUDGATE CIRCUS, LONDON, E.C.4

their competitors. At present, both metals are sold at substantially lower prices—between a quarter and a third less—in the United States than in this country; one reason for the advantage of consumers in the United States lies in the fact that costs of production in that country—and in Canada—are lower than in Britain, which meets its needs partly from home production and partly from imports.

Since the maintenance of a policy of cheap raw materials is a prime condition of the survival of this country as a major industrial Power, the time has come for the formulation of a policy designed to enable the metal industries to obtain their light metals at competitive prices. There are a number of possible solutions. For example, supplies might be imported freely and bought in the cheapest market—since many of the new plants in North America are Government-owned, the resuscitation of the pre-war private cartel is unlikely. This drastic solution, however, may not commend itself, for there may be a case for maintaining plants in this country for reasons of defence. If it is decided to maintain a given volume of production in this country, supplemented by imports, the prices at which home-produced metals are sold should be no higher than import prices. In other words, if, for non-economic reasons, a nucleus of productive capacity is to be maintained, the taxpayer and not the metal-using industries should bear the cost.

Aircraft for Sale

The US Government's offer of Dakota and Lodestar aircraft to British air-line operators has been taken as a stern reminder—if one were necessary—that American constructors will not be backward in promoting the export of their aircraft. In this case, however, it is not the constructors who are selling aircraft, but a Government agency, the Surplus Property Branch of the Foreign Economic Administration. Trade criticism of the Americans for using their embassies as bases for trade promotion is, therefore, hardly fair. The American Government can hardly be blamed for selling their own property when it is no longer needed.

Primarily, the offer follows from the division of labour involved in the Allied production programme, by which American constructors concentrated on transport aircraft. It has been implicit in previous American assurances that transport aircraft would be made available to this country during the reconversion period. Whether this limited offer will now be taken up by prospective British operators is another matter. At best, a second-hand Dakota can only be a stop-gap until more suitable and more economical aircraft are available. Its attractiveness depends entirely on what alternatives are offered by the British aircraft industry.

Among many civil transport aircraft in the development stage, only the Lancastrian and the York are so far being produced in numbers. In recent months good progress has been achieved, and high priority for the work has been admitted by the Government. Even so, the British aircraft industry has a long way to go to catch up with American constructors. Within five years or so there is no reason why British aircraft, particularly in such vital matters as weight control and standardisation, should not be as good as American. Meanwhile, the urgency of having at least some British aircraft available for the home and export markets, even at the cost of subsidising ex-military types, must be realised to the full. Rightly or wrongly, the well-meant offer of the American Government has helped to put wind in the wings of the aircraft industry.

Zinc Corporation Scheme

The judgment of Solomon was a simple problem compared with the complicated issues which shareholders in Zinc Corporation face under the terms of the scheme put forward this week by the directors. The company, which owns lead-zinc-silver leases at Broken Hill, New South Wales, as well as smelting interests, wishes to expand its operations and, as a preliminary, to simplify its capital structure. At present, some £245,692 of £1 preference shares are entitled to a cumulative preferential 20 per cent and equal share-for-share participation with 653,139 ordinary shares of 10s. (which rank in all respects as £1 shares) in surplus profits.

The scheme offers, for each £1 preference share (a) one

and a half 5½ per cent cumulative redeemable preference shares of £1, (b) one and a half 5½ per cent cumulative (but irredeemable) preference shares of £1, and (c) one ordinary share of £1, with the relinquishment of participating rights. In fact, fixed preferential dividends will be reduced from 20 to 16½ per cent and (if ordinary dividends are maintained at their present 10 per cent level) total payments to existing preference holders will be 26½ per cent against 30 per cent. In a liquidation, preference shareholders will receive £3 against £1 as at present. Additional capital is to be raised by issuing 224,708 £1 ordinary shares for cash at 40s. to existing preference and ordinary shareholders in the proportion of one new ordinary share for each four shares held.

What is the issue of all this? First, the psychological difficulty due to the hostility of workers and others in New South Wales to the existence of 20 per cent preference shares is overcome. Secondly, a somewhat archaic capital structure, the legacy of unavoidable circumstances at the company's formation, is undeniably simplified. Thirdly, assent is given to the company's expansion plans by the British Treasury, which apparently does not view the writing up of nominal preference capital (with the increase in the balance-sheet value of mining property from £355,393 to £1,419,039 which it involves) in the same unfavourable light as a capital "bonus" to ordinary shareholders. Fourthly, the preference shareholders give away 11½ per cent of their income-in-hand—presuming ordinary dividends are maintained at the current rate—in return for 200 per cent increased capital-in-the-bush—that is, in the event of liquidation.

The choice is one with which few preference shareholders can have been confronted before, and it is hard to say on what solid ground they can base their judgment. The argument by market values is, on the whole, favourable. The new preference shares will be far more marketable than the old, and the combined market value of the parcel of shares which preference holders will receive is expected to come out at approximately £6 2s. 6d., against £6 for a single 20 per cent preference share. The company held consultations with the Association of Investment Trusts before issuing the scheme, and, apparently, encountered no opposition in that quarter.

It seems anomalous, however, that, under the scheme, preference shareholders should be worse off if the company prospered as a going concern and better off if it unfortunately had to wind up. The aims of the scheme command complete approval, but could not the income rights of the preference shareholders have been virtually maintained by offering them three new shares with 6½ per cent (instead of 5½ per cent) dividend—plus an ordinary share—for every existing preference share?

Overseas Apparel Markets

The overseas market for British tailoring has always been what is known in the trade as "exclusive," and this applies particularly to men's clothing. In most countries it is fairly clear that more British-made suits could be sold, provided prices were brought down and styles modified to suit foreign tastes. It should be perfectly possible to sell mass-produced ready-made suits abroad as well as at home, and so capture the medium-price markets, which previously had scarcely been touched—it is only the demand for the most expensive materials which has to any extent been satisfied.

During the last five pre-war years, exports of apparel from the United Kingdom averaged about £9,000,000, of which about two-thirds went to the Empire. On the other hand, imports were as high as £7,000,000 a year, and came almost entirely from foreign countries.

Women's wear presents problems different from men's. Women, being more amenable to fashion, are less conservative about style. It may well be that cheap American dresses, for example, sold so well as much because of the excellence of their sizing as for anything else. This difference between American and British methods may have accounted for the popularity of American dresses which gave British manufacturers—and, indeed, the Government—so much cause for concern just before the war. As far as the overseas market for men's clothing goes, too little study of it was made in the past. It is good, therefore, to learn that some sections

of the trade are thinking about it. Mr H. Jenner, president of the two-year-old Federation of Clothing Designers and Production Managers, went to the root of the matter in a speech last Saturday when he said that while

demand for British material is universal, the manufactured product is just not good enough.

This applies equally to men's and women's, and probably children's, clothing. The Federation is preparing to work with the Industrial Design Council to raise the standard of manufactured garments both for the home and export markets. There seem to be few natural obstacles to a great increase in clothing exports. The clothing trades have the advantages of an old-established goodwill for British textiles, and there seems little reason, if styling and production can be equally good, why they should not make more than their proportionate contribution to the export programme.

Still Better Window-Dressing

The clearing banks' window-dressing, in preparation for the end-1944 balance-sheets, broke all previous records in this form of activity. The data required for measuring these efforts became available with the publication of the Bank of England's Statistical Summary for December. This shows that in that month the clearing banks' cash holding (balances at the bank and till money) on the Wednesdays averaged £329 million. The cash shown in the aggregate December 31st balance-sheet was £500 million. Even this disparity does not reflect the whole of the year-end window-dressing, since the figures for the last two Wednesdays of December, which go to make up the "undressed" average for the month, had already been swollen as a result of preparations for the year-end balance-sheets. The balance-sheets showed an aggregate cash ratio of 11 per cent. The true cash for December was 7.7 per cent. The disparity of nearly one-third between the true and the published figure is one which has never before been approached.

This record was no mere end-of-year flash in the pan. It was the culmination of a long-term trend towards more vigorous window-dressing. This trend is well brought out by the following table giving the yearly averages since 1938 of the various items from which the extent of window-dressing can be measured.

Average	Clearing Banks' Cash (in £ million)		Published Ratio %	True Ratio %
	Making-up Days	Wed- nesdays		
1938	241	218	10.6	9.6
1939	244	226	10.9	10.0
1940	268	243	10.7	9.7
1941	311	258	10.5	8.7
1942	345	277	10.5	8.5
1943	386	300	10.5	8.2
1944	437	329	10.5	7.9

Towards the close of 1944 the true cash ratio of the clearing banks dipped on two occasions to 7.5 per cent. There is much to be said for the economy of cash and for other advantages represented by this low ratio, but very little in favour of the elaborate subterfuge which veils this true position beneath the rigidity of an appreciably higher published ratio.

Shopping for Christmas

Last autumn many people began to make plans for the first Christmas of peace, and later for the last Christmas of the war, as the prevailing mood changed. There seemed to be a grim determination to continue preparations and celebrations despite the military disappointments which accompanied the approach to Christmas and the holiday itself. The retail trade report for December last, published in the *Board of Trade Journal* for February 10th, shows how far the Christmas spirit was translated into spending.

The consumer let himself go as he had not done for the past two years, and this was made possible by the rise in spendable incomes that had taken place. Only a small part of the additional turnover can be ascribed to a rise in prices; indeed, in some categories, such as food, for example, the rise was probably negligible. There was undoubtedly some increase in supplies as well as a substantial drain on stocks—of apparel, particularly—to cover the higher volume of purchases; the value of stocks (at cost) of all

commodities, including food, fell by 15.4 per cent during the past year.

The accompanying table brings out the extent of the rise in expenditure, compared with the previous December and the average for the years 1943 and 1944:

AVERAGE VALUE OF DAILY RETAIL SALES
(1942=100)

	Apparel	House- hold Goods	Non-food Mer- chandise	Food	Total
December, 1943	102	105	123	113	117
Average	88	89	93	102	98
December, 1944	125	114	140	119	128
Average	102	87	101	107	105

More money was spent last December than in any month during the previous two years in every one of the categories. It is remarkable that this should apply, too, to apparel, since December was the fifth month of the coupon period. The consequence was, of course, to leave stocks lower than they were a year before. Apparel stocks were only three-quarters the size by value—and therefore proportionately less in quantity—of those in 1942. Unless more labour can be found to make clothing, the shops will find it increasingly difficult to meet demand.

Tilling Prospects

Thomas Tilling's profits for the year ended December 31, 1944, are slightly higher at £698,000 against £692,000, and the ordinary dividend, which is maintained at 10 per cent, is covered by earnings of 16.5 against 15.9 per cent. Tilling's profits are mainly derived from a wide range of motor and omnibus companies, in the majority of which it does not, however, hold a controlling financial interest. This is the reason given by the chairman, Sir Frederick Heaton, for the failure to publish a consolidated balance-sheet, in the absence of which the group's position is hard to assess.

Sir Frederick refers to the effect of the EPT cushion in scooping up most of the improved profits of the associated companies. This fact suggests that a substantial rise in the profits of bus companies may follow the lifting of EPT. The potential demand for bus services is at least as great as before the war, but their expansion will be partly limited by the availability of petrol. In this connection, Sir Frederick states that, although it is no longer compulsory to run a proportion of vehicles on producer gas, research into its possibilities, especially as regards plants of the built-in type, will be continued. Tilling's £1 units of ordinary stock stand at 6½s. 6d., at which the rather low yield of £3 6s. 6d. shows no more than reasonable optimism about the group's considerable prospects.

Woolworth's Turn the Corner

Woolworth's full accounts for the year ended December 31, 1944, show a greater improvement in the com-

pany's position than was suggested by the preliminary announcement, discussed in *The Economist* on January 27th. It is now revealed that the £300,000 allocation to future taxation made in the previous year has not been used, and that, in accordance with the recommendations of the Institute of Chartered Accountants, it is intended gradually to build up a fund which will cover income-tax liability on the profits of the current year. This fund receives this year a further £450,000, and thus totals £750,000.

The chairman, Mr. Stephenson, states that the 1944 rise in profits, before tax, of £666,000 (or 12.8 per cent), indicates a slight easing in supplies of some essential goods, which he regards as a happy augury for the future. It should be noted that Woolworth's has met the leaner profits of war-time years by reducing its dividends and not its allocations to reserves. The carry forward has actually increased since 1939 by as much as £924,000, and now stands at £7,395,183, which compares with a total issued capital of £12,500,000. In the last five years £1,250,000 has been added to buildings' reserve, which now totals £1,850,000, and substantial sums have been written off leasehold properties and fixtures. Woolworth's thus turns the corner towards recovery in a strong liquid position.

It is pointed out that the present dividend ratio does not take into account the full value of the assets employed in trading which are partly covered by surplus and reserves. The price of the 5s. units of ordinary stock rose on publication of the accounts from 72s. 6d. to 74s. 9d.

Access to Home Markets

Despite Woolworth's strong position, the speed of its recovery will depend very largely on how soon it is allowed to supply the large arrears of demand in the home market. Mr Stephenson urges that to limit sales at home would hamper export trade. The reasons he gives are that mass production for the home market would stimulate export efficiency, and that the first market to be won from foreign competition is the home one. This specious argument reflects the natural desire of many manufacturers for quick access to their safest and easiest market.

It fails to realise the high degree of priority that must be given, in the immediate post-war period, to the production of essential goods and equipment. The only justification for increasing the production of many types of manufactured goods is that they can be exchanged for essential imports, which would not, of course, include articles of a similar type. To let manufacturers decide how much, if anything, they will export would lead to the nation being supplied with semi-luxuries and going short of necessities, or to it satisfying immediate demands at the expense of rebuilding permanent prosperity. To avoid such disasters it may prove necessary both to give prior facilities to manufactures for export and to limit home demand by a modified rationing system.

Canadian Pacific's High Dividend

The Canadian Pacific Railway has declared a final dividend on ordinary stock of 3 per cent, making a total pay-

ment for 1944 of 5 per cent. This compares with 2 per cent for 1943 and no payment at all for the previous decade. This result far exceeds the prospects held out during the year, which were coloured by pessimism over last July's wages award. This award added \$15 million to operating costs, but preliminary results show that 1944 railway profits, after taxation, are only \$6,050,000 lower at \$43,160,000. The decline in railway profits may be partly or even wholly offset by increases in the company's income from dividends, steamships and hotels, and by reductions in its fixed charges, for which items figures are not yet available.

But even if CPR, in spite of the wages award, has done as well in 1944 as in 1943, it remains to be asked why the dividend has been more than doubled. It should be remembered, however, that the 1943 earned for ordinary was 11.3 per cent, and that this year's dividend is certain to be comfortably covered. The Board may have decided that it is time to pass on to equity-holders some of the war-time gains which are represented by the large reduction of funded debt and the increase in surplus revenue from \$141,000,000 in 1939 to \$225,000,000 in 1943. Against this increase of \$84,000,000, 5 per cent dividend costs only \$16,750,000. Last year's payment may have been unduly conservative, due to uncertainty about the size and effect of wages increases. Finally, this year's handsome payment, perhaps half of which will come to United Kingdom stockholders, may reflect the political desirability of making more Canadian dollars available for British purchasers.

Whatever the reason for the increased dividend, it would be highly optimistic to expect any increase in the coming years in CPR's railway profits. Increased cost and wages are at present covered by a high level of trade, which must inevitably slacken with the fall-off in war-time production. Although CPR may perhaps hope to increase passenger travel and the activities of its subsidiary air company, the majority of its revenue depends on goods freights. Everything indicates that this year's dividend payment is exceptional; although it is always possible that the Board's policy will continue to be less conservative.

Savings Stimuli

The Government of India was defeated in the Central Assembly last week on a motion to discuss "the illegal and unfair use of force by Government of India agents to compel the public of Bihar to buy National Savings Certificates." One speaker alleged that if Bihar parents fail to subscribe to National Savings Certificates their children are not allowed to remain at school. Another accused the authorities in rural districts of demanding "by beat of drum" that each person who paid a tax of one rupee should buy Savings Certificates for 20 rupees, and that those who refused were "harassed in all possible ways." A third told a more horrifying tale of a man "being beaten with shoes" because he would not buy savings certificates. Great Britain may have gone much further than India in devising the system of compulsory savings; but in the matter of "voluntary" savings devices the authorities in India appear to have shown a resourcefulness unequalled by Lord Kindersley and his savings committee.

The Finance Member, Sir Jeremy Raisman, denied that the Government had given any instruction for the use of force in making collections for national savings, but admitted that the line between the "high degree of persuasion" recommended by the authorities and actual compulsion, might have been overstepped. Beyond this, he could only emphasise the need for savings, given the present scarcity of things and plethora of money in India.

US Gold Reserve Requirements

Legislation sponsored by the United States Federal Reserve Board proposes to reduce the gold reserve requirements against Federal Reserve notes and reserve deposits. The present minimum reserve against notes is 40 per cent, and against reserve deposits 35 per cent. The proposal is to reduce both to 25 per cent. Federal Reserve Board officials have explained that the legislation has been made necessary by war-time expansion in the monetary circulation.

The currency in circulation in the United States has recently been expanding rapidly. The latest global figure, for February 1st, showed a circulation of \$25,290 million,

which compares with \$20,534 million a year previously. The expansion both in Federal Reserve notes and in reserve deposits has not, however, proceeded to the point at which the reserve position is becoming strained. On the basis of the latest figures, those for February 1st last, the amount of gold immobilised by minimum reserve requirements against Federal Reserve notes and Reserve deposits was \$13,900 million. The gold stock on that day amounted to \$20,550 million. Admittedly the gold stock has fallen by \$1,360 million over the past year, while the credit and currency expansion has been gathering speed. These trends emphasise the need for precautionary legislation such as has now been proposed.

Apart from this consideration of immediate requirements, the Federal Reserve authorities probably have in mind the losses of gold that may occur as a result of the US participation in the Monetary Fund and Reconstruction Bank. The gold reserve requirements, as reduced by the proposed legislation, would free gold to the amount of about \$4,800 million, on the basis of the present position of the Federal Reserve Bank, and would reduce the gold immobilised by reserve requirements to less than half the present holding of the United States. The legislation, therefore, anticipates further encroachments on American gold reserves. It is significant for this reason, and for the expansionist philosophy which appears to underlie it.

Bretton Woods and Congress

The Bretton Woods proposals for a Monetary Fund and an International Bank have been commended to the US Congress in a Presidential message. In the same message President Roosevelt also promises early proposals which will include

the establishment of a food and agriculture organisation by the United Nations, the broadening and strengthening of the Trade Agreement Act of 1934, international agreement for the reduction of trade barriers, control of cartels and the orderly marketing of world surpluses of certain commodities, revision of export and import banking, and the international oil agreement, as well as proposals in the fields of civil aviation, shipping and radio and cable communications and the repeal of the Johnson Act.

No indication has yet become apparent of the reception that the Bretton Woods proposals are likely to receive at the hands of Congress.

Training for Business Administration

The field of retraining ex-Service men and women for civilian employment is being covered piece by piece. Government plans for apprenticeship, industrial training, training of teachers and further education schemes have been formulated, and many industries and firms are making or have made their own plans. The latest step announced by the Ministry of Labour is the setting up of a Committee on Training for Business Administration, under the chairmanship of Sir Frank Newson-Smith.

Many men and women in the Services would by now have achieved good executive positions in business but for the war. The pre-war practice of big business of taking young people fresh from school or university, with a view to their speedy advancement to higher paid posts may prejudice the chances of older entrants. The new committee will examine how far a course of instruction is likely to assist the absorption of promising candidates, and will examine what kind of course will best compensate for lack of experience.

There should be no difficulty in working out a suitable curriculum. A certain amount of business practice was taught at commercial and technical schools, and so was

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so before the date of expiry. If they fail to do so, their subscriptions will be automatically cancelled as soon as that date is passed, and this may mean a gap of many months before the despatch of copies can be resumed.

salesmanship. At a higher level, the University of London used to run a course in business administration, intended for graduates and higher executives with business experience.

The Committee may find that its third term of reference—to secure general recognition of the recommended courses—the most difficult. The Appointments Board could probably help them there, but perhaps the members of the Committee, of whom about half are directors or representatives of large firms, will know best what tactics to adopt in selling its recommendations.

Shorter Notes

In last week's article on the Banks' Capital the statement that the banks could raise substantial amounts of new capital by calling up unpaid amounts on their partly paid shares should have been qualified by pointing out that much of this unpaid capital is a reserve liability callable only in the event of liquidation. Of the partly paid shares shown in the tables, this applies to the following:

	Number of Shares	Nominal Value	Paid-up	Callable	Reserve Liability
Midland	2,869,079	£12	£2 10s.	£2 10s.	£7
Lloyds "A"	14,372,956	£5	£1	5s.	£3 15s.
National Provincial "A"	600,000	£5	14s.	19s. 4d.	£3 6s. 8d.
Westminster "B"	7,889,416	£5	£1	13s. 4d.	£3 6s. 8d.
Westminster	7,070,990	£4	£1	£1	£2

The British Commercial Gas Association has followed the example of the British Electrical Development Association in exhibiting its ideas on kitchen planning. Gas kitchens have been designed for every type of home. The choice between gas and electricity will be guided in the main by two things—taste and relative cost. The lay-out of a kitchen is not greatly influenced by the type of fuel to be used, but equipment can be more suitably designed as part of the ultimate setting, instead of in isolation, as used to be the case. The interest which manufacturers of both gas and electrical equipment are taking in the proper incorporation of their products into planned kitchens is a large step towards the achievement of a more efficient kitchen in the post-war home.

The laying down of new building regulations under the Factories Act, 1937, was delayed by the war, but a new start has just been made, so that the regulations can be in force during the period of reconstruction. A draft Statutory Rule and Order has just been published for study and discussion before being put into its final form. The regulations are of importance, since they not only consolidate those made in 1926 and 1931, but take account of accident experience since those dates. More important still is that they cover the International Labour Convention and Recommendations of 1937, in the framing of which British representatives played a prominent part, and which the 1937 Act was partly meant to ratify.

The first of the thousand or so factories which the Government will have for disposal has been leased to the Dunlop Rubber Company. The Ministry of Aircraft Production No. 1 factory at Speke, near Liverpool, at present operated by Rootes, Ltd., is the one concerned. Dunlop proposes to "rehabilitate" products not made during the war, in which the acquisition of a modern factory will give them great advantages, which they recognise.

London Trustee Savings Bank deposits last year increased by £3,250,000 to £19,800,000, the largest annual increase recorded in the history of the bank. It was announced at the meeting of the London Trustee Savings Bank, held this week, that since November, 1939, this bank alone had contributed over £12,500,000 to the war finance campaign. The scheme of expansion launched last year will be vigorously pursued during the coming year.

COMPANY MEETINGS

THE LAW DEBENTURE CORPORATION, LIMITED

VERY STRONG POSITION

The fifty-fifth ordinary general meeting of this company was held, on the 9th instant, in London.

The Rt. Hon. The Viscount Greenwood, P.C. (the chairman) first referred to the loss which the Corporation and other great concerns and indeed the City of London had sustained by the death of their late most respected chairman, Sir Miles Matkinson.

Continuing, he said that the accounts were presented in a form somewhat different from that to which they were accustomed. The change made clearer, if possible, the strong financial liquid position of the Corporation. "Investments" at £947,838, showed an increase of £35,794, partly accounted for by a reduction in cash at bank which this year was £39,658 as compared with £60,814 in 1943, and also by including investments of over £10,000 which at December 31st had been bought for payment at a later date. Those figures disclosed that they were more fully invested than at this time last year. That policy had become more than ever necessary in view of the low rate of interest on deposits and the consequent difficulty of maintaining revenue.

"General Reserve Fund" had increased by £9,463 and had reached £300,000, to which the fund was limited by the Articles of Association. But for that limitation the fund would have been increased by a further £2,064. In the circumstances, that latter amount became available for distribution. The ordinary shareholders' dividend fund investment stood at £102,224, or £2,144 less than in 1943.

APPRECIATION OF INVESTMENTS

As regarded the "Investments," they had an appreciation in value of £211,489, or 22 per cent. above book cost. On "General Reserve" the appreciation amounted to £57,651, or over 19 per cent. and on "Ordinary Shareholders' Dividend Fund" the appreciation was £24,535, or 24 per cent. above book cost. Once again it could be said that the Corporation was in a very strong position. Their total invested funds were distributed over some 400 securities amounting at book cost to £1,350,062, with a market value of £1,643,737, showing, therefore, a surplus of £293,675. Less than 3 per cent. of the book cost were investments not quoted on the London Stock Exchange.

Turning to the profit and loss account the revenue figures were gross as were those for 1943. "Interest and Dividends" were some £700 higher than in 1943. "Commission and Fees" were higher by £2,542, a satisfactory figure, indicating much additional work for a depleted staff. "Profit on Realisation of Securities" amounted to £4,575 against a corresponding loss of £1,222 in 1943. The difference this year arose almost entirely from repayment of investments in some cases at prices much in excess of book cost of securities bought during times of depression. The balance available for distribution in respect of the year 1944 was £34,598.

After payment of 5 per cent. on the preference share capital and 7 per cent. dividend on the ordinary share capital, there remained £19,098 net. That amount was divisible in equal parts between the ordinary shareholders' dividend fund and the founders' shareholders, paying to the latter a dividend of £47 14s. 11d. per £10 share, free of income tax, and the remaining £9,549 was added to the ordinary shareholders' dividend fund. In recommending the payment of an additional ordinary dividend of 7 per cent. out of the ordinary shareholders' dividend fund the directors were following the precedent established in 1934, and continued yearly since then.

The report was adopted.

BARROW, HEPBURN AND GALE, LIMITED

TOTAL TURNOVER MAINTAINED

The twenty-fourth ordinary general meeting of this company will be held, on the 22nd instant, at Winchester House, Old Broad Street, London, E.C.

The following is an extract from the statement of Mr George W. Odey (chairman and managing director), circulated with the report and accounts. The accounts for 1944 now presented show a profit for the year of £52,978 as compared with £55,313 for the previous year. After allowing for interest, etc., and reserving £7,500 for depreciation of buildings, we are left with a profit of £42,787, which after paying the 6 per cent. dividend on our preference and ordinary shares, enables us to increase our carry-forward by £5,287 to £106,442.

The total turnover of all our undertakings for 1944 was maintained. The company's productions are all vital to the war effort in a greater or less degree and are subject to a varying extent to governmental control, both with regard to the quantities produced and to the margin of profit permitted.

SOLE LEATHER PRODUCTION

In the case of our sole leather production, which is an important part of the company's activities, we are subject to a special scheme of government control of profit whereby our profits are regulated by the average profit of the trade. This profit control scheme has a number of undesirable features and is causing considerable dissatisfaction to the industry.

The sole leather tanners have given notice to terminate the present scheme, and it is to be trusted that a new scheme will be devised on a simpler basis.

We are suffering increasingly from the difficulty which is affecting so many industries at the present time of obtaining adequate labour. The whole governmental machinery for dealing with this has become so cumbersome that there appears to be little prospect of any early improvement in the position. It is important to stress this fact because labour is undoubtedly our most pressing problem.

Whilst I have little doubt that, before the position of supply and demand is ultimately adjusted, we shall have to go through a period of high prices, there is no need for the period of adjustment to be unduly prolonged because, as a result of progress made during the war, there are many leather substitutes available and these would all tend to bring the price of hides and leather to a reasonable level.

NO REASON FOR PESSIMISM

In spite of the world-wide dislocation of the tanning industry arising as a result of the war, there is no reason for pessimism on the part of our shareholders with regard to the future of this company. We have striven, and shall continue to strive, to make our leather-production plants as efficient as any in the world, and even if we may have anxieties about the future expansion of the tanning industry in this country, it must be remembered that we have other interests, all of which we are determined to develop as opportunities arise.

We are continuing to press our appeal for a substituted standard, but in connection with the question of an increased dividend it must be borne in mind that our large preference shareholding would participate to a quarter of one per cent. in any further improvement in our ordinary dividend and the problem is not, therefore, simply one of an increase on the ordinary dividend which of itself would absorb a comparatively small amount. We have a large repayment of E.P.T. due to us, which will clearly be of the greatest value in enabling us further to modernise and equip our factories and we can look forward to the future with justifiable confidence.

F. W. WOOLWORTH AND COMPANY, LIMITED

MR W. L. STEPHENSON'S STATEMENT

The thirty-sixth annual general meeting of this company will be held on the 23rd instant in London.

The following is an extract from the statement of the chairman, Mr W. L. Stephenson, circulated with the accounts:

Some recovery was made in 1944 over the results of 1943. The increased profit over the year is £665,991, an improvement of 12.80 per cent. It is an indication that there has been a slight easing in supplies of some essential goods. We can accept this as a happy augury. We should, however, at the same time realise we are a long way from complete recovery, and our present figure of £5,869,645 compared with the first full year of £7,958,159 net profit, provides a true picture, but we can be thankful that we have halted the downward trend.

It is proposed that a final dividend of 1s. 9d. per unit shall be paid, making a total dividend of 2s. 3d. per unit for the year 1944, as against 2s. for the previous year.

As to the future trend of trade, one guess is as good as another. A great deal depends on Government policy. There has been much said recently about the urgency of placing ourselves in a position to export our manufactured goods just as soon as we could turn from war to peace. We shall be a debtor nation and it is vitally necessary that we should build up credits as a basis for our import of produce and materials. I venture the humble opinion that these exports of manufactured articles will not eventuate if our home market is withheld, by restriction, from our manufacturers. We shall all have to work hard and skilfully if we are to face competition, and I cannot see any better way of winning export trade than predicating it on our own home market.

BOOKER BROTHERS, McCONNELL AND COMPANY, LIMITED

FUTURE OF DEMERARA SUGAR

The annual general meeting of Booker Brothers, McConnell and Company, Limited, was held, on the 15th instant, in London.

The following is an extract from the statement of the chairman (Sir Alfred Sherlock): For the year ended June 30, 1944, the company made a profit of £140,206 as against £141,601 in the previous year, a result which has been achieved in spite of the fact that the dividend from our main sugar-producing subsidiary was £10,000 less. A satisfactory feature is that the reserve amalgamated balance-sheet is over £1,000,000.

We now have to look at the foundations on which future accounts must rest—the Sugar Estates. The Colony's 1944 crop fell to about 138,000 tons as compared with 196,502 tons in the year 1938, and the prospects for the future are none too promising.

The Demerara sugar industry is not receiving fair treatment in that it has to sell a tenth of its sugar in the Colony at a price which is now £5 a ton below the cost of production and in addition is called upon to bear a production tax of 4s. 2d. a ton to subsidise the cost of other foodstuffs. This means that in addition to income tax and other general taxes the sugar industry is singled out for a special contribution of about £100,000 a year towards the cost of running the Colony.

Trinidad sugar producers on the other hand are receiving from their Government substantial subsidies. Happily we have some reason to hope that a request the Demerara industry has made for an independent official enquiry into the sugar industry will be granted.

The report was adopted.

FINANCE AND BANKING

THE MONEY MARKET.—Credit conditions were exceptionally difficult last week-end, when some special assistance had to be given to the market. Since then the position has eased, though at no time has there been any superabundance of credit. Heavy tax transfers have again had to be made this week, while at the same time the Treasury resumed floating debt borrowing. Treasury bill maturities this week equalled the payments for new bills after a four-week period, during which there has been a weekly excess of maturities of £10,000,000. Treasury Deposit Receipt payments of £90,000,000 were equal to nominal maturities, but owing to pre-encashments, involved the finding of some £20,000,000 of new money. By Thursday, though heavy tax payments were being transferred, the position had been eased, a helpful factor being the mid-February dividends on Government debt.

MONEY RATES, LONDON.—The following rates remained unchanged between February 8th and February 15th:—

Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1¾%; 6 months, 1½-1¾%. Treasury Bills: 2 months, 1-1½%; 3 months, 1-1½%. Day-to-day money, 1-1½%. Short Loans, 1-1½%. Bank deposit rates, ½%. Discount deposit at call, 1%; at notice, 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained

unchanged between February 8th and February 15th. (Figures in brackets are par of exchange).

United States. \$ (4-8½) 4-02½-03½; mail transfers 4-02½-03½. Canada \$ (4-8½) 4-43-47; mail transfers 4-43-47. Switzerland. Francs (25-22½) 17-30-40. French Empire. Francs 197½-200½. "The Economist" Sensitive Index.—During the week ended February 13th the crop component of the sensitive index (1935=100), rose from 135.7 on February 8th to 135.8 on February 9th, owing to a rise in the price of Canadian wheat. The raw materials index remained unchanged at 185.5, and the complete index, which stands at 158.7, was not affected.

Cotton Cloth Export Allocations.—The Cotton Board has issued cotton piece goods export allocations for the first period of 1945. Reductions have been made for certain markets, but on the whole the previous pattern has been followed. A new feature is that owing to the shortage of European styles in India a small allocation of about two million square yards has been made available, this market having been excluded from the allocation list for some considerable time. The general restrictions on export production remain virtually unchanged, but there are some exceptions. Applications for all widths of sheetings will now be considered and some drill production will be available. Cloths containing 2/80s Egyptian yarns will not be allowed. The yardage for South Africa again is a ceiling token and sales will have to be made against certificates issued by the High Commissioner's Office in London. Arrangements have been made to revert to normal French West Africa channels of trade. The latest date for applications for production against the current allocations is February 28th, giving longer than usual. It is estimated that total allocations amount to about 70 million square yards, and of this total, 20 per cent will be reserved under the free production scheme. Owing to manufacturers' long order lists some difficulties may be found in placing orders against the allocations. In general, weaving concerns in Lancashire are fully sold for over six months ahead and some of the contracts now being arranged will not be completed until the end of the year.

GOVERNMENT RETURNS

For the week ended Feb. 10, 1945, total ordinary revenue was £100,813,000, against ordinary expenditure of £103,136,000 and issues to sinking funds of £420,000. Thus, including sinking fund allocations £1,808,210, the deficit accrued since April 1st is £2,498,805,000 against £2,419,746,000 for the corresponding period a year ago.

A change has been made in the method of showing the excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £42,339 to £3,372,925, the other operations for the week (no longer shown separately) increased the gross National Debt by £2,695,312 to £22,084 million.

BANK FOR INTERNATIONAL SETTLEMENTS—Million Swiss gold francs of 0.29 grammes

	July 31, 1943	May 31, 194
--	---------------	-------------

THE OUTLOOK FOR INTERNATIONAL LAW

By J. L. Brierly

6/- net

International Law has come to the forefront of attention during the war, and will play a large part in the ultimate settlement of the peace. This book, by the Chichele Professor of International Law and Diplomacy in the University of Oxford, aims at providing the general reader with the necessary background to his thinking. The author considers the existing system, traces its historical development, and outlines the part which International Law is bound to play during the years ahead.

REDISTRIBUTION OF INCOMES THROUGH PUBLIC FINANCE IN 1937

By Tibor Barna

(Shortly)

This book represents the first systematic attempt to estimate the actual change in the distribution of incomes brought about by the activities of the Government, by public expenditure as well as taxation. An estimate is made of the amount of income transferred in 1937 by redistribution from the rich to the poor.

Oxford University Press

New KODAK glass

**makes possible best lenses
of all time**

Illustration shows a melt of Kodak's revolutionary new glass being poured. This "rare element" glass—first basic discovery in optical glass for 55 years—is made with tantalum and tungsten and lanthanum instead of sand. It produces lenses which let through more light and take clearer pictures faster. To-day, such lenses, in conjunction with 'Kodak' Film, mean better aerial pictures for Allied Air Forces. Tomorrow, they will mean better 'Kodak' snaps for you.

Kodak Limited, Kodak House, Kingsway, London, W.C.2.

F.26L

ISSUED BY THE MINISTRY OF FUEL AND POWER

URGENT CALL

To Cut Consumption of GAS AND ELECTRICITY

Ice-bound coal trains, an unprecedented strain on gas works and power stations—these were the consequences of the recent abnormal weather. It will take time for coal stocks to recover from the effects of these conditions.

All consumers must make a special effort to cut gas and electricity consumption everywhere, at home and in the works, in offices, shops, restaurants and hotels.

FROM INDUSTRY AN ALL-ROUND CUT OF 10% HAS BEEN ASKED. Management must see that these savings are made without harm to essential war production. A good fuel watching system will be found invaluable.

Unless an all-round economy of at least 10% can be secured and maintained by voluntary efforts, the Government will be compelled to issue directions which would necessarily give less latitude to the industrial user.

**THE SITUATION CALLS FOR THE FULLEST
CO-OPERATION FROM EVERYONE WHO USES
GAS AND ELECTRICITY**

Allowance is made for net interest accrued, and for redemption for fixed interest stocks and for changes in interim dividends for ordinary stocks.

BACKGROUND TO ACHIEVEMENT

Flight

SCARCELY a British plane takes to the air without the assistance of BTH. From the pulsating magneto with its vital spark to the tiny Mazda lamp on the control board, BTH has contributed a generous quota to flying efficiency. Included in this electrical equipment are starters, generators,

air-compressors, engine-speed indicators, under-carriage and flap-operating equipment, petrol pump motors, etc. In war-time BTH research has contributed much to the efficiency of the air-arm in combat and defence, and especially in the development of Air Commodore Whittle's jet engine.

Send your factory round the world

The old method of export selling was arduous and slow. The Sales Director with his samples and specifications tried to interest buyers, and successes were hard won. The modern Sales Director is armed with a new tool. The film can carry overseas, in as many languages as you wish, the whole carefully considered story of your product and organisation, equivalent to a personally conducted tour of your works. It can also provide your representatives with the proper prestige background and help them to make new contacts. It is clear that British salesmen will in future have to compete with others already so equipped. To make such a film you must have the advice of creative people, experienced in the art of successful film propaganda, backed by the best technical resources.

THE FILM PRODUCERS GUILD

ARE YOU OVER
17 YEARS OLD?

UNLESS you are over 17, there have been no Black Magic Chocolates since you were 14; and at that age (if we remember aright) chocolates were chocolates and never mind the name.

But if you are over 17, the words "Black Magic" probably strike a chord in your memory.

Let us help a little.

A very plain box—glossy black, with a few white lines on it.

Twelve different kinds of chocolates, in simple paper cups, without any fripperies.

Truffle-and-Nougat, Hazel Cluster, Liquid Cherry, Orange Cream, Strawberry Cup . . . heigh-ho. The girls loved 'em; and the boys took no poor view of them, either.

And now, you say, here it comes—"Come Peace, come Black Magic." But nothing of the sort. There will be a lot of pre-war goods back in the shops before Black Magic; for though we shall move fast, we shall take no short cuts—no half measures, no skimping.

Don't expect to buy Black Magic on Armistice Day; but when you do buy it, it will be as good as ever. We believe it will be better, but that will be for you to say.

Black Magic

BOWNTREE & CO. LTD., YORK

TEMPERATURE
CHAMELEON

YOU know the chameleon will change its colour according to the demands of the surroundings. But did you know that he can also register changes in temperature? How useful he would be for registering temperature changes in an engine under test. The problem of getting this little magician from Madagascar to sit still on a Rolls-Merlin engine would of course present its difficulties. The Ministry of Supply would hate the idea.

Fortunately, there is something else which will do this job much more effectively—heat-sensitive paints. These paints are on the market but their full commercial development is yet to come.

Some heat-sensitive paints contain iodine, an element which is playing an increasingly important part in our lives. New uses are constantly being found for iodine in medicine, agriculture and industry. Its field of application is so large that in 1938 the IODINE EDUCATIONAL BUREAU was set up in London to collate and distribute the mass of information on iodine which had accumulated in the last 100 years. The services of this bureau are available free to any institution or manufacturer with an iodine problem.

Iodine Educational Bureau

13 STONE HOUSE, BISHOPSGATE, LONDON, E.C.2

At 2/8 for 20, Abdulla No. 7 is a cigarette* of outstanding quality with a charm of its own—a charm which comes from superb tobacco and masterly manufacture. It's larger and firmer than the ordinary cigarette, too.

P.S. In the wardrooms of H.M. Navy, they smoke literally millions of No. 7 every year—and you know what sailors are!

* For Virginia smokers

ABDULLA No. 7

JOHN STUART MILL

On Liberty

"Every function super added to those already exercised by the government causes its influence over hopes and fears to be more widely diffused, and converts, more and more, the active and ambitious part of the public into hangers-on of the government, or of some party which aims at becoming the government. If the roads, the railways, the banks, the insurance offices, the great joint-stock companies, the universities, and the public charities, were all of them branches of the government; if, in addition, the municipal corporations and local boards, with all that now devolves on them, became departments of the central administration; if the employes of all these different enterprises were appointed and paid by the government, and looked to the government for every rise in life; not all the freedom of the press and popular constitution of the legislature would make this or any other country free otherwise than in name. And the evil would be greater, the more efficiently and scientifically the administrative machinery was constructed—the more skilful the arrangements for obtaining the best qualified hands and heads with which to work it."

THE CO-OPERATIVE WHOLESALE SOCIETY, LIMITED,
proposes to extend its

MARKET AND ECONOMIC RESEARCH ORGANISATION

The scope is wide, embracing the study of commercial, industrial and political developments affecting all aspects of the Society's operations, as well as general marketing problems, relationships with Retail Co-operative Societies, and Consumer Research.

Vacancies will arise for:—

(i) SENIOR RESEARCH ASSISTANTS.

(ii) SPECIAL LIBRARIAN.

(iii) AREA TRADE RESEARCH OFFICERS.—Applicants should have such knowledge of the problems of retailing as would enable them to discuss intelligently the development of co-operative trade with Retail Societies.

A background of general training in economics or social science, knowledge of the organisation of the Co-operative Movement, and sympathy with its aims are highly desirable qualifications.

Applications—stating age, education, experience and other qualifications, salary required, and indicating when the candidate will be available—should be addressed to the Secretary and Executive Officer, C.W.S., Limited, 1 Balloon Street, Manchester, 4, endorsed "Market Research."

ECONOMIST-STATISTICIAN Business Consultant, M.Sc. (Econ.) (London), LL.B., Inter.B.Sc. (Engineering), etc., two years research on management problems; industrial, commercial and civil service experience, 4 foreign languages, young and energetic, seeks suitable employment. Only first-class positions considered.—Box 56, *The Economist*, Breitenham House, Lancaster Place, London, W.C.2.

SYDNEY, SON & Co.

Surveyors, Valuers & Assessors.

Specialists in Claims for War Damage,
Compensation after De-requisitioning, Dilapidations, Deferred Repairs, etc.Valuers of Buildings, Plant, Machinery and
Trade Stocks. Fire Loss Assessors.**DENMAN HOUSE, 20, PICCADILLY,**

Trouble in Tokyo

THESE are black weeks for the leaders and people of Japan. The Philippines are all but lost. American forces are landing on Iwojima, only some six hundred miles from the coasts of Japan. Tokyo and other towns have received the first of what promises to be a continuous series of bombing raids from over a thousand American aircraft. At the same time, the news from Europe—the Crimea Conference and the sweeping Russian advances into Germany—suggests that the Allies may soon be free to concentrate all their resources against Japan.

Nor is the political scene at home very reassuring. When General Koiso succeeded General Tojo some six months ago, one of the reasons given for his appointment was the need for greater drive and efficiency in the direction of the war industry. It does not seem that his handling of the problem has stilled criticism. On January 21, he faced a restrictive Diet. One member complained that "not a single satisfactory solution" had been found for the difficulties of the munitions industry. Another declared that "resolute action is lacking." There was strong feeling that the business world was not fulfilling its task, and the aircraft industry in particular came under fire. Japanese correspondents on Luzon have returned to criticise the quality

of Japanese aircraft. General Koiso himself admitted in the Diet that

It is a fact that there is a shortage in some fields of production which must be made to tide over the present crisis.

It is easy to see that in this situation it would need a great deal of optimism in Japan to-day to feel that there is still any chance of victory. It even needs optimism to hope for a stalemate. These are days when careful people begin to forecast the future with misgiving and begin to count the costs and reckon the possibilities of alternative policies. Other nations have in the course of the war faced the same crisis—the growing conviction of fighting a losing fight. Their reactions to it have varied with their political structure, but, with the one exception of Germany, they have all managed to get out of the war.

Italy is the chief example of a nation that has carried through a total reversal of its policy once defeat seemed certain. The elements which made such a revolution possible were the existence of alternative centres of authority to the ruling dictatorship and its lack of real mass following. In other words, Italy was only very incom-

pletely a totalitarian regime. In Germany, on the contrary, the Nazi Party, symbolised to-day not by Hitler but by Himmler, has proved strong enough not only to crush its potential rivals—the old “conservative” elements of army, big business and the trades unions—but its grip on the German people has so far prevented any catastrophic disintegration of the framework of the state.

It may be that Japanese society resembles the Italian far more closely than the German model; it may be even less totalitarian. Until 1940 there was something of a parliamentary regime. The single party, the Imperial Rule Assistance Association (*Taisei Yokusankai*), which was set up in that year in imitation of the German model was never a mass party. It was simply an association imposed from above to embrace in a single organisation all such groups as local party associations, ARP, youth groups, neighbourhood groups and the like. It was supposed nominally to replace the two traditional parliamentary parties, the Minseito and the Seiyukai, but the party members in the Diet only discarded their labels. They continued to uphold their identity even though nominally they were now a branch—the Imperial Rule Assistance Political Association (*Taisei Yokusan Seijikai*)—of the new single party. In 1942, elections were held nominally under the single party system; but a great many of the old party men were returned and the new Diet, like the old, offered persistent and successful resistance to any attempt at incorporating it bodily in a new regime.

Thus in Japan so far no mass party of support for the rulers exists, not even that semblance of one that existed in Italy under Fascism. Japan also resembles Italy in having maintained some distinct and potentially competing centres of authority. The Emperor is not a complete cipher and he is surrounded by a Court in which statesmen such as Marquis Kido can, at times, take an independent line. In the Diet, the party members still feel some solidarity and the business world—which, on the whole, they represent—is not completely merged either with the bureaucracy or with the army. Even the Services are not unified. A moderate and an extremist wing exist within the Army, and the Navy has not always seen eye to eye with the Generals in the past.

There is thus a certain amount of evidence to support the view that as the prospects of defeat grow more certain, the chance will increase of a change of regime in Japan bringing in the Japanese Badoglio, ready not to negotiate but to accept unconditional surrender. But it would be very rash to dogmatise, and there are other factors and forces to tell a different story. The centre of extremism is the Army and at every decisive turn in Japanese policy since 1931 the military leaders have had most of their own way. It is also true that their own way has hitherto been crowned with quick success. On the other hand, to force Japan to accept a fight to the finish probably needs the backing of a mass party which so far the extremists have failed to create.

There are signs that they are now making an attempt to remedy this weakness. The ringleader is the arch-extremist, Colonel Hashimoto. He was partly responsible for the 1936 rebellion of the Army. In 1937, he sank the American ship, *Panay* in the Yangtse. After periods of retirement for these offences, he reappeared in public life. In 1942 he was one of a number of extremists elected to the Diet. He has been Vice-President of the Youth Corps, which is one of the militarist and militant organisations loosely included in the Imperial Rule Assistance Association. Another leader of this movement is General Tachikawa, a noted extremist of the Hashimoto type, and a former Ambassador to Moscow. These men lead a strong body of critics who demand an enormous increase in the toughness and discipline of the war effort. They want a total war fought on German lines. Hitherto, there have been no shootings in Japan to increase discipline. This they wish to remedy ruthlessly. Hashimoto is, in other words, a would-be Himmler. But, unlike Himmler, he still has no party. However, reports from Tokyo in recent weeks suggest that the

extremists are now attempting to use the Youth Corps—Comrades' League as it is now to be called—as the basis of a new totalitarian party which will swallow the Assistance Association, purge the Court, set up a fully dictatorial government and prepare Japan for war to the bitter end. If they could build up a strong nucleus from the different Youth Associations, the Secret Societies and the officers' corps, their plan would be presumably to swallow the Imperial Rule Assistance Association and set up a Government based on a single totalitarian party. An essential step in such a programme would be to repeat—this time successfully—the 1936 revolt, when officer assassins murdered a number of the chief moderate politicians and troops marched on the Royal Palace to secure the support of the Emperor. Such a purge of the “moderates” in the present Government, Mr. Shigemitsu for instance, and of the Court officials, might be attempted. With the Mikado as figurehead, the extremists might be able to develop the strong loyalty and traditional obedience of the Japanese people into a fanaticism strong enough to carry a totalitarian party. On such a base, they could, perhaps, emulate the Nazis and build a regime tough enough and brutal enough to fight to the bitter end.

Such a crisis is not likely to arise immediately. In spite of air-raids and amphibious operations, the Allies are still some distance away. It seems, too, that the Government is aware of these stirrings in extremist circles and distrusts them. In January General Koiso appears to have made an abortive attempt to take over the Youth Corps himself, and Colonel Hashimoto was made to resign some if not all of the offices he holds in the Corps. It is one thing to dream of a mass totalitarian party, another to build one up at the eleventh hour. The “moderates” still seem to hold most of the cards and it is possible that external events, not internal strength, may decide the success or failure of the extremists' policy. Any party in Japan which seeks to end the war by capitulation must presumably feel some assurance that the settlement they would secure would be less onerous and fatal than an actual fight to the death. The Allied formula of “unconditional surrender” gives no firm lead on this point. The Japanese know that they are to lose their colonies, old as well as new. They do not know whether they are to be allowed to avoid mass starvation. They can live without their colonies if they can trade, not otherwise. So far no Allied pronouncement has demanded the destruction of their economic system. But silence is not in itself a lead. There is thus, underlying the choice between capitulation or final resistance, the question whether in fact annihilation does not lie at the end of either course.

The Allies may, therefore, have more power than they know to revolutionise the Japanese situation. There are, of course, dangers and obstacles to the formulation of any terms. It can be argued that if a Japanese Badoglio is encouraged by promising the Japanese some sort of economic future, such a policy would involve the Allies in dealing with the business leaders who condoned and made possible Japanese aggression. The same arguments can be used against an attempt to come to terms with the Emperor or any of his advisers.

On the other hand, it seems certain that a fight to the finish on the soil of Japan itself would be incredibly costly. And some might argue that the total destruction of the Japanese economy would leave such destitution in Japan and indeed among some of its neighbours that the resulting disequilibrium would be in itself a cause of future war.

Whatever line Allied policy follows, it will clearly have a decisive influence upon developments inside Japan. There the situation is fluid. A struggle for power is developing and the chances of the extremists may well be decided by the hopelessness or the promise of the external situation. To state this fact is not to suggest a peace of compromise or a “negotiated” settlement. It is simply to point out that if the Allies are following a policy of extermination, the way will be long and bitter; and if they are not, some military and political advantages may be gained by saying so.

Post-War Arithmetic

REMEMBER, O Stranger, Arithmetic is the first of the Sciences and the Mother of Safety.”

Unless very great care is taken, the Mother of Safety is going to land the British economy in the ditch. To a certain extent, a nation can, in wartime, get more than a pint out of a pint pot. It can consume—or otherwise use for current purposes—more than it produces, by borrowing, by raising credit or by receiving lend-lease assistance. But sooner or later the pint and the pint pot have to come together again, and when two and two again add up to no more than four, the laws of arithmetic will once again have to be deferred to. The estimates of future national income made by Mr Kaldor in the Appendix to Sir William Beveridge's recent report on Full Employment may serve as a thread on which to hang a few simple exercises in post-war arithmetic.

The gross national income of the United Kingdom (at factor cost) in 1938, and the disposition of it among the three great categories of expenditure, were as follows*:

	(£ million)
Consumption expenditure	3,510
Government expenditure on goods and services	800
Expenditure on the maintenance, replacement and increase of capital, at home and overseas	705
Gross National Income	5,015

Mr Kaldor has attempted to make an estimate of the probable national income in 1948—a year standing symbolically (and perhaps over-optimistically) for a time when demobilisation will have been completed and physical shortages overcome. On a carefully stated set of assumptions, he estimates that the net national income in 1948 would be about 20 per cent higher than in 1938. Put on a gross basis, and expressed in money of 1938 value, the total comes out at £5,940 million. None of Mr Kaldor's assumptions is immoderate. Nevertheless, their cumulative effect is to make his estimate an optimistic one. It is quite easy, without any undue pessimism, to imagine a combination of circumstances somewhat less favourable. Suppose, for instance, that, instead of assuming with Mr Kaldor that the average hours of work after the war are the same as in 1938, we assume that the TUC's announced claim for a 40-hour week leads to some reduction in the actual hours worked. Mr Kaldor assumes an unemployment ratio of 3 per cent, and this, though it is Sir William Beveridge's aim, is, by all past experience, a very low figure; in 1938 it would have meant an unemployment

* These are Mr Kaldor's figures, which differ slightly, but not significantly, from those in the Budget White Paper. They are given gross—that is, they include expenditure on the maintenance and replacement of existing capital equipment—in order that, for clarity's sake, they may cover the whole flow of national output.

total of only 450,000. It is by no means inconceivable that the actual rate in 1948 will be 5 per cent. Or again, it may be that wartime experience—on which Mr Kaldor bases his assumption of a 13 per cent increase in average productivity per man-hour—is a deceptive guide to what will be recorded when normal times return, especially if foreign trade difficulties lead to the necessity for employing labour in industries in which Britain is at a comparative disadvantage. Let us suppose that the overall increase is only 10 per cent—surely not a poor showing for such a dislocated decade. Mr Kaldor assumes that the terms of international trade (that is, the volume of British goods that exchange for a given volume of foreign goods) will be unchanged; but the terms of trade turned sharply against Britain when the pound sterling depreciated in 1940, and perhaps some of this disadvantage may remain.

This alternative combination of assumptions is at least as probable as Mr Kaldor's. Their combined effect might well be that the gross national income would increase from £5,015 million in 1938 to only about £5,500 million in 1948, instead of to his figure of £5,940 million—all still in terms of 1938 prices. Indeed, even this involves some optimism; it is quite possible to imagine circumstances in which there would be no increase at all. But let us not run the risk of being accused of the crime of pessimism. Let us pursue the exercise in arithmetic, on two alternative figures, Mr Kaldor's and a more cautious, but still sanguine, one.

The next step is to split up the total post-war income among the three constituents. Here, again, Mr Kaldor makes estimates that are not wholly unreasonable, but have a consistently optimistic bias. Thus, he assumes that the expenditure of the Government and local authorities goes up only from £800 million to £845 million (at constant prices). This seems a very small increase to allow for, even when it is remembered that the service of the National Debt and the cost of social security plans are excluded, being “transfer payments” and not expenditure on goods and services. Mr Kaldor further attempts to estimate how much the public, having received a larger income and paid its taxes, would freely elect to spend on consumption (provided, as is assumed, that supplies of consumption goods were available) and how much it would save. His answer is that about the same proportion of total expenditure would be spent on consumption in 1948 as in 1938. But here again this surely assumes a remarkably high degree of continence. The war will have effected a re-distribution of income in favour of the smaller incomes, which do less saving. An expanded system of social insurance will also tend to increase, as well as to stabilise,

War-time conditions have proved the advantages of appointing the “Royal Exchange” as Executor and Trustee under a Will. This ensures a permanent and expert administration and can be associated with a private co-trustee.

For particulars apply to:—

Incorporated
A.D. 1720

ROYAL EXCHANGE Assurance

Head Office at the Royal Exchange, London

consumption expenditure. Six years of enforced austerity, and the savings that have accumulated as a result, will have an effect in stimulating consumption that will last for many years and perhaps indefinitely.

Thus the revised and more cautious estimate must allow not merely for a smaller national income than Mr Kaldor does, but also for proportionately larger slices of the cake for the Government and for "spontaneous" consumption. The contrasted pictures can be set out as follows:—

	1938 Actual	Kaldor Estimate (£millions)	Revised Estimate
Consumption expenditure...	3,510	4,170	3,950
Government expenditure on goods and services	800	895	1,000
Expenditure on the main- tenance, replacement and increase of capital, at home and overseas	705	875	550
Gross National Income ...	5,015	5,940	5,500

The third column, it should be remembered, is by no means pessimistic, but merely cautious in its optimism.

The substantial point that emerges is that the provision for capital, being the residuary legatee, may well be left far too small. By what is now virtually unanimous consent, the rate of capital formation in pre-war Britain was at much too slow a rate. Depreciation of plant was spread over too long a period, and the amounts devoted to new productive equipment were so inadequate that British industry (with a few shining exceptions) was gradually falling behind in the race for productive efficiency. The post-war need for capital expenditures will clearly be much larger than the pre-war. There will be six years of deferred maintenance to be done—and though the financial funds for these expenditures may have been accumulating in depreciation accounts, the real resources of manpower and materials will have to come out of the output of the year in which they are spent. There are the additional expenditures needed not merely for getting British industry back to where it was, but for speeding up the process of modernisation. There is the re-stocking of industry and commerce. There is all the building work to be done, not only in houses, but in hospitals, schools and office accommodation. If £705 million was spent on gross capital formation in 1938—not a good year in this respect—a sum of £1,200 million (at the same level of prices) might be no more than enough to meet the most urgent needs of a post-war year. This is all the more true if large sums of capital are to be spent on things that, however necessary and desirable, are not productive in the sense of raising national income. The housing programme alone, for example, may well require £200 millions, and this, together with the bare maintenance, at pre-war rates, of existing plant could easily absorb £550 millions.

This can be seen very clearly from a comparison of gross capital expenditures before the war with the allocation that Mr Kaldor suggests for his £875 million:

	1938 Actual	1948 Kaldor Estimate
Public utilities	140	140
Buildings	350	405
Plant and machinery	120	145
Other fixed capital	65	85
Working capital and stocks	25	40
Costs incurred in capital formation	60	60
Net additions to (+) or drafts on (—) overseas capital	—55	0
	705	875

It takes only a moment's thought to see how utterly inadequate these figures are. How can the public utilities (which include transport as well as power) be expected, after six years of neglect, to get along with only the same gross capital expenditure as in 1938? How can it be supposed that an increase of less than 20 per cent for plant and machinery, or a total sum of £145 million—to cover replacements as well as new plant—will be enough for the needs of industry, when the needs of coal, steel and cotton alone run into many hundreds of millions?

Furthermore—and this is what is really frightening—the total of £875 million is credible only if all Mr Kaldor's hopes come true. So long as the provision of capital is the residuary legatee from the national dividend, it may very well turn out to be no larger at all than before the war, or even smaller. No doubt a time will come again when the major difficulty of economic policy will be to find employment for all the savings potentially available. But that time is not likely to come soon, and until it does the great anxiety will be to find capital to supply all the clamant demands for it. There is a curious paradox in the comparison between British economics, as they seem to be developing, and Russian economics under the First Five-Year Plan. Soviet Russia, which claimed to be anti-capitalist and interested in the workers' welfare, gave capital formation a first charge on the national income and left consumption as the residuary legatee—with the result that there were two years of famine. Britain, which is a capitalist country and believes in freedom of enterprise, gives a priority (after taxation) to consumption, with the effect that the supply of capital may well prove inadequate to sustain a capitalist economy.

The conclusion for practical policy would seem to be that capital formation must not be allowed to be the neglected residuary legatee. All those who believe in any form of purposive direction of the national economic policies, however general and overall in character, should see the necessity of a Plan for Capital—and those who have the largest interest in the survival of the capitalist system ought, in this case, to be the chief shouters for Planning. But this is where the laws of arithmetic come in. If more is to be found for capital formation, then one of three things, or some combination of all three, must happen. Either the total national income must be made larger; or Government expenditure must be reduced; or consumption expenditure must be compressed below what it would spontaneously be. An increase in the national income would, of course, be the ideal remedy. But, apart from the familiar requirements of hard work and a ban on restrictive practices of all kinds, the chief prescription for a rising national income is the rapid investment of productive capital—which takes the argument back to where it began. Governmental economy is always to be desired; but there is not much prospect of achieving a great deal without fundamental changes in policy at home and abroad, which would be neither possible nor desirable. The conclusion is inescapable: if there is to be more for capital, on which the future progress of the community depends, there must be less for consumption in the present (that is, in the immediate post-war years). But this, in its turn, is easier to say than to accomplish. One way of limiting consumption would be to retain the rationing and other controls after the physical shortages disappear. Another would be to mop up purchasing power by a continued high-pressure National Savings campaign and by taxation higher than is necessary to balance the budget. A third method—the classical method of a free economy—would be to issue unlimited credit to those who want to undertake capital expenditures and let it exert an inflationary effect on prices. None of these, it will be seen, is both politically practical and desirable. But the choice before the country may well be between some combination of these evils and a famine of capital.

A famine of capital could hardly help but be disastrous. Its immediate effect would be to limit the pace of reconstruction and to hobble most plans of social development. Its more distant effect would be to slow down a rate of internal progress which badly needs speeding up. There are lessons for both Left and Right to learn before economic policy can be put on a sound footing. The Left will have to learn the lesson that Stalin taught—that the best way to increase consumption in the future may sometimes be to limit it in the present. The Right will have to learn that those who will the end of an abundant supply of capital will have to will the means of an apparatus of economic direction and control. And both will have to re-learn the relationship between a pint and a pint pot.

Counties and County Boroughs

LAST Thursday's debate on local government areas was disappointing. The Commons gave general approval to the Government's intention to maintain the present framework of local government, but to appoint a Boundary Commission with powers to change the areas and status of all local authorities. The delegation to a judicial tribunal of what seems a politically insoluble problem has much to recommend it. But the Commission will only touch the fringe of the real problem, unless Parliament gives it a clear mandate to proceed boldly and is willing to uphold the major decisions (those concerning counties and county boroughs) which require Parliamentary approval. Mr Willink stated, however, that the "general directions" to the Commission would be issued by himself, after consulting with the local authorities, and not by Parliament; and Parliament accepted this decision with hardly a murmur. There seemed to be little intention or wish to make the Commission a serious instrument of reform.

What is the essence of this problem of the local government areas? The major authorities—that is, the top layer under the Central Government—are the counties and the county boroughs. The county boroughs embrace all functions in themselves, but in the counties some functions are devolved on the subordinate areas, which comprise municipal boroughs and urban and rural districts. In the 55 years which have passed since county boroughs were created by the Local Government Act of 1888, the steady creation of new county boroughs—each one involving the abstraction of some functions from a county—has had the effect of increasing the number, and thereby reducing the average size, of major authorities. The trouble is that the needs of efficiency have called for progressively larger units. Instead, the same number of county councils as in 1888 now administer a much smaller area, and have been further stripped since that date of over 3,000,000 population. The size of most county boroughs is no more satisfactory. Over half of them contain under 125,000 people, the minimum that the Minister of Health now considers desirable for the creation of a new county borough; and more than three-quarters of them contain under 200,000, which, judged by modern needs, is a small administrative unit for many major services.

The result is a land hunger among major authorities, unpleasantly reminiscent of Balkan conditions, which finds its simplest expression in the conflict between counties and county boroughs. Many of the latter no longer embrace cities so much as the central nuclei of cities, which are not only growing in population, but, noticeably, are spreading the same population over a much wider area.

County council opposition succeeded in 1926 in halting the process of extending county borough boundaries; further changes were made dependent on private Acts of Parliament. But the case for further and considerable extensions has now become much stronger, and has, in effect, been accepted by the Government. It is not simply that the need to replace urban sprawl by controlled and co-ordinated development calls for a single authority. Adequate replanning and decongestion of the present areas of some county boroughs involves large reductions of their population. As things are, such county boroughs must undertake extensive housing schemes outside their boundaries, and be left themselves to meet a top-heavy burden of debt and public services out of reduced rates.

This is the almost unanswerable case for county borough extensions, which was pleaded by the "blitzed" cities during amendments to the Town and County Planning Act last autumn. It raises the paradox that the better and bolder such cities plan, the worse off they will be. But the case of the counties, though less related to practical needs, is hardly less cogent if the present system of areas is to be maintained. The counties, which no longer administer any

major town, draw much of their revenue and some of their personnel from the suburbs of large cities. To reduce them still further in size and to strip them of their richest areas would be to risk making them administratively and financially unworkable.

The conflict between counties and county boroughs can only be resolved by putting the process of the last half-century into reverse and reducing the number of major authorities. Theoretically, this task could be carried out by the Boundary Commission, which has power to amalgamate counties, to expand county boroughs, and to re-incorporate county boroughs in counties. Although it can create no new type of authority, it can—theoretically again—weed the ground very thoroughly. In practice, it will do nothing of the sort, as Mr Morrison indicated in the very act of admitting that the Commission would have technical powers to effect the amalgamation of Tyneside local authorities, which a pre-war Royal Commission urged in vain. Experience has shown that the vested interests involved in the present multiplicity of counties and county boroughs could only be uprooted by direct command of Parliament, which has not only given no such instructions to the Commission, but has also reserved the right to veto its major decisions. The Commission may perhaps venture to amalgamate such ludicrously small counties as Rutland, the Soke of Peterborough and the Isle of Ely and some of the Welsh counties. It may possibly join East with West Suffolk, and conceivably East with West Sussex. It may even reduce the status of a few of the 20 county boroughs with less than 70,000 population. But that is about as much as it would be reasonable to expect.

The Commission is much more likely to be successful in regrouping county districts, where opposition is much less powerful and where substantial strides have already been taken towards reducing the number of urban and rural districts. It is here that Mr Willink suggested the experiment of uniting some small boroughs with the rural area around them, as a means to integrating town and country. But it is at the higher level that this integration is most needed, and could be undertaken, for example, by joining together a mainly rural county and the county borough which is its natural centre and focus; or by giving a "green belt" to a large county borough.

The inadequate size of many or most counties and county boroughs is all the more serious because, as Mr Willink himself pointed out, the administration of all main services is progressively passing to these bodies. This difficulty does not, as Mr Morrison maintained, concern chiefly the "engineers' services" of transport, gas, electricity, water, and drainage, some of which can in fact be adjusted to most sizes of unit, while in others efficiency depends on geographical factors which take no account of local boundaries. It affects as much or more the "human services" of education, health, housing, and town planning, in which the local electorate naturally feel most interest. A system of joint committees and of inter-authority contracting can, it is true, get over some of the difficulties—but only in a limping and inadequate way. Hybrid bodies devoid both of taxing powers and of direct election are inevitably a very second-best solution. Further, numerous joint committees, covering in each case a different area, both increase the present multiplicity of authorities and decrease the public's interest and understanding of local administration.

Another common fallacy is that to get active local interest requires much smaller units than to get efficient administration. This is certainly sometimes so. But there are few practices so destructive of municipal loyalties as the now common one of working in the area of one authority and sleeping in that of another. If the old dictum that the local government area should equal the ambit of daily travel can no longer be strictly applied, it is at any rate true that the suburban resident often feels an interest in the affairs of his city as a whole—in its shape and size, its buildings and parks, and its future growth—which is at

present frustrated. Again, a wide range of social classes within an authority's area facilitates the selection of able and energetic councillors. Many county councils suffer from being too narrowly based on the land-owning class, and many county borough councils were suffering before the war from the loss of their better-educated citizens to neighbouring suburbs, where they often took scant interest in any local authority.

Finance has not been mentioned in this article—and was hardly mentioned in the debate. It is, in practice, the point at which a breakdown in the present system of local government is most likely to come. But its relevance to the present argument is limited by the fact that no regrouping of major authorities, however carried out, would by itself solve their financial problems. Larger units would facilitate financial adjustments within a region, such as those needed to make possible the replanning of the "blitzed" cities. But no adjustment of areas could make

Trade Union International

THE world trade union conference, which came to an end last Saturday, achieved a measure of success far beyond the expectations of its sponsors. At one moment on the verge of shipwreck, and all the time running into troubled waters and navigating dangerous cross-currents, the conference yet managed to reach its destination without mishap. This was largely due to the delegates' readiness to compromise in order to reach agreement on the broad issues which they had come to discuss. It had been the original intention of the British Trades Union Congress, who convened it, that the conference should merely be exploratory and advisory, but the more realistic view, that it would be unthinkable to leave London after a fortnight's talk "with empty hands," prevailed and enabled the conference to record concrete decisions.

By far the most important of these was the decision in principle to set up a new world trade union federation, and to appoint a committee from the conference to work out the details, and to frame a constitution for the new organisation. The constitution will be presented to the various organisations for their consideration, and will be submitted to the recalled world conference before the end of this year. This committee consists of 40 members, 22 more than the original committee proposed by Sir Walter Citrine. The British, United States, Russian, French and Latin-American unions have three members each, the International Federation of Trade Unions and the International Trade Secretariats two each, and 18 other countries, including Finland, Bulgaria, Italy and Rumania, one member each. The inclusion of representatives of ex-enemy countries represents a gain for the Russians, who pressed for their admission to the conference in the first week, though most of them arrived too late to take advantage of the invitation. The fact that the French Confédération Générale de Travail has been given three seats, and the choice of Paris as the headquarters of the new organisation, are intended to be a gesture of recognition of France's claim to equality with the Big Three. Though committees are often apt to be a device for delay, it seems likely, to judge from the composition of the conference committee, which closely reflects the alignment of forces at the conference, that it will act with energy and expedition. Indeed, after a few days' deliberation, it has already reached agreement on important points of administration, and has sensibly decided to set up a small executive body. It is obvious that a committee of forty is unnecessarily cumbersome and might tend to develop into a second conference.

It would be foolish to assume, from the unexpected success of the conference, that the next stages in the proceedings will be smooth sailing, or that the new International will come into existence without prolonged birth pangs. The difference in constitution, methods and pur-

pose between the trade unions of western countries and those of Russia are too deep to be slurred over by the repetition of expressions of "international solidarity," however sincerely they may be meant. The fact remains that in Great Britain, the United States, the Dominions and most European countries, trade unions are essentially an instrument for collective bargaining with employers to improve their members' remuneration and working conditions, and although in wartime there is an inevitable tendency, carried furthest in Britain, for the unions to acquire some share in responsibility for the Government's labour policy, this is a temporary condition which is likely to disappear. In the Soviet Union, on the other hand, the trade unions are, and always have been, a limb of the State. Their membership is 100 per cent of the working population, and not, as in Britain, less than 50 per cent. There is no collective bargaining with employers, for the State is the only employer, and the unions undertake a great many social insurance and welfare functions which would normally be performed by the Government in other countries. The divergence between the two types of trade unionism was never more clearly shown than in the Conference's discussions on the International Labour Office. The British pointed out that the ILO was the most effective (indeed the only effective) international platform for labour. The Russians objected, because they do not belong to the ILO, whose tripartite constitution makes their position very difficult. This particular snag, like so many others in the conference, was solved by a verbal compromise—the adoption of a formula which satisfied all parties. It was typical of the kind of adaptability which was in evidence throughout the meeting.

Unfortunately the financial solution, which will in any case have to be found, may leave unchecked the growth of administrative inefficiency and local apathy. Things left undone do not compel attention in the same way as things not paid for. But it will be a national disaster of the first order if elected local government falls into discredit, or is gradually replaced by *ad hoc* bodies, through trying to match modern needs and modern loyalties with outdated, and actually shrinking, units—through pouring very new wine into very old bottles. Parliament has still time to turn the Boundary Commission into a more effective instrument of reform, by explicitly requiring it to take steps to secure fewer, larger, and better-balanced major authorities.

The conflict is not a new one. Its roots are a quarter of a century old. After the last war, as to-day, Labour was faced with the urgent problem of reconstructing its international organisation. The IFTU, as at present constituted, was formed at Amsterdam in 1919, but the Russians refused to join because it was dominated by British and German "reformist" influences. They started their own international at Moscow in opposition to the "Amsterdam" International. This body, known as the Profintern, never made much headway in the West, where social-democratic traditions were deep-rooted, but the Russian-dictated attempts to revolutionise western trade unions were a constant source of irritation to the Labour movements in Britain and Germany. The Profintern was allowed to lapse when Russia abandoned its policy of isolation in the 1930s and sought collective security. But although the League of Nations admitted and welcomed Russian participation, the western trade unions, suspicious of Soviet motives and remembering the past, were far more reluctant to allow the Russians into their fold. As recently as 1939, at the Zurich conference of the

IFTU, an attempt, sponsored by the British, to invite the Russians into the Federation was defeated, largely because of the opposition of the powerful American Federation of Labour, supported by certain smaller European countries, though not by France.

The 1945 conference has completely turned the tables on the AFL, which refused to attend it because the Russians and its own domestic rival, the Congress of Industrial Organisations, had been invited. Under no circumstances, it seems, is it prepared to co-operate with these organisations. Precisely the same situation was encountered when the British TUC wanted to set up a tripartite committee with the AFL and the Russians earlier in the war; it had to abandon the project and form separate committees with each organisation. The British hoped at this conference that it would be possible to reconstruct and broaden the existing IFTU, and Sir Walter Citrine appealed to the delegates for patience and caution and not to say too hastily, "Off with the old love and on with the new." The trouble was that nobody else seemed to love the IFTU, which came in for particularly bitter criticism not only from the Russians, the CIO and the Latin-Americans, all of which were outside it, but from its French and other European members, who charged it with inactivity during the years of Nazi occupation. The great majority of delegates were in favour of a completely new organisation rather than a resurrection of a body which had become a skeleton of its former self. The British TUC, finding itself virtually isolated, conformed with the view of the majority and suggested the compromise which was finally adopted. The discussion on this issue provided an example of the leftward swing in the European trade union movements and their tendency to follow the Russian rather than the British lead. Just how representative the delegates were of unions which had been for so long suppressed it is difficult to judge, but it seems more likely than not that, if and when union elections are held in Europe, this trend will be confirmed.

The American Federation of Labour is thus the only large organisation outside the new international. Its isolation looks like being complete unless Mr Green can decide to swallow his dislike of the Russians and the CIO. There is no inherent reason, visible to the outsider, why the AFL and the Russians should not sit side by side in the new organisation, nor why two organisations from one country should not be represented, as happens in other cases. Mr Sidney Hillman, of the CIO, held out an olive branch. He said that there would be a place for the AFL on the Executive of the new organisation which is designed

to unite in one world federation the trade union bodies of freedom-loving nations, irrespective of considerations of race or creed or of political, religious or philosophical differences.

But the fear that the new body would be dominated by Russian and Russian-influenced unions, and the absence of identity of interests, will make the AFL very chary of co-operation, while there is also the suspicion that the CIO intend to use it as a lever against the federation in American union affairs.

The complex of inter-union relationships and rivalries, operating within the framework of the international organisation, will obviously require the most careful handling. If the new federation is to hold together it will have to concentrate its activities on issues about which there is a wide measure of agreement. It will have to exclude national politics completely, and it is probably realistic to assume that the present unanimity on international politics will soon disappear. As Sir Walter Citrine emphasised

We are trade unions and not political bodies. We combine to raise the standards of the worker, to reduce his hours of work, and to give him an enlarging measure of control over his work. Here we have common ground.

The differences between craft and industrial unionism and between the Russian and western brands are not the only difficulties which will be encountered. There are racial

and religious conflicts, such as those between Arab and Jewish workers, and between the Indian TUC and the Indian Federation of Labour, which emerged during the conference. The various movements are at different stages of development and influence. Indeed, perhaps the most significant feature of the conference was the representation of the young movements from the colonies and backward countries, where trade unionism is of recent origin. Delegates from British Colonies where trade unionism is officially encouraged (they have this much in common with the Russians) and from India were at pains to remind the world that they, too, had a war on, their war of independence, and that to them "Imperialism" was as much the enemy as Nazism. The Latin American Confederation of Labour, ably led by Señor Lombardo Toledano, has made giant strides since it was formed in 1938, but it has very different characteristics and problems from those of either the West African or British movements.

Having agreed to get together under one enormous umbrella, which will cover 60 million workers instead of the 17 million of the IFTU, the great question is, what will the new International do? This was not answered by the conference, except in the most general terms, and presumably it will be left to the conference committee to work out any plan or programme. It is certainly clear from the mere fact that such a conference was held at all and met with such enthusiastic response that the unions themselves set great store by having an effective and united international organisation. One of the first endeavours of the conference committee will be to secure union representation at the San Francisco conference. No one would deny that the unions have played a vital, perhaps a decisive, part in the war, and they are equally determined to have a voice in the peace settlement and in the establishment of a world security system. The programme for the post-war treatment of Germany, which preceded the Yalta declaration by a few days, is identical in many respects with the Governments' policy, and the unions seek assurances that they will be consulted in carrying it out. To set up the Labour International as the equal of Governments would be ridiculous, but such questions as the future of German industry and the standards under which reparation labour shall be employed clearly concern world labour, and it is reasonable that they should be consulted.

Quite apart from the immediate issues of the war and the peace, the conference adopted a far-reaching and high-sounding resolution on social and economic reconstruction, calling, among other things, for the 40-hour week throughout industry; equal pay for equal work; and a fortnight's paid holiday for all workers. These are all, of course, matters that require a great deal of argument before they can be accepted by Governments and employers as glibly as they can be incorporated into the resolutions of labour conferences. It might also be argued that they are properly the province of the ILO and not of the world trade union federation. But the two cannot be separated, since the effectiveness of the ILO depends largely on the pressure which organised labour can bring to bear in its counsels, nationally and internationally. An effective international movement might be of value in exercising pressure to bring about world-wide improvements in wages and standards of living, which, from every point of view, would be to the advantage of those who have high standards already. As well as acting as a centre for the collection and publication of trade union information, it should be able to assist them in developing their trade union organisation in backward countries. The setting up of regional sections might be a logical and practical corollary to these developments. The world trade union movement will undoubtedly have to turn its attention to the problem of reconstructing free trade unionism and democratic institutions in enemy countries once they have been purged of Fascist influences.

Trade unionism had from the start consistently fostered an international outlook. Though the practical worth of the new federation may be limited by the very real political and constitutional difficulties which have been indicated, the nearer the unions can approach to speaking with a united voice the greater is likely to be their effect in the post-war world.

NOTES OF THE WEEK

Arabian Nights

The British Government has effectively answered the criticism that it is giving no lead in Middle Eastern affairs. On his journey back from Yalta, Mr Churchill gave a lead in the grand manner. Emperors hurried from the south, kings from the east, presidents and prime ministers arrived by aeroplane and warship, and drove, convoyed in cars, across the desert. Fabulous figures from the Arab world walked and talked in scarlet and gold. Gifts were exchanged—swords and silks for mimosa and jasmine and amber musk. There was, it is true, no magic carpet. Nor did djinns enliven the feasts. But Haroun al Raschid may well have looked down a little enviously from his nightingale enchanted paradise.

It is obvious that the Egyptian meetings were very enjoyable. It is more difficult to say whether they were really decisive. The desperate secretiveness of secret diplomacy these days makes any estimate hazardous, but the timing of the meeting—immediately after the Crimea Conference—is probably significant. Russia has a more direct territorial interest in the Middle East than the United States. At the same time, the Big Three were careful at Yalta to exclude the French from nothing to which they have a legitimate claim. It is therefore perhaps safe to guess that at Yalta the Big Three recognised the common interest of themselves and of France in the security, independence and "democratic" development of the Middle East as a whole. This may well have been the conformity of interest and approach which the President and Mr Churchill could announce to the Middle Eastern leaders. It is, however, less certain that any machinery was developed to express this common concern. And without such machinery, the concern is likely to remain largely ineffective.

What do the independence and free development of the Middle East entail? Were decisions on this point taken at Yalta? It is possible to say that since the President and the Prime Minister have seen the King of Egypt, the King of Arabia and the President of Syria and expressed their regret at not seeing the Regent of Iraq, they are now thinking of the Middle East as a whole and are attempting to draw the various states together. The project of a Greater Syria, including Syria, Transjordan and part of Palestine, has appeared among the floods of rumours. Such a scheme could be fitted into a wider Arab federation, including Iraq, Egypt and Saudi Arabia. The rest of Palestine would be an independent Jewish state and Lebanon would preserve complete independence as a Christian state. Both might, however, adhere to the larger, looser federation.

There is much to be said for such a scheme. It gives some promise of unity and joint economic development. It has a chance at least of ending the rivalries and frictions which have kept the Middle East in ferment for twenty years. But it involves as a precondition a solution of French difficulties in Syria and Lebanon and British difficulties in Palestine. Were decisions taken on these vital points? Were procedures proposed and goals accepted? It is impossible to say and the impression is left that, however excellent the Great Powers' intentions may be, a good deal of concrete work remains to be done before Middle East unity and Great Power responsibility are more than an aspiration.

Achilles in His Tent

General de Gaulle's refusal to see President Roosevelt at Algiers was unfortunate; it is difficult to see what advantages it gained for France, and the attitude it expressed is not likely to heighten the cordiality of France's partners. The motives behind the General's refusal are certainly easy to understand. President Roosevelt's administration was responsible for the very long delay in recognising the French National Committee as the Provisional Government of France, and this delay in its turn long excluded the French from exercising an effective influence in international affairs. More recently the general must have been tempted to pin on the Americans the chief responsibility for France's absence from Yalta. The British appear to have

supported the invitation and the Russians not actively to have opposed it.

Yet to understand General de Gaulle's attitude is not necessarily to think it judicious. The Yalta agreements gave France the promise of attaining Great Power status in the near future, and it was foolish to plead ignorance of the Yalta settlement as an argument for refusing the President's invitation when it was precisely the details of that settlement that Mr Roosevelt wished to communicate to General de Gaulle.

The General's aim in refusing the invitation was presumably to underline France's strength and independence. But his gesture gives the impression of weakness and uncertainty. It can do no country good to acquire among its friends the reputation of angularity and non-cooperation. France's status should certainly be raised and all its vital interests fully safeguarded. But Great Power status is not won by playing to the gallery. The General has done his people a real disservice.

The Location of Industry

The text of the Government's Bill to implement the promised policy on the location of industry was issued too late in the week for detailed comment to be possible. Nor is it easy in a complicated matter of this sort to be sure from the wording of a Bill what the policy will amount to. The Bill grants powers—both powers of attraction to the Development Areas and powers of repulsion from the congested areas—but it is the spirit in which the powers will be administered that will matter. Moreover, circumstances change. Purely persuasive powers may be very effective in inducing industry to go to South Wales, when the persuading department can reinforce its persuasions by the grant or withholding of priorities for labour, materials or building. The same powers may be wholly ineffective when the period of scarcity comes to an end.

The emphasis of the Bill is more on the attraction of industry to the Development (ex-Special, ex-Depressed) Areas than on exclusion from London. Its parentage, that is to say, is to be found more in the Special Area Acts of the pre-war decade than in the Barlow Report. The negative provisions, in fact, are of the mildest. Any intention to build a factory (other than an extension of an existing factory) will, it is proposed, have to be notified to the Board of Trade, which will, therefore, have an opportunity of pointing out the superior attractions of the Development Areas. But the building of factories can be prohibited only in areas to be scheduled and, in each case, approved by affirmative resolution of Parliament. In practice, this probably means that London will alone be scheduled, for in all other cases local opinion will certainly be adverse.

On the positive side, however, the Bill embodies some far-reaching provisions for making the Development Areas attractive. The trading estate technique is to be developed and factory space to let in these Areas may be very attractive indeed if, for some years to come, it is almost the only factory space available anywhere in the country. There is power to provide adequate public utility services in these areas, and even the thin end of the subsidy wedge in a proposal to assist the raising of private capital for approved purposes.

If these powers are energetically administered in the years immediately after the war, when their leverage on the fulcrum of scarcity will be very great, they may largely solve the problem of the existing Depressed Areas. But the Bill will contribute little to the relief of congested areas and, in the longer run, its powers both of attraction and repulsion would seem to be too weak to constitute a really effective location policy.

Inflation in Italy

As the war drags on in Italy the economic situation goes from bad to worse. The most disturbing aspect of the economic collapse is undoubtedly the grave threat of serious inflation. The budget deficit at the end of 1944 was something in the neighbourhood of 150 milliard lire.

Money in circulation has increased from 260 milliard lire to 300 milliard in the last months; in 1935, before Italy's two wars, the circulation amounted to only about 12 milliards. The value of money is falling more and more rapidly, and the Italian Government obviously fears that on a not too distant day public confidence in the currency may finally collapse.

This is principally a problem of scarcity, destruction and unemployment. There is nothing to buy. But it is also a question of confidence, and on this issue the Italian Government has appealed to the Allied Control Commission to assist them in two ways: by backing all the AMG lire they issue—to troops, to Italian workers and so forth—with equivalent amounts of sterling and dollars; and by giving a similar backing to all the orders they place in Italian factories, with Italian contractors or with the Italian authorities. In this way the Government feels that a measure of confidence in the currency would be restored and that meanwhile something would be accumulating in the Exchequer for the formidable tasks of post-war reconstruction.

This request appears reasonable. The Italian Government carries the full cost of the Allied occupation under Article 33 of the Armistice. Since the signing of the Armistice, however, the Italians have been declared "co-belligerent" and have fought with the Allies to free their territory. The work of the partisans, in particular, has been frequently praised by Allied commanders. It would therefore seem the course of reason and goodwill to remit, in recognition of these services, the more onerous economic terms of the Armistice. The Italian Government is taking steps at home to fight inflation—the measures are discussed in a Note on page 256. Their readiness for self-help is another argument in favour of more generous treatment from the Allies.

Back to Business

Mr Bevin last week announced the Government's plans to assist ex-Servicemen and women to restart in business or work on their own account after the war. The grants made will vary according to the nature of the business and the capital resources—including war gratuities and post-war credits—of the applicants, but will normally have an upper limit of £150. Disabled persons who have received appropriate training will be eligible for grants enabling them to start in business for the first time; and in certain cases help will be provided for persons anxious to resume on their own account in the professions.

Clearly it will not always be wise or practicable to insist that the businesses restored should be precisely those abandoned at the time of enlistment. Prospects and possibilities in many lines of business activity have been radically affected by the inventions, substitutes and changed habits of the war years. If it is essential, in the interests of the applicants themselves, and of the national economy, that the control of business licences should, for a time, be carefully and firmly administered, it is equally necessary that the qualifications of applicants for grants should not be considered from too rigid an angle. An advisory service, to deal with these problems, is to be set up throughout the country.

Although the scope of the assistance will be small, it will do something to remove the disadvantage which many servicemen will face on their return to civilian life. But for those who are assisted there will, in all probability, be many more disappointed. After the war the country will not be able to afford, and should not tolerate, the waste and hardship involved in the overcrowding of certain trades by an excessive number of small and uneconomic units.

The Women's Land Army

Business resettlement grants will be available to members of the Forces, the Merchant Navy and the Civil Defence Services, but not to the Women's Land Army. This distinction has led to the resignation of Lady Denman from her post as honorary director of the WLA.

The problem is a difficult one. National Service in all its branches ranges from full-time combatant duty to part-time participation in industry; and it would be both impolitic and unjust to treat every branch as equally deserving of resettlement assistance. But wherever the line between beneficiaries and non-beneficiaries is drawn there will inevitably be marginal cases who feel themselves to be unfairly treated. In the circumstances the Government's decision does not

appear unwise. By its nature—its recruits are mainly young people—the WLA can comprise very few women who were in business on their own account before the war; and fewer who have been disabled by war service. If the grants were extended to the WLA it would be difficult to withhold similar treatment from women in other branches of war-time service—in transport, for example. This does not mean that the WLA should be excluded from all plans for reinstatement. Its problems, as Mr Bevin has said, "will be dealt with in another way"—by the Ministry of Agriculture.

Relieve and Rehabilitate UNRRA

Discontent over the inactivity of UNRRA has again been voiced, this time from within UNRRA itself. At a recent session of the European Committee of UNRRA all its members agreed on the urgent need to galvanise the prematurely paralysed organisation. Similarly, at a recent session of the Far Eastern Committee the Australian Foreign Secretary, Dr Evatt, described in strong terms "the crisis in UNRRA affairs and functions" and the resulting "signs of frustration and disillusionment."

Among the weaknesses of UNRRA Dr Evatt mentioned administrative "over-centralisation" which is a euphemistic description for UNRRA's heavy and costly bureaucratic apparatus. Before it can effectively give relief to others, UNRRA itself apparently needs to be relieved from the excessive tutelage of its central headquarters. UNRRA also seems to need relief from the national susceptibilities of the Governments of liberated countries, some of whom seem to be undecided whether to make the rehabilitation of national prestige or of the empty stomachs of their citizens the first charge on their energies.

But the most important handicap on UNRRA has been the desperate shortage of the means of relief, in particular of transport. The greatest efficiency in the administration of UNRRA and the greatest willingness on the part of the Governments to simplify matters of procedure would be of no avail as long as UNRRA as a claimant on ships and supplies were not promoted to a much higher priority than hitherto. It is perhaps too easy to blame UNRRA for its failure. All the efforts of an official national French delegation have persuaded the Combined Boards to release only twenty-six ships for the next three months. How can UNRRA do better? The time really seems to have come to form a special organisation for the relief and rehabilitation of UNRRA.

Pressure on the Swiss

Negotiations on the demand for the stoppage of German-Swiss trade are still being conducted by the Allied Economic Missions in Berne and the Swiss Government. The Swiss point out that their trade with Germany has been reduced to a minimum and that they have placed an embargo on all exports of arms and military equipment to Germany. However, the export of important precision tools still continues. The Swiss claim that they are unable to stop it as long as they are dependent on the import of German coal and iron. Another topic under discussion is the transit traffic from Germany to Northern Italy across Switzerland. The Swiss Government refers to the commercial treaty with Germany under which Switzerland is

SKANDINAVBANK

obliged to allow the transit of goods, especially as the Germans do not send any directly military cargoes through Switzerland. Finally the Allied Economic Missions are reported to have asked the Swiss to confiscate all assets held in their country by Nazis. This last demand has met with a great deal of approval from the Swiss Left. A case can, of course, be made against this demand because, if the Nazi funds in Switzerland were to be confiscated, the German Government might very well apply measures of retaliation against Swiss subjects and property in Germany. The confiscation of assets belonging to the Nazis ought to be treated as part of the general problem of punishment for war criminals. It is asking rather much to expect this traditionally neutral country to initiate so new and radical and unneutral a step, especially as it would make no difference to the Allied war effort.

Teachers' Salaries

Tuesday's debate in the House of Commons on teachers' salaries made it abundantly clear that the Burnham Committee's proposed new scales do not please everybody. The main proposals have been widely welcomed. They provide for substantial increases in salary for many thousands of teachers and they remove the financial distinctions between primary and secondary and urban and rural schools.

This levelling-up process meets with strongest criticism in its treatment of graduate teachers. For them the new proposals seem to involve some levelling down. Allowing for changes in the cost of living, assistant masters and mistresses in secondary schools will be worse off (when in receipt of maximum salary) under the new scales than they were before the war. Graduates (assistants) will not recover the salary lost—in comparison with non-graduates—by later entry into the profession until they have completed sixteen years of service. Moreover, in many existing secondary schools the scales to be paid to headmasters and headmistresses appointed in the future will be lower than the scales now in operation. Many people fear that these and other weaknesses in the new scales will adversely affect the recruitment of graduates to the profession—a development that would ruin all hopes and prospects raised by the Education Act.

If the object of attracting men and women of high academic and administrative attainments and abilities to the profession is to be realised it would seem that the remuneration offered to graduates should be on a more generous scale, and that there should be greater recognition of exceptional qualities, qualifications and responsibilities. In the circumstances—the new scales are due to come into force on April 1st—Mr Butler's attitude is reasonable and reassuring. The scheme will be tried out during the next three years, but should it prove unsatisfactory in the meantime it will be referred to the Burnham Committee for reconsideration.

The fears of the local authorities that the new salary scales would prove a heavy burden on local rates have been relieved by the Government's announcement of adjustment in the grant formula attached to the Education Act. Instead of a gradual increase, over four years, in the rate of Exchequer grant, as originally proposed, the rate of grant will be raised immediately from 49.36 to 55 per cent. The Exchequer will thus bear the bulk of the cost of reforms under the Act during the next four years.

Forestry Commission

Sir John Anderson's announcement last week on the revised status of the Forestry Commission is a necessary preliminary to the formulation of post-war policy. The Commission is to exchange its semi-independent position under the Treasury for one subordinate to the Minister of Agriculture. Between the wars the present machinery worked well enough. But once again a major war has made inroads on British forests, and re-afforestation becomes a vital if small part of post-war reconstruction. New machinery is felt to be necessary for new and greater tasks.

In a Bill soon to be introduced the Government will propose that the Forestry Commission should become a single, expert advisory body to the Ministry of Agriculture and the Secretary of State for Scotland, who will be jointly responsible for the executive functions which it will retain. If the change is approved by Parliament, political parties in the House can no longer be represented on the Commission and the four MP Commissioners will have to be replaced. Following the Bill—or possibly partially included in it—is to come a statement of Government forestry

policy for the future. What scale of reafforestation, in private woodlands and state forests the Government will adopt it is not possible to guess. But even if it follows only the second-best policy put forward by the Commission in their White Paper (Cmd. 6447) on the subject, the cost to the Exchequer for the initial decade is likely to be well over £30,000,000. That such a policy, minimum though it is, is felt to be necessary and that its cost (considering the small numbers who will feel any direct benefit from the outlay) is not inconsiderable, make very good reasons why the Commission should be brought under closer Parliamentary control. There may, however, be some disagreement over the nature of that control.

In their own statement, the Forestry Commission were strongly opposed to subordination to the Ministry of Agriculture, on the grounds that the enthusiasts of silviculture would be overborne by agriculturalists and good forest land would be used for poor farming. Instead of the Minister, the Commissioners suggested the Lord President of the Council. Against this contention there is the obvious reply that land policy, for the purposes both of use and pleasure, must be co-ordinated. A measure of consultation and collaboration with the Ministry of Agriculture is naturally unavoidable. The very fact of ministerial responsibility for forestry can be used as a safeguard that the need for new and improved woods and forests will not be neglected.

Albania Under Fire

The only liberated country in Europe in which no constitutional crisis seems to have arisen so far is Albania. The country is being ruled by M. Enver Hoxha, a young Communist teacher, who at the head of the Albanian National Liberation Army marched into Tirana and Durazzo three months ago. King Ahmed Zogu, who left the country when the Italians invaded it in April, 1939, has apparently not expressed any desire to return to his kingdom. The attraction of the Albanian throne is clearly not very powerful.

Even so, an Albanian crisis may soon break into the headlines. The old frontier feud between Greeks and Albanians is flaring up. The Greeks want to annex the Northern Epirus—the districts of Argyrokastró and Koritza where they fought so valiantly against the Italians in 1940. These districts have a large Greek and Christian minority which has suffered persecution at the hands of the Albanians. A Northern Epirus Committee, headed by the former bishop of Argyrokastró, is very active in Athens, demanding the immediate transfer of southern Albania to the Greeks; and since Mr Churchill's latest visit to Athens, Greek sources have hinted that the claim has met with British approval. In reply, Radio Tirana has appealed to the "democratic conscience" of the world; and from its appeals and protests it appears that the Atlantic Charter has its most faithful European adherents in Enver Hoxha's Army and Committee of Liberation.

Albania owed its independent existence (as well as its downfall) to Italy. Italian influence no longer counts. But nature and geopolitics know no vacuum; and the country is already being engulfed in something like a Greek-Yugoslav rivalry. The new ruler of Tirana looks with admiration to his older brother—Marshal Tito; and he presumably dreams about federation with Yugoslavia. If southern Albania goes to General Plastiras, northern Albania will certainly throw itself into Marshal Tito's arms. Meanwhile, the first Greek-Albanian "incidents" have been reported from the Adriatic sea, where Albanian ships with food cargoes have allegedly been seized by Greek "imperialists" from the island of Corfu.

Himmler's Special Courts

During the retreat of the German army and civilians from Western Poland and Eastern Germany, regional Gauleiters and SS commanders, under direct orders from Himmler, summarily tried civil servants who had panicked or left their posts. Some of them, like Spielhagen, second Burgomaster of Breslau, or the Burgomaster of Bydgoszcz, were executed at once. Others were sentenced to long terms of imprisonment.

This rough and ready method of dealing with defeatists, political opponents and faint-hearted civil servants has always been a characteristic feature of the Nazi regime. During periods of great emergency these methods were as a rule legalised by special decrees. Since more German provinces in the east and in the west will soon come

under the direct threat of invasion, a special decree issued by Himmler has set up "Military Courts of Summary Justice" in the threatened zones. The judges of the courts will be assisted by an official of the Nazi party and an officer of the Wehrmacht. They will be appointed by the regional Defence Commissar, that is to say, by the Gauleiter. The courts will have to try all crimes by which Germany's fighting strength or will to fight are endangered. As a rule the trial will end in a death sentence. Minor offences will be transferred to ordinary courts and each decision of the new courts requires confirmation by the Gauleiter. The decree stipulates no points of special procedure. In fact, it can be said that the new special courts are a combination of the methods of the People's Courts and courts set up under martial law.

The composition of the courts shows that Nazi party and Wehrmacht are treated as equals. It shows at the same time that in the immediately threatened zone, the Gauleiter, in his capacity of Regional Defence Commissar, has become the sole arbiter in all cases where soldiers or civilians have been found wanting in determination to continue the fight. Although executions on the spot have now been legalised according to totalitarian rules, the procedure to be used by the courts is left purposely vague. The local officials are to be free to decide which offences merit the application of totalitarian "justice."

Psychology and the Civil Service

As part of its recruitment plan, the Civil Service is proposing to introduce a scheme for the psychological selection of candidates, on the lines of the War Office scheme for selecting men for commissions. Men and women who reach a certain level in the qualifying examination for the administrative grades to be held in the "reconstruction" period will be invited to spend a few days in a country house as the guests of the Civil Service Commission. Their behaviour as individuals and as members of a group, at work and at play, will be closely observed by trained psychologists; they will probably do physical exercises and be set conditions as near as possible to those which they might encounter in the service. Candidates will not, it seems, be told the identity of the psychologists among them. The qualities which will count are those which are regarded as making a good civil servant—intelligence, personality and being a "good mixer." The house will accommodate about 48 to 64 people a week, so that some 3,000 candidates might be received in the course of a year. The number of vacancies in the Home Civil Service is put at 400 to 500, at 200 in the Foreign Service, and at about 1,000 in the special administrative grades.

The War Office Selection Board has worked well in the Army, and it is true that far too much attention was paid in the past to the results of the written Civil Service examination, while the oral examination, in so far as it was not purely formal, laid too much emphasis on the social stigmata of a correct education. Within the prescribed limits set by the Government's recruitment schemes, a psychological approach will undoubtedly be valuable. Nevertheless, it is open to doubt whether the qualities of a good administrator—which are a matter of the intellect quite as much as of the character—will reveal themselves by this means nearly as easily as the qualities of a good subaltern officer. The reference to physical exercise is a little ominous; and it is doubtful how far a country house-party with parlour games and brains trusts will, in fact, reveal character.

Moreover, the addition of psychological tests does nothing to widen the main cramping influence on the recruitment of the Civil Service—the fact that its higher grades will continue to be filled straight from the universities (except for the period which ex-service entrants will have spent in the Forces). The condition attached, that a candidate coming from the Forces must spend at least one year at the university, if he has only had one year there before enlisting, may mean that some older men, with families to support and without private incomes, though admirably qualified in other respects, could not afford to spend a whole year at the university with the risk of being rejected in the personality tests.

The Magistrates Reply

The juvenile court magistrates concerned in the inquiry into the London County Council's remand homes issued a public statement in reply to the committee's report (dis-

cussed in *The Economist* last week, page 209). The statement is largely concerned with the committee's criticisms of their original remarks. But it also re-emphasises the main point at issue—the question of segregation. The committee agreed with the magistrates to the extent of recommending that children under eight should be sent to a different institution and that children and young persons who have been committed to approved schools and are awaiting transfer should be separated from those on remand.

But there is an unresolved difference between the committee and the magistrates on the segregation of the different classes of children and adolescents on remand. The magistrates—not only those originally concerned but six others together with twelve women probation officers and two psychiatrists—urged very strongly that "gravely immoral" girls should not be allowed to associate with the "innocent," innocence being defined in this context not in terms of law but of sexual experience. The committee rejected this view, chiefly for practical reasons—it is difficult to know where to draw a line which is not drawn in approved schools, and particularly difficult to draw it during a girl's short stay at a remand home. But there is the further, more idealistic view, which inspired the Children and Young Persons Act of 1933. The argument behind the Act runs somewhat as follows: all these children that come before the Courts are maladjusted to society; any offence they may have committed is merely symptomatic of their maladjustment; let us, therefore, treat the disease instead of concentrating on the symptoms; and let us not draw invidious distinctions between fellow-unfortunates. It is an attractive ideal, which in the long run may well be the only effective means of dealing with juvenile delinquency. But in the short run is there not a danger that the symptoms may be catching?

A possible solution to the dilemma is that contamination should be prevented, not by complete segregation, but by very careful supervision in decent, well-equipped surroundings. Magistrates and committee are at one in finding the Marlesford Lodge home, where the child whose case gave rise to the inquiry was sent, badly understaffed and badly equipped. The former also urge that the LCC does not obtain the right sort of staff, because, relying on their sense of vocation, it underpays them. If the authorities are convinced that the policy embodied in the 1933 Act is the right

MILK · CHOCOLATE & the Nation's Milk Supply

THE contribution of the Milk Chocolate Industry in ensuring Britain's milk supply during these critical war years is not generally realised.

Before the war this industry was using 40 million gallons of milk a year. Cadburys took more than half of this vast quantity. It came from the counties of Hereford, Gloucester, Salop, Stafford, Flint and Denbigh where Cadburys have consistently encouraged dairy farming over a number of years. In these areas they have established four Milk Factories which have greatly assisted in developing milk production. Today these four factories alone collect and distribute sufficient fresh milk for well over a million people.

Cadbury means Quality

one, they should realise that it will succeed only if it is administered in the best possible conditions.

Family Allowances

The Bill providing family allowances follows so closely the outline given in the White Paper on Social Insurance that discussion of it is hardly likely to cover any new ground. The best that can be said for it is that though it may be a small beginning, it is at least a beginning. Once the principle of family allowances is accepted and embodied in a statute, succeeding Parliaments will always be able to press for an amending measure to increase the amount.

The Government's reply to cries for more at the present time will be that £13 a year for the second and each subsequent eligible child is not the only provision being made for children. The supply of meals and milk to school-children, when it is fully developed, will cost £60 million a year, which is equal to about £12 a child. In addition, there will be the as yet unestimated cost of provision that may be made for children under school age. With the amount of £57 million estimated for the cash payments, the total will exceed the Beveridge figure of £110 million.

But it is not clear whether the Government's estimate for the cash payments is a gross or a net figure—in other words whether they will be subject to income tax. Replying to a Parliamentary question on this point on December 5th, the Financial Secretary to the Treasury stated that the broad principle which the Government had in mind was that contributions made under the national insurance scheme should be deducted and benefits included when the taxpayer's taxable income was being computed. This sounds ominous, but since family allowances are not an insurance benefit but are to come out of general taxation, the principle hardly seems to apply in their case. If it does, the taxpayer will find himself paying money out of one pocket, receiving it back in another and paying it out again from a third, and his net gain in respect of each of his eligible children will be—depending upon his taxable income—3s. 4d. or half-a-crown.

Commonwealth Quarrel

By the assertion of its authority over the Natal Provincial Council the South African Government has taken a firm step towards easing its strained relations with India. The Union Government has now announced that the ordinances passed by the Provincial Council controlling Indian ownership of houses in European residential districts in Natal go beyond its constitutional powers. This action follows the mounting resentment, in India itself as well as in the Indian colony of Natal, which culminated earlier this month in a vote of censure by the Legislative Assembly on the failure of the Indian Government to apply sanctions against South Africa.

The disputants are now back where they started after the Pegging Act. This Act, passed in 1943 by General Smuts' Government under pressure of European opinion, expressed the white South African desire for racial segregation. It added still further to the onerous disabilities, legal and economic, of the Indians settled in Natal. Since then, Indian protests were partially met by an inter-Commonwealth agreement, known as the Pretoria Agreement, designed to limit the interpretation of the Pegging Act. It was this Agreement which the Natal Provincial Council contravened by passing the Residential Property Regulation Ordinance in June last year.

From this summary of the development of events, it is clear that the Indians' uneasiness over the treatment accorded to members of the Natal colony by the Union Government will not even now be wholly quieted. It has also been made clear, in the Indian press and in the debates of the Legislative Assembly, that there is a tendency to blame Great Britain, as the focus and guardian of Commonwealth relations, for anti-Indian actions in South Africa. However unreasonable, this tendency underlines the concern which should be felt in this country over any coolness or tension existing between members of the Commonwealth. It should not therefore be thought that this perennial hatchet has been finally buried. Indians will not cease to claim the full benefits—as yet untasted—of the more sympathetic Cape Town Agreement of 1927; the great majority of white South Africans will not cease to resent the Indian incursion and commercial competition; and Great Britain will not cease to be blamed by one side or the other, either for intervention or for non-intervention.

The Civil Estimates

Reconstruction and reform are well illustrated in the civil estimates for 1945-46 summarised in a Vote on Account presented to Parliament this week. Largely because of the introduction of supplementary pensions in 1940, the cost of which is now more than double the saving on unemployment assistance since the war began, civil expenditure had been rising steadily, and the final estimate for 1944-45 (excluding broadcasting and the revenue departments) was £481,815,000, compared with appropriations of £416,012,000 for 1939-40. But whereas this means an increase of £66,000,000 in five years, the increase shown by next year's estimate of £549,905,000 is £68,000,000 over the current year alone.

The biggest single rise in next year's estimates is shown by the Ministry of Education. The effect of the Education Act will be to raise expenditure under this item from an estimate of £64,898,000 in 1944-45 to £84,503,000. Also in this class, the estimate for grants to universities has gone up from £2,149,000 to £5,900,000. The establishment of the Ministry of National Insurance has so far merely transferred expenditure from the Ministries of Health and Labour. Health and pensions insurance and unemployment insurance will be administered by the new Ministry from April 1. But it is interesting to note that next year's estimate for the remaining expenditure of the Ministry of Labour is as much as £24,040,000, whereas the comparable estimate in the current year is only £11,682,100. This increase is possibly due to plans for demobilisation and resettlement.

Other increases are, as usual, for supplementary pensions, which rise by £5,000,000 to £61,920,000 and old age pensions, which will cost £57,750,000, compared with £56,000,000. The estimate for the Ministry of Fuel and Power rises from £390,000 to £3,100,000. There is also a big rise in the estimate for "miscellaneous works services" from £399,835 to £8,767,000. It is also interesting to note that the vote for development and welfare in the colonies—£4,937,000—almost reaches the annual maximum allowed under the 1940 Act.

Shorter Notes

The Royal Commission on Equal Pay is hoping to complete its report by the end of the summer. It has been held up by delay on the part of various important organisations in preparing their evidence. So far, some 120 statements have been submitted to the Commission, which has now started to hear oral evidence. The following individual economists have been invited to give evidence: Sir William Beveridge, Sir Hubert Henderson, Professor J. R. Hicks, Mr R. F. Harrod, Professor D. H. Macgregor, Mrs. Barbara Wootton, Professor Sargent Florence, Professor Pigou, Mr G. R. Shove and Professor Hamilton Whyte. The Commission is limited by its terms of reference to an examination of the relationship between men's and women's wages and of the economic complications of applying the principle of equal pay. It will not, it appears, be required to make recommendations to the Government, so it is all the more important that there should be the minimum delay in the presentation of its fact-finding report.

One of the Chancellor of the Exchequer's amendments to the Requisitioned Land and War Works Bill gives local authorities and recognised amenity societies a right of appeal to the War Works Commission where public amenity is affected. Another amendment enables Parliament to overrule by resolution any Ministerial decision to acquire land made in face of an adverse report by the Commission. A third amendment excludes "depreciated" land from the Bill, except where the purpose is to restore it to its proper condition.

The Minister of Health and the Secretary of State for Scotland have appointed a committee under the chairmanship of Sir Will Spens to consider what should be the range of total professional income of a medical practitioner in a publicly organised service of general medical practice.

There are many men and women in the Services who would welcome a chance of reading this publication. If you would hand it in, unwrapped, unstamped, and unaddressed at any Post Office, it will go to them.

AMERICAN SURVEY

Lewis versus Labour

The American Federation of Labour's latest rebuff to Mr John L. Lewis and his United Mine Workers recalls Mr Lewis' answer to the Federation last year when his first request for readmission, made early in 1943, was rejected.

Mr Lewis then accused the AFL of "sinking to the status of a political company union in its servility to the New Deal." He apparently has reconsidered his views, but the core of his difference with Mr Green's AFL remains hard and quite the same as it was. The AFL insists that the United Mine Workers Union shall restrict itself to the same ground as when it left the Federation in 1935, while Mr Lewis says jurisdictional problems can be solved after his readmission.

There is a serious challenge to the craft principles on which the AFL rests in Mr Lewis' all-inclusive "District 50," a subsidiary of the UMW, through which he has extended his influence far beyond the limits of mining, embracing such varied groups as building and construction workers, clerical workers, dairy farmers and chemical workers.

The prospects of a working unity between the Congress of Industrial Organisations and the AFL can actually be said to be brightened by the AFL's refusal to readmit Mr Lewis. With enormous funds at his disposal and a constitutional inability to be anything but chief, Mr Lewis would have thrown his considerable weight into widening the breach between the CIO and the AFL. He would have drawn the Federation toward isolationism both in political and in trade union matters; his stand against Government interference and price controls would have become, if anything, noisier and more intransigent. And at a time when the war effort demands increases in war production, he would have tried to gain strength for his inflexible, bitter attitude that this is not labour's war.

The leaders of the CIO clearly see the advantages to be gained now and in the post-war period from a united labour front. They gathered the AFL into the forces of the Political Action Committee; they have offered Mr Green a seat for the AFL on the committee set up by the recent World Conference to draft the constitution of a new international federation of trade unions. The CIO has also appealed to AFL leaders to co-operate on a post-war programme which would provide for protection to workers during reconversion, repeal of anti-labour laws, legislation to assure social security and 60 million jobs at fair wages. So far the Federation has been adamant. But if it and the CIO are now to be under common attack by Mr Lewis, their mutual hostility might soften.

Rescuing the Colleges

To help the colleges and universities in facing the critical situation brought about by war dislocations, an advisory committee appointed by the House of Representatives has recommended that Federal aid should be extended to them. The war has left the institutions of higher education half-empty and hungry. About three-quarters of the male students are in military service and the attractions of war work have contributed to a decline in enrolment which last autumn was one-third below the 1,400,000 of 1939. By the end of this year it is estimated that Army and Navy programmes in the colleges—which provided some alternative use for their facilities—will have diminished to less than thirty per cent of their peak in 1943-44.

The Committee recommended that students and faculty members specialising in fields essential to the national welfare be given special priority in discharge from the Army and Navy; that gifts and grants be stimulated by additional tax exemptions; that educational institutions be included in programmes of public works; and that a committee representing the educational institutions and the armed services work out a plan for using the institutions of higher learning in future national emergencies.

Many educators in the United States see their salvation in the so-called "GI Bill of Rights," which will draw to

the colleges perhaps as many as 650,000 ex-service men. Tuition fees for these men, up to \$500, will be paid directly to the institution and they will receive living allowances of \$50 a month if single, \$75 if married.

The chief spokesman for the opposing faction has been President Robert M. Hutchins, of the University of Chicago, who has called the bill "an open invitation to any entrepreneur to buy up the charters of half a dozen bankrupt institutions and make his fortune." Mr Hutchins fears the possibility of education being utilised as a substitute for a dole or national works programme and he foresees a rush to the colleges by thousands of unqualified, uninterested ex-servicemen "because they cannot get jobs."

And so the battle lines are drawn. It is not an argument over what the ex-soldiers deserve to receive. It is fundamentally a battle over whether the provision of education for ex-soldiers can be made to introduce into America a new era of more widely spread learning or whether the institutions will use the veterans as a fat source of easy income, cynically adopting state control along with a billion dollars of Federal money.

The George Bill

Adversity makes strange bed-fellows and stranger politics. Three weeks ago it would have seemed inconceivable that the forces of the Administration and the New Deal should fight tooth and nail to assure the passage of Senator George's Bill divorcing the financial agencies from the Department of Commerce. But, ironically enough, the George Bill, devised originally as an anti-Wallace measure, has become the means of assuring Mr Wallace's appointment as Secretary of Commerce.

Two main issues were at stake in the complicated Congressional manoeuvres of the past fortnight. The anti-Wallace contingent made every effort, first, to shelve the George Bill until after Mr Wallace's confirmation was considered, in the expectation that favourable action on the appointment would not be secured in the Senate as long as the post carried with it control over the Reconstruction Finance Corporation and its subsidiaries; and second, to add to the bill amendments sponsored by the Republicans which would have made the Export-Import Bank completely independent of the Secretary of Commerce, and would have forbidden the President to transfer any additional powers to the Secretary of Commerce. This last amendment was designed to prevent the transfer of other financial agencies not at present associated with the Department.

At a number of points the Administration very narrowly escaped defeat, with votes of 202-192, and 204-196, although the final vote in the House on the George Bill was 399-2. The measure goes to the President in the form which he indicated would be acceptable; and the chances are all in favour of Mr Wallace's confirmation in his reduced powers. His job now will approximate to those functions of persuasion and publicity which Mr Lippmann outlined some weeks ago. The bitterness of the Congressional debate and the closeness of the votes, which in essence were on Mr Wallace, rather than on the George Bill, do not, however, hold out much prospect of easy conversion on Capitol Hill.

Dodging the Draft

The big guns which are being rolled up in an attempt to save the May-Bailey manpower Bill suggest that it is very nearly a lost cause. Last week Mr Stimson, the Secretary of War, broadcast an urgent appeal to the "American conscience" in which he accused the enemies of the Bill of boasting that they had killed it. Mr Stimson insisted that "deadly shortages" are imminent; Mr Krug of the War Production Board has asserted that immediate passage is necessary "because we are running short of manpower"; and Mr Roosevelt, in a brief message to the Senate, reinforced their appeal for action.

Apparently unmoved, the Senate has shelved the Bill, which would have used compulsion to move men from

18 to 45 into essential war work. The substitute bill which it is now considering, proposed by Senators Kilgore, Wagner, and O'Mahoney, contains none of the compulsory features of the May-Bailey Bill. Workers would have to have permission to change their jobs, and employers who hired more men than they were entitled to would be penalised only to the extent that they would not be compensated for their wages in government contracts, or might have these wages disallowed for tax purposes. Of new or effective sanctions there is no mention.

The bill, which is sponsored by the Congressional friends of labour, seeks to control the employer, rather than the individual worker. It is concerned with the budgeting of manpower, the establishment of manpower ceilings for individual plants, and "channeling workers."

These are all devices which have been tried in the past; and, although no doubt there is scope for improvement in their application, they cannot equal the effectiveness of a bill which provides specifically for the direction of individual workers and establishes drastic penalties for disobedience. These are precisely the features of the May-Bailey Bill to which organised labour—with the exception of the extreme left-wing unions—objects. It may be, indeed, that at this date the creation of an administrative machine to direct workers would prove extremely difficult; and its chance of success would not have been improved by steady hostility from the labour unions. It does not look, however, as though it would ever be put to the test.

The Forty-Fivers

What would have happened if President Wilson had taken Elihu Root and William Howard Taft with him to the Versailles Peace Conference? This is one of the great ifs of history, debated for twenty-five years. The American delegation to the San Francisco Conference bears all the marks of Mr Roosevelt's determination to avoid a repetition of that historic blunder. In addition to Mr Hull and Mr Stettinius, the delegates include Senator Connally (Dem) chairman of the Senate Foreign Relations Committee, Mr Bloom (Dem), Chairman of the comparable House Committee; and on the Republican side, Senator Vandenberg, Representative Eaton, and Commander Stassen, former Governor of Minnesota. There is also one woman, Dean Gildersleeve of Barnard College.

The selection is remarkable for its careful party balance and its inclusion of influential members of both Senate and House. It is no less remarkable for its omission of Governor Dewey, titular leader of the Republican party, and his adviser, Mr John Foster Dulles, who was so prominent during the election campaign and who has a strong church following. The choice of Commander Stassen,

instead, recognised the service of the young internationalist Republican group; it also lays Mr Roosevelt open to the charge, not merely of playing party politics, but of playing Republican party politics.

What remains to be seen is whether, in fact, the inclusion of representatives of the opposition this time will do as much to assure Republican support of the peace settlement as Mr Wilson's critics have always assumed. No individual Republican can, of course, bind his party. Nor is the parallel with 1919 exact. Senator Vandenberg's recent speeches transformed him almost overnight into a force to be reckoned with in internationalist circles, and he is one of the most powerful Republicans in the Senate. But with Mr Wilkie's death there are no Republicans of a stature, sustained conviction, and influence comparable to that of Root, Hughes, and Taft, in 1919. Nor does Senator Vandenberg promise to be altogether a docile collaborator. As yet he has not accepted the appointment, and his appearance at San Francisco is conditional upon his remaining a free agent. The issue on which he is most likely to be sensitive is that of Poland. To offend Polish-American opinion might cost him his Senate seat next year, for there are nearly 500,000 Polish-American voters in Michigan.

None of these considerations detracts, of course, from the adroitness and good sense with which the Administration has sought to associate both parties in Congress with the work of the conference. The fullness and candour of Mr Byrnes' account of the Yalta decisions, combined with the choice of delegates, have done as much as is humanly possible to assure in advance that the settlement will receive a favourable reception.

Shorter Notes

The educational community is split on the question of post-war compulsory military training. The heads of twelve universities recently requested the President to delay consideration of "this highly controversial question" until after the defeat of Germany. Last week fourteen prominent educators, representing many of the outstanding men's colleges, requested immediate action by Congress, on the ground that public opinion is sounder on this issue during the war than it will be after the war. According to a Gallup poll taken in December, 70 per cent of those questioned favoured a year's service in the army and navy for every able-bodied young man after the war.

The Alabama poll tax may follow that of Georgia into the discard. Alabama's poll tax is the most restrictive of all; it is fixed at \$1.50 a year, but being cumulative, a new voter may have to pay up to a maximum of \$36 for the privilege. At best less than one-fifth of Alabama's potential voters go to the polls.

THE WORLD OVERSEAS

Latin America and the Peace

PEACE, though indivisible, is a house of many mansions. This week, with the Crimea Conference behind them and San Francisco ahead, the Foreign Ministers of nineteen American nations are meeting in Mexico City to discuss the contribution of the Americas towards winning the war and establishing a peace based on collective security. At the last Pan-American Conference, at Rio de Janeiro in January, 1942, the war had already reached the Americas. Nine Central American and Caribbean republics had followed the United States to war. Mexico, the tenth, had broken with the Axis. The rest of Latin America, comprising the ten South American republics, were left to implement the Conference's unanimous recommendation to do likewise.

It was here that a cloud appeared on the Pan-American scene. Before the Conference, Argentina had attempted to induce its neighbours to continue a policy of neutrality and to form a "southern neutrality bloc" under Argentine leadership. This attempt failed. Paraguay and Uruguay broke off relations. But Argentina managed at the Rio Conference to water down an otherwise unanimous resolve to break

with the Axis to a mere recommendation to do so. In fact, it was not until a year after Chile's breach that, in January, 1944, Argentina broke off relations with the Axis. By then all the other Latin American states except Chile, Ecuador, Paraguay, Peru, Uruguay and Venezuela had declared war. Last week, on the eve of the present Conference, and no doubt mindful of it, five of these six announced that they were at war, while in Uruguay parliamentary sanction was awaited to sign the United Nations Declaration. Argentina remains entrenched in solitary isolationism.

Such is the surface pattern of Pan-American politics. It overlays a deeper and more intricate pattern of inter-American relations. In the last three years Argentina's isolation has deepened; Brazil and Mexico, in their effective support of the war effort, have gained a new stature in the American community; and smaller republics have realised that, economically as well as diplomatically, Brazil bids strongly to regain the South American leadership it lost to Argentina half a century ago. President Vargas has already made it clear to his neighbours in various speeches that he claims for

Brazil the right to speak for South America at the peace table. It is likely that, with their support, Brazil will press at this week's Conference for a permanent seat on the Security Council proposed at Dumbarton Oaks.

Brazil's friendship with the United States is traditional; the stability of Mexico's is of more recent date; since the war Argentina's has been strained as never before. These three nations are the protagonists in the Latin American scene. Under a stable Government, Mexico's understanding with the United States gives it an influence farther south. Its vigorous leadership of Latin American Labour (whose voice was heard in London last week) is undoubtedly a factor in this influence. But it is the relationship between Argentina and Brazil that is likely to play the principal part in determining the shape of the peace for the South American republics.

Helped by Lend-Lease and by very big American credits, Brazil has in the course of the war developed its vast hinterland in the Amazon basin, and along the frontiers of Bolivia and Paraguay—the river system of the Plate. Hitherto these areas have been served exclusively by the Amazon and the River Parana (which flows into the River Plate); Brazil has roots in both, and the development of the two areas is advantageous not only for Brazilian economy, but also for neighbouring states. In Amazonia, President Vargas has developed communications, and with them the friendship of the border states from Bolivia to Venezuela, with vigour and promise. The Brazilian Government played a leading rôle in settling the recent boundary dispute between Peru and Ecuador; and Bolivian irredentism shows signs of having been at least assuaged by the approach of Brazil's railways, which will offer its eastern lowlands a chance of development.

Bolivia and Paraguay are suspended between the Argentine and Brazilian orbits. But while Argentina has sought to maintain for these land-locked (and potentially oil-producing) states the attractions of its River Plate outlet, Brazil is offering both countries the prospect of an entrepot trade through Santos and a link with Sao Paulo, the industrial hub of Brazil. Its new railway system connects Santos and Sao Paulo with Corumbá, and other branches are to stretch into Bolivia. Paraguay has long been classed as a colonial dependency of Argentina. Brazil's interest in it, backed by treaties, technical aid and a loan, will undoubtedly grow if the United States oil company recently permitted to explore the Paraguayan Chaco should strike oil. The weakening of Argentina's economic monopoly in Paraguay is so far largely potential. But Paraguay's eleventh-hour decision to declare war against the Axis appears to be designed not only to secure a firmer voice at Mexico City, but, nearer home, to reinforce Brazil's friendship.

These are designs in the deeper pattern of Latin American relations. American aid during the war has emphasised and hastened them, largely through instruments such as Lend-Lease, the Export-Import Bank of Washington, and the whole machinery of mutual help—and self-help—developed to exploit Latin America's resources on the basis of the Good Neighbour policy. Since Argentina has in practice rejected this policy, it is excluded from the economic advantages it entails. Here are, therefore, grounds for friction and misunderstanding between Argentina and Brazil.

The deepest pattern of all, and the most obscure, is that of Latin American politics, where revolution is still regarded as an inalienable right of peoples professing democracy. It is easy to over-simplify the forces at work in Argentina that have led it to stand alone in the Pan-American scene, recognised only by Bolivia, Chile, Ecuador and Paraguay, and outside the Mexico City Conference. An essential feature of this process of self-exclusion has been the parallel growth of diplomatic isolation (though trade with neighbours has increased) and extreme nationalism. This is the real basis of General Farrell's authoritarian regime. It would be misleading to discount the potency of such forces in other republics; reactionary nationalism is very near the surface in Latin American politics. Although it failed to create a neutrality bloc, the Argentine Government still seeks sympathy among the forces of reaction and nationalism elsewhere.

The authoritarianism of Brazil carries, in President Vargas's own statements, the promise of a democratic regime when the war ends. So far, then, Brazil has shown signs of proceeding towards democratic forms, while Argentina, the traditionally democratic republic, has put on totalitarian trappings. In this relationship there are those who see a coming clash of interest between an expanding Brazil and an Argentine oligarchy determined to enlist the forces of nationalism against any South American hegemony except its own. But there are others, dubious of President Vargas's promise of post-war elections (or dubious of their effect),

who profess to see in a Brazilian rapprochement with the present reactionary Argentine government a likely bulwark of the authoritarian Vargas régime against internal opposition.

These deeper issues, which cut across the central problem of Pan-American unity, may not be discussed at Mexico City, or at least they are likely to be discussed only by implication. No one need underestimate the centrifugal forces which attempt to pull the American Republics apart. When Bolivar, over a hundred years ago, sought this unity, he complained that he had been ploughing the sea. There is at least evidence that to-day, too, the ground is as difficult and unfertile. Nevertheless, the achievements of Pan-American unity are real, and they enjoy now, and will enjoy in the future, the fullest possible backing of the United States. As Mr Nelson Rockefeller said last week:

The unity of the American Hemisphere will always be our first line of defence.

The United States delegation, headed by Mr Stettinius, and including in an advisory capacity a strong body of Congressional committee men and the President of the Export-Import Bank at Washington, is a very strong team, and it reflects the importance which the United States attaches to the success of the Conference. It is not without potent weapons of persuasion. The continued economic development of backward areas in South America must continue for some time to depend on American help. There will be thus strong inducements to the republics to keep in line; indeed, economic isolation may finally prove to be the threat that brings Argentina back into the Pan-American community.

The Belgian Deflation

[BY A CORRESPONDENT]

SUFFICIENT time has elapsed since the launching of the Belgian deflationary scheme last October to review some of its results. The mechanism of the operation worked comparatively smoothly. As the Belgian Government experienced some difficulty in importing the required quantity of new notes, which had been printed in England, and in

No. 6 — SIERRA LEONE

SIERRA LEONE is the oldest of the British West African Colonies and has an area, including the Protectorate, of 28,000 square miles with a population of nearly 2,000,000.

European interest in this coast began with the voyages of the early navigators in the XVth Century. There was much rivalry between Portuguese, Dutch and British. It was not until 1792 that any settlement was made at Freetown which possesses one of the finest natural harbours in the world. A great port of call for the convoys of to-day it is interesting to remember that Sir Francis Drake who visited Sierra Leone in 1579, found that "here also we had oysters and plenty of lemons which gave us good refreshing."

The Bank has a branch at Freetown, which is now the capital of the territory. The average annual value of external trade 1935/39 was about £3,500,000, the chief exports being diamonds, gold, iron ore, palm kernels, palm oil, ginger and piassava. Those concerned with trade in Africa, the Mediterranean or the West Indies, are invited to communicate with:—

BARCLAYS BANK
(DOMINION, COLONIAL AND OVERSEAS)
LONDON, E.C.3

distributing them throughout the country, a start could not be made until the beginning of October, almost a month after the liberation of Belgium, and in the interval a not inconsiderable flight from the franc took place. Again, the decree provided for a maximum of 2,000 francs in old notes to be exchanged by or on behalf of each person; the fact that 14,363,000,000 francs were so exchanged by a population of not more than 8,250,000, certain districts being excluded, indicates that a certain amount of exchange took place "by arrangement." And although loopholes in the law were stopped as soon as they became apparent, there was undoubtedly some leakage. But, on the whole, the scheme worked as well as could reasonably be expected.

Yet none of the outward phenomena of a deflation was apparent. The cost of living—a cost which must be calculated on the black market price of necessities if it is to have any meaning at all—showed virtually no change, while at least one factor—rent—began a slightly upward trend. Prices of luxury articles, which had been rising steadily ever since the arrival of Allied troops in the country, continued to rise, and in general the purchasing power of the franc, inside Belgium, seemed unchanged. This lack of change was apparent rather than real. That the "arrêts financiers de M. Guiz" were markedly deflationary can very soon be seen by considering the value of the Belgian franc vis-à-vis other currencies on the black Bourse. The price of the gold sovereign fell from approximately 6,500 francs to something in the region of 1,800 francs, and that of the pound note in even greater proportion. Trading in *valuta*, though illegal, is conducted quite openly, and these rates indicate financial trends as adequately as any official quotations would do. Table I shows the prices of the gold and paper pound respectively in early September, in mid-October (immediately after the scheme came into force) and in mid-December (after a further 13,000,000,000 francs were unblocked). It will be seen that the rates of exchange are not strictly proportional and also that the gold pound is valued at anything from 12 to 16 paper pounds.

TABLE I—VALUE OF THE GOLD AND PAPER POUNDS ON THE BRUSSELS BLACK BOURSE

	Official Rate	Value in Unblocked Francs		
		Early Sept., 1944	Mid Oct., 1944	Mid Dec., 1944
£1 gold	176.6	6,500	1,800	2,450
£1 paper		420	160	200

The reason why prices did not fall in Belgium as a result of financial measures which, other things being equal, should have had that effect, was that other things were not equal. First is the presence of many hundreds of thousands of Allied soldiers who, however well provided with rations, have been a serious drain on local resources. The Belgian currency supplied to them has been the main element in the re-expansion of the currency since the deflation decrees. Their expenditure has directly and indirectly provided the principal stimulus to the black market. Secondly, the supply position during the first two months following the liberation of Belgium was probably worse than it had been at any time during the occupation. The large stocks of merchandise which Belgian traders habitually carry, and the private hoards which a great many people, profiting from the lesson of 1914, had accumulated during the first few months of the war, had alike been eaten away; the Dutch frontier was closed; trade with the other food-producing countries of Europe, which had worked comparatively smoothly under the German occupation, was impossible; and the Allied armies could grant very little in the way of facilities either for their Civil Affairs staff and UNRRA or for the Belgian Government itself to bring in supplies from the western hemisphere. But the dominating factor was, as it still is, the virtual freezing of transport. Such few railways as continued to operate were required by the armies to supplement their 300-mile long lines of communication, and the retreating Germans had carried off with them everything on wheels they could persuade to move. The strain on the remaining transport facilities was too great and the highly organised black market provisioning system broke down.

The Black Market

It is necessary to take a liberal view of the Belgian black market. The Belgians threw themselves with joy into the

organisation of a black market which had as its aims, morally, the defeat of German wishes and, materially, the provision of supplies for those who could afford to pay for them and a livelihood for those who trafficked. The official ration provided only two-thirds of the calories normally considered sufficient to sustain life, but even this figure was meaningless as the full official ration was never obtainable. Thus there was never any feeling of shame in the existence of a black market, and it was able to become highly organised at all levels. The Belgian bought his meat from his butcher, his butter from his dairy, his bread from his baker and his coal from his coalman as though they were his normal ration, except that he could buy as much as he chose to pay for and that, instead of paying 36 francs a kilo for meat and 40 francs a kilo for butter, he paid 250 francs and 350 francs respectively. He still does, though thanks to the reopening of Antwerp the ration for increasingly more commodities is becoming available and black market prices are tending to drop. The black market in bread and farinaceous products, for example, has virtually disappeared; on the other hand, the price of coal is rising steadily, and is now about 8,000 or 9,000 francs a ton—about £50.

All this organisation, which depended on the existence of a large volume of transport in the hands of the organisers, was seriously shaken during the first month or two after liberation, while the dissolution by the Government of the Nazi-sponsored system for marketing agricultural produce, the CNAA—a patriotic gesture which would possibly have been more effective had an adequate substitute been provided—made the official rationing position worse. It is a mild cause of complaint among those Belgians who are able to buy on the black market that whereas, before the liberation, they had to pay high prices but could at least obtain the goods, now they have to pay equally high prices for goods and cannot always get them.

It seems clear, therefore, that the deflationary measures, sharp and crude though they had to be, did in fact prevent what might easily have become an extremely serious inflationary spiral. That the operation had to be performed on the note issue and bank deposits rather than on the volume of commercial credit was unfortunate, since it produced anomalies, but unavoidable, since the volume of commercial credit was ridiculously low. Indeed, the Belgian Government hoped that one of the by-products of its scheme would eventually be the regeneration of commercial credits. The traditional depressing effects of a deflation on industry have been avoided, largely because industry was in any case virtually at a standstill, since it lacked means of transport and carried no stocks of materials. Applied in an economic vacuum of this kind, deflation does not hurt.

It can no longer be doubted that while the physical condition of Belgium, like that of the rest of Europe, leaves a good deal to be desired, the financial situation, with the franc firmly pegged to the pound, is healthy. An indication of this is given in Table II.

TABLE II—VALUES OF THE POUND, FRENCH FRANC AND DUTCH GUILDER ON THE BRUSSELS BLACK BOURSE (Mid-December, 1944)

	Official Rate	Black Bourse Rate	
		In Francs	As Per cent. of Official Rate
£1 sterling	176.6	200	114
French franc	0.88	0.50	53
Dutch guilder	16.36	7.25	44

It shows the black Bourse prices of the French franc and Dutch guilder, compared with the official exchange rates, with the pound used as a yardstick. It should be remembered that these values are for notes of small denomination; large notes have a considerably lower rate of exchange.

THE BUSINESS WORLD

The Anatomy of British Industry

THE Paper on "The Structure of British Industry," read by Mr H Leak and Mr A Maizels of the Board of Trade before the Royal Statistical Society on February 20th, fills an important and irritating gap in the knowledge about the degree of concentration of ownership and control in British industry. Their analysis of the anatomy of British industry relates to the position in 1935 and is based on the results of the census of production of that year. It has three disadvantages. First, since it describes the position in a single year, it is not possible to ascertain the trend, that is changes, in the degree of concentration over a period of years; secondly, the information given is now ten years old; thirdly, it takes no account of the monopolistic practices of trade associations and of other types of arrangement among financially independent business concerns. The first two deficiencies will be removed by the next census of production; the facts about the third can only be ascertained by a special investigation. But these lacunae do not detract from the merits of the Paper; it is one of the most interesting that has been read before the Royal Statistical Society in recent years.

The massive statistical tables cannot be conveniently summarised; they deserve careful study in the original (this might with advantage have been published as a White Paper) by all who are interested in the anatomy of British industry. As an appetiser, three specific points may be selected for brief comment.

First, the statistical evidence marshalled by Mr Leak and Mr Maizels settles once and for all the argument whether or no British industry is still predominantly in the hands of small concerns. They draw the line between small and large business units*—arbitrarily but with some justification—at 500 employees—that is, units employing between 11 and 499 persons are small ones, and units employing 500 persons or more are large ones. By this definition there were, in 1935, some 1,959 large business units employing together 3,970,000 persons, equivalent to 55 per cent of the total of 7,203,000 persons employed by all establishments with a personnel of more than 10 persons. (Establishments employing less than 10 persons were responsible for less than

* A large "business unit," as defined by the authors of the Paper, may be a single firm employing 500 persons or more and engaged in one or more trades; it may also be an aggregate of firms, employing jointly 500 persons or more, owned or controlled by a single company—a firm is regarded as being controlled if the parent company owns more than half of its capital or voting power.

† Gross output is equivalent to total selling value; net output is the value added by manufacture; that is, it is equivalent to the total selling value, less the cost of materials and work given out.

a tenth of total output.) The same number of business units were responsible, in 1935, for £2,025 million, or 57 per cent of the total value of the gross output† of all establishments, amounting to £3,533 million, and for £931 million, or 58 per cent of the value of their net output of £1,603 million.

If the dividing line between small and large units were drawn at 1,000 employees, the large ones would still have accounted for nearly half the total output and employment, that is for 48 per cent of the gross output, 49 per cent of the net output, and 45 per cent of the total number of persons employed. It can thus reasonably be said that British industry is no longer predominantly small in scale.

Even within the category of large business units (those employing 500 or more persons), there is a marked concentration of output in favour of very large units. This tendency is reflected in Table IV. Some 2.6 per cent of the total number of large business units were responsible for nearly a third of the total net output of all large units; 6.9 per cent produced nearly half and 13.1 per cent three-fifths.

The difference in the average value of net output per head between small firms and large ones (employing 500 persons or more) is surprisingly small; it was £208 in the one group and £234 in the other. But this evidence does not justify any conclusions. Numbers employed are no guide to the degree of mechanisation; for example, a company employing several thousand persons may

use old-fashioned methods. Again, in some trades, modern methods of production can be used by individual firms with a personnel of less than 500.

Secondly, the preponderance of the large business unit in industry as a whole is matched, in many industries, by the concentration of ownership or control in the hands of a few units. The degree of concentration in the main trade groups (measured by the proportion of the total number of persons in each group employed by the three largest business units) is shown, in descending order, in Table II.

But the degree of concentration in a group of trades provides little evidence of that in individual trades. In individual trades and sub-divisions of trades the degree of concentration is much higher than has been generally suspected. This is clearly revealed in a table in which Mr Leak and Mr Maizels have set out, for 302 individual trades or divisions, the proportion of total gross output, net output and employment that is concentrated in the hands of the three largest business units. The table is far too long for reproduction *in extenso*. There are 33 trades, or sub-divisions of trades, in which the degree of concentration—that is, the proportion of the total number of persons em-

The figures on the diagram indicate the percentage of the total employment in each of two trades accounted for by the large units (that is, units employing 500 persons or more) engaged in both. For example, the large units producing both coal and iron ore employ 8 per cent of the total number of persons in coal mines and 49 per cent of those in metalliferous mines. As the figures involve a substantial amount of duplication, they cannot be added, for example, nearly all the large units operating blast furnaces and ironstone mines also operate coal mines, so that for blast furnaces, the 72 per cent shown for the former connection is essentially duplicated in the 81 per cent shown for the latter.

Authors' corrections.—Printing, bookbinding: this industry should have a double instead of a single square, indicating that it employed between 150,000 and 250,000 persons. The following percentages should be corrected: blast furnaces to coal mines, 84 instead of 81; blast furnaces to smelting, 65 instead of 61; hardware, etc., to smelting, 5 instead of 15; coke to coal mines, 84 instead of 75; tramways to local authorities, 71 instead of 74; water to local authorities, 32 instead of 33.

ployed by the three largest units—is at least 70 per cent; these trades are set out in Table I in order of the degree of concentration of employment. (Of the 33 trades, or sub-divisions of trades, no less than 8 are in the Chemical and

Allied Trades group.) Even the figures for a trade as a whole may conceal the fact that concentration is still higher in certain of its products; the proportion of the total output of individual commodities produced by the three

I—TRADES OR SUB-DIVISIONS IN WHICH THE THREE LARGEST UNITS ACCOUNTED FOR 70 PER CENT OR MORE OF EMPLOYMENT

Trade or Sub-Division	Three Largest Units		Product	Value of Output

III—SOME COMMODITIES OUTPUT OF WHICH WAS CONCENTRATED IN ONE OR TWO FIRMS

Commodity	Value of Output	Proportion of Total	Commodity	Value of Output	Proportion of Total
Sewing Cotton			Borax		
Rayon staple fibre			Calcium carbide		
Pile fabrics, wholly of silk			Carbon bisulphide		
Rayon piece-goods, printed			Cellulose acetate		
Umbrella frames			Chlorine liquefied		
Ferro-silicon			Acetylene		
Railway spikes			Oxygen		
Ingots of stainless steel			Magnesium chloride		
Armour plates not under 1/4 in. thick			Methyl alcohol*		
Universal plates			Phosphorus		
Tinned sheets			Rubber accelerators		
Enamelled hollow-ware of cast iron for industrial purposes			Cream of tartar		
Transmission chain for vehicles			Tin oxide		
Springs for ordnance			Zinc sulphate		
Insulated staples			Sodium carbonate		
Gas containers			Caustic soda		
Woven wire fencing			Sodium cyanide		
Circular saws, segmented			Gum		
Hair clippers			Fishmeal		
Military rifles			Castor oil, unrefined*		
Automatic guns			Rape-seed cake and meal*		
Guns, howitzers and mortars			Wheat oil, unrefined		
Cash registers			Loaded military small-arms ammunition		
Electric accounting, calculating, etc., machines			Safety fuse		
Typesetting machinery			Cordite		
Cream separators			Blasting powder		
Domestic sewing-machines			Farina		
Furnace carbons			Safety matches, in containers of not more than 20		
Carbon electrodes (for welding or for other purposes)			Tennis balls, uncovered		
Time switches			Aeroplane tyres		
Wireless transmitting sets			Measuring tapes		
Bulbs for flashlamps			Photographic plates		
Lighting and starting sets for motor vehicles			Cinematograph film, blank		
Cycle lamps			Synthetic resins in blocks, sheets, rods, and tubes (laminated)		
Chassis for taxicabs			Celluloid, xylonite and the like		
Electric commercial vehicles			Low-temperature carbonization fuel*		
Parachutes			Manufactured fuel of which coal or coke is the chief constituent		
Rail carriages of iron and steel complete*			Oilcloth other than for floor covering		
Copper shapes and angles			Strings for musical instruments		
Tungsten			Gramophones, mechanically driven		
Nickel, unwrought			Gramophone motors		
Clocks for motor-cars			Metal constructional toys		
Chronometers			Oil stones		
Water ices			Rubbing blocks		
Mustard			Strawboard		
Lump sugar			Wallboards and comps boards exceeding 1/2 in. thick		
Solid caramel			Tea chests, metal lined		
Phenacetin			Plumbago crucibles		
Dyestuffs for lake-making*			Other crucibles		
Indigo			Plain sheet window-glass		
Acetone			Plate glass, polished, not further worked		
Nitric acid*			Optical glass		
A number of other acids			Spectacle glass		
Aluminium oxide			Vacuum flasks		
Anhydrous ammonia			Synphon vases		
Ammonium chloride			Pavement kerbs		
			Whetstones		
			Lithographic stones		
			Grindstones

IV—DISTRIBUTION OF PRODUCTION IN BUSINESS UNITS EMPLOYING MORE THAN 500 PERSONS

Average No. Employed	No. of Units	Percentage of Total	Net Output (£'000,000)	Percentage of Total
3,000 and over	257	13.1	558	60
5,000 and over	135	6.9	446	48
10,000 and over	52	2.6	295	32
All Units	1,959	100.0	931	100

V—COAL MINES

(Total Employment in Coal Mines=764,175)

Connected trade	No. of units	Employment in these units			Employment in connected trade as proportion of the whole trade
		Total	In Coal Mines	In connected trade	
Blast furnaces	22	Thous. 251.4	Thous. 102.8	Thous. 13.3	84
Coke and by-products	67	435.0	284.3	11.8	84
Iron and steel (smelting and rolling)	21	248.0	97.1	69.1	51
Metalliferous mines and quarries	13	178.0	64.3	5.4	49
Chain, nail, screw, etc.	6	90.7	26.8	9.2	16
Brick and fireclay	117	604.9	431.1	14.1	15
Iron and steel foundries	21	277.3	91.7	14.0	13
Railway carriage and wagon	10	149.2	80.7	2.0	10
Non-metalliferous mines & quarries	27	233.2	134.2	3.9	7
Mechanical engineering	21	268.9	119.4	25.2	6
Hardware, hollow-ware, etc.	5	100.5	8.7	1.0	3
Building materials	7	111.3	59.7	1.2	4
Chemicals, dyestuffs and drugs	13	168.9	61.0	1.2	2
Timber (saw-milling, etc.)	5	62.7	17.6	0.8	1

largest units is therefore printed on the right-hand side of the table, alongside the figures showing the degree of concentration in the trade—or its sub-division—as a whole. Table III is self-explanatory; it shows that there is a long list of commodities that are produced by one or two firms. There is, in fact, strong evidence of monopoly.

At the other end of the scale, there are a number of trades in which the degree of concentration of employment is still low. In building and contracting it is only 2 per cent; in the timber trade it is 3 per cent., and in cotton weaving 4 per cent. It is between 4 and 10 per cent in these trades:

Woollen and worsted; tailoring; dressmaking; millinery, etc.; bread, cakes, etc.; furniture and upholstery; leather (tanning and dressing); printing, bookbinding, etc.; local authorities; mechanical engineering; boot and shoe; hat and cap; finished brass; china and earthenware; and coal mines.

Thirdly, and finally, the statistics assembled in the Paper reveal that the extent of vertical integration in some of the principal industries is perhaps more marked than was widely supposed. The most important industrial inter-connections are shown in the accompanying chart. It gives, for each of the more important industries, an approximate indication of its total employment; it shows, secondly, the other industries with which the industry is connected; and

it reveals, thirdly, the proportion of the total number of persons employed in each of two trades by large business units (employing 500 persons or more) operating in both.

The chart, however, is no more than a broad guide to the importance of vertical integration. Full statistical details of the ramifications of a number of important industries are given in the Paper. How far-flung these ramifications are is indicated, by way of example, in Table V, relating to the coal-mining industry. The third line in that table shows that there were, in 1935, 21 business units in the coal-mining industry, which were also engaged in the smelting and rolling section of the iron and steel industry. The total number of persons employed by the 21 units was 248,000, and of this total 97,100—well over a third—were employed in coal-mining and 69,100 in iron and steel smelting and rolling; the numbers employed in iron and steel smelting and rolling—the connected trade—represented 51 per cent of the total number of persons employed in that trade. The degree of connection between coal-mining and other trades—that is, the numbers employed by business units engaged in coal-mining in each of the connected trades expressed as a proportion of total employment in the connected trades—is shown in descending order in the last column of the table; vertical integration gradually shades into mere connections. The pattern is similar in other trades.

Business Notes

Directionless Markets

The stock markets at the moment give an impression of waiting to keep an appointment with events which are late at the rendezvous. The volume of business has tended to contract rather than expand, but, even so, it has been sufficient to take up the stock available, and even to bring about a modest rise in the index of ordinary share prices calculated by *The Financial News*.

Buying, however, has been of the "news headline" kind, following increased dividends (as with store shares after the increased Woolworth distribution), or outside developments like the strength of American demand for diamonds at the present series of London "sights," which had favourable repercussions on diamond share prices. Demand of this kind is one of the surest of indicators of a market which is firm enough, but can find no major stimulus to set a general advance in motion. It seems increasingly clear that when the stimulus comes it will be a military one, and this week, as it happened, the news from both the Eastern and Western fronts in Germany lacked both immediate dramatic appeal and obvious near-term implication.

The one really unexpected market feature was the weakness of short-dated gilt-edged stocks, particularly National War Bonds, 1945-47, which fell by as much as $\frac{1}{2}$ on Tuesday. The most obvious—and probably the correct—explanation was that the banks were large sellers, at a time when they had substantial tax transfers to effect, and were possibly rather bare of cash on the approach of the monthly "making-up." A more ingenuous suggestion was that the authorities, seeing that the end of the war might not be unduly far away, might call in the issue this year instead of waiting till 1947. Such a course would leave them three clear years before the next compulsory maturity—that is, that of National War Bonds, 1946-48—in which to concentrate on maintaining their cheap money policy during the critical reconstruction phase, without being worried by conversion operations. The suggestion, though it met with little credence, was at least interesting as an unsolicited testimonial to the respect in which the market holds both the conception of cheap money and the Treasury's ability to maintain it. In the market as a whole, however, both immediate purposiveness and a sense of direction are still absent. Professional investors await a sign which so far has not been vouchsafed them.

Capital Issue Control

Unlike street-lighting, official regulation of new capital issues is not among the controls which the authorities are inclined to relax in the final phase of the war. Outwardly, the Chancellor's reply to a question by Mr Kendall, the Independent Member for Grantham in the House of Commons last Tuesday, on the future of restrictions on

capital issues, was stern and uncompromising. The necessity for the policy, Sir John Anderson declared, "clearly continues." It is not proposed to change the practice by which essential non-Government issues which have been approved by the Capital Issues Committee are raised not by public issues but by placing with investment institutions. Indeed, control is to be tightened, for no re-sale will be permitted for six months, and thereafter applicants for permission to deal in such issues on the Stock Exchange must first apply to the Capital Issues Committee for permission to apply to the Stock Exchange authorities.

So far as concerns the "grey market"—that is, the regulation of dealings in existing unquoted securities—conditions are unchanged. Institutions which have honoured the official request not to deal in such securities without Treasury approval will continue to honour the "gentlemen's agreement," and those which have not been so disposed will, presumably, after their own fashion, "continue the procedures which they have followed hitherto." Treasury approval will continue to honour the "gentle-which accord with Government policy or are justified by special circumstances like payment of death duties.

Behind this firm façade some not unimportant modifications in the present system may be in mind, or even in train. It is understood that the Stock Exchange has been in touch with the Bank of England on the question of possible arrangements to ensure technical co-operation in policy as applied to placings, which will be reasonably agreeable to both parties and will obviate a repetition of recent "incidents" where the lack of such co-operation was only too obvious. Conceivably, the placing of a proportion of issues with Stock Exchange firms for distribution among institutional clients—or even, in comparatively rare cases, private clients subject, of course, to the six months rule—may form part of the normal procedure which the Treasury will view favourably. But so far, willing agreement has been to seek; at best, Stock Exchange co-operation will probably be more obedient than enthusiastic, so long as the framework of the administration of the capital regulations remains what it is.

In fact, all the parties concerned are aware that the end of the war in Europe is probably not far off. The Chancellor himself expressly recognised that the transition from war to peace will involve the opening of the market to a larger flow of issues and that modifications of policy and procedure are under consideration. Everything turns on the nature of these modifications, for there is no possibility whatever that control to "regulate the flow in an orderly manner" will be discontinued. As an indispensable cur-ain-raiser, the Government might well take the City into its confidence, and state clearly what objectives it considers that capital issue control ought to serve, in war and peace, and exactly how the various

procedures it has imposed, or has in mind, contribute to those objectives.

Under neither heading are the answers readily apparent from a study of the control's actions so far. Even the apparently categorical phraseology of the Chancellor's statement this week conceals important ambiguities. If, for example, it is probable that the General Electric Company's application to issue new preference shares to existing holders might not have been refused if the company had proposed a "rights" issue instead of a "pink form" issue, what is the present position of "rights" issues to shareholders? Are they among the "public offers" which are banned, or are they, by official logic, to be classed with "placings with investment institutions," which are permissible? And does "borrowing essential in the national interest" include the raising of capital for industrial transitional needs, as a clause in the public announcement relating to an approved capital issue by Franco Signs, Ltd., seems to suggest? It seems essential that all doubts should be cleared up before, with the war's ending, the present trickle of applications to raise new capital becomes a torrent.

The Bretton Woods Bill

The "Bretton Woods Agreement Bill" drawn up by the Senate and House Banking and Currency Committees has been brought before Congress. Congressional debate of this measure had been expected to centre on the appropriation of the United States contribution of \$2,750 million for the proposed monetary fund and of \$3,175 million for the Bank. These expectations have, however, been neatly turned by the device of transferring towards these contributions \$1,800 million of the never-used US Stabilisation Fund and making up the balance by the creation of non-interest bearing Treasury notes, which will be replaced by cash only as and when the resources in question are needed. The Bill includes a clause for the repeal of the Johnson Act, which forbids private loans to countries in default on their 1914-18 war debts, but limits the repeal to countries that become members of the proposed fund and bank. It reserves to Congress the right to change the value of the dollar in terms of gold, a concession which should go some way to meeting the objections of some of the more strident gold standardists now so vocal in the United States. Congress is also given the right to decide on any additional contribution to the Fund from the United States, either by way of loans or of increased contribution.

The case for Bretton Woods in the United States is fortified by two authoritative articles in the current issue of *Foreign Affairs*. The first is a general review of the spirit of the Bretton Woods proposals by Mr Morgenthau, the second is a more detailed defence of the Monetary Fund by Dr Harry White. Both are directed essentially to an American audience, and set out to stress the importance to the United States of the restoration of a system of free multilateral convertibility of currencies. Mr Morgenthau argues that

it is necessary only to recall the use of exchange controls, competitive currency depreciation, multiple currency practices, blocked balances, bilateral clearing arrangements and the host of other restrictive and discriminating devices to find the causes for inadequate recovery in international trade in the decade before the war.

If Mr Morgenthau had added to his list the American tariff increases of the 1920's and early 1930's he would have made it more comprehensive and realistic. If he had further mentioned the effect on world trade of the instability of the American economic system in those crucial years he would have gone a long way toward prescribing the conditions under which his ideal of a freely and multilaterally trading world could function. Dr. Harry White's article on the Fund is mainly intended to answer American criticisms from the bankers of Wall Street. It is a fairly easy task and is accomplished with great skill.

Tax Relief for Industry

The Government's post-war policy of industrial taxation, outlined by Sir John Anderson in his Budget Speech on April 25, 1944, has now been defined in the Income Tax Bill published this week. The proposals, inevitably, are technical and detailed. These are the main features:

1. There is to be an initial allowance of 10 per cent of the cost of new buildings and an annual allowance of 2 per cent

to write off the balance of the cost; the annual allowance will be granted in respect of old as well as new buildings, provided they were erected less than 50 years before the date on which the allowance becomes effective. In the main, the allowances are to be confined to industrial buildings; dwellings, retail shops, hotels, showrooms and offices are specifically excluded. The combined effect of the initial allowance of 10 per cent and of the annual allowance of 2 per cent is to write off the cost over a period of 45 years; if the building is scrapped sooner, an allowance will be given in the year of scrapping equivalent to the amount of expenditure still unallowed.

2. There is to be an initial allowance of 20 per cent on capital expenditure incurred on plant and machinery—second-hand as well as new. If the plant is scrapped before the whole of the cost has been allowed, a balancing allowance is to be given as on buildings. When the plant is sold and the proceeds of sale are less than the expenditure still unallowed, there will also be a balancing allowance; if the proceeds of sale exceed the still unallowed expenditure, there is to be a balancing charge. The addition to ordinary wear and tear allowances is to be one-quarter in place of the existing one-fifth.

3. Extractive industries are to be given an initial allowance of 10 per cent on the expenditure incurred in the construction of works. Further, there is to be an annual allowance in respect of expenditure on the construction of works and on exploration and development; the allowance is to be computed for each year of assessment by reference to the relation of the output of the basis period to the remaining reserves of the deposits. (In view of the difficulty of accurately assessing reserves, this may give rise to complications.) As in plant and machinery, there is to be a balancing allowance or charge if the assets are sold.

4. In agriculture, there is to be an allowance on the basis of a ten-year forward spread in respect of capital expenditure incurred on agricultural buildings and works which does not qualify for relief under the existing law. Where the maintenance expenditure as computed for the purposes of the existing maintenance claim is greater than the income from the property, the balance, upon which no relief is due under the existing law, may be set off against other, primarily agricultural, income.

5. There is to be an annual allowance in respect of capital spent on the purchase of patent rights; it is to be given on the basis of spreading the expenditure over 17 years or the life of the rights acquired, if shorter. A corresponding

charge, on the basis of a six-year spread, is to be made on the vendor. There is the usual provision for a balancing allowance or a balancing charge in the event of sale.

6. The existing allowance for expenditure on scientific research is to be extended to payments made after April 6, 1944. An allowance will also be made for capital expenditure on buildings, plant and machinery for research after January 1, 1937.

7. The existing exceptional depreciation allowances (these are special war-time allowances) are to be extended to buildings, plant and machinery not scrapped but retained in the business, if they are worth less than their cost.

Scope of Relief

The scope of the proposals is wide, perhaps even wider than could be inferred from the statements made by Sir John Anderson in his Budget speech last year and during the subsequent debate. Only detailed study of the Bill can reveal its full implications; but it is a great step forward in the overdue reform of the system of industrial taxation.

But reform has been guided exclusively by accounting principles. The Bill does not take into account the fact that replacement of existing plant by new and better plant often involves expenditure greater than that incurred in the purchase of the original plant. If modernisation is to be encouraged, the problem is one of permitting traders to accumulate tax-free funds sufficient, not merely to recover the cost of the old plant, but to buy a better one.

Secondly, the Bill does not provide for the contingency that, during a period of rising prices, the cost of new machinery, though identical in type with the old plant, will be more than was that of the old plant. Both these problems will have to be faced as one means to the end of accelerating the rate of replacement and of the modernisation of British industry.

More French Notes

The latest Bank of France return, covering the week to February 1, is chiefly of interest for its revelation of the sharp increase in the note circulation from Frs. 562,500

million to Frs. 570,000 million. This increase is, apparently, due in the main to the completion of the exchange of currency from reichsmark to francs in the Moselle department. The conversion was made at the rate of 15 francs to the mark, which gave the mark a sterling cross rate of 13.33 to the £, against the official rate of 40 marks to the £ fixed by the Allied military authorities. In other words, the French authorities offered conversion terms which were extremely favourable to the holders of the German currency. The Bank of France has financed this new currency for the liberated department through an advance to the state. This is not the end of this particular influence on the Bank of France circulation, for the conversion of currency in Alsace has yet to be booked in the returns, though the actual process of providing franc currency in the two departments concerned has already begun.

British Railways in 1944

The announcements of the four main line British railways and the London Passenger Transport Board, relating to revenue and dividends for 1944, have been singularly bare of surprises. All the undertakings are repeating their dividends of 1943 except London Transport, which is paying only 3 per cent against 3½ per cent which was expressly declared, a year ago, to have resulted from an exceptional payment to the Board arising from a pool adjustment in respect of 1940. As the accompanying table shows, net revenue has closely followed the lines of 1943, except that the LNER has obtained an increase of nearly £98,000, which is offset by the bringing in of approximately £100,000 less of profit on realisation of investments.

	Share in Pool	Year's Net Revenue	Change in Year	Other Revenue	Total Change in Year	To Reserves	Carry Forward
GWR	£000	£000	£000	£000	£000	£000	£000
LMS	6,871	6,940	+ 6.9	...	+ 0.1	400	18.5
LNER	14,750	15,679	+ 6.4	...	+ 6.4	400	14.4
Southern	10,136	10,753	+ 97.8	35.1	2.5	200	1.4
	6,607	7,000	+ 0.9	...	+ 0.9	...	3.5
Total	38,165	40,372	+ 92.4	35.1	7.9	600	2.0
LPTB	4,636	4,657	+ 0.9	5.6	53.8*	...	9.7
Total	42,821	45,029	+ 91.5	40.7	60.7	600	7.7

* Offset by saving £64,200 through reducing "C" stock dividend.

Clearly, the day has passed when home rail market forecasters could speculate, more or less profitably, on the possibility of changes of one-eighth or one-quarter per cent in dividends on this or that marginal stock, resulting from variations in extra-pool revenue. The market's prime concern now is with events after the war, about which one man's guess is as good as another's. The fact, however, that the marginal junior stocks of all the main line companies are still priced to yield anything from 7 to 9 per cent suggests that the market's approach to post-war possibilities remains definitely pessimistic.

Presumably, there will be some reference to the future in the chairmen's coming speeches, but it can hardly be very definite, in the absence of any evidence that the Government has made up its own mind—or perhaps is in too great a hurry to do so in what may well be a General Election year. Last year stockholders' organised representatives successfully pressed the railway chairmen to take up again with the Government the question of amending the existing agreement with the railways. Though these attempts were abortive, it has been stated that those who have persistently pressed for such a change have "other approaches" in mind.

Argentine Rail Accounts

Interest in 1943-44 accounts of Argentine railways is rather out-dated by more recent events. The accounts of the Buenos Ayres Great Southern and the Buenos Ayres Western railways for the year ended June 30, 1944, do, however, confirm the impression that costs have been rising more steeply than receipts.

The former company is much larger, owning over 5,000 miles of line, extending southwards to Bahia Blanca and Zapala. Its gross receipts, at £13,365,000, are up by £1,223,000, or over 10 per cent; but its working expenses, at £11,470,970, have risen still more—by £1,676,000, or over 14 per cent. The working expense ratio has thus

risen from 80.7 to 85.8 per cent, and net receipts are some £450,000 lower. The same picture, on a smaller scale, of rising receipts and costs is given in the accounts of Buenos Ayres Western, with the difference that a smaller rise in working expenses and a saving of £31,000 over maintenance of rolling stock enable the company to show a slight rise in net receipts of £46,000.

The higher receipts are attributed more to Argentina's continued internal prosperity than to increases in tariffs. The Buenos Ayres Great Southern accounts show that the greatest increases, both in volume and receipts, took place in goods and livestock traffic, these items accounting for nearly two-thirds of gross receipts. The rise in costs is due almost exclusively to the phenomenal increase in fuel costs, which by itself outpaced the rise in receipts in the case of both companies.

The wages agreement negotiated by Sir Montague Eddy with the Argentine Government last autumn aimed roughly to cancel out the cost of wage increases by permitting a 10 per cent increase in goods tariffs. The exchange concessions announced later are of limited assistance in increasing actual receipts and temporary in character. Any hope, therefore, of an improvement in Argentine rail earnings must depend largely upon reducing working costs—which means, notably, the cost of fuel.

Plans for Coal

Mr Robert Foot, Chairman of the Mining Association, claims that 95 per cent of the industry, measured in terms of output, supports his "plan for coal." Two large Scottish undertakings (whose names have not been divulged) have rejected the scheme, but the opposition is said to represent less than 2 per cent of the total number of undertakings. The industry's acceptance of the plan, Mr Foot states, is

neither perfunctory nor half-hearted, but, on the contrary, the coal owners endorse to the full . . . the fundamental conception of the future organisation of the industry on the basis of national service.

On Thursday, the plan was formally accepted by the Mining Association's central committee, which decided to draw up a constitution for the proposed central coal board of mine-owner representatives.

Mr Foot strongly resents criticisms that the industry itself may not be able to find enough capital to effect the necessary modernisation and re-equipment of the mines. He repeats his conviction that

given an assurance of reasonable stability under private ownership, the necessary finances will be forthcoming through the usual channels without recourse to the Government.

But he still has not advanced any evidence to support this assertion, which, to judge by past experience, would seem somewhat over-optimistic.

It is not surprising that the owners should accept a plan which meets their desire for independence and gives them *carte blanche* to run their own industry. As Sir Francis Joseph wrote in a letter to *The Times* (February 3rd), "The owners have their chance—maybe their last chance." But it is surely necessary for owners, as well as miners and the public, to be realistic about the coal question. The future of the Ministry of Fuel and Power is now under consideration by Parliament; it seems unthinkable that Government control over this essential and difficult industry should be lifted. In the meantime, the miners have prepared their reply to Mr Foot and will present their detailed case for nationalisation to the Minister some time this spring. Both sides are now waiting for the report of the Minister's committee of technical experts, upon which the Government's long-term production plans will probably be based. The future of the coal industry is thus very much in the melting-pot, and Parliament will, within the next few weeks, be called upon to examine the agglomeration of plans that are hatched or hatching.

Coal Statistics

The coal production figures for the last quarter of 1944, given in detail on page 260, show a decline in output of nearly 1½ million tons compared with the corresponding period of 1943, though there was an increase of nearly 3 million tons over the third quarter of last year. Output per manshift at the coalface is slightly higher than it was in the third quarter of 1944, though it is 5 cwt below that in the fourth quarter of 1943. Judged by the figures for the

third quarter of 1943, the performance is not so unsatisfactory, but that period was perhaps exceptionally bad, and it would be foolish to look for any long-term improvement from the slightly upward trend of production. Absenteeism has remained about the same, and it is satisfactory to note that the death rate from accidents has not increased, though the rise in minor accidents, especially from falls of ground and haulage, needs to be carefully watched.

But the most disturbing thing about the latest figures is the growing seriousness of the manpower position. Although the total numbers employed have been maintained at about 713,500, this has been done only by "abnormal recruitment," chiefly Bevin boys, a source of supply which Mr Bevin hinted last week will dry up when the fighting in Europe stops. What the Ministry of Fuel and Power calls the net natural wastage, that is, the excess of those leaving the industry over the number of boys entering it, totalled over 11,000 in the last quarter of 1944, suggesting an annual rate in the neighbourhood of 44,000. Nor is this all. The Ministry has for some time distinguished between the numbers nominally on colliery books and those effectively employed at any one time, and the gap between these two figures seems to be growing; the number of non-effectives was some 6,000 higher in the last quarter of 1944 than in the same period of 1943, giving a real net wastage of the order of 50,000 in the year, compared with less than half that rate two years ago.

The Catering Industry

The prospect of an acute shortage of accommodation for holiday-makers in the coming holiday season has led the Government to issue an appeal to industry to arrange for the staggering of holidays. The regional boards of the Ministry of Production have been charged with supervision of the task. The shortage of holiday accommodation is thrown into relief by the publication a week ago of *The Rehabilitation of the Catering Industry* (HMSO, 9d.), a report made to the Ministry of Labour by the Catering Wages Commission.

It would appear that unless immediate steps are taken to implement some of the Commission's recommendations towards speeding up the reopening of hotels in former defence areas, and possibly to supplement them by the provision of other holiday accommodation, the chaotic conditions of the last holiday season are likely to be repeated on an even greater scale. The railways, too, will be faced with larger numbers of would-be travellers.

One part of the report, taking a longer-term view, throws out a suggestion for a national catering corporation, with wide functions ranging from the rehabilitation of the industry to the organisation of the tourist trade, and financed partly by the catering trades, partly by other interests concerned, and partly by the Government. Probably the Commission have already discussed this idea with some of the bodies they have consulted, but they themselves are not sufficiently confident to put the idea forward as a definite recommendation. They hope to receive the views of all the interests concerned, and to make a further report to the Government at a later date.

Shipowners Look Ahead

The annual report of the Chamber of Shipping and the address of its president are usually a reflection of a large body of British shipping opinion. This year's statements are no exception.

The report contains a useful record of past events. In looking ahead, there is the usual insistence, both in the report and in the presidential address by Mr H. T. Schierwater, on Britain's dependence on overseas trade and on the need for maintaining an adequate merchant navy, prospering within a regime of private enterprise. There is, in fact, much preoccupation in the shipping industry with the problem of replacement at costs substantially in excess of pre-war costs; it arises largely, but not wholly, from the disparity between war risks insurance recoveries and the cost of building.

On another subject, the participation of shipping companies in international air transport, the report—not surprisingly—voices the industry's sense of frustration and disappointment in its relations with the Government. The industry was told, in fact, that shipowners were free to fly, if they sought no subsidy and if they could get aircraft.

Australian Banking Control

The Australian Government's proposals for the permanent control of banking in the Commonwealth were discussed this week at a pre-session meeting of the Parliamentary Labour Party. The extremists' demand for complete nationalisation of the banking system was decisively rejected in favour of the Government's scheme put forward in the form of a memorandum by Mr Chifley, the Commonwealth Treasurer.

The proposed legislation follows closely the lines indicated in *The Economist* of November 11, 1944. The Commonwealth Bank board is to be abolished, and the Governor is, in future, to be responsible solely to the Treasurer. The Commonwealth Bank's trading functions are to be extended. As regards the trading banks, it is proposed to make permanent the war-time control achieved through the National Security Regulations of November, 1941. This means the virtual stabilisation of bank profits at their pre-war level, Commonwealth Bank control over all investment operations of the trading banks, and the compulsory deposit with the Commonwealth Bank of the trading banks' "surplus" funds, defining the "surplus" as the excess of assets over those held in August, 1939. The maximum rate of interest on these deposits is to be $\frac{1}{2}$ per cent. At present there is no stipulated ceiling on this rate, but the banks are actually getting $\frac{1}{2}$ per cent. The other provisions of the proposed legislation refer to the closer supervision of the establishment and operation of commercial banks. It is laid down that each bank must maintain in Australia tangible assets equalling its deposit liabilities.

There is no concealing the animus against the trading banks which inspires this legislation. If it is enacted, the trading banks will be prevented from taking further part in the expansion of active banking business in the Commonwealth. Loans and investments will perforce be kept within the strait jacket of their August, 1939, dimensions. Additional resources will have to be placed at the disposal of the Commonwealth Bank which, for its part, will be afforded

DENTURE
COMFORT with CONFIDENCE

Do you suffer pain and embarrassment by wearing a denture which has become loose through gum-shrinkage? Dentists recommend KOLYNOS DENTURE FIXATIVE to make false teeth fit firmly—to restore confidence and to enable you to masticate food properly. A tasteless powder, harmless to denture and user, it will hold your dental plate in correct position, thus obviating painful and embarrassing situations. From all chemists—1/3 & 3/3.

KOLYNOS DENTURE FIXATIVE
The KOLYNOS DENTURE FIXATIVE is a new product for cleaning false teeth. 1/3

added opportunity of competing for commercial business with the trading banks. The rigid restriction of trading bank profits must limit the opening of new branches and other forms of expansion involving capital outlay. The proposed political domination of the Commonwealth Bank is another retrograde step, and one which is in no way justified by the recent policy of the bank. But the main objection to the legislation is its attempt to remove from the trading banks of a new and undeveloped country every real incentive to get new business.

Saving the Lira

The financial situation in liberated Italy has recently been drifting dangerously. Prices have been rocketing; on the black market the value of the lira has depreciated sharply, both in terms of other currencies and against gold, and the turnover in the unofficial markets has been steadily expanding. In the face of the mounting danger to the currency, the Italian Government has this week introduced a series of drastic measures. Most of them are intended to reduce the budget deficit, which is the main gap through which inflation is seeping into the economic system. The main economy item is the abolition of the bread subsidy, which will mean raising the price from 5 lire to 15 lire per kilo. This alone will save the Government the equivalent of £30 million, or about one-fifth of the estimated budget deficit for the current year. One immediate result of this move must appear paradoxical in any anti-inflationary context, namely, an increase in all basic rates of wages and salaries. Other fiscal measures include the seizure of property of high Fascist Party officials, higher direct taxation, increased taxes on wines, foods and spirits, and higher death duties.

More direct attacks on the rise in prices and on the black market in foodstuffs will be made by abolishing the right of provincial governments to interfere with exports of foodstuffs from their own areas and by the compulsory closing of all restaurants, the main buyers and retailers of black market produce. Moreover, the Government has launched a new loan or "National Fund," to which Italian citizens are invited to subscribe in order to help the financial situation. Finally, and definitely an anti-climax, the Government has banned the publication of unofficial lira exchange rates. There are in these many and diverse items the makings of an effective financial policy, but the recent flabbiness of the Italian Government and unresponsiveness of the population do not suggest that such a policy will necessarily be implemented.

Scottish Hydro-Electric Scheme

The North of Scotland Hydro-Electric Board, which was set up in 1943, prepared last year a development scheme for its generating area, which covers the whole of the Highlands and Islands. This scheme envisaged the eventual development of over 100 projects, which would yield a total estimated annual output of over 6,000 million units. Many of these projects will be small, especially those in the remote areas of the western mainland and the Islands, to which the Board has a statutory duty to supply electricity at cheap rates. Elsewhere in its area, the Board cannot supply electricity direct to consumers, but must make available bulk supplies for the use of existing supply authorities. An exception to this rule is that the Board can supply electricity direct, on favourable terms, to new industries, which it is hoped to attract by these means to the Highlands.

The Board's supply of cheap electricity to the remote areas of Scotland, which will inevitably be carried out at a loss, is intended to be paid for by its export of electricity southwards for the general use of the Central Electricity Board. This principle is well implemented in the first two constructional schemes to be prepared by the Board, in each of which a major project which will supply electricity for export to the grid is balanced by small local projects for the remote areas.

Scotland's Electricity Needs

The first constructional scheme has now been approved by the Secretary of State for Scotland, after an inquiry had been held by Mr John Cameron to consider objections

to it.* The main project in this scheme is the damming of the waters of Loch Sloy in order to supply a generating station to be established on Loch Lomond. This project should yield a considerable profit to the Board to finance its schemes in the remote areas, since the bulk of the estimated annual output of 100 million units will be sold to the Central Electricity Board. At the inquiry the CEB stated that this supply was urgently needed in order to meet the requirements of central and southern Scotland, and even indicated that a delay in implementing the project might compel a curtailment of supplies to consumers.

The statement underlines the fact that the Board's activities are needed not only or mainly to bring electricity to the Highlands but to increase the electric supply of the country as a whole. In face of these urgent needs, the rather vague and unsubstantiated claim of the Dumbarton County Council that it needed Loch Sloy for the development of its water supplies was rightly rejected. The Board's second constructional scheme, recently published, proposes a still larger project in Perthshire, which will yield nearly 300 million units per annum, much of which will be supplied to the Grampian Company and other existing undertakers in the region. The two constructional schemes together are expected to cost about £11,000,000.

Exports in 1944

With commendable speed, the Board of Trade has published details of British exports during 1944. Details of imports are still withheld. An analysis of the course of exports by industrial groups from 1938 to 1944, together with indices of the average price and volume, is given in a table on page 261.

The total value of exports rose by £25 million, from £234 million in 1943 to £258 million in 1944. The increase was due mainly to heavier shipments of machinery. Exports of iron and steel, vehicles, cotton and rayon goods were also substantially higher. The value of coal shipments declined still further, from £6.2 million in 1943 to £4.5 million in 1944. The principal changes in the distribution of exports are, first, an increase of £21 million in shipments to British countries, secondly, one of £14 million in those to Russia, and, thirdly, a fall of £11 million in the value of goods consigned to South America.

There was a further rise of 4 per cent in the average price of exports, in line with the general upward trend of costs. The volume—as distinct from the value—of exports showed a slight rise last year; it was then 31 per cent of its volume in 1938, against 29 per cent in 1943.

Clearing Banks in January

The contraction of bank credit which normally occurs in January, following the end-year inflation, has this year been greater than usual. Deposits, as shown in the January statements, have fallen by £82,750,000, compared with the December 31st totals. Of this decline, no less than £50,470,000 is accounted for by a fall of cheques in course of collection and other items in transit and is, to that extent, entirely fictitious. The balance is more than accounted by the fall of £40,236,000 in the banks' cash holding. This reduction compares with a corresponding movement of only £6,361,000 a year previously and provides further evidence of the magnitude of the window-dressing which preceded the end of 1944 balance-sheets. The main earning assets show very small changes. The most important is a rise of £12,684,000 in bills discounted which is offset to the extent of £4,000,000 by a fall in Treasury Deposit Receipts. The cash ratio which had been

* North of Scotland Hydro-Electric Board, Constructional Scheme No. 1. H.M.S.O. 1945, 3d.

As there is now a long waiting list for *The Economist*, subscribers who wish to renew their subscription are advised to do so before the date of expiry. If they fail to do so, their subscriptions will be automatically cancelled as soon as that date is passed, and this may mean a gap of many months before the despatch of copies can be resumed.

worked up to 11 per cent. for the end of 1944, had declined to 10.3 per cent in the January statements.

Racketeers

There were disturbing delayed action explosions in the House of Commons last week when members ruminated upon their Christmas dinners and attacked the Ministry of Food's Poultry (Maximum Price) Order. It was argued that the Order is unenforceable; that it encourages the black marketeer and brings the law into contempt. The criticism seemed to include even the poor birds themselves. Some members wanted them "canalised" and used such disparaging terms as "all stuff and nonsense" and "enormous loopholes."

Considered statistically, home supplies of poultry over the whole country would provide less than one chicken per person per year—so that those people who sat down to their less than one chicken on Christmas Day should count themselves lucky. The removal of the Maximum Price Order, it is said, would see the price of poultry pushed up to the black market level of 5s. a lb.; and this would encourage the killing off of laying hens, with a consequent reduction in the egg supply. It might also encourage the raising of new stocks fed on feeding-stuffs "diverted" from their proper channels or gullets.

Colonel Llewellyn said that the black market was "not so big as a number of people made out." Certainly, to judge by the man who pilfered a Manchester omnibus the other week, with the intention of "flogging" it on the London black market, there are people with grandiose ideas on the subject. The black markets provide the most persistent and intractable of all wartime problems of supply—and one for which the various ministries are often unjustly blamed. As the Minister of Agriculture has pointed out, the problem of the black marketeer is not a new one. A black market flourished as long ago as 1274, in the reign of Edward I, when what must surely have been the first Maximum Controlled Price Order was imposed. The Order referred to poultry.

Shorter Notes

On February 22nd the Ministry of Aircraft Production announced that the price of aluminium ingots is to be reduced from £110 per ton to £85 per ton, delivered at the works of consumers. The reduction brings the price of the metal in this country more into line with its price in the United States. The reduction is important in that it will place British manufacturers on more equal terms with American.

Another increase in the number of persons registered at employment exchanges in Great Britain was recorded between October 16th, 1944, and January 15th last, when total unemployment was 98,720. The figures are classified in a table on page 259. Some rise in unemployment is inevitable and unavoidable in a period of mounting changes in production. Although the January figures may be partly accounted for by weather, a rise at the current rate—for the last two quarters it has been nearly 18,000—needs to be carefully watched, and kept down by all possible means.

Company Result

Imperial Tobacco.

COMPANY MEETINGS

AMALGAMATED
ROADSTONE CORPORATION,
LIMITED

GOOD POST-WAR OUTLOOK

MR G. F. NALDER'S REVIEW

The ninth annual general meeting of the Amalgamated Roadstone Corporation, Limited, was held, on the 20th instant, at Universal House, 60 Buckingham Palace Road, London, S.W.

Mr G. F. Nalder (the chairman) presided.

The following is the chairman's statement circulated with the report and accounts for the year ended March 31, 1944:

We regret we are again so late with the completion of the audit and therefore with the issue of the accounts. Government departments to which our company is a contractor, or sub-contractor, are partly at fault in raising post-mortem price queries long after the event; the difficulty of finalising taxation liabilities is another contributory cause. Liability for E.P.T. has not yet been finally determined, but the auditors advise that fully adequate provision has been made.

PROFIT AND DIVIDENDS

Turning to the accounts, it will be noted that after providing for depreciation, amortisation and war damage contributions, there is a net profit, subject only to taxation, of £143,865, compared with £105,937 for last year. After making provision for excess profits tax and income-tax there remains for appropriation £54,119, of which dividends absorb £45,934 (less tax), leaving £8,185 to be added to carry-forward.

Including the proceeds of an investment since realised for the sum of £5,846, and after deducting as a liability the net amount of the final dividend, £8,550, it is apparent from the consolidated balance-sheet that the net liquid surplus of the company exceeded £83,000, without taking into account capital redemption policies standing in the balance-sheet at £37,585. It gives the board great pleasure to be able to recommend for the year under review a final dividend of 4½ per cent., making 6½ per cent. for the year, and at the same time to pay an interim ordinary dividend of 2 per cent. in respect of the current year.

CONFIDENCE IN THE FUTURE

In conclusion, now that the war in Europe is, we all hope, showing signs of drawing to a close, I should like to emphasise the confidence of the board in the future of this company. Road maintenance has inevitably been neglected during the war, and there are in consequence large arrears to be overtaken. Large programmes of new road construction have been planned. The quarrying industry is in the fortunate position that, while vital to the country in war-time for aerodrome construction, etc., it will be equally vital in the post-war reconstruction period.

Buildings, roads, public works in general are all grist to our mill, and companies such as ours should make an important contribution to the policy of full employment which rightly constitutes one of the principal planks in the post-war programme of every political party. The directors take this opportunity of expressing their appreciation of the loyal service given by the staff under difficult conditions.

The report and accounts were adopted.

BRITISH-AMERICAN TOBACCO
COMPANY, LIMITED

POST-WAR EXPORTS

SIR HUGO CUNLIFFE-OWEN'S VIEWS

The annual general meeting of the British-American Tobacco Company, Limited, was held, on the 19th instant, in London.

Sir Hugo Cunliffe-Owen, Bt., the chairman, after announcing that he was about to retire from the chairmanship and would be elected President, and that the new chairman would be Mr Gray Miller, in the course of his speech, said: The accounts show a net profit for the year, after deducting all charges and expenses for management, etc., and providing for taxation, of £3,404,027, an increase of £82,292 over the net profit for the previous year. Last year we carried forward a balance of £2,505,707. To this must be added the profit for the year as previously mentioned of £3,404,027, less the dividend on the 5 per cent. preference stock of £225,000; on the 6 per cent. second preference stock of £360,000; and the two interim dividends paid during the year on the ordinary stock amounting to £1,979,813, leaving a disposable balance of £3,344,921.

Out of this amount the directors recommend the distribution on March 31st next of a final dividend (free of United Kingdom income tax) on the issued ordinary stock of sixpence per £1 of stock, amounting to £593,944, and the allocation of £250,000 to general reserve, leaving £2,500,977 to be carried forward.

INCREASED COST OF LEAF

In looking at the balance-sheet, on the one hand you may have noticed the large increases in loans and current accounts with both subsidiary and associated companies, and also the increase in cost of stocks, of leaf, manufactured goods, etc.; on the other hand, there has been a substantial reduction in our liquid resources. The second is a corollary of the first.

In my speech at the annual meeting last year, I said that in many countries the price of domestic leaf tobacco had been increased, while in other countries the excise tax had been raised, necessitating a larger investment in revenue stamps, manufactured goods and accounts receivable, all of which had affected the cash position of our subsidiary and associated companies operating in those territories. Last year I said that, in all probability, this state of affairs would entail increased advances by your company to subsidiary and associated companies abroad, and that is exactly what has happened during the year under review.

The reasons for the continual increases in leaf prices vary in different territories, but the result is that a larger amount of capital is required to handle the same volume of business as was done in past years. I anticipate that further advances to subsidiary and associated companies will have to be made during the current year.

Subject to unforeseen events, I also anticipate that the results of the current year will be no less favourable than those of the year under review. I would mention that sales by this company and its affiliated companies continue to be satisfactory.

POST-WAR PROBLEMS

Since I last spoke to you, there have been tremendous events in Europe and the Far East, and victory in both spheres has been brought considerably closer. It has, therefore, become all the more important to ask ourselves whether we are fully

prepared to cope with the problems and to seize the opportunities which are likely to present themselves in the near future.

I think I can answer with confidence that we are doing everything possible, within the limits of the resources allowed to us, to anticipate and prepare for the problems which will arise at the end of the war.

The country has a huge task before it, not only to regain its lost visible export trade, but to increase that trade and to replace, as far as possible, the invisible exports which have been lost. The measures taken to encourage exports must be those measures which will promote an expansion and balanced growth of international trade. Methods designed to force exports and to limit imports tend in the opposite direction and are likely to have a boomerang effect on this country in the long run. The country, and particularly your company, can only prosper in an expanding world economy where there is a steadily increasing standard of living.

NEED FOR INDIVIDUAL EFFORT

It will be a difficult task for this country to recover and increase its pre-war export trade sufficiently to maintain, let alone improve, its standard of living. Every effort must be made, therefore, to recover and expand not only visible, but also invisible exports, including shipping, insurance and finance. So far as it is compatible with a policy of full employment in this country, I include in the latter term participation along the lines I have already indicated in the industrialisation of other countries—a process which, in my opinion, is inevitable.

I believe that this country's future can be rebuilt in spite of all the difficulties which, undoubtedly, lie ahead, but I am firmly of the opinion that the rebuilding has got to be done by the individual efforts of the merchant adventurers of this country who, after all, built its original prosperity. It seems to me that the function of the Government is to support and help the individual trader by all means in its power, but I do not believe in the socialistic theory that the Government—by nationalising that everything—can rebuild the trade of this country and its export position. The war has been fought for freedom—not for the subservience of all individual effort to Government control.

DOUBLE TAXATION

The Government, undoubtedly, fully appreciates the necessity of encouraging visible and invisible exports; indeed, important steps have already been taken in this end, but there is one matter which is of particular importance to the type of visible export trade in which your company is concerned. I am referring to double taxation, which acts as a brake upon enterprise. The negotiation of international agreements on this subject is a matter of urgency but, in my view, the proper solution is for His Majesty's Government to take unilateral action by giving relief from United Kingdom tax to taxpayers in this country in respect of foreign taxes paid by them.

I may mention that the directors have declared for the year 1944/45 an interim dividend of tenpence per £1 of stock (free of United Kingdom income tax) also payable on March 31st next, so that the ordinary stockholders will receive on that date 1s. 4d. per £1 of stock.

The report and accounts were adopted.

'WANDSWORTH AND
DISTRICT GAS COMPANY

SALES WELL MAINTAINED

The annual general meeting of this company was held, on the 20th instant, in Wandsworth, Mr Frank H. Jones, M.Inst.C.E. (chairman and managing director), presiding.

The following are extracts from the chairman's address circulated with the report and accounts:—I feel that the shareholders will regard the accounts as satisfactory.

The sales of gas have been well maintained and do in fact represent a considerable increase above the sales in 1939.

In 1939 it will be remembered that after providing for dividends there was little in excess of £20,000 remaining to the credit of the account, whereas now a more substantial credit appears. I am pleased to be able to say that the total reserves and surplus are appreciably above the corresponding figure of 1939.

STAFF.—The positions of the men who have been called to the Services have, to a very large extent, been filled temporarily by female workers, who have been engaged in almost every department. Without them it would have been impossible to carry on. I take this, the first opportunity of expressing not only the thanks and appreciation of the directors, but also of the proprietors in the essential and useful work they have performed. Additional accommodation has been provided at all the works for the comfort of the workers; at the large canteen built at Wandsworth,

with the most modern equipment, meals can be obtained for the convenience of employees at work during the twenty-four hours of every day.

The joint works and staff association committees have carried on with advantage to the company and the employees throughout the year.

The report and accounts were adopted.

THE GENERAL MORTGAGE
BANK OF PALESTINE,
LIMITED

MR S. HOOFIEN'S STATEMENT

The twenty-third annual general meeting of the General Mortgage Bank of Palestine, Limited, was held on the 11th instant at the bank's offices at Tel-Aviv.

The Chairman, Mr S. Hoofien, M.B.E., pointed out that the main problem, within the province of the bank's activities, with which the community had to deal, was that of housing, not only popular housing, but housing generally. In particular in respect of the near future this problem was a pressing one; labour, occupied before the war in the building trade, had largely volunteered for the fighting forces or joined other industries and would not be available at a time when the need for additional housing accommodation would already be very strongly felt. In fact, the problem was already with us and would grow in urgency from day to day. Laudable efforts were being made to cope with it and the bank had made arrangements to support as far as feasible all such efforts

with its mortgage loans, but more would be needed, and the Government would have to appreciate the necessity of dealing with the housing problem in the same way as all other Governments had been and were doing.

Business, Mr Hoofien went on, had through the effect of further premature repayments, continued to contract during the year under review, but some measure of satisfaction could be derived from the fact that the contraction amounted to only £205,000, as against £375,000 in the previous year. Moreover, while the first half of the year showed a drop of £131,000, the second half showed one of £74,000 only, and it would seem, therefore, that things were moving in the right direction.

The debenture conversion operation which had been mentioned in last year's address had been completed in January of the year under review and all the bank's debentures were now uniformly on a 4 per cent. basis. The bank continued to hold a very large cash balance out of all proportion to its present needs, so as to enable the directors to deal without delay with such business opportunities as are now bound to arise in the comparatively near future.

The usual dividends of 7½ per cent. on ordinary shares and 6½ per cent. on preference shares had been maintained and the bank's record of never having suffered any loss on any forced sale had been upheld again. An amount of £10,000 was transferred to reserve account, partly from the balance of profit, partly from contingency fund.

The report and accounts were unanimously adopted.

but the rate of Government expenditure has been considerable and has allowed the volume of bank cash to be maintained at a relatively high level despite further floating debt borrowing from the market. TDR payments this week amounted to £80 million, which was some £30 million in excess of the effective maturities. The discount market was called upon to take up 37 per cent allotment of the Treasury bills applied for last week and, allowing for the current maturities sold to official quarters in recent weeks, the uptake of new bills must have been appreciably greater than the maturities held by the banks and the market. The Bank return reflects the easier credit position in a rise of £13,085,000 in bankers' deposits.

MONEY RATES, LONDON.—The following rates remained unchanged between February 15th and February 22nd:—
Bank rate, 2% (changed from 3% October 26, 1939). Discount rates: Bank Bills 60 days, 1½%; 3 months, 1½%; 4 months, 1½-1½%; 6 months, 1½-1½%. Treasury Bills: 2 months, 1½%; 3 months, 1½-1½%. Day-to-day money, 1½%. Short Loans, 1½-1½%. Bank deposit rates, 1%. Discount deposit at call, 1%; at notice, 1%.

Exchange Rates.—The following rates fixed by the Bank of England remained unchanged between February 15th and February 22nd. (Figures in brackets are per of exchange.)

United States. \$ (4-88) 4-02½-03½; mail transfers 4-02½-03½. Canada \$ (4-88) 4-43-47; mail transfers 4-43-47. Switzerland. France (24-25)

(Continued on page 261)

VALUE OF EXPORTS OF PRODUCE AND MANUFACTURES OF THE UNITED KINGDOM DURING 1938, 1939, 1940, 1941, 1942, 1943 AND 1944

Stores owned by the Government which are shipped for the use of United Kingdom Forces abroad have always been excluded from the Accounts. Exports of munitions to the Governments of other countries, including supplies for the use of British Government Forces in the Dominions and India were, however, included in the pre-war Accounts, and have also been included in the figures for the years 1939, 1940 and 1941, with the exception of military stores sent to India for use by United Kingdom Forces as well as by the Indian Army. From January, 1942, however, the export figures exclude shipments by Government Departments of aircraft and other vehicles (except tyres and tubes for road vehicles) and arms, ammunition and military and naval stores, which may be referred to shortly as "munitions." The figures for 1938 are essentially comparable with those for 1942 to 1944 as before the war these goods were mostly exported direct by manufacturers or by representatives of the Government concerned; any such goods now exported in this way would be included in the current Account. The value of parcels despatched to prisoners of war is excluded. Goods other than "munitions" which are supplied to any Government are recorded throughout as export whether exported by a Government Department or not. The export figures for 1941 to 1944 accordingly include, for example, exports to Russia of military goods other than "munitions" and of machinery and other supplies not purely commercial, and exports to the United States under Reciprocal Aid. Stores for the Navy, Army and Air Force Institutes, the Y.M.C.A. and other similar organisations are included, unless these are consigned to a Military Control Officer.

Total	1,098,509	909,260	971,360	125,135	150,259

A change has been made in the method of showing an excess of Post Office Expenditure over the Post Office Revenue. Such excess is now included as ordinary expenditure under "Total Supply Services" instead of being shown, as up to July 24, 1943, inclusive, as a deduction from ordinary revenue.

After decreasing Exchequer balances by £372,661 to £3,000,264, the other operations for the week (no longer shown separately) increased the gross National Debt by £27,265,226 to £22,111, million.

BENEFACTORS OF MANKIND

CHARLES FRANCIS BRUSH (1849-1929)
His outstanding work was in the field of light, a subject, akin to life itself, which still engages the seeker after scientific truth, and awaits final definition. In his great old age he was described as "A Pioneer of Light". Could any epitaph be more honourable?

Pioneering

THIS brilliant American scientist interested himself in the study of gravitation and molecular physics, but his great obsession was electricity. He lived through the progressive stages of candle light, lamp light and gas light, and then he contributed the electric arc lamp to the amenities of civilisation, bringing noon-day light at midnight to city squares, boulevards and broadways. His inventions include a dynamo, and he claimed the lead storage battery as one of his original conceptions. The Brush Electrical Engineering Co. Ltd., which bears his name, sprang directly from his activities, and has carried on the tradition of his pioneering through half a century of progress.

T. 150 GENERATORS, TRANSFORMERS, F.H.T. and M.T. SWITCHGEAR, A.C. and D.C. MOTORS, GENERATORS, CONVERTERS, ELECTRIC TRUCKS, BUS and COACH BODIES

The stage is set . . . There is a first-night atmosphere in the radio and electrical industry today. And when the curtain rises on the post-war scene, the star turn will be provided by the Philco Group. This new alliance of progressive manufacturing companies is going to play an impressive part in the development, manufacture and distribution of radio and television as well as electro-mechanical productions of the widest possible variety . . . The stage is set for the great post-war programme of the Philco Group.

BEHOLD the invisible!

THE visible comprises all that can be seen by the naked eye. Within that range of vision man has learned wonderful things. But outside that range lie phenomena marvellous too. And man is now finding ways to 'see' those phenomena. Here are two instances.

Rays of light in the spectrum beyond the violet and below the red, which have vibrations too fine or too coarse for the human eye to receive, are within the range of specially treated photographic plates. Hence, many things about the ultimate structure of matter, hitherto hidden from sight, are now revealed.

Engineers have long sought easy means of gauging strains and stresses. Through the use of Polaroid the strains and stresses in transparent plastic materials can actually be seen.

Both these developments require iodine. They are but two of the many recent applications of this remarkable element.

The IODINE EDUCATIONAL BUREAU was set up in 1938 to collect and collate all available information on iodine. The services of this Bureau are available free to any institution or manufacturer with an iodine problem.

Iodine Educational Bureau

Foot Candles

What are foot candles to you? What is lighting for your works? An essential service to enable your works to function and foot candles are the measure of the illumination. Adequate lighting is the first necessity of good work but it must be more; it must be suitable for the work in hand to provide good seeing and to enable the operatives to make the best use of the machinery and materials that you provide.

Benjamin are in the forefront of the world's industrial lighting engineers with many years experience behind them and a qualified staff capable of handling any lighting problem.

Put your lighting in Benjamin's hands.

BENJAMIN
INDUSTRIAL LIGHTING

THE BENJAMIN ELECTRIC LTD.,
Brantwood Works, London, N.17.
TOTtenham 5252 (5 Lines)

G.E.C. In war or peace - at the service of the Empire

Before the war the G.E.C. planned and installed lighting equipment for tens of thousands of miles of streets and thoroughfares, and pioneered many new developments in this important lighting field.

Today when the entire G.E.C. resources are devoted to the war effort, the Company's technical experience and scientific advancement in all applications of electricity including electronics, are being increasingly enriched, and will be of incalculable value to all concerned with electrification schemes after the war.

Electrification Schemes

G.E.C. Electrification Schemes have been applied to all industries, including: Aircraft Factories; Chemical Works; Collieries; Food Factories; Gold Mines; Iron, Steel and Copper Works; Locomotive and Railway Carriage and Wagon Works; Motor Car Works; Oil Refineries; Ships and Shipyards; Textile Mills; etc.

G.E.C. - always in the forefront of electrical progress

CANCER is not hopeless

Statistics at the Christie Hospital have revealed that in every 100 cases of a common form of Cancer, where early treatment is given 80 are alive after 5 years. In cases of late treatment the number is 18. The moral is obvious—at the first sign of a lump, growth or tumor get medical advice. It may not be Cancer, but if it is there is a good chance that early treatment will be effective.

BUY
3% SAVINGS BONDS
1965-1975

- ★ May be sold quickly through your Savings Bank
- ★ Purchasable in multiples of £5
- ★ Interest paid half-yearly
- ★ Interest is subject to Income Tax, but tax is not deducted at the source.

Issued by the National Savings Committee, London

"Why I read The Yorkshire Post"

"Well, to tell you the truth, it was Robinson who started me off. He's a pretty successful man and I noticed he always read it. So I began, largely out of curiosity. Then I found its judgments were pretty shrewd, its opinions authoritative and trustworthy. So I've kept on with it ever since. "As you know, I've got a finger in many pies and it is essential for me to know what the North is

thinking and doing. I get to know by reading The Yorkshire Post. "Another thing. Northern industries, politics and finance are more closely linked up with the rest of the country nowadays, and reading The Yorkshire Post helps me to see national questions in better focus. "I also rely on The Yorkshire Post to give me full reports on many northern industrial meetings that I cannot get elsewhere."

Bovril is so warming

★ On cold dreary days, you'll welcome the warmth and cheeriness of Bovril. It helps to ward off chills. It stimulates you and gives a feeling of well-being. The war has changed many familiar things, but the high quality of Bovril remains the same.

Verdict on the Crimea

THE recent conference of the three Powers in the Crimea faced realities and difficulties in so exceptional a manner that the results constitute an act of State on which Parliament should formally express its opinion. With these words Mr Churchill began a long and eloquent appeal to the Commons to pass judgment on the Crimea agreements. His speech was one of his most masterly and contained many illuminating personal details of his journeying to Malta, the Crimea and Cairo. It did not, however, add very much to the official statement already published on the results of the Conference. On the crucial issue of the settlement for Germany, Mr Churchill said even less than the official account. He referred, it is true, to the Allies' determination to destroy Germany's capacity for aggression and, from remarks made both by him and by Mr Eden, it can perhaps be inferred that the chief transfers of German territory to Poland will be made in East Prussia and Silesia and not, as the Oder plan entails, in Pomerania and Brandenburg. But the Prime Minister made no mention of the central problem of a successful agreement over Germany—the creation of a German administration acceptable to the occupying Powers.

It is on two general considerations that Mr Churchill appears to place his hopes for a secure settlement. The

first is unity and confidence between the Big Three.

I trust the House will feel that hope has been powerfully strengthened by our meeting in the Crimea. The ties that bind the Great Powers together and their mutual comprehension of each other have grown.

The second is the creation of an association of nations which, unlike the old League, will be strong enough and well enough armed to preserve the peace. In this body, the great and the small powers will work together and "the Great Powers must seek to serve and not to rule." These general provisions are unexceptionable. There will be no room for aggression if the Great Powers can remain united in friendship nor will the smaller nations resent this hegemony, if it is the servant and not the master, of international life. Unhappily it is not so much on admirable general intentions but on precise points of detail such as the future administration of Germany or the present frontiers and future government of Poland that the effectiveness of general security arrangements will, in the event, depend. Mr Churchill would have proved more decisively that the Crimea agreements will serve as the basis of a workable peace if he had made it clearer that the detailed decisions it involves are as satisfactory as its general spirit.

On this point many members of the House of Commons obviously have doubts. The vote rejecting the high Tory

amendment on the Polish issue was overwhelming; but several of the speeches made in support of the Government gave expression to uneasiness and questioning, and these feelings cut across ordinary party divisions. Mr Churchill's discussion of the problem was not wholly reassuring. On the issue of Poland's future frontiers, he had little to add; he defended the Curzon Line as ethnically just both to the Russians and the Poles. All modifications necessary to the actual drawing of the frontier would, he said, be in Poland's favour; but he gave no hint whether the question of Lwow is still open. The frontier issue, however, as has always been clear and as Mr Churchill admitted, is secondary to the question whether Poland, within any frontiers, will enjoy full sovereignty and independence.

Even more important than the frontiers of Poland, within the limits now disclosed, is the freedom of Poland. The home of the Poles is settled. Are they to be masters in their own house? . . . Or are they to become a mere projection of the Soviet State, forced against their will by an armed minority to adopt a Communist and totalitarian system?

This is indeed the question "in all its bluntness." It cannot be said that Mr Churchill really answered it, or rather that he added anything to the assurances and safeguards already promised in the Crimea Agreement. He repeated the guarantee of a provisional government based on "Poles of all democratic parties," and, provided the invitation were issued by the new government to be installed in Warsaw, he promised international supervision for the holding of free elections. When pressed, however, to define more closely what these guarantees meant—what, for instance, is a "democratic" party, what procedures are being adopted by the Allied Commission in Moscow, in what manner invitations to join the new Government are being issued—Mr Churchill had nothing to say. He even confused the issue still further by making an unworthy jest about the difficulty of deciding, even in Britain, which parties are democratic and which are not. Mr Eden was a little more explicit. He stated that

we would not recognise a Government which we did not think representative. The addition of one or two Ministers would not meet our views.

This negative definition was the only expansion of the Crimea terms given throughout the Debate. Yet it is clear that the creation of a genuinely representative Government is the last opportunity of salvaging something from the Polish disaster. In spite of the difficulty experienced by the Prime Minister in defining democratic parties in Poland, it is essential that the main groups—the Peasants, the Socialists, the Christian Democrats, the Nationalists, and the Communists—should be the basis of the adminis-

tration. It is equally obvious that the men chosen to represent these parties must be leaders of the standing of a Witos, a Zulawski, or a Sapieha. These men are known. There is no mystery about them. They should be invited, not as personalities but as party leaders, to Moscow. If Mr. Churchill had given definite assurances that his Government was using all its influence to set up an all-party coalition of known and trusted party leaders, his defence of the Crimea proposals would have been very impressive. As it is, his speech gave the unhappy impression that all initiative in Polish problems has now been handed over to Moscow and that the British Government would be prepared to back any Russian decision provided a certain amount of face-saving appearances were preserved. Mr Eden somewhat corrected this impression. There were some Polish Governments the British would not recognise. But he, too, gave little impression of a positive approach to the problem of securing, at this eleventh hour, a genuinely representative Polish Government.

Unfortunately the critics of the Government failed equally to suggest a constructive approach. They concentrated on the whole on the territorial issue—on which, in spite of the brusqueness of their procedures, the Russians have a reasonable case—and neglected the vital matter of the genuine independence of the Polish Government. Moreover, their speeches were in many cases informed with only a very lightly veiled spirit of hatred for all things Russian. They offered no attempt at a solution. On the contrary, they proposed implicitly that the breach between the Allies should be widened as far as possible, whatever the consequences for Poland, Europe and the world.

It is precisely because the Polish issue is central to any plan for effective peace that a friendly but determined effort should be made in the next months to secure a representative administration in Poland. The British and the American Governments cannot shelve the issue and leave the Poles without any guidance on the points for which they must press and the compromises which they would be advised to seek. The basis for negotiation must be the recognition of the major parties in Poland, the acceptance of their well-established leaders and the coming together of these men—all of them, or almost all of them—in a provisional Government. Secondary provisions are freedom of the press, of speech, and of meeting within the limits set by military necessity—in short, a quick end to the suspicious unanimity of the Lublin regime. It should also be pressed on the Russians that, as a solvent of suspicion, foreign correspondents and observers ought to have as much freedom in Poland as they enjoy in Greece or France. Only under these conditions, formulated as precisely as possible, can the general provisions reached at Yalta be turned into concrete achievement.

regarded as plague-spots, to be diagnosed by specialists and treated as something apart from the rest of the community. Their boundaries have been redrawn. The Scottish Development Area, for instance, now takes in Glasgow and also Dundee, which, being of all towns the most dependent on a single industry (jute), is consequently highly prone to unemployment. The north-east area now includes parts of the Northumberland coast, Middlesbrough and the Cleveland district of the North Riding. The port towns of South Wales, Cardiff, Swansea, Newport and Llanelli, which for some inexplicable reason were left out of the Special Area, are now on the map. These additions, which are as sensible as the original omissions were foolish, should facilitate the planning of the regions as an economic whole. The present schedule (South Wales, Central Scotland, the north-east coast and West Cumberland) is not sacrosanct. The Board of Trade can add or subtract districts from the list of Development Areas as and when they approach or recede from the danger level. The first six clauses of the Bill deal with the measures that can be taken to assist the Development Areas. The

Board of Trade is empowered to acquire land for the building of factories and may itself build factories. It can also acquire derelict land for the purpose of bringing it into industrial use or improving its condition. It can make loans to non-profit-making trading estate companies which provide factory buildings and communal facilities to private firms. These are familiar lines of approach, but Clause 4 breaks new ground in providing that the Treasury may assist any individual who proposes to carry on an undertaking in a Development Area by making loans or by making annual grants "either towards the cost of paying interest on moneys borrowed or to be borrowed for the purposes of the undertaking or generally for those purposes." This clause, as phrased, is very wide, and though it will no doubt be administered cautiously—the Treasury is to have the assistance of an advisory committee—it introduces the principle of the subsidy, from which, in undisguised form, the Government has hitherto shrunk. Further, grants or loans may be made by the appropriate Ministries, with the consent of the Treasury, towards the cost of improving the basic services in any Development Area—this includes road and rail communications, docks and harbours, gas and electricity, and health and housing services. The White Paper on Employment Policy indicated other measures, such as the concentration of munitions production and the placing of Government contracts in the Development Areas, which presumably do not require legislation.

These clauses for the encouragement of the Development Areas are the main substance of the Bill. It may be, however, that more controversy will revolve around the clauses in which it attempts to tackle the problem of limiting development in congested areas. Two proposals are made, one of general and the other of limited application. Clause 8 stipulates that any proposal to build a new factory of over 3,000 square feet must be notified to the Board of Trade within three months. In general, the Board of Trade will have no powers to approve or disapprove, but the notification will give it an opportunity to exercise its arts of persuasion. In some areas, however, there is to be the right of prohibition. These areas, unlike the Development Areas, are not specified in the Bill; under Clause 9, they are to be named by the Board of Trade in Orders, each of which will require an affirmative resolution of Parliament. The Bill does not define them more closely than to say that they are those areas where further development "would be seriously detrimental to the proper distribution of industry."

Both these clauses are in accordance with the recommendations of the Barlow Report. But the Barlow Commission also proposed that a Central Authority should have powers from the outset to prohibit industrial development in London and the Home Counties. London will presumably be scheduled under the new Bill, but uncertainty will remain—and delay will be inevitable—until the scheduling Order has been issued and accepted

by Parliament. The restrictions on building do not, moreover, apply to the replacement of war-damaged premises. This may mean that many of the bombed factories in Greater London will merely be replaced, and a valuable opportunity will have been lost to secure a greater degree of decentralisation.

Over and above the specified powers contained in the Bill, the Board of Trade will be able to exercise a powerful direct influence over industrial location so long as building materials and labour are in short supply through the issue of building licences, without which no firm can build. By ensuring priority for building in the Development Areas, the Board can steer industry in the desired direction during an initial period, which may well be long enough to be decisive for the rehabilitation of these regions. Mr Dalton himself places great reliance on this method, and he has stated:

If in the last resort a manufacturer wants to put his factory somewhere against our advice, there is no power to stop him, but we have powers which approximate to powers of compulsion, because he will have to get a building licence which is only given on the advice of the Board of Trade.

The emphasis on new industrial building is undoubtedly in accordance with the needs of the Development Areas themselves, especially in Scotland and the north-east area, where the cry has persistently been raised that they received less than their fair share of new building for war purposes. Trading or industrial estates have been successful wherever they have been established; their scale of operation has hitherto been too small to make any real difference to employment, and it is satisfactory that they will be encouraged and extended. The small or medium-sized manufacturer is only too ready to accept the facilities offered at moderate prices and to concentrate on production without having to worry unduly about his overhead charges. It is to be hoped that there will be a close liaison between the section of the Board of Trade responsible for development policy and the two projected Finance Corporations, which should provide valuable assistance in carrying out the policy. There is also need, in some cases, for large-scale public works in the areas. Projects such as the Forth road bridge, the Severn bridge and the Tyne tunnel are regarded in the Development Areas as works of pressing importance, but there is nothing to indicate whether such large-scale schemes will be included in the Treasury grants. Housing is apparently to be included in the "basic services" which will receive Treasury assistance, and rehousing is certainly one of the most urgent needs of the areas, but there is nothing to show that the schemes will be effectively linked with those of the Ministry of Health or, indeed, whether the whole policy will be adjusted to the needs of Town and Country Planning.

All these are matters of administration, and if the

The Distribution of Industry

THE Board of Trade's Bill for the Distribution of Industry would be more appropriately called a Bill for the removal of the depressed areas. In essence, it is the old Special Areas legislation, which it supersedes, stream-lined, strengthened, and brought up to date—but still Special Areas legislation. Its main purpose is to promote a more balanced and diversified industrial development in areas which, because of their dependence on a few heavy industries, are exceptionally liable to unemployment. It is very far from being a measure for regulating the nation-wide distribution of industry, and it is in a far more limited context than the Barlow Report that it should in the first place be considered.

Nevertheless, within this narrower context, it must be acknowledged that the new Bill represents an advance on the Special Areas Acts. Had the Government possessed (and used) similar powers in the 1930s, much of the suffering and unemployment in the depressed areas might have been mitigated. The change of name from "special" to "development" areas is in itself symptomatic of a new attitude, in which the scheduled areas are no longer

A CAPITAL ANNUITY

Part capital, part interest . . . £315 per annum guaranteed for twelve years . . . of which, on average, £271 is capital repayment and £44 is taxable interest . . . and, after the twelve years, an annuity of £472 10s. (subject to tax) continuing for life . . . this can all be secured by a male life aged sixty for a present investment of £5,000

administration is energetic and not too closely limited by finance, a great deal can undoubtedly be done, under this Bill, to rehabilitate the Development Areas during the transition period. The question should, of course, be raised whether the Board of Trade is right to use strong-arm tactics in exploiting its wartime powers to get industry to settle in the Areas. In some cases, economic harm can undoubtedly be done, as when Richard Thomas's continuous strip mill was built at Ebbw Vale for political reasons. But these cases are likely to be few—it is only in the heavy industries that transport costs are a major consideration, and even in the Richard Thomas case some other site within the Development Area, as now more broadly defined, might have been fully economic. In the great majority of cases, industry's dislike of the depressed areas has not been based on tangible, or at least not on economic, factors. The remoteness of the areas of heavy unemployment and the bleakness of life in them; the bad housing; the absence of amenities and social life; the tradition (generally unfounded) of labour unrest; the superior social attractions of the home counties for the directorial and managerial grades—these have been the decisive factors, and these the Government is certainly right in correcting (so far as they are legitimate) or over-riding (so far as they are illegitimate), in view of the great wastage of social capital in depressed areas.

There is some evidence that employers, once they get over the psychological hurdle, find the depressed areas just as economic as more prosperous areas—if not more so. The war has broken down many prejudices; evacuation and dispersal have increased the mobility of business men, willy nilly, and many firms now in the development areas have been so well satisfied with the quality of the labour that they are preparing to remain, apart from any social considerations. The decision of Courtaulds and Imperial Chemical Industries to set up a nylon factory in Pontypool is based on economic, as well as on public-spirited, grounds. The evidence from Scotland is that many more firms are anxious to start peacetime production than can be accommodated in existing factories. The present trend, which is likely to develop after the war, is for the range of industries which can be regarded as mobile to increase, and for a policy of mobile industry to be preferred to one of mobile labour.

*

For these reasons, a policy of exerting considerable pressure, during the short period, to get the existing Development Areas on their feet, is certainly to be commended. But as a vehicle for longer-term policy, the effectiveness of this Bill is much more doubtful. When building licences and labour priorities are no longer needed, the attractions held out by the Development Areas

Post-War Holidays

NO one now believes that the "last all clear" will herald an immediate resumption of pre-war life with its abundance of good things. The continuance of rationing, with only gradual relaxation, is accepted as inevitable. Nonetheless, the armistice with Germany will release a flow of spending—however much discouraged officially—which will pour through every gap not closed by definite *per caput* rationing. The end of the war will break the mould in which the social conscience has been set for the last five years. Few will give a second thought to saving fuel or money, making do and mending, or taking journeys which on any definition are not "really necessary."

Many of the journeys will be the prelude to the first holiday since the last days of peace. Reunited families, demobilised ex-servicemen on paid leave, workers on holidays with pay, newly married couples, families of children who have never seen the sea, and others who have forgone wartime holidays, may well mean that half the population will be holiday-making in the first year or so after the war. It seems that the Government does not intend to put obstacles in the way of these holidays.

will have to be very much stronger than they were before the war to exert any influence at all on the location of new industry (in 1935, out of 488 new factories built in England and Wales, only two were in the Special Areas). The powers contained in the Bill might be enough; but only if they were most generously administered. The administration of the powers will make all the difference: and after the Board of Trade has lost its temporary personnel, it may well relapse to the *laissez faire* mood shown in its evidence to the Barlow Commission. The present President, Socialist though he is, has said that "the business men of the country are best able to judge the business needs of the country" and has disavowed a coercive policy.

Moreover, the other side of the policy, the powers to prohibit development in congested areas, is equally weak. Local opinion will probably prevent the scheduling of any areas other than London; and purely persuasive powers may be wholly ineffective in normal times. This side of the Bill may perhaps be the means of diverting a few factories from the Great West Road to some other non-depressed area. It can hardly be said to embody a workable policy for permanent control of the location of industry. Indeed, it serves to illustrate the point made on more than one occasion in these columns, that an effective location policy requires far more drastic interference with full economic processes than public opinion probably will—and possibly should—accept.

A judgment on this Bill therefore depends entirely on how much hay can be made in the existing Development Areas while the sun of wartime control shines. It is possible that quite a lot can be done—though it is difficult to believe that the maladies of these areas can be completely cured so long as there is no effective policy for their basic industries of coal and steel. But, thereafter, there will, under this Bill, be an effective policy for guiding the distribution of industry only if it can be assumed that emergent depressed areas will be recognised at a very early stage, that they will be promptly scheduled and that the shock troops of assistance will be rushed to the scene at once. Nothing in the peacetime behaviour of Government departments justifies very much optimism on this score. And even if these steps were in every case taken in good time, the policy would still be one of first aid rather than of prevention.

The Bill should therefore best be regarded as a temporary reconstruction measure. As such, it is welcome. But the problem of securing, as a permanent policy, a balanced distribution of industry remains largely untouched by it—and will require many more years of research into the nature of the relationships between government and industry before it can be effectively tackled.

The soft-pedalling of the campaign for "holidays at home" and the urgent appeal that arrangements should be made for staggering holidays are evidence of this.

The mere removal of prohibitions is unlikely by itself to produce a satisfactory state of affairs. Scenes at railway stations and endless queues for meals and beds at seaside resorts may be accepted as an inevitable concomitant of war, but post-war holiday-makers will deserve and demand a better deal. How to ensure them more comfortable journeys and a measure of welcome at their destination promises to be one of the minor problems of the immediate post-war period. It seems that the Ministry of Production is to assist in staggering holidays, while the Ministry of Labour is to be the Government agency to supervise the overall problem, operating through the Catering Wages Commission.

*

This Commission, set up in July, 1943, under the Catering Wages Act of that year, was given the primary function of inquiring into wages and conditions of employment in the catering trades, and of recommending, where

necessary, the setting up of wages boards. This side of its work has proceeded successfully and speedily; a number of wages boards have been recommended and two have already been appointed.

Provision was made in the Act for the Commission to inquire into those aspects of the catering trades that concern the requirements of the public and of overseas tourists. About the time of their appointment, this somewhat vague provision was given point and decision by an instruction of the Minister of Labour that they should inquire into the effect of war conditions on the hotel and catering services and recommend the steps to be taken to meet the requirements of the public, including visitors from overseas, in the immediate post-war period.

These inquiries have been pursued concurrently with the Commission's work on wages boards, and they culminated a fortnight ago in a tentative report* to the Minister of Labour, outlining the present state of the trade and making a number of recommendations concerning de-requisitioning, payment of war damage claims, priorities for re-equipment, the restoration of amenities of which coastal resorts were deprived because of defence measures, the absorption of suitably qualified ex-service men and women into the trades, and so on. Many of these recommendations will command immediate and general agreement, and Mr Bevin has stated that there is no reason why the Government should not take immediate steps to implement them. He did not, however, indicate which of the recommendations fall into this class.

*

It is perhaps hard on the Commission that they have had the onerous task of covering the whole sphere of catering, as well as the allied trades, in addition to their work on catering wages. No blame should be attached to the Commission, but it might be questioned whether a wages commission was the best body to grapple with the whole gamut. Their weakness is apparent in that, after twenty months of consultation and deliberation, their main proposal on catering as a whole is put forward only as a tentative suggestion, and as a stimulus to fresh evidence.

The proposal is that there should be established a national corporation for the catering industry. The intention is to issue a further report later, when the views of the trade on the proposal have been examined.

A body such as the Commission envisage would be new to this country, although the idea is commonplace on the Continent. It would have the widest functions in regard to the catering industries and others necessarily connected with it. Its activities would include assisting the industry to get on to its feet again, maintaining a statistical and research office, sponsoring national propaganda at home and abroad, dealing with training schemes, co-ordinating the interests of the catering industry with allied industries, assisting in staggering holidays, promoting workers' holidays, classifying and grading catering establishments, establishing information centres, and generally keeping a watchful eye on the tourist trade and the interests of holiday-makers and travellers.

The Corporation would be financed from four sources, and each fund would be earmarked for use accordingly. Rehabilitation and development would be financed by a "sleeping tax" yielding nearly £500,000 a year. Secondly, a Government grant would cover the overseas tourist trade activities, since the gain from this source is widely spread. Thirdly, contributions from local authorities, transport and other non-catering but interested parties, would be earmarked for holiday traffic promotion generally. A further fund, yielding over £200,000 annually, built up from fees paid by catering establishments for registration, would be shared among all the Corporation's activities, although the bulk would be used for the benefit of the catering trades.

It is still too soon for the considered views of the trade to be available. Certainly there will be neither wholehearted support nor wholesale rejection of the idea. Perhaps the main factor is likely to be the intense indivi-

* "The Rehabilitation of the Catering Industry." HMSO. 48 pages. 9d.

dualism of the various sections of the catering industry, each thinking it is separate and sharply divided from the rest in function and service. In the event, what is there that the eel and pie shop and the hotel of international repute have in common? The Corporation's blanket may be too large to be smoothly placed over the conglomeration of interests that exists to provide catering services. Although some, or even all, sections of the trade would welcome the 'fruits of the Corporation's work, the trade in general is likely to be sceptical of the value or practicability of any overall organisation. Some want to wait and see what help they can get from the new finance corporations.

There is no denial that definite assistance in a number of directions is required from the Government, and a modified form of national catering corporation might eventually be found to be of assistance.

Whatever the ultimate fate of the proposal, it would be a pity if overseas tourist trade development were to be lost sight of. There is still, perhaps, much to be said for a separate body to deal with tourist traffic, and for its immediate establishment. The Travel Association, with which the Commission have been in consultation, are preparing to expend the balance of their funds in preparatory work. The Catering Wages Commission, in recommending that the Government should finance the overseas tourist side of a national catering corporation, accepts the thesis that interests other than the catering trades stand to gain from an increase in this traffic. In fact, all forms of transport, personal services and retail trade—and, indirectly, industry as a whole—would benefit by more overseas visitors. The Treasury itself, through indirect taxation, takes its share of the revenue thus brought into the country. Tourists should not be looked upon as only a peacetime phenomenon or only as pleasure seekers. They include business men; and even American soldiers can be regarded as tourists. At the moment, according to a recent statement of the Chancellor of the Exchequer,

of our current dollar receipts the dollar equivalent of the pay of the United States forces stationed in the sterling area is much the most important element.

While this will not be the case after the war, steps should now be taken to ensure that revenue from overseas tourists should be as high as possible.

*

The catering industries' need for Government assistance is a matter of urgency. The lifting last year of the defence area ban on travellers resulted in an influx of visitors to East and South-East coast resorts which they were ill-prepared to receive and with which the railways could not cope. This year the number of holiday-makers is likely to be considerably larger, in view of the mood engendered by the military situation. People are now prepared to permit themselves some relaxation of effort. If the Armistice should come before the main holiday season, the demand for holidays will be heightened. The immediate prospect is one of an acute shortage of holiday accommodation.

Seaside hotels and boarding houses are being de-requisitioned. But this is only a first step. In many cases furniture and equipment were requisitioned too, and hotels and boarding houses have had their share of war damage. Labour is needed to repair hotels, furniture and equipment to restock them. These have to be found in the face of supplies scarcely adequate to meet minimum needs for more vital purposes than holiday-making.

It is tempting to suggest that people should wait longer for luxuries such as holidays away from home, but it is unlikely that mere exhortation would have much effect. And if people rate their holiday so high on the list of their post-war demands, perhaps facilities should be accorded them, provided it is made quite clear that a postponement of some building and some domestic re-equipment might be involved.

The main difficulty is that cheap accommodation will be relatively scarcer than the expensive hotel. The problem provided by the extension of holidays with pay would have been a difficult one to solve in any case. Five years

of war have hindered even the most elementary steps towards solution, and have aggravated the problem.

No doubt there is room for Government action, in view of the Holidays with Pay Act, 1938, and the encouragement given to holidays-with-pay schemes. The idea has been mooted that the Government itself should run holiday camps, but this, mercifully, would be destined for unpopularity. Army camps and industrial workers' hostels in suitable areas could be offered to voluntary societies. Local authorities, having run British restaurants, might

in holiday areas expand into the holiday camp trade. Perhaps the Government could best assist the provision of cheap holiday facilities by a system of supply priorities, and the allocation of furniture and equipment at low prices, to establishments with scales of charges below a certain level. Such a system would be of help to non-profit-making organisations, and commercial enterprises on these lines might qualify for special loans. No previous suggestion along these lines appears to have been made, and it might be worth serious attention.

NOTES OF THE WEEK

M. Bidault's Visit

It is known that during the visit of the French Foreign Minister to London, long-term questions of treaties, alliances and permanent relationships were shelved in favour of more pressing problems. The most urgent political question is France's reaction to the Crimea agreements and its decision on the convening of the San Francisco Conference. Since General de Gaulle refused to confer with President Roosevelt, the French Government remained in ignorance of the precise details of the Yalta discussions until M. Bidault reached London. It is to be hoped that close acquaintance with the facts will satisfy the French that their interests have not been overlooked and that they will see their way to becoming joint-conveners of the San Francisco Conference, even though they are not in a position to modify in advance the proposed procedure on voting.

These questions concern the status and standing of France as a Great Power; but far more pressing are the problems of France's survival as an ordinary functioning economic community. The country's first need is more supplies—coal or imports to replace the coal which the French are supplying to the Allied armies, a certain amount of wheat, fats, and above all shipping to bring into France the supplies—including vegetable oils—which are only awaiting shipment from the French colonies. In all this, France must rely on Allied generosity. Mr Churchill has said that, owing to the coincidence of the peak of the German war with the peak of the Japanese war, shipping space has never been tighter. This may be so, but it is difficult to believe that if Britain ate into some of its food stocks, and if the United States reduced some of its non-essential seaborne imports from South America, more supplies and ships could not be spared. The British are sending over 1,000 reconditioned lorries. This is a good start, and it is to be hoped that M. Bidault's mission has secured other tangible results of the same kind.

The Greek Scene

According to official Greek statements, the agreement between the Greek Government and EAM and ELAS is working satisfactorily. The surrender of arms by ELAS is proceeding smoothly, though some ELAS groups are reported to have crossed the frontier into Yugoslavia. The National Guards and British units have already taken over some areas held by ELAS. Peace has been restored, but political excitement continues to run high.

Mr Churchill has reminded the Greeks that "the intense political activity of the Greek mind must continue to give way to practical problems of economic reconstruction." There are many signs that this "intense political activity of the Greek mind" is now much more noticeable on the Right than on the Left. It is true that the peace has been without the vengeance that was feared, but, nevertheless, several unpleasant incidents have occurred. The Orthodox bishops who have served as chaplains to ELAS units have been dismissed from the Church; and there have been complaints that employees have been penalised who were suspected of sympathy for E.A.M. M. Rallis, the Minister of the Interior in General Plastiras' Government, has resigned in protest against the appointment of a special Under-Secretariat for the Gendarmerie and Police—an ill-famed institution since the days of the Metaxas regime—and the Under-Secretary for the Gendarmerie is meanwhile the acting Secretary of the Interior. Political emotion has also been kindled with the trial of the quisling minis-

ters who are now openly defended by the Royalists. General Plastiras' Government seems to be internally less coherent than it pretends to be.

The Liberal ministers, headed by the Foreign Secretary, M. Sophianopoulos, try hard (and not without some success) to make matters run smoothly. They insist on fair treatment for the defeated but still buoyant Left. At the same time the Government tries to divert political passions from internal to foreign affairs; and a strong anti-Bulgarian campaign, culminating in the demand for a revision of the Greco-Bulgarian frontier seems to be in full swing in Athens.

The Housing Muddle

The fog surrounding the Government's housing policy gets thicker and thicker. Mr Sandys's latest statement has been the most confusing of all and has resulted, first, in a variety of contradictory interpretations of his meaning, and second, in an agonised plea from Parliament and the press for a fuller and more satisfactory explanation of the situation through a debate, a White Paper, or both.

The statement in question announced, rather apologetically, a change of policy and a switchover from the construction of temporary to that of permanent houses. This, the Minister said, was necessary because factory space could not be released from war production, because labour, timber and steel were still scarce, and because local authorities could not find the extra sites for temporary bungalows. Consequently, the housing programme for the moment would be limited to a small number of prefabricated bungalows (plus the 30,000—now "a substantial proportion" of the total—to be despatched from the United States) and to the construction of less highly prefabricated types.

The conclusion to be drawn would therefore appear to be that the delayed end to the war has made it impossible to carry out the promises made last year. That, by itself, is understandable, and only a moderate virtuosity would seem to be needed to put across this very simple explanation. But the situation is confused by Mr Sandys's peculiarly contradictory assertion that the change in policy will not result in any fewer houses being built—this in spite of the fact that less prefabrication is to be used and that permanent and not temporary houses are to be put up. Were, then, all the arguments of time-saving and labour-saving once so plausibly put forward in favour of the Portal house quite untrue?

Mr Sandys is getting into deep and dangerous waters. There is no longer any certainty that the Government's one aim is to find shelter for as many people as possible as quickly as possible. The justification of the latest volte-face is said to lie "in the interests of town planning and of public economy." Here, perhaps, is the clue to the conundrum. The temporary housing programme has to be abandoned—not merely delayed—because there is no room for it in the overcrowded towns where it is chiefly needed. It also has to be abandoned because the Government considers it too costly a makeshift—even though the inevitable slowing-up in the housebuilding programme means overcrowding and discomfort for thousands of families. These two considerations would provide an explanation of why the temporary housing programme has to be abandoned and not merely delayed. The slackened progress of the war, if that had been the only difficulty, would have deferred the temporary house programme, but would still have allowed it to make its contribution of time-saving and labour-saving

at a later date, when it would have been still more necessary. If these are the reasons for the change of policy, as appears to be the case, the Minister of Works would be well advised to complete his confessions. Whatever the disappointment he may give, a full explanation of the difficulties encountered and the alternatives offered can only do good to his reputation and may help to reverse the unfortunate impression made last week. As it is, even those who are most ready to give the Government full credit are confused, perplexed and increasingly suspicious that the right order of policy is being reversed. The obvious course of wisdom is to have a moderate long-term programme of "traditional" housing, with the largest possible supplementary and immediate programme of "untraditional" houses—which should be permanent for preference but temporary if necessary. The Government seem to be moving in the precisely opposite direction.

The Severn Barrage Scheme

The Panel of Engineers appointed by the Minister of Fuel and Power in 1943 to review the conclusions of the Severn Barrage Committee of 1933 has now issued its report. This supports the main recommendations and findings of the committee, advises certain technical modifications in the project, and maintains that it could, in certain circumstances, be economically justified. The main points of agreement between the two reports are that the site chosen for the barrage, the "English Stones" reef, is the most advantageous; that single-tide working—the development of power on the falling tide only—is preferable, under existing conditions; and that the committee's estimate of available power, an average annual output of energy at the barrage sub-stations of 2,190 million kilowatt-hours, is substantially correct.

The modifications include the abandonment of the pumped storage suggestion, the installation of larger turbines, a more cautious assessment of the value of the basin above the barrage as a new dock area, and the recommendation that rail and road crossings of the estuary should be regarded as projects distinct from the barrage itself.

The new scheme and its transmission system are estimated to cost £47,000,700, compared with £28,640,000 for the 1933 scheme. Construction would occupy about nine years and would employ 4,570 men annually at the site and 6,285 indirectly in the provision of cement, steel, machinery and transport. During the first fifteen years of operation, the plant would mean an annual saving of nearly one million tons of coal.

From the engineering point of view the scheme is certainly workable and has the attractions of an untried idea; and recent developments—such as the extension of grid supply and improvements in constructional and electrical engineering—make it more feasible. But considered economically, the barrage seems much less practicable.

It is true that coal-fired power stations now pay at least twice as much for their fuel as they did in 1933, and that interest rates, which represent the heaviest single item of cost in hydro-electric projects, are at the moment favourable. But will the price of coal remain at its present level? Or, rather, can it be allowed to remain so high? And what will happen to construction costs? Can it be assumed that, in the long run, construction costs will be only 65 per cent above the pre-war level, while coal costs not only remain at their present high level but rise by a further 6s. a ton? The prospects for British industry, particularly for its power to export, are grim indeed if the price of the basic raw material is to remain so much out of line with other costs. Yet it is only on this artificial basis that the project can be justified as a commercial proposition.

A decision to launch the barrage project now could only be justified if the future of coal were regarded with the deepest pessimism. With so many less speculative calls upon the nation's limited capital resources, investment in the barrage would certainly be untimely. At the very least, it is elementary prudence to wait a few years and see in what relationship the various costs settle down.

Fuel and Power

The second reading of the Ministry of Fuel and Power Bill provided members with another opportunity to relieve their feelings about the coal situation by attacking

the war-time record of the Ministry. Nobody would pretend that the Ministry has been an unqualified success—as Colonel Lyons said, it has too often been "a Ministry of complacency one day and a Ministry of apology the next"—but its record is not nearly so black as it is painted. It has carried most of the blame for shortages quite beyond its control.

The purpose of the Bill is to continue the Ministry's functions, other than the emergency ones, so that the powers and functions which were operated separately before the war can be brought under unified control during the difficult years of transition. Efficiency in the various fuel and power industries is largely a matter of internal organisation and technical development, but it can be powerfully assisted by good team-work and co-ordination. It would be ridiculous to go back to the pre-war system by which coal was the concern of one Ministry, gas and petroleum of another and electricity of a third. A single Ministry does not by any means guarantee a co-ordinated policy. But, without it, anything of the sort is impossible.

Rehabilitation for Italy

On February 24th, the heads of the Allied Commission in Italy communicated to the Italian Government the details of the new status which the Allies had agreed to grant to Italy. In accordance with President Roosevelt's and Mr Churchill's declaration of September 26, 1944, the "relationship between the Allied Commission and the Italian Government" has now become "one of consultation and advice." In matters of day-to-day administration the Italian Government is now free to pursue its policy without interference from the Allied authorities, at least in so far as those policies are not prejudicial to the military interests of the Allies. In practice, the Italian Government has been freed from the obligation to submit its decrees and laws to the Allied Commission for approval. It is also free to make appointments at all levels of the civilian administration. Allied regional officers will no longer supervise local Italian authorities. In relations with foreign countries, too, the Italian Government has now been allowed to establish

Chinese horse typical of the T'ang period

FLYING MONEY

Fei-Tsien—Flying Money—the ancestor of the bill of exchange, was invented in China in the seventh century. It provided a means of transmitting money from place to place and thus assisted in developing trade and travel in China's vast territories.

The Emperor of the T'ang dynasty who originated this method of payment little knew he was sowing a seed which would grow into a highly specialized financial system enabling nation to trade with nation.

Modern international commerce calls at many stages for facilities which only a bank with wide ramifications can provide. In whatever overseas transactions you are interested and whatever the nature of your engagements, this Bank, with an extensive branch system in the home country and banking connections throughout the whole wide world, is able to offer you unrivalled services at whichever of its 1800 offices is most convenient for your purpose.

direct contacts with other Governments, and not as hitherto indirect contacts through the Allied Commission. Italian Ambassadors in Allied capitals will enjoy the privileges to which diplomatic representatives of sovereign states are entitled and accustomed.

It is enough to mention these new arrangements in order to realise the extent to which the activities of the Italian Administration have hitherto been restricted by Allied control. The real responsibility of Signor Bonomi's Government for the conduct of Italian affairs is therefore beginning only now.

The burden of that responsibility is very heavy indeed, set as it is against the background of economic and political disorganisation throughout Italy. Yet the present Government has so far had to contend with less political difficulties than either the Badoglio Government or Signor Bonomi's first Administration. The core of the present Governmental coalition consists of three parties: the Liberals, the Christian Democrats and the Communists. The Socialists, the Action Party, and the extreme Monarchists remain in semi-opposition—the Monarchists because they are not satisfied with the fact that the rights of the dynasty have not been explicitly recognised, and the Socialists and the Action Party because they want the principle of the Republic to be explicitly asserted. However, not a single party (except for the remnants of Fascism) has gone into outright opposition; and so far the seemingly unnatural coalition between the Liberals, Catholics and Communists has to all intents and purposes worked with surprising smoothness.

As the Prime Minister pointed out in the House of Commons, the Italian Government will have to re-shuffle itself after the liberation of the industrial north. The present coalition, after some changes in the personnel of the Government, will probably have a fair chance of continuing in office. In the north the Communist influence is presumably very strong; and the Communists' participation in the Government may help the present Administration to tide over what is likely to be the most critical period in the political life of post-Fascist Italy.

Economic Charter for the Americas?

Of the nine draft proposals submitted on Monday by the United States delegation to the Mexico City Conference, the two most outstanding were those calling for a free trade policy in the Americas and a programme for the industrialisation of the Latin American republics. The first, described as "a ten-point economic charter of the Americas," proposes the elimination of cartels and economic nationalism, provides for equal access to raw materials as envisaged in the Atlantic Charter, and seeks equitable treatment for foreign enterprise and capital, together with the encouragement of private enterprise and discouragement of Government intervention in business. The second promises American co-operation in industrialising Latin America by the provision of the necessary machinery as soon as possible after the war.

These far-reaching proposals inevitably call attention to the great strides made during the war towards the diversification of the economies of the different Latin American states, and to the prospects lying ahead for new industries which have so far been built up to meet a strategic demand, but which must, after the war, sustain the impact of the proposed economic charter for the Americas. The iron resources of Brazil and Peru are no longer unexploited wealth. Brazil's output of pig-iron, steel ingots and rolled steel during the first half of 1944 was respectively 67, 81, and 66 per cent higher than in the first half of 1939. Forty-five million dollars from the Export-Import Bank of Washington and 25 million dollars from the Brazilian Government have been invested in the Volta Redonda steel mills and in opening up the Itabira iron reserves. President Vargas's Economic Planning Committee, although it wishes to avoid charges of self-sufficiency, sponsors full exploitation of Brazil's resources. In particular, it wishes to build up secondary industries round its steel plants. There are parallel trends in Peru. In Bolivia, whose extractive industry has little immediate prospect of secondary development, prosperity hinges on the level of ore quotas and prices established in the United States.

On technical grounds, the future of heavy industry in Latin America must be uncertain, if only because of labour problems and the general absence of adequate coal reserves. On economic grounds, Latin America has received strong support from the Export-Import Bank, which has emerged

since 1940 as a definite instrument of American foreign policy. Lend-Lease disbursements throughout Latin America totalled \$172 million at June 30, 1944. Between January, 1940, and June, 1944, the Export-Import Bank invested approximately \$200 million in Latin America, most of which has led directly to the purchase of exports from the United States. With similar stimuli, lighter manufacturing industries, free from the competition of American, British or European imports during the war, have enjoyed boom conditions. In 1943, for instance, the textile output of Sao Paulo was estimated to equal that of Lancashire. Is all this new production going to exclude foreign goods after the war? How will it affect the trade relations of the Latin American states? Can it even be maintained without massive help from the United States? These are the problems which America's "Economic Charter" will certainly raise.

Tuberculosis at Large

A report of the Medical Research Council on the mass miniature radiography of civilians (HMSO, price 3s) is primarily a technical document of interest only to those concerned in this specialised work. But the findings of the survey, which covered two factories, an office group composed of civil servants, and a mental hospital, on the incidence of tuberculosis among the working population are of general interest. If the mental hospital cases are omitted—for the population of such hospitals is well known to show a higher incidence than the general population—it appears that newly discovered significant tuberculosis lesions were found in 1.0 to 1.5 per cent of the persons examined. These figures include 0.3 to 0.4 per cent who were in need of institutional treatment, the remainder requiring out-patient observation while continuing at work. If these findings can be generalised for the working population as a whole, it would appear that, out of a total of, say, 20,000,000, some 200,000 to 300,000 have tuberculosis without knowing it and that of these some 60,000 to 80,000 ought not to be at work and require institutional accommodation. In a recent parliamentary answer, the Minister of Health stated that the total number of sanatorium beds provided by local authorities in England and Wales was 29,000, and that the existing waiting list was about 4,500.

The survey reveals other problems besides the shortage of sanatorium beds—which is a short-term problem since the 80,000 cases, once detected, would be non-recurrent. There is the question of the re-employment of TB patients after treatment and the employment of those in whom treatment is unlikely to arrest the disease. Of the total of 21,000 persons radiographed, 69 had previously-diagnosed pulmonary TB of whom 14 were classed as unsatisfactory from the standpoint of their medical or social condition. Some of them were able to do a normal job but were a danger to their fellow workers because they were potentially infective. There is at present no means of dealing with these so-called chronic active cases. All the TB authorities can do is either to advise them to stop work, which means they would fall on relief, or to try to have their working conditions modified—which again might mean a loss in earnings. The Disabled Persons (Employment) Act may enable suitable facilities to be provided for the employment of these cases, but in the meantime the Ministry of Health's decision to exclude them from the special scheme of financial allowances should be reversed.

The report of this survey fully justifies the use of routine mass radiographic examinations of the civilian population, provided it is emphasised that a clear X-ray does not prevent a person from contracting the disease later. Of the 79 new cases needing treatment, 29 denied having any symptoms at all and only 17 of those admitting symptoms had consulted a doctor about them. Together with adequate facilities for radiographing people developing symptoms between the routine examinations, the extensive use of the miniature apparatus should be a valuable weapon in combating the disease which causes more than half of all deaths of people in their youth and prime.

Arise, Ye Neutrals

In its sixty-sixth month, seven new members of the United Nations—Egypt, Turkey, Syria, Lebanon, Chile, Paraguay, Peru and Ecuador—have joined in the war against the Axis. Some of these new Allies were a good deal more than passively neutral during the most critical stages of the war. Egypt, for instance, as the Prime Minister reminded the

House of Commons, rendered the most valuable services to the Allies during the war in Africa. At that time the security of Allied communication lines depended to a large extent on Egypt's good will and friendliness, and the British Government advised Egypt against a formal declaration of war. The Syrian and Lebanese Governments, too, co-operated with the Allies at a difficult period in the war.

As for Turkey, it is true that "we knew where its heart lay," but the Turks have not allowed their feelings to govern their actions; and the strictness of their neutrality even after Teheran was underlined by their continued resistance to Allied pressure. Since the odds against them were extremely heavy as long as they were within Germany's striking power, it would clearly be self-righteous to condemn Turkey's attitude. The Latin American republics, however, cannot defend their neutrality on similar grounds. The grotesque touch about the sudden mass conversion of neutrals, and co-belligerents into Allies is provided by the fact that a declaration of war on the Axis before March 1, 1945, has been made a condition for admittance to the San Francisco Conference. Many hitherto neutral Governments are anxious to obtain admission tickets to the Conference before the box-office closes.

But are such conditions for admittance really necessary? Could the participation of the interested nations not have been secured by a liberal interpretation of the term "United and Associated Nations' Conference"? Will Sweden and Switzerland (nobody doubts where their hearts lie) be excluded? It would be absurd to penalise those countries which, for geographical reasons, are still somewhat timid towards Germany; and it would be unjust to deny them the seats at the Conference table that Chile and Paraguay have been enabled to obtain almost at cut prices.

Exit General Radescu

The political tension in Rumania, caused by the attacks of the Left on General Radescu's Government, has now developed into an acute crisis. Armed clashes between General Radescu's followers and his opponents have taken place in many Rumanian towns; and in Bucharest itself several Ministries and the Royal Palace were for a while beleaguered by members of the National Democratic Front, among whom the Communists were most prominent. The Allied Control Commission, it is reported, has now intervened and has forbidden the Rumanian troops to open fire on the demonstrators.

A new feature of the situation is that the King has become involved in the crisis. The Left hinted that if the King failed to yield to the demand for General Radescu's dismissal "the position of the dynasty will be compromised" and that the agreement of September last under which the King preserved his throne might be invalidated. Significantly enough, these warnings were broadcast not from Bucharest but from Moscow. On Wednesday M. Molotov's Deputy, Commissar Vyshinsky, arrived in Bucharest presumably in order to communicate the warning in person. The King apparently yielded; he has dismissed General Radescu. The ostensible motives for the Russian intervention in Rumania have been that the Rumanian Government has failed to fulfil the terms of the armistice and that law and order must be preserved along the Russian communication lines in Rumania. It will be interesting to see whether the political trouble in Rumania will come under the joint consideration of the Big Three, as the Crimea agreement would seem to suggest.

Prospects for Emigration

A question last week in the House of Commons raised once more the question of emigration from this country to the Dominions after the war. Many young men and women in the services without any civilian ties of family or employment in this country are considering the advantages of beginning new lives overseas. The question is whether it should be public policy to encourage them or not.

The Prime Minister's reply indicated that the matter was under discussion with the Dominion Governments; presumably, when these talks have been concluded, the Government will make a comprehensive statement of policy. That this will not contain any great encouragement to emigrants on the part of the British Government was also hinted at, when Mr Churchill stressed the manpower needs of the United Kingdom. There will be, it is clear, a certain conflict

of interest between the individual and the state in this matter. The United Kingdom, faced with a hard struggle to recover from the economic wounds and sacrifices of the war, is also faced with an ageing population which can ill afford further losses, by migration, of its young men and women.

The Duke of Devonshire's assurance in September, 1943, that British policy would not be affected by Britain's own declining numbers can, for these reasons, only be safely interpreted as meaning that no prohibitory restriction will be placed on would-be emigrants. The measure of assistance, on the other hand, will be by arrangement with each Dominion Government. This policy, rooted in the pre-war agreements with Australia and Southern Rhodesia, would mean that financial assistance to emigrants would come largely from the Dominions. Besides this help, which in any case is likely to be limited, there will be needed greatly improved machinery—in Mr Churchill's words, "a careful and refined organisation"—to inform and assist the emigrant.

A policy on these lines would not be likely to lead—nor should it—to a great increase in the rate of emigration from these islands; it would, therefore, still leave unsolved the problem of finding new blood for the Dominions. In both Australia and New Zealand—and to a smaller extent in Canada—there is a strong desire, not only to set off a declining birth-rate, but to increase the population to a new economic optimum by encouraging immigration. The relatively few immigrants of British stock will have to be supplemented by Europeans. Mr Churchill's offer, on Tuesday, of British Empire citizenship to Polish veterans is a step in this direction, and there have been other signs recently that the Dominion peoples are prepared to widen their hitherto narrow definition of "desirable" immigrants. It is on these lines, rather than by mass emigration from this country that the problems should be tackled.

Murder in Cairo

The murder of the Prime Minister of Egypt, Ali Maher Pasha, during the Parliamentary session devoted to the Egyptian Declaration of war on Germany, might seem

OVERSEAS TRADE

Exports are vital to our post-war national prosperity, and the Bank will, as in the past, provide the requisite finance for their production and distribution. Technical information for overseas traders will also be available regarding Exchange, market conditions and commercial requirements abroad.

to indicate important political undercurrents—dissatisfaction with the British connection, underground fascism, or, since it is only a few weeks since Ali Maher's Saadists swept the polls, political spite on the part of his rivals, the Wafd. It seems almost certain, however, that the murder was an act of individual and aimless terrorism. The assassin was a young student—the traditional assassin type of the Middle East. He claimed to represent a group of other students, but has, it appears, no particular party affiliations. The passion which led him to murder was extreme nationalism. The Egyptian declaration of war seemed, no doubt, to youths of his stamp to be dictated by the British and to be a rebuff to Egyptian sovereignty and independence.

The assassination, as the work of an irresponsible extremist, has no immediate political significance. Yet it is a reminder of how easily resentments can be inflamed and passions aroused against the Anglo-Egyptian relationship. As Mr Churchill reminded the Commons in his statement on the Conference, Egyptians of all parties have loyally observed the Treaty. But there are Egyptians in all parties who want to see it modified after the war and who are also ready to raise the question of the Anglo-Egyptian Condominium in the Sudan. Mr Churchill stated that, at the recent talks in Cairo,

there was no question of shaping new policy for the Middle East.

Perhaps the occasion was premature, but without new policies in the not too distant future there are shoals ahead for British interests in the Middle East.

Aids to Hearing

A Deaf Aids Committee has been appointed to advise and assist the Medical Research Council in promoting research into problems relating to instrument design which have been raised by new methods of alleviating deafness. These new methods, based upon a combination of microphone, earpiece and amplifier, are undoubtedly effective. But there is a danger that the technical progress achieved may be exploited by fraudulent concerns. As the National Institute for the Deaf pointed out some years ago,

Advertisements of aids to hearing appear in almost every publication of the country. . . . In many cases, the claims put forward are often so absurdly extravagant, and often so ignorant, that it is surprising that intelligent people can be deceived by them. . . .

There is a big demand from the deaf for inconspicuous appliances, and this has been exploited by the production and advertisement of a large number of gadgets costing a few shillings to produce, but sold at prices up to five guineas.

The Institute advises deaf and semi-deaf persons to seek medical advice before accepting such aids, and after they have been fitted. It has also compiled a list of reputable firms on which the deaf can rely for fair dealing. But once a good appliance has been bought, the problem of the high cost of maintenance remains. A correspondent in the *British Medical Journal* recently drew attention to this problem, and suggested that a "standard model" should be produced which could be serviced by any competent wireless mechanic.

The establishment of a national health service is a good time for a full investigation into all these questions. Every insured deaf person should have the right to the best possible appliance, just as every amputation case should have the right to the best possible make of artificial limb. But the best possible appliance at the moment is undoubtedly very expensive—an efficient machine may cost £21 or more. Yet it would be contrary to the principles of the health service if people who could afford it were able to buy such a machine while those who relied on state provision had to be content with something less effective. The state has so far done little for the deaf, presumably because they are likely to be less economically dependent than, for instance, the blind. But they deserve no less pity and help.

Experiment with Time

Daylight is among those many commodities which have been stretched to go round a little further in wartime. If the worker has seen daylight only on Saturday in winter, at least he has seen it for an hour more. The fate of the extra hour's daylight in the evening, unseasonably termed British

Double Summer Time in summer and British Summer Time in winter, has now been decided. Already, the farmers have been asking for their stolen hour back. Their claim that wartime needs no longer justify its retention may be granted. But what of peacetime needs?

There is, of course, no witchcraft in changing the clock. An hour more of daylight in the evening means an hour less in the morning. Exactly the same result would be secured if everyone got up an hour earlier; but that seems to be asking too much. It is much easier to change the clock than to change conventions—and the question to ask is whether urban conventions, which govern the lives of nine-tenths of the population, have become so sluggish and lie-abed that more than pre-war summer time is needed to give them a maximum share of daylight—and with it health, happiness and working efficiency. If the answer is in the affirmative, it does not follow that the clock must be changed an hour at a time or only twice each year. For instance, in the three mid-winter months daylight is so short that no clock-changing can help, and in the three mid-summer months it is so plentiful that at least two hours can be added at night without many workers getting up in the dark; but the amount of clock-changing must be strictly limited—to four times a year at most—if muddle is to be avoided.

The farmer's case rests on the claim that he needs to work by the sun. Difficulties arise for him if markets and transport work by clocks that are an hour or two hours behind his natural schedule. The farmer's case could be largely met if milk lorries, markets, and rural buses and licensing hours were also determined by the sun. The delay in delivery to consumers would be very slight, and rambblers would on occasion be pleasantly surprised. By such methods, farmers might be persuaded not to let the sun go down on their wrath.

Shorter Notes

The chairman of the Inter-Departmental Committee which is to inquire into the provision made for children deprived of a normal home life will be Miss Myra Curtis, Principal of Newnham College, Cambridge, who was one of the two members of the Committee which inquired into conditions in the London County Council's remand homes. There will be 16 other members, including representatives of local authority and voluntary welfare services, a professor of child health, and three MPs.

The Labour Party's decision—long delayed and much debated—to re-admit Sir Stafford Cripps to the fold will be welcomed in non-Labour as well as Labour circles. Sir Stafford has certainly worked his passage since he was expelled from the party in 1938 for Popular Front activities; he has travelled from Southport to Transport House via Moscow, Delhi and Whitehall. The decision can hardly mean that Labour is allowing any relaxation of party discipline—the door to co-operation with other political parties was bolted at the December Conference. But brains and a national prestige are electoral assets which the party cannot afford to neglect.

A debate on air accidents in the House recently revealed considerable disquiet concerning the dangers of air travel. It should be remembered, however, that the risks of wartime flying are necessarily greater; that long journeys by high officials are now more frequently made by air than by sea or land; and that the percentage of accidents per passenger-mile is quite possibly lower in the air than on the roads. The table below is a fair indication of the enormous increase in air travel, even if military transport is discounted, during the war. By comparison, it would seem unlikely, to say the least, that the rate of accidents not due to enemy action has increased by as much.

	1938	1943	1944
Total miles flown by British airlines on overseas routes	11,053,702	12,575,417	18,813,913
Passengers carried on overseas routes	74,585	66,565	100,852

Letters to the Editor

Post-War Arithmetic

SIR,—I heartily agree with the conclusions of your article on Post-War Arithmetic, that capital formation must not be allowed to be the "residuary legatee" from the national dividend, but the allocation of resources should be subject to the purposive direction of the state, and must have due regard to a scheme of national priorities. I should like to make it clear, however, that the particular figures of post-war investment, which you quote as "utterly inadequate," were not put forward by me as an estimate of what is desirable, but were introduced for the very purpose of demonstrating how inadequate capital investment would be if it were treated merely as a residuary item. In the same table from which these figures were taken (Table 60, page 391, of "Full Employment in a Free Society"), there were two other alternative investment plans given which you ignore, the one showing a rate of gross investment (on your definition) of £1,050 million, and the other of £1,300 million, both involving some control over consumption, though both consistent with a higher level of actual consumption than that reached in 1938.

You also criticise my assumption that the post-war national real income, under a full employment policy, will be 20 per cent above that of 1938. My own view is that this estimate is more likely to prove too low, if it is taken to refer (as it was meant to refer) to the position at the close of the transition period, when the situation will again be stabilised; though I may have allowed too short a period for this transition. But even if one took your own estimate of a no more than 10 per cent increase, it would still be possible to double the rate of net investment in fixed capital without restricting real consumption below its pre-war level—i.e., while increasing private consumption by 25 per cent over its present level.

The conclusion to be drawn from such estimates, therefore—whether one inclines to be pessimistic or optimistic about the future national income—is not that we "can't afford" major schemes of national improvement without a drastic curtailment of consumption, but that we cannot afford to do without planning. Provided that the idea of budgeting the use of national resources in accordance with a scheme of priorities is carried over into peace-time, and the necessary controls are retained, there is little danger of the post-war reconstruction plans having to be curtailed for lack of means. —Yours faithfully,
Cambridge

NICHOLAS KALDOR

[There was no intention of suggesting that Mr Kaldor expressed himself as satisfied with the results of his statistical estimates. His two alternative plans were not quoted because they did not attempt to show what was alone relevant to our article—namely, what is likely to happen in the absence of any attempt to impose a scale of priorities. There was also no attempt to say that Mr Kaldor's estimate of post-war national income was wrong—but only that a more cautious figure is just as likely.—EDITOR.]

Patent Medicines

SIR,—The Secretary of the National Pharmaceutical Union, writing on the "Chemists' Friends Scheme" in your issue of February 3rd, makes it appear that the functions of this organisation consist merely of the restriction of sales of medicines to persons qualified for that purpose and to the most laudable prevention of misleading advertisements. His letter, however, omits a third function which was very clearly described in an excellent survey of the chemists' business published before the war by the Pharmaceutical Society of Great Britain. According to this report,

Manufacturers of proprietary medicines are asked to limit to pharmacists the retail distribution of their goods, and those that agree to do so are placed in the "Chemists' Friends" list and their products are given special prominence by retail pharmacists who support the scheme. Retail supporters of the scheme are asked not to give prominence to the goods of manufacturers who are not on the "Chemists' Friends" list.

The aim of the scheme, therefore, is to restrict competition; it is devised to increase the turnover of the so-called genuine chemist and has, to this extent, a purely

commercial purpose. Not very long ago a trade journal reported that there was conflict between the Chemists' Friends Scheme and another retail trade association; it was suggested that the Friends Scheme was "prohibiting under penalties all chemists from granting, if they so desire, normal display facilities to manufacturer members" of that association. If the principle on which the Chemists' Friends Scheme is based should find general acceptance, Mr Mallinson's friends may one day find that manufacturers of photographic articles, cosmetics and leather goods, or publishers of books, might exclude pharmacists from selling commodities so out of keeping with their proper business; they might restrict the sale of these commodities to "genuine" retailers in order to protect the public from buying from non-specialised salesmen.

Nobody will deny that the sale of most medicines definitely requires a qualified chemist; there is legislation to secure this object. But there are patent medicines and semi-medical articles where such limitation is not necessary and where, if organised in the Friends Scheme manner, it simply means restriction of commercial competition.—Yours faithfully,
HERMANN LEVY

Richmond

The Dutch Government

SIR,—I was very much surprised to read the note in your issue of February 17th on the resignation of the former Dutch Minister of the Interior, Mr Burger. Nobody will deny that there should be discrimination in the treatment of the various categories of collaborators. Mr Burger, however, advocated that there should be no treatment at all, except as regards those who had been members of the Dutch National Socialist movement. Admittedly not every burgomaster who acted as a tool of the Germans should be sentenced to heavy penalties; there are degrees in collaboration. But public opinion rightly insists that the liberated nation should have leaders with a clean record. This Mr Burger opposed.

You may have noticed that his two Socialist colleagues, Minister Albarda and Minister Van den Temple, have made it clear that they in no way shared Mr Burger's unstatesmanlike opinion.—Yours faithfully,

L. DE JONG
(Editor of *Radio Orange*)

The Coal Industry

SIR,—In his letter appearing in your issue of February 17th, Sir P. Malcolm Stewart criticises Mr Robert Foot's Plan for Coal on the ground that "no hand is held out to labour so as to secure the essential co-operation of the trade unions."

No doubt your correspondent had read the plan before writing his letter, but perhaps he paid insufficient attention to principle X on page 42, which reads as follows:—

That the workers in the Industry be kept fully informed of its progress and circumstances in every direction and given every opportunity and encouragement to make their full contribution towards its greater prosperity. For this purpose close liaison between the two sides should be established and permanently maintained, on a national level, on a district level and at every colliery. With this object in view a Joint National Committee, a suitable Joint Committee in each district and Pit Production Committees, should be regarded as essential parts of the structure of the industry. The latter should not only be continued and everywhere be brought up to the level of the many that are already being operated with success, but the scope of their discussions and, if necessary, their constitution, should be enlarged and altered to enable proper effect to be given to the general intention stated in this paragraph. No matter that is established as one of national principle should be excluded from the discussions of the Joint National Committee, the Joint District Committee or the Joint Committee established in each colliery.

Yours faithfully,
H. J. GILLESPIE.

The Mining Association of Great Britain.

There are many men and women in the Services who would welcome a chance of reading this publication. If you would hand it in, unwrapped, unstamped, and unaddressed at any Post Office, it will go to them.

AMERICAN SURVEY

Wage Issues

Two actions by the War Labour Board have brought wage policy back into the limelight and threaten to disrupt the Board. One is the report of the Board's public members advising the President against any upward revision in the "little steel" formula for the fixing of wage rates, from which Labour hotly dissents; the other is the Board's recommendation of a minimum wage of 55 cents an hour in the textile industry which was opposed by its industry members.

The "little steel" formula, evolved in 1942, provided, it will be remembered, for the freezing of basic wage rates except for a 15 per cent increase over the levels of January 1941, to compensate for the rise in the cost of living between January, 1941, and May, 1942. Provision was also made for raising substandard wages and correcting inequalities. The extent of further increases in living costs since May, 1942, is the subject of bitter disagreement. A recent report by Mr Davis, the chairman of the WLB, put the rise over the whole period at less than 30 per cent, while labour insists it is nearer 45 per cent. As for wage increases, the public members of the Board, while admitting that basic wage rates have risen only 19.4 per cent, point to an increase in hourly earnings of 30 per cent, due to upgrading, incentive payments, and merit rises, and to a 75 per cent growth in gross weekly earnings, due to longer hours, overtime pay, and shifts to higher-wage industries.

Labour is motivated not only by its conviction that higher prices have out-stripped wage increases, but by its fear that when the work-week is shortened, labour will experience a 22 per cent drop in "take-home" pay without any immediate compensation in the form of lower prices. It complains, as well, of the injection of gross weekly earnings into the discussion of a stabilisation plan originally designed to stabilise hourly wage rates. The public members' report admits some truth in labour's arguments both as to the cost of living and a possible post-war "squeeze," but argues that greater injustices would be done to white-collar workers and non-unionised labour, by endangering the stabilisation programme.

The report urges, instead, that Congress amend the Fair Labour Standards Act, which fixes minimum wages at 40 cents an hour, along the lines of Senator Pepper's Bill, which would make anything below 65 cents an hour substandard during the war. In effect, this is what the War Labour Board has been doing in decisions on "substandard" and "inequitable" wage rates. Until the textile case, anything under a rate of 50 cents an hour had come to be regarded by the Board as sub-standard, and capable of adjustment without infringing the stabilisation formula. Should the textile decision go into effect, it appears that 55 cents an hour would become the new effective minimum. Such an increase requires, however, the consent of the Office of Economic Stabilisation if it will result in price increases.

The textile industry, which pays the lowest wages of any basic manufacturing industry (earnings average 64.6 cents an hour) probably presents as good a case as can be found for upward adjustment, not only on the grounds of fair play, but on account of its loss of manpower at a time of textile shortages. The CIO union involved has pressed for a basic rate of 60 cents an hour and in protest at the delay in reaching a decision has released workers from their anti-strike pledge.

But it is certain that public opinion would condemn a general policy of increasing wage rates. The Congress of Industrial Organisations and the American Federation of Labour are well aware of the probable public reaction; but they are forced on, partly by a sense that this winter may prove the last opportunity to secure favourable treatment, and by their apprehensions lest Mr John L. Lewis repeat his earlier coup. The current coal contract expires on April 1; and should he demonstrate once more his capacity for securing by force what more co-operative labour leaders have failed to obtain, the ability of the CIO and AFL leaders to control their members may be impaired.

The chief victim of these conflicting pressures is the War Labour Board. If it is unable to make its textile recommendations effective, and the CIO withdraws its representatives as is threatened, the Board's authority will suffer a blow even more fatal than that contained in the Montgomery Ward decision handed down last month.

Advice to Conservatives

During the past week Mr Walter Lippmann has read the Republicans in Congress a lecture on the principles and practice of sound Conservatism and the functions of an Opposition party. The occasion of these strictures is the implacable hostility of Senator Taft and his followers, not only to Mr Wallace's control of the Reconstruction Finance Corporation, but to his appointment in any form. Senator Taft, who has made himself the mouthpiece of the die-hard Republicans, has made it clear that he regards this as a particularly offensive form of teaching one's grandmother to suck eggs.

It is Mr Lippmann's contention that, while Congress was well within its rights in depriving Mr Wallace of the financial power to carry out his policies without resort to Congress, the Senate has no further case for blocking his appointment; that to do so would be unconstitutional. Legally, there may be some doubts about the view that the power to confirm does not imply the power to reject. The fight over Mr Wallace, however, recalls irresistibly President Jackson's shrewd prophecy when the Senate rejected the nomination of Martin Van Buren as Minister to Great Britain: "They have broken a Minister, but they have made a President."

Mr Wallace's enemies may not have done him a comparable service; but the moral applies to issues as well as men. Mr Lippmann accuses Senator Taft of

leading the Republican Party into the blind alleys of dumb obstruction on vital issues, and of making it incapable of offering a trustworthy alternative to a third and fourth term for Mr Roosevelt

and of committing an unforgivable folly by not insisting that Mr Wallace share the responsibilities and practical difficulties of the job.

The adaptability which has marked British Toryism and has served it so well is conspicuously lacking on the American Right. Republican standard-bearers like Mr Willkie and Governor Dewey have, in their different ways, recognised this danger, but without any noticeable effect on the rank and file. The charge that he was only a "carbon-copy Roosevelt" proved Mr Willkie's greatest handicap with his party; and even Governor Dewey has been attacked on the same score. In the long run, however, Mr Lippmann undoubtedly is right in insisting that adaptability is the foundation of a successful and practical Conservatism. It is a lesson which might be studied with profit in both party camps, by Senator Byrd as well as Senator Taft. A species which is incapable of adaptation eventually becomes extinct.

The Stroke of Twelve

Entertainment becomes the industrial Cinderella this week. Mr Byrnes has followed the "brown-out" and the ban on horse-racing by a midnight curfew on restaurants, night-clubs, cinemas, and theatres all over the country on the ground that early closing will save fuel, and, incidentally, manpower and transport. The effect will be felt mainly in the large cities, and especially in New York, where Mayor LaGuardia has made a valiant, but fruitless effort to secure a reprieve for over a thousand night-clubs.

New York has always been an entertainment centre for the nation. Now, although passed over, to a large extent, by war industry itself, it is crowded with war workers from a hundred other cities seeking relaxation. There has been a mushroom growth of new restaurants and night-clubs; there is standing room only at the theatres.

However valid the reasons for the curfew—and it would be interesting to see some estimate of the expected savings—the step will inevitably be regarded as a sumptuary ordin-

ance, undertaken with at least one eye on public morale. Hollywood already is grumbling that no fuel economies are needed in sunny California. Experience with Prohibition showed how impossible it is to enforce such regulations unless there is free public consent; neither morals nor morale can be legislated into existence. In this case there is an even greater danger that evasions will be winked at by local authorities and condoned by local opinion. It would only be in line with tradition if fuel, in the place of alcohol, is bootlegged, and if illicit lights shone in the eyes of the "blind pigs."

What Price Steel

Rundstedt, the weather and the manpower shortage have all combined to make the steel outlook in the United States dismal. The total effect of the decline in production in January will not really be visible until the second quarter, when the deficit may be as high as 3 million of the required 17,465,000 tons. This seriously threatens the war production programme, which does not reach its peak until June.

Steel is at the top of the manpower priority list. The industry still needs 100,000 men, but has no hope of getting them without compulsory legislation. Those now employed are working at their peak, but such strained production cannot be maintained; the men will reach a point of exhaustion. And always hovering ominously over the steel landscape is Mr John L. Lewis's courtly letter to Secretary of Labour Perkins, giving her the legal thirty days' notice of strike action because "a dispute exists within the meaning of the Smith-Connally Bill."

Although it does not compare with war production in immediacy, the problem that probably looms largest to a steelmonger is post-war steel prices. The industry has absorbed a 20 per cent rise in steel-making costs since 1929 by spreading overhead costs over a much larger volume of production. With an eye on the time when war orders will decline, the industry is anxious to absorb some of this overhead now by a general price rise.

Prices were frozen in 1941 at 1939 levels, but earnings have been fortified by withdrawal of the concessions from

official prices usually made in peacetime competitive markets; by speciality products which carry extra charges; and by the sure profit of ordnance and shipbuilding work, which looms large in the industry's total business. Application is now being made to the Office of Price Administration for a ten per cent general rise in prices, which would restore prewar profit margins. There is a significant proviso that basic wages should not be increased after Germany's defeat.

The demand for a general increase in steel prices on a declining market is an exceptional one. But those spokesmen of the industry who justify it expect a demand up to 75 per cent of capacity after Germany's defeat, since they look for a good degree of maintenance in arms production. This 75 per cent market estimate, however, discounts the possibilities inherent in large inventories, which some other authorities think will amount to 20 million tons. Heavy drafts on these stocks for civilian production, if combined with a sharp decline in war production, would make any price rise the OPA granted now look very academic.

Shorter Notes

Fewer people were employed in the United States in January than in any month since Pearl Harbour. The total potential labour force declined to 50,960,000 workers, while those actually employed out of this estimated force hit another low of 50,120,000.

The Manpower Bill which the Senate Military Affairs Committee proposes to substitute for the May-Bailey "work or fight" measure passed by the House is so patently inadequate, and has received such a bad press, that it now seems likely that the May Bill may be reintroduced on the floor of the Senate. Amendments to the Senate's Committee's proposed Bill, drastically increasing the penalties for employers, have not increased its popularity.

THE WORLD OVERSEAS

Conservation of Canada

[FROM OUR OTTAWA CORRESPONDENT]

THE conservation of natural resources has become a matter of growing concern to the Canadian people. The Eastern Ontario Conservation Conference, which was held at Queen's University, Kingston, early in February, 1945, is only one of many signs of an awareness that, to use the language of a recent parliamentary committee, "unless adequate precautions be now taken, much of our national wealth will rapidly disappear." The interest taken in it in the later stages of the war is in part connected with the expectation that considerable post-war employment can be derived from conservation and development measures. Many studies have been undertaken in various parts of Canada, and a number of concrete plans will be ready when hostilities cease.

Until very recently, conservation was a neglected art in Canada. In the atmosphere of boundless optimism which accompanied the expansion of the Canadian economy from 1896 onwards, the after-dinner speakers, talking about "Canada's inexhaustible resources," drowned the more prudent voices. The prodigal "gutting" of Canada's natural wealth has, in many areas, been notorious. It has not yet ceased, and, indeed, the exigencies of war have compelled acceleration in some fields.

Some consequences of exploitation have been spectacular, such as widespread soil-drifting on the prairies, the abandonment of exhausted mining camps and the disappearance of the white pine forests of southern Ontario. Others have been more subtle, such as the recent evidences of malnutrition of cattle and the steady lowering of the butterfat content of milk in dairy regions where the soil is being depleted of chemical elements.

A recent issue of *Canadian Affairs* quoted the Chief

Forester of British Columbia as estimating that the province is cutting one-third more timber than it is growing, and that about one-half of the sound wood cut in the forests is being left on the ground. The British Columbia government appointed a Royal Commission on Forest Resources in 1943 to investigate and make recommendations.

A committee set up by the Canadian Institute of Mining and Metallurgy recently reported that 63 per cent of Canada's metal production in 1942 came from mining areas discovered prior to 1910, and only 5 per cent from mining areas discovered since 1930.

Dr Robert Wallace, chairman of a government sub-committee on conservation, recently wrote of southern Ontario that

the submarginal areas are growing larger, the water in streams and wells is becoming less, and erosion of different types, including topsoil washing on agricultural land, is increasing.

As a joint project between the Dominion Government and the Province of Ontario, Dr Wallace's sub-committee and the Ontario Department of Lands and Forests have recently completed an exhaustive study of the results of thoughtless exploitation of the natural resources of one small region of southern Ontario. The area chosen was the Ganaraska Watershed, of about 100 square miles, which is the drainage basin of a small river flowing into Lake Ontario at Port Hope. The area was originally covered with heavy forest, wild life was abundant, floods on the river were rare, the soil was fertile. Settlement began with the arrival of United Empire Loyalists in 1793, and the population rose rapidly after 1837, reaching a peak in 1881. By this time the rich stand of timber had been nearly exhausted, the farms had begun to deteriorate under steady cropping and erosion of soil by wind and water began. Then the young people began to migrate from the area. The population has declined steadily since then, and several formerly thriving communities have disappeared.

altogether. Floods on the Ganaraska River have become much more severe since the forest cover was removed, and the wild life has largely disappeared. The silt carried downstream in the floods makes constant expensive dredging necessary in Port Hope Harbour. In a single year floods have caused damage to property of \$250,000.

The Interdepartmental Committee, after a thorough survey of the Ganaraska Watershed, recommended measures to end the soil erosion, control flooding and substantially restore its timber, wild life and agricultural resources to their original state. Precise estimates were made not only of the cost of this rehabilitation, but of the exact number of man-days' work which would be incidentally provided as an employment project after the war. The sponsors of the recommendations believe that they have given Canada a gauge or yardstick by which the cost and employment possibilities of larger projects in other parts of Canada can be computed.

The most important proposal for the restoration of the Ganaraska Watershed is the creation of a new forest of 20,000 acres on the northern part of the watershed, sub-marginal lands being withdrawn from agriculture for the purpose. Other recommendations include engineering works to prevent flooding; tree planting and woodlot management in the agricultural areas; new farming methods to control erosion; the building of dams to encourage wild life and for agricultural needs; the building of tourist and recreational centres; the creation of community pastures; and the roadside planting of highways. The cost is estimated at about \$1,400,000, and the projects would provide work for 600 persons for approximately two years.

The Ganaraska Watershed is not, of course, typical of Canada. The overall picture is far from depressing. Authorities estimate that proper forest management across Canada would permit the present high rate of exploitation and export to be continued indefinitely. There are still vast water powers to conserve and develop. There are extensive mineral areas not even scratched. Few agricultural areas have been so severely gutted that they cannot be restored.

The activities conducted under the 'Prairie Farm Rehabilitation Act of 1935 demonstrate what strides can be made in a single decade in repairing the damage done by reckless farming methods. The Act was passed when soil drifting, abandonment of farms and economic destitution was widespread. Under the Act, over 20,000 dug-outs and dams have been constructed to conserve "run-off," and another 20,000 are projected. One and a quarter million acres of sub-marginal land have been withdrawn from field cropping and converted into permanent community pastures. Soil drifting has been controlled by the planting of hardy grasses and by proper methods of cultivation. The PFRA administration has also undertaken many small irrigation projects, and has done preliminary surveys on projects which would give the prairies four or five million acres of irrigated land against the present 600,000. These major projects cannot be undertaken until steel, concrete and plentiful labour are again available. But already, by tree planting, by water conservation and by the wise use of land, the PFRA has transformed the face of a considerable portion of the sub-humid and semi-arid plains of Western Canada.

Italy's Finances

[FROM A CORRESPONDENT IN ROME]

THE condition of Italy's finances can best be described if the Budget report made by the Secretary to the Treasury, Signor Soleri, on September 29, 1944, is brought up to a later date, December 10, and analysed.

The first section includes ordinary revenue and expenditure. The whole of the revenue is included here, but only that part of the expenditure which can properly be called permanent and excludes those items that result from the state of war. Total ordinary expenditure is thus put at 33,658.2 million lire and total revenue at 12,938.3 million lire, leaving a deficit of 20,719.9 million. This part of the total deficit should not cause concern. Revenue is low because the best part of the revenue-producing territory, the north of Italy, is still in the hands of the enemy. When Italy is wholly liberated it should not be difficult to return, in a couple of years or so, to a Budget balanced at the level of about 40 milliard lire. A few items, for instance defence, will be reduced; others will expand. Social welfare and

education will be greatly increased. Eventually the state Budget will rise to 60 milliard and perhaps 80 milliard lire. Whatever the future rate of exchange, there is a big difference between a present-day Budget of 40 milliard lire and the pre-1914 Budget of 2.5 milliard. At the present official rate of exchange of 400 lire to the pound or 100 lire to the dollar, which means 170 1945 lire to one 1914 dollar, the real burden of the 1914 2.5 milliards cannot be valued at less than 80 milliard lire of to-day—or even more, since if the lira was undervalued when the Allies first landed in Sicily, it is now overvalued. Thanks to the devaluation of the lira and the virtual nullification of the debt charges, it is now easier than in 1914 to make both ends meet in the ordinary Budget.

The real problem concerns the extraordinary war and transition-to-peace Budget. Here there is no revenue, but only expenditure. Nevertheless, a distinction can be made between non-recurrent and permanent extraordinary expenditure.

It is fairly certain that the non-recurrent items will not reappear in the future. For instance, the State Railways' deficit is estimated at 6,661.6 million lire for the fiscal year 1944-45, with a probable further increase of 4,000 million lire in the same year. This deficit will surely disappear when the railways are rehabilitated and civil traffic substituted for the almost exclusively military traffic of the Allies. The war expenditure of the army, navy and air force is estimated at 32,653 million lire, and this item will likewise disappear. The repatriation of Italian prisoners is estimated to cost 30,000 million lire. The total of such non-recurrent expenditure for the current year is estimated at the grand total of 95,412.6 million. It is probable that the whole of this big sum will not be spent before June 30, 1945. After the war, war expenditure will be replaced by reconstruction expenditure, for which only 4,658.4 millions are budgeted in the current fiscal year. Even if a five-year or, better, ten-year reconstruction plan should require a state expenditure of 50 milliard lire yearly, the burden should not exceed the internal savings plus potential imports of foreign capital.

The total internal savings prior to 1914 were estimated at 2 milliard lire, which at the present official rate of exchange is equivalent to 50 milliard 1945 lire. Will Italian savers be able and willing to lend to the state and to private entrepreneurs 25 milliard lire each? In addition, will foreign bankers and capitalists lend to the Italian state the 25 milliards needed to complete the 50 milliards wanted for the state's ten-year reconstruction plan? Savers, Italians and foreigners alike, will come to the rescue only if a truly democratic regime can maintain law and order.

The Bread Subsidy

From a strictly financial point of view, the first step to be taken is to put a final stop on those recurrent extraordinary expenditures which are the true causes of the permanent gap between revenue and expenditure. The first and foremost of these recurrent extraordinary expenditures is the bread subsidy. The cost of the 1 kg. loaf of bread is 15 lire, against a price of 5 lire. The present loss to the Exchequer is 18 milliard lire yearly and the loss will go up to at least 30 milliards when the north of Italy is liberated. This and this alone is the motor driving the presses printing banknotes. Italian savers are willing to subscribe to Treasury bonds and bills for the sake of the liberation and rehabilitation of Italian territory, but they are afraid to give money which is squandered on a purely demagogic bread subsidy. There is a limit to voluntary loans and taxes; and people feel that the limit has been passed when the state tries vainly to keep down the cost of living by subsidising bread at so huge a cost. Inflation becomes inevitable; general prices in their turn do increase; and wages and salaries are pushed up.

The old and new increases in the wages and salaries of state employees alone are estimated at about 20 milliard lire. The vicious circle will nullify the purchasing power of the lira if the source of inflation is not stopped at once. A generation ago, Signor Gjolitti, the Prime Minister, and Signor Soleri, the Minister of Food, persuaded Parliament, after a six-months' fight, to approve the act of February 21, 1921, which abolished the bread subsidy and rescued Italy's finances. When, on October 28, 1922, the march on Rome put Mussolini and the Fascists in power, the Italian state budget was balanced thanks to the courageous behaviour of the last democratic liberal statesmen.

WHAT WILL IT BE LIKE?

What will it be like, your post-war car? It must give you speed with perfect safety... comfort... reliability... economy... a supreme quality of workmanship and mechanical perfection. But you will look for some in

that, to compensate for the years of waiting. This distinctive quality will be yours in the post-war LANCHESTER... the car with personality, created from knowledge, experience and craftsmanship by individual designers and engineers.

LANCHESTER

THE LANCHESTER MOTOR COMPANY LTD., LONDON AND COVENTRY

ISSUED BY THE MINISTRY OF FUEL AND POWER

URGENT CALL

To Cut Consumption of GAS AND ELECTRICITY

Ice-bound coal trains, an unprecedented strain on gas works and power stations—these were the consequences of the recent abnormal weather. It will take time for coal stocks to recover from the effects of these conditions.

All consumers must make a special effort to cut gas and electricity consumption everywhere, at home and in the works, in offices, shops, restaurants and hotels.

FROM INDUSTRY AN ALL-ROUND CUT OF 10% HAS BEEN ASKED. Management must see that these savings are made without harm to essential war production. A good fuel watching system will be found invaluable.

Unless an all-round economy of at least 10% can be secured and maintained by voluntary efforts, the Government will be compelled to issue directions which would necessarily give less latitude to the industrial user.

THE SITUATION CALLS FOR THE FULLEST CO-OPERATION FROM EVERYONE WHO USES GAS AND ELECTRICITY

THE BUSINESS WORLD

Middle Eastern Inflation

EVERY country in the Middle East has suffered some measure of inflation as a result of the war. The causes of that experience have been broadly the same for all the countries concerned, but they have operated with varying degrees of intensity. What is more important, forces of inflation have not met with equally vigorous resistance in each of the countries in question. Though their claims to real belligerent status may be a little doubtful, each of them has felt the direct effect of war on its economy. In most of them the impact has come through the presence of large bodies of Allied troops and through the effect of their expenditure on the volume of available consumer goods. Military purchases of materials and competition for local labour have inevitably influenced and distorted price and cost structures.

All these countries have suffered in varying degrees from shortages of materials. Additional purchasing power has thus been superimposed on a smaller volume of things to be purchased. In Turkey, where the presence and expenditure of Allied troops have not been felt, the keen competition for local produce by Germany and the Allies has produced much the same result. The direct effect of pre-emption on the economy of Turkey suddenly ceased more than a year ago, but its distorting influence on the Turkish price structure and on the volume of currency pumped into circulation in that country during the previous four years is likely to endure for a long time.

As will be seen from the accompanying table, which gives the latest indices of the monetary circulation, wholesale prices and cost of living in seven Middle East countries, the incidence of inflation has varied considerably within this area.

	Monetary Circulation (1944)	Wholesale Prices (1944)	Cost of Living (1944)
Turkey.....	321 (July)	459 (May)	422 (May)
Egypt.....	562 (Dec.)	328 (Sept.)	287 (Sept.)
Palestine.....	691 (Dec.)	365 (Nov.)	252 (Dec.)
Syria.....	1,013 (Dec.)	1,078 (Nov.)	592 (Nov.)
Iraq.....	918 (Dec.)	493 (Nov.)	375 (Dec.)
Persia.....	786 (Dec.)	497 (Dec.)	684 (Dec.)
Sudan.....	168 (Oct.)	227 (Nov.)	160 (Dec.)

The degree of inflation has proved smallest in the Red Sea area. In the Sudan, which makes the best showing, this must be attributed to the existence of a first-class administrative machine which is, in effect, a branch of the British Civil Service. In Egypt, the comparative modesty of the rise in prices—when measured in terms of the expansion of the monetary circulation—must be attributed to the richness of the country. Egypt, more than any other country in the Middle East, has been able to meet the additional strains made upon its economy by the war through an increase in production. In addition, Egypt has had a potent anti-inflation solvent at its disposal in the form of external sterling debt which it has been able, in part, to repatriate. In the case of Palestine, the relatively small dimensions of the inflationary problem (especially when viewed in the light of that in neighbouring Syria) are largely due to the existence of an efficient civil administration operating the only real price control system in the Middle East. Outside this Red Sea area, the ravages of inflation have been greater, increasing in each country with the poverty of its material resources and of its administrative machine.

Inflation in the Middle East has been fought with a variety of weapons. In Egypt advantage has been taken of the accumulation of sterling balances (which now stand at about £300 million, compared with £50 million at the beginning of the war) to repatriate Government sterling debt. The counterpart of the repayment of external debt has been domestic borrowing, which has helped to mop up purchasing power within the country. In addition to the official repayment of external debt, private investors—not only in Egypt, but in Palestine—have for some time

past been purchasing sterling securities, mostly of enterprises with local interests, in the London market. These purchases have helped to keep down the rate of growth both of monetary expansion and of the "abnormal" sterling balances.
